Cette distribution peut comprendre des composants développés par des tierces parties.
Des parties de ce produit pourront être dérivées des systèmes Berkeley BSD licenciés par l’Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays et licenciée exclusivement par X/Open Company, Ltd.
Sun, Sun Microsystems, le logo Sun, Java, et JavaHelp sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc.
Ce produit est soumis à la législation américaine en matière de contrôle des exportations et peut être soumis à la règlementation en vigueur dans d'autres pays dans le domaine des exportations et importations. Les utilisations, ou utilisateurs finaux, pour des armes nucléaires,des missiles, des armes biologiques et chimiques ou du nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers les pays sous embargo américain, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exhaustive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites.
LA DOCUMENTATION EST FOURNIE "EN L'ÉTAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFAÇON.

## Sun Performance Library[tm] Reference Manual

## Sun [tm] Studio 8

This reference manual is the Sun Performance Library section 3P man pages, available in HTML and PDF formats. For additional information, see the Sun Performance Library User's Guide, available on docs. sun . com, or the LAPACK Users' Guide, available from the Society for Industrial and Applied Mathematics (SIAM).
available_threads - available_threads - returns information about current thread usage
blas_dpermute - blas_dpermute - permutes a real (double precision) array in terms of the permutation vector P , output by dsortv
blas_dsort - blas_dsort - sorts a real (double precision) vector X in increasing or decreasing order using quick sort algorithm
blas_dsortv - blas_dsortv - sorts a real (double precision) vector X in increasing or decreasing order using quick sort algorithm and overwrite P with the permutation vector
blas_ipermute - blas_ipermute - permutes an integer array in terms of the permutation vector P , output by dsortv
blas_isort - blas_isort - sorts an integer vector X in increasing or decreasing order using quick sort algorithm
blas_isortv - blas_isortv - sorts a real vector X in increasing or decreasing order using quick sort algorithm and overwrite P with the permutation vector
blas_spermute - blas_spermute - permutes a real array in terms of the permutation vector P , output by dsortv
blas_ssort - blas_ssort - sorts a real vector X in increasing or decreasing order using quick sort algorithm
blas_ssortv - blas_ssortv - sorts a real vector X in increasing or decreasing order using quick sort algorithm and overwrite P with the permutation vector
$\underline{\text { caxpy }- \text { caxpy }- \text { compute } y:=}$ alpha $* x+y$
$\underline{\text { caxpyi }- \text { caxpyi - Compute } y:=\text { alpha } * x+y ~}$
cbcomm - cbcomm - block coordinate matrix-matrix multiply
cbdimm - cbdimm - block diagonal format matrix-matrix multiply
cbdism - cbdism - block diagonal format triangular solve
cbdsqr - cbdsqr - compute the singular value decomposition (SVD) of a real N -by- N (upper or lower) bidiagonal matrix $B$.
cbelmm - cbelmm - block Ellpack format matrix-matrix multiply
cbelsm - cbelsm - block Ellpack format triangular solve
cbscmm - cbscmm - block sparse column matrix-matrix multiply
cbscsm - cbscsm - block sparse column format triangular solve
cbsrmm - cbsrmm - block sparse row format matrix-matrix multiply
cbsrsm - cbsrsm - block sparse row format triangular solve
cenvcor - cenvcor - compute the convolution or correlation of complex vectors
cenvcor2 - cenvcor2 - compute the convolution or correlation of complex matrices
ccoomm - ccoomm - coordinate matrix-matrix multiply
ccopy - ccopy - Copy $x$ to $y$
ccscmm - ccscmm - compressed sparse column format matrix-matrix multiply
$\underline{\text { ccscsm - ccscsm - compressed sparse column format triangular solve }}$
$\underline{\text { ccsrmm - ccsrmm - compressed sparse row format matrix-matrix multiply }}$
ccsrsm - ccsrsm - compressed sparse row format triangular solve
cdiamm - cdiamm - diagonal format matrix-matrix multiply
cdiasm - cdiasm - diagonal format triangular solve
$\underline{\text { cdotc }- \text { cdotc }- \text { compute the dot product of two vectors } \operatorname{conjg}(x) \text { and } y . ~}$
cdotci - cdotci - Compute the complex conjugated indexed dot product.
cdotu - cdotu - compute the dot product of two vectors x and y .
cdotui - cdotci - Compute the complex conjugated indexed dot product.
cellmm - cellmm - Ellpack format matrix-matrix multiply
cellsm - cellsm - Ellpack format triangular solve
$\underline{\text { cfft2b }}$ - cfft2b - compute a periodic sequence from its Fourier coefficients. The xFFT operations are unnormalized, so a call of $x$ FFT2F followed by a call of $x F F T 2 B$ will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}$.
cfft2f - cfft2f - compute the Fourier coefficients of a periodic sequence. The xFFT operations are unnormalized, so a call of xFFT2F followed by a call of xFFT2B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}$.
cfft 2 i - cfft 2 i - initialize the array WSAVE, which is used in both the forward and backward transforms.
$\underline{\text { cfft } 3 \mathrm{~b}}$ - cfft3b-compute a periodic sequence from its Fourier coefficients. The FFT operations are unnormalized, so a call of CFFT3F followed by a call of CFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N} * \mathrm{~K}$.
cfft3f - cfft3f - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of CFFT3F followed by a call of CFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}^{*} \mathrm{~K}$.
cfft3i - cfft3i - initialize the array WSAVE, which is used in both CFFT3F and CFFT3B.
cfftb - cfftb - compute a periodic sequence from its Fourier coefficients. The FFT operations are unnormalized, so a call of CFFTF followed by a call of CFFTB will multiply the input sequence by N .
cfftc - cfftc - initialize the trigonometric weight and factor tables or compute the Fast Fourier transform (forward or inverse) of a complex sequence.
cfftc2 - cfftc2 - initialize the trigonometric weight and factor tables or compute the two-dimensional Fast Fourier Transform (forward or inverse) of a two-dimensional complex array.
cfftc3 - cfftc3 - initialize the trigonometric weight and factor tables or compute the three-dimensional Fast Fourier Transform (forward or inverse) of a three-dimensional complex array.
cfftcm - cfftcm - initialize the trigonometric weight and factor tables or compute the one-dimensional Fast Fourier Transform (forward or inverse) of a set of data sequences stored in a two-dimensional complex array.
cfftf - cfftf - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of CFFTF followed by a call of CFFTB will multiply the input sequence by N .
cffti - cffti - initialize the array WSAVE, which is used in both CFFTF and CFFTB.
cfftopt - cfftopt - compute the length of the closest fast FFT
cffts - cffts - initialize the trigonometric weight and factor tables or compute the inverse Fast Fourier Transform of a complex sequence as follows.
cffts2 - cffts2 - initialize the trigonometric weight and factor tables or compute the two-dimensional inverse Fast Fourier Transform of a two-dimensional complex array.
cffts3 - cffts3 - initialize the trigonometric weight and factor tables or compute the three-dimensional inverse Fast Fourier Transform of a three-dimensional complex array.
cfftsm - cfftsm - initialize the trigonometric weight and factor tables or compute the one-dimensional inverse Fast Fourier Transform of a set of complex data sequences stored in a two-dimensional array.
cgbbrd - cgbbrd - reduce a complex general m-by-n band matrix A to real upper bidiagonal form B by a unitary transformation
cgbcon - cgbcon - estimate the reciprocal of the condition number of a complex general band matrix A , in either the 1-norm or the infinity-norm,
cgbequ - cgbequ - compute row and column scalings intended to equilibrate an M -by-N band matrix A and reduce its condition number
cgbmv - cgbmv - perform one of the matrix-vector operations $y:=a l p h a^{*} A^{*} x+$ beta*y, or $y:=a l p h a * A^{\prime} * x+$ beta*y, or y $:=\operatorname{alpha}{ }^{*} \operatorname{conjg}\left(\mathrm{~A}^{\prime}\right)^{*} \mathrm{x}+$ beta* $^{\mathrm{y}}$
cgbrfs - cgbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is banded, and provides error bounds and backward error estimates for the solution
cgbsv - cgbsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is a band matrix of order N with KL subdiagonals and KU superdiagonals, and X and B are N -by-NRHS matrices
cgbsvx - cgbsvx - use the LU factorization to compute the solution to a complex system of linear equations $A * X$ $=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*} \mathrm{H}^{*} \mathrm{X}=\mathrm{B}$,
cgbtf2 - cgbtf2 - compute an LU factorization of a complex m-by-n band matrix A using partial pivoting with row interchanges
cgbtrf - cgbtrf - compute an LU factorization of a complex m-by-n band matrix A using partial pivoting with row interchanges
cgbtrs - cgbtrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*} * \mathrm{H} * \mathrm{X}=\mathrm{B}$ with a general band matrix A using the LU factorization computed by CGBTRF
cgebak - cgebak - form the right or left eigenvectors of a complex general matrix by backward transformation on the computed eigenvectors of the balanced matrix output by CGEBAL
cgebal - cgebal - balance a general complex matrix A
cgebrd - cgebrd - reduce a general complex M-by-N matrix A to upper or lower bidiagonal form B by a unitary transformation
cgecon - cgecon - estimate the reciprocal of the condition number of a general complex matrix A , in either the 1norm or the infinity-norm, using the LU factorization computed by CGETRF
cgeequ - cgeequ - compute row and column scalings intended to equilibrate an M-by-N matrix A and reduce its condition number
cgees - cgees - compute for an N -by-N complex nonsymmetric matrix A, the eigenvalues, the Schur form T, and, optionally, the matrix of Schur vectors Z
cgeesx - cgeesx - compute for an N-by-N complex nonsymmetric matrix A, the eigenvalues, the Schur form T, and, optionally, the matrix of Schur vectors $Z$
cgeev - cgeev - compute for an N -by- N complex nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors
cgeevx - cgeevx - compute for an N -by-N complex nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors
cgegs - cgegs - routine is deprecated and has been replaced by routine CGGES
cgegv - cgegv - routine is deprecated and has been replaced by routine CGGEV
cgehrd - cgehrd - reduce a complex general matrix A to upper Hessenberg form H by a unitary similarity transformation
cgelqf - cgelqf - compute an LQ factorization of a complex M-by-N matrix A
cgels - cgels - solve overdetermined or underdetermined complex linear systems involving an M-by-N matrix A, or its conjugate-transpose, using a QR or LQ factorization of A
cgelsd - cgelsd - compute the minimum-norm solution to a real linear least squares problem
cgelss - cgelss - compute the minimum norm solution to a complex linear least squares problem
cgelsx - cgelsx - routine is deprecated and has been replaced by routine CGELSY
cgelsy - cgelsy - compute the minimum-norm solution to a complex linear least squares problem
cgemm - cgemm - perform one of the matrix-matrix operations $C:=$ alpha*op( A )*op( B ) + beta*C
cgemv - cgemv - perform one of the matrix-vector operations y := alpha*A*x + beta*y, or y := alpha*A'*x+ beta* y , or $\mathrm{y}:=\operatorname{alpha}{ }^{*} \operatorname{conjg}\left(\mathrm{~A}^{\prime}\right)^{*} \mathrm{x}+$ beta* $^{\mathrm{y}}$
cgeqlf - cgeqlf - compute a QL factorization of a complex M-by-N matrix A
cgeqp3 - cgeqp3 - compute a QR factorization with column pivoting of a matrix A
cgeqpf - cgeqpf - routine is deprecated and has been replaced by routine CGEQP3
cgeqrf - cgeqrf - compute a QR factorization of a complex M -by-N matrix A
cgerc - cgerc - perform the rank 1 operation $\mathrm{A}:=\operatorname{alpha}{ }^{*} x^{*} \operatorname{conjg}\left(y^{\prime}\right)+A$
cgerfs - cgerfs - improve the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution
cgerqf - cgerqf - compute an RQ factorization of a complex M-by-N matrix A
cgeru - cgeru - perform the rank 1 operation A := alpha*x*y' + A
cgesdd - cgesdd - compute the singular value decomposition (SVD) of a complex M-by-N matrix A, optionally computing the left and/or right singular vectors, by using divide-and-conquer method
cgesv - cgesv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cgesvd - cgesvd - compute the singular value decomposition (SVD) of a complex M-by-N matrix A, optionally computing the left and/or right singular vectors
cgesvx - cgesvx - use the LU factorization to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}$ $=\mathrm{B}$,
cgetf2 - cgetf2 - compute an LU factorization of a general m-by-n matrix A using partial pivoting with row interchanges
cgetrf - cgetrf - compute an LU factorization of a general M-by-N matrix A using partial pivoting with row interchanges
cgetri - cgetri - compute the inverse of a matrix using the LU factorization computed by CGETRF
cgetrs - cgetrs - solve a system of linear equations $A * X=B, A^{*} * T * X=B$, or $A^{* *} H * X=B$ with a general $N-$ by-N matrix A using the LU factorization computed by CGETRF
cggbak - cggbak - form the right or left eigenvectors of a complex generalized eigenvalue problem $A^{*} \mathrm{x}=$ lambda*B*x, by backward transformation on the computed eigenvectors of the balanced pair of matrices output by CGGBAL
cggbal - cggbal - balance a pair of general complex matrices (A,B)
cgges - cgges - compute for a pair of $\mathrm{N}-\mathrm{by}-\mathrm{N}$ complex nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ), the generalized eigenvalues, the generalized complex Schur form (S, T), and optionally left and/or right Schur vectors (VSL and VSR)
cggesx - cggesx - compute for a pair of $N-b y-N$ complex nonsymmetric matrices (A,B), the generalized eigenvalues, the complex Schur form (S,T),
cggev - cggev - compute for a pair of N -by- N complex nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors
cggevx - cggevx - compute for a pair of $N$-by-N complex nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ) the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors
cggglm - cggglm - solve a general Gauss-Markov linear model (GLM) problem
cgghrd - cgghrd - reduce a pair of complex matrices (A,B) to generalized upper Hessenberg form using unitary transformations, where A is a general matrix and B is upper triangular
cgglse - cgglse - solve the linear equality-constrained least squares (LSE) problem
cggqrf - cggqrf - compute a generalized QR factorization of an N -by-M matrix A and an N -by-P matrix B .
cggrqf - cggrqf - compute a generalized RQ factorization of an M-by-N matrix A and a P-by-N matrix B
cggsvd - cggsvd - compute the generalized singular value decomposition (GSVD) of an M-by-N complex matrix A and P-by-N complex matrix B
cggsvp - cggsvp - compute unitary matrices $\mathrm{U}, \mathrm{V}$ and Q such that $\mathrm{N}-\mathrm{K}-\mathrm{L} K \mathrm{~L} \mathrm{U}^{*} * \mathrm{~A} * \mathrm{Q}=\mathrm{K}(0 \mathrm{~A} 12 \mathrm{~A} 13)$ if $\mathrm{M}-\mathrm{K}-$ $\mathrm{L}>=0$
cgssco - cgssco - General sparse solver condition number estimate.
cgssda - cgssda - Deallocate working storage for the general sparse solver.
cgssfa - cgssfa - General sparse solver numeric factorization.
cgssfs - cgssfs - General sparse solver one call interface.
cgssin - cgssin - Initialize the general sparse solver.
cgssor - cgssor - General sparse solver ordering and symbolic factorization.
cgssps - cgssps - Print general sparse solver statics.
cgssrp - cgssrp - Return permutation used by the general sparse solver.
cgsssl - cgsssl - Solve routine for the general sparse solver.
cgssuo - cgssuo - User supplied permutation for ordering used in the general sparse solver.
cgtcon - cgtcon - estimate the reciprocal of the condition number of a complex tridiagonal matrix A using the LU factorization as computed by CGTTRF
cgthr - cgthr - Gathers specified elements from y into $x$.
cgthrz - cgthrz - Gather and zero.
cgtrfs - cgtrfs - improve the computed solution to a system of linear equations when the coefficient matrix is tridiagonal, and provides error bounds and backward error estimates for the solution
cgtsv - cgtsv - solve the equation $\mathrm{A}^{*} \mathrm{X}=\mathrm{B}$,
cgtsvx - cgtsvx - use the LU factorization to compute the solution to a complex system of linear equations $A * X$ $=\mathrm{B}, \mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B}$,
cgttrf - cgttrf - compute an LU factorization of a complex tridiagonal matrix A using elimination with partial pivoting and row interchanges
cgttrs - cgttrs - solve one of the systems of equations $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*}{ }^{*} \mathrm{H}^{*} \mathrm{X}=\mathrm{B}$,
$\underline{\text { chbev - chbev - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix A }}$
chbevd - chbevd - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix A
chbevx - chbevx - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix A
chbgst - chbgst - reduce a complex Hermitian-definite banded generalized eigenproblem $A * x=l a m b d a * B * x$ to standard form $\mathrm{C}^{*} \mathrm{y}=$ lambda* y ,
chbgv - chbgv - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitiandefinite banded eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}$
chbgvd - chbgvd - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}$
chbgvx - chbgvx - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $A * x=($ lambda $) * B * x$

chbtrd - chbtrd - reduce a complex Hermitian band matrix A to real symmetric tridiagonal form T by a unitary similarity transformation
checon - checon - estimate the reciprocal of the condition number of a complex Hermitian matrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHETRF
$\underline{\text { cheev - cheev - compute all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A }}$
cheevd - cheevd - compute all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A
cheevr - cheevr - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian tridiagonal matrix T
cheevx - cheevx - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A
chegs2 - chegs2 - reduce a complex Hermitian-definite generalized eigenproblem to standard form
chegst - chegst - reduce a complex Hermitian-definite generalized eigenproblem to standard form
chegv - chegv - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitiandefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B}^{*} \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
chegvd - chegvd - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized

Hermitian-definite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
chegvx - chegvx - compute selected eigenvalues, and optionally, eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
chemm - chemm - perform one of the matrix-matrix operations $\mathrm{C}:=$ alpha*A* $\mathrm{B}+$ beta* $^{*} \mathrm{C}$ or $\mathrm{C}:=$ alpha* $\mathrm{B}^{*} \mathrm{~A}+$ beta*C
$\underline{\text { chemv }}$ - chemv - perform the matrix-vector operation $\mathrm{y}:=\operatorname{alpha*} \mathrm{A}^{*} \mathrm{x}+$ beta* $^{\mathrm{y}}$
cher - cher - perform the hermitian rank 1 operation $\mathrm{A}:=\operatorname{alpha} \mathrm{x}^{*} \operatorname{conjg}\left(\mathrm{x}^{\prime}\right)+\mathrm{A}$
cher2 - cher2 - perform the hermitian rank 2 operation $\mathrm{A}:=\operatorname{alpha} *^{*}{ }^{*} \operatorname{conjg}\left(\mathrm{y}^{\prime}\right)+\operatorname{conjg}(\operatorname{alpha}) * \mathrm{y}^{*} \operatorname{conjg}\left(\mathrm{x}^{\prime}\right)+\mathrm{A}$
cher $2 \mathrm{k}-$ cher 2 k - perform one of the Hermitian rank 2 k operations $\mathrm{C}:=\operatorname{alpha} \mathrm{A}^{*}$ *conjg( $\left.\mathrm{B}^{\prime}\right)+\operatorname{conjg}($ alpha $)$ *B*conjg ( $\mathrm{A}^{\prime}$ ) + beta* C or $\mathrm{C}:=\operatorname{alpha*} \operatorname{conjg}\left(\mathrm{A}^{\prime}\right) * \mathrm{~B}+\operatorname{conjg}(\operatorname{alpha}) * \operatorname{conjg}\left(\mathrm{~B}^{\prime}\right) * \mathrm{~A}+$ beta$^{*} \mathrm{C}$
cherfs - cherfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite, and provides error bounds and backward error estimates for the solution
cherk - cherk - perform one of the Hermitian rank k operations $C:=\operatorname{alpha*} A^{*} \operatorname{conjg}\left(\mathrm{~A}^{\prime}\right)+$ beta* C or $\mathrm{C}:=$ alpha*conjg( $\left.\mathrm{A}^{\prime}\right)^{*} \mathrm{~A}+$ beta* $^{*} \mathrm{C}$
chesv - chesv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
chesvx - chesvx - use the diagonal pivoting factorization to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
chetf2 - chetf2 - compute the factorization of a complex Hermitian matrix A using the Bunch-Kaufman diagonal pivoting method
chetrd - chetrd - reduce a complex Hermitian matrix A to real symmetric tridiagonal form T by a unitary similarity transformation
chetrf - chetrf - compute the factorization of a complex Hermitian matrix A using the Bunch-Kaufman diagonal pivoting method
chetri - chetri - compute the inverse of a complex Hermitian indefinite matrix A using the factorization $\mathrm{A}=$ $\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHETRF
chetrs - chetrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ with a complex Hermitian matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{H}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHETRF
chgeqz - chgeqz - implement a single-shift version of the QZ method for finding the generalized eigenvalues $\mathrm{w}(\mathrm{i})$ $=\operatorname{ALPHA}(\mathrm{i}) / \mathrm{BETA}(\mathrm{i})$ of the equation $\operatorname{det}(\mathrm{A}-\mathrm{w}(\mathrm{i}) \mathrm{B})=0$ If $\mathrm{JOB}=$ 'S', then the pair $(\mathrm{A}, \mathrm{B})$ is simultaneously reduced to Schur form (i.e., A and B are both upper triangular) by applying one unitary tranformation (usually called Q) on the left and another (usually called Z) on the right
chpcon - chpcon - estimate the reciprocal of the condition number of a complex Hermitian packed matrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHPTRF
$\underline{\text { chpev - chpev - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix in }}$ packed storage
chpevd - chpevd - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A in packed storage
chpevx - chpevx - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A in packed storage
chpgst - chpgst - reduce a complex Hermitian-definite generalized eigenproblem to standard form, using packed storage
chpgv - chpgv - compute all the eigenvalues and, optionally, the eigenvectors of a complex generalized Hermitiandefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B}^{*} \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
chpgvd - chpgvd - compute all the eigenvalues and, optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
chpgvx - chpgvx - compute selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}){ }^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
$\underline{\text { chpmv }}$ - chpmv - perform the matrix-vector operation $\mathrm{y}:=$ alpha* $\mathrm{A} * \mathrm{x}+$ beta*y
$\underline{\text { chpr }}$ - chpr - perform the hermitian rank 1 operation $\mathrm{A}:=\operatorname{alpha}{ }^{*} \mathrm{x}^{*} \operatorname{conjg}\left(\mathrm{x}^{\prime}\right)+\mathrm{A}$
chpr2 - chpr2 - perform the Hermitian rank 2 operation $A:=\operatorname{alpha}{ }^{*} x^{*} \operatorname{conjg}\left(y^{\prime}\right)+\operatorname{conjg}($ alpha $) * y * \operatorname{conjg}\left(x^{\prime}\right)+$ A
chprfs - chprfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite and packed, and provides error bounds and backward error estimates for the solution
chpsv - chpsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
chpsvx - chpsvx - use the diagonal pivoting factorization $A=U^{*} D^{*} U^{* *} H$ or $A=L^{*} D^{*} L^{* *} H$ to compute the solution to a complex system of linear equations $A * X=B$, where $A$ is an $N$-by-N Hermitian matrix stored in packed format and X and B are N -by-NRHS matrices
chptrd - chptrd - reduce a complex Hermitian matrix A stored in packed form to real symmetric tridiagonal form T by a unitary similarity transformation
chptrf - chptrf - compute the factorization of a complex Hermitian packed matrix A using the Bunch-Kaufman diagonal pivoting method
chptri - chptri - compute the inverse of a complex Hermitian indefinite matrix A in packed storage using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D} * \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHPTRF
chptrs - chptrs - solve a system of linear equations $A * X=B$ with a complex Hermitian matrix A stored in packed format using the factorization $A=U^{*} D^{*} U^{* *} H$ or $A=L^{*} D^{*} L^{* *} H$ computed by CHPTRF
chsein - chsein - use inverse iteration to find specified right and/or left eigenvectors of a complex upper Hessenberg matrix H
chseqr - chseqr - compute the eigenvalues of a complex upper Hessenberg matrix H , and, optionally, the matrices T and Z from the Schur decomposition $\mathrm{H}=\mathrm{Z} \mathrm{T} \mathrm{Z}{ }^{* *} \mathrm{H}$, where T is an upper triangular matrix (the Schur form), and Z is the unitary matrix of Schur vectors
cjadmm - cjadmm - Jagged diagonal matrix-matrix multiply (modified Ellpack)
cjadrp - cjadrp - right permutation of a jagged diagonal matrix
cjadsm - cjadsm - Jagged-diagonal format triangular solve
$\underline{\text { clarz - clarz - applie a complex elementary reflector } \mathrm{H} \text { to a complex } \mathrm{M} \text {-by-N matrix } \mathrm{C} \text {, from either the left or the }}$ right
 from the left or the right
clarzt - clarzt - form the triangular factor T of a complex block reflector H of order $>\mathrm{n}$, which is defined as a product of $k$ elementary reflectors
clatzm - clatzm - routine is deprecated and has been replaced by routine CUNMRZ
$\underline{\text { cosqb - cosqb - synthesize a Fourier sequence from its representation in terms of a cosine series with odd wave }}$ numbers. The COSQ operations are unnormalized inverses of themselves, so a call to COSQF followed by a call to COSQB will multiply the input sequence by $4 * \mathrm{~N}$.
cosqf - cosqf - compute the Fourier coefficients in a cosine series representation with only odd wave numbers. The COSQ operations are unnormalized inverses of themselves, so a call to COSQF followed by a call to COSQB will multiply the input sequence by $4 * \mathrm{~N}$.
cosqi - cosqi - initialize the array WSAVE, which is used in both COSQF and COSQB.
cost - cost - compute the discrete Fourier cosine transform of an even sequence. The COST transforms are unnormalized inverses of themselves, so a call of COST followed by another call of COST will multiply the input sequence by $2 *(\mathrm{~N}-1)$.
$\underline{\text { costi - costi - initialize the array WSAVE, which is used in COST. }}$
cpbcon - cpbcon - estimate the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite band matrix using the Cholesky factorization $A=U^{*} * H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPBTRF
cpbequ - cpbequ - compute row and column scalings intended to equilibrate a Hermitian positive definite band matrix A and reduce its condition number (with respect to the two-norm)
cpbrfs - cpbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite and banded, and provides error bounds and backward error estimates for the solution cpbstf - cpbstf - compute a split Cholesky factorization of a complex Hermitian positive definite band matrix A cpbsv - cpbsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cpbsvx - cpbsvx - use the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cpbtf2 - cpbtf2 - compute the Cholesky factorization of a complex Hermitian positive definite band matrix A
cpbtrf - cpbtrf - compute the Cholesky factorization of a complex Hermitian positive definite band matrix A
cpbtrs - cpbtrs - solve a system of linear equations $A * X=B$ with a Hermitian positive definite band matrix $A$ using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPBTRF
cpocon - cpocon - estimate the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite matrix using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} \mathrm{H}$ computed by CPOTRF
cpoequ - cpoequ - compute row and column scalings intended to equilibrate a Hermitian positive definite matrix A and reduce its condition number (with respect to the two-norm)
cporfs - cporfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite,
cposv - cposv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cposvx - cposvx - use the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cpotf2 - cpotf2 - compute the Cholesky factorization of a complex Hermitian positive definite matrix A
cpotrf - cpotrf - compute the Cholesky factorization of a complex Hermitian positive definite matrix A
cpotri - cpotri - compute the inverse of a complex Hermitian positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CPOTRF
cpotrs - cpotrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ with a Hermitian positive definite matrix A using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPOTRF
cppcon - cppcon - estimate the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite packed matrix using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPPTRF
cppequ - cppequ - compute row and column scalings intended to equilibrate a Hermitian positive definite matrix A in packed storage and reduce its condition number (with respect to the two-norm)
cpprfs - cpprfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite and packed, and provides error bounds and backward error estimates for the solution
cppsv - cppsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cppsvx - cppsvx - use the Cholesky factorization $A=U^{*} * H^{*} U$ or $A=L^{*} L^{* *} \mathrm{H}$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
cpptrf - cpptrf - compute the Cholesky factorization of a complex Hermitian positive definite matrix A stored in packed format
cpptri - cpptri - compute the inverse of a complex Hermitian positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CPPTRF
cpptrs - cpptrs - solve a system of linear equations A*X $=\mathrm{B}$ with a Hermitian positive definite matrix A in packed storage using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPPTRF
cptcon - cptcon - compute the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite tridiagonal matrix using the factorization $A=L^{*} D^{*} L^{* *} H$ or $A=U^{* *} H^{*} D^{*} U$ computed by CPTTRF
cpteqr - cpteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric positive definite tridiagonal matrix by first factoring the matrix using SPTTRF and then calling CBDSQR to compute the singular values of the bidiagonal factor
cptrfs - cptrfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite and tridiagonal, and provides error bounds and backward error estimates for the solution
cptsv - cptsv - compute the solution to a complex system of linear equations $A * X=B$, where $A$ is an $N-b y-N$ Hermitian positive definite tridiagonal matrix, and X and B are N -by-NRHS matrices.
cptsvx - cptsvx - use the factorization $A=L * D^{*} L^{* *} H$ to compute the solution to a complex system of linear equations $A^{*} X=B$, where $A$ is an $N$-by-N Hermitian positive definite tridiagonal matrix and $X$ and $B$ are N -byNRHS matrices
cpttrf - cpttrf - compute the $L^{*} D^{*} L^{\prime}$ factorization of a complex Hermitian positive definite tridiagonal matrix $A$
cpttrs - cpttrs - solve a tridiagonal system of the form $A * X=B$ using the factorization $A=U^{*} * D^{*} U$ or $A=$ L*D*L' computed by CPTTRF
cptts2 - cptts2 - solve a tridiagonal system of the form $A * X=B$ using the factorization $A=U^{\prime} * D^{*} U$ or $A=$ L*D*L' computed by CPTTRF
crot - crot - apply a plane rotation, where the $\cos (\mathrm{C})$ is real and the $\sin (\mathrm{S})$ is complex, and the vectors X and Y are complex
crotg - crotg - Construct a Given's plane rotation
cscal - cscal - Compute y $:=$ alpha * y
$\underline{\text { csctr }}$ - csctr - Scatters elements from $x$ into $y$.
cskymm - cskymm - Skyline format matrix-matrix multiply
cskysm - cskysm - Skyline format triangular solve
cspcon - cspcon - estimate the reciprocal of the condition number (in the 1-norm) of a complex symmetric packed matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSPTRF
csprfs - csprfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite and packed, and provides error bounds and backward error estimates for the solution

cspsvx - cspsvx - use the diagonal pivoting factorization $A=U^{*} D^{*} U^{*} * T$ or $A=L^{*} D^{*} L^{* *} T$ to compute the solution to a complex system of linear equations $A * X=B$, where $A$ is an $N$-by-N symmetric matrix stored in
packed format and X and B are N -by-NRHS matrices
csptrf - csptrf - compute the factorization of a complex symmetric matrix A stored in packed format using the Bunch-Kaufman diagonal pivoting method
csptri - csptri - compute the inverse of a complex symmetric indefinite matrix A in packed storage using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSPTRF
csptrs - csptrs - solve a system of linear equations A*X $=\mathrm{B}$ with a complex symmetric matrix A stored in packed format using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L} * * \mathrm{~T}$ computed by CSPTRF
csrot - csrot - Apply a plane rotation.
csscal - csscal - Compute y $:=$ alpha * y
cstedc - cstedc - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method
cstegr - cstegr - Compute T-sigma_i = L_i D_i L_i^T, such that L_i D_i L_i^T is a relatively robust representation
cstein - cstein - compute the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, using inverse iteration
csteqr - csteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit QL or QR method
cstsv - cstsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ where A is a Hermitian tridiagonal matrix
csttrf - csttrf - compute the factorization of a complex Hermitian tridiagonal matrix A
$\underline{\text { csttrs }}$ - csttrs - computes the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$
cswap - cswap - Exchange vectors x and y .
csycon - csycon - estimate the reciprocal of the condition number (in the 1-norm) of a complex symmetric matrix A using the factorization $A=U^{*} D^{*} U^{* *} T$ or $A=L^{*} D^{*} L^{* *} T$ computed by CSYTRF
csymm - csymm - perform one of the matrix-matrix operations $\mathrm{C}:=$ alpha*A*B + beta* C or $\mathrm{C}:=$ alpha*B*A + beta*C
$\underline{\text { csyr } 2 \mathrm{k}}-\operatorname{csyr} 2 \mathrm{k}$ - perform one of the symmetric rank 2 k operations $\mathrm{C}:=\operatorname{alpha} \mathrm{A}^{*} \mathrm{~A}^{\prime}+\operatorname{alpha} \mathrm{B}^{*} \mathrm{~A}^{\prime}+$ beta* C or C :
$=$ alpha* ${ }^{\prime} *$ B + alpha* ${ }^{\prime} * A+$ beta $^{*} \mathrm{C}$
csyrfs - csyrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution
 beta*C

csysvx - csysvx - use the diagonal pivoting factorization to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
csytf2 - csytf2 - compute the factorization of a complex symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
csytrf - csytrf - compute the factorization of a complex symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
csytri - csytri - compute the inverse of a complex symmetric indefinite matrix A using the factorization $\mathrm{A}=$ $\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ computed by CSYTRF
csytrs - csytrs - solve a system of linear equations $A * X=B$ with a complex symmetric matrix $A$ using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSYTRF
ctbcon - ctbcon - estimate the reciprocal of the condition number of a triangular band matrix A , in either the 1norm or the infinity-norm

$\underline{\text { ctbrfs - ctbrfs - provide error bounds and backward error estimates for the solution to a system of linear equations }}$ with a triangular band coefficient matrix
$\underline{\text { ctbsv }}$ - ctbsv - solve one of the systems of equations $A^{*} x=b$, or $A^{\prime} * x=b$, or $\operatorname{conjg}\left(A^{\prime}\right) * x=b$
$\underline{\text { ctbtrs }}$ - ctbtrs - solve a triangular system of the form $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{* *} \mathrm{H} * \mathrm{X}=\mathrm{B}$,
ctgevc - ctgevc - compute some or all of the right and/or left generalized eigenvectors of a pair of complex upper triangular matrices (A,B)
ctgexc - ctgexc - reorder the generalized Schur decomposition of a complex matrix pair ( $\mathrm{A}, \mathrm{B}$ ), using an unitary equivalence transformation $(A, B):=Q *(A, B) * Z$, so that the diagonal block of $(A, B)$ with row index IFST is moved to row ILST
ctgsen - ctgsen - reorder the generalized Schur decomposition of a complex matrix pair (A, B) (in terms of an unitary equivalence trans- formation $\left.\mathrm{Q}^{\prime} *(\mathrm{~A}, \mathrm{~B}) * \mathrm{Z}\right)$, so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the pair $(\mathrm{A}, \mathrm{B})$
ctgsja - ctgsja - compute the generalized singular value decomposition (GSVD) of two complex upper triangular (or trapezoidal) matrices A and B
ctgsna - ctgsna - estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (A, B)
ctgsyl - ctgsyl - solve the generalized Sylvester equation
ctpcon - ctpcon - estimate the reciprocal of the condition number of a packed triangular matrix A , in either the 1norm or the infinity-norm
$\underline{\text { ctpmv }}$ - ctpmv - perform one of the matrix-vector operations $x:=A^{*} x$, or $x:=A^{\prime *} x$, or $x:=\operatorname{conjg}\left(A^{\prime}\right)^{*} x$
ctprfs - ctprfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular packed coefficient matrix
$\underline{\text { ctpsv }}$ - ctpsv - solve one of the systems of equations $A^{*} x=b$, or $A^{\prime} * x=b$, or $\operatorname{conjg}\left(A^{\prime}\right)^{*} x=b$
ctptri - ctptri - compute the inverse of a complex upper or lower triangular matrix A stored in packed format
ctptrs - ctptrs - solve a triangular system of the form $\mathrm{A}^{*} \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*} * \mathrm{H} * \mathrm{X}=\mathrm{B}$,
ctrans - ctrans - transpose and scale source matrix
ctrcon - ctrcon - estimate the reciprocal of the condition number of a triangular matrix A , in either the 1-norm or the infinity-norm

ctrexc - ctrexc - reorder the Schur factorization of a complex matrix $\mathrm{A}=\mathrm{Q}^{*} \mathrm{~T}^{*} \mathrm{Q} * * \mathrm{H}$, so that the diagonal element of T with row index IFST is moved to row ILST
ctrmm - ctrmm - perform one of the matrix-matrix operations B :=alpha*op(A)*B, or B :=alpha*B*op(A ) where alpha is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and op $(A)$ is one of op $(A)=A$ or op( $A)=A^{\prime}$ or op $(A)=\operatorname{conjg}\left(A^{\prime}\right)$
$\underline{\text { ctrmv }}-\operatorname{ctrmv}$ - perform one of the matrix-vector operations $x:=A^{*} x$, or $x:=A^{\prime}{ }^{*} x$, or $x:=\operatorname{conjg}\left(A^{\prime}\right)^{*} x$
ctrrfs - ctrrfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular coefficient matrix
 eigenvalues appears in the leading positions on the diagonal of the upper triangular matrix T , and the leading columns of Q form an orthonormal basis of the corresponding right invariant subspace
ctrsm - ctrsm - solve one of the matrix equations op (A)*X $=$ alpha*B, or $X^{*} o p(A)=$ alpha*B
ctrsna - ctrsna - estimate reciprocal condition numbers for specified eigenvalues and/or right eigenvectors of a complex upper triangular matrix T (or of any matrix $\mathrm{Q}^{*} \mathrm{~T}^{*} \mathrm{Q}^{* *} \mathrm{H}$ with Q unitary)
$\underline{\text { ctrsv }}-\operatorname{ctrsv}$ - solve one of the systems of equations $A^{*} x=b$, or $A^{\prime *} x=b$, or $\operatorname{conjg}\left(A^{\prime}\right)^{*} x=b$
ctrsyl - ctrsyl - solve the complex Sylvester matrix equation
$\underline{\text { ctrti2 }}$ - ctrti2 - compute the inverse of a complex upper or lower triangular matrix
ctrtri - ctrtri - compute the inverse of a complex upper or lower triangular matrix A
$\underline{\text { ctrtrs }-\operatorname{ctrtrs}-\text { solve a triangular system of the form } \mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}, \text { or } \mathrm{A}^{*} * \mathrm{H} * \mathrm{X}=\mathrm{B}, ~}$
ctzrqf - ctzrqf - routine is deprecated and has been replaced by routine CTZRZF
ctzrzf - ctzrzf - reduce the M-by-N ( $\mathrm{M}<=\mathrm{N}$ ) complex upper trapezoidal matrix A to upper triangular form by means of unitary transformations
cung21 - cung21-generate an m by $n$ complex matrix Q with orthonormal columns,
cung 2 r - cung 2 r - generate an m by n complex matrix Q with orthonormal columns,
cungbr - cungbr - generate one of the complex unitary matrices Q or $\mathrm{P}^{* *} \mathrm{H}$ determined by CGEBRD when reducing a complex matrix A to bidiagonal form
cunghr - cunghr - generate a complex unitary matrix Q which is defined as the product of IHI-ILO elementary reflectors of order N , as returned by CGEHRD
cung12 - cung12 - generate an m-by-n complex matrix Q with orthonormal rows,
cunglq - cunglq - generate an M-by-N complex matrix Q with orthonormal rows,
cungql - cungql - generate an M-by-N complex matrix Q with orthonormal columns,
cungqr - cungqr - generate an M-by-N complex matrix Q with orthonormal columns,
cungr2 - cungr2 - generate an $m$ by $n$ complex matrix $Q$ with orthonormal rows,
cungrq - cungrq - generate an M-by-N complex matrix Q with orthonormal rows,
cungtr - cungtr - generate a complex unitary matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors of order N , as returned by CHETRD
cunmbr - cunmbr - VECT = ' Q ', CUNMBR overwrites the general complex M -by-N matrix C with SIDE = ' L ' SIDE $=$ 'R' TRANS $=$ 'N'

cunml2 - cunml2 - overwrite the general complex m-by-n matrix C with $\mathrm{Q} * \mathrm{C}$ if $\operatorname{SIDE}=$ ' L ' and TRANS = ' N ', or $\mathrm{Q}^{\prime *} \mathrm{C}$ if SIDE $=$ 'L' and TRANS $=$ ' C ', or $\mathrm{C} * \mathrm{Q}$ if SIDE $=$ 'R' and TRANS $=$ ' N ', or $\mathrm{C} * \mathrm{Q}$ ' if SIDE $=$ ' R ' and TRANS = 'C',
cunmlq - cunmlq - overwrite the general complex M -by- N matrix C with $\operatorname{SIDE}=$ 'L' $\operatorname{SIDE}=$ ' R ' TRANS $=$ ' $\mathrm{N}^{\prime}$
cunmql - cunmql - overwrite the general complex M -by- N matrix C with $\operatorname{SIDE}=$ 'L' SIDE = 'R' TRANS = ' N '
$\underline{\text { cunmqr }}$ - cunmqr - overwrite the general complex $\mathrm{M}-$ by- N matrix C with $\operatorname{SIDE}=\mathrm{L}^{\prime} \mathrm{L}$ SIDE $=$ ' $\mathrm{R}^{\prime}$ TRANS $=$ ' $\mathrm{N}^{\prime}$
cunmr2 - cunmr2 - overwrite the general complex m-by-n matrix C with $\mathrm{Q} * \mathrm{C}$ if SIDE $=$ ' L ' and TRANS $=$ ' N ', or $\mathrm{Q}{ }^{*} \mathrm{C}$ if SIDE $=$ 'L' and TRANS $=$ ' C ', or $\mathrm{C} * \mathrm{Q}$ if SIDE $=$ ' R ' and TRANS $=$ ' N ', or $\mathrm{C} * \mathrm{Q}$ ' if SIDE $=$ ' R ' and TRANS = 'C',

cunmtr - cunmtr - overwrite the general complex M-by-N matrix C with $\operatorname{SIDE}={ }^{\prime} \mathrm{L}^{\prime} \operatorname{SIDE}={ }^{\prime} \mathrm{R}$ ' TRANS $=$ ' $\mathrm{N}^{\prime}$
cupgtr - cupgtr - generate a complex unitary matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors $\mathrm{H}(\mathrm{i})$ of order n , as returned by CHPTRD using packed storage
cupmtr - cupmtr - overwrite the general complex M-by-N matrix C with SIDE $=$ 'L' SIDE $=$ ' R ' TRANS $=$ ' $\mathrm{N}^{\prime}$
cvbrmm - cvbrmm - variable block sparse row format matrix-matrix multiply
cvbrsm - cvbrsm - variable block sparse row format triangular solve
cvmul - cvmul - compute the scaled product of complex vectors
dasum - dasum - Return the sum of the absolute values of a vector x .
daxpy - daxpy - compute $\mathrm{y}:=$ alpha $* \mathrm{x}+\mathrm{y}$
daxpyi - daxpyi - Compute $\mathrm{y}:=$ alpha $* \mathrm{x}+\mathrm{y}$
dbcomm - dbcomm - block coordinate matrix-matrix multiply
dbdimm - dbdimm - block diagonal format matrix-matrix multiply
dbdism - dbdism - block diagonal format triangular solve
 matrix B
dbdsqr - dbdsqr - compute the singular value decomposition (SVD) of a real N -by- N (upper or lower) bidiagonal matrix $B$.
dbelmm - dbelmm - block Ellpack format matrix-matrix multiply
dbelsm - dbelsm - block Ellpack format triangular solve
dbscmm - dbscmm - block sparse column matrix-matrix multiply
$\underline{\text { dbscsm - dbscsm - block sparse column format triangular solve }}$
dbsrmm - dbsrmm - block sparse row format matrix-matrix multiply
$\underline{\text { dbsrsm - dbsrsm - block sparse row format triangular solve }}$
denvcor - denveor - compute the convolution or correlation of real vectors
denvcor2 - denvcor2 - compute the convolution or correlation of real matrices
dcoomm - dcoomm - coordinate matrix-matrix multiply
dcopy - dcopy - Copy x to y
dcosqb - dcosqb - synthesize a Fourier sequence from its representation in terms of a cosine series with odd wave numbers. The COSQ operations are unnormalized inverses of themselves, so a call to COSQF followed by a call to COSQB will multiply the input sequence by $4 * \mathrm{~N}$.
dcosqf - dcosqf - compute the Fourier coefficients in a cosine series representation with only odd wave numbers. The COSQ operations are unnormalized inverses of themselves, so a call to COSQF followed by a call to COSQB will multiply the input sequence by $4 * \mathrm{~N}$.
dcosqi - dcosqi - initialize the array WSAVE, which is used in both COSQF and COSQB.
dcost - dcost - compute the discrete Fourier cosine transform of an even sequence. The COST transforms are unnormalized inverses of themselves, so a call of COST followed by another call of COST will multiply the input sequence by $2 *(\mathrm{~N}-1)$.
dcosti - dcosti - initialize the array WSAVE, which is used in COST.
dcscmm - dcscmm - compressed sparse column format matrix-matrix multiply
$\underline{\text { dcscsm - dcscsm - compressed sparse column format triangular solve }}$
dcsrmm - dcsrmm - compressed sparse row format matrix-matrix multiply
$\underline{\text { dcsrsm - dcsrsm - compressed sparse row format triangular solve }}$
ddiamm - ddiamm - diagonal format matrix-matrix multiply
ddiasm - ddiasm - diagonal format triangular solve
ddisna - ddisna - compute the reciprocal condition numbers for the eigenvectors of a real symmetric or complex Hermitian matrix or for the left or right singular vectors of a general m-by-n matrix
ddot - ddot - compute the dot product of two vectors x and y .
ddoti - ddoti - Compute the indexed dot product.
dellmm - dellmm - Ellpack format matrix-matrix multiply
dellsm - dellsm - Ellpack format triangular solve
$\underline{\text { dezftb }}$ - dezftb - computes a periodic sequence from its Fourier coefficients. DEZFTB is a simplified but slower version of DFFTB.
dezftf - dezftf - computes the Fourier coefficients of a periodic sequence. DEZFTF is a simplified but slower version of DFFTF.
dezfti - dezfti - initializes the array WSAVE, which is used in both DEZFTF and DEZFTB.
$\underline{\mathrm{dfft} 2 \mathrm{~b}}$ - dfft2b - compute a periodic sequence from its Fourier coefficients. The DFFT operations are unnormalized, so a call of DFFT2F followed by a call of DFFT2B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}$.
dfft2f - dfft2f - compute the Fourier coefficients of a periodic sequence. The DFFT operations are unnormalized, so a call of DFFT2F followed by a call of DFFT2B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}$.
dfft2i - dfft2i - initialize the array WSAVE, which is used in both the forward and backward transforms.
$\underline{\mathrm{dfft} 3 \mathrm{~b}}$ - dfft3b - compute a periodic sequence from its Fourier coefficients. The DFFT operations are unnormalized, so a call of DFFT3F followed by a call of DFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}^{*} \mathrm{~K}$.
dfft3f - dfft3f - compute the Fourier coefficients of a real periodic sequence. The DFFT operations are unnormalized, so a call of DFFT3F followed by a call of DFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}^{*} \mathrm{~K}$.
dfft3i - dfft3i - initialize the array WSAVE, which is used in both DFFT3F and DFFT3B.
dfftb - dfftb - compute a periodic sequence from its Fourier coefficients. The DFFT operations are unnormalized, so a call of DFFTF followed by a call of DFFTB will multiply the input sequence by N .
dfftf - dfftf - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of DFFTF followed by a call of DFFTB will multiply the input sequence by N .
dffti - dffti - initialize the array WSAVE, which is used in both DFFTF and DFFTB.
dfftopt - dfftopt - compute the length of the closest fast FFT
dfftz - dfftz - initialize the trigonometric weight and factor tables or compute the forward Fast Fourier Transform of a double precision sequence.
dfftz2 - dfftz2 - initialize the trigonometric weight and factor tables or compute the two-dimensional forward Fast Fourier Transform of a two-dimensional double precision array.
dfftz3 - dfftz3 - initialize the trigonometric weight and factor tables or compute the three-dimensional forward Fast Fourier Transform of a three-dimensional double complex array.
dfftzm - dfftzm - initialize the trigonometric weight and factor tables or compute the one-dimensional forward Fast Fourier Transform of a set of double precision data sequences stored in a two-dimensional array.
dgbbrd - dgbbrd - reduce a real general m-by-n band matrix A to upper bidiagonal form B by an orthogonal transformation
dgbcon - dgbcon - estimate the reciprocal of the condition number of a real general band matrix A , in either the 1 norm or the infinity-norm,
dgbequ - dgbequ - compute row and column scalings intended to equilibrate an M-by-N band matrix A and reduce its condition number
dgbmv - dgbmv - perform one of the matrix-vector operations $y:=a l p h a * A * x+b^{*} \operatorname{beta}^{*} y$ or $y:=\operatorname{alpha}{ }^{*} A^{\prime} * x+$ beta*y
dgbrfs - dgbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is banded, and provides error bounds and backward error estimates for the solution
dgbsv - dgbsv - compute the solution to a real system of linear equations $A * X=B$, where $A$ is a band matrix of order N with KL subdiagonals and KU superdiagonals, and X and B are N -by-NRHS matrices
dgbsvx - dgbsvx - use the LU factorization to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, $\mathrm{A}^{*} \mathrm{~T}^{*} \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*}{ }^{*} \mathrm{H}^{*} \mathrm{X}=\mathrm{B}$,
dgbtf2 - dgbtf2 - compute an LU factorization of a real m-by-n band matrix A using partial pivoting with row interchanges
dgbtrf - dgbtrf - compute an LU factorization of a real m-by-n band matrix A using partial pivoting with row interchanges
dgbtrs - dgbtrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{\prime} * \mathrm{X}=\mathrm{B}$ with a general band matrix A using the LU factorization computed by SGBTRF
dgebak - dgebak - form the right or left eigenvectors of a real general matrix by backward transformation on the computed eigenvectors of the balanced matrix output by SGEBAL
dgebal - dgebal - balance a general real matrix A
dgebrd - dgebrd - reduce a general real M-by-N matrix A to upper or lower bidiagonal form B by an orthogonal transformation
dgecon - dgecon - estimate the reciprocal of the condition number of a general real matrix A , in either the 1-norm or the infinity-norm, using the LU factorization computed by SGETRF
dgeequ - dgeequ - compute row and column scalings intended to equilibrate an M -by- N matrix A and reduce its condition number
dgees - dgees - compute for an N -by- N real nonsymmetric matrix A, the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z
dgeesx - dgeesx - compute for an N -by-N real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors $Z$
dgeev - dgeev - compute for an N -by-N real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/ or right eigenvectors
dgeevx - dgeevx - compute for an N-by-N real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors
dgegs - dgegs - routine is deprecated and has been replaced by routine SGGES
dgegv - dgegv - routine is deprecated and has been replaced by routine SGGEV
dgehrd - dgehrd - reduce a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation
dgelqf - dgelqf - compute an LQ factorization of a real M-by-N matrix A
dgels - dgels - solve overdetermined or underdetermined real linear systems involving an M-by-N matrix A, or its transpose, using a QR or LQ factorization of A
dgelsd - dgelsd - compute the minimum-norm solution to a real linear least squares problem
dgelss - dgelss - compute the minimum norm solution to a real linear least squares problem
dgelsx - dgelsx - routine is deprecated and has been replaced by routine SGELSY
dgelsy - dgelsy - compute the minimum-norm solution to a real linear least squares problem
dgemm - dgemm - perform one of the matrix-matrix operations C :=alpha*op(A)*op(B)+beta*C
dgemv - dgemv - perform one of the matrix-vector operations $y:=a l p h a * A * x+$ beta*y or $y:=a l p h a * A^{\prime} * x+$ beta*y
dgeqlf - dgeqlf - compute a QL factorization of a real M-by-N matrix A
dgeqp3 - dgeqp3 - compute a QR factorization with column pivoting of a matrix A
dgeqpf - dgeqpf - routine is deprecated and has been replaced by routine SGEQP3
dgeqrf - dgeqrf - compute a QR factorization of a real M-by-N matrix A
dger - dger - perform the rank 1 operation $\mathrm{A}:=$ alpha* $\mathrm{x}^{*} \mathrm{y}^{\prime}+\mathrm{A}$
dgerfs - dgerfs - improve the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution
dgerqf - dgerqf - compute an RQ factorization of a real M-by-N matrix A
dgesdd - dgesdd - compute the singular value decomposition (SVD) of a real M-by-N matrix A, optionally computing the left and right singular vectors
dgesv - dgesv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dgesvd - dgesvd - compute the singular value decomposition (SVD) of a real M-by-N matrix A, optionally computing the left and/or right singular vectors
dgesvx - dgesvx - use the LU factorization to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dgetf2 - dgetf2 - compute an LU factorization of a general m-by-n matrix A using partial pivoting with row interchanges
dgetrf - dgetrf - compute an LU factorization of a general M-by-N matrix A using partial pivoting with row interchanges
dgetri - dgetri - compute the inverse of a matrix using the LU factorization computed by SGETRF
dgetrs - dgetrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{\prime} * \mathrm{X}=\mathrm{B}$ with a general N -by-N matrix A using the LU factorization computed by SGETRF
dggbak - dggbak - form the right or left eigenvectors of a real generalized eigenvalue problem $A * x=$ lambda*B*x, by backward transformation on the computed eigenvectors of the balanced pair of matrices output by SGGBAL
dggbal - dggbal - balance a pair of general real matrices (A,B)
dgges - dgges - compute for a pair of N -by- N real nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ),
dggesx - dggesx - compute for a pair of $N-b y-N$ real nonsymmetric matrices $(A, B)$, the generalized eigenvalues, the real Schur form ( $\mathrm{S}, \mathrm{T}$ ), and,
dggev - dggev - compute for a pair of N-by-N real nonsymmetric matrices (A,B)
dggevx - dggevx - compute for a pair of N-by-N real nonsymmetric matrices (A,B)
dggglm - dggglm - solve a general Gauss-Markov linear model (GLM) problem
dgghrd - dgghrd - reduce a pair of real matrices (A,B) to generalized upper Hessenberg form using orthogonal transformations, where A is a general matrix and B is upper triangular
dgglse - dgglse - solve the linear equality-constrained least squares (LSE) problem
dggqrf - dggqrf - compute a generalized QR factorization of an N -by-M matrix A and an N -by-P matrix B .
dggrqf - dggrqf - compute a generalized RQ factorization of an M-by-N matrix A and a P-by-N matrix B
dggsvd - dggsvd - compute the generalized singular value decomposition (GSVD) of an M-by-N real matrix A and P-by-N real matrix B
dggsvp - dggsvp - compute orthogonal matrices $U, V$ and $Q$ such that $N-K-L K L U^{\prime} * A * Q=K(0$ A12 A13 ) if M-K-L >=0
dgssco - dgssco - General sparse solver condition number estimate.
dgssda - dgssda - Deallocate working storage for the general sparse solver.
dgssfa - dgssfa - General sparse solver numeric factorization.
dgssfs - dgssfs - General sparse solver one call interface.
dgssin - dgssin - Initialize the general sparse solver.
dgssor - dgssor - General sparse solver ordering and symbolic factorization.
dgssps - dgssps - Print general sparse solver statics.
dgssrp - dgssrp - Return permutation used by the general sparse solver.
dgsssl - dgsssl - Solve routine for the general sparse solver.
dgssuo - dgssuo - User supplied permutation for ordering used in the general sparse solver.
dgtcon - dgtcon - estimate the reciprocal of the condition number of a real tridiagonal matrix A using the LU factorization as computed by SGTTRF
dgthr - dgthr - Gathers specified elements from y into x .
dgthrz - dgthrz - Gather and zero.
dgtrfs - dgtrfs - improve the computed solution to a system of linear equations when the coefficient matrix is tridiagonal, and provides error bounds and backward error estimates for the solution
dgtsv - dgtsv - solve the equation $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dgtsvx - dgtsvx - use the LU factorization to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$,
dgttrf - dgttrf - compute an LU factorization of a real tridiagonal matrix A using elimination with partial pivoting and row interchanges
dgttrs - dgttrs - solve one of the systems of equations $\mathrm{A}^{*} \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{\prime} * \mathrm{X}=\mathrm{B}$,
dhgeqz - dhgeqz - implement a single-/double-shift version of the QZ method for finding the generalized eigenvalues $w(j)=\left(\operatorname{ALPHAR}(\mathrm{j})+\mathrm{i}^{*} \operatorname{ALPHAI}(\mathrm{j})\right) / \operatorname{BETAR}(\mathrm{j})$ of the equation $\operatorname{det}(\mathrm{A}-\mathrm{w}(\mathrm{i}) \mathrm{B})=0 \operatorname{In}$ addition, the pair A,B may be reduced to generalized Schur form
dhsein - dhsein - use inverse iteration to find specified right and/or left eigenvectors of a real upper Hessenberg matrix H
dhseqr - dhseqr - compute the eigenvalues of a real upper Hessenberg matrix H and, optionally, the matrices T and Z from the Schur decomposition $\mathrm{H}=\mathrm{Z} \mathrm{T} \mathrm{Z**T}$,where T is an upper quasi-triangular matrix (the Schur form), and Z is the orthogonal matrix of Schur vectors
djadmm - djadmm - Jagged diagonal matrix-matrix multiply (modified Ellpack)
djadrp - djadrp - right permutation of a jagged diagonal matrix
djadsm - djadsm - Jagged-diagonal format triangular solve
dlagtf - dlagtf - factorize the matrix (T-lambda*I), where T is an n by n tridiagonal matrix and lambda is a scalar, as T-lambda*I = PLU
dlamrg - dlamrg - will create a permutation list which will merge the elements of A (which is composed of two independently sorted sets) into a single set which is sorted in ascending order

dlarzb - dlarzb - applies a real block reflector H or its transpose $\mathrm{H}^{*}$ T to a real distributed M -by- N C from the left or the right
dlarzt - dlarzt - form the triangular factor T of a real block reflector H of order $>\mathrm{n}$, which is defined as a product of k elementary reflectors
dlasrt - dlasrt - the numbers in D in increasing order (if ID = 'I') or in decreasing order (if ID = 'D' )
dlatzm - dlatzm - routine is deprecated and has been replaced by routine SORMRZ
dnrm2 - dnrm2 - Return the Euclidian norm of a vector.
dopgtr - dopgtr - generate a real orthogonal matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors $\mathrm{H}(\mathrm{i})$ of order n , as returned by SSPTRD using packed storage
$\underline{\text { dopmtr }}$ - dopmtr - overwrite the general real M-by-N matrix C with $\operatorname{SIDE}=$ 'L' SIDE $=$ 'R' TRANS $=$ ' N '
dorg21-dorg21-generate an m by n real matrix Q with orthonormal columns,
$\underline{\text { dorg } 2 r}$ - dorg $2 r$ - generate an $m$ by $n$ real matrix $Q$ with orthonormal columns,
dorgbr - dorgbr - generate one of the real orthogonal matrices Q or $\mathrm{P}^{* *}$ T determined by SGEBRD when reducing a real matrix A to bidiagonal form
dorghr - dorghr - generate a real orthogonal matrix Q which is defined as the product of IHI-ILO elementary reflectors of order N , as returned by SGEHRD
dorg12 - dorg12 - generate an $m$ by $n$ real matrix Q with orthonormal rows,
dorglq - dorglq - generate an M-by-N real matrix Q with orthonormal rows,
dorgql - dorgql - generate an M-by-N real matrix Q with orthonormal columns,
dorgqr - dorgqr - generate an M-by-N real matrix Q with orthonormal columns,
dorgr2 - dorgr2 - generate an $m$ by $n$ real matrix Q with orthonormal rows,
dorgrq - dorgrq - generate an M-by-N real matrix Q with orthonormal rows,
dorgtr - dorgtr - generate a real orthogonal matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors of order N , as returned by SSYTRD
dormbr - dormbr - VECT = 'Q', SORMBR overwrites the general real M-by-N matrix C with SIDE = 'L' SIDE = 'R' TRANS = 'N'
$\underline{\text { dormhr }}$ - dormhr - overwrite the general real M-by-N matrix C with $\operatorname{SIDE}=$ 'L' SIDE $=$ 'R' TRANS $=$ ' $\mathrm{N}^{\prime}$
 dormql - dormql - overwrite the general real M-by-N matrix C with $\mathrm{SIDE}=$ 'L' SIDE $=$ 'R' TRANS $=$ ' N '
 dormrq - dormrq - overwrite the general real M-by-N matrix C with $\operatorname{SIDE}=$ 'L' SIDE $=$ 'R'TRANS $=$ ' N '
 $\underline{\text { dormtr }}$ - dormtr - overwrite the general real M-by-N matrix C with SIDE = 'L' SIDE = 'R' TRANS $=$ ' N '
dpbcon - dpbcon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite band matrix using the Cholesky factorization $A=U * * T * U$ or $A=L^{*} L^{* *} T$ computed by SPBTRF
dpbequ - dpbequ - compute row and column scalings intended to equilibrate a symmetric positive definite band matrix A and reduce its condition number (with respect to the two-norm)
dpbrfs - dpbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite and banded, and provides error bounds and backward error estimates for the solution
dpbstf - dpbstf - compute a split Cholesky factorization of a real symmetric positive definite band matrix A
dpbsv - dpbsv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dpbsvx - dpbsvx - use the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dpbtf2 - dpbtf2 - compute the Cholesky factorization of a real symmetric positive definite band matrix A dpbtrf - dpbtrf - compute the Cholesky factorization of a real symmetric positive definite band matrix A
dpbtrs - dpbtrs - solve a system of linear equations $\mathrm{A}^{*} \mathrm{X}=\mathrm{B}$ with a symmetric positive definite band matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPBTRF
dpocon - dpocon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite matrix using the Cholesky factorization $A=U^{*} * T^{*} U$ or $A=L^{*} L^{* *} T$ computed by SPOTRF
dpoequ - dpoequ - compute row and column scalings intended to equilibrate a symmetric positive definite matrix A and reduce its condition number (with respect to the two-norm)
dporfs - dporfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite,
dposv - dposv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dposvx - dposvx - use the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dpotf2 - dpotf2 - compute the Cholesky factorization of a real symmetric positive definite matrix A
dpotrf - dpotrf - compute the Cholesky factorization of a real symmetric positive definite matrix A
dpotri - dpotri - compute the inverse of a real symmetric positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPOTRF
dpotrs - dpotrs - solve a system of linear equations $A * X=B$ with a symmetric positive definite matrix $A$ using the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ computed by SPOTRF
dppcon - dppcon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite packed matrix using the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ computed by SPPTRF
dppequ - dppequ - compute row and column scalings intended to equilibrate a symmetric positive definite matrix A in packed storage and reduce its condition number (with respect to the two-norm)
dpprfs - dpprfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite and packed, and provides error bounds and backward error estimates for the solution
dppsv - dppsv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dppsvx - dppsvx - use the Cholesky factorization $A=U^{* *} T^{*} U$ or $A=L^{*} L^{* *} T$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dpptrf - dpptrf - compute the Cholesky factorization of a real symmetric positive definite matrix A stored in packed format
dpptri - dpptri - compute the inverse of a real symmetric positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPPTRF
dpptrs - dpptrs - solve a system of linear equations $A * X=B$ with a symmetric positive definite matrix $A$ in packed storage using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L} * \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPPTRF
dptcon - dptcon - compute the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite tridiagonal matrix using the factorization $A=L * D * L * * T$ or $A=U * * T * D * U$ computed by SPTTRF
dpteqr - dpteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric positive definite tridiagonal matrix by first factoring the matrix using SPTTRF, and then calling SBDSQR to compute the singular values of the bidiagonal factor
dptrfs - dptrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite and tridiagonal, and provides error bounds and backward error estimates for the solution
dptsv - dptsv - compute the solution to a real system of linear equations $A * X=B$, where $A$ is an $N-b y-N$ symmetric positive definite tridiagonal matrix, and X and B are N -by-NRHS matrices.
dptsvx - dptsvx - use the factorization $A=L^{*} D^{*} L^{* *} T$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is an N -by- N symmetric positive definite tridiagonal matrix and X and B are N -by-NRHS matrices
dpttrf - dpttrf - compute the $L^{*} D^{*} L^{\prime}$ factorization of a real symmetric positive definite tridiagonal matrix A
dpttrs - dpttrs - solve a tridiagonal system of the form $A * X=B$ using the $L * D^{*} L^{\prime}$ factorization of A computed by SPTTRF
dptts2 - dptts2 - solve a tridiagonal system of the form $A * X=B$ using the $L^{*} D^{*} L^{\prime}$ factorization of A computed by SPTTRF
dqdota - dqdota - compute a double precision constant plus an extended precision constant plus the extended precision dot product of two double precision vectors x and y .
dqdoti - dqdoti - compute a constant plus the extended precision dot product of two double precision vectors x and $y$.
drot - drot - Apply a Given's rotation constructed by SROTG.
drotg - drotg - Construct a Given's plane rotation
droti - droti - Apply an indexed Givens rotation.
drotm - drotm - Apply a Gentleman's modified Given's rotation constructed by SROTMG.
drotmg - drotmg - Construct a Gentleman's modified Given's plane rotation
$\underline{\text { dsbev - dsbev - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A }}$
dsbevd - dsbevd - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
dsbevx - dsbevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
dsbgst - dsbgst - reduce a real symmetric-definite banded generalized eigenproblem $\mathrm{A} * \mathrm{x}=\operatorname{lambda} * \mathrm{~B} * \mathrm{x}$ to standard form $\mathrm{C} * \mathrm{y}=$ lambda*y,
dsbgv - dsbgv - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite banded eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}$
dsbgvd - dsbgvd - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite banded eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}$
$\underline{\text { dsbgvx - dsbgvx - compute selected eigenvalues, and optionally, eigenvectors of a real generalized symmetric- }}$ definite banded eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}$

dsbtrd - dsbtrd - reduce a real symmetric band matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation
dscal - dscal - Compute y $:=$ alpha * y
$\underline{\text { dsctr }}$ - dsctr - Scatters elements from x into y .
dsdot - dsdot - compute the double precision dot product of two single precision vectors x and y .
dsecnd - dsecnd - return the user time for a process in seconds
dsinqb - dsinqb - synthesize a Fourier sequence from its representation in terms of a sine series with odd wave numbers. The SINQ operations are unnormalized inverses of themselves, so a call to SINQF followed by a call to SINQB will multiply the input sequence by $4 * \mathrm{~N}$.
dsinqf - dsinqf - compute the Fourier coefficients in a sine series representation with only odd wave numbers. The SINQ operations are unnormalized inverses of themselves, so a call to SINQF followed by a call to SINQB will multiply the input sequence by $4 * \mathrm{~N}$.
dsinqi - dsinqi - initialize the array xWSAVE, which is used in both SINQF and SINQB.
dsint - dsint - compute the discrete Fourier sine transform of an odd sequence. The SINT transforms are unnormalized inverses of themselves, so a call of SINT followed by another call of SINT will multiply the input
sequence by $2 *(\mathrm{~N}+1)$.
dsinti - dsinti - initialize the array WSAVE, which is used in subroutine SINT.
dskymm - dskymm - Skyline format matrix-matrix multiply
dskysm - dskysm - Skyline format triangular solve
dspcon - dspcon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric packed matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by SSPTRF
dspev - dspev - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
dspevd - dspevd - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
dspevx - dspevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
dspgst - dspgst - reduce a real symmetric-definite generalized eigenproblem to standard form, using packed storage
dspgv - dspgv - compute all the eigenvalues and, optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}{ }^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
dspgvd - dspgvd - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
dspgvx - dspgvx - compute selected eigenvalues, and optionally, eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\mathrm{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\mathrm{lambda}) * \mathrm{x}$, or $\mathrm{B}^{*} \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$

dspr - dspr - perform the symmetric rank 1 operation A := alpha*x*x' +A
$\underline{\text { dspr2 }}$ - dspr2 - perform the symmetric rank 2 operation A := alpha*x*y' + alpha* $y^{*} x^{\prime}+$ A
dsprfs - dsprfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite and packed, and provides error bounds and backward error estimates for the solution

dspsvx - dspsvx - use the diagonal pivoting factorization $A=U * D * U * * T$ or $A=L * D * L * * T$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is an $\mathrm{N}-$ by-N symmetric matrix stored in packed format and X and B are N-by-NRHS matrices
dsptrd - dsptrd - reduce a real symmetric matrix A stored in packed form to symmetric tridiagonal form T by an orthogonal similarity transformation
dsptrf - dsptrf - compute the factorization of a real symmetric matrix A stored in packed format using the BunchKaufman diagonal pivoting method
dsptri - dsptri - compute the inverse of a real symmetric indefinite matrix A in packed storage using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by SSPTRF
dsptrs - dsptrs - solve a system of linear equations A*X $=\mathrm{B}$ with a real symmetric matrix A stored in packed format using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by SSPTRF
dstebz - dstebz - compute the eigenvalues of a symmetric tridiagonal matrix T
dstedc - dstedc - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method
dstegr - dstegr - (a) Compute T-sigma_i = L_i $\mathrm{D}_{-} \mathrm{i} \mathrm{L}_{-} \mathrm{i}^{\wedge} \mathrm{T}$, such that $\mathrm{L}_{-} \mathrm{i} \mathrm{D}_{-} \mathrm{i} \mathrm{L}_{-} \mathrm{i}^{\wedge} \mathrm{T}$ is a relatively robust representation
dstein - dstein - compute the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, using inverse iteration
dsteqr - dsteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit QL or QR method
dsterf - dsterf - compute all eigenvalues of a symmetric tridiagonal matrix using the Pal-Walker-Kahan variant of the QL or QR algorithm
dstev - dstev - compute all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
dstevd - dstevd - compute all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix
dstevr - dstevr - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T
dstevx - dstevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
$\underline{\text { dstsv }}$ - dstsv - compute the solution to a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ where A is a symmetric tridiagonal matrix
dsttrf - dsttrf - compute the factorization of a symmetric tridiagonal matrix A
dsttrs - dsttrs - computes the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$
dswap - dswap - Exchange vectors $x$ and $y$.
dsycon - dsycon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric matrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by SSYTRF
dsyev - dsyev - compute all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
dsyevd - dsyevd - compute all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
$\underline{\text { dsyevr - dsyevr - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal }}$ matrix T
$\underline{\text { dsyevx - dsyevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix A }}$
dsygs2 - dsygs2 - reduce a real symmetric-definite generalized eigenproblem to standard form
dsygst - dsygst - reduce a real symmetric-definite generalized eigenproblem to standard form
dsygv - dsygv - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
dsygvd - dsygvd - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
dsygvx - dsygvx - compute selected eigenvalues, and optionally, eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B}^{*} \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
$\underline{\text { dsymm }}-$ dsymm - perform one of the matrix-matrix operations $\mathrm{C}:=$ alpha*A*B + beta* C or $\mathrm{C}:=$ alpha*B*A + beta*C

dsyr - dsyr - perform the symmetric rank 1 operation A:= alpha*x*x' + A

dsyr2k - dsyr 2 k - perform one of the symmetric rank 2 k operations $\mathrm{C}:=$ alpha* $\mathrm{A}^{*} \mathrm{~B}^{\prime}+$ alpha* $\mathrm{B}^{*} \mathrm{~A}^{\prime}+$ beta* $\mathrm{C}^{\text {or }} \mathrm{C}$ : $=$ alpha* ${ }^{\prime} *$ B + alpha* ${ }^{\prime} * \mathrm{~A}+$ beta $^{*} \mathrm{C}$
dsyrfs - dsyrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution
dsyrk - dsyrk - perform one of the symmetric rank k operations $\mathrm{C}:=\operatorname{alpha} \mathrm{a}^{*} \mathrm{~A}^{*} \mathrm{~A}^{\prime}+\operatorname{beta}^{*} \mathrm{C}$ or $\mathrm{C}:=\operatorname{alpha} \mathrm{A}^{\prime} * \mathrm{~A}+$ beta*C

dsysvx - dsysvx - use the diagonal pivoting factorization to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
dsytd2 - dsytd2 - reduce a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation
dsytf2 - dsytf2 - compute the factorization of a real symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
dsytrd - dsytrd - reduce a real symmetric matrix A to real symmetric tridiagonal form T by an orthogonal similarity transformation
dsytrf - dsytrf - compute the factorization of a real symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
dsytri - dsytri - compute the inverse of a real symmetric indefinite matrix A using the factorization $\mathrm{A}=$ $\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ computed by SSYTRF
dsytrs - dsytrs - solve a system of linear equations $\mathrm{A}^{*} \mathrm{X}=\mathrm{B}$ with a real symmetric matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SSYTRF
dtbcon - dtbcon - estimate the reciprocal of the condition number of a triangular band matrix A , in either the 1norm or the infinity-norm

dtbrfs - dtbrfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular band coefficient matrix
$\underline{\text { dtbsv }}$ - dtbsv - solve one of the systems of equations $A^{*} \mathrm{x}=\mathrm{b}$, or $\mathrm{A}^{\prime}{ }^{*} \mathrm{X}=\mathrm{b}$
$\underline{\text { dtbtrs - dtbtrs - solve a triangular system of the form } \mathrm{A} * \mathrm{X}=\mathrm{B} \text { or } \mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}, ~}$
$\underline{\text { dtgevc - dtgevc - compute some or all of the right and/or left generalized eigenvectors of a pair of real upper }}$ triangular matrices $(A, B)$
dtgexc - dtgexc - reorder the generalized real Schur decomposition of a real matrix pair (A,B) using an orthogonal equivalence transformation $(A, B)=Q^{*}(A, B) * Z^{\prime}$,
dtgsen - dtgsen - reorder the generalized real Schur decomposition of a real matrix pair (A, B) (in terms of an orthonormal equivalence trans- formation $\mathrm{Q}^{\prime *}(\mathrm{~A}, \mathrm{~B}) * \mathrm{Z}$ ), so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix A and the upper triangular B
dtgsja - dtgsja - compute the generalized singular value decomposition (GSVD) of two real upper triangular (or trapezoidal) matrices A and B
dtgsna - dtgsna - estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (A, B) in generalized real Schur canonical form (or of any matrix pair ( $Q^{*} A^{*} Z^{\prime}, Q^{*} B^{*} Z^{\prime}$ ) with orthogonal matrices Q and Z , where $\mathrm{Z}^{\prime}$ denotes the transpose of Z
dtgsyl - dtgsyl - solve the generalized Sylvester equation
dtpcon - dtpcon - estimate the reciprocal of the condition number of a packed triangular matrix A , in either the 1norm or the infinity-norm
$\underline{\text { dtpmv }}$ - dtpmv - perform one of the matrix-vector operations $\mathrm{x}:=\mathrm{A}^{*} \mathrm{x}$, or $\mathrm{x}:=\mathrm{A}^{\prime *} \mathrm{x}$
dtprfs - dtprfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular packed coefficient matrix
$\underline{d t p s v}-\mathrm{dtpsv}$ - solve one of the systems of equations $\mathrm{A}^{*} \mathrm{x}=\mathrm{b}$, or $\mathrm{A}^{\prime}{ }^{*} \mathrm{x}=\mathrm{b}$
dtptri - dtptri - compute the inverse of a real upper or lower triangular matrix A stored in packed format
$\underline{\text { dtptrs }-d t p t r s ~-~ s o l v e ~ a ~ t r i a n g u l a r ~ s y s t e m ~ o f ~ t h e ~ f o r m ~} \mathrm{~A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$,
dtrans - dtrans - transpose and scale source matrix
dtrcon - dtrcon - estimate the reciprocal of the condition number of a triangular matrix A , in either the 1-norm or the infinity-norm
dtrevc - dtrevc - compute some or all of the right and/or left eigenvectors of a real upper quasi-triangular matrix T
dtrexc - dtrexc - reorder the real Schur factorization of a real matrix $\mathrm{A}=\mathrm{Q}^{*} \mathrm{~T}^{*} \mathrm{Q} * * \mathrm{~T}$, so that the diagonal block of T with row index IFST is moved to row ILST
$\underline{\text { dtrmm }}$ - dtrmm - perform one of the matrix-matrix operations B $:=\operatorname{alpha*op(A)*B,~or~B:=alpha*B*op(A)~}$ $\underline{\text { dtrmv }}$ - dtrmv - perform one of the matrix-vector operations $\mathrm{x}:=\mathrm{A}^{*} \mathrm{x}$, or $\mathrm{x}:=\mathrm{A}^{\prime *} \mathrm{x}$
dtrrfs - dtrrfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular coefficient matrix
dtrsen - dtrsen - reorder the real Schur factorization of a real matrix $A=Q^{*} T^{*} Q^{* *} T$, so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix T ,
$\underline{\text { dtrsm }}$ - dtrsm - solve one of the matrix equations $o p(A) * X=$ alpha*B, or $X * o p(A)=$ alpha*B
dtrsna - dtrsna - estimate reciprocal condition numbers for specified eigenvalues and/or right eigenvectors of a real upper quasi-triangular matrix T (or of any matrix $\mathrm{Q} * \mathrm{~T} * \mathrm{Q} * * \mathrm{~T}$ with Q orthogonal)
$\underline{\text { dtrsv }}$ - dtrsv - solve one of the systems of equations $A^{*} x=b$, or $A^{*} x=b$
dtrsyl - dtrsyl - solve the real Sylvester matrix equation
$\underline{\text { dtrti2 }}$ - dtrti2 - compute the inverse of a real upper or lower triangular matrix
dtrtri - dtrtri - compute the inverse of a real upper or lower triangular matrix A
$\underline{\text { dtrtrs }}$ - dtrtrs - solve a triangular system of the form $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$,
dtzrqf - dtzrqf - routine is deprecated and has been replaced by routine STZRZF
dtzrzf - dtzrzf - reduce the $\mathrm{M}-\mathrm{by}-\mathrm{N}(\mathrm{M}<=\mathrm{N})$ real upper trapezoidal matrix A to upper triangular form by means of orthogonal transformations
dvbrmm - dvbrmm - variable block sparse row format matrix-matrix multiply
dvbrsm - dvbrsm - variable block sparse row format triangular solve
dwiener - dwiener - perform Wiener deconvolution of two signals
dzasum - dzasum - Return the sum of the absolute values of a vector x .
dznrm2 - dznrm2-Return the Euclidian norm of a vector.
$\underline{\text { ezfftb - ezfftb - computes a periodic sequence from its Fourier coefficients. EZFFTB is a simplified but slower }}$
version of RFFTB.
ezfftf - ezfftf - computes the Fourier coefficients of a periodic sequence. EZFFTF is a simplified but slower version of RFFTF.
ezffti - ezffti - initializes the array WSAVE, which is used in both EZFFTF and EZFFTB.
fft - Overview of Fast Fourier Transform subroutines
icamax - icamax - return the index of the element with largest absolute value.
idamax - idamax - return the index of the element with largest absolute value.
ilaenv - The name of the calling subroutine, in either upper case or lower case.
isamax - isamax - return the index of the element with largest absolute value.
izamax - izamax - return the index of the element with largest absolute value.

1same - lsame - returns .TRUE. if CA is the same letter as CB regardless of case
$\underline{\mathrm{rfft} 2 \mathrm{~b}}-\mathrm{rfft} 2 \mathrm{~b}$ - compute a periodic sequence from its Fourier coefficients. The RFFT operations are unnormalized, so a call of RFFT2F followed by a call of RFFT2B will multiply the input sequence by $\mathrm{M} * \mathrm{~N}$.
$\underline{\mathrm{rfft} 2 \mathrm{f}}$ - rfft 2 f - compute the Fourier coefficients of a periodic sequence. The RFFT operations are unnormalized, so a call of RFFT2F followed by a call of RFFT2B will multiply the input sequence by $M^{*} N$.
$\underline{\mathrm{rfft} 2 \mathrm{i}}-\mathrm{rfft} 2 \mathrm{i}$ - initialize the array WSAVE, which is used in both the forward and backward transforms.
$\underline{\mathrm{rfft} 3 \mathrm{~b}}$ - rfft3b - compute a periodic sequence from its Fourier coefficients. The RFFT operations are unnormalized, so a call of RFFT3F followed by a call of RFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}^{*} \mathrm{~K}$.
$\underline{\mathrm{rfft} 3 \mathrm{f}}-\mathrm{rfft} 3 \mathrm{f}$ - compute the Fourier coefficients of a real periodic sequence. The RFFT operations are unnormalized, so a call of RFFT3F followed by a call of RFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}^{*} \mathrm{~K}$.
$\underline{\mathrm{rfft} 3 \mathrm{i}}-\mathrm{rfft} 3 \mathrm{i}$ - initialize the array WSAVE, which is used in both RFFT3F and RFFT3B.
$\underline{\text { rfftb }}$ - rfftb - compute a periodic sequence from its Fourier coefficients. The RFFT operations are unnormalized, so a call of RFFTF followed by a call of RFFTB will multiply the input sequence by N .
$\underline{\mathrm{rfftf}}-\mathrm{rfftf}$ - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of RFFTF followed by a call of RFFTB will multiply the input sequence by N .
rffti - rffti - initialize the array WSAVE, which is used in both RFFTF and RFFTB.
rfftopt - rfftopt - compute the length of the closest fast FFT
sasum - sasum - Return the sum of the absolute values of a vector x .
saxpy - saxpy - compute $\mathrm{y}:=$ alpha $* \mathrm{x}+\mathrm{y}$
saxpyi - saxpyi - Compute y := alpha * $\mathrm{x}+\mathrm{y}$
sbcomm - sbcomm - block coordinate matrix-matrix multiply
sbdimm - sbdimm - block diagonal format matrix-matrix multiply
sbdism - sbdism - block diagonal format triangular solve
 matrix B
sbdsqr - sbdsqr - compute the singular value decomposition (SVD) of a real N-by-N (upper or lower) bidiagonal matrix $B$.
sbelmm - sbelmm - block Ellpack format matrix-matrix multiply
sbelsm - sbelsm - block Ellpack format triangular solve
sbscmm - sbscmm - block sparse column matrix-matrix multiply
$\underline{\text { sbscsm - sbscsm - block sparse column format triangular solve }}$
sbsrmm - sbsrmm - block sparse row format matrix-matrix multiply
sbsrsm - sbsrsm - block sparse row format triangular solve
scasum - scasum - Return the sum of the absolute values of a vector x .
scnrm2 - scnrm2-Return the Euclidian norm of a vector.
scnvcor - scnvcor - compute the convolution or correlation of real vectors
scnvcor2 - scnvcor2 - compute the convolution or correlation of real matrices
scoomm - scoomm - coordinate matrix-matrix multiply
scopy - scopy - Copy x to y
scscmm - scscmm - compressed sparse column format matrix-matrix multiply
scscsm - scscsm - compressed sparse column format triangular solve
scsrmm - scsrmm - compressed sparse row format matrix-matrix multiply
scsrsm - scsrsm - compressed sparse row format triangular solve
sdiamm - sdiamm - diagonal format matrix-matrix multiply
sdiasm - sdiasm - diagonal format triangular solve
sdisna - sdisna - compute the reciprocal condition numbers for the eigenvectors of a real symmetric or complex Hermitian matrix or for the left or right singular vectors of a general m-by-n matrix
sdot - sdot - compute the dot product of two vectors x and y .
sdoti - sdoti - Compute the indexed dot product.
sdsdot - sdsdot - compute a constant plus the double precision dot product of two single precision vectors x and y
second - second - return the user time for a process in seconds
sellmm - sellmm - Ellpack format matrix-matrix multiply
sellsm - sellsm - Ellpack format triangular solve
$\underline{\text { sfftc }}$ - sfftc - initialize the trigonometric weight and factor tables or compute the forward Fast Fourier Transform of a real sequence.
sfftc2 - sfftc2 - initialize the trigonometric weight and factor tables or compute the two-dimensional forward Fast Fourier Transform of a two-dimensional real array.
sfftc3 - sfftc3 - initialize the trigonometric weight and factor tables or compute the three-dimensional forward Fast Fourier Transform of a three-dimensional complex array.
sfftcm - sfftcm - initialize the trigonometric weight and factor tables or compute the one-dimensional forward

Fast Fourier Transform of a set of real data sequences stored in a two-dimensional array.
sgbbrd - sgbbrd - reduce a real general m-by-n band matrix A to upper bidiagonal form B by an orthogonal transformation
sgbcon - sgbcon - estimate the reciprocal of the condition number of a real general band matrix A, in either the 1norm or the infinity-norm,
sgbequ - sgbequ - compute row and column scalings intended to equilibrate an M-by-N band matrix A and reduce its condition number
sgbmv - sgbmv - perform one of the matrix-vector operations y $:=$ alpha*A*x + beta* $^{2} y$ or $y:=$ alpha* $^{\prime} A^{\prime} x^{x}+$ beta*y
sgbrfs - sgbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is banded, and provides error bounds and backward error estimates for the solution
sgbsv - sgbsv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is a band matrix of order N with KL subdiagonals and KU superdiagonals, and X and B are N -by-NRHS matrices
sgbsvx - sgbsvx - use the LU factorization to compute the solution to a real system of linear equations $A * X=B$, $\mathrm{A}^{* *} \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{* *} \mathrm{H}^{*} \mathrm{X}=\mathrm{B}$,
sgbtf2 - sgbtf2 - compute an LU factorization of a real m-by-n band matrix A using partial pivoting with row interchanges
sgbtrf - sgbtrf - compute an LU factorization of a real m-by-n band matrix A using partial pivoting with row interchanges
sgbtrs - sgbtrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{\prime} * \mathrm{X}=\mathrm{B}$ with a general band matrix A using the LU factorization computed by SGBTRF
sgebak - sgebak - form the right or left eigenvectors of a real general matrix by backward transformation on the computed eigenvectors of the balanced matrix output by SGEBAL
sgebal - sgebal - balance a general real matrix A
sgebrd - sgebrd - reduce a general real M-by-N matrix A to upper or lower bidiagonal form B by an orthogonal transformation
sgecon - sgecon - estimate the reciprocal of the condition number of a general real matrix A , in either the 1-norm or the infinity-norm, using the LU factorization computed by SGETRF
sgeequ - sgeequ - compute row and column scalings intended to equilibrate an M -by- N matrix A and reduce its condition number
sgees - sgees - compute for an N -by- N real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z
sgeesx - sgeesx - compute for an N-by-N real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z
sgeev - sgeev - compute for an N-by-N real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/ or right eigenvectors
sgeevx - sgeevx - compute for an N-by-N real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors
sgegs - sgegs - routine is deprecated and has been replaced by routine SGGES
sgegv - sgegv - routine is deprecated and has been replaced by routine SGGEV
sgehrd - sgehrd - reduce a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation
sgelqf - sgelqf - compute an LQ factorization of a real M-by-N matrix A
sgels - sgels - solve overdetermined or underdetermined real linear systems involving an M-by-N matrix A, or its transpose, using a QR or LQ factorization of A
sgelsd - sgelsd - compute the minimum-norm solution to a real linear least squares problem
sgelss - sgelss - compute the minimum norm solution to a real linear least squares problem
sgelsx - sgelsx - routine is deprecated and has been replaced by routine SGELSY
sgelsy - sgelsy - compute the minimum-norm solution to a real linear least squares problem
sgemm - sgemm - perform one of the matrix-matrix operations C :=alpha*op(A )*op(B)+beta*C
sgemv - sgemv - perform one of the matrix-vector operations $y:=a l p h a * A * x+$ beta* $^{*} y$ or $y:=a l p h a * A^{\prime} * x+$ beta*y
sgeqlf - sgeqlf - compute a QL factorization of a real M-by-N matrix A
sgeqp3 - sgeqp3 - compute a QR factorization with column pivoting of a matrix A
sgeqpf - sgeqpf - routine is deprecated and has been replaced by routine SGEQP3
sgeqrf - sgeqrf - compute a QR factorization of a real M-by-N matrix $A$
sger - sger - perform the rank 1 operation $\mathrm{A}:=\operatorname{alpha}{ }^{*} \mathrm{x}^{*} \mathrm{y}^{\prime}+\mathrm{A}$
sgerfs - sgerfs - improve the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution
sgerqf - sgerqf - compute an RQ factorization of a real M-by-N matrix A
sgesdd - sgesdd - compute the singular value decomposition (SVD) of a real M-by-N matrix A, optionally computing the left and right singular vectors
sgesv - sgesv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
sgesvd - sgesvd - compute the singular value decomposition (SVD) of a real M-by-N matrix A, optionally computing the left and/or right singular vectors
sgesvx - sgesvx - use the LU factorization to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
sgetf2 - sgetf2 - compute an LU factorization of a general m-by-n matrix A using partial pivoting with row interchanges
sgetrf - sgetrf - compute an LU factorization of a general M-by-N matrix A using partial pivoting with row interchanges
sgetri - sgetri - compute the inverse of a matrix using the LU factorization computed by SGETRF
sgetrs - sgetrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{\prime} * \mathrm{X}=\mathrm{B}$ with a general N -by-N matrix A using the LU factorization computed by SGETRF
sggbak - sggbak - form the right or left eigenvectors of a real generalized eigenvalue problem $A * x=$ lambda*B*x, by backward transformation on the computed eigenvectors of the balanced pair of matrices output by SGGBAL
sggbal - sggbal - balance a pair of general real matrices (A,B)
sgges - sgges - compute for a pair of N-by-N real nonsymmetric matrices (A,B),
sggesx - sggesx - compute for a pair of $N$-by-N real nonsymmetric matrices $(A, B)$, the generalized eigenvalues, the real Schur form (S,T), and,
sggev - sggev - compute for a pair of N -by-N real nonsymmetric matrices (A,B)
sggevx - sggevx - compute for a pair of N-by-N real nonsymmetric matrices (A,B)
sggglm - sggglm - solve a general Gauss-Markov linear model (GLM) problem
sgghrd - sgghrd - reduce a pair of real matrices (A,B) to generalized upper Hessenberg form using orthogonal transformations, where $A$ is a general matrix and $B$ is upper triangular
sgglse - sgglse - solve the linear equality-constrained least squares (LSE) problem
sggqrf - sggqrf - compute a generalized QR factorization of an N -by-M matrix A and an N -by-P matrix B .
sggrqf - sggrqf - compute a generalized RQ factorization of an M-by-N matrix A and a P-by-N matrix B
sggsvd - sggsvd - compute the generalized singular value decomposition (GSVD) of an M-by-N real matrix A and P-by-N real matrix B
sggsvp - sggsvp - compute orthogonal matrices $U, V$ and $Q$ such that $N-K-L K L U^{*} * A^{*} Q=K(0 A 12 A 13)$ if $M-$ $K-L>=0$
sgssco - sgssco - General sparse solver condition number estimate.
sgssda - sgssda - Deallocate working storage for the general sparse solver.
sgssfa - sgssfa - General sparse solver numeric factorization.
sgssfs - sgssfs - General sparse solver one call interface.
sgssin - sgssin - Initialize the general sparse solver.
sgssor - sgssor - General sparse solver ordering and symbolic factorization.
sgssps - sgssps - Print general sparse solver statics.
sgssrp - sgssrp - Return permutation used by the general sparse solver.
sgsssl - sgsssl-Solve routine for the general sparse solver.
sgssuo - sgssuo - User supplied permutation for ordering used in the general sparse solver.
sgtcon - sgtcon - estimate the reciprocal of the condition number of a real tridiagonal matrix A using the LU factorization as computed by SGTTRF
sgthr - sgthr - Gathers specified elements from y into $x$.
sgthrz - sgthrz - Gather and zero.
sgtrfs - sgtrfs - improve the computed solution to a system of linear equations when the coefficient matrix is tridiagonal, and provides error bounds and backward error estimates for the solution
sgtsv - sgtsv - solve the equation $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
sgtsvx - sgtsvx - use the LU factorization to compute the solution to a real system of linear equations A * $\mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$,
sgttrf - sgttrf - compute an LU factorization of a real tridiagonal matrix A using elimination with partial pivoting and row interchanges
sgttrs - sgttrs - solve one of the systems of equations $A^{*} X=B$ or $A^{*} * X=B$,
shgeqz - shgeqz - implement a single-/double-shift version of the QZ method for finding the generalized eigenvalues $w(j)=\left(\operatorname{ALPHAR}(\mathrm{j})+\mathrm{i}^{*} \operatorname{ALPHAI}(\mathrm{j})\right) / \operatorname{BETAR}(\mathrm{j})$ of the equation $\operatorname{det}(\mathrm{A}-\mathrm{w}(\mathrm{i}) \mathrm{B})=0$ In addition, the pair A,B may be reduced to generalized Schur form
shsein - shsein - use inverse iteration to find specified right and/or left eigenvectors of a real upper Hessenberg matrix H
shseqr - shseqr - compute the eigenvalues of a real upper Hessenberg matrix H and, optionally, the matrices T and Z from the Schur decomposition $\mathrm{H}=\mathrm{Z} \mathrm{T} \mathrm{Z} * *$, where T is an upper quasi-triangular matrix (the Schur form), and Z is the orthogonal matrix of Schur vectors
$\underline{\text { sinqb }}$ - sinqb - synthesize a Fourier sequence from its representation in terms of a sine series with odd wave numbers. The SINQ operations are unnormalized inverses of themselves, so a call to SINQF followed by a call to SINQB will multiply the input sequence by $4 * \mathrm{~N}$.
sinqf - sinqf - compute the Fourier coefficients in a sine series representation with only odd wave numbers. The SINQ operations are unnormalized inverses of themselves, so a call to SINQF followed by a call to SINQB will multiply the input sequence by $4 * \mathrm{~N}$.
sinqi - sinqi - initialize the array xWSAVE, which is used in both SINQF and SINQB.
sint - sint - compute the discrete Fourier sine transform of an odd sequence. The SINT transforms are unnormalized inverses of themselves, so a call of SINT followed by another call of SINT will multiply the input sequence by $2 *(\mathrm{~N}+1)$.
sinti - sinti - initialize the array WSAVE, which is used in subroutine SINT.
sjadmm - sjadmm - Jagged diagonal matrix-matrix multiply (modified Ellpack)
sjadrp - sjadrp - right permutation of a jagged diagonal matrix
sjadsm - sjadsm - Jagged-diagonal format triangular solve
slagtf - slagtf - factorize the matrix (T-lambda*I), where T is an n by n tridiagonal matrix and lambda is a scalar, as T-lambda* $\mathrm{I}=\mathrm{PLU}$
slamrg - slamrg - will create a permutation list which will merge the elements of A (which is composed of two independently sorted sets) into a single set which is sorted in ascending order
slarz - slarz - applies a real elementary reflector H to a real M-by-N matrix C, from either the left or the right
slarzb - slarzb - applies a real block reflector H or its transpose $\mathrm{H}^{* *} \mathrm{~T}$ to a real distributed $\mathrm{M}-\mathrm{by}-\mathrm{N} \mathrm{C}$ from the left or the right
slarzt - slarzt - form the triangular factor T of a real block reflector H of order $>\mathrm{n}$, which is defined as a product of k elementary reflectors
slasrt - slasrt - the numbers in D in increasing order (if ID = 'I') or in decreasing order (if ID = 'D' )
slatzm - slatzm - routine is deprecated and has been replaced by routine SORMRZ
snrm2 - snrm2 - Return the Euclidian norm of a vector.
sopgtr - sopgtr - generate a real orthogonal matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors H (i) of order n , as returned by SSPTRD using packed storage
sopmtr - sopmtr - overwrite the general real M-by-N matrix C with SIDE = 'L' SIDE $=$ ' R ' TRANS $=$ ' N '
sorg21-sorg21 - generate an m by n real matrix Q with orthonormal columns,
sorg2r - sorg2r - generate an $m$ by $n$ real matrix Q with orthonormal columns,
sorgbr - sorgbr - generate one of the real orthogonal matrices Q or $\mathrm{P}^{* *} \mathrm{~T}$ determined by SGEBRD when reducing
a real matrix A to bidiagonal form
sorghr - sorghr - generate a real orthogonal matrix Q which is defined as the product of IHI-ILO elementary reflectors of order N , as returned by SGEHRD
sorgl2 - sorgl2 - generate an $m$ by $n$ real matrix Q with orthonormal rows,
sorglq - sorglq - generate an M-by-N real matrix Q with orthonormal rows,
sorgql - sorgql - generate an M-by-N real matrix Q with orthonormal columns,
sorgqr - sorgqr - generate an M-by-N real matrix Q with orthonormal columns,
sorgr2 - sorgr2 - generate an m by $n$ real matrix Q with orthonormal rows,
sorgrq - sorgrq - generate an M-by-N real matrix Q with orthonormal rows,
sorgtr - sorgtr - generate a real orthogonal matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors of order N , as returned by SSYTRD
sormbr - sormbr - VECT = 'Q', SORMBR overwrites the general real $\mathrm{M}-\mathrm{by}-\mathrm{N}$ matrix C with $\operatorname{SIDE}=$ 'L' $\mathrm{SIDE}=$ 'R' TRANS = 'N'
sormhr - sormhr - overwrite the general real M-by-N matrix C with SIDE = 'L' SIDE = 'R' TRANS = 'N'
sormlq - sormlq - overwrite the general real M-by-N matrix C with SIDE $=$ 'L' SIDE $=$ 'R' TRANS $=$ ' N '
sormql - sormql - overwrite the general real M-by-N matrix C with SIDE $=$ 'L' SIDE $=$ ' $\mathrm{R}^{\prime}$ TRANS $=$ ' N '
sormqr - sormqr - overwrite the general real M-by-N matrix C with SIDE $=$ 'L' SIDE $=$ ' $\mathrm{R}^{\prime}$ TRANS $=$ ' N '
sormrq - sormrq - overwrite the general real M-by-N matrix C with SIDE = 'L' SIDE $=$ ' R ' TRANS $=$ ' N '
sormrz - sormrz - overwrite the general real M-by-N matrix C with SIDE = 'L' SIDE = 'R' TRANS = 'N'
sormtr - sormtr - overwrite the general real M-by-N matrix C with $\operatorname{SIDE}=$ 'L' SIDE $=$ ' R ' TRANS $=$ ' N '
spbcon - spbcon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite band matrix using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPBTRF
spbequ - spbequ - compute row and column scalings intended to equilibrate a symmetric positive definite band matrix A and reduce its condition number (with respect to the two-norm)
spbrfs - spbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite and banded, and provides error bounds and backward error estimates for the solution
spbstf - spbstf - compute a split Cholesky factorization of a real symmetric positive definite band matrix A
$\underline{\text { spbsv }}$ - spbsv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
spbsvx - spbsvx - use the Cholesky factorization $A=U^{*} * T^{*} U$ or $A=L^{*} L^{* *} T$ to compute the solution to a real system of linear equations $A * X=B$,
spbtf2 - spbtf2 - compute the Cholesky factorization of a real symmetric positive definite band matrix A
spbtrf - spbtrf - compute the Cholesky factorization of a real symmetric positive definite band matrix A
spbtrs - spbtrs - solve a system of linear equations $A * X=B$ with a symmetric positive definite band matrix $A$ using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L} * \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPBTRF
spocon - spocon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite matrix using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPOTRF
spoequ - spoequ - compute row and column scalings intended to equilibrate a symmetric positive definite matrix A and reduce its condition number (with respect to the two-norm)
sporfs - sporfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite,
sposv - sposv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
sposvx - sposvx - use the Cholesky factorization $A=U^{*} * T^{*} U$ or $A=L^{*} L^{* *} T$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
spotf2 - spotf2 - compute the Cholesky factorization of a real symmetric positive definite matrix A
$\underline{\text { spotrf }}$ - spotrf - compute the Cholesky factorization of a real symmetric positive definite matrix A
spotri - spotri - compute the inverse of a real symmetric positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by SPOTRF
spotrs - spotrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ with a symmetric positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L} * \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPOTRF
sppcon - sppcon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric positive
definite packed matrix using the Cholesky factorization $A=U * * T * U$ or $A=L * L * * T$ computed by SPPTRF
sppequ - sppequ - compute row and column scalings intended to equilibrate a symmetric positive definite matrix A in packed storage and reduce its condition number (with respect to the two-norm)
spprfs - spprfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite and packed, and provides error bounds and backward error estimates for the solution
$\underline{\text { sppsv }}$ - sppsv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
sppsvx - sppsvx - use the Cholesky factorization $A=U^{*} * T^{*} U$ or $A=L^{*} L^{*} * T$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
spptrf - spptrf - compute the Cholesky factorization of a real symmetric positive definite matrix A stored in packed format
spptri - spptri - compute the inverse of a real symmetric positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{*} * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SPPTRF
spptrs - spptrs - solve a system of linear equations $A * X=B$ with a symmetric positive definite matrix $A$ in packed storage using the Cholesky factorization $A=U * * T * U$ or $A=L * L * * T$ computed by SPPTRF
sptcon - sptcon - compute the reciprocal of the condition number (in the 1-norm) of a real symmetric positive definite tridiagonal matrix using the factorization $A=L * D * L * * T$ or $A=U * * T * D * U$ computed by SPTTRF
spteqr - spteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric positive definite tridiagonal matrix by first factoring the matrix using SPTTRF, and then calling SBDSQR to compute the singular values of the bidiagonal factor
sptrfs - sptrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric positive definite and tridiagonal, and provides error bounds and backward error estimates for the solution
sptsv - sptsv - compute the solution to a real system of linear equations $A * X=B$, where $A$ is an $N-b y-N$ symmetric positive definite tridiagonal matrix, and X and B are N -by-NRHS matrices.
sptsvx - sptsvx - use the factorization $A=L^{*} D^{*} L^{*} * T$ to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is an N -by- N symmetric positive definite tridiagonal matrix and X and B are N -by-NRHS matrices
spttrf - spttrf - compute the $L^{*} D^{*} L^{\prime}$ factorization of a real symmetric positive definite tridiagonal matrix A
spttrs - spttrs - solve a tridiagonal system of the form $\mathrm{A} * \mathrm{X}=\mathrm{B}$ using the $\mathrm{L} * \mathrm{D} * \mathrm{~L}$ ' factorization of A computed by SPTTRF
sptts2 - sptts2 - solve a tridiagonal system of the form $A * X=B$ using the $L * D * L$ factorization of A computed by SPTTRF
srot - srot - Apply a Given's rotation constructed by SROTG.
srotg - srotg - Construct a Given's plane rotation
sroti - sroti - Apply an indexed Givens rotation.
srotm - srotm - Apply a Gentleman's modified Given's rotation constructed by SROTMG.
srotmg - srotmg - Construct a Gentleman's modified Given's plane rotation
ssbev - ssbev - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
ssbevd - ssbevd - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
ssbevx - ssbevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
ssbgst - ssbgst - reduce a real symmetric-definite banded generalized eigenproblem $A * x=1 a m b d a * B * x$ to standard form $\mathrm{C}^{*} \mathrm{y}=$ lambda* y ,
ssbgv - ssbgv - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite banded eigenproblem, of the form $A * x=(l a m b d a) * B * x$
ssbgvd - ssbgvd - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite banded eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\mathrm{lambda}) * \mathrm{~B}$ * x
ssbgvx - ssbgvx - compute selected eigenvalues, and optionally, eigenvectors of a real generalized symmetricdefinite banded eigenproblem, of the form $A * x=(l a m b d a) * B * x$
ssbmv - ssbmv - perform the matrix-vector operation $y:=a l p h a * A * x+$ beta* $y$
ssbtrd - ssbtrd - reduce a real symmetric band matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation
sscal - sscal - Compute y $:=$ alpha $* y$
ssctr - ssctr - Scatters elements from x into y .
sskymm - sskymm - Skyline format matrix-matrix multiply
sskysm - sskysm - Skyline format triangular solve
sspcon - sspcon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric packed matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SSPTRF
sspev - sspev - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
sspevd - sspevd - compute all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
sspevx - sspevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
sspgst - sspgst - reduce a real symmetric-definite generalized eigenproblem to standard form, using packed storage
sspgv - sspgv - compute all the eigenvalues and, optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
sspgvd - sspgvd - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
sspgvx - sspgvx - compute selected eigenvalues, and optionally, eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
$\underline{\text { sspmv }}-$ sspmv - perform the matrix-vector operation $y:=a l p h a * A * x+$ beta* $y$
sspr - sspr - perform the symmetric rank 1 operation $\mathrm{A}:=$ alpha* $\mathrm{x}^{*} \mathrm{x}^{\prime}+\mathrm{A}$
sspr2 - sspr2 - perform the symmetric rank 2 operation A :=alpha* $x^{*} y^{\prime}+$ alpha* $y^{*} x^{\prime}+A$
ssprfs - ssprfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite and packed, and provides error bounds and backward error estimates for the solution
sspsv - sspsv - compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
sspsvx - sspsvx - use the diagonal pivoting factorization $A=U * D^{*} U^{* *} T$ or $A=L^{*} D^{*} L^{*} * T$ to compute the solution to a real system of linear equations $A * X=B$, where $A$ is an $N-b y-N$ symmetric matrix stored in packed format and X and B are N -by-NRHS matrices
ssptrd - ssptrd - reduce a real symmetric matrix A stored in packed form to symmetric tridiagonal form T by an orthogonal similarity transformation
ssptrf - ssptrf - compute the factorization of a real symmetric matrix A stored in packed format using the BunchKaufman diagonal pivoting method
ssptri - ssptri - compute the inverse of a real symmetric indefinite matrix A in packed storage using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by SSPTRF
ssptrs - ssptrs - solve a system of linear equations $A * X=B$ with a real symmetric matrix $A$ stored in packed format using the factorization $A=U^{*} D^{*} U^{*} * T$ or $A=L * D * L * T$ computed by SSPTRF
sstebz - sstebz - compute the eigenvalues of a symmetric tridiagonal matrix T
sstedc - sstedc - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method
sstegr - sstegr - (a) Compute T-sigma_i = L_i D_i L_i^T, such that L_i D_i L_i^ ${ }^{\wedge}$ is a relatively robust representation
sstein - sstein - compute the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, using inverse iteration
ssteqr - ssteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit QL or QR method
ssterf - ssterf - compute all eigenvalues of a symmetric tridiagonal matrix using the Pal-Walker-Kahan variant of the QL or QR algorithm
sstev - sstev - compute all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
sstevd - sstevd - compute all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix
sstevr - sstevr - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T
sstevx - sstevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
sstsv - sstsv - compute the solution to a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ where A is a symmetric tridiagonal matrix
ssttrf - ssttrf - compute the factorization of a symmetric tridiagonal matrix A
ssttrs - ssttrs - computes the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$
sswap - sswap - Exchange vectors $x$ and $y$.
ssycon - ssycon - estimate the reciprocal of the condition number (in the 1-norm) of a real symmetric matrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ computed by SSYTRF
ssyev - ssyev - compute all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
ssyevd - ssyevd - compute all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
ssyevr - ssyevr - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix T
ssyevx - ssyevx - compute selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
ssygs2 - ssygs2 - reduce a real symmetric-definite generalized eigenproblem to standard form
ssygst - ssygst - reduce a real symmetric-definite generalized eigenproblem to standard form
ssygv - ssygv - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
ssygvd - ssygvd - compute all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B}^{*} \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
ssygvx - ssygvx - compute selected eigenvalues, and optionally, eigenvectors of a real generalized symmetricdefinite eigenproblem, of the form $\mathrm{A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
 beta*C

$\underline{\text { ssyr }- \text { ssyr }- \text { perform the symmetric rank } 1 \text { operation } \mathrm{A}:=\operatorname{alpha}{ }^{*} \mathrm{x}^{*} \mathrm{x}^{\prime}+\mathrm{A}, ~}$

ssyr2k - ssyr2k - perform one of the symmetric rank $2 k$ operations $C:=$ alpha* $A^{*} B^{\prime}+$ alpha* $B^{*} A^{\prime}+$ beta* $C$ or $C$ : $=$ alpha* ${ }^{\prime} * \mathrm{~B}+$ alpha* ${ }^{\prime} * \mathrm{~A}+$ beta* C
ssyrfs - ssyrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution
 beta*C
$\underline{\text { ssysv - ssysv - compute the solution to a real system of linear equations } \mathrm{A} * \mathrm{X}=\mathrm{B}, ~}$
ssysvx - ssysvx - use the diagonal pivoting factorization to compute the solution to a real system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
ssytd2 - ssytd2 - reduce a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation
ssytf2 - ssytf2 - compute the factorization of a real symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
ssytrd - ssytrd - reduce a real symmetric matrix A to real symmetric tridiagonal form T by an orthogonal similarity transformation
ssytrf - ssytrf - compute the factorization of a real symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
ssytri - ssytri - compute the inverse of a real symmetric indefinite matrix A using the factorization $\mathrm{A}=$ $\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L}^{*} * \mathrm{~T}$ computed by SSYTRF
ssytrs - ssytrs - solve a system of linear equations $A * X=B$ with a real symmetric matrix $A$ using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by SSYTRF
 norm or the infinity-norm

stbrfs - stbrfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular band coefficient matrix

stgevc - stgevc - compute some or all of the right and/or left generalized eigenvectors of a pair of real upper triangular matrices ( $\mathrm{A}, \mathrm{B}$ )
stgexc - stgexc - reorder the generalized real Schur decomposition of a real matrix pair $(A, B)$ using an orthogonal equivalence transformation $(A, B)=Q^{*}(A, B) * Z^{\prime}$,
stgsen - stgsen - reorder the generalized real Schur decomposition of a real matrix pair (A, B) (in terms of an orthonormal equivalence trans- formation $\mathrm{Q}^{\prime *}(\mathrm{~A}, \mathrm{~B}) * \mathrm{Z}$ ), so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix A and the upper triangular B
stgsja - stgsja - compute the generalized singular value decomposition (GSVD) of two real upper triangular (or trapezoidal) matrices A and B
stgsna - stgsna - estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (A, B) in generalized real Schur canonical form (or of any matrix pair ( $Q^{*} A^{*} Z^{\prime}, Q^{*} B^{*} Z^{\prime}$ ) with orthogonal matrices Q and Z , where $\mathrm{Z}^{\prime}$ denotes the transpose of Z
stgsyl - stgsyl - solve the generalized Sylvester equation
stpcon - stpcon - estimate the reciprocal of the condition number of a packed triangular matrix A , in either the 1norm or the infinity-norm

stprfs - stprfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular packed coefficient matrix
$\underline{\text { stpsv }}$ - stpsv - solve one of the systems of equations $A^{*} x=b$, or $A^{*} x=b$
stptri - stptri - compute the inverse of a real upper or lower triangular matrix A stored in packed format
stptrs - stptrs - solve a triangular system of the form $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$,
strans - strans - transpose and scale source matrix
strcon - strcon - estimate the reciprocal of the condition number of a triangular matrix A, in either the 1-norm or the infinity-norm
$\underline{\text { strevc - strevc - compute some or all of the right and/or left eigenvectors of a real upper quasi-triangular matrix } \mathrm{T}}$
strexc - strexc - reorder the real Schur factorization of a real matrix $A=Q^{*} T^{*} Q^{*} * T$, so that the diagonal block of T with row index IFST is moved to row ILST
strmm - strmm - perform one of the matrix-matrix operations B :=alpha*op(A)*B, or B :=alpha*B*op(A)
$\underline{\text { strmv }}$ - strmv - perform one of the matrix-vector operations $x:=A^{*} x$, or $x:=A^{\prime} * x$
strrfs - strrfs - provide error bounds and backward error estimates for the solution to a system of linear equations
with a triangular coefficient matrix
strsen - strsen - reorder the real Schur factorization of a real matrix $A=Q^{*} T^{*} Q^{*} * T$, so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix T ,
$\underline{\operatorname{strsm}}-\operatorname{strsm}-$ solve one of the matrix equations op(A)$)^{*} X=\operatorname{alpha} * B$, or $X * o p(A)=$ alpha*B
strsna - strsna - estimate reciprocal condition numbers for specified eigenvalues and/or right eigenvectors of a real upper quasi-triangular matrix T (or of any matrix $\mathrm{Q}^{*} \mathrm{~T}^{*} \mathrm{Q}^{* *} \mathrm{~T}$ with Q orthogonal)
$\underline{\text { strsv }}$ - strsv - solve one of the systems of equations $A^{*} x=b$, or $A^{\prime} * x=b$
strsyl - strsyl - solve the real Sylvester matrix equation
strti2 - strti2 - compute the inverse of a real upper or lower triangular matrix
strtri - strtri - compute the inverse of a real upper or lower triangular matrix A
strtrs - strtrs - solve a triangular system of the form $\mathrm{A} * \mathrm{X}=\mathrm{B}$ or $\mathrm{A}^{*} \mathrm{~T}^{*} \mathrm{X}=\mathrm{B}$,
stzrqf - stzrqf - routine is deprecated and has been replaced by routine STZRZF
stzrzf - stzrzf - reduce the M-by-N ( $\mathrm{M}<=\mathrm{N}$ ) real upper trapezoidal matrix A to upper triangular form by means of orthogonal transformations
sunperf_version - sunperf_version - gets library information .HP 1i SUBROUTINE SUNPERF_VERSION (VERSION, PATCH, UPDATE) .HP 1i INTEGER VERSION, PATCH, UPDATE .HP 1i
svbrmm - svbrmm - variable block sparse row format matrix-matrix multiply
svbrsm - svbrsm - variable block sparse row format triangular solve
swiener - swiener - perform Wiener deconvolution of two signals
use_threads - use_threads - set the upper bound on the number of threads that the calling thread wants used
using_threads - using_threads - returns the current Use number set by the USE_THREADS subroutine
vcfftb - vcfftb - compute a periodic sequence from its Fourier coefficients. The VCFFT operations are normalized, so a call of VCFFTF followed by a call of VCFFTB will return the original sequence.
vcfftf - vcfftf - compute the Fourier coefficients of a periodic sequence. The VCFFT operations are normalized,
so a call of VCFFTF followed by a call of VCFFTB will return the original sequence.
vcffti - vcffti - initialize the array WSAVE, which is used in both VCFFTF and VCFFTB.
vcosqb - vcosqb - synthesize a Fourier sequence from its representation in terms of a cosine series with odd wave numbers. The VCOSQ operations are normalized, so a call of VCOSQF followed by a call of VCOSQB will return the original sequence.
vcosqf - vcosqf - compute the Fourier coefficients in a cosine series representation with only odd wave numbers. The VCOSQ operations are normalized, so a call of VCOSQF followed by a call of VCOSQB will return the original sequence.
vcosqi - vcosqi - initialize the array WSAVE, which is used in both VCOSQF and VCOSQB.
vcost - vcost - compute the discrete Fourier cosine transform of an even sequence. The VCOST transform is normalized, so a call of VCOST followed by a call of VCOST will return the original sequence.
vcosti - vcosti - initialize the array WSAVE, which is used in VCOST.
vdcosqb - vdcosqb - synthesize a Fourier sequence from its representation in terms of a cosine series with odd wave numbers. The VCOSQ operations are normalized, so a call of VCOSQF followed by a call of VCOSQB will return the original sequence.
vdcosqf - vdcosqf - compute the Fourier coefficients in a cosine series representation with only odd wave numbers. The VCOSQ operations are normalized, so a call of VCOSQF followed by a call of VCOSQB will return the original sequence.
vdcosqi - vdcosqi - initialize the array WSAVE, which is used in both VCOSQF and VCOSQB.
vdcost - vdcost - compute the discrete Fourier cosine transform of an even sequence. The VCOST transform is normalized, so a call of VCOST followed by a call of VCOST will return the original sequence.
vdcosti - vdcosti - initialize the array WSAVE, which is used in VCOST.
vdfftb - vdfftb - compute a periodic sequence from its Fourier coefficients. The VRFFT operations are normalized, so a call of VRFFTF followed by a call of VRFFTB will return the original sequence.
vdfftf - vdfftf - compute the Fourier coefficients of a periodic sequence. The VRFFT operations are normalized, so a call of VRFFTF followed by a call of VRFFTB will return the original sequence.
vdffti - vdffti - initialize the array WSAVE, which is used in both VRFFTF and VRFFTB.
$\underline{\text { vdsinqb }}$ - vdsinqb - synthesize a Fourier sequence from its representation in terms of a sine series with odd wave
numbers. The VSINQ operations are normalized, so a call of VSINQF followed by a call of VSINQB will return the original sequence.
vdsinqf - vdsinqf - compute the Fourier coefficients in a sine series representation with only odd wave numbers. The VSINQ operations are normalized, so a call of VSINQF followed by a call of VSINQB will return the original sequence.
vdsinqi - vdsinqi - initialize the array WSAVE, which is used in both VSINQF and VSINQB.
vdsint - vdsint - compute the discrete Fourier sine transform of an odd sequence. The VSINT transforms are unnormalized inverses of themselves, so a call of VSINT followed by another call of VSINT will multiply the input sequence by $2 *(\mathrm{~N}+1)$. The VSINT transforms are normalized, so a call of VSINT followed by a call of VSINT will return the original sequence.
vdsinti - vdsinti - initialize the array WSAVE, which is used in subroutine VSINT.
vrfftb - vrfftb - compute a periodic sequence from its Fourier coefficients. The VRFFT operations are normalized, so a call of VRFFTF followed by a call of VRFFTB will return the original sequence.
vrfftf - vrfftf - compute the Fourier coefficients of a periodic sequence. The VRFFT operations are normalized, so a call of VRFFTF followed by a call of VRFFTB will return the original sequence.
vrffti - vrffti - initialize the array WSAVE, which is used in both VRFFTF and VRFFTB.
vsinqb - vsinqb - synthesize a Fourier sequence from its representation in terms of a sine series with odd wave numbers. The VSINQ operations are normalized, so a call of VSINQF followed by a call of VSINQB will return the original sequence.
vsinqf - vsinqf - compute the Fourier coefficients in a sine series representation with only odd wave numbers. The VSINQ operations are normalized, so a call of VSINQF followed by a call of VSINQB will return the original sequence.
vsinqi - vsinqi - initialize the array WSAVE, which is used in both VSINQF and VSINQB.
vsint - vsint - compute the discrete Fourier sine transform of an odd sequence. The VSINT transforms are unnormalized inverses of themselves, so a call of VSINT followed by another call of VSINT will multiply the input sequence by $2 *(\mathrm{~N}+1)$. The VSINT transforms are normalized, so a call of VSINT followed by a call of VSINT will return the original sequence.
vsinti - vsinti - initialize the array WSAVE, which is used in subroutine VSINT.
vzfftb - vzfftb - compute a periodic sequence from its Fourier coefficients. The VZFFT operations are normalized, so a call of VZFFTF followed by a call of VZFFTB will return the original sequence.
vzfftf - vzfftf - compute the Fourier coefficients of a periodic sequence. The VZFFT operations are normalized, so a call of VZFFTF followed by a call of VZFFTB will return the original sequence.
vzffti - vzffti - initialize the array WSAVE, which is used in both VZFFTF and VZFFTB.
zaxpy - zaxpy - compute $\mathrm{y}:=$ alpha $* \mathrm{x}+\mathrm{y}$
zaxpyi - zaxpyi - Compute $\mathrm{y}:=$ alpha $* \mathrm{x}+\mathrm{y}$
zbcomm - zbcomm - block coordinate matrix-matrix multiply
zbdimm - zbdimm - block diagonal format matrix-matrix multiply
zbdism - zbdism - block diagonal format triangular solve
zbdsqr - zbdsqr - compute the singular value decomposition (SVD) of a real N-by-N (upper or lower) bidiagonal matrix $B$.
zbelmm - zbelmm - block Ellpack format matrix-matrix multiply
zbelsm - zbelsm - block Ellpack format triangular solve
zbscmm - zbscmm - block sparse column matrix-matrix multiply
zbscsm - zbscsm - block sparse column format triangular solve
zbsrmm - zbsrmm - block sparse row format matrix-matrix multiply
zbsrsm - zbsrsm - block sparse row format triangular solve
$\underline{\text { zenvcor - zenvcor - compute the convolution or correlation of complex vectors }}$
zcnvcor2 - zcnvcor2 - compute the convolution or correlation of complex matrices
zcoomm - zcoomm - coordinate matrix-matrix multiply

Zcopy - zcopy - Copy x to y
zcscmm - zcscmm - compressed sparse column format matrix-matrix multiply
$\underline{\text { zcscsm }}$ - zcscsm - compressed sparse column format triangular solve
zcsrmm - zcsrmm - compressed sparse row format matrix-matrix multiply
zcsrsm - zcsrsm - compressed sparse row format triangular solve
zdiamm - zdiamm - diagonal format matrix-matrix multiply
zdiasm - zdiasm - diagonal format triangular solve
$\underline{\text { zdotc }-z d o t c}$ - compute the dot product of two vectors conjg(x) and y .
zdotci - zdotci - Compute the complex conjugated indexed dot product.

zdotui - zdotui - Compute the complex unconjugated indexed dot product.
zdrot - zdrot - Apply a plane rotation.
zdscal - zdscal - Compute y $:=$ alpha * y
zellmm - zellmm - Ellpack format matrix-matrix multiply
zellsm - zellsm - Ellpack format triangular solve
$\underline{\text { zfft2b }}$ - zfft2b - compute a periodic sequence from its Fourier coefficients. The FFT operations are unnormalized, so a call of ZFFT2F followed by a call of ZFFT2B will multiply the input sequence by $\mathrm{M} * \mathrm{~N}$.
zfft2f - zfft2f - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of ZFFT2F followed by a call of ZFFT2B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}$.
zfft2i - zfft2i - initialize the array WSAVE, which is used in both the forward and backward transforms.
$\underline{\text { zfft3b }}$ - zfft3b - compute a periodic sequence from its Fourier coefficients. The FFT operations are unnormalized, so a call of ZFFT3F followed by a call of ZFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N} * \mathrm{~K}$.
zfft3f - zfft3f - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of ZFFT3F followed by a call of ZFFT3B will multiply the input sequence by $\mathrm{M}^{*} \mathrm{~N}^{*} \mathrm{~K}$.
zfft3i - zfft3i - initialize the array WSAVE, which is used in both ZFFT3F and ZFFT3B.
zfftb - zfftb - compute a periodic sequence from its Fourier coefficients. The FFT operations are unnormalized, so a call of ZFFTF followed by a call of ZFFTB will multiply the input sequence by N .
zfftd - zfftd - initialize the trigonometric weight and factor tables or compute the inverse Fast Fourier Transform of a double complex sequence.
zfftd2 - zfftd2 - initialize the trigonometric weight and factor tables or compute the two-dimensional inverse Fast Fourier Transform of a two-dimensional double complex array.
zfftd3 - zfftd3 - initialize the trigonometric weight and factor tables or compute the three-dimensional inverse Fast Fourier Transform of a three-dimensional double complex array.
zfftdm - zfftdm - initialize the trigonometric weight and factor tables or compute the one-dimensional inverse Fast Fourier Transform of a set of double complex data sequences stored in a two-dimensional array.
zfftf - zfftf - compute the Fourier coefficients of a periodic sequence. The FFT operations are unnormalized, so a call of ZFFTF followed by a call of ZFFTB will multiply the input sequence by N .
zffti - zffti - initialize the array WSAVE, which is used in both ZFFTF and ZFFTB.
zfftopt - zfftopt - compute the length of the closest fast FFT
zfftz - zfftz - initialize the trigonometric weight and factor tables or compute the Fast Fourier transform (forward or inverse) of a double complex sequence.
zfftz2 - zfftz2 - initialize the trigonometric weight and factor tables or compute the two-dimensional Fast Fourier Transform (forward or inverse) of a two-dimensional double complex array.
zfftz3 - zfftz3 - initialize the trigonometric weight and factor tables or compute the three-dimensional Fast Fourier Transform (forward or inverse) of a three-dimensional double complex array.
zfftzm - zfftzm - initialize the trigonometric weight and factor tables or compute the one-dimensional Fast Fourier Transform (forward or inverse) of a set of data sequences stored in a two-dimensional double complex array.

> zgbbrd - zgbbrd - reduce a complex general m-by-n band matrix A to real upper bidiagonal form B by a unitary transformation
zgbcon - zgbcon - estimate the reciprocal of the condition number of a complex general band matrix A, in either the 1-norm or the infinity-norm,
zgbequ - zgbequ - compute row and column scalings intended to equilibrate an M-by-N band matrix A and reduce its condition number
 beta* y , or y $:=\operatorname{alpha}{ }^{*} \operatorname{conjg}\left(\mathrm{~A}^{\prime}\right)^{*} \mathrm{x}+$ beta* $^{\mathrm{y}}$
zgbrfs - zgbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is banded, and provides error bounds and backward error estimates for the solution
zgbsv - zgbsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is a band matrix of order N with KL subdiagonals and KU superdiagonals, and X and B are N -by-NRHS matrices
zgbsvx - zgbsvx - use the LU factorization to compute the solution to a complex system of linear equations A * X $=\mathrm{B}, \mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B}$,
zgbtf2 - zgbtf2 - compute an LU factorization of a complex m-by-n band matrix A using partial pivoting with row interchanges
zgbtrf - zgbtrf - compute an LU factorization of a complex m-by-n band matrix A using partial pivoting with row interchanges
zgbtrs - zgbtrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*}{ }^{*} \mathrm{H}^{*} \mathrm{X}=\mathrm{B}$ with a general band matrix A using the LU factorization computed by CGBTRF
zgebak - zgebak - form the right or left eigenvectors of a complex general matrix by backward transformation on the computed eigenvectors of the balanced matrix output by CGEBAL
zgebal - zgebal - balance a general complex matrix A
zgebrd - zgebrd - reduce a general complex M-by-N matrix A to upper or lower bidiagonal form B by a unitary transformation
zgecon - zgecon - estimate the reciprocal of the condition number of a general complex matrix A , in either the 1norm or the infinity-norm, using the LU factorization computed by CGETRF
zgeequ - zgeequ - compute row and column scalings intended to equilibrate an M-by-N matrix A and reduce its condition number
zgees - zgees - compute for an N -by-N complex nonsymmetric matrix A , the eigenvalues, the Schur form T, and, optionally, the matrix of Schur vectors Z
zgeesx - zgeesx - compute for an N-by-N complex nonsymmetric matrix A, the eigenvalues, the Schur form T, and, optionally, the matrix of Schur vectors Z
zgeev - zgeev - compute for an N -by-N complex nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors
zgeevx - zgeevx - compute for an N-by-N complex nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors
zgegs - zgegs - routine is deprecated and has been replaced by routine CGGES
zgegv - zgegv - routine is deprecated and has been replaced by routine CGGEV
zgehrd - zgehrd - reduce a complex general matrix A to upper Hessenberg form H by a unitary similarity transformation
zgelqf - zgelqf - compute an $L Q$ factorization of a complex M-by-N matrix A
zgels - zgels - solve overdetermined or underdetermined complex linear systems involving an M-by-N matrix A, or its conjugate-transpose, using a QR or LQ factorization of A
zgelsd - zgelsd - compute the minimum-norm solution to a real linear least squares problem
zgelss - zgelss - compute the minimum norm solution to a complex linear least squares problem
zgelsx - zgelsx - routine is deprecated and has been replaced by routine CGELSY
zgelsy - zgelsy - compute the minimum-norm solution to a complex linear least squares problem
zgemm - zgemm - perform one of the matrix-matrix operations C :=alpha*op(A)*op(B)+beta*C
zgemv - zgemv - perform one of the matrix-vector operations y $:=$ alpha* $A^{*} x+$ beta* $y$, or $y:=a l p h a * A^{\prime} * x+$ beta*y, or y $:=$ alpha*conjg( $\left.A^{\prime}\right)^{*} \mathrm{x}+$ beta*y $^{\text {y }}$
zgeqlf - zgeqlf - compute a QL factorization of a complex M-by-N matrix A
zgeqp3 - zgeqp3 - compute a QR factorization with column pivoting of a matrix A
zgeqpf - zgeqpf - routine is deprecated and has been replaced by routine CGEQP3
zgeqrf - zgeqrf - compute a QR factorization of a complex M-by-N matrix A
zgerc - zgerc - perform the rank 1 operation A := alpha*x*conjg( $\left.\mathrm{y}^{\prime}\right)+\mathrm{A}$
zgerfs - zgerfs - improve the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution
zgerqf - zgerqf - compute an RQ factorization of a complex M-by-N matrix A
zgeru - zgeru - perform the rank 1 operation $\mathrm{A}:=$ alpha* $\mathrm{x}^{*} \mathrm{y}^{\prime}+\mathrm{A}$
zgesdd - zgesdd - compute the singular value decomposition (SVD) of a complex M-by-N matrix A, optionally computing the left and/or right singular vectors, by using divide-and-conquer method
zgesv - zgesv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zgesvd - zgesvd - compute the singular value decomposition (SVD) of a complex M-by-N matrix A, optionally computing the left and/or right singular vectors
zgesvx - zgesvx - use the LU factorization to compute the solution to a complex system of linear equations A*X $=\mathrm{B}$,
zgetf2 - zgetf2 - compute an LU factorization of a general m-by-n matrix A using partial pivoting with row interchanges
zgetrf - zgetrf - compute an LU factorization of a general M-by-N matrix A using partial pivoting with row interchanges
zgetri - zgetri - compute the inverse of a matrix using the LU factorization computed by CGETRF
zgetrs - zgetrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B}$ with a general $\mathrm{N}-$ by-N matrix A using the LU factorization computed by CGETRF
zggbak - zggbak - form the right or left eigenvectors of a complex generalized eigenvalue problem $\mathrm{A}^{*} \mathrm{x}=$ lambda*B*x, by backward transformation on the computed eigenvectors of the balanced pair of matrices output by CGGBAL
zggbal - zggbal - balance a pair of general complex matrices (A,B)
zgges - zgges - compute for a pair of $N$-by- $N$ complex nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ), the generalized eigenvalues, the generalized complex Schur form (S, T), and optionally left and/or right Schur vectors (VSL and VSR)

Zggesx - zggesx - compute for a pair of $N$-by-N complex nonsymmetric matrices (A,B), the generalized eigenvalues, the complex Schur form (S,T),
zggev - zggev - compute for a pair of $N$-by-N complex nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors
zggevx - zggevx - compute for a pair of $N$-by-N complex nonsymmetric matrices ( $\mathrm{A}, \mathrm{B}$ ) the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors
zggglm - zggglm - solve a general Gauss-Markov linear model (GLM) problem
zgghrd - zgghrd - reduce a pair of complex matrices (A,B) to generalized upper Hessenberg form using unitary transformations, where A is a general matrix and B is upper triangular
zgglse - zgglse - solve the linear equality-constrained least squares (LSE) problem
zggqrf - zggqrf - compute a generalized QR factorization of an N -by-M matrix A and an N -by- P matrix B .
zggrqf - zggrqf - compute a generalized RQ factorization of an M-by-N matrix A and a P-by-N matrix B
zggsvd - zggsvd - compute the generalized singular value decomposition (GSVD) of an M-by-N complex matrix A and P-by-N complex matrix B
zggsvp - zggsvp - compute unitary matrices $\mathrm{U}, \mathrm{V}$ and Q such that $\mathrm{N}-\mathrm{K}-\mathrm{L} K \mathrm{~L} \mathrm{U}^{\prime} * \mathrm{~A} * \mathrm{Q}=\mathrm{K}(0 \mathrm{~A} 12 \mathrm{~A} 13)$ if $\mathrm{M}-\mathrm{K}-$ $\mathrm{L}>=0$
zgssco - zgssco - General sparse solver condition number estimate.
zgssda - zgssda - Deallocate working storage for the general sparse solver.
zgssfa - zgssfa - General sparse solver numeric factorization.
zgssfs - zgssfs - General sparse solver one call interface.

Zgssin - zgssin - Initialize the general sparse solver.
zgssor - zgssor - General sparse solver ordering and symbolic factorization.
zgssps - zgssps - Print general sparse solver statics.
zgssrp - zgssrp - Return permutation used by the general sparse solver.
zgsssl-zgsssl-Solve routine for the general sparse solver.
zgssuo - zgssuo - User supplied permutation for ordering used in the general sparse solver.
zgtcon - zgtcon - estimate the reciprocal of the condition number of a complex tridiagonal matrix A using the LU factorization as computed by CGTTRF
zgthr - zgthr - Gathers specified elements from y into x .
zgthrz - zgthrz - Gather and zero.
zgtrfs - zgtrfs - improve the computed solution to a system of linear equations when the coefficient matrix is tridiagonal, and provides error bounds and backward error estimates for the solution
zgtsv - zgtsv - solve the equation $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zgtsvx - zgtsvx - use the LU factorization to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}$ $=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*}{ }^{*} \mathrm{H} * \mathrm{X}=\mathrm{B}$,
zgttrf - zgttrf - compute an LU factorization of a complex tridiagonal matrix A using elimination with partial pivoting and row interchanges
$\underline{\text { zgttrs }}-\operatorname{zgttrs}-$ solve one of the systems of equations $A * X=B, A * * T * X=B$, or $A * * H * X=B$,
zhbev - zhbev - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix A
zhbevd - zhbevd - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix A
zhbevx - zhbevx - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix A
zhbgst - zhbgst - reduce a complex Hermitian-definite banded generalized eigenproblem $A * x=l a m b d a * B * x$ to standard form $\mathrm{C} * \mathrm{y}=$ lambda*y,
zhbgv - zhbgv - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitiandefinite banded eigenproblem, of the form $A * x=(l a m b d a) * B * x$
zhbgvd - zhbgvd - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}$
zhbgvx - zhbgvx - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $\mathrm{A}^{*} \mathrm{X}=($ lambda $){ }^{*} \mathrm{~B}^{*} \mathrm{x}$
zhbmv - zhbmv - perform the matrix-vector operation $\mathrm{y}:=\operatorname{alpha*} \mathrm{A}^{*} \mathrm{x}+$ beta*y
zhbtrd - zhbtrd - reduce a complex Hermitian band matrix A to real symmetric tridiagonal form T by a unitary similarity transformation
zhecon - zhecon - estimate the reciprocal of the condition number of a complex Hermitian matrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHETRF
zheev - zheev - compute all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A
zheevd - zheevd - compute all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A
zheevr - zheevr - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian tridiagonal matrix T
zheevx - zheevx - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A
zhegs2 - zhegs2 - reduce a complex Hermitian-definite generalized eigenproblem to standard form
zhegst - zhegst - reduce a complex Hermitian-definite generalized eigenproblem to standard form
zhegv - zhegv - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitiandefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
zhegvd - zhegvd - compute all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
zhegvx - zhegvx - compute selected eigenvalues, and optionally, eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{~B}^{*} \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B}^{*} \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
zhemm - zhemm - perform one of the matrix-matrix operations $\mathrm{C}:=$ alpha* $\mathrm{A} * \mathrm{~B}+$ beta* C or $\mathrm{C}:=$ alpha* $\mathrm{B}^{*} \mathrm{~A}+$ beta*C
zhemv - zhemv - perform the matrix-vector operation $y:=a l p h a * A * x+$ beta*y

zher2 - zher2 - perform the hermitian rank 2 operation $A:=\operatorname{alpha}{ }^{*} x^{*} \operatorname{conjg}\left(y^{\prime}\right)+\operatorname{conjg}(\operatorname{alpha})^{*} y^{*} \operatorname{conjg}\left(x^{\prime}\right)+A$
zher2k - zher2k - perform one of the Hermitian rank $2 k$ operations $C:=a l p h *^{*} A^{*} \operatorname{conjg}\left(B^{\prime}\right)+\operatorname{conjg}($ alpha $)$ ${ }^{*} \mathrm{~B}^{*} \operatorname{conjg}\left(\mathrm{~A}^{\prime}\right)+$ beta* $^{\mathrm{C}}$ or $\mathrm{C}:=\operatorname{alpha*} \operatorname{conjg}\left(\mathrm{A}^{\prime}\right) * \mathrm{~B}+\operatorname{conjg}(\operatorname{alpha})^{*} \operatorname{conjg}\left(\mathrm{~B}^{\prime}\right)^{*} \mathrm{~A}+\operatorname{beta}^{*} \mathrm{C}$
zherfs - zherfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite, and provides error bounds and backward error estimates for the solution
zherk - zherk - perform one of the Hermitian rank k operations $C:=\operatorname{alpha} A^{*} \operatorname{conjg}\left(\mathrm{~A}^{\prime}\right)+$ beta* C or $\mathrm{C}:=$ alpha*conjg ( $\mathrm{A}^{\prime}$ )*A + beta*C

zhesvx - zhesvx - use the diagonal pivoting factorization to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zhetf2 - zhetf2 - compute the factorization of a complex Hermitian matrix A using the Bunch-Kaufman diagonal pivoting method
zhetrd - zhetrd - reduce a complex Hermitian matrix A to real symmetric tridiagonal form T by a unitary similarity transformation
zhetrf - zhetrf - compute the factorization of a complex Hermitian matrix A using the Bunch-Kaufman diagonal pivoting method
zhetri - zhetri - compute the inverse of a complex Hermitian indefinite matrix A using the factorization $\mathrm{A}=$ $\mathrm{U} * \mathrm{D} * \mathrm{U}^{*} * \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L}^{*} * \mathrm{H}$ computed by CHETRF
zhetrs - zhetrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ with a complex Hermitian matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{H}$ computed by CHETRF
zhgeqz - zhgeqz - implement a single-shift version of the QZ method for finding the generalized eigenvalues w(i) $=A L P H A(i) / B E T A(i)$ of the equation $\operatorname{det}(A-w(i) B)=0$ If $\mathrm{JOB}=$ 'S', then the pair (A,B) is simultaneously reduced to Schur form (i.e., A and B are both upper triangular) by applying one unitary tranformation (usually called Q) on the left and another (usually called Z) on the right
zhpcon - zhpcon - estimate the reciprocal of the condition number of a complex Hermitian packed matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHPTRF
zhpev - zhpev - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix in packed storage
zhpevd - zhpevd - compute all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A in packed storage
zhpevx - zhpevx - compute selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix A in packed storage
zhpgst - zhpgst - reduce a complex Hermitian-definite generalized eigenproblem to standard form, using packed storage
zhpgv - zhpgv - compute all the eigenvalues and, optionally, the eigenvectors of a complex generalized Hermitiandefinite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda})^{*} \mathrm{x}$
zhpgvd - zhpgvd - compute all the eigenvalues and, optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
zhpgvx - zhpgvx - compute selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form $\mathrm{A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{Bx}=(\operatorname{lambda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A}^{*} \mathrm{x}=(\operatorname{lambda}) * \mathrm{x}$
zhpmv - zhpmv - perform the matrix-vector operation $\mathrm{y}:=\operatorname{alpha*} \mathrm{A}^{*} \mathrm{x}+$ beta*y $^{\mathrm{y}}$
zhpr - zhpr - perform the hermitian rank 1 operation $\mathrm{A}:=\operatorname{alpha}{ }^{*} \mathrm{x}^{*} \operatorname{conjg}\left(\mathrm{x}^{\prime}\right)+\mathrm{A}$
zhpr2 - zhpr2 - perform the Hermitian rank 2 operation A :=alpha* $x^{*} \operatorname{conjg}\left(y^{\prime}\right)+\operatorname{conjg}(\text { alpha })^{*} y^{*} \operatorname{conjg}\left(x^{\prime}\right)+$ A
zhprfs - zhprfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite and packed, and provides error bounds and backward error estimates for the solution

zhpsvx - zhpsvx - use the diagonal pivoting factorization $A=U * D * U * * H$ or $A=L * D * L^{*} H$ to compute the solution to a complex system of linear equations $A * X=B$, where $A$ is an $N$-by-N Hermitian matrix stored in packed format and X and B are N-by-NRHS matrices
zhptrd - zhptrd - reduce a complex Hermitian matrix A stored in packed form to real symmetric tridiagonal form T by a unitary similarity transformation
zhptrf - zhptrf - compute the factorization of a complex Hermitian packed matrix A using the Bunch-Kaufman diagonal pivoting method
zhptri - zhptri - compute the inverse of a complex Hermitian indefinite matrix A in packed storage using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CHPTRF
zhptrs - zhptrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ with a complex Hermitian matrix A stored in packed format using the factorization $A=U^{*} D^{*} U^{* *} H$ or $A=L^{*} D^{*} L^{* *} H$ computed by CHPTRF
zhsein - zhsein - use inverse iteration to find specified right and/or left eigenvectors of a complex upper Hessenberg matrix H
zhseqr - zhseqr - compute the eigenvalues of a complex upper Hessenberg matrix H , and, optionally, the matrices T and Z from the Schur decomposition $\mathrm{H}=\mathrm{Z} \mathrm{T} \mathrm{Z}{ }^{* *} \mathrm{H}$, where T is an upper triangular matrix (the Schur form), and Z is the unitary matrix of Schur vectors
zjadmm - zjadmm - Jagged diagonal matrix-matrix multiply (modified Ellpack)
zjadrp - zjadrp - right permutation of a jagged diagonal matrix
zjadsm - zjadsm - Jagged-diagonal format triangular solve
zlarz - zlarz - applie a complex elementary reflector H to a complex M-by-N matrix C, from either the left or the right
zlarzb - zlarzb - applie a complex block reflector H or its transpose $\mathrm{H}^{* *} \mathrm{H}$ to a complex distributed M-by-N C from the left or the right
zlarzt - zlarzt - form the triangular factor T of a complex block reflector H of order $>\mathrm{n}$, which is defined as a product of $k$ elementary reflectors
zlatzm - zlatzm - routine is deprecated and has been replaced by routine CUNMRZ
zpbcon - zpbcon - estimate the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite band matrix using the Cholesky factorization $A=U^{*} * H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPBTRF
zpbequ - zpbequ - compute row and column scalings intended to equilibrate a Hermitian positive definite band matrix A and reduce its condition number (with respect to the two-norm)
zpbrfs - zpbrfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite and banded, and provides error bounds and backward error estimates for the solution
zpbstf - zpbstf - compute a split Cholesky factorization of a complex Hermitian positive definite band matrix A
zpbsv - zpbsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zpbsvx - zpbsvx - use the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zpbtf2 - zpbtf2 - compute the Cholesky factorization of a complex Hermitian positive definite band matrix A
zpbtrf - zpbtrf - compute the Cholesky factorization of a complex Hermitian positive definite band matrix A
zpbtrs - zpbtrs - solve a system of linear equations $A * X=B$ with a Hermitian positive definite band matrix $A$ using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CPBTRF
zpocon - zpocon - estimate the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite matrix using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} \mathrm{H}$ computed by CPOTRF
zpoequ - zpoequ - compute row and column scalings intended to equilibrate a Hermitian positive definite matrix A and reduce its condition number (with respect to the two-norm)
zporfs - zporfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite,
zposv - zposv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zposvx - zposvx - use the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zpotf2 - zpotf2 - compute the Cholesky factorization of a complex Hermitian positive definite matrix A
zpotrf - zpotrf - compute the Cholesky factorization of a complex Hermitian positive definite matrix A
zpotri - zpotri - compute the inverse of a complex Hermitian positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CPOTRF
zpotrs - zpotrs - solve a system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ with a Hermitian positive definite matrix A using the Cholesky factorization $A=U^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CPOTRF
zppcon - zppcon - estimate the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite packed matrix using the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPPTRF
zppequ - zppequ - compute row and column scalings intended to equilibrate a Hermitian positive definite matrix A in packed storage and reduce its condition number (with respect to the two-norm)
zpprfs - zpprfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite and packed, and provides error bounds and backward error estimates for the solution
zppsv - zppsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zppsvx - zppsvx - use the Cholesky factorization $A=U^{* *} H^{*} U$ or $A=L^{*} L^{* *} \mathrm{H}$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zpptrf - zpptrf - compute the Cholesky factorization of a complex Hermitian positive definite matrix A stored in packed format
zpptri - zpptri - compute the inverse of a complex Hermitian positive definite matrix A using the Cholesky factorization $\mathrm{A}=\mathrm{U}^{* *} \mathrm{H}^{*} \mathrm{U}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{~L}^{* *} \mathrm{H}$ computed by CPPTRF
zpptrs - zpptrs - solve a system of linear equations $A * X=B$ with a Hermitian positive definite matrix A in packed storage using the Cholesky factorization $A=U^{*} * H^{*} U$ or $A=L^{*} L^{* *} H$ computed by CPPTRF
zptcon - zptcon - compute the reciprocal of the condition number (in the 1-norm) of a complex Hermitian positive definite tridiagonal matrix using the factorization $A=L * D * L * * H$ or $A=U^{* *} H^{*} D^{*} U$ computed by CPTTRF
zpteqr - zpteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric positive definite tridiagonal matrix by first factoring the matrix using SPTTRF and then calling CBDSQR to compute the singular values of the bidiagonal factor
zptrfs - zptrfs - improve the computed solution to a system of linear equations when the coefficient matrix is Hermitian positive definite and tridiagonal, and provides error bounds and backward error estimates for the solution
zptsv - zptsv - compute the solution to a complex system of linear equations $A * X=B$, where $A$ is an $N-b y-N$ Hermitian positive definite tridiagonal matrix, and X and B are N -by-NRHS matrices.
zptsvx - zptsvx - use the factorization $A=L^{*} D^{*} L^{* *} H$ to compute the solution to a complex system of linear equations $A * X=B$, where $A$ is an $N$-by-N Hermitian positive definite tridiagonal matrix and $X$ and $B$ are $N$-byNRHS matrices
zpttrf - zpttrf - compute the $L^{*} D^{*} L^{\prime}$ factorization of a complex Hermitian positive definite tridiagonal matrix A
zpttrs - zpttrs - solve a tridiagonal system of the form $A * X=B$ using the factorization $A=U^{*} * D * U$ or $A=$ L*D*L' computed by CPTTRF
zptts2 - zptts2 - solve a tridiagonal system of the form $A * X=B$ using the factorization $A=U^{\prime} * D^{*} U$ or $A=$ L*D*L' computed by CPTTRF
zrot - zrot - apply a plane rotation, where the $\cos (\mathrm{C})$ is real and the $\sin (\mathrm{S})$ is complex, and the vectors X and Y are complex
zrotg - zrotg - Construct a Given's plane rotation
zscal - zscal - Compute y $:=$ alpha * y
zsctr - zsctr - Scatters elements from $x$ into $y$.
zskymm - zskymm - Skyline format matrix-matrix multiply
zskysm - zskysm - Skyline format triangular solve
zspcon - zspcon - estimate the reciprocal of the condition number (in the 1-norm) of a complex symmetric packed matrix A using the factorization $\mathrm{A}=\mathrm{U}^{*} \mathrm{D}^{*} \mathrm{U}^{* *} \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{* *} \mathrm{~T}$ computed by CSPTRF
zsprfs - zsprfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite and packed, and provides error bounds and backward error estimates for the solution
zspsv - zspsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zspsvx - zspsvx - use the diagonal pivoting factorization $A=U^{*} D^{*} U^{*} * T$ or $A=L^{*} D^{*} L^{* *} T$ to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$, where A is an N -by-N symmetric matrix stored in packed format and X and B are N-by-NRHS matrices
zsptrf - zsptrf - compute the factorization of a complex symmetric matrix A stored in packed format using the Bunch-Kaufman diagonal pivoting method
zsptri - zsptri - compute the inverse of a complex symmetric indefinite matrix A in packed storage using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L}^{*} \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSPTRF
zsptrs - zsptrs - solve a system of linear equations $A * X=B$ with a complex symmetric matrix A stored in packed format using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L} * * \mathrm{~T}$ computed by CSPTRF
zstedc - zstedc - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method
zstegr - zstegr - Compute T-sigma_i $=L_{-} \mathrm{i} \mathrm{D}_{-} \mathrm{i} \mathrm{L}_{-} \mathrm{i}^{\wedge} T$, such that $\mathrm{L}_{-} \mathrm{i} \mathrm{D}_{-} \mathrm{i} \mathrm{L}_{-} \mathrm{i}^{\wedge} \mathrm{T}$ is a relatively robust representation
zstein - zstein - compute the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, using inverse iteration
zsteqr - zsteqr - compute all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit QL or QR method
$\underline{\text { zstsv }}$ - zstsv - compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$ where A is a Hermitian tridiagonal matrix
zsttrf - zsttrf - compute the factorization of a complex Hermitian tridiagonal matrix A
$\underline{\text { zsttrs }}$ - zsttrs - computes the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$
zswap - zswap - Exchange vectors x and y .
zsycon - zsycon - estimate the reciprocal of the condition number (in the 1-norm) of a complex symmetric matrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSYTRF
$\underline{\text { zsymm }}-$ zsymm - perform one of the matrix-matrix operations $\mathrm{C}:=\operatorname{alpha*} \mathrm{A} * \mathrm{~B}+$ beta* $^{\mathrm{C}}$ or $\mathrm{C}:=$ alpha* $\mathrm{B} * \mathrm{~A}+$ beta*C
zsyr2k-zsyr2k - perform one of the symmetric rank $2 k$ operations $C:=$ alpha* $A^{*} B^{\prime}+$ alpha* $B^{*} A^{\prime}+$ beta* $C$ or $C$ : $=$ alpha* ${ }^{\prime} * B+$ alpha $* B^{\prime} * \mathrm{~A}+$ beta $^{*} \mathrm{C}$
zsyrfs - zsyrfs - improve the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution
zsyrk - zsyrk - perform one of the symmetric rank k operations C :=alpha*A*A' + beta*C or C :=alpha*A'*A + beta*C

zsysvx - zsysvx - use the diagonal pivoting factorization to compute the solution to a complex system of linear equations $\mathrm{A} * \mathrm{X}=\mathrm{B}$,
zsytf2 - zsytf2 - compute the factorization of a complex symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
zsytrf - zsytrf - compute the factorization of a complex symmetric matrix A using the Bunch-Kaufman diagonal pivoting method
zsytri - zsytri - compute the inverse of a complex symmetric indefinite matrix A using the factorization $\mathrm{A}=$ $\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D}^{*} \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSYTRF
zsytrs - zsytrs - solve a system of linear equations $A * X=B$ with a complex symmetric matrix $A$ using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D}^{*} \mathrm{U}^{*} * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L}^{*} * \mathrm{~T}$ computed by CSYTRF
ztbcon - ztbcon - estimate the reciprocal of the condition number of a triangular band matrix A , in either the 1norm or the infinity-norm

ztbrfs - ztbrfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular band coefficient matrix
$\underline{\text { ztbsv }}$ - ztbsv - solve one of the systems of equations $A^{*} x=b$, or $A^{\prime} * x=b$, or $\operatorname{conjg}\left(A^{\prime}\right)^{*} x=b$
ztbtrs - ztbtrs - solve a triangular system of the form $\mathrm{A}^{*} \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*} * \mathrm{H} * \mathrm{X}=\mathrm{B}$,
ztgevc - ztgevc - compute some or all of the right and/or left generalized eigenvectors of a pair of complex upper triangular matrices (A,B)

Ztgexc - ztgexc - reorder the generalized Schur decomposition of a complex matrix pair (A,B), using an unitary equivalence transformation $(A, B):=Q *(A, B) * Z$, so that the diagonal block of $(A, B)$ with row index IFST is moved to row ILST
ztgsen - ztgsen - reorder the generalized Schur decomposition of a complex matrix pair (A, B) (in terms of an unitary equivalence trans- formation $\left.\mathrm{Q}^{\prime *}(\mathrm{~A}, \mathrm{~B}) * \mathrm{Z}\right)$, so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the pair $(\mathrm{A}, \mathrm{B})$
ztgsja - ztgsja - compute the generalized singular value decomposition (GSVD) of two complex upper triangular (or trapezoidal) matrices A and B
ztgsna - ztgsna - estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (A, B)

Ztgsyl - ztgsyl - solve the generalized Sylvester equation
ztpcon - ztpcon - estimate the reciprocal of the condition number of a packed triangular matrix A , in either the 1norm or the infinity-norm
ztpmv - ztpmv - perform one of the matrix-vector operations $\mathrm{x}:=\mathrm{A}^{*} \mathrm{x}$, or $\mathrm{x}:=\mathrm{A}^{\prime}{ }^{*} \mathrm{x}$, or $\mathrm{x}:=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right)^{*} \mathrm{x}$
ztprfs - ztprfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular packed coefficient matrix
$\underline{\text { ztpsv }}-\mathrm{ztpsv}$ - solve one of the systems of equations $\mathrm{A}^{*} \mathrm{x}=\mathrm{b}$, or $\mathrm{A}^{\prime} * \mathrm{x}=\mathrm{b}$, or $\operatorname{conjg}\left(\mathrm{A}^{\prime}\right)^{*} \mathrm{x}=\mathrm{b}$
ztptri - ztptri - compute the inverse of a complex upper or lower triangular matrix A stored in packed format
ztptrs - ztptrs - solve a triangular system of the form $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*} * \mathrm{H} * \mathrm{X}=\mathrm{B}$,
ztrans - ztrans - transpose and scale source matrix
$\underline{z t r c o n}$ - ztrcon - estimate the reciprocal of the condition number of a triangular matrix A , in either the 1-norm or the infinity-norm

ztrexc - ztrexc - reorder the Schur factorization of a complex matrix $\mathrm{A}=\mathrm{Q}^{*} \mathrm{~T}^{*} \mathrm{Q}^{* *} \mathrm{H}$, so that the diagonal element of T with row index IFST is moved to row ILST
ztrmm - ztrmm - perform one of the matrix-matrix operations B := alpha*op(A)*B, or B := alpha*B*op(A) where alpha is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and op $(A)$ is one of op $(A)=A$ or op $(A)=A^{\prime}$ or op $(A)=\operatorname{conjg}\left(A^{\prime}\right)$
$\underline{\text { ztrmv }}-\mathrm{ztrmv}$ - perform one of the matrix-vector operations $\mathrm{x}:=\mathrm{A}^{*} \mathrm{x}$, or $\mathrm{x}:=\mathrm{A}^{\prime}{ }^{*} \mathrm{x}$, or $\mathrm{x}:=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right)^{*} \mathrm{x}$
ztrrfs - ztrrfs - provide error bounds and backward error estimates for the solution to a system of linear equations with a triangular coefficient matrix
$\underline{\text { ztrsen }}$ - ztrsen - reorder the Schur factorization of a complex matrix $A=Q^{*} T^{*} Q^{* *} H$, so that a selected cluster of eigenvalues appears in the leading positions on the diagonal of the upper triangular matrix T , and the leading
columns of Q form an orthonormal basis of the corresponding right invariant subspace

ztrsna - ztrsna - estimate reciprocal condition numbers for specified eigenvalues and/or right eigenvectors of a complex upper triangular matrix T (or of any matrix $\mathrm{Q}^{*} \mathrm{~T}^{*} \mathrm{Q}^{* *} \mathrm{H}$ with Q unitary)
$\underline{\text { ztrsv }}$ - ztrsv - solve one of the systems of equations $A^{*} x=b$, or $A^{\prime} * x=b$, or conjg $\left(A^{\prime}\right)^{*} x=b$
ztrsyl - ztrsyl - solve the complex Sylvester matrix equation
ztrti2 - ztrti2 - compute the inverse of a complex upper or lower triangular matrix
ztrtri - ztrtri - compute the inverse of a complex upper or lower triangular matrix A
$\underline{\text { ztrtrs }-z t r t r s ~-~ s o l v e ~ a ~ t r i a n g u l a r ~ s y s t e m ~ o f ~ t h e ~ f o r m ~} \mathrm{~A} * \mathrm{X}=\mathrm{B}, \mathrm{A}^{*} * \mathrm{~T} * \mathrm{X}=\mathrm{B}$, or $\mathrm{A}^{*} * \mathrm{H} * \mathrm{X}=\mathrm{B}$,
ztzrqf - ztzrqf - routine is deprecated and has been replaced by routine CTZRZF
ztzrzf - ztzrzf - reduce the M-by-N ( $\mathrm{M}<=\mathrm{N}$ ) complex upper trapezoidal matrix A to upper triangular form by means of unitary transformations
zung21-zung21-generate an m by $n$ complex matrix Q with orthonormal columns,
zung2r - zung2r - generate an $m$ by $n$ complex matrix $Q$ with orthonormal columns,
zungbr - zungbr - generate one of the complex unitary matrices Q or $\mathrm{P}^{* *} \mathrm{H}$ determined by CGEBRD when reducing a complex matrix A to bidiagonal form
zunghr - zunghr - generate a complex unitary matrix Q which is defined as the product of IHI-ILO elementary reflectors of order N , as returned by CGEHRD
zung12 - zung12 - generate an m-by-n complex matrix Q with orthonormal rows,
zunglq - zunglq - generate an M-by-N complex matrix Q with orthonormal rows,
zungql - zungql - generate an M-by-N complex matrix Q with orthonormal columns,
zungqr - zungqr - generate an M-by-N complex matrix Q with orthonormal columns,
zungr2 - zungr2 - generate an $m$ by $n$ complex matrix Q with orthonormal rows,
zungrq - zungrq - generate an M-by-N complex matrix Q with orthonormal rows,
zungtr - zungtr - generate a complex unitary matrix $Q$ which is defined as the product of $n-1$ elementary reflectors of order N , as returned by CHETRD
zunmbr - zunmbr - VECT = 'Q', CUNMBR overwrites the general complex M-by-N matrix C with SIDE = 'L' SIDE $=$ 'R' TRANS $=$ 'N'

zunml2 - zunml2 - overwrite the general complex m-by-n matrix C with Q * C if $\operatorname{SIDE}=$ ' L ' and TRANS = ' N ', or $\mathrm{Q}^{\prime *} \mathrm{C}$ if SIDE $=$ 'L' and TRANS $=$ ' C ', or $\mathrm{C} * \mathrm{Q}$ if SIDE $=$ ' R ' and TRANS $=$ ' N ', or $\mathrm{C} * \mathrm{Q}$ ' if SIDE $=$ ' R ' and TRANS = 'C',

zunmql - zunmql - overwrite the general complex M-by-N matrix C with SIDE $=$ 'L' SIDE $=$ ' R ' TRANS $=$ ' $\mathrm{N}^{\prime}$

zunmr2 - zunmr2- overwrite the general complex m-by-n matrix C with $\mathrm{Q} * \mathrm{C}$ if $\operatorname{SIDE}=$ ' L ' and TRANS $=$ ' N ', or $\mathrm{Q}^{*} \mathrm{C}$ if SIDE = 'L' and TRANS $=$ ' C ', or $\mathrm{C} * \mathrm{Q}$ if SIDE $=$ 'R' and TRANS $=$ ' N ', or $\mathrm{C} * \mathrm{Q}$ ' if SIDE $=$ 'R' and TRANS = 'C',

zupgtr - zupgtr - generate a complex unitary matrix Q which is defined as the product of $\mathrm{n}-1$ elementary reflectors $\mathrm{H}(\mathrm{i})$ of order n , as returned by CHPTRD using packed storage
$\underline{\text { zupmtr }}$ - zupmtr - overwrite the general complex M-by-N matrix C with SIDE = 'L' SIDE = 'R'TRANS = ' N '
zvbrmm - zvbrmm - variable block sparse row format matrix-matrix multiply
zvbrsm - zvbrsm - variable block sparse row format triangular solve

Zvmul - zvmul - compute the scaled product of complex vectors

## NAME

available_threads - retums inform ation about cument thread usage

## SYNOPSIS

SUBROUTINEAVA ILABLE_THREADS $\mathbb{N} T O T A L, N U S \mathbb{N} G)$
$\mathbb{N}$ TEGERNTOTAL,NUSNG

SU BROUTINEAVA ILABLE_THREADS_64 $\mathbb{N} T O T A L, N U S \mathbb{N} G)$
$\mathbb{N} T E G E R * 8 N T O T A L, N U S \mathbb{N} G$

F95 INTERFACE
SU BROUTINEAVAIABLE_THREADS $\mathbb{N} T O T A L, N U S \mathbb{N} G)$
$\mathbb{N} T E G E R:: N T O T A L, N U S \mathbb{N} G$

SU BROUTINEAVA $\left.\mathbb{L} A B L E \_T H R E A D S \_64 \mathbb{N} T O T A L, N U S \mathbb{N} G\right)$
$\mathbb{N}$ TEGER (8) ::NTOTAL,NUSNG

## C INTERFACE

\#include < sunperfh>
void available_threads(int *ntotal, int *nusing);
void available_threads_64 (long *ntotal, long *nusing);

## PURPOSE

available_threads threads retums N TO TA L , w hich is the total num ber of C PU s available to the job (generally the num ber of CPU s presently on-line in the partition), and N U S $\mathbb{N}$ G , which is the sum of the currentU se num bers for all threads specified in USE_THREADS. IfNTOTAL <NUSING then the system is potentially overcom m itted.

## ARGUMENTS

NTOTAL (output)
Totalnum ber of CPU s available.
NUSING (output)
Sum of currentU se num bers forall threads specified in USE_THREADS.

\mathbb{NTEGER \mathbb{NCX}}\mathbf{N}=\mp@code{N}
SUBROUT\mathbb{NE BLAS_DPERMUTE_64 N,P,\mathbb{NCP,X,INCX)}}\mathbf{N}=1
INTEGER*8 N
\mathbb{NTEGER*8 P (*)}
INTEGER*8 \mathbb{NCP}
REAL*8 X (*)
\mathbb{NTEGER*8 }\mathbb{N}CX
```

F95 INTERFACE

```
    SUBROUT\mathbb{NE PERMUTE (X,P)}
    USE SUNPERF
    SUBROUT\mathbb{NE PERMUTE_64 (X,P)}
    USE SUNPERF
```

## ARGUMENTS

N (input) $\mathbb{N}$ TEGER, the num ber ofelem ents to be perm uted in X If $N<=1$, the subroutine retums w ithout trying to perm ute X .

P (input) $\mathbb{N}$ TEGER $(\mathbb{N}-1) \star \mathbb{N} C P \mid+1$ ), the perm utation (index) vectordefined follows the same conventions as that for DTYPE SORTV. It records the details of the interchanges of the elem ents of $X$ during sorting. That is $X=P * X$. In current im plem entation, $P$ contains the index of sorted $X$.
$\mathbb{N} C P$ (input) $\mathbb{N} T E G E R$, increm ent for $P$
$\mathbb{N} C P$ m ustnotbe zero. $\mathbb{N}$ CP could be negative. If
$\mathbb{N} C P<0$, the perm utation is applied in the oppo-
site direction. That is
If $\mathbb{N} C P>0$, if $\mathbb{N} C X>0$, sorted $X((i-1) * \mathbb{N} C X+1)=X(P(i-1) * \mathbb{N} C P+1))$, if $\mathbb{N} C X<0$, sorted $X(\mathbb{N}-i) \star \mathbb{N} C X+1)=X(P((i-1) \star \mathbb{N} C P+1))$;
If $\mathbb{N} C P<0$, if $\mathbb{N} C X>0$, sorted $X((i-1) * \mathbb{N} C X+1)=X(P(\mathbb{N}-i) * \mathbb{N} C P \mid+1))$. if $\mathbb{N} C X<0$, sorted $X(\mathbb{N}-i) \star \mid \mathbb{N} C X+1)$
$=X(\mathbb{P}(\mathbb{N}-i) \star|\mathbb{N} C P|+1))$.
X (input/output) REA $\left.L * 8(\mathbb{K} \mathbb{N D})(\mathbb{N}-1)^{\star}|\mathbb{N} C X|+1\right)$, the array to be perm uted. M inim um size $\mathbb{N}-1)^{\star} \mathbb{N} C X+1$ is required
$\mathbb{N} C X$ (input) $\mathbb{N} T E G E R$, increm ent for $X$
$\mathbb{N} C X$ m ustnotbe zero. $\mathbb{N} C X$ could be negative. If $\mathbb{N} C X<0, X$ w illbe perm uted in a reverse way (see the description for $\mathbb{N}$ CP above).

## PURPOSE

caxpy com pute $\mathrm{y}:=$ alpha * $\mathrm{x}+\mathrm{y}$ w here alpha is a scalar and $x$ and $y$ are $n$-vectors.

## ARGUMENTS

N (input)
O n entry, N specifies the num ber of elem ents in the vector. N m ustbe at least one for the subroutine to have any visible effect. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
array ofD $\mathbb{I M}$ ENSION at least ( $1+(\mathrm{n}-1)$ *abs( $\mathbb{N C X}$ ) ). Before entry, the increm ented amay $X$ $m$ ust contain the vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents of $\mathrm{X} . \mathbb{N} C X$ m ustnotbe zero. U nchanged on exit.

Y (input/output)
aray ofD $\mathbb{I M}$ ENSION at least ( $1+(\mathrm{n}-1$ )*abs( $\mathbb{N} C Y$ )). On entry, the increm ented amay $Y \mathrm{~m}$ ust contain the vectory. On exit, $Y$ is overw rilten by the updated vectory.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y . \mathbb{N} C Y$ m ustnotbe zero. U nchanged on exit.

## DESCRIPTION

$$
\begin{aligned}
& C<-A L P H A \text { Op (A) B + BETA } C \quad C<-A L P H A D \text { Op (A) B + BETA C } \\
& C<-A L P H A \text { Op (A)D B + BETA } C
\end{aligned}
$$

where ALPHA and BETA are scalar, $C$ and $B$ are m by $n$ dense $m$ atrices, $D$ is a block diagonalm atrix, $A$ is a unit, ornon-unit, upperor low ertriangularm atrix represented in block diagonal form at and op (A) is one of op (A) $)=\operatorname{inv}(A)$ or op (A $)=\operatorname{inv}(A)$ or op (A) $=\operatorname{inv}\left(\operatorname{cong}\left(A^{\prime}\right)\right)$ (inv denotesm atrix inverse, 'indicates m atrix transpose)

## ARGUMENTS

TRAN SA Indicates how to operate $w$ th the sparse $m$ atrix 0 : operate $w$ ith $m$ atrix 1 : operate $w$ th transpose $m$ atrix 2 : operate $w$ ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M B $\quad$ Num ber ofblock row $s$ in $m$ atrix $A$

N $\quad$ um berof colum $n s$ in $m$ atrix $C$

UN ITD Type of scaling:
1 : Identity matrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum $n$ scaling)

DV () A rray of length M B *LB *LB containing the elem ents of the diagonalblocks of them atrix $D$. The size of each square block is LB -by-LB and each block is stored in standard colum n-m ajor form .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger anay DESCRA (1) m atrix structure
0 : general
1 : symm etric ( $\mathrm{A}=\mathrm{A}$ )
2 : Herm itian ( $A=\operatorname{CONJG}(A))$
3 :Triangular
4 : Skew (A nti)-Symm etric ( $\mathrm{A}=-\mathrm{A}$ )
5 :D iagonal
6 : Skew Herm itian ( $A=-C O N J(A)$ )
N ote: For the routine, D ESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonaltype
0 : non-identity blocks on the $m$ ain diagonal
1 : identity diagonalblocks
2 : diagonalblocks are dense $m$ atrices
DESCRA (4) A may base $\mathbb{N O T} \mathbb{I}$ PLEM ENTED)
0 :C C ++ com patible
1 :Fortran com patible
DESCRA (5) repeated indices? $\mathbb{N O T} \mathbb{I}$ PLEM ENTED)
0 : unknown
1 : no repeated indices
VAL () Two-dim ensionalLB *LB *B LD A -by-N BD IA G scalaranay
consisting of the N BD IA G non-zero block diagonal.
Each dense block is stored in standard colum n-m ajor form .
B LD A Leading block dim ension ofV A L (). Should be greater
than orequal to M B .
IBD IA G 0 integer amay of length NBD IA G consisting of the corresponding diagonal offsets of the non-zero block diagonals ofA in VA L. Low ertriangularblock diagonals have negative offsets, them ain block diagonalhas offset 0 , and upper triangularblock diagonals have positive offset. Elem ents of IBD IA G M UST be sorted in increasing order.
NBD IA G The num berofnon-zero block diagonals in A.
LB D im ension of dense blocks com posing A.
B 0 Rectangular aray with firstdim ension LD B .
LD B Leading dim ension of B .
BETA Scalarparam eter.
C 0 Rectangular array w ith first dim ension LD C .
LD C Leading dim ension of C .

W ORK 0 scratch array of length LW ORK. On exit, ifLW ORK=-1,W ORK (1) retums the optim um size ofLW ORK.

LW ORK length ofW ORK amay.LW ORK should be at least M B *LB.

Forgood penform ance, LW ORK should generally be larger. Foroptim um perform ance on $m$ ultiple processors, LW ORK $>=M B * L B * N \_C P U S$ where $N$ _CPU $S$ is the $m$ axim um num berof processors available to the program .

IfLW ORK $=0$, the routine is to allocate $w$ orkspace needed.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no enrorm essage related to LW ORK is issued by X ERBLA.

## SEE ALSO

http://w w w netlib .org/utk/papers/sparse.ps

## NOTES/BUGS

1. N o test for singularity ornear-singularity is included in this routine. Such tests $m$ ustbe perform ed before calling this routine.
2. If $D E S C R A$ (3)=0, the low erorupper triangularpart ofeach diagonalblock is used by the routine depending on DESCRA (2).
3. If $D E S C R A$ (3)=1, the unit diagonalblocksm ightorm ight notbe referenced in the BD I representation of a sparse $m$ atrix. They are notused anyw ay.
4. If $D E S C R A$ (3)=2, diagonalblocks are considered as dense $m$ atrices and the LU factorization $w$ th partialpivoting is used by the routine.

WORK (1)=0 on retum if the factorization foralldiagonal
blocks has been com pleted successfiully, otherw ise wORK $(1)=$ -iw here $i$ is the block num ber forw hich the LU
factorization could not.be com puted.
5.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse m atrix A is used. H ow erver DESCRA (1) m ustbe equalto 3 in this case.

## PURPOSE

codsqr com putes the singularvahue decom position (SV D) of a realN -by-N (upper orlow er) bidiagonalm atrix $B: B=Q * S$ * $P^{\prime}\left(P^{\prime}\right.$ denotes the transpose of $\left.P\right)$, w here $S$ is a diagonal $m$ atrix $w$ ith non-negative diagonal elem ents the singular values of $B$ ), and $Q$ and $P$ are orthogonalm atrices.

The routine com putes $S$, and optionally com putes $U * Q, P^{\prime} \star$ $\mathrm{V} T$, or $Q^{\prime *} \mathrm{C}$, forgiven com plex inputm atrices $\mathrm{U}, \mathrm{V} T$, and C.

See "C om puting Sm allSingularV alues ofB idiagonalM atrioes W th G uaranteed H igh Relative A ccuracy," by J. D em m eland W . K ahan, LAPA CK W orking N ote \#3 (orSIAM J.Sci. Statist. C om put.vol.11, no.5, pp. 873-912, Sept1990) and
"A ccurate singular values and differential qd algorithm $s$, "
by B. Parlett and V.Femando, TechnicalReportCPAM -554, $M$ athem atics D epartm ent, U niversity of C alifomia at Berkeley, July 1992 for a detailed description of the algorithm .

## ARGUMENTS

```
UPLO (input)
\(=\mathrm{U}\) : B is upperbidiagonal;
\(=1 \mathrm{~L}\) ': B is low erbidiagonal.
```

N (input) The order of them atrix $\mathrm{B} . \mathrm{N}>=0$.

NCVT (input)
The num berof colum ns of the m atrix V T.NCV T >=0.

NRU (input)
The num ber of row s of the $m$ atrix $U . N R U>=0$.

NCC (input)
The num ber of colum ns of the m atrix C . N CC $>=0$.

D (input/output)
O n entry, the n diagonalelem ents of the bidiago-
nal $m$ atrix $B$. On exit, if $\mathbb{N F O}=0$, the singular
values ofB in decreasing order.
E (input/output)
On entry, the elem ents of E contain the offdiagonalelem ents of of the bidiagonalm atrix w hose SV D is desired. O norm alexit ( $\mathbb{N} \mathrm{FO}=0$ ), E is destroyed. If the algorithm does not converge ( $\mathbb{N}$ FO > 0), D and E w illcontain the diagonal and superdiagonal elem ents of a bidiagonalm atrix orthogonally equivalent to the one given as input. E N ) is used forw orkspace.

## VT (input/output)

On entry, an N-by-N CV T m atrix VT. On exit, V T is overw rilten by $\mathrm{P}^{\prime * V T . V T}$ is notreferenced if $\mathrm{NCVT}=0$.

LDVT (input)
The leading dim ension of the array VT . LDV T >= $\max (1, N)$ ifnCVT >0;LDVT >=1 ifNCVT = 0 .

U (input/output)
On entry, an NRU -by $N$ m atrix $U$. On exit, $U$ is overw ritten by $U$ * $Q$. $U$ is not referenced if $N R U$ $=0$.

LD U (input)
The leading dim ension of the array $U$. LDU >= max (1,NRU).

C (input/output)
On entry, an N -by -NCC matrix C. On exit, C is overw ritten by $Q$ '* C . C is not referenced if NCC $=0$.

LD C (input)
The leading dim ension of the array C. LD C >= $\max (1, N)$ if $N C C>0 ; L D C>=1$ if $N C C=0$.

W ORK (w orkspace)
dim ension ( $4 * N$ )

IN FO (output)
= 0: successfulexit
$<0:$ If $\mathbb{N} F O=-i$, the $i$ th argum enthad an illegalvalue
$>0$ : the algorithm did notconverge; D and E contain the elem ents of a bidiagonalm atrix w hich is orthogonally sim ilarto the input matrix B; if $\mathbb{N F O}=i$, ielem ents ofe have notconverged to zero.

## DESCRIPTION

C <-aloha op (A ) B + beta C
where A LPHA andBETA are scalar, $C$ and $B$ are dense $m$ atrices, A is a m atrix represented in block sparse row form at and op (A ) is one of $o p(A)=A$ or $o p(A)=A^{\prime}$ or $o p(A)=\operatorname{conjg}\left(A^{\prime}\right)$.
( 'indicates m atrix transpose)

## ARGUMENTS

TRANSA Indicates how to operate $w$ ith the sparse $m$ atrix
0 : operate $w$ ith $m$ atrix
1 : operate $w$ th transpose $m$ atrix
2 : operate $w$ th the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix $A$ is real.

M B $\quad$ Num ber ofblock row s in m atrix A
$N \quad N$ um berof colum $n s$ in $m$ atrix $C$

K B $\quad$ Number ofblock colum ns in m atrix A

ALPHA Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger anay

## NOTES /BUGS

It is know $n$ that there exists another representation of the block sparse row form at (see forexam ple Y Saad, "Iterative M ethods forSparse LinearSystem s",W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. The $m$ ain difference is that only one array, $\mathbb{A}$, containing the pointers to the beginning of each block row in the amays $V A L$ and $B \mathbb{N D X}$ is used instead of tw o arrays BPN TRB and BPN TRE. To use the routine w ith this kind ofblock sparse row form at the follow ing calling sequence should be used

## DESCRIPTION

$$
\begin{aligned}
& C<-A L P H A \text { OP (A) B + BETA } C \quad C<-A L P H A D \text { Op }(A) B+B E T A C \\
& C<-A L P H A \text { Op }(A) D B+B E T A C
\end{aligned}
$$

where ALPHA and BETA are scalar, $C$ and $B$ are m by $n$ dense $m$ atrices, $D$ is ablock diagonalm atrix, $A$ is a unit, ornon-unit, upperor low ertriangularm atrix represented in block sparse row form at form atand op (A) is one of op (A) $)=\operatorname{inv}(A)$ or op (A $)=\operatorname{inv}(A)$ or op (A) $=\operatorname{inv}\left(\infty n \dot{g}\left(A^{\prime}\right)\right)$ (inv denotesm atrix inverse, 'indicates m atrix transpose)

## ARGUMENTS

TRA N SA Indicates how to operate $w$ th the sparse $m$ atrix 0 : operate $w$ ith $m$ atrix 1 : operate $w$ th transpose $m$ atrix 2 : operate $w$ ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M B $\quad$ Num ber ofblock row $s$ in $m$ atrix $A$
$N \quad N$ um berof colum $n s$ in $m$ atrix $C$

UN ITD Type of scaling:
1 : Identity matrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum $n$ block scaling)

DV () A mray of the length M B *LB *LB consisting of the block entries ofblock diagonalm atrix $D$ w here each block is stored in standard colum n-m ajor form .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem ent integer array
DESCRA (1) m atrix structure
0 : general

1 : symm etric ( $\mathrm{A}=\mathrm{A}$ )
2: Herm itian ( $\mathrm{A}=\mathrm{CONJG}(\mathrm{A})$ )
3 :Triangular
4 : Skew (A nti)-Symm etric ( $A=-A$ )
5 :D iagonal
6 : Skew Herm itian ( $\mathrm{A}=-\operatorname{CONJG}(\mathrm{A})$ )
N ote: For the routine, D ESCRA $(1)=3$ is only supported.
D ESCRA (2) upper/low er triangular indicator
1: low er
2 : upper
DESCRA (3) m ain diagonal type
0 : non-identity blocks on the $m$ ain diagonal
1 : identily diagonalblocks
2 : diagonalblocks are densem atrices
DESCRA (4) A ray base NOT IM PLEM ENTED )
0 : C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? NOT IM PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL () scalar aray of length LB *LB *BNN Z consisting of the block entries stored colum $n$-m ajorw thin each dense block.
$B \operatorname{IN}$ X ( integer array of length BNNZ consisting of the block colum n indices of the block entries of A. The block colum n indices M U ST be sorted in increasing order foreach block row .

BPN TRB () integer array of length $M B$ such that BPN TRB (J) BPN TRB (1)+1 points to location in B IND X of the firstblock entry of the J-th block row of A.

BPN TRE ( integer array of length $M B$ such that BPN TRE (J)-BPN TRB (1) points to location in B IND X of the last.block entry of the J-th block row of A.

LB dim ension of dense blocks com posing A.
B 0 rectangular array w th first dim ension LD B.
LD B leading dim ension ofB
BETA Scalarparam eter
C 0 rectangular array w ith first dim ension LD C.
LD C leading dim ension of $C$

W ORK 0 scratch array of length LW ORK. On exit, if LW ORK $=-1, W$ ORK (1) retums the optim um size ofLW ORK.

LW ORK length ofW ORK array. LW ORK should be at least M B*LB.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on $m$ ultiple processors, LW ORK $>=\mathrm{M} \mathrm{B} * \mathrm{LB} * \mathrm{~N}$ _CPU $S$ where $N$ _CPUS is the $m$ axim um num berof processors available to the program .

If LW ORK $=0$, the routine is to allocate $w$ orkspace needed.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

## SEE ALSO

htyp://w w w netlib .org/utk/papers/sparse.ps

## NOTES/BUGS

1. No test for singularity ornear-singularity is included in this routine. Such tests $m$ ustbe perform ed before calling this routine.
2. If $D E S C R A$ ( 3 )=0, the low erorupper triangularpart of each diagonalblock is used by the routine depending on DESCRA (2).
3. If $\operatorname{DESCRA}$ (3)=1, the unitdiagonalblocksm ightorm ight not.be referenced in the BSR representation of a sparse $m$ atrix. They are notused anyw ay .
4. If $D E S C R A(3)=2$, diagonalblocks are considered as dense m atrices and the LU factorization w th partialpivoting is used by the routine. WORK (1)=0 on retum if the factorization for alldiagonalblocks has been com pleted
successfully, otherw ise wORK (1) = -iw here is the block
num ber forw hich the LU factorization could notbe com puted.
5. The routine can be applied for solving triangular system $s$ w hen the upper or low er triangle of the general sparse m atrix A is used. H ow erver DESCRA (1) m ustbe equal to 3 in this case.
6. It is know $n$ that there exists another representation of the block sparse row form at (see forexam ple Y Saad, "Iterative M ethods forSparse LinearSystem S", W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. Them ain difference is that only one array, $\mathbb{I A}$, containing the pointers to the beginning of each block row in the amays VAL and B $\mathbb{N D}$ D is used instead of tw o arrays BPN TRB and BPN TRE. To use the routine w ith this kind ofblock sparse row form at the follow ing calling sequence should be used

## PURPOSE

convoor com putes the convolution or correlation of com plex vectors.

## ARGUMENTS

CNVCOR (input)
CHARACTER
$V$ 'or $V^{\prime}$ if convolution is desired, $R^{\prime}$ or $r^{\prime}$ if comelation is desired.

FOUR (input)
CHARACTER
T'or t'ifthe Fourier transform $m$ ethod is to be used, D 'or d'if the com putation should be done directly from the definition. The Fourier transform $m$ ethod is generally faster, but itm ay introduce noticeable errors into certain results, notably w hen both the real and im aginary parts of the filter and data vectors consist entirely of integers or vectors w here elem ents of either the filter vector or a given data vectordiffer significantly in $m$ agnitude from the 1-norm of the vector.

Length of the filtervector. $\mathrm{NX}>=0$. CCNVCOR w ill retum im m ediately if $\mathrm{NX}=0$.

X (input) dim ension (*)
Filtervector.
IFX (input)
Index of the firstelem entofX. $\mathrm{NX}>=\mathbb{F} \mathrm{X}>=1$.
$\mathbb{N C X}$ (input)
Stride betw een elem ents of the filtervector in $X$. $\mathbb{N} C X>0$.
NY (input)
Length of the inputvectors. NY >= 0. CCNVCOR w ill retum im m ediately if $\mathrm{N} \mathrm{Y}=0$.

NPRE (input)
The num ber of im plicit zeros prepended to the $Y$ vectors. NPRE $>=0$.

M (input)
Num berof inputvectors. M >= 0. CCNVCOR will retum im $m$ ediately if $M=0$.

Y (input) dim ension ( ${ }^{*}$ )
Inputvectors.
IFY (input)
Index of the firstelem entof Y . $\mathrm{N} Y>=\mathbb{F Y}>=1$.
$\mathbb{N} C 1 Y$ (input)
Stride betw een elem ents of the inputvectors in $Y$. $\mathbb{N} C 1 Y>0$.
$\mathbb{N} C 2 Y$ (input)
Stride betw een the inputvectors in $Y . \mathbb{N} C 2 Y>0$.

NZ (input)
Length of the output vectors. $\mathrm{NZ}>=0$. CCNVCOR w ill retum im mediately if $\mathrm{N}=0$. See the N otes section below for inform ation abouthow this argu$m$ ent interacts $w$ ith $N X$ and NY to control circular versus end-off shifting.

K (input)
$N$ um berof $Z$ vectors. $K>=0$. If $K=0$ then
$C C N V C O R \mathrm{w}$ ill retum immediately. If $K$ $M$ then
only the firstK inputvectors $w$ ill be processed.
If $K>M$ then $M$ inputvectors $w$ illbe processed.

Z (output)
dim ension (*)
Result vectors.
FZ (input)
Index of the firstelem entof $Z . N Z>=\mathbb{F Z}>=1$.
$\mathbb{N C 1 7}$ (input)
Stride betw een elem ents of the output vectors in Z. $\mathbb{N} C 1 Z>0$.
$\mathbb{N} C 2 Z$ (input)
Stride betw een the output vectors in $\mathrm{Z} . \mathbb{N N C}^{2 Z}>$ 0.

W ORK (input/output)
(input/scratch) dim ension (LW ORK)
Scratch space. Before the firstcall to CCNVCOR w ith particular values of the integer argum ents the firstelem entofW ORK m ustbe set to zero. If W ORK is written betw een calls to CCNVCOR or if CCNVCOR is calledw ith different values of the integer argum ents then the firstelem entofW ORK m ustagain be set to zero before each call. If W ORK has notbeen w rilten and the sam e values of the integer argum ents are used then the firstele$m$ entofW ORK to zero. This can avoid certain initializations that store their results into W ORK, and avoiding the initialization can makeCCNVCOR run faster.

LW ORK (input)
Length ofW ORK. LW ORK >= 2*M AX NX,NY+NPRE,NZ)+8.

## C INTERFACE

\#include <sunperfh>
void ccnvcor2 (char cnvcor, charm ethod, char transx, char scratchx, chartransy, char scratchy, intm $x$, int $n x$, com plex * $x$, int ldx, intm $y$, intny, intm pre, int npre, complex *y, int ldy, intm $z$, intnz, com plex *z, int ldz, com plex *w ork, int lw ork);
void ccnvcor2_64 (charcnvcor, charm ethod, chartransx, char scratchx, char transy, char scratchy, long $m x$, long $n x$, com plex *x, long ldx, long m y, long ny, long m pre, long npre, com plex *y, long ldy, long m z, long nz, com plex *z, long ldz, com plex *w ork, long lw ork);

## PURPOSE

ccnvcor2 com putes the convolution or conrelation of com plex m atrices.

## ARGUMENTS

CNVCOR (input)
V 'or $\mathrm{V}^{\prime}$ to com pute convolution, $R$ 'or $I$ ' to com pute correlation.

METHOD (input)
T'or t'if the Fouriertransform $m$ ethod is to be used, D 'or d'to com pute directly from the definition.

TRANSX (input)
$N$ 'or h'ifX is the filterm atrix, $T$ ' or $t^{\prime}$
iftranspose ( $X$ ) is the filterm atrix.

SCRATCHX (input)
N 'or h'ifX m ustbe preserved, S'or s 'if X
can be used as scratch space. The contents of $X$
are undefined after retuming from a callin w hich
$X$ is allow ed to be used for scratch.

TRANSY (input)
N 'or h'ify is the inputm atrix, T'or t'if
transpose $(Y)$ is the inputm atrix .

SCRATCHY (input)
N 'or h'ifY mustbe preserved, S'or S'ifY
can be used as scratch space. The contents ofy are undefined after retuming from a callin w hich Y is allow ed to be used for scratch.

M X (input)
N um ber of row s in the filterm atrix. $\mathrm{M} \mathrm{X}>=0$.

NX (input)
N um ber of colum ns in the filterm atrix. NX $>=0$.

X (input)
O n entry, the filterm atrix. U nchanged on exitif
SCRATCHX is $N^{\prime}$ or $h$ ', undefined on exitif SCRATCHX is S'or $s^{\prime}$.

LD X (input)
Leading dim ension of the array that contains the filterm atrix.

M Y (input)
$N$ um ber of row $S$ in the inputm atrix. $\mathrm{M} \mathrm{Y}>=0$.

NY (input)
Num ber of colum ns in the inputm atrix. $\mathrm{N} Y>=0$.

M PRE (input)
$N$ um ber of im plicit zeros to prepend to each row of the inputm atrix. M PRE $>=0$.

NPRE (input)
N um ber of im plicit zeros to prepend to each colum n of the inputm atrix. NPRE $>=0$.

Y (input)

Inputm atrix. U nchanged on exit if SCRATCHY is $N^{\prime}$ or $h^{\prime}$, undefined on exitifSCRATCHY is $S^{\prime}$ or $\mathrm{S}^{\prime}$.

LD Y (input)
Leading dim ension of the array that contains the inputm atrix.
M Z (input)
N um ber of row s in the output m atrix. $\mathrm{M} \mathrm{Z} \mathrm{>=0}$. CCNVCOR2 will retum im m ediately ifM $Z=0$.

NZ (input)
N um ber of colum ns in the outputm atrix. $\mathrm{N} Z>=0$. $C C N V C O R 2 \mathrm{w}$ ill retum im m ediately if $\mathrm{Z}=0$.

Z (output)
dim ension (LD Z,*)
Resultm atrix.
LD Z (input)
Leading dim ension of the array that contains the resultm atrix. LD Z >= M AX ( $1, \mathrm{M} \mathrm{Z}$ ).

W ORK (input/output)
(input/scratch) dim ension (LW ORK )
On entry for the first call to CCNVCOR2, W ORK (1)
$m$ ust contain CM PLX $(0.0,0.0)$. A fter the first
call, w ORK (1) m ustibe set to CM PLX ( $0.0,0.0$ ) iff
W ORK has been altered since the last call to this subroutine or if the sizes of the arrays have changed.

LW ORK (input)
Length of the w ork vector. The upperbound of the w orkspace length requirem ent is 2 * M Y C + NYC) + 15, where M YC = MAX MAX MX,NX), MAX MY,NY)+NPRE)
and NYC $=M A X M A X(M X X), M A X M Y, N Y)+M P R E)$. If
LW ORK indicates a w orkspace that is too sm all, the routine will allocate its ow n w orkspace. If the
FFT is notused, the value of LW ORK is unim portant.

## NOTES/BUGS

It is know $n$ that there exists another representation of the com pressed sparse colum n form at (see forexam ple Y Saad, "IterativeM ethods forSparse LinearSystem s", W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. Them ain difference is that only one array, $\mathbb{I A}$, containing the pointers to the beginning of each colum $n$ in the arrays VA L and $\mathbb{N} D \mathrm{X}$ is used instead oftw o arraysPN TRB and PN TRE.To use the routine $w$ th this kind of sparse colum $n$ form at the follow ing calling sequence should be used

SUBROUTINE SCSCMM (TRANSA, M,N,K,ALPHA,DESCRA,

## NOTES/BUGS

1. N o test for singularity ornear-singularity is included in this routine. Such tests $m$ ust.be perform ed before calling this routine.
2. If UN ITD $=4$, the routine scales the colum ns of A such that their 2 -norm s are one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries of VA L are changed only in the particular case. On retum D V $m$ atrix stored as a vector contains the diagonalm atrix by which the colum ns have been scaled. UN ITD = 3 should be used for the next calls to the routine $w$ ith overw ritten VA L and DV.

WORK (1)=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the colum n num berw hich 2 -norm is exactly zero.
3. If $D E S C R A(3)=1$ and $U N$ ITD < 4, the unitdiagonalelem ents m ightorm ightnotbe referenced in the C SC representation
of a sparse $m$ atrix. They are notused anyw ay in these cases. ButifU N ITD = 4, the unitdiagonalelem ents M U ST be referenced in the CSC representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general.sparse $m$ atrix A is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.
5. It is know $n$ that there exists another representation of the com pressed sparse colum n form at (see for exam ple Y Saad, "Iterative M ethods forSparse LinearSystem $s$ ", W PS, 1996). Its data structure consists of three anray instead of the fourused in the cumentim plem entation. Them ain difference is thatonly one amray, IA , containing the pointers to the beginning ofeach colum $n$ in the arrays VA L and $\mathbb{I N D X}$ is used instead of tw o amaysPNTRB and PN TRE.To use the routine $w$ th this kind of sparse colum $n$ form at the follow ing calling sequence should be used

& 5 \text { : D iagonal } \\
& 6 \text { : Skew Herm itian ( } A=-\operatorname{CON} \text { JG (A ) ) }
\end{aligned}
$$

N ote: For the routine, only DESCRA (1)=3 is supported.

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 : non-unit
1 :unit
DESCRA (4) A ray base $\mathbb{N O T} \mathbb{M}$ PLEM ENTED )
0 : C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? $\mathbb{N O T} \mathbb{I}$ PLEM ENTED)
0 : unknown
1 : no repeated indices
VAL () scalar array of length N N Z consisting of nonzero entries ofA.
$\mathbb{I N D X ( ) \quad i n t e g e r a m a y ~ o f ~ l e n g t h ~ N ~ N ~ Z ~ c o n s i s t i n g ~ o f ~ t h e ~ c o l u m ~ n ~}$ indices of nonzero entries ofA (colum n indices M U ST be sorted in increasing order for each row )

PNTRB () integer amay of length $M$ such thatPN TRB (J) PN TRB (1)+1 points to location in VA L of the firstnonzero elem ent in row J.

PN TRE () integer amay of length M such thatPNTRE (J)-PN TRB (1) points to location in VA L of the lastnonzero elem ent in row J.

B 0 rectangular array w ith first dim ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch array of length LW ORK.

On exit, ifLW ORK $=-1, W$ ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .
Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on $m$ ultiple processors, LW ORK $>=M$ *N_CPUS where N_CPUS is the m axim um num berof processors available to the program .

If LW ORK $=0$, the routine is to allocate $w$ orkspace needed.
IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

M $\quad N$ um berof row $s$ in $m$ atrix A

N $\quad N$ um berof colum ns in $m$ atrix $C$

UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 :Scale on left (row scaling)
3 : Scale on right (colum $n$ scaling)
4 :A utom atic row scaling (see section NOTES for furtherdetails)

DV 0 A ray of length M containing the diagonalentries of the scaling diagonalm atrix D .

A LPH A Scalarparam eter
DESCRA 0 D escriptor argum ent. Five elem ent integer amay
DESCRA (1) m atrix structure
0 : general

1 : symm etric ( $\mathrm{A}=\mathrm{A}$ )
2 : Herm itian ( $A=C O N J(A)$ )
3 :Triangular
4 : Skew (A nti)-Symm etric ( $(A=-A$ )
5 :D iagonal
6 : Skew Herm titian ( $A=-\operatorname{CON}$ J ( $A$ ) )
N ote: For the routine, only D ESCRA (1)=3 is supported.

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 :unit
DESCRA (4) A ray base $\mathbb{N O T} \mathbb{M}$ PLEM ENTED )
0 :C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? (NOT $\mathbb{M}$ PLEM ENTED)
0 : unknown
1 : no repeated indices
VAL () tw o-dim ensionalLD A boy-ND IA G aray such thatVAL(:,I) consists of non-zero elem ents on diagonal ID IA G (I) of A. D iagonals in the low er triangularpart of A are padded from the top, and those in the upper triangularpart are padded from the bottom.

LDA leading dim ension ofVAL, m ustbe GE.M $\mathbb{N}(M, K)$

ID IA G () integer anay of length ND IA G consisting of the corresponding diagonaloffsets of the non-zero diagonals ofA in VAL. Low ertriangular diagonals have negative offsets, them ain diagonalhas offset 0 , and uppertriangular diagonals have positive offset. Elem ents of $\mathbb{D}$ IA G ofM UST be sorted in increasing order.

ND IA G num berofnon-zero diagonals in A.

B 0 rectangular array w ith firstdim ension LD B .

LD B leading dim ension of $B$

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch amay of length LW ORK. On exit, if LW ORK = -1,W ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK aray. LW ORK should be at leastM.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on $m$ ultiple processors, LW ORK $>=M$ *N_CPU $S$ where $N$ _CPU $S$ is the $m$ axim um num berof processors available to the program .

IfLW ORK $=0$, the routine is to allocate $w$ orkspace needed.
IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK anray, retums this value as the firstentry of theW ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

## SEE ALSO

N IST FO RTRA N Sparse B las U ser's G uide available at:
http://m ath nistgov fn csd/Staff/k Rem ington/tspoblas/

http://w w w netlib.org/utk/papers/sparse.ps

## NOTES/BUGS

1. No test for singularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.
2. If U N ITD $=4$, the routine scales the row sofA such that their 2 -norm sare one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD $=2$ should be used for the next calls to the routine w ith overw ritten VA L and DV .

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise $W O R K(1)=-i w$ here $i$ is the row num berw hich 2 -norm is exactly zero.
3. If $D E S C R A(3)=1$ and $U N$ ITD $<4$, the unitdiagonalelem ents m ightorm ightnotbe referenced in the D IA representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD = 4, the unit diagonalelem ents M U ST be referenced in the $D \mathbb{I A}$ representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse
m atrix $A$ is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

## NOTES/BUGS

1. N o test for singularity ornear-singularity is included in this routine. Such tests $m$ ustbe perform ed before calling this routine.
2. IfUN ITD $=4$, the routine scales the row s of $A$ such that their 2 -nom s are one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the row num berw hich 2 -norm is exactly zero.
3. If $\operatorname{DESCRA}(3)=1$ and U N ITD < 4, the unitdiagonalelem ents $m$ ightorm ightnotbe referenced in the ELL representation of a sparse m atrix. They are notused anyw ay in these cases.

ButifUN ITD $=4$, the unit diagonalelem ents M U ST be referenced in the ELL representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

## C INTERFACE

\#include <sunperfh>
void cfftc_ (int*iopt, int*n, float *scale, com plex *x, com plex *y, float *trigs, int*ifac, float *w ork, int *lw ork, int *ienr);
void cfftc_64_ (long *iopt, long *n, float *scale, com plex *x, complex *y, float*trigs, long *ifac, float *W Ork, long *lw ork, long *ien);

## PURPOSE

cfftc initializes the trigonom etric w eight and factortables or com putes the FastFouriertransform (forw ard or inverse) of a com plex sequence as follow s:

## N-1

$Y(k)=$ scale * SUM W *X ( $)$
$\dot{F}$
where
k ranges from 0 to $\mathrm{N}-1$
$i=\operatorname{sqnt}(-1)$
isign $=1$ for inverse transform or -1 for forw ard transform
$W=\exp \left(i s i g n * i^{\star} j^{\star} k \star 2 \star \mathrm{piN}\right)$

## ARGUMENTS

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT $=0$ com putes the trigonom etric $w$ eight table
and factortable
IO PT $=-1$ com putes forw ard FFT
IO PT $=+1$ com putes inverse FFT
$N$ (input)
Integer specifying length of the input sequence $X$.
N is mostefficientw hen it is a productof sm all prim es. $\mathrm{N}>=0$. U nchanged on exit.

SCALE (input)
Real scalarby w hich transform results are scaled.
U nchanged on exit. SCA LE is defaulted to 1.0 for F95 $\mathbb{I N}$ TERFACE.

X (input) On entry, X is a complex array of dimension at least N that contains the sequence to be transform ed.

Y (output)
C om plex array of dim ension at least N that contains the transform results. $X$ and $Y m$ ay be the sam e array starting at the sam e $m$ em ory location. O therw ise, it is assum ed that there is no overlap betw een $X$ and $Y$ in $m$ em ory.

TRIGS (input/output)
Realarray of length $2 * \mathrm{~N}$ that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith IO PT = 0 and they are used in subsequent calls when IO PT $=1$ orIOPT $=$ -1. U nchanged on exit.

IFAC (input/output)
Integer array ofdim ension at least 128 that contains the factors of N . The factors are com puted when the routine is called w ith IO PT = 0 and they are used in subsequent calls w here $10 P T=1$ or IO PT $=-1$. U nchanged on exit.

W ORK (w orkspace)
Realarray of dim ension at least $2 \star \mathrm{~N}$. The user can also choose to have the routine allocate its own w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. If LW O RK = 0, the routine w illallocate its ow n w orkspace.
$\mathbb{E R R}$ (output)
On exit, integer $\mathbb{E} R R$ has one of the follow ing
values:
0 = norm alretum
$-1=10$ PT is not 0,1 or -1
$-2=\mathrm{N}<0$
$-3=(L W O R K$ is not 0 ) and (LW ORK is less than $2 \star \mathrm{~N}$ )
$-4=m$ em ory allocation forw orkspace failed

## C INTERFACE

\#include < sunperfh>
void cfftc2_ (int*iopt, int *n1, int *n2, float *scale, com plex *x, int*ldx, com plex *y, int *ldy, float
*trigs, int*ifac, float*w ork, int *lw ork, int
*ienr);
void cfftc2_64_ (long *iopt, long *n1, long *n2, float *scale, com plex *x, long *ldx, com plex *y, long *ldy, float *trigs, long *ifac, float *w ork, long *lw ork, long *ient);

## PURPOSE

cfftc2 initializes the trigonom etric weight and factor tables or computes the two-dim ensional Fast Fourier T ransform (forw ard or inverse) of a tw o-dim ensional com plex array. In computing the two-dimensional FFT, one-dim ensionalFFT s are com puted along the colum ns of the input array. O ne-dim ensionalFFTs are then com puted along the row s of the interm ediate results.

> N2-1 N 1-1
$Y(k 1, k 2)=$ scale $*$ SUM SUM W 2*W 1*X (1, 12)
j2=0 $\mathfrak{j}=0$
where
k 1 ranges from 0 to $\mathrm{N} 1-1$ and k 2 ranges from 0 to $\mathrm{N} 2-1$
$i=\operatorname{sqrt}(-1)$
isign $=1$ for inverse transform or -1 for forw ard transform
W $1=\exp \left(\right.$ isign*i* $\left.{ }^{1} * k 1 * 2 * p i / N 1\right)$
W $2=\exp ($ isign*i* $2 * k 2 * 2 * p i N 2)$

## ARGUMENTS

IOPT (input)
Integer specifying the operation to be perform ed:
IO PT $=0$ com putes the trigonom etric weight table and factortable
IO PT = -1 com putes forw ard FFT
IO PT $=+1$ com putes inverse FFT
N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprin es. N $1>=0$. U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es. N $2>=0$. U nchanged on exit.
SCALE (input)
Real scalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 $\mathbb{I N}$ TERFACE.

X (input) X is a com plex array ofdim ensions (LD $\mathrm{X}, \mathrm{N} 2$ ) that contains inputdata to be transform ed.

LD X (input)
Leading dim ension of X . LD X >= N 1 U nchanged on exit.

Y (output)
Y is a com plex array ofdim ensions (LD Y ,N 2) that contains the transform results. $X$ and $Y$ can be the sam e anray starting at the sam $e m$ em ory location, in which case the input data are overw rilten by their transform results. O therw ise, it is assum ed that there is no overlap betw een $X$ and $Y$ in $m$ em ory.

LD Y (input)
Leading dim ension of $Y$. If $X$ and $Y$ are the same array, LD Y = LD X Else LD Y >= N 1 U nchanged on exit.

TRIGS (input/output)
Realarray of length $2 *(\mathbb{N} 1+\mathrm{N} 2$ ) that contains the trigonom etric weights. The weights are com puted
w hen the routine is called w ith IO PT = 0 and they are used in subsequent calls w hen IO PT $=1$ or IO PT $=-1$. U nchanged on exit.

IFAC (input/output)
Integeranay ofdim ension at least $2 * 128$ that contains the factors of 1 and N 2 . The factors are com puted when the routine is called w ith IO PT
$=0$ and they are used in subsequent calls $w$ hen IO PT = 1 or IO PT = -1 . U nchanged on exit.

W ORK (w orkspace)
Real array of dimension at least
$2 * \mathrm{M} A X(\mathbb{N} 1, N 2) * N C P U S$ where $\operatorname{NCPUS}$ is the num berof threads used to execute the routine. The user can
also choose to have the routine allocate its ow $n$ w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. If LW ORK $=0$, the routine w illallocate its ow n w orkspace.
$\mathbb{E R R}$ (output)
On exit, integer $\mathbb{E R R}$ has one of the follow ing
values:
0 = norm alretum
$-1=10$ PT is not 0,1 or -1
$-2=\mathrm{N} 1<0$
$-3=N 2<0$
$-4=(\mathbb{L D X}<\mathrm{N} 1)$
$-5=(\mathbb{L D} Y<N 1)$ or (LD Y notequalld $X$ when $X$ and $Y$
are sam e array)
$-6=(L W$ ORK not equal 0) and (LWORK <
$2 * M A X(N 1, N 2) * N C P U S)$
$-7=m$ em ory allocation failed

IN TEGER N
REALW SAVE (*)
SU BROUTINE CFFTI_64N,W SAVE)
$\mathbb{N}$ TEGER*8 N
REALW SAVE (*)
F95 INTERFACE
SU BROUTINE CFFTIN,W SAVE)
$\mathbb{N} T E G E R:: N$
REAL,D $\mathbb{I M}$ ENSION (:) ::W SAVE

SU BROUTINECFFTI_64 N, W SAVE)
$\mathbb{N}$ TEGER (8) :: N
REAL,D $\mathbb{M}$ ENSION (:) ::W SAVE

## C INTERFACE

\#include <sunperfh>
void cffti(intn, float *W save);
void cffti_ 64 (long n , float *w save);

## ARGUMENTS

N (imput) Length of the sequence to be transform ed. $\mathrm{N}>=0$.

W SAVE (input/output)
O n entry, an array ofdim ension ( $4 * N+15$ ) or greater. CFFTI needs to be called only once to initialize array $W$ ORK before calling CFFTF and/or CFFTB if $N$ and W SAVE rem ain unchanged betw een these calls. Thus, subsequent transform $s$ or inverse transform s of sam e size can be obtained faster than the first since they do not require in itialization of the w orkspace.

## PURPOSE

Fourier transform algorithm s , including those used in Perform ance L ibrary, w ork bestw ith vector lengths that are products of sm all prim es. Forexam ple, an FFT of length $32=2 * * 5 \mathrm{w}$ ill run fasterthan an FFT of prime length 31 because 32 is a product ofsm allprim es and 31 is not. If your application is such that you can taper or zero pad your vector to a larger length then this function $m$ ay help you select a better length and run your FFT faster.

CFFTOPT w ill retum an integerno sm aller than the input argum entN that is the closestnum ber that is the product of sm allprim es. CFFTO PT w ill retum 16 for an input of $\mathrm{N}=16$ and retum 18=2*3*3 foran inputof $\mathrm{N}=17$.

N ote that the length com puted here is not guaranteed to be optim al, only to be a productofsm allprim es. A lso, the value retumed $m$ ay change as the underlying FFTs become capable of handling largerprim es. Forexam ple, passing in $\mathrm{N}=51$ today w ill retum $52=2 * 2 * 13$ rather than 51=3*17 because the FFTs in Perform ance Library do nothave fast radix 17 code. In the future, radix 17 code $m$ ay be added and then $\mathrm{N}=51 \mathrm{w}$ ill retum 51 .

## C INTERFACE

\#include <sunperfh>
void cffts_ (int*iopt, int*n, float *scale, com plex *x, float *y, float *trigs, int*ifac, float*w ork, int*lw ork, int *ient);
void cffts_64_ (long *iopt, long *n, float *scale, com plex ${ }^{*} \mathrm{x}$, float *y, float *trigs, long *ifac, float *W Ork, long *lw ork, long *ien);

## PURPOSE

cffts initializes the trigonom etric w eight and factor tables or com putes the inverse FastFourier T ransform of a com plex sequence as follow s:

N-1
Y (k) $=$ scale * SUM W *X ( $)$
$=0$
where
k ranges from 0 to $\mathrm{N}-1$
$i=\operatorname{sqnt}(-1)$
isign $=1$ for inverse transform or -1 for forw ard transform
$W=\exp \left(i s i g n \star i^{\star} j^{\star} k * 2 * p i N N\right)$
In com plex-to-realtransform of length $N$, the $(\mathbb{N} / 2+1)$ com plex input data points stored are the positive-frequency half of the spectrum of the $D$ iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is notstored. Furtherm ore, due to sym $m$ etries the im aginary of the com ponentof $\mathrm{X}(0)$ and $\mathrm{X} \mathbb{N} / 2$ ) (if N is even in the latter) is assum ed to be zero and is notreferenced.

## ARGUMENTS

IOPT (input)
Integer specifying the operation to be perform ed:
IO PT $=0$ com putes the trigonom etric weight table and factortable
IO PT = 1 com putes inverse FFT
N (input)
Integer specifying length of the input sequence $X$.
N is mostefficientw hen it is a product of sm all prim es. $\mathrm{N}>=0$. U nchanged on exit.

SCALE (input)
Real scalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 $\mathbb{N}$ TERFACE.
$X$ (input) $O n$ entry, $X$ is a com plex array whose first $\mathbb{N} / 2+1$ )
elem ents are the input sequence to be transform ed.
Y (output)
Realaray ofdim ension at least $N$ that contains the transform results. $X$ and $Y m$ ay be the sam $e$ array starting at the sam emem ory location. O therw ise, it is assum ed that there is no overlap betw een $X$ and $Y$ in $m$ em ory.

## TR IG S (input/output)

Real array of length $2 * \mathrm{~N}$ that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith IOPT $=0$ and they are used in subsequent calls w hen ID PT $=1$. U nchanged on exit.

IFAC (input/output)
Integer array of dim ension at least 128 that contains the factors of N . The factors are com puted when the routine is called w ith $\mathbb{I O P T}=0$ and they are used in subsequent calls where $\mathrm{IOPT}=1$. U nchanged on exit.

W ORK (w orkspace)
Realarray ofdim ension at leastN. The user can also choose to have the routine allocate its ow $n$ w orkspace (see LW ORK).

LW ORK (input)
Integer specifying workspace size. If LW ORK $=0$, the routine w illallocate its ow n w orkspace.

ERR (output)
On exit, integer $\mathbb{E} R R$ has one of the follow ing
values:
0 = norm alretum
$-1=10 P T$ is not 0 or 1
$-2=\mathrm{N}<0$
$-3=(L W O R K$ is not 0) and (LW ORK is less than N)
$-4=m$ em ory allocation forw orkspace failed

*ldy, float *trigs, long *ifac, float *w ork, long
*lw ork, long *ien);

## PURPOSE

cffls2 initializes the trigonom etric w eight and factor tables or com putes the tw o-dim ensional inverse FastF ourier Transform of a tw o-dim ensionalcom plex array. In com puting the tw o-dim ensional FFT, one-dim ensionalFFT s are com puted along the row s of the input array. O ne-dim ensionalFFT s are then com puted along the colum ns of the interm ediate results.

N 1-1 N 2-1
$Y(k 1, k 2)=$ scale * SUM SUM W 2*W 1*X (1, 2 2 )

$$
\mathfrak{j}=0 \quad \mathfrak{2}=0
$$

where
k 1 ranges from 0 to $\mathrm{N} 1-1$ and k 2 ranges from 0 to $\mathrm{N} 2-1$
$i=\operatorname{sqrt}(-1)$
isign $=1$ for inverse transform
W $1=\exp ($ isign *i* $11 * k 1 * 2 * \mathrm{pi} N 1)$
W $2=\exp \left(\right.$ isign $\left.* i^{*} \mathrm{R}^{*} k 2 * 2 * \mathrm{pi} / \mathrm{N} 2\right)$
In com plex-to-real transform of length $N 1$, the $\mathbb{N} 1 / 2+1$ ) com -
plex input data points stored are the positive-frequency
half of the spectrum of the $D$ iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is not stored.

## ARGUMENTS

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT $=0$ com putes the trigonom etric weight table
and factor table
IO PT = 1 com putes inverse FFT
N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprim es. N $1>=0$. U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es. N $2>=0$. U nchanged on exit.

SCALE (input)
Real scalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 $\mathbb{I N}$ TERFACE.

X (input) X is a com plex array ofdim ensions (LD $\mathrm{X}, \mathrm{N} 2)$ that contains input data to be transform ed.

LD X (input)
Leading dimension of $X . \operatorname{LDX}>=\mathbb{N} 1 / 2+1)$
U nchanged on exit.
Y (output)
$Y$ is a realamay of dim ensions (LD Y, N 2) that contains the transform results. $X$ and $Y$ can be the sam e array starting at the sam e mem ory location, in which case the input data are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een X and Y in $m$ em ory.

LD Y (input)
Leading dim ension of $Y$. If $X$ and $Y$ are the same anay, LD Y $=2 *$ LD X Else LD $Y>=2 * L D X$ and LD Y m ust
be even. U nchanged on exit.

TRIGS (input/output)
Real array of length $2 *(\mathbb{N} 1+\mathrm{N} 2)$ that contains the trigonom etric w eights. The weights are com puted w hen the routine is called w ith $10 \mathrm{PT}=0$ and they are used in subsequent calls when $\mathrm{IOPT}=1$.
U nchanged on exit.

IFAC (input/output)
Integer array ofdim ension at least $2 * 128$ that
contains the factors ofN 1 and N2. The factors are com puted w hen the routine is called w ith IO PT
$=0$ and they are used in subsequent calls w hen
IO PT = 1. U nchanged on exit.

W ORK (w orkspace)
Real array of dimension at least
$M A X(\mathbb{N} 1,2 * N 2) * N C P U S$, where $N C P U S$ is the num ber of
threads used to execute the routine. The user can
also choose to have the routine allocate its ow $n$
w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w ork.space size. If LW ORK $=0$, the routine w illallocate its ow n w ork.space.

ERR (output)
On exit, integer $\mathbb{E} R \mathrm{R}$ has one of the follow ing
values:
0 = norm alretum
$-1=10 P T$ is not 0,1
$-2=N 1<0$
$-3=N 2<0$
$-4=(\llbracket D X<N 1 / 2+1)$
$-5=L D Y$ notequal $2 \star$ LD $X$ when $X$ and $Y$ are same
aray
$-6=(L D Y<2 \star L D X$ orLD $Y$ odd) $w$ hen $X$ and $Y$ are
sam e array
$-7=(L W O R K$ not equal 0) and (LWORK <
M AX $\mathbb{N} 1,2 * N 2$ ) $\left.{ }^{*} N C P U S\right)$
$-8=m$ em ory allocation failed

## SEE ALSO

fflt

## CAUTIONS

Y $\mathbb{N} 1+1: L D Y,:$ ) is used as scratch space. U pon retuming, the original contents of Y $(\mathbb{N} 1+1: L D Y,:)$ w illbe lost, w hereas $\mathrm{Y}(1 \mathbb{N} 1,1 \mathbb{N} 2)$ contains the transform results.

## PURPOSE

cffls3 initializes the trigonom etric weight and factor tables or com putes the three-dim ensional inverse Fast Fourier $T$ ransform of a three-dim ensional com plex array.

N 3-1 N2-1 N1-1
$Y(k 1, k 2, k 3)=$ scale $*$ SUM SUM SUM W 3*W 2*W 1*X ( $11, \mathfrak{p}, \mathfrak{j})$

$$
\mathfrak{j}=0 \quad \mathfrak{j}=0 \quad j 1=0
$$

where
k 1 ranges from 0 to $\mathrm{N} 1-1$; $k 2$ ranges from 0 to $\mathrm{N} 2-1$ and $k 3$
ranges from 0 to $N 3-1$
$i=\operatorname{sqrt}(-1)$
isign = 1 for inverse transform
W $1=\exp (i s i g n * i * 1 \times k 1 * 2 * p i N 1)$

W $2=\exp \left(i s i g n * i *{ }^{2} * k 2 * 2 * p i N 2\right)$
W $3=\exp ($ isign*i* $3 * k 3 * 2 * p i N 3$ )

## ARGUMENTS

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT $=0$ com putes the trigonom etric $w$ eight table
and factor table
IO $\mathrm{PT}=+1$ com putes inverse FFT
N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 ism ostefficientw hen it is a productofsm allprim es. N $1>=0$. U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es. N $2>=0$. U nchanged on exit.
N 3 (input)
Integer specifying length of the transform in the third dim ension. N 3 ism ostefficientw hen it is a productofsm allprim es. N $3>=0$. U nchanged on exit.

SCALE (input)
Real scalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 $\mathbb{I N T E R F A C E}$.

X (input) X is a com plex array of dim ensions (LD X 1, LD X 2, N 3 ) that contains input data to be transform ed.

## LD X 1 (input)

firstdim ension of X . LD X $1>=\mathrm{N} 1 / 2+1$ U nchanged on exit.

LD X 2 (input)
second dim ension of X . LD X $2>=\mathrm{N} 2$ U nchanged on exit.

Y (output)
Y is a com plex anay of dim ensions (LD Y 1, LD Y 2,
N 3 ) that contains the transform results. X and $Y$
can be the sam e array starting at the sam $e m$ em ory
location, in which case the input data are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een $X$ and $Y$ in $m$ em ory.

LD Y 1 (input)
firstdin ension of $Y$. If $X$ and $Y$ are the same array, LD Y $1=2 * L D X 1$ Else LD Y $1>=2 * L D X 1$ and LD Y 1 is even U nchanged on exit.

LD Y 2 (input)
second dim ension of $Y$. If $X$ and $Y$ are the same aray, LD Y 2 = LD X 2 Else LD Y 2 >= N 2 U nchanged on exit.

TR IG S (input/output)
Real array of length $2 *(\mathbb{N} 1+\mathrm{N} 2+\mathrm{N} 3$ ) that contains the trigonom etric weights. The w eights are com puted when the routine is called w ith $\mathbb{I D}$ PT $=0$ and they are used in subsequent calls when IOPT $=1$. U nchanged on exit.

IFAC (input/output)
Integer array ofdim ension at least $3 * 128$ that contains the factors of $1, \mathrm{~N} 2$ and N 3 . The factors are com puted w hen the routine is called w ith IOPT = 0 and they are used in subsequent calls w hen $\mathrm{IOPT}=1$. U nchanged on exit.

W ORK (w orkspace)
Realarray ofdim ension at least MAX $\mathbb{N}, 2 * N 2,2 * N 3$ )
$+16 * N 3)$ * NCPUS where NCPUS is the num berof
threads used to execute the routine. The user can
also choose to have the routine allocate its ow $n$
w orkspace (see LW ORK).
LW ORK (input)
Integer specifying w orkspace size. If LW ORK = 0, the routine w illallocate its ow n w orkspace.

ERR (output)
On exit, integer $\mathbb{E R R}$ has one of the follow ing
values:
0 = norm alretum

## CAUTIONS

This routine uses $Y \mathbb{N} 1+1$ LD Y $1,: \%$ : as scratch space. Therefore, the original contents of this subarray $w$ illbe lost upon retuming from routine while subarray $Y(1 \mathbb{N} 1,1 \mathbb{N} 2,1 \mathbb{N} 3)$ contains the transform results.

## C INTERFACE

\#include <sunperfh>
void cfftsm _ (int*iopt, int*n1, int *n2, float *scale, com plex *x, int *ldx, float*y, int*ldy, float *trigs, int *ifac, float *w ork, int *lw ork, int *ient);
void cfftsm_64_ (long *iopt, long *n1, long *n2, float
*scale, com plex *x, long *ldx, float*y, long
*ldy, float *trigs, long *ifac, float *w ork, long
*lw ork, long *ienr);

## PURPOSE

cfftem initializes the trigonom etric weight and factor tables or com putes the one-dim ensional inverse FastFourier T ransform of a set of com plex data sequences stored in a tw o-dim ensionalamay:

N 1-1
Y ( $k, 1)=$ scale * SUM W *X (jl)

$$
\dot{j} 0
$$

where
k ranges from 0 to N 1-1 and lranges from 0 to N 2-1
$i=\operatorname{sqrt}(-1)$
isign $=1$ for inverse transform
$W=\exp \left(i s i g n * i^{\star} j^{\star} k * 2 \star \mathrm{piN} 1\right)$
In com plex-to-real transform of length N 1 , the $(\mathbb{N} 1 / 2+1$ ) com -
plex input data points stored are the positive-frequency half of the spectrum of the $D$ iscrete Fourier $T$ ransform. The other half can be obtained through com plex conjugation and therefore is not stored. Furthem ore, due to sym $m$ etries the
im aginary of the com ponent of $\mathrm{X}(0,0 \mathbb{N} 2-1)$ and $\mathrm{X}(\mathbb{N} 1 / 2,0$ N 2-1) (ifN 1 is even in the latter) is assum ed to be zero and is not referenced.

## ARGUMENTS

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT $=0$ com putes the trigonom etric weight table and factor table
IO PT = 1 com putes inverse FFT

N 1 (input)
Integer specifying length of the input sequences.
N 1 ism ostefficientw hen it is a product ofsm all prim es. N $1>=0$. U nchanged on exit.

N 2 (input)
Integer specifying num ber of input sequences. N 2 $>=0$. U nchanged on exit.
SCALE (input)
Real scalarby w hich transform results are scaled.
U nchanged on exit. SCA LE is defaulted to 1.0 for F95 $\mathbb{I N}$ TERFACE.

X (input) X is a com plex aray ofdim ensions (LD $\mathrm{X}, \mathrm{N} 2$ ) that contains the sequences to be transform ed stored in its colum ns in $\mathrm{X}(0 \mathrm{~N} 1 / 2,0 \mathbb{N} 2-1)$.

LD X (input)
Leading dim ension of $\mathrm{X} . \operatorname{LD} \mathrm{X}>=\mathbb{N} 1 / 2+1$ ) U nchanged on exit.

Y (output)
$Y$ is a realarray of dim ensions (LD Y, N 2) that contains the transform results of the input sequences in $Y(0: N 1-1,0 \mathbb{N} 2-1)$. $X$ and $Y$ can be the sam e array starting at the sam em em ory location, in which case the input sequences are overw rilten by their transform results. O therw ise, it is assum ed that there is no overlap betw een X and Y in $m$ em ory.

LD Y (input)
Leading dim ension of $Y$. If $X$ and $Y$ are the same array, LDY $=2 * L D X$ Else LD Y >= N 1 U nchanged on exit.

TR IG S (input/output)
Realaray of length $2 * \mathrm{~N} 1$ that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith IOPT $=0$ and they are used in subsequent calls w hen IO PT $=1$. U nchanged on exit.

IFAC (input/output)
Integer array ofdim ension at least 128 that contains the factors of 1 . The factors are com puted when the routine is called w ith IO PT $=0$ and they are used in subsequent calls when IOPT $=1$.
U nchanged on exit.
W ORK (w orkspace)
Real anray of dim ension at least 1 1. The user can also choose to have the routine allocate its ow $n$ w orkspace (see LW ORK).

LW ORK (input)
Integer specifying workspace size. IfLW ORK $=0$, the routine w illallocate its ow n w orkspace.

ERR (output)
On exit, integer $\mathbb{E R R}$ has one of the follow ing
values:
0 = norm alretum
$-1=10 \mathrm{PT}$ is not 0 or 1
$-2=\mathrm{N} 1<0$
$-3=N 2<0$
$-4=(\operatorname{LDX}<\mathrm{N} 1 / 2+1)$
$-5=(\operatorname{LD} Y<N 1)$ or (LD Y notequal2*LD w wen X and
Y are sam e array)
$-6=(\mathbb{L W}$ ORK notequal0) and (LW ORK < N 1)
$-7=m$ em ory allocation failed

## PURPOSE

cgbbrd reduces a com plex generalm -by-n band $m$ atrix $A$ to real upperbidiagonal form $B$ by a unitary transform ation: Q '

* $A * P=B$.

The routine com putes B, and optionally form s Q or P', or com putes $Q$ "C for given $m$ atrix $C$.

## ARGUMENTS

```
VECT (input)
    Specifies w hetherornot the m atrices Q and P 'are
    to be form ed. = N ': do not form Q orP ';
    = Q': form Q only;
    = P':form P'only;
    = B':form both.
```

M (input) The num ber of row s of the m atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
NCC (input)
The num berof colum ns of the m atrix C. NCC >=0.

KL (input)
The num ber of subdiagonals of the m atrix A.K L >=
0.

KU (input)
The num berof superdiagonals of the m atrix A. KU $>=0$.

AB (input/output)
On entry, the $m$ by $-n$ band $m$ atrix $A$, stored in row $s$ 1 to $\mathrm{KL}+\mathrm{KU}+1$. The $j$ th column of is stored in the $j$ th column of the array $A B$ as follows: $A B(k u+1+i-j)=A(i, j)$ for $\max (1, j$ $\mathrm{ku})<=i<=m$ in $(m, j+k l)$. On exit, $A$ is overw rilten by values generated during the reduction.
LDAB (input)
The leading dim ension of the anay A. LD A B >= $K L+K U+1$.

D (output)
The diagonalelem ents of the bidiagonalm atrix B .

E (output)
The superdiagonal elem ents of the bidiagonal $m$ atrix B.

Q (output)
IfVECT = $Q$ 'or $B$ ', the $m$-by $m$ unitary $m$ atrix $Q$. If $V E C T=N$ 'or $P$ ', the array $Q$ is not referenced.

LD Q (input)
The leading dim ension of the array $Q$. LDQ >= $m$ ax (1, M) ifVECT = Q 'or B'; LD Q >= 1 otherw ise.

PT (output)
IfVECT $=P$ 'or $B^{\prime}$ ', the $n-b y-n$ unitary matrix
$P^{\prime}$. If VECT $=N$ 'or $Q$ ', the amay PT is not referenced.

LDPT (input)
The leading dim ension of the array PT. LD PT >= $\max (1, \mathbb{N})$ if $\mathrm{VECT}=\mathrm{P}$ 'or $\mathrm{B} ; \operatorname{LDPT}>=1$ otherw ise.

C (input/output)
On entry, an $m$-by-ncc m atrix C. On exit, $C$ is overw rilten by $\mathrm{Q}{ }^{*} \mathrm{C} . \mathrm{C}$ is not referenced if $\mathrm{NCC}=$ 0 .

LD C (input)
The leading dim ension of the array C. LD C >=
$\max (1, M)$ if $N C C>0 ; L D C>=1$ if $N C C=0$.

*a, int lda, int *ipivot, float anorm, float
*rcond, int*info);
void ogbcon_64 (char norm , long n, long nsub, long nsuper, complex *a, long lda, long *ípivot, floatanorm , float *roond, long *info);

## PURPOSE

cgbcon estim ates the reciprocal of the condition num ber of a com plex general band $m$ atrix $A$, in either the 1 -norm or the infinity-norm, using the LU factorization com puted by CGBTRF.

A $n$ estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as
$\operatorname{RCOND}=1 /(\operatorname{norm}(A) * \operatorname{norm}(\operatorname{inv}(A)))$.

## ARGUMENTS

## NORM (input)

Specifies w hether the 1-norm condition num ber or the infinity-norm condition num ber is required:
= 1 'or $0^{\prime}$ : 1-norm;
$=1 ': \quad$ Infinity-norm .

N (input) The order of the m atrix A. $\mathrm{N}>=0$.

N SUB (input)
The num ber of subdiagonals w ithin the band of A. N SUB $>=0$.

## N SU PER (input)

The num ber of superdiagonals w ithin the band of A. N SU PER $>=0$.

A (input) D etails of the LU factorization of the band $m$ atrix
A, as com puted by CGBTRF. U is stored as an upper triangularband $m$ atrix $w$ ith N SU B +N SU PER superdiagonals in rows 1 to NSUB+NSUPER+1, and them ultipliers used during the factorization are stored in row SN SU B + N SU PER +2 to $2 *$ N SU B + N SU PER +1 .

## LDA (input)

The leading dim ension of the array A . LDA >= $2 * N$ SU B + N SU PER +1 .

PIVOT (input)
The pivot indices; for $1<=i<=N$, row $i$ of the $m$ atrix $w$ as interchanged w ith row $\mathbb{P} \mathbb{I V}$ T (i).

ANORM (input)
IfNORM = I' or $\mathrm{D}^{\prime}$ ', the 1 -norm of the original $m$ atrix $A$. IfNORM = 'I', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition number of the $m$ atrix $A$, computed as RCOND $=1 /($ norm (A) * norm (inv (A))).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{N} F O$ (output)

## C INTERFACE

\#include <sunperfh>
void cgbequ (intm, intn, intkl, intku, com plex *a, int lda, float *r, float *c, float*row cnd, float *colend, float *am ax, int*info);
void cgbequ_64 (long m, long n, long kl, long ku, com plex *a, long lda, float *r, float * C , float *row cnd, float
*colcnd, float *am ax, long *info);

## PURPOSE

cgbequ com putes row and colum n scalings intended to equilibrate an M -by-N band $m$ atrix A and reduce its condition num ber. $R$ retums the row scale factors and $C$ the colum $n$ scale factors, chosen to try to $m$ ake the largestelem ent in each row and colum $n$ of the $m$ atrix $B$ ith elem ents $\mathrm{B}(\mathrm{i}, \mathrm{j})=\mathrm{R}(\mathrm{i}) \star \mathrm{A}(\mathrm{i}, \mathrm{j}) * \mathrm{C}(\mathrm{j})$ have absolute value 1.

R (i) and C (j) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N U M = largest safe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

## ARGUMENTS

M (input) The num ber of row s of the m atrix A. M >=0.

N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

KL (input)
The num ber of subdiagonals $w$ thin the band of $A$. $\mathrm{KL}>=0$ 。

K U (input)
The num ber of superdiagonals $w$ ithin the band of $A$.
$K U>=0$ 。

A (input) The band $m$ atrix $A$, stored in row $s 1$ to $K L+K U+1$.
The $j$ th colum $n$ ofA is stored in the $j$ th colum $n$
of the array A as follow s: A $(k u+1+i-j)=A(i, 7)$
form ax $(1, j \mathrm{jku})<=i<=m$ in $(m, j+k l)$.
LD A (input)
The leading dim ension of the array A. LDA >= K L+KU +1.

R (output)
If $\mathbb{N} F O=0$, or $\mathbb{N} F O>M, R$ contains the row scale factors forA.
C (output)
If $\mathbb{N} F O=0, C$ contains the colum $n$ scale factors
forA.

ROW CND (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O>M, R O W C N D$ contains the ratio
of the sm allest $R$ (i) to the largestR (i). If
ROW CND >=0.1 and AM AX is neither too large nor too sm all, it is notw orth scaling by $R$.

COLCND (output)
If $\mathbb{N} F O=0, C O L C N D$ contains the ratio of the sm allest $C$ (i) to the largestC (i). IfC O LCND >= 0.1 , it is notw orth scaling by $C$.

AM AX (output)
A bsolute value of largestm atrix elem ent. IfA M AX
is very close to overflow orvery close to under-
flow , the m atrix should be scaled.
$\mathbb{I N} F O$ (output)
= 0: successfulexit
<0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an ille-
galvalue
> 0 : if $\mathbb{N} F O=i$, and $i$ is
$<=\mathrm{M}$ : the i-th row ofA is exactly zero
$>M$ : the ( -H ) -th colum n of A is exactly zero

## C INTERFACE

\#include <sunperfh>
void cgbm v (chartransa, intm , intn, intnsub, int nsuper, com plex *alpha, com plex *a, int lda, com plex *x, int incx, com plex *beta, com plex *y, int incy);
void cgbm v_64 (char transa, long m, long n, long nsub, long nsuper, com plex *alpha, com plex *a, long lda, com plex *x, long incx, com plex *beta, complex *y, long incy);

## PURPOSE

cgbm v perform s one of the $m$ atrix-vector operations $y:=$ alpha*A *x + beta*y, ory : alpha*A *x + beta*y, or y := alpha*conjg (A ')*x + beta*y where alpha and beta are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band $m$ atrix, w ith nsub sub-diagonals and nsuper super-diagonals.

## ARGUMENTS

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow $s$ :
TRANSA $=\mathrm{N}$ 'or h ' $\mathrm{y}:=$ alpha*A *x + beta* y .
TRANSA = ' 'or t' $y=a l p h a * A ~ * x+b e t a * y$.
TRANSA $=$ C'or $\epsilon^{\prime} y:=$ alpha*conǵ (A')*x + beta*y.
U nchanged on exit.

TRANSA is defaulted to $N$ 'forF95 $\mathbb{I N}$ TERFACE.

M (input)
On entry, M specifies the num berof rows of the m atrix A. M mustbe at least zero. U nchanged on exit.

O n entry, $N$ specifies the num ber of colum ns of the $m$ atrix A. $N$ m ustbe at least zero. U nchanged on exit.

NSUB (input)
On entry, NSUB specifies the number of subdiagonals of the matrix A.N SUB m ustsatisfy 0 le. N SU B . U nchanged on exit.

## NSUPER (input)

O n entry, N SU PER specifies the num ber of superdiagonals of them atrix A.N SU PER m ust satisfy 0 le. N SU PER. U nchanged on exit.
ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry, the leading (nsub + nsuper+1) by $n$ part of the array $A$ ustcontain the $m$ atrix of coefficients, supplied colum $n$ by colum $n$, w th the leading diagonal of the $m$ atrix in row (nsuper+ 1 ) of the array, the first super-diagonal starting at position 2 in row nsuper, the firstsubdiagonalstarting atposition 1 in row (nsuper + 2 ), and so on. Elem ents in the array A that do notcorrespond to elem ents in the band $m$ atrix (such as the top leftnsuperby nsupertriangle) are not referenced. The follow ing program segm ent $w$ illtransfera band $m$ atrix from conventional full $m$ atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, \mathrm{~J}=1, \mathrm{~N} \\
& \mathrm{~K}=\mathrm{N} \text { SUPER }+1-\mathrm{J} \\
& \text { DO } 10, \mathrm{I}=\mathrm{M} \text { AX }(1, \mathrm{~J}-\mathrm{NSUPER}), \mathrm{M} \mathbb{I}(\mathrm{M}, \mathrm{~J}+ \\
& \text { NSUB }) \\
& \quad \text { A }(\mathrm{K}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \quad \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

U nchanged on exit.

## LDA (input)

On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A m ust be at least (nsub + nsuper+ 1 ). Unchanged on exit.

X (input)
$(1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C X))$ when TRANSA $=\mathrm{N}$ 'or
$h^{\prime}$ and at least ( $\left.1+(m-1) * a b s(\mathbb{N} C X)\right)$ otherw ise. Before entry, the increm ented array $X$ $m$ ust contain the vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents of $\mathrm{X} . \mathbb{N} C X$ m ustnotbe zero. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then Y need notbe seton input. U nchanged on exit.

Y (input/output)
$(1+(m-1) \star \operatorname{abs}(\mathbb{N} C Y))$ when TRANSA $=\mathrm{N}$ 'or $h^{\prime}$ and at least ( $\left.1+(\mathrm{n}-1)^{\star} \operatorname{abs}(\mathbb{N} C Y)\right)$
otherw ise. Before entry, the increm ented array $Y$ m ust contain the vectory. On exit, Y is overw ritten by the updated vectory.
$\mathbb{N C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y . \mathbb{N} C Y$ m ustnotbe zero. U nchanged on exit.

## PURPOSE

cgbrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is banded, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

TRANSA (input)
Specifies the form of the system ofequations:
$=\mathrm{N}: A * X=B \quad$ (Notranspose)
$=T$ ': $\mathrm{A} * * \mathrm{~T} * \mathrm{X}=\mathrm{B} \quad$ ( T ranspose)
$=C$ ': $A * * H * X=B \quad$ (C onjugate transpose)

TRANSA is defaulted to N 'forF95 $\mathbb{I N T E R F A C E .}$

N (input) The order of them atrix A. N $>=0$.

KL (input)
The num berof subdiagonals w thin the band of A. $\mathrm{KL}>=0$.

KU (input)
The num ber of superdiagonals w ithin the band of A. $K U>=0$.

NRHS (input)
The num berof righthand sides, i.e., the num ber of collm ns of the m atrioes B and X. NRH S >=0.

A (input) The originallband $m$ atrix $A$, stored in row $s$ to $K L+K U+1$. The $j$ th column of $A$ is stored in the $j$ th colum $n$ of the array A as follow s: A (ku+1+i$j \gg)=A(i, j)$ form ax $(1, j k u)<=i<=m$ in $(n, j+k l)$.

LD A (input)
The leading dim ension of the anay A. LDA >= $K L+K U+1$.

AF (input)
D etails of the LU factorization of the band $m$ atrix A, as com puted by CGBTRF. U is stored as an upper triangularband $m$ atrix $w$ ith $\mathrm{KL}+\mathrm{KU}$ superdiagonals in row $s 1$ to $K L+K U+1$, and the $m$ ultipliers used during the factorization are stored in row S $K L+K U+2$ to $2 * K L+K U+1$.

LDAF (input)
The leading dim ension of the array AF. LDAF >= $2 * K L * K U+1$.

PIVOT (input)
The pivotindices from CGBTRF; for $1<=i<=N$, row $i$ of the $m$ atrix $w$ as interchanged $w$ th row $\mathbb{P}$ IV OT (i).
$B$ (input) The righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by CGBTRS. On exit, the im proved solution $m$ atrix $X$.

## LD X (input)

The leading dim ension of the array X . LD X >=
$\max (1, \mathbb{N})$.
FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O})$, $\operatorname{FERR}(\mathcal{)}$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{\nu})-X$ TRU $E$ ) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{j})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard emor of each
solution vectorX (j) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( $)$ ) an exactsolution).

W ORK (w orkspace)
dim ension $\left(2{ }^{*} \mathrm{~N}\right)$
W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
< 0 : if $\mathbb{N} F O=-i$, the $i$-th argum enthad an illegalvalue

\mathbb{NTEGER*8 \mathbb{PIVOT (*)}}\mathbf{(})
```

## F95 INTERFACE

SU BROUTINE GBSV ( $\mathbb{N}], K L, K U, \mathbb{N} R S], A,[L D A], \mathbb{P} \mathbb{I} O T, B,[L D B]$, [ $\mathbb{N}$ FO ])

COM PLEX,D $\mathbb{M}$ ENSION (:,:) ::A, B
$\mathbb{N} T E G E R:: N, K L, K U, N R H S, L D A, L D B, \mathbb{N} F O$
$\mathbb{N} T E G E R, D \mathbb{I M} \operatorname{ENSION}(:):: \mathbb{P} \mathbb{V} O T$
 [LDB], [ $\mathbb{N F O}$ ])

## C INTERFACE

\#include <sunperfh>
void cgbsv (intn, int kl, int ku, intnrhs, com plex *a, int lda, int *ịívot, com plex *b, int ldb, int *info);
void cgbsv_64 long n, long kl, long ku, long nrhs, com plex
*a, long lda, long *ipívot, com plex *b, long ldb, long *info);

## PURPOSE

cgbsv com putes the solution to a com plex system of linear equations $A$ * $X=B$, where $A$ is a band $m$ atrix oforder $N$ $w$ th $K L$ subdiagonals and $K U$ superdiagonals, and $X$ and $B$ are N -by-N R H S m atrices.

The LU decom position $w$ ith partialpivoting and row interchanges is used to factorA asA $=\mathrm{L} * \mathrm{U}$, where L is a productof perm utation and unit low er triangularm atrices $w$ th $K L$ subdiagonals, and $U$ is uppertriangularw ith K L+K U superdiagonals. The factored form of $A$ is then used to solve the system of equations $A * X=B$.

## ARGUMENTS

N (input) The num ber of linearequations, i.e., the order of them atrix $A . N>=0$.

KL (input)
The num ber of subdiagonals w ithin the band of A. $K L>=0$.

KU (input)
The num ber of superdiagonals $w$ ithin the band of $A$. $K U>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS >=0.

A (input/output)
On entry, the m atrix A in band storage, in row s
$K L+1$ to $2 * K L+K U+1$; row s 1 to $K L$ of the anay need notbe set. The $j$ th column of A is stored in the $j$ th collumn of the array A as follows: $A(K L+K U+1+i-j, j)=A(i, j)$ for $\max (1, j$ $K U)<=i<=m$ in ( $N, j+K L$ ) On exit, details of the factorization: $U$ is stored as an upper triangular band $m$ atrix $w$ ith $K L+K U$ superdiagonals in row $s 1$ to $K L+K U+1$, and the $m$ ultipliers used during the factorization are stored in rows $K L+K U+2$ to $2 \star K L+K U+1$. See below for further details.

LD A (input)
The leading dim ension of the array A. LDA >= $2 * K L+K U+1$.
$\mathbb{P I V O T}$ (output)
The pivot indices that define the perm utation $m$ atrix $P$; row i of the $m$ atrix $w$ as interchanged w ith row $\mathbb{P I V O T}$ (i).

B (input/output)
On entry, the $N-b y-N R H S$ righthand sidem atrix $B$. On exit, if $\mathbb{N} F O=0$, the $N$ by $-N R H S$ solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N} F O=i, U(i, i)$ is exactly zero. The factorization has been com pleted, but the factor U is exactly singular, and the solution has notbeen com puted.

## FURTHER DETAILS

The band storage scheme is illustrated by the follow ing exam ple, when $M=N=6, K L=2, K U=1$ :

On entry: Onexit:
u36

*     *         +             +                 +                     +                         *                             * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55 u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65 * a31 a42 a53 a64 * * m31 m 42 m 53 m 64 * *

A rray elem entsm arked * are notused by the routine; ele$m$ entsm arked + need notbe seton entry, but are required by the routine to store elem ents of $U$ because of fill-in resulting from the row interchanges.

## C INTERFACE

\#include <sunperfh>
void ogbsvx (char fact, chartransa, intn, intkl, int ku, int nuhs, complex *a, int lda, com plex *af, int ldaf, int*ipivot, char equed, float * $r$, float * c, com plex *b, int ldb, com plex *x, int ldx, float *rcond, float *ferr, float *berr, int*info);
void cgbsvx_64 (char fact, chartransa, long n, long kl, long ku, long nrhs, com plex *a, long lda, com plex *af, long ldaf, long *íivot, char equed, float *r, float *${ }^{\text {C }}$, com plex ${ }^{*} \mathrm{~b}$, long ldlo, com plex ${ }^{*}$ x, long ldx, float *rcond, float *ferr, float*berr, long *info);

## PURPOSE

cgbsvx uses the LU factorization to com pute the solution to a complex system of linearequations $A * X=B, A * * T * X=$ $B$, orA $* * H * X=B, w h e r e A$ is a band $m$ atrix of order $N w$ ith $K L$ subdiagonals and KU superdiagonals, and $X$ and $B$ are $N$ -by-N R H S m atrices.

Emrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed by this subroutine:

1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
TRANS $=N^{\prime}: \operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C) \quad * \operatorname{inv}(\operatorname{diag}(C)) * X=$ diag (R)*B

TRANS $=T$ ': $(\operatorname{diag}(R) * A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(R)) * X=$ diag (C ) *B

TRANS = C': (diag $(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=$ diag (C)*B
W hether or not the system w illbe equilibrated depends on the scaling of the m atrix A, but if equilibration is used, A is overw rilten by diag $(\mathbb{R}) * A$ *diag ( $C$ ) and $B$ by diag $(\mathbb{R}) * B$ (if TRANS = N ) ordiag (C)*B (if TRANS = 'T'orC). 2. IfFACT $=\mathrm{N}$ 'or E ', the LU decom position is used to factor the m atrix A (afterequilibration ifFACT =E) as $A=L * U$, where $L$ is a product of perm utation and unit low er triangular
$m$ atrices $w$ ith KL subdiagonals, and U is upper triangular w ith K L+KU superdiagonals.
3. If som e $U(i, i)=0$, so that $U$ is exactly singular, then the routine
retums w ith $\mathbb{N} F O=$ i. O therw ise, the factored form of A is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N} F O=N+1$ is retumed as a waming, but the routine stillgoes on
to solve for $X$ and com pute emor bounds as described below .
4.The system of equations is solved for $X$ using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.
6. Ifequilibration w as used, the $m$ atrix $X$ is prem ultiplied
by
diag $(C)$ (ifTRANS $=N$ ) ordiag $(\mathbb{R})$ (ifTRANS $=T$ 'or C) so
that itsolves the originalsystem before equilibration.

## ARGUMENTS

FACT (input)
Specifies w hether ornotthe factored form of the $m$ atrix $A$ is supplied on entry, and ifnot, whether the $m$ atrix A should be equilibrated before it is factored. = F ': On entry, AF and $\mathbb{P}$ IV O T contain the factored form of . IfEQUED is not $N$ ', the $m$ atrix A has been equilibrated $w$ ith scaling factors given by R and $\mathrm{C} . \mathrm{A}, \mathrm{AF}$, and $\mathbb{P}$ IV OT are not m odified. $=\mathrm{N}$ ': Them atrix A w ill.be copied to A F and factored.
= E ': The matrix A will be equilibrated if necessary, then copied to A F and factored.

TRANSA (input)
Specifies the form of the system of equations. $=$
$\mathrm{N}: A * X=B \quad$ N o transpose)
$=T$ ': A**T * $\mathrm{X}=\mathrm{B} \quad$ ( T ranspose)
$=C: A * * H * X=B \quad$ (C onjugate transpose)

TRANSA is defaulted to $N$ 'forF95 $\mathbb{I N T E R F A C E .}$

N (input) The num ber of linearequations, ie., the order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

K L (input)
The num ber of subdiagonals $w$ thin the band of $A$. $\mathrm{K} L>=0$ 。

K U (input)
The num ber of superdiagonals $w$ ithin the band of $A$. $K U>=0$ 。

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrioes B and X. NRHS >=0.

A (input/output)
On entry, the m atrix A in band storage, in row s 1 to $K L+K U+1$. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum $n$ of the array A as follow s: A (KU+1+i$j, j)=A(i, j)$ form $a x(1, j K U)<=i<=m$ in $(\mathbb{N}, j+k l)$

IfFACT = F'and EQUED is not $N^{\prime}$, then $A$ must
have been equilibrated by the scaling factors in $R$ and/orC. A is notm odified ifFACT = F'or N',
orifFACT = E'andEQUED $=\mathrm{N}$ 'on exit.
Onexit, ifEQUED ne. $N$ ', A is scaled as follow s: $E Q U E D=R$ ': A : $=\operatorname{diag}(\mathbb{R}) * A$
EQUED = C': A : A * diag (C)
EQUED = B ': A := diag (R)*A * diag (C ).
LD A (input)
The leading dim ension of the array A. LDA >= $K L+K U+1$.
AF (input/output)
If FACT = $F$ ', then AF is an input argum entand on entry contains details of the LU factorization of the band $m$ atrix $A$, as com puted by CGBTRF. U is stored as an upper triangularband $m$ atrix $w$ ith
$K L+K U$ superdiagonals in row $s 1$ to $K L+K U+1$, and the m ultipliers used during the factorization are stored in row sKL+KU+2 to $2 \star \mathrm{~K} L+K U+1$. If EQUED ne. $N$ ', then $A F$ is the factored form of the equilibrated $m$ atrix $A$.

IfFACT $=\mathrm{N}$ ', then $A F$ is an output argum ent and on exit retums details of the LU factorization of A.

IfFACT $=\mathrm{E}$ ', then AF is an output argum ent and on exit retums details of the LU factorization of the equilibrated $m$ atrix $A$ (see the description of $A$ for the form of the equilibrated $m$ atrix).

LD AF (input)
The leading dim ension of the array AF. LDAF >= $2 * K L+K U+1$.
$\mathbb{P} \mathbb{V} O T$ (input)
IfFACT=F', then $\mathbb{P I V O T}$ is an input argum ent and on entry contains the pivot indioes from the factorization $\mathrm{A}=\mathrm{L} * \mathrm{U}$ as com puted by CGBTRF ; row i of the $m$ atrix $w$ as interchanged $w$ ith row $\mathbb{P}$ IV OT (i).

IfFACT $=\mathrm{N}^{\prime}$, then $\mathbb{P} \mathbb{I V} \operatorname{T}$ is an output argum ent and on exit contains the pivot indioes from the factorization $A=L * U$ of the originalm atrix $A$.

IfFACT = E ', then $\mathbb{P}$ IV OT is an output argum ent and on exit contains the pivot indices from the factorization $A=L * U$ of the equilibrated $m$ atrix
A.

EQUED (input)
Specifies the form of equilibration thatw as done.
$=\mathrm{N}^{\prime}$ : N o equilibration (alw ays true ifFACT =
N 7 。
$=R$ ': R ow equilibration, i.e., A has been
prem ultiplied by diag $(\mathbb{R}) .=\mathrm{C}$ : C olum $n$ equilibration, ie., A has been postm ultiplied by diag $(C)$. $=B$ ': B oth row and colum $n$ equilibration, ie., A has been replaced by diag $(R)$ * A * diag (C). EQUED is an inputargum entifFACT= $F$ '; otherw ise, it is an output argum ent.

R (input/output)
The row scale factors forA. IfEQUED $=R^{\prime}$ or $B$ ', A is multiplied on the leftby diag $(\mathbb{R})$; if $E Q U E D=N$ 'or $C$ ', $R$ is notaccessed. $R$ is an input argum ent iffACT = F ; otherw ise, R is an outputargum ent. IfFACT $=\mathrm{F}^{\prime}$ and EQUED $=\mathrm{R}^{\prime}$ or B ', each elem entofR m ustbe posilive.

C (input/output)
The colum n scale factors forA. IfEQUED = C 'or $B$ ', A ism ultiplied on the rightby diag (C); if EQUED $=N$ 'or $R$ ', $C$ is notaccessed. $C$ is an input argum ent ifFACT $=\mathrm{F}$; otherw ise, C is an outputargum ent. IfFACT = $\mathrm{F}^{\prime}$ and EQUED $=\mathrm{C}^{\prime}$ or B ', each elem entofC mustbe positive.

B (input/output)
On entry, the righthand side m atrix B. On exit, ifEQUED $=N^{\prime}$ ', $B$ is notm odified; ifTRANSA $=N^{\prime}$ and EQUED $=R^{\prime}$ or $B^{\prime}, B$ is overw ritten by $\operatorname{diag}(\mathbb{R}) * B$; if TRANSA $=T^{\prime}$ or $C^{\prime}$ and EQUED $=C^{\prime}$ or $B \prime, B$ is overw rilten by diag $(C) * B$.

LD B (input)
The leading dim ension of the array B . LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N}$ FO $=0$ or $\mathbb{N} F O=N+1$, the $N$ boy-NRHS solution $m$ atrix $X$ to the original system of equations. $N$ ote that $A$ and $B$ arem odified on exit if EQUED ne. $N$ ', and the solution to the equilibrated system is inv (diag (C))*X ifTRANSA = N 'and EQUED $=C$ 'or $B$ ', orinv (diag $(\mathbb{R})) * X$ ifTRANSA $=T$ 'or C'andEQUED = R 'or $\mathrm{B}^{\prime}$.

LD $X$ (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

RCOND (output)
The estim ate of the reciprocal condition num ber of the $m$ atrix $A$ afterequilibration (if done). If
RCOND is less than them achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to w orking precision. This condition is indicated by a retum code of $\mathbb{N}$ FO $>0$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X(\mathcal{I})$ the $j$ th column of the solution matrix X). If XTRUE is the true solution corresponding to $X(\mathcal{H}), \operatorname{FERR}(\mathcal{H})$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $\mathrm{X}(\mathcal{i})-\mathrm{X}$ TRUE) divided by the m agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector X (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dimension (N) On exit, WORK2(1) contains the reciprocal pivot grow th factornorm (A)/norm (U). The "max absolute element" norm is used. If W ORK2(1) is much less than 1 , then the stability of the LU factorization of the (equilibrated)
$m$ atrix A could be poor. This also $m$ eans that the solution X, condition estim atorRCOND, and forw ard error bound FERR could be unreliable. If factorization fails w ith $0<\mathbb{N} F O<=N$, then $W$ ORK 2 (1) contains the reciprocal pivot grow th factor for the leading $\mathbb{N}$ FO colum ns of .
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N} F O=i$, and $i$ is
$<=\mathrm{N}: \mathrm{U}(\mathrm{i}, \mathrm{i})$ is exactly zero. The factorization has been com pleted, but the factor U is exactly singular, so the solution and emor bounds could not be com puted. R COND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{U}$ is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void cgbtf2_64 (long m, long n, long kl, long ku, com plex *ab, long ldab, long *ipiv, long *info);

## PURPOSE

cgbtf2 com putes an LU factorization of a com plex $m$-by-n band $m$ atrix A using partialpivoting $w$ ith row interchanges.

This is the unblocked version of the algorithm , calling Level2 BLAS.

## ARGUMENTS

M (input) The num ber of row s of the matrix $A . M>=0$.

N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

KL (input)
The num ber of subdiagonals w ithin the band of A.
$K L>=0$ 。

KU (input)
The num ber of superdiagonals $w$ thin the band of $A$.
$K U>=0$ 。

A B (input/output)
O n entry, the m atrix A in band storage, in row s $K L+1$ to $2 * K L+K U+1$; row $s 1$ to $K L$ of the anay need notbe set. The $j$ th colum $n$ of $A$ is stored in the jth column of the array $A B$ as follow s: $A B(k l+k u+1+i-j)=A(i, j)$ for $\max (1, j$ $\mathrm{ku})<=\mathrm{i}<=\mathrm{m}$ in $(\mathrm{m}, \mathrm{j}+\mathrm{kl})$

O $n$ exit, details of the factorization: $U$ is stored as an upper triangular band $m$ atrix $w$ th $K L+K U$ superdiagonals in row s 1 to $\mathrm{K} L+K \mathrm{U}+1$, and the m ultipliers used during the factorization are stored in row $s K L+K U+2$ to $2 * K L+K U+1$. See below for furtherdetails.

LDAB (input)
The leading dim ension of the array AB. LDAB >=
$2 * K L+K U+1$.

IPIV (output)
The pivot indices; for $1<=i<=m$ in $M, N$ ), row i of the $m$ atrix $w$ as interchanged $w$ ith row $\mathbb{P} \mathbb{V}$ (i).
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
$<0$ : if $\mathbb{N N F O}=-$ i, the $i$-th argum ent had an illegalvalue $>0$ : if $\mathbb{N} F O=+i, U(i, i)$ is exactly zero. The factorization has been com pleted, but the factor $U$ is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

## FURTHER DETAILS

The band storage scheme is illustrated by the follow ing exam ple, $w$ hen $M=N=6, K L=2, K U=1$ :

On entry: On exit:

```
    * * * + + + * * * u14 u25
u36
    * * + + + + * * u13 u24 u35
u46
    * a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
    a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55
u66
    a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65
*
    a31 a42 a53 a64 * * m 31 m 42 m 53 m 64 *
```

* 

A ray elem entsm arked * are notused by the routine; ele$m$ entsm arked + need notbe seton entry, but are required by the routine to store elem ents of $U$, because of fill-in resulting from the row interchanges.

\#include <sunperfh>
void cgebak (char jo.b, charside, intn, int ilo, int ihi, float *scale, int $m$, com plex *v, int ldv, int *info);
void cgebak_64 (char jंb, char side, long n, long ilo, long ihi, float *scale, long m, com plex *v, long ldv, long *info);

## PURPOSE

cgebak form sthe rightor left eigenvectors of a com plex general $m$ atrix by backw ard transform ation on the com puted eigenvectors of the balanced $m$ atrix outputby CGEBAL .

## ARGUMENTS

JOB (input)
Specifies the type of backw ard transform ation required: = N ', do nothing, retum im $m$ ediately; = P ', do backw ard transform ation for perm utation only; = S', do backw ard transform ation for scaling only; = B ', do backw ard transform ations for both perm utation and scaling. JOB m ustbe the sam e as the argum ent $J 0$ B supplied to CG EBA L .

STDE (input)
= R : : V contains righteigenvectors;
= $\mathrm{L}: \mathrm{V}$ contains lefteigenvectors.

N (input) The num ber of row s of the m atrix $\mathrm{V} . \mathrm{N}>=0$.

ㅍO (input)
The integer ILO determ ined by CGEBAL. $1<=\mathbb{L O}$ <= $\mathbb{H} I<=N$, if $N>0 ; \mathbb{H}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

HH I (input)
The integer $\mathbb{H}$ Ideterm ined by CGEBAL. $1<=\mathbb{L O}$ <= $\mathbb{H} I<=N$, if $N>0 ; \mathbb{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

SCALE (input)
D etails of the perm utation and scaling factors, as retumed by CGEBAL.

M (input) The num ber of collm ns of the $m$ atrix $V . M>=0$.
V (input/output)
O $n$ entry, the $m$ atrix of right or lefteigenvectors to be transform ed, as retumed by CHSE IN or CTREVC. On ex㝳, $V$ is overw ritten by the transform ed eigenvectors.

LD V (input)
The leading dim ension of the array $V$. LDV >= $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum ent had an illegalvalue.

## C INTERFACE

\#include <sunperfh>
void cgebal(char j̀b, intn, com plex *a, intlda, int *ilo, int *ini, float *scale, int *info);
void cgebal 64 (char jं.b, long n, com plex *a, long lda, long *ilo, long *ihi, float *scale, long *info);

## PURPOSE

cgebalbalances a general com plex m atrix A. This involves, first, perm uting A by a sim ilarity transform ation to isolate eigenvalues in the first1 to $\mathrm{ILO}-1$ and last $\mathrm{IH} \mathrm{I}+1$ to N elem ents on the diagonal; and second, applying a diagonal sim ilarity transform ation to row s and colum ns $\mathbb{I} O$ to $\mathbb{H} I$ to $m$ ake the rows and colum ns as close in norm as possible. B oth steps are optional.
$B$ alancing $m$ ay reduce the 1 -norm of the $m$ atrix, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors.

## ARGUMENTS

JOB (input)
Specifies the operations to be perform ed on A :
$=\mathrm{N}$ ': none: simply set $\mathbb{H} \mathrm{O}=1, \mathbb{H} I=\mathrm{N}$, SCALE (I) = 1.0 for $i=1, \ldots, N ;=P$ : perm ute only;
= S': scale only;
$=B$ ': both perm ute and scale.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the inputm atrix A. On exit, A is overw ritten by the balanced $m$ atrix. If $\mathrm{OB}=\mathrm{N}^{\prime}$, $A$ is not referenced. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LD A >= $\max (1, N)$.

IO and $\mathbb{H}$ Iare set to integers such thaton exit A $(i, 7)=0$ if $i>$ jand $j=1, \ldots$, ILO-1 or $I=$
 $=\mathrm{N}$.

HI I (output)
IO and $\mathbb{H}$ Iare set to integers such thaton exit A $(i, j)=0$ if $i>j a n d j=1, \ldots$, IL O-1 or $I=$ $\mathrm{HH} \mathrm{I}+1, \ldots, \mathrm{~N}$. If $\mathrm{JOB}=\mathrm{N}$ 'or $\mathrm{S}^{\prime}, \mathrm{LIO}=1$ and H I $=\mathrm{N}$.

SCALE (output)
D etails of the perm utations and scaling factors applied to $A$. IfP $(j)$ is the index of the row and colum $n$ interchanged $w$ th row and colum $n$ jand $D(1)$ is the scaling factor applied to row and column $\mathfrak{j}$ then SCALE $(j)=P(j) \quad$ for $j=1, \ldots, I L O-1=D(j)$ for $j=\mathbb{L O}, \ldots, \mathbb{H} I=P(j) \quad$ for $j=\mathbb{H} I+1, \ldots, N$. The order in which the interchanges are m ade is N to $\mathbb{H} \mathrm{I}+1$, then 1 to $\mathbb{L} O-1$.
$\mathbb{N} F O$ (output)
= 0: successfulexit.
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue.

## FURTHER DETAILS

The perm utations consist of row and column interchanges which put the $m$ atrix in the form

$$
\begin{gathered}
(\mathrm{T} 1 \mathrm{X} \\
\mathrm{PAP}=\left(\begin{array}{ll}
0 & \mathrm{~B}
\end{array}\right) \\
\left(\begin{array}{ll}
0 & \mathrm{O}
\end{array}\right)
\end{gathered}
$$

where T1 and T2 are uppertriangularm atrices whose eigenvalues lie along the diagonal. The colum $n$ indioes $\Pi 0$ and IH Im ark the starting and ending colum ns of the subm atrix B. Balancing consists of applying a diagonal sim ilarity transform ation inv (D) * $B * D$ to $m$ ake the 1 -norm $s$ of each row of $B$ and its comesponding colum n nearly equal. The outputm atrix is
$\left(\begin{array}{lll}T 1 & X * D & Y\end{array}\right)$
$\left(\begin{array}{lll}0 & \operatorname{inv}(D) * B * D & \operatorname{inv}(D) * Z\end{array}\right)$.
$\left(\begin{array}{lll}0 & 0 & T 2\end{array}\right)$

Inform ation about the perm utations $P$ and the diagonalm atrix D is retumed in the vectorSC A LE .

This subroutine is based on the E ISPA CK routine CBAL.

## C INTERFACE

\#include <sunperfh>
void cgebrd (intm , intn, com plex *a, int lda, float *d, float *e, complex *tauq, complex *taup, int *info);
void cgebrd_64 (long m, long n, com plex *a, long lda, float *d, float *e, com plex *tauq, com plex *taup, long *info);

## PURPOSE

cgebrd reduces a general com plex M -by-N m atrix A to upper or low er bidiagonal form B by a unitary transform ation: Q **H * $A * P=B$.

Ifm $>=n, B$ is upperbidiagonal; ifm $<n, B$ is low erbidiagonal

## ARGUMENTS

M (input) The num ber of row s in the m atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of colum ns in them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O $n$ entry, the $M-b y-N$ generalm atrix to be reduced. On exit, if $m>=n$, the diagonal and the first superdiagonal are overw rilten w ith the upperbidiagonal $m$ atrix B; the elem ents below the diagonal, $w$ ith the amay TAU $Q$, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors, and the elem ents above the first superdiagonal, w ith the array TAUP, represent the unitary $m$ atrix $P$ as a product ofelem entary reflectors; ifm < n, the diagonaland the first subdiagonal are overw rilten w ith the low erbidiagonalm atrix $B$; the elem ents below the firstsubdiagonal, with the array TAU Q, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors, and the elem ents above the diagonal, w ith the array TA UP, represent the unitary $m$ atrix $P$ as a productofelem entary reflec-
tors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LD A >= $\max (1, M)$.

D (output)
The diagonalelem ents of the bidiagonalm atrix B :
$D(i)=A(i, i)$.

E (output)
The off-diagonalelem ents of the bidiagonalm atrix
$B$ : ifm $>=n, E(i)=A(i, i+1)$ for $i=1,2, \ldots, n-$
1 ; ifm $<n, E(i)=A(i+1, i)$ for $i=1,2, \ldots, m-1$.
TAUQ (output)
The scalar factors of the elem entary reflectors which represent the unitary $m$ atrix $Q$. See Further D etails.

TAUP (output)
The scalar factors of the elem entary reflectors w hich represent the unitary m atrix P. See Further D etails.

W ORK (w orkspace)
On exiv, if $\mathbb{N F O}=0, W$ ORK ( 1 ) retums the optim al LW ORK.

LW ORK (input)
The length of the amay $W$ ORK. LW ORK >= $\max (1, M, N)$. For optim um perform ance LW ORK >= $(M+N) \star N B$, w here N B is the optim alblocksize.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{I N F O}$ (output)
= 0: successfillexit.
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an illegalvalue.

## FURTHER DETAILS

Them atrices $Q$ and $P$ are represented as products of elem entary reflectors:

Ifm $>=n$,

$$
Q=H(1) H(2) \ldots H(n) \text { and } P=G(1) G(2) \ldots G(n-1)
$$

Each H (i) and G (i) has the form :

$$
H(i)=I-\operatorname{tanq}{ }^{\star} v^{\star} v^{\prime} \text { and } G(i)=I-\operatorname{taup} * u^{\star} u^{\prime}
$$

$w$ here tauq and taup are com plex scalars, and $v$ and $u$ are complex vectors; $v(1: i-1)=0, v(i)=1$, and $v(i+1 m)$ is stored on exitin $A(i+1 m, i) ; u(1: i)=0, u(i+1)=1$, and $u(i+2 m)$ is stored on exitin A $(i, i+2 m)$; tauq is stored in TAUQ (i) and taup in TAUP (i).
Ifm < n,

$$
Q=H(1) H(2) \ldots H(m-1) \text { and } P=G(1) G(2) \ldots G(m)
$$

Each H (i) and G (i) has the form :

$$
H(i)=I-\operatorname{tanq}{ }^{\star} v^{\star} v^{\prime} \text { and } G(i)=I-\operatorname{taup}{ }^{\star} u^{\star} u^{\prime}
$$

$w$ here tauq and taup are com plex scalars, and $v$ and $u$ are complex vectors; $v(1: i)=0, v(i+1)=1$, and $v(i+2 \mathrm{~m})$ is stored on exitin $A(i+2 m, i) ; u(1: i-1)=0, u(i)=1$, and $u(i+1 \mathrm{~m})$ is stored on exitin $A(i, i+1 \mathrm{~m})$; tauq is stored in TAUQ (i) and taup in TA UP (i).

The contents of A on exitare illustrated by the follow ing exam ples:
$m=6$ and $n=5(m>n): \quad m=5$ and $n=6(m<n):$
( d e u1 u1 u1 ) ( d u1 u1 u1 u1
u1)
(v1 d e u2 u2) ( e d u2 u2 u2
u2 )
( v1 v2 d e u3) (v1 e d u3 u3
u3)
( v1 v2 v3 d e ) (v1 v2 e d u4 u4)
( v1 v2 v3 v4 d ) (v1 v2 v3 e d u5 )
( v1 v2 v3 v4 v5 )
where d and e denote diagonal and off-diagonal elem ents of $B$, videnotes an elem ent of the vectordefining $H$ (i), and ui an elem ent of the vectordefining $G$ (i).

\#include <sunperfh>
void ogecon (charnorm , intn, com plex *a, int lda, float anorm, float*rcond, int*info);
void cgecon_64 (charnorm, long n, complex *a, long lda, floatanorm , float *rcond, long *info);

## PURPOSE

cgecon estim ates the reciprocal of the condition num ber of a general com plex m atrix $A$, in either the 1 -norm orthe infinity-norm, using the LU factorization com puted by CGETRF.

A $n$ estim ate is obtained fornorm (inv (A ) ), and the reciprocal of the condition num ber is com puted as
$\operatorname{RCOND}=1 /(\operatorname{nom}(A) * \operatorname{norm}(\operatorname{inv}(A)))$.

## ARGUMENTS

NORM (input)
Specifies w hether the 1-norm condition number or the infinity-norm condition num ber is required:
= 1 'or $\mathrm{O}^{\prime}$ : 1 -nom ;
$=$ I': Infinity-norm .

N (input) The order of the matrix A. $\mathrm{N}>=0$.
A (input) The factors $L$ and $U$ from the factorization $A=$ $\mathrm{P} * \mathrm{~L} * \mathrm{U}$ as com puted by CGETRF.

LD A (input)
The leading dim ension of the amay A. LDA >= $\max (1, N)$.

## ANORM (input)

IfNORM = 1 'or 0 ', the 1 -nom of the original
$m$ atrix $A$. IfNORM = $I$ ', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition num ber of the
$m$ atrix $A$, computed as $R C O N D=1 /($ norm (A) * norm (inv (A))).

W ORK (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )

W ORK 2 (w orkspace)
dim ension ( $2 * N$ )
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the i-th argum enthad an illegalvalue

## C INTERFACE

\#include <sunperfh>
void cgeequ (intm , intn, com plex *a, int lda, float *r, float *C, float *row cnd, float *colend, float
*am ax, int*info);
void ogeequ_64 (long m, long n, com plex *a, long lda, float
*r, float*c, float*row cnd, float*colend, float
*am ax, long *info);

## PURPOSE

cgeequ com putes row and colum n scalings intended to equilibrate an M boy-N m atrix A and reduce its condition num ber. R retums the row scale factors and $C$ the colum $n$ scale factors, chosen to try to $m$ ake the largestelem ent in each row and column of the $m$ atrix $B \quad w$ ith elements $B(i, j)=R(i) * A(i, j) * C(i)$ have absolute value 1.

R (i) and C (i) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N U M = largest safe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

## ARGUMENTS

M (input) The num ber of row s of the m atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input) The M -by-N m atrix whose equilibration factors are to be com puted.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

R (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O>M, R$ contains the row scale factors forA.

C (output)
If $\mathbb{N} F O=0, C$ contains the colum $n$ scale factors forA.

ROW CND (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O>M, R O W C N D$ contains the ratio of the sm allest $R$ (i) to the largest $R$ (i). If
ROW CND >=0.1 and AM AX is neither too large nor too sm all, it is notw orth scaling by $R$.

COLCND (output)
If $\mathbb{N F O}=0, \operatorname{COLCND}$ contains the ratio of the sm allest $C$ (i) to the largestC (i). IfCO LCND >= 0.1 , it is notw orth scaling by $C$.

AMAX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to underflow , the m atrix should be scaled.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue
$>0$ : if $\mathbb{N F O}=i$, and $i$ is
$<=\mathrm{M}$ : the i-th row ofA is exactly zero
> M : the ( $\mathrm{i}-\mathrm{M}$ ) -th colum n of A is exactly zero

## C INTERFACE

\#include <sunperfh>
void cgees (char jobz, char sortev, int(*select) (com plex), intn, com plex *a, int lda, int *nout, com plex *w, com plex ${ }^{*} z$, int ldz, int *info);
void ogees_64 (char jobz, char sortev, long (*select) (com plex), long n, com plex *a, long lda, long *nout, com plex *w, com plex *z, long ldz, long *info);

## PURPOSE

cgees com putes for an N -by- N com plex nonsym m etric $m$ atrix A , the eigenvalues, the Schur form T, and, optionally, the $m$ atrix of Schurvectors Z. This gives the Schur factorization $A=Z * T *(Z * * H)$.

Optionally, italso orders the eigenvalues on the diagonal of the Schur form so that selected eigenvalues are at the top left. The leading colum ns of $Z$ then form an orthonorm al basis for the invariant subspace corresponding to the selected eigenvalues.

A com plex $m$ atrix is in Schur form if it is uppertriangular.

## ARGUMENTS

JO B Z (input)
$=\mathrm{N}$ ': Schurvectors are notcom puted;
$=\mathrm{V}$ : Schurvectors are com puted.
SORTEV (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the Schur form . = N ': Eigenvalues are not ordered:
= $S^{\prime}$ ': E igenvalues are ordered (see SE LEC T ) .

## SELECT (input)

SELECT mustbe declaredEXTERNAL in the calling subroutine. If SORTEV $=S^{\prime}$, SELECT is used to selecteigenvalues to order to the top left of the Schurform. IfSORTEV = N', SELECT is notreferenced. The eigenvalue $W(\mathcal{j})$ is selected if SELECT $(\mathbb{N}(\mathcal{J})$ is true.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
A (input/output)
On entry, the N -by -N m atrix A. On exit, A has been overw rilten by its Schur form T.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

NOUT (output)
If SORTEV $=\mathrm{N}$ ', NOUT $=0$. IfSORTEV $=S^{\prime}$, NOUT
= num berofeigenvalues forw hich SELEC $T$ is true.
W (output)
W contains the com puted eigenvalues, in the sam e order that they appearon the diagonal of the outputSchur form T.

Z (output)
If $\mathrm{OOBZ}=\mathrm{V}^{\prime}, \mathrm{Z}$ contains the unitary m atrix Z of Schur vectors. If $J O B Z=N^{\prime}, Z$ is not referenced.

LD $Z$ (input)
The leading $d i m$ ension of the array $Z . L D Z>=1$;
if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >= N.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= $\max (1,2 \star N)$. For good perform ance, LDW ORK must
generally be larger.
IfLDW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension (N)
W ORK 3 (w orkspace)
dim ension (N) N ot referenced if SO RTEV = N '.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0$ : if $\mathbb{N N F O}=-$ i, the $i$-th argum ent had an illegalvalue.
$>0:$ if $\mathbb{N F O}=i$, and $i$ is
<= N : the QR algorithm failed to com pute all the eigenvalues; elem ents $1: \mathbb{I}-1$ and i+ $1 \mathbb{N}$ ofW con-
tain those eigenvalues which have converged; if JO BZ $=V$ ', Z contains the $m$ atrix which reduces $A$ to its partially converged Schur form.$=N+1$ : the eigenvalues could notbe reordered because some eigenvalues were too close to separate the problem is very ill-conditioned); $=\mathrm{N}+2$ : after reordering, roundoff changed values of som e com plex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy SELECT = TRUE.. This could also be caused by underflow due to scaling.

## PURPOSE

cgeesx com putes for an $N$ toy $N$ com plex nonsym m etric $m$ atrix $A$, the eigenvalues, the Schur form $T$, and, optionally, the $m$ atrix of Schurvectors $Z$. This gives the Schur factorization $A=Z{ }^{*} T^{*}(Z * * H)$.

Optionally, 辻also orders the eigenvalues on the diagonal of the Schur form so that selected eigenvalues are at the top left; com putes a reciprocal condition num ber for the average of the selected eigenvahes (RCONDE); and com putes a reciprocal condition num ber for the right invariant subspace
comesponding to the selected eigenvalues (RCONDV). The leading colum ns of $Z$ form an orthonorm al basis for this invariant subspace.

For furtherexplanation of the reciprocalcondition num bers RCONDE and RCONDV, see Section 4.10 of the LAPACK U sers' G uide (w here these quantities are called s and sep respectively).

A com plex $m$ atrix is in Schur form if it is uppertriangular.

## ARGUMENTS

JO BZ (input)
= N ':Schurvectors are not com puted;
$=\mathrm{V}$ ':Schurvectors are com puted.
SORTEV (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the Schur form . = N ': Eigenvalues are notordered;
= S ': E igenvalues are ordered (see SE LEC T ) .

## SELECT (input)

SELECT mustbe declared EXTERNAL in the calling subroutine. If SORTEV = S', SELECT is used to select eigenvalues to order to the top left of the Schurform. IfSORTEV = N', SELECT is notreferenced. An eigenvalue $W(\mathcal{)}$ is selected if SELECT $(\mathbb{N}(\mathcal{J})$ is true.

SENSE (input)
D eterm ines which reciprocal condition num bers are com puted. = N ': N one are com puted;
= E ': C om puted for average of selected eigenvalues only;
= V ': C om puted for selected right invariant subspace only;
= B ': C om puted forboth. If SEN $S E=E$ ', $\mathrm{V}^{\prime}$ or B',SORTEV mustequal $S^{\prime}$.

N (input) The order of the m atrix A. $\mathrm{N}>=0$.

A (input/output)
On entry, the N boy -N m atrix A. On exit, A is overw ritten by its Schur form T.

LDA (input)
The leading dim ension of the array A. LDA >=
$\max (1, N)$.

NOUT (output)
If SORTEV $=\mathrm{N}$ ',NOUT $=0$. IfSORTEV $=\mathrm{S}$ ', NOUT
= num ber ofeigenvalues forw hich SELEC $T$ is true.
W (output)
W contains the com puted eigenvalues, in the sam e order that they appearon the diagonal of the outputSchur form T.

Z (output)
If $\mathrm{OBBZ}=\mathrm{V}^{\prime}, \mathrm{Z}$ contains the unitary m atrix Z of Schur vectors. If $J O B Z=N^{\prime}, Z$ is not referenced.

LD Z (input)
The leading din ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >=N.

RCONE (output)
If SEN SE = E 'or B', RCONE contains the reciprocal condition number for the average of the selected eigenvalues. N ot referenced if SEN SE = N 'or V'.

## RCONV (output)

If SEN SE = V 'or B',RCONV contains the reciprocal condition num ber for the selected right invariant subspace. N ot referenced if SEN SE $=\mathrm{N}$ ' or E'.

W ORK (w orkspace)
dim ension (LDW ORK) On exit, if $\mathbb{I N F O}=0, W$ ORK (1) retums the optim allD W ORK .

## PURPOSE

cgeev com putes foran N -by- N com plex nonsym m etric m atrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.

The righteigenvectorv $(\mathcal{J})$ of A satisfies A * $\mathrm{V}(\mathrm{y})=\operatorname{lam} \operatorname{bda}(\mathrm{y}) * \mathrm{~V}(\mathrm{I})$ where lam bda ( $\mathcal{j}$ ) is its eigenvalue. The lefteigenvectoru ( $)$ ) ofA satisfies

where $u(\mathcal{j}) * * H$ denotes the conjugate transpose of $u(j)$.
The com puted eigenvectors are norm alized to have Euclidean norm equalto 1 and largest com ponent real.

## ARGUMENTS

$J 0 \mathrm{BVL}$ (input)
$=\mathrm{N}$ ': lefteigenvectors of A are not com puted;
= V': lefteigenvectors of are com puted.
JOBVR (input)
= N ': righteigenvectors of A are not com puted;
= V ': righteigenvectors of A are com puted.
N (input) The order of the m atrix $\mathrm{A} \cdot \mathrm{N}>=0$.

A (input/output)
On entry, the N -by-N m atrix A. On exit, A has been overw rilten.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

W (output)
W contains the com puted eigenvalues.

VL (input)
If $\mathrm{JOBVL}=\mathrm{V}$ ', the left eigenvectors $\mathrm{u}(\mathcal{)}$ are stored one after another in the colum ns of V L, in the sam e order as theireigenvalues. If JOBVL = $N^{\prime}, \mathrm{VL}$ is not referenced. $\mathrm{u}(\mathcal{J})=\mathrm{VL}(:, 7)$, the j-th colum n ofVL.

LDVL (input)
The leading dim ension of the array V L. LD V L >=1; if $\mathrm{JOBVL}=\mathrm{V}, \mathrm{LD} V \mathrm{~L}>=\mathrm{N}$.

VR (input)
If $\mathrm{JO} \mathrm{BVR}=\mathrm{V}$ ', the right eigenvectors $\mathrm{V}(\mathrm{I})$ are stored one after another in the colum ns of V R, in the sam e order as theireigenvalues. If JOBVR = $\mathrm{N}^{\prime}, \mathrm{VR}$ is not referenced. $\mathrm{V}(\mathcal{j})=\mathrm{VR}(:, 7)$, the $j$ th colum n ofVR.

LDVR (input)
The leading dim ension of the array VR. LD V R >= 1; if JO BVR = V', LDVR >= N .

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the amray $W$ ORK. LDW ORK >= $\max (1,2 \star \mathrm{~N})$. For good perform ance, LDW ORK must generally be larger.

If LD W ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA .

W ORK 2 (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the i-th argum enthad an illegalvałue.
$>0$ : if $\mathbb{N F O}=i$, the QR algorithm failed to com pute all the eigenvalues, and no eigenvectors have been com puted; elem ents and i+1 N of W contain eigenvalues w hich have converged.

## C INTERFACE

\#include <sunperfh>
void cgeevx (char, char, char, char, int, complex*, int, complex*, complex*, int, com plex*, int, int*, int*, float*, float*, float*, float*, int* );
void cgeevx_64 (char, char, char, char, long, com plex*, long, com plex*, com plex*, long, com plex*, long, long*, long*, float*, float*, float*, float*, long*);

## PURPOSE

cgeevx com putes for an $N$-by-N com plex nonsym m etric $m$ atrix A, the eigenvalues and, optionally, the left and/orright eigenvectors.

O ptionally also, it com putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( $\mathbb{L} \mathrm{O}, \mathbb{H} \mathrm{I}, \mathrm{SCA} L E$, and A BN RM ), reciprocal condition num bers for the eigenvalues (RCONDE), and reciprocal condition num bers for the right eigenvectors (RCONDV).

The righteigenvectorv (i) ofA satisfies

$$
\text { A * } \mathrm{v}(\mathcal{\jmath})=\operatorname{lam} \operatorname{bda}(\mathcal{\jmath}) * v(\mathcal{I})
$$

where $\operatorname{lam} \operatorname{bda}(\mathcal{j})$ is its eigenvalue.
The lefteigenvectoru ( ) ) of A satisfies

where $u(j) * * H$ denotes the conjugate transpose of $u(j)$.
The com puted eigenvectors are norm alized to have Euclidean
norm equalto 1 and largest com ponent real.
B alancing a $m$ atrix $m$ eans perm uting the row $s$ and colum $n s$ to m ake itm ore nearly upper triangular, and applying a diagonalsm ilarity transform ation $D$ * $A$ * $D *(-1)$, where $D$ is a diagonalm atrix, to $m$ ake its row $s$ and colum ns closer in norm and the condition num bers of its eigenvalues and eigenvectors sm aller. The com puted reciprocalcondition num bers comespond to the balanced $m$ atrix. Perm uting row $s$ and colum ns w ill not change the condition num bers (in exact arithm etic) but diagonalscaling w ill. For further explanation of balancing, see section 4.102 of the LA PA CK U sers' Guide.

## ARGUMENTS

BA LANC (input)
Indicates how the input matrix should be diagonally scaled and/orperm uted to im prove the conditioning of its eigenvalues. = N ': D ○ not diagonally scale orperm ute;
$=\mathrm{P}$ ': Perform perm utations to m ake the m atrix $m$ ore nearly upper triangular. D o notdiagonally scale; = S':D iagonally scale the matrix, ie. replace $A$ by $D$ *A *D ** ( -1 ), where $D$ is a diagonal $m$ atrix chosen to $m$ ake the row $s$ and colum ns of $A$ m ore equal in norm .D o notperm ute; = B ':Both diagonally scale and perm ute A .

C om puted reciprocalcondition num bersw illbe for the $m$ atrix afterbalancing and/orperm uting. Per$\mathrm{m} u$ uting does not change condition num bers (in exact arithm etic), butbalancing does.

JOBVL (input)
= N ': lefteigenvectors of A are not com puted;
= V': lefteigenvectors of A are computed. If SEN SE = E 'or B', JO BV L m ust= V'.

JO BV R (input)
= N ': righteigenvectors of A are not com puted;
$=\mathrm{V}$ ': righteigenvectors of A are com puted. If SEN SE = E 'or B', JO BV R m ust= V'.

SENSE (input)
D eterm ines which reciprocal condition num bers are com puted. = N ': N one are com puted;
= E ': C om puted foreigenvalues only;
$=\mathrm{V}$ : $: \mathrm{C}$ om puted for righteigenvectors only;
= B ': C om puted foreigenvalues and right eigenvectors.

If SEN SE = E 'or B ', both leftand right eigenvectors must also be com puted ( $\mathrm{JOBVL}=\mathrm{V}$ 'and $\mathrm{JOBVR}=\mathrm{V}$ ).

N (input) The order of the m atrix A . $\mathrm{N}>=0$.

A (input/output)
On entry, the $\mathrm{N}-$ by -N m atrix A. On exit, A has been overw rilten. If JOBVL = V'orJOBVR = V', $A$ contains the Schur form of the balanced version of the m atrix A.
LD A (input)
The leading din ension of the array A. LD A >= $\max (1, N)$.

W (output)
W contains the com puted eigenvalues.
VL (input)
If $\mathrm{JOBVL}=\mathrm{V}$ ', the left eigenvectors $u(1)$ are stored one after another in the colum ns of V L, in the sam e order as theireigenvahues. If $\mathrm{JOBVL}=$ $\mathrm{N}^{\prime}, \mathrm{VL}$ is not referenced. $\mathrm{u}(\mathcal{j})=\mathrm{VL}(:, 7)$, the $j$ th colum n ofVL.

LDVL (input)
The leading dim ension of the array V L. LD V L >=1; if $\mathrm{JOBVL}=\mathrm{V}$ ', LDVL $>=\mathrm{N}$.

VR (input)
If JOBVR = V', the right eigenvectors $\mathrm{v}(\mathrm{J})$ are stored one after another in the colum ns of VR, in the sam e order as theireigenvalues. If JOBVR $=$ $\mathrm{N}^{\prime}, \mathrm{VR}$ is notreferenced. $\mathrm{V}(\mathrm{O})=\mathrm{VR}(:, 7)$, the $j$ th colum n ofVR.

LDVR (input)
The leading dim ension of the array V R. LD V R >=1; if $J O B V R=V$ ', LDVR $>=N$.

ㅍO (output)
HO and $\mathbb{H}$ I are integervalues determ ined when $A$ w as balanced. The balanced $A(i, 7)=0$ if I> J and $J=1, \ldots, \mathbb{I L} O-1$ or $I=\mathbb{H} \mathrm{I}+1, \ldots, N$.

IH I (output)

ㅍO and $\mathbb{H}$ I are integer values determ ined when $A$ $w$ as balanced. The balanced $A(i, T)=0$ if $I>J$ and $J=1, \ldots, \mathbb{I L} O-1$ or $I=\mathbb{H} I+1, \ldots, N$.

SCALE (output)
D etails of the perm utations and scaling factors applied w hen balancing $A$. IfP $(j)$ is the index of the row and column interchanged $w$ th row and colum $n j$ and $D(j)$ is the scaling factorapplied to row and column $j$ then SCALE $(J)=P(J)$, for $J=1, \ldots, \Pi \circ-1=D(J)$ for $J=\mathbb{L O}, \ldots, \mathbb{H} I=$ P (J) for $J=\mathbb{H} I+1, \ldots, N$. The order in which the interchanges are $m$ ade is $N$ to $\mathbb{H} I+1$, then 1 to ㅍㅇㅇ.

## ABNRM (output)

The one-norm of the balanced $m$ atrix (the $m$ axim um of the sum of absolute values of elem ents of any colum n).

RCONE (output)
RCONE ( ) ) is the reciprocalcondition num ber of the $j$ th eigenvalue.

## RCONV (output)

RCONV ( $j$ ) is the reciprocalcondition num berof the $j$ th righteigenvector.

W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, \mathrm{~W}$ ORK (1) retums the optim al LDW ORK.

LDW ORK (output)
The dim ension of the array $W$ ORK. IfSENSE $=N^{\prime}$ or $\mathrm{E}^{\prime}, \mathrm{LDW}$ ORK $>=\mathrm{max}\left(1,2^{*} \mathrm{~N}\right)$, and ifSENSE $=\mathrm{V}^{\prime}$ or B ', LDW ORK $>=\mathrm{N} * \mathrm{~N}+2{ }^{*} \mathrm{~N}$. Forgood perform ance, LD W ORK m ust generally be larger.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

## W ORK 2 (w orkspace)

dim ension ( $2 * \mathrm{~N}$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an ille-
galvalue.
$>0:$ if $\mathbb{N} F O=$ i, the $Q R$ algorithm failed to com pute all the eigenvalues, and no eigenvectors or condition num bers have been com puted; elem ents 1: IHO-1 and i+1 N ofW contain eigenvalues which have converged.

## C INTERFACE

\#include <sunperfh>
void cgegs (char jobvsl, char j’bvsr, intn, com plex *a, int lda, com plex *b, int ldb, com plex *alpha, com plex *beta, com plex *vsl, int ldvsl, com plex *Vsr, int ldvsr, int *info);
void ogegs_64 (char j̇bvsl, char jobvss, long n, com plex *a, long lda, com plex *b, long ldb, com plex *alpha, com plex *beta, com plex *vsl, long ldvsl, com plex *vsr, long ldvss, long *info);

## PURPOSE

cgegs routine is deprecated and has been replaced by routine CGGES .

CGEGS com putes for a pair of N łoy- N com plex nonsymm etric $m$ atrices A, B: the generalized eigenvalues (alpha, beta), the com plex Schur form (A , B ), and optionally left and/or rightSchurvectors ( V SL and V SR ) .
(If only the generalized eigenvalues are needed, use the driverCGEGV instead.)

A generalized eigenvalue for a pair of $m$ atrices ( $A, B$ ) is, roughly speaking, a scalar w or a ratio alphaßeta $=\mathrm{w}$, such that $A-w * B$ is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta $=0$, and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G.G olub \& C .van Loan (Johns H opkins U .Press)

The (generalized) Schur form of a pair of $m$ atriges is the result ofm ultiplying both $m$ atrices on the leftby one unitary $m$ atrix and both on the rightby another unitary $m$ atrix, these two unitary $m$ atrioes being chosen so as to bring the pair ofm atrioes into upper triangular form w ith the diago-
nal elem ents ofB being non-negative realnum bers this is also called com plex Schur form .)

The left and rightSchurvectors are the colum ns ofV SL and VSR, respectively, where VSL and VSR are the unitary $m$ atrices
which reduce A and B to Schur form :

Schurform of $(A, B)=(N S L) * * H A(N S R),(N S L) * * H B(N S R))$

## ARGUMENTS

JO BVSL (input)
$=N^{\prime}:$ do notcom pute the left:Schurvectors;
= V ': com pute the leftSchurvectors.
$J O B V S R$ (input)
$=N$ : do notcom pute the rightSchurvectors;
= V ': com pute the rightSchurvectors.
N (input) The order of the m atrices A, B, V SL, and VSR. N $>=0$.

A (input/output)
O $n$ entry, the firstof the pairofm atrices whose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the generalized Schur form of A.

LD A (input)
The leading dim ension ofA. LD A $>=\max (1, N)$.
B (input/output)
O n entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) Schur vectors are to be com puted. O n exit, the general ized Schur form ofB.

LD B (input)
The leading dim ension ofB. LD B $>=m$ ax $(1, N)$.

## A LPHA (output)

On exit, ALPHA ( $\mathfrak{j}$ ) BETA ( $\mathcal{j}$ ) $\mathfrak{j} 1, \ldots, N$, w illbe the generalized eigenvalues. A LPHA ( $\mathcal{\imath}, \dot{于} 1, \ldots, \mathrm{~N}$ and $\operatorname{BETA}(\mathcal{j}) \dot{j} 1, \ldots, N$ are the diagonals of the com plex Schur form ( $A, B$ ) output by CGEGS. The BETA (j) w illbe non-negative real.

N ote: the quotients A LPHA ( $\mathcal{7}$ ) $B E T A(\mathcal{)}$ may easily
over- orunderflow, and BETA ( 7 ) m ay even be zero. Thus, the user should avoid naively com puting the ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

BETA (output)
See the description of A LPH A.

VSL (input)
If JOBVSL = V',VSL w illcontain the left Schur vectors. (See "Puppose", above.) N ot referenced if $J O B V S L=N^{\prime}$ 。

LDVSL (input)
The leading dim ension of the m atrix V SL.LDV SL >= 1 , and if $\mathrm{OBVSL}=\mathrm{V}^{\prime}$, LDVSL $>=\mathrm{N}$.

VSR (input)
If OB BVSR $=V$ ',VSR willcontain the right Schur
vectors. (See "Puppose", above.) N ot referenced if JO BV SR = $N^{\prime}$ 。

LDVSR (input)
The leading dim ension of the $m$ atrix $V$ SR.LD V SR $>=$ 1 , and if OB B $S R=V^{\prime}$ ', LD $V S R>=N$.

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the anray $W$ ORK. LDW ORK $>=$ $m a x(1,2 * N)$. For good perform ance, LD W ORK must generally be larger. To com pute the optim alvalue of LDW ORK, call ILAENV to getblocksizes (for $C G E Q R F, C U N M Q R$, and $C U N G Q R$.) Then com pute: $N B$ as the MAX of the blocksizes forCGEQRF, CUNM QR, and CUNGQR; the optim alLDW ORK is $N$ * $(\mathbb{B}+1)$.

IfLDW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK2 (w orkspace)
dim ension $(3 * N)$
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the ith argum enthad an illegalvalue.
$=1, \ldots, N$ : The Q Z iteration failed. ( $\mathrm{A}, \mathrm{B}$ ) are not
in Schur form, butA LPHA ( 1 ) and BETA ( 7 ) should be
correct for $\mathcal{F} \mathbb{N F O}+1, \ldots, N .>N: ~ e m o r s ~ t h a t ~$
usually indicate LA PA C K problem s:
$=\mathrm{N}+1$ : emor retum from CGGBAL
$=\mathrm{N}+2$ : error retum from $C G E Q R F$
$=\mathrm{N}+3$ : emor retum from $C U N M Q R$
$=\mathrm{N}+4$ : error retum from CUNGQR

## PURPOSE

cgegv routine is deprecated and has been replaced by routine CGGEV .

CGEGV com putes fora pair of N boy N com plex nonsymm etric $m$ atrices $A$ and $B$, the generalized eigenvalues (alpha, beta), and optionally, the leftand/or rightgeneralized eigenvectors ( VL and $V R$ ).

A generalized eigenvalue for pair of $m$ atrices ( $A, B$ ) is, roughly speaking, a scalar w ora ratio alpha/beta $=\mathrm{w}$, such that $A-w * B$ is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta $=0$, and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G.G olub \& C . van Loan (Johns H opkins U .Press)

A rightgeneralized eigenvector comesponding to a generalized eigenvalue $w$ for pair ofm atrioes $(A, B)$ is a vector $r$ such that ( $A-w B$ ) r=0.A left generalized eigenvector is a vectorlsuch that $l^{* *} H *(A-w B)=0$, where ${ }^{* * *} \mathrm{H}$ is the conjugate-transpose of l.

N ote: this routine perform s "fullbalancing" on A and B. See "FurtherD etails", below .

## ARGUMENTS

JOBVL (input)
$=\mathrm{N}^{\prime}$ : do not com pute the leftgeneralized eigenvectors;
$=\mathrm{V}$ ': com pute the left generalized eigenvectors.
JOBVR (input)
$=\mathrm{N}$ ': do not com pute the right generalized eigenvectors;
$=\mathrm{V}$ : com pute the right generalized eigenvectors.

N (input) The order of the matrices $A, B, V L$, and $V R . N \quad>=$ 0.

A (input/output)
O n entry, the first of the pairofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents will have been destroyed. (Fora description of the contents of A on exit, see "FurtherD etails", below .)

LD A (input)
The leading dim ension ofA. LD A $>=\max (1, \mathbb{N})$.
B (input/output)
O n entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents w ill have been destroyed. (Fora description of the contents of $B$ on exit, see "FurtherD etails", below .)

LD B (input)
The leading dim ension ofB. LD B $>=\mathrm{max}(1, \mathrm{~N})$.
ALPHA (output)
On exit, A LPHA ( ) NL ( $\mathfrak{j}$ ) $\dot{=} 1, \ldots, N$, will be the generalized eigenvalues.

N ote: the quotients ALPHA ( $)$ NL ( $\mathcal{j}$ ) may easily over- or underflow, and VL ( 7 ) m ay even be zero. Thus, the user should avoid naively com puting the
ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w th norm (A) in m agnitude, and VL alw ays less than and usually com parable $w$ ith norm (B).

VL (output)
If $\mathrm{JO} \mathrm{BVL}=\mathrm{V}$ ', the left generalized eigenvectors. (See "Purpose", above.) Each eigenvectorw ill.be scaled so the largest com ponentw ill have abs (real part) + abs(mag. part) $=1$, *exœept that for eigenvalues $w$ th alpha=beta=0, a zero vector $w i l l$ be retumed as the corresponding eigenvector. N ot referenced if $\mathrm{JOBVL}=\mathrm{N}^{\prime}$.
BETA (output)
If $\mathrm{JOBVL}=\mathrm{V}$ ', the left generalized eigenvectors.
(See "Pupose", above.) Each eigenvectorw ill.be scaled so the largest com ponentw ill have abs (real part) $+\mathrm{abs}($ ( m ag. part) $=1$, *exœept* that for eigenvalues w ith alpha=beta=0, a zero vector w ill be retumed as the comesponding eigenvector. N ot referenced if $\mathrm{JO} \mathrm{BVL}=\mathrm{N}$ '.

LDVL (input)
The leading dim ension of the $m$ atrix $V \mathrm{~L} . \mathrm{LD} V \mathrm{~L}>=1$, and if $\mathrm{JOBVL}=\mathrm{V}$ ', LDVL >=N.

## VR (output)

If $\mathrm{JOBVR}=\mathrm{V}$ ', the right generalized eigenvectors. (See "Pupose", above.) Each eigenvector w illbe scaled so the largest com ponentw ill have abs(real part) +abs (im ag. part) $=1$,*except* that foreigenvalues $w$ th alpha=beta=0, a zero vector will be retumed as the corresponding eigenvector. N ot referenced if $\mathrm{JO} B V R=\mathrm{N}^{\prime}$.

LDVR (input)
The leading dim ension of the $m$ atrix $V R$.LD $V R>=1$, and if $J O B V R=V$ ', LDVR $>=N$.

W ORK (w orkspace)
On exit, if $\mathbb{N F} F=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= $\max (1,2 \star \mathrm{~N})$. For good perform ance, LDW ORK must generally be larger. To com pute the optim alvalue of LDW ORK, call IIA ENV to getblocksizes (for CGEQRF, CUNM QR, and CUNGQR.) Then com pute: NB as the MAX of the blocksizes forCGEQRF, CUNM QR, and

CUNGQR; The optim alldW ORK is MAX $(2 * N, N * \mathbb{N}+1)$
).
IfLDW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
W ORK 2 (w orkspace)
dim ension ( $8 * \mathrm{~N}$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0$ : if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an illegalvahue.
$=1, \ldots, N$ : The Q Z iteration failed. N o eigenvectors have been calculated, butA LPH A ( $\mathcal{j}$ ) and VL ( $\mathcal{j}$ )
should be correct for $\mathcal{j} \mathbb{N} F O+1, \ldots, N .>N$ :
enrors that usually indicate LA PACK problem s:
$=\mathrm{N}+1$ : error retum from CGGBAL
$=\mathrm{N}+2$ : error retum from CGEQRF

$=\mathrm{N}+9$ : error retum from CGGBAK (com puting VR)
$=\mathrm{N}+10$ : enror retum from CLASCL (various calls)

## FURTHER DETAILS

Balancing

This driver calls C G G B A L to both perm ute and scale row s and colum ns of $A$ and $B$. The perm utationsPL and PR are chosen so that $\mathrm{PL} * \mathrm{~A} * P R$ and $P L * B * R$ w illlbe upper triangular except for the diagonal blocksA ( $i: j i: j$ ) and $B(i: j i: j$, w ith $i$ and jas close together as possible. The diagonal scaling $m$ atrices $D L$ and $D R$ are chosen so that the pair DL*PL*A*PR*DR,DL*PL*B*PR*DR have elem ents close to one (except for the elem ents that start out zero .)

A fter the eigenvalues and eigenvectors of the balanced $m$ atrices have been com puted, C G G B A K transform s the eigenvectors back to $w$ hat they w ould have been (in perfect arithm etic) if they had notbeen balanced.

Contents of $A$ and $B$ on Exit

If any eigenvectors are com puted (either $J 0 B V L=V$ ' or JO $B V R=V$ ' or both), then on exit the arrays $A$ and $B$ will contain the com plex Schur form [*] of the "balanced" versions of $A$ and $B$. If no eigenvectors are com puted, then only the diagonalblocksw illbe conect.
[ $\star$ ] In otherw ords, uppertriangular form .

## PURPOSE

cgehrd reduces a com plex generalm atrix A to upper H essenberg form $H$ by a untary sim ilarity transform ation: $Q^{\prime \prime *} A$

* $\mathrm{Q}=\mathrm{H}$.

## ARGUMENTS

N (input) The order of them atrix $A . N>=0$.

IIO (input)
It is assum ed that A is already upper triangular in row s and colum ns $1: \mathbb{W} 0-1$ and $\mathbb{H} \mathrm{I}+1 \mathbb{N} . \mathbb{I} O$ and
IH I are norm ally setby a previous call to CGEBAL; otherw ise they should be setto 1 and $N$ respectively . See FurtherD etails.

IH I (input)
See the description of $\amalg \mathrm{O}$.

A (input/output)
O n entry, the N boy N generalm atrix to be reduced.
O n exit, the upper triangle and the first subdiagonalofA are overw rilten $w$ ith the upper $H$ essenberg $m$ atrix $H$, and the elem ents below the first subdiagonal, w ith the array TAU, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

TAU (output)
The scalar factors of the elem entary reflectors (see Further Details). Elem ents 1:Ш1O-1 and IH IN -1 ofTAU are setto zero.

W ORK $\mathbb{N}$ (w orkspace)

On exit, if $\mathbb{N F O}=0, W O R K \mathbb{N}$ (1) retums the optim allW ORK $\mathbb{N}$.

LW ORK $\mathbb{N}$ (input)
The length of the array $W O R K \mathbb{N}$. LW ORK $\mathbb{N}>=$ $\max (1, \mathbb{N})$. For optim um perform ance LW ORK $\mathbb{N}>=$ N *N B , w here N B is the optim alblocksize.

If LW ORK $\mathbb{N}=-1$, then a workspace query is assum ed; the routine only calculates the optim al size of the $W$ ORK $\mathbb{N}$ array, retums this value as the firstentry of the $W$ ORK $\mathbb{N}$ array, and no error $m$ essage related to LW ORK $\mathbb{N}$ is issued by XERBLA.
$\mathbb{N F O}$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the i-th argum enthad an illegalvahue.

## FURTHER DETAILS

Them atrix $Q$ is represented as a productof (hi-ib) ele$m$ entary reflectors

Each H (i) has the form

$$
\mathrm{H}(\mathrm{i})=\mathrm{I}-\tan * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
$$

$w$ here tau is a com plex scalar, and $v$ is a com plex vector w ith $\mathrm{v}(1: i)=0, \mathrm{v}(i+1)=1$ and $v(i h i+1 \mathrm{~m})=0 ; \mathrm{v}(i+2$ : ihi $)$ is stored on exitin A (i+2:ihi,i), and tau in TAU (i).

The contents ofA are illustrated by the follow ing exam ple, w ith $\mathrm{n}=7$, $\mathrm{il}=2$ and ihi $=6$ :

```
on entry, on ex斗,
```

(a a a a a a a) (a a h h h h a) ( a a a a a a) ( a h h h $h a)(a \operatorname{a} a \operatorname{a} a)(\mathrm{h} h \mathrm{~h}$ h h h ) ( a a a a a a) ( v2 h h h h h) ( a a a a a a) ( v2 v3 h h h h ) ( a a a a a a) ( v2 v3 v4 h h h ) (a) ( a)
where a denotes an elem ent of the original $m$ atrix $A, h$ denotes a $m$ odified elem ent of the upper $H$ essenberg $m$ atrix $H$, and videnotes an elem ent of the vector defining $H$ (i).

void cgelqf_64 (long m, long n, com plex *a, long lda, com plex
*tau, long *info);

## PURPOSE

cgelqfoom putes an LQ factorization of a complex M -by-N $m$ atrix $A: A=L * Q$.

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of colum ns of the matrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the M -by-N m atrix A. On exit, the ele$m$ ents on and below the diagonal of the array contain the $m$-by-m in $(m, n)$ low er trapezoidalm atrix $L$ ( $L$ is low er triangularifm <= n); the elem ents above the diagonal, w ith the array TA $U$, represent the unitary matrix $Q$ as a productofelem entary reflectors (see FurtherD etails).

LDA (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array $W$ ORK. LDW ORK >= $m a x(1, M)$. Foroptim um perform ance LDW ORK $>=M$ *NB, w here NB is the optim alblocksize.

If LD W ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim al size of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LDW ORK is issued by X ERBLA .
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors
$Q=H(k)^{\prime} \ldots H(2)$ 'H $(1)$ ', where $k=m$ in $(m, n)$.
Each $H$ (i) has the form
H (i) $=I-\tan * V^{*} V^{\prime}$
$w$ here tau is a com plex scalar, and $v$ is a com plex vector w ith $v(1: i-1)=0$ and $v(i)=1$; con $\dot{g}(v(i+1 n))$ is stored on exitin A ( $i, i+1 \mathrm{n}$ ), and tau in TAU (i).

## C INTERFACE

\#include <sunperfh>
void cgels (char, int, int, int, com plex*, int, com plex*, int, int ${ }^{\star}$ );
void cgels_64 (char, long, long, long, com plex*, long, com plex*, long, long*);

## PURPOSE

cgels solves overdeterm ined or underdeterm ined com plex linear system $s$ involving an $M$ by N matrix $A$, or its conjugate-transpose, using a Q R orLQ factorization of A. It is assum ed thatA has full rank.

The follow ing options are provided:

1. IfTRANS $=N$ 'and $m>=n$ : find the leastsquares solution of
an overdeterm ined system , i.e., solve the least squares problem $m$ inim ize $\|B-A * X\|$.
2. IfTRAN $S=N$ 'and $m<n$ : find the $m$ inim um norm solution of an underdeterm ined system $A * X=B$.
3. IfTRAN $S=C$ 'and $m>=n$ : find the $m$ inim um norm solution of
an undeterm ined system $A * * H * X=B$.
4. IfTRANS = C'and $m<n$ : find the least squares solution of
an overdeterm ined system , ie., solve the least squares problem

$$
\mathrm{m} \text { in.m ize }\|\mathrm{B}-\mathrm{A} * * \mathrm{H} * \mathrm{X}\| .
$$

Several righthand side vectors b and solution vectors $x$ can be handled in a single call; they are stored as the colum ns of the M -by-NRHS righthand side m atrix B and the $N$-by-NRHS solution $m$ atrix $X$.

## ARGUMENTS

TRANSA (input)
$=\mathrm{N}$ : the linearsystem involves A;
$=C$ ': the linear system involves $A * * H$.

TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

M (input) The num ber of row s of the matrix A. M >=0.

N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X .NRH S >=0.
A (input/output)
On entry, the M boy-N m atrix A. ifM $>=N, A$ is overw ritten by details of its $Q R$ factorization as retumed by CGEQRF; ifM < N, A is overw ritten by details of its LQ factorization as retumed by CGELQF.

LDA (input)
The leading dim ension of the anay A. LDA >= $\max (1, M)$.

B (input/output)
O n entry, the m atrix B of righthand side vectors,
stored colum nw ise; B is M byy-NRHS ifTRANSA = N',
orN byy-NRHS ifTRANSA = C'. On exit, B is
overw rilten by the solution vectors, stored colum nw ise: ifTRANSA $=N$ 'and $m>=n$, row 1 to n ofB contain the least squares solution vectors; the residual.sum ofsquares for the solution in each colum $n$ is given by the sum of squares of ele$m$ ents $N+1$ to $M$ in thatcolum $n$; ifTRA $N S A=N$ 'and $m<n$, row $s 1$ to $N$ ofB contain them inim um norm solution vectors; ifTRANSA $=C$ 'and $m>=n$, row $s$ 1 to M ofB contain them inim um norm solution vectors; ifTRANSA $=C$ 'and $m<n$, row 1 to $M$ of $B$ contain the least squares solution vectors; the residualsum of squares for the solution in each colum $n$ is given by the sum of squares of elem ents $M+1$ to $N$ in that colum $n$.

LD B (input)
The leading dim ension of the amay $\mathrm{B} . \mathrm{LD} \mathrm{B}>=$ M AX ( $1, \mathrm{M}, N$ ) 。

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (output)
The dim ension of the amay W ORK. LDW ORK >= $\max ($
1, $\mathrm{M} N+\max (\mathrm{M} N, \mathrm{NRHS})$ ). Foroptim alperfor
$m$ ance, LDW ORK $>=\max (1, M N+\max (M N, N R H S) * N B$
). where $M N=m$ in $M N$ ) and $N B$ is the optim um
block size.

IfLD W ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LD W ORK is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the i-th argum enthad an ille-
galvalue

## C INTERFACE

\#include < sunperfh>
void cgelsd (intm, intn, intnrhs, com plex *a, int lda, complex *b, int ldb, float *s, float roond, int
*rank, int*info);
void cgelsd_64 (long m, long n, long nrhs, com plex *a, long
lda, com plex *b, long ldb, float *s, float roond, long *rank, long *info);

## PURPOSE

cgelsd com putes the $m$ inim um -norm solution to a real linear least squares problem :
$m$ inim ize 2 -norm (|b-A *x |)
using the singularvalue decom position (SVD ) ofA.A is an M -by-N m atrix which m ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-NRHS righthand side m atrix $B$ and the $N$ by-NRHS solution $m$ atrix $X$.

The problem is solved in three steps:
(1) Reduce the coefficientm atrix A to bidiagonal form $w$ ith H ouseholdertranform ations, reducing the original problem
into a "bidiagonal least squares problem " (BLS)
(2) Solve the BLS using a divide and conquer approach.
(3) A pply back all the H ouseholder tranform ations to solve the original least squares problem .

The effective rank of is determ ined by treating as zero those singular values which are less than RCOND tim es the largest singular value.

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray $X-M P, C$ ray $Y-M P, C$ ray $C-90$, or C ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

## ARGUMENTS

M (input) The num ber of row sof the $m$ atrix $A . M>=0$.
N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

NRH S (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the $m$ atrices $B$ and X.NRHS $>=0$.

A (input/output)
On entry, the M -by -N m atrix A. On exit, A has been destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the M-by-NRHS righthand sidem atrix B . On exit, B is overw ritten by the N -by-NRH S solution $m$ atrix $X$. If $m>=n$ and RANK $=n$, the residual sum -of-squares for the solution in the $i$-th colum $n$ is given by the sum of squares of elem ents $\mathrm{n}+1 \mathrm{~m}$ in thatcolumn.

LD B (input)
The leading dim ension of the amay $B$. LD B >= $\max (1, M, N)$.

S (output)
The singular values ofA in decreasing order. The condition number of $A$ in the 2 -norm $=$ $S(1) / S(m$ in $(m, n))$.

RCOND (input)
RCOND is used to determ ine the effective rank of
A. Singularvalues $S(i)<=$ RCOND *S ( 1 ) are treated as zero. IfRCOND $<0, m$ achine precision is used instead.

RANK (output)
The effective rank of A, ie., the num ber of singular values w hich are greater than RCOND *S (1).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the anray $W$ ORK. LW ORK $>=1$. The exact $m$ inim um am ount of $w$ orkspace needed depends on $\mathrm{M}, \mathrm{N}$ andNRHS. IfM >= N , LW ORK >= 2*N + $N * N R H S$. If $M<N$, LW ORK $>=2 * M+M * N R H S$. For good penform ance, LW ORK should generally be larger.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
IfM $>=\mathrm{N}$, LRW ORK $>=8{ }^{*} \mathrm{~N}+2{ }^{\star} \mathrm{N} *$ SM LSIZ $+8{ }^{*} \mathrm{~N} * \mathrm{NLVL}+$ $\mathrm{N} * \mathrm{~N}$ RHS. If $\mathrm{M}<\mathrm{N}, \mathrm{LRW}$ ORK $>=8 * \mathrm{M}+2 * \mathrm{M} *$ SM LSZ + $8 * M * N L V L+M * N R H S . S M L S Z$ is retumed by HAENV and is equal to the $m$ axim um size of the subproblem sat the bottom of the com putation tree (usually about 25), and NLVL= $\mathbb{N} T\left(L O G \_2(M \mathbb{N}(M, N\right.$
)/(SM LSTZ+1)) ) + 1
IV ORK (w orkspace)
LIV ORK >= $3 * M \mathbb{N} M N * N L V L+11 * M \mathbb{N} M N$, where $M \mathbb{N} M N=M \mathbb{N}(M, N)$.
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N} F O=-$ i, the $i$-th argum enthad an illegalvalue.
>0: the algorithm forcom puting the SVD failed
to converge; if $\mathbb{N} F O=$ i, ioff-diagonalelem ents of an interm ediate bidiagonal form did not converge to zero.

## PURPOSE

cgelss com putes the $m$ inim um norm solution to a com plex linear least squares problem :
$M$ inim ize 2 -norm ( $|\mathrm{b}-\mathrm{A} * \mathrm{x}|$.
using the singularvalue decom position (SVD) ofA.A is an M -by-N $m$ atrix which $m$ ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-NRH S righthand sidem atrix $B$ and the $N$ by-NRH S solution $m$ atrix $X$.

The effective rank ofA is determ ined by treating as zero those singular values which are less than RCOND tim es the largest singularvalue.

## ARGUMENTS

M (input) The num ber of row sof the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.
$N$ (input) The num ber of collm ns of the m atrix $A . N>=0$.

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the $m$ atrioes $B$ and $X$.NRH $S>=0$.

A (input/output)
On entry, the M -by -N m atrix A. On exit, the first $m$ in $(m, n)$ row $s$ of A are overw ritten $w$ ith its right singularvectors, stored row w ise.

LD A (input)
The leading dim ension of the array A. LDA >= $m a x(1, M)$.

B (input/output)
On entry, the M -by NRHS righthand side m atrix B .
On exit, B is overw ritten by the $N$ by $-\mathrm{NRH} S$ solution $m$ atrix $X$. Ifm $>=n$ and $\mathbb{R A N K}=n$, the residual sum -of-squares for the solution in the i-th colum $n$ is given by the sum of squares of ele$m$ ents $n+1 m$ in that $c o l u m n$.

LD B (input)
The leading dim ension of the anay $B$. LD B >= $\max (1, M, N)$.

## SNN (output)

The singularvalues ofA in decreasing order. The condition number of $A$ in the 2 -norm $=$ $S \mathbb{N} G(1) / S \mathbb{N} G(m$ in $(m, n))$.

RCOND (input)
RCOND is used to determ ine the effective rank of
A. Singular values SING (i) <= RCOND *SING (1) are treated as zero. IfRCOND $<0, \mathrm{~m}$ achine precision is used instead.

RANK (output)
The effective rank of A, i.e., the num ber of singular values which are greater than RCOND *SING (1).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the amray $W$ ORK. LDW ORK $>=1$, and also: LDW ORK $>=2 \star_{m}$ in $\left.(M, N)+m a x M, N, N R H S\right)$ For good perform ance, LDW ORK should generally be larger.

If LDW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK anay, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension $\left(5{ }^{*} \mathrm{~m}\right.$ in $\left.\mathrm{M}, \mathrm{N}\right)$ )
$\mathbb{N F O}$ (output)
$=0$ : successfulexit
< 0: if $\mathbb{N N}$ FO = -i, the i-th argum ent had an illegalvalue.
> 0: the algorithm forcom puting the SVD failed to converge; if $\mathbb{N} F O=$ i, ioff-diagonalelem ents of an interm ediate bidiagonal form did not converge to zero.

## C INTERFACE

\#include < sunperfh>
void cgelsx (intm, intn, intnrhs, complex *a, int lda, com plex *b, int ldb, int * jivivot, floatrcond, int *irank, int *info);
void cgelsx_64 (long m, long n, long nrhs, com plex *a, long lda, com plex *b, long ldb, long * jpivot, float rcond, long *irank, long *info);

## PURPOSE

cgelsx routine is deprecated and has been replaced by routine CGELSY .

CGELSX com putes the $m$ inim um-norm solution to a complex linear least squares problem :
$m$ inim ize $\| A$ * $X-B \|$
using a com plete orthogonal factorization of A. A is an $M-$ by-N m atrix w hich m ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by - N R H S righthand side m atrix B and the N boy-NRHS solution m atrix X .

The routine firstcom putes a QR factorization with colum $n$ pivoting:
$A * P=Q *[R 11 R 12]$
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix w hose estim ated condition num ber is less than $1 \notin C O N D$. The order of $\mathrm{R} 11, \mathrm{RANK}$, is the effective rank ofA.

Then, R 22 is considered to be negligible, and R 12 is annihilated by unitary transform ations from the right, arriving at the com plete orthogonal factorization:
$A * P=Q *[T 110] * Z$
[ 0 0]
Them inim um norm solution is then
$\mathrm{X}=\mathrm{P} * \mathrm{Z}$ ' [inv (T11)*Q 1 *B ]
[ 0 ]
where Q 1 consists of the firstRANK colum ns of Q .

## ARGUMENTS

M (input) The num ber of row s of the m atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, ie., the num ber of collm ns ofm atrices B and X.NRHS $>=0$.

A (input/output)
On entry, the $M$-by -N matrix A. On exit, A has been overw rilten by details of its complete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the M-by-NRHS righthand sidem atrix B . On exit, the N -by-N RH S solution $m$ atrix X . Ifm >= n and $\mathbb{R} A N K=n$, the residual sum-of-squares for the solution in the $i$-th colum $n$ is given by the sum of squares of elem ents $N+1 \mathrm{M}$ in thatcolum $n$.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \operatorname{LD} \mathrm{B}>=$ $\max (1, M, N)$.

JPIVOT (input/output)
On entry, if $\mathbb{P} \mathbb{I V O T}$ (i) ne.0, the i-th column of $A$ is an initial colum $n$, otherw ise it is a free colum $n$. Before the $Q R$ factorization of $A$, all initial colum ns are perm uted to the leading positions; only the rem aining free colum ns are m oved as a resultof colum $n$ pivoting during the factorization. On exit, if $\mathbb{P} \operatorname{IVOT}(i)=k$, then the $i$-th colum $n$ of A *P was the $k$-th collm $n$ of A.

RCOND (input)

RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest leading triangular subm atrix R 11 in the $Q$ R factorization w ith pivoting ofA , whose estim ated condition num ber $<1$ RCOND.

RANK (output)
The effective rank of A, i.e., the order of the subm atrix R11. This is the sam e as the orderof the subm atrix T11 in the com plete orthogonal factorization of A.
W ORK (w orkspace)
$(m$ in $M, N)+\max \left(N, 2 \star_{m}\right.$ in $\left.\left.(M, N)+N R H S\right)\right)$,

W ORK 2 (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )
$\mathbb{I N F O}$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an ille-
galvalue

## C INTERFACE

\#include <sunperfh>
void cgelsy (intm, intn, intnrhs, com plex *a, int lda, complex *b, int ldb, int *jpvt, float roond, int *rank, int*info);
void cgelsy_64 (long m, long n, long nrhs, com plex *a, long lda, com plex *b, long ldb, long * jpvt, float rcond, long *rank, long *info);

## PURPOSE

cgelsy com putes the m inim um-norm solution to a com plex linear least squares problem :
$m$ inim ize $\|A * X-B\|$
using a com plete orthogonal factorization of . A is an $M$ by -N m atrix w hich m ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M by $-N$ RH S righthand side $m$ atrix $B$ and the $N$ by-NRHS solution $m$ atrix $X$.

The routine firstcom putes $a Q R$ factorization with $c o l u m n$ pivoting:

A * $\mathrm{P}=\mathrm{Q}$ * [R11R12]
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix whose estim ated condition num ber is less than $1 \not R C O N D$. The order ofR11,RANK, is the effective rank ofA.

Then, R22 is considered to be negligible, and R 12 is annihilated by unitary transform ations from the right, amiving at the com plete orthogonal factorization:
$A * P=Q *[T 110] * Z$
[ 0 0]

Them inim um norm solution is then
$\mathrm{X}=\mathrm{P}$ * Z ' [ inv (T11)*Q 1 *B ]
[ 0 ]
where Q 1 consists of the firstRANK colum ns of $Q$.
This routine is basically identical to the original xG ELSX except three differences:

- The perm utation ofm atrix $B$ (the right hand side) is faster and
m ore sim ple.
o The call to the subroutine $x G E Q P F$ has been substituted by the
the call to the subroutine $x G E Q P 3$. This subroutine is a B las-3
version of the $Q R$ factorization $w$ th colum $n$ pivoting. $O M$ atrix $B$ (the righthand side) is updated $w$ ith $B$ las-3.

## ARGUMENTS

M (input) The num ber of row s of the m atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of collm ns of the $m$ atrix $\mathrm{A} . \mathrm{N}>=0$.

NRH S (input)
The num ber of righthand sides, ie., the num ber of colum ns ofm atrices $B$ and $X . N R H S>=0$.

A (input/output)
On entry, the M by -N matrix A. On exit, A has been overw ritten by details of its com plete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathrm{M})$.

B (input/output)
On entry, the M -by - N RH S righthand side m atrix B . On exit, the $N$-by N RH S solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the aray $B . L D B>=$ $\max (1, M, N)$.

JPVT (input/output)
On entry, if JPV T (i) ne. 0, the i-th collm n of A is perm uted to the frontofA $P$, otherw ise colum n i is a free colum $n$. On exit, if JPV $T(i)=k$, then
the i-th column of A *P w as the $k$-th colum $n$ of A.

## RCOND (input)

RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest leading triangular subm atrix R 11 in the $Q R$ factorization $w$ th pivoting ofA , whose estim ated condition num ber $<1$ RCOND.

## RANK (output)

The effective rank ofA, ie., the order of the subm atrix R11. This is the sam e as the orderof the subm atrix T11 in the complete orthogonal factorization of A.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. The unblocked strategy requires that: LW ORK >=MN+MAX (2*M N, $\mathrm{N}+1, \mathrm{M} \mathrm{N}+\mathrm{NRH} \mathrm{S}$ ) where $\mathrm{M} \mathrm{N}=\mathrm{m}$ in $\mathrm{M}, \mathrm{N})$. The block algorithm requires that: LW ORK $>=\mathrm{MN}+\mathrm{MAX}(2 * \mathrm{M} N$,
 upper bound on the blocksize retumed by IUA EN V for the routines CGEQP3, CTZRZF, CTZRQF, CUNM QR, and CUNMRZ.

If LW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension $(2 * N)$
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N} F O=-$ i, the $i$-th argum ent had an illegalvalue

## PURPOSE

cgem $m$ perform s one of the $m$ atrix-m atrix operations

C : = alpha*op (A )*op (B) + beta*C
where op (X ) is one of
op $(X)=X$ or $o p(X)=X^{\prime}$ or op $(X)=$ con $\dot{g}(X)$, alpha and beta are scalars, and $A, B$ and $C$ arem atrices, $w$ ith op (A) an $m$ by $k m$ atrix, op (B) a $k$ by $n m$ atrix and $C$ an $m$ by $n m$ atrix.

## ARGUMENTS

TRANSA (input)
O n entry, TRAN SA specifies the form of op (A ) to be used in the $m$ atrix $m$ ultiplication as follow $s$ :

TRANSA $=N$ 'or $h$ ', op $(A)=A$.

TRANSA = T'or $t^{\prime}, o p(A)=A$ '.

TRANSA $=C^{\prime}$ or $E^{\prime}, o p(A)=\operatorname{conjg}\left(A^{\prime}\right)$.

U nchanged on exit.

TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

TRANSB (input)
On entry, TRAN SB specifies the form of op (B) to be used in the $m$ atrix $m$ ultiplication as follow $s:$

TRANSB $=N^{\prime}$ 'or $h^{\prime}, ~ o p(B)=B$.

TRANSB = T'or $t^{\prime}$, op (B) $)=B^{\prime}$.

TRANSB = C'or $C^{\prime}, ~ o p(B)=$ con $\dot{g}\left(B^{\prime}\right)$.

U nchanged on exit.

TRAN SB is defaulted to $N$ 'forF95 $\mathbb{I N T E R F A C E .}$

M (input)
O n entry, $M$ specifies the num ber of rows of the $m$ atrix op (A ) and of the $m$ atrix C. $M>=$ 0 . U nchanged on exit.

N (input)
O n entry, $N$ specifies the num ber of colum ns of the $m$ atrix op ( B ) and the num ber of colum ns of the $m$ atrix $C . N>=0$. U nchanged on exit.

K (input)
On entry, $K$ specifies the num ber of colum ns of the $m$ atrix op (A) and the num ber of row s of the $m$ atrix op (B).K $>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
COM PLEX array ofD $\mathbb{M}$ ENSION (LDA, ka), where ka is K when TRANSA $=\mathrm{N}$ 'or h ', and is M otherw ise. Before entry w ith TRANSA $=\mathrm{N}$ 'or h ', the leading $M$ by $K$ part of the array A m ust contain the $m$ atrix A , otherw ise the leading $K$ by $M$ part of the array A m ust contain the m atrix A. U nchanged on exit.

## LD A (input)

O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .W hen TRANSA $=N$ 'or $h$ 'then LDA $>=\max (1, M)$, otherw ise LD $A>=\mathrm{m}$ ax $(1, K)$. U nchanged on exit.

B (input)
COM PLEX aray ofD $\mathbb{I M} E N S I O N$ (LD $\mathrm{B}, \mathrm{kb}$ ), where kb is n when TRANSB $=\mathrm{N}$ 'or h ', and is k oth-
erw ise. Before entry $w$ ith TRANSB $=N^{\prime}$ or $h$ ', the leading $k$ by $n$ part of the anay $B$ must contain the $m$ atrix $B$, otherw ise the leading $n$ by $k$ part of the array $B$ mustcontain the $m$ atrix $B$. U nchanged on exit.

LDB (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program .W hen TRANSB $=N$ 'or h'then LD B $>=m a x(1, k)$, otherw ise LD B $>=\max (1, \mathrm{n})$. U nchanged on exit.
BETA (input)
O n entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need not.be set on input. U nchanged on exit.

C (input/output)
COM PLEX aray ofD $\mathbb{I M}$ ENSION (LDC, n ). Before entry, the leading $m$ by $n$ part of the array $C$ $m$ ustcontain the $m$ atrix $C$, exceptw hen beta is zero, in which case $C$ need notbe seton entry. On exit, the array $C$ is overw ritten by the $m$ by n matrix (alpha*op (A )*op (B ) + beta*C ).

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C $>=\max (1, m)$. U nchanged on exit.

\#include <sunperfh>
void cgeqlf(intm , intn, com plex *a, int lda, com plex *tau, int*info);
void cgeqlf_ 64 (long m , long n, com plex *a, long lda, com plex
*tau, long *info);

## PURPOSE

cgeqlf com putes a QL factorization of a complex M -by -N $m$ atrix $A: A=Q * L$.

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of $c o l u m$ ns of the $m$ atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the $\mathrm{M}-\mathrm{by}-\mathrm{N} \mathrm{m}$ atrix A . On exit, if $\mathrm{m}>=$ $n$, the low er triangle of the subarray A ( $m$ $\mathrm{n}+1 \mathrm{~m}, 1 \mathrm{n}$ ) contains the N -by-N low er triangular $m$ atrix $L$; ifm <= $n$, the elem ents on and below the ( $n-m$ )-th superdiagonalcontain the M by -N low er trapezoidalm atrix $L$; the rem aining elem ents, w ith the anray TA $U$, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors (see Further D etails).

LD A (input)
The leading dim ension of the array A . LD A $>=$ max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, \mathrm{~W}$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the array W ORK. LDW ORK >= $m$ ax $(1, N)$. Foroptim um perform ance LD W ORK $>=N * N B$, w here NB is the optim alblocksize.

IfLD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{N F O}$ (output)
= 0 : successfiulexit
<0: if $\mathbb{I N}$ FO $=-$ i, the $i$-th argum enthad an illegalvalue

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(k) \ldots H(2) H(1), \text { where } k=m \text { in }(m, n) .
$$

Each $H$ (i) has the form

H (i) $=I-\tan * V^{*} V^{\prime}$
$w$ here tau is a com plex scalar, and $v$ is a com plex vector w ith $v(m-k+i+1 \mathrm{~m})=0$ and $v(m-k+i)=1 ; v(1 m-k+i-1)$ is stored on exitin A ( $1 \mathrm{~m}-\mathrm{k}+\mathrm{i}-1, \mathrm{n}-\mathrm{k}+\mathrm{i}$ ), and tau in TAU (i).

## C INTERFACE

\#include < sunperfh>
void cgeqp3 (intm, intn, com plex *a, int lda, int * jpvt, com plex *tau, int *info);
void ogeqp3_64 (long m, long n, com plex *a, long lda, long * jpvt, com plex *tau, long *info);

## PURPOSE

cgeqp3 com putes a $Q R$ factorization $w$ ith colum $n$ pivoting of a $m$ atrix $A: A * P=Q * R$ using Level3 BLA $S$.

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
A (input/output)
On entry, the $M$-by-N m atrix A. On exit, the upper triangle of the array contains the $m$ in $(\mathbb{N}, N)$-by $-N$ upper trapezoidalm atrix $R$; the elem ents below the diagonal, together $w$ th the array TA $U$, represent the unitary $m$ atrix $Q$ as a productofm in $M, N$ ) ele$m$ entary reflectors.

LDA (input)
The leading dim ension of the array A. LDA >= $m a x(1, M)$.

JPVT (input/output)
On entry, if $\mathbb{P V} T(J)$ ne. 0 , the $J$ th colum $n$ of $A$ is perm uted to the frontof $A$ * (a leading colum $n$ ); if JPVT $(J)=0$, the $J$ th column of $A$ is a free column. On exit, if $\mathbb{J P V}(\mathcal{J})=\mathrm{K}$, then the J th colum $n$ of A *P was the the $K$-th colum $n$ of A.

TAU (output)
The scalar factors of the elem entary reflectors.
W ORK (w orkspace)
Onexit, if $\mathbb{N} F O=0, \mathrm{~W}$ ORK (1) retums the optim al
LW ORK.

LW ORK (input)
The dim ension of the aray W ORK. LW ORK >= N+1. For optim alperform ance LW ORK >=( $\mathrm{N}+1$ ) N B , where N B is the optim alblocksize.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )
$\mathbb{N} F O$ (output)
= 0 : successfiulexit.
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue.

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(m, n) .
$$

Each $H$ (i) has the form

H (i) $=I-\tan * V^{*} V^{\prime}$
w here tau is a real/com plex scalar, and $v$ is a real/com plex vectorw ith $v(1: i-1)=0$ and $v(i)=1 ; v(i+1 \mathrm{~m})$ is stored on exit in A (i+1 $m, i)$, and tau in TAU (i).

* jpivot, com plex *tau, long *info);

## PURPOSE

cgeqpf routine is deprecated and has been replaced by routine CGEQP3.

CGEQPF com putes $a \mathrm{Q}$ factorization w th colum n pivoting of a com plex $M$-by $-N$ m atrix $A: A * P=Q * R$.

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix A. $\mathrm{M}>=0$.
N (input) The num ber of colum ns of the $m$ atrix $\mathrm{A} \cdot \mathrm{N}>=0$

A (input/output)
On entry, the M -by-N m atrix A. On exit, the upper triangle of the array contains the $m$ in $(M, N)$-by $-N$ upper triangularm atrix $R$; the elem ents below the diagonal, together $w$ th the array TA $U$, represent the unitary $m$ atrix $Q$ as a productofm in $(m, n)$ ele$m$ entary reflectors.

LDA (input)
The leading dim ension of the array A. LD A >= $m a x(1, M)$.

JPIVOT (input/output)
On entry, if $\mathbb{P} \mathbb{I V O T}$ (i) ne.0, the i-th colum n of $A$ is perm uted to the front of A *P (a leading colum n); if $\mathbb{P} \mathbb{V} O T(i)=0$, the i-th column of $A$ is a free column. On exit, if $\mathbb{P I V O T}(i)=k$, then
the i-th colum $n$ of $A * P$ was the $k$-th colum $n$ of $A$.

TAU (output)
The scalar factors of the elem entary reflectors.

W ORK (w orkspace)
dim ension $\mathbb{N}$ )

W ORK 2 (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )
$\mathbb{I N} F O$ (output)
= 0: successfulexit
$<0$ : if $\mathbb{N F O}=-\mathrm{i}$, the i -th argum ent had an illegal value

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors
$Q=H(1) H(2) \ldots H(n)$
Each $H$ (i) has the form
$\mathrm{H}=\mathrm{I}-\tan { }^{*} \mathrm{~V}^{*} \mathrm{~V}^{\prime}$
$w$ here tau is a com plex scalar, and $v$ is a com plex vector with $v(1: i-1)=0$ and $v(i)=1 ; v(i+1 \mathrm{~m})$ is stored on exit in $A(i+1 m, i)$.

The $m$ atrix $P$ is represented in jpvtas follow s: If put $(\mathcal{j})=i$
then the th colum n ofP is the ith canonicalunitvector.

## PURPOSE

cgerc perform sthe rank 1 operation $A:=a ł p h a \star x^{\star} c o n \dot{g}\left(y^{\prime}\right)$
$+A$ where alpha is a scalar, $x$ is an $m$ elem entvector, $y$ is an $n$ elem entvector and $A$ is an $m$ by $n m$ atrix.

## ARGUMENTS

M (input)
O n entry, M specifies the num ber of row s of the $m$ atrix A. M >=0. U nchanged on exit.

N (input)
O n entry, $N$ specifies the num ber of colum ns of the $m$ atrix A. N >=0. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
$(1+(m-1) \star \operatorname{abs}(\mathbb{N C X}))$. Before entry, the increm ented anray $X$ must contain the $m$ elem ent vectorx. U nchanged on exit.
$\mathbb{N} C X$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents of X. $\mathbb{N} C X$ m ustnotbe zero. U nchanged on exit.

Y (input)
$(1+(\mathrm{n}-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y \mathrm{~m}$ ust contain the n elem ent vectory. U nchanged on exit.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the
elem ents of $Y . \mathbb{N} C Y$ m ustnotbe zero. U nchanged on exit.

A (input/output)
Before entry, the leading $m$ by $n$ part of the array
A must contain the matrix ofcoefficients. O n exit, A is overw rilten by the updated $m$ atrix.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A $>=$ $\max (1, m)$. U nchanged on exit.

void ogerfs_64 (chartransa, long n, long nrhs, com plex *a, long lda, com plex *af, long ldaf, long *ipivot, com plex *b, long ldb, com plex *x, long ldx, float * ferrr, float *berr, long *info);

## PURPOSE

cgerfs im proves the com puted solution to a system of linear equations and provides emorbounds and backw ard erroresti$m$ ates for the solution.

## ARGUMENTS

TRANSA (input)
Specifies the form of the system of equations:
$=N: A * X=B \quad$ (Notranspose)
$=T$ ': $A * * T * X=B \quad$ ( ranspose)
$=C$ ': $A * * H * X=B \quad$ (C onjugate transpose)

TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atriges B and X. NRH S $>=0$.

A (input) The originalN by N m atrix A .

LD A (input)
The leading dim ension of the anay A. LDA >= $\max (1, N)$.

AF (input)
The factors L and U from the factorization $\mathrm{A}=$ $\mathrm{P} * \mathrm{~L} * \mathrm{U}$ as com puted by CGETRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= max ( $1, \mathbb{N}$ ).
$\mathbb{P I V O T}$ (input)
The pivotindices from CGETRF; for $1<=\mathrm{i}<=\mathrm{N}$, row i of the $m$ atrix $w$ as interchanged w ith row $\mathbb{P}$ IV OT (i).
$B$ (input) The righthand side m atrix $B$.
LD B (input)
The leading dim ension of the array $B$. LD B >= max ( $1, N$ ).

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by CGETRS. On exit, the im proved solution $m$ atrix $X$.

LD X (input)
The leading din ension of the array X . LD X >= $\max (1, N)$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution conesponding to $X(\mathcal{O})$, FERR ( $)$ ) is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $\mathrm{X}(\mathcal{\nu})-\mathrm{X}$ TRU E ) divided by the m agnitude of the largestelem entin $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( $\mathcal{j}$ ) (i.e., the sm allest relative change in any elem entof $A$ orB thatm akes $X(\mathcal{J})$ an exactsolution).

W ORK (w orkspace)
dim ension $(2 * N)$

W ORK 2 (w orkspace)
dim ension $(\mathbb{N})$
$\mathbb{N} F O$ (output)
= 0: successfulexit
< 0 : if $\mathbb{N} F O=-i$, the $i$-th argum ent had an illegal value

## C INTERFACE

\#include <sunperfh>
void cgerqf(intm, intn, com plex *a, int lda, com plex *tau, int*info);
void cgerqf_ 64 (long m , long n, com plex *a, long lda, com plex
*tau, long *info);

## PURPOSE

cgergf com putes an RQ factorization of a com plex $M$-by-N $m$ atrix $A: A=R * Q$.

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.
N (input) The num ber of $c o l u m$ ns of the $m$ atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the $\mathrm{M}-$ by -N m atrix A. On exit, if $\mathrm{m}<=$ n , the upper triangle of the subarray $A(1 \mathrm{~m}, \mathrm{n}$ $\mathrm{m}+1 \mathrm{~m}$ ) contains the M boy -M upper triangularm atrix $R$; if $m>=n$, the elem ents on and above the $m$ n )-th subdiagonalcontain the M by -N upper trapezoidal $m$ atrix $R$; the rem aining elem ents, $w$ th the anay TA $U$, represent the unitary $m$ atrix $Q$ as a product of $m$ in $(m, n$ ) elem entary reflectors (see FurtherD etails).

LD A (input)
The leading dim ension of the array A . LD A $>=$ max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, \mathrm{~W}$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= $m$ ax ( $1, M$ ). Foroptim um perform ance LDW ORK $>=M$ *NB, w here NB is the optim alblocksize.

IfLD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{N F O}$ (output)
= 0 : successfulexit
<0: if $\mathbb{I N}$ FO $=-$ i, the $i$-th argum enthad an illegalvalue

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(1) \text { 'H (2)' } \ldots H(k) \text { ', where } k=m \text { in }(m, n) \text {. }
$$

Each $H$ (i) has the form

H (i) $=I-\tan * V^{*} V^{\prime}$
$w$ here tau is a com plex scalar, and $v$ is a com plex vector with $v(n-k+i+1 n)=0$ and $v(n-k+i)=1$; con $\operatorname{jg}(v(1 n-k+i-1))$ is stored on exitin A $(m-k+i, 1 m-k+i-1)$, and tau in TAU (i).

```

void cgenu (intm, intn, com plex *alpha, com plex *x, int incx, com plex *y, int incy, com plex *a, int lda);
void cgeru_64 (long m,long n, com plex *alpha, com plex *x, long incx, com plex *y, long incy, com plex *a, long lda);

## PURPOSE

cgeru perform sthe rank 1 operation $A:=a l p h a^{*} x^{*} y^{\prime}+A$ $w$ here alpha is a scalar, $x$ is an $m$ elem entvector, $y$ is an $n$ elem entvectorand $A$ is an $m$ by $n m$ atrix.

## ARGUMENTS

M (input)
O $n$ entry, $M$ specifies the num berof row $s$ of the $m$ atrix $A . M>=0$. U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the $m$ atrix $A . N>=0$. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
$(1+(m-1) * \operatorname{abs}(\mathbb{N C X}))$. Before entry, the increm ented array $X$ ust contain them elem ent vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents of $\mathrm{X} . \mathbb{I N C X}$ m ustnotbe zero. U nchanged on exit.
$Y$ (input)
$(1+(n-1) * a b s(\mathbb{N} C Y))$. Before entry, the increm ented array $Y \mathrm{~m} u$ ust contain the n elem ent vectory. U nchanged on exit.
$\mathbb{N C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of Y. $\mathbb{N} C Y$ m ustnotbe zero. U nchanged
on exit.

A (input/output)
B efore entry, the leading $m$ by $n$ part of the aray A must contain the matrix of coefficients. O $n$ exit, $A$ is overw rilten by the updated $m$ atrix.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD $A>=$ $m a x(1, m)$. U nchanged on exit.

## C INTERFACE

\#include <sunperfh>
void cgesdd (char j̀bz, intm , intn, com plex *a, int lda, float *s, com plex *u, int ldu, com plex *vt, int ldvt, int *info);
void cgesdd_64 (char jobz, long m, long n, com plex *a, long lda, float*s, com plex *u, long ldu, com plex *vt, long ldvt, long *info);

## PURPOSE

cgesdd com putes the singular value decom position (SV D ) of a complex M -by-N matrix A, optionally com puting the left and/orrightsingularvectors, by using divide-and-conquer method.The SVD isw ritten $=U * S \mathbb{I G M A}$ * conjugate-transpose $(N)$
$w$ here SIG M A is an $M$ by $-N \mathrm{~m}$ atrix which is zero except for its $m$ in $(m, n$ ) diagonal elem ents, $U$ is an $M$ by $M$ unitary $m$ atrix, and V is an N -by -N unitary m atrix. The diagonalelem ents of SIGMA are the singularvalues ofA ; they are real and nonnegative, and are retumed in descending order. The first $m$ in $(m, n)$ colum ns of $U$ and $V$ are the left and rightsingular vectors of A.

N ote that the routine retums $\mathrm{V} T=\mathrm{V} * * \mathrm{H}$, not V .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ ithout guard digits w hich subtract like the $C$ ray X M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard

## ARGUMENTS

JOBZ (input)
Specifies options for com puting allorpart of the
m atrix U :
= $A$ ': allM colum ns of U and all N row sof $\mathrm{V} * * H$ are retumed in the arays $U$ and $V T ;=S$ : the firstm in $(M, N)$ colum ns of $U$ and the firstm in $(M, N)$ row s of V ** H are retumed in the arrays U and VT ; $=\mathrm{O}^{\prime}$ : If $\mathrm{M}>=\mathrm{N}$, the first N colum ns of U are overw rilten on the array $A$ and allrow sofV **H are retumed in the array VT; otherw ise, all colum $n s$ of $U$ are retumed in the anray $U$ and the firstM row sofV ${ }^{* * H}$ are overw rilten in the amay $\mathrm{VT} ;=\mathrm{N}$ ': no colum ns of U or row sof V ** H are com puted.

M (input) The num ber of row s of the inputm atrix $A . M>=0$.

N (input) The num ber of colum ns of the inputm atrix $\mathrm{A} . \mathrm{N}>=$ 0.

A (input/output)
On entry, the M -by-N m atrix A. On exit, if OBB = $O^{\prime}$ ' $A$ is overw rilten $w$ ith the first $N$ colum $n s$ of
U (the leftsingularvectors, stored colum nw ise) if $\mathrm{M}>=\mathrm{N}$; A is overw ritten w ith the firstM row S of $V * * H$ the right singularvectors, stored row wise) otherw ise. if JOBZ ne. O', the contents of A are destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, M)$.

S (output)
The singularvalues of $A$, sorted so that $S$ (i) $>=$ $S(i+1)$ 。

U (output)
$\mathrm{UCOL}=\mathrm{M}$ if $\mathrm{OBZ}=\mathrm{A}^{\prime}$ or $\mathrm{OBZ}=\mathrm{D}^{\prime}$ 'and $\mathrm{M}<\mathrm{N}$;
$\mathrm{UCOL}=\mathrm{m}$ in $(\mathrm{M}, \mathrm{N})$ if $J O B Z=S^{\prime}$. If $\mathrm{OOBZ}=A^{\prime}$ or
JOBZ $=0$ 'and $M<N$, U contains the $M$ boy $M$ unitary $m$ atrix $U$; if $J O B Z=S$ ', $U$ contains the first
$m$ in $(M, N)$ colum ns of $U$ (the leftsingular vectors, stored colum nw ise); if $\mathrm{OBBZ}=0$ 'and $\mathrm{M}>=\mathrm{N}$, or
$J O B Z=N ', U$ is not referenced.

LD U (input)
The leading dim ension of the array $U$. LD U >= 1 ; if $\mathrm{OBZ}=\mathrm{S}^{\prime}$ or A 'or $\mathrm{OB} \mathrm{BZ}=\mathrm{O}^{\prime}$ 'and $\mathrm{M}<\mathrm{N}$, LDU $>=M$.

VT (output)
If $\mathrm{JOBZ}=\mathrm{A}$ 'or $\mathrm{JOBZ}=\mathrm{O}$ 'and $\mathrm{M}>=\mathrm{N}, \mathrm{VT}$ contains the N -by N unitary m atrix $\mathrm{V} * * \mathrm{H}$; if $\mathrm{JOBZ}=$ $S ', V T$ contains the firstm in $M, N$ ) row s of $V * * H$ (the right singularvectors, stored row w ise); if $\mathrm{JOBZ}=\mathrm{O}$ 'andM $<\mathrm{N}$, or $\mathrm{OBBZ}=\mathrm{N}$ ', VT is not referenced.

LDVT (input)
The leading dim ension of the array V T. LD V T >=1;
if $J 0 B Z=A$ 'or $O B Z=0$ 'and $M>=N, L D V T>=N$;
if $J O B Z=S \prime, L D V T>=m$ in $M, N)$.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array $W$ ORK.LW ORK >= 1. if $\operatorname{JOBZ}=N$ ', LW ORK $>=2 \star \mathrm{~m}$ in $M, N)+m a x(M, N)$. if JOBZ
$=\quad 0!\quad L W O R K \quad>=$

$=S^{\prime}$ or $A^{\prime}$, LWORK >=
$m$ in $(M, N){ }^{*} m$ in $\left.M, N\right)+2 \star_{m}$ in $\left.M, N\right)+m$ ax $(M, N)$. For good perform ance, LW ORK should generally be larger. If LW ORK < 0 but other input argum ents are legal, W ORK (1) retums optim alLW ORK.

RW ORK (w orkspace)
If $\mathrm{JOBZ}=\mathrm{N}$ ', LRW ORK $>=7 * \mathrm{~m}$ in $M, N)$. O therw ise, LRW ORK $>=5 \star^{m}$ in $(M, N) *_{m}$ in $(M, N)+5 \star_{m}$ in $\left.M, N\right)$

IV ORK (w orkspace)
dim ension ( $8 \star \mathrm{M} \mathbb{I} \mathbb{M}, N)$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit.
< 0: if $\mathbb{N N}$ FO = -i, the i-th argum ent had an illegalvahue.
$>0$ : The updating process of SBD SD C did not converge.

## PURPOSE

cgesv com putes the solution to a com plex system of linear equations
$A * X=B, w h e r e A$ is an $N$ boy $-N m$ atrix and $X$ and $B$ are N -by -N R H S m atrices.

The LU decomposition w ith partial pivoting and row interchanges is used to factorA as
$A=P * L * U$,
$w$ here $P$ is a perm utation $m$ atrix, $L$ is unit low er triangular, and $U$ is upper triangular. The factored form of $A$ is then used to solve the system ofequations $A * X=B$.

## ARGUMENTS

N (input) The num ber of linear equations, ie., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS $>=0$.

A (input/output)
O n entry, the $N$ boy -N coefficient $m$ atrix A. On exit, the factors $L$ and $U$ from the factorization $A$ $=P * L * U$; the unitdiagonalelem ents of L are not stored.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.

IPIVOT (output)
The pivot indices that define the perm utation $m$ atrix $P$; row $i$ of the $m$ atrix $w$ as interchanged w ith row $\mathbb{P}$ IVOT (i).

B (input/output)
On entry, the N -by-N RH S m atrix of righthand side
$m$ atrix $B$. On exit, if $\mathbb{N} F O=0$, the $N$ boy-NRHS solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the aray $B$. LD B $>=$ $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{I N}$ FO = -i, the i-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{U}(i, i)$ is exactly zero. The factorization has been com pleted, but the factor $U$ is exactly singular, so the solution could not be com puted.

## C INTERFACE

\#include <sunperfh>
void cgesvd (char jobu, char jobvt, intm , intn, com plex *a, int lda, float *sing, com plex *u, int ldu, com plex *vt, int ldvt, int *info);
void cgesvd_64 (char jobu, char jobvt, long m, long n, com plex *a, long lda, float *sing, com plex *u, long ldu, com plex *vt, long ldvt, long *info);

## PURPOSE

cgesvd com putes the singular value decom position (SVD ) of a com plex M -by -N m atrix A , optionally com puting the left and/or rightsingularvectors. The SVD is w ritten
$=U$ * SIGMA* conjugate-transpose $(N)$
where SIG M A is an $M$-by $-\mathrm{N} m$ atrix which is zero except for its $m$ in $(m, n$ ) diagonal elem ents, $U$ is an $M$ by $M$ unitary $m$ atrix, and $V$ is an $N$ by $-N$ unitary $m$ atrix. The diagonalelem ents of SIGMA are the singularvalues ofA; they are realand nonnegative, and are retumed in descending order. The first $m$ in ( $m, n$ ) colum ns of $U$ and $V$ are the left and right singular vectors of A.

N ote that the routine retums V ** H , not V .

## ARGUMENTS

## JO BU (input)

Specifies options for com puting allor part of the m atrix U :
= A : allm colum ns of U are retumed in anay
U :
$=S$ : the firstm in (m,n) colum nsofU the left singular vectors) are retumed in the array $U$; $=$ $O^{\prime}$ : the firstm in $(m, n)$ colum ns of $U$ the left singular vectors) are overw rilten on the array A;
$=\mathrm{N}$ ': no colum ns of U (no left singularvectors) are com puted.
$J 0 \operatorname{BVT}$ (input)
Specifies options for com puting allor part of the m atrix V **H:
$=A$ ': alln rowsofV ${ }^{* *} \mathrm{H}$ are retumed in the array VT;
$=S$ ': the firstm in $(m, n)$ row sofV $* * H$ the right singular vectors) are retumed in the array VT ; $=$ 0 : the firstm in $(m, n)$ row s of $V * * H$ the right singular vectors) are overw ritten on the array A; $=\mathrm{N}$ ': no row sofV **H (no right singular vectors) are com puted.

JO BVT and JOBU cannotboth be $\mathrm{D}^{\prime}$.
$M$ (input) The num ber of row s of the inputm atrix $A . M>=0$.

N (input) The num ber of colum ns of the inputm atrix $\mathrm{A} . \mathrm{N}>=$ 0.

A (input/output)
On entry, the $M$-by $-N m$ atrix A. On exit, if $J O B U=$ $O^{\prime}$ ' A is overw ritten w the firstm in $(m, n)$
collum ns of $U$ (the left singular vectors, stored colum nw ise); if JOBVT = O',A is overw rilten w th the firstm in $(m, n)$ row sof $V * * H$ the right singularvectors, stored row w ise); if JO BU ne. 0 'and JOBVT ne. 0 ', the contents of A are destroyed.

## LD A (input)

The leading dim ension of the array A. LDA >= max (1, M).

## SING (output)

The singularvalues ofA, sorted so that SIN G (i) $>=S \mathbb{N} G(i+1)$.

$S '$. If $\operatorname{OOBU}=A$ ', $U$ contains the $M$-by $-M$ unitary
$m$ atrix $U$; if $J O B U=S^{\prime}, U$ contains the first
$m$ in ( $m, n$ ) colum ns of $U$ (the left singular vectors, stored collm nw ise); if $\mathrm{OOBU}=\mathrm{N}$ 'or $\mathrm{O}^{\prime}$ ' U is not referenced.

LD U (input)
The leading dim ension of the array $U$. LD $U>=1$;
if $J 0 B U=S$ 'or $A$ ', LDU $>=M$.
VT (input)

If $\mathrm{JOBVT}=\mathrm{A}, \mathrm{VT}$ contains the N by -N unitary $m$ atrix $\mathrm{V} * * \mathrm{H}$; if $\mathrm{JOBV} T=\mathrm{S}^{\prime}, \mathrm{VT}$ contains the first m in $(\mathrm{m}, \mathrm{n})$ row s of $\mathrm{V} * * \mathrm{H}$ (the right singularvectors, stored row w ise); if JOBVT = N 'or D',VT is not referenced.

LDVT (input)
The leading dim ension of the array V T. LD V T >=1;
 m in $(\mathrm{M}, \mathrm{N})$.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LD W ORK (input)
The dim ension of the aray W ORK. LDW ORK >= 1 . LDW ORK >= $2 \star \mathrm{M} \mathbb{N}(M, N)+M A X(M, N)$ Forgood perform ance, LD W ORK should generally be larger.

IfLDW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
D $\mathbb{I}$ ENSION $(5 * M \mathbb{N} M, N))$. On exit, if $\mathbb{N} F O>0$, W ORK $2(1 \mathbb{M} \mathbb{N} M, N)-1)$ contains the unconverged superdiagonal elem ents of an upper bidiagonal $m$ atrix $B$ whose diagonal is in $S \mathbb{N} G$ (notnecessarily sorted). $B$ satisfies $A=U * B * V T$, so it has the sam e singular values as A, and singular vectors related by U and V T.
$\mathbb{N} F O$ (output)
= 0: successfulexit.
$<0$ : if $\mathbb{N}$ FO $=-$-i, the $i$-th argum enthad an illegalvalue.
> 0: ifCBD SQR did notconverge, $\mathbb{N F O}$ specifies
how $m$ any superdiagonals of an interm ediate bidiagonalform B did not converge to zero. See the description ofW ORK 2 above for details.

## C INTERFACE

\#include <sunperfh>
void cgesvx (char fact, chartransa, intn, intnins, com plex
*a, int lda, com plex *af, int ldaf, int *ípivot, char equed, float*r, float*c, com plex *b, int ldb, com plex *x, int ldx, float*rcond, float * ferrs, float *bers, int *info);
void cgesvx_64 (char fact, chartransa, long n, long nihs, com plex *a, long lda, com plex *af, long ldaf, long *ipívot, char equed, float *r, float *c, com plex *b, long ldb, com plex *x, long ldx, float * rcond, float *ferr, float *berr, long *info);

## PURPOSE

cgesvx uses the LU factorization to com pute the solution to a com plex system of linear equations
$A$ * $X=B$, where $A$ is an $N$ boy $N \mathrm{~m}$ atrix and $X$ and $B$ are N -by-N R H S m atrices.

E rorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
TRANS $=N^{\prime}: \operatorname{diag}(R) \star A * \operatorname{diag}(C) \quad \star \operatorname{inv}(\operatorname{diag}(C)) \star X=$ $\operatorname{diag}(R) \star B$
$\operatorname{TRANS}=T:(\operatorname{diag}(\mathbb{R}) \star A * \operatorname{diag}(C)) \star * T * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) \star \mathrm{X}=$ diag (C) *B

TRANS $=C^{\prime}:(\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=$ diag (C)*B

W hether or not the system w illbe equilibrated depends on the scaling of them atrix A , but ifequilibration is used, A is overw rilten by diag $(\mathbb{R}) * A$ *diag $(C)$ and $B$ by $\operatorname{diag}(\mathbb{R}) * B \quad$ (if TRANS = N ) ordiag (C)*B (if TRANS = T'or C).
2. IfFACT $=N$ 'or $E$ ', the LU decomposition is used to factorthe
$m$ atrix A (afterequilibration ifFACT $=$ E) as

$$
A=P \star L \star U
$$

$w$ here $P$ is a perm utation $m$ atrix, $L$ is a unit low er triangular
$m$ atrix, and $U$ is upper triangular.
3. If som e $U(i, i)=0$, so that $U$ is exactly singular, then the routine
retums $w$ ith $\mathbb{N F O}=i .0$ therw ise, the factored form of $A$ is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N} F O=N+1$ is retumed as a $w$ aming, but the routine stillgoes on
to solve for $X$ and com pute error bounds as described below .
4.The system ofequations is solved forX using the factored form of A.
5. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for 五.
6. If equilibration $w$ as used, the $m$ atrix $X$ is prem ultiplied by diag (C) (ifTRANS = N) ordiag $(\mathbb{R})$ (ifTRANS = T' or
C) so that itsolves the originalsystem before equilibration.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of the $m$ atrix A is supplied on entry, and ifnot, w hether them atrix A should be equilibrated before it is factored. $=\mathrm{F}^{\prime}:$ On entry, AF and $\mathbb{P} \mathbb{I V O T}$ contain the factored form of A. IfEQUED is not $N$ ', the $m$ atrix A has been equilibrated $w$ ith scaling factors given by $R$ and $C . A, A F$, and $\mathbb{P} \mathbb{I V O T}$ are not m odified. $=\mathrm{N}$ ': The m atrix A w ill.be copied to A F and factored.
$=\mathrm{E}$ : The matrix A w ill be equilibrated if necessary, then copied to A F and factored.

TRANSA (input)
Specifies the form of the system of equations:
$=\mathrm{N}$ ': A * $\mathrm{X}=\mathrm{B} \quad$ N o transpose)
$=T: A * * T * X=B \quad$ ( ranspose)
$=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad$ (C onjugate transpose)
TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

N (input) The num ber of linear equations, i.e., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the $m$ atrices $B$ and X. NRH S $>=0$.

A (input/output)
On entry, the N -by -N m atrix A . IfFA CT $=\mathrm{F}^{\prime}$ and EQUED is not $N$ ', then $A$ musthave been equilibrated by the scaling factors in R and/orC. A is not modified if FACT $=$ F'or $\mathrm{N}^{\prime}$, or if $\mathrm{FACT}=$ E'and EQUED = N 'on exit.

Onexit, ifEQUED ne. $N$ ', A is scaled as follow s: EQUED $=R$ ': $A=\operatorname{diag}(R) * A$
EQUED = C ': A :=A * diag (C)
EQUED = B': A := diag (R)*A * diag (C ).

LD A (input)
The leading dim ension of the anay A. LDA >= $\max (1, \mathbb{N})$.

AF (input/output)
IfFACT = $\mathrm{F}^{\prime}$, then AF is an input argum entand on
entry contains the factors $L$ and $U$ from the factorization $A=P * L * U$ as com puted by CGETRF. If EQUED ne. $N$ ', then $A F$ is the factored form of the equilibrated $m$ atrix $A$.

If $\mathrm{FACT}=\mathrm{N}$ ', then AF is an output argum ent and on exit retums the factors $L$ and $U$ from the factorization $A=P * L * U$ of the originalm atrix $A$.

IfFACT $=\mathrm{E}$ ', then $A F$ is an output argum ent and on exit retums the factors $L$ and $U$ from the factorization $\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}$ of the equilibrated m atrix A (see the description of $A$ for the form of the equilibrated $m$ atrix).

## LDAF (input)

The leading dim ension of the array AF. LD AF >= $\max (1, N)$.

## IPIVOT (inputoroutput)

IfFACT=F', then $\mathbb{P} \mathbb{V} O T$ is an input argum ent and on entry contains the pivot indioes from the factorization $\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}$ as com puted by CGETRF; row $i$ of the $m$ atrix $w$ as interchanged $w$ th row $\mathbb{P} \mathbb{V} O T$ (i).

IfFACT $=N$ ', then $\mathbb{P} \mathbb{I V O T}$ is an output argum ent and on exit contains the pivot indiges from the factorization $\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}$ of the originalm atrix A .

IfFACT=E', then $\mathbb{P I V O T}$ is an output argum ent and on exit contains the pivot indices from the factorization $A=P * L * U$ of the equilibrated $m$ atrix A.

EQUED (input/output)
Specifies the form of equilibration thatw as done.
$=N^{\prime}:$ N o equilibration (alw ays true ifFACT =
$\mathrm{N})$.
$=R$ ': Row equilibration, ie., A has been
prem ultiplied by diag $(R)$ ) = C': Colum n equilibration, ie., A has been postm ultiplied by diag (C ). = B ': B oth row and colum $n$ equilibration, ie., A has been replaced by diag $(\mathbb{R})$ * A * diag (C). EQUED is an inputargum entifFACT= F '; otherw ise, it is an output argum ent.
$R$ (input/output)
The row scale factors forA. IfEQUED = R' or
$B$ ', A is multiplied on the leftby diag $(\mathbb{R})$; if
$E Q U E D=N$ 'or $C$ ', $R$ is notaccessed. $R$ is an
input argum ent if $\mathrm{FACT}=\mathrm{F}$ '; otherw ise, R is an output argum ent. IfFACT = F'andEQUED = R'or $B$ ',each elem entofR $m$ ustbe positive.

C (input/output)
The colum $n$ scale factors for $A$. IfEQUED = C 'or
B ', A is multiplied on the right.by diag ( C ); if EQUED $=N$ 'or $R$ ', $C$ is notaccessed. $C$ is an input argum ent ifFACT = F '; otherw ise, C is an outputargum ent. IfFACT = F 'and $\mathrm{EQUED}=\mathrm{C}$ 'or B ', each elem entofC m ustbe positive.
B (input/output)
On entry, the N -by-NRH S righthand side m atrix B .
On exit, if EQUED $=N$ ', $B$ is notm odified; if TRANSA $=N^{\prime}$ and EQUED $=R$ 'or $B$ ', $B$ is overw rilten by diag $(R) * B$; ifTRANSA $=T^{\prime}$ 'or $C^{\prime}$ and EQUED $=C^{\prime}$ or $B^{\prime}, B$ is overw ritten by diag (C) *B .

LD B (input)
The leading dim ension of the array $B$. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=N+1$, the N -by -N RH $S$ solution
$m$ atrix $X$ to the original system of equations.
$N$ ote that $A$ and $B$ arem odified on exit if EQUED
ne. $N$ ', and the solution to the equilibrated
system is inv (diag (C ))*X ifTRANSA = N 'and EQUED
$=C$ 'or $B^{\prime}$, orinv (diag $\left.(R)\right) * X$ ifTRANSA $=T$ 'or $C^{\prime}$ and EQUED $=R$ 'or $B$ '.

LD X (input)
The leading dim ension of the anay X . LD X >= $\max (1, N)$.

## RCOND (output)

The estim ate of the reciprocal condition num ber of the matrix A afterequilibration (if done). If
RCOND is less than them achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to w orking precision. This condition is indicated by a retum code of $\mathbb{N} \mathrm{FO}>0$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O}), \operatorname{FERR}(\mathcal{7})$ is an estim ated upperbound for the $m$ agnitude of the largest ele-
$m$ ent in $(X(\mathcal{O})-X$ TRUE $)$ divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{)}$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector $X(\mathcal{)}$ (i.e., the sm allest relative change in any elem entof $A$ orB thatm akes $X(\mathcal{j})$ an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dim ension ( $2 *$ N ) On exit, W ORK 2 (1) contains the reciprocal pivot grow th factornorm (A)/norm (U). The "max absolute elem ent" norm is used. If W ORK2(1) is much less than 1, then the stability of the LU factorization of the (equilibrated)
$m$ atrix A could be poor. This also $m$ eans that the solution X, condition estim atorRC OND, and forw ard error bound $F E R R$ could be unreliable. If factorization fails $w$ ith $0<\mathbb{N} F O<=N$, then $W$ ORK 2 (1) contains the reciprocalpivot grow th factor for the leading $\mathbb{N}$ FO colum ns of A.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N F O}=i$, and $i$ is
<= N : U (i,i) is exactly zero. The factorization
has been com pleted, but the factorU is exactly singular, so the solution and error bounds could not be com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{U}$ is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void cgetf2_64 (long m, long n, com plex *a, long lda, long *ipiv, long *info);

## PURPOSE

cgetff com putes an LU factorization of a general $m$-by-n $m$ atrix A using partialpivoting $w$ ith row interchanges.

The factorization has the form

$$
A=P * L * U
$$

$w$ here $P$ is a perm utation $m$ atrix, $L$ is low er triangular $w$ ith unit diagonal elem ents (low ertrapezoidalifm > n), and U is uppertriangular (uppertrapezoidalifm < n).

This is the right-looking Level2 B LA S version of the algorithm .

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.

N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O n entry, them by $n m$ atrix to be factored. On
exit, the factors $L$ and $U$ from the factorization $A$
$=\mathrm{P} * \mathrm{~L} * \mathrm{U}$; the unitdiagonalelem ents of L are not stored.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, M)$.
$\mathbb{P} \mathbb{I} V$ (output)
The pivotindioes; for $1<=i<=m$ in $(M)$ ), row i of the $m$ atrix $w$ as interchanged $w$ ith row $\mathbb{P} \mathbb{I V}$ (i).

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-\mathrm{k}$, the k -th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=k, U(k, k)$ is exactly zero. The factorization has been com pleted, but the factor $U$ is
exactly singular, and division by zero will occur
if it is used to solve a system of equations.

## PURPOSE

cgetrf com putes an LU factorization of a general M boy-N $m$ atrix A using partialpivoting $w$ ith row interchanges.

The factorization has the form

$$
A=P * L * U
$$

$w$ here $P$ is a perm utation $m$ atrix, $L$ is low er triangular $w$ ith unit diagonal elem ents (low ertrapezoidalifm > n), and U is upper triangular (uppertrapezoidalifm < n).

This is the right-looking Level3 B LA S version of the algorithm .

## ARGUMENTS

M (input) The num ber of row s of the m atrix $\mathrm{A} . \mathrm{M}>=0$.

N (input) The num ber of colum ns of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the $M$ boy $-\mathrm{N} m$ atrix to be factored. On exit, the factors $L$ and $U$ from the factorization $A$
$=\mathrm{P} * \mathrm{~L} * \mathrm{U}$; the unitdiagonalelem ents of L are not stored.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, M)$.

## IPIVOT (output)

The pivotindioes; for $1<=i<=m$ in $(M)$ ), row i of the $m$ atrix $w$ as interchanged $w$ ith row $\mathbb{P}$ IV OT (i).

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i$ th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i, U(i, i)$ is exactly zero. The factorization has been com pleted, but the factor U
is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

$\mathbb{N}$ TEGER (8) :: N, LDA,LDW ORK, $\mathbb{N} F O$
$\mathbb{N} T E G E R(8), D \mathbb{M} \operatorname{ENSION}(:):: \mathbb{P} \mathbb{V} O T$

## C INTERFACE

\#include <sunperfh>
void cgetri(intn, com plex *a, int lda, int *ipivot, int *info);
void ogetri_ 64 (long n, com plex *a, long lda, long *ịivot, long *info);

## PURPOSE

cgetricom putes the inverse of a m atrix using the LU factorization com puted by CGETRF .

Thism ethod inverts $U$ and then com putes inv (A) by solving the system inv (A) ${ }^{(A L}=\operatorname{inv}(\mathbb{U})$ for inv (A).

## ARGUMENTS

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O n entry, the factors $L$ and $U$ from the factoriza-
tion $\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}$ as com puted by CGETRF. On ex斗, if $\mathbb{N} F O=0$, the inverse of the originalm atrix $A$.

LD A (input)
The leading dim ension of the array A. LD A >= $\max (1, N)$.

IPIVOT (input)
The pivotindiges from CGETRF ; for $1<=i<=N$, row $i$ of the $m$ atrix $w$ as interchanged $w$ ith row $\mathbb{P I V O T}$ (i).

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0$, then $W$ ORK (1) retums the optim alLDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= $\max (1, N)$. Foroptim alperform ance LDW ORK $>=N * N B$, where NB is the optim al blocksize retumed by ILAENV.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i, U(i, i)$ is exactly zero; the $m$ atrix is singular and its inverse could notbe com puted.

void cgetrs (chartransa, intn, intnrhs, com plex *a, int lda, int *ipivot, com plex *b, int ldlo, int *info);
void ogetrs_64 (chartransa, long n, long nrhs, com plex *a, long lda, long *ipívot, com plex *b, long ldb, long *info);

## PURPOSE

cgetrs solves a system of linear equations
$A * X=B, A * * T * X=B$, or $A * * H * X=B$ with $a$ general $N$ boy $-N$ m atrix A using the LU factorization com puted by CGETRF.

## ARGUMENTS

TRANSA (input)
Specifies the form of the system ofequations:
$=N: A * X=B \quad$ ( $o$ transpose)
$=T$ ': A **T * $\mathrm{X}=\mathrm{B} \quad$ (Transpose)
$=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad$ (C onjugate transpose)

TRANSA is defaulted to N 'forF95 $\mathbb{I N T E R F A C E .}$

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRH S >=0.

A (input) The factors $L$ and $U$ from the factorization $A=$ $\mathrm{P} * \mathrm{~L} * \mathrm{U}$ as com puted by CGETRF.

LDA (input)
The leading dim ension of the array A. LD A >= $\max (1, N)$.

IPIVOT (input)
The pivotindiaes from CGETRF ; for $1<=i<=N$, row $i$
of the $m$ atrix $w$ as interchanged $w$ ith row $\mathbb{P}$ IV OT (i).

B (input/output)
On entry, the right hand side $m$ atrix $B$. On exit, the solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the array B . LD B >= $\max (1, N)$.

IN FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N N}$ FO $=-i$, the $i$ th argum ent had an illegalvalue

void cggbak_64 (char job, char side, long n, long ilo, long ihi, float *lscale, float * rscale, long m, com plex * v , long ldv, long *info);

## PURPOSE

cggbak form $s$ the rightor left eigenvectors of a com plex generalized eigenvalue problem $A$ * $x=$ lam bda* $B * x$, by backw ard transform ation on the com puted eigenvectors of the balanced pair ofm atrioes output.by C G G BAL .

## ARGUMENTS

$J O B$ (input)
Specifies the type of backw ard transform ation
required:
$=\mathrm{N}$ ': do nothing, retum im m ediately;
$=\mathrm{P}:$ do backw ard transform ation forperm utation
only;
= S': do backw ard transform ation for scaling
only;
= B ': do backw ard transform ations forboth per$m$ utation and scaling. JO B m ustbe the sam e as the argum ent JO B supplied to C G GBAL.
$S D E$ (input)
= R : : V contains righteigenvectors;
$=\mathrm{L} \cdot: \mathrm{V}$ contains lefteigenvectors.
N (input) The num ber of row s of the m atrix $\mathrm{V} . \mathrm{N}>=0$.

The integers $\mathbb{H O}$ and $\mathbb{H}$ I determ ined by CG GBAL. 1 $<=\mathbb{H O}<=\mathbb{H} I<=N$, if $N>0 ; \mathbb{H}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

IH I (input)
The integers $\mathbb{I L O}$ and $\mathbb{H}$ I determ ined by CG GBAL. 1 $<=\mathbb{L O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H} \mathrm{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

LSCALE (input)
D etails of the perm utations and/or scaling factors applied to the left side of $A$ and $B$, as retumed by CGGBAL .
RSCALE (input)
D etails of the perm utations and/or scaling factors applied to the right side of $A$ and $B$, as retumed by CGGBAL .

M (input) The num ber of colum ns of the matrix $\mathrm{V} . \mathrm{M}>=0$.
V (input/output)
O $n$ entry, the $m$ atrix of right or lefteigenvectors to be transform ed, as retumed by CTGEVC. On exit, $V$ is overw ritten by the transform ed eigenvectors.

LDV (input)
The leading $d m$ ension of the $m$ atrix $V$. LDV >= $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0: successfulexit.
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an illegalvahue.

## C INTERFACE

\#include <sunperfh>
void cggbal(char j.b, intn, com plex *a, int lda, com plex
*b, int ldlo, int*ilo, int*ihi, float*lscale, float*rscale, int*info);
void cggbal 64 (char jंb, long n, com plex *a, long lda, com plex *b, long ldb, long *ilo, long *ihi, float *lscale, float * rscale, long *info);

## PURPOSE

cggbalbalances a pair of general com plex matrices ( $A, B$ ). This involves, first, perm uting $A$ and $B$ by sim ilarity transform ations to isolate eigenvalues in the first 1 to IIO \$-\$1 and last $\mathbb{H}$ I+1 to $N$ elem ents on the diagonal; and second, applying a diagonal sim ilarity transform ation to row $s$ and colum ns $\mathbb{I} O$ to $\mathbb{H}$ Ito $m$ ake the row $s$ and colum ns as close in norm as possible. B oth steps are optional.

B alancing $m$ ay reduce the 1 -norm of the $m$ atrices, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors in the generalized eigenvalue problem $A{ }^{*} x=\operatorname{lam} . b d a * B{ }^{*} \times$.

## ARGUMENTS

JO B (input)
Specifies the operations to be perform ed on A and
B :
$=\mathrm{N}^{\prime}$ : none: simply set $\mathbb{H} 0=1, \mathbb{H} I=\mathrm{N}$, LSCALE $(\mathbb{I})=1.0$ and RSCALE $(\mathbb{I})=1.0$ fori=1,...N ;
$=P^{\prime}$ : perm ute only;
$=\mathrm{S}$ ': scale only;
$=B:$ both perm ute and scale.

N (input) The order of them atriges $A$ and $B . N>=0$.

A (input/output)
On entry, the input $m$ atrix A. On exit, A is overw rilten by the balanced $m$ atrix. If $\mathrm{OB}=\mathrm{N}^{\prime}$,

A is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.
$B$ (input) On entry, the input $m$ atrix $B$. On exit, $B$ is overw rilten by the balanced $m$ atrix. If $J 0 B=N$ ', $B$ is not referenced.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

ㅍO (output)
IOO and $\mathbb{H}$ Iare set to integers such thaton exit
$A(i, j)=0$ and $B(i, 1)=0$ if $i>$ jand $j=$ $1, \ldots$, ILO O -1 or $i=\mathbb{H}$ I $+1, \ldots, N$. If $J O B=N$ ' or $S^{\prime}, \mathrm{HO}=1$ and $\mathbb{H} \mathrm{I}=\mathrm{N}$.

IH I (output)
IIO and $\mathbb{H}$ I are set to integers such that on exit
$A(i, j)=0$ and $B(i, 7)=0$ if $i>j a n d i=$

LSCALE (input)
D etails of the perm utations and scaling factors applied to the left side of $A$ and $B$. IfP $(\mathcal{J})$ is the index of the row interchanged $w$ ith row $j$ and D ( $j$ ) is the scaling factor applied to row $j$ then LSCALE ( $)=\mathrm{P}(\mathcal{i}$ ) for $J=1, \ldots$, ILO-1 $=\mathrm{D}(\mathcal{j})$ for $J=\mathbb{L O}, \ldots, \mathbb{H} I=P(\mathcal{O}) \quad$ for $J=\mathbb{H} I+1, \ldots, N$. The order in which the interchanges are m ade is N to $\mathbb{H} \mathrm{I}+1$, then 1 to $\mathbb{H} O-1$.

RSCALE (input)
D etails of the perm utations and scaling factors applied to the right side of $A$ and $B$. If $P(i)$ is the index of the colum $n$ interchanged $w$ ith colum $n$ $j$ and $D(j)$ is the scaling factorapplied to column $j$ then RSCALE $(\mathcal{j})=P(\mathcal{j})$ for $J=$
 for $J=\mathbb{H} I+1, \ldots, N$. The order in which the interchanges are m ade is N to $\mathrm{IH} \mathrm{I}+1$, then 1 to [ H - 1 .

W ORK (w orkspace)
dim ension (6*N )
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
< 0: if $\mathbb{N}$ FO = -i, the i-th argum enthad an illegalvalue.

## C INTERFACE

\#include <sunperfh>
void cgges(char jobvsl, char jobvss, char sort, int(*selctg) (com plex,com plex), intn, com plex *a, int lda, com plex *b, int ldb, int *sdim, com plex *alpha, com plex *beta, com plex *vsl, int ldvsl, com plex *vsr, int ldvsr, int*info);
void cgges_64 (char jobvsl, char jojbvsr, char sort, long (*selctg) (com plex,com plex), long n, com plex *a, long lda, com plex *b, long ldb, long *sdim, com plex *alpha, com plex *beta, com plex *vsl, long ldvsl, com plex *vsr, long ldvss, long *info);

## PURPOSE

cgges com putes for a pair of N -by-N com plex nonsym m etric $m$ atrices ( $A, B$ ), the generalized eigenvalues, the generalized com plex Schur form ( $\mathrm{S}, \mathrm{T}$ ), and optionally left and/or right Schur vectors (NSL and VSR). This gives the generalized Schur factorization

$$
(A, B)=(N S L) * S * N S R) * * H,(N S L) * T * N S R) * * H)
$$

where ( NSR$)^{* *} \mathrm{H}$ is the conjugate-transpose of SR .
Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonalblocks of the upper triangularm atrix $S$ and the upper triangularm atrix T. The leading colum ns of V SL and V SR then form an unitary basis for the comesponding left and right eigenspaces (deflating subspaces).
(Ifonly the generalized eigenvalues are needed, use the driverC G G EV instead, which is faster.)

A generalized eigenvalue fora pairofm atrices $(A, B)$ is a scalar w or a ratio alphałbeta $=\mathrm{w}$, such that $A-\mathrm{w} * \mathrm{~B}$ is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta $=0$, and even forboth being zero.
A pairofm atrices ( $\mathrm{S}, \mathrm{T}$ ) is in generalized complex Schur form if S and T are uppertriangularand, in addition, the diagonalelem ents of $T$ are non-negative realnum bers.

## ARGUMENTS

JO BV SL (input)
$=\mathrm{N}^{\prime}:$ do notcom pute the leftSchurvectors;
$=\mathrm{V}$ : com pute the leftSchurvectors.

JO BV SR (input)
$=\mathrm{N}$ ': do notcom pute the rightSchurvectors;
$=\mathrm{V}$ : com pute the rightSchurvectors.
SORT (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the generalized Schur form . =
N ': E igenvalues are notordered;
= S': Eigenvalues are ordered (see SELCTG).

SELCTG (input)
SELCTG mustbe declaredEXTERNAL in the calling subroutine. If SORT = N',SELCTG is notreferenced. IfSORT = S',SELCTG is used to select eigenvalues to sort to the top leftof the Schur form. A n eigenvalue A LPHA ( $)$ ( BETA ( $\mathcal{O}$ ) is selected ifSELCTG (ALPHA ( $\mathcal{j}$, BETA ( $\mathbf{j}$ ) is true.
$N$ ote that a selected com plex eigenvalue $m$ ay no longer satisfy SELCTG (ALPHA ( $\mathcal{j}$,BETA ( $\mathcal{j}$ ) = TRUE. afterordering, since ordering $m$ ay change the
value of com plex eigenvalues (especially if the eigenvalue is ill-conditioned), in this case $\mathbb{N N}$ FO is set to $\mathrm{N}+2$ (See $\mathbb{N}$ FO below ).

N (input) The order of the m atrioes A, B, V SL, and V SR. N $>=0$.

A (input/output)
O $n$ entry, the first of the pair of $m$ atrices. On exit, A has been overw ritten by its generalized Schur form $S$.

LD A (input)
The leading dim ension ofA. LD A $>=\max (1, N)$.
B (input/output)
O n entry, the second of the pair ofm atrices. On exit, B has been overw ritten by its generalized Schur form T.

LD B (input)
The leading din ension ofB. LD $B>=m a x(1, N)$.
SD $\mathbb{I M}$ (output)
If $S O R T=N^{\prime}, S D \mathbb{I M}=0$. IfSORT $=S^{\prime}, S D \mathbb{M}=$ num ber of eigenvalues (after sorting) forw hich SELCTG is true.

ALPHA (output)
On exit, A LPHA ( $\mathfrak{j}$ ) BETA ( $\mathcal{j}$ ) $\dot{j} 1, \ldots, N$, w illbe the generalized eigenvalues. ALPHA ()$, j 1, \ldots, N$ and $\operatorname{BETA}(\mathcal{D}, \dot{于} 1, \ldots, N$ are the diagonals of the com plex Schur form (A,B) output by CGGES. The BETA ( $)$ w illbe non-negative real.

N ote: the quotients A LPHA ( $)$ ) BETA ( ) may easily over- orunderflow, and BETA ( $\mathcal{)}$ m ay even be zero. Thus, the user should avoid naively com puting the ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

BETA (output)
See description of A LPHA.
VSL (input)
If $J 0 B V S L=V$ ',VSL w illcontain the left Schur
vectors. N ot referenced if $\mathrm{JO} \mathrm{BVSL}=\mathrm{N}$ '.

The leading dim ension of the $m$ atrix V SL. LD V SL >= 1 , and if $J 0$ BV SL $=V$ ', LDV SL $>=N$.

## C INTERFACE

\#include <sunperfh>
void cggesx (char jobvsl, char jobvsr, char sort, int(*selctg) (com plex,com plex), charsense, intn, com plex *a, int lda, com plex $*$, int ldb , int *sdim, complex *alpha, complex *beta, complex *vsl, int ldvsl, com plex *vsr, int ldvsr, float *rconde, float *rcondv, int *info);
void cggesx_64 (char jobvsl, char jobvssr, char sort, long (*selctg) (com plex,com plex), char sense, long n, com plex *a, long lda, com plex *b, long ldb, long *sdim , com plex *alpha, com plex *beta, com plex *vsl, long ldvsl, com plex *vsr, long ldvss, float * rconde, float *rcondv, long *info);

## PURPOSE

cggesx com putes for a pair of N łoy -N com plex nonsymm etric $m$ atrices ( $A, B$ ), the generalized eigenvalues, the com plex Schurform ( $\mathrm{S}, \mathrm{T}$ ), and, optionally, the left and/or right $m$ atrices of Schur vectors (VSL andVSR). This gives the generalized Schur factorization $A, B)=(N S L) S(V S R) * * H$, (VSL) T (VSR)**H )
where $(\mathrm{VSR}){ }^{\star *} \mathrm{H}$ is the conjugate-transpose of SR .

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonalblocks of the uppertriangularm atrix $S$ and the upper triangular m atrix T; com putes a reciprocalcondition num ber for the average of the selected eigenvalues (RCONDE); and com putes a reciprocal condition num ber for the rightand left deflating subspaces corresponding to the selected eigenvalues (RCONDV). The leading colum ns ofV SL and V SR then form an orthonorm albasis for the corresponding left and righteigenspaces (deflating subspaces).

A generalized eigenvalue for a pair ofm atrices ( $A, B$ ) is a scalar $w$ or a ratio alpha/beta $=w$, such that $A-w * B$ is singular. It is usually represented as the pair (alpharbeta), as there is a reasonable interpretation for beta=0 or forboth being zero.

A pairofm atrices ( $\mathrm{S}, \mathrm{T}$ ) is in generalized complex Schur form if $T$ is uppertriangularw ith non-negative diagonal and $S$ is upper triangular.

## PURPOSE

cggev com putes for a pair of N łoy -N com plex nonsymm etric $m$ atrices $(A, B)$, the generalized eigenvalues, and optionally, the leftand/or rightgeneralized eigenvectors.

A generalized eigenvalue for a pair ofm atrices $(A, B)$ is a scalar lam bda or a ratio alpha/beta = lam bda, such thatA lam boda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta $=0$, and even forboth being zero.

The rightgeneralized eigenvectorv ( $\mathcal{I}$ ) comesponding to the generalized eigenvalue lam boda ( $\mathcal{I}$ ) of $(A, B)$ satisfies

$$
A * v(\mathcal{J})=\operatorname{lam} \operatorname{bda}(\mathcal{I}) * B * v(\mathcal{I})
$$

The leftgeneralized eigenvector u ( 7 ) comesponding to the generalized eigenvalues lam bda ( $\mathcal{I}$ ) of ( $\mathrm{A}, \mathrm{B}$ ) satisfies

$$
u(\mathfrak{j}) \star \star H * A=\operatorname{lam} \operatorname{bda}(\mathfrak{j}) * u(j) \star * H * B
$$

where $u(\mathcal{j}) * * H$ is the conjugate-transpose ofu (1) .

## ARGUMENTS

JO BVL (input)
$=\mathrm{N}$ ': do notcom pute the leftgeneralized eigenvectors;
$=\mathrm{V}$ ': com pute the leftgeneralized eigenvectors.
$J O B V R$ (input)
$=\mathrm{N}$ : : do not com pute the right generalized eigenvectors;
$=\mathrm{V}$ ': com pute the right generalized eigenvectors.

N (input) The order of the m atriges $\mathrm{A}, \mathrm{B}, \mathrm{VL}$, and $\mathrm{VR} . \mathrm{N}>=$ 0.

A (input/output)
On entry, them atrix $A$ in the pair $(A, B)$. On exit, A has been overw rilten.

LD A (input)
The leading dim ension ofA. LD A $>=\max (1, N)$.

B (input/output)
On entry, them atrix $B$ in the pair ( $A, B$ ). On exit, B has been overw ritten.

LD B (input)
The leading dim ension ofB. LD B >=max $(1, N)$.

ALPHA (output)
On exit, ALPHA ( ) BETA ( $)$, $1, \ldots, N$, w illbe the generalized eigenvalues.

N ote: the quotients A LPHA ( 7 ) $B E T A(7) \mathrm{m}$ ay easily over- orunderflow, and BETA ( 1 ) m ay even be zero. Thus, the user should avoid naively com puting the ratio alphaßbeta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in $m$ agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

BETA (output)
See description of A LPH A.

VL (input)
If $\mathrm{OBV} \mathrm{B}=\mathrm{V}$ ', the leftgeneralized eigenvectors
$u(7)$ are stored one after another in the colum ns ofVL, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(im ag.
part $=1$. N ot referenced if $J 0 B V L=N^{\prime}$.

LDVL (input)
The leading dim ension of the $m$ atrix $V L$. LD V L $>=1$, and if $\mathrm{JOBVL}=\mathrm{V}$ ', LDVL $>=\mathrm{N}$.

VR (input)
If JO BVR = V ', the right generalized eigenvectors $v(j)$ are stored one after another in the colum ns ofVR, in the sam e order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(m ag. part) $=1 . \operatorname{N}$ ot referenced if $J 0 B V R=N '$.

LDVR (input)
The leading dim ension of the $m$ atrix $V R$.LD $V R>=1$, and if $\mathrm{JOBVR}=\mathrm{V}$ ', LDVR $>=\mathrm{N}$.

W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the anay $W$ ORK. LW ORK >= max ( $1,2 * \mathrm{~N}$ ). For good perform ance, LW ORK m ustgenerally be larger.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

## C INTERFACE

\#include <sunperfh>
void oggevx (charbalanc, char jंbvl, char jobvr, char sense, int $n$, com plex *a, int lda, com plex *b, int ldb, com plex *alpha, com plex *beta, com plex *vl, int ldvl, com plex *vr, int ldvr, int *ilo, int *ihi, float*lscale, float*rscale, float*abnm, float *bonm, , float * rconde, float *rcondv, int *info);
void oggevx_64 (charbalanc, char jobvl, char jobvr, char sense, long n, com plex *a, long lda, com plex *b, long ldb, com plex *alpha, com plex *beta, com plex *vl, long ldvl, com plex *vr, long ldvr, long *ilo, long *ihi, float *lscale, float *rscale, float *abnım, float *bbnm, float *rconde, float *rcondv, long *info);

## PURPOSE

cggevx com putes for a pair of $N$-by -N com plex nonsym $m$ etric $m$ atrices $(A, B)$ the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

O ptionally, italso com putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( $\mathbb{L} O, \mathbb{H} I, L S C A L E, R S C A L E, A B N R M$, and BBNRM), reciprocal condition num bers for the eigenvalues (RCONDE), and reciprocalcondition num bers for the righteigenvectors (RCONDV).

A generalized eigenvalue fora pairofm atrices $(A, B)$ is a scalar lam bda or a ratio alpha/beta = lam bda, such thatA lam bda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta= 0 , and even forboth being zero.
The righteigenvectorv (i) comesponding to the eigenvalue lam bda ( $)$ ) of $(A, B)$ satisfies

$$
A * v(\mathcal{j})=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * B * v(\mathcal{j}) .
$$

The lefteigenvectoru ( $\mathcal{j}$ ) corresponding to the eigenvalue lam boda ( $)$ ) of $(A, B)$ satisfies

$$
u(j) \star * H * A=\operatorname{lam} \cdot \operatorname{bda}(j) * u(j) * * H * B .
$$

where $u(\mathcal{J}) * * H$ is the conjugate transpose of $u(\mathcal{)}$.

## ARGUMENTS

BALANC (input)
Specifies the balance option to be perform ed:
= N ': do notdiagonally scale orperm ute;
$=\mathrm{P}^{\prime}$ : perm ute only;
= S': scale only;
= B ': both perm ute and scale. C om puted reciprocal condition num bers $\mathrm{w} i l l$ be for the $m$ atrices afterperm uting and/orbalancing. Perm uting does not change condition numbers (in exactarithm etic), butbalancing does.

JO BVL (input)
= N ': do not com pute the left generalized eigenvectors;
$=\mathrm{V}$ ': com pute the left generalized eigenvectors.
JO BVR (input)
$=N^{\prime}$ : do not com pute the right generalized
eigenvectors;
$=\mathrm{V}$ : com pute the right generalized eigenvec-
tors.

D eterm ines which reciprocal condition num bers are com puted. = N ': none are com puted;
$=\mathrm{E}$ ': com puted foreigenvalues only;
= V ': com puted foreigenvectors only;
$=B$ ': com puted foreigenvalues and eigenvectors.
N (input) The order of the $m$ atrices $\mathrm{A}, \mathrm{B}, \mathrm{VL}$, and $V \mathrm{R} . \mathrm{N}>=$ 0.

A (input/output)
On entry, them atrix $A$ in the pair $(A, B)$. On exit, $A$ has been overw rilten. If $J O B V L=V$ 'or Jo BVR=V 'orboth, then A contains the first part of the com plex Schur form of the "balanced" versions of the input $A$ and $B$.

LD A (input)
The leading dim ension ofA. LD A $>=\max (1, N)$.
B (input/output)
On entry, them atrix $B$ in the pair $(A, B)$. On exit, $B$ has been overw ritten. If $\mathrm{JO} \mathrm{BV} \mathrm{L}=\mathrm{V}$ 'or JO BVR=V 'orboth, then B contains the second part of the com plex Schur form of the "balanced" versions of the inputA and $B$.

LD B (input)
The leading dim ension ofB. LD B $>=m$ ax $(1, N)$.
ALPHA (output)
On exit, A LPHA ( $)$ BETA ( $\mathcal{\nu}, \dot{于} 1, \ldots, N$, w illbe the generalized eigenvalues.

N ote: the quotient A LPHA ( ) BETA (j) ) may easily over- orunderflow, and BETA ( $)$ ) m ay even be zero. Thus, the user should avoid naively com puting the ratio A LPHA BETA. H ow ever, A LPHA w illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA aliv ays less than and usually com parable w ith norm (B).

## BETA (output)

See description of A LPHA.
VL (output)
If JOBVL = V', the leftgeneralized eigenvectors
$u(\mathcal{)}$ are stored one after another in the colum ns of VL, in the sam e order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(m ag.
part $=1$. N ot referenced if $J 0 B V L=N^{\prime}$.

LD V L (input)
The leading dim ension of the $m$ atrix $V L$. LD V L $>=1$, and if $\mathrm{JOBVL}=\mathrm{V}$ ', LDVL $>=\mathrm{N}$.
VR (input)
If $\mathrm{JOBVR}=\mathrm{V}$ ', the right generalized eigenvectors
$v(i)$ are stored one after another in the colum ns ofVR, in the sam e order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(im ag. part) $=1 . \operatorname{N}$ ot referenced if $J 0 B V R=N{ }^{\prime}$.

LDVR (input)
The leading dim ension of the $m$ atrix $V R$.LD V $\gg=1$, and if $J O B V R=V$ ', LDVR $>=N$.

HO (output)
ШO is an integervalue such that on exitA $(i, 7)=$ 0 and $B(i, \gamma)=0$ ifi> jand $j=1, \ldots$, ILO -1 ori
$=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}$. IfBALANC=N'or $\mathrm{S}^{\prime}, \mathbb{L} \mathrm{O}=1$ and $\mathbb{H} I=N$.

IH I (output)
IH $I$ is an integervalue such that on exitA $(i, 7)=$
0 and $B(i, j)=0$ if $i>$ jand $j=1, \ldots$, ILO -1 ori
$=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}$. IfBALANC=$=\mathrm{N}^{\prime}$ or $\mathrm{S}^{\prime}$, $\mathbb{L} \mathrm{O}=1$
and $H I=N$.

LSCALE (output)
D etails of the perm utations and scaling factors
applied to the left side of $A$ and $B$. IfPL $(\mathcal{)}$ ) is the index of the row interchanged $w$ ith row $j$ and D L ( ) is the scaling factor applied to row $j$ then LSCALE ( $\mathcal{j}$ ) = PL ( $\mathfrak{j}$ ) for $j=1, \ldots$, ILO-1 = DL ( $)$ for $j=\mathbb{H O}, \ldots, \mathbb{H} I=P L(j)$ for $j=\mathbb{H} I+1, \ldots, N$. The order in which the interchanges are m ade is N to $\mathbb{H} \mathrm{I}+1$, then 1 to $\mathbb{L O}-1$.

## RSCALE (output)

D etails of the perm utations and scaling factors applied to the right side of A and B. IfPR ( $)$ ) is the index of the colum $n$ interchanged with colum $n$ $j$ and $\operatorname{DR}(\mathcal{j})$ is the scaling factor applied to column $j$ then RSCALE $(j)=\operatorname{PR}(\mathcal{j})$ for $j=$ $1, \ldots, \Pi \circ-1=\operatorname{DR}(j)$ for $j=\mathbb{H}, \ldots, I H I=\operatorname{PR}(\mathcal{j})$ for $j=\mathrm{HH} \mathrm{I}+1, \ldots, \mathrm{~N}$ The order in which the interchanges are m ade is N to $\mathbb{H} \mathrm{I}+1$, then 1 to $\mathbb{I} \mathrm{O}-1$.

The one-norm of the balanced $m$ atrix A.

## BBNRM (output)

The one-norm of the balanced $m$ atrix B .

## RCONDE (output)

IfSENSE = E'or B', the reciprocal condition
num bers of the selected eigenvalues, stored in consecutive elem ents of the array. If SENSE = V ',RCONDE is not referenced.

## RCONDV (output)

If $\mathrm{JOB}=\mathrm{V}$ 'or B ', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. If the eigenvalues cannot be reordered to com pute RCONDV ( 7 ), RCONDV ( $j$ ) is setto 0 ; this can only occurw hen the true value w ould be very sm allanyway. If SENSE = E',RCONDV is not referenced. N ot referenced if $\mathrm{JOB}=\mathrm{E}$ '.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the aray W ORK. LW ORK >= $\mathrm{max}(1,2 \star \mathrm{~N})$. If SEN $S E=\mathrm{N}$ 'or E ', LW ORK $>=2 \star^{*} \mathrm{~N}$ 。 IfSENSE $=V$ 'or $B^{\prime}$ 'LW ORK $>=2 * N * N+2 \star N$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension ( $6 \star$ N ) Realw orkspace.
IV ORK (w orkspace)
dim ension $(\mathbb{N}+2)$ If SEN $S E=E$ ', IV ORK is not referenced.

BW ORK (w orkspace)
dim ension $(\mathbb{N})$ If SEN $S E=N$ ', BW ORK is not referenced.
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvahue.
$=1, \ldots, \mathrm{~N}:$ The Q Z iteration failed. N o eigenvec-
tors have been calculated, but A LPHA ( ) ) and BETA ( $\mathcal{j}$ ) should be comect for $\mathcal{j} \mathbb{N} F O+1, \ldots, N .>$ $\mathrm{N}:=\mathrm{N}+1$ : other than Q Z teration failed in CHGEQZ.
$=\mathrm{N}+2$ : error retum from CTGEVC.

## FURTHER DETAILS

Balancing am atrix pair ( $A, B$ ) includes, first, perm uting row s and colum ns to isolate eigenvalues, second, applying diagonal sim ilarity transform ation to the row s and colum ns to $m$ ake the row $s$ and colum ns as close in norm as possible. The com puted reciprocal condition num bers comespond to the balanced m atrix. Perm uting row s and colum ns will not change the condition num bers (in exact arithm etic) but diagonal scaling will. For further explanation ofbalancing, see section 4.11 .12 of LA PA CK U sers'G uide.

A $n$ approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue $w$ and the comesponding exacteigenvalue lam bda is hord (w , lam bda) <= EPS * norm (A BN RM, BBNRM) /RCONDE (I)

A $n$ approxim ate errorbound forthe angle betw een the $i$-th com puted eigenvectorV L (i) orVR (i) is given by PS * norm (ABNRM,BBNRM)/D $\mathbb{F}$ (i).

For further explanation of the reciprocal condition num bers RCONDE and RCONDV, see section 4.11 ofLAPACK U sers G uide.

void cggglm (intn, intm, intp, com plex *a, int lda, complex *b, int ldb, com plex *d, com plex *x, com plex *y, int*info);
void aggglm _64 (long n, long m, long p, com plex *a, long lda, com plex *b, long ldb, com plex *d, com plex *x, com plex *y, long *info);

## PURPOSE

cggglm solves a general Gauss M arkov linear model (G LM ) problem :
$m$ inim ize $\|y\| 2$ subject to $d=A *_{x}+B^{*} y$
X
$w$ here $A$ is an $N$ boy $-M m$ atrix, $B$ is an $N$ boy $P m$ atrix, and $d$ is a given N -vector. It is assum ed that $\mathrm{M}<=\mathrm{N}<=\mathrm{M}+\mathrm{P}$, and

$$
\operatorname{rank}(A)=M \quad \text { and } \quad \operatorname{rank}(A B)=N
$$

U nder these assum ptions, the constrained equation is alw ays consistent, and there is a unique solution $x$ and a minim al 2-nom solution $y$, which is obtained using a generalized $Q R$ factorization of $A$ and $B$.

In particular, ifm atrix $B$ is square nonsingular, then the problem G LM is equivalent to the follow ing w eighted linear least squares problem
$m$ inim ize $\|\operatorname{inv}(B) *(d-A * x)\| 2$
X
w here inv ( $B$ ) denotes the inverse of $B$.

## ARGUMENTS

N (input) The num ber of row s of the m atrices A and $\mathrm{B} . \mathrm{N}>=$ 0 .

M (input) The num ber of colum ns of them atrix A. $0<=\mathrm{M}<=$ N .

P (input) The num ber of colum ns of the m atrix B. P $>=\mathrm{N}-\mathrm{M}$.

A (input/output)
On entry, the $N$-by $-M$ m atrix A. On exit, A is destroyed.

LD A (input)
The leading dim ension of the aray A. LD A >= $\max (1, N)$.

B (input/output)
On entry, the N -by P m atrix B. On exit, B is destroyed.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \mathrm{LD} \mathrm{B}>=$ $\max (1, N)$.

D (input/output)
On entry, $D$ is the lefthand side of the G LM equation. On exit, D is destroyed.

X (output)
On exit, X and Y are the solutions of the G LM problem.

Y (output)
On exit, X and Y are the solutions of the G LM
problem.

W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, \mathrm{~W}$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the amay W ORK. LDW ORK >= $m a x(1, N+M+P)$. Foroptim um perform ance, LD W ORK >= $M+m$ in $(\mathbb{N}, P)+m$ ax $(\mathbb{N}, P) * N B$, where $N B$ is an upperbound for the optim al blocksizes forCGEQRF,CGERQF, CUNMQR and CUNMRQ.

IfLDW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0: successfulexit.
< 0 : if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue.

## PURPOSE

cgghrd reduces a pair of com plex $m$ atrices $(A, B)$ to generalized upper H essenberg form using unitary transform ations, $w$ here $A$ is a generalm atrix and $B$ is upper triangular: $Q$ '* $\mathrm{A} * \mathrm{Z}=\mathrm{H}$ and $\mathrm{Q}{ }^{\prime} * \mathrm{~B} * \mathrm{Z}=\mathrm{T}$, where H is upper H essenberg, T is uppertriangular, and Q and Z are unitary, and ' m eans conjugate transpose.

The unitary $m$ atrices $Q$ and $Z$ are determ ined as products of G ivens rotations. They $m$ ay eitherbe form ed explicitly, or they $m$ ay be postm ultiplied into inputm atrioes Q 1 and Z 1 , so that
$1 * A * Z 1{ }^{\prime}=\left(Q 1^{*} Q\right) * H *(Z 1 * Z) '$

## ARGUMENTS

COM PQ (input)
= N ': do not com pute Q ;
$=I^{\prime}: Q$ is initialized to the unit $m$ atrix, and the unitary m atrix Q is retumed; $=\mathrm{V}: \mathrm{Q} \mathrm{m}$ ust contain a unitary $m$ atrix $Q 1$ on entry, and the product $\mathrm{Q} 1 * \mathrm{Q}$ is retumed.

COMPZ (input)
$=\mathrm{N}$ ': do notcom pute Q ;
$=\mathrm{I}^{\prime}: \mathrm{Q}$ is in inialized to the unit m atrix, and the unitary m atrix Q is retumed; $=\mathrm{V}$ : $: \mathrm{Q}$ m ust contain a unitary $m$ atrix $Q 1$ on entry, and the product $\mathrm{Q} 1 * \mathrm{Q}$ is retumed.

N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

ㅍO (input)
It is assum ed thatA is already upper triangular
in row sand colum ns $1: \mathbb{H O - 1}$ and $\mathbb{H} \mathrm{I}+1 \mathbb{N} . \mathbb{H O}$ and
HH I are norm ally setby a previous call to C G G BA L;
otherw ise they should be setto 1 and $N$ respec-
tively. $1<=\mathbb{L O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H}=1$ and $\mathbb{H} \mathrm{I}=0$, $\mathrm{if} \mathrm{N}=0$.

IH I (input)
See description of IIO .
A (input/output)
On entry, the N -by -N generalm atrix to be reduced.
On exit, the upper triangle and the first subdiagonalofA are overw ritten w th the upper $H$ essenberg $m$ atrix $H$, and the rest is set to zero.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

B (input/output)
On entry, the $N-b y-N$ upper triangular $m$ atrix $B$.
On exit, the upper triangularm atrix $T=Q$ ' Z . The elem ents below the diagonal are set to zero.

LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, N)$.

Q (input/output)
If $C O M P Q=N$ : $Q$ is not referenced.
If COM PQ = 'I': on entry, $Q$ need notbe set, and on exit it contains the unitary $m$ atrix $Q$, where $Q$ 'is the product of the $G$ ivens transform ations which are applied to $A$ and $B$ on the left. If $C O M P Q=V$ ': on entry, Q m ustcontain a unitary m atrix Q 1 , and on exit this is overw ritten by $Q 1 * Q$.

LD Q (input)
The leading dim ension of the array $Q . L D Q>=N$ if $\mathrm{COMPQ}=\mathrm{V}$ 'or I '; LD Q >= 1 otherw ise.

Z (input/output)
If $C O M P Z=N^{\prime}: Z$ is not referenced.
If $\mathrm{COMPZ}=\mathrm{I}^{\prime}$ : on entry, Z need notbe set, and on exit it contains the unitary $m$ atrix $Z$, which is the product of the G ivens transform ations which
are applied to $A$ and $B$ on the right. If
$\mathrm{COMPZ=V}$ ': on entry, Z must contain a unitary $m$ atrix Z1, and on exit this is overw ritten by Z1*Z。

LD Z (input)
The leading dim ension of the array $Z$. LD $Z>=N$ if $C O M P Z=V$ 'or $I ; L D Z>=1$ otherw ise.
$\mathbb{N F O}$ (output)
= 0: successfulexit.
<0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvahue.

## FURTHER DETAILS

This routine reduces $A$ to $H$ essenberg and $B$ to triangular form by an unblocked reduction, as described in _M atrix_C om putations_, by G olub and van Loan (Johns H opkins Press).

## C INTERFACE

\#include <sunperfh>
void agglse (intm, intn, intp, com plex *a, int lda, com plex *b, int ldb, com plex ${ }^{*} \mathrm{C}$, com plex *d, com plex * $x$, int*info);
void agglse_64 (long m , long $n$, long p, com plex *a, long lda, com plex *b, long ldb, com plex ${ }^{*}$ C, com plex ${ }^{\star}$ d, com plex *x, long *info);

## PURPOSE

cgglse solves the linearequality-constrained least squares (LSE ) problem :
$m$ inim ize $\left\|C-A *_{x}\right\| 2$ subject to $B *_{x}=d$
where $A$ is an $M$ boy $N \mathrm{~N}$ atrix, $B$ is a $P$ boy $N \mathrm{~m}$ atrix, $c$ is a given $M$-vector, and $d$ is a given $P$-vector. It is assum ed that $P<=N<=M+P$, and
$\operatorname{rank}(B)=P$ and $\operatorname{rank}((A))=N$. ( (B) )

These conditions ensure that the LSE problem has a unique solution, which is obtained using a G RQ factorization of the $m$ atrices $B$ and $A$.

## ARGUMENTS

M (input) The num ber of row s of the matrix $A . M>=0$.

N (input) The num ber of colum ns of the m atrioes A and B. N $>=0$.
$P$ (input) The num ber of row s of the m atrix B. $0<=P<=N<=$ $M+P$.

A (input/output)
O n entry, the $M-b y-N m$ atrix A. On exit, A is destroyed.

LD A (input)
The leading dim ension of the array A.LDA >= $\max (1, M)$.

B (input/output)
On entry, the $P-b y-N$ m atrix B. On exit, B is destroyed.

LD B (input)
The leading dim ension of the aray B . LD B >= $\max (1, \mathrm{P})$.

C (input/output)
On entry, $C$ contains the right hand side vector for the least squares part of the LSE problem. On exit, the residual sum of squares for the solution is given by the sum of squares ofelem ents $\mathrm{N}-\mathrm{P}+1$ to $M$ ofvector $C$.

D (input/output)
O n entry, $D$ contains the right hand side vector for the constrained equation. On exit, $D$ is destroyed.

X (output)
On exit, X is the solution of the LSE problem.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the anay W ORK. LDW ORK >= $\max (1, M+N+P)$. For optim um perform ance LD $W$ ORK $>=$ $P+m$ in $M, N)+m$ ax $M, N) * N B$, where $N B$ is an upperbound for the optim al blocksizes forCGEQRF,CGERQF, CUNM QR and CUNMRQ.

If LD W ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LD W ORK is issued by XERBLA.
$\mathbb{I N F O}$ (output)
= 0: successfulexit.
<0: if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvahue.

## C INTERFACE

\#include < sunperfh>
void cggqrf(intn, intm, intp, com plex *a, int lda, complex *taua, com plex *b, int ldb, com plex *taub, int*info);
void oggqrf_64 (long $n$, long $m$, long $p$, com plex *a, long lda, complex *taua, complex *b, long ldb, com plex *taub, long *info);

## PURPOSE

cggqrf com putes a generalized $Q$ R factorization of an $N$-by -M $m$ atrix $A$ and an $N$ by $P m$ atrix $B$ :

$$
A=Q * R, \quad B=Q * T * Z,
$$

where $Q$ is an $N$ by $N$ unitary $m$ atrix, $Z$ is a $P$-by $P$ unitary $m$ atrix, and $R$ and $T$ assum e one of the form $s$ :
if $N>=M, R=(R 11) M$, orif $N<M, R=(R 11 R 12$
) N,
( 0 ) N M
N $\mathrm{M}-\mathrm{N}$
M
where R11 is upper triangular, and
if $\mathrm{N}<=\mathrm{P}, \mathrm{T}=(0 \mathrm{~T} 12) \mathrm{N}$, orifN $>\mathrm{P}, \mathrm{T}=(\mathrm{T} 11$ )
$\mathrm{N}-\mathrm{P}$,

$$
\begin{equation*}
\mathrm{P}-\mathrm{N} \mathrm{~N} \tag{T21}
\end{equation*}
$$

P
where T12 or T 21 is uppertriangular.
In particular, if $B$ is square and nonsingular, the $G Q R$ factorization of $A$ and $B$ im plicitly gives the $Q R$ factorization of inv (B)*A :

$$
\operatorname{inv}(B) \star A=Z \text { * }(\operatorname{inv}(T) * R)
$$

$w$ here inv ( $B$ ) denotes the inverse of the $m$ atrix $B$, and $Z^{\prime}$ denotes the conjugate transpose ofm atrix $Z$.

## ARGUMENTS

N (input) The num ber of row sof the m atrioes A and $\mathrm{B} . \mathrm{N}>=$
0.

M (input) The num ber of colum ns of the m atrix A. M >=0.
$P$ (input) The num ber of colum ns of the $m$ atrix $B . P>=0$.

A (input/output)
On entry, the $N$ boy $M \mathrm{~m}$ atrix A. On exit, the ele$m$ ents on and above the diagonal of the amay contain the $m$ in $\mathbb{N}, M$ )-by $-M$ uppertrapezoidalm atrix $R$ $(R$ is upper triangular if $N>=M)$; the elem ents below the diagonal, w th the array TA U A , represent the unitary $m$ atrix $Q$ as a productofm in $(\mathbb{N}, M)$ ele$m$ entary reflectors (see FurtherD etails).

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.

TAUA (output)
The scalar factors of the elem entary reflectors $w$ hich represent the unitary $m$ atrix $Q$ (see Further D etails).

B (input/output)
On entry, the N -by P m atrix B. On exit, if $\mathrm{N}<=$ P , the upper triangle of the subaray $B(\mathcal{N}, \mathrm{P}-$ $\mathrm{N}+1: \mathrm{P}$ ) contains the N -by N uppertriangularm atrix
$T$; ifN > P, the elem ents on and above the $(\mathbb{N} P)-$ th subdiagonal contain the N Hoy -P upper trapezoidal m atrix T ; the rem aining elem ents, w th the array TA UB, represent the unitary matrix Z as a product of elem entary reflectors (see Further D etails).

LD B (input)
The leading dim ension of the aray $\mathrm{B} . \mathrm{LD} \mathrm{B}>=$ $\max (1, N)$.

TAUB (output)
The scalar factors of the elem entary reflectors which represent the unitary $m$ atrix $Z$ (see Further D etails).

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay W ORK. LW ORK >=
$\max (1, N, M, P)$. For optim um perform ance LW ORK $>=$ $\max (\mathbb{N}, \mathbb{M}, P){ }^{m} \max (\mathbb{N} 1, N B 2, N B 3)$, where $N B 1$ is the optim al blocksize forthe QR factorization of an N toy -M m atrix, N B 2 is the optim al blocksize for the RQ factorization of an $N$ boy $P m$ atrix, and NB3 is the optim alblocksize for a call of CUNM QR .

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i$ th argum enthad an illegalvalue.

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(k), w \text { here } k=m \text { in }(n, m) .
$$

Each H (i) has the form

$$
H(i)=I-\operatorname{tana}{ }^{*} v^{*} v^{\prime}
$$

$w$ here taua is a com plex scalar, and $v$ is a com plex vector $w$ ith $v(1: i-1)=0$ and $v(i)=1 ; v(i+1 m)$ is stored on exit in A $(i+1 m, i)$, and taua in TAUA (i).
To form Q explicitly, use LA PACK subroutine CUNGQR. To use Q to update another matrix, use LAPACK subroutine CUNM QR.

Them atrix $Z$ is represented as a product of elem entary reflectors
$Z=H(1) H(2) \ldots H(k), w$ here $k=m$ in $(n, p)$.
Each H (i) has the form

$$
H(i)=I-\operatorname{taub} * v^{*} v^{\prime}
$$

$w$ here taub is a com plex scalar, and $v$ is a com plex vector $w$ ith $v(p-k+i+1 \mathrm{p})=0$ and $v(p-k+i)=1 ; v(1 \mathrm{p}-k+i-1)$ is stored on exitin B ( $n-k+i, 1$ p $k+i-1$ ), and taub in TA U B (i). To form Z explicitly, use LAPACK subroutine CUNGRQ. To use Z to update another matrix, use LAPACK subroutine CUNMRQ.

void cggrqf(intm, intp, intn, com plex *a, int lda, com plex *taua, com plex *b, int ldb, com plex *taub, int*info);
void cggrqf_64 (long m, long p, long n, com plex *a, long lda, complex *taua, complex *b, long ldb, com plex *taub, long *info);

## PURPOSE

cggrqf com putes a generalized RQ factorization of an M by -N $m$ atrix $A$ and $a P-b y-N m$ atrix $B$ :

$$
A=R * Q, \quad B=Z * T * Q,
$$

where $Q$ is an $N$ boy $N$ unitary $m$ atrix, $Z$ is a $P$-by $P$ unitary $m$ atrix, and $R$ and $T$ assum e one of the form $s$ :

```
ifM <= N, R = (0 R12)M, orifM > N, R = ( R11 )
```

$\mathrm{M}-\mathrm{N}$,

$$
\mathrm{N}-\mathrm{M} \text { M (R21)N }
$$

N
where R12 orR21 is upper triangular, and
if $\mathrm{P}>=\mathrm{N}, \mathrm{T}=(\mathrm{T} 11) \mathrm{N}$, orifP $<\mathrm{N}, \mathrm{T}=(\mathrm{T} 11 \mathrm{~T} 12$
) P,
( 0 ) P-N
P NP
N
where T11 is upper triangular.
In particular, if $B$ is square and nonsingular, the $G R Q$ factorization ofA and $B$ im plicitly gives the $R Q$ factorization of A *inv (B):

$$
A * \operatorname{inv}(B)=(R * \operatorname{inv}(I)) * Z^{\prime}
$$

where inv ( $B$ ) denotes the inverse of the $m$ atrix $B$, and $Z^{\prime}$ denotes the conjugate transpose of the $m$ atrix $Z$.

## ARGUMENTS

M (input) The num ber of row s of the $m$ atrix $A . M>=0$.
$P$ (input) The num ber of row sof the $m$ atrix $B . P>=0$.
N (input) The num ber of colum ns of the $m$ atrioes $A$ and $B . N$ $>=0$.

A (input/output)
On entry, the M -by -N m atrix A. On exit, if M <=
N , the upper triangle of the subaray A ( $1 \mathrm{M}, \mathrm{N}$ -
$\mathrm{M}+1 \mathrm{~N}$ ) contains the M -by -M uppertriangularm atrix
$R$; if $M>N$, the elem ents on and above the $M-N$ )th subdiagonal contain the $\mathrm{M}-$ by -N upper trapezoidal $m$ atrix $R$; the rem aining elem ents, $w$ ith the amay TAUA, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors (see Further D etails).
LDA (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAUA (output)
The scalar factors of the elem entary reflectors which represent the unitary $m$ atrix $Q$ (see Further D etails).

B (input/output)
On entry, the $P-b y-N m$ atrix B. On exit, the ele$m$ ents on and above the diagonal of the array contain the $m$ in $(\mathbb{P}, N)-b y-N$ uppertrapezoidalm atrix $T$ ( $T$ is upper triangular if $P>=N$ ); the elem ents below the diagonal, w ith the amray TA U B, represent the unitary $m$ atrix $Z$ as a productofelem entary reflectors (see FurtherD etails).

LD B (input)
The leading dim ension of the array $\mathrm{B} . \operatorname{LD} \mathrm{B}>=$ $\max (1, P)$.

TAUB (output)
The scalar factors of the elem entary reflectors which represent the unitary $m$ atrix $Z$ (see Further D etails).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= $m a x(1, N, M, \mathbb{P})$. For optim um perform ance LW $O R K>=$
$\max (\mathbb{N}, \mathbb{M}, \mathbb{P})_{m a x}(N B 1, N B 2, N B 3)$, where NB1 is the optim al blocksize forthe $R Q$ factorization of an M by $-\mathrm{N} m$ atrix, NB2 is the optim al blocksize for the $Q R$ factorization of $P$-by $-N m$ atrix, and NB3 is the optim alblocksize for a callof $C U N M R Q$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0 : successfiulexit
< 0: if $\mathbb{N F O}=-i$, the $i$-th argum enthad an illegal value.

## FURTHER DETAILS

Them atrix $Q$ is represented as a product of elem entary reflectors
$Q=H(1) H(2) \ldots H(k)$, where $k=m$ in $(m, n)$.
Each H (i) has the form

$$
\mathrm{H}(\mathrm{i})=\mathrm{I}-\operatorname{tana} * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
$$

where taua is a com plex scalar, and $v$ is a complex vector $w$ ith $v(n-k+i+1 n)=0$ and $v(n-k+i)=1 ; v(1 n-k+i-1)$ is stored on exitin A ( $m-k+i, 1 n-k+i-1$ ), and taua in TAUA (i). To form $Q$ explicitly, use LAPACK subroutine CUNGRQ. To use $Q$ to update another $m$ atrix, use LAPACK subroutine CUNMRQ.

Them atrix $Z$ is represented as a product of elem entary reflectors

$$
Z=H(1) H(2) \ldots H(k), w \text { here } k=m \text { in }(p, n) .
$$

Each H (i) has the form

$$
\mathrm{H}(\mathrm{i})=\mathrm{I}-\operatorname{tanb} * \mathrm{~V}^{*} \mathrm{v}^{\prime}
$$

where taub is a com plex scalar, and $v$ is a com plex vector w ith $\mathrm{v}(1: i-1)=0$ and $v(i)=1 ; \mathrm{v}(i+1: p)$ is stored on exit in B (i+1 $\mathrm{P}, \mathrm{i}$ ), and taub in TA UB (i).
To form $Z$ explicitly, use LAPACK subroutine CUNGQR. To use $Z$ to update another matrix, use LAPACK subroutine CUNMQR.

## PURPOSE

cggsvd com putes the generalized singularvalue decom position (G SV D ) of an $M$ łoy $-N$ com plex $m$ atrix $A$ and $P$ boy $-N$ com plex m atrix B :

$$
U^{*} A * Q=D 1^{*}(0 R), \quad V{ }^{*} B * Q=D 2^{*}(0 R)
$$

$w$ here $U, V$ and $Q$ are unitary $m$ atriges, and $Z$ ' $m$ eans the conjugate transpose of $\mathrm{Z} . \mathrm{Let} \mathrm{K}+\mathrm{L}=$ the effective num erical rank of them atrix ( $A$ ', $B$ )', then $R$ is a $(\mathbb{K}+L$ ) -by $(\mathbb{K}+L$ ) nonsingular upper triangularm atrix, $D 1$ and $D 2$ are $M$ foy $-(K+L)$ and $\mathrm{P}-\mathrm{by}-(\mathrm{K}+\mathrm{L})$ "diagonal" $m$ atrioes and of the follow ing structures, respectively:

IfM $\mathrm{K}-\mathrm{L}>=0$,

K L

$$
\begin{aligned}
& D 1=K(I 0) \\
& \text { L ( } 0 \mathrm{C} \text { ) } \\
& M \text { K 乙 ( } 0 \text { O) } \\
& \text { K L } \\
& \mathrm{D} 2=\mathrm{L}(0 \mathrm{~S}) \\
& \mathrm{P} \longleftarrow(0 \quad 0) \\
& \mathrm{NH} \mathrm{~K} \mathrm{~K} \quad \mathrm{~L} \\
& \text { (0R) }=\mathrm{K} \text { (0 R11 R12) } \\
& \text { L ( } 0 \quad 0 \quad \mathrm{R} 22 \text { ) } \\
& \text { where } \\
& C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(K+L)) \text {, } \\
& S=\operatorname{diag}(\operatorname{BETA}(K+1), \ldots, B E T A(K+L)) \text {, } \\
& C * * 2+S * * 2=I \text {. }
\end{aligned}
$$

$R$ is stored in $A(1: K+L, N-K-1 \mathbb{N})$ on exit． IfM $-\mathrm{K} \mathrm{f}<0$ ，

$$
\begin{aligned}
& \text { K M K K + L }-\mathrm{M} \\
& D 1=K\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& M-K(0 C 0) \\
& \text { K M K K + L } \mathrm{M} \\
& D 2=M K(0 S 0) \\
& \mathrm{K}+\mathrm{L} \mathrm{M} \text { ( } 0 \text { O I ) } \\
& \text { P孔 (0 0 0 ) } \\
& N \not K \dashv K \quad M-K+L-M \\
& (0 R)=K(0 \text { R11 R12 R13 ) } \\
& \mathrm{M}-\mathrm{K} \text { ( } 0 \quad 0 \text { R22 R23) } \\
& \mathrm{K}+\mathrm{L} \mathrm{M} \text { (0 } 0 \text { (0 R33) }
\end{aligned}
$$

w here

$$
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, \text { A LPHA } M)), \\
& S=\operatorname{diag}(\operatorname{BETA}(K+1), \ldots, \text { BETA }(M)), \\
& C \star * 2+S \star * 2=I .
\end{aligned}
$$

$(\mathrm{R} 11 \mathrm{R} 12 \mathrm{R} 13)$ is stored in $\mathrm{A}(1 \mathbb{M}, \mathrm{~N}-\mathrm{K}-\mathrm{L}+\mathbb{N})$ ，and R 33 is stored
（0 R 22 R 23 ）
in $B(M-K+1: N+M-K-\perp+1 \mathbb{N})$ on exit．

The routine com putes $C, S, R$ ，and optionally the unitary transform ation $m$ atrices $U, V$ and $Q$ ．

In particular，if $B$ is an $N$ boy -N nonsingular $m$ atrix，then the G SVD ofA and B im plicitly gives the SVD ofA＊inv（B）：

$$
A * \operatorname{inv}(B)=U *(D 1 * \operatorname{inv}(D 2)) * V V^{\prime} .
$$

If ( $A$ ', B )' 'has orthnorm alcolum ns, then the GSVD of $A$ and $B$ is also equal to the CS decom position of A and B.Further$m$ ore, the GSVD can be used to derive the solution of the eigenvalue problem :

$$
\text { A *A } \mathrm{x}=\operatorname{lam} \text { bda* } \mathrm{B} \text { *B } \mathrm{x} .
$$

In som e literature, the G SVD of $A$ and $B$ is presented in the form
$\mathrm{U} * \mathrm{~A} * \mathrm{X}=(0 \mathrm{D} 1), \mathrm{V}$ *B*X=(0D2)
where $U$ and $V$ are orthogonal and $X$ is nonsingular, and $D 1$ and D 2 are "diagonal". The form erG SVD form can be converted to the latter form by taking the nonsingularm atrix X as

$$
\begin{aligned}
X= & Q *\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& (0 \operatorname{inv}(R))
\end{aligned}
$$

## ARGUMENTS

$J O B U$ (input)
$=\mathrm{U}$ : U nitary $m$ atrix U is com puted;
$=N^{\prime}: U$ is notcom puted.
$J O$ BV (input)
= V : U nitary m atrix V is com puted;
$=\mathrm{N}: \mathrm{V}$ is not com puted.
$J O B Q$ (input)
$=Q$ : U nitary matrix Q is com puted;
$=\mathrm{N}^{\prime}: \mathrm{Q}$ is not com puted.

M (input) The num ber of row s of the m atrix $\mathrm{A} . \mathrm{M}>=0$.

N (input) The num ber of collm ns of the m atrioes A and B. N $>=0$.
$P$ (input) The num ber of row sof the $m$ atrix $B . P>=0$.
K (output)
On exit, $K$ and $L$ specify the dim ension of the subblocks described in Puppose. $\mathrm{K}+\mathrm{L}=$ effective num erical rank of (A 'B )'.

L (output)
On exit, $K$ and L specify the dim ension of the subblocks described in Punpose. $\mathrm{K}+\mathrm{L}=$ effective num erical rank of (A 'B ')'.

A (input/output)

On entry, the M by -N m atrix A. On exit, A contains the triangularm atrix $R$, orpart of $R$. See Purpose fordetails.

LD A (input)
The leading dim ension of the array A. LDA >= $m a x(1, M)$.

B (input/output)
On entry, the $P$-by $-N$ m atrix B. On exit, B contains part of the triangularm atrix $R$ if $M K-4<$ 0 . See Punpose fordetails.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \operatorname{LD} \mathrm{B}>=$ $\max (1, \mathrm{P})$.

## A LPHA (output)

On exit, ALPHA andBETA contain the generalized singular value pairs of $A$ and $;$; LPHA $(1: K)=1$, A LPHA ( $1: K$ ) = 1 ,
BETA $(1: K)=0$, and ifM $K-L>=0$, ALPHA $(K+1 \mathbb{K}+L)$
= C,
BETA $(K+1: K+L)=S$, orifM $K-L<0$, ALPHA $(K+1 M)=$
C, ALPHA $M+1: K+L)=0$
$\operatorname{BETA}(K+1 M)=S, \operatorname{BETA}(M+1: K+L)=1$ and
A LPHA $(\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0$
BETA $(\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0$

BETA (output)
See description of A LPH A .
U (output)
If $\mathrm{JOBU}=\mathrm{U}$ ', U contains the M -by M unitary
$m$ atrix $U$. If $J O B U=N$ ', $U$ is not referenced.
LD U (input)
The leading dim ension of the array $U$. LD U >= $m a x(1, M)$ if $J O B U=U ' ; L D U>=1$ otherw ise.

V (output)
If $\mathrm{JOBV}=\mathrm{V}$ ', V contains the P -by P unitary m atrix V . If $\mathrm{JO} \mathrm{BV}=\mathrm{N}, \mathrm{V}$ is not referenced.

LDV (input)
The leading dim ension of the array $V$. LDV >= $\mathrm{max}(1, \mathrm{P})$ if $\mathrm{JOBV}=\mathrm{V}$; LDV $>=1$ otherw ise.

Q (output)
If $J O B Q=Q ', Q$ contains the $N$ by $-N$ unitary
$m$ atrix $Q$. If $J O B Q=N$ ', $Q$ is not referenced.

LD Q (input)
The leading dim ension of the array $Q . \operatorname{LDQ}>=$ $\max (1, N)$ if $J O B Q=Q ; L D Q>=1$ otherw ise.

W ORK (w orkspace)
dim ension $M$ AX $(3 * N, M, P)+N)$
W ORK 2 (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )
IV ORK 3 (output)
dim ension $(\mathbb{N})$ On exit, $\mathbb{I W}$ ORK 3 stores the sorting inform ation. M ore precisely, the follow ing loop willsortA LPHA for $I=K+1$, $m$ in $M, K+L$ ) sw ap ALPHA (I) and ALPHA ( $\mathbb{W}$ ORK 3 (I)) endfor such that A LPHA ( 1 ) >=ALPHA (2) >= ... $>=A L P H A(N)$.
$\mathbb{I N} F \mathrm{O}$ (output)
= 0: successfulexit.
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvahue.
>0: if $\mathbb{N F O}=1$, the Jacobi-type procedure failed to converge. For further details, see subroutine C TG SJA.

P 乙 ( 0000 )
where the $K-b y-K m$ atrix A 12 and $L-b y-L m$ atrix B 13 are nonsingularuppertriangular; A 23 is L-by- L uppertriangular if $\mathrm{M} \mathrm{K}-\mathrm{L}>=0$, otherw ise A 23 is M K) -by C upper trapezoidal. $K+L=$ the effective num erical rank of the $M+P)$-by $-N$ m atrix
( $\mathrm{A}, \mathrm{B}$ )'. Z 'denotes the conjugate transpose of $Z$.
This decom position is the preprocessing step for com puting the Generalized Singular V alue D ecom position (G SV D ), se subroutine CG G SV D .

## ARGUMENTS

$J 0 \mathrm{BU}$ (input)
$=\mathrm{U}$ : U nitary matrix U is com puted;
$=N^{\prime}: \mathrm{U}$ is not com puted.
$J O B V$ (input)
$=\mathrm{V}$ : U nitary m atrix V is com puted;
$=\mathrm{N}^{\prime}: \mathrm{V}$ is not com puted.
$J O B Q$ (input)
$=Q$ ': Unitary matrix $Q$ is com puted;
$=\mathrm{N}^{\prime}: \mathrm{Q}$ is notcom puted.

M (input) The num ber of row s of the $m$ atrix $\mathrm{A} . \mathrm{M}>=0$.
$P$ (input) The num ber of row sof the $m$ atrix $B . P>=0$.

N (input) The num ber of colmm ns of the $m$ atrioes $A$ and $B$. $N$ $>=0$.

A (input/output)
On entry, the M by-N m atrix A. On exit, A contains the triangular (or trapezoidal) matrix described in the Punpose section.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

B (input/output)
On entry, the $P-b y-N$ m atrix B. On exit, B contains the triangularm atrix described in the Purpose section.

LD B (input)

The leading dim ension of the array $\mathrm{B} . \operatorname{LD} \mathrm{B}>=$ $\max (1, \mathrm{P})$.

TO LA (input)
TO LA and TO LB are the thresholds to determ ine the effective num erical rank ofm atrix $B$ and a subblock ofA. Generally, they are set to TO LA =
 MAX $(P, N) *$ norm ( $B$ )*M ACHEPS. The size of TOLA and TO LB $m$ ay affect the size of backw ard emors of the decom position.
TOLB (input)
See description of TO LA .
K (output)
O n exit, $K$ and $L$ specify the dim ension of the subblocks described in Punpose section. $\mathrm{K}+\mathrm{L}=$ effective num erical rank of $(A, B)^{\prime}$.

L (output)
See the description ofK .
U (input) If $\mathrm{JOBU}=\mathrm{U}$ ', U contains the unitary matrix U . If $\mathrm{JOBU}=\mathrm{N}$ ', U is not referenced.

LD U (input)
The leading dim ension of the array U. LD U >= $m a x(1, M)$ if $\mathcal{O B B U}=U$; LD $U>=1$ otherw ise.

V (input) If $\mathrm{JO} \mathrm{BV}=\mathrm{V}$ ', V contains the unitary matrix V .
If $\mathrm{JOBV}=\mathrm{N}$ ', V is not referenced.
LD V (input)
The leading dim ension of the array $V$. LDV >= $\max (1, \mathrm{P})$ if $\mathrm{JOBV}=\mathrm{V}$ '; LD V >= 1 otherw ise.
$Q$ (input) If $J B Q=Q$ ', $Q$ contains the unitary $m$ atrix $Q$.
If $\mathrm{JOBQ}=\mathrm{N}^{\prime}, \mathrm{Q}$ is not referenced.
LDQ (input)
The leading dim ension of the aray $Q . L D Q>=$ $\max (1, N)$ if $\operatorname{OOB}=Q ; L D Q>=1$ otherw ise.

IW ORK (w orkspace)
dim ension $\mathbb{N}$ )

RW ORK (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )
TAU (w orkspace)
dim ension $\mathbb{N}$ )

W ORK (w orkspace)
dim ension $M A X(3 * N, M, P))$
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0$ : if $\mathbb{I N F O}=-i$, the i-th argum enthad an illegalvalue.

## FURTHER DETAILS

The subroutine uses LA PA CK subroutine CGEQPF for the QR factorization w ith column pivoting to detect the effective num erical rank of the a m atrix. It $m$ ay be replaced by a better rank determ ination strategy

cgssis -G eneral sparse solver one call interface.

## SYNOPSIS

```
SUBROUTINE CGSSFS(M TXTYP,PIVOT,NEQNS,COLSTR,ROW IND,
        VALUES,NRHS ,RHS ,LDRHS,ORDM THD,
        OUTUNT,MSGLVL,HANDLE,\mathbb{ER)}
```

CHARACTER*2 M TXTYP
CHARACTER*1 PIVOT
$\mathbb{N}$ TEGER NEQNS,COLSTR (*),ROW $\mathbb{N} D\left({ }^{*}\right)$,NRHS,LDRHS,
OUTUNT,MSGLVL, $\mathbb{E R}$
CHARACTER*3 ORDMTHD
COMPLEX VALUES (*),RHS (*)
DOUBLE PRECISION HANDLE (150)

## PURPOSE

CGSSFS -G eneral sparse solver one call interface.

## PARAMETERS

MTXTYP -CHARACTER*2
On entry, M TX TY P specifies the coefficientm atrix type. Specifically, the valid options are:

Sp 'or SP '-sym m etric structure, H erm itian positive definite
values
ss'or SS '-sym m etric structure, sym $m$ etric values
su 'or SU '-sym m etric structure, unsym $m$ etric values
uu 'or UU '-unsym $m$ etric structure, unsym $m$ etric values
U nchanged on exit.

## PIVOT -CHARACTER*1

O n entry, pivotspecifies w hetherornotpivoting is used in the course of the num eric factorization. The valid options are:
h'or $\mathrm{N}^{\prime}$-no pivoting is used
(Pivoting is notsupported forthis release).

U nchanged on exit.

## NEQNS - $\mathbb{N}$ TEGER

On entry, N EQ N S specifies the num ber ofequations in the coefficientm atrix. N EQ N S m ustbe at least one. U nchanged on exit.
$\operatorname{COLSTR}$ (*) - $\mathbb{N}$ TEG ER aray
On entry, COLSTR (*) is an array of size (NEQNS+1), containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND (*) - $\mathbb{N}$ TEG ER anay
On entry, ROWIND (*) is an array of size COLSTR $\mathbb{N E Q N S}+1)-1$, containing the indices of the $m$ atrix structure. U nchanged on exit.

## VALUES (*) -COM PLEX aray

O $n$ entry, $V A L U E S$ (*) is an aray of size
COLSTR $\mathbb{N} E Q N S+1$ )-1, containing the non-zero num eric values of the sparse $m$ atrix to be factored. U nchanged on exit.

NRHS - INTEGER
On entry, N RH S specifies the num ber of right hand sides to solve for. U nchanged on exit.

RHS (*) -COM PLEX aray
On entry, RH S (LD RH S NRHS) contains the NRHS right hand sides. On exit, itcontains the solutions.

LDRHS - $\mathbb{N}$ TEGER
O n entry, LD RH S specifies the leading dim ension of the RH S array. U nchanged on exit.

ORDMTHD -CHARACTER*3
On entry, ORD M THD specifies the fill-reducing ordering to be used by the sparse solver.
Specifically, the valid options are:
hat'or NAT'-natural ordering (no ordering) mmd'or M M D '-m ultiplem inim um degree
gnd 'or GND '-general nested dissection
uso 'or U SO '-user specified ordering (see C G SSU O )
U nchanged on exit.

OUTUNT - $\mathbb{N}$ TEGER
O utputunit. U nchanged on exit.
M SG LVL - $\mathbb{N}$ TEGER
M essage level.

0 -no output from solver.
( $N$ o m essages supported for this release.)
U nchanged on exit.
HANDLE (150) -DOUBLE PRECISIO N aray
On entry, HANDLE (*) is an amay of containing
inform ation needed by the solver, and $m$ ustibe passed
unchanged to each sparse solver subroutine.
M odified on exit.
$\mathbb{E R} \quad-\mathbb{N} T E G E R$
Enrornum ber. If no errorencountered, unchanged on
exit. If emorencountered, it is set to a non-zero
integer. Errornum bers set.by this subroutine:
-101: Failure to dynam ically allocate $m$ em ory.
-102 : Invalid m atrix type.
-103 : Invalid pivotoption.
-104: N um berofnonzeros is less than N EQ N S .
-105: NEQNS < 1
-201 : Faihure to dynam ically allocate $m$ em ory.
-301 : Failure to dynam ically allocate $m$ em ory.
-401 : Failure to dynam ically allocate $m$ em ory.
-402 :NRHS < 1
-403 : NEQN S > LD RHS
-666 : Intemalerror.

CHARACTER*1 PIVOT
\mathbb{NTEGER NEQNS,COLSTR (*),ROW IND (*),OUTUNT,MSGLVL,\mathbb{ER}}\mathbf{N}\mathrm{ (*)}
DOUBLE PRECISION HANDLE (150)
```

## PURPOSE

CGSSIN -Initialize the sparse solver and input the $m$ atrix
structure.

## PARAMETERS

## MTXTYP -CHARACTER*2

On entry, M TX TY P specifies the coefficientm atrix type. Specifically, the valid options are:

Sp 'or SP '-sym m etric structure, H erm itian positive definite
ss'or SS '-sym m etric structure, sym m etric values
su 'or SU '-sym m etric structure, unsym $m$ etric values
uu 'or UU '-unsym $m$ etric structure, unsym $m$ etric values
U nchanged on exit.

On entry, PIV OT specifies whether ornotpivoting is
used in the course of the num eric factorization.
The valid options are:
h'or $\mathrm{N}^{\prime}$-no pivoting is used
(Pivoting is not supported forthis release).

U nchanged on exit.
NEQNS - $\mathbb{N} T E G E R$
On entry, NEQNS specifies the num berofequations in the coefficientm atrix. N EQ N S m ustbe at leastone. U nchanged on exit.
$\operatorname{COLSTR}$ ( $\left.^{*}\right)-\mathbb{N}$ TEG ER amay
On entry, $\operatorname{COLSTR}$ ( ${ }^{*}$ ) is an array of size $\mathbb{N E Q N S + 1 ) \text { , }}$ containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND ( ${ }^{\star}$ ) - $\mathbb{N}$ TEG ER array
On entry, ROWIND ( ${ }^{\star}$ ) is an array of size
CO LSTR $\mathbb{N} E Q N S+1$ )-1, containing the indices of the $m$ atrix structure. U nchanged on exit.

HANDLE (150) -D OUBLE PRECIS IO N array
On entry, $H A N D L E$ (*) is an array containing inform ation needed by the solver, and $m$ ust.be passed unchanged to each sparse solver subroutine. M odified on exit.

OUTUNT - $\mathbb{N}$ TEGER
O utputunit. U nchanged on exit.

M SGLVL - $\mathbb{N}$ TEGER
M essage level.
0 -no output from solver.
(N o m essages supported for this release.)
U nchanged on exit.
$\mathbb{E R} \quad$ - $\mathbb{N}$ TEGER
Enrornum ber. If no errorencountered, unchanged on
exit. If emrorencountered, it is set to a non-zero
integer. Enrornum bers setby this subroutine:
-101: Failure to dynam ically allocate mem ory.
-102 : Invalid m atrix type.
-103 : Invalid pivotoption.
-104 : N um berofnonzeros less than N EQ N S .
-105:NEQNS<1

## NAME

cgssor-G eneral sparse solver ordering and sym bolic factorization.

## SYNOPSIS

```
SUBROUTINECGSSOR(ORDMTHD,HANDLE,\mathbb{ER})
CHARACTER*3 ORDMTHD
\mathbb{NTEGER ER}
DOUBLE PRECISION HANDLE (150)
```

## PURPOSE

CGSSOR -O rders and sym bolically factors a sparse m atrix .

## PARAMETERS

ORDMTHD -CHARACTER*3
On entry, ORDM THD specifies the fill-reducing ordering to be used by the sparse solver. Specifically, the valid options are:
hat'or NAT '-naturalordering (no ordering)
mmd'or M M D '-m ultiplem inim um degree
gnd 'or GND '-generalnested dissection
uso 'or U SO '-user specified ordering (see C G SSU O )
U nchanged on exit.
HANDLE (150) -DOUBLE PRECISIO N aray
On entry, HANDLE (*) is an array containing
inform ation needed by the solver, and $m$ ust.be passed unchanged to each sparse solver subroutine.

M odified on exit.
$\mathbb{E R} \quad-\mathbb{N} T E G E R$
Errornum ber. If no errorencountered, unchanged on
exit. If emrorencountered, it is set to a non-zero
integer. Enrornum bers set.by this subroutine:
-200 : Invalid calling sequence - need to callC G SSIN first.
-201 : Failure to dynam ically allocate $m$ em ory.
-666 : Intemalerror.

cgssps -P rint general.sparse solver statics.

## SYNOPSIS

SUBROUTINECGSSPS (HANDLE, $\mathbb{E R}$ )
$\mathbb{N} T E G E R \quad \mathbb{E R}$
DOUBLE PRECISION HANDLE (150)

## PURPOSE

CGSSPS -Print solver statistics.

## PARAMETERS

HANDLE (150) -DOUBLE PRECISION aray
On entry, HANDLE ( $*$ ) is an amay containing
inform ation needed by the solver, and $m$ ust.be passed
unchanged to each sparse solver subroutine.
M odified on exit.

ER

- $\mathbb{N}$ TEGER

Errornum ber. If no errorencountered, unchanged on
exit. If errorencountered, it is set to a non-zero
integer. Errornum bers setby this subroutine:
-800: Invalid calling sequence - need to callC G SSSL first.
-899 : Printed solver statistics not supported this release.

## SYNOPSIS

SUBROUTINECGSSRP (PERM, HANDLE, $\mathbb{E R}$ )
$\mathbb{N} T E G E R \quad$ PERM (*), $\mathbb{E R}$
DOUBLE PRECISION HANDLE (150)

## PURPOSE

CGSSRP -R etums the perm utation used by the solver for the fill-reducing ordering.

## PARAMETERS

PERM $\mathbb{N E Q N S}$ ) - $\mathbb{N}$ TEGER amay
U ndefined on entry. PERM $\mathbb{N E Q N S}$ ) is the perm utation array used by the sparse solver for the fillreducing ordering. M odified on exit.

HANDLE (150) -D OUBLE PRECISION array
On entry, HANDLE ( $*$ ) is an array containing
inform ation needed by the solver, and $m$ ust.be passed unchanged to each sparse solver subroutine.
M odified on exit.
$\mathbb{E R} \quad-\mathbb{N} T E G E R$
Errornum ber. If no errorencountered, unchanged on exit. If errorencountered, it is set to a non-zero
integer. Errornum bers set.by this subroutine:
-600 : Invalid calling sequence - need to callC G SSO R first.

## NAME

cgsssl-Solve routine for the general sparse solver.

## SYNOPSIS

SUBROUTINECGSSSL (NRHS,RHS,LDRHS,HANDLE, ER )
$\mathbb{N}$ TEGER NRHS,LDRHS, $\mathbb{E R}$
COM PLEX RHS (LDRHS,NRHS)
DOUBLE PRECISION HANDLE (150)

## PURPOSE

CGSSSL -Triangular solve of a factored sparse m atrix.

## PARAMETERS

NRHS - $\mathbb{N}$ TEGER
On entry, N RH S specifies the num ber of righthand
sides to solve for. U nchanged on exit.

RHS (LDRHS,*) -COM PLEX array
On entry, RH S (LDRHS,NRHS) contains the NRHS right hand sides. On exit, itcontains the solutions.

LDRHS - $\mathbb{N}$ TEGER
On entry, LD RH S specifies the leading dim ension of the RH S amay. U nchanged on exit.

HANDLE (150) -D OUBLE PREC ISIO N aray
O n entry, HANDLE ( ${ }^{\star}$ ) is an array containing
inform ation needed by the solver, and $m$ ustbe passed
unchanged to each sparse solver subroutine.
M odified on exit.

ER

- $\mathbb{N}$ TEGER

Errornum ber. If no errorencountered, unchanged on
exit. If errorencountered, it is set to a non-zero
integer. Errornum bers setby this subroutine:
-400 : Invalid calling sequence - need to callC G SSFA first.
-401 : Failure to dynam ically allocate $m$ em ory.
-402 : NRHS < 1
-403 : NEQN S > LD RHS

cgssuo -U ser supplied perm utation for ordering used in the generalsparse solver.

## SYNOPSIS

SUBROUTINECGSSUO (PERM,HANDLE, $\mathbb{E R}$ )
$\mathbb{N}$ TEGER PERM (*), $\mathbb{E R}$
DOUBLE PRECISION HANDLE (150)

## PURPOSE

CGSSUO -U ser supplied perm utation for ordering. M ust.be called after CGSS IN 0 (sparse solver initialization) and before CGSSOR () (sparse solver ordering).

## PARAMETERS

PERM $\mathbb{N} E Q N S$ ) - $\mathbb{N}$ TEGER array
On entry, PERM (NEQNS) is a perm utation array supplied by the user for the fill-reducing ordering.
U nchanged on exit.

HANDLE (150) -D OUBLE PREC IS IO N array
On entry, HANDLE (*) is an anay containing
inform ation needed by the solver, and $m$ ustbe passed
unchanged to each sparse solver subroutine.
M odified on exit.
$\mathbb{E R} \quad-\mathbb{N} T E G E R$
Errornum ber. If no errorencountered, unchanged on
exit. If emorencountered, it is set to a non-zero
integer. Errornum bers setby this subroutine:
-500 : Invalid calling sequence - need to callC G SSIN first.

## C INTERFACE

\#include <sunperfh>
void ogtoon (charnorm , intn, com plex *low , com plex *diag, complex *up1, complex *up2, int*ipivot, float anorm, float *rcond, int*info);
void cgtcon_64 (charnorm, long n, com plex *low, com plex *diag, com plex *up1, com plex *up2, long *ípivot, floatanorm , float *rcond, long *info);

## PURPOSE

cgtcon estim ates the reciprocal of the condition num ber of a com plex tridiagonal $m$ atrix A using the LU factorization as com puted by C G TTRF .

A $n$ estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND $=1 /(A N O R M *$ norm (inv (A))).

## ARGUMENTS

NORM (input)
Specifies w hether the 1-norm condition num ber or the infinity-norm condition num ber is required:
= ' 'or $\mathrm{D}^{\prime}$ : 1-norm;
= I ': Infinity-norm .

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

LOW (input)
The $(n-1) \mathrm{m}$ ultipliers that define the $m$ atrix $L$ from the LU factorization of $A$ as com puted by CGTTRF.

D IA G (input)

Then diagonalelem ents of the upper triangular $m$ atrix $U$ from the $L U$ factorization ofA.

UP1 (input)
The ( $n-1$ ) elem ents of the first superdiagonal of U.

UP2 (input)
The ( $n-2$ ) elem ents of the second superdiagonal of U.
$\mathbb{P I V O T}$ (input)
The pivotindices; for $1<=i<=n$, row $i$ of the matrix was interchanged with row PIVOT (i). IPIVOT (i) will always be either $i$ or i+1; PIVOT (i) = iindicates a row interchange w as not required.

ANORM (input)
IfNORM = ' 1 'or $\mathrm{D}^{\prime}$ ', the 1-nom of the original $m$ atrix $A$. IfNORM = I', the infinity-norm of the originalm atrix A .

RCOND (output)
The reciprocal of the condition number of the $m$ atrix $A$, com puted as RCOND $=1 /(A N O R M * A \mathbb{N} V N M)$, where $A \mathbb{N} V N M$ is an estim ate of the 1 -nom of $\operatorname{inv}(A)$ com puted in this routine.

W ORK (w orkspace)
dim ension $(2 * N)$
$\mathbb{N}$ FO (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue

## PURPOSE

cgtrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is tridiagonal, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

TRANSA (input)
Specifies the form of the system of equations:
$=N^{\prime}: A * X=B \quad$ ( 0 transpose)
$=T$ ': $A * * T * X=B \quad$ ( ranspose)
$=C$ ': $A * * H * X=B \quad$ (C onjugate transpose)

TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRH S $>=0$.

LOW (input)
The ( $n-1$ ) subdiagonalelem ents ofA.
D IA G (input)
The diagonalelem ents ofA.

UP (input)
The ( $\mathrm{n}-1$ ) superdiagonalelem ents of A.

LOW F (input)
The $(n-1) \mathrm{m}$ ultipliers that define the $m$ atrix $L$ from the LU factorization of $A$ as com puted by CGTTRF.

D IA GF (input)
Then diagonalelem ents of the upper triangular $m$ atrix $U$ from the $L U$ factorization ofA .

UPF1 (input)
The ( $n-1$ ) elem ents of the first superdiagonal of U.

UPF2 (input)
The ( $n-2$ ) elem ents of the second superdiagonal of U.

IPIVOT (input)
The pivotindioes; for $1<=i<=n$, row $i$ of the $m$ atrix $w a s$ interchanged w th row $\mathbb{P I V O T}(i)$. PIVOT (i) will always be either $i$ or $i+1$; $\mathbb{P} \mathbb{I V}$ OT (i) = i indicates a row interchange w as not required.

B (input) The righthand side m atrix B .

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (input/output)
O $n$ entry, the solution $m$ atrix $X$, as com puted by CG TTRS. On exit, the im proved solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the anay X . LD X >= $\max (1, N)$.

FERR (output)
The estim ated forw ard emrorbound for each solution vector $X()$ ) the $j$ th column of the solution matrix X). If XTRUE is the true solution corresponding to $X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{i})-X$ TRUE) divided by the $m$ agnitude of the largestelem ent in $X(j)$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector $X$ ( $j$ ) (ie., the sm allest relative change in any elem entofA orB thatm akes $X(\mathcal{J})$ an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )

W ORK 2 (w orkspace)
dim ension $(\mathbb{N})$
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue

## PURPOSE

cgtsv solves the equation
where $A$ is an $N$-by N tridiagonalm atrix, by $G$ aussian elim ination $w$ ith partialpivoting.

N ote that the equation $\mathrm{A} * \mathrm{X}=\mathrm{B}$ may be solved by interchanging the order of the argum ents $D U$ and $D L$.

## ARGUMENTS

N (input) The order of the matrix A. $\mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS >=0.

LOW (input/output)
On entry, LOW m ust contain the ( $n-1$ ) subdiagonal elem ents ofA. On exit, LOW is overw ritten by the ( $n-2$ ) elem ents of the second superdiagonal of the upper triangular $m$ atrix $U$ from the $L U$ factorization ofA, in LOW (1), ..., LOW (n-2).

D IA G (input/output)
On entry, D IA G mustcontain the diagonal elem ents of A. On exit, D IA G is overw ritten by the $n$ diagonalelem ents of $U$.

UP (input/output)
O n entry, UP m ust contain the ( $n-1$ ) superdiagonal elem ents of A. On exit, UP is overw ritten by the $(n-1)$ elem ents of the first superdiagonal of $U$.

B (input/output)
On entry, the N -by-NRH S righthand side m atrix $B$. On exi, if $\mathbb{N} F O=0$, the $N$ by N RH S solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the array B. LD B >=
$\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$ th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=i, U(i, i)$ is exactly zero, and the solution has notbeen com puted. The factorization has notbeen com pleted unless $i=N$.

## C INTERFACE

\#include < sunperfh>
void cgtsvx (char fact, chartransa, intn, intnrhs, com plex *low, com plex *diag, com plex *up, com plex *low f, com plex *diagf, com plex *upfl, com plex *upf2, int *ịíivot, com plex *b, int ldb, com plex *x, int ldx, float *rcond, float *ferr, float *berr, int *info);
void cgtsvx_64 (char fact, char transa, long n, long nihs, com plex *low, com plex *diag, com plex *up, com plex *low f, com plex *diagf, com plex *upfl, com plex *upf2, long *ípívot, com plex *b, long ldb, com plex
*x, long ldx, float *rcond, float *ferr, float
*bers, long *info);

## PURPOSE

cgtsvx uses the LU factorization to com pute the solution to a complex system of linearequations $\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A} * * \mathrm{~T}$ * $\mathrm{X}=$ $B$, orA $* * H * X=B, w h e r e A$ is a tridiagonalm atrix of order N and X and B are N -by N RH S m atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=N$ ', the LU decom position is used to factor the $m$ atrix A
as $A=L * U, w h e r e L$ is a product of perm utation and unit low er
bidiagonal m atrices and U is upper triangular w th
nonzeros in
only the $m$ ain diagonal and first tw o superdiagonals.
2. If som e $U(i, i)=0$, so that $U$ is exactly singular, then the routine
retums w ith $\mathbb{N}$ FO $=$ i. $O$ therw ise, the factored form of $A$ is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N} F O=N+1$ is retumed as a waming, but the routine stillgoes on
to solve for X and com pute error bounds as described below .
3.The system ofequations is solyed for X using the factored form of A.
3. Iterative refinem ent is applied to im prove the com puted solution
m atrix and calculate error bounds and backw ard error estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies whether ornot the factored form of A has been supplied on entry. = F': LOW F, D IA GF, $\mathrm{UPF} 1, \mathrm{UPF} 2$, and $\mathbb{P}$ IV OT contain the factored form of $A$; LOW, DIAG, UP, LOW F,D $\mathbb{A} G F, U P F 1, U P F 2$ and $\mathbb{P} \mathbb{V} O T \mathrm{w}$ illnotbe m odified. $=\mathrm{N}$ ': The m atrix w ill be copied to LOW F, D IA GF, and UPF1 and factored.

TRANSA (input)
Specifies the form of the system of equations:
$=N: A * X=B \quad$ N $\circ$ transpose)
$=T$ ': A **T * X = B (Transpose)
= C': A ** H * X = B (C onjugate transpose)

TRANSA is defaulted to $N$ 'forF95 $\mathbb{I N}$ TERFACE.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of them atrix B. NRHS $>=0$.

LOW (input)
The $(n-1)$ subdiagonalelem ents of $A$.

D IA G (input)
The n diagonalelem ents of A .

UP (input)
The ( $n-1$ ) superdiagonalelem ents ofA.

LOW F (input/output)
IfFACT $=\mathrm{F}^{\prime}$, then LOW F is an inputargum ent and on entry contains the ( $n-1$ ) multipliers that define the $m$ atrix $L$ from the $L U$ factorization of $A$ as com puted by C G TTRF.

IfFACT $=\mathrm{N}$ ', then LOW F is an outputargum ent and on exit contains the ( $n-1$ ) m ultipliers that define them atrix $L$ from the LU factorization of A.

D IA GF (input/output)
If FACT $=\mathrm{F}^{\prime}$, then $\mathrm{D} \mathbb{I} G \mathrm{~F}$ is an input argum ent and on entry contains the n diagonalelem ents of the uppertriangularm atrix $U$ from the LU factorization ofA.

IfFACT = $N$ ', then DIAGF is an output argum ent and on exit contains the $n$ diagonalelem ents of the uppertriangularm atrix $U$ from the $L U$ factorization of $A$.

UPF1 (input/output)
IfFACT = $\mathrm{F}^{\prime}$, then UPF 1 is an inputargum ent and on entry contains the ( $n-1$ ) elem ents of the first superdiagonalofU .

IfFACT = N ', then UPF1 is an outputargum ent and on exit contains the ( $n-1$ ) elem ents of the first superdiagonalofU.

UPF2 (input/output)
If FACT = F ', then UPF 2 is an input argum ent and on entry contains the ( $n-2$ ) elem ents of the second superdiagonalofU .

IfFACT $=\mathrm{N}$ ', then UPF2 is an output argum entand on exitcontains the ( $n-2$ ) elem ents of the second superdiagonalofU .

IPIVOT (input/output)
If $F A C T=F '$, then $\mathbb{P I V O T}$ is an input argum ent and on entry contains the pivotindioes from the LU factorization of A as com puted by CG TTRF.

IfFACT = $N$ ', then $\mathbb{P} \mathbb{I V O T}$ is an output argum ent and on exit contains the pivot indices from the LU factorization of ; row iof the $m$ atrix $w$ as interchanged w ith row $\mathbb{P} \mathbb{I V O T}$ (i). $\mathbb{P} \mathbb{I V O T}$ (i) w illalw ays be ether ior i+ 1 ; $\mathbb{P} \mathbb{I V O T}(i)=$ indicates a row interchange $w$ as not required.
$B$ (input) The $N$-by-N RH S righthand side $m$ atrix $B$.

LD B (input)
The leading din ension of the array $B$. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=\mathrm{N}+1$, the $\mathrm{N}-$ by -NRH S solution
$m$ atrix $X$.

LD $X$ (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

RCOND (output)
The estim ate of the reciprocal condition num ber of the $m$ atrix $A$. IfRCOND is less than them achine precision (in particular, if RCOND $=0$ ), the $m$ atrix is singular to working precision. This condition is indicated by a retum code of $\mathbb{N}$ FO > 0.

FERR (output)
The estim ated forw ard enorbound for each solution vector $X(\mathcal{)}$ ) the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O}), \operatorname{FERR}(\mathcal{7})$ is an estim ated upperbound for the $m$ agnitude of the largest ele-
$m$ ent in $(X(\mathcal{O})$ X TRUE $)$ divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vector $X(\mathcal{)}$ ) (i.e., the sm allest relative change in any elem entof $A$ orB thatm akes $X(j)$ an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )

W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an ille-
galvalue
>0: if $\mathbb{N} F O=i$, and $i$ is
$<=\mathrm{N}: \mathrm{U}(i, i)$ is exactly zero. The factorization has notbeen com pleted unless $i=N$, but the factor $U$ is exactly singular, so the solution and error bounds could notbe com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1$ : U is nonsingular, but RCOND is less than $m$ achine precision, m eaning that the $m$ atrix is singular to working precision. $N$ evertheless, the solution and errorbounds are com puted because there are a num ber of situations where the com puted solution can bem ore accurate than the value of RCOND w ould suggest.

void cgttrf(intn, com plex *low, complex *diag, com plex *up1, com plex *up2, int *ipivot, int *info);
void ogttrf_64 (long n, com plex *low , com plex *diag, com plex
*up1, com plex *up2, long *ípívot, long *info);

## PURPOSE

cgttrf com putes an LU factorization of a com plex tridiagonal $m$ atrix A using elim ination w ith partialpivoting and row interchanges.

The factorization has the form

$$
A=L * U
$$

where $L$ is a productofperm utation and unit low er bidiagonalm atrioes and $U$ is upper triangularw ith nonzeros in only the $m$ ain diagonal and firsttw o superdiagonals.

## ARGUMENTS

$N$ (input) The order of the $m$ atrix $A$.

LOW (input/output)
On entry, LOW m ustcontain the ( $\mathrm{n}-1$ ) sub-diagonal elem ents ofA.

On exit, LOW is overw rilten by the ( $n-1$ ) multipliers that define the $m$ atrix $L$ from the $L U$ factorization of A.

D IA G (input/output)
O n entry, D IA G m ust contain the diagonal elem ents of A.

On exit, D IA G is overw rilten by the $n$ diagonal elem ents of the upper triangularm atrix $U$ from the LU factorization of A.

UP1 (input/output)
On entry, UP1 must contain the ( $n-1$ ) superdiagonalelem ents ofA.

O n exit, UP1 is overw rilten by the ( $\mathrm{n}-1$ ) elem ents of the first super-diagonal of .

UP2 (output)
On exit, UP2 is overw rilten by the ( $n-2$ ) elem ents of the second super-diagonalofU.

IPIVOT (output)
The pivotindioes; for $1<=i<=n$, row $i$ of the matrix was interchanged w th row $\mathbb{P I V O T}$ (i). IPIVOT (i) will always be either $i$ or i+1; PIVOT (i) = iindicates a row interchange was not required.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0$ : if $\mathbb{N} F O=-k$, the $k$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=k, U(k, k)$ is exactly zero. The factorization has been com pleted, but the factor $U$ is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

\#include <sunperfh>
void chbev (char jobz, charuple, intn, int kd, com plex *a, int lda, float *w, com plex *z, int ldz, int *info);
void chbev_64 (char jojbz, char uplo, long n, long kd, com plex *a, long lda, float *w , com plex *z, long ldz, long *info);

## PURPOSE

chbev com putes all the eigenvalues and, optionally, eigenvectors of a com plex H erm itian band m atrix A .

## ARGUMENTS

JOBZ (input)
$=N^{\prime}:$ C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
= U : U Upertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. $\mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO = U',orthe num berof subdiagonals ifU PLO $=L^{\prime} . \mathrm{KD}>=0$.

A (input/output)
On entry, the upper or low ertriangle of the Her $m$ tian band $m$ atrix A, stored in the firstKD +1 row sof the array. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum $n$ of the amay $A$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{A}(\mathrm{kd}+1+i-j, j)=A(i, j)$ for $\max (1, j$ $\mathrm{kd})<=i<=j$ if UPLO $=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)$
for $\dot{j}=i<=m$ in $(n, j+k d)$.
On exit, A is overw rilten by values generated during the reduction to tridiagonal form. If P PLO = U ', the first superdiagonal and the diagonal of the tridiagonal $m$ atrix $T$ are retumed in row sK D and $K D+1$ ofA, and if $U P L O=L$ ', the diagonaland first subdiagonal of T are retumed in the first tw o row sofA.

LD A (input)
The leading dim ension of the array A. LD A >= KD + 1.

W (output) If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

Z (input) If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N F O}=0, \mathrm{Z}$ contains the orthonom aleigenvectors of the $m$ atrix $A, w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated w th $W$ (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading dim ension of the amray Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
dim ension (N)
W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
$\mathbb{N} F O$ (output)
= 0 : successfulexit.
<0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvahue.
> 0 : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include < sunperfh>
void chbevd (char jobz, charuplo, int n, int kd, com plex
*ab, int ldab, float *w, com plex *z, int ldz, int
*info);
void chbevd_64 (char jobz, charuplo, long n, long kd, com plex *ab, long ldab, float *w, com plex *z, long ldz, long *info);

## PURPOSE

chbevd com putes all the eigenvalues and, optionally, eigenvectors of a com plex $H$ erm titian band $m$ atrix $A$. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w th a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the C ray X - M P , C ray Y M P , C ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

## ARGUMENTS

JOBZ (input)
$=N^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.
UPLO (input)
= U ': U ppertriangle ofA is stored;
= L' : Low ertriangle ofA is stored.

N (input) The order of the matrix A. $\mathrm{N}>=0$.
$K D$ (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO $=\mathrm{U}$ ', orthe num berof subdiagonals if UPLO $=L^{\prime} . K D>=0$.

AB (input/output)
O $n$ entry, the upper or low er triangle of the Her$m$ itian band $m$ atrix $A$, stored in the firstKD +1 row sof the array. The $j$ th colum n of $A$ is stored in the $j$ th colum $n$ of the array $A B$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{j}(i, 1)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=i<=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j, 7)=A(i, j)$ for $j=i<=m$ in $(n, j+k d)$.
On exit, AB is overw rilten by values generated during the reduction to tridiagonal form. IfU PLO $=\mathrm{U}$ ', the first superdiagonal and the diagonal of the tridiagonal m atrix T are retumed in row sKD and $K D+1$ of $A B$, and if $U P L O=L$ ', the diagonal and first subdiagonal of $T$ are retumed in the first tw o row sofA B .

LDAB (input)
The leading dim ension of the array AB. LD A B > $>=K D$ +1 .

W (output) If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $\mathcal{O B Z}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated $w$ th $W$ (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading din ension of the array $\mathrm{Z} . \operatorname{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
On exit, if $\mathbb{N F} F=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. If $\mathrm{N}<=1$, LW ORK must be at least1. If $J 0 B Z=N$ 'and $N>$ 1, LW ORK m ust.be at leastN. If JO BZ $=\mathrm{V}$ 'and N > 1, LW ORK m ustbe at least $2 * N$ **2.

IfLW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On exit, if $\mathbb{I N} F O=0, R W O R K(1)$
retums the optim allRW ORK.
LRW ORK (input)
The dimension of array RW ORK. If $\mathrm{N}<=1$, LRW ORK mustibe at least 1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>$ 1, LRW ORK m ustbe at leastN. If JO B Z $=\mathrm{V}$ 'and N > 1,LRW ORK m ust.be at least1 + 5*N + 2*N **2.

If LRW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK amray, retums this value as the first entry of the RW ORK amay, and no enorm essage related to LRW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
On exit, if $\mathbb{N}$ FO $=0, \mathbb{I N}$ ORK (1) retums the optim al LIN ORK.

LIN ORK (input)
The dim ension of array $\mathbb{I N}$ ORK. If JOBZ = N 'or N $<=1, \mathrm{LIV} O R K$ mustbe at least1. If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$ and $N>1, L \mathbb{I}$ ORK m ustbe at least $3+5{ }^{*} N$.

If $L \mathbb{I V} O R K=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I W} O R K$ array, and no errorm essage related to LIIN ORK is issued by X ERBLA.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit.
< 0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvahue. > 0 : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void chbevx (char jobz, char range, charuplo, intn, int kd, com plex *a, int lda, com plex *q, int ldq, float vl, floatvu, int il, int in, float abtol, int ${ }^{*}$ nfound, float ${ }^{*} \mathrm{w}$, com plex ${ }^{*} \mathrm{z}$, int ldz , int *ifail, int*info);
void chbevx_64 (char j.bzz, char range, char uplo, long n, long kd, complex *a, long lda, com plex *q, long ldq, float vl, floatvu, long il, long iu, float abtol, long *nfound, float*w, com plex *z, long ldz, long *ifail, long *info);

## PURPOSE

chbevx com putes selected eigenvahues and, optionally, eigenvectors of a com plex H erm itian band m atrix A. E igenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ : C om pute eigenvahues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A : alleigenvalues w illibe found;
$=\mathrm{V}$ ::alleigenvalues in the half-open interval
(NL,VU] will be found; = 'I': the $\mathbb{L}$-th through
$\mathbb{I J}$-th eigenvaluesw illlbe found.

UPLO (input)
= U ': U ppertriangle ofA is stored;
$=\mathrm{L}$ ': Low er triangle of A is stored.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO = U', orthe num berof subdiagonals if UPLO $=\mathbb{L}^{\prime} . \mathrm{KD}>=0$.

A (input/output)
On entry, the upper or low er triangle of the Her$m$ itian band $m$ atrix $A$, stored in the firstKD +1 row sof the array. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the amay A as follows: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{A}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{A}(i, j)$ for max $(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)$ for $j=i<=m$ in $(n, j+k d)$.

On exit, A is overw rilten by values generated during the reduction to tridiagonal form .

LD A (input)
The leading dim ension of the amray A. LD A >=KD + 1.

Q (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', the N -by-N unitary m atrix used in the reduction to tridiagonal form. If $J 0 B Z=N$ ', the array Q is not referenced.

LD Q (input)
The leading dim ension of the array $Q$. If $\operatorname{JOBZ}=$ V ', then LD $Q>=\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU.
N ot referenced ifRANGE = A 'or I'.
VU (input)

IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N G E = A' 'or I'.

II (input)
IfRA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{U}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.
UU (input)
IfRA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0 ; \mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

ABTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to $l i e$ in an interval [a,b]
of w idth less than orequal to
ABTOL + EPS * $\max (k|,||$,$) ,$
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS* $\mid$ |w illbe used in its place, where $T$ | is the 1 -norm of the tridiagonal m atrix obtained by reducing $A$ to tridiagonalform .

E igenvalues w illbe com puted m ost accurately when
ABTOL is set to tw ice the underflow threshold $2 * S L A M C H$ ( ${ }^{\eta}$ ), not zero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to 2 *SLAM CH (S ).

See "C om puting Sm allSingularV alues ofB idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by D em m eland K ahan, LA PA CK W orking N ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. $0<=$
NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE = 'I',NFOUND = $\mathbb{U}-\mathbb{L}+1$.

W (output)
The firstNFOUND elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V '$, then if $\mathbb{N} F O=0$, the first $N F O U N D$ colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A corresponding to the selected eigenvalues, $w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated w ith $W$ (i). If an eigenvector fails to converge, then that colum n of $Z$ contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in FAII. If $J O B Z=N$ ', then $Z$ is not referenced.
$N$ ote: the user must ensure that at least
$\max (1, N F O U N D)$ colum ns are supplied in the anray $Z$; if RANGE = V', the exact value ofNFOUND is not know $n$ in advance and an upperbound $m$ ustbe used.

LD Z (input)
The leading $d i m$ ension of the array $Z$. LD $Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
dim ension (N)

W ORK 2 (w orkspace)
dim ension ( $7 * \mathrm{~N}$ )

IV ORK 3 (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )
FFA II (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the first NFOUND
elem ents of $\mathbb{F A} I I$ are zero. If $\mathbb{N} F O>0$, then
FAII contains the indices of the eigenvectors
that failed to converge. If $\mathrm{JOBZ}=\mathrm{N}$ ', then
$\mathbb{F A} \mathbb{I L}$ is not referenced.
$\mathbb{N} F O$ (output)
= 0: successfulexit
<0: if $\mathbb{I N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N F O}=$ i, then ieigenvectors failed to converge. Their indioes are stored in array ㅍFAI.

## PURPOSE

chbgst reduces a com plex Herm tian-definite banded generalized eigenproblem $\mathrm{A} * \mathrm{X}=\operatorname{lam}$ bda* $\mathrm{B} * \mathrm{x}$ to standard form $\mathrm{C} * \mathrm{Y}=$ lam bda* $y$, such that $C$ has the sam e bandw idth as A.

B musthave been previously factorized as $S * * H * S$ by CPBSTF, using a split Cholesky factorization. A is overw rilten by C $=\mathrm{X} * * \mathrm{H} * \mathrm{~A} * \mathrm{X}$, where $\mathrm{X}=\mathrm{S} * *(-1) * \mathrm{Q}$ and Q is a unitary matrix chosen to preserve the bandw idth of A.

## ARGUMENTS

VECT (input)
$=N^{\prime}$ : do not form the transform ation $m$ atrix $X$;
= V ': form X .

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low er triangle of A is stored.

N (input) The order of the m atrioes A and $\mathrm{B} . \mathrm{N}>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO = U',orthe num berof subdiagonals ifU PLO
$=\mathbb{L}^{\prime} . \mathrm{KA}>=0$.

KB (input)
The num ber of superdiagonals of the $m$ atrix $B$ if UPLO = U',or the num berof subdiagonals ifU PLO $=L^{\prime} . K A>=K B>=0$.

AB (input/output)
On entry, the upper or low ertriangle of the Her$m$ tian band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the array $A B$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{ka}+1+i-j)=\mathrm{A}(i, 7)$ for $\max (1, j$ $\mathrm{ka})<=i<=j ;$ ifUPLO $=\mathrm{L}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $j=i<=m$ in $(n, j+k a)$.
On exit, the transform ed $m$ atrix $X * * H * A * X$, stored in the sam e form atasA.

LD AB (input)
The leading dim ension of the array AB. LDAB >= KA+1.

BB (input)
The banded factorS from the split Cholesky factorization ofB, as retumed by CPBSTF, stored in the first kb+1 row sof the anay.

LD BB (input)
The leading dim ension of the array $\mathrm{BB} . \operatorname{LDBB}>=$ K B +1 .

X (output)
If VECT = V', the $n-b y-n m$ atrix $X$. If $V E C T=$ N ', the array X is not referenced.

LD X (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$ ifVECT $=V$ '; LD $X>=1$ otherw ise.

W ORK (w orkspace)
dim ension (N)
RW ORK (w orkspace)
dim ension $(\mathbb{N})$
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{I N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue.

## C INTERFACE

\#include < sunperfh>
void chbgv (char j̀jbz, charuplo, intn, int ka, int kb, com plex *ab, int ldab, com plex *bb, int ldbb, float ${ }^{*}$ w , com plex *z, int ldz, int *info);
void chbgv_64 (char jobz, charuplo, long n, long ka, long kb, com plex *ab, long ldab, com plex *bb, long ldbb, float *w , com plex *z, long ldz, long *info);

## PURPOSE

chbogv com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized $H$ erm itian-definite banded eigenproblem, of the form $A * x=(l a m ~ b d a) * B * x$. Here A and $B$ are assum ed to be $H$ erm itian and banded, and $B$ is also positive definite.

## ARGUMENTS

$J 0 \mathrm{BZ}$ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
= U ': U pper triangles ofA and B are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the m atrioes A and $\mathrm{B} . \mathrm{N}>=0$.
KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO $=U$ ', ort the num berof subdiagonals if UPLO $=\mathrm{L} \cdot \mathrm{KA}>=0$.

KB (input)
The num ber of superdiagonals of the $m$ atrix $B$ if
UPLO = U',orthe num berof subdiagonals ifU PLO
$=L^{\prime} \cdot \mathrm{KB}>=0$.

AB (input/output)
On entry, the upper or low er triangle of the Her$m$ itian band $m$ atrix $A$, stored in the firstka+1 row sof the anray. The $j$ th colum $n$ of $A$ is stored in the jth colum $n$ of the amay AB as follows: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{ka}+1+\mathrm{i}-j)=\mathrm{A}(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{ka})<=i<=j$ ifUPLO $=\mathbb{L}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $j<=i<=m$ in $(n, j+k a)$.

On exit, the contents of $A$ are destroyed.
LDAB (input)
The leading dim ension of the array AB. LD AB >= $K A+1$.

BB (input/output)
O n entry, the upper or low ertriangle of the Her$m$ tian band $m$ atrix $B$, stored in the first kb+1 row sof the array. The $j$ th colum n of $B$ is stored in the jth colum $n$ of the array $B B$ as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(\mathrm{kb}+1+\mathrm{i}-j, j)=\mathrm{B}(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kb})<=\mathrm{i}<=\dot{j}$ if P PLO $=\mathrm{L}, \mathrm{BB}(1+i-j, j)=B(i, 7)$ for $j<=i<=m$ in $(n, \dot{j}+k b)$.

On exit, the factors from the splitCholesky factorization $\mathrm{B}=\mathrm{S} * * \mathrm{H} * \mathrm{~S}$, as retumed by CPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB >= $\mathrm{KB}+1$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ th the $i$-th colum n of Z holding the eigenvector associated with W (i). The eigenvectors are norm alized so that Z **H *B *Z = I. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

## LD $Z$ (input)

The leading dim ension of the array $Z$. LD $Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $\mathrm{Z}>=\mathrm{N}$.

W ORK (w orkspace)
dim ension (N)
RW ORK (w orkspace)

## C INTERFACE

\#include <sunperfh>
void chbgvd (char jobz, charuplo, intn, int ka, int kb, complex *ab, int ldab, com plex *bbb, int ldbb, float * ${ }_{\text {w }}$, com plex * $z$, int ldz, int *info);
void chbogvd_64 (char jobz, char uplo, long n, long ka, long kb, com plex *ab, long ldab, com plex *bb, long ldbb, float *w , com plex * z, long ldz, long *info);

## PURPOSE

chbgvd com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized $H$ erm itian-definite banded eigenproblem, of the form $A * x=\left(l a m\right.$ bda) ${ }^{*} B{ }^{*} x$. H ere $A$ and $B$ are assum ed to be $H$ erm titian and banded, and $B$ is also positive definite. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conqueralgorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits $w$ hich subtract like the $C$ ray $\mathrm{X}-\mathrm{M} P, \mathrm{C}$ ray $\mathrm{Y}-\mathrm{M} \mathrm{P}$, C ray $\mathrm{C}-90$, or C ray -2 . It could conceivably fail on hexadecim al or decim al machines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}:$ : C om pute eigenvalues and eigenvectors.
UPLO (input)
$=\mathrm{U}$ ': U pper triangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the m atriges $A$ and $B . N>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num berof subdiagonals if UPLO
$=\mathbb{L}$ '.KA >=0.
K B (input)
The num ber of superdiagonals of the $m$ atrix $B$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num ber of subdiagonals if UPLO $=\mathbb{L} . \mathrm{KB}>=0$.

A B (input/output)
O n entry, the upper or low ertriangle of the H er$m$ titian band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum n of A is stored in the jth colum n of the amay AB as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{ka}+1+i-j)=\mathrm{A}(i, 1)$ for $\mathrm{max}(1, j$ $\mathrm{ka})<=\dot{i}=j$ ifUPLO $=\mathrm{L}^{\prime}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k a)$.

On exit, the contents of A B are destroyed.

LDAB (input)
The leading dim ension of the array AB. LDAB >= $K A+1$.

BB (input/output)
O n entry, the upper or low er triangle of the H er$m$ titian band $m$ atrix $B$, stored in the first $k b+1$ row s of the aray. The $j$ th colum n of $B$ is stored in the $j$ th colum $n$ of the array $B B$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(\mathrm{kb}+1+i-j, j)=\mathrm{B}(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kb})<=\dot{i}<=\dot{j}$ ifUPLO $=\mathrm{L}, \mathrm{BB}(1+i-j, j)=\mathrm{B}(i, 7)$ for $\dot{j}=i<=m$ in $(n, j+k b)$.

O n exit, the factors from the splitCholesky factorization $B=S * * H * S$, as retumed by CPBSTF .

LD BB (input)

The leading dim ension of the array BB. LD BB >= K B+1.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
Z (input) If $\mathrm{OOBZ}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the $m$ atrix $Z$ of eigenvectors, $w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated $w$ ith $W$ (i). The eigenvectors are norm alized so that $\mathrm{Z} * * \mathrm{H} * \mathrm{~B} * \mathrm{Z}=$ I. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading din ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{N}$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array $\mathrm{W} O R \mathrm{~K}$. If $\mathrm{N}<=1$, LW ORK >=1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>1$, LW ORK $>=\mathrm{N}$. If $\mathrm{JOBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$, LW $O R K>=2 * \mathrm{~N} * * 2$.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, R W$ ORK (1) retums the optim al LRW ORK.

LRW ORK (input)
The dimension of array RW ORK. If $\mathrm{N}<=1$, LRW ORK >= 1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $N>1$, LRW $O R K>=$ N . If JOBZ $=\mathrm{V}$ 'and $\mathrm{N}>1$,LRW $O R K>=1+5^{\star} \mathrm{N}+$ $2{ }^{*} N * * 2$ 。

If LRW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK array, retums this value as the first entry of the RW ORK amay, and no emorm essage related to LRW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al LIV ORK.

LIV ORK (input)
The dim ension of array $\mathbb{I N}$ ORK. If JOBZ $=\mathrm{N}$ 'or N
$<=1$, LIV ORK >= 1. If $\mathrm{OOBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$, LIV ORK $>=3+5{ }^{*} \mathrm{~N}$.

If $\mathrm{L} \mathbb{I V}$ ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim al size of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I V}$ ORK array, and no errorm essage related to $L \mathbb{I W} O R K$ is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N F O}=i$, and $i$ is:
$<=\mathrm{N}$ : the algorithm failed to converge: i offdiagonal elem ents of an interm ediate tridiagonal form did not converge to zero; $>\mathrm{N}$ : if $\mathbb{N} F \mathrm{FO}=\mathrm{N}$ +i , for $1<=\mathrm{i}<=\mathrm{N}$, then CPBSTF
retumed $\mathbb{N} F O=i: B$ is not positive definite. The factorization ofB could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

## PURPOSE

chbgvx com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized $H$ erm itian-definite banded eigenproblem, of the form $A * x=(l a m . b d a) * B * x$. H ere A and $B$ are assum ed to be $H$ erm itian and banded, and $B$ is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either alleigenvalues, a range of values ora range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvahues w illbe found;
$=\mathrm{V}$ : alleigenvahues in the half-open interval (VL, VU ] w ill be found; = I': the II-th through $\mathbb{I U}$-th eigenvaluesw illbe found.

UPLO (input)
$=\mathrm{U}$ ': U pper triangles of $A$ and $B$ are stored;
= ${ }^{L}$ ': Low er triangles ofA and B are stored.
N (input) The order of the m atriges A and $\mathrm{B} . \mathrm{N}>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of subdiagonals if $\mathrm{U} P L O$
$=\mathbb{L} \cdot \mathrm{KA}>=0$.

K B (input)
The num ber of superdiagonals of the $m$ atrix $B$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num ber of subdiagonals if U PLO $=\mathrm{L} \cdot \mathrm{KB}>=0$ 。

A B (input/output)
O n entry, the upper or low ertriangle of the H er$m$ titian band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum n of A is stored in the fth colum $n$ of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}$ ', AB $(k a+1+i-j)=A(i, j)$ for $m$ ax $(1, j$ $\mathrm{ka})<=\dot{i}=\dot{j}$ ifUPLO $=\mathrm{L} ', A B(1+i-j, j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k a)$.

On exit, the contents ofA B are destroyed.

LDAB (input)
The leading dim ension of the aray AB. LDAB >= K A +1 .

B B (input/output)
O n entry, the upper or low ertriangle of the H er$m$ Itian band $m$ atrix $B$, stored in the firstkb+1
row s of the anray. The $j$ th colum n ofB is stored in the $j$ th colum n of the array B B as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(\mathrm{kb}+1+i-j, j)=\mathrm{B}(1, j)$ for m ax $(1, j$
$\mathrm{kb})<=\mathrm{i}<=\dot{j}$ if UPLO $=\mathrm{L}, \mathrm{BB}(1+i-j, j)=B(i, 7)$
for $j=i<=m$ in $(n, j+k b)$.
On exit, the factors from the splitCholesky factorization $B=S * * H * S$, as retumed by CPBSTF .

LD BB (input)
The leading dim ension of the array $B B$. LD BB $>=$ K B+1.

Q (output)
If $J O B Z=V$ ', the $n-b y-n$ matrix used in the reduction of ${ }^{*} \mathrm{x}=\left(\mathrm{lam}\right.$ bda) ${ }^{\mathrm{B}} \mathrm{B}^{\mathrm{x}} \mathrm{x}$ to standard form, i.e. $C * x=\left(l a m\right.$ bda) ${ }^{*} \mathrm{x}$, and consequently C to tridiagonal form. If $J O B Z=N$ ', the array $Q$ is not referenced.

LDQ (input)
The leading dim ension of the array Q . If $\mathrm{JOBZ}=$ $N^{\prime}, L D Q>=1$. If $\mathrm{OBBZ}=\mathrm{V}$ ', LD Q >= $\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A 'or I'.

VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A 'or I '.

II (input)
If RA N GE= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{\Pi}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE $=$ A'or V'.
$\mathbb{I U}$ (input)
IfRA NGE= I', the indices (in ascending order) of the sm allest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE $=$ A'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
of w idth less than orequalto

ABSTOL + EPS * $\max (|k|, \mid)$,
where EPS is the machine precision. IfABSTOL is less than or equalto zero, then EPS* $\mid$ |w illibe used in its place, where $T$ is the 1 -norm of the tridiagonalm atrix obtained by reducing AP to tridiagonal form .
E igenvalues w illbe com puted m ostaccurately when
ABSTOL is set to tw ice the underflow threshold $2 \star$ SLAM CH (S ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABSTO L to $2 *$ SLAM CH (S ).

M (output)
The total num ber ofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{I U}-\mathbb{L}+1$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V '$, then if $\mathbb{N} F O=0, Z$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ th the $i$-th colum n of Z holding the eigenvector associated with W (i). The eigenvectors are norm alized so that $\mathrm{Z} * * \mathrm{H} * \mathrm{~B} * \mathrm{Z}=$ I. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading dim ension of the array $Z$. LD $Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >=N.

W ORK (w orkspace)
dim ension $(\mathbb{N})$
RW ORK (w orkspace)
dim ension ( $7 * \mathrm{~N}$ )
IN ORK (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )
FAII (output)
If $\mathrm{OBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the firstM ele$m$ ents of $\mathbb{F} A \mathbb{L}$ are zero. If $\mathbb{N} F O>0$, then $\mathbb{F} A \mathbb{L}$ contains the indices of the eigenvectors that failed to converge. If $J O B Z=N$ ', then $\mathbb{F A} I$ is not referenced.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvahue
> 0: if $\mathbb{N F O}=\mathrm{i}$, and i is:
$<=\mathrm{N}$ : then i eigenvectors failed to converge. Their indices are stored in array $\mathbb{F A} \mathbb{I} .>N$ : if $\mathbb{N} F O=N+i$, for $1<=i<=N$, then CPBSTF retumed $\mathbb{N} F O=i: B$ is not positive definite. The factorization ofB could notbe com pleted and no eigenvalues oreigenvectors w ere com puted.

## C INTERFACE

\#include < sunperfh>
void chbm $v$ (charuplo, intn, intk, com plex *alpha, com plex
*a, int lda, com plex *x, int incx, com plex *beta, com plex *y, int incy);
void chbm v_64 (char uplo, long n, long k, com plex *alpha, com plex *a, long lda, com plex *x, long incx, com plex *beta, com plex *y, long incy);

## PURPOSE

chbm $v$ perform $s$ the $m$ atrix-vector operation $y:=a l p h a * A * x+$ beta* $y$ where alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ ent vectors and $A$ is an $n$ by $n$ herm tian band $m$ atrix, $w$ ith k super-diagonals.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the bandmatrix $A$ is being supplied as follow s:

UPLO $=\mathrm{U}$ 'or $\mathrm{L}^{\prime}$ ' The uppertriangularpartofA is being supplied.

UPLO = L'or $\mathrm{I}^{\prime}$ ' The low ertriangularpart of A is being supplied.

U nchanged on exit.

N (input)
O $n$ entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

K (input)
On entry, $K$ specifies the number of superdiagonals of them atrix A. K m ust satisfy 0 .le.

K . U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or G ', the leading ( $k+1$ ) by $n$ part of the array A $m$ ust contain the upper triangular band part of the herm tian $m$ atrix, supplied colum $n$ by colum $n$, $w$ th the leading diagonal of the $m$ atrix in row ( $k+1$ ) of the array, the first super-diagonalstarting atposition 2 in row $k$, and so on. The top left $k$ by $k$ triangle of the anray $A$ is not referenced. The follow ing program segm entw illtransfer the upper triangular part of a herm itian band $m$ atrix from conventional fullm atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, \mathrm{~J}=1, \mathrm{~N} \\
& \mathrm{M}=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{MAX}(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

Before entry w ith UPLO = L 'or 1', the leading ( $k+1$ ) by $n$ part of the array A m ust contain the low er triangular band part of the herm itian $m$ atrix, supplied colum $n$ by colum $n$, $w$ th the leading diagonalof them atrix in row 1 of the amay, the first sub-diagonalstarting atposition 1 in row 2 , and so on. The bottom right k by $k$ triangle of the amay $A$ is not referenced. The follow ing program segm entw ill transfer the low er triangular part of a herm itian band $m$ atrix from conventional fullm atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

N ote that the im aginary parts of the diagonalele$m$ ents need notbe set and are assum ed to be zero. U nchanged on exit.

O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A >= ( $\mathrm{k}+1$ ). U nchanged on exit.

X (input)
$(1+(n-1) * a b s(\mathbb{N} C X))$. Before entry, the
increm ented array $X$ must contain the vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents of $\mathrm{X} . \mathbb{N} C X$ m ustnotbe zero. U nchanged on exit.
BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

Y (input/output)
$(1+(n-1) * a b s(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ m ustcontain the vectory. On exit, $Y$ is overw rilten by the updated vectory.
$\mathbb{N C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of Y. $\mathbb{N} C Y$ m ustnotbe zero. U nchanged on exit.

## C INTERFACE

\#include < sunperfh>
void chbtrd (charvect, charuplo, int n, int kd, com plex *ab, int ldab, float *d, float *e, com plex *q, int ldq, int *info);
void chbtrd_64 (charvect, charuplo, long n, long kd, com plex *ab, long ldab, float*d, float*e, com plex
*q, long ldq, long *info);

## PURPOSE

chbtrod reduces a com plex $H$ erm itian band $m$ atrix $A$ to real symmetric tridiagonal form $T$ by a unitary similarity transform ation: Q ** $\mathrm{H} * \mathrm{~A} * \mathrm{Q}=\mathrm{T}$.

## ARGUMENTS

VECT (input)
$=N^{\prime}$ : do not form $Q$;
$=\mathrm{V}$ : form Q ;
$=\mathrm{U}$ : update am atrix X , by form ing $\mathrm{X} * \mathrm{Q}$.

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the matrix A. $\mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO $=\mathrm{U}$ ', ort the num berof subdiagonals if UPLO $=\mathbb{L}^{\prime} . \mathrm{KD}>=0$.

AB (input/output)
On entry, the upper or low ertriangle of the Her $m$ itian band $m$ atrix A, stored in the firstK $D+1$
row sof the anray. The $j$ th colum n of $A$ is stored in the $j$ th colum $n$ of the array AB as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{j}(i, 1)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j)=A(i, 7)$ for $\dot{j}=i<=m$ in $(n, \dot{j}+\mathrm{kd})$. O $n$ exit, the diagonalele$m$ ents of AB are overw ritten by the diagonalele$m$ ents of the tridiagonalm atrix T ; if K D > 0, the elem ents on the first superdiagonal (if UPLO $=$ U ) orthe first subdiagonal (ifU PLO = L ) are overw rilten by the off-diagonalelem ents of $T$; the rest of A B is overw ritten by values generated during the reduction.

LDAB (input)
The leading dim ension of the array AB. LDAB >= K D +1 .

D (output)
The diagonalelem ents of the tridiagonalm atrix T .
E (output)
The off-diagonal elem ents of the tridiagonal m atrix $\mathrm{T}: \mathrm{E}(\mathrm{i})=\mathrm{T}(\mathrm{i}, \mathrm{i}+1)$ if $\mathrm{PLO}=\mathrm{U} ; \mathrm{E}(\mathrm{i})=$ $T(i+1, i)$ if $\mathrm{PLLO}=\mathrm{L}^{\prime}$ 。

Q (input/output)
Onentry, ifVECT = U', then $Q \mathrm{must}$ contain an N by -N m atrix X ; if VECT $=\mathrm{N}$ 'or V ', then Q need notbe set.

On exit: if $\mathrm{VECT}=\mathrm{V}$ ', Q contains the N -by -N unitary matrix $Q$; ifVECT = U', $Q$ contains the product $X$ * $Q$; ifVECT $=N$ ', the array $Q$ is not referenced.

LD Q (input)
The leading $d i m$ ension of the array $Q . L D Q>=1$, and LDQ >= N ifVECT = V'or U'.

W ORK (w orkspace)
dim ension (N)
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue

\#include <sunperfh>
void checon (charuplo, int $n$, com plex *a, int lda, int *ípívot, floatanorm , float *roond, int *info);
void checon_64 (charuplo, long n, com plex *a, long lda, long *ipivot, floatanorm , float *roond, long *info);

## PURPOSE

checon estim ates the reciprocal of the condition num ber of a complex Herm itian matrix A using the factorization A = $\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}$ orA $=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}$ com puted by CHETRF.

A $n$ estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND $=1$ / (ANORM * norm (inv (A )) ).

## ARGUMENTS

UPLO (input)
Specifies w hether the details of the factorization
are stored as an upper or low er triangularm atrix.
$=\mathrm{U}$ : U ppertriangular, form is $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}$ ** H ;
$={ }^{\prime} \mathrm{L}$ ': Low er triangular, form is $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}$.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input) The block diagonalm atrix D and the m ultipliers used to obtain the factorU orL as com puted by CHETRF.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.
$\mathbb{P} \mathbb{V} O T$ (input)
D etails of the interchanges and the block structure ofD as determ ined by CHETRF.

## ANORM (input)

The 1-norm of the originalm atrix A.

## RCOND (output)

The reciprocal of the condition number of the $m$ atrix $A$, com puted as RCOND $=1$ ( $A N O R M * A \mathbb{N} V N M$ ), where $A \mathbb{N} V N M$ is an estim ate of the 1 -nom of inv (A) com puted in this routine.

W ORK (w orkspace)

void cheev_64 (char joboz, charuplo, long n, com plex *a, long lda, float *w , long *info);

## PURPOSE

cheev com putes alleigenvalues and, optionally, eigenvectors of a com plex $H$ erm itian $m$ atrix A .

## ARGUMENTS

JO B Z (input)
$=\mathrm{N}$ : C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
$=U^{\prime}:$ U ppertriangle of $A$ is stored;
$=\mathbb{L}$ ': Low ertriangle ofA is stored.

N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the H erm itian $m$ atrix A . If $\mathrm{UPLO}=\mathrm{U}$ ', the leading N -by N uppertriangularpart of A contains the upper triangular part of the $m$ atrix $A$. If U PLO $=\mathrm{L}$ ', the leading N -by-N low er triangular part ofA contains the low er triangular part of the $m$ atrix $A$. On exit, if $J O B Z=V$ ', then if $\mathbb{N} F O=0, A$ contains the orthonorm al eigenvectors of them atrix A . If $\mathrm{OOBZ}=\mathrm{N}$ ', then on exit the low er triangle (if $\mathrm{U} P \mathrm{PO}=\mathrm{L}$ ) or the upper triangle (if $\mathrm{UPLO}=\mathrm{U}$ ) of $A$, including the diagonal, is destroyed.

The leading dim ension of the array A. LDA >= $\max (1, N)$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al
LDW ORK.
LDW ORK (input)
The length of the array W ORK. LDW ORK >= max $(1,2 * \mathrm{~N}-1)$. For optim alefficiency, LD W ORK >= $(N B+1) * N$, where $N B$ is the blocksize for CHETRD retumed by ILAENV.

If LD W ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
$\mathbb{N} F O$ (output)
= 0 : successfiulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=$ i, the algonithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void cheevd (char j̀bz, charuplo, int n, com plex *a, int lda, float *w , int *info);
void cheevd_64 (char jobz, charuplo, long n, com plex *a, long lda, float *w , long *info);

## PURPOSE

cheevd com putes alleigenvalues and, optionally, eigenvectors of a com plex H erm itian m atrix A. If eigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on m achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits $w$ hich subtract like the $C$ ray $\mathrm{X}-\mathrm{M} P, \mathrm{C}$ ray $\mathrm{Y}-\mathrm{M} \mathrm{P}, \mathrm{C}$ ray $\mathrm{C}-90$, or C ray -2 . It could conceivably fail on hexadecim al or decim al $m$ achines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

```
JO B Z (input)
    = N':}\mathrm{ C om pute eigenvahues only;
    = V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
    = U ': U pper triangle ofA is stored;
    = L': Low ertriangle ofA is stored.
N (input) The order of them atrix A. N >= 0.
```

A (input/output)
On entry, the $H$ em itian m atrix A. If P PLO = U', the leading N -by -N uppertriangularpartofA contains the uppertriangularpart of the $m$ atrix $A$. If U PLO = L', the leading $N$-by N low er triangular part ofA contains the low er triangular part of the $m$ atrix $A$. On exit, if $J O B Z=V$ ', then if $\mathbb{N} F O=0, A$ contains the orthonorm al eigenvectors of the $m$ atrix $A$. If $J O B Z=N$ ', then on exit the low er triangle (if $\mathrm{PLLO}=\mathrm{L}$ ) or the upper triangle (if $U P L O=U$ ) of $A$, including the diagonal, is destroyed.

LDA (input)
The leading dim ension of the array A. LD A >= $\max (1, \mathbb{N})$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, \mathrm{~W}$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the array $\mathrm{W} O R K$. If $\mathrm{N}<=1$, LW ORK mustibe at least 1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>$ 1, LW ORK m ustbe at least $\mathrm{N}+1$. If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1$, LW ORK m ustbe at least2*N + N **2.

If LW O RK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On ex止, if $\mathbb{N F F O}=0$, RW ORK (1) retums the optim alLRW ORK .

LRW ORK (input)
The dim ension of the aray RW ORK. If $\mathrm{N}<=1$, LRW ORK m ustbe at least1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>$ 1,LRW ORK m ust.be at leastN. If JOBZ $=V^{\prime}$ and $\mathrm{N}>1$,LRW ORK m ust.be at least1 + 5*N + 2*N **2.

If LRW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the RW ORK array, retums this value as the first entry of the RW ORK aray, and no enrorm essage
related to LRW ORK is issued by XERBLA.
IN ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I}$ O RK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N}$ ORK. If $\mathrm{N}<=1$, LIN ORK must.be at least1. If $J 0 \mathrm{BZ}=\mathrm{N}$ 'and $\mathrm{N}>$ $1, \mathrm{LIV}$ ORK m ustbe at least 1. If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1, \mathrm{~L} \mathbb{I} \mathrm{O}$ ORK mustbe at least $3+5 * \mathrm{~N}$.

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the $\mathbb{I V}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK array, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0 : successfulexit
$<0$ : if $\mathbb{N} F O=-i$, the $i$-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N F O}=$ i, the algonithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void cheevr(char jobz, char range, charuple, intn, com plex
*a, int lda, float vl, float vu, int il, intiu,
floatabstol, int ${ }^{\mathrm{m}} \mathrm{m}$, float ${ }_{\mathrm{w}}$, com plex ${ }^{\text {z }}$, int ldz, int *isuppz, int*info);
void cheevr_64 (char jobz, char range, char uplo, long n, com plex *a, long lda, floatvl, float vu, long il, long iu, float abstol, long *m, float *w, com plex *z, long ldz, long *isuppz, long *info);

## PURPOSE

cheevr com putes selected eigenvalues and, optionally , eigenvectors of a com plex H erm itian tridiagonalm atrix T. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

W heneverpossible, CHEEVR calls C STEGR to com pute the eigenspectrum using Relatively Robust Representations. CSTEGR com putes eigenvalues by the dqds algorithm, while orthogonaleigenvectors are com puted from various "good" L D
$L^{\wedge} \mathrm{T}$ representations (also known as Relatively Robust Representations). G ram -Schm idtorthogonalization is avoided as far as possible. M ore specifically, the various steps of the algorithm are as follow s.For the i-th unreduced block of T ,
(a) C om pute $T$-sigm a_i= L_iD _iL_i^T, such that L_i D_iL_i^T is a relatively robust representation,
(b) C om pute the eigenvalues, lam bda_j, of L_i D _i L_i^T to high relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose" sigm a_i close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D _i L_i^T, com pute the comesponding eigenvectorby form ing a rank-revealing tw isted factorization.
The desired accuracy of the output can be specified by the inputparam eterA BSTOL.

Form ore details, see "A new O ( $n^{\wedge} 2$ ) algorithm for the sym m etric tridiagonal eigenvahue/eigenvector problem ", by Inder光D hillon, C om puter Science D ivision TechnicalR eport N o.U CB //C SD -97-971, U C B erkeley, M ay 1997.

N ote 1 : CHEEVR calls CSTEGR when the fill spectrum is requested on $m$ achines $w$ hich conform to the ieee-754 floating pointstandard. CHEEVR calls SSTEBZ and CSTEIN on non-ieee $m$ achines and
w hen partialspectrum requests are $m$ ade.

N orm alexecution of CSTEGR m ay create NaNs and infinities and hence $m$ ay abort due to a floating pointexception in environm ents w hich do nothandle N aN s and infinities in the ieee standard defaultm anner.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found.
$=\mathrm{V}$ ': alleigenvalues in the half-open interval
(VL, V U ] w ill be found. = I': the II th through
IU th eigenvalues w illbe found.

UPLO (input)
= U : U ppertriangle ofA is stored;
= L': Low er triangle of A is stored.

N (input) The orderof the m atrix A. $\mathrm{N}>=0$.

A (input/output)
On entry, the $H$ erm itian $m$ atrix $A$. If $\mathrm{PLO}=\mathrm{U}$ ', the leading N -by -N uppertriangularpartofA contains the upper triangularpart of the $m$ atrix $A$. If UPLO = L', the leading N -by-N low er triangular part ofA contains the low er triangular part of the $m$ atrix $A$. On exit, the low ertriangle (if $\mathrm{UPLO}=\mathrm{L}$ ) or the upper triangle (if UPLO = U ) of A , including the diagonal, is destroyed.
LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N G E = A 'or I''.

II (input)
IfRA NGE= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.
$\mathbb{I U}$ (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

ABSTOL (input)
The absolute error tolerance forthe eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * $\max (|k|, \mid)$,
where EPS is the m achine precision. IfA BSTOL is less than or equal to zero, then EPS* $\mid$ | w illbe used in its place, w here $F \mid$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonal form .

See "C om puting Sm allSingularV ahues of B idiagonal $M$ atrices $w$ ith $G$ uaranteed $H$ igh Relative A ccuracy," by D em meland K ahan, LA PA CK W orking N ote \#3.

If high relative accuracy is im portant, setA BSTO L to SLAMCH (Safe minimum '). Doing so will guarantee thateigenvalues are com puted to high relative accuracy when possible in future releases. The current code does not $m$ ake any guarantees abouthigh relative accuracy, but funutre releasesw ill. See J.Barlow and J. Demmel, "C om puting A ccurate E igensystem sofScaled D iagonally D om inantM atrioes", LA PA CK W orking N ote \#7, for a discussion of $w$ hich $m$ atrices define their eigenvalues to high relative accuracy.

M (output)
The totalnum berofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=A^{\prime}, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{U}-\mathbb{L}+1$.

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.

Z (output)
If $\mathrm{OOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the first M colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, $w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated w ith W (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then $Z$ is not referenced. N ote: the userm ust ensure that at leastm ax $(1, M)$ colum ns are supplied in the array $Z$; ifRANGE = V', the exact value of $M$ is not know $n$ in advance and an upperbound $m$ ust be used.

LD $Z$ (input)
The leading dim ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\max (1, N)$.

ISUPPZ (output)

The support of the eigenvectors in $Z$, i.e., the indices indicating the nonzero elem ents in $Z$. The i-th eigenvector is nonzero only in elem ents $\operatorname{ISUPPZ}(2 \star i-1)$ through $\operatorname{ISU} \operatorname{PPZ}$ (2*i).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.
LW ORK (input)
The length of the aray $W$ ORK. LW ORK >= $\max (1,2 \star \mathrm{~N})$. For optim al efficiency, LW ORK $>=$ $(N B+1) * N$, where $N B$ is the $m$ ax of the blocksize for CHETRD and forCUNM TR as retumed by HAENV.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, R W$ ORK (1) retums the optim al (andm inim al) LRW ORK.

LRW ORK (input)
The length of the array RW ORK. LRW ORK >= $\max (1,24 \star \mathrm{~N})$.

If LRW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK array, retums this value as the first entry of the RW ORK anay, and no enorm essage related to LRW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al (and $m$ inim al) $L \mathbb{I N} O R K$.

LIN ORK (input)
The dimension of the array $\mathbb{I W}$ ORK. LIW ORK >= $\max (1,10 \star \mathrm{~N})$.

If LIV ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK anay, and no enrorm essage related to $L \mathbb{I N} O R K$ is issued by X ERBLA.
$\mathbb{I N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N N F O}=-i$, the $i$-th argum ent had an illegalvahue
> 0: Intemalemor

## PURPOSE

cheevx com putes selected eigenvalues and, optionally, eigenvectors of a com plex $H$ erm itian $m$ atrix A. E igenvalues and eigenvectors can be selected by specifying either a range of values or range of indices for the desired eigenvalues.

## ARGUMENTS

JO B Z (input)
$=\mathrm{N}:$ : Com pute eigenvahes only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.
= A ': alleigenvalues $w$ illibe found.
= V : alleigenvalues in the half-open interval
(NL, VU ] will be found. = I': the $\mathbb{I}$-th through
$\mathbb{I U}$-th eigenvaluesw illbe found.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the $H$ erm itian $m$ atrix A. If $\mathrm{PLO}=\mathrm{U}$ ', the leading N -by N upper triangularpart of A contains the upper triangularpart of the $m$ atrix A. If U PLO = L', the leading N -by-N low er triangular part of A contains the low er triangular part of the $m$ atrix $A$. On exit, the low ertriangle (if $\mathrm{UPLO}=\mathrm{L}$ ) or the uppertriangle (if $\mathrm{UPLO}=\mathrm{U}$ ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N G E = A 'or I''.

VU (input)
IfRANGE=V ', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A 'or I''.

II (input)
If RA NGE= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE= A 'or V'.

IU (input)
IfRA N G E= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

ABTOL (input)

The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABTOL + EPS * max (k|,b|),
where EPS is them achine precision. If ABTOL is less than or equalto zero, then EPS* $\mid$ | w illibe used in its place, w here $F \mid$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonal form .

E igenvalues w illlbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold 2*SLAM CH (S ), not zero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to $2 *$ SLAM CH (S ).

See "C om puting Sm allSingularV alues of B idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by Dem m eland K ahan, LA PA CK W orking N ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. $0<=$ NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE $=I^{\prime}$ ', NFOUND $=\mathbb{U}-\mathbb{H}+1$.

W (output)
On norm alexit, the firstN FOUND elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V '$, then if $\mathbb{N} F O=0$, the first $N F O U N D$ colum ns of $Z$ contain the orthonorm aleigenvectors of thematrix A comesponding to the selected eigenvalues, $w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated w ith $W$ (i). If an eigenvector fails to converge, then that colum n of $Z$ contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in $\mathbb{F A} \mathbb{I}$. If $J O B Z=N$ ', then $Z$ is not referenced.
$N$ ote: the user must ensure that at least
$m$ ax ( $1, N$ FOUND ) colum ns are supplied in the array $Z$; if RANGE = V', the exact value ofNFOUND is not know $n$ in advance and an upperbound $m$ ustbe used.

LD Z (input)
The leading dim ension of the array $Z$. LD $Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK (1) retums the optim al LDW ORK.

LD W ORK (input)
The length of the array W ORK. LDW ORK $>=$ $\max (1,2 * N)$. For optim al efficiency, LDW ORK >= $(\mathbb{N B}+1) \star \mathrm{N}$, w here $N B$ is the $m$ ax of the blocksize for CHETRD and forCUNM TR as retumed by $\amalg A E N V$.

IfLDW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by X ERBLA.

W ORK 2 (w orkspace)
dim ension ( $7 \star \mathrm{~N}$ )

IV ORK 3 (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )
$\mathbb{F A} I I$ (output)
If $J O B=V^{\prime}$ ', then if $\mathbb{N F O}=0$, the first $N F O U N D$ elem ents of $\mathbb{F A} I I$ are zero. If $\mathbb{N F O}>0$, then $\mathbb{F} A$ II contains the indices of the eigenvectors that failed to converge. If $\mathrm{OBZ}=\mathrm{N}$ ', then $\mathbb{F A} \mathbb{I}$ is notreferenced.
$\mathbb{N F O}$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue
> 0: if $\mathbb{N N F O}=i$, then ieigenvectors failed to converge. Their indioes are stored in array正AI.

void chegs2_64 (long itype, charuple, long n, com plex *a, long lda, com plex *b, long ldb, long *info);

## PURPOSE

chegs2 reduces a complex Herm tian-definite generalized eigenproblem to standard form .

If ITYPE $=1$, the problem is $A * x=\operatorname{lam}$ bda ${ }^{*}{ }^{*} \mathrm{x}$, and $A$ is overw ritten by inv ( $U 1$ ) *A *inv (U) orinv (L) *A *inv (L) If ITYPE $=2$ or 3 , the problem is $A * B * x=\operatorname{lam}$ bda* $x$ or $B * A * X=\operatorname{lam}$ bda ${ }^{\mathrm{X}} \mathrm{X}$, and A is overw ritten by $\mathrm{U} * \mathrm{~A} * \mathrm{U}$ `orL ${ }^{*} \mathrm{~A} * \mathrm{~L}$. B m usthave been previously factorized as U *U or L *L' by CPOTRF.

## ARGUMENTS

ITYPE (input)

$=2$ or 3: com pute $U * A$ *U 'orL *A *L.

UPLO (input)
Specifies w hether the upper or low er triangular
part of the $H$ erm itian $m$ atrix A is stored, and how
B has been factorized. = U ': U pper triangular
= L': Low ertriangular
N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

A (input/output)
O n entry, the $H$ erm tian matrix A. If U PLO $=\mathrm{U}$ ', the leading $n$ by $n$ upper triangularpart of $A$ contains the upper triangular part of the $m$ atrix $A$, and the strictly low ertriangularpartofA is not referenced. If UPLO $=\mathrm{L}$ ', the leading n by n low er triangularpart ofA contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of $A$ is not referenced.

Onexit, if $\mathbb{N} F O=0$, the transform ed $m$ atrix, stored in the sam e form atas A.

## LD A (input)

The leading dim ension of the array A. LDA >= $\max (1, N)$.
$B$ (input) The triangular factor from the C holesky factorization ofB, as retumed by CPO TRF .

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.
$\mathbb{I N} F O$ (output)
= 0: successfulexit.
< 0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvahue.

void chegst 64 (long itype, charuplo, long n, com plex *a, long lda, com plex *b, long ldb, long *info);

## PURPOSE

chegst reduces a com plex H erm itian-definite generalized eigenproblem to standard form .

If ITY $\mathrm{PE}=1$, the problem is $\mathrm{A}{ }_{\mathrm{x}}=$ lam bda*B ${ }_{\mathrm{X}} \mathrm{X}$, and $A$ is overw ritten by $\operatorname{inv}(U * * H) * A * \operatorname{inv}(U)$ or $\operatorname{inv}(\amalg) * A * \operatorname{inv}(\amalg * * H)$
If ITYPE $=2$ or 3 , the problem is $A * B *_{x}=$ lam bda* x or $B * A * x=\operatorname{lam} . b d a * x$, and $A$ is overw rilten by $U * A * U * * H$ or L** $\mathrm{H} * \mathrm{~A}$ *L.

B m usthave been previously factorized as U ** $\mathrm{H} * \mathrm{U}$ or $\mathrm{L} * \mathrm{~L}$ ** H by CPOTRF .

## ARGUMENTS

ITYPE (input)
$=1:$ compute $\quad \operatorname{inv}(\mathrm{U} * * H) * A * \operatorname{inv}(\mathrm{U}) \quad$ or
$\operatorname{inv}(\amalg) \star A$ *inv $(\amalg * * H)$;
$=2$ or 3 :com pute $\mathrm{U} * \mathrm{~A} * \mathrm{U} * * \mathrm{H}$ orL** $\mathrm{H} * \mathrm{~A} * \mathrm{~L}$.

UPLO (input)
$=U^{\prime}$ : Uppertriangle of $A$ is stored and $B$ is factored as $\mathrm{U} * * \mathrm{H} * \mathrm{U} ;=\mathrm{L}:$ : Low er triangle of is stored and B is factored as $\mathrm{L} * \mathrm{~L}^{\star *} \mathrm{H}$.

N (input) The order of the $m$ atriges $A$ and $B . N>=0$.

A (input/output)
On entry, the $H$ erm itian $m$ atrix A. If $\mathrm{UPLO}=\mathrm{U}$ ', the leading N -by N uppertriangularpartofA contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. IfUPLO = L ', the leading N -by -N low er triangularpart ofA contains the low ertriangularpart of them atrix A, and the strictly upper triangularpart of A is not referenced.

On exit, if $\mathbb{N F O}=0$, the transform ed matrix,
stored in the sam e form at as A .

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.

B (input) The triangular factor from the Cholesky factorization ofB , as retumed by CPO TRF .

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i-$ th argum enthad an illegalvalue

*info);
void chegv_64 (long itype, char jobz, charuplo, long n, com plex *a, long lda, com plex *b, long ldb, float *w , long *info);

## PURPOSE

chegv com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized H erm itian-definite eigenproblem, of the form $A * x=(l a m ~ b d a) * B * x$, $\mathrm{A} * \mathrm{~B} \mathrm{x}=(\operatorname{lam} . \mathrm{bda}){ }^{\star} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{X}=\left(\mathrm{lam}\right.$ bda) ${ }^{*} \mathrm{x}$. H ere A and B are assum ed to be $H$ erm itian and $B$ is also positive definite.

## ARGUMENTS

ITYPE (input)
Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{x}=\left(\mathrm{lam}\right.$ bda) ${ }^{\mathrm{B}}{ }^{*}{ }_{\mathrm{x}}$
$=2: \mathrm{A} * \mathrm{~B} * \mathrm{X}=\left(\mathrm{lam}\right.$ bda) ${ }^{*} \mathrm{X}$
$=3: B * A * X=(l a m ~ b d a){ }^{*} \mathrm{x}$

JOBZ (input)
$=N^{\prime}:$ C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
$=\mathrm{U}$ ': U ppertriangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

A (input/output)
On entry, the $H$ erm itian $m$ atrix A. If UPLO = U', the leading N -by N upper triangularpartof A contains the upper triangularpart of the $m$ atrix $A$. If UPLO = L', the leading N -by-N low er triangular partofA contains the low er triangular part of the m atrix A.

On exit, if $J \mathrm{OBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N} F O=0$, A contains the $m$ atrix $Z$ ofeigenvectors. The eigenvectors are norm alized as follow s: if ITYPE = 1 or $2, Z * * H * B * Z=I ;$ if $I T Y P E=3, Z * * H * i n v(B) * Z=I$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then on exit the upper triangle (if $\mathrm{U} P L O=\mathrm{U}$ ) or the low er triangle (if $\mathrm{U} P L O=\mathrm{L}$ ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

B (input/output)
On entry, the $H$ erm itian positive definite $m$ atrix $B$. If $U P L O=U$ ', the leading $N$ by $N$ uppertriangularpartofB contains the upper triangular part of them atrix B. IfU PLO = L', the leading N toy -N low er triangularpart of B contains the low er triangularpart of the $m$ atrix B .

On exit, if $\mathbb{N} F O<=N$, the part of $B$ containing the $m$ atrix is overw rilten by the triangular factor U orL from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ or $B=\mathrm{L} * \mathrm{~L} * * \mathrm{H}$.

LD B (input)
The leading dim ension of the aray B. LD B >= $\max (1, N)$.

W (output)
If $\mathbb{N}$ FO $=0$, the eigenvalues in ascending order.

## W ORK (w orkspace)

On exit, if $\mathbb{N} F O=0, W$ ORK ( 1 ) retums the optim al LDW ORK.

LDW ORK (input)
The length of the array $W$ ORK. LDW ORK >= max $\left(1,2^{\star} \mathrm{N}-1\right)$. For optim alefficiency, LD W ORK >= $(\mathrm{NB}+1) * \mathrm{~N}$, where NB is the blocksize for CHETRD retumed by LLAENV.

IfLD W ORK $=-1$, then aw orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
< $0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
> 0: CPOTRF orCH EEV retumed an errorcode:
$<=\mathrm{N}$ : if $\mathbb{N F O}=\mathrm{i}, \mathrm{CHEEV}$ failed to converge; i off-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero; $>N$ : if $\mathbb{N F O}$
$=N+i$, for $1<=i<=N$, then the leading $m$ inor oforderiofB is not positive definite. The factorization of B could notbe com pleted and no eigenvahues or eigenvectors w ere com puted.

void chegvd_64 (long itype, char jobz, char uplo, long n, com plex *a, long lda, com plex *b, long ldb, float *W, long *info);

## PURPOSE

chegvd com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized $H$ erm itian-definite eigenproblem, of the form $A{ }^{*} x=(l a m ~ b d a) * B{ }^{*} x$, $\mathrm{A} * \mathrm{~B} \mathrm{x}=(\operatorname{lam} \mathrm{bda})^{*} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\operatorname{lam} \mathrm{bda}) * \mathrm{x}$. H ere A and B are assum ed to be $H$ erm itian and $B$ is also positive definite. If eigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on m achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits $w$ hich subtract like the $C$ ray $\mathrm{X}-\mathrm{M} P, \mathrm{C}$ ray $\mathrm{Y}-\mathrm{M} \mathrm{P}, \mathrm{C}$ ray $\mathrm{C}-90$, or C ray -2 . It could conceivably fail on hexadecim al or decim al machines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

ITYPE (input)

Specifies the problem type to be solved:
$=1: A{ }^{*}=\left(\operatorname{lam}\right.$ bda) ${ }^{\mathrm{B}} \mathrm{A}^{*} \mathrm{x}$
$=2: A * B * x=\left(l a m\right.$ bda) ${ }^{*} \mathrm{x}$
$=3: B{ }^{*}{ }^{*}{ }^{x}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{X}$

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}$ :: C om pute eigenvalues and eigenvectors.
UPLO (input)
$=\mathrm{U}:$ : U pper triangles of $A$ and $B$ are stored;
= L': Low ertriangles of $A$ and $B$ are stored.
N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.
A (input/output)
On entry, the $H$ erm itian m atrix A. If UPLO = U', the leading N -by N uppertriangularpart of A contains the upper triangularpart of the $m$ atrix $A$. If UPLO = L', the leading N -by N low er triangular partofA contains the low er triangular part of them atrix $A$.

Onexit, if $J O B Z=V^{\prime}$, then if $\mathbb{N} F O=0, A$ contains the $m$ atrix $Z$ of eigenvectors. The eigenvectors are norm alized as follow s: if ITYPE = 1 or $2, Z * * H * B * Z=I ;$ if $I T Y P E=3, Z * * H * i n v(B) * Z=I$. If $J O B Z=N$ ', then on exit the upper triangle (if $\mathrm{UPLO}=\mathrm{U}$ ) or the low er triangle (if $\mathrm{UPLO}=\mathrm{L}$ ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LD A >= $\max (1, N)$.

B (input/output)
O n entry, the $H$ erm itian m atrix B. If UPLO = U', the leading N -by N uppertriangularpart of B contains the upper triangularpart of the $m$ atrix $B$. If UPLO = L', the leading N by N low er triangular part ofB contains the low er triangular part of them atrix B .

Onexit, if $\mathbb{N} F O<=N$, the part of $B$ containing the $m$ atrix is overw rilten by the triangular factor U orL from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ or $B=L * L^{* *} \mathrm{H}$.

LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, N)$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the amay $W$ ORK. If $N<=1$, LW ORK $>=1$. If $O B Z=N$ 'and $N>1, L W O R K>=N$ +1 . If $O B Z=V$ 'andN $>1$, LW ORK $>=2 * N+$ $\mathrm{N} * * 2$ 。

If LW O RK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
On exit, if $\mathbb{N} F O=0$, RW ORK (1) retums the optim al LRW ORK.

LRW ORK (input)
The dim ension of the aray RW ORK. If $\mathrm{N}<=1$, LRW ORK $>=1$. If $\mathrm{OBZ}=\mathrm{N}$ 'and $\mathrm{N}>1$,LRW ORK $>=$ N . If $\mathrm{OBB}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1$,LRW ORK $>=1+5 \star \mathrm{~N}+$ $2 * N * * 2$ 。

If LRW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK aray, retums this value as the first entry of the RW ORK array, and no errorm essage related to LRW ORK is issued by X ERBLA.

IW ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0$, $\mathbb{I N}$ O RK (1) retums the optim al
LIW ORK.

LIW ORK (input)
The dim ension of the anay $\mathbb{I N} O R K$. If $\mathrm{N}<=1$, LIW ORK $>=1$. If $O B Z=N$ 'andN $>1, L \mathbb{W} O R K>=$ 1. If $\mathrm{OBBZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1, \mathrm{~L} \mathbb{I} \mathrm{ORK}>=3+5 * \mathrm{~N}$.

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$ th argum enthad an illegalvalue
$>0$ : CPOTRF orCHEEVD retumed an error code:
<= N: if $\mathbb{N} F O=i, C H E E V D$ failed to converge; i off-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero; > N : if $\mathbb{N}$ FO $=N+i$, for $1<=i<=N$, then the leading $m$ inor oforderiofB is not positive definite. The factorization of B could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void chegvx (int itype, char j̀bz, char range, charuplo, int n, com plex *a, int lda, com plex *b, int ldb, float vl, float vu, int il, int iu, float abstol, int *m , float *w , com plex *z, int ldz, int *ifail, int *info);
void chegvx_64 (long itype, char jobz, char range, char uplo, long n, com plex *a, long lda, com plex *b, long ldb, float vl, float vu, long il, long in, float abstol, long *m, float* ${ }_{\mathrm{w}}$, com plex *z, long ldz, long *ifail, long *info);

## PURPOSE

chegvx com putes selected eigenvalues, and optionally, eigenvectors of a com plex generalized H erm itian-definite eigenproblem, of the form $A * x=\left(\operatorname{lam}\right.$ bda) ${ }^{*}{ }^{*}{ }^{x}, A$ A $\mathrm{Bx}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{x}$, or $B{ }^{*} A * x=(l a m ~ b d a){ }^{*} x$. H ere $A$ and $B$ are assum ed to be $H$ erm itian and $B$ is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

ITYPE (input)
Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{x}=\left(\operatorname{lam}\right.$ bda)${ }^{\mathrm{B}}{ }^{*} \mathrm{x}$
$=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{x}$
$=3: B * A * x=\left(l a m\right.$ bda) ${ }^{*} \mathrm{x}$
JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
RANGE (input)
= A : alleigenvalues w illbe found.
= V ': alleigenvalues in the half-open interval ( $\mathrm{L}, \mathrm{VU}]$ w ill be found. = ' I ': the I -th through $\mathbb{I U}$-th eigenvaluesw illlbe found.

UPLO (input)
$=\mathrm{U}$ ': U pper triangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.
$N$ (input) The order of the $m$ atrices $A$ and $B . N>=0$.
A (input/output)
O n entry, the $H$ erm itian $m$ atrix $A$. If $U P L O=U '$, the leading N -by N uppertriangular partofA contains the upper triangular part of the $m$ atrix $A$. If UPLO = L', the leading N by -N low er triangular part ofA contains the low er triangular part of them atrix $A$.

On exit, the low er triangle (if $\mathrm{UPLO}=\mathrm{L}$ ) or the upper triangle (if $\mathrm{U} P \mathrm{O}=\mathrm{U}$ ) of , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

B (input/output)
O n entry, the $H$ erm tian $m$ atrix $B$. If $U P L O=U '$, the leading N -by N uppertriangular partofB contains the upper triangular part of the $m$ atrix $B$. If UPLO $=\mathrm{L}$ ', the leading N -by -N low er triangular partofB contains the low er triangular part of the $m$ atrix $B$.

On exit, if $\mathbb{N} F O<=N$, the part of $B$ containing the $m$ atrix is overw rilten by the triangular factor
U orL from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ or $B=L{ }^{*} \mathrm{~L}^{* *} \mathrm{H}$.

LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA NGE = A 'or I'.
VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU. N ot referenced ifRANGE=A 'or I '.

II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, ifN $>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE $=$ A'or V'.

IU (input)
If RA NGE= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE $=$ A'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABSTOL + EPS * max ( $k|$,$| b|),$
where EPS is the m achine precision. IfA BSTOL is less than or equalto zero, then EPS* $\mid$ | w illbe used in its place, where $F \mid$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonal form .

E igenvalues w illbe com puted m ost accurately when ABSTOL is set to tw ioe the underflow threshold $2 *$ SLAM CH ( $\mathrm{S}^{\prime}$ ), not zero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did
not converge, try setting ABSTOL to $2 *$ SLAM CH (S ).
M (output)
The total num ber ofeigenvalues found. $0<=\mathrm{M}<=$
N . IfRANGE $=\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{U}-\mathbb{L}+1$.

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
Z (output)
If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced. If JOBZ $=\mathrm{V}$ ', then if $\mathbb{N} F O=0$, the firstM columns of $Z$ contain the orthonorm aleigenvectors of the $m$ atrix A comesponding to the selected eigenvalues, $w$ ith the i-th colum $n$ of $Z$ holding the eigenvectorassociated $w$ ith $W$ (i). The eigenvectors are norm alized as follow s: if $I T Y P E=1$ or $2, Z * * T * B * Z=I$; if TTYPE $=3, Z * * T * \operatorname{inv}(B) * Z=I$.

If an eigenvector fails to converge, then that colum $n$ of $Z$ contains the latestapproxim ation to the eigenvector, and the index of the eigenvector is retumed in $\mathbb{F A} \mathbb{I}$. N ote: the userm ustensure that at leastm ax $(1, M)$ colum ns are supplied in the aray $Z$; ifRANGE = V', the exactvalue of $M$ is notknow $n$ in advance and an upper bound $m$ ust be used.

LD Z (input)
The leading dim ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the array $W$ ORK. LW ORK >= $\max \left(1,2{ }^{*} \mathrm{~N}-1\right)$. For optim al efficiency, LW ORK $>=$ $(N B+1) * N$, where $N B$ is the blocksize for CHETRD retumed by ILAENV.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
dim ension ( $7 * \mathrm{~N}$ )

IV ORK (w orkspace)
dim ension ( $5 * N$ )

FAII (output)
If $J O B Z=V^{\prime}$, then if $\mathbb{N F O}=0$, the firstM ele$m$ ents of $\mathbb{F} A \mathbb{I}$ are zero. If $\mathbb{N} F O>0$, then $\mathbb{F} A \mathbb{H}$ contains the indices of the eigenvectors that failed to converge. If $\mathrm{OBB}=\mathrm{N}$ ', then $\mathbb{F} A \mathbb{I}$ is notreferenced.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i-$ th argum enthad an illegalvalue
> 0: CPO TRF orCHEEVX retumed an errorcode:
$<=\mathrm{N}:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{CHEEVX}$ failed to converge; i eigenvectors failed to converge. Their indices are stored in amay $\mathbb{F A} \mathbb{I} .>N:$ if $\mathbb{N F O}=\mathrm{N}+$ $i$, for $1<=i<=N$, then the leading $m$ inor of orderiofB is notpositive definite. The factorization of $B$ could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

void chemm (charside, char uplo, int m, int n, com plex *alpha, com plex *a, int lda, com plex *b, int ldb, com plex *beta, com plex *c, int ldc);
void chem m _64 (charside, charuplo, long m, long n, com plex *alpha, com plex *a, long lda, com plex *b, long ldlb, com plex *beta, com plex * C , long ldc);

## PURPOSE

chem $m$ perform sone of the $m$ atrix $m$ atrix operations $C:=$ alpha*A *B + beta*C orC $:=$ alpha*B *A + beta*C where alpha and beta are scalars, $A$ is an herm titian $m$ atrix and $B$ and $C$ arem by $n \mathrm{~m}$ atriges.

## ARGUMENTS

SIDE (input)
On entry, SIDE specifiesw hether the herm itian $m$ atrix A appears on the leftorright in the operation as follow s:
$S \mathbb{D E}=$ L'or I' $C:=$ a耳pha*A *B + beta* $C$,

SIDE = R 'or 'r' C : alpha*B *A + beta*C ,

U nchanged on exit.

## UPLO (input)

On entry, UPLO specifies whether the upper or lower triangular part of the herm itian $m$ atrix $A$ is to be referenced as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or U ' Only the upper triangularpart of the herm itian $m$ atrix is to be referenced.
$\mathrm{UPLO}=\mathrm{L}$ 'or $\mathrm{I}^{\prime}$ ' O nly the low ertriangularpart of the herm itian m atrix is to be referenced.

U nchanged on exit.
M (input)
O $n$ entry, M specifies the num ber of row sof the $m$ atrix $C . M$ M $=0$. U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the $m$ atrix $C . N>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.
A (input)
COM PLEX array ofD $\mathbb{I M}$ ENSION (LDA,ka), where ka is $m$ when $S D E=\mathbb{L}$ 'or $I^{\prime}$ and is $n$ otherw ise.

Before entry with SDE = L'or 1 ', the $m$ by m partof the array A mustcontain the herm itian $m$ atrix, such thatw hen UPLO $=U$ ' or $L^{\prime}$ ', the leading $m$ by $m$ uppertriangular part of the array A mustcontain the upper triangular part of the herm itian $m$ atrix and the strictly low er triangularpart of $A$ is not referenced, and $w$ hen UPLO = L' or ${ }^{1}$ ', the leading $m$ by $m$ lowertriangularpart of the array A m ust contain the lowertriangularpart of the herm itian $m$ atrix and the strictly upper triangular part of A is not referenced.

Before entry w ith $S D E=R$ 'or $r$ ', the $n$ by $n$ partof the array A must contain the herm itian $m$ atrix, such thatw hen UPLO = U ' or L ', the leading n by n uppertriangularpart of the array A mustcontain the upper triangular part of the herm itian $m$ atrix and the strictly low er triangularpart of A is not referenced, and when UPLO = L' or 1 ', the leading $n$ by $n$ low er triangularpart of the array A must contain the lowertriangularpart of the herm itian $m$ atrix and the strictly upper triangular part of A is not referenced.
$N$ ote that the im aginary parts of the diagonal elem ents need notbe set, they are assum ed to be zero. U nchanged on exit.

O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen SDE = L'or I' then LD A >= max ( $1, \mathrm{~m}$ ), otherw ise LD $A>=\max (1, n)$. U nchanged on exit.

B (input)
COM PLEX array ofD $\mathbb{I M}$ ENSION (LD $B, n$ ). Before
entry, the leading $m$ by $n$ part of the array $B$
$m$ ust contain the $m$ atrix $B$. Unchanged on exit.
LD B (input)
O $n$ entry, LD B specifies the firstdim ension of $B$ as declared in the calling (sub) program.
LDB $m$ ust be at leastm ax ( $1, \mathrm{~m}$ ). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen
BETA is supplied as zero then $C$ need notbe set on input. U nchanged on exit.

C (input/output)
COMPLEX aray ofD $\mathbb{I M} E N S I O N(L D C, n)$.
Before entry, the leading $m$ by $n$ part of the array $C$ mustcontain the $m$ atrix $C$, exceptw hen beta is zero, in which case $C$ need notbe set on entry.

On exit, the array $C$ is overw ritten by the $m$ by $n$ updated $m$ atrix.

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastm ax ( $1, \mathrm{~m}$ ). U nchanged on exit.

void chem v_64 (charuplo, long n, com plex *alpha, com plex *a, long lda, com plex *x, long incx, com plex *beta, com plex *y, long incy);

## PURPOSE

chem $v$ perform $s$ the $m$ atrix-vector operation $y:=a l p h a \star A * x+$ beta*y w here alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ entvectors and $A$ is an $n$ by $n$ herm itian $m$ atrix.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the array $A$ is to be referenced as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' Only the upper triangularpart of A is to be referenced.

UPLO = L 'or I' O nly the low ertriangularpart of A is to be referenced.

U nchanged on exit.

N (input)
O $n$ entry, $N$ specifies the order of the $m$ atrix $A$. $\mathrm{N}>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading
n by n uppertriangularpart of the anay A m ust contain the upper triangular part of the herm itian $m$ atrix and the strictly low ertriangularpart of $A$ is not referenced. Before entry w ith UPLO = L' or I', the leading $n$ by $n$ low er triangularpart of the array A m ustcontain the low er triangular part of the herm itian $m$ atrix and the strictly uppertriangularpart of $A$ is not referenced. $N$ ote that the im aginary parts of the diagonalele$m$ ents need notbe set and are assum ed to be zero. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A >= $\max (1, n)$. U nchanged on exit.
X (input)
$(1+(n-1) \star \operatorname{abs}(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the $n$ elem ent vectorx. U nchanged on exit.
$\mathbb{N} C X$ (input)
On entry, $\mathbb{I N C X}$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then Y need notbe set on input. U nchanged on exit.

Y (input/output)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectory. On exit, $Y$ is overw rilten by the updated vectory.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N N C Y}$ specifies the increm ent for the elem ents of $. \mathbb{N} C Y<>0$. U nchanged on exit.

```
CHARACTER (LEN=1)::UPLO
COMPLEX,D IM ENSION (:) ::X
COM PLEX,D IM ENSION (:,:)::A
\mathbb{NTEGER::N,\mathbb{NCX,LDA}}\mathbf{N}=\mp@code{N}
REAL ::ALPHA
SUBROUTINE HER_64 (UPLO, N ],ALPHA ,X , [NCX ],A,[LDA ])
CHARACTER (LEN=1)::UPLO
COMPLEX,D IM ENSION (:) ::X
```

## C INTERFACE

\#include <sunperfh>
void cher(charuple, intn, float alpha, complex *x, int incx, com plex *a, int lda);
void cher_64 (charuplo, long n, float alpha, com plex *x, long incx, com plex *a, long lda);

## PURPOSE

cher performs the herm titian rank 1 operation $A:=$ alpha* $x^{\star}$ con $j g\left(x^{\prime}\right)+A$ where alpha is a realscalar, $x$ is an $n$ elem ent vector and $A$ is an $n$ by $n$ herm titian $m$ atrix.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the array $A$ is to be referenced as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' Only the upper triangularpant of $A$ is to be referenced.
$\mathrm{UPLO}=\mathrm{L}$ 'or l' O nly the low er triangularpart of $A$ is to be referenced.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix $A$. $N>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the $n$ elem ent vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

A (input/output)
Before entry w ith UPLO = U 'or 4 ', the leading $n$ by $n$ upper triangular part of the array A m ust contain the upper triangular part of the herm itian $m$ atrix and the strictly low er triangularpart of A is not referenced. O n exit, the upper triangular part of the array A is overw ritten by the upper triangularpart of the updated $m$ atrix. Before entry w ith UPLO = L 'or I', the leading $n$ by $n$ low er triangularpart of the anray A m ust contain the low er triangularpart of the herm itian $m$ atrix and the strictly upper triangularpart of A is not referenced. On exit, the low er triangularpart of the array $A$ is overw rilten by the low er triangular part of the updated $m$ atrix. N ote that the im aginary parts of the diagonalelem ents need not be set, they are assum ed to be zero, and on exit they are setto zero.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A >= $\max (1, n)$. U nchanged on exit.

\#include <sunperfh>
void cher2 (charuplo, intn, com plex *alpha, com plex *x, int incx, com plex *y, int incy, com plex *a, int lda);
void cher2_64 (charuplo, long n, com plex *alpha, com plex *x, long incx, com plex *y, long incy, com plex *a, long lda);

## PURPOSE

cher2 performs the herm titian rank 2 operation $A:=$ alpha* $x^{\star}$ con $\dot{\jmath}\left(y^{\prime}\right)+$ con $\dot{g}(\text { alpha })^{\star} y^{\star}$ con $\dot{g}\left(x^{\prime}\right)+A$ where alpha is a scalar, $x$ and $y$ are $n$ elem ent vectors and $A$ is an $n$ by $n$ herm itian m atrix.

## ARGUMENTS

UPLO (input)
O n entry, UPLO specifies whether the upper or low er triangular part of the array $A$ is to be referenced as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' Only the upper triangularpant of A is to be referenced.
$\mathrm{UPLO}=\mathrm{L}$ 'or I' O nly the low ertriangularpart of $A$ is to be referenced.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
$(1+(n-1) * a b s(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the $n$ elem ent
vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

Y (input)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectory. U nchanged on exit.
$\mathbb{N C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y$. $\mathbb{N C} C$ <> 0 . U nchanged on exit.

A (input/output)
Before entry w ith UPLO = U 'or L ', the leading $n$ by $n$ upper triangular part of the array A $m$ ust contain the upper triangular part of the herm itian $m$ atrix and the strictly low ertriangularpartofA is not referenced. On exit, the upper triangular part of the array A is overw rilten by the upper triangularpart of the updated $m$ atrix. Before entry $w$ ith UPLO $=\mathrm{L}$ 'or I ', the leading $n$ by $n$ low er triangularpart of the array A m ust contain the low er triangularpart of the hem itian $m$ atrix and the strictly uppertriangularpart of A is not referenced. On exit, the low er triangularpart of the array $A$ is overw ritten by the low er triangular part of the updated $m$ atrix. N ote that the im aginary parts of the diagonalelem ents need not be set, they are assum ed to be zero, and on exit they are set to zero.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A $>=$ $\max (1, n)$. U nchanged on exit.

\#include <sunperfh>
void cher2k (charuplo, chartransa, intn, int $k$, com plex* alpha, com plex *a, intlda, com plex *b, int ldb, floatbeta, com plex ${ }^{*}$ c, int ldc);
void cher2k_64 (charuplo, chartransa, long n, long k, com plex *alpha, com plex *a, long lda, com plex *b, long ldlo, floatbeta, com plex *c, long ldc);

## PURPOSE

cher 2 k perform s one of the H erm titian rank 2 k operations $\mathrm{C}:=$

 beta*C where alpha and beta are scalarsw ith beta real, $C$ is an $n$ by $n H$ erm itian $m$ atrix and $A$ and $B$ are $n$ by $k$ $m$ atrices in the first case and $k$ by $n m$ atrioes in the second case.

## ARGUMENTS

## UPLO (input)

On entry, UPLO specifies whether the upper
or lower triangular part of the array $C$ is
to be referenced as follow $s$ :
UPLO = U'or L' Only the upper triangular partof $C$ is to be referenced.

UPLO = L'or I' Only the lower triangular partof $C$ is to be referenced.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA $=\mathrm{N}^{\prime}$ 'or $\mathrm{h}^{\prime} \mathrm{C}=$ alpha*A*conjg ( $\mathrm{B}^{\prime}$ )

+ congg (alpha)*B*conjg (A') + beta*C .
TRANSA $=C^{\prime}$ ort' $\mathrm{C}:=$ alpha*conjg ( $\left.\mathrm{A}^{\prime}\right) \star$ B + cong (alpha )*conjg ( $\mathrm{B}^{\prime}$ )*A + beta*C .

U nchanged on exit.

TRANSA is defaulted to N 'forF $95 \mathbb{I N}$ TERFACE.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix C. N m ustbe at least zero. U nchanged on exit.

K (input)
On entry w th TRANSA $=N$ 'or $h$ ', $K$ specifies the num berof colum ns of the $m$ atrices $A$ and $B$, and on entry $w$ ith TRANSA $=C^{\prime}$ or $\mathrm{K}^{\prime}, \mathrm{K}$ specifies the num ber of row sof the $m$ atrices $A$ and B. K m ustbe at least zero. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
COM PLEX anay ofD $\mathbb{M}$ ENSION (LDA, ka ), where ka isk when TRANSA = N 'or h ', and is n otherw ise. Before entry w th TRANSA $=\mathrm{N}$ ' or h ', the leading n by k partof the array $A$ $m$ ust contain the $m$ atrix $A$, otherw ise the leading k by n partof the array A mustcontain the $m$ atrix A. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program.
W hen TRANSA $=N$ 'orh'then LDA must be at least $\max (1, n)$, otherw ise LDA $m$ ust.be at least $\max (1, k)$. U nchanged on exit.

B (input)
COM PLEX anay ofD $\mathbb{M}$ ENSION (LDB, kb ), where kb isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith TRANSA $=\mathrm{N}$ ' or
h ', the leading n by k part of the anay B $m$ ust contain the $m$ atrix $B$, otherw ise the leading k by n part of the array $\mathrm{B} m$ ustcontain the $m$ atrix $B$. Unchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. W hen TRANSA $=N$ 'or $h$ 'then LDB must be at least $\max (1, n)$, otherw ise LDB mustbe at least $\max (1, k)$. U nchanged on exit.
BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
COMPLEX amay ofD $\mathbb{M} E N S I O N(L D C, n)$.

Before entry with UPLO = U 'or $L$ ', the leading $n$ by $n$ upper triangularpart of the array $C$ $m$ ustcontain the upper triangular part of the H erm itian $m$ atrix and the strictly low er triangularpartof $C$ is not referenced. On exit, the uppertriangularpart of the amay $C$ is overw ritten by the upper triangularpart of the updated $m$ atrix.

Before entry w ith UPLO = L'or I', the leading $n$ by $n$ low er triangular part of the array $C$ $m$ ustcontain the low er triangular part of the H erm itian $m$ atrix and the strictly upper triangularpartof C is not referenced. On exit, the low er triangularpart of the amay $C$ is overw ritten by the low er triangularpart of the updated $m$ atrix.
$N$ ote that the im aginary parts of the diagonalele$m$ ents need not be set, they are assum ed to be zero, and on exit they are set to zero.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C m ust be at leastm $a x(1, n)$. U nchanged on exit.

## PURPOSE

cherfs im proves the com puted solution to a system of linear equations w hen the coefficientm atrix is H erm itian indefinite, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': Upper triangle ofA is stored;
$=\mathbb{L}$ ': Low ertriangle of is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the m atrices B and X. NRHS $>=0$.

A (input) The $H$ erm tian $m$ atrix $A$. If $U P L O=U$ ', the leading N -by- N uppertriangularpartofA contains the
upper triangularpart of the $m$ atrix $A$, and the strictly low ertriangularpartofA is not referenced. IfU PLO = L', the leading N -by-N lower triangularpart ofA contains the low er triangular part of the $m$ atrix A, and the strictly upper triangularpartofA is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

## AF (input)

The factored form of them atrix A. AF contains the block diagonal $m$ atrix $D$ and the $m$ ultipliers used to obtain the factor $U$ orL from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}$ orA $=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}$ as com puted by CHETRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= $\max (1, N)$.
$\mathbb{P I V O T}$ (input)
D etails of the interchanges and the block structure ofD as determ ined by CHETRF.
$B$ (input) The righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the amay $B$. LD B >= $\max (1, \mathbb{N})$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by CHETRS. On exit, the im proved solution $m$ atrix $X$.

LD $X$ (input)
The leading dim ension of the anay X . LD X >= $\max (1, \mathbb{N})$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{\nu})-X$ TRUE) divided by the $m$ agnitude of the largestelem ent in $X(j)$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector $X$ ( $\mathcal{j}$ ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{J}$ ) an exactsolution).
W ORK (w orkspace)

void cherk_64 (charuplo, chartransa, long n, long k, float aloha, com plex *a, long lda, floatbeta, com plex *C, long ldc);

## PURPOSE

cherk perform s one of the $H$ erm itian rank $k$ operations $C:=$ alpha*A *conjg ( $A^{\prime}$ ) + beta*C orC := alpha*cong ( $\mathrm{A}^{\prime}$ ) ${ }^{*} \mathrm{~A}+$ beta*C where alpha and beta are realscalars, C is an n by $n$ Herm itian $m$ atrix and $A$ is an $n$ by $k m$ atrix in the first case and $a k$ by $n m$ atrix in the second case.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or lower triangular part of the array $C$ is to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof $C$ is to be referenced.

UPLO = L'or I' Only the lower triangular part of $C$ is to be referenced.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA $=$ N 'or $h^{\prime} \mathrm{C}:=$ alpha*A *conjg (A') + beta*C.

TRANSA = C'or $\boldsymbol{E}^{\prime} \mathrm{C}:=$ alpha*cong (A')*A +
beta*C .

U nchanged on exit.
TRANSA is defaulted to N 'forF95 $\mathbb{I N}$ TERFACE.

N (input)
On entry, $N$ specifies the order of the $m$ atrix $C$.
N m ustbe at least zero. U nchanged on exit.
K (input)
On entry with TRANSA = N 'or h', K specifies the number of columns of the matrix $A$, and on entry $w$ ith TRANSA $=C^{\prime}$ or $\mathrm{C}^{\prime}$, $K$ specifies the num ber of row sof the $m$ atrix A. K m ustbe at least zero. U nchanged on exit.
ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
COM PLEX aray ofD $\mathbb{M}$ ENSION (LDA, ka), where ka isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w th TRANSA $=\mathrm{N}$ ' or h ', the leading n by k part of the aray $A$ $m$ ust contain the $m$ atrix $A$, otherw ise the leading k by n partofthe array A mustcontain the m atrix A. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA $=\mathrm{N}$ 'or h 'then LDA must be at least $\max (1, n)$, otherw ise LDA m ust.be at least $\max (1, k)$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
COM PLEX array ofD $\mathbb{M}$ ENSION (LDC,n).
Before entry with UPLO = U 'or U ', the leading $n$ by $n$ upper triangularpart of the array $C$ $m$ ust contain the upper triangular part of the H erm itian $m$ atrix and the strictly low ertriangularpartofC is not referenced. On exit, the upper triangularpart of the array $C$ is overw ritten by the upper triangularpart of the updated
m atrix.

Before entry w ith UPLO = L 'or I', the leading $n$ by $n$ low er triangular part of the array $C$ $m$ ust contain the low er triangular part of the H erm itian $m$ atrix and the strictly upper triangularpartof $C$ is not referenced. On exit, the low er triangularpart of the amay $C$ is overw ritten by the low er triangularpart of the updated $m$ atrix.

N ote that the im aginary parts of the diagonalele$m$ ents need not be set, they are assum ed to be zero, and on exit they are set to zero.
LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastm ax ( $1, \mathrm{n}$ ). U nchanged on exit.

## C INTERFACE

\#include <sunperfh>
void chesv (char uplo, intn, intnrhs, com plex *a, int lda, int *ipivot, com plex *b, int ldb, int *info);
void chesv_64 (charuplo, long n, long nms, com plex *a, long lda, long *ipivot, com plex *b, long ldb, long *info);

## PURPOSE

chesv com putes the solution to a com plex system of linear equations
$A * X=B, w h e r e A$ is an $N$ boy $N$ H erm titian $m$ atrix and $X$ and $B$ are N boy-N RH S m atrices.

The diagonalpivoting $m$ ethod is used to factorA as
$A=U * D * U * * H$, if $U P L O=U$ ', or
$A=L * D * L * * H$, if $U P L O=L^{\prime}$,
where U (orL) is a productofperm utation and unit upper (low er) triangular matrices, and D is H erm itian and block diagonalw th 1 boy-1 and 2 -by-2 diagonalblocks. The factored form of $A$ is then used to solve the system of equations A * X $=$ B .

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ : U Ppertriangle of $A$ is stored;
$=\mathbb{L}$ ': Low er triangle of A is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRH S $>=0$.

A (input/output)

On entry, the $H$ erm itian $m$ atrix $A$. If $U P L O=U$ ', the leading N -by N uppertriangularpart of A contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. If $\mathrm{UPLO}=\mathrm{L}$ ', the leading N -by -N low er triangularpart ofA contains the low ertriangularpart of the matrix A, and the strictly upper triangular partofA is not referenced.

On exit, if $\mathbb{N F} F=0$, the block diagonalm atrix $D$ and the multipliers used to obtain the factor $U$ or L from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}$ or $\mathrm{A}=$ L*D *L**H as com puted by CHETRF.
LDA (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

IPIVOT (output)
D etails of the interchanges and the block structure ofD, as determ ined by CHETRF. If $\mathbb{P} \mathbb{V} O T(k)$ $>0$, then row $s$ and colum nsk and $\mathbb{P} \mathbb{V O T}(\mathrm{k})$ were interchanged, and $D(k, k)$ is a 1 -by -1 diagonal block. If UPLO $=\mathrm{U}$ 'and $\mathbb{P} \mathbb{I V O T}(\mathrm{k})=\mathbb{P} \mathbb{V} O T(k-1)$ $<0$, then row s and colum ns k-1 and -IP IV O T (k) w ere interchanged and $D(k-1 *, k-1 k)$ is a 2 -by-2 diagonal block. If UPLO = L' and $\mathbb{P} \mathbb{I V O T}(k)=$ $\mathbb{P I V O T}(k+1)<0$, then row $s$ and colum ns $k+1$ and $-\mathbb{P} \mathbb{I V O T}(k)$ w ere interchanged and $D(k \cdot k+1, k \cdot k+1)$ is a 2-by-2 diagonalblock.

B (input/output)
On entry, the $\mathrm{N}-\mathrm{by}-\mathrm{N}$ RH S righthand side m atrix B . On exit, if $\mathbb{N} F O=0$, the $N$ by-NRHS solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the array $B$. LD B $>=$ $\max (1, \mathbb{N})$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length of O ORK. LDW ORK $>=1$, and for best perform ance LDW ORK $>=N * N B$, where $N B$ is the optim alblocksize forCHETRF.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of
the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LD W ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i, D(i, i)$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, so the solution could notbe com puted.

## C INTERFACE

\#include <sunperfh>
void chesvx (char fact, charuplo, intn, int nrhs, com plex
*a, int lda, com plex *af, int ldaf, int *ipivot, com plex *b, int ldb, com plex *x, int ldx, float *rcond, float * ferr, float *berr, int *info);
void chesvx_64 (char fact, charuplo, long n, long nrhs, com plex *a, long lda, com plex *af, long ldaf, long *ịívot, com plex *b, long ldb, com plex *x, long ldx, float * rcond, float * ferr, float *berr, long *info);

## PURPOSE

chesvx uses the diagonal pivoting factorization to com pute the solution to a com plex system of linearequations A * $\mathrm{X}=$ B , where A is an N -by N H erm Hian m atrix and X and B are N -by-N RH S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=\mathrm{N}$ ', the diagonal pivoting m ethod is used to factorA.
The form of the factorization is

$$
A=U * D * U * * H \text {, if } U P L O=U ' \text { or }
$$

$$
A=L * D * L * * H, \text { if } U P L O=L \prime,
$$

where $U$ (orL) is a product of perm utation and unit upper (low er)
triangularm atrices, and $D$ is $H$ erm itian and block diagonalw th
1-by-1 and 2-by-2 diagonalblocks.
2. If som eD $(i, i)=0$, so thatD is exactly singular, then the routine
retums w ith $\mathbb{N} F O=$ i. O therw ise, the factored form of $A$ is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N} F O=N+1$ is retumed as a waming, but the routine stillgoes on
to solve for $X$ and com pute error bounds as described below.
3.The system of equations is solved for $X$ using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard enror estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of A has been supplied on entry. = F ': On entry, A F and $\mathbb{P}$ IV OT contain the factored form of A. A, AF and $\mathbb{P} \mathbb{V O T}$ will not be modified. = N : The $m$ atrix A w ill be copied to A F and factored.

UPLO (input)
$=U$ : U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of right hand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS >=0.

A (input) The $H$ erm itian $m$ atrix $A$. If $U P L O=U$ ', the leading $N$-by- N upper triangularpart of $A$ contains the upper triangularpart of the $m$ atrix $A$, and the strictly low ertriangularpartofA is not referenced. If $\mathrm{PLO}=\mathrm{L}$ ', the leading N by- N lower triangularpartofA contains the low er triangular partof the $m$ atrix $A$, and the strictly upper triangularpart of A is not referenced.

LD A (input)
The leading dim ension of the anay A. LDA >= max ( $1, \mathbb{N}$ ) .

AF (input/output)
If $F A C T=F$ ', then $A F$ is an inputargum entand on entry contains the block diagonalm atrix $D$ and the m ultipliers used to obtain the factorU orl from the factorization $A=U * D * U * * H$ orA $=L * D * L * * H$ as com puted by CHETRF .

If FA C T = N ', then AF is an output argum ent and on exit retums the block diagonalm atrix $D$ and the multipliers used to obtain the factorU or L from the factorization $A=U * D * U * * H$ or $A=$ L*D *L**H.

LDAF (input)
The leading dim ension of the array AF. LDAF >= $\max (1, N)$.

PIVOT (inputoroutput)
If $F A C T=F '$, then $\mathbb{P I V O T}$ is an input argum ent and on entry contains details of the interchanges and the block structure of D, as determ ined by CHETRF. If $\mathbb{P}$ IV OT $(k)>0$, then row sand colum ns k and $\mathbb{P} \mathbb{I V O T}(k)$ w ere interchanged and $D(k, k)$ is a 1 -by-1 diagonal block. If UPLO $=U^{\prime}$ and $\mathbb{P} \mathbb{I V} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0$, then row sand colum ns $\mathrm{k}-1$ and $-\mathbb{P} \mathbb{I V O T}(\mathrm{k})$ were interchanged and $\mathrm{D}(\mathrm{k}-$ $1 \mathrm{k}, \mathrm{k}-1 \mathrm{k})$ is a $2-$ by-2 diagonalblock. IfU PLO $=$ L'and $\mathbb{P} \mathbb{I V}$ OT $(k)=\mathbb{P} \mathbb{I V}$ OT $(k+1)<0$, then row $s$ and colum nsk+1 and - $\mathbb{P}$ IV OT (k) were interchanged and D ( $k: k+1, k: k+1$ ) is a 2 -by-2 diagonalblock.

IfFACT = $N$ ', then $\mathbb{P} \mathbb{I V O T}$ is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by CHETRF.
$B$ (input) The $N$-by-N RH S righthand side $m$ atrix $B$.

LD B (input)
The leading dim ension of the aray B. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=N+1$, the $N$ boy $-N$ RH S solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the array $\mathrm{X} . \mathrm{LDX}>=$ $\max (1, N)$.

## RCOND (output)

The estim ate of the reciprocal condition num ber of
the matrix A. IfRCOND is less than the m achine precision (in particular, if RCOND $=0$ ), the $m$ atrix is singular to $w$ orking precision. This condition is indicated by a retum code of $\mathbb{N}$ FO > 0 .

FERR (output)
The estim ated forw ard errorbound for each solution vectorX ( 1 ) the $j$ th colum $n$ of the solution $m$ atrix $X)$. If $X T R U E$ is the true solution comesponding to $\mathrm{X}(\mathcal{1}), \mathrm{FERR}(\mathcal{)}$ is an estim ated upperbound forthe $m$ agnitude of the largest ele$m$ entin ( $X(\mathcal{)})-X$ TRU $E$ ) divided by the $m$ agnitude of the largestelem entin X ( 7 ) . The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vectorX (i) (ie., the sm allest relative change in any elem entof $A$ orB thatm akes $X$ ( 7 ) an exactsolution).

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK (1) retums the optim al LDW ORK.

LD W ORK (input)
The length of W ORK. LDW ORK $>=2 \star N$, and for best perform ance LDW ORK $>=N * N B$, where $N B$ is the optim alblocksize forCHETRF.

If LD W ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK aray, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA .

W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=i$, and $i$ is
<= N : D (i,i) is exactly zero. The factorization has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND $=0$ is retumed. $=N+1$ : D is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. N evertheless, the solution and enror bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\#include <sunperfh>
void chetf2 (charuplo, int n, com plex *a, int lda, int *ị̆̇v, int *info);
void chetf2_64 (charuplo, long n, com plex *a, long lda, long *ipiv, long *info);

## PURPOSE

chetf2 com putes the factorization of a com plex H erm itian $m$ atrix A using the Bunch-K aufm an diagonalpivoting $m$ ethod:

$$
A=U * D * U^{\prime} \text { or } A=L * D * L^{\prime}
$$

where $U$ (orL) is a product of perm utation and unit upper (low er) triangular m atrices, $U$ 'is the conjugate transpose of $U$, and $D$ is $H$ erm itian and block diagonalw ith 1-by-1 and 2-by-2 diagonalblocks.

This is the unblocked version of the algorithm , calling Level2 BLAS.

## ARGUMENTS

## UPLO (input)

Specifies w hether the upper or low er triangular part of the $H$ erm itian $m$ atrix $A$ is stored:
$=\mathrm{U}$ ': Upper triangular
$=\mathrm{L}$ ': Low ertriangular

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the $H$ erm itian $m$ atrix A. If $\mathrm{U} P \mathrm{O}=\mathrm{U}$ ', the leading $n-b y-n$ uppertriangularpartofA contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. If UPLO $=\mathbb{L}$ ', the leading $n-b y-n$ low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of $A$ is notreferenced.

On exit, the block diagonalm atrix D and the mul
tipliers used to obtain the factorU orl (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

IPIV (output)
D etails of the interchanges and the block structure ofD. If $\mathbb{P} \mathbb{I V}(k)>0$, then row $s$ and colum ns $k$ and $\mathbb{P} \mathbb{I V}(k)$ were interchanged and $D(k, k)$ is a 1 -by-1 diagonalblock. IfUPLO $=U$ 'and $\mathbb{P} \mathbb{I V}(k)$ $=\mathbb{P} \mathbb{I V}(k-1)<0$, then row $s$ and colum ns $k-1$ and $-\mathbb{P} \mathbb{I V}(k)$ w ere interchanged and $D(k-1 *, k-1 k)$ is a 2 -by-2 diagonalblock. IfUPLO $=\mathbb{L}$ 'and $\mathbb{P} \mathbb{I V}(k)$
$=\mathbb{P} \mathbb{I}(k+1)<0$, then row sand colum ns $k+1$ and $-\mathbb{P} \mathbb{V}(k)$ w ere interchanged and $D(k, k+1, k \mathrm{k}+1)$ is a 2-by-2 diagonalblock.
$\mathbb{N F O}$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N} F O=-\mathrm{k}$, the k -th argum enthad an illegalvalue $>0:$ if $\mathbb{N} F O=k, D(k, k)$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, and division by zero w ill occur if it is used to solve a system of equations.

## FURTHER DETAILS

## C INTERFACE

\#include <sunperfh>
void chetrd (charuplo, intn, com plex *a, int lda, float *d, float *e, com plex *tau, int *info);
void chetrd_64 (charuplo, long n, complex *a, long lda, float *d, float *e, com plex *tau, long *info);

## PURPOSE

chetrd reduces a com plex $H$ erm itian $m$ atrix $A$ to real sym m etric tridiagonal form T by a unitary sim ilarity transformation: Q ** H * $\mathrm{A} * \mathrm{Q}=\mathrm{T}$.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': Upper triangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input) On entry, the $H$ erm itian $m$ atrix $A$. If UPLO $=U \prime$, the leading N boy N uppertriangularpartofA contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. IfUPLO $=\mathrm{L}$ ', the leading N -by -N low er triangularpart of A contains the low ertriangularpart of the $m$ atrix $A$, and the strictly upper triangularpart of A is notreferenced. On exit, if $\mathrm{UPLO}=\mathrm{U}$ ', the diagonal and first superdiagonalofA are overw ritten by the comesponding elem ents of the tridiagonalm atrix T , and the ele$m$ ents above the first superdiagonal, $w$ ith the array TAU, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors; ifU PLO = 'L', the diagonal and firstsubdiagonal of A are overw ritten by the comesponding elem ents of the tri-
diagonalm atrix T , and the elem ents below the first subdiagonal, $w$ ith the array TA $U$, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

D (output)
The diagonal elem ents of the tridiagonalm atrix T : D (i) $=A(i, i)$.

E (output)
The off-diagonal elem ents of the tridiagonal $m$ atrix $T: E(i)=A(i, i+1)$ if $U P L O=U^{\prime}, E(i)=$ A (i+1,i) if UPLO = L'.
TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK ( 1 ) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. LW ORK >=1. For optim um penform ance LW ORK $>=N * N B$, where $N B$ is the optim alblocksize.

If LW O RK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue

## FURTHER DETAILS

If U PLO $=\mathrm{U}$ ', them atrix Q is represented as a product of elem entary reflectors

$$
Q=H(n-1) \ldots H(2) H(1)
$$

Each H (i) has the form
$H(i)=I-\tan * V^{*} V^{\prime}$
where tau is a com plex scalar, and $v$ is a com plex vector w ith $\mathrm{v}(\mathrm{i}+1 \mathrm{n})=0$ and $\mathrm{v}(\mathrm{i})=1 ; \mathrm{v}(1: i-1)$ is stored on exit in

A ( $1: i-1, i+1$ ), and tau in TAU (i).

If $\mathrm{ULO}=\mathrm{L}$ ', them atrix Q is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(n-1)
$$

Each H (i) has the form

$$
H(i)=I-\tan { }^{\star} v^{*} v^{\prime}
$$

where tau is a com plex scalar, and $v$ is a com plex vector w ith $\mathrm{v}(1: i)=0$ and $v(i+1)=1 ; v(i+2 \mathrm{n})$ is stored on exit in $A(i+2 m, i)$, and tau in TAU (i).

The contents ofA on exit are illustrated by the follow ing exam ples $w$ th $n=5$ :

```
ifUPLO = U ': ifUPLO = L ':
```

    ( d e v2 v3 v4 ) ( d
    )
( d e v3 v4 ) ( e d
)
( d e v4 ) (v1 e d
)
( d e ) ( v1 v2 e d
)
( d ) (v1 v2 v3 e d
)
where d and e denote diagonal and off-diagonal elem ents of $T$, and videnotes an elem ent of the vectordefining $H$ (i).

\#include <sunperfh>
void chetrf(charuplo, int $n$, com plex *a, int lda, int *ipivot, int*info);
void chetrf_64 (charuplo, long n, com plex *a, long lda, long *ịívot, long *info);

## PURPOSE

chetrf com putes the factorization of a com plex Herm itian $m$ atrix $A$ using the $B$ unch- $K$ aufn an diagonalpivoting $m$ ethod. The form of the factorization is

$$
\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H} \text { or } \mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}
$$

where $U$ (orL) is a productof perm utation and unit upper (low er) triangular matrioes, and $D$ is H em itian and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
A (input/output)
O n entry, the $H$ erm tian m atrix A. If $\mathrm{PLO}=\mathrm{U}$ ', the leading N -by -N uppertriangularpartofA contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpartofA is not referenced. If $\mathrm{UPLO}=\mathrm{L}$ ', the leading N -by -N low er triangularpart ofA contains the low ertriangularpart of the m atrix A, and the strictly
upper triangularpartofA is not referenced.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

## IPIVOT (output)

D etails of the interchanges and the block structure of D. If $\mathbb{P I V O T}(k)>0$, then row sand columnsk and $\mathbb{P I V O T}(k)$ were interchanged and $D(k, k)$ is a $1-b y-1$ diagonalblock. If $U P L O=U^{\prime}$ and $\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)<0$, then row $s$ and colum ns $k-1$ and - $\mathbb{P I V O T}(k)$ were interchanged and D ( $k-1 * k, k-1 k)$ is a $2-b y-2$ diagonal block. If UPLO $=\mathrm{L}$ 'and $\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0$, then row sand colum ns $k+1$ and $-\mathbb{P} \mathbb{V} O T(k)$ were interchanged and $D(k: k+1, k k+1)$ is a $2-b y-2$ diagonal block.

W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, \mathrm{~W}$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >=1. Forbestperfor$m$ ance LDW ORK >=N *NB, where NB is the block size retumed by ㅍAENV .
$\mathbb{I N}$ FO (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N} F O=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, and division by zero w illoccur if it is used to solve a system ofequations.

## FURTHER DETAILS

If U PLO $=\mathrm{U}$ ', then $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}$ ', where
$U=P(n) \star U(n)^{\star} \ldots * P(k) U(k)^{\star} . . .$,
i.e., $U$ is a product of term $s P(k) * U(k)$, where $k$ decreases
from $n$ to 1 in steps of 1 or 2 , and $D$ is a block diagonal $m$ atrix $w$ ith 1 -by- 1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V O T}(k)$, and $U(k)$ is a unit uppertriangularm atrix, such that if the diagonal
block $D(k)$ is of orders ( $s=1$ or 2 ), then

$$
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=\left(\begin{array}{lll}
0 & I
\end{array}\right) s \\
& \text { ( } 0 \text { O I ) } n-k \\
& \mathrm{k}-\mathrm{s} \text { s } \mathrm{n}-\mathrm{k}
\end{aligned}
$$

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(1 k-$ $1, k)$. If $s=2$, the uppertriangle of $(k)$ overw rites $A(k-$ $1, k-1), A(k-1, k)$, and $A(k, k)$, and $v$ overw rites $A(1 k-2, k-$ 1 k).

If $U P L O=L$ ', then $A=L * D * L '$, where
$L=P(1) \star L(1)^{\star} \ldots * P(k) \star L(k)^{\star} \ldots$,
ie., $L$ is a product ofterm $s P(k) * L(k)$, where $k$ increases from 1 to $n$ in steps of 1 or 2 , and $D$ is a block diagonal $m$ atrix $w$ ith 1 -by -1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V} O T(k)$, and $L(k)$ is a unitlow ertriangularm atrix, such that if the diagonal
block D (k) is of orders ( $s=1$ or 2 ), then

$$
\begin{aligned}
& \text { ( I 0 0 ) k-1 } \\
& L(k)=\left(\begin{array}{lll}
0 & I & 0
\end{array}\right) s \\
& \text { ( } 0 \text { v I ) n-k-s+1 } \\
& \mathrm{k}-1 \text { s } \mathrm{n}-\mathrm{k}-\mathrm{s}+1
\end{aligned}
$$

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(k+1 m, k)$. If $s=2$, the low ertriangle ofD $(k)$ overw rites $A(k, k), A(k+1, k)$, and $A(k+1, k+1)$, and $v$ overw rites $A(k+2 m, k: k+1)$.

chgeqz im plem ents a single-shiftversion of the $\mathrm{Q} Z \mathrm{~m}$ ethod
for finding the generalized eigenvalues
$w(i)=A L P H A(i) B E T A$ (i) of the equation $A$ are then A LPHA (1), $\ldots, A \operatorname{LPHA}(\mathbb{N})$, and ofB areBETA $(1), \ldots, B E T A \mathbb{N})$.

If $J O B=S$ 'and $C O M P Q$ and $C O M P Z$ are $V$ 'or 'I', then the unitary transform ations used to reduce ( $A, B$ ) are accum ulated into the arrays $Q$ and $Z$ s.t.:
(in) A (in) Z (in) ${ }^{\star}=\mathrm{Q}$ (out) A (out) Z (out)*

Ref: C B.M oler \& G N . Stew art, "A n A lgorithm for Generalized M atrixigenvalue Problem s", SIAM J. Num er. A nal, 10 (1973) „. 241-256.

## ARGUMENTS

JOB (input)
= E': com pute only A LPHA and BETA. A and B will
not necessarily be put into generalized Schur
form . $=5$ ': putA and B into generalized Schur
form, asw ellas com puting A LPHA and BETA.
COMPQ (input)
$=N^{\prime}$ : do notm odify Q .
$=\mathrm{V}$ ':m ultiply the array Q on the right by the conjugate transpose of the unitary tranform ation that is applied to the left side of A and B to reduce them to Schur form . = 'I': like COM PQ = V', except that Q w illbe initialized to the identity first.

COMPZ (input)
$=\mathrm{N}$ ': do notm odify Z .
= V ':m ultiply the array Z on the right by the unitary tranform ation that is applied to the right side of $A$ and $B$ to reduce them to Schur form . = I': like COM PZ=V', exœet thatZ w illbe initialized to the identity first.

N (input) The order of the m atrices $\mathrm{A}, \mathrm{B}, \mathrm{Q}$, and $\mathrm{Z} . \mathrm{N}>=0$.

## ㅍO (input)

It is assum ed that A is already upper triangular in row s and colum ns $1: \mathbb{H O}-1$ and $\mathbb{H} \mathrm{I}+1 \mathbb{N} .1<=\mathbb{L} \mathrm{O}$ $<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0 ; \mathbb{H}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

IH I (input)
It is assum ed that A is already upper triangular
in row sand colum ns 1: $\mathbb{H} O-1$ and $\mathbb{H} \mathrm{I}+1 \mathrm{~N} .1<=\mathbb{L O}$
$<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0 ; \mathbb{H} \mathrm{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.
A (input) On entry, the N -by-N upper H essenberg m atrix A .
E lem ents below the subdiagonalm ustbe zero. If
JO B $=S$ ', then on exit A and B w ill have been sim ultaneously reduced to upper triangular form . If $\mathcal{O C B}=\mathrm{E}$ ', then on exitA w ill have been destroyed.

LD A (input)
The leading dim ension of the array A. LD A $>=m a x$ ( 1, N ).
$B$ (input) $O n$ entry, the $N$ boy $-N$ upper triangular $m$ atrix $B$. Elem ents below the diagonal m ust be zero. If JO $B=S$ ', then on exit $A$ and $B$ will have been
sim ultaneously reduced to upper triangular form . If $J O B=E$ ', then on exitB will have been destroyed.

LD B (input)
The leading dim ension of the array $B$. LD B $>=m a x$ ( $1, \mathrm{~N})$.

## A LPHA (output)

The diagonalelem ents of $A$ when the pair $(A, B)$ has been reduced to Schur form. ALPHA (i)ßETA (i) $i=1, \ldots, N$ are the generalized eigenvalues.
BETA (output)
The diagonalelem ents of $B$ w hen the pair $(A, B)$ has been reduced to Schur form. ALPHA (i) BETA (i) $\mathrm{i}=1, \ldots, \mathrm{~N}$ are the generalized eigenvalues. A and B are norm alized so thatBETA (1),...,BETA $\mathbb{N}$ ) are non-negative real num bers.

Q (input/output)
If $C O M P Q=N$ ', then $Q \mathrm{w}$ ill notbe referenced. If $\mathrm{COM} P Q=\mathrm{V}$ ' or ' I ', then the conjugate transpose of the unitary transform ationsw hich are applied to $A$ and $B$ on the leftw illbe applied to the array $Q$ on the right.

LD Q (input)
The leading dim ension of the array $Q . L D Q>=1$. If $C O M P Q=V$ 'or $I$ ', then $L D Q>=N$.

Z (input/output)
If COM PZ=N', then Z w ill notbe referenced. If $\mathrm{COMPZ}=\mathrm{V}$ 'or I', then the unitary transform ations which are applied to $A$ and $B$ on the rightw ill be applied to the amay $Z$ on the right.

LD $Z$ (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=1$. If COM PZ=V 'or 'I', then LD Z >= N .

W ORK (w orkspace)
On exit, if $\mathbb{N}$ FO >=0, W ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= $\max (1, \mathbb{N})$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of
the W ORK amray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA .

RW ORK (w orkspace)
dim ension (N)
$\mathbb{N F O}$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue
$=1, \ldots, N$ : the QZ iteration did not converge.
( $A, B$ ) is not in Schur form, butA LPHA (i) and BETA (i), $i=\mathbb{N} F O+1, \ldots, N$ should be correct. $=$ $\mathrm{N}+1, \ldots, 2 \star \mathrm{~N}$ : the shift calculation failed. ( $A, B$ ) is not in Schur form, but A LPH A (i) and BETA (i), $\mathrm{i}=\mathbb{N} F O-\mathrm{N}+1, \ldots, \mathrm{~N}$ should be comect. > 2*N : various "im possible" enrors.

## FURTHER DETAILS

W e assum e that com plex A BS w orks as long as its value is less than overflow .

void chpevd_64 (char jobz, charuplo, long n, complex *ap, float *w , com plex *z, long ldz, long *info);

## PURPOSE

chpevd com putes all the eigenvalues and, optionally, eigenvectors of a com plex H erm itian m atrix A in packed storage. Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on m achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits $w$ hich subtract like the $C$ ray $X$-M P , C ray Y M P , C ray C-90, orC ray- 2 . Itcould conceivably fail on hexadecim al or decim al $m$ achines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

```
JO B Z (input)
    = N ': C om pute eigenvalues only;
    = V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
    = U ': U pper triangle ofA is stored;
    = L': Low ertriangle ofA is stored.
N (input) The order of them atrix A. N >=0.
```

AP (input/output)
O $n$ entry, the upper or low er triangle of the H er$m$ tian $m$ atrix A, packed colum nw ise in a linear array. The jth column of A is stored in the array AP as follows: ifUPLO = U',AP (i+ (j
 $+(j-1)^{\star}\left(2{ }^{*} n-j / 2\right)=A(i, 7)$ for $j=i<=n$.

On exit, AP is overw rilten by values generated during the reduction to tridiagonal form. If PLO $=U$ ', the diagonal and first superdiagonal of the tridiagonal $m$ atrix $T$ overw rite the corresponding elem ents ofA, and if UPLO = L', the diagonal and first subdiagonalof $T$ overw rite the corresponding elem ents ofA.
W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

Z (input) If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N F O}=0, \mathrm{Z}$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ ith the $i-t h$ colum $n$ of $Z$ holding the eigenvector associated w ith $W$ (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\max (1, N)$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of array $\mathrm{W} O R K$. If $\mathrm{N}<=1$, LW ORK must be at least1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>$ 1, LW ORK m ust.be at least N . If $\mathrm{JOBZ}=\mathrm{V}$ 'and N $>1$, LW ORK m ustbe at least $2 \star_{\mathrm{N}}$.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

## RW ORK (w orkspace)

dim ension (LRW ORK) On exit, if $\mathbb{N} F O=0$, RW ORK (1)
retums the optim alLRW ORK .
LRW ORK (input)
The dim ension of aray RW ORK. If $\mathrm{N}<=1$,

LRW ORK m ustbe atleast1. If $\operatorname{OBZ}=N^{\prime}$ 'and $N>$ 1,LRW ORK m ustbe atleastN. If OBZ $=\mathrm{V}$ 'and $N$ $>1$, LRW ORK m ustbe at least $1+5 * N+2 * N * * 2$.

IfLRW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK array, retums this value as the first entry of the RW ORK array, and no errorm essage related to LRW ORK is issued by X ERBLA.
$\mathbb{I W}$ ORK (w orkspace/output)
O n exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al LIW ORK.

LIW ORK (input)
The dim ension of array $\mathbb{I W}$ ORK. If JOBZ $=\mathrm{N}$ 'orN $<=1$, LIN ORK m ustbe at least1. If $\mathrm{OBZ}=\mathrm{V}^{\prime}$ and $N>1, L \mathbb{I N} O R K m$ ust.be at least $3+5 * N$.

If LIV ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the $\mathbb{I V}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK anay, and no errorm essage related to $L \mathbb{I W}$ ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the i-th argum enthad an illegalvalue.
$>0:$ if $\mathbb{N F O}=$ i, the algorithm failed to con-
verge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

chpevx com putes selected eigenvalues and, optionally, eigenvectors of a com plex $H$ erm itian m atrix $A$ in packed storage. E igenvalues/vectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
= N ': C om pute eigenvahues only;
$=\mathrm{V}:$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A : : alleigenvalues willbe found;
= V $:$ :alleigenvalues in the half-open interval (NL,VU] will be found; = I': the $\mathbb{I}$-th through

IU -th eigenvaluesw illube found.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L ': Low ertriangle ofA is stored.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the upperor low ertriangle of the Her $m$ tian matrix A, packed collm nw ise in a linear array. The jth column of A is stored in the aray A as follows: if UPLO = U',A (i+ (j)
 $(j-1) *(2 * n-j / 2)=A(i, 7)$ for $\dot{j}=i<=n$.
On exit, A is overw ritten by values generated during the reduction to tridiagonal form. If UPLO $=$ U', the diagonaland firstsuperdiagonal of the tridiagonal m atrix T overw rite the comesponding elem ents ofA, and if U PLO = L', the diagonal and first subdiagonal of $T$ overw rite the corresponding elem ents ofA .

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N G E = A' 'or I'.

II (input)
If RA N G E= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

IU (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

ABTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged
when it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABTOL + EPS * max (k|, b|),
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS* $\mid$ | w illbe used in its place, where $F \mid$ is the 1 -norm of the tridiagonal m atrix obtained by reducing A to tridiagonal form.

E igenvalues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold $2 *$ SLAM CH ( ${ }^{\prime}$ ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to $2 *$ SLAM CH (S ).

See "C om puting Sm allSingularV alues ofB idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by $D$ em m eland $K$ ahan, LA PA CK $W$ orking $N$ ote \#3.

## NFOUND (output)

The total num ber of eigenvalues found. $0<=$ NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE $=I^{\prime}$, NFOUND $=\mathbb{U}-\mathbb{L}+1$.

W (output)
If $\mathbb{N}$ FO $=0$, the selected eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V^{\prime}$, then if $\mathbb{N F O}=0$, the first $N F O U N D$ colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, $w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated w ith W (i). If an eigenvector fails to converge, then that colum n of $Z$ contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in FAII. If $J 0 B Z=N$ ', then $Z$ is not referenced. $N$ ote: the user must ensure that at least m ax (1,NFOUND) colum ns are supplied in the array $Z$; if RANGE = V', the exactvalue ofNFOUND is not know $n$ in advance and an upperbound $m$ ustbe used.

## LD Z (input)

The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\max (1, N)$.

W ORK (w orkspace)
dim ension $(2 * N)$

W ORK 2 (w orkspace)
dim ension ( $7 * \mathrm{~N}$ )

IV ORK 3 (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )
IFAII (output)
If $\mathrm{OBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N F O}=0$, the first NFOUND
elem ents of $\mathbb{F} A \mathbb{I}$ are zero. If $\mathbb{N F O}>0$, then
IFA II contains the indices of the eigenvectors that failed to converge. If $\mathrm{OBZ}=\mathrm{N}$ ', then $\mathbb{F} A \mathbb{I}$ is notreferenced.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N ~ F O ~}=-$ i, the i-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i$, then ieigenvectors failed to converge. Their indices are stored in aray $\mathbb{F} A \mathbb{I}$.

void chpgst_64 (long itype, char uplo, long n, com plex *ap, com plex *bp, long *info);

## PURPOSE

chpgst reduces a complex H erm tian-definite generalized eigenproblem to standard form, using packed storage.

If ITY $\mathrm{PE}=1$, the problem is $\mathrm{A} * \mathrm{X}=\operatorname{lam} \mathrm{bda}^{*} \mathrm{~B}{ }^{*} \mathrm{x}$, and $A$ is overw ritten by inv $\left(U{ }^{* *} H\right) * A * \operatorname{inv}(U)$ or $\operatorname{inv}(\mathbb{L}) * A * \operatorname{inv}(\amalg * * H)$
If ITYPE $=2$ or 3 , the problem is $A * B * x=l a m$ bda* $x$ or $B * A * x=\operatorname{lam} b d a{ }^{*} x$, and $A$ is overw rilten by $U * A * U * * H$ or $\mathrm{L} * \star_{\mathrm{H}}{ }^{*} \mathrm{~A} * \mathrm{~L}$.

B m usthave been previously factorized as $\mathrm{U} * * \mathrm{H} * \mathrm{U}$ or $\mathrm{L} * \mathrm{~L} * * \mathrm{H}$ by CPPTRF.

## ARGUMENTS

ITYPE (input)
$=1$ : compute $\quad \operatorname{inv}(U * * H) * A * \operatorname{inv}(U)$ or
inv (L) ${ }^{\text {A } A * i n v ~(L * * H) ; ~}$
$=2$ or 3: com pute U *A $* \mathrm{U} * * \mathrm{H}$ or $\mathrm{L} * * \mathrm{H} * \mathrm{~A} * \mathrm{~L}$.
UPLO (input)
= U ': Uppertriangle ofA is stored and B is factored as $\mathrm{U}{ }^{* *} \mathrm{H} * \mathrm{U} ;=\mathrm{L}$ ': Low ertriangle ofA is stored and $B$ is factored as $L * L * * H$.

N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.
AP (input/output)
O $n$ entry, the upper or low er triangle of the H er$m$ itian matrix A, packed colum nw ise in a linear aray. The $j$ th colum n of A is stored in the array AP as follows: ifUPLO = U', AP (i+ (j 1) ${ }^{2} 2$ ) $=A(i, 7)$ for $1<=i<=j$ if $U P L O=L ', A P(i$ $+(j-1)^{*}(2 n-j / 2)=A(i, j)$ for $j=i<=n$.

Onexit, if $\mathbb{N F F O}=0$, the transform ed matrix, stored in the sam e form at as A.
$B P$ (input)
The triangular factor from the $C$ holesky factoriza-
tion of B, stored in the sam e form at as A, as retumed by CPPTRF.
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue

*info);
void chpgv_64 (long itype, char jobz, char uplo, long n, com plex *a, complex *b, float*w, com plex *z, long ldz, long *info);

## PURPOSE

chpgv com putes all the eigenvalues and, optionally, the eigenvectors of a com plex generalized H erm itian-definite eigenproblem, of the form $A * x=(l a m ~ b d a) * B * x$, $\mathrm{A} * \mathrm{~B} \mathrm{x}=(\operatorname{lam} . \mathrm{bda}){ }^{\star} \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=\left(\mathrm{lam}\right.$ bda) ${ }^{*} \mathrm{x}$. H ere A and B are assum ed to be $H$ erm tian, stored in packed form at, and $B$ is also positive definite.

## ARGUMENTS

ITYPE (input)
Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{x}=(\operatorname{lam} \mathrm{bda}){ }^{\mathrm{B}}{ }^{*} \mathrm{x}$
$=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{x}$
$=3: B * A * X=(l a m ~ b d a){ }^{*} \mathrm{x}$

JOBZ (input)
$=N^{\prime}:$ C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
$=\mathrm{U}$ : : U pper triangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the m atrioes A and $\mathrm{B} . \mathrm{N}>=0$.

A (input/output)
O $n$ entry, the upper or low er triangle of the Her $m$ itian $m$ atrix $A$, packed colum nw ise in a linear aray. The jth column of A is stored in the array A as follows: if UPLO $=\mathrm{U}^{\prime}, \mathrm{A}(i+(j$
 $(j-1)^{\star}(2 \star n-j / 2)=A(i, 7)$ for $j=i<=n$.

On exit, the contents ofA are destroyed.
B (input/output)
O n entry, the upper or low er triangle of the Her $m$ tian $m$ atrix $B$, packed colum nw ise in a linear anray. The jth column of $B$ is stored in the array B as follows: if UPLO $=\mathrm{U}$ ', $\mathrm{B}(\mathrm{i}+(j$ 1) $\star j 2$ ) $=\mathrm{B}(i, 7)$ for $1<=i<=j$ if $U P L O=L$ ', $B(i+$ $(j-1) *(2 * n-j / 2)=B(i, 7)$ for $j=i<=n$.

On exit, the triangular factor $U$ or $L$ from the Cholesky factorization $B=U * * H * U$ or $B=L * L * * H$, in the sam e storage form atas $B$.

W (output)
If $\mathbb{N}$ FO $=0$, the eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V$ ', then if $\mathbb{N F O}=0, Z$ contains the m atrix Z of eigenvectors. The eigenvectors are norm alized as follow s : if ITYPE $=1$ or 2 , $Z * * H * B * Z=I$; if IT $Y P E=3, Z * * H * i n v(B) * Z=I$. If JO BZ $=N$ ', then $Z$ is not referenced.

## LD $Z$ (input)

The leading $d i m$ ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\max (1, N)$.

W ORK (w orkspace)
dim ension M AX ( $1,2 * \mathrm{~N}-1)$ )
W ORK 2 (w orkspace)
dim ension MAX ( $1,3 * N-2)$ )
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
<0: if $\mathbb{N N}$ FO = -i, the i-th argum ent had an illegalvahue
> 0: CPPTRF orCHPEV retumed an error code:
$<=\mathrm{N}:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{CH}$ PEV failed to converge; i
off-diagonalelem ents of an interm ediate tridiagonal form did not convergeto zero; > N : if $\mathbb{N} F O=$
$\mathrm{N}+\mathrm{i}$, for $1<=\mathrm{i}<=\mathrm{n}$, then the leading m inorof orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void chpgvd (int itype, char jobz, char uplo, intn, com plex *ap, com plex *bp, float*w , com plex *z, int ldz, int*info);
void chpgvd_64 (long itype, char jobz, char uplo, long n, com plex *ap, complex *bp, float*w, com plex *z, long ldz, long *info);

## PURPOSE

chpgrd com putes all the eigenvalues and, optionally, the eigenvectors of a com plex generalized H erm itian-definite eigenproblem, of the form $A * x=(l a m ~ b d a) * B * x$, $\mathrm{A} * \mathrm{~B} x=(\operatorname{lam} \operatorname{bda}) * \mathrm{x}$, or $\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\mathrm{lam} . \mathrm{bda}) * \mathrm{x}$. H ere A and B are assum ed to be $H$ erm itian, stored in packed form at, and $B$ is also positive definite.
Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray X M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

ITYPE (input)

Specifies the problem type to be solved:
$=1: \mathrm{A}{ }^{*} \mathrm{x}=\left(\mathrm{lam}\right.$ bda) ${ }^{\mathrm{B}} \mathrm{B}_{\mathrm{x}}$
$=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=\left(\mathrm{lam}\right.$ bda) ${ }^{*} \mathrm{x}$
$=3: B{ }^{*} \mathrm{~A} * \mathrm{X}=\left(\right.$ lam bda) ${ }^{*} \mathrm{X}$

JOBZ (input)
$=\mathrm{N}^{\prime}$ : C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.
UPLO (input)
$=U$ ': U ppertriangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.
N (input) The order of the $m$ atrices $A$ and $B . N>=0$.
AP (input/output)
O $n$ entry, the upper or low er triangle of the H er-
$m$ itian matrix A, packed colum nw ise in a linear
array. The jth colum n of A is stored in the
array AP as follows: ifUPLO = U', AP (i+ (j

$\left.+(j-1)^{\star}(2 \star n-j) / 2\right)=A(i, 7)$ for $j=i<=n$.
On exit, the contents of AP are destroyed.

BP (input/output)
O $n$ entry, the upper or low ertriangle of the Her $m$ tian $m$ atrix $B$, packed colum nw ise in a linear array. The jth column of $B$ is stored in the array BP as follows: if UPLO $=\mathrm{U}^{\prime}, \mathrm{BP}(i+(j$
 $+(j-1)^{\star}(2 \star n-j / 2)=B(i, 7)$ for $j=i<=n$.

On exit, the triangular factor $U$ or $L$ from the Cholesky factorization $B=U * * H * U$ or $B=L * L * * H$, in the sam e storage form at as $B$.

W (output)
If $\mathbb{N}$ FO $=0$, the eigenvalues in ascending order.
$Z$ (input) If $\mathcal{O D B Z}=\mathrm{V}^{\prime}$, then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the m atrix Z of eigenvectors. The eigenvectors are norm alized as follows: if ITYPE $=1$ or 2 , $Z * * H * B * Z=I$; if IT $Y P E=3, Z * * H * i n v(B) * Z=I$. If Jo $\mathrm{BZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading $d i m$ ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace)

On exit, if $\mathbb{N F} F=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of array $\mathrm{W} O R \mathrm{~K}$. If $\mathrm{N}<=1$, LW ORK $>=1$. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $N>1$, LW $O R K>=N$. If $\mathrm{OOBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$, LW ORK $>=2 \star \mathrm{~N}$.

IfLW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of theW ORK ancay, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
On exit, if $\mathbb{N}$ FO $=0, R W$ ORK (1) retums the optim al LRW ORK.

LRW ORK (input)
The dimension of array RW ORK. If $\mathrm{N}<=1$, LRW ORK >=1. IfJOBZ $=N$ 'and $N>1$,LRW ORK $>=$ N. If JOBZ $=\mathrm{V}$ 'and $\mathrm{N}>1$,LRW ORK >=1 + 5*N + $2 * N * * 2$ 。

If LRW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the RW ORK array, retums this value as the first entry of the RW ORK aray, and no enrorm essage related to LRW ORK is issued by X ERBLA.

IN ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al
LIN ORK.

LIV ORK (input)
The dim ension of array $\mathbb{I N}$ ORK. If JOBZ $=\mathrm{N}$ 'orN
$<=1$, LIV ORK >= 1. If JOBZ $=V$ 'and $N>1$, LIN ORK >= $3+5 * N$ 。

If $L \mathbb{I V} O R K=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I V}$ ORK array, retums this value as the first entry of the $\mathbb{I W} O R K$ aray, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by X ERBLA.
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvalue
>0: CPPTRF orCHPEVD retumed an enrorcode:
<= N: if $\mathbb{N F F O}=\mathrm{i}, \mathrm{CHPEVD}$ failed to converge; i off-diagonalelem ents of an interm ediate tridiagonal form did notconvergeto zero; > N : if $\mathbb{N} F O=$ $\mathrm{N}+\mathrm{i}$, for $1<=\mathrm{i}<=\mathrm{n}$, then the leading m inorof orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void chpgvx (int itype, char jंjbz, char range, charuple, int n, com plex *ap, com plex *bp, floatvl, floatvu, int il, int in, floatabstol, int $\star_{m}$, float ${ }^{*}$, com plex *z, int ldz, int *ifail, int *info);
void chpgvx_64 (long type, char jobz, char range, charuplo, long n, com plex *ap, com plex *bp, floatvl, float vu, long il, long in, float abstol, long *m, float ${ }^{*}{ }_{W}$, complex *z, long ldz, long *ifail, long *info);

## PURPOSE

chpgvx com putes selected eigenvalues and, optionally, eigenvectors of a com plex generalized $H$ erm itian-definite eigenproblem, of the form $A * x=(\operatorname{lam} \operatorname{bda}) * B * x, A * B x=(\operatorname{lam} b d a){ }^{*} x$, or $B * A * x=\left(l a m\right.$ bda) ${ }^{*} x$. H ere $A$ and $B$ are assum ed to be $H$ erm itian, stored in packed form at, and $B$ is also positive definite.
E igenvahues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

## ITYPE (input)

Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{X}=\left(\mathrm{lam}\right.$ bda) ${ }^{\mathrm{B}} \mathrm{B}_{\mathrm{X}}$
$=2: \mathrm{A} * \mathrm{~B} * \mathrm{X}=\left(\mathrm{lam}\right.$ bda) ${ }^{*} \mathrm{X}$
$=3: B * A * X=(l a m ~ b d a){ }^{*} \mathrm{x}$
JOBZ (input)
$=N^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w ill be found;
= V ::alleigenvalues in the half-open interval
( $\mathrm{NL}, \mathrm{VU}$ ] will be found; = I ': the I -th through $\mathbb{I U}$-th eigenvaluesw illbe found.
UPLO (input)
$=\mathrm{U}$ ': U ppertriangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.
N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

AP (input/output)
On entry, the upper or low ertriangle of the Her $m$ itian matrix A, packed colum nw ise in a linear array. The $j$ th colum $n$ of $A$ is stored in the aray AP as follows: ifUPLO = U',AP (i+ (j

$\left.+(j-1)^{\star}(2 \star n-j) / 2\right)=A(i, 7)$ for $j<=i<=n$.
On exit, the contents ofAP are destroyed.

BP (input/output)
O $n$ entry, the upper or low ertriangle of the Her -
$m$ itian matrix B, packed colum nw ise in a linear
array. The jth colum n of $B$ is stored in the array BP as follows: if UPLO $=\mathrm{U}, \mathrm{BP}(\mathrm{i}+(j$
$1) \star j 2)=\mathrm{B}(i, 7$ for $1<=i<=j$ if $U P L O=\mathrm{L}, \mathrm{BP}(i$
$+(j-1)^{\star}(2 \star n-j / 2)=B(i, j)$ for $j=i<=n$.
On exit, the triangular factor $U$ or $L$ from the
Cholesky factorization $B=U * * H * U$ orB $=\mathrm{L} * \mathrm{~L} * * \mathrm{H}$,
in the sam e storage form atas $B$.
VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A' 'or I'.

II (input)
IfRA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.
IU (input)
IfRA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0 ; \mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to $l i e$ in an interval $[a, b]$ of w idth less than orequal to

ABSTOL + EPS * max ( $\mid$ |, $\mid$ |) ,
where EPS is them achine precision. IfABSTOL is less than or equal to zero, then EPS* $\mid$ |w illbe used in its place, where $T$ | is the 1-norm of the tridiagonalm atrix obtained by reducing AP to tridiagonal form .

E igenvalues w illbe com puted m ost accurately when ABSTOL is set to tw ioe the underflow threshold $2 *$ SLAM CH ( $\mathrm{S}^{7}$ ), notzero. If this routine retums w ith $\mathbb{N}$ FO >0, indicating that som e eigenvectors did not converge, try setting ABSTOL to $2 *$ SLAM CH (S ).

M (output)
The total num berofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=A \prime$ ', $\mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{U}-\mathbb{L}+1$.

W (output)
O n norm alexit, the firstM elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $\mathrm{OO} \mathrm{BZ}=\mathrm{N}$ ', then Z is not referenced. If JO BZ
$=\mathrm{V}$ ', then if $\mathbb{N} F O=0$, the firstM colum ns of $Z$ contain the orthonorm aleigenvectors of the $m$ atrix A comesponding to the selected eigenvalues, w ith
the i-th colum $n$ of $Z$ holding the eigenvectorassociated w ith W (i). The eigenvectors are norm alized as follow s : if $I T Y \mathrm{PE}=1$ or $2, \mathrm{Z} * * \mathrm{H} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}$; if ITYPE $=3, Z * * H * \operatorname{inv}(B) * Z=I$.

If an eigenvector fails to converge, then that colum $n$ of $Z$ contains the latestapproxim ation to the eigenvector, and the index of the eigenvector is retumed in $\mathbb{F A} \mathbb{I}$. N ote: the userm ustensure that at leastm ax $(1, M)$ ) 0 lum ns are supplied in the array $Z$; ifRANGE = $V$ ', the exactvalue of $M$ is not know $n$ in advance and an upper bound $m$ ust be used.

LD $Z$ (input)
The leading dim ension of the array $Z$. LD $Z>=1$, and if $\mathrm{OB} \mathrm{B}=\mathrm{V}$ ', LD Z $>=\max (1, \mathbb{N})$.

W ORK (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )

RW ORK (w orkspace)
dim ension ( $7 * \mathrm{~N}$ )

IW ORK (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )

IFA II (output)
If $J 0 B Z=V$ ', then if $\mathbb{N} F O=0$, the firstM ele$m$ ents of $\mathbb{F} A \mathbb{I}$ are zero. If $\mathbb{N} F O>0$, then $\mathbb{F} A \mathbb{I}$ contains the indices of the eigenvectors that failed to converge. If $\mathrm{JOBZ}=\mathrm{N}$ ', then $\mathbb{F} A \mathbb{I}$ is not referenced.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N N}$ FO $=-$ i, the i-th argum enthad an illegalvalue
> 0: CPPTRF orCH PEVX retumed an errorcode:
$<=\mathrm{N}:$ if $\mathbb{N} F \mathrm{O}=\mathrm{i}, \mathrm{CHPEVX}$ failed to converge; i eigenvectors failed to converge. Their indices are stored in amray $\mathbb{F} A \mathbb{I} .>N$ : if $\mathbb{N} F O=N+$ $i$, for $1<=i<=n$, then the leading $m$ inorof orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

void chpm v (charuplo, intn, com plex *alpha, complex *a, com plex *x, int incx, com plex *beta, com plex *y, intincy);
void chpm v_64 (char uplo, long n, com plex *alpha, com plex *a, com plex *x, long incx, com plex *beta, com plex *y, long incy);

## PURPOSE

chpm $v$ perform $s$ the $m$ atrix-vector operation $y:=a l p h a * A * x+$ beta* $y$ where alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ ent vectors and $A$ is an $n$ by $n$ herm itian $m$ atrix, supplied in packed form .

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the $m$ atrix A is supplied in the packed array A as follow s:

UPLO = U'or U ' The uppertriangularpartofA is supplied in A.

UPLO = L'or I' The low ertriangularpartofA is supplied in A.

U nchanged on exit.

N (input)
O n entry, N specifies the order of the m atrix A . $\mathrm{N}>=0$. U nchanged on exit.

A LPH A (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
$\left(\left(\mathrm{n}^{*}(\mathrm{n}+1)\right) / 2\right)$. Before entry w ith UPLO $=$ U' or L', the array A mustcontain the upper triangularpartof the herm itian matrix packed
sequentially, column by colum $n$, so that A (1) containsa(1,1), A (2) and A (3) contain a( 1,2 ) and a( 2,2 ) respectively, and so on. Before entry w ith UPLO = L'or I', the array A m ust contain the low er triangularpart of the her$m$ tiian matrix packed sequentially, column by colum n, so thatA (1) contains a (1,1), A (2) and $A(3)$ contain a $(2,1)$ and a $(3,1)$ respectively, and so on. N ote that the im aginary parts of the diagonalelem ents need notbe set and are assum ed to be zero. U nchanged on exit.

X (input)
$(1+(n-1) * a b s(\mathbb{N} C X))$. Before entry, the increm ented array $X \mathrm{~m}$ ust contain the n elem ent vectorx. U nchanged on exit.
$\mathbb{N} C X$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N C X}$ <> 0 . U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen
BETA is supplied as zero then $Y$ need notbe seton input. U nchanged on exit.

Y (input/output)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectory. On exit, Y is overw rilten by the updated vectory.
$\mathbb{N} C Y$ (input)
O n entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents ofY. $\mathbb{N} C Y$ <> 0 . U nchanged on exit.

void chpr2_64 (charuple, long n, com plex *alpha, com plex *x, long incx, com plex *y, long incy, com plex *ap);

## PURPOSE

chpr2 performs the Herm tian rank 2 operation $A:=$ alpha*x*conjg ( $\mathrm{y}^{\prime}$ ) + conjg (alpha ) $\mathrm{y}^{\star}$ con $\dot{g}\left(\mathrm{x}^{\prime}\right)$ + A where alpha is a scalar, $x$ and $y$ are $n$ elem ent vectors and $A$ is an $n$ by $n$ herm itian $m$ atrix, supplied in packed form .

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the $m$ atrix $A$ is supplied in the packed amay AP as follow s:

UPLO = U 'or L ' The uppertriangularpartof $A$ is supplied in AP .

UPLO = L'or I' The low ertriangularpartof A is supplied in A P .

U nchanged on exit.

N (input)
O n entry, N specifies the order of the m atrix A . $\mathrm{N}>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
$(1+(n-1) \star a b s(\mathbb{N} C X))$. Before entry, the increm ented array X m ust contain the n elem ent vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)

On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

Y (input)
$(1+(n-1) \star \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectory. U nchanged on exit.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y$. $\mathbb{N} C Y$ <> 0 . Unchanged on exit.
AP (input/output)
$\left(\left(n^{*}(n+1)\right) / 2\right)$. Before entry $w$ ith UPLO $=$
$U$ ' or $L$ ', the array AP m ust contain the upper
triangularpartof the herm tian $m$ atrix packed
sequentially, column by colum n, so thatAP (1) contains a (1, 1), AP (2) and AP (3) contain a ( 1,2 ) and a (2,2) respectively, and so on. On exit, the array AP is overw ritten by the upper triangular part of the updated $m$ atrix. Before entry with UPLO = L 'or I', the array AP must contain the low er triangular part of the herm itian $m$ atrix packed sequentially, colum $n$ by colum $n$, so thatA P (1) contains a (1, 1), AP (2) and AP (3 ) contain a(2,1) and a (3, 1 ) respectively, and so on. On exit, the array AP is overw ritten by the low ertriangularpart of the updated $m$ atrix. N ote that the im aginary parts of the diagonalele$m$ ents need notbe set, they are assum ed to be zero, and on exit they are set to zero.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the matrioes $B$ and $X$. NRHS $>=0$.

A (input) The upper or low er triangle of the H erm itian
$m$ atrix A, packed colum nw ise in a linear array.
The jth column ofA is stored in the array A as
follows: if UPLO $=U$ ',A $(i+(j-1) * j 2)=A(i, 7)$ for $1<=i<=j$ if $U P L O=L ', A(i+(j-1) *(2 * n-7 / 2)$
=A $(i, j)$ for $j=i<=n$.

## AF (input)

The factored form of them atrix A. AF contains the block diagonal matrix D and the multipliers used to obtain the factor $U$ orL from the factorization $A=U * D * U * * H$ orA $=L * D * L * * H$ as com puted by CHPTRF, stored as a packed triangularm atrix.

PIVOT (input)
D etails of the interchanges and the block structure ofD as determ ined by CHPTRF.
$B$ (input) The righthand side m atrix $B$.
LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, \mathbb{N})$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by CHPTRS. On exit, the im proved solution $m$ atrix $X$.

## LD X (input)

The leading dim ension of the array X . LD X >= $\max (1, N)$.

## FERR (output)

The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\neg)$ FERR $(\neg)$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{D})-X$ TRU $E$ ) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{)}$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vector $X$ ( $j$ ) (ie., the sm allest relative change in any elem entofA orB thatm akes $X$ ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{I N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N ~ F O ~}=-$ i, the i-th argum enthad an illegalvalue

void chpsv (charuple, int n, int nrhs, com plex *a, int *ịivot, com plex *b, int ldlo, int *info);
void chpsv_64 (char uplo, long n, long nrhs, com plex *a, long *ípivot, com plex *b, long ldb, long *info);

## PURPOSE

chpsv com putes the solution to a com plex system of linear equations
$A$ * $X=B, w h e r e A$ is an $N$ boy-N H erm tian $m$ atrix stored in packed form atand X and B are N Hoy-N RH S $m$ atrices.

The diagonalpivoting $m$ ethod is used to factorA as
$A=U * D * U * * H$, if $U P L O=U$ ', or
$A=L * D * L * * H$, if $U P L O=L^{\prime}$,
w here U (orL) is a productof perm utation and unit upper (low er) triangularm atrices, $D$ is $H$ erm itian and block diagonalw ith 1 boy -1 and 2 -by-2 diagonal blocks. The factored form of A is then used to solve the system of equations A * $X=B$.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': Upper triangle ofA is stored;
= $\mathbb{L}$ ': Low er triangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS $>=0$.

A (input/output)
O n entry, the upper or low ertriangle of the H er$m$ itian $m$ atrix $A$, packed colum nw ise in a linear anray. The $j$ th column of $A$ is stored in the
array A as follows: if UPLO = U',A (i+ $(\mathfrak{j}$
 $(j-1) *(2 n-j / 2)=A(i, j)$ for $j=i<=n$. See below for further details.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}$ orA $=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}$ as com puted by CHPTRF, stored as a packed triangular $m$ atrix in the sam e storage form atas $A$.

IPIVOT (output)
D etails of the interchanges and the block structure ofD, as determ ined by CHPTRF. If IPIVOT (k) $>0$, then row sand columnsk and $\mathbb{P} \mathbb{V} O T(k)$ were interchanged, and $\mathrm{D}(\mathrm{k}, \mathrm{k})$ is a 1 -by -1 diagonal block. If UPLO $=\mathrm{U}$ 'and $\mathbb{P} \mathbb{I V O T}(\mathrm{k})=\mathbb{P} \mathbb{V} O T(\mathrm{k}-1)$ $<0$, then row s and colum ns $k-1$ and $-\mathbb{P} \mathbb{I V}$ O ( $k$ ) w ere interchanged and $D(k-1 * k, k-1 k)$ is a 2 -by-2 diagonal block. If UPLO $=\mathrm{L}^{\prime}$ and $\mathbb{P} \mathbb{I V O T}(\mathrm{k})=$ $\mathbb{P I V O T}(k+1)<0$, then row $s$ and colum ns $k+1$ and $-\mathbb{P}$ IV O T (k) w ere interchanged and $D(k \cdot k+1, k \cdot k+1)$ is a 2-by-2 diagonalblock.

B (input/output)
On entry, the N -by -N RH S righthand side $m$ atrix B . On exit, if $\mathbb{N F O}=0$, the $N$-by-NRHS solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, \mathbb{N})$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, so the solution could notbe com puted.

## FURTHER DETAILS

The packed storage schem e is illustrated by the follow ing exam ple when $\mathrm{N}=4, \mathrm{UPLO}=\mathrm{U}$ ':

Tw o-dim ensional storage of the $H$ erm itian $m$ atrix A:
al1 a12 a13 a14
a33 a34 (aij= con $\dot{j}(a \ddot{j}))$ a44

Packed storage of the upper triangle ofA :

$$

## C INTERFACE

\#include <sunperfh>
void chpssx (char fact, charuplo, intn, int nrhs, com plex *a, com plex *af, int *ipivot, com plex *b, int ldb, com plex *x, int ldx, float *rcond, float *ferr, float*ber, int*info);
void chpssx_64 (char fact, charuplo, long n, long nrhs, com plex *a, com plex *af, long *ipivot, com plex *b, long lab, com plex *x, long ldx, float *roond, float *ferr, float *berr, long *info);

## PURPOSE

chpsvx uses the diagonalpivoting factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}$ to com pute the solution to a com plex system of linear equations $A * X=B$, where $A$ is an $N$ by $-N$ Herm itian $m$ atrix stored in packed form at and $X$ and $B$ are $N$-byNRH S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=N$ ', the diagonalpivoting $m$ ethod is used to factorA as

$$
A=U * D * U * * H, \text { if } U P L O=U ' \text { or }
$$

$$
A=L * D * L * * H, \text { if } U P L O=L \prime,
$$

where $U$ (orL) is a product of perm utation and unit upper (low er)
triangularm atrices and $D$ is Herm itian and block diagonal w ith
1-by-1 and 2-by-2 diagonalblocks.
2. If som eD $(i, i)=0$, so thatD is exactly singular, then the routine
retums w ith $\mathbb{N} F O=$ i. O therw ise, the factored form of $A$ is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N} F O=N+1$ is retumed as a waming, but the routine stillgoes on
to solve for $X$ and com pute error bounds as described below.
3.The system of equations is solved for $X$ using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard enror estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of A has been supplied on entry. = F ': On entry, A F and $\mathbb{P I V O T}$ contain the factored form of A. AF and $\mathbb{P} \mathbb{I V}$ O T w illnotbe m odified. $=\mathrm{N}$ ': Them atrix A
w ill.be copied to AF and factored.

UPLO (input)
$=\mathrm{U}:$ : U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of right hand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS >=0.

A (input) The upper or low er triangle of the H erm itian $m$ atrix A, packed colum nw ise in a linear anray. The $j$ th column of A is stored in the array A as follows: if UPLO $=U U^{\prime}, A(i+(j-1) * j 2)=A(i, 7)$ for $1<=i<=j$ if $U P L O=L ', A(i+(j-1) *(2 * n-) / 2)$
$=A(i, y)$ for $j=i<=n$. See below forfurther details.

AF (input/output)
If $F A C T=F$ ', then $A F$ is an input argum ent and on entry contains the block diagonalm atrix $D$ and the m ultipliers used to obtain the factor $U$ orl from the factorization $A=U * D * U * * H$ orA $=L * D * L * * H$ as com puted by CH PTRF, stored as a packed triangular $m$ atrix in the sam e storage form atasA.
IfFACT = N ', then AF is an output argum ent and on exit contains the block diagonalm atrix $D$ and the m ultipliers used to obtain the factorU or L from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}$ or $\mathrm{A}=$ L*D *L**H as com puted by CHPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

## IPIVOT (inputoroutput)

If $F A C T=F '$, then $\mathbb{P I V O T}$ is an input argum ent and on entry contains details of the interchanges and the block structure of D, as determ ined by CHPTRF. If $\mathbb{P I V O T}(k)>0$, then row sand colum nsk and $\mathbb{P} \mathbb{I V O T}(k)$ w ere interchanged and $D(k, k)$ is a 1 -by-1 diagonal block. If UPLO = U'and $\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0$, then row sand colum ns $k-1$ and $-\mathbb{P} \mathbb{V O T}(k)$ were interchanged and $D(k-$ $1 \mathrm{k}, \mathrm{k}-1 \mathrm{k})$ is a 2 -by-2 diagonalblock. IfUPLO $=$ L 'and $\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0$, then row s and colum nsk+1 and - $\mathbb{P}$ IV OT (k) w ere interchanged and D $(k *+1, k k+1)$ is a 2 -by-2 diagonalblock.

IfFACT = $N$ ', then $\mathbb{P I V O T}$ is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by CHPTRF.

B (input) The N -by-N RH S righthand side m atrix B .
LD B (input)
The leading dim ension of the aray $\mathrm{B} . \operatorname{LD} B>=$ $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=\mathrm{N}+1$, the N -by-NRH S solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

## RCOND (output)

The estim ate of the reciprocal condition num berof the matrix A. IfRCOND is less than them achine precision (in particular, if RCOND $=0$ ), the $m$ atrix is singular to working precision. This condition is indicated by a retum code of $\mathbb{N}$ FO > 0.

## FERR (output)

The estim ated forw ard enrorbound for each solution vector $X(\mathcal{)})$ (the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{H})$, FERR ( $)$ ) is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{y})-X$ TRUE) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector $X(\mathcal{j})$ (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * \mathrm{~N}$ )

W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{I N} F O$ (output)
= 0: successfulexit
< 0 : if $\mathbb{N N F O}=-$ i, the $i$-th argum ent had an illegalvalue
> 0 : if $\mathbb{N F O}=i$, and $i$ is
<= N : D (i,i) is exactly zero. The factorization has been com pleted but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1$ : D is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num berof situationsw here the com puted solution
can bem ore accurate than the value ofRCOND w ould suggest.

## FURTHER DETAILS

## PURPOSE

chptrd reduces a com plex H erm itian m atrix A stored in packed form to real sym $m$ etric tridiagonal form $T$ by a unitary sim ilarity transform ation: Q ** H * A * $\mathrm{Q}=\mathrm{T}$.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

AP (input)
O $n$ entry, the upper or low ertriangle of the Her $m$ tian $m$ atrix $A$, packed colum nw ise in a linear array. The jth column of A is stored in the array AP as follows: ifUPLO = U',AP (i+ (j $1) \star j 2$ ) $=A(i, \gamma)$ for $1<=i<=j$ ifUPLO $=L^{\prime}$, AP $(i$ $+(j-1)^{\star}(2 * n-j / 2)=A(i, 7)$ for $j<=i<=n$. On exit, if $\mathrm{UPLO}=\mathrm{U}$ ', the diagonal and first superdiagonalofA are overw ritten by the comesponding ele$m$ ents of the tridiagonalm atrix $T$, and the ele$m$ ents above the first superdiagonal, $w$ ith the array TAU, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors; if $\mathrm{i} P L O=\mathrm{L}$ ', the diagonaland firstsubdiagonalofA are overw ritten by the comesponding elem ents of the tridiagonalm atrix $T$, and the elem ents below the first subdiagonal, w ith the amay TAU, represent the unitary $m$ atrix $Q$ as a product of elem entary reflectors. See FurtherD etails.

D (output)
The diagonalelem ents of the tridiagonalm atrix T :
$D(i)=A(i, i)$.

E (output)
The off-diagonal elem ents of the tridiagonal $m$ atrix $T: E(i)=A(i, i+1)$ if $U P L O=U^{\prime}, E(i)=$ A $(i+1, i)$ if $\mathrm{UPLO}=\mathrm{L}$.

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails) .
$\mathbb{I N F O}$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i-$ th argum enthad an illegalvalue

## FURTHER DETAILS

IfU PLO $=U$ ', the m atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(n-1) \ldots H(2) H(1)
$$

Each H (i) has the form
$H(i)=I-\tan { }^{*} V^{*} V^{\prime}$
$w$ here tau is a com plex scalar, and $v$ is a com plex vector w ith $\mathrm{v}(\mathrm{i}+1 \mathrm{n})=0$ and $\mathrm{v}(\mathrm{i})=1 ; \mathrm{v}(1: i-1)$ is stored on exit in $A P$, overw riting $A(1: i-1, i+1)$, and tau is stored in TAU (i).

If U PLO $=\mathrm{L}$ ', them atrix Q is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(n-1)
$$

Each H (i) has the form

$$
H(i)=I-\tan * v^{\star} v^{\prime}
$$

$w$ here tau is a com plex scalar, and $v$ is a com plex vector w ith $\mathrm{v}(1: i)=0$ and $v(i+1)=1 ; v(i+2 \mathrm{~m})$ is stored on exit in AP, overw riting A (i+2 $\mathrm{n}, \mathrm{i}$ ), and tau is stored in TA U (i).

## C INTERFACE

\#include <sunperfh>
void chptrf(charuple, intn, com plex *a, int *ipivot, int *info);
void chptrf_64 (charuplo, long n, com plex *a, long *ipivot, long *info);

## PURPOSE

chptrf com putes the factorization of a com plex H erm itian packed $m$ atrix $A$ using the Bunch-K aufm an diagonalpivoting $m$ ethod:

$$
A=U * D * U * * H \text { or } A=L * D * L * * H
$$

where U (orL) is a productofperm utation and unit upper (low er) triangular matrices, and $D$ is $H$ erm itian and block diagonalw ith 1 boy-1 and 2 -by-2 diagonalblocks.

## ARGUMENTS

UPLO (input)
$=U^{\prime}:$ U ppertriangle of $A$ is stored;
$=1$ ': Low er triangle ofA is stored.

N (input) The order of the $m$ atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O n entry, the upper or low er triangle of the H er$m$ itian $m$ atrix A, packed colum nw ise in a linear array. The $j$ th colum n of $A$ is stored in the aray $A$ as follows: if UPLO = U',A (i+ (j $1) \star j 2$ ) $=A(i, j)$ for $1<=i<=j$ ifUPLO $=L^{\prime}, A(i+$ $(j-1) *(2 n-1) / 2)=A(i, 7)$ for $\dot{j}=i<=n$.

O n exit, the block diagonalm atrix $D$ and the $m u l$ tipliers used to obtain the factorU orL, stored as a packed triangularm atrix overw riting A (see below for further details).

D etails of the interchanges and the block structure of $D$. If $\mathbb{P I V O T}(k)>0$, then row sand columnsk and $\mathbb{P I V O T}(k)$ were interchanged and $D(k, k)$ is a $1-b y-1$ diagonalblock. If $U P L O=U '$ and $\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{V} O T(k-1)<0$, then row $s$ and colum ns $k-1$ and - $\mathbb{P I V O T}(k)$ were interchanged and D $(k-1 k, k-1 k)$ is a $2-b y-2$ diagonal block. If UPLO $=\mathrm{L}$ 'and $\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0$, then row s and colum nsk+1 and - $\mathbb{P}$ IV OT (k) were interchanged and $D(k, k+1, k \cdot k+1)$ is a 2 -by -2 diagonal block.
$\mathbb{I N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue $>0:$ if $\mathbb{N} F O=i, D(i, i)$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, and division by zero w ill occur if it is used to solve a system ofequations.

## FURTHER DETAILS

## 5-96-B ased on m odifications by J.Lew is, Boeing C om puter

 ServicesCom pany
If $U P L O=U$ ', then $A=U * D * U$ ', where
$U=P(n) \star U(n) * \ldots{ }^{\star}(k) U(k)^{\star} \ldots$,
i.e., $U$ is a product of term $S P(k) * U(k)$, where $k$ decreases from $n$ to 1 in steps of 1 or 2 , and $D$ is ablock diagonal $m$ atrix $w$ ith 1 -by -1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V O T}(k)$, and $U(k)$ is a unituppertriangularm atrix, such that if the diagonal block $D(k)$ is of orders ( $s=1$ or 2 ), then

$$
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=(0 \quad 1 \quad 0) s \\
& \text { ( } 00 \text { I ) n-k } \\
& \mathrm{k}-\mathrm{s} \mathrm{~s} \mathrm{n}-\mathrm{k}
\end{aligned}
$$

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(1 k-$ $1, k$ ). If $s=2$, the upper triangle ofD ( $k$ ) overw rites $A(k-$ $1, k-1)$, A $(k-1, k)$, and $A(k, k)$, and $v$ overw rites A $(1 k-2, k-$ 1 k).

If $U P L O=L$ ', then $A=L * D * L$ ', where

$$
L=P(\mathbb{1}) \star L(1) \star \ldots * P(k) \star L(k)^{\star} \ldots,
$$

i.e., $L$ is a product of term $s P(k) * L(k)$, where $k$ increases
from 1 to $n$ in steps of 1 or 2, and $D$ is a block diagonal $m$ atrix $w$ ith 1 -by- 1 and 2 -by-2 diagonalblocks $D(k)$. $P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V} O T(k)$, and $L(k)$ is a unit low ertriangularm atrix, such that if the diagonal
block D (k) is of orders ( $s=1$ or2), then

```
    ( I 0 0 ) k-1
L (k)=( 0 I 0 ) s
    ( 0 v I ) n-k-s+1
        k-1 s n-k-s+1
```

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites A ( $k+1 n, k$ ). If $s=2$, the low ertriangle ofD ( $k$ ) overw rites $A(k, k), A(k+1, k)$, and $A(k+1, k+1)$, and $v$ overw rites A ( $k+2 n, k k+1$ ).

## PURPOSE

chsein uses inverse teration to find specified rightand/or lefteigenvectors of a com plex upper $H$ essenberg $m$ atrix $H$.

The righteigenvectorx and the lefteigenvector $y$ of the $m$ atrix $H$ comesponding to an eigenvalue $w$ are defined by:

$$
H * x=w * x, \quad y^{* * h} * H=w * y^{* * h}
$$

$w$ here $y^{\star *} h$ denotes the conjugate transpose of the vectory.

## ARGUMENTS

= R ': com pute righteigenvectors only;
= L ': com pute lefteigenvectors only;
= B ': com pute both right and lefteigenvectors.

## E IG SRC (input)

Specifies the souroe of eigenvalues supplied in $W$ :
= Q': the eigenvalueswere found using CHSEQR;
thus, if H has zero subdiagonalelem ents, and so is block-triangular, then the $j$ th eigenvalue can be assum ed to be an eigenvalue of the block containing the jth row /oolum $n$. This property allow $s$ CHSEIN to perform inverse iteration on justone diagonalblock. = N ': no assum ptions are $m$ ade on the correspondence betw een eigenvalues and diagonalblocks. In this case, CH SE $\mathbb{I N}$ m ustalw ays perform inverse iteration using the $w$ hole $m$ atrix $H$.
$\mathbb{N}$ ITV (input)
= N ': no initialvectors are supplied;
= U ': user-supplied initial vectors are stored in the arrays V L and/orV R .

SELECT (input)
Specifies the eigenvectors to be com puted. To select the eigenvector corresponding to the eigenvalueW ( $\mathcal{j}$ ) SELECT ( $\mathbf{j}$ ) m ustbe set to TRUE..

N (input) The order of the m atrix H. N >=0.
$H$ (input) The upper $H$ essenberg $m$ atrix $H$.

LD H (input)
The leading dim ension of the array $H$. LD H >= $\max (1, N)$.

W (input/output)
On entry, the eigenvalues of H . On exit, the real parts of $W$ may have been altered since close eigenvalues are perturbed slightly in searching for independenteigenvectors.

VL (input/output)
On entry, if $\mathbb{N} \mathbb{I T V}=\mathrm{U}$ 'and $S \mathbb{D} E=\mathrm{L}$ 'or B ', VL $m$ ust contain starting vectors for the inverse iteration for the lefteigenvectors; the starting vector for each eigenvectorm ustbe in the sam e colum $n$ in which the eigenvector will be stored. On exit, if $S \mathbb{D} E=$ 'L or B', the lefteigenvectors specified by SELEC T w illbe stored consecutively in the colum ns of $V L$, in the sam e order as
theireigenvalues. If $S \mathbb{D} E=R \prime V L$ is not referenced.

LDVL (input)
The leading dim ension of the array VL . LDVL >= $\max (1, \mathbb{N})$ if $\mathrm{S} \mathbb{D} E=\mathrm{L}$ 'or B'; LDVL >= 1 otherw ise.

VR (input/output)
On entry, if $\mathbb{N} \operatorname{ITV}=U$ 'and $S \mathbb{D} E=R$ 'or $B^{\prime}, V R$ $m$ ust contain starting vectors for the inverse iteration for the righteigenvectors; the starting vector for each eigenvectorm ustbe in the sam e colum $n$ in which the eigenvector will be stored. On exit, if $S \mathbb{D} E=R$ 'or $B$ ', the righteigenvectors specified by SELEC T w illbe stored consecutively in the colum ns of $V R$, in the sam e order as theireigenvalues. If $S \mathbb{D} E=L^{\prime}, V R$ is not referenced.

LDVR (input)
The leading dim ension of the array $V R$. LDVR >= $\max (1, \mathbb{N})$ if $S \mathbb{D} E=R$ 'or $B^{\prime} ; L D V R>=1$ otherw ise.

M M (input)
The num berof colum ns in the arrays VL and/or VR. $M M>=M$.

M (output)
The num ber of colum ns in the arrays VL and/or VR required to store the eigenvectors $\vDash$ the num ber of TRUE . elem ents in SELECT).

W ORK (w orkspace)
dim ension $(\mathbb{N} * N)$
RW ORK (w orkspace)
dim ension (N)
FAILL (output)
IfSDE $=\mathrm{L}$ 'or B ', $\mathbb{F A} A L L(i)=j>0$ if the left eigenvector in the $i$-th column of VL (comesponding to the eigenvalue w ( $j$ ) failed to converge; $\mathbb{F A} \mathbb{I L}($ (i) $=0$ if the eigenvectorconverged satisfactorily. If $S \mathbb{D} E=R$ ', $\mathbb{F A} \mathbb{I L}$ is not referenced.

FA IIR (output)
If $S \mathbb{D} E=R$ 'or $B^{\prime}, \mathbb{F} A \mathbb{L} R(i)=j>0$ if the
right eigenvector in the i-th colum $n$ of VR (comesponding to the eigenvalue w ( $~(~) ~ f a i l e d ~ t o ~$ converge; $\mathbb{F A}$ IIR (i) = 0 ifthe eigenvectorconverged satisfactorily. IfSDE $E=\mathbb{L}, \mathbb{F} A \Pi R$ is notreferenced.

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i$, is the num ber of eigenvectors which failed to converge; see $\mathbb{F} A \mathbb{I} L$ and $\mathbb{F} A \mathbb{I} R$ for further details.

## FURTHER DETAILS

E ach eigenvector is norm alized so that the elem entof largest $m$ agnitude has $m$ agnitude 1 ; here the $m$ agnitude of a com plex num ber $(x, y)$ is taken to be $|x|+|y|$.

## PURPOSE

chseqr com putes the eigenvalues of a com plex upper H essenberg $m$ atrix $H$, and, optionally, the $m$ atrices $T$ and $Z$ from the Schurdecom position $H=Z \mathrm{~T} \mathrm{Z**H}$, where T is an upper triangular $m$ atrix (the Schur form ), and $Z$ is the unitary $m$ atrix of Schurvectors.

O ptionally Z may be postm ultiplied into an input unitary $m$ atrix $Q$, so that this routine can give the Schur factorization of a m atrix A which has been reduced to the $H$ essenberg form $H$ by the unitary $m$ atrix $Q: A=Q * H * Q * H=$ (Q Z ) * $\mathrm{T}^{*}(\mathrm{Q} \mathrm{Z}) * * \mathrm{H}$.

## ARGUMENTS

$J O B$ (input)
= E ': com pute eigenvalues only;
$=S$ ': com pute eigenvalues and the Schur form $T$.

COM PZ (input)
= N ': no Schurvectors are com puted;
$=$ ' $I$ ': Z is initialized to the unitm atrix and the m atrix Z of Schurvectors of H is retumed; $=\mathrm{V}$ : $Z \mathrm{~m}$ ust contain an unitary m atrix Q on entry, and the product $\mathrm{Q} * \mathrm{Z}$ is retumed.

N (input) The order of the m atrix $\mathrm{H} . \mathrm{N}>=0$.
\#O (input)
It is assum ed that $H$ is already upper triangular
in row $s$ and colum ns 1: $\mathrm{HO}-1$ and $\mathbb{H} \mathrm{I}+1 \mathrm{~N} . \mathbb{H O}$ and IH I are norm ally setby a previous call to C G EBA L, and then passed to CGEHRD when the $m$ atrix output by CGEBAL is reduced to $H$ essenberg form . O therw ise HO and $\mathbb{H}$ I should be set to 1 and $N$ respectively. $1<=\mathbb{H O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H} \mathrm{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

IH I (input)
See the description of IIO .

H (input/output)
On entry, the upper $H$ essenberg $m$ atrix $H$. On exit, if $\mathrm{JOB}=\mathrm{S}^{\prime}, \mathrm{H}$ contains the uppertriangular $m$ atrix $T$ from the Schurdecom position the Schur form). If $J O B=E$ ', the contents of $H$ are unspecified on exit.

LD H (input)
The leading dim ension of the aray H. LD H >= $\max (1, \mathbb{N})$.

W (output)
The com puted eigenvalues. If $J O B=S$ ', the eigenvalues are stored in the sam e order as on the diagonal of the Schur form retumed in H , w th $W(i)=H(i, i)$.

Z (input) IfCOM PZ = N ': Z is not referenced.
If COMPZ = I': on entry, Z need notbe set, and on exit, $Z$ contains the unitary $m$ atrix $Z$ of the Schurvectors of H . IfCOM PZ = V : on entry Z $m$ ust contain an $N$ by $-\mathrm{N} m$ atrix $Q$, which is assum ed to be equal to the unitm atrix except for the sub$m$ atrix $Z$ ( $\mathbb{H} O: \mathbb{H} I, \mathbb{I} O: \mathbb{H} I$ ); on exitZ contains $Q$ *Z . N orm ally $Q$ is the unitary $m$ atrix generated by CUNGHR after the call to CGEHRD which form ed the H essenberg $m$ atrix $H$.

LD $Z$ (input)
The leading dim ension of the aray $Z$. LD $Z>=$ $\max (1, N)$ if COMPZ = I'orV';LD Z >= 1 otherw ise.

W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, \mathrm{~W}$ ORK (1) retums the optim al LW ORK.

LW ORK (output)
The dimension of the aray $W$ ORK. LW ORK >=
$\max (1, N)$.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i$-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N} F O=$ i, CHSEQR failed to compute all the eigenvalues in a total of $30 *$ ( $\mathbb{H}$ I- $\mathrm{HO}+1$ ) terations; elem ents 1 :ilo-1 and i+1 1 of $W$ contain those eigenvalues which have been successfully com puted.

DESCRIPTION

A $<-A P$
$A<-A P^{\prime}$
( 'indicates m atrix transpose)
$w$ here perm utation $P$ is represented by an integervector $\mathbb{P} E R M$, such that $\mathbb{P E R M}(I)$ is equal to the position of the only nonzero elem entin row Iofperm utation $m$ atrix $P$.

N O TE : In orderto get a sym etrically perm uted jagged diagonal $m$ atrix P A P', one can explicitly perm ute the colum ns P A by calling

SJADRP ( $0, M, M, V A L, \mathbb{N} D X, P N T R, M A X N Z, \mathbb{P} E R M, W$ ORK,LW ORK)
where param eters $V A L, \mathbb{N D X}, P N T R, M A X N Z, \mathbb{P E R M}$ are the representation of $A$ in the jagged diagonal form at. The operation $m$ akes sense if the originalm atrix $A$ is square.

## ARGUMENTS

TRAN SP Indicates how to operate $w$ ith the perm utation $m$ atrix
0 : operate w ith m atrix
1 : operate $w$ ith transpose $m$ atrix

M $\quad \mathrm{N}$ um berof row $s$ in matrix A

K $\quad \mathrm{N}$ um ber of colum ns in matrix A

VAL () amay of length PNTR MAXNZ+1)-PNTR (1) consisting of entries ofA. VA L can be view ed as a colum $n m$ ajor ordering of a row perm utation of the E llpack representation of A, w here the Ellpack representation is perm uted so that the row $s$ are non-increasing in the num ber of nonzero entries. $V$ alues added for padding in Ellpack are not included in the Jagged - D iagonal form at.

INDX () array of length PN TR MAXNZ+1)-PNTR (1) consisting of the colum $n$ indices of the corresponding entries in VAL.

PNTR () array of length M AXNZ+1, where PNTR (I) PNTR (1)+1 points to the location in VA L of the firstelem ent in the row -perm uted E lhpack represenation of .

M A X N Z max num ber ofnonzeros elem ents per row.
$\mathbb{P} E R M$ ( integeramay of length $K$ such that $I=\mathbb{P} E R M$ ( $I$ ).

A ray $\mathbb{P} E R M$ represents a perm utation $P$, such that $\mathbb{P E R M}$ ( I ) is equal to the position of the only nonzero elem ent in row Iofperm utation $m$ atrix $P$.
Forexam ple, if
|001|
$\mathrm{P}=\left|\begin{array}{lll}1 & 0 & 0\end{array}\right|$
|010|
then $\mathbb{P E R M}=(3,1,2)$.

W ORK () scratch array of length LW ORK. LW ORK should be at leastK.

LW ORK length ofW ORK aray

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

http://w w w netlib .org/utk/papers/sparse.ps

## NOTES/BUGS

1. No test for singularity ornear-singularity is included in this routine. Such tests $m$ ust.be perform ed before calling this routine.
2. If U N ITD $=4$, the routine scales the row s ofA such that their 2 -norm s are one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK (1)=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here $i$ is the row num berw hich 2 -norm is exactly zero.
3. If $\operatorname{DESCRA}(3)=1$ and UN ITD < 4, the unitdiagonalelem ents $m$ ightorm ightnotbe referenced in the JA D representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD=4, the unit diagonalelem ents M U ST be referenced in the $\sqrt{A} D$ representation.
4.The routine can be applied for solving triangular system $s$ w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ust.be equal to 3 in this case.

## C INTERFACE

\#include <sunperfh>
void clarz (char side, intm, intn, intl, com plex *v, int incv, com plex *tau, com plex *c, int lddc);
void clarz_64 (char side, long m , long n, long l, com plex *v, long incv, com plex *tau, com plex *c, long ldc);

## PURPOSE

clarz applies a com plex elem entary reflectorH to a com plex M -by -N m atrix C , from either the leftor the right. H is represented in the form

$$
\mathrm{H}=\mathrm{I}-\tan * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
$$

$w$ here tau is a com plex scalar and $v$ is a com plex vector.

If tau $=0$, then H is taken to be the unitm atrix.

To apply H ' the conjugate transpose of H), supply con'j (tau) instead tau.

H is a product ofk elem entary reflectors as retumed by CTZRZF.

## ARGUMENTS

```
S\mathbb{DE (input)}
\(=\mathrm{L}:\) form \(\mathrm{H} * \mathrm{C}\)
\(=R\) : form \(C\) * \(H\)
```

M (input) The num ber of row s of the $m$ atrix $C$.

N (input) The num ber of colum ns of the $m$ atrix C .

L (input) The num berofentries of the vector $V$ containing the $m$ eaningful part of the $H$ ouseholdervectors. If $S \mathbb{D} E=L \prime, M>=L>=0$, if $S D E=R \prime, N>=L$ $>=0$.

V (input) The vector v in the representation of H as
retumed by CTZRZF.V is notused ifTAU $=0$.
$\mathbb{N} C V$ (input)
The increm entbetw een elem ents of $v . \mathbb{N} C V<>0$.

TAU (input)
The value tau in the representation of $H$.

C (input/output)
On entry, the $M$-by $N$ matrix C. On exit, $C$ is overw ritten by the $m$ atrix $H$ * $C$ if $S \mathbb{D E}=\mathrm{L}$ ', or $C * H$ if $S \mathbb{D} E=R$ '.

LDC (input)
The leading dim ension of the aray C. LD C >= $m a x(1, M)$.

W ORK (w orkspace)
$(\mathbb{N})$ if $S \mathbb{D} E=L^{\prime}$ or $\left.M\right)$ if $S \mathbb{D} E=R^{\prime}$

\#include <sunperfh>
void clarzb (char side, char trans, char direct, char storev, int $m$, intn, intk, intl, com plex *v, int ldv, com plex *t, intldt, com plex ${ }^{*}$ c, int ldc, int ldw ork);
void clarzb_64 (charside, char trans, char direct, char storev, long m , long n , long k , long l , com plex *v, long ldv, com plex *t, long ldt, com plex *c, long ldc, long ldw ork);

## PURPOSE

clarzb applies a com plex block reflector H or its transpose $\mathrm{H} * * \mathrm{H}$ to a com plex distributed M -by -N C from the leftorthe right.

Cumently, only STOREV = R'and D $\mathbb{R E C T}=\mathrm{B}$ 'are supported.

## ARGUMENTS

STDE (input)
= L': apply H orH 'from the Left
= R':apply H orH 'from the Right
TRANS (input)
= N ': apply H N o transpose)
= C ': apply H ' (C onjugate transpose)

D $\mathbb{R E C T}$ (input)
Indicates how H is form ed from a product of elem entary reflectors = F ': H = H (1) H (2) . . . H (k) (Forw ard, not supported yet)
= $\mathrm{B}^{\prime}: \mathrm{H}=\mathrm{H}(\mathrm{k}) \ldots \mathrm{H}(2) \mathrm{H}(1)$ (Backw ard)

STOREV (input)
Indicates how the vectors w hich define the elem en-
tary reflectors are stored:
= C':Colum nw ise (notsup-
ported yet)
= R ':Rowwise

M (input) The num ber of row s of the $m$ atrix $C$.

N (input) The num ber of colum ns of the m atrix C .

K (input) The order of the $m$ atrix T ( $=$ the num ber of elem entary reflectors whose product defines the block reflector).

L (input) The num berof colum ns of the $m$ atrix $V$ containing the $m$ eaningfilpart of the $H$ ouseholder reflectors. If $S \mathbb{D} E=L ', M>=L>=0$, if $S \mathbb{D} E=R \prime, N>=L$ $>=0$ 。
V (input) If $S T O R E V=C^{\prime}, N V=K$; if $S T O R E V=R \prime, N V=L$.

LDV (input)
The leading dim ension of the aray $V$. IfSTOREV = C',LDV >=L; ifSTOREV = R',LDV >=K .

T (input) The triangular K -by K m atrix T in the representation of the block reflector.

LD T (input)
The leading dim ension of the anay $\mathrm{T} \cdot \mathrm{LD} \mathrm{T}>=\mathrm{K}$.

C (input/output)
On entry, the M -by -N m atrix C . On exit, C is overw ritten by H * C orH * C or $\mathrm{C}^{*} \mathrm{H}$ orC *H '.

LD C (input)
The leading dim ension of the array $C . \operatorname{LDC}>=$ $\max (1, M)$.

W ORK (w orkspace)
dim ension ( $\mathrm{M} A X(M, N), K)$

LDW ORK (input)
The leading dim ension of the array $W$ ORK. If $S \mathbb{D} E$
$=\mathrm{L} \prime$, LDW ORK >= max $(1, N)$; ifS $\mathbb{D} E=R \prime$ LDW ORK $>=\max (1, M)$.

## C INTERFACE

\#include <sunperfh>
void clarzt(chardirect, char storev, intn, intk, com plex ${ }^{*} \mathrm{v}$, int $l d \mathrm{v}$, com plex *tau, com plex *t, int ldt);
void clarzt 64 (chardirect, char storev, long n, long k, complex ${ }^{*}$ v, long $l d v, ~ c o m p l e x ~ * t a u, ~ c o m p l e x ~ * t, ~$ long ldt);

## PURPOSE

clarzt form s the triangular factor T of a com plex block reflectorH of order> n,which is defined as a product ofk elem entary reflectors.

IfD $\mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{H}=\mathrm{H}(1) \mathrm{H}(2) \ldots \mathrm{H}(\mathrm{k})$ and T is upper triangular;

IfD $\mathbb{R E C T}=\mathrm{B}^{\prime}, \mathrm{H}=\mathrm{H}(\mathrm{k}) \ldots \mathrm{H}(2) \mathrm{H}(1)$ and T is lower triangular.

IfSTOREV = C', the vector which defines the elem entary reflector $\mathrm{H}(\mathrm{i})$ is stored in the $i$-th colum n of the amray V , and

$$
H=I-V \star T * V^{\prime}
$$

IfSTOREV = R', the vector which defines the elem entary reflectorH (i) is stored in the $i$-th row of the array $V$, and

$$
\mathrm{H}=\mathrm{I}-\mathrm{V}^{\prime} \star \mathrm{T} \star \mathrm{~V}
$$

Curently, only STOREV = R'and D $\mathbb{R E C T}=B$ 'are supported.

## ARGUMENTS

D $\mathbb{R E C T}$ (input)
Specifies the order in which the elem entary
reflectors are multiplied to form the block
reflector:
$=F ': H=H(1) H(2) \ldots H(k)$ (Forw ard, notsup-
ported yet)
$=B^{\prime}: H=H(k) \ldots H(2) H(1)$ (Backw ard)

## STOREV (input)

Specifies how the vectors w hich define the elem entary reflectors are stored (see also Further
D etails):
= R ': row w ise
N (input) The order of the block reflector $\mathrm{H} . \mathrm{N}>=0$.
$K$ (input) The order of the triangular factor $T \vDash$ the num ber of elem entary reflectors). $\mathrm{K}>=1$.
$V$ (input) ( $L D V, K$ ) if $S T O R E V=C^{\prime}(L D V, N)$ if $S T O R E V=R^{\prime}$ Them atrix $V$. See furtherdetails.

LD V (input)
The leading dim ension of the array V . If $\operatorname{STOREV}=$ $C$ ', LDV $>=\max (1, N)$; ifSTOREV = $R$ ', LDV $>=K$.

TAU (input)
TAU (i) must contain the scalar factor of the elem entary reflectort (i).
$T$ (input) The $k$ by $k$ triangular factor $T$ of the block reflector. If $\mathrm{D} \mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{T}$ is upper triangular; if $\mathrm{D} \mathbb{R E C T}=\mathrm{B}$ ', T is low er triangular. The restof the aray is notused.

LD T (input)
The leading dim ension of the array T.LD T >=K.

## FURTHER DETAILS

B ased on contributions by
A. Petitet, C om puter Science D ept., U niv. of Tenn., K noxville, U SA

The shape of the $m$ atrix $V$ and the storage of the vectors which define the $H$ (i) is bestillustrated by the follow ing exam ple w th $\mathrm{n}=5$ and $\mathrm{k}=3$. The elem ents equal to 1 are not stored; the comesponding aray elem ents arem odified but restored on exit. The restof the array is notused.

D $\mathbb{R E C T}=\mathrm{F}^{\prime}$ and STOREV $=\mathrm{C}^{\prime}: \quad \mathrm{D} \mathbb{R E C T}=\mathrm{F}^{\prime}$ and STOREV = R':

void costi_ 64 (long n, float *w save);

## ARGUMENTS

N (input) Length of the sequence to be transform ed. The $m$ ethod is $m$ ostefficientw hen $N-1$ is a product of sm allprim es. $\mathrm{N}>=2$.

W SAVE (input)
On entry, an array ofdim ension ( 3 * $N+15$ ) or greater. COST I is called once to initializeW SA VE before calling COST and need notbe called again between calls to COST if N and W SAVE rem ain unchanged. Thus, subsequent transform $s$ of sam e size can be obtained faster than the first since they do not require initialization of the w orkspace.

\#include <sunperfh>
void qpbcon (charuple, intn, intkd, com plex *a, int lda, floatanorm, float*rcond, int*info);
void qpbcon_64 (charuplo, long n, long kd, com plex *a, long lda, float anorm , float *roond, long *info);

## PURPOSE

cpbcon estim ates the reciprocal of the condition num ber (in the 1 -norm ) of a com plex H erm itian positive definite band $m$ atrix using the Cholesky factorization $A=U * * H * U$ or $A=$ L*L**H com puted by CPB TRF .

A $n$ estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND = 1 / (ANORM * norm (inv (A))).

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U pper triangular factorstored in A ;
= IL ': Low er triangular factor stored in A .

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

K D (input)
The num ber of superdiagonals of the $m$ atrix $A$ if U PLO $=\mathrm{U}$ ', or the num ber of sub-diagonals if UPLO
$=\mathrm{L}^{\prime} . \mathrm{KD}>=0$ 。

A (input) The triangular factorU or $L$ from the Cholesky
factorization $\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ orA $=\mathrm{L} * \mathrm{~L} * * \mathrm{H}$ of the band
$m$ atrix $A$, stored in the first KD +1 row $s$ of the array. The jth colum n ofU orL is stored in the $j$ th colum $n$ of the array A as follows: if UPLO
$=U ', A(k d+1+i-j)=U(i, j)$ for $m a x(1, j$
$\mathrm{kd})<=\mathrm{i}<=\dot{j}$ if UPLO $=\mathrm{L}$ ', $\mathrm{A}(1+i-j)=\mathrm{L}(i, j)$
for $j=i<=m$ in $(n, j+k d)$.

LD A (input)
The leading dim ension of the array A. LDA >= K D +1 .
ANORM (input)
The 1-norm (or infinity-norm ) of the Herm tian band $m$ atrix $A$.

## RCOND (output)

The reciprocal of the condition number of the $m$ atrix $A$, com puted asRCOND = $1 /(A N O R M * A \mathbb{N} V N M)$, where $A \mathbb{N} V N M$ is an estim ate of the 1 -nom of inv (A) com puted in this routine.

W ORK (w orkspace)
dim ension $(2 * N)$

W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an ille-
galvalue

void qpbequ_64 (charuplo, long n, long kd, com plex *a, long lda, float * scale, float * scond, float * am ax, long *info);

## PURPOSE

cpbequ com putes row and colum n scalings intended to equilibrate a H erm itian positive definite band $m$ atrix A and reduce its condition num ber (w ith respect to the tw o-norm ). S contains the scale factors, $S(i)=1 /$ squt $(A)(i, i))$, chosen so that the scaled matrix B w th elem ents $B(i, 7)=$ $S(i) * A(i, j) * S(j)$ has ones on the diagonal. This choioe of $S$ puts the condition num berofB $w$ ithin a factor $N$ of the sm allest possible condition num ber over allpossible diagonal scalings.

## ARGUMENTS

UPLO (input)
$=U$ : U ppertriangularofA is stored;
= L': Low er triangularofA is stored.
N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals ifU PLO $=\mathrm{L} \cdot \mathrm{KD}>=0$.

A (input) The upper or low er triangle of the H erm Itian band
$m$ atrix $A$, stored in the firstK $D+1$ row sof the array. The $j$ th colum n of A is stored in the $j$ th column of the amay A as follow s: if UPLO = U', A $(k d+1+i-j)=A(i, j)$ for $\max (1, j k d)<=i<=j$ if UPLO $=L \prime$ ', $A(1+i-j)=A(i, 7)$ for $\dot{j}=i<=m$ in $(n, \dot{j}+k d)$.

LD A (input)
The leading dim ension of the array A. LDA >= K D +1 .

SCALE (output)
If $\mathbb{N} F O=0$, SCA LE contains the scale factors for A.

SCOND (output)
If $\mathbb{N} F O=0, S C A$ LE contains the ratio of the sm allest SCA LE (i) to the largestSCA LE (i). If SCOND $>=0.1$ and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

AMAX (output)
A bsolute value of largestm atrix elem ent. IfA M AX is very close to overflow orvery close to underflow , the $m$ atrix should be scaled.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvahue.
$>0$ : if $\mathbb{N F O}=$ i, the $i$-th diagonal elem ent is nompositive.

## PURPOSE

cpbrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is $H$ erm itian positive definite and banded, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. N >=0.
KD (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO = U',orthe num berof subdiagonals ifU PLO
$=L^{\prime} . \mathrm{KD}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the m atrices B and X. NRHS >=0.

A (input) The upper or low er triangle of the $H$ erm itian band $m$ atrix $A$, stored in the firstK $D+1$ row s of the array. The jth colum n of A is stored in the jth column of the anay A as follow s: if UPLO = U',
$\mathrm{A}(\mathrm{kd}+1+i-j, j)=A(i, 7)$ for $\max (1, j \mathrm{jkd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{A}(1+i-j)=A(i, 7)$ for
j $=$ i< $=m$ in $(n, j+k d)$.

LD A (input)
The leading dim ension of the array A. LDA >= K D +1 .

AF (input)
The triangular factor $U$ or $L$ from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ orA $=\mathrm{L} * \mathrm{~L} * * \mathrm{H}$ of the band $m$ atrix A as com puted by CPBTRF, in the same storage form atas A (see A).

LDAF (input)
The leading dim ension of the array AF. LDAF >= $K D+1$.
$B$ (input) The righthand side $m$ atrix $B$.

LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, \mathbb{N})$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by CPBTRS. On exit, the im proved solution $m$ atrix $X$.

LD $X$ (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

## FERR (output)

The estim ated forw ard enrorbound for each solution vector $X(\mathcal{)}$ ) the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{H})$-XTRUE) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vectorX (i) (i.e., the sm allest relative
change in any elem entofA orB thatm akes X ( 7 ) an exactsolution).

W ORK (w orkspace)
dim ension ( $2 * N$ )

W ORK2 (w orkspace)
dim ension $(\mathbb{N})$

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i$ th argum enthad an illegalvalue

SU BROUTINE PBSTF_64 (UPLO, $\mathbb{N}], K D, A B,[L D A B],[\mathbb{N} F O])$

CHARACTER (LEN=1) ::UPLO
COMPLEX,D $\mathbb{I M}$ ENSION (:,:) ::AB
$\mathbb{N} T E G E R(8):: N, K D, L D A B, \mathbb{N} F O$
void qpbstf(char uplo, intn, int kd, com plex *ab, int ldab, int*info);
void qpbstf_ 64 (charuplo, long n, long kd, com plex *ab, long ldab, long *info);

## PURPOSE

cpbstf com putes a split C holesky factorization of a com plex H erm itian positive definite band $m$ atrix A.

This routine is designed to be used in conjunction with CHBGST.
The factorization has the form $A=S * * H * S$ where $S$ is a band $m$ atrix of the sam e bandw idth as A and the follow ing structure:

$$
\begin{aligned}
& S=(U \quad) \\
& \text { (M L ) }
\end{aligned}
$$

w here U is upper triangular of orderm $=(\mathrm{n}+\mathrm{kd}) / 2$, and L is low er triangular of ordern-m .

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U ppertriangle ofA is stored;
$=\mathrm{L}$ ': Low er triangle of A is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if
$\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of subdiagonals if UPLO
$=\mathbb{L}^{\prime} . \mathrm{KD}>=0$ 。

A B (input/output)
O n entry, the upper or low er triangle of the Her $m$ itian band $m$ atrix A, stored in the firstkd+1 row s of the amay. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{AB}(\mathrm{kd}+1+i-j, j)=A(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=i<=\dot{j}$ ifU PLO $=L^{\prime}, A B(1+i-j, j)=A(i, j)$ for $j=i<=m$ in $(n, j+k d)$.

On exit, if $\mathbb{N F O}=0$, the factors from the split Cholesky factorization $A=S * * H * S$. See Further D etails.

LD A B (input)
The leading dim ension of the array AB. LD A B >= K D +1 .
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue $>0:$ if $\mathbb{N} F O=$ i, the factorization could not be com pleted, because the updated elem enta (i,i) w as negative; the m atrix $A$ is notposilive definite.

## FURTHER DETAILS

The band storage schem e is illustrated by the follow ing exam ple, w hen $N=7, K D=2$ :

| $\mathrm{S}=(\mathrm{s} 11 \mathrm{~s} 12 \mathrm{~s} 13$ |  |
| :---: | :---: |
| ( | s22 s23 s24 ) |
| ( | s33 s34 ) |
| ( | s44 ) |
| ( | s53 s54 s55 |
| ( | s64 s65 s66 ) |
| ( | s75 s76 s77) |

If U PLO $=\mathrm{U}$ ', the amay A B holds:
on entry: on exit:

*     * a13 a24 a35 a46 a57 * * s13 s24 s53' s64's75'
* a12 a23 a34 a45 a56 a67 * s12 s23 s34 s54' s65's76' a11 a22 a33 a44 a55 a66 a77 s11 s22 s33 s44 s55 s66 s77

IfU PLO = L', the anay AB holds:
on entry: on exit:

```
a11 a22 a33 a44 a55 a66 a77 s11 s22 s33 s44 s55
s66 s77 a21 a32 a43 a54 a65 a76 * s12's23's34'
s54 s65 s76 * a31 a42 a53 a64 a64 * * s13'
s24's53 s64 s75 * *
```

A ray elem entsm arked * are notused by the routine; s12' denotes con $\mathfrak{j}(s 12)$; the diagonalelem ents of $S$ are real.

## PURPOSE

cpbsv com putes the solution to a com plex system of linear equations
$A * X=B, w h e r e A$ is an $N$ boy $N$ H erm itian positive defintie band $m$ atrix and X and B are N -by-N R H S m atrices. The Cholesky decom position is used to factorA as
$A=U * * H * U$, if $U P L O=U '$, or
$A=L * L \star * H$, if U PLO $=\mathrm{L}$ ',
$w$ here $U$ is an uppertriangularband $m$ atrix, and $L$ is a low er triangular band $m$ atrix, w ith the sam e num ber of superdiagonals or subdiagonals as A. The factored form of A is then used to solve the system ofequations $A * X=B$.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix $A . N>=0$.

ND IA G (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if P PLO
$=L^{\prime} \cdot \mathrm{ND} \mathbb{I} G>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS $>=0$.

A (input/output)
O $n$ entry, the upper or low er triangle of the Her -
$m$ itian band m atrix A, stored in the firstND IA G +1
row s of the array. The $j$ th colum $n$ of $A$ is stored
in the jth colum $n$ of the array A as follow s: if
 $\max (1, j \mathrm{jND} \mathrm{IAG})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{A}(1+i-j)$
$=A(i, j)$ for $j<i<=m$ in $(\mathbb{N}, j+N D$ IA G ). See below for furtherdetails.

On exit, if $\mathbb{N} F O=0$, the triangular factor $U$ orL from the Cholesky factorization $A=U * * H * U$ or $A=$ $\mathrm{L} * \mathrm{~L} * * H$ of the band $m$ atrix $A$, in the sam e storage form atas A.

LD A (input)
The leading dim ension of the aray A. LD A >= N D IA G +1.
B (input/output)
O n entry, the N foy-NRHS righthand sidem atrix B. On exit, if $\mathbb{N F O}=0$, the N boy -N RH S solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \operatorname{LDB}>=$ $\max (1, N)$.

IN FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvałue $>0:$ if $\mathbb{N F O}=i$, the leading $m$ inoroforder iof $A$ is notpositive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

## C INTERFACE

\#include < sunperfh>
void qpbsvx (char fact, charuplo, int n, int ndiag, int nihs, com plex *a, int lda, com plex *af, int ldaf, char equed, float *s, com plex *b, int ldb, com plex *x, int ldx, float *roond, float *ferr, float *bers, int*info);
void qpbsvx_64 (char fact, char uplo, long n, long ndiag, long nrhs, com plex *a, long lda, com plex *af, long ldaf, charequed, float *s, com plex *b, long ldb, com plex *x, long ldx, float *roond, float *ferr, float *berr, long *info);

## PURPOSE

cpbsvx uses the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ or $\mathrm{A}=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{H}$ to com pute the solution to a com plex system of linear equations
$A * X=B$, where $A$ is an $N$-by $-N$ H erm itian positive definthe band m atrix and X and B are N -by-N RH S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :

$$
\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B
$$

W hether or not the system willbe equilibrated depends on the
scaling of the m atrix A , but ifequilibration is used, A is
overw ritten by diag $(S) * A * \operatorname{diag}(S)$ and $B$ by diag $(S) * B$.
2. IfFACT $=\mathrm{N}$ 'or E ', the Cholesky decom position is used to
factorthem atrix A (afterequilibration ifFACT = E) as
$A=U * * H * U$, if $U P L O=U$ ', or
$\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{H}$, if $\mathrm{UPLO}=\mathrm{L}$ ',
$w$ here $U$ is an upper triangularband $m$ atrix, and $L$ is a low er
triangularband $m$ atrix.
3. If the leading i-by-iprincipal $m$ inor is not positive definite,
then the routine retums w ith $\mathbb{N} F O=$ i. O therw ise, the factored
form of A is used to estim ate the condition num ber of the $m$ atrix
A. If the reciprocal of the condition num ber is less than $m$ achine
precision, $\mathbb{I N}$ FO $=\mathrm{N}+1$ is retumed as a w aming, but the routine
still goes on to solve for X and com pute errorbounds as described below .
4. The system of equations is solved for $X$ using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration w as used, the $m$ atrix $X$ is prem ultiplied by
diag (S) so that it solves the original system before equilibration.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of the
$m$ atrix $A$ is supplied on entry, and ifnot, whether them atrix A should be equilibrated before it is factored. = F ': On entry, AF contains the factored form ofA. IfEQUED = Y', them atrix A has been equilibrated $w$ ith scaling factors given by $S$.
A and A F w illnotbe m odified. = N ': Them atrix
A w ill.be copied to AF and factored.
$=\mathrm{E}$ ': The matrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
$=\mathrm{U}$ ': Upper triangle ofA is stored;
= $\mathbb{L}$ ': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix $A . N>=0$.

ND IA G (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num berof subdiagonals ifUPLO $=\mathbb{L}^{\prime} . \mathrm{NDIAG}>=0$.

NRHS (input)
The num ber of right-hand sides, ie., the num ber
of colum ns of the $m$ atriges $B$ and X. NRH S $>=0$.

A (input/output)
O $n$ entry, the upper or low er triangle of the Her $m$ itian band $m$ atrix A, stored in the firstND IA G +1 row s of the amay, exceptifFACT = $\mathrm{F}^{\prime}$ and EQUED $=Y \prime$, then A m ustcontain the equilibrated $m$ atrix diag $(S) * A$ *diag $(S)$. The $j$ th colum n ofA is stored in the $j$ th colum $n$ of the array $A$ as follow $s$ : if $\left.\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{A} \mathbb{N D I A G + 1 + i - j}\right)=A(i, j$ for $\max (1, j \mathrm{j} D \mathrm{IA} \mathrm{G})<=\dot{i}=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}$ ', A ( $1+i-j$ ) $=A(i, j)$ for $\dot{j}=i<=m$ in $(\mathbb{N}, \dot{j}+N D I A G)$. See below for furtherdetails.

On exit, ifFACT = E' and EQUED = Y', A is overw ritten by diag $(\mathrm{S}) \star A$ *diag $(\mathrm{S})$.

LD A (input)
The leading dim ension of the array A. LDA >= ND IA G +1.

AF (input/output)
If FACT $=F^{\prime}$, then $A F$ is an inputargum entand on entry contains the triangular factor $U$ or $L$ from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}$ or $\mathrm{A}=$ $L * L * * H$ of the band $m$ atrix $A$, in the sam e storage
form atas A (see A). IfEQUED = Y', then AF is the factored form of the equilibrated $m$ atrix A.

If $F A C T=N$ ', then $A F$ is an output argum ent and on exitretums the triangular factor $U$ orL from the Cholesky factorization $A=U * * H * U$ or $A=$ L*L**H.

IfFACT = E', then AF is an output argum ent and on exit retums the triangular factor $U$ orL from the Cholesky factorization $A=U * * H * U$ or $A=$ L*L**H of the equilibrated $m$ atrix $A$ (see the description of $A$ for the form of the equilibrated m atrix) .

LD AF (input)
The leading dim ension of the amay AF. LDAF >= N D IA G +1.

EQUED (input)
Specifies the form of equilibration thatw as done.
$=\mathrm{N}^{\prime}$ : N o equilibration (alw ays true ifFACT = N 7 .
$=$ Y ': Equilibration w as done, i.e., A has been replaced by diag $(\mathrm{S})$ * A * diag $(\mathrm{S})$. EQUED is an inputargum entifFACT = F ; otherw ise, it is an outputargum ent.

S (input/output)
The scale factors forA; notaccessed if EQUED = $N^{\prime} . S$ is an inputargum entifFACT=F'; otherw ise, S is an outputargum ent. IfFACT $=\mathrm{F}^{\prime}$ and EQUED $=Y$ ', each elem entof m ustbe positive.

B (input/output)
O n entry, the N $-b y-N R H S$ righthand side m atrix B .
On exit, if EQUED $=\mathrm{N}$ ', B is notm odified; if EQUED $=Y$ ', $B$ is overw ritten by diag $(S)$ * $B$.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{I N} F O=\mathrm{N}+1$, the N -by-NRHS solution
$m$ atrix $X$ to the original system ofequations.
$N$ ote that if EQ UED $=Y$ ', A and B arem odified on exit, and the solution to the equilibrated system is inv (diag (S ) ) *X .

## LD X (input)

The leading dim ension of the anay X . LD X >= $\max (1, N)$.

## RCOND (output)

The estim ate of the reciprocal condition num ber of the $m$ atrix $A$ after equilibration (if done). If RCOND is less than them achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to w orking precision. This condition is indicated by a retum code of $\mathbb{N} F O>0$.
FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{O})$, FERR ( $)$ ) is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in (X ( $)$-X TRUE) divided by the magnitude of the largestelem entin $\mathrm{X}(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard emror of each
solution vectorX (j) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )

W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit
< 0 : if $\mathbb{N} F O=-$ i, the $i$-th argum enthad an ille-
galvalue
> 0 : if $\mathbb{N F F O}=\mathrm{i}$, and i is
$<=N$ : the leading $m$ inoroforderiof $A$ is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1$ : U is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to $w$ orking precision. Nevertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

## FURTHER DETAILS

\section*{PURPOSE}
cpbtrf com putes the C holesky factorization of a com plex H er\(m\) itian positive definite band \(m\) atrix A.

The factorization has the form
\[
\begin{aligned}
& A=U * * H * U, \text { if } U P L O=U^{\prime}, \text { or } \\
& A=L * L * * H, \text { if } U P L O=L ',
\end{aligned}
\]
\(w\) here \(U\) is an uppertriangularm atrix and \(L\) is low er triangular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Uppertriangle of \(A\) is stored;
\(=1 \mathrm{~L}\) ': Low er triangle of A is stored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num berof superdiagonals of the \(m\) atrix \(A\) if
UPLO = U', orthe num berof subdiagonals ifUPLO
\(=L^{\prime} . K D>=0\) 。

A (input/output)
O \(n\) entry, the upper or low er triangle of the H er\(m\) tian band \(m\) atrix \(A\), stored in the firstKD +1 row s of the array. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the amay \(A\) as follow \(s\) : if \(\mathrm{UPLO}=U ', A(k d+1+i-j, j)=A(i, j)\) for \(m a x(1, j\) \(\mathrm{kd})<=i<=j\) if \(\mathrm{UPLO}=\mathbb{L}, \mathrm{A}(1+i-j, j)=A(i, j)\) for \(j<=i<=m\) in \((n, j+k d)\).

On exit, if \(\mathbb{N} F O=0\), the triangular factor \(U\) orL from the Cholesky factorization \(A=U * * H * U\) orA \(=\) L*L**H of the band \(m\) atrix A, in the sam e storage form atas A.

The leading dim ension of the array A. LDA >= K D +1 .
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the leading \(m\) inoroforder is notpositive definite, and the factorization could notbe com pleted.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(N=6, K D=2\), and \(U P L O=U:\)
On entry: On exit:
```

    * a13 a24 a35 a46 * * u13 u24 u35
    u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55
u66

```
Sim ilarly, if UPLO = L 'the form atofA is as follow s:
On entry: Onexit:
    a11 a22 a33 a44 a55 a66 \(111 \quad 122 \quad 133144 \quad 155\)
166
    a21 a32 a43 a54 a65 * \(121 \quad 132143154165\)
*
    a31 a42 a53 a64 * * 131142153164 *
*

A rray elem entsm arked * are notused by the routine.

\section*{PURPOSE}
cpbtre solyes a system of linear equations \(A * X=B\) with a H erm itian positive definite band \(m\) atrix A using the C holesky factorization \(A=U * * H * U\) orA \(=L * L * * H\) com puted by CPBTRF .

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=\mathrm{U}\) : U Upertriangular factorstored in A;
\(=1\) ': Low er triangular factorstored in A.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num berof superdiagonals of the \(m\) atrix \(A\) if \(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of subdiagonals if \(\mathrm{U} P L O\)
\(=L^{\prime} . K D>=0\) 。

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrix B. NRH S \(>=0\).

A (input) The triangular factor \(U\) or L from the Cholesky factorization \(A=U * * H * U\) orA \(=L * L * * H\) of the band \(m\) atrix \(A\), stored in the first \(K D+1\) row \(s\) of the array. The jth colum n of \(U\) orL is stored in the jth colum \(n\) of the anay \(A\) as follow s: if UPLO \(=U \prime, A(k d+1+i-j)=U(i, j)\) for \(m a x(1, j\) \(\mathrm{kd})<=\mathrm{i}<=\dot{j}\) ifUPLO \(=\mathrm{L}\) ', A \((1+i-j, j=\mathrm{j}(i, j)\) for \(\dot{j}=i<=m\) in \((n, j+k d)\).

LD A (input)
The leading dim ension of the aray A. LDA >= K D +1 .

B (input/output)

O \(n\) entry, the right hand side \(m\) atrix \(B\). On exit, the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue

\section*{C INTERFACE}
\#include <sunperfh>
void qpoequ (intn, com plex *a, int lda, float *scale, float
*scond, float *am ax, int *info);
void qpoequ_64 (long n, com plex *a, long lda, float *scale, float*scond, float *am ax, long *info);

\section*{PURPOSE}
cpoequ computes row and colum n scalings intended to equilibrate a Herm itian positive definite matrix A and reduce its condition num ber (w th respect to the tw o-norm ). \(S\) contains the scale factors, \(S(i)=1 /\) sqrt (A \((i, i))\), chosen so that the scaled matrix B w ith elem ents \(\mathrm{B}(1,7)=\) S (i)*A \((i, 7) * S(i)\) has ones on the diagonal. This choige of \(S\) puts the condition num ber ofB w ithin a factor N of the sm allest possible condition num ber over allpossible diagonalscalings.

\section*{ARGUMENTS}

N (input) The order of the m atrix A. N >= 0 .

A (input) The N -by-N Herm itian positive definite m atrix whose scaling factors are to be com puted. Only the diagonalelem ents ofA are referenced.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

SCALE (output)
If \(\mathbb{N} F O=0, S C A L E\) contains the scale factors for A.

\section*{SCOND (output)}

If \(\mathbb{N} F O=0, S C A L E\) contains the ratio of the sm allest SCA LE (i) to the largestSCA LE (i). IfSC O ND >= 0.1 and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the \(m\) atrix should be scaled.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=\) i, the \(i\)-th diagonal elem ent is nonpositive.

\section*{C INTERFACE}
\#include <sunperfh>
void qposvx (char fact, charuplo, intn, int nrhs, com plex
*a, int lda, com plex *af, intldaf, charequed, float *s, com plex *b, int ldb, com plex *x, int ldx, float *roond, float *ferr, float *berr, int *info);
void qposvx_64 (char fact, charuplo, long n, long nrhs, com plex *a, long lda, com plex *af, long ldaf, char equed, float*s, com plex *b, long ldb, com plex *x, long ldx, float *roond, float * ferr, float *berr, long *info);

\section*{PURPOSE}
cposvx uses the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) to com pute the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\)-by-N H erm tian positive definthe \(m\) atrix and \(X\) and \(B\) are \(N\)-by-N RH S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=\mathrm{E}\) ', real scaling factors are computed to equilibrate the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
W hether or not the system willbe equilibrated depends on the
scaling of the m atrix A , but if equilibration is used, A
overw rilten by diag \((\mathrm{S}) \star A\) *diag \((\mathrm{S})\) and B by diag \((\mathrm{S}) \star\) B .
2. IfFACT = N 'or E', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT =E)
as
\[
\begin{aligned}
& A=U \star * H * U, \text { if } U P L O=U ' \text {, or } \\
& A=L * L * * H, \text { if } U P L O=L^{\prime},
\end{aligned}
\]
w here U is an upper triangularm atrix and L is a low er triangular
\(m\) atrix.
3. If the leading i-by-iprincipal m inor is not positive definite,
then the routine retums \(w\) ith \(\mathbb{N F O}=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine
precision, \(\mathbb{N} F O=N+1\) is retumed as a \(w\) aming, but the routine
stillgoes on to solve forX and com pute emorbounds as described below .
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry, and if not, whether them atrix A should be equilibrated before it is factored. = F': On entry, AF contains the fac-
tored form ofA. IfEQUED \(=Y\) ', them atrix \(A\) has been equilibrated \(w\) ith scaling factors given by \(S\). A and A F w illnotbe m odified. \(=\mathrm{N}\) ': The m atrix A w illle copied to A F and factored.
= E : The m atrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
= U :: Uppertriangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of the matrix A. \(N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrices \(B\) and X. NRHS \(>=0\).
A (input/output)
O n entry, the \(H\) erm itian \(m\) atrix A, except ifFACT =
\(\mathrm{F}^{\prime}\) and EQUED = Y ', then A mustcontain the equilibrated \(m\) atrix diag \((S) \star A * d i a g(S)\). If U PLO \(=\) U', the leading N -by-N uppertriangular partofA contains the upper triangularpart of the \(m\) atrix A, and the strictly low ertriangularpartofA is not referenced. If \(\mathrm{PLO}=\mathrm{L}\) ', the leading N -by N low er triangularpart ofA contains the low ertriangularpart of the m atrix A, and the strictly upper triangular part of A is not referenced. A is notm odified ifFACT = F or N', or ifFACT = E'and EQUED = N 'on exit.

Onexit, ifFACT=E' and EQUED = Y', A is overw rilten by diag ( S ) A A *diag ( S ) .

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

AF (input/output)
If \(F A C T=F\) ', then \(A F\) is an inputargum entand on entry contains the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), in the sam e storage form at as A. IfEQUED ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix diag \((S) * A * \operatorname{diag}(S)\).

If \(F A C T=N\) ', then \(A F\) is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) of the originalm atrix A.

If \(F A C T=E\) ', then \(A F\) is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(L * L * * H\) of the equilibrated \(m\) atrix \(A\) (see the description of \(A\) for the form of the equilibrated \(m\) atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=\mathrm{N}^{\prime}\) : N o equilibration (alw ays true ifFACT = N).
\(=Y^{\prime}:\) Equilibration \(w\) as done, i.e., A has been replaced by diag (S) * A * diag (S). EQUED is an inputargum ent if \(\mathrm{FACT}=\mathrm{F}\) '; otherw ise, it is an outputargum ent.

S (input/output)
The scale factors forA ; not accessed if EQUED = \(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum ent if \(\mathrm{FACT}=\mathrm{F}\) '; otherw ise, S is an outputargum ent. IfFACT = \(\mathrm{F}^{\prime}\) and EQUED = Y', each elem entofS m ustbe positive.

B (input/output)
On entry, the \(N-b y-N R H S\) righthand side \(m\) atrix \(B\).
On exit, if EQUED \(=N\) ', \(B\) is notm odified; if EQUED \(=Y\) ', \(B\) is overw ritten by diag \((S) * B\).

LD B (input)
The leading dim ension of the anay \(B\). LD B \(>=\) \(\max (1, \mathbb{N})\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the N -by-NRH S solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that if EQUED \(=Y\) ', A and \(B\) are m odified on exit, and the solution to the equilibrated system is inv (diag (S))*X .

LD X (input)
The leading dim ension of the array X . LDX >= \(\max (1, \mathbb{N})\).

RCOND (output)
The estim ate of the reciprocal condition num berof the \(m\) atrix \(A\) after equilibration (if done). If

RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N} F O>0\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O})\), FERR ( \()\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in (X ( \()\)-X TRU E) divided by the magnitude of the largestelem ent in \(\mathrm{X}(\mathcal{j})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vectorX (j) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(j\) ) an exact solution).

W ORK (w orkspace)
dim ension ( \(2 \star \mathrm{~N}\) )

W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N}\) FO (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F F O}=i\), and \(i\) is
<= \(N\) : the leading \(m\) inor oforderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND would suggest.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).

A (input) The upper or low er triangle of the H erm itian \(m\) atrix A, packed colum nw ise in a linear anray. The \(j\) th column of A is stored in the array A as follows: if UPLO = U',A ( \(i+(j-1) * j 2)=A(i, 7)\) for \(1<=i<=j\) ifUPLO = L', A ( \(\left.i+(j-1)^{*}(2 n-j) / 2\right)\) \(=A(i, 7)\) for \(j=i<=n\).

SCALE (output)
If \(\mathbb{N} F O=0, S C A L E\) contains the scale factors for A.

\section*{SCOND (output)}

If \(\mathbb{N} F O=0, S C A\) LE contains the ratio of the sm allest SCA LE (i) to the largestSCA LE (i). If SC OND \(>=0.1\) and \(A M A X\) is neither too large nor too sm all, it is notw orth scaling by SC A LE .

AMAX (output)
A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the m atrix should be scaled.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
> 0 : if \(\mathbb{N} F O=i\), the \(i\) th diagonal elem ent is nonpositive.

void qppsv_64 (char uple, long n, long nrhs, com plex *a, com plex *b, long ldb, long *info);

\section*{PURPOSE}
cppsv com putes the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\)-by-N Herm itian positive defintie \(m\) atrix stored in packed form at and \(X\) and \(B\) are \(N\) by \(-N\) RH \(S\) \(m\) atrices.

The Cholesky decom position is used to factorA as
\[
\begin{aligned}
& A=U * * H * U, \text { if } U P L O=U ' \text { or } \\
& A=L * L * * H, \text { if } U P L O=L \prime
\end{aligned}
\]
where \(U\) is an upper triangularm atrix and \(L\) is a low er triangular \(m\) atrix. The factored form ofA is then used to solve the system ofequations \(A * X=B\).

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) : : U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

A (input/output)
O \(n\) entry, the upper or low ertriangle of the Her \(m\) itian \(m\) atrix A, packed colum nw ise in a linear array. The jth column of A is stored in the array A as follows: if UPLO = U',A (i+ (j)
 \((j-1)^{*}(2 n-j / 2)=A(i, 7)\) for \(\dot{j}=i<=n\). See below for further details.

On exit, if \(\mathbb{N} F O=0\), the factor \(U\) orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), in the sam e storage form at as A.

B (input/output)
On entry, the N -by -NRH S righthand side m atrix B. On exit, if \(\mathbb{N F O}=0\), the N boy \(-\mathrm{NRH} S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N}\) FO \(=i\), the leading \(m\) inoroforder iof \(A\) is notposilive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing
exam ple w hen \(N=4, \mathrm{UPLO}=\mathrm{U}\) ':

Tw o-dim ensionalstorage of the H erm itian m atrix A :
```

a11 a12 a13 a14
a22 a23 a24
a33 a34 (aij= congj (aï))
a44

```

Packed storage of the upper triangle ofA:
\(A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]\)

\section*{C INTERFACE}
\#include <sunperfh>
void qppsvx (char fact, charuple, intn, int nrhs, com plex *a, com plex *af, char equed, float *s, com plex *b, int ldlo, com plex *x, int ldx, float *rcond, float * ferrr, float *berr, int *info);
void qppsvx_64 (char fact, char uple, long n, long nrhs, com plex *a, com plex *af, charequed, float*s, com plex *b, long ldb, com plex *x, long ldx, float *rcond, float *ferr, float *berr, long *info);

\section*{PURPOSE}
cppsvx uses the Cholesky factorization \(A=U * * H * U\) or \(A=\) L*L**H to com pute the solution to a com plex system of linear equations
\(A * X=B, w h e r e A\) is an \(N\) boy \(-N\) H erm itian positive defintie \(m\) atrix stored in packed form atand \(X\) and \(B\) are \(N\) boy \(-N\) RH S m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1.IfFACT = E', real scaling factors are computed to equilibrate
the system :
diag \((\mathrm{S})\) * A * diag \((\mathrm{S})\) * inv \((\operatorname{diag}(\mathrm{S}))\) * X \(=\operatorname{diag}(\mathrm{S})\) * B
W hether or not the system w illbe equilibrated depends on the
scaling of them atrix A , but ifequilibration is used, A is
overw ritten by diag \((\mathrm{S}) \star A\) *diag \((\mathrm{S})\) and B by diag \((\mathrm{S}) \star\) B .
2. IfFACT = N 'or E', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT = E ) as
\(A=U\) * \(U\), iff \(U P L O=U\) ', or
\(A=L * L \prime\), ifUPLO \(=L \prime\),
where \(U\) is an upper triangularm atrix, \(I\) is a low er triangular
\(m\) atrix, and 'indicates conjugate transpose.
3. Ifthe leading iboy-iprincipal \(m\) inor is not positive definite, then the routine retums w ith \(\mathbb{N N F O}=i\). O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine
precision, \(\mathbb{N N} F O=N+1\) is retumed as a w aming, but the routine
stillgoes on to solve for X and com pute emorbounds as described below .
4.The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration w as used, the \(m\) atrix \(X\) is prem ultiplied by diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry, and if not, w hether the m atrix A should be equilibrated before it is factored. = F': On entry, AF contains the factored form of . IfEQUED \(=Y\) ', them atrix A has been equilibrated w ith scaling factors given by \(S\).

A and AF w illnotbe m odified. \(=\mathrm{N}\) ': The m atrix
A w ill.be copied to A F and factored.
= E': The matrix A w ill be equilibrated if necessary, then copied to A F and factored.

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collum ns of the \(m\) atrioes \(B\) and X. NRH \(S>=0\).

A (input/output)
On entry, the upper or low er triangle of the H erm itian \(m\) atrix A, packed colum nw ise in a linear array, except ifFACT = F'andEQUED = \(Y\) ', then
A \(m\) ust contain the equilibrated \(m\) atrix diag \((S) * A * \operatorname{diag}(S)\). The jth column ofA is stored in the array A as follow s: if UPLO = U', A (i+ \((j-1) * j 2)=A(i, 7)\) for \(1<=i<=j\) if \(U P L O=L\), A \((i+(j-1) *(2 n-j) / 2)=A(i, j)\) for \(j=i<=n\). See below for further details. A is not \(m\) odified if FACT = F' or \(N\) ', orifFACT = E'andEQUED = N 'on exit.

On exit, ifFACT=E' and EQUED = \(\mathrm{Y}^{\prime}, \mathrm{A}\) is overw ritten by diag \((S) * A * d i a g(S)\).

AF (input/output)
If \(F A C T=F\) ', then \(A F\) is an inputargum entand on entry contains the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(L \star L * * H\), in the sam e storage form at as \(A\). IfEQ \(U E D\) ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix \(A\).

If \(F A C T=N\) ', then \(A F\) is an output argum ent and on exit retums the triangular factor \(U\) orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) of the originalm atrix A.

IfFACT \(=\mathrm{E}\) ', then \(A F\) is an output argum ent and on exit retums the triangular factor \(U\) orl from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) of the equilibrated \(m\) atrix A (see the description of \(A\) for the form of the equilibrated
matrix).

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=\mathrm{N}^{\prime}\) : N o equilibration (alw ays true ifFACT = N 7 .
\(=Y\) ': Equilibration w as done, i.e., A has been replaced by diag \((\mathrm{S}) ~ * A * \operatorname{diag}(\mathrm{~S})\). EQUED is an inputargum entifFACT = F'; otherw ise, it is an outputargum ent.
\(S\) (input/output)
The scale factors forA; not accessed if EQUED = \(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum entifFACT=F'; otherw ise, S is an outputargum ent. IfFACT=\(=\mathrm{F}^{\prime}\) and
EQUED \(=Y\) ', each elem entof m ustbe posilive.
B (input/output)
On entry, the N -by-NRHS righthand side m atrix B.
On exit, if EQUED = \(N^{\prime}\) ', B is notm odified; if
\(E Q U E D=Y ', B\) is overw ritten by diag \((S) * B\).

LD B (input)
The leading dim ension of the array B . LD B \(>=\) \(\max (1, N)\).

X (output)
If \(\mathbb{N}\) FO \(=0\) or \(\mathbb{N}\) FO \(=N+1\), the \(N\) boy \(-N\) RH S solution
\(m\) atrix \(X\) to the original system ofequations.
N ote that ifEQUED = Y',A and B arem odified on exit, and the solution to the equilibrated system is inv \((\) diag \((S)) \star X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num ber of the \(m\) atrix A after equilibration (ifdone). If
RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singularto w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X\) ( \()\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X)\). If \(X T R U E\) is the true solution corresponding to \(X(\mathcal{J}), \operatorname{FERR}(\mathcal{)}\) ) is an estim ated upperbound forthe \(m\) agnitude of the largest ele-
\(m\) ent in \((X(\mathcal{O})\) X TRUE \()\) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).
W ORK (w orkspace)
dím ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}\) : the leading m inor oforderiof A is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singularto working precision. Nevertheless, the solution and error bounds are com puted because there are a num berof siluations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing exam ple when \(N=4, U P L O=U\) ':

*z, intldz, int *info);
void qpteqr_64 (charcom pz, long n, float *d, float *e, com plex *z, long ldz, long *info);

\section*{PURPOSE}
cpteqr com putes alleigenvalues and, optionally, eigenvectors of a sym \(m\) etric posilive definite tridiagonalm atrix by first factoring the \(m\) atrix using SPTTRF and then calling CBD SQR to com pute the singularvalues of the bidiagonal factor.

This routine com putes the eigenvalues of the positive definte tridiagonal m atrix to high relative accuracy. This m eans that if the eigenvalues range overm any orders ofm agnitude in size, then the sm alleigenvalues and comesponding eigenvectors \(w\) illbe com puted m ore accurately than, for exam ple, w ith the standard \(Q R\) m ethod.

The eigenvectors of a fullorband positive definite Herm itian \(m\) atrix can also be found ifCHETRD, CHPTRD, orCHBTRD has been used to reduce this \(m\) atrix to tridiagonal form . (The reduction to tridiagonal form, how ever, \(m\) ay preclude the possibility of obtaining high relative accuracy in the sm all eigenvalues of the originalm atrix, if these eigenvalues range overm any orders ofm agnitude.)

\section*{ARGUMENTS}

COM PZ (input)
= N ': C om pute eigenvalues only .
\(=\mathrm{V}\) : C om pute eigenvectors of original H erm itian \(m\) atrix also. A may \(Z\) contains the unitary \(m\) atrix used to reduce the originalm atrix to tridiagonal form . = I': C om pute eigenvectors of tridiagonal \(m\) atrix also.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).
D (input/output)
O n entry, the \(n\) diagonalelem ents of the tridiagonalm atrix. On norm alexit, D contains the eigenvalues, in descending order.

E (input/output)
O \(n\) entry, the ( \(n-1\) ) subdiagonal elem ents of the tridiagonal matrix. On exit, E hasbeen destroyed.

Z (input) \(O n\) entry, if \(C O M P Z=V\) ', the unitary \(m\) atrix used in the reduction to tridiagonal form. On exit, if \(C O M P Z=V\) ', the orthonorm aleigenvectors of the original Herm tian matrix; if COM PZ = I', the orthonorm al eigenvectors of the tridiagonal \(m\) atrix. If \(\mathbb{N} F O>0\) on exit, \(Z\) contains the eigenvectors associated with only the stored eigenvalues. If COMPZ \(=N\) ', then \(Z\) is not referenced.

LD Z (input)
The leading dim ension of the amray Z . LD \(\mathrm{Z}>=1\), and ifCOM PZ \(=V\) 'or \(I\) ', LD \(Z>=\max (1, N)\).

W ORK (w orkspace)
dim ension ( \(4 * \mathrm{~N}\) )
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
< \(0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue.
> 0 : if \(\mathbb{N} F O=i\), and \(i\) is: <= \(N\) the Cholesky factorization of the \(m\) atrix could notbe perform ed because the \(i\)-th principalm inorw as not positive definite. > N the SVD algorithm failed to converge; if \(\mathbb{N} F O=N+\) i, ioff-diagonal elem ents of the bidiagonal factor did not converge to zero.

cptrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is H erm itian positive definite and tridiagonal, and provides error bounds and backw ard errorestim ates for the solution.

\section*{ARGUMENTS}

UPLO (input)
Specifies w hether the superdiagonal or the subdiagonal of the tridiagonalm atrix A is stored and the form of the factorization:
\(=\mathrm{U}\) ': OFFD is the superdiagonalofA, and A = \(\mathrm{U} * * \mathrm{H} * \mathrm{D}\) IA G * U ;
\(=\mathrm{L}\) : : OFFD is the subdiagonal of A , and \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{D} \operatorname{IA} \mathrm{G} * \mathrm{~L} * * \mathrm{H}\). (The two form s are equivalent if A is real.)

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

D IA G (input)
The n realdiagonalelem ents of the tridiagonal matrix A.

OFFD (input)
The ( \(n-1\) ) off-diagonalelem ents of the tridiagonal \(m\) atrix A (see UPLO).

D IA GF (input)
Then diagonalelem ents of the diagonal matrix D IA G from the factorization com puted by CPTTRF.
OFFDF (input)
The ( \(n-1\) ) off-diagonalelem ents of the unit bidiagonal factor \(U\) orL from the factorization computed by CPTTRF (see UPLO).
\(B\) (input) The righthand side \(m\) atrix \(B\).
LD B (input)
The leading dim ension of the array \(B\). LD B \(>=\) \(\max (1, \mathbb{N})\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by CPTTRS. On exit, the im proved solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the array X . LD X >= \(\max (1, \mathbb{N})\).

FERR (output)
The forw ard errorbound foreach solution vector \(X\) ( \()\) (the \(j\) th colum \(n\) of the solution \(m\) atrix \(X\) ). IfXTRUE is the true solution comesponding to \(X(\mathcal{J})\), FERR \((\mathcal{F})\) is an estim ated upperbound for the \(m\) agnitude of the largestelem ent in ( \(X(\mathcal{\jmath})\) XTRUE) divided by the \(m\) agnitude of the largestelem ent in X ( 7 ).

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector X (j) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)

void qptsv_64 (long n, long nrhs, float *diag, com plex *sub, com plex *b, long ldlo, long *info);

\section*{PURPOSE}
cptsv com putes the solution to a com plex system of linear equations \(A * X=B\), where \(A\) is an \(N\) boy \(-N\) H erm itian positive definite tridiagonalm atrix, and X and B are N boy-NRHS \(m\) atrices.
\(A\) is factored as \(A=L * D * L * * H\), and the factored form of \(A\) is then used to solve the system ofequations.

\section*{ARGUMENTS}

N (input) The order of the matrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRH S >=0.

D IA G (input/output)
O n entry, the \(n\) diagonalelem ents of the tridiago-
nalm atrix A. On exit, the \(n\) diagonalelem ents of the diagonalm atrix D IA G from the factorization \(A\) \(=\mathrm{L} * \mathrm{D}\) IA G *L**H.

SU B (input/output)
O \(n\) entry, the \((n-1)\) subdiagonal elem ents of the tridiagonalm atrix A. On exit, the ( \(\mathrm{n}-1\) ) subdiagonalelem ents of the unitbidiagonal factorL from the L*D IA G *L**H factorization ofA. SUB can also be regarded as the superdiagonal of the unitbidiagonalfactor \(U\) from the \(U * * H * D I A G * U\) factorization of A.

B (input/output)
On entry, the N -by -NRH S righthand side m atrix B.
On ex弌, if \(\mathbb{N F O}=0\), the N boy \(-\mathrm{NRH} S\) solution
m atrix X .

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

IN FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=i\), the leading \(m\) inoroforder \(i\) is not positive definite, and the solution has not been com puted. The factorization has not been com pleted unless \(i=N\).

\section*{C INTERFACE}
\#include <sunperfh>
void qptsvx (char fact, intn, intnrhs, float*diag, com plex *sub, float *diagf, com plex *subf, com plex *b, int ldb, com plex *x, int ldx, float *roond, float * ferr, float *berr, int *info);
void qptsvx_64 (char fact, long n, long nrhs, float *diag, com plex *sub, float *diagf, com plex *subf, com plex *b, long ldlo, com plex *x, long ldx, float *rcond, float * ferr, float *berr, long *info);

\section*{PURPOSE}
cptsvx uses the factorization \(A=L * D *\) \({ }^{*} * H\) to com pute the solution to a com plex system of linear equations \(A * X=B\), where A is an N -by N H erm itian positive definite tridiagonal \(m\) atrix and X and B are N -by-N R H S m atrioes.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N^{\prime}\), them atrix \(A\) is factored as \(A=L * D{ }^{*} \mathrm{~L} * * H\), w here L
is a unit low erbidiagonalm atrix and D is diagonal. The factorization can also be regarded as having the form
\(A=U * * H * D * U\).
2. If the leading iloy-iprincipal \(m\) inor is not posilive definite,
then the routine retums w ith \(\mathbb{N N F O}=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the
m atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine
precision, \(\mathbb{N}\) FO \(=\mathrm{N}+1\) is retumed as a w aming, but the routine
still goes on to solve for X and com pute emorbounds as described below .
3.The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry \(=\mathrm{F}^{\prime}\) : On entry, D IA GF and SUBF contain the factored form of A. D IA G , SUB, D IA G F , and SUBF w illnotbe m odified.
\(=N\) ': Them atrix A w illbe copied to D IA GF and SUBF and factored.

N (input) The order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the m atriges B and X. NRH S \(>=0\).

D IA G (input)
The \(n\) diagonalelem ents of the tridiagonal matrix A.

SUB (input)
The ( \(n-1\) ) subdiagonalelem ents of the tridiagonal \(m\) atrix A.

D IA GF (input/output)
IfFACT = \(\mathrm{F}^{\prime}\), then \(D \mathrm{IAGF}\) is an inputargum entand on entry contains the \(n\) diagonalelem ents of the diagonalm atrix D IA G from the \(L * D\) IA G *L **H factorization ofA. IfFACT \(=N\) ', then D IA GF is an outputargum entand on exitcontains the \(n\) diagonal
elem ents of the diagonal \(m\) atrix \(D \mathbb{I A}\) from the \(\mathrm{L} * \mathrm{D} \mathbb{I A}\) G \(\mathrm{L}^{* * *}{ }^{\mathrm{H}}\) factorization ofA.

\section*{SU BF (input/output)}

If \(F A C T=F\) ', then \(S U B F\) is an inputargum ent and on entry contains the ( \(n-1\) ) subdiagonalelem ents of the unit bidiagonal factor \(L\) from the \(\mathrm{L} * \mathrm{D} \operatorname{IAG} \mathrm{L}_{\mathrm{L} * *} \mathrm{H}\) factorization of A . IfFACT=N', then SUBF is an outputargum entand on exit contains the ( \(n-1\) ) subdiagonalelem ents of the unit bidiagonal factorl from the \(L * D I A G * L * * H\) factorization ofA.
\(B\) (input) The \(N\) toy \(-N\) RH S righthand side \(m\) atrix \(B\).
LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the N -by-NRH \(S\) solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the amay X . LD X >= \(\max (1, N)\).

\section*{RCOND (output)}

The reciprocalcondition num berof the \(m\) atrix \(A\). If RCOND is less than the machine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The forw ard emorbound foreach solution vector \(X\) (j) (the \(j\) th colum \(n\) of the solution \(m\) atrix \(X\) ). IfXTRUE is the true solution comesponding to \(X(\mathcal{j})\), FERR ( \(\mathcal{j})\) is an estim ated upperbound for the \(m\) agnitude of the largestelem ent in (X ( \()\)-X TRU E) divided by the \(m\) agnitude of the largestelem ent in \(\mathrm{X}(\underset{)}{ }\).

BERR (output)
The com ponentw ise relative backw ard emorof each solution vector \(X(\mathcal{j})\) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension \((\mathbb{N})\)

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{I N F O}\) (output)
= 0: successfiulexit
\(<0\) : if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=N\) : the leading \(m\) inor of orderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than \(m\) achine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void cspsv_64 (charuplo, long n, long nihs, com plex *ap, long *ịíivot, com plex *b, long ldb, long *info);

\section*{PURPOSE}
cspsv com putes the solution to a com plex system of linear equations
\(A\) * \(X=B\), where \(A\) is an \(N\)-by-N symm etric \(m\) atrix stored in packed form at and \(X\) and \(B\) are \(N\)-by \(-N\) RH \(S m\) atrices.

The diagonal pivoting \(m\) ethod is used to factorA as
\(A=U * D * U * *\), if \(U P L O=U\) ', or
\(A=L * D * L * T\), if \(U P L O=L '\),
where \(U\) (orL) is a product of perm utation and unit upper (low er) triangularm atrices, \(D\) is sym \(m\) etric and block diagonalw th 1 -by -1 and 2 -by -2 diagonal blocks. The factored form ofA is then used to solve the system of equations A * \(X=B\).

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

AP (input/output)
C om plex array, dim ension \(\mathbb{N}^{*}(\mathbb{N}+1) / 2\) ) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The jth
column of A is stored in the array AP as follow s : ifUPLO \(=U\) ',AP \((i+(j-1) * j 2)=A(i, j)\) for \(1<=\mathrm{i}<=\dot{j}\) if UPLO = L',AP (i+ (j-1)* (2n-j)/2)= A \((i, j)\) for \(j=i<=n\). See below for further details.

On exit, theblock diagonalm atrix \(D\) and the \(m\) ultipliers used to obtain the factor \(U\) orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by CSPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atas \(A\).

\section*{PIVOT (output)}

Integer array, dim ension \(\mathbb{N}\) ) D etails of the interchanges and the block structure of \(D\), as determ ined by CSPTRF. If IPIV OT \((k)>0\), then row \(s\) and colum nsk and \(\mathbb{P} \mathbb{I V} O T(k)\) w ere interchanged, and \(D(k, k)\) is a 1 -by-1 diagonalblock. If P PLO \(=\mathrm{U}^{\prime}\) and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k-1)<0\), then row sand colum nsk-1 and - \(\mathbb{P}\) IV OT (k) were interchanged and D ( \(k-1 * k, k-1 k)\) is a \(2-b y-2\) diagonalblock. If \(\mathrm{UPLO}=\mathrm{L}\) 'and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0\), then row s and colum ns \(k+1\) and \(-\mathbb{P}\) IV OT ( \(k\) ) were interchanged and \(D(k: k+1, k: k+1)\) is a \(2-b y-2\) diagonal block.

\section*{B (input/output)}

Com plex array, dim ension (LD B , NRHS) On entry, the N -by-N RH S right hand sidem atrix B. On exit, if \(\mathbb{N} F O=0\), the \(N\) by \(-N\) RH \(S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the anay B. LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{FURTHER DETAILS}

The packed storage scheme is illustrated by the follow ing exam ple when \(N=4\), UPLO = U':

Tw o-dim ensional storage of the sym m etric m atrix A:
a11 a12 a13 a14
```

a22 a23 a24
a33 a34 (aij= aji)
a44

```

Packed storage of the upper triangle ofA :
\[
A P=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]
\]

\section*{C INTERFACE}
\#include <sunperfh>
void cspsvx (char fact, charuplo, intn, int nrhs, com plex *a, com plex *af, int *ipivot, com plex *b, int ldb, com plex *x, int ldx, float *rcond, float *ferr, float*berr, int*info);
void cspsvx_64 (char fact, charuplo, long n, long nihs, com plex *a, com plex *af, long *ipivot, com plex *b, long lab, com plex *x, long ldx, float *roond, float * ferr, float *berr, long *info);

\section*{PURPOSE}
cspsvx uses the diagonalpivoting factorization \(A=U * D * U * * T\) or \(A=L * D * L * * T\) to com pute the solution to a com plex system of linear equations \(A\) * \(X=B\), where \(A\) is an \(N\)-by \(-N\) sym\(m\) etric \(m\) atrix stored in packed form at and \(X\) and \(B\) are \(N\)-byN RH S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to factorA as
\[
A=U * D * U * * T, \text { if } U P L O=U ' \text {,or }
\]
\[
A=L * D * L \star * T \text {, if } U P L O=L '
\]
where \(U\) (orL) is a productofperm utation and unitupper (low er)
triangularm atrioes and D is sym m etric and block diagonal w ith

1-by-1 and 2-by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums w ith \(\mathbb{N N F O}=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix A. If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a w aming, but the routine stillgoes on
to solve for \(X\) and com pute error bounds as described below.
3.The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether ornot the factored form of \(A\) has been supplied on entry.\(=F^{\prime}\) : On entry, A F and \(\mathbb{P} \mathbb{I V O T}\) contain the factored form of A. A, AF and \(\mathbb{P} \mathbb{I V O T} w\) ill not be modified. \(=\mathrm{N}\) ': The m atrix A w illibe copied to AF and factored.

UPLO (input)
\(=\mathrm{U}\) : U ppertriangle of A is stored;
\(=\mathbb{L}\) ': Low ertriangle of \(A\) is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix A. \(N>=0\).

NRHS (input)
The num ber of right hand sides, ie., the num ber of colum ns of the m atrioes B and X. NRH S >=0.

A (input) C om plex array, dim ension \(\mathbb{N} *(N+1) / 2\) ) The upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linearamay. The jth colum \(n\) of A is stored in the array A as follow S : if f PLO \(=\) \(U^{\prime}, A(i+(j-1) * j 2)=A(i, 7)\) for \(1<=i<=j\) if UPLO = L', A (i+ (j-1)* (2*n-j) 2 ) =A ( \(i, j\) ) for \(j=i<=n\). See below for furtherdetails.

AF (input/output)
Complex array, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) If FACT = \(F\) ', then \(A F\) is an inputargum ent and on entry contains the block diagonalm atrix D and the multipliers used to obtain the factor \(U\) orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by CSPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atasA.
If \(\mathrm{FACT}=\mathrm{N}\) ', then AF is an output argum ent and on exit contains the block diagonalm atrix D and the m ultipliers used to obtain the factorU or L from the factorization \(A=U * D * U * * T\) or \(A=\) L *D *L**T as com puted by CSPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

PIVOT (inputoroutput)
Integer array, dim ension (N) IfFACT = F', then \(\mathbb{P} \mathbb{V} O T\) is an inputargum entand on entry contains details of the interchanges and the block structure ofD , as determ ined by CSPTRF. If \(\mathbb{P}\) IV OT (k) \(>0\), then row sand colum nsk and \(\mathbb{P} \mathbb{V} O T(k)\) were interchanged and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1 -by -1 diagonal block. IfUPLO = U'and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{V} O T(k-1)\) \(<0\), then row s and colum nsk-1 and - \(\mathbb{P}\) IV OT (k) were interchanged and \(D(k-1 k, k-1 k)\) is a 2 -by-2 diagonal block. If UPLO = L ' and \(\mathbb{P} \mathbb{I V O T}(\mathrm{k})=\) \(\mathbb{P} \mathbb{V} O T(k+1)<0\), then row \(s\) and columns \(k+1\) and \(-\mathbb{P}\) IV O \(T(k)\) w ere interchanged and \(D(k \cdot k+1, k \cdot k+1)\) is a 2 -by-2 diagonalblock.

IfFACT = \(N\) ', then \(\mathbb{P I V O T}\) is an output argum ent and on exitcontains details of the interchanges and the block structure of D, as determ ined by CSPTRF.

B (input) C om plex anay, dim ension (LD B ,NRHS) The N by-NRH S righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array \(B\). LD B >= max (1,N).

\section*{X (output)}

If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the N -by-NRH S solution \(m\) atrix \(X\).

LD X (input)
Com plex array, dim ension (LDX,NRHS) The leading dim ension of the aray \(X . \operatorname{LD} X=\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num ber of the \(m\) atrix \(A\). IfRCOND is less than them achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0.

\section*{FERR (output)}

C om plex array, dim ension (NRHS) The estim ated forw ard emror bound for each solution vectorX (i) (the \(j\) th colum \(n\) of the solution \(m\) atrix \(X\) ). If XTRUE is the true solution corresponding to \(\mathrm{X}(\mathcal{\nu})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest elem ent in ( \(\mathrm{X}(\mathcal{J})\)-XTRUE) divided by the \(m\) agnitude of the largestelem ent in
X ( \(\mathcal{j}\) ) The estim ate is as reliable as the estim ate forR C OND, and is alm ostalw ays a slightoveresti\(m\) ate of the true error.

\section*{BERR (output)}

Com plex array, dim ension \((\mathbb{N} H\) S) The com ponentw ise relative backw ard error ofeach solution vector \(\mathrm{X}(\mathrm{j})\) (ie., the sm allestrelative change in any elem ent of A orB thatm akes X ( \(\mathcal{I}\) ) an exact solution).

W ORK (w orkspace)
C om plex array, dim ension ( \(2 \star \mathrm{~N}\) )

W ORK 2 (w orkspace)
Integer anray, dim ension (N)
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue
> 0 : if \(\mathbb{N F O}=i\), and \(i\) is
<= N : D (i,i) is exactly zero. The factorization has been completed but the factorD is exactly
singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=N+1: D\)
is nonsingular, butRCOND is less than m achine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are computed because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing exam ple when \(N=4, \mathrm{UPLO}=\mathrm{U}\) ':

Tw o-dim ensionalstorage of the sym m etric m atrix A :

\section*{PURPOSE}
cstedc com putes alleigenvalues and, optionally, eigenvectors of a sym \(m\) etric tridiagonalm atrix using the divide and conquerm ethod. The eigenvectors of a fullorband com plex Herm itian matrix can also be found ifCHETRD orCHPTRD or CHBTRD has been used to reduce this \(m\) atrix to tridiagonal form.

This code \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. It w illw ork on m achines w ith a guard digitin add/subtract, or on those binary machines w thout guard digits which subtract like the C ray X \(-\mathrm{M} P, C\) ray \(Y \mathrm{M} P\), C ray \(\mathrm{C}-90\), or C ray-2. It could conœivably fail on hexadecim al or decin al machines w thout guard digits, butw e know of none. Se SLA ED 3 for details.

\section*{ARGUMENTS}

COMPZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only.
= 'I': C om pute eigenvectors of tridiagonalm atrix
also.
\(=\mathrm{V}\) : C om pute eigenvectors of original H erm itian
\(m\) atrix also. On entry, \(Z\) contains the unitary
\(m\) atrix used to reduce the originalm atrix to tridiagonal form .

N (input) The dim ension of the sym \(m\) etric tridiagonalm atrix. \(\mathrm{N}>=0\).

D (input/output)
O n entry, the diagonalelem ents of the tridiagonal m atrix. On exit, if \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

E (input/output)
O n entry, the subdiagonalelem ents of the tridiagonalm atrix. On exit, E has been destroyed.

Z (input) \(O n\) entry, if COMPZ \(=V\) ', then \(Z\) contains the unitary m atrix used in the reduction to tridiagonalform. On exit, if \(\mathbb{N F O}=0\), then if \(C O M P Z=\) V', Z contains the orthonorm aleigenvectors of the original H erm itian m atrix, and if \(\mathrm{COMPZ}=\mathrm{I}\) ', Z contains the orthonorm al eigenvectors of the sym m etric tridiagonalm atrix. If COMPZ \(=\mathrm{N}^{\prime}\) ', then Z is not referenced.

LD Z (input)
The leading din ension of the array Z . LD \(\mathrm{Z}>=1\). If eigenvectors are desired, then LD Z \(>=\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. IfCOM PZ \(=\mathrm{N}^{\prime}\) or 'I', orN <=1,LW ORK mustbe at least1. If
COM PZ \(=V\) 'and \(N>1\), LW ORK m ust.be at least \(N * N\).

IfLW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK anray, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On exit, if \(\mathbb{N} F O=0\), RW ORK (1) retums the optim allRW ORK .

LRW ORK (input)
The dim ension of the array RW ORK. IfCOMPZ \(=N^{\prime}\) or \(\mathrm{N}<=1\), LRW ORK mustbe at least1. IfCOMPZ \(=\)

V'and \(\mathrm{N}>1\),LRW ORK m ustbe atleast1 \(+3 * \mathrm{~N}+\) \(2 * N * \lg +3 * N * * 2\), where \(\lg (N)=s m\) allest integerk such that \(2 \star * \mathrm{k}>=\mathrm{N}\). IfCOM PZ \(=\) I'and \(\mathrm{N}>1\),LRW ORK mustbe at least \(1+4 * N+2 * N * * 2\).

If LRW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the RW ORK array, retums this value as the first entry of the RW ORK amay, and no emorm essage related to LRW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I W}\) ORK (1) retums the optim al LIW ORK.

LIW ORK (input)
The dim ension of the anay \(\mathbb{I W}\) ORK. IfCOMPZ \(=\mathrm{N}^{\prime}\) or \(\mathrm{N}<=1\), LIW ORK m ustbe at least1. IfCOMPZ \(=\) V 'orN > 1, LIW ORK mustbe at least \(6+6 * N+\) \(5 * N * \operatorname{N}\). IfCOMPZ = I'orN \(>1\), LIV ORK must be at least \(3+5 * N\).

IfLIW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK aray, and no errorm essage related to \(L \mathbb{I W} O R K\) is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue.
\(>0\) : The algorithm failed to com pute an eigenvalue while w orking on the subm atrix lying in row S and colum ns \(\mathbb{N}\) FO \(/ \mathbb{N}+1\) ) through \(m o d(\mathbb{N}\) FO, \(\mathbb{N}+1)\).

\section*{C INTERFACE}
\#include <sunperfh>
void cstegr(char jobz, char range, intn, float *d, float
*e, float vl, float vu, intil, intiu, float abstol, int \({ }_{\mathrm{m}} \mathrm{m}\), float \({ }^{*} \mathrm{~W}\), com plex \({ }^{*} \mathrm{z}\), int \(l \mathrm{ld} \mathrm{z}\), int *isuppz, int *info);
void cstegr_64 (char jobz, char range, long n, float *d, float *e, float vl, floatvu, long il, long iu, float abstol, long *m , float *w, com plex *z, long ldz, long *isuppz, long *info);

\section*{PURPOSE}
cstegrb) C om pute the eigenvalues, lam bda_j of L_i D_i L_i^T to high relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam boda_jofL_i D _i L_i^T,
com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization.
The desired accuracy of the output can be specified by the inputparam eterA BSTOL.

Form ore details, see "A new O ( \(n^{\wedge} 2\) ) algorithm for the sym \(m\) etric tridiagonal eigenvahue/eigenvector problem ", by Inder吕D hillon, C om puterScience D ìvision TechnicalR eport N o. U CB C SD -97-971, U C Berkeley, M ay 1997.

N ote 1 : Cumently CSTEGR is only setup to find ALL the \(n\) eigenvalues and eigenvectors of \(T\) in \(O\left(n^{\wedge} 2\right)\) tim e

N ote 2 : Currently the routine CSTE \(\mathbb{N}\) is called when an appropriate sigm a_i cannot be chosen in step (c) above. CSTE IN invokesm odified G ram -Schm idt when eigenvalues are close.
N ote 3 : C STEGR w orks only on \(m\) achines \(w\) hich follow ieee-754 floating-point standard in their handling of infinities and N aN s. N orm alexecution of CSTEGR m ay create N aN s and infinities and hence \(m\) ay abortdue to a floating pointexception in environm ents w hich do notconform to the ieee standard.

\section*{ARGUMENTS}

JO B Z (input)
\(=\mathrm{N}:\) : Com pute eigenvalues only;
\(=\mathrm{V}^{\prime}:\) C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w illbe found.
\(=\mathrm{V}\) : alleigenvalues in the half-open interval (VL, VU ] w ill be found. = I': the II th through \(\mathbb{I U}\) th eigenvalues w illbe found.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).

D (input/output)
O n entry, the \(n\) diagonalelem ents of the tridiagonalm atrix T.On exit, D is overw rilten.

E (input/output)
O \(n\) entry, the \((n-1)\) subdiagonal elem ents of the tridiagonal \(m\) atrix \(T\) in elem ents 1 to \(N-1\) of \(E\);
\(E(\mathbb{N})\) need notbe set. On exit, \(E\) is overw rilten.

VL (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. VL < V U . N ot referenced ifRANGE = A 'or I'.

VU (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. \(\mathrm{VL}<\mathrm{VU}\). N ot referenced ifRANGE=A 'or 'I'.

II (input)
IfRA N G E = ' 1 ', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE \(=\) A'or V'.

IU (input)
IfRA N G E = I', the indices (in ascending order) of the sm allest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE= A 'or V'.

ABSTOL (input)
The absolute enror tolerance for the eigenvalues/eigenvectors. \(\mathbb{F} \mathrm{JOBZ}=\mathrm{V}\) ', the eigenvalues and eigenvectors outputhave residual norm s bounded by ABSTOL, and the dotproducts betw een different eigenvectors are bounded by ABSTOL. If ABSTOL is less than N *EPS* \(|\mathrm{F}|\), then \(\mathrm{N} * E P S *|T| w\) illbe used in its place, w here EPS is the \(m\) achine precision and \(F \mid\) is the 1 -norm of the tridiagonalm atrix. The eigenvalues are com puted to an accuracy ofEPS*| \(\mid\) imespective of A BSTOL. If high relative accuracy is im portant, setA BSTO L to DLAM CH (Safem inim um '). See Barlow and Dem m el "C om puting A ccurate Eigensystem s of Scaled D iagonally D om inantM atrices", LA PA CK W orking \(N\) ote \#7 for a discussion of \(w\) hich \(m\) atrioes define their eigenvalues to high relative accuracy.

M (output)
The total num ber ofeigenvalues found. \(0<=\mathrm{M}\) <= N. IfRANGE = A', M = N , and ifRANGE = \(\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{L}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.

Z (input/output)
If \(J O B Z=V\) ', then if \(\mathbb{N F O}=0\), the first \(M\) colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix T comesponding to the selected eigenvalues, \(w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). If \(30 \mathrm{BZ}=\mathrm{N}\) ', then \(Z\) is not referenced. N ote: the userm ust ensure that at leastm ax \((1, M)\) colum ns are supplied in the array \(Z\); ifRANGE = V', the exact value of M is notknow n in advance and an upperbound m ust be used.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, N)\).

ISU PPZ (output)
The support of the eigenvectors in \(Z\), ie., the indices indicating the nonzero elem ents in \(Z\). The \(i\)-th eigenvector is nonzero only in elem ents ISU PPZ (2*i-1 ) through ISU PPZ (2*i).
W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al (andm inim al) LW ORK .

\section*{LW ORK (input)}

The dimension of the array W ORK. LW ORK >= max (1,18*N)

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) ORK (1) retums the optim al LIN ORK.

LIN ORK (input)
The dim ension of the array \(\mathbb{I N}\) ORK. LIW ORK >= max ( \(1,10 * \mathrm{~N}\) )

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the IV ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I N} O R K\) is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{I N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=1\), intemalerror in SLARRE, if \(\mathbb{N} F O=2\), intemalemor in CLARRV .

\#include <sunperfh>
void cstein (intn, float *d, float *e, intm, float \({ }^{*}\) w, int *iblock, int *isplit, com plex *z, int ldz, int *ifail, int*info);
void cstein_ 64 llong \(n\), float *d, float *e, long \(m\), float * , , long *iblock, long *isplit, com plex *z, long ldz, long *ifail, long *info);

\section*{PURPOSE}
cstein com putes the eigenvectors of a realsym \(m\) etric tridiagonal \(m\) atrix \(T\) corresponding to specified eigenvalues, using inverse iteration.

Them axim um num ber of terations allow ed for each eigenvector is specified by an intemal param eterM A X ITS (currently set to 5).

A though the eigenvectors are real, they are stored in a com plex array, which m ay be passed to CUNM TR orCUPM TR for back transform ation to the eigenvectors of a com plex H erm itian \(m\) atrix w hich \(w\) as reduced to tridiagonal form .

\section*{ARGUMENTS}

N (input) The order of the m atrix. \(\mathrm{N}>=0\).

D (input) The n diagonalelem ents of the tridiagonal \(m\) atrix T.

E (input) The ( \(\mathrm{n}-1\) ) subdiagonalelem ents of the tridiagonal \(m\) atrix \(T\), stored in elem ents 1 to \(N-1 ; E(\mathbb{N})\) need notbe set.

M (input) The num ber of eigenvectors to be found. \(0<=\mathrm{M}<=\) N .

W (input) The firstM elem ents of \(W\) contain the eigenvalues for which eigenvectors are to be com puted. The eigenvalues should be grouped by split-off block and ordered from sm allest to largestw ithin the block. (The output anay \(W\) from SSTEBZ w ith ORDER = B'is expected here.)

IBLOCK (input)
The subm atrix indices associated \(w\) ith the corresponding eigenvalues in W ; \(\mathbb{B L O C K}(i)=1\) if eigenvalueW (i) belongs to the first subm atrix from the top, \(=2\) ifW (i) belongs to the second subm atrix, etc. (The output array \(\mathbb{B L O C K}\) from SSTEBZ is expected here.)

ISPLIT (input)
The splilting points, atw hich \(T\) breaks up into subm atrices. The first subm atrix consists of row s/columns 1 to ISPLIT ( 1 ), the second of row s/colum ns ISPLIT ( 1 ) +1 through ISPLIT (2), etc. (The outputarray ISPLIT from SSTEBZ is expected here.)

\section*{Z (output)}

The com puted eigenvectors. The eigenvector associated w ith the eigenvalue W (i) is stored in the \(i-t h\) colum \(n\) of \(Z\). A ny vectorw hich fails to converge is set to its cument iterate afterM AXITS terations. The im aginary parts of the eigenvectors are set to zero.

\section*{LD Z (input)}

The leading dim ension of the aray \(Z\). LD \(Z \quad>=\) \(\max (1, N)\).

W ORK (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )
IN ORK (w orkspace)
dim ension (N)

IFA II (output)
On norm alexit, allelem ents of \(\mathbb{F} A \mathbb{I}\) are zero.
If one orm ore eigenvectors fail to converge after
M AX ITS iterations, then their indices are stored
in array \(\mathbb{F A} \mathbb{I}\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an ille-
galvalue
\(>0:\) if \(\mathbb{N F O}=i\), then \(i\) eigenvectors failed to converge in M AXITS terations. Their indioes are stored in array \(\mathbb{F A} \mathbb{I I}\).

void csym m_64 (char side, charuplo, long m, long n, com plex *alpha, com plex *a, long lda, com plex *b, long ldlb, com plex *beta, com plex * C , long ldc);

\section*{PURPOSE}
csymm perform sone of the \(m\) atrix-m atrix operations \(C:=\) alpha*A *B + beta*C orC \(:=\) alpha*B *A + beta*C where alpha and beta are scalars, \(A\) is a sym \(m\) etric \(m\) atrix and \(B\) and \(C\) are \(m\) by \(n m\) atrices.

\section*{ARGUMENTS}

SID E (input)
O n entry, SIDE specifiesw hether the sym metric \(m\) atrix A appears on the leftorright in the operation as follow s:
\(S \mathbb{D E}=\) L'or I' \(C:=\) a耳pha*A *B + beta* \(C\),
\(S \mathbb{D} E=R\) 'or \(r^{\prime} \mathrm{C}:=\) alpha*B*A + beta* \(C\),

U nchanged on exit.

\section*{UPLO (input)}

On entry, UPLO specifies whether the upper or lower triangular part of the symm etric \(m\) atrix \(A\) is to be referenced as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or U ' Only the upper triangularpart of the sym \(m\) etric \(m\) atrix is to be referenced.
\(\mathrm{UPLO}=\mathrm{L}\) 'or \(\mathrm{I}^{\prime}\) ' O nly the low ertriangularpart of the sym \(m\) etric \(m\) atrix is to be referenced.

U nchanged on exit.
M (input)
O \(n\) entry, M specifies the num ber of row sof the \(m\) atrix \(C . M\) M \(=0\). U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the \(m\) atrix \(C . N>=0\). U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.
A (input)
COM PLEX array ofD \(\mathbb{I M}\) ENSION (LDA,ka), where ka is \(m\) when \(S D E=\mathbb{L}\) 'or \(I^{\prime}\) and is \(n\) other-
w ise.
Before entry with SDDE \(=\mathrm{L}\) 'or 1 ', the \(m\) by \(m\) part of the anay A mustcontain the sym\(m\) etric \(m\) atrix, such thatw hen UPLO \(=U\) 'or 4 ', the leading \(m\) by \(m\) uppertriangularpart of the array A mustcontain the upper triangular part of the symm etric \(m\) atrix and the strictly lower triangularpart of A is not referenced, and \(w\) hen UPLO = L' or \({ }^{1}\) ', the leading \(m\) by \(m\) low er triangularpart of the array A must contain the lower triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangular partof A is not referenced.

Before entry with \(S D E=R\) 'or \(r\) ', the \(n\) by \(n\) part of the array \(A\) mustcontain the sym\(m\) etric \(m\) atrix, such thatw hen UPLO \(=U\) 'or L ', the leading \(n\) by \(n\) uppertriangularpart of the aray A mustcontain the upper triangular part of the symm etric \(m\) atrix and the strictly lower triangularpartof \(A\) is not referenced, and when UPLO = L' or 1 ', the leading \(n\) by \(n\) low er triangularpart of the array A must contain the lower triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangular part of A is not referenced.

U nchanged on exit.

LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen
\(S \mathbb{D} E=\mathbb{L}\) 'or 1 ' then LD \(A>=m a x(1, m)\), otherw ise LD \(\mathrm{A}>=\max (1, \mathrm{n})\). U nchanged on exit.

B (input)
COM PLEX aray ofD \(\mathbb{I M}\) ENSION (LDB, n ). Before entry, the leading \(m\) by \(n\) part of the array \(B\) \(m\) ustcontain the \(m\) atrix \(B\). U nchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program.
LD B \(>=\max (1, m)\). U nchanged on exit.
BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need notbe set on input. U nchanged on exit.

C (input/output)
COM PLEX aray ofD \(\mathbb{I M}\) ENSION (LD C, n ). Before entry, the leading \(m\) by \(n\) partof the amay \(C\) \(m\) ustcontain the \(m\) atrix \(C\), exceptw hen beta is zero, in which case \(C\) need notbe seton entry. On exit, the array \(C\) is overw rilten by the \(m\) by \(n\) updated \(m\) atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C \(>=\max (1, m)\). U nchanged on exit.

\section*{PURPOSE}
csyn2k perform s one of the sym \(m\) etric rank 2 k operations \(\mathrm{C}:=\) alpha*A *B'+ alpha*B*A ' + beta*C or C : alpha*A *B + alpha*B *A + beta*C where alpha and beta are scalars, C is an \(n\) by \(n\) symm etric \(m\) atrix and \(A\) and \(B\) are \(n\) by \(k\) \(m\) atrices in the first case and \(k\) by \(n m\) atrices in the second case.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper
or lower triangular part of the array \(C\) is
to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular partof C is to be referenced.

U nchanged on exit.
TRANSA (input)
O \(n\) entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} \quad C:=a l p h a * A * B^{\prime}+\) alpha*B*A '+ beta*C .

TRANSA \(=\) T' or t' \(C=\) alpha*A *B + alpha*B *A + beta*C.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input)
O n entry, \(N\) specifies the order of the m atrix C. N m ustibe at least zero. U nchanged on exit.

K (input)
On entry w ith TRANSA = N 'or h', K specifies the num ber of colum ns of the \(m\) atrioes \(A\) and \(B\), and on entry w th TRANSA = T' or \(t^{\prime}, \mathrm{K}\) specifies the num ber of row s of the \(m\) atrices \(A\) and B. K m ustibe at least zero. U nchanged on ex止.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
COM PLEX aray ofD \(\mathbb{M} E N S I O N\) (LDA, ka ),
where ka isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith TRANSA \(=\mathrm{N}^{\prime}\) or
\(h\) ', the leading \(n\) by k partof the array \(A\) \(m\) ustcontain the \(m\) atrix \(A\), otherw ise the leading k by n partof the array A mustcontain the \(m\) atrix A. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program.
W hen TRANSA \(=N\) 'or \(h\) 'then LDA must be at least \(\max (1, n)\), otherw ise LD A m ustbe at least \(\max (1, k)\). U nchanged on exit.

B (input)
COM PLEX aray ofD \(\mathbb{M} E N S I O N\) (LDB, kb ),
where kb isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith TRANSA \(=\mathrm{N}^{\prime}\) or
\(h\) ', the leading \(n\) by k part of the array \(B\) m ustcontain the \(m\) atrix \(B\), otherw ise the leading k by n partof the aray \(B \mathrm{~m}\) ustcontain the \(m\) atrix \(B\). U nchanged on exit.

LD B (input)

On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. W hen TRANSA = N 'or h'then LDB must be at least \(\max (1, n)\), otherw ise LD \(B\) ustbe at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.
C (input/output)
COM PLEX array ofD \(\mathbb{M}\) ENSION (LDC,n).
Before entry w ith UPLO = U 'or L', the leading \(n\) by \(n\) upper triangularpart of the array \(C\) \(m\) ustcontain the upper triangular part of the sym metric \(m\) atrix and the strictly low er triangularpartofC is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated \(m\) atrix.

Before entry w ith UPLO = L'or 1', the leading \(n\) by \(n\) low er triangularpart of the array \(C\) m ustcontain the low er triangular part of the sym \(m\) etric \(m\) atrix and the strictly uppertriangularpartofC is not referenced. On exit, the low er triangularpart of the array \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C must be at leastmax (1,n). Unchanged on exit.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper
or low er triangular part of the amay \(C\) is
to be referenced as follow s:

UPLO = U'or \(\mathrm{U}^{\prime}\) Only the upper triangular part of \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular part of \(C\) is to be referenced.

U nchanged on exit.

TRANSA (input)
O n entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} \mathrm{C}:=\) alpha*A *A ' + beta* C.

TRANSA \(=\) T'ort' \(\mathrm{C}:=\) alpha*A *A + beta*C.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N T E R F A C E .}\)
N (input)
On entry, \(N\) specifies the order of the \(m\) atrix \(C\).
N m ustbe at least zero. U nchanged on exit.
\(K\) (input)
On entry with TRANSA \(=N\) 'or \(h\) ', \(K\) specifies the number of columns of the matrix \(A\), and on entry \(w\) th TRANSA \(=T^{\prime}\) or \(t^{\prime}, \mathrm{K}\) specifies the num ber of row sof the m atrix A. K m ust.be at least zero. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
COM PLEX aray ofD \(\mathbb{M}\) ENSION (LDA, ka ),
where ka isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith TRANSA \(=\mathrm{N}^{\prime}\) or
h ', the leading n by k part of the array A
m ustcontain the \(m\) atrix \(A\), otherw ise the leading k by n partof the amay A mustcontain the \(m\) atrix A. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program.
W hen TRANSA \(=\mathrm{N}\) 'or h 'then LDA must be at
least \(\max (1, \mathrm{n})\), otherw ise LDA m ust.be at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
COMPLEX aray ofD \(\mathbb{M} E N S \mathbb{N} N(L D C, n)\).
Before entry w ith UPLO = U 'or L', the leading \(n\) by \(n\) upper triangularpart of the array \(C\) \(m\) ustcontain the upper triangular part of the sym \(m\) etric \(m\) atrix and the strictly low ertriangularpartofC is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated \(m\) atrix.

Before entry with UPLO = L'or 1', the leading \(n\) by \(n\) low er triangularpart of the anray \(C\) \(m\) ustcontain the low er triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangularpartof \(C\) is not referenced. On exit, the low er triangularpart of the array \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastmax(1,n). Unchanged on exit.

\section*{C INTERFACE}
\#include <sunperfh>
void csysv (charuplo, intn, intnrhs, com plex *a, int lda, int *ipiv, com plex *b, int ldb, int *info);
void csysv_64 (charuplo, long n, long nrhs, com plex *a, long lda, long *ịív, complex *b, long ldb, long *info);

\section*{PURPOSE}
csysv com putes the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) sym m etric \(m\) atrix and \(X\) and \(B\) are \(N\)-by \(-N\) RH S \(m\) atrices.

The diagonalpivoting \(m\) ethod is used to factorA as
\(A=U * D * U * T\), if \(U P L O=U\) ', or
\(A=L * D * L * *\), if \(U P L O=L '\),
where \(U\) (orL) is a productof perm utation and unit upper (low er) triangular \(m\) atrices, and \(D\) is sym \(m\) etric and block diagonalw ith 1 -by -1 and 2 -by -2 diagonalblocks. The factored form of \(A\) is then used to solve the system of equations \(\mathrm{A} * \mathrm{X}=\mathrm{B}\).

\section*{ARGUMENTS}

\section*{UPLO (input)}
= U : U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

A (input/output)

On entry, the symm etric \(m\) atrix \(A\). If \(\mathrm{PLO}=\mathrm{U}\) ', the leading N -by -N upper triangularpart of A contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by -N low er triangularpart of A contains the low ertriangularpart of the \(m\) atrix \(A\), and the strictly upper triangular partofA is not referenced.

On exit, if \(\mathbb{N F O}=0\), the block diagonalm atrix \(D\) and the multipliers used to obtain the factor \(U\) or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by CSY TRF.
LDA (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

IPIV (output)
D etails of the interchanges and the block structure ofD, as determ ined by CSY TRF. If \(\mathbb{P} \mathbb{I V}(k)>\) 0 , then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V}(k)\) w ere interchanged, and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1-by-1 diagonalblock. If \(U P L O=U\) 'and \(\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I}(k-1)<0\), then rows and colum ns \(k-1\) and \(-\mathbb{P} I V(k)\) were interchanged and \(D(k-1 k, k-1 k)\) is a \(2-b y-2\) diagonal block. IfU PLO = L'and \(\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I V}(k+1)<0\), then row \(s\) and colum ns \(k+1\) and - \(\mathbb{P}\) IV ( \(k\) ) w ere interchanged and \(D(k: k+1, k \cdot k+1)\) is a \(2-b y-2\) diagonal block.

B (input/output)
On entry, the N -by-NRH S righthand side m atrix B . On exit, if \(\mathbb{N} F O=0\), the \(N\)-by \(-N\) RH \(S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray B. LD B \(>=\) \(\max (1, N)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F}\) F \(=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length ofW ORK. LW ORK >=1, and forbestperform ance LW ORK \(>=N * N B\), where \(N B\) is the optim al blocksize forCSYTRF.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of
the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i, D(i, i)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{C INTERFACE}
\#include <sunperfh>
void csysvx (char fact, char uplo, intn, int nrhs, com plex
*a, int lda, com plex *af, int ldaf, int *ipivot, com plex *b, int ldb, com plex *x, int ldx, float *rcond, float * ferr, float *berr, int *info);
void csysvx_64 (char fact, charuplo, long n, long nrhs, com plex *a, long lda, com plex *af, long ldaf, long *ịíivot, com plex *b, long ldb, com plex *x, long ldx, float * rcond, float * ferr, float *berr, long *info);

\section*{PURPOSE}
csysvx uses the diagonal pivoting factorization to com pute the solution to a com plex system of linear equations A * X = \(B\), where \(A\) is an \(N\) by \(-N\) sym \(m\) etric \(m\) atrix and \(X\) and \(B\) are \(N-\) by-N RH S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=\mathrm{N}\) ', the diagonalpivoting m ethod is used to factorA.
The form of the factorization is
\[
A=U * D * U * * T \text {, if } U P L O=U \text { ', or }
\]
\[
A=L * D * L \star * T \text {, if } U P L O=L '
\]
where \(U\) (orL) is a productofperm utation and unitupper (low er)
triangularm atrioes, and D is sym \(m\) etric and block diagonalw ith

1-by-1 and 2-by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums w ith \(\mathbb{N N F O}=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix A. If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a \(w\) aming, but the routine stillgoes on
to solve for \(X\) and com pute error bounds as described below.
3.The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether ornot the factored form of \(A\) has been supplied on entry.\(=F\) ': On entry, A F and \(\mathbb{P} \mathbb{I V O T}\) contain the factored form of A. A, AF and \(\mathbb{P} \mathbb{I V O T} w\) ill not be modified. \(=\mathrm{N}\) ': The m atrix A w illibe copied to AF and factored.

UPLO (input)
\(=\mathrm{U}\) : U ppertriangle of A is stored;
\(=\mathbb{L}\) ': Low er triangle ofA is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix A. \(N>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atrioes B and X. NRH S >=0.

A (input) The symm etricm atrix \(A\). If \(U P L O=U\) ', the leading \(N\)-by -N upper triangularpart of \(A\) contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low ertriangularpartofA is not referenced. If UPLO = L', the leading N -by-N lower triangularpartofA contains the low er triangular partof the \(m\) atrix \(A\), and the strictly upper triangularpart ofA is not referenced.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

AF (input/output)
If \(F A C T=F '\), then \(A F\) is an input argum ent and on entry contains the block diagonalm atrix D and the m ultipliers used to obtain the factor \(U\) orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by C SY TRF .

If FA C T = N ', then AF is an output argum ent and on exit retums the block diagonalm atrix D and them ultipliers used to obtain the factorU or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\) L *D *L**T.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

IPIVOT (inputoroutput)
If \(F A C T=F '\), then \(\mathbb{P I V O T}\) is an input argum ent and on entry contains details of the interchanges and the block structure of \(D\), as determ ined by CSY TRF. If \(\mathbb{P}\) IV OT ( \(k\) ) > 0, then row sand colum nsk and \(\mathbb{P} \mathbb{I V O T}(k)\) w ere interchanged and \(D(k, k)\) is a 1 -by-1 diagonal block. If UPLO \(=U^{\prime}\) and \(\mathbb{P} \mathbb{I V} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0\), then row sand colum ns \(\mathrm{k}-1\) and \(-\mathbb{P} \mathbb{I V}\) O (k) were interchanged and D ( \(\mathrm{k}-\) \(1 \mathrm{k}, \mathrm{k}-1 \mathrm{k})\) is a \(2-\) by-2 diagonalblock. IfU PLO \(=\) L 'and \(\mathbb{P} \mathbb{I V}\) OT \((k)=\mathbb{P} \mathbb{I V}\) OT \((k+1)<0\), then row \(s\) and colum nsk+1 and - \(\mathbb{P}\) IV OT (k) were interchanged and D \((k: k+1, k k+1)\) is a \(2-b y-2\) diagonalblock.

IfFACT = \(N\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by CSY TRF.
\(B\) (input) The \(N\)-by-N RH S righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\) boy \(-N\) RH S solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array \(\mathrm{X} . \mathrm{LDX}>=\) \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num ber of
the matrix A. IfRCOND is less than the m achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to \(w\) orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0 .

FERR (output)
The estim ated forw ard errorbound for each solution vectorX ( 1 ) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X)\). If \(X T R U E\) is the true solution comesponding to \(\mathrm{X}(\mathcal{1}), \mathrm{FERR}(\mathcal{)}\) is an estim ated upperbound forthe \(m\) agnitude of the largest ele\(m\) entin ( \(X(\mathcal{)})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem entin X ( 7 ) . The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vectorX (i) (ie., the sm allest relative change in any elem entof \(A\) orB thatm akes \(X\) ( 7 ) an exactsolution).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LD W ORK (input)
The length of W ORK. LDW ORK \(>=2 \star N\), and for best perform ance LDW ORK \(>=N * N B\), where \(N B\) is the optim alblocksize forC SY TRF .

If LD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK aray, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA .

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
<= N : D (i,i) is exactly zero. The factorization has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=N+1\) : D is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and enror bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{PURPOSE}
csytf2 com putes the factorization of a com plex symm etric \(m\) atrix A using the Bunch \(K\) aufm an diagonalpivoting \(m\) ethod:
\[
A=U * D * U{ }^{\prime} \text { or } A=L * D * L^{\prime}
\]
where U (orL) is a productofperm utation and unit upper (low er) triangularm atriges, U 'is the transpose of U , and D is sym \(m\) etric and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

\section*{UPLO (input)}

Specifies w hether the upper or low er triangular part of the sym m etricm atrix A is stored:
\(=\mathrm{U}\) ': Upper triangular
\(=\mathrm{L}\) ': Low ertriangular

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O n entry, the sym m etric m atrix A. If \(\mathrm{ULO}=\mathrm{U}\) ', the leading \(n-b y-n\) uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If \(\mathrm{UPLO}=\mathbb{L}\) ', the leading \(\mathrm{n}-\mathrm{boy}-\mathrm{n}\) low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of A is not referenced.

On exit, the block diagonalm atrix D and the mul
tipliers used to obtain the factorU orl (see below for further details).

LDA (input)
The leading dim ension of the anray A. LD A >= \(\max (1, \mathbb{N})\).

IPIV (output)
D etails of the interchanges and the block structure ofD. If \(\mathbb{P} \mathbb{I V}(k)>0\), then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V}(k)\) were interchanged and \(D(k, k)\) is a 1 -by-1 diagonalblock. IfUPLO \(=U\) 'and \(\mathbb{P} \mathbb{I V}(k)\) \(=\mathbb{P} \mathbb{V}(k-1)<0\), then row \(s\) and colmm ns \(k-1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k-1 * k, k-1 *)\) is a 2 -by-2 diagonalblock. IfUPLO \(=\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V}(k)\)
\(=\mathbb{P} \mathbb{I}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k, k+1, k \mathrm{k}+1)\) is a 2-by-2 diagonalblock.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\mathrm{k}\), the k -th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=k, D(k, k)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

\section*{FURTHER DETAILS}

\section*{PURPOSE}
csytrf com putes the factorization of a com plex symm etric \(m\) atrix A using the B unch-K aufm an diagonalpivoting \(m\) ethod. The form of the factorization is
\[
\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T} \text { or } \mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}
\]
where \(U\) (orL) is a productof perm utation and unit upper (low er) triangular \(m\) atrices, and \(D\) is sym \(m\) etric and block diagonalw ith w th 1 -by-1 and 2 -by- 2 diagonalblocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading N -by -N uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low ertriangularpart of A is not referenced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by -N low er triangularpart ofA contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpartofA is not referenced.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{IPIVOT (output)}

D etails of the interchanges and the block structure of D. If \(\mathbb{P I V O T}(k)>0\), then row sand columnsk and \(\mathbb{P I V O T}(k)\) were interchanged and \(D(k, k)\) is a \(1-b y-1\) diagonalblock. If \(U P L O=U^{\prime}\) and \(\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)<0\), then row \(s\) and colum ns \(k-1\) and - \(\mathbb{P I V O T}(k)\) were interchanged and D ( \(k-1 * k, k-1 k)\) is a \(2-b y-2\) diagonal block. If UPLO \(=\mathrm{L}\) 'and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V} O T(k)\) were interchanged and \(D(k k+1, k k+1)\) is a \(2-b y-2\) diagonal block.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >=1. Forbestperfor\(m\) ance LDW ORK >=N *NB, where NB is the block size retumed by \(\amalg A E N V\).

IfLDW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfinlexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

\section*{FURTHER DETAILS}

If \(\mathrm{ULO}=\mathrm{U}\) ', then \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}\) ', where
\(U=P(n) \star U(n)^{\star} \ldots{ }^{\star} P(k) U(k)^{\star} \ldots\),
ie., \(U\) is a product ofterm \(\operatorname{sP}(k) * U(k)\), where \(k\) decreases from \(n\) to 1 in steps of 1 or 2 , and \(D\) is a block diagonal \(m\) atrix w ith 1 -by-1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(\mathrm{k})\), and \(\mathrm{U}(\mathrm{k})\) is a unituppertriangularm atrix, such that if the diagonal block D (k) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=\left(\begin{array}{lll}
0 & I
\end{array}\right) s \\
& \text { ( } 000 \text { I ) n-k } \\
& \mathrm{k}-\mathrm{s} \text { s n-k }
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(1 k-\) \(1, k\) ). If \(s=2\), the upper triangle ofD \((k)\) overw rites \(A(k-\) \(1, k-1), A(k-1, k)\), and \(A(k, k)\), and \(V\) overw rites \(A(1 k-2, k-\) \(1 \mathrm{k})\).

If \(\mathrm{UPLO}=\mathrm{L}\) ', then \(A=\mathrm{L} * \mathrm{D} * \mathrm{~L}\) ', where
\(L=P(1) \star L(1)^{\star} \ldots * P(k) \star L(k) * \ldots\)
ie., \(L\) is a productofterm \(s P(k) * L(k)\), where \(k\) increases
from 1 to n in steps of 1 or 2 , and D is a block diagonal \(m\) atrix \(w\) th 1 -by -1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(k)\), and \(L(k)\) is a unitlow ertriangularm atrix, such that if the diagonal
block \(D(k)\) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( } \left.\begin{array}{llll}
I & 0 & 0
\end{array}\right) k-1 \\
& L(k)=\left(\begin{array}{lll}
0 & I & 0
\end{array}\right) s \\
& \text { ( } 0 \mathrm{~V} \text { I ) } \mathrm{n}-\mathrm{k}-\mathrm{s}+1 \\
& \mathrm{k}-1 \text { s } \mathrm{n}-\mathrm{k}-\mathrm{s}+1
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(k+1 m, k)\). If \(s=2\), the low ertriangle ofD \((k)\) overw rites \(A(k, k), A(k+1, k)\), and \(A(k+1, k+1)\), and \(v\) overw rites A \((k+2 m, k: k+1)\).

O n entry, the block diagonalm atrix D and the m ultipliers used to obtain the factorU orL as com puted by CSY TRF.

On exit, if \(\mathbb{N F F O}=0\), the (sym metric) inverse of the original m atrix. If \(\mathrm{UPLO}=\mathrm{U}\) ', the upper triangularpart of the inverse is form ed and the partofA below the diagonal is not referenced; if UPLO = 'L' the lower triangular part of the inverse is form ed and the partofA above the diagonal is not referenced.

LD A (input)
The leading din ension of the aray A. LDA >= \(\max (1, N)\).
\(\mathbb{P I V O T}\) (input)
D etails of the interchanges and the block structure ofD as determ ined by CSY TRF.

W ORK (w orkspace)
dim ension ( 2 * N )
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i, D(i, i)=0\); the \(m\) atrix is singular and its inverse could notbe com puted.

void ctbm v_64 (charuplo, chartransa, char diag, long n, long k, com plex *a, long lda, com plex *y, long incy);

\section*{PURPOSE}
ctom \(v\) perform s one of the \(m\) atrix-vectoroperations \(x:=A * x\), or \(x:=A{ }^{*} x\), or \(x:=\infty \quad \dot{g}\left(A^{\prime}\right){ }^{*} x\) where \(x\) is an \(n\) elem ent vectorand \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularband \(m\) atrix, \(w\) ith ( \(k+1\) ) diagonals.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix.

UPLO = L' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) 'or \(h^{\prime} \mathrm{x}:=\mathrm{A}{ }^{*} \mathrm{x}\).
TRANSA \(=\) T'ort' \(x:=A * x\).

TRANSA \(=\) C'ort \(^{\prime} \mathrm{x}:=\operatorname{conj} \mathrm{g}^{\prime}\left(\mathrm{A}^{\prime}\right){ }^{\star} \mathrm{x}\).
U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

O n entry, D IA G specifies w hether ornotA is unit triangular as follow \(s\) :

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
\(K\) (input)
On entry w th UPLO \(=U\) 'or L ', K specifies the num ber of super-diagonals of them atrix \(A\). On entry w ith UPLO = L' or I', K specifies the num ber of sub-diagonals of the \(m\) atrix \(A . K>=0\). U nchanged on exit.

A (input)
Before entry w th UPLO = U 'or G ', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the upper triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row ( \(k+1\) ) of the anay, the firstsuper-diagonal starting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the amay A is not referenced. The follow ing program segm entw ill transfer an upper triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINE } \\
& 20 \text { CONTINUE }
\end{aligned}
\]

Before entry w ith UPLO = L 'or I', the leading ( \(k+1\) ) by \(n\) part of the amay A \(m\) ust contain the low er triangularband part of the \(m\) atrix of coefficients, supplied colum n by colum n, w th the leading diagonal of the \(m\) atrix in row 1 of the array, the firstsub-diagonal starting atposition 1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the amay A is not referenced. The follow ing program segm entw ill transfer a low er
triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \operatorname{CONTINUE} \\
& 20 \mathrm{CONTINUE}
\end{aligned}
\]
\(N\) ote thatw hen D \(\mathbb{A} G=U\) 'or L 'the elem ents of the array A comesponding to the diagonalelem ents of the \(m\) atrix are not referenced, but are assum ed to be unity. U nchanged on exit.
LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A \(>=\) ( \(\mathrm{k}+1\) ). U nchanged on exit.

Y (input/output)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. On exit, \(Y\) is overw rilten \(w\) th the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
O n entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
ctbrfs provides errorbounds and backw ard error estim ates forthe solution to a system of linearequations \(w\) th a triangularband coefficientm atrix.

The solution \(m\) atrix \(X\) m ustibe com puted by CTBTRS or some other \(m\) eans before entering this routine. CTBRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=\mathrm{U}\) : A is uppertriangular;
= L' ': A is low er triangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=N\) : A * \(\mathrm{X}=\mathrm{B} \quad\) N \(\circ\) transpose)
\(=T: A * * T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}\) : A is non-unit triangular;
\(=\mathrm{U}:\) : A is unit triangular.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
\(K D\) (input)
The num berof superdiagonals or subdiagonals of the triangularband \(m\) atrix \(A . K D>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS \(>=0\).
A (input) The upper or low er triangular band \(m\) atrix \(A\), stored in the firstkd+1 row sof the amay. The \(j\) th column ofA is stored in the \(j\) th column of the anay A as follow s: if UPLO = U',A (kd+1+i\(j, 7)=A(i, j)\) for \(\max (1, j \mathrm{kd})<=i<=j\) if UPLO \(=\) L', A \((1+i-j\rangle)=A(i, 7)\) for \(j<=i<=m\) in \((n, j+k d)\). IfD \(\mathbb{I A}=U\) ', the diagonalelem ents of A are not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the anay A. LDA >= K D +1.
\(B\) (input) The righthand side m atrix \(B\).

LD B (input)
The leading dim ension of the array B . LD B >= \(\max (1, N)\).
\(X\) (input) The solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay X . LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(1)\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(}\) ) an exactsolution).

W ORK (w orkspace) dim ension \(\left(2{ }^{*} \mathrm{~N}\right.\) )
W ORK 2 (w orkspace) dim ension (N)
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue

void ctbsv_64 (charuplo, chartransa, char diag, long n, long k, complex *a, long lda, com plex *y, long incy);

\section*{PURPOSE}
ctbsv solves one of the system sofequations \(A * x=b\), or \(A^{*} \mathrm{x}=\mathrm{b}\), or cong ( \(\mathrm{A}^{\prime}\) ')* \(\mathrm{x}=\mathrm{b}\) where b and x are n elem ent vectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upperor low er triangularband \(m\) atrix, \(w\) ith \((k+1)\) diagonals.

No test for singularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the \(m\) atrix is an upper or low er triangularm atrix as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix.

UPLO = L' or 1 ' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A * x=b\).
TRANSA \(=T^{\prime}\) or \(t^{\prime} A^{*} x=b\).
TRANSA \(=C^{\prime}\) ort' cong \(\left(A^{\prime}\right) \star \mathrm{x}=\mathrm{b}\).
U nchanged on exit.

TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

D IA G (input)
On entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D \(\mathbb{I}\) G \(=U\) 'or \(\mathrm{l}^{\prime} A\) is assum ed to be unit triangular.

D IA G = N 'or h' A is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

K (input)
On entry with UPLO \(=U\) 'or U ', \(K\) specifies the num ber of super-diagonals of them atrix \(A\). On entry w th UPLO = L' or I', K specifies the num ber of sub-diagonals of the \(m\) atrix \(A . K>=0\). U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the upper triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row ( \(k+1\) ) of the aray, the firstsuper-diagonalstarting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the array A is not referenced. The follow ing program segm entw illtransfer an upper triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:

D O 20, J=1, N
\(\mathrm{M}=\mathrm{K}+1-\mathrm{J}\)
DO \(10, I=M A X(1, J-K), J\)
\(A(M+I, J)=m \operatorname{atrix}(I, J)\)
10 CONTINUE
20 CONTINUE
Before entry w ith UPLO = L 'or 1', the leading ( \(k+1\) ) by \(n\) part of the array A m ustcontain the low er triangularband part of the \(m\) atrix of coefficients, supplied column by colum n, w th the
leading diagonal of the m atrix in row 1 of the array, the firstsub-diagonalstarting atposition
1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the array \(A\) is not referenced. The follow ing program segm entw ill transfer a low er triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\text { D O } 20, \mathrm{~J}=1, \mathrm{~N}
\]
\[
M=1-J
\]
\[
\text { DO } 10, I=J, M \mathbb{N}(N, J+K)
\]
\[
A(M+I, J)=m \operatorname{atrix}(I, J)
\]

10 CONTINUE
20 CONTINUE
\(N\) ote thatw hen D IA G = U 'or L'the elem ents of the amay A comesponding to the diagonalelem ents of the \(m\) atrix are not referenced, but are assum ed to be unity. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A >= ( \(\mathrm{k}+1\) ). U nchanged on exit.

Y (input/output)
\((1+(n-1) \star \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent right-hand side vectorb. On exit, \(Y\) is overw ritten \(w\) th the solution vectorx.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\#include <sunperfh>
void ctgevc (char side, char how m ny, int *select, intn, com -
plex *a, int lda, com plex *b, int ldb, com plex
*vl, int ldvl, com plex *vr, int ldvr, intm \(m\), int
*m,int*info);
void ctgevc_64 (char side, charhow m ny, long *select, long n, com plex *a, long lda, com plex *b, long ldb, com plex *vl, long ldvl, com plex *vr, long ldvr, long m m, long *m, long *info);

\section*{PURPOSE}
ctgevc com putes som e orallof the right and/or left generalized eigenvectors of a pair of com plex upper triangular \(m\) atrices \((A, B)\).

The right generalized eigenvectorx and the left generalized eigenvectory of \((A, B)\) corresponding to a generalized eigenvaluew are defined by:
\[
(A-w B) * x=0 \text { and } y^{\star *} H *(A-w B)=0
\]
\(w h e r e ~ y * * H\) denotes the conjugate tranpose of \(y\).
If an eigenvalue w is determ ined by zero diagonal elem ents of both A and B, a unit vector is retumed as the comesponding eigenvector.

If alleigenvectors are requested, the routine \(m\) ay either retum the \(m\) atrices \(X\) and/or \(Y\) of rightor lefteigenvectors of \((A, B)\), or the products \(Z * X\) and/or \(Q\) * \(Y\), where \(Z\) and \(Q\) are input unitary \(m\) atrioes. If ( \(A, B\) ) was obtained from the generalized Schur factorization of an original pair ofm atrices
( \(0, B 0\) ) \(=Q * A * Z * * H, Q * B * Z * * H)\),
then \(Z * X\) and \(Q * Y\) are the \(m\) atrices of right or lefteigenvectors ofA.

\section*{ARGUMENTS}

STDE (input)
\(=\mathrm{R}\) ': com pute righteigenvectors only;
\(=\mathrm{L}\) ': com pute lefteigenvectors only;
= \(\mathrm{B}^{\prime}:\) com pute both right and lefteigenvectors.

HOW M NY (input)
= A ': com pute all right and/or lefteigenvectors;
= B ': com pute all right and/or lefteigenvectors, and backtransform them using the inputm atrices supplied in VR and/orV L; = S': com pute selected right and/or lefteigenvectors, specified by the logicalarray SELECT.

SELECT (input)
If HOW M NY = S', SELECT specifies the eigenvectors to be computed. IfHOW M NY=A 'or B', SELECT is not referenced. To select the eigenvector corresponding to the jth eigenvalue, SELECT (i) m ust.be set to .TRUE ..
\(N\) (input) The order of the \(m\) atrices \(A\) and \(B . N>=0\).

A (input) The upper triangularm atrix A .
LD A (input)
The leading dim ension of array A. LDA >= \(\max (1, \mathbb{N})\).

B (input) The upper triangularm atrix B . B m ust have real diagonalelem ents.

LD B (input)
The leading dimension of array B. LDB >= \(\max (1, \mathbb{N})\).

VL (input/output)
On entry, if \(S D E=L\) 'or \(B\) 'and HOW MNY = \(B\) ', VL must contain an \(N\)-by N m atrix \(Q\) (usually the unitary \(m\) atrix \(Q\) of leftSchurvectors retumed by CHGEQZ). On exit, if \(S \mathbb{D} E=L\) 'or \(B^{\prime}, V L\) contains: if HOW MNY = A', the matrix Y of left eigenvectors of \((A, B)\); if HOW M NY = \(B\) ', the matrix \(Q * Y\); ifHOW M NY \(=S^{\prime}\), the left eigenvectors of
(A , B ) specified by SELEC T, stored consecutively in the colum ns of \(\mathrm{V} L\), in the same order as their eigenvalues. If \(S \mathbb{D} E=R \prime V L\) is not referenced.

LDVL (input)
The leading dimension of array \(V L . L D V L>=\) \(\max (1, \mathbb{N})\) if \(S \mathbb{D} E=L\) 'or \(B ' ; L D V L>=1\) otherwise.

VR (input/output)
On entry, if \(S \mathbb{D} E=R\) 'or \(B\) 'and HOW MNY = \(B^{\prime}\) ', VR m ust contain an N -by- N m atrix Q (usually the unitary m atrix \(Z\) of rightSchur vectors retumed by CHGEQZ). On exit, if \(S \mathbb{D} E=R\) 'or \(B^{\prime}, V R\) contains: if HOW M NY = A', them atrix \(X\) of right eigenvectors of \((A, B)\); if HOW M NY = B', them atrix \(Z * X\); if HOW \(M N Y=S\) ', the right eigenvectors of (A , B ) specified by SELEC T, stored consecutively in the colum ns ofVR, in the same order as their eigenvalues. If \(S \mathbb{D} E=L\) ', \(V R\) is not referenced.

LDVR (input)
The leading dim ension of the array VR. LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R\) 'or \(B^{\prime} ; L D V R>=1\) otherwise.

M M (input)
The num ber of colum ns in the arrays VL and/or VR. \(\mathrm{M} M>=\mathrm{M}\) 。

M (output)
The num ber of colum ns in the arrays \(V \mathrm{~L}\) and/or VR actually used to store the eigenvectors. If HOW M NY = A 'or B', M is set to N. Each selected eigenvector occupies one colum \(n\).

W ORK (w orkspace)
dim ension \((2 \star \mathrm{~N})\)

RW ORK (w orkspace)
dim ension \((2 * N)\)

INFO (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i-\) th argum ent had an illegalvalue.

\#include <sunperfh>
void ctgsen (int ijob, intw antq, intw antz, int * select, int n, com plex *a, int lda, com plex *b, int ldb, com plex *alpha, com plex *beta, com plex *q, int ldq, com plex *z, int ldz, int *m, float *pl, float *pr, float*dif, int*info);
void ctgsen_64 (long ij̀b, long w anta, long w antz, long *select, long n, com plex *a, long lda, com plex *b, long ldb, com plex *ałpha, com plex *beta, com plex
*q, long ldq, com plex *z, long ldz, long *m, float *pl, float *pr, float *dif, long *info);

\section*{PURPOSE}
ctgsen reorders the generalized Schur decom position of a complex \(m\) atrix pair ( \(A, B\) ) (in term \(s\) of an unitary equivalence trans-form ation \(Q\) '* \((A, B)\) * \(Z\) ), so that a selected chuster of eigenvalues appears in the leading diagonalblocks of the pair ( \(A, B\) ).The leading colum ns of \(Q\) and \(Z\) form unitary bases of the corresponding left and right eigenspaces (deflating subspaces). (A , B) m ust be in generalized Schur canonical form, that is, A and B are both upper triangular.

C TG SEN also com putes the generalized eigenvalues
w \((\mathcal{j})=A L P H A(\mathcal{j}) / B E T A(\mathcal{O})\)
of the reordered \(m\) atrix pair ( \(A, B\) ).
Optionally, the routine com putes estim ates of reciprocal condition num bers foreigenvalues and eigenspaces. These are \(D\) ifin [ \(A 11, B 11\) ), (A 22, B22)] and D ifl[ \((A 11, B 11)\), (A 22, B22)], i.e. the separation (s) betw een the \(m\) atrix pairs (A 11, B11) and (A22,B22) that comespond to the selected cluster and the eigenvalues outside the cluster, resp., and norm sof "pro jections" onto left and right eigenspaces w r.t. the selected cluster in the \((1,1)\)-block .

\section*{ARGUMENTS}
```

INO B (input)
Specifies w hether condition num bers are required
for the cluster ofeigenvalues (PL and PR) or the
deflating subspaces (D ifiu and D ifl):
=0:Only reorderw r.t.SELEC T .N o extras.
=1:Reciprocal of norm s of "pro jections" onto left
and righteigenspaces w r.t. the selected cluster
(PL and PR). = 2:U pperbounds on D ifu and D ifl.
F-norm -based estim ate
(D F (1:2)).
=3:Estim ate ofD ifu and D ifl.1-norm -based esti-
m}\mathrm{ ate
(D IF (1:2)). A bout5 tim es as expensive as IJO B =
2. =4: Com pute PL,PR and D FF (i.e.0,1 and 2
above): Econom ic version to getitall. =5: C om -
pute PL,PR and D FF (i.e.0,1 and 3 above)

```
W ANTQ (input)

\section*{SELECT (input)}

SELEC T specifies the eigenvalues in the selected cluster. To selectan eigenvalue w ( \()\), SELECT ( \()\) m ustbe set to

N (input) The order of the m atrioes A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input/output)
On entry, the uppertriangularm atrix \(A\), in generalized Schur canonical form. On exit, A is overw rilten by the reordered \(m\) atrix A.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).
B (input/output)
On entry, the upper triangularm atrix \(B\), in generalized Schur canonical form. On exit, \(B\) is overw ritten by the reordered \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, N)\).

\section*{A LPHA (output)}

The diagonalelem ents of \(A\) and \(B\), respectively, when the pair \((A, B)\) has been reduced to generalized Schurform. A LPHA (i) BETA (i) \(i=1, \ldots, \mathrm{~N}\) are the generalized eigenvalues.

BETA (output)
See the description of A LPH A .
Q (input/output)
On entry, if WANTQ = TRUE., \(Q\) is an \(N\)-by \(-N\) \(m\) atrix. On exit, \(Q\) has been postm ultiplied by the leftunitary transform ation \(m\) atrix which reorder ( \(\mathrm{A}, \mathrm{B}\) ); The leading \(M\) colum ns ofe form orthonor\(m\) albases for the specified pair of left eigenspaces (deflating subspaces). IfW ANTQ = FALSE., \(Q\) is not referenced.

LD Q (input)
The leading dim ension of the array \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1\). IfW \(A N T Q=\) TRUE., LDQ \(>=N\).

Z (input/output)
On entry, if W ANTZ = .TRUE., Z is an N -by -N \(m\) atrix. On exit, \(Z\) has been postm ultiplied by the leftunitary transform ation \(m\) atrix which reorder
( \(\mathrm{A}, \mathrm{B}\) ); The leading \(M\) colum ns of \(Z\) form orthonorm albases for the specified pair of left eigenspaces (deflating subspaces). IfW ANTZ = FALSE., Z is not referenced.

LD \(Z\) (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\). IfW ANTZ \(=\).TRUE, \(\mathrm{LD} Z>=\mathrm{N}\).
M (output)
The dim ension of the specified pair of left and righteigenspaces, (deflating subspaces) \(0<=\mathrm{M}<=\) N .

PL (output)
IF \(\mathrm{IJOB}=1,4\), or \(5, \mathrm{PL}, \mathrm{PR}\) are low er bounds on the reciprocal of the norm of "projections" onto leftand right eigenspace \(w\) ith respect to the selected cluster.
\(0<\mathrm{PL}, \mathrm{PR}<=1\). If \(\mathrm{M}=0\) orM \(=\mathrm{N}, \mathrm{PL}=\mathrm{PR}=1\). If \(\mathrm{IJO} \mathrm{B}=0,2\), or \(3 \mathrm{PL}, \mathrm{PR}\) are not referenced.

PR (output)
See the description ofPL .

D IF (output)
If IOO B >= 2, D \(\mathbb{F}(1: 2)\) store the estim ates ofD ifu and \(D\) ifl.
If \(\mathrm{IOO} B=2\) or \(4, \mathrm{D} \mathbb{F}(1: 2)\) are F -nom -based upper bounds on
\(D\) ifu and \(D\) ifl. If \(I \mathcal{L D} B=3\) or \(5, D \mathbb{F}(1: 2)\) are 1norm -based estim ates of \(D\) ifu and \(D\) ifl, com puted using reversed com \(m\) unication \(w\) ith CLACON. IfM \(=\) 0 orN,\(D \operatorname{FF}(1: 2)=F\) norm ( \([A, B]\) ). If \(I J B=0\) or \(1, \mathrm{D} \mathbb{F}\) is not referenced.

W ORK (w orkspace)
If \(I O B=0, W\) ORK is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK.LW ORK >= 1 If \(\mathrm{IJOB}=1,2\) or \(4, L W\) ORK \(>=2 \star M *(N+M)\) If \(\mathrm{IJOB}=3\) or \(5, \operatorname{LW}\) ORK >= \(4 * M *(\mathbb{N}+\mathrm{M})\)

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
If \(I O B=0, \mathbb{I W} O R K\) is notreferenced. O therw ise, on exit, if \(\mathbb{N F}\) FO \(=0, \mathbb{I} W\) ORK (1) retums the optim al LIW ORK.

LIW ORK (input)
The dim ension of the aray \(\mathbb{I W}\) ORK.LIW ORK \(>=1\). If \(\mathrm{IJOB}=1,2\) or \(4, \mathrm{LIW}\) ORK \(>=\mathrm{N}+2\); If \(\mathrm{IWOB}=3\) or \(5, L \mathbb{I} W\) ORK \(>=M A X \mathbb{N}+2,2 * M * \mathbb{N}+M)\) );

IfLIW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I W}\) ORK is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
=0: Successfulexit.
\(<0:\) If \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegal
value.
=1: Reordering of ( \(A\), B) failed because the transform ed \(m\) atrix pair ( \(A, B\) ) w ould be too far from generalized Schur form ; the problem is very ill-conditioned. (A, B) m ay have been partially reordered. If requested, 0 is retumed in D \(\mathbb{F}(*)\), \(P L\) and \(P R\).

\section*{FURTHER DETAILS}

CTG SEN first collects the selected eigenvalues by com puting unitary \(U\) and \(W\) thatm ove them to the top leftcomer of ( \(A\), B ). In otherw ords, the selected eigenvalues are the eigenvalues of (A11, B11) in
\[
\begin{gathered}
U *(A, B) * W=(A 11 A 12)(B 11 B 12) n 1 \\
(0 \text { A 22) (0 B 22) n2 } \\
n 1 \mathrm{n} 2 \mathrm{n} 1 \mathrm{n} 2
\end{gathered}
\]
where \(N=n 1+n 2\) and \(U\) ' \(m\) eans the conjugate transpose of \(U\). The first n1 colum ns of \(U\) and \(W\) span the specified pair of leftand righteigenspaces (deflating subspaces) of (A, B).

If \((A, B)\) has been obtained from the generalized real Schur decom position of a \(m\) atrix pair \((C, D)=Q\) * \((A, B) * Z\) ', then the reordered generalized Schur form of ( \(C, D\) ) is given by
\[
(\mathrm{C}, \mathrm{D})=(\mathrm{Q} * \mathrm{U}) \star(\mathrm{U} *(\mathrm{~A}, \mathrm{~B}) * \mathrm{~W}) \star(\mathrm{Z} * \mathrm{~W})^{\prime}
\]
and the firstn 1 colum ns of \(Q\) * \(U\) and \(Z * W\) span the correspond-
ing deflating subspaces of ( \(\mathrm{C}, \mathrm{D}\) ) Q and Z store Q * U and Z *W, resp.).

N ote that if the selected eigenvalue is sufficiently illconditioned, then its valuem ay differ significantly from its value before reordering.

The reciprocalcondition num bers of the left and right eigenspaces spanned by the firstn1 colum nsofU and \(W\) (or \(Q * U\) and \(Z * W) m\) ay be retumed in \(D \operatorname{FF}(1: 2)\), corresponding to \(D\) ifu and \(D\) ifl, resp.

The \(D\) ifu and \(D\) iflare defined as:
ifu \([\) A 11, B11), (A 22, B22) \(]=\operatorname{sigm} \operatorname{arm}\) in ( Zu )
and
where sigm a-m in \((Z u)\) is the sm allest singular value of the ( \(2 *_{n} 1 *_{n} 2\) )-by-( \(2 *_{n} 1 *_{n} 2\) ) m atrix
\(\mathrm{u}=[\mathrm{kron}(\mathrm{In} 2, \mathrm{~A} 11)-\mathrm{kron}(\mathrm{A} 22\) ', In1) \(]\)
[kron(In2, B11) kron (B22', In1)].
H ere, \(I n x\) is the identily \(m\) atrix of size \(n x\) and \(A 22\) 'is the transpose of A \(22 . \operatorname{kron}(X, Y)\) is the \(K\) roneckerproduct betw een the \(m\) atrices \(X\) and \(Y\).

W hen D IF (2) is sm all, sm all changes in (A, B) can cause large changes in the deflating subspace. A \(n\) approxim ate (asym ptotic) bound on the \(m\) axim um angularemor in the com puted deflating subspaces is PS * norm ( \((\mathrm{A}, \mathrm{B})\) )/D \(\mathbb{F}(2)\),
where EPS is the \(m\) achine precision.
The reciprocal norm of the pro jectors on the left and right eigenspaces associated w ith (A 11, B 11) m ay be retumed in PL and PR. They are com puted as follow s. First we com pute L and \(R\) so that \(P\) * \((A, B) * Q\) is block diagonal, w here \(=(I-4) n 1 \quad \mathrm{Q}=(\mathrm{IR}) \mathrm{n} 1\)
( 0 I ) n2 and ( 0 I ) n2
n1 n2 n1 n2
and ( \((,, R)\) is the solution to the generalized Sylvester equation \(11 * \mathrm{R}-\mathrm{L} *\) A \(22=-\mathrm{A} 12\)

Then PL \(=(\mathbb{E} \text {-norm }(L) * * 2+1)^{* *}(-1 / 2)\) and \(P R=(F-\) norm \(\left.(\mathbb{R})^{* *} 2+1\right)^{* *}(-1 / 2)\). A \(n\) approxim ate (asym ptotic) bound on the average absolute error of the selected eigenvalues is EPS * norm ( \(A, B)\) )/PL.

There are also globalemorbounds which valid forperturbations up to a certain restriction: A low erbound \((x)\) on the
sm allest \(F\)-norm ( \(E, F\) ) forw hich an eigenvalue of (A 11, B 11) \(m\) ay \(m\) ove and coalesce \(w\) th an eigenvalue of (A 22,B22) under perturbation \((\mathbb{E})\), (i.e. \((A+E, B+F)\), is

X

\section*{\(=\)}
\(m\) in \((\mathbb{D}\) ifu, D ifl)/( \((1 / \mathbb{P L} * \mathrm{PL})+1 /(\mathrm{PR} * \mathrm{PR})) * *(1 / 2)+2 * \mathrm{~m}\) ax \((1 / P L, 1 / P R))\).
A \(n\) approxim ate bound on \(x\) can be com puted from \(D \mathbb{F}(1: 2)\), PL and PL.

If \(y=(F-\) norm \((E, F) / x)<=1\), the angles betw een the perturbed ( \((1, R)\) and unperturbed ( \(L, R\) ) left and right deflating subspaces associated \(w\) ith the selected chuster in the \((1,1)\)-blocks can be bounded as
max-angle \((L, L)<=\arctan (y * P L /(1-y *(1-P L *\) PL)** (1/2))
\(\max \operatorname{angle}(R, R)<=\arctan (y * P R /(1-y *(1-P R *\) PR)** (1/2))

See LA PA CK U sers G uide section 4.11 or the follow ing references form ore inform ation.
\(N\) ote that if the default \(m\) ethod for com puting the Frobenius-norm - based estim ate D \(\mathbb{F}\) is not wanted (see CLATDF), then the param eter \(\mathbb{D} \mathbb{F}\) JB (see below) should be changed from 3 to 4 (routine CLATDF (IJOB \(=2\) w ill be used)). See C TG SY L form ore details.

w here
\(C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(M))\), \(S=\operatorname{diag}(B E T A(K+1), \ldots, B E T A(M))\), \(C * * 2+S * * 2=I\).
\(R=(R 11 R 12 R 13)\) is stored in \(A(1 M, N-K-1 \mathbb{N})\) and \(R 33\) is stored
( 0 R22R23)
in \(B(M-K+1: L+M-K-\rfloor+1 \mathbb{N})\) on exit.

The com putation of the unitary transform ation \(m\) atrices \(U, V\) or \(Q\) is optional. These \(m\) atrioes \(m\) ay eitherbe form ed explicitly, or they \(m\) ay be postm ultiplied into input \(m\) atrices \(\mathrm{U} 1, \mathrm{~V} 1\), or Q 1 .

CTGSJA essentially uses a variantof K ogbetliantz algorithm to reduce \(m\) in ( \(\llcorner, M \mathrm{~K}\) ) -by L triangular (or trapezoidal) m atrix A 23 and L -by -m atrix B 13 to the form :
\(\mathrm{U} 1{ }^{*} \mathrm{~A} 13^{*} \mathrm{Q} 1=\mathrm{C} 1 * \mathrm{R} 1\); V 1 * \(\mathrm{B} 13^{*} \mathrm{Q} 1=\mathrm{S} 1 * \mathrm{R} 1\),
where \(\mathrm{U} 1, \mathrm{~V} 1\) and Q 1 are unitary \(m\) atrix, and \(Z\) 'is the conjugate transpose of Z . C1 and S1 are diagonalm atrioes satisfying
\(\mathrm{C} 1 * * 2+\mathrm{S} 1 * * 2=\mathrm{I}\),
and R1 is an L-oy- L nonsingularuppertriangularm atrix.

\section*{ARGUMENTS}

JOBU (input)
\(=\mathrm{U}\) ': U m ustcontain a unitary matrix U 1 on entry, and the productU \(1 * \mathrm{U}\) is retumed; = I ': U is initialized to the unitm atrix, and the unitary m atrix U is retumed; \(=\mathrm{N}: \mathrm{U}\) is not com puted.

JOBV (input)
\(=\mathrm{V}\) ': V m ustcontain a unitary matrix V1 on
entry, and the product \(1 * V\) is retumed; = \(I\) ': V is initialized to the unitm atrix, and the unitary m atrix V is retumed; \(=\mathrm{N}: \mathrm{V}\) is not com puted.

JOBQ (input)
\(=\mathrm{Q}\) ': Q m ustcontain a unitary matrix Q 1 on entry, and the product \(\mathrm{Q} 1^{*} \mathrm{Q}\) is retumed; = I ': Q is initialized to the unitm atrix, and the unitary m atrix Q is retumed; \(=\mathrm{N}\) : Q is notcom puted.

M (input) The num ber of row s of them atrix \(A . M>=0\).
\(P\) (input) The num ber of row s of the \(m\) atrix \(B . P>=0\).

N (input) The num ber of colum ns of the \(m\) atrioes A and B. N \(>=0\).
\(K\) (input) \(K\) and \(L\) specify the subblocks in the input \(m\) atrices \(A\) and \(B\) : \(A 23=A(K+1 \mathbb{M} \mathbb{N}(\mathbb{K}+L, M), N-1+1 \mathbb{N})\) and \(B 13=\) \(B(1: L, N- \pm+1 \mathbb{N})\) of \(A\) and \(B\), whose G SVD is going to be com puted by CTGSJA. See the Further D etails section below .

L (input) See the description of K.

A (input/output)
On entry, the \(M\) boy \(-N\) m atrix \(A\). On exit, \(A \mathbb{N}-\) \(K+1 \mathbb{N}, 1 \mathbb{M} \mathbb{N}(\mathbb{K}+\mathrm{L}, \mathrm{M})\) ) contains the triangular \(m\) atrix R orpart of \(R\). See Punpose for details.

LD A (input)
The leading dim ension of the array A.LDA >= \(\max (1, M)\).

B (input/output)
On entry, the \(\mathrm{P}-\mathrm{by}-\mathrm{N} m\) atrix B. On exit, if neces sary, \(B(M-K+1: N+M-K-1 \mathbb{N})\) contains a partof \(R\). See Purpose for details.

LD B (input)
The leading dim ension of the aray \(\mathrm{B} \cdot \mathrm{LD} \mathrm{B}>=\) \(\max (1, P)\).

TOLA (input)
TO LA and TO LB are the convergence criteria for the Jacobi- K ogbetliantz iteration procedure. G enerally, they are the sam e as used in the prepro-
 TOLB \(=M A X(\mathbb{P} N)^{\star}\) norm \((B) \star M A C H E P S\).

\section*{TOLB (input)}

See the description of TO LA .

ALPHA (output)
On exit, A LPHA and BETA contain the generalized singularvalue pairs of \(A\) and \(B\); \(A \operatorname{LPH} A(1: K)=1\), \(\operatorname{BETA}(1: K)=0\), and ifM \(K->=0\), ALPHA \((\mathbb{K}+1 \mathbb{K}+L)\)
\(=\operatorname{diag}(\mathrm{C})\),
BETA \((\mathbb{K}+1 \mathbb{K}+L)=\operatorname{diag}(S)\), or if \(M K- \pm<0\), ALPHA \((\mathbb{K}+1 \mathrm{M})=C, A L P H A(M+1 K+L)=0\)
BETA \((\mathbb{K}+1 \mathbb{M})=S, B E T A(M+1: K+L)=1\). Furtherm ore, if \(\mathrm{K}+\mathrm{L}<\mathrm{N}, \mathrm{A} L P H A(K+\mathrm{L}+1 \mathbb{N})=0\)
BETA \((\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0\) 。

BETA (output)
See the description of A LPH A.

U (input) On entry, if \(\mathrm{JOBU}=\mathrm{U}\) ', U m ustcontain a matrix U 1 (usually the unitary matrix retumed by CGGSVP). On exit, if \(J O B U=\) I', \(U\) contains the unitary matrix U ; if \(\mathrm{JOBU}=\mathrm{U}\) ', U contains the product I * U . If \(\mathrm{JOBU}=\mathrm{N}\) ', U is notreferenced.

LDU (input)
The leading dim ension of the aray U.LDU >= \(m\) ax (1, M) if OB BU \(=\mathrm{U}\) '; LD \(\mathrm{U}>=1\) otherw ise.

V (input) On entry, if JOBV \(=\mathrm{V}^{\prime}, \mathrm{V}\) m ustcontain a matrix V 1 (usually the unitary \(m\) atrix retumed by CGGSVP). On ex正, if \(\mathrm{JOBV}=\mathrm{I}, \mathrm{V}\) contains the unitary \(m\) atrix \(V\); if \(J O B V=V ' V\) contains the productV 1*V. If JO BV = N',V is notreferenced.

LDV (input)
The leading dim ension of the array \(V\). LD V >= \(m\) ax ( \(1, \mathrm{P}\) ) if \(\mathrm{OB} \mathrm{BV}=\mathrm{V}\); LD \(V>=1\) otherw ise.
\(Q\) (input) \(O n\) entry, if \(J O B Q=Q\) ', \(Q\) m ustcontain a matrix Q 1 (usually the unitary \(m\) atrix retumed by CGGSVP). On exit, if \(J O B Q=\) I', Q contains the unitary \(m\) atrix \(Q\); if \(J B Q=Q ', Q\) contains the productQ \(1 *\) Q. If \(J O B Q=N\) ', Q is notreferenced.

LDQ (input)
The leading dim ension of the array \(Q . \operatorname{LDQ}>=\) \(m a x(1, N)\) if \(\mathrm{OBQ}=\mathrm{Q}^{\prime} ; \mathrm{LDQ}>=1\) otherw ise.

W ORK (w orkspace)
dim ension ( \(2 * N\) )

NCYCLE (output)
The num ber of cycles required for convergence.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.
= 1 : the procedure does not converge after M A X IT cycles.

\section*{PURPOSE}
ctgsna estim ates reciprocal condition num bers for specified eigenvalues and／oreigenvectors of a \(m\) atrix pair（ \(A, B\) ）．
（ \(A, B\) ）\(m\) ustbe in generalized Schurcanonical form ，that is， \(A\) and \(B\) are both upper triangular．

\section*{ARGUMENTS}

JOB（input）
Specifies w hether condition num bers are required
foreigenvalues（S）oreigenvectors（D \(\mathbb{F}\) ）：
＝E＇：foreigenvalues only（S）；
＝V＇：foreigenvectors only（D \(\mathbb{F}\) ）；
＝ B ：forboth eigenvalues and eigenvectors（ S
and \(D \mathbb{F}\) ).

HOW MNT (input)
= A ': com pute condition num bers for all eigen-
pairs;
= \(\mathrm{S}^{\prime}\) : com pute condition num bers for selected eigenpairs specified by the array SELEC T .

\section*{SELECT (input)}

If HOW M NT = S',SELECT specifies the eigenpairs
for which condition num bers are required. To
select condition num bers for the corresponding \(j\)
th eigenvalue and/oreigenvector, SELECT ( ) \() \mathrm{m}\) ust
be setto TRUE.. IfHOWMNT=A',SELECT is not referenced.

N (input) The order of the square \(m\) atrix pair \((A, B) . N \quad>=\) 0.
\(A\) (input) The uppertriangularm atrix \(A\) in the pair \((A, B)\).
LD A (input)
The leading dim ension of the aray A. LD A >= \(\max (1, \mathbb{N})\).
\(B\) (input) The uppertriangularm atrix \(B\) in the pair ( \(A, B\) ).

\section*{LD B (input)}

The leading dim ension of the array \(B . L D B>=\) \(\max (1, \mathbb{N})\).

VL (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VL m ust contain left eigenvectors of \((A, B)\), comesponding to the eigenpairs specified by H OW M NT and SELECT. The eigenvectors m ust be stored in consecutive colum ns of V , as retumed by CTGEVC. If JOB \(=V\) ', \(V L\) is not referenced.

LDVL (input)
The leading dim ension of the array VL. .LD VL \(>=1\); and If \(J 0 B=E\) 'or \(B\) ', LDVL \(>=N\).

VR (input)
If \(\mathrm{JO}=\mathrm{E}\) ' or B ', VR m ust contain right eigenvectors of \((A, B)\), comesponding to the eigenpairs specified by HOW M NT and SELECT. The eigenvectors \(m\) ust be stored in consecutive colum ns of V , as retumed by CTGEVC. If JOB \(=V^{\prime}, V R\) is not referenced.

LDVR (input)
The leading dim ension of the array VR.LD VR >= 1; If \(\mathrm{JOB}=\mathrm{E}\) 'or \(\mathrm{B}^{\prime}, \mathrm{LDVR}>=\mathrm{N}\).

S (output)
If \(J O B=E\) ' or \(B\) ', the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the array. If \(\mathrm{JOB}=\mathrm{V}\) ', \(S\) is not referenced.

D \(\mathbb{F}\) (output)
If \(\mathrm{JOB}=\mathrm{V}\) 'or B ', the estim ated reciprocalcondition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. If the eigenvalues cannot be reordered to com pute D \(\mathbb{F}(\mathcal{J}), \mathrm{D} \mathbb{F}(\mathcal{)})\) is setto 0 ; this can only occur when the true value w ould be very sm allanyw ay. Foreach eigenvalue/vector specified by SELECT, D \(\mathbb{F}\) stores a Frobenius norm -based estim ate of \(D\) ifl. If \(J O B=E ', D \mathbb{F}\) is not referenced.

M M (input)
The num berofelem ents in the arays \(S\) and \(D \mathbb{F} . M\) M \(>=M\).

M (output)
The num berof elem ents of the amays \(S\) and D \(\mathbb{F}\) used to store the specified condition num bers; for each selected eigenvalue one elem ent is used. If HOWMNT=A', M is set to N.

\section*{W ORK (w orkspace)}

If \(J \mathrm{OB}=\mathrm{E}, \mathrm{W} \mathrm{ORK}\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the aray \(W\) ORK. LW ORK >= 1. If JOB = V'or B', LW ORK >= 2*N *N.

IV ORK (w orkspace)
dim ension \((\mathbb{N}+2)\) If \(J O B=E ', \mathbb{I N} O R K\) is not referenced.
\(\mathbb{N} F O\) (output)
= 0 : Successfulexit
\(<0:\) If \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of the i-th generalized eigenvalue \(\mathrm{w}=(\mathrm{a}, \mathrm{b})\) is defined as
\[
S(I)=\left(\left|V^{A} u\right| * * 2+|v B u| * * 2\right)^{\star *}(1 / 2) /
\]
(norm (u)*norm (v))
\(w\) here \(u\) and \(v\) are the right and lefteigenvectors of ( \(A, B\) ) comesponding to w ; \(|z|\) denotes the absolute value of the com plex num ber, and norm (u) denotes the 2-norm of the vector \(u\). The pair ( \(a, b\) ) comesponds to an eigenvalue \(w=a \neq\) \(v A u / v B u\) ) of the \(m\) atrix pair ( \(A, B\) ). If both \(a\) and \(b\) equal zero, then \((A, B)\) is singular and \(S(I)=-1\) is retumed.

A n approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue \(w\) and the comesponding exacteigenvalue lam bda is
\[
\text { chord }(w, \operatorname{lam} \text { bda) }<=\text { EPS * norm }(A, B) / S(I),
\]
where EPS is the m achine precision.
The reciprocal of the condition num ber of the right eigenvector \(u\) and lefteigenvectorv corresponding to the generalized eigenvalue w is defined as follow s. Suppose
\[
\begin{array}{rl}
(\mathrm{A}, \mathrm{~B}) & =(\mathrm{a} *)(\mathrm{b} *) 1 \\
(0 & \mathrm{A} 22),(0 \mathrm{~B} 22) \mathrm{n}-1 \\
1 & \mathrm{n}-1 \\
1 \mathrm{n}-1
\end{array}
\]

Then the reciprocalcondition num berD \(\mathbb{F}(\mathbb{I})\) is
\(D\) ifl \([(a, b),(A 22, B 22)]=\operatorname{sigm} \operatorname{arm}\) in ( \(Z 1\) )
where sigm a-m in (2l) denotes the sm allest singular value of
```

Zl= [kron (a, In-1)-kron(1,A 22)]
[kron (b, In-1) -kron (1,B22)].

```

H ere In - 1 is the identity m atrix of size \(\mathrm{n}-1\) and X ' is the conjugate transpose of \(\mathrm{X} . \mathrm{kron}(\mathrm{X}, \mathrm{Y})\) is the K roneckerproduct.betw een the \(m\) atrices \(X\) and \(Y\).

W e approxim ate the sm allest singularvalue of \(\mathrm{Zl} w\) ith an upperbound. This is done by C LA TD F.

A \(n\) approxim ate errorbound for a com puted eigenvector \(V \mathrm{~L}\) (i) orV R (i) is given by

EPS * norm ( \(\mathrm{A}, \mathrm{B}\) )/D \(\mathbb{F}\) (i).

\#include <sunperfh>
void ctgsyl(chartrans, int ijob, intm, intn, com plex *a, int Ida, com plex *b, int ldb, com plex *c, int ldc, com plex *d, int ldd, com plex *e, int lde, com plex *f, int ldff, float *scale, float *dif, int *info);
void ctgsyl 64 (chartrans, long ijob, long m, long n, com plex *a, long lda, com plex *b, long ldb, com plex *c, long ldc, com plex *d, long ldd, com plex *e, long lde, com plex *f, long ldf, float*scale, float *dif, long *info);

\section*{PURPOSE}
ctgsylsolves the generalized Sylvesterequation:
\(A * R-L * B=\) scale * C
\(D * R-L * E=\) scale \(* F\)
(1)
where \(R\) and \(L\) are unknow \(n m\)-by-n matrices, ( \(A\), D ), ( \(B\), E) and ( \(C, F\) ) are given \(m\) atrix pairs of size \(m-b y-m, n-b y-n\) and \(m\)-by-n, respectively, with com plex entries. A, B, D and E are upper triangular (ie., \((A, D)\) and \((B, E)\) in generalized Schur form ).

The solution ( \(\mathbb{R}, \mathrm{L}\) ) overw rites ( \(\mathrm{C}, \mathrm{F}\) ). \(0<=\) SCALE \(<=1\) is an output scaling factor chosen to avoid overflow .

In \(m\) atrix notation (1) is equivalent to solve \(\mathrm{Zx}=\) scale*b, where \(Z\) is defined as
```

Z = [kron(In,A ) -kron(B', Im )] (2)
[kron(In,D) -kron(E',Im)],

```

Here Ix is the identity m atrix of size x and X 'is the conjugate transpose of X . K ron \((X, Y)\) is the K roneckerproduct betw een the \(m\) atrices \(X\) and \(Y\).

If TRANS = C',y in the conjugate transposed system Z "y = scale*b is solved for, which is equivalent to solve for \(R\) and \(L\) in
\[
\begin{align*}
& A^{\prime} * R+D^{\prime} * L=\text { scale * C }  \tag{3}\\
& R^{*} B^{\prime}+L^{*} E^{\prime}=\text { scale } *
\end{align*}
\]

This case (TRANS = C ) is used to com pute an one-norm -based estim ate of \(D\) if \([(A, D),(B, E)]\), the separation betw een the \(m\) atrix pairs \((A, D)\) and \((B, E)\), using C LA CON .

If IJO \(B>=1, C T G S Y L\) com putes a \(F\) robenius norm -based esti\(m\) ate ofD if \([(A, D),(B, E)]\). That is, the reciprocalofa low er bound on the reciprocal of the sm allest singular value of \(Z\).

This is a level-3 B LA S algorithm .

\section*{ARGUMENTS}

TRANS (input)
= N ': solve the generalized sylvester equation
(1).
= C':solve the "conjugate transposed" system
(3).

IO B (input)
Specifies whatkind of functionality to be perform ed. \(=0\) : solve (1) only .
\(=1\) : The functionality of 0 and 3 .
\(=2\) :The functionality of 0 and 4 .
\(=3: 0\) nly an estim ate ofD if \([(A, D),(B, E)]\) is com-
puted. (look ahead strategy is used). \(=4: 0\) nly an estim ate of \(D\) if \([(A, D),(B, E)]\) is com puted.
(CGECON on sub-system s is used). N ot referenced ifTRANS = C \({ }^{\prime}\).
\(M\) (input) The order of the \(m\) atrices \(A\) and \(D\), and the row
dim ension of the \(m\) atrioes \(C, F, R\) and \(L\).

N (input) The order of the \(m\) atrioes \(B\) and E , and the \(c o l m m\) dim ension of the \(m\) atrices \(C, F, R\) and \(L\).

A (input) The upper triangularm atrix A .
LD A (input)
The leading dim ension of the aray A. LDA >= \(m a x(1, M)\).
\(B\) (input) The upper triangularm atrix \(B\).
LD B (input)
The leading dim ension of the array B. LD B >= max (1,N).

C (input/output)
On entry, \(C\) contains the right-hand-side of the first \(m\) atrix equation in (1) or (3). On exit, if IJO \(B=0,1\) or \(2, C\) has been overw ritten by the solution R. If \(I \mathcal{O D}=3\) or 4 and TRANS \(=N^{\prime}\) ', C holds R, the solution achieved during the com putation of the \(D\) if-estim ate.

LD C (input)
The leading dim ension of the array C. LD C >= max (1, M).

D (input) The uppertriangularm atrix D .

LD D (input)
The leading din ension of the anay D. LDD >= \(m a x(1, M)\).

E (input) The upper triangularm atrix E .

LDE (input)
The leading dim ension of the array E. LDE >= \(m a x(1, N)\).

\section*{F (input/output)}

O n entry, F contains the right-hand-side of the second \(m\) atrix equation in (1) or (3). On exit, if IJO B \(=0,1\) or \(2, \mathrm{~F}\) has been overw ritten by the solution L. If \(\mathrm{IO} B=3\) or 4 and TRANS \(=N^{\prime}, \mathrm{F}\) holds \(L\), the solution achieved during the com putation of the D if-estim ate.

LD F (input)

The leading dim ension of the array F. LDF >= max (1, M).

D \(\mathbb{F}\) (output)
On exitSCA LE is the reciprocalof a low er bound of the reciprocal of the \(D\) if-function, i.e. SCA LE is an upperbound ofD if \([(A, D),(B, E)]=\) sigm a\(m\) in ( \(Z\) ), where \(Z\) as in (2). If \(I O B=0\) orTRAN \(S=\) \(C^{\prime}\),SCA LE is not referenced.

SCALE (output)
On exitSCA LE is the reciprocalofa lower bound of the reciprocal of the \(D\) if-function, ie. SCA LE is an upperbound ofD if \([(A, D),(B, E)]=\operatorname{sigm}\) a\(m\) in ( \(Z\) ), where \(Z\) as in (2). If \(I O B=0\) orTRAN \(S=\) C',SCALE is notreferenced.

W ORK (w orkspace)
If \(\mathrm{IJOB}=0, \mathrm{~W} O R K\) is not referenced. O therw ise, on exit, if \(\mathbb{N F O}=0\) then \(W\) ORK (1) retums the optim allW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK.LW ORK \(>=1\). If \(\mathrm{IJOB}=1\) or 2 and TRANS \(=\mathrm{N}^{\prime}\), LW ORK >= \(2 * \mathrm{M} * \mathrm{~N}\) 。

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IW ORK (w orkspace)
If \(I O B=0, \mathbb{I N} O R K\) is not referenced.
\(\mathbb{I N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) If \(\mathbb{N}\) FO \(=-\) - , the \(i\)-th argum ent had an illegal
value.
>0: \((A, D)\) and \((B, E)\) have com \(m\) on or very close eigenvalues.

*a, com plex *y, intincy);
void ctpm v_64 (charuplo, chartransa, char diag, long n, com plex *a, com plex *y, long incy);

\section*{PURPOSE}
ctpm v perform s one of the \(m\) atrix-vector operations \(x:=A * x\), or \(x:=A{ }^{*} x\), or \(x:=c o n \dot{g}\left(A^{\prime}\right)^{\star} x w h e r e x\) is an \(n\) elem ent vector and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix, supplied in packed form.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or 4 ' A is an upper triangular \(m\) atrix.

UPLO = L' or 1 ' A is a lower triangular m atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) 'or \(h^{\prime} \mathrm{x}:=\mathrm{A} \mathrm{*}_{\mathrm{x}}\).

TRANSA \(=\) T'ort' \(x:=A * x\).

TRANSA \(=\) C'or \(\mathrm{E}^{\prime} \mathrm{x}:=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right) \star \mathrm{x}\).
U nchanged on exit.

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D \(\mathbb{I}\) G \(=\) U 'or L ' \(A\) is assum ed to be unit tri-
angular.
\(D \mathbb{A G}=N\) 'or \(h\) ' \(A\) is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
O n entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

A (input)
( \((n *(n+1)) / 2)\). Before entry with UPLO = \(U\) ' or \(L\) ', the amay A m ustcontain the upper triangularm atrix packed sequentially, colum \(n\) by colum \(n\), so thatA (1) contains a (1, 1), A (2) and \(A(3)\) contain \(a(1,2)\) and \(a(2,2)\) respectively, and so on. Before entry w ith UPLO = L' or I', the anray A m ust contain the low er triangular m atrix packed sequentially, colum \(n\) by colum \(n\), so thatA (1) contains a (1,1),A(2) and \(A(3)\) contain \(a(2,1)\) and \(a(3,1)\) respec tively, and so on. N ote thatw hen D IA G \(=U U^{\prime}\) or \(G\) ', the diagonal elem ents of A are notreferenced, butare assum ed to be unity. U nchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. O n exit, \(Y\) is overw ritten \(w\) ith the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(. \mathbb{N} C Y<>0\). U nchanged on exit.

\section*{PURPOSE}
ctpris provides errorbounds and backw ard error estim ates for the solution to a system of linear equations \(w\) th a triangular packed coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by CTPTRS or some other \(m\) eans before entering this routine. C TPRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

UPLO (input)
= U ': A is uppertriangular;
\(=\mathrm{L}\) ': A is low ertriangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=N^{\prime}: A * X=B \quad\) N \(\circ\) transpose)
\(=T\) ': A ** \(T\) * \(\mathrm{X}=\mathrm{B}\) ( T ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.
D IA G (input)
\(=N^{\prime}\) ': A is non-unit triangular;
\(=\mathrm{U}: \mathrm{A}\) is unit triangular.
\(N\) (input) The order of the matrix A. \(N>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices \(B\) and X. NRH \(S>=0\).

A (input) The upper or low er triangular m atrix A, packed colum nw ise in a linear anray. The jth colum n of A is stored in the amay A as follow s: if UPLO = \(U^{\prime}, A(i+(j-1) * j 2)=A(i, j)\) for \(1<=i<=j\) if UPLO = L', A ( \(\left.i+(j-1)^{*}(2 n-j) / 2\right)=A(i, 7)\) for \(j=i<=n\). If \(\mathbb{A} G=U\) ', the diagonalelem ents of A are not referenced and are assum ed to be 1 .
\(B\) (input) The righthand side \(m\) atrix \(B\).
LD B (input)
The leading dim ension of the aray B. LD B \(>=\) \(\max (1, \mathbb{N})\).
\(X\) (input) The solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the amay X . LD X >= \(\max (1, \mathbb{N})\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th colum n of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O})\), FERR ( \()\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vectorX ( \(\mathcal{j}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)

\section*{PURPOSE}
ctpsv solves one of the system s of equations \(A * x=b\), or \(A{ }^{*} x=b\), or con \(\dot{g}\left(A^{\prime}\right)^{\star} x=b\) where \(b\) and \(x\) are \(n\) elem ent vectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix, supplied in packed form.

N o testforsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{U}^{\prime} \mathrm{A}\) is an upper triangular m atrix .
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA \(=T\) 'ort' \(A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA \(=C^{\prime}\) or \(t^{\prime} \operatorname{cong} \dot{g}\left(A^{\prime}\right) \star x=b\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
\(\left(\left(\mathrm{n}^{*}(\mathrm{n}+1)\right) / 2\right)\). Before entry w th \(\mathrm{UPLO}=\) \(U\) ' or U ', the array A m ustcontain the upper triangularm atrix packed sequentially, colum \(n\) by colum n , so that A (1) contains a ( 1,1 ), A (2) and \(A(3)\) contain \(a(1,2)\) and \(a(2,2)\) respectively, and so on. Before entry w ith UPLO = \(\mathrm{L}^{\prime}\) or 1 ', the amay A m ust contain the low er triangular \(m\) atrix packed sequentially, colum \(n\) by colum n, so thatA (1) contains a (1,1), A (2) and \(A\) ( 3 ) contain a \((2,1)\) and a \((3,1)\) respectively, and so on. N ote thatw hen D IA G \(=\) U' or G ', the diagonal elem ents of A are notreferenced, but are assum ed to be unity. Unchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y \mathrm{~m}\) ust contain the n elem ent righthand side vectorb. O \(n\) exit, \(Y\) is overw ritten \(w\) ith the solution vector \(x\).
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of. \(\mathbb{I N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
ctpters solves a triangular system of the form
where \(A\) is a triangularm atrix of orderN stored in packed form at, and B is an N boy-NRH S m atrix. A check ism ade to verify thatA is nonsingular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}:\) A is upper triangular;
\(=\mathbb{L}\) ': A is low ertriangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}: A * \mathrm{X}=\mathrm{B} \quad\) (Notranspose)
\(=T\) ': \(A * * T * X=B \quad\) ( ranspose)
\(=C: A * * H * X=B \quad\) (C onjugate transpose)

D IA G (input)
\(=\mathrm{N}: A\) is non-unit triangular;
\(=U\) : A is unittriangular.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input) The upper or low er triangular matrix A , packed colum nw ise in a linear array. The jth colum n of A is stored in the amay A as follow s: if UPLO = \(U ', A(i+(j-1) * j 2)=A(i, j)\) for \(1<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(i+(j 1) \star(2 \star \mathrm{n}-\mathrm{j} / 2)=A(i, j)\) for \(j=i<=n\).

B (input/output)
On entry, the righthand side \(m\) atrix B. On exit, if \(\mathbb{N} F O=0\), the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).
\(\mathbb{I N} F O\) (output)
= 0 : successfinlexit
\(<0\) : if \(\mathbb{N F O}=-i\), the \(i\)-th argum ent had an illegal value
> \(0:\) if \(\mathbb{N} F O=i\), the \(i\)-th diagonalelem ent of \(A\)
is zero, indicating that the \(m\) atrix is singular and the solutions \(X\) have notbeen com puted.

\#include <sunperfh>
void ctrevc (char side, char how m ny, int *select, intn, com plex *t, intldt, com plex *vl, int ldvl, com plex
*vr, int ldvr, intm \(m\), int *m, int *info);
void ctrevc_64 (charside, charhow m ny, long *select, long n, com plex *t, long ldt, com plex *vl, long ldvl, com plex *vr, long ldvr, long mm, long *m, long *info);

\section*{PURPOSE}
ctrevc com putes som e orallof the rightand/or left eigenvectors of a com plex upper triangularm atrix T .

The righteigenvector \(x\) and the left eigenvector \(y\) of \(T\) comesponding to an eigenvalue w are defined by:
\[
\mathrm{T}^{*} \mathrm{x}=\mathrm{w}^{*} \mathrm{x}, \quad \mathrm{Y} \mathrm{y}^{*} \mathrm{~T}=\mathrm{w}^{*} \mathrm{y}^{\prime}
\]
where \(y\) 'denotes the conjugate transpose of the vectory.
If alleigenvectors are requested, the routine \(m\) ay either retum the \(m\) atrices \(X\) and/or \(Y\) of rightor lefteigenvectors of \(T\), or the products \(Q * X\) and/or \(Q * Y\), where \(Q\) is an input unitary
\(m\) atrix. If \(T\) w as obtained from the Schur factorization of an original \(m\) atrix \(A=Q * T * Q\) ', then \(Q * X\) and \(Q * Y\) are the \(m\) atrices of right or lefteigenvectors of \(A\).

\section*{ARGUMENTS}
\(=\mathrm{R}^{\prime}\) : com pute righteigenvectors only;
= L ': com pute lefteigenvectors only;
= B ': com pute both right and lefteigenvectors.

HOW M NY (input)
= A ': com pute all right and/or left eigenvectors;
= B ': com pute all right and/or left eigenvectors, and backtransform them using the input m atrices supplied in VR and/orV L; = S ': com pute selected right and/or lefteigenvectors, specified by the logicalanay SELECT .

\section*{SELECT (input/output)}

If H OW M NY = S', SELEC T specifies the eigenvectors to be com puted. IfHOW M NY = A 'or B', SELECT is not referenced. To select the eigenvector comesponding to the \(j\) th eigenvalue, SELECT ( 1 ) m ustbe set to .TRUE..

N (input) The order of the matrix \(\mathrm{T} . \mathrm{N}>=0\).
T (input/output)
The upper triangularm atrix T. T ism odified, but restored on exit.

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, \mathbb{N})\).

VL (input/output)
On entry, if \(S D E=L\) 'or \(B\) 'and HOWMNY = \(B^{\prime}\) ', VL must contain an \(N\) by N m atrix Q (usually the unitary \(m\) atrix \(Q\) of Schur vectors retumed by CHSEQR). On exit, if \(S \mathbb{D} E=\) L'or \(B^{\prime}, V L\) contains: if HOW MNY = A', the matrix Y of left eigenvectors of ; VL is low ertriangular. The ith column VL (i) of VL is the eigenvector corresponding to \(\mathrm{T}(i, i)\). if HOW MNY = B', the \(m\) atrix \(Q * Y\); if HOW M NY = \(S^{\prime}\), the lefteigenvectors of \(T\) specified by SELEC \(T\), stored consecutively in the colum ns ofVL, in the same order as their eigenvalues. If \(S \mathbb{D} E=R\) ', \(V L\) is notreferenced.

LD V L (input)
The leading dim ension of the array VL. LDVL >= \(\max (1, N)\) if \(S \mathbb{D} E=L\) 'or \(B^{\prime}\) ';LDVL \(>=1\) otherw ise.

VR (input/output)

On entry, if \(S D E=R\) 'or \(B\) 'and \(H O W M N Y=B\) ', VR m ust contain an \(N\)-by-N \(m\) atrix \(Q\) (usually the unitary \(m\) atrix \(Q\) of Schur vectors retumed by CHSEQR). On exit, if \(S \mathbb{D} E=R\) 'or \(B \prime, V R\) contains: ifHOW MNY = A', the \(m\) atrix \(X\) of right eigenvectors of \(T\); \(V R\) is uppertriangular. The ith column VR (i) of VR is the eigenvector comesponding to \(T(i, i)\). if HOW MNY \(=\mathrm{B}^{\prime}\), the \(m\) atrix \(Q * X\); if HOW MNY \(=S^{\prime}\), the right eigenvectors of \(T\) specified by SELECT, stored consecutively in the colum ns of \(V R\), in the sam e order as their eigenvalues. If \(S \mathbb{D} E=L^{\prime}, V R\) is not referenced.
LDVR (input)
The leading dim ension of the amay VR. LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R\) 'or \(B\) '; LDVR \(>=1\) other w ise.

\section*{M M (input)}

The num berof \(\infty\) lum ns in the anrays \(V L\) and/or VR. \(M M>=M\).

M (output)
The num berof colum ns in the amays VL and/or VR actually used to store the eigenvectors. If HOW M NY = A 'or B', M is set to N. Each selected eigenvector occupies one colum \(n\).

W ORK (w orkspace)
dim ension \(\left(2{ }^{*} \mathrm{~N}\right)\)

RW ORK (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N N}\) FO \(=-\) i, the i-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

The algorithm used in this program is basically backw ard (forw ard) substitution, w ith scaling to \(m\) ake the the code robustagainst possible overflow .

E ach eigenvector is nom alized so that the elem ent of largest \(m\) agnitude has \(m\) agnitude 1 ; here the \(m\) agnitude of a com plex num ber \((x, y)\) is taken to be \(|x|+|y|\).

\section*{C INTERFACE}
\#include <sunperfh>
void ctrm \(m\) (char side, char uplo, char transa, chardiag, int \(m\), int \(n\), com plex *alpha, com plex *a, int lda, com plex *b, int ldb);
void ctrm m _64 (char side, charuplo, char transa, char diag, long m, long n, com plex *alipha, com plex *a, long lda, com plex *b, long ldb);

\section*{PURPOSE}
ctrm \(m\) perform sone of the \(m\) atrix-m atrix operations \(B:=\) alpha*op ( A ) B , or \(\mathrm{B}:=\) alpha* B *op ( A ) where alpha is a scalar, \(B\) is an \(m\) by \(n m\) atrix, \(A\) is a unit, or non-unit, upper or low er triangularm atrix and op (A ) is one of op ( \(\mathrm{A})=\mathrm{A} \operatorname{orop}(\mathrm{A})=\mathrm{A}^{\prime} \operatorname{orop}(\mathrm{A})=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right)\)

\section*{ARGUMENTS}

STDE (input)
On entry, SDE specifies whether op (A) m ultiplies \(B\) from the leftor rightas follow \(s\) :
\(S \mathbb{D} E=\) L'or I' B : alpha*op (A )*B.

U nchanged on exit.

UPLO (input)
On entry, UPLO specifies whether them atrix A is an upper or low er triangularm atrix as follow \(s\) :

UPLO = U'or 4 ' \(A\) is an upper triangular \(m\) atrix.

UPLO = L' or I' A is a lower triangular
m atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the form of op (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N^{\prime}\) 'or \(h^{\prime}\) op (A) \()=A\).

TRANSA \(=\) T'ort'op \((A)=A\).

TRANSA \(=C^{\prime}\) or \(C^{\prime} o p(A)=c o n \dot{g}\left(A^{\prime}\right)\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.
D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:
\(D \mathbb{A G}=U\) 'or \(U^{\prime} A\) is assum ed to be unit triangular.

D IA G \(=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, \(M\) specifies the num ber of row \(s\) of \(B . M\) \(>=0\). U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of \(B\). \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, A LPH A specifies the scalar alpha.W hen alpha is zero then \(A\) is notreferenced and \(B\) need notbe setbefore entry. U nchanged on exit.

A (input)
COM PLEX aray ofD \(\mathbb{I M} E N S I O N\) (LDA,k), wherek is m when \(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathrm{I}^{\prime}\) and is n when \(S \mathbb{D} E=\) R 'or 'r'.

Before entry w th UPLO = U'or L', the leading \(k\) by \(k\) upper triangularpart of the array \(A\) \(m\) ustcontain the upper triangularm atrix and the
strictly low ertriangularpartofA is not referenced.

Before entry with UPLO = L'or 1', the leading \(k\) by \(k\) low er triangularpart of the array A m ust contain the low er triangularm atrix and the strictly uppertriangularpartofA is not referenced.

N ote thatw hen \(\mathrm{D} \mathbb{I A} G=\mathrm{U}\) ' or U ', the diagonal elem ents of A are not referenced either, butare assum ed to be unity.

U nchanged on exit.
LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen SDE \(=\) L'or 1 'then LD \(A>=\max (1, M)\), when \(S \mathbb{D} E\) \(=R^{\prime}\) or 'r'then LD A \(>=\max (1, N)\). U nchanged on exit.

B (input/output)
COM PLEX aray ofD \(\mathbb{I M}\) ENSION (LD B, n ). Before entry, the leading \(M\) by \(N\) part of the array \(B\) m ust contain the \(m\) atrix \(B\), and on exit is overw rilten by the transform ed \(m\) atrix.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling subprogram. LD B m ust be at leastm ax ( \(1, M\) ). U nchanged on exit.

*a, intlda, com plex *y, intincy);
void ctrm v_64 (charuplo, chartransa, char diag, long n, com plex *a, long lda, com plex *y, long incy);

\section*{PURPOSE}
ctrm \(v\) perform s one of the \(m\) atrix-vector operations \(x:=A{ }^{*} x\), or \(\mathrm{x}:=A{ }^{*} \mathrm{x}\), or \(\mathrm{x}:=\operatorname{con} \dot{g}\left(\mathrm{~A}^{\prime}\right){ }^{\star} \mathrm{x}\) where x is an n elem ent vectorand \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix.

\section*{ARGUMENTS}

\section*{UPLO (input)}

O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{U}^{\prime} A\) is an upper triangular \(m\) atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
O n entry, TRANSA specifies the operation to be perform ed as follow \(s\) :

TRANSA \(=N^{\prime}\) or \(h^{\prime} x:=A * x\).

TRANSA = T'ort'x:=A*x.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether or notA is unit triangular as follow s:

D \(\mathbb{A} G=U\) 'or \(u\) ' \(A\) is assum ed to be unit triangular.

D \(\mathbb{A} G=N\) 'or \(h\) ' A is notassum ed to be unit triangular.

U nchanged on exit.
N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix \(A\). \(\mathrm{N}>=0\). U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L', the leading \(n\) by \(n\) upper triangular part of the array A \(m\) ust contain the upper triangular \(m\) atrix and the strictly low er triangular part of A is not referenced. Before entry with UPLO = L 'or I', the leading \(n\) by \(n\) low er triangularpart of the array A m ust contain the low er triangular matrix and the strictly uppertriangularpartofA is not referenced. N ote thatw hen D IA G = U' or L', the diagonal elem ents of A are not referenced either, but are assum ed to be unity. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A \(>=\) \(m a x(1, n)\). U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. On exit, \(Y\) is overw rilten \(w\) ith the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
ctrifs provides errorbounds and backw ard error estim ates for the solution to a system of linear equations \(w\) th a triangular coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by CTRTRS or some other \(m\) eans before entering this routine. CTRRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=\mathrm{U}\) ': A is uppertriangular;
= L' ': A is low er triangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad\) N 0 transpose)
\(=T: A * * T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}: A\) is non-unit triangular;
\(=U\) ': A is unit triangular.

N (input) The order of the matrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, ie., the num ber of colum ns of the m atrices B and X . NRH S >=0.

A (input) The triangularm atrix A. If \(\mathrm{U} P L O=\mathrm{U}\) ', the leading N -by- N upper triangularpart of the aray A contains the upper triangular \(m\) atrix, and the strictly low er triangular part of \(A\) is not referenced. IfUPLO = L ', the leading N -by- N low er triangular part of the amray A contains the low ertriangularm atrix, and the strictly upper triangularpart ofA is not referenced. IfD IA G = U', the diagonal elem ents of A are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(X\) (input) The solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X. LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard emorbound for each solution vectorX (i) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X)\). If \(X T R U E\) is the true solution comesponding to \(X(\mathcal{i}), \operatorname{FERR}(\mathcal{)}\) is an estim ated upperbound forthe \(m\) agnitude of the largest ele\(m\) entin (X ( \()\)-X TRUE) divided by the magninude of the largestelem entin X ( 7 ) . The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0: successfulexit

\section*{C INTERFACE}
\#include <sunperfh>
void ctrsen (char job, char com pq, int *select, int n, com plex *t, int ldt, com plex *q, int ldq, com plex *w, int *m, float *s, float*sep, int*info);
void ctrsen_64 (char job, char com pq, long *select, long n, com plex *t, long ldt, com plex *q, long ldq, com plex *w, long *m, float *s, float *sep, long *info);

\section*{PURPOSE}
ctrsen reorders the Schur factorization of a com plex m atrix \(\mathrm{A}=\mathrm{Q} * \mathrm{~T} * \mathrm{Q} * * \mathrm{H}\), so that a selected clusterofeigenvalues appears in the leading positions on the diagonal of the upper triangularm atrix \(T\), and the leading colum ns ofQ form an orthonom albasis of the comesponding right invariant subspace.

Optionally the routine com putes the reciprocal condition num bers of the cluster ofeigenvalues and/or the invariant subspace.

\section*{ARGUMENTS}

JO B (input)
Specifies w hether condition num bers are required for the cluster ofeigenvalues (S) or the invariantsubspace (SEP):
= N ': none;
= E': foreigenvalues only (S);
= V ': for invariant subspace only (SEP);
= B ': forboth eigenvalues and invariant subspace
( S and SEP).
\(C O M P Q\) (input)
\(=\mathrm{V}\) ': update the m atrix Q of Schurvectors;
\(=N\) ': do notupdate \(Q\).

\section*{SELECT (input)}

SELEC T specifies the eigenvalues in the selected cluster. To select the \(j\) th eigenvahue, SELEC T ( 7 ) m ust.be set to .TRUE..

N (input) The order of the m atrix \(\mathrm{T} . \mathrm{N}>=0\).
T (input/output)
On entry, the upper triangularm atrix T. On exit, T is overw ritten by the reordered m atrix T , w th the selected eigenvalues as the leading diagonal elem ents.

LD T (input)
The leading dim ension of the aray T. LD T >= \(\max (1, N)\).

Q (input) \(O n\) entry, if \(C O M P Q=V\) ', them atrix \(Q\) of Schur vectors. On exit, if \(C O M P Q=V\) ', Q hasbeen postm ultiplied by the unitary transform ation \(m\) atrix which reorders \(T\); the leading \(M\) colum ns of \(Q\) form an orthonorm al basis for the specified invariant subspace. If \(C O M P Q=N^{\prime}, \mathrm{Q}\) is not referenced.

LD Q (input)
The leading \(d i m\) ension of the anray \(Q . L D Q>=1\); and if \(C O M P Q=V\) ', LD \(Q>=N\).

W (output)
The reordered eigenvalues of \(T\), in the sam e order as they appear on the diagonal of \(T\).

M (output)
The dim ension of the specified invariant subspace. \(0<=\mathrm{M}<=\mathrm{N}\).

S (output)
If \(J 0 B=E\) 'or \(B ', S\) is a lower bound on the reciprocal condition num ber for the selected clusterofeigenvalues. S cannot underestim ate the
true reciprocal condition num berby \(m\) ore than a factorof sqit \(\mathbb{N}\) ). If \(M=0\) or \(N, S=1\). If \(J 0 B=\) N 'or \(V\) ', S is not referenced.

SEP (output)
If \(\mathrm{OB}=\mathrm{V}\) 'or B ', SEP is the estim ated reciprocal condition num ber of the specified invariant subspace. IfM \(=0\) or \(N\), \(\mathrm{SEP}=\) norm ( I ). If \(\mathrm{JOB}=\) N 'or E',SEP is not referenced.
W ORK (w orkspace)
If \(\mathrm{JO} \mathrm{B}=\mathrm{N}\) ', W ORK is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the anay \(W\) ORK. If \(J 0 B=N\) ', LW ORK >=1; if \(J O B=E\) ', LW ORK \(=M *(N+M)\); if \(J O B\) \(=V\) 'or \(B^{\prime}\), LW ORK \(>=2 * M *(N+M)\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N}\) FO (output)
= 0 : successfulexit
< \(0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

C TRSEN first collects the selected eigenvalues by com puting a unitary transform ation \(Z\) to \(m\) ove them to the top left comerofT. In otherw ords, the selected eigenvalues are the eigenvalues of T11 in:
\[
\begin{gathered}
\mathrm{Z} \text { *T*Z }=(\mathrm{T} 11 \mathrm{~T} 12) \mathrm{n} 1 \\
(0 \mathrm{~T} 22) \mathrm{n} 2 \\
\mathrm{n} 1 \mathrm{n} 2
\end{gathered}
\]
\(w\) here \(N=n 1+n 2\) and \(Z\) ' \(m\) eans the conjugate transpose of \(Z\). The firstn1 colum ns of \(Z\) span the specified invariant subspace of \(T\).

IfT has been obtained from the Schur factorization of a \(m\) atrix \(A=Q * T * Q '\), then the reordered Schur factorization of \(A\) is given by \(\left.A=(Q *) *\left(Z \quad{ }^{*} T Z\right) * Q * Z\right)\) ', and the first \(n 1\) colum ns of Q Z span the comesponding invariant subspace of A.

The reciprocal condition num ber of the average of the eigenvalues of T11 m ay be retumed in S.S lies betw een 0 (very badly conditioned) and 1 (very w ellconditioned). It is com puted as follow s. Firstw e com pute R so that
\[
\begin{gathered}
P=\left(\begin{array}{l}
\text { I R }) ~ n 1 ~ \\
(00) n 2 \\
n 1 n 2
\end{array}\right.
\end{gathered}
\]
is the pro jector on the invariant subspace associated with T11. R is the solution of the Sylvesterequation:
\[
\mathrm{T} 11 * \mathrm{R}-\mathrm{R} * \mathrm{~T} 22=\mathrm{T} 12 .
\]

LetF-norm M) denote the Frobenius-norm of M and 2 -norm (M) denote the tw o-norm of . Then \(S\) is com puted as the low er bound
\[
(1+F-\operatorname{nom}(\mathbb{R}) * * 2)^{\star *}(-1 / 2)
\]
on the reciprocal of 2 -norm ( P ), the true reciprocal condition num ber. \(S\) cannotunderestim ate \(1 / 2\)-norm (P) by \(m\) ore than a factorof sqred ).

A n approxim ate errorbound for the com puted average of the eigenvalues of T11 is
EPS * norm (T) /S
where EPS is the \(m\) achine precision.
The reciprocal condition num ber of the right invariant subspace spanned by the firstn1 colum nsof \(Z\) (orofQ*Z) is retumed in SEP. SEP is defined as the separation of T11 and T 22 :
\[
\operatorname{sep}(T 11, T 22)=\text { sigm a-m in (C ) }
\]
where sigm a-m in (C) is the sm allest singularvalue of the \(n 1 * n 2-b y-n 1 * n 2 m\) atrix
\[
C=\operatorname{kprod}(I(n 2), T 11)-\operatorname{kprod}(\text { transpose }(T 22), I(n 1))
\]

I( \(m\) ) is an \(m\) by \(m\) identity \(m\) atrix, and kprod denotes the \(K\) ronecker product. W e estim ate sigm a-m in (C) by the reciprocalofan estim ate of the 1 -norm of inverse (C). The true reciprocal 1-norm of inverse ( \(C\) ) cannot differ from sigm a\(m\) in (C ) by \(m\) ore than a factor of squt (n1*n2).

W hen SEP is sm all, sm all changes in T can cause large
changes in the invariant subspace. A \(n\) approxim ate bound on the \(m\) axim um angularerror in the com puted right invariant subspace is

EPS * norm (T) /SEP

void ctrsm (char side, charuplo, char transa, chardiag, int \(m\), int \(n\), com plex *alpha, com plex *a, int lda, com plex *b, int ldb);
void ctrsm _64 (char side, charuplo, chartransa, char diag, long m, long n, com plex *alpha, com plex *a, long lda, com plex *b, long ldb);

\section*{PURPOSE}
ctrsm solves one of the \(m\) atrix equations op (A )*X = alpha*B, or X *op (A ) = alpha*B where alpha is a scalar, X and \(B\) arem by \(n m\) atrioes, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix and op (A) is one of
\(\mathrm{op}(\mathrm{A})=\mathrm{A}\) or \(\mathrm{op}(\mathrm{A})=\mathrm{A}^{\prime}\) or \(\mathrm{op}(\mathrm{A})=\operatorname{con} \overline{\mathrm{g}}(\) A').

Them atrix \(X\) is overw rilten on \(B\).

\section*{ARGUMENTS}

STDE (input)
On entry, SDD E specifies w hetherop (A ) appears on the leftor rightofX as follow s:

SDE = L'or I' op (A )*X = alpha*B .
\(S \mathbb{D} E=R\) 'or 'r' \(X\) *op (A ) = alpha*B.

U nchanged on exit.

UPLO (input)
On entry, UPLO specifies whether the matrix A is an upper or low er triangularm atrix as follow \(s\) :

UPLO = U'or \(\mathrm{L}^{\prime} A\) is an upper triangular \(m\) atrix.

UPLO = L' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRAN SA specifies the form ofop (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N^{\prime}\) 'or \(h^{\prime}\) op ( \(\left.A\right)=A\).

TRANSA = T'ort'op(A) = A'.

TRANSA \(=\) C'or \(\mathrm{E}^{\prime} \mathrm{op}(\mathrm{A})=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right)\).
U nchanged on exit.
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE .

D IA G (input)
On entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D \(\mathbb{A} G=U\) 'or \(l^{\prime} A\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.
M (input)
O \(n\) entry, M specifies the num ber of row sof B.M \(>=0\). Unchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the num ber of colum ns of \(B\).
\(\mathrm{N}>=0\). U nchanged on exit.
ALPHA (input)
O n entry, A LPH A specifies the scalar alpha.W hen alpha is zero then \(A\) is not referenced and \(B\) need notbe setbefore entry. U nchanged on exit.

A (input)
COM PLEX aray ofD \(\mathbb{M}\) ENSION (LDA, k),
where \(k\) is \(m\) when \(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathbb{I}\) and is \(n\)
when \(S \mathbb{D E}=\) R'or 'r'.
Before entry \(w\) th UPLO \(=U\) 'or \(u\) ', the lead-
ing \(k\) by \(k\) upper triangularpart of the array \(A\) \(m\) ust contain the upper triangularm atrix and the strictly low ertriangularpartofA is not referenced.

Before entry w th UPLO = L'or 1', the leading \(k\) by \(k\) low er triangularpart of the array \(A\) m ustcontain the low er triangularm atrix and the strictly uppertriangularpart ofA is not referenced.

N ote thatw hen D \(\mathbb{A}\) G = U ' or U ', the diagonal elem ents of A are not referenced either, butare assum ed to be unity. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen \(S \mathbb{D} E=\mathbb{L}\) 'or \(I^{\prime}\) then LD \(A>=m a x(1, M)\), when \(S \mathbb{D} E\) \(=R^{\prime}\) or ' \(r^{\prime}\) then LD \(A>=m\) ax \((1, N)\). U nchanged on exit.

B (input/output)
COM PLEX array ofD \(\mathbb{I M} E N S \mathbb{I} N(L D B, n)\).
Before entry, the leading \(M\) by \(N\) part of the array
\(B m\) ust contain the righthand side \(m\) atrix \(B\), and on exit is overw rilten by the solution \(m\) atrix \(X\).

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling subprogram. LD B >= max ( \(1, M\) ). U nchanged on exit.

PURPOSE
ctrsna estim ates reciprocalcondition num bers for specified eigenvahues and/or right eigenvectors of a com plex upper triangularm atrix T (orofany \(m\) atrix \(Q * T * Q * * H\) with \(Q\) unitary).

\section*{ARGUMENTS}

JOB (input)
Specifies w hethercondition num bers are required
foreigenvalues (S) oreigenvectors (SEP):
\(=\mathrm{E}\) ': foreigenvalues only ( S );
\(=\mathrm{V}\) : foreigenvectors only (SEP);
\(=B^{\prime}:\) forboth eigenvalues and eigenvectors ( \(S\) and SEP).

H OW M NY (input)
= A ': com pute condition num bers for all eigenpairs;
\(=S\) : com pute condition num bers for selected
eigenpairs specified by the anray SELECT .

SELECT (input)
IfHOW M NY = S',SELECT specifies the eigenpairs for which condition num bers are required. To selectcondition num bers for the \(j\) th eigenpair,
SELECT ( \(\ddagger\) ) mustbe set to TRUE .. IfHOW M NY = A ',
SELECT is notreferenced.

N (input) The order of the m atrix \(\mathrm{T} \cdot \mathrm{N}>=0\).

T (input) The upper triangularm atrix T .

LD T (input)
The leading dim ension of the array \(\mathrm{T} . \mathrm{LD} \mathrm{T}>=\) \(\max (1, \mathbb{N})\).

VL (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VL mustcontain left eigenvectors of \(T\) (or of any \(\mathrm{Q} * \mathrm{~T} * \mathrm{Q} * * \mathrm{H}\) w ith Q unitary), corresponding to the eigenpairs specified by H OW M NY and SELECT.The eigenvectors m ustbe stored in consecutive colum ns of \(V L\), as retumed by \(C H S E \mathbb{I}\) orCTREVC. If \(J B=V\) ', \(V L\) is notreferenced.

LDVL (input)
The leading dim ension of the array V L. LD V L >=1; and if \(J 0 B=E\) 'or \(B ', L D V L>=N\).

VR (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VR m ust contain right eigenvectors of \(T\) (or of any \(Q * T * Q * * H\) with Q unitary), corresponding to the eigenpairs specified by H OW M NY and SELEC T. The eigenvectors m ustbe stored in consecutive columns of VR, as retumed by \(C H S E \mathbb{N}\) orCTREVC. If \(O B=V\) ',VR is notreferenced.

LDVR (input)
The leading din ension of the array VR. LD V R >=1; and if \(J 0 B=E\) 'or \(B ', L D V R>=N\).

S (output)
If \(\mathrm{OOB}=\mathrm{E}\) ' or \(\mathrm{B}^{\prime}\), the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the array. Thus \(S(\mathcal{)}\), \(\operatorname{SEP}(\mathcal{j})\), and the \(j\) th colum ns of VL and VR all comespond to the sam e eigenpair (butnotin general the \(j\) th eigenpair, unless alleigenpairs are selected). If \(\mathrm{JOB}=\mathrm{V}^{\prime}\) ', S is not referenced.

SEP (output)
If \(\mathrm{JOB}=\mathrm{V}\) ' or B ', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the aray. If \(\mathrm{JOB}=\mathrm{E}\) ', SEP is not referenced.

M M (input)
The num berofelem ents in the arrays \(S\) (if \(J O B=\) E' or B') and/orSEP (if \(J O B=V\) 'or B ).MM \(>=M\).

M (output)
The num berof elem ents of the arrays \(S\) and/or SEP actually used to store the estim ated condition num bers. If HOW M NY = A', M is set to \(N\).

W ORK (w orkspace)
dim ension (LDW ORK, N+1) If \(\mathrm{OOB}=\mathrm{E}\) ', W ORK is not referenced.

LDW ORK (input)
The leading dim ension of the array W ORK. LDW ORK \(>=1\); and if \(J O B=V\) 'or \(B\) ', LDW ORK \(>=N\).

W ORK 1 (w orkspace)
dim ension \((\mathbb{N})\) If \(\mathrm{JOB}=E\) ', W ORK 1 is not referenced.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
< 0 : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of an eigenvalue lam boda is defined as
\[
S(\operatorname{lam} \text { bda })=\left|N^{*} u\right| /(\text { norm }(u) * \text { norm }(v))
\]
\(w\) here \(u\) and \(v\) are the right and left eigenvectors of \(T\) comesponding to lam bda; v 'denotes the conjugate transpose of \(v\), and norm (u) denotes the Euclidean norm. These reciprocal condition num bers alw ays lie betw een zero (very badly conditioned) and one (very well conditioned). If \(\mathrm{n}=1\), S (lam bda) is defined to be 1 .

A \(n\) approxim ate errorbound for a com puted eigenvalue \(W\) (i) is given by
```

EPS * norm (T) /S (i)

```
where EPS is the \(m\) achine precision.
The reciprocal of the condition num ber of the right eigenvector \(u\) corresponding to lam bda is defined as follow s. Suppose
\[
\begin{gathered}
\mathrm{T}=(\operatorname{lam} \text { bda } \mathrm{c}) \\
\left(\begin{array}{cc}
\mathrm{T} 22
\end{array}\right)
\end{gathered}
\]

Then the reciprocalcondtion num ber is
SEP (lam bda, T22 \()=\) sigm a-m in (T22 -lam bda*I \()\)
where sigm a-m in denotes the sm allest singular value. \(W\) e approxim ate the sm allest singularvalue by the reciprocal of an estim ate of the one-norm of the inverse of T22 lam bda*I. If \(n=1, \operatorname{SEP}(1)\) is defined to be \(\operatorname{abs}(T(1,1))\).

A \(n\) approxim ate errorbound for a com puted right eigenvector VR (i) is given by
EPS * norm (I) /SEP (i)

\section*{PURPOSE}
ctrsv solves one of the system s ofequations \(A *_{x}=b\), or \(A{ }^{*} x=b\), orcon \(j g\left(A^{\prime}\right){ }^{\star} x=b\) where \(b\) and \(x\) are \(n\) elem ent vectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix.
N o testforsingularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{U}^{\prime} A\) is an upper triangular m atrix .
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix .

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA = T'ort' \(A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA \(=C^{\prime}\) or \(\mathrm{C}^{\prime} \operatorname{con} \dot{\rho}\left(\mathrm{A}^{\prime}\right) \star \mathrm{x}=\mathrm{b}\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit
triangular as follow s:
\(D \mathbb{A G}=U\) 'or \(U^{\prime} A\) is assum ed to be unit triangular.
\(D \mathbb{A G}=N^{\prime}\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
O n entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
Before entry w ith UPLO = U 'or L ', the leading \(n\) by \(n\) upper triangularpart of the anray A m ust contain the upper triangular \(m\) atrix and the strictly low ertriangularpart of \(A\) is notreferenced. Before entry w ith UPLO = 'L 'or '1', the leading \(n\) by \(n\) low er triangularpart of the array A m ustcontain the low ertriangularm atrix and the strictly uppertriangularpart of \(A\) is notreferenced. N ote thatw hen DIAG \(=U^{\prime}\) or \(L^{\prime}\) ', the diagonal elem ents ofA are notreferenced either, butare assum ed to be unity. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the first dim ension of A as declared in the calling (sub) program .LD A >= \(\max (1, n)\). U nchanged on exit.

Y (input/output)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) m ust contain the \(n\) elem ent right-hand side vectorb. On exit, \(Y\) is overw ritten \(w\) th the solution vectorx.
\(\mathbb{N} C Y\) (input)
O n entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(. \mathbb{N} C Y<>0\). U nchanged on exit.

\section*{PURPOSE}
ctrsylsolves the com plex Sylvesterm atrix equation:
op (A ) *X \(+X\) *op \((B)=\) scale \({ }^{\star} C\) or \(o p(A) * X-X * o p(B)=\) scale \({ }^{*} C\),
where op \((A)=A\) or \(A * * H\), and \(A\) and \(B\) are both upper triangular. \(A\) is \(M\) boy -M and B is N foy -N ; the righthand side C and the solution X are M boy N ; and scale is an output.scale factor, set<= 1 to avoid overflow in \(X\).

\section*{ARGUMENTS}

TRANA (input)
Specifies the option op (A):
\(=N^{\prime}: \operatorname{op}(A)=A \quad(N \circ\) transpose)
\(=C\) ':op \((A)=A * * H \quad\) (C onjugate transpose)

TRANB (input)
Specifies the option op (B):
\(=N\) : op \((B)=B \quad(N \circ\) transpose)
\(=C\) ':op \((B)=B * * H \quad\) (Conjugate transpose)
ISGN (input)
Specifies the sign in the equation:
\(=+1\) : solve op (A ) *X + X *op (B) = scale*C
\(=-1\) : solve op \((A) * X-X\) *op \((B)=\) scale \({ }^{*} C\)
\(M\) (input) The order of the \(m\) atrix \(A\), and the num ber of row \(s\)
in the m atrioes X and \(\mathrm{C} . \mathrm{M}>=0\).

N (input) The order of the \(m\) atrix \(B\), and the num ber of collm ns in the m atrices X and \(\mathrm{C} . \mathrm{N}>=0\).

A (input) The upper triangularm atrix A .
LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathrm{M})\).
\(B\) (input) The upper triangularm atrix \(B\).
LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

C (input/output)
On entry, the \(M-b y-N\) righthand side \(m\) atrix C. On exit, \(C\) is overw rilten by the solution \(m\) atrix \(X\).

LD C (input)
The leading dim ension of the aray C. LD C >= \(\max (1, \mathrm{M})\)

SCALE (output)
The scale factor, scale, set <= 1 to avoid overflow in \(X\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an illegalvalue
\(=1\) : A and B have com m on or very close eigenvalues; perturbed values w ere used to solve the equation (but the \(m\) atrices \(A\) and \(B\) are unchanged).

\section*{PURPOSE}
ctutrs solves a triangular system of the form where \(A\) is a triangularm atrix of order \(N\), and \(B\) is an \(N\) -by-NRHS m atrix. A check ism ade to verify that A is nonsingular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}: \mathrm{A}\) is uppertriangular;
= L': A is low ertriangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}\) ': A * \(\mathrm{X}=\mathrm{B} \quad\) N o transpose)
\(=T: A * * T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=N^{\prime}: A\) is non-unit triangular;
\(=\mathrm{U}\) ': A is unit triangular.
N (input) The order of the \(m\) atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrix B. NRHS \(>=0\).

A (input) The triangularm atrix A. If \(\mathrm{PLO}=\mathrm{U}\) ', the lead-
ing N -by N upper triangularpart of the array A
contains the upper triangular \(m\) atrix, and the strictly low ertriangularpartofA is not refer-
enced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by N lower triangular part of the array A contains the low er triangularm atrix, and the strictly upper triangular part ofA is not referenced. IfD \(\mathbb{I A} G=U\) ', the diagonalelem ents of \(A\) are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).

B (input/output)
On entry, the right hand side m atrix B. On exit, if \(\mathbb{N} F O=0\), the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the \(i\)-th diagonalelem ent of \(A\) is zero, indicating that the \(m\) atrix is singular and the solutions \(X\) have notbeen com puted.

void ctzrqf_64 (long m , long n, com plex *a, long lda, com plex
*tau, long *info);

\section*{PURPOSE}
ctzrqf routine is deprecated and has been replaced by routine CTZRZF.

C TZRQF reduces the M -by -N ( \(\mathrm{M}<=\mathrm{N}\) ) com plex upper trapezoidal \(m\) atrix \(A\) to upper triangular form by meansofunitary transform ations.

The upper trapezoidalm atrix A is factored as
\[
A=\left(\begin{array}{ll}
R & 0
\end{array}\right) * Z,
\]
w here Z is an N -by -N unitary m atrix and R is an M -by -M upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the matrix \(\mathrm{A} . \mathrm{N}>=\mathrm{M}\).

A (input/output)
O \(n\) entry, the leading \(\mathrm{M}-b y-\mathrm{N}\) upper trapezoidal part of the amay A m ust contain them atrix to be factorized. On exit, the leading \(M\)-by -M upper triangularpart ofA contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row s of \(A, w\) ith the array \(T A U\), represent the unitary \(m\) atrix \(Z\) as a productof \(M\) elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

TAU (output)
The scalar factors of the elem entary reflectors.
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
< 0 : if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an ille-

\section*{FURTHER DETAILS}

The factorization is obtained by H ouseholder'sm ethod. The k th transform ation \(m\) atrix, Z ( \(k\) ), w hose conjugate transpose is used to introduce zeros into the ( \(m-k+1\) ) th row of \(A\), is given in the form
\[
\left.\begin{array}{c}
\mathrm{Z}(\mathrm{k})=\left(\begin{array}{ll}
\mathrm{I} & 0
\end{array}\right), \\
\left(\begin{array}{l}
\mathrm{O}
\end{array} \mathrm{~T}(\mathrm{k})\right.
\end{array}\right),
\]
where
\[
\begin{gathered}
T(k)=I-\tan * u(k) * u(k))^{\prime} \quad u(k)=\left(\begin{array}{ll}
1
\end{array}\right), \\
\left(\begin{array}{l}
0
\end{array}\right) \\
(z(k))
\end{gathered}
\]
tau is a scalar and \(z(k)\) is an ( \(n-m\) ) elem ent vector. tau and \(\mathrm{z}(\mathrm{k})\) are chosen to annihilate the elem ents of the kth row of .

The scalartau is retumed in the \(k\) th elem entofTA \(U\) and the vectoru ( \(k\) ) in the \(k\) th row of \(A\), such that the elem ents of \(z(k)\) are in \(a(k, m+1), \ldots, a(k, n)\). The elem ents ofR are retumed in the upper triangularpartofA.
\(Z\) is given by
\[
Z=Z(1) * Z(2) * \ldots * Z(m) .
\]

void ctzrzf(intm, intn, com plex *a, int lda, com plex *tau, int*info);
void ctzrzf_64 (long m, long n, com plex *a, long lda, com plex *tau, long *info);

\section*{PURPOSE}
ctzrzf reduces the M boy \(-\mathrm{N} \quad(\mathrm{M}<=\mathrm{N})\) com plex uppertrapezoidal \(m\) atrix \(A\) to upper triangular form by \(m\) eans of unitary transform ations.

The uppertrapezoidalm atrix \(A\) is factored as
\[
A=\left(\begin{array}{ll}
R & 0
\end{array}\right) * Z,
\]
\(w\) here \(Z\) is an \(N\) boy \(-N\) unitary \(m\) atrix and \(R\) is an \(M\) boy \(-M\) upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
On entry, the leading M -by -N upper trapezoidal part of the array A m ust contain the m atrix to be factorized. On exit, the leading M -by -M upper triangularpart ofA contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row s of \(A\), w ith the array TA \(U\), represent the unitary \(m\) atrix \(Z\) as a productof \(M\) elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors.
W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

The dimension of the array \(W\) ORK. LW ORK >= \(m\) ax \((1, M)\). Foroptim um perform anœ \(L W O R K>=M * N B\), w here NB is the optim alblocksize.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value

\section*{FURTHER DETAILS}

B ased on contributions by
A. Petitet, C om puterScience D ept., U niv . of Tenn., K noxville, U SA

The factorization is obtained by H ouseholdersm ethod. The \(k\) th transform ation \(m\) atrix, \(Z(k)\), which is used to introduce zeros into the ( \(m-k+1\) )th row ofA, is given in the form
\[
\begin{gathered}
\mathrm{Z}(\mathrm{k})=\left(\begin{array}{ll}
\mathrm{I} & 0
\end{array}\right), \\
\binom{\mathrm{O}}{\mathrm{~T}(\mathrm{k})}
\end{gathered}
\]
where
\[
\begin{gathered}
\left.T(k)=I-\tan { }^{*} u(k) * u(k)\right), \quad u(k)=\left(\begin{array}{ll}
1
\end{array}\right), \\
\left(\begin{array}{l}
0
\end{array}\right) \\
(z(k))
\end{gathered}
\]
tau is a scalar and \(z(k)\) is an ( \(n-m\) ) elem ent vector. tau and \(\mathrm{z}(\mathrm{k})\) are chosen to annihilate the elem ents of the kth row of .

The scalartau is retumed in the kth elem entofTAU and the vectoru ( \(k\) ) in the kth row of A, such that the elem ents of \(z(k)\) are in \(a(k, m+1), \ldots, a(k, n)\). The elem ents ofR are retumed in the upper triangularpartofA.
\(Z\) is given by
\[
Z=Z(1) * Z(2) * \ldots * Z(m) .
\]

\section*{PURPOSE}
cung2rR generates an \(m\) by \(n\) com plex \(m\) atrix \(Q w\) th orthonorm al colum ns, which is defined as the firstn colum ns of a product ofk elem entary reflectors of orderm
\[
Q=H(1) H(2) \ldots H(k)
\]
as retumed by CGEQRF.

\section*{ARGUMENTS}

M (input) The num ber of row sof the m atrix \(\mathrm{Q} . \mathrm{M}>=0\).
N (input) The num ber of Colum ns of the m atrix \(\mathrm{Q} . \mathrm{M}>=\mathrm{N}>=\) 0.
\(K\) (input) The num ber of elem entary reflectors w hose product defines the \(m\) atrix \(Q . N>=K>=0\).

A (input/output)
On entry, the \(i\)-th columnm ustcontain the vector which defines the elem entary reflectorH (i), for i \(=1,2, \ldots, k\), as retumed by CG EQRF in the first k colum ns of its array argum entA. On exit, the \(m\) by \(n m\) atrix \(Q\).

LD A (input)
The first dim ension of the array A. LDA >= max (1, M).

TAU (input)
TAU (i) m ust contain the scalar factor of the ele\(m\) entary reflectort (i), as retumed by CGEQRF.

W ORK (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthas an illegalvalue

void cungbr(charvect, intm, intn, intk, com plex *a, int lda, com plex *tau, int *info);
void cungbr_64 (charvect, long m, long \(n\), long \(k\), com plex
*a, long lda, com plex *tau, long *info);

\section*{PURPOSE}
cungbrgenerates one of the com plex untary matrioes Q or \(\mathrm{P} * * \mathrm{H}\) determ ined by CGEBRD when reducing a com plex \(m\) atrix \(A\) to bidiagonal form : \(A=Q * B * P * * H . Q\) and \(P * * H\) are defined as products ofelem entary reflectors \(H\) (i) orG (i) respectively .

IfVECT \(=Q\) ', \(A\) is assum ed to have been an \(M\) boy \(K m\) atrix, and \(Q\) is of orderM :
ifm \(>=k, Q=H(1) H(2) \ldots H(k)\) and CUNGBR retams the firstn colum \(n s\) of \(Q\), where \(m>=n>=k\);
ifm \(<k, Q=H(1) H(2) \ldots H(m-1)\) and CUNGBR retums \(Q\) as an \(M\) łoy \(-M\) matrix.

IfVECT \(=P\) ', A is assum ed to have been a K -by -N m atrix, and \(P * * H\) is oforderN :
if \(k<n, P * * H=G(k) \ldots G(2) G(1)\) and \(C U N G B R\) retums the firstm row sof \({ }^{* *} H\), where \(n>=m>=k\);
if \(k>=n, P * * H=G(n-1) \ldots G(2) G(1)\) and CUNGBR retums \(\mathrm{P} * * \mathrm{H}\) as an N boy -N m atrix.

\section*{ARGUMENTS}

VECT (input)
Specifies w hether the m atrix Q orthem atrix \(P * * H\)
is required, as defined in the transform ation
applied by CGEBRD :
= Q ': generate Q ;
\(=P^{\prime}:\) generate \(\mathrm{P}^{* *} \mathrm{H}\).

M (input) The num ber of row s of the \(m\) atrix \(Q\) orP** \(H\) to be retumed. \(\mathrm{M}>=0\).
\(N\) (input) The num ber of colum ns of the \(m\) atrix \(Q\) or \(P * * H\) to
be retumed. \(\mathrm{N}>=0\). IfVECT \(=\) Q', \(\mathrm{M}>=\mathrm{N}>=\) \(m\) in \((M, K) ;\) ifVECT \(=P^{\prime}, N>=M>=m\) in \((\mathbb{N}, K)\).

K (input) IfVECT = Q', the num ber of colum ns in the original \(M\) by \(K\) matrix reduced by CGEBRD. IfVECT = \(P\) ', the num ber of row \(s\) in the original \(K\) boy \(N\) \(m\) atrix reduced by \(C G E B R D . K>=0\).

A (input/output)
O n entry, the vectors w hich define the elem entary reflectors, as retumed by CGEBRD. On exit, the M boy -N m atrix Q orP**H.

LDA (input)
The leading dim ension of the aray A.LDA >=M.

TAU (input)
\((m\) in \(M, K))\) ifVECT \(=Q^{\prime}(m\) in \((\mathbb{N}, K))\) ifVECT \(=P^{\prime}\)
TAU (i) m ustcontain the scalar factor of the ele\(m\) entary reflectorH (i) orG (i), which determ ines Q or \(P^{* *} H\), as retumed by \(C\) G EBRD in its array argu\(m\) entTAUQ orTAUP.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the anay W ORK. LW ORK >= \(m\) ax \((1, m\) in \(M, N))\). Foroptim um perform ance LW ORK \(>=\) \(m\) in \(M, N) \star N B, w\) here \(N B\) is the optim alblocksize.

IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue

void cungrq (intm, intn, int \(k\), com plex *a, int lda, com plex *tau, int*info);
void cungrq_64 (long m, long n, long k, com plex *a, long lda, com plex *tau, long *info);

\section*{PURPOSE}
cungrq generates an M -by N com plex m atrix Q w ith orthonorm al row \(S\), which is defined as the lastM row s of a product of \(K\) elem entary reflectors of orderN
\[
Q=H(1) \cdot H(2)^{\prime} \ldots H(k) '
\]
as retumed by CGERQF.

\section*{ARGUMENTS}

M (input) The num ber of row sof the m atrix \(\mathrm{Q} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{Q} \cdot \mathrm{N}>=\mathrm{M}\).
\(K\) (input) The num ber of elem entary reflectors \(w\) hose product defines the \(m\) atrix \(Q . M>=K>=0\).

A (input/output)
On entry, the ( \(m-k+i\) )-th row \(m\) ust contain the vector which defines the elem entary reflectorH (i), for \(i=1,2, \ldots, k\), as retumed by CGERQF in the lastk row sof its amay argum entA. O n exit, the M Hy -N m atrix Q .

LD A (input)
The first dim ension of the array A. LDA >= max (1, M).

TAU (input)
TAU (i) m ust contain the scalar factor of the ele\(m\) entary reflectort (i), as retumed by CGERQF.

W ORK (w orkspace)
On exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the anay \(W\) ORK. LW ORK >= max (1,M). Foroptim um perform anœ LW ORK \(>=M\) *NB,
w here NB is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{I N F O}=-i\), the i-th argum enthas an illegalvałue

cunm brVECT = Q ', CUNM BR overw rites the general com plex M by -N m atrix C w ith
```

        SDEE= L' SDDE = R'TRANS = N':
    Q * C C *Q TRANS=C': Q**H * C C *

```
Q**H

IfVECT = P', CUNM BR overw rites the general com plex M -by -N \(m\) atrix \(C\) w ith
\[
S \mathbb{D} E=L^{\prime} \quad S \mathbb{D} E=R^{\prime}
\]

TRANS = N: \(\quad \mathrm{P} * \mathrm{C} \quad \mathrm{C} * \mathrm{P}\)
TRANS = C : \(\quad \mathrm{P} * * H * C \quad C * P * * H\)

Here \(Q\) and \(P * * H\) are the unitary \(m\) atrices determ ined by CGEBRD when reducing a com plex m atrix A to bidiagonal form : \(A=Q * B * P * * H . Q\) and \(P * * H\) are defined as products of ele\(m\) entary reflectors \(H\) (i) and \(G\) (i) respectively.

Letnq \(=m\) if \(S \mathbb{D} E=L\) 'and \(n q=n\) if \(S \mathbb{D} E=R\) '. Thus \(n q\) is the order of the unitary \(m\) atrix \(Q\) or \(P * * H\) that is applied.

IfVECT = Q',A is assum ed to have been an NQ -by K m atrix:
if \(n q>=k, Q=H(1) H(2) \ldots H(k)\);
ifnq \(<k, Q=H(1) H(2) \ldots H(n q-1)\).
IfVECT \(=P^{\prime}, A\) is assum ed to have been a \(K-b y-N Q\) matrix:
ifk < nq, P = G (1) G (2) .. . G (k);
if \(k>=n q, P=G(1) G(2) \ldots G(n q-1)\).

\section*{ARGUMENTS}

VECT (input)
\(=Q\) ': apply \(Q\) or \(Q * * H\);
\(=P\) ': apply P orP**H .

SID E (input)
\(=L\) ': apply \(Q, Q^{* *} H, P\) orP**H from the Left;
\(=R\) ': apply \(Q, Q{ }^{* *} H, P\) or \({ }^{* *}{ }^{*} H\) from the \(R\) ight.

TRANS (input)
\(=\mathrm{N}\) ': N o transpose, apply Q orP;
\(=C\) ': C onjugate transpose, apply \(\mathrm{Q} * * H\) or \({ }^{* * * H}\).

TRANS is defaulted to \(N\) 'forF \(95 \mathbb{N}\) TERFACE.

M (input) The num ber of row s of the m atrix \(\mathrm{C} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{C} . \mathrm{N}>=0\).

K (input) IfVECT = Q', the num ber of colum ns in the original \(m\) atrix reduced by CGEBRD. IfVECT \(=P\) ', the num ber of row \(S\) in the originalm atrix reduced by CGEBRD. \(K>=0\) 。

A (input) (LDA,min (nq,K)) ifVECT = Q' (LDA,nq) if
\(\mathrm{VECT}=\mathrm{P}\) 'The vectors w hich define the elem entary reflectors \(H\) (i) and G (i) , w hose products determ ine the \(m\) atrioes \(Q\) and \(P\), as retumed by CGEBRD.

LD A (input)
The leading dim ension of the array A. If VECT = Q', LDA \(>=\max (1, n q)\); if \(V E C T=P^{\prime}, L D A>=\) \(m \operatorname{ax}(1, m\) in \((n q, K))\).

TAU (input)
TAU (i) m ust contain the scalar factor of the ele\(m\) entary reflectorH (i) orG (i) which determ ines Q or P , as retumed by CGEBRD in the array argum ent TAUQ orTAUP.

C (input/output)
On entry, the \(M\) boy \(-\mathrm{N} m\) atrix C . On exit, C is overw ritten by \(\mathrm{Q} * \mathrm{C}\) or \(\mathrm{Q} * * \mathrm{H} * \mathrm{C}\) or \(\mathrm{C} \mathrm{Q}^{* *} \mathrm{H}\) or \(\mathrm{C} \mathrm{Q}^{\mathrm{Q}}\) or \(P{ }^{*} \mathrm{C}\) or \(\mathrm{P}^{* *} \mathrm{H} * \mathrm{C}\) or C * or \(\mathrm{C}^{*} \mathrm{P} * * \mathrm{H}\).

C <-alpha op (A ) B + beta C
where A LPHA and BETA are scalar, \(C\) and \(B\) are \(m\) atriges, \(A\) is a \(m\) atrix represented in variable block sparse row form at and op (A ) is one of
\(o p(A)=A\) or \(o p(A)=A^{\prime}\) or op \((A)=\operatorname{conjg}\left(A^{\prime}\right)\).
( 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) th transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix.
2 is equivalent to 1 if the \(m\) atrix is real.

M B \(\quad\) Num ber ofblock row s in m atrix A
\(N \quad N\) um ber of colum ns in \(m\) atrix \(C\)

K B \(\quad\) Num ber ofblock colum ns in m atrix A

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger aray
D ESCRA (1) m atrix structure
0 :general
1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm itian ( \(A=\) CON JG (A ) )
3 :Triangular
4 : Skew (A nti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(A=-C O N J(A)\) )

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 : unit
DESCRA (4) A ray base \(N\) OT \(\mathbb{M}\) PLEM ENTED)
0 :C C++ com patible
1 :Fortran com patible
DESCRA (5) repeated indices? NOT IM PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL ( scalar array of length NN Z consisting of the block entries of A w here each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NN Z is the total num berof pointentries in all nonzero block entries of am atrix A.
\(\mathbb{N} D \mathrm{X}\) () integer anray of length BNN Z +1 where BNNZ is the num berof block entries of a m atrix A such that the I-th elem entof \(\mathbb{N}\) D X [] points to the location in VAL of the \((1,1)\) elem ent of the I-th block entry.

B IND X () integer array of length BNN Z consisting of the block colum \(n\) indiges of the block entries of \(A\) where BNNZ is the num berblock entries of a m atrix A.

RPN TR 0) integer amay of length M B+1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the \(I\)-th block
row .
RPN TR \(M B+1\) ) is set to \(M+\operatorname{RPN} \operatorname{TR}(1)\) where \(M\) is the num ber of row \(s\) in \(m\) atrix \(A\).
Thus, the num berof point row sin the I-th block row is RPNTR (I+1)RPNTR (I).

CPN TR 0 integer array of length \(K B+1\) such that CPN TR (J)-CPN TR (1)+1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR ( \(K B+1\) ) is set to \(K+C P N T R(1)\) where \(K\) is the num ber of \(c o l u m n s\) in \(m\) atrix \(A\). Thus, the num ber of point \(\infty 0\) lum ns in the \(J\) th block colum n is CPNTR ( \(\mathrm{J}+1\) )-CPNTR ( \(J\) ).

BPNTRB () integer array of length \(M B\) such thatBPNTRB (I) BPNTRB (1) +1 points to location in B IND X of the first.block entry of the I-th block row of A.

BPNTRE 0 integer anay of length \(M B\) such that BPN TRE (I) BPNTRB (1) points to location in B \(\mathbb{N}\) D X of the lastblock entry of the I-th block row of A.

B 0 rectangular array w ith firstdin ension LD B .

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) th the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(\sin m\) atrix \(A\)

N \(\quad\) Num berof colum ns in matrix C

UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum \(n\) block scaling)

DV () A rray containing the block entries of the block diagonalm atrix D. The size of the Jth block is RPN TR ( \(\mathrm{J}+1\) )-RPN TR (J) and each block containsm atrix entries stored colum n-m ajor. The total length of aray DV is given by the form ula:
sum over J from 1 to M B:

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem ent integer array
DESCRA (1) m atrix structure
0 :general
1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm itian ( \(\mathrm{A}=\mathrm{CONJG}(\mathrm{A})\) )
3 :Triangular
4 : Skew (Anti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\mathrm{CON}\) J ( A ) )
N ote: For the routine, DESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) main diagonal type
0 : non-identity blocks on the \(m\) ain diagonal
1 : identily diagonalblock
2 : diagonalblocks are densem atrices
DESCRA (4) A ray base \(\mathbb{N} O T \mathbb{I}\) PLEM ENTED )
0 :C C++ com patible
1 :Fortran com patible
D ESCRA (5) repeated indices? NOT IM PLEM EN TED )
0 : unknown
1 :no repeated indices
VAL 0 scalar array of length NN Z consisting of the block entries ofA where each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NN Z is the total num berof pointentries in allnonzero block entries of a m atrix A.
\(\mathbb{I N}\) D X 0 integer array of length BNN Z +1 where BNN \(Z\) is the num ber block entries of a \(m\) atrix A such that the I-th elem ent of \(\mathbb{N} D \mathrm{X}[]\) points to the location in VAL of the \((1,1)\) elem ent of the I-th block entry.
\(B \mathbb{N} D\) X () integer array of length BNNZ consisting of the block colum \(n\) indioes of the block entries of A where BNN Z is the num berblock entries of a m atrix A. B lock colum n indices M U ST be sorted in increasing order foreach block row .

RPN TR 0) integer aray of length M B +1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the I-th block
row.
RPN TR \(M B+1\) ) is set to \(M+R P N T R(1)\) where \(M\) is the num ber of row \(s\) in square triangularm atrix \(A\).

Thus, the num berof point row s in the I-th block row is RPNTR (I+1)RPNTR (I).

NOTE: For the cumentversion CPN TR m ustequalRPN TR and a single array can be passed forboth argum ents

CPNTR 0 integeramay of length \(M B+1\) such thatCPN TR (J)-CPN TR (1) +1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR M B+1) is set to M +CPN TR (1). Thus, the num ber of pointcolum ns in the J-th block colum n is CPNTR ( \(\mathrm{J}+1\) )-CPNTR (J).

NO TE: For the current version CPN TR m ustequal RPN TR and a single aray can be passed forboth argum ents
BPN TRB 0 integer aray of length \(M B\) such thatBPN TRB (I)-BPNTRB (1)+1 points to location in B IND X of the firstblock entry of the I-th block row of A.

BPN TRE () integer array of length \(M B\) such thatBPN TRE (I) BPN TRB (1) points to location in B \(\mathbb{N} D \mathrm{X}\) of the last.block entry of the I-th block row of A.

B 0 rectangular aray w th first dim ension LD B.

LD B leading dim ension ofB
BETA Scalarparam eter
C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC
W ORK 0 scratch array of length LW ORK. On exit, ifLW ORK = -1,W ORK (1) retums the optim um size of LW ORK.

LW ORK length of ORK array. LW ORK should be at least \(\mathrm{M}=\mathrm{RPNTR} \mathrm{M} \mathrm{B}+1)\) RPNTR (1).

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M} * \mathrm{~N}\) _CPUS where N _CPUS is the \(m\) axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK amray, and no enrorm essage related to LW ORK is issued

Elem ents of IBD IA G M UST be sorted in increasing order.
NBD IA G The num berofnon-zero block diagonals in A.
LB D im ension of dense blocks com posing A.
B 0 Rectangular aray with firstdim ension LD B .
LD B Leading dim ension of B .
BETA Scalarparam eter.
C 0 Rectangular array w ith first dim ension LD C .
LD C Leading dim ension of C .

W ORK 0 scratch array of length LW ORK. On exit, ifLW ORK=-1,W ORK (1) retums the optim um size ofLW ORK.

LW ORK length ofW ORK array. LW ORK should be at least M B *LB.

Forgood penform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=M B * L B * N \_C P U S\) where \(N\) _CPU \(S\) is the \(m\) axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no enrorm essage related to LW ORK is issued by X ERBLA.

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such tests \(m\) ustbe perform ed before calling this routine.
2. If \(D E S C R A\) (3)=0, the low erorupper triangularpart of each diagonalblock is used by the routine depending on DESCRA (2).
3. If \(D E S C R A\) (3)=1, the unit diagonalblocksm ightorm ight notbe referenced in the BD I representation of a sparse \(m\) atrix. They are notused anyw ay .
4. If \(D E S C R A(3)=2\), diagonalblocks are considered as dense \(m\) atrices and the LU factorization \(w\) ith partialpivoting is used by the routine. WORK (1)=0 on retum if the factorization for alldiagonalblocks has been com pleted successfully, otherw ise WORK (1) = -iw here is the block
num ber forw hich the LU factorization could notbe com puted.
5. The routine can be applied for solving triangular system \(s\) w hen the upper or low er triangle of the general.sparse m atrix \(A\) is used. H ow erver \(D E S C R A\) (1) m ustbe equal to 3 in this case.

\#include <sunperfh>
void dbdsdc (charuple, char com pq, intn, double *d, double
*e, double *u, int ldu, double *vt, int ldvt, double *q, int *iq, int *info);
void dbdsdc_64 (charuplo, charcom pq, long n, double *d, double *e, double *u, long ldu, double *vt, long ldvt, double *q, long *iq, long *info);

\section*{PURPOSE}
dbdsdc com putes the singular value decom position (SVD ) of a realN -by -N (upper or low er) bidiagonalm atrix \(\mathrm{B}: \mathrm{B}=\mathrm{U} * \mathrm{~S}\) * VT, using a divide and conquerm ethod, where \(S\) is a diagonalm atrix w ith non-negative diagonalelem ents the singular values ofB ), and U and V T are orthogonalm atrices of left and right singular vectors, respectively. SBD SD C can be used to com pute allsingular values, and optionally, singular vectors or singular vectors in com pact form .

This code \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. It w ill w ork on m achines w ith a guard digitin add/subtract, oron those binary machines w ithout guard digits which subtract like the \(C\) ray \(X-M P, C\) ray \(Y ~ M P, C\) ray \(\mathrm{C}-90\), or C ray-2. Itcould conœívably fail on hexadecim al or decin al machines w thout guard digits, butw e know of none. See SLA SD 3 fordetails.

The code cumently callSLA SD Q if singularvalues only are desired. H ow ever, it can be slightly \(m\) odified to com pute singular values using the divide and conquerm ethod.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': B is upperbidiagonal.
= L ': B is low erbidiagonal.

COM PQ (input)
Specifies w hether singularvectors are to be com puted as follow s:
\(=\mathrm{N}:\) : C om pute singular values only;
\(=\mathrm{P}\) ': C om pute singularvahues and com pute singular vectors in compact form ; = I': C om pute singularvalues and singularvectors.

N (input) The orderof the matrix \(\mathrm{B} . \mathrm{N}>=0\).

D (input/output)
O n entry, the n diagonalelem ents of the bidiagonal matrix B. On exit, if \(\mathbb{N} F O=0\), the singular values ofB.

E (input/output)
O n entry, the elem ents of \(E\) contain the offdiagonalelem ents of the bidiagonalm atrix whose SVD is desired. On exit, E has been destroyed.

U (output)
If \(\mathrm{COMPQ}=\) ' \('\) ', then: On exit, if \(\mathbb{N F O}=0\), U contains the left singular vectors of the bidiagonalm atrix. Forothervahues of \(C O M P Q, U\) is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD U >= 1 . If singular vectors are desired, then LD \(U>=\max\) ( \(1, \mathrm{~N})\).

VT (output)
If \(C O M P Q=I '\), then: \(O n\) exit, if \(\mathbb{N F F O}=0, V T\) '
contains the right singularvectors of the bidiagonalm atrix. Forothervalues of COM PQ,VT is not referenced.

LDVT (input)
The leading dim ension of the array V T. LD V T >= 1 . If singular vectors are desired, then LD V T \(>=\max\) ( 1,N ).
\(Q\) (input) If \(C O M P Q=P\) ', then: \(O n\) exit, if \(\mathbb{N} F O=0, Q\) and \(\mathbb{I Q}\) contain the left and rightsingularvectors in a com pact form, requiring \(O(N \log N\) ) space instead of \(2 * \mathrm{~N} * * 2\). In particular, \(Q\) contains all
the REAL data in LDQ \(>=\mathrm{N}^{*}(11+2 * S M L S I+\) \(8 * \mathbb{N}\) T (LOG_2 \(\mathbb{N} /(\) SM LSIZ + 1) ) )) w ords ofm em ory, where SM LSIZ is retumed by ILAENV and is equal to the m axim um size of the subproblem s at the bottom of the com putation tree (usually about 25). For othervalues of COM PQ,Q is notreferenced.

IQ (output)
If \(C O M P Q=P\) ', then: On exit, if \(\mathbb{N} F O=0, Q\) and \(I Q\) contain the leftand rightsingularvectors in a com pactform, requiring \(O(\mathbb{N} \log N\) ) space instead of \(2 * N * * 2\). In particular, IQ contains all \(\mathbb{N T E G E R ~ d a t a ~ i n ~ L D I Q ~}>=\mathrm{N} *(3 \quad+\) \(3 * \mathbb{N}\) T (LOG_2 \(\mathbb{N} /(\) SM LSSZ + 1) ) )) w ords ofm em ory, where SM LSIZ is retumed by \(\amalg \mathrm{A} A \mathrm{ENV}\) and is equal to the \(m\) axim um size of the subproblem s at the bottom of the com putation tree (usually about 25). For other values of \(C O M P Q, \mathbb{Q}\) is notreferenced.

W ORK (w orkspace)
IfCOMPQ \(=N\) 'then LW ORK \(>=(2 * N)\). IfCOMPQ \(=\)
\(P^{\prime}\) then LW ORK \(>=(6 * N)\). IfCOMPQ = \(I^{\prime}\) then
LWORK \(>=(3 * N * * 2+4 * N)\).

IW ORK (w orkspace)
dim ension ( \(8 * N\) )
\(\mathbb{N}\) FO (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N F O}=-i\), the i-th argum enthad an ille-
galvalue.
\(>0\) : The algorithm failed to com pute an singular
value. The update process of divide and conquer
failed.

\section*{PURPOSE}
dbdsqr com putes the singularvahe decom position (SVD) of a realN -by-N (upper orlow er) bidiagonalm atrix \(B: B=Q * S\) * \(P^{\prime}\left(P^{\prime}\right.\) denotes the transpose of \(\left.P\right)\), w here \(S\) is a diagonal \(m\) atrix \(w\) ith non-negative diagonal elem ents the singular values of \(B\) ), and \(Q\) and \(P\) are orthogonalm atrices.

The routine com putes \(S\), and optionally com putes \(U * Q, P^{\prime} \star\) V , or \(\mathrm{Q}^{\prime} * \mathrm{C}\), for given realinputm atrioes \(\mathrm{U}, \mathrm{V} \mathrm{T}\), and C .

See "C om puting Sm allSingularV alues ofB idiagonalM atrioes W th G uaranteed H igh Relative A ccuracy," by J. D em m eland W . K ahan, LAPACK W orking N ote \#3 (orSIAM J. Sci. Statist. C om put.vol.11, no.5,pp. 873-912, Sept1990) and "A ccurate singular values and differential qd algorithm \(s\), " by B. Parlett and V.Femando, TechnicalReportCPAM -554, \(M\) athem atics D epartm ent, U niversity of \(C\) alifomia at Berkeley, July 1992 for a detailed description of the algorithm .

\section*{ARGUMENTS}

UPLO (input)
\(=U\) ': B is upperbidiagonal;
\(=1 \mathrm{~L}\) ': B is low erbidiagonal.

N (input) The order of the m atrix \(\mathrm{B} . \mathrm{N}>=0\).

NCVT (input)

The num berof colum ns of them atrix V T.NCV T \(>=0\).

NRU (input)
The num ber of row sof the \(m\) atrix \(U . N R U>=0\).

NCC (input)
The num berof colum ns of the m atrix C. \(\mathrm{NCC}>=0\).

D (input/output)
O n entry, the n diagonalelem ents of the bidiagonal \(m\) atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the singular values ofB in decreasing order.
E (input/output)
O n entry, the elem ents ofE contain the offdiagonalelem ents of the bidiagonalm atrix whose SVD is desired. On norm alexit ( \(\mathbb{N} F O=0\) ), E is destroyed. If the algorithm does not converge ( \(\mathbb{N}\) FO > 0), D and E w ill contain the diagonal and superdiagonal elem ents of a bidiagonalm atrix orthogonally equivalent to the one given as input. E (N) is used forw orkspace.

VT (input/output)
On entry, an N Hy \(-\mathrm{NCVT} m\) atrix VT. On exit, VT is overw rilten by \(\mathrm{P}^{\prime *} \mathrm{VT}\). VT is notreferenced if \(\mathrm{NCVT}=0\).

LDVT (input)
The leading dim ension of the array VT. LDV T >= \(\max (1, N)\) ifncV \(>0 ; L D V T>=1\) ifNCVT \(=0\).

U (input/output)
On entry, an NRU -by-N m atrix U. On exit, \(U\) is overw ritten by \(U * Q\). \(U\) is not referenced if \(N R U\) \(=0\).

LD U (input)
The leading dim ension of the array \(U\). LD U >= max ( \(1, N R U\) ).

C (input/output)
On entry, an N-by -N CC matrix C. On exit, C is overw ritten by \(Q\) '* C . C is not referenced if \(\mathrm{N} C \mathrm{C}\) \(=0\).

LD C (input)
The leading dim ension of the anay C. LD C \(>=\) \(\max (1, N)\) if \(N C C>0 ; L D C>=1\) if \(N C C=0\).

W ORK (w orkspace)
dim ension ( \(4 * N\) )
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) If \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue
> 0: the algorithm did not converge; D and E contain the elem ents of a bidiagonalm atrix which is orthogonally sim ilarto the inputm atrix B; if \(\mathbb{N F O}=\) i, ielem ents ofE have notconverged to zero.

\section*{DESCRIPTION}
```

C<-ALPHA OP(A)B + BETA C C <-ALPHA D Op (A)B + BETA C
C<-ALPHA Op(A)D B + BETA C

```
where A LPHA andBETA are scalar, \(C\) and \(B\) are \(m\) by \(n\) dense \(m\) atrices, \(D\) is a block diagonalm atrix, \(A\) is a unit, ornon-unit, upperor low er triangularm atrix represented in block sparse row form at form atand op (A ) is one of
op \((A)=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}\left(\operatorname{An} \bar{g}\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix
0 : operate w ith m atrix
1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(s\) in \(m\) atrix \(A\)
\(N \quad N\) um berof colum ns in matrix C

UN ITD Type of scaling:
1 : Identity \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum n block scaling)

DV () A mray of the length M B *LB *LB consisting of the block entries ofblock diagonalm atrix \(D\) where each block is stored in standard colum \(n-m\) ajor form .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Fíve elem ent integer anay

DESCRA (1) m atrix structure
0 :general
1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm tian ( \(\mathrm{A}=\mathrm{CONJG}\) (A))
3 :Triangular
4 : Skew (Anti)-Symm etric ( \(A=-A\) )
5 : D iagonal
6 : Skew Herm Hian ( \(\mathrm{A}=-\mathrm{CONJG}(\mathrm{A})\) )
N ote:For the routine, DESCRA \((1)=3\) is only supported.

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 : non-identity blocks on the \(m\) ain diagonal
1 : identity diagonalblocks
2 : diagonalblocks are densem atrices
DESCRA (4) A ray base (NOT IM PLEM ENTED)
0 : C C + + com patible
1 :Fortran com patible
D ESCRA (5) repeated indices? NOT IM PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL 0 scalar array of length LB *LB *BNN Z consisting of the block entries stored colum \(n-m\) ajorw thin each dense block.
\(B \mathbb{N} D X 0 \quad\) integer amray of length BNNZ consisting of the block collum \(n\) indiges of the block entries of A.
The block colum \(n\) indices M U ST be sorted in increasing order foreach block row .

BPNTRB () integeramay of length \(M B\) such that BPN TRB (J) BPN TRB (1)+1 points to location in B IND X of the firstblock entry of the J-th block row of A.

BPN TRE () integer aray of length \(M B\) such that BPN TRE (J)-BPN TRB (1) points to location in B IND X of the lastblock entry of the \(J\) th block row of A.

LB dim ension of dense blocks com posing A.
B 0 rectangular anray with firstdim ension LD B .

LD B leading din ension ofB
BETA Scalarparam eter
C 0 rectangular array with first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch array of length LW ORK.
On exit, if LW ORK \(=-1\), W ORK (1) retums the optim um size ofLW ORK.

LW ORK length ofW ORK array.LW ORK should be at least M B*LB.

Forgood perform ance, LW O RK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK >=M B *LB*N_CPU \(S\) where N_CPU \(S\) is the \(m\) axim um num berof processors available to the program .

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

http://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.
2. If \(D E S C R A\) (3)=0, the low erorupper triangularpart of each diagonalblock is used by the routine depending on DESCRA (2).
3. If \(D E S C R A\) (3)=1, the unitdiagonalblocksm ightorm ight not.be referenced in the \(B S R\) representation of a sparse \(m\) atrix. They are notused anyw ay.
4. If \(D E S C R A\) (3)=2, diagonalblocks are considered as dense \(m\) atrices and the LU factorization \(w\) ith partialpivoting is
used by the routine. WORK (1)=0 on retum if the factorization foralldiagonalblocks has been com pleted successfully, otherw ise WORK (1) = -iw here i is the block num ber forw hich the LU factorization could notbe com puted.
5.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse \(m\) atrix A is used. H ow erverDESCRA (1) m ustbe equalto 3 in this case.

6 . It is know \(n\) that there exists another representation of the block sparse row form at (see forexam ple Y Saad, "Tterative M ethods forSparse LinearSystem s",W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. Them ain difference is that only one array, \(\mathbb{I A}\), containing the pointers to the beginning of each block row in the arrays VAL and B \(\mathbb{N} D X\) is used instead of tw o arrays BPN TRB and BPN TRE. To use the routine \(w\) ith this kind ofblock sparse row form at the follow ing calling sequence should be used

void denvcor(char cnvcor, char four, intnx, double *x, int ifx, int incx, intny, int npre, intm, double * \(y\), intify, int incly, int inc2y, intnz, intk, double \({ }^{z}\), int ify, int inclz, intinc \(2 z\), double \(*_{\text {w ork, }}\) int lw ork);
void denvcor_64 (char cnvcor, char four, long nx, double *x, long ifx, long incx, long ny, long npre, long m, double *y, long ify, long inc1y, long inc \(2 y\), long \(n z\), long \(k\), double *z, long ifz, long inc1z, long inc2z, double *w ork, long lw ork);

\section*{PURPOSE}
dcnvcorcom putes the convolution or comelation of realvectors.

\section*{ARGUMENTS}

CNVCOR (input)
V 'or \(\mathrm{V}^{\prime}\) if convolution is desired, R ' or 'r' if comelation is desired.

FOUR (input)
T 'or t'if the Fourier transform \(m\) ethod is to be used, D 'or d'if the com putation should be done directly from the definition. The Fourier transform m ethod is generally faster, but itm ay introduce noticeable errors into certain results, notably w hen both the filter and data vectors consistentirely of integers or vectors where ele\(m\) ents ofeither the filtervector or a given data vectordiffer significantly in \(m\) agnitude from the 1 -norm of the vector.

NX (input)
Length of the filtervector. \(\mathrm{NX}>=0\). DCNVCOR
w ill retum im m ediately if \(\mathrm{NX}=0\).

X (input)
Filtervector.

IFX (input)
Index of the firstelem entofX. \(\mathrm{NX}>=\mathbb{F} \mathrm{X}>=1\).
\(\mathbb{N} C X\) (input)
Stride betw een elem ents of the filtervector in X . \(\mathbb{N} C X>0\).

NY (input)
Length of the inputvectors. NY \(>=0\). DCNVCOR w ill retum im m ediately if \(\mathrm{N} Y=0\).
NPRE (input)
The num ber of im plicit zeros prepended to the \(Y\) vectors. NPRE \(>=0\).

M (input)
Num ber of inputvectors. \(\mathrm{M}>=0\). DCNVCOR will retum imm ediately if \(M=0\).

Y (input)
Inputvectors.

IFY (input)
Index of the firstelem entof \(. \mathrm{NY}>=\mathbb{F} Y>=1\).
\(\mathbb{N} C 1 Y\) (input)
Stride betw een elem ents of the inputvectors in Y.
\(\mathbb{I N C} 1 \mathrm{Y}>0\).
\(\mathbb{I N C} 2 Y\) (input)
Stride betw een the inputvectors in \(Y . \mathbb{N} C 2 Y>0\).

N Z (input)
Length of the outputvectors. NZ \(>=0\). DCNVCOR w ill retum im m ediately if \(\mathrm{NZ}=0\). See the N otes section below for inform ation abouthow this argu\(m\) ent interacts \(w\) ith \(N X\) and \(N Y\) to control circular versus end-off shifting.

K (input)
N um berof \(Z\) vectors. \(\mathrm{K}>=0\). If \(\mathrm{K}=0\) then DCNVCOR will retum immediately. If \(K<M\) then only the firstK inputvectors \(w\) ill.be processed. If \(K>M\) then \(M\) inputvectors \(w\) ill.be processed.

Z (output)
Resultvectors.

FZ (input)
Index of the firstelem entofZ. NZ >= \(\mathbb{F Z}\) >=1.
\(\mathbb{N} C 1 Z\) (input)
Stride betw een elem ents of the output vectors in Z. \(\mathbb{N} C 1 Z>0\).
\(\mathbb{N} C 2 Z\) (input)
Stride betw een the outputvectors in Z. \(\mathbb{N N}\) C 2 Z > 0 .

W ORK (input/output)
Scratch space. Before the first call to DCNVCOR w th particular values of the integer argum ents the firstelem entofW ORK mustbe set to zero. If W ORK is written betw een calls to DCNVCOR or if DCNVCOR is called w ith different values of the integer argum ents then the firstelem entofW ORK \(m\) ustagain be setto zero before each call. If W ORK has notbeen w rilten and the sam e values of the integer argum ents are used then the firstelem entofW ORK to zero. This can avoid certain initializations that store their results into \(W\) ORK, and avoiding the initialization can \(m\) akeD CNVCOR nun faster.

LW ORK (input)
Length ofW ORK. LW ORK >= 4*M AX NX NY,NZ)+15.

\section*{NOTES}

If any vector overlaps a w ritable vector, eitherbecause of argum ent aliasing or ill-chosen values of the various \(\mathbb{I N} C\) argum ents, the results are undefined and \(m\) ay vary from one nun to the next.

Them ost com \(m\) on form of the com putation, and the case that executes fastest, is applying a filtervectorX to a series of vectors stored in the colum ns of \(Y\) w ith the resultplaced into the colum nsof \(Z\). In that case, \(\mathbb{N} C X=1, \mathbb{N} C 1 Y=1\), \(\mathbb{N} C 2 Y>=N Y, \mathbb{N} C 1 Z=1, \mathbb{N} C 2 Z>=N Z\). A nothercomm on form is applying a filtervectorX to a series of vectors stored in the row sof \(Y\) and store the result in the row of \(Z\), in which case \(\mathbb{N} C X=1, \mathbb{N} C 1 Y>=N Y, \mathbb{N} C 2 Y=1, \mathbb{N} C 1 Z>=N Z\), and \(\mathbb{N} C 2 Z=1\).

\section*{PURPOSE}
dcnvcor2 com putes the convolution or comelation of real m atrices.

\section*{ARGUMENTS}
```

CNVCOR (input)
V 'or も'to com pute convolution, R 'or 'r' to
com pute comelation.

```

METHOD (input)
T'or t'if the Fourier transform \(m\) ethod is to
be used, D 'or d'to com pute directly from the definition.

TRANSX (input)
\(N\) 'or \(h\) 'if \(X\) is the filterm atrix, \(T\) ' or \(t^{\prime}\) if transpose \((X)\) is the filterm atrix.

SCRATCHX (input)
N 'or h'ifX m ustbe preserved, S'or S'ifX can be used as scratch space. The contents of \(X\) are undefined after retuming from a call in which X is allow ed to be used for scratch.

TRANSY (input)
N 'or h'if \(Y\) is the inputm atrix, \(T\) 'or \(\mathrm{t}^{\prime}\) if transpose \((Y)\) is the inputm atrix.
SCRATCHY (input)
N 'or h'ifY m ustbe preserved, S 'or s 'if Y
can be used as scratch space. The contents of \(Y\) are undefined after retuming from a call in which \(Y\) is allow ed to be used for scratch.

M X (input)
Num ber of row s in the filterm atrix. \(\mathrm{M} \mathrm{X}>=0\).

NX (input)
N um ber of colum ns in the filterm atrix. \(\mathrm{NX}>=0\).

X (input) dim ension (LD X ,NX)
On entry, the filterm atrix. U nchanged on exit if SCRATCHX is N' or h', undefined on exitif SCRATCHX is \(S^{\prime}\) 'or \(\mathrm{S}^{\prime}\).

LD \(X\) (input)
Leading dim ension of the array that contains the filterm atrix.

M Y (input)
N um ber of row s in the inputm atrix. \(\mathrm{M} Y>=0\).
NY (input)
\(N\) um ber of colum ns in the inputm atrix. \(N Y>=0\).
M PRE (input)
N um ber of im plicit zeros to prepend to each row of the inputm atrix. M PRE \(>=0\).

NPRE (input)
\(N\) um berof im plicit zeros to prepend to each colum n of the inputm atrix. NPRE \(>=0\).

Y (input) dim ension (LD Y ,*)
Inputm atrix. U nchanged on exit if SCRATCHY is \(N^{\prime}\) or \(h^{\prime}\), undefined on exitifSCRATCHY is \(S^{\prime}\) or \(S^{\prime}\).

LD Y (input)
Leading dim ension of the array that contains the inputm atrix.

M Z (input)
N um ber of row s in the output m atrix. \(\mathrm{M} \mathrm{Z} \mathrm{>=0}\). D CNV COR 2 w ill retum im m ediately ifM \(\mathrm{Z}=0\).

N Z (input)
N um ber of colum ns in the outputm atrix. \(\mathrm{NZ}>=0\). D CNV COR2 w ill retum im m ediately if \(\mathrm{NZ}=0\).

Z (output)
dim ension (LD Z, *)
Resultm atrix.

LD Z (input)
Leading dim ension of the array that contains the resultm atrix. LD Z >= M AX (1, M Z).

W ORK \(\mathbb{N}\) (input/output)
(input/scratch) dim ension (LW ORK)
On entry for the first call to D CNVCOR2, W ORK \(\mathbb{N}\) (1)
m ust contain 0.0. A fter the first call, W ORK \(\mathbb{N}\) (1)
m ustbe set to 0.0 iff \(W\) ORK IN has been altered since the lastcall to this subroutine or if the sizes of the arrays have changed.

LW ORK (input)
Length of the w ork vector. If the FFT is to be used then forbestperform ance LW ORK should be at least 30 w ords longerthan the am ount of \(m\) em ory needed to hold the trig tables. If the FFT is not used, the value ofLW ORK is unim portant.

\section*{DESCRIPTION}
\[
\begin{aligned}
& C<-A L P H A \text { Op (A) B + BETA } C \quad C<-A L P H A D \text { op }(A) B+B E T A C \\
& C<-A L P H A \text { OP }(A) D B+B E T A C
\end{aligned}
\]
where A LPHA and BETA are scalar, \(C\) and \(B\) are \(m\) by \(n\) dense matrices, \(D\) is a diagonalscaling \(m\) atrix, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix represented in com pressed sparse colum n form atand op (A ) is one of op (A) \()=\operatorname{inv}(A)\) or op (A \()=\operatorname{inv}(A)\) or op (A) \()=\operatorname{inv}\left(\operatorname{con} \dot{g}\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicatesm atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix 0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) th transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M \(\quad N\) um berof row \(s\) in \(m\) atrix \(A\)

N \(\quad\) umberof colum \(n s\) in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum \(n\) scaling)
4 : A utom atic colum n scaling (see section NOTES for furtherdetails)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D.

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem ent integer anay DESCRA (1) m atrix structure
\[
\begin{aligned}
& 0 \text { : general } \\
& 1 \text { : sym m etric ( } A=A \text { ) } \\
& 2: \text { H erm itian ( } A=\operatorname{CON} \text { JG (A }) \text { ) } \\
& 3 \text { : Triangular } \\
& 4 \text { : Skew (A nti)-Sym m etric ( } A=-A \text { ) } \\
& 5 \text { : D iagonal } \\
& 6 \text { : Skew Herm itian ( } A=-\operatorname{CON} \text { JG (A ) ) }
\end{aligned}
\]

N ote: For the routine, D ESCRA (1)=3 is only supported.

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonaltype
0 : non-unit
1 :unit
DESCRA (4) A may base \(\mathbb{N O T} \mathbb{M}\) PLEM ENTED)
0 : C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? \(N\) OT \(\mathbb{M}\) PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL () scalar array of length N N Z consisting of nonzero entries ofA.
\(\mathbb{N} D \mathrm{X}\) () integer array of length N N Z consisting of the row indices of nonzero entries of . (R ow indigesM UST be sorted in increasing order for each colum n).

PNTRB () integer amay of length \(M\) such thatPN TRB (J) PN TRB (1)+1 points to location in VA L of the firstnonzero elem ent in colum \(n \mathrm{~J}\).

PN TRE () integer array of length \(M\) such thatPN TRE (J)-PN TRB (1) points to location in VA L of the lastnonzero elem ent in colum \(n \mathrm{~J}\).

B 0 rectangular array w ith first dim ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch array of length LW ORK.

On exit, if LW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .
Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=M\) *N_CPUS where N_CPUS is the m axim um num berof processors available to the program .

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

http://w w w netlib.org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. No test for singularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.
2. If U N ITD \(=4\), the routine scales the row sofA such that their 2 -norm sare one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD \(=2\) should be used for the next calls to the routine w ith overw ritten VA L and DV .

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise \(W O R K(1)=-i w\) here \(i\) is the row num berw hich 2 -norm is exactly zero.
3. If \(D E S C R A(3)=1\) and \(U N\) ITD \(<4\), the unitdiagonalelem ents m ightorm ightnotbe referenced in the D IA representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD = 4, the unit diagonalelem ents M U ST be referenced in the \(D \mathbb{I A}\) representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse
m atrix \(A\) is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

void ddisna_64 (char jंjb, long m, long n, double *d, double *sep, long *info);

\section*{PURPOSE}
ddisna com putes the reciprocal condition num bers for the eigenvectors of a realsym m etric or com plex H erm itian m atrix orforthe left or rightsingular vectors of a general m-by-n matrix. The reciprocalcondition num ber is the gap' betw een the corresponding eigenvalue or singular value and the nearest other one.

The bound on the error, \(m\) easured by angle in radians, in the I-th com puted vector is given by

SLAMCH (E')* (ANORM /SEP (I))
where \(A N O R M=2-\) norm \((A)=\max (\operatorname{abs}(D(\mathcal{D}))\). SEP (I) is not allow ed to be sm allerthan SLAM CH (E')*ANORM in orderto lim it the size of the errorbound.

SD ISN A m ay also be used to com pute enrorbounds for eigenvectors of the generalized sym \(m\) etric definite eigenproblem .

\section*{ARGUMENTS}

JOB (input)
Specifies forw hich problem the reciprocal condition num bers should be com puted:
\(=E\) ': the eigenvectors of a sym m etric/H erm itian m atrix;
= IL ': the leftsingular vectors of a general
\(m\) atrix;
\(=\mathrm{R}\) ': the rightsingularvectors of a general \(m\) atrix.
\(M\) (input) The num ber of row \(s\) of the \(m\) atrix. \(M>=0\).

N (input) If \(\mathrm{OB}=\mathrm{L}\) 'or R ', the num ber of colum ns of the \(m\) atrix, in which case \(N>=0\). Ignored if \(\mathrm{JO} \mathrm{B}=\) E'

D (input) dim ension ( \(m\) in \(M, N\) )) if \(30 B=L\) ' or \(R^{\prime}\) The eigenvalues (if \(\mathrm{JOB}=\mathrm{E}\) ) or singular values (if \(J O B=L\) ' or \(R\) ) of the matrix, in either increasing or decreasing order. If singular values, they \(m\) ustbe non-negative.

SEP (output)
dimension ( \(m\) in \((M, N)\) ) if \(J O B=L^{\prime}\) or \(R^{\prime}\) The reciprocal condition num bers of the vectors.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value.

\section*{DESCRIPTION}
\[
\begin{aligned}
& C<-A L P H A \text { op (A)B + BETA C } \quad C<-A L P H A D \text { op (A) B + BETA C } \\
& C<-A L P H A \text { op(A)D B + BETA C }
\end{aligned}
\]
where A LPHA and BETA are scalar, C and B are m by n dense \(m\) atrices, \(D\) is a diagonalscaling \(m\) atrix, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix represented in Ellpack form at and op (A) is one of \(\mathrm{op}(\mathrm{A})=\operatorname{inv}(\mathrm{A})\) or \(\mathrm{op}(\mathrm{A})=\operatorname{inv}\left(\mathrm{A}^{\prime}\right)\) or \(\mathrm{op}(\mathrm{A})=\operatorname{inv}\left(\mathrm{conjg}\left(\mathrm{A}^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicatesm atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) ith the sparse \(m\) atrix 0 : operate with m atrix 1 : operate \(w\) th transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M \(\quad N\) um berof row \(s\) in \(m\) atrix A
N \(\quad\) Uum berof colum ns in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identity \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum n scaling)
4 :A utom atic row scaling (see section N O TES for furtherdetails)

DV 0 A ray of length M containing the diagonalentries of the scaling diagonalm atrix D .

A LPH A Scalarparam eter
DESCRA 0 D escriptor argum ent. Five elem ent integer aray DESCRA (1) m atrix structure
```

    0 :general

LD B leading dim ension ofB
BETA Scalarparam eter
C 0 rectangular array w ith first dim ension LD C .
LD C leading dim ension ofC

```
    W ORK () scratch amay of length LW ORK.
        On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .
Forgood penform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M}\) *N_CPUS where N_CPUS is the m axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of theW ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SEE ALSO}

N IST FO RTRA N Sparse B las U ser's G uide available at:
http://m ath nistgov/m cso/Staff/k Rem ington/tspblas/

htep://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such tests \(m\) ustbe perform ed before calling this routine.
2. IfUN ITD \(=4\), the routine scales the row s of \(A\) such that their 2 -nom s are one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the row num berw hich 2 -norm is exactly zero.
3. If \(\operatorname{DESCRA}(3)=1\) and U N ITD < 4, the unitdiagonalelem ents \(m\) ightorm ightnotbe referenced in the ELL representation of a sparse m atrix. They are notused anyw ay in these cases.

ButifUN ITD \(=4\), the unit diagonalelem ents M U ST be referenced in the ELL representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

void dffi3b_64 (charplace, long m, long n, long k, double
*a, long lda, double *b, long ldb, double *w ork, long lw ork);

\section*{ARGUMENTS}

PLACE (input)
Selectan in-place ('I'or i') or out-of-place ( \(\mathrm{D}^{\prime}\) 'or \(\mathrm{b}^{\prime}\) ) transform .

M (input) Integer specifying the num ber of row s to be transform ed. It is m ost efficientw hen M is a productofsm allprim es. \(M>=0\); when \(M=0\), the subroutine retums im mediately w ithoutchanging any data.

N (input) Integerspecifying the num ber of colum ns to be transform ed. It is m ost efficientw hen N is a productof.sm allprim es. \(\mathrm{N}>=0\); w hen \(\mathrm{N}=0\), the subroutine retums im mediately w ithoutchanging any data.

K (input) Integer specifying the num ber of planes to be transform ed. It is m ost efficientw hen K is a product ofsm allprim es. \(\mathrm{K}>=0\); when \(K=0\), the subroutine retums im mediately w ithoutchanging any data.

A (input/output)
O n entry, the three-dim ensional aray A (LD A, \(N, K\) ) contains the data to be transform ed if an in-place transform is requested. O therw ise, it is not referenced. Upon exit, results are stored in A \((\mathbb{M}, 1 \mathbb{N}, 1: K)\).

LD A (input)
Integer specifying the leading dim ension of A. If an out-of-place transform is desired LDA \(>=M\). Else if an in-place transform is desired LDA \(>=\) 2* ( \(/ 2+1\) )

B (input/output)
Realaray ofdim ension \(B(2 * L D B, N, K)\). On entry, if an out-ofplace transform is requested
\(\left.B\left(1: 2^{\star} M / 2+1\right), 1 \mathbb{N}, 1: K\right)\) contains the input data.
O therw ise, \(B\) is not referenced. \(B\) is unchanged upon exit.

LD B (input)
If an out-of-place transform is desired, \(2 * \mathrm{LDB}\) is
the leading dim ension of the array \(B\) which contains the data to be transform ed and \(2 *\) LD B \(>=\) \(2 * M / 2+1)\). O therw ise it is not referenced.

W ORK (input/output)
O ne-dim ensional real anray of length at least LW ORK. On input, W ORK m usthave been initialized by DFFT3I.

LW ORK (input)
Integer. LW ORK >= \(M+2 *(\mathbb{N}+K)+4 * K+45)\).

\section*{ARGUMENTS}

PLACE (input)
Selectan in-place (I'or li) or out-of-place ( D 'or b ) transform .

FU LL (input)
Selecta full (F' or 'I') or partial (' )
representation of the results. If the caller
selects fiull representation then an \(\mathrm{M} \times N \times K\) real array w ill transform to produce an M xN xK com plex array. If the caller does not select full representation then an \(\mathrm{M} \times N \times K\) real array \(w i l l\) transform to a \(M / 2+1) x N\) xK complex array that takes advantage of the sym \(m\) etry properties of a transform ed realsequence.
\(M\) (input) Integer specifying the num ber of row s to be transform ed. It is most efficientw hen \(M\) is a productofsm allprim es. \(\mathrm{M}>=0\); when \(\mathrm{M}=0\), the subroutine retums im mediately withoutchanging any data.

N (input) Integer specifying the num ber of colum ns to be transform ed. It is m ost efficientw hen N is a product ofsm allprim es. \(\mathrm{N}>=0\); when \(\mathrm{N}=0\), the subroutine retums im mediately without changing any data.
\(K\) (input) Integer specifying the num ber of planes to be transform ed. It is m ost efficientw hen K is a productofsm allprim es. \(K>=0\); when \(K=0\), the subroutine retums im \(m\) ediately without changing any data.

A (input/output)
O n entry, a three-dim ensional array A (LD A \(N, K\) )
that contains input data to be transform ed. On
exit, if an in-place transform is done and FU LL is
not \(\mathrm{F}^{\prime}\) or \(\left.\mathrm{I}^{\prime}, \mathrm{A}\left(1: 2^{*} \mathrm{M} / 2+1\right), 1 \mathbb{N}, 1: K\right)\) w illcon-
tain the partialtransform ed results. If FU LL \(=\) F'or ' \(\mathrm{I}^{\prime}, \mathrm{A}(1: 2 \star \mathrm{M}, 1 \mathbb{N}, 1: \mathrm{K})\) w illcontain the com plete transform ed results.

LD A (input)
Leading dim ension of the array containing the data to be transform ed. LD A must be even if the transform ed sequences are to be stored in A.

IfPLACE \(=\left(\right.\) ( 'or \(\left.^{\prime}\right)\) LD A \(>=\mathrm{M}\)
IfPLACE \(=\left(\right.\) I'or \({ }^{\prime}\) ) LD A m ustbe even. If
\(\left.F U L L=\left(F^{\prime} \text { or }{ }^{\prime}\right)^{\prime}\right), L D A>=2 * M\)

FULL is not ( \(\mathrm{F}^{\prime}\) or \(\mathrm{I}^{\prime}\) ), LDA \(>=2 \star \mathrm{M} / 2+1\) )
B (input/output)
U pon exit, a three-dim ensional array \(B(2 * L D B, N, K)\) that contains the transform ed results if an out-of-place transform is done. O therw ise, \(B\) is not used.

If an out-of-place transform is done and FULL is not \(\mathrm{F}^{\prime}\) or \(\left.\mathrm{I}^{\prime}, \mathrm{B}\left(1 \cdot 2^{\star} \mathrm{M} / 2+1\right), 1 \mathbb{N}, 1 \mathrm{~K}\right) \mathrm{w}\) illcontain the partialtransform ed results. If FU LL \(=\) F 'or 'f', B ( \(1: 2 * \mathrm{M}, 1\) N, \(1 \mathrm{~K})\) w ill contain the com plete transform ed results.

LD B (input)
\(2 * L D B\) is the leading dim ension of the array \(B\). If an in-place transform is desired LD B is ignored.

IfPLACE is ( 0 'or b') and

FULL is ( F 'or ' F ), then LD B >=M
FULL is not ( F ' or ' F ), then \(\mathrm{LD} \mathrm{B}>=\mathrm{M} / 2+1\)
\(N\) ote thateven though LD B is used in the argum ent list, \(2 *\) LD \(B\) is the actual leading dim ension ofB.

W ORK (input/output)
O ne-dim ensional real array of length at least
LW ORK. W ORK m usthave been initialized by DFFT 3I.

LW ORK (input)
Integer. LW ORK >= \(M+2 \star(\mathbb{N}+K)+4 * K+45)\).

\section*{NAME} dfftopt - com pute the length of the closest fast FFT

\section*{SYNOPSIS}
\(\mathbb{N}\) TEGER FUNCTION DFFTOPT (LEN)
\(\mathbb{N}\) TEGER LEN
\(\mathbb{N}\) TEGER*8FUNCTION DFFTOPT_64 (LEN)
\(\mathbb{N}\) TEGER*8 LEN

F95 INTERFACE
\(\mathbb{N}\) TEGER FUNCTION DFFTOPT (LEN)
\(\mathbb{N}\) TEGER ::LEN
\(\mathbb{N}\) TEGER (8) FUNCTION DFFTO PT_64 (LEN)
\(\mathbb{N} T E G E R(8):: L E N\)
C INTERFACE
\#include <sunperfh>
intdfftopt(int len);
long dfffopt 64 (long len);

\section*{PURPOSE}

Fourier transform algorithm s , including those used in Perform ance L ibrary, w ork bestw ith vector lengths that are products of sm all prim es. Forexam ple, an FFT of length \(32=2 * * 5 \mathrm{w}\) ill nun fasterthan an FFT of prime length 31 because 32 is a productofsm allprim es and 31 is not. If your application is such that you can taper or zero pad your vector to a larger length then this function \(m\) ay help you select a better length and run your FFT faster.

DFFTOPT will retum an integerno sm aller than the input argum entN that is the closestnum ber that is the product of sm allprim es. D FFTO PT w ill retum 16 foran input of \(\mathrm{N}=16\) and retum 18=2*3*3 foran inputof \(\mathrm{N}=17\).

N ote that the length com puted here is not guaranteed to be optim al, only to be a product of sm allprim es. A lso, the value retumed \(m\) ay change as the underlying
FFT sbecom e capable of handling larger prim es. For exam ple, passing in \(N=51\) to day \(w\) ill retum \(52=2 \star 2 \star 13\) rather than \(51=3 * 17\) because the FFT s in Perform ance Library do not have fast radix 17 code. In the future, radix 17 code m ay be added
and then \(\mathrm{N}=51 \mathrm{w}\) ill retum 51 .

\#include <sunperfh>
void dfflz_ (int*iopt, int*n, double *scale, double *x, doublecom plex *y, double *trigs, int *ifac, double *W ork, int *lw ork, int *ienc);
void dfftz_64_ (long *iopt, long *n, double *scale, double \({ }^{*} \mathrm{x}\), doublecom plex *y, double *trigs, long *ifac, double *w ork, long *lw ork, long *ienc);

\section*{PURPOSE}
dfftz initializes the trigonom etric w eight and factor tables or com putes the forw ard FastFourier T ransform of a double precision sequence as follow s:
\[
\mathrm{N}-1
\]

Y (k) = scale * SUM W *X (i)
\(=0\)
where
k ranges from 0 to \(\mathrm{N}-1\)
\(i=\operatorname{sqnt}(-1)\)
isign \(=-1\) for forw ard transform
\(W=\exp \left(i s i g n \star i^{\star} j^{\star} k \star 2 \star p i N N\right)\)
In real-to-com plex transform of length \(N\), the \((\mathbb{N} / 2+1)\) com plex output data points stored are the positive-frequency half of the spectrum of the D iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is notstored.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:

IO PT \(=0\) com putes the trigonom etric weight table and factor table
IO PT = -1 com putes forw ard FFT

N (input)
Integer specifying length of the input sequence \(X\). N is \(m\) ostefficientw hen it is a product of sm all prim es. \(\mathrm{N}>=0\). U nchanged on exit.

SCALE (input)
D ouble precision scalarby w hich transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF95 \(\mathbb{I N}\) TERFA CE .

X (input) On entry, X is a realanay whose first N elem ents contain the sequence to be transform ed.

Y (output)
D ouble com plex array w hose first \(\mathbb{N} / 2+1\) ) elem ents contain the transform results. \(X\) and \(Y ~ m\) ay be the sam e array starting at the sam e \(m\) em ory location, in which case the dim ension of \(\mathrm{X} m\) ustbe at least \(2 *(N / 2+1)\). O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

TR IG S (input/output)
D ouble precision array of length \(2 * N\) that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith \(\mathbb{I O}\) PT \(=0\) and they are used in subsequent calls w hen 10 PT \(=-1\). U nchanged on exit.

FAC (input/output)
Integer array of dim ension at least 128 that contains the factors of N . The factors are com puted when the routine is called w ith IO PT = 0 and they are used in subsequent calls where \(10 P T=-1\). U nchanged on exit.

W ORK (w orkspace)
D ouble precision array ofdim ension at least N . The user can also choose to have the routine allocate its ow n w orkspace (see LW ORK).

LW ORK (input)
Integer specifying workspace size. IfLW ORK = 0, the routine w illallocate its ow n w orkspace.

ERR (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=10 P T\) is not 0 or -1
\(-2=\mathrm{N}<0\)
\(-3=(L W O R K\) is not 0) and (LW ORK is less than N)
\(-4=m\) em ory allocation forw orkspace failed

\section*{PURPOSE}
dfftz2 initializes the trigonom etric weight and factor tables orcom putes the tw o-dim ensional forw ard FastFourier \(T\) ransform of a tw o-dim ensional double precision array. In com puting the tw o-dim ensionalFFT, one-dim ensionalFFT s are computed along the columns of the input array. O ne-dim ensionalFFT s are then com puted along the row s of the interm ediate results.

> N 2-1 N 1-1
\(Y(k 1, k 2)=\) scale * SUM SUM W 2*W \(1 * X(\mathcal{1},-2)\)
j2=0 \(\quad \mathfrak{l}=0\)
where
k 1 ranges from 0 to N 1-1 and \(k 2\) ranges from 0 to \(\mathrm{N} 2-1\)
\(i=\operatorname{sqrt}(-1)\)
isign \(=-1\) for forw ard transform
W \(1=\exp \left(\right.\) isign*i* \(\left.{ }^{1} * k 1 * 2 * p i / N 1\right)\)
W \(2=\exp \left(i s i g n \star i^{\star}{ }^{2}{ }^{2} k 2 * 2 * p i N 2\right)\)
In real-to-com plex transform of length \(N 1\), the \((N 1 / 2+1\) ) com -
plex output data points stored are the positive-frequency half of the spectrum of the D iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is not stored.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric \(w\) eight table and factor table
IO PT \(=-1\) com putes forw ard FFT

N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es \(\mathrm{N} 2>=0\). U nchanged on exit.

SCALE (input)
D ouble precision scalarby which transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF95 \(\mathbb{N}\) TERFACE.

X (input) X is a double com plex aray of din ensions (LD X , N 2 ) that contains input data to be transform ed. X and \(Y\) can be the sam e array.

LD X (input)
Leading dim ension of X . LD X >=N1 if X is not the sam e aray as Y.Else, LD X = 2*LD Y. U nchanged on exit.

Y (output)
\(Y\) is a double com plex array of dim ensions (LD Y, \(N 2\) ) that contains the transform results. \(X\) and \(Y\) can be the sam e array starting at the sam e \(m\) em ory location, in which case the input data are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y (input)
Leading dim ension of Y . LD Y \(>=\mathrm{N} 1 / 2+1\) U nchanged on exit.

TR IG S (input/output)
D ouble precision array of length 2* (N1+N2) that contains the trigonom etric w eights. The w eights are com puted when the routine is called w ith IO PT
= 0 and they are used in subsequent calls w hen
IO PT \(=-1\). U nchanged on exit.

IFAC (input/output)
Integer array ofdim ension at least \(2 * 128\) that
contains the factors ofN 1 and N2. The factors are com puted when the routine is called w ith IO PT
= 0 and they are used in subsequent calls w hen IO PT \(=-1\). U nchanged on exit.

W ORK (w orkspace)
D ouble precision array of dimension at least
\(\operatorname{MAX}(\mathbb{N} 1,2 * N 2)\) where \(N C P U S\) is the num berof threads used to execute the routine. The user can also choose to have the routine allocate its own w orkspace (see LW ORK).
LW ORK (input)
Integer specifying workspace size. If LW ORK = 0, the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=\mathbb{I O P T}\) is not0 or -1
\(-2=\mathrm{N} 1<0\)
\(-3=\mathrm{N} 2<0\)
\(-4=(\operatorname{LDX}<\mathrm{N} 1)\) or (LD X notequal2*LD Y when X and
\(Y\) are sam e array)
\(-5=(\mathbb{L D Y}<\mathrm{N} 1 / 2+1)\)
\(-6=(L W O R K\) not equal 0) and (LWORK <
\(\operatorname{MAX}(\mathbb{N} 1,2 * N 2)\) )
\(-7=m\) em ory allocation failed

\section*{PURPOSE}
dgbbid reduces a realgeneralm -by-n band m atrix A to upper bidiagonal form \(B\) by an orthogonaltransform ation: \(Q^{\prime *} A\) * \(P=B\).

The routine com putes B, and optionally form s Q or P', or com putes \(Q\) *C for given \(m\) atrix \(C\).

\section*{ARGUMENTS}

\section*{VECT (input)}

Specifies w hether ornot the \(m\) atrices \(Q\) and \(P\) 'are
to be form ed. \(=\mathrm{N}\) ': do not form Q orP';
\(=Q\) ': form \(Q\) only;
\(=P^{\prime}:\) form \(P^{\prime}\) 'only;
\(=B^{\prime}:\) form both.

M (input) The num ber of row s of the matrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NCC (input)
The num berof colum ns of the m atrix \(C . N C C>=0\).

KL (input)
The num ber of subdiagonals of the m atrix A.KL >= 0 .

KU (input)
The num ber of superdiagonals of the m atrix A. K U \(>=0\).

AB (input/output)
DOUBLE PRECISION array, dimension (LDAB,N) On entry, the \(m\)-by-n band \(m\) atrix \(A\), stored in row \(s 1\) to \(K L+K U+1\). The \(j\) th colum n of \(A\) is stored in the \(j\) th column of the array AB as follows: \(A B(k u+1+i-j)=A(i, j)\) for \(\max (1, j\) \(\mathrm{ku})<=i<=m\) in \((m, j+k l)\). On exit, \(A\) is overw rilten by values generated during the reduction.

LDAB (input)
The leading dim ension of the aray A. LD AB >= \(K L+K U+1\).

D (output)
D OUBLE PRECISION aray, dim ension (m in \(M, N)\) ) The diagonalelem ents of the bidiagonalm atrix \(B\).

E (output)
D O U BLE PREC ISIO N aray, dim ension ( \(m\) in \((M, N)-1\) ) The superdiagonalelem ents of the bidiagonalm atrix \(B\).

Q (output)
DOUBLE PRECISION aray, dim ension (LDQ, M) IfVECT = \(Q\) ' or \(B\) ', them -by \(m\) orthogonalm atrix \(Q\). If \(\mathrm{VECT}=\mathrm{N}\) 'or P ', the array Q is not referenced.

LDQ (input)
The leading dim ension of the anay \(Q\). LDQ >= \(m\) ax \((1, M)\) if \(V E C T=Q\) 'or \(B\) '; LD \(Q>=1\) otherw ise.

PT (output)
D OUBLE PRECISION array, dim ension (LDPT,N) If VECT
\(=\mathrm{P}\) 'or B ', the \(\mathrm{n}-\mathrm{by}-\mathrm{n}\) orthogonalm atrix P '. If
VECT = N 'or Q ', the amay PT is not referenced.
LDPT (input)
The leading dim ension of the array PT. LD PT >= \(\mathrm{max}(1, \mathrm{~N})\) if VECT \(=\mathrm{P}\) 'or B ; LDPT >= 1 otherw ise.

C (input/output)
DOUBLE PRECISION aray, dimension (LDCNCC) On entry, an \(m\)-by-ncc matrix \(C\). On exit, \(C\) is overw rilten by Q *C. C is notreferenced if \(\mathrm{NCC}=\) 0.

LD C (input)
The leading dim ension of the array \(C\). LD \(C>=\) \(\max (1, M)\) if \(N C C>0 ; L D C>=1\) if \(N C C=0\). W ORK (w orkspace)

D OUBLE PRECISIO N aray, dim ension (2*MAX \(M, N)\) )
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.

void dgbcon_64 (charnorm, long n, long nsub, long nsuper, double *a, long lda, long *ịívot, double anorm , double *rcond, long *info);

\section*{PURPOSE}
dgbcon estim ates the reciprocal of the condition num berofa real general band matrix A, in either the 1 -nom orthe infinity-norm, using the LU factorization computed by SGBTRF.

A \(n\) estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as
\(\operatorname{RCOND}=1 /(\operatorname{norm}(A) * \operatorname{norm}(\operatorname{inv}(A)))\).

\section*{ARGUMENTS}

NORM (input)
Specifies w hether the 1-norm condition num ber or the infinity-norm condition num ber is required:
= ' 'or \(\mathrm{O}^{\prime}\) : 1-norm;
= I': Infinity-norm .

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

N SU B (input)
The num ber of subdiagonals \(w\) thin the band of \(A\).
N SUB \(>=0\) 。

\section*{N SU PER (input)}

The num ber of superdiagonals w ithin the band of A. N SU PER \(>=0\).

A (input) D etails of the LU factorization of the band \(m\) atrix A, as com puted by SGBTRF. U is stored as an upper triangularband \(m\) atrix \(w\) ith N SU B \(+N\) SU PER superdiagonals in row s 1 to NSUB+NSUPER+1, and them ultipliers used during the factorization are stored in row sN SU B +N SU PER + 2 to \(2 *\) N SU B + N SU PER +1 .

LD A (input)
The leading dim ension of the anay A. LDA >= \(2 *\) N SU B + N SU PER +1 .
\(\mathbb{P I V O T}\) (input)
The pivot indices; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P}\) IV OT (i).

ANORM (input)
IfNORM = ' 1 'or 0 ', the 1 -norm of the original \(m\) atrix \(A\). IfNORM = \(I\) ', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition number of the \(m\) atrix \(A\), com puted as RCOND \(=1 /(\) norm (A) * nom (inv (A))).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )

W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue

void dgbequ (intm, intn, intkl, int ku, double *a, int
lda, double *r, double * c , double *row cn, double
*colcn, double *am ax, int *info);
void dgbequ_64 (long m, long n, long kl, long ku, double *a, long lda, double *r, double *c, double *row cn, double *colcn, double *am ax, long *info);

\section*{PURPOSE}
dgbequ com putes row and colum n scalings intended to equilibrate an M boy -N band m atrix A and reduce its condition num ber. \(R\) retums the row scale factors and \(C\) the colum \(n\) scale factors, chosen to try to \(m\) ake the largestelem ent in each row and colum \(n\) of the \(m\) atrix \(B \quad w\) ith elem ents \(B(i, j)=R(i) \star A(i, j) * C(i)\) have absolute value 1.

R (i) and C (i) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N UM = largestsafe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

KL (input)
The num ber of subdiagonals \(w\) thin the band of \(A\). \(\mathrm{KL}>=0\) 。

KU (input)
The num ber of superdiagonals \(w\) thin the band of \(A\). \(K U>=0\) 。

A (input) The band \(m\) atrix \(A\), stored in row 1 to \(K L+K U+1\). The jth colum n of \(A\) is stored in the \(j\) th column of the array \(A\) as follow s: A \((k u+1+i-j, j)=A(i, j)\)
form ax \((1, j \mathrm{j} k)<=i<=m\) in \((m, j+k l)\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(K L+K U+1\).

R (output)
If \(\mathbb{N} F O=0\), or \(\mathbb{N} F O>M, R\) contains the row scale
factors forA.
C (output)
If \(\mathbb{N} F O=0, C\) contains the colum \(n\) scale factors forA.
ROW CN (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R O W C N\) contains the ratio
of the sm allest \(R\) (i) to the largest \(R\) (i). If
ROW CN >= 0.1 and AM AX is neither too large nor too
sm all, it is notw orth scaling by \(R\).
COLCN (output)
If \(\mathbb{N} F O=0, C O L C N\) contains the ratio of the sm allest C (i) to the largestC (i). IfC OLCN >=0.1, it is notw orth scaling by \(C\).

\section*{AM AX (output)}

A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the m atrix should be scaled.
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum ent had an illegalvalue
>0: if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{M}\) : the i-th row ofA is exactly zero
> M : the ( \(j-\mathrm{M}\) ) -th collum n ofA is exactly zero

void dgbm v (Char transa, intm, intn, intnsub, int nsuper, double alpha, double *a, int lda, double *x, int incx, double beta, double *y, int incy);
void dgbm v_64 (char transa, long m, long n, long nsub, long nsuper, double alpha, double *a, long lda, double *x, long incx, double beta, double *y, long incy);

\section*{PURPOSE}
dgbm v perform sone of the \(m\) atrix-vector operations \(y:=\) alpha*A *x + beta*y ory := alpha*A *x + beta*y, where alpha and beta are scalars, \(x\) and \(y\) are vectors and \(A\) is an \(m\) by \(n\) band \(m\) atrix, w ith nsub sub-diagonals and nsupersuperdiagonals.

\section*{ARGUMENTS}

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=\mathrm{N}\) 'or h ' \(\mathrm{y}:=\) alpha*A \(* \mathrm{x}+\) beta* y .
TRANSA = T'ort' \(\mathrm{y}:=\) alpha*A *x + beta* y .

TRANSA \(=\) C'ort' \(y:=\) alpha*A *x + beta* \(y\).
U nchanged on exit.

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.
M (input)
O \(n\) entry, M specifies the num berof row \(s\) of the \(m\) atrix \(A . M>=0\). U nchanged on exit.

N (input)

O n entry, \(N\) specifies the num ber of colum ns of the \(m\) atrix \(A . N>=0\). U nchanged on exit.

NSUB (input)
On entry, NSUB specifies the number of subdiagonals of them atrix A.NSUB \(>=0\). U nchanged on exit.

N SU PER (input)
On entry, N SU PER specifies the num ber of superdiagonals of the m atrix A. N SU PER \(>=0\). U nchanged on exit.
ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry, the leading (nsub + nsuper+1) by \(n\) part of the array A m ust contain the matrix of coefficients, supplied colum \(n\) by colum \(n\), with the leading diagonal of the \(m\) atrix in row (nsuper+ 1 ) of the array, the first super-diagonal starting at position 2 in row nsuper, the firstsubdiagonal starting atposition 1 in row (nsuper + 2 ), and so on. Elem ents in the array A that do not comespond to elem ents in the band matrix (such as the top leftnsuperby nsupertriangle) are not referenced. The follow ing program segm ent w ill transfer a band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\text { DO } 20, \mathrm{~J}=1, \mathrm{~N}
\]
\[
K=N S U P E R+1-J
\]
\[
\text { DO } 10, I=\text { M AX }(1, J-N \text { SU PER }), M \mathbb{N}(M, J+
\]
N SUB )
\[
A(K+I, J)=m \operatorname{atrix}(I, J)
\]

10 CONTINUE
20 CONTINUE
U nchanged on exit.
LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A \(>=\) (
nsub + nsuper+ 1 ). U nchanged on exit.
X (input)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C X))\) when TRANSA \(=\mathrm{N}\) 'or
\(h^{\prime}\) and at least \((1+(m-1) * a b s(\mathbb{N} C X))\)
otherw ise. Before entry, the increm ented amay \(X\)
m ustcontain the vectorx. U nchanged on exit.
\(\mathbb{N C X}\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents ofX. \(\mathbb{N} C X<>0\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then \(Y\) need notbe set on input. U nchanged on exit.

Y (input/output)
\((1+(m-1) \star \operatorname{abs}(\mathbb{N} C Y))\) when TRANSA \(=\mathrm{N}\) 'or \(h^{\prime}\) and at least \((1+(n-1) * a b s(\mathbb{N} C Y))\)
otherw ise. Before entry, the increm ented array \(Y\) m ust contain the vectory. On exit, Y is overw ritten by the updated vectory.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
dgbris im proves the com puted solution to a system of linear equations when the coefficientm atrix is banded, and provides errorbounds and backw ard error estim ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system ofequations:
\(=\mathrm{N}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad\) (N o transpose)
\(=T{ }^{\prime}: A * * T X=B \quad\) (Transpose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran spose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

K L (input)

The num berof subdiagonals w ithin the band of A. \(K L>=0\).

KU (input)
The num ber of superdiagonals within the band of A. \(K U>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrioes \(B\) and \(X\). NRH \(S>=0\).

A (input) The originalband m atrix A, stored in row s 1 to \(K L+K U+1\). The \(j\) th column ofA is stored in the \(j\) th colum n of the array A as follow s: A (ku+1+i\(j, j)=A(i, j)\) form ax \((1, j \mathrm{jku})<=i<=m\) in \((n, j+k l)\).

LD A (input)
The leading dim ension of the array A. LDA >= K L+KU+1.

AF (input)
D etails of the LU factorization of the band \(m\) atrix A , as com puted by SG BTRF. U is stored as an upper triangularband \(m\) atrix \(w\) th \(K L+K U\) superdiagonals in row \(s 1\) to \(K L+K U+1\), and the \(m\) ultipliers used during the factorization are stored in row S \(K L+K U+2\) to \(2 * K L+K U+1\).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(2 * K L * K U+1\).
\(\mathbb{P I V O T}\) (input)
The pivotindices from SGBTRF; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P}\) IV OT (i).
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SGBTRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X . LDX >= \(\max (1, N)\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O}), \operatorname{FERR}(\underset{)}{(1)}\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in \((X(\mathcal{J})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(\mathrm{X}(\mathcal{j})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard emror of each solution vector \(X\) (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)

void dgbsv_64 (long n, long kl, long ku, long nrhs, double
*a, long lda, long *ipivot, double *b, long ldb, long *info);

\section*{PURPOSE}
dgbsv com putes the solution to a real system of linear equations A * \(X=B\), where A is a band \(m\) atrix of orderN w th K L subdiagonals and \(K U\) superdiagonals, and \(X\) and \(B\) are \(N\)-byNRH S m atrices.

The LU decom position w ith partialpivoting and row interchanges is used to factorA asA \(=\mathrm{L} * \mathrm{U}\), where L is a productof perm utation and unit low er triangularm atrioes with \(K L\) subdiagonals, and \(U\) is uppertriangularw ith \(K L+K U\) superdiagonals. The factored form of \(A\) is then used to solve the system of equations \(A * X=B\).

\section*{ARGUMENTS}

N (input) The num ber of linearequations, ie., the order of them atrix A. \(N>=0\).

KL (input)
The num ber of subdiagonals w ithin the band of A. \(\mathrm{KL}>=0\).

KU (input)
The num ber of superdiagonals w ithin the band of A. \(K U>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS >=0.

A (input/output)
On entry, the m atrix A in band storage, in row s
\(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the anay need notbe set. The \(j\) th column of A is stored in the \(j\) th collumn of the array A as follows: \(A(K L+K U+1+i-j, j)=A(i, j)\) for \(\max (1, j\) \(K U)<=i<=m\) in ( \(N, j+K L\) ) On exit, details of the factorization: \(U\) is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row \(s 1\) to \(K L+K U+1\), and the \(m\) ultipliers used during the factorization are stored in rows \(K L+K U+2\) to \(2 \star K L+K U+1\). See below for further details.

LD A (input)
The leading dim ension of the array A. LDA >= \(2 * K L+K U+1\).
\(\mathbb{P I V O T}\) (output)
The pivot indices that define the perm utation \(m\) atrix \(P\); row i of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P I V O T}\) (i).

B (input/output)
On entry, the \(N-b y-N R H S\) righthand sidem atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the \(N\) by \(-N R H S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i, U(i, i)\) is exactly zero. The factorization has been com pleted, but the factor U is exactly singular, and the solution has notbeen com puted.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(M=N=6, K L=2, K U=1\) :

On entry: Onexit:
u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55 u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65 * a31 a42 a53 a64 * * m31 m 42 m 53 m 64 * *

A rray elem entsm arked * are notused by the routine; ele\(m\) entsm arked + need notbe seton entry, but are required by the routine to store elem ents of \(U\) because of fill-in resulting from the row interchanges.

\section*{C INTERFACE}
\#include <sunperfh>
void dgbsvx (char fact, chartransa, intn, intkl, int ku, int nrhs, double *a, int lda, double *af, int ldaf, int*ipivot, char equed, double * \(x\), double \({ }^{*} \mathrm{c}\), double *b, int ldb, double *x, int ldx, double *rcond, double *ferr, double *berr, int *info);
void dgbsvx_64 (char fact, chartransa, long n, long kl, long ku, long nrhs, double *a, long lda, double *af, long ldaf, long *ipivot, char equed, double *r, double *c, double *b, long ldb, double *x, long \(l d x\), double *rcond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
dgbsvx uses the LU factorization to com pute the solution to a real system of linear equations \(A * X=B, A * * T * X=B\), orA \(* * H * X=B\), where \(A\) is a band \(m\) atrix of order \(N\) w ith \(K L\) subdiagonals and \(K U\) superdiagonals, and \(X\) and \(B\) are \(N\) byN R H S m atrioes.

E mrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed by this subroutine:
1. IfFACT \(=\) E', real scaling factors are computed to
equilibrate
the system :
TRANS \(=N^{\prime}: \operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C) \quad * \operatorname{inv}(\operatorname{diag}(C)) * X=\) \(\operatorname{diag}(R) * B\)

TRANS \(=T\) ': \((\operatorname{diag}(R) * A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(R)) * X=\) diag (C) *B

TRANS \(=C^{\prime}:(\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C) *B
W hether or not the system w illbe equilibrated depends on the
scaling of them atrix A, but if equilibration is used, A is
overw rilten by diag \((\mathbb{R}) * A\) *diag \((C)\) and \(B\) by \(\operatorname{diag}(R) * B\) (ff TRANS = N )
ordiag (C)*B (if TRANS = T'or C) .
2. IfFACT = N 'or E', the LU decom position is used to factor the
m atrix A (afterequilibration ifFACT = E) as
\[
A=L * U,
\]
where \(L\) is a product of perm utation and unit low er triangular
\(m\) atricesw ith \(\mathrm{K} L\) subdiagonals, and \(U\) is upper triangular w ith
K L+KU superdiagonals.
3. If som eU \((i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=i .0\) therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for X and com pute error bounds as described below .
4. The system of equations is solved for X using the factored form of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw and error estim ates
for it.
6. Ifequilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (C) (iftRANS = N) ordiag \((\mathbb{R})\) (ifTRANS = \(T^{\prime}\) or C) so
that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies whether ornot the factored form of the \(m\) atrix A is supplied on entry, and if not, w hether the m atrix A should be equilibrated before it is factored. \(=\mathrm{F}\) ': On entry, AF and \(\mathbb{P I V O T}\) contain the factored form of A. IfEQUED is not \(N\) ', the \(m\) atrix A has been equilibrated w th scaling factors given by \(R\) and \(C . A, A F\), and \(\mathbb{P} I V O T\) are not m odified. \(=\mathrm{N}\) ': The m atrix A w illbe copied to A F and factored.
= E ': The matrix A will be equilibrated if necessary, then copied to AF and factored.
TRANSA (input)
Specifies the form of the system of equations. = N : : A * \(\mathrm{X}=\mathrm{B} \quad\) N \(\circ\) transpose)
\(=T\) ': A ** \(T\) * \(\mathrm{X}=\mathrm{B}\) ( T ranspose)
\(=C: A * * H * X=B \quad\) (Transpose)

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The num ber of linear equations, i.e., the order of them atrix A. \(\mathrm{N}>=0\).

KL (input)
The num ber of subdiagonals w thin the band of A.
\(\mathrm{KL}>=0\) 。

KU (input)
The num ber of superdiagonals \(w\) ithin the band of \(A\). \(K U>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the m atrices B and X. NRHS \(>=0\).

A (input/output)
O \(n\) entry, the \(m\) atrix A in band storage, in row \(s 1\)
to \(K L+K U+1\). The \(j\) th colum \(n\) ofA is stored in the \(j\) th colum \(n\) of the anray A as follow s: A ( \(K U+1+i-\) \(j, j)=A(i, 7)\) form ax \((1, j K U)<=i<=m\) in \((N, j+k l)\)

IfFACT = F'and EQUED is not \(N\) ', then \(A\) must have been equilibrated by the scaling factors in \(R\)
and/orC. A is notm odified if FACT = F'or N', or ifFACT = E'andEQUED = N 'on exit.

Onexit, ifEQUED ne. \(N\) ', A is scaled as fol-
low s: EQUED = R': A := diag \((\mathbb{R}) * A\)
EQUED = C': A : A * diag (C)
EQUED \(=B: A:=\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(K L+K U+1\).

AF (input/output)
If \(F A C T=F\) ', then \(A F\) is an input argum ent and on entry contains details of the LU factorization of the band \(m\) atrix \(A\), as com puted by SGBTRF. U is stored as an upper triangularband \(m\) atrix \(w\) ith \(K \mathrm{~L}+\mathrm{K} \mathrm{U}\) superdiagonals in row s 1 to \(\mathrm{K} L+K \mathrm{~K}+1\), and the multi liers used during the factorization are stored in row \(s K L+K U+2\) to \(2 * K L+K U+1\). If EQUED
ne. \(N\) ', then AF is the factored form of the equilibrated \(m\) atrix \(A\).

If FACT \(=\mathrm{N}\) ', then AF is an output argum ent and on exit retums details of the LU factorization of A.

IfFACT = E', then AF is an output argum ent and on exit retums details of the LU factorization of the equilibrated \(m\) atrix A (see the description of \(A\) forthe form of the equilibrated \(m\) atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(2 * K L+K U+1\).
\(\mathbb{P I V O T}\) (input)
IfFACT = F ', then \(\mathbb{P} \mathbb{I V O T}\) is an input argum ent and on entry contains the pivot indioes from the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{U}\) as com puted by SGBTRF; row i of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P}\) IV OT (i).

If FACT \(=N^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indioes from the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{U}\) of the originalm atrix A .

IfFACT = \(E\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indioes from the factorization \(A=L * U\) of the equilibrated \(m\) atrix
A.

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=N\) : N 0 equilibration (alw ays true ifFACT \(=\) \(\mathrm{N})\).
\(=R\) ': Row equilibration, ie., A has been prem ultiplied by diag \((R)\). = C ': C olum n equilibration, ie., A has been postm ultiplied by diag (C). = B': B oth row and colum n equilibration, ie., A has.been replaced by diag \((\mathbb{R})\) * A * diag (C). EQUED is an inputargum entifFACT= F '; otherw ise, it is an outputargum ent.
R (input/output)
The row scale factors for \(A\). IfEQUED \(=R^{\prime}\) or \(B\) ', \(A\) is multiplied on the left by diag \((\mathbb{R})\); if EQUED = N 'or \(C\) ', \(R\) is notaccessed. \(R\) is an input argum ent ifFACT = \(F\) '; otherw ise, \(R\) is an outputargum ent. IfFACT = F'and EQUED = R'or \(B\) ', each elem entofR \(m\) ustbe positive.

C (input/output)
The colum \(n\) scale factors for \(A\). IfEQUED = C 'or
B', A is multiplied on the rightby diag (C ) ; if \(E Q U E D=N\) 'or \(R\) ', \(C\) is notaccessed. \(C\) is an input argum ent ifFACT = F '; otherw ise, C is an outputargum ent. IfFACT = F'and EQUED = C'or \(B\) ',each elem entofC \(m\) ustbe positive.

B (input/output)
On entry, the righthand side matrix B. On exit, ifEQUED \(=N^{\prime}\) ', \(B\) is notm odified; ifTRANSA \(=N^{\prime}\) and \(E Q U E D=R^{\prime}\) or \(B^{\prime}, B\) is overw ritten by \(\operatorname{diag}(\mathbb{R}) * B\); if TRANSA \(=T\) 'or \(C\) 'and \(E Q U E D=C^{\prime}\) or \(B^{\prime}, B\) is overw rilten by diag ( \(C\) )*B.

LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, \mathbb{N})\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\)-by \(-\mathrm{NRH} S\) solution
\(m\) atrix \(X\) to the original system ofequations.
\(N\) ote that \(A\) and \(B\) arem odified on exit if EQUED
ne. \(\mathrm{N}^{\prime}\), and the solution to the equilibrated
system is inv (diag (C))*X ifTRANSA \(=N\) 'andEQUED
\(=C\) 'or \(B^{\prime}\), orinv (diag \(\left.(R)\right) * X\) ifTRANSA \(=T\) 'or \(C\) 'and EQUED \(=R\) 'or \(B\) '.

LD X (input)
The leading dim ension of the array X . LD X >=
\(\max (1, \mathbb{N})\).

RCOND (output)
The estim ate of the reciprocal condition num berof the \(m\) atrix A after equilibration (if done). If
RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

\section*{FERR (output)}

The estim ated forw ard enorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(\mathrm{X}(\mathcal{)}, \mathrm{FERR}()\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{H})\)-XTRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(j)\) (i.e., the sm allest relative change in any elem entofA orB thatm akesX ( \(\mathcal{(})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) ) On exit, W ORK (1) contains the reciprocal pivot grow th factornorm (A)/norm (U). The "m ax absolute elem ent" norm is used. If W ORK (1) ism uch less than 1 , then the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also \(m\) eans that the solution X , condition estim atorRCOND, and forw ard error bound FERR could be unreliable. If factorization fails w ith \(0<\mathbb{N} F O<=N\), then \(W\) ORK (1) contains the reciprocal pivot grow th factor for the leading
\(\mathbb{N}\) FO colum ns of A.
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfinlexit
<0: if \(\mathbb{N N}\) FO \(=-\) i, the i-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=\mathrm{i}\), and i is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization
has been completed, but the factor \(U\) is exactly
singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than \(m\) achine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{PURPOSE}
dgbtf2 com putes an LU factorization ofa real \(m\)-by-n band \(m\) atrix A using partialpivoting \(w\) ith row interchanges.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
KL (input)
The num ber of subdiagonals w ithin the band of A.
\(\mathrm{KL}>=0\).
KU (input)
The num ber of superdiagonals w ithin the band of A. \(K U>=0\).

AB (input/output)
O n entry, them atrix \(A\) in band storage, in row \(s\) \(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the anay need not.be set. The \(j\) th column ofA is stored in the \(j\) th column of the array AB as follows: \(A B(k l+k u+1+i-j, j)=A(i, j)\) for \(m a x(1, j\) \(\mathrm{ku})<=i<=m\) in \((\mathrm{m}, \mathrm{j}+\mathrm{kl})\)

On exit, details of the factorization: U is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row s 1 to \(K L+K U+1\), and the \(m u l-\) tipliers used during the factorization are stored in row s \(K L+K U+2\) to \(2 * K L+K U+1\). See below for furtherdetails.

The leading dim ension of the array A B . LD AB >=
\(2 * K L+K U+1\).

IPIV (output)
The pivot indices; for \(1<=i<=m\) in \(M, N\) ), row i of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P} \mathbb{V}\) (i).
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0\) : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue \(>0\) : if \(\mathbb{N} F O=+i, U(i, i)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, \(w\) hen \(M=N=6, K L=2, K U=1\) :

On entry: On exit:
```

    * * * + + + * * * u14 u25
    u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55
u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65
*
a31 a42 a53 a64 * * m 31 m 42 m 53 m 64 *

```
*

A ray elem entsm arked * are notused by the routine; ele\(m\) entsm arked + need notbe seton entry, but are required by the routine to store elem ents of \(U\), because of fill-in resulting from the row interchanges.

\#include <sunperfh>
void dgebal(char j̣ंb, intn, double *a, intlda, int *io, int *ihi, double *scale, int *info);
void dgebal 64 (char job, long n, double *a, long lda, long *ilo, long *ihi, double *scale, long *info);

\section*{PURPOSE}
dgebalbalances a general real m atrix A. This involves, first, perm uting A by a sm ilarity transform ation to isolate eigenvalues in the first 1 to IIO -1 and last IH I+1 to N ele\(m\) ents on the diagonal; and second, applying a diagonal sim ilarity transform ation to row sand colum ns \(\mathbb{H O}\) to \(\mathbb{H}\) Ito \(m\) ake the rows and columns as close in norm aspossible. Both steps are optional.

B alancing \(m\) ay reduce the 1-norm of the \(m\) atrix, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors.

\section*{ARGUMENTS}
\(J O B\) (input)
Specifies the operations to be perform ed on A:
= N ': none: simply set \(\Pi \mathrm{O}=1\), \(\mathbb{H} \mathrm{I}=\mathrm{N}\), SCALE (I) \(=1.0\) fori= \(1, \ldots, N ;=P\) ': perm ute only;
= S ': scale only;
= \(\mathrm{B}:\) : both perm ute and scale.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
A (input/output)
On entry, the inputm atrix A. On exit, A is overw rilten by the balanced \(m\) atrix. If \(J O B=N\) ', \(A\) is not referenced. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

世O (output)
IIO and \(\mathbb{H}\) I are set to integers such thaton exit
A \((i, 1)=0\) if \(i>j a n d j=1, \ldots\), ILO -1 or \(I=\)
\(\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\). If \(\mathrm{OB}=\mathrm{N}\) 'or \(\mathrm{S}^{\prime}, \mathbb{I} \mathrm{HO}=1\) and \(\mathbb{H} \mathrm{I}\)
\(=\mathrm{N}\).
IH I (output)
See the description for IIO .
SCALE (output)
D etails of the perm utations and scaling factors applied to \(A\). IfP ( \(j\) ) is the index of the row and colum \(n\) interchanged \(w\) th row and colum \(n\) jand \(D(1)\) is the scaling factorapplied to row and column \(j\) then SCALE \((j)=P(j) \quad\) for \(j=1, \ldots, I L O-1=D(j)\) for \(j=\mathbb{L O}, \ldots, \mathbb{H} I=P(j) \quad\) for \(j=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L O} \mathrm{O}\).
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

The perm utations consist of row and column interchanges which put the \(m\) atrix in the form
\[
\left.\begin{array}{c}
(\mathrm{T} 1 \mathrm{X} \\
\mathrm{PAP}
\end{array}\right)=\left(\begin{array}{ll}
0 & \mathrm{~B} \\
\mathrm{P}
\end{array}\right) .
\]
where T1 and T2 are uppertriangularm atrices whose eigenvalues lie along the diagonal. The colum \(n\) indices \(\Pi \mathrm{HO}\) and IH Im ark the starting and ending colum ns of the subm atrix B. Balancing consists of applying a diagonal sim ilarity transform ation inv \((D) * B * D\) to \(m\) ake the 1 -norm \(s\) of each row of \(B\) and its comesponding colum n nearly equal. The outputm atrix is
\(\left(\begin{array}{lll}(11 & X * D & Y\end{array}\right)\)
\(\left(\begin{array}{lll}0 & \operatorname{inv}(D) * B * D & \operatorname{inv}(D) * Z\end{array}\right)\).
\(\left(\begin{array}{lll}0 & 0 & T 2\end{array}\right)\)

Inform ation about the perm utations P and the diagonalm atrix \(D\) is retumed in the vectorSCA LE.

This subroutine is based on the E ISPACK routine BA LANC.

\#include <sunperfh>
void dgebrd (intm , intn, double *a, int lda, double *d, double *e, double *tauq, double *taup, int *info);
void dgebrd_64 (long m , long n, double *a, long lda, double
*d, double *e, double *tauq, double *taup, long
*info);

\section*{PURPOSE}
dgebrd reduces a general realM -by N m atrix A to upper or lower bidiagonal form \(B\) by an orthogonaltransform ation: \(\mathrm{Q} * * \mathrm{~T} * \mathrm{~A} * \mathrm{P}=\mathrm{B}\).

Ifm >= \(n, B\) is upperbidiagonal; ifm < \(n, B\) is low erbidiagonal.

\section*{ARGUMENTS}

M (input) The num ber of row s in the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of collm ns in them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O \(n\) entry, the \(M-b y-N\) generalm atrix to be reduced. On exit, if \(m>=n\), the diagonal and the first superdiagonal are overw rilten w ith the upperbidiagonal \(m\) atrix \(B\); the elem ents below the diagonal, \(w\) th the array \(T A U Q\), represent the orthogonal \(m\) atrix \(Q\) as a productofelem entary reflectors, and the elem ents above the first superdiagonal, w th the aray TAUP, represent the orthogonal \(m\) atrix \(P\) as a product of elem entary reflectors; if \(\mathrm{m}<\mathrm{n}\), the diagonaland the first subdiagonalare overw ritten \(w\) ith the low er bidiagonal \(m\) atrix \(B\); the elem ents below the firstsubdiagonal, w ith the array TAUQ, represent the orthogonalm atrix \(Q\) as a product ofelem entary reflectors, and the elem ents above the diagonal, w th the amay TA U P, represent the orthogonalm atrix \(P\) as a productofelem entary reflectors. See FurtherD etails.

The leading dim ension of the amay A. LDA >= \(\max (1, M)\).

D (output)
The diagonalelem ents of the bidiagonalm atrix B :
\(D(i)=A(i, i)\).

E (output)
The off-diagonalelem ents of the bidiagonalm atrix
\(B:\) ifm \(>=n, E(i)=A(i, i+1)\) for \(i=1,2, \ldots, n-\)
\(1 ;\) ifm \(<n, E(i)=A(i+1, i)\) for \(i=1,2, \ldots m-1\).

TAUQ (output)
The scalar factors of the elem entary reflectors
which represent the orthogonal matrix Q. See
FurtherD etails.

TAUP (output)
The scalar factors of the elem entary reflectors which represent the orthogonal \(m\) atrix \(P\). See FurtherD etails.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, W\) ORK ( 1 ) retums the optim al
LW ORK.

LW ORK (input)
The length of the array \(W\) ORK. LW ORK \(>=\) \(\max (1, M, N)\). For optim um perform ance LW ORK >= \((M+N) \star N B\), where N B is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no emorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{I N F O}=-i\), the \(i\) th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

The \(m\) atrices \(Q\) and \(P\) are represented as products of elem entary reflectors:

Ifm \(>=n\), \(Q=H(1) H(2) \ldots H(n)\) and \(P=G(1) G(2) \ldots G(n-1)\)

Each H (i) and G (i) has the form :
\(H(i)=I-\operatorname{tanq} * v^{*} v^{\prime}\) and \(G(i)=I-\operatorname{tanp} * u * u^{\prime}\)
where tauq and taup are realscalars, and \(v\) and \(u\) are real vectors; \(v(1: i-1)=0, v(i)=1\), and \(v(i+1 m)\) is stored on exitin \(A(i+1 m, i) ; u(1: i)=0, u(i+1)=1\), and \(u(i+2 m)\) is stored on exit in A ( \(\mathbf{i}, \mathrm{i}+2 \mathrm{n}\) ); tauq is stored in TA U Q (i) and taup in TA UP (i).
```

Ifm < n,
$Q=H(1) H(2) \ldots H(m-1)$ and $P=G(1) G(2) \ldots G(m)$

```

Each H (i) and G (i) has the form :
\(H(i)=I-\operatorname{tanq} * v^{*} v^{\prime}\) and \(G(i)=I-\operatorname{taup} * u^{*} u^{\prime}\)
where tauq and taup are realscalars, and \(v\) and \(u\) are real vectors; \(v(1: i)=0, v(i+1)=1\), and \(v(i+2 \mathrm{~m})\) is stored on exitin \(A(i+2 m, i) ; u(1: i-1)=0, u(i)=1\), and \(u(i+1 m)\) is stored on exitin A (i,i+1 n); tauq is stored in TA U Q (i) and taup in TA UP (i).

The contents ofA on exitare illustrated by the follow ing exam ples:
\(m=6\) and \(n=5(m>n): \quad m=5\) and \(n=6(m<n):\)
( d e ul ul u1) ( \(d\) u1 u1 u1 u1
ul)
( v1 d e u2 u2) (e d u2 u2 u2
u2)
( v1 v2 d e u3 ) (v1 e d u3 u3
u3 )
( v1 v2 v3 d e ) (v1 v2 e d u4
u4)
( v1 v2 v3 v4 d ) (v1 v2 v3 e d u5 )
( v1 v2 v3 v4 v5 )
where \(d\) and e denote diagonal and off-diagonal elem ents of \(B\), videnotes an elem ent of the vectordefining \(H\) (i), and ui an elem entof the vectordefining G (i).

void dgeequ (intm, intn, double *a, int lda, double *r, double *c, double *row cn, double *colen, double *am ax, int*info);
void dgeequ_64 (long \(m\), long \(n\), double *a, long lda, double *r, double *c, double *row cn, double *colen, double *am ax, long *info);

\section*{PURPOSE}
dgeequ com putes row and colum n scalings intended to equilibrate an M -by-N m atrix A and reduce its condition num ber. R retums the row scale factors and \(C\) the colum \(n\) scale factors, chosen to tey to \(m\) ake the largestelem ent in each row and column of the matrix \(B\) with elements \(B(i, \gamma)=R(i) * A(i, \lambda) * C(j)\) have absolute value 1 .
\(R\) (i) and C (i) are restricted to be betw een SM LN UM \(=\) sm allest safe num ber and B IG N UM = largest safe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input) The \(M\)-by -N m atrix w hose equilibration factors are to be com puted.

LDA (input)
The leading dim ension of the array A. LDA >= \(m a x(1, M)\).

R (output)
If \(\mathbb{N F O}=0\) or \(\mathbb{N} F O>M, R\) contains the row scale
factors forA.

C (output)

If \(\mathbb{N} F O=0, C\) contains the colum \(n\) scale factors forA.

ROW CN (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R O W C N\) contains the ratio of the sm allest \(R\) (i) to the largest \(R\) (i). If ROW CN >= 0.1 and AM AX is nether too large nortoo sm all, it is notw orth scaling by R .

COLCN (output)
If \(\mathbb{N} F O=0, C O L C N\) contains the ratio of the sm allest C (i) to the largestC (i). IfC O LCN >=0.1, it is notw orth scaling by \(C\).
AMAX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to underflow , the m atrix should be scaled.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvahue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{M}\) : the i-th row ofA is exactly zero
> M : the ( \((-\mathrm{M})\) )-th collum n ofA is exactly zero

void dgees(char jobz, char sortev, int(*select) (double,double), intn, double *a, int lda, int *nout, double *W r, double *W i, double *z, intldz, int*info);
void dgees_64 (char jobz, char sortev, long (*select) (double,double), long n, double *a, long lda, long *nout, double *w r, double *w i, double *z, long ldz, long *info);

\section*{PURPOSE}
dgees com putes for an \(N\) boy -N realnonsym \(m\) etric \(m\) atrix \(A\), the eigenvalues, the real Schur form \(T\), and, optionally, the \(m\) atrix of Schurvectors Z. This gives the Schur factorization \(A=Z * T *(Z * * T)\).

Optionally, italso orders the eigenvalues on the diagonal of the realSchur form so that selected eigenvalues are at the top left. The leading colum ns of \(Z\) then form an orthonorm albasis forthe invariantsubspace coresponding to the selected eigenvalues.

A matrix is in real Schur form if it is upper quasitriangularw ith 1 -by-1 and 2 -by -2 blocks. 2 -by -2 blocksw ill be standardized in the form
[ a b ]
\(\left[\begin{array}{ll}\mathrm{c} & \mathrm{a}\end{array}\right]\)
where \(\mathrm{b}^{*} \mathrm{c}<0\). The eigenvalues of such a block are a +squt (bc).

\section*{ARGUMENTS}

JO BZ (input)
\(=\mathrm{N}\) ': Schurvectors are notcom puted;
\(=\mathrm{V}\) : Schurvectors are com puted.

SORTEV (input)
Specifies w hether or not to order the eigenvalues
on the diagonalof the Schur form . = N ': Eigenvalues are notordered;
\(=S\) ': Eigenvalues are ordered (see SELECT).

SELECT (input)
SELECT m ustbe declared EXTERNAL in the calling subroutine. If SORTEV \(=S^{\prime}\), SELECT is used to selecteigenvalues to sort to the top leftof the Schur form. If SORTEV = \(N^{\prime}\), SELECT is not referenced. A n eigenvalue W R ( 1\()+\operatorname{sqnt}(-1) * W I(1)\) is selected ifSELECT (W R ( 7 ) , \(\mathrm{N} I(\mathcal{j})\) ) is tue; ie., if either one of a com plex conjugate pair of eigenvalues is selected, then both com plex eigenvalues are selected. N ote that a selected com plex eigenvalue m ay no longer satisfy SELECT \((\mathbb{W} R(\mathcal{J}) \mathbb{W} I(\mathcal{J})=\) .TRUE.afterordering, since ordering may change the value of com plex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case \(\mathbb{N}\) FO is set to \(N+2\) (see \(\mathbb{N}\) FO below).

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).

A (input/output)
On entry, the \(N\) boy -N m atrix A. On exit, A has been overw ritten by its realSchur form \(T\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

NOUT (output)
If SORTEV = N',NOUT = 0. IfSORTEV = S', NOUT
= num ber of eigenvalues (aftersorting) forw hich
SELECT is true. (C om plex conjugate pairs forw hich
SELECT is true foreithereigenvalue countas 2.)

\section*{W R (output)}

W R and W I contain the real and im aginary parts, respectively, of the com puted eigenvahues in the sam e order that they appear on the diagonal of the output Schur form T. C om plex conjugate pairs of eigenvalueswill appear consecutively w ith the
eigenvalue having the positive in aginary part first.

W I (output)
See the description forW \(R\).
Z (output)
If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{Z}\) contains the orthogonalm atrix Z of Schurvectors. If \(J 0 \mathrm{BZ}=\mathrm{N}^{\prime}, \mathrm{Z}\) is notreferenced.
LD Z (input)
The leading dim ension of the array Z . LD \(\mathrm{Z}>=1\); if \(\mathrm{JO} \mathrm{BZ}=\mathrm{V}\) ', LD \(\mathrm{Z}>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) contains the optim al LDW ORK.

LDW ORK (input)
The dimension of the amay \(W\) ORK. LDW ORK >= \(m a x(1,3 \star N)\). For good perform ance, LDW ORK must generally be larger.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 3 (w orkspace)
dim ension ( N\() \mathrm{N}\) ot referenced if \(S O\) RTEV \(=\mathrm{N}^{\prime}\).
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
\(<=N\) : the Q R algorithm failed to com pute all the eigenvalues; elem ents \(1: \mathbb{H}-1\) and i+ \(1 \mathbb{N}\) ofW R and W I contain those eigenvalues which have converged; if \(J O B Z=V^{\prime}, Z\) contains the \(m\) atrix which reduces \(A\) to its partially converged Schur form . \(=\mathrm{N}+1\) : the eigenvalues could not be reordered because som e eigenvalues w ere too close to separate (the problem is very ill-conditioned); \(=\mathrm{N}+2\) : after reordering, roundoff changed values of som e com plex eigenvalues so that leading eigenvalues in the Schur form no longersatisfy SELECT=TRUE. This could also be caused by underflow due to scaling.

\section*{C INTERFACE}
\#include <sunperfh>
void dgeesx (char jobz, char sortev, int(*select) (double,double), char sense, intn, double *a, int lda, int *nout, double *W \(r\), double \({ }^{*}\) w i, double *z, intldz, double *srcone, double *rconv, int*info);
void dgeesx_64 (char jंbz, char sortev, long (*select) (double,double), charsense, long n, double *a, long lda, long *nout, double *w r, double *w i, double * z, long ldz, double *srcone, double *roonv, long *info);

\section*{PURPOSE}
dgeesx com putes for an \(N\) boy \(-N\) real nonsym \(m\) etric \(m\) atrix \(A\), the eigenvahues, the realSchur form T, and, optionally, the \(m\) atrix of Schurvectors \(Z\). This gives the Schur factorization \(A=Z * T *(Z * * T)\).

O ptionally, italso orders the eigenvalues on the diagonal of the realSchur form so thatselected eigenvalues are at
the top left; com putes a reciprocalcondition num ber for the average of the selected eigenvalues (RCONDE); and com putes a reciprocal condition num ber for the right invariant subspace comesponding to the selected eigenvalues (RCONDV). The leading colum ns of \(Z\) form an orthonorm al basis for this invariant subspace.

For further explanation of the reciprocal condition num bers RCONDE and RCONDV, see Section 4.10 of the LAPACK U sers' G uide (w here these quantities are called s and sep respectively).

A realm atrix is in realSchur form if it is upper quasitriangularw ith 1-by-1 and 2 -by- 2 blocks. 2 -by- 2 blocksw ill be standardized in the form
[ a b ]
[ \(\mathrm{c} a \mathrm{a}\) ]
\(w\) here \(b^{*} c<0\). The eigenvalues of such a block are a +sqrt(bc).

\section*{ARGUMENTS}

JOBZ (input)
= N ':Schurvectors are not com puted;
= V ':Schurvectors are com puted.

SORTEV (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the Schur form . = N ': Eigenvalues are not ordered;
= S':E igenvahues are ordered (see SELECT) .
SELECT (input)
SELECT mustbe declaredEXTERNAL in the calling subroutine. If SORTEV = S', SELECT is used to selecteigenvalues to sort to the top left of the Schurform. If SORTEV = N', SELECT is notreferenced. An eigenvalue \(W\) R \((j)+\operatorname{sqnt}(-1) * W I(j)\) is selected if SELECT \((\mathbb{N} R(\mathcal{J}), N I(\mathcal{J})\) is true; ie., if either one of a com plex conjugate pair of eigenvalues is selected, then both are. N ote that a selected com plex eigenvalue \(m\) ay no longer satisfy \(\operatorname{SELECT} \mathbb{N} R(\mathcal{J}, \mathbb{N} I(\mathcal{j})=\) TRUE.after ordering, since ordering \(m\) ay change the value of com plex eigenvalues (especially if the eigenvalue is illconditioned); in this case \(\mathbb{I N F O} \mathrm{m}\) ay be set to \(\mathrm{N}+3\) (see \(\mathbb{I N} F O\) below ).

D eterm ines which reciprocal condition num bers are com puted. = N ': N one are com puted;
\(=\mathrm{E}\) ': C om puted for average of selected eigenvalues only;
= V ': C om puted for selected right invariant subspace only;
\(=\mathrm{B}\) ': C om puted forboth. If SEN \(S E=\mathrm{E}^{\prime}, \mathrm{V}^{\prime}\) or B',SORTEV mustequal \(S^{\prime}\).

N (input) The order of the m atrix A \(. \mathrm{N}>=0\).

A (input/output)
On entry, the \(N\) boy \(-N m\) atrix A. On exit, A is overw ritten by its realSchur form T.
LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

NOUT (output)
If SORTEV \(=\mathrm{N}\) ', NOUT \(=0\). If SORTEV \(=\mathrm{S}\) ', NOUT
= num ber of eigenvalues (aftersorting) forw hich
SELECT is true. (C om plex conjugate pairs forw hich
SELECT is true fore thereigenvalue countas 2 .)
W R (output)
W R and W Icontain the real and im aginary parts, respectively, of the com puted eigenvalues, in the sam e order that they appearon the diagonal of the output Schur form T. C om plex conjugate pairs of eigenvalues appear consecutively \(w\) ith the eigenvalue having the positive im aginary part first.

W I (output)
See the description forW R.
Z (output)
If \(\mathrm{OBBZ}=\mathrm{V}\) ', Z contains the orthogonalm atrix Z of Schurvectors. If JO BZ \(=N^{\prime}\), Z is notreferenced.

LD \(Z\) (input)
The leading dim ension of the array \(Z\). LD \(Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(\mathrm{Z}>=\mathrm{N}\).

SRCONE (output)
If SENSE = E' or B', SRCONE contains the reciprocal condition num ber for the average of the selected eigenvalues. N ot referenced if SEN SE = N 'or V '.

RCONV (output)
If SEN SE = V 'or B ', RCONV contains the reciprocal condition num ber for the selected right invariant subspace. N ot referenced if \(\operatorname{SEN} S E=\mathrm{N}^{\prime}\) or E'.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= \(\max (1,3 \star \mathrm{~N})\). A lso, if SENSE = E'or V 'or B',
LDW ORK >=N+2*NOUT* \((\mathbb{N}-N O U T)\), where NOUT is the
num ber of selected eigenvalues com puted by this routine. N ote that \(\left.\mathrm{N}+2{ }^{*} \mathrm{NOUT} \mathrm{N}^{*} \mathrm{~N}+\mathrm{NOUT}\right)<=\mathrm{N}+\mathrm{N} * \mathrm{~N} / 2\).
For good perform ance, LDW ORK mustgenerally be larger.

IW ORK 2 (w orkspace/output)
N ot referenced if SEN \(S E=\mathrm{N}\) 'or \(\mathrm{E}^{\prime}\). . On exit, if \(\mathbb{N} F O=0, \mathbb{I}\) ORK 2 (1) retums the optim alld W RK 2.

LD W RK 2 (input)
The dim ension of the array \(\mathbb{I W}\) ORK 2. LDW RK 2 >= 1;
if SENSE \(=V\) 'or \(B^{\prime}\),LDW RK2 \(>=\) NOUT* \((N-N O U T)\).

BW ORK 3 (w orkspace)
dim ension ( \(\mathbb{N}\) ) N ot referenced if \(S O R T E V=\mathrm{N}^{\prime}\).
\(\mathbb{I N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum ent had an illegalvalue.
\(>0:\) if \(\mathbb{I N F O}=i\), and \(i\) is
\(<=N\) : the \(Q R\) algorithm failed to com pute all the eigenvalues; elem ents \(1: \mathbb{I} \mathrm{O}-1\) and i+ 1 N ofW R and W I contain those eigenvalues which have converged; if \(\mathrm{JOBZ}=\mathrm{V}\) ', Z contains the transform ation w hich reduces A to its partially converged Schur form. \(=\mathrm{N}+1\) : the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned); = \(\mathrm{N}+2\) : after reordering, roundoff changed values of som e com plex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy SELEC T= TRU E. This could also be caused by underflow due to scaling.

\section*{PURPOSE}
dgeev com putes for an \(N\) boy -N realnonsym \(m\) etric \(m\) atrix \(A\), the eigenvalues and, optionally, the left and/or righteigenvectors.

The righteigenvectorv ( \()\) ) ofA satisfies
A * \(\mathrm{v}(\mathrm{J})=\operatorname{lam} \mathrm{bda}(\mathrm{j}) * \mathrm{v}(\boldsymbol{j})\)
w here lam bda ( 7 ) is its eigenvalue.
The lefteigenvectoru ( \()\) of ) satisfies

where \(u(j) * * H\) denotes the conjugate transpose ofu ( \(\mathcal{j}\) ).

The com puted eigenvectors are norm alized to have Euclidean norm equal to 1 and largest com ponent real.

\section*{ARGUMENTS}
\(J 0 \mathrm{BVL}\) (input)
\(=\mathrm{N}\) : lefteigenvectors of \(A\) are not com puted;
\(=\mathrm{V}\) ': lefteigenvectors of A are com puted.

JOBVR (input)
\(=\mathrm{N}\) ': righteigenvectors of \(A\) are notcom puted;
\(=\mathrm{V}\) ': righteigenvectors of A are com puted.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).

A (input/output)
On entry, the \(N\) boy -N m atrix A. On exit, A has
been overw ritten.

LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

W R (output)
W R and W Icontain the real and im aginary parts, respectively, of the com puted eigenvalues. Com plex conjugate pairs of eigenvalues appear consecutively w ith the eigenvalue having the positive im aginary part first.

\section*{W I (output)}

See the description forW R.
VL (output)
If \(\mathrm{JOBVL}=\mathrm{V}\) ', the left eigenvectors \(\mathrm{u}(\mathrm{y})\) are stored one afteranother in the colum ns of V L, in the sam e order as theireigenvalues. If \(\mathrm{JOBVL}=\) N ', VL is not referenced. If the \(j\) th eigenvalue is real, then \(u(\eta)=V L(: r)\), the \(j\) th column of \(V L\). If the \(j\) th and ( \(j+1\) )-steigenvalues form a com plex conjugate pair, then \(u(\mathcal{j})=V L(:, i)+\) \(i^{\star} V L(: j+1)\) and
\(u(j+1)=V L(:, 7)-i \star V L(:, j+1)\).
LDVL (input)
The leading dim ension of the array VL. LD V L >=1; if JO BVL = V', LDVL >= N .

VR (input)
If \(\mathrm{JOBVR}=\mathrm{V}\) ', the right eigenvectors \(\mathrm{V}(\mathrm{y})\) are stored one afteranother in the colum ns of VR, in the sam e order as theireigenvalues. If \(J 0 B V R=\) \(N^{\prime}, \mathrm{VR}\) is not referenced. If the \(j\) th eigenvalue is real, then \(v(\mathcal{I})=V R(:, \gamma)\), the \(j\) th column of \(V R\). If the \(j\) th and ( \(j+1\) )-steigenvalues form a com plex conjugate pair, then \(\mathrm{V}(\mathcal{j})=\operatorname{VR}(:, 7)+\) i*VR (: \(1 \mathrm{j}+1\) ) and
\(\mathrm{V}(j+1)=\operatorname{VR}(:, 7)-\mathrm{i} \star \mathrm{V}(:, j+1)\).
LDVR (input)
The leading dim ension of the array VR. LD V \(\mathrm{R}>=1\); if \(\mathrm{JOBVR}=\mathrm{V}\) ', LDVR \(>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al
LDW ORK.
LDW ORK (input)

The dimension of the amray \(W\) ORK. LDW ORK >= \(\mathrm{max}(1,3 * \mathrm{~N})\), and if \(\mathrm{JOBVL}=\mathrm{V}\) 'orJobVR \(=\mathrm{V}\) ', LDW ORK >= 4*N. Forgood perform ance, LDW ORK must generally be larger.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\)-i, the \(i\)-th argum enthad an illegalvalue.
> 0: if \(\mathbb{N} F O=i\), the \(Q R\) algorithm failed to com -
pute all the eigenvalues, and no eigenvectors have
been com puted; elem ents i+ \(1 \mathbb{N}\) of R and \(W\) I contain eigenvalues which have converged.

\section*{C INTERFACE}
\#include <sunperfh>
void dgeevx (charbalanc, char jobvl, char jobvr, charsense, int \(n\), double *a, int lda, double \({ }_{\mathrm{W}} \mathrm{r}\), double *\({ }_{\mathrm{w}} \mathrm{i}_{\text {, }}\) double *Vl, int ldvl, double *Vr, int ldvr, int *ilo, int *ihi, double *scale, double *abnrm , double *roone, double *roonv, int *info);
void dgeevx_64 (charbalanc, char jobvl, char jobvr, char sense, long \(n\), double *a, long lda, double *W r, double *W i, double *vl, long ldvl, double *vr, long ldvr, long *ilo, long *ihi, double *scale, double *abnrm, double *roone, double *rconv, long *info);

\section*{PURPOSE}
dgeevx com putes for an \(N\) boy -N real nonsymm etric \(m\) atrix \(A\), the eigenvalues and, optionally, the left and/or right eigenvectors.

Optionally also, it com putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( \(\mathbb{L} O, \mathbb{H} I\), SCALE , and A BN RM ), reciprocal condition num bers for the eigenvalues (RCONDE), and reciprocal condition num bers for the right eigenvectors (RCONDV).

The righteigenvectorv ( \()\) ) of A satisfies
\[
\text { A * } \mathrm{v}(\mathcal{\jmath})=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * v(\mathcal{j})
\]
where \(\operatorname{lam} \operatorname{bda}(j)\) is its eigenvalue.
The lefteigenvectoru ( \()\) ) of A satisfies
\[
\mathrm{u}(\mathrm{j}) * * \mathrm{H} * \mathrm{~A}=\operatorname{lam} \operatorname{bda}(\mathrm{j}) * \mathrm{u}(\hat{)})^{* *} \mathrm{H}
\]
where \(u(j) * * H\) denotes the conjugate transpose of \(u(j)\).
The com puted eigenvectors are norm alized to have Euclidean norm equalto 1 and largestcom ponent real.

B alancing a \(m\) atrix \(m\) eans perm uting the row \(s\) and colum \(n s\) to m ake itm ore nearly upper triangular, and applying a diagonalsim ilarity transform ation \(D\) * \(A\) * \(D\) ** \((-1)\), where \(D\) is a diagonalm atrix, to \(m\) ake its row \(s\) and colum ns closer in norm and the condition num bers of its eigenvalues and eigenvectors sm aller. The com puted reciprocalcondition num bers comespond to the balanced \(m\) atrix. Perm uting row \(s\) and colum ns will not change the condition num bers (in exact arithm etic) but diagonal scaling will. For further explanation of balancing, see section 4.102 of the LA PA CK U sers'G uide.

\section*{ARGUMENTS}

BALANC (input)
Indicates how the inputm atrix should be diagonally scaled and/orperm uted to im prove the conditioning of its eigenvalues. \(=\mathrm{N}\) ': D o not diagonally scale orperm ute;
\(=\mathrm{P}\) ':Perform perm utations to m ake the m atrix \(m\) ore nearly upper triangular. D o notdiagonally scale; = S':D iagonally scale the m atrix, ie. replace \(A\) by \(D * A * D * *(-1)\), where \(D\) is a diagonal \(m\) atrix chosen to \(m\) ake the row \(s\) and colum ns of \(A\) m ore equal in norm .D o notperm ute; \(=\mathrm{B}\) ':Both diagonally scale and perm ute A.

C om puted reciprocalcondition num bers \(w\) illbe for the \(m\) atrix afterbalancing and/orperm uting. Per\(m\) uting does not change condition num bers (in exact arithm etic), butbalancing does.

JOBVL (input)
\(=N\) ': lefteigenvectors of A are not com puted;
\(=\mathrm{V}\) ': lefteigenvectors of A are com puted. If
SEN SE = E 'or B', JO BV L m ust= V'.
\(J 0 B V R\) (input)
= N ': righteigenvectors of \(A\) are not com puted;
\(=\mathrm{V}\) : righteigenvectors of A are com puted. If SEN SE = E'or B', JO BV R m ust= V'.

SENSE (input)
D eterm ines which reciprocalcondition num bers are com puted. = N ': N one are com puted;
\(=\mathrm{E}: \mathrm{C}\) om puted foreigenvalues only;
\(=\mathrm{V}\) ':C om puted for righteigenvectors only;
\(=B: C\) om puted foreigenvalues and right eigenvectors.

If SEN SE = E 'or B ', both leftand right eigenvectors \(m\) ust also be com puted ( \(\mathrm{JO} \mathrm{BVL}=\mathrm{V}\) 'and \(\mathrm{JO} B V R=V\) ).

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
A (input/output)
On entry, the \(N-b y-N\) m atrix A. On exit, A has
been overw ritten. If \(J 0 B V L=V\) 'orJOBVR \(=V\) ',
A contains the realSchur form of the balanced version of the inputm atrix A.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, \mathbb{N})\).

\section*{W R (output)}

W R and W I contain the real and im aginary parts, respectively, of the com puted eigenvalues. Com plex conjugate pairs of eigenvahues w ill appear consecutively w th the eigenvalue having the positive im aginary part first.

W I (output)
See the description forW R.
VL (output)
If \(\mathrm{JOBVL}=\mathrm{V}\) ', the left eigenvectors \(\mathrm{u}(\mathrm{y})\) are stored one after another in the colum ns of V L, in the sam e order as theireigenvalues. If \(\mathrm{JOBVL}=\) N ', VL is not referenced. If the \(j\) th eigenvalue is real, then \(u(j)=V L(:, ~ j)\), the \(j\) th column of \(V L\). If the \(j\) th and ( \(j+1\) )-steigenvalues form a com plex conjugate pair, then \(u(\mathcal{J})=\mathrm{VL}(:, 7)+\) i*V L (:,j+1) and \(u(j+1)=V L(:, 7)-i \star V L(:, j+1)\).

LDVL (input)
The leading dim ension of the array VL. LD V L >=1; if \(\mathrm{JOBVL}=\mathrm{V}\) ', LDVL \(>=\mathrm{N}\) 。

\section*{VR (output)}

If \(\mathrm{OB} \mathrm{BR}=\mathrm{V}\) ', the right eigenvectors \(\mathrm{V}(\mathrm{I})\) are stored one after another in the colum ns of VR, in the sam e order as theireigenvalues. If \(J 0 B V R=\) N ', VR is not referenced. If the jth eigenvalue is real, then \(v(\mathcal{F})=V R\left(:, ~ \mathcal{I}^{\prime}\right)\), the \(j\) th column of VR. If the \(j\) th and ( \(j+1\) )-steigenvalues form \(a\) com plex conjugate pair, then \(\mathrm{v}(\mathcal{1})=\mathrm{VR}(:, 1)+\) i \({ }^{*}\) VR (: \(\ddagger+1\) ) and

LDVR (input)
The leading dim ension of the amay VR.LDVR >=1, and if \(J O B V R=V^{\prime}, L D V R>=N\).

ㅍO (output)
HO and IH Iare integervahes determ ined when A w as balanced. The balanced \(A(i, j)=0\) if \(I>J\) and \(J=1, \ldots, I \mathrm{HO}-1\) or \(I=\mathbb{H} I+1, \ldots, N\).

IH I (output)
See the description of IIO .

SCALE (output)
D etails of the perm utations and scaling factors applied w hen balancing A. IfP ( \(\mathcal{D}\) ) is the index of the row and colum \(n\) interchanged \(w\) ith row and colum \(n j\) and \(D(\mathcal{)}\) ) is the scaling factor applied to row and colum \(n j\) then \(\operatorname{SCALE}(J)=P(J)\), for \(J=1, \ldots, \Pi O-1=D(J), \quad\) for \(J=\Pi O, \ldots, \mathbb{H} I=\) \(P(J) \quad\) for \(J=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} \mathrm{I}+1\), then 1 to ILO-1.

\section*{ABNRM (output)}

The one-norm of the balanced \(m\) atrix the \(m\) axim um of the sum of absolute values of elem ents of any colum n).

RCONE (output)
RCONE ( \(\mathcal{j}\) ) is the reciprocal condition num ber of the jth eigenvalue.

RCONV (output)
RCONV (ㄱ) is the reciprocalcondition num ber of the jth righteigenvector.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the amay \(W\) ORK. IfSENSE \(=N^{\prime}\)
or E', LDW ORK >= max ( \(1,2 * \mathrm{~N}\) ), and if \(\mathrm{JOBVL}=\mathrm{V}^{\prime}\) orJOBVR = V',LDW ORK >= 3*N. IfSENSE = V' or B', LDW ORK >= \(N * \mathbb{N}+6)\). Forgood perform ance, LD W ORK m ustgenerally be larger.

IfLD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of
the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by X ERBLA .

IV ORK 2 (w orkspace)
dim ension ( 2 * \(\mathrm{N}-2\) ) IfSEN SE = N 'or E', notreferenced.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue.
\(>0:\) if \(\mathbb{N} F O=i\), the \(Q R\) algorithm failed to com -
pute all the eigenvalues, and no eigenvectors or condition num bers have been com puted; elem ents 1:ITO-1 and i+ \(1 \mathbb{N}\) ofW R and W I contain eigenvalues w hich have converged.

\#include <sunperfh>
void dgegs (char jobvsl, char jobvss, intn, double *a, int
lda, double *b, intldb, double *alphar, double
*alphai, double *beta, double *vsl, int ldvsl, double *vsr, int ldvsr, int*info);
void dgegs_64 (char jंbvsl, char jंbvsr, long n, double *a, long lda, double *b, long ldb, double *alphar, double *alphai, double *beta, double *vsl, long ldvsl, double *vsr, long ldvsr, long *info);

\section*{PURPOSE}
dgegs routine is deprecated and has been replaced by routine SG G ES .

SG EG S com putes for a pair of N -by N real nonsym \(m\) etric \(m\) atrices \(A, B\) : the generalized eigenvalues (alphar+/alphai*i, beta), the realSchur form ( \(\mathrm{A}, \mathrm{B}\) ), and optionally leftand/or rightS churvectors (VSL and V SR ).
(If only the generalized eigenvalues are needed, use the driverSG EGV instead.)

A generalized eigenvalue for a pair of \(m\) atriges ( \(A, B\) ) is, roughly speaking, a scalar w or a ratio alphaßbeta \(=\mathrm{w}\), such that \(A-w * B\) is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta \(=0\), and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G.G olub \& C .van Loan (Johns H opkins U .Press)

The (generalized) Schur form of a pair of \(m\) atriges is the result of \(m\) ultiplying both \(m\) atrices on the leftby one orthogonalm atrix and both on the rightby another orthogonalm atrix, these tw o orthogonalm atrices being chosen so as to bring the pair ofm atrices into (real) Schur form .

A pair ofm atrices \(A, B\) is in generalized realSchur form if \(B\) is upper triangularw ith non-negative diagonal and \(A\) is block uppertriangularw ith 1 -by -1 and 2 -by -2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues,
while 2-by-2 blocks ofA willbe "standardized" by making the corresponding elem ents ofB have the form :
[ a 0 ]
[ 0 b ]
and the pair of corresponding 2 -by -2 blocks in \(A\) and \(B\) w ill have a com plex conjugate pair of generalized eigenvalues.

The left and rightSchurvectors are the colum ns ofV SL and VSR, respectively, where VSL and VSR are the orthogonal \(m\) atrices \(w\) hich reduce \(A\) and \(B\) to Schur form :

Schurform of \((A, B)=((N S L) * * T A(N S R),(N S L) * * T B(N S R))\)

\section*{ARGUMENTS}

JO BV SL (input)
= N ': do notcom pute the leftSchurvectors;
\(=\mathrm{V}\) : com pute the leftSchurvectors.
\(J O B V S R\) (input)
\(=N\) ': do notcom pute the rightSchurvectors;
\(=\mathrm{V}\) : com pute the rightSchurvectors.
N (input) The order of the m atrices A , B , V SL, and V SR. N \(>=0\).

A (input/output)
O \(n\) entry, the first of the pair ofm atrioes whose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the general ized Schur form of A. N ote: to avoid overflow, the Frobenius norm of the \(m\) atrix A should be less than the overflow threshold.

LD A (input)
The leading dim ension ofA . LD A \(>=\max (1, \mathbb{N})\).
B (input/output)
O \(n\) entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the generalized Schur form of B. N ote: to avoid overflow, the Frobenius norm of the matrix B should be less than the overflow threshold.

LD B (input)
The leading dim ension ofB . LD B \(>=m\) ax \((1, N)\).

ALPHAR (output)
On exit, (ALPHAR ( ) + ALPHAI ( 1 *i) BETA ( \(\boldsymbol{\lambda}\) ) ,于1,...,N, will be the generalized eigenvalues.
ALPHAR ( \() ~+~ A L P H A I(\beth * i, ~ j 1, \ldots, N\) and BETA ( 7\(), 1, \ldots, N\) are the diagonals of the com plex Schur form ( \(\mathrm{A}, \mathrm{B}\) ) thatw ould result if the 2-by-2 diagonal blocks of the realSchur form of ( \(A, B\) ) w ere further reduced to triangular form using 2 łoy -2 com plex unitary transform ations. If A LPHAI( \(\mathcal{j})\) is zero, then the \(j\) th eigenvalue is real; if positive, then the jth and (j+1)-st eigenvahues are a com plex conjugate pair, w ith A LPH A I(j+1) negative.

N ote: the quotients \(A \operatorname{LPHAR}\) ( 1 ) BETA ( \()\) ) and A LPHAI ( ) , BETA ( \()\) m ay easily over-orunderflow, and BETA (ㄱ) m ay even be zero. Thus, the user should avoid naively computing the ratio alpha/beta. H ow ever, A LPH AR and A LPH A I w ill be alw ays less than and usually com parable w ith norm (A) in magnitude, and BETA alw ays less than and usually com parable \(w\) ith norm (B).

\section*{A LPH A I (output)}

See the description forA LPH A R .

\section*{BETA (output)}

See the description forA LPH A R .

VSL (input)
If JOBVSL = V',VSL willcontain the left Schur vectors. (See "Punpose", above.) N ot referenced if \(J O B V S L=N^{\prime}\).

LDVSL (input)
The leading dim ension of the \(m\) atrix VSL. LDVSL \(>=1\), and if \(\mathrm{OBVSL}=\mathrm{V}^{\prime}, \mathrm{LDVSL}>=\mathrm{N}\).

VSR (input)
If OB BVSR \(=V\) ',VSR willcontain the right Schur
vectors. (See "Puppose", above.) N ot referenced if \(J O B V S R=N^{\prime}\) 。

LDVSR (input)
The leading dim ension of the \(m\) atrix \(V\) SR.LD VSR \(>=\) 1 , and if OB B \(S R=V^{\prime}\) ', LD \(V S R>=N\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al

LDW ORK.

LDW ORK (input)
The dim ension of the array \(W\) ORK. LDW ORK \(>=\) \(\max (1,4 \star N)\). For good perform ance, LDW ORK must generally be larger. To com pute the optim alvalue of LDW ORK, call ILAENV to getblocksizes (for SGEQRF, SORM QR, and SORGQR .) Then com pute: NB-
M AX of the blocksizes for SGEQRF, SORM QR, and SORGQR The optim alLDW ORK is \(2 * N+N * \mathbb{N B + 1 )}\).

IfLD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK aray, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LD W ORK is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
= 0: successfiulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the i-th argum enthad an ille-
galvahue.
\(=1, \ldots, N\) : The \(\mathrm{Q} Z\) teration failed. ( \(\mathrm{A}, \mathrm{B}\) ) are
not in Schurform, butALPHAR ( \()\), ALPHAI( \()\), and
BETA ( 1 ) should be comect for \(\ddagger \mathbb{N} \mathrm{FO}+1, \ldots, N\). >
