A rightgeneralized eigenvector corresponding to a generalized eigenvalue \(w\) for pair ofm atrioes \((A, B)\) is a vector \(r\) such that ( \(A-w B\) ) \(r=0\). A left generalized eigenvector is a vectorlsuch thatl**H * (A -w B) \(=0\), where l**H is the conjugate-transpose of l.

N ote: this routine perform s "fullbalancing" on A and B see "FurtherD etails", below .

\section*{ARGUMENTS}

JO BVL (input)
\(=\mathrm{N}\) ': do notcom pute the leftgeneralized eigenvectors;
\(=\mathrm{V}\) ': com pute the leftgeneralized eigenvectors.

JO BVR (input)
\(=\mathrm{N}\) : : do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvectors.

N (input) The order of the m atriges \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and \(\mathrm{VR} . \mathrm{N}>=\) 0.

A (input/output)
O n entry, the first of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents w ill have been destroyed. Fora description of the contents of A on exit, see "FurtherD etails", below .)

LD A (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).

B (input/output)
O n entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents will have been destroyed. Fora description of the contents of B on exit, see "FurtherD etails", below .)

LD B (input)
The leading dim ension ofB. LD \(B>=m a x(1, N)\).

\section*{ALPHAR (output)}

On exit, (ALPHAR ( ) + ALPHAI ( 1 *i) BETA ( 1 ), \(j 1, \ldots, N\), w ill be the generalized eigenvalues. IfA LPH A I( \(\mathfrak{j}\) ) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and ( \(j+1\) )-st eigenvahues are a com plex conjugate pair, w ith A LPH A I (j+1) negative.

Note: the quotients ALPHAR ( 7 ) BETA ( \()\) and A LPHAI( ) BETA ( \()\) m ay easily over-orunderflow, and BETA ( 7 ) m ay even be zero. Thus, the user should avoid naively computing the ratio alpha/beta. H ow ever, A LPH AR and A LPHAI w ill be
alw ays less than and usually com parable w ith norm (A) in magnitude, and BETA alw ays less than and usually com parable w ith norm (B).

\section*{A LPH A I (output)}

See the description of A LPH AR .

BETA (output)
See the description of A LPH AR .
VL (output)
If \(30 \mathrm{BVL}=\mathrm{V}\) ', the left generalized eigenvectors.
(See "Purpose", above.) Realeigenvectors take one colum n, com plex take tw o colum ns, the first for the realpart and the second for the im aginary part. Complex eigenvectors correspond to an eigenvalue w ith posilive im aginary part. Each eigenvectorw illbe scaled so the largest com ponent w ill have abs (realpart) + abs(im ag. part) \(=1\), *except* that for eigenvalues \(w\) ith alpha=beta=0, a zero vectorw illbe retumed as the comesponding eigenvector. N ot referenced if JOBVL = N '.

LDVL (input)
The leading dim ension of the \(m\) atrix \(\mathrm{V} \mathrm{L} . \mathrm{LD} \mathrm{VL}>=1\), and if \(\mathrm{OOBVL}=\mathrm{V}^{\prime}, \mathrm{LDVL}>=\mathrm{N}\) 。

\section*{VR (output)}

If \(\mathrm{OB} \mathrm{BR}=\mathrm{V}\) ', the right generalized eigenvectors. (See "Purpose", above.) Realeigenvectors take one colum n, com plex take two colum ns, the first for the real partand the second for the im aginary part. C om plex eigenvectors correspond to an eigenvalue \(w\) ith positive im aginary part. Each eigenvectorw illbe scaled so the largest com ponent w ill have abs(real part) + abs(im ag. part) \(=1\), *except* that for eigenvalues \(w\) ith alpha=beta=0, a zero vectorw illbe retumed as the corresponding eigenvector. N otreferenced if JOBVR = N'.

LDVR (input)
The leading dim ension of the \(m\) atrix \(V R\).LD \(V R>=1\), and if \(\mathrm{OBVR}=\mathrm{V}^{\prime}, \mathrm{LDVR}>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)

The dim ension of the amay W ORK. LDW ORK >= \(m\) ax \((1,8 \star N)\). For good perform ance, LDW ORK m ust generally be larger. To com pute the optim alvalue of LDW ORK, call HAENV to getblocksizes (for SGEQRF, SORMQR, and SORGQR .) Then com pute: NB -
\(M A X\) of the blocksizes for \(S G E Q R F\), \(S O R M Q R\), and SORGQR; The optim alLDW ORK is: \(2{ }^{*} \mathrm{~N}+\mathrm{MAX}\left(6^{*} \mathrm{~N}\right.\), \(N\) * (NB+1)).

IfLDW ORK \(=-1\), then a w ork.space query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LD W ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the \(i-\) th argum ent had an illegalvalue.
\(=1, \ldots, N\) : The Q Z iteration failed. N o eigenvec-
tors have been calculated, but ALPHAR (1),
A LPHAI( \()\), and BETA ( 1 ) should be correct for
\(\dot{F} \mathbb{N}\) FO \(+1, \ldots, N .>N\) : errors thatusually indi-
cate LA PA CK problem s:
\(=\mathrm{N}+1\) : error retum from SGGBAL
\(=\mathrm{N}+2\) : error retum from SGEQRF
\(=N+3\) : error retum from \(S O R M Q R\)
\(=\mathrm{N}+4\) : error retum from \(S O R G Q R\)
\(=\mathrm{N}+5\) : error retum from SGGHRD
\(=\mathrm{N}+6\) : error retum from \(\mathrm{SH} G E Q Z\) (other than failed
iteration) \(=\mathrm{N}+7\) : error retum from STGEVC
\(=\mathrm{N}+8\) : enor retum from SGGBAK (com puting VL )
\(=\mathrm{N}+9\) : error retum from SGGBAK (com puting \(V R\) )
\(=\mathrm{N}+10\) : enor retum from SLA SC L (various calls)

\section*{FURTHER DETAILS}

Balancing

This driver calls SG G B A L to both perm ute and scale row s and colum ns of \(A\) and \(B\). The perm utations \(P L\) and \(P R\) are chosen so that \(\mathrm{PL}{ }^{*} \mathrm{~A} * P R\) and \(P L * B * R\) w illbe upper triangular except for the diagonal blocksA (i:ji:j) and B (i:ji:j) w ith i and jas close together as possible. The diagonal scaling \(m\) atrices DL and DR are chosen so that the pair \(D L * P L * A * P R * D R, D L * P L * B * P R * D R\) have elem ents close to one (except for the elem ents that start out zero.)

A fter the eigenvalues and eigenvectors of the balanced
\(m\) atrices have been com puted, SG G BA K transform s the eigenvectors back to what they w ould have been (in perfect arithm etic) ifthey had notbeen balanced.

Contents of \(A\) and \(B\) on Exit

If any eigenvectors are com puted (either \(J O B V L=V\) ' or JO BVR=V' or both), then on exit the arrays \(A\) and \(B\) w ill contain the realSchur form [ \({ }^{\star}\) ] of the "balanced" versions of A and B. If no eigenvectors are com puted, then only the diagonalblocks w illbe comect.
[*] See SH GEQ Z, SGEGS, or read the book "M atrix Com putations",
by G olub \& van Loan, pub. by Johns H opkins U .Press.

\section*{PURPOSE}
dgehrd reduces a realgeneralm atrix A to upper \(H\) essenberg form \(H\) by an orthogonalsim ilarity transform ation: Q '* A * \(\mathrm{Q}=\mathrm{H}\).

\section*{ARGUMENTS}

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
ㅍO (input)
It is assum ed that A is already upper triangular in row s and colum ns 1: \(\mathbb{T} 0-1\) and \(\mathbb{H}\) I+1:N. \(\mathbb{H} 0\) and IH I are norm ally setby a previous call to SG EBA L; otherw ise they should be set to 1 and \(N\) respectively. See FurtherD etails.

IH I (input)
See the description of IIO .
A (input/output)
O \(n\) entry, the N -by -N generalm atrix to be reduced.
O n exit, the upper triangle and the firstsubdiagonalofA are overw ritten \(w\) ith the upper H essenberg \(m\) atrix \(H\), and the elem ents below the first subdiagonal, w ith the array TAU, represent the orthogonal \(m\) atrix \(Q\) as a productof elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

TAU (output)
The scalar factors of the elem entary reflectors (see Further Details). Elem ents 1:THO-1 and IH IN -1 of TA U are setto zero.

W ORK \(\mathbb{N}\) (w orkspace)

On exit, if \(\mathbb{N F O}=0, W O R K \mathbb{N}\) (1) retums the optim allW ORK \(\mathbb{N}\).

LW ORK \(\mathbb{N}\) (input)
The length of the array \(W O R K \mathbb{N}\). LW ORK \(\mathbb{N}>=\) \(\max (1, \mathbb{N})\). For optim um perform ance LW ORK \(\mathbb{N}>=\) \(\mathrm{N} * \mathrm{NB}\), where NB is the optim alblocksize.

If LW ORK \(\mathbb{N}=-1\), then a workspace query is assum ed; the routine only calculates the optim al size of the \(W\) ORK \(\mathbb{N}\) array, retums this value as the firstentry of the \(W\) ORK \(\mathbb{N}\) array, and no error \(m\) essage related to LW ORK \(\mathbb{N}\) is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a productof (hi-ib) ele\(m\) entary reflectors
\[
Q=H \text { ( } 0 \text { ) H (ib+1) . . H (ihi-1) . }
\]

Each H (i) has the form
\[
H(i)=I-\tan * V^{*} V^{\prime}
\]
where tau is a real scalar, and \(v\) is a realvectorw ith \(\mathrm{v}(1: i)=0, v(i+1)=1\) and \(v\) (init 1 n\()=0\); \(\mathrm{v}(\mathrm{i}+2\) : ihi) is stored on exitin A (i+2:ihi,i), and tau in TA U (i).

The contents of A are illustrated by the follow ing exam ple, w ith \(\mathrm{n}=7\), il = \(=2\) and ihi= 6:
```

on entry, on exit,

```
(a a a a a a a) (a a h h h h a) ( a a a a a a) ( a h h h ha) ( a a a a a a) ( \(h\) h h h h h ) ( a a a a a a) ( v2 h \(h \mathrm{~h} h \mathrm{~h})(\mathrm{a}\) a a a a a) ( v2 v3 h h h h ) ( a a a a a a) ( v2 v3 v4 h h h) (
a) (

> a)
\(w\) here a denotes an elem ent of the original \(m\) atrix \(A, h\) denotes a \(m\) odified elem ent of the upper \(H\) essenberg \(m\) atrix \(H\), and videnotes an elem ent of the vector defining \(H\) (i).

\#include <sunperfh>
void dgels (char, int, int, int, double*, int, double*, int, int*);
void dgels_64 (char, long, long, long, double*, long, double^, long, long*);

\section*{PURPOSE}
dgels solves overdeterm ined or underdeterm ined real linear system \(s\) involving an \(M\) boy -N matrix \(A\), or its transpose, using a Q R orLQ factorization ofA. It is assum ed that A has full rank.

The follow ing options are provided:
1. IfTRAN \(S=N\) 'and \(m>=n\) : find the least squares solution of
an overdeterm ined system , i.e., solve the least squares problem
\[
m \text { inim ize }\|\mathrm{B}-\mathrm{A} * \mathrm{X}\| .
\]
2. IfTRAN \(S=N\) 'and \(m<n\) : find the \(m\) inim um norm solution of an underdeterm ined system \(A * X=B\).
3. IfTRANS = T'and \(m>=n\) : find them inim um norm solution of
an undeterm ined system \(A * * T * X=B\).
4. IfTRANS = \(T\) 'and \(m<n\) : find the least squares solution of
an overdeterm ined system , ie., solve the least squares problem
\[
\mathrm{m} \text { inim ize }\|\mathrm{B}-\mathrm{A} * * \mathrm{~T} * \mathrm{X}\| .
\]

Several right hand side vectors \(b\) and solution vectors \(x\) can be handled in a single call; they are stored as the colum ns of the M -by-NRHS righthand side m atrix B and the \(N\)-by-NRHS solution \(m\) atrix \(X\).

\section*{ARGUMENTS}

TRANSA (input)
\(=N^{\prime}\) : the linearsystem involves A;
\(=T\) ': the linear system involves \(A * * T\).

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input) The num ber of row s of the matrix A. M >=0.

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrioes B and X .NRH S \(>=0\).
A (input/output)
On entry, the M -by -N m atrix A. On exit, if \(\mathrm{M}>=\) \(\mathrm{N}, \mathrm{A}\) is overw ritten by details of its Q R factorization as retumed by SGEQRF; if \(M<N, A\) is overw rilten by details of its LQ factorization as retumed by SGELQF.

LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

B (input/output)
O n entry, the \(m\) atrix \(B\) of righthand side vectors,
stored colum nw ise; B is M byy-NRHS ifTRANSA = N',
orN boy-NRHS ifTRANSA = T'. On exit, B is
overw rilten by the solution vectors, stored colum nw ise: ifTRAN SA \(=\mathrm{N}\) 'and \(\mathrm{m}>=\mathrm{n}\), row s 1 to \(n\) ofB contain the least squares solution vectors; the residual.sum ofsquares for the solution in each colum \(n\) is given by the sum of squares of ele\(m\) ents \(N+1\) to \(M\) in thatcolumn; ifTRANSA \(=N\) 'and \(m<n\), row \(s 1\) to \(N\) ofB contain them inim um norm solution vectors; ifTRANSA \(=T\) 'and \(m>=n\), row \(s\) 1 to M ofB contain them inim um norm solution vectors; ifTRANSA \(=T\) 'and \(m<n\), row 1 to \(M\) of \(B\) contain the least squares solution vectors; the residual.sum of squares forthe solution in each colum \(n\) is given by the sum of squares of elem ents \(M+1\) to \(N\) in that colum \(n\).

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) M AX ( \(1, \mathrm{M}, N\) ) 。

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (output)
The dim ension of the amay W ORK. LDW ORK >= \(\max (\)
1, \(\mathrm{M} N+\max (\mathrm{M} N, \mathrm{NRHS})\) ). Foroptim alperfor
\(m\) ance, LDW ORK \(>=\max (1, M N+\max (M N, N R H S) * N B\)
). where \(M N=m\) in \(M N\) ) and \(N B\) is the optim um
block size.

IfLD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LD W ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an ille-
galvalue

REAL (8),D IM ENSION (:) ::S,W ORK
REAL (8), D IM ENSION (:,:) ::A,B

\section*{C INTERFACE}
\#include <sunperfh>
void dgelsd (intm , intn, intnrhs, double *a, int lda, double *b, int ldb, double *s, double rcond, int *rank, int*info);
void dgelsd_64 (long m, long n, long nrhs, double *a, long lda, double *b, long ldb, double *s, double roond, long *rank, long *info);

\section*{PURPOSE}
dgelsd com putes the \(m\) inim um -norm solution to a real linear least squares problem :
\(m\) inim ize 2 -nom (|b-A *x )
using the singularvalue decom position (SVD ) ofA.A is an M -by-N m atrix which \(m\) ay be rank-deficient.

Several righthand side vectors b and solution vectors \(x\) can be handled in a single call; they are stored as the colum ns of the M -by-NRH S righthand sidem atrix \(B\) and the \(N\) by-NRH S solution \(m\) atrix \(X\).

The problem is solved in three steps:
(1) Reduce the coefficientm atrix A to bidiagonal form w th H ouseholder transform ations, reducing the original problem into a "bidiagonal least squares problem " (BLS)
(2) Solve the BLS using a divide and conquer approach.
(3) A pply back all the \(H\) ouseholder tranform ations to solve the original least squares problem .

The effective rank of A is determ ined by treating as zero those singular values which are less than RCOND tim es the largestsingularvalue.

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) ithout guard digits w hich subtract like the \(C\) ray

X - M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines \(w\) thout guard digits, butw e know of none.

\section*{ARGUMENTS}

M (input) The num ber of row sofA. \(\mathrm{M}>=0\).
N (input) The num ber of colum nsofA . \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrices \(B\) and X.NRHS \(>=0\).
A (input/output)
On entry, the M -by -N m atrixA. On exit, A has been destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, M)\).

B (input/output)
On entry, the M -by \(-N\) RH \(S\) righthand side \(m\) atrix \(B\).
On exit, B is overw ritten by the \(N\) by-NRHS solution \(m\) atrix \(X\). Ifm \(>=n\) and RANK \(=n\), the residual sum-of-squares for the solution in the \(i\)-th colum \(n\) is given by the sum of squares of elem ents \(\mathrm{n}+1 \mathrm{~m}\) in thatcolum n .

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, m a x(M, N))\).

S (output)
The singularvalues of A in decreasing order. The condition number of \(A\) in the 2 -norm \(=\) \(S(1) / S(m\) in \((m, n))\).

RCOND (input)
RCOND is used to determ ine the effective rank of A. Singularvalues \(S\) (i) <= RCOND *S (1) are treated as zero. IfRCOND \(<0, \mathrm{~m}\) achine precision is used instead.

RANK (output)
The effective rank of A, i.e., the num ber of singular values w hich are greater than RCO N D *S (1).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK.LW ORK \(>=1\). The exact \(m\) inim um am ount of w orkspace needed depends on M , N and NRHS. As long as LW ORK is at least \(12 * \mathrm{~N}+2 * \mathrm{~N} * \mathrm{SM} \mathrm{LSIZ}+8 * \mathrm{~N} * \mathrm{NLVL}+\mathrm{N} * \mathrm{NRHS}\) * (SMLSLZ +1 ) \({ }^{* *} 2\), ifM is greater than orequal to \(N\) or \(12 * \mathrm{M}+2 * \mathrm{M} * \mathrm{SMLSIZ}+8 * \mathrm{M} * \mathrm{NLVL}+\mathrm{M}\) *NRHS + (SM LSIZ + 1) **2, ifM is less than N , the code will execute correctly. SM LSIZ is retumed by ILA ENV and is equal to the \(m\) axim um size of the subproblems at the bottom of the com putation tree (usually about 25) , and \(\mathrm{NLVL}=\mathbb{N} T\left(\mathrm{LOG} \_2\right.\) ( \(\mathrm{M} \mathbb{N}(\mathrm{M}, \mathbb{N}\) )/(SM LSIZ+1) ) ) + 1 Forgood penform ance, LW ORK should generally be larger.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)

\(M \mathbb{N} M N=M \mathbb{N}(M, N)\) 。

IN FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvahue.
\(>0\) : the algorithm forcom puting the SVD failed to converge; if \(\mathbb{N} F O=\) i, ioff-diagonalelem ents of an interm ediate bidiagonalform did not converge to zero.

void dgelsx_64 (long m, long n, long nrhs, double *a, long
lda, double *b, long ldb, long *jívot, double
rcond, long *irank, long *info);

\section*{PURPOSE}
dgelsx routine is deprecated and has been replaced by routine SGELSY .

SG ELSX com putes them inim um norm solution to a real linear
least squares problem :
\(m\) inim ize \(\|A * X-B\|\)
using a com plete orthogonal factorization of A. A is an \(M-\) by-N m atrix w hich \(m\) ay be rank-deficient.

Several right hand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M boy-N RHS righthand sidem atrix B and the N boy-N R H S solution \(m\) atrix X .

The routine first com putes a Q R factorization with colum \(n\) pivoting:
\[
A * P=Q *[R 11 R 12]
\]
[ 0 R22]
w ith R11 defined as the largest leading subm atrix whose estim ated condition num ber is less than \(1 \notin C O N D\). The order ofR 11, RANK, is the effective rank ofA.

Then, R 22 is considered to be negligible, and R 12 is annihilated by orthogonal transform ations from the right, arriving at the com plete orthogonal factorization:
\(A * P=Q *\left[\begin{array}{lll}11 & 0\end{array}\right] * Z\)
\(\left[\begin{array}{ll}0 & 0\end{array}\right]\)
Them inim um norm solution is then
\(\mathrm{X}=\mathrm{P} * \mathrm{Z}^{\prime}\left[\operatorname{inv}(\mathrm{T} 11) \star \mathrm{Q} 1^{*} \mathrm{~B}\right]\)
where Q 1 consists of the firstRA K colum ns of Q .

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of collm ns of the m atrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns ofm atrices \(B\) and \(X\).NRH \(S>=0\). A (input/output)

On entry, the M -by -N m atrix A. On exit, A has been overw rilten by details of its complete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, M)\).

B (input/output)
On entry, the M by -N RH S righthand side \(m\) atrix \(B\).
On exit, the N -by-N RH S solution \(m\) atrix X . Ifm >= \(n\) and \(\mathbb{R A N K}=\mathrm{n}\), the residual sum -of-squares for the solution in the \(i\)-th colum \(n\) is given by the sum of squares of elem ents \(N+1 \mathrm{M}\) in that colum \(n\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, M, N)\).

JPIVOT (input/output)
On entry, if \(\mathbb{P} \mathbb{I V O T}\) (i) ne.0, the i-th colum n of \(A\) is an initial colum \(n\), otherw ise it is a free colum \(n\). Before the \(Q R\) factorization of \(A\), all initial colum ns are perm uted to the leading positions; only the rem aining free colum ns are m oved as a result of colum \(n\) pivoting during the factorization. On exit, if JPIV OT \((i)=k\), then the \(i\)-th colum \(n\) of A *P was the \(k\)-th collm \(n\) of A.

RCOND (input)
RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest leading triangular subm atrix R 11 in the \(Q R\) factorization w ith pivoting ofA , whose estim ated condition num ber \(<1\) RCOND.

IRANK (output)
The effective rank ofA, ie., the order of the subm atrix R11. This is the sam e as the order of the subm atrix T11 in the com plete orthogonal factorization of A.

W ORK (w orkspace)
\((m\) ax \((m\) in \(M, N)+3 * N, 2 * m\) in \((M, N)+N R H S))\), INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue

void dgelsy (intm , intn, intnrhs, double *a, int lda, dou-
ble *b, int ldb, int * jpvt, double roond, int
*rank, int*info);
void dgelsy_64 (long m, long n, long nihs, double *a, long lda, double *b, long ldb, long * pivt, double rcond, long *rank, long *info);

\section*{PURPOSE}
dgelsy com putes the \(m\) in'm um -norm solution to a real linear least squares problem :
\(m\) inim ize \(\|A * X-B\|\)
using a com plete orthogonal factorization ofA. A is an M -by-N \(m\) atrix which \(m\) ay be rank-deficient.

Several righthand side vectors b and solution vectors \(x\) can be handled in a single call; they are stored as the colum ns of the M by-NRHS righthand side m atrix \(B\) and the \(N\) by-NRHS solution \(m\) atrix \(X\).

The routine firstcom putes \(a Q R\) factorization \(w\) th \(c o l u m n\) pivoting:
\(A * P=Q *[R 11 R 12]\)
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix whose estim ated condition num ber is less than 1RCOND. The order ofR11,RANK, is the effective rank ofA.

Then, R 22 is considered to be negligible, and R 12 is anninilated by orthogonal transform ations from the right, aniving at the com plete orthogonal factorization:
\[
\begin{gathered}
A * P=Q *[T 110] * Z \\
{\left[\begin{array}{ll}
0 & 0
\end{array}\right]}
\end{gathered}
\]

Them inim um norm solution is then
\(\mathrm{X}=\mathrm{P} * \mathrm{Z}^{\prime}[\operatorname{inv}(\mathrm{T} 11) * \mathrm{Q} 1\) *B]
[ 0 ]
where Q 1 consists of the firstRANK colum ns of Q .

This routine is basically identical to the original xG ELSX except three differences:
o The call to the subroutine xGEQPF has been substituted by the
the call to the subroutine xG EQP3.This subroutine is a B las-3
version of the \(Q R\) factorization \(w\) ith colum \(n\) pivoting.
0 M atrix B (the righthand side) is updated w ith B las -3 . - The perm utation ofm atrix B (the right hand side) is fasterand m ore sim ple.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of collm ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns ofm atrices B and X.NRHS \(>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, A has been overw rilten by details of its com plete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the M \(-b y-N\) RH S righthand side m atrix B . On exit, the N -by-N RH S solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= max (1, M N \()\).

JPVT (input/output)
On entry, if JPV T (i) ne. 0, the i-th collm n of A is perm uted to the frontof \(P\), otherw ise colum \(n\) i is a free colum n. On exit, if JPV T (i) = k, then the \(i\)-th colum \(n\) of AP \(w\) as the \(k\)-th colum \(n\) of \(A\).

RCOND (input)
RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest
leading triangularsubm atrix R 11 in the Q R factorization w ith pivoting ofA , w hose estim ated condition num ber<1/RCOND.

RANK (output)
The effective rank ofA, ie., the order of the subm atrix R11. This is the sam e as the order of the subm atrix T11 in the com plete orthogonal factorization of A.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the aray W ORK. The unblocked strategy requires that: LW ORK \(>=\mathrm{MAX}(\mathrm{MN}+3 * \mathrm{~N}+1\), \(2 * M N+N R H S)\), where \(M N=m\) in ( \(M, N\) ). The block algorithm requires that: LWORK >= MAX ( \(\mathrm{M} N+2 * N+N B *(\mathbb{N}+1), 2 * \mathrm{MN}+\mathrm{NB} * \mathrm{NRHS}\) ), where NB is an upper bound on the blocksize retumed by HAENV for the routines SGEQP3, STZRZF, STZRQF, SORMQR, and SORM RZ .

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) If \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue.

void dgem m _64 (chartransa, chartransb, long m, long n, long k , double alpha, double *a, long lda, double *b, long lalb, double beta, double * c , long ldc);

\section*{PURPOSE}
dgem \(m\) perform s one of the \(m\) atrix \(-m\) atrix operations \(C:=\) alpha*op (A )*op (B) + beta*C where op (X ) is one of
\[
o p(X)=X \quad \text { or } o p(X)=X^{\prime},
\]
alpha and beta are scalars, and \(A, B\) and \(C\) are \(m\) atrices, with op (A ) an m by kmatrix, op (B) a k by \(n m a t r i x\) and \(C\) an \(m\) by \(n m\) atrix.

\section*{ARGUMENTS}

TRANSA (input)
O n entry, TRANSA specifies the form of op (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N\) 'or \(h^{\prime}, ~ o p(A)=A\).

TRANSA = T'ort', op (A ) = A'.

TRANSA = C 'or \(C^{\prime}\), op (A) \(=\) A '.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

TRANSB (input)
O n entry, TRAN SB specifies the form ofop (B) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSB = N 'or h', op (B) = B.
TRANSB \(=T\) 'or \(\mathrm{t}^{\prime}, \mathrm{op}(\mathrm{B})=\mathrm{B}\) '.
TRANSB = C'or \(\mathrm{t}^{\prime}, \mathrm{op}(\mathrm{B})=\mathrm{B}\) '.
U nchanged on exit.
TRANSB is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input)
O n entry, M specifies the num ber of row s of the matrix op (A ) and of the matrix C.M m ust be at least zero. U nchanged on exit.
N (input)
O n entry, N specifies the num ber of colum ns of the \(m\) atrix \(o p(B)\) and the num ber of colum ns of them atrix C.N m ustbe at least zero. U nchanged on exit.

K (input)
On entry, \(K\) specifies the num berof colum ns of the \(m\) atrix \(o p\) ( \(A\) ) and the num berof row s of the \(m\) atrix op ( B ). K must be at least zero. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
D OUBLE PRECISION amay ofD \(\mathbb{I M} E N S I O N(L D A, k a)\),
where ka isk when TRANSA = N 'or h', and is
\(m\) otherw ise. Before entry \(w\) ith TRANSA \(=N\) ' or
\(h\) ', the leading \(m\) by \(k\) partof the aray \(A\)
\(m\) ustcontain the \(m\) atrix \(A\), otherw ise the leading
\(k\) by \(m\) part of the array A mustcontain the \(m\) atrix A. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA \(=N\) 'or \(h\) 'then LDA \(>=\max (1, m)\), otherw ise LDA \(>=\max (1, k)\). U nchanged on exit.

B (input)
DOUBLE PRECISION amay ofD \(\mathbb{I M}\) ENSION (LDB, kb ),
w here kb isn when TRANSB \(=\mathrm{N}\) 'or h ', and is
k otherw ise. Before entry w ith TRANSB \(=\mathrm{N}^{\prime}\) or
h ', the leading k by n part of the aray B \(m\) ust contain the \(m\) atrix \(B\), otherw ise the leading \(n\) by \(k\) partofthe array B mustcontain the \(m\) atrix \(B\). U nchanged on exit.

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. W hen TRANSB \(=N^{\prime}\) 'or h'then LD B \(>=m a x(1, k)\), otherw ise LD \(B>=m a x(1, n)\). U nchanged on exit.
BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need notbe set on input. U nchanged on exit.

C (input/output)
D OUBLE PREC ISION amay ofD \(\mathbb{I M}\) ENSION (LD \(\mathrm{C}, \mathrm{n}\) ).
Before entry, the leading \(m\) by \(n\) partof the array \(\mathrm{C} m\) ust contain the m atrix C , exœept when beta is zero, in which case \(C\) need notbe set on entry. On exit, the array \(C\) is overw rilten by the \(m\) by \(n m a t r i x ~(a l p h a * o p(A) * o p(B)+\) beta*C).

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program . LD C \(>=\max (1, m)\). U nchanged on exit.

\section*{PURPOSE}
dgeqlf com putes a Q L factorization of a real M -by -N m atrix \(A: A=Q\) * .

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, if \(m>=\) \(n\), the lower triangle of the subanay A ( \(m\) \(\mathrm{n}+1 \mathrm{~m}, 1 \mathrm{n}\) ) contains the N by N low er triangular \(m\) atrix \(L\); ifm <= \(n\), the elem ents on and below the ( \(n-m\) )-th superdiagonalcontain the M -by -N lower trapezoidalm atrix \(L\); the rem aining elem ents, w ith the array TAU, represent the orthogonal matrix \(Q\) as a product of elem entary reflectors (see Further D etails).

LD A (input)
The leading dim ension of the aray A. LDA >= max (1,M).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the array \(W\) ORK. LDW ORK >= \(m\) ax \((1, N)\). Foroptim um perform ance LD \(W\) ORK \(>=N * N B\), where NB is the optim alblocksize.

IfLDW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(k) \ldots H(2) H(1), \text { where } k=m \text { in }(m, n) .
\]

Each \(H\) (i) has the form
\[
\mathrm{H}(\mathrm{i})=\mathrm{I}-\tan * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
\]
where tau is a real scalar, and \(v\) is a realvectorw ith \(v(m-k+i+1 m)=0\) and \(v(m-k+i)=1\); \(v(1 m-k+i-1)\) is stored on exitin A ( \(1 \mathrm{~m}-\mathrm{k}+\mathrm{i}-1, \mathrm{n}-\mathrm{k}+\mathrm{i}\) ), and tau in TAU (i).

\section*{PURPOSE}
dgegp3 com putes a Q R factorization \(w\) th colum \(n\) pivoting of a \(m\) atrix \(A: A * P=Q * R\) using Level3 BLA \(S\).

\section*{ARGUMENTS}
\(M\) (input) The num ber of row s of the \(m\) atrix \(A . M>=0\).

N (input) The num ber of colum ns of them atrix \(A . N>=0\).

A (input/output)
O n entry, the M -by-N m atrix A. On exit, the upper triangle of the aray contains the \(m\) in \((M, N)\)-by \(-N\) upper trapezoidalm atrix R ; the elem ents below the diagonal, together w ith the array TA \(U\), represent the orthogonalm atrix \(Q\) as a product of \(m\) in \((M, N)\) elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, M)\).

JPVT (input/output)
On entry, if JPV T (J) ne. 0 , the J-th colum n of \(A\) is perm uted to the frontofA *P (a leading colum \(n\) ); if \(\operatorname{JPV} T(J)=0\), the \(J\) th column of \(A\) is a free column. On exit, if \(\mathbb{P V V T}(J)=K\), then the \(J\) th colum \(n\) of \(A\) * w as the the K -th colum \(n\) of \(A\).

TAU (output)
The scalar factors of the elem entary reflectors.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al

LW ORK.

LW ORK (input)
The din ension of the anray \(W\) ORK. LW ORK \(>=3 * N+1\). For optim al perform ance LW ORK \(>=2 * N+(N+1) * N B\), w here NB is the optim alblocksize.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit.
< 0 : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(m, n) .
\]

Each H (i) has the form
H (i) \(=I-\tan * V^{*} V^{\prime}\)
w here tau is a real/com plex scalar, and \(v\) is a real/com plex vectorw th \(v(1: i-1)=0\) and \(v(i)=1 ; v(i+1 \mathrm{~m})\) is stored on exitin A ( \(+1+1 \mathrm{~m}, \mathrm{i})\), and tau in TAU (i).

\#include < sunperfh>
void dgeqrf(intm, intn, double *a, int lda, double *tau, int*info);
void dgeqrif_ 64 (long m , long n, double *a, long lda, double *tau, long *info);

\section*{PURPOSE}
dgeqrf com putes \(a \mathrm{QR}\) factorization of a real M -by-N matrix \(A: A=Q\) * .

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, the ele\(m\) ents on and above the diagonal of the array contain the \(m\) in \((M, N)\)-by \(-N\) uppertrapezoidalm atrix \(R\) \((R\) is upper triangular if \(m>=n\) ); the elem ents below the diagonal, w ith the aray TAU, represent the orthogonal \(m\) atrix \(Q\) as a productofm in \((m, n\) ) elem entary reflectors (see FurtherD etails).

LDA (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the amay \(W\) ORK. LDW ORK >= \(m\) ax \((1, N)\). Foroptim um perform ance LDW ORK \(>=N * N B\), w here NB is the optim alblocksize.

If LD W ORK = -1 , then aw orkspace query is assum ed;
the routine only calculates the optim al size of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\(Q=H(1) H(2) \ldots H(k)\), where \(k=m\) in \((m, n)\).
Each \(H\) (i) has the form
H (i) \(=I-\tan * V^{*} V^{\prime}\)
where tau is a real scalar, and \(v\) is a realvectorw ith
\(\mathrm{v}(1: \mathrm{i}-1)=0\) and \(\mathrm{v}(\mathrm{i})=1\); \(\mathrm{v}(\mathrm{i}+1 \mathrm{~m})\) is stored on exit in A ( \(i+1 m, i)\), and tau in TAU (i).

void dger_64 (long m, long n, double alpha, double *x, long incx, double *y, long incy, double *a, long lda);

\section*{PURPOSE}
dgerperform s the rank 1 operation \(A:=a \prod h a^{\star} x^{\star} y^{\prime}+A\), \(w\) here alpha is a scalar, \(x\) is an \(m\) elem entvector, \(y\) is an \(n\) elem entvector and \(A\) is an \(m\) by \(n m\) atrix.

\section*{ARGUMENTS}

M (input)
On entry, M specifies the num ber of rows of the \(m\) atrix \(A . M>=0\). U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
\((1+(m-1) \star a b s(\mathbb{N C X}))\). Before entry, the increm ented array \(X \mathrm{~m}\) ust contain them elem ent vectorx. U nchanged on exit.
\(\mathbb{N} C X\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents of \(\mathrm{X} . \mathbb{N} C X<>0\). U nchanged on exit.

Y (input)
\((1+(n-1) \star \operatorname{abs}(\mathbb{N} C Y))\). B efore entry, the increm ented array \(Y \mathrm{~m}\) ust contain the \(n\) elem ent vectory. U nchanged on exit.
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(. \mathbb{N} C Y<>0\). U nchanged on exit.

A (input/output)

Before entry, the leading \(m\) by \(n\) part of the anray
A must contain the matrix ofcoefficients. On exit, A is overw rilten by the updated \(m\) atrix.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program . LD A \(>=\) \(\max (1, m)\). U nchanged on exit.

\section*{PURPOSE}
dgerfs im proves the com puted solution to a system of linear equations and provides errorbounds and backw ard erroresti\(m\) ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system of equations:
\(=N\) ': A * \(\mathrm{X}=\mathrm{B} \quad\) ( o transpose)
\(=T\) ': A ** T * \(\mathrm{X}=\mathrm{B}\) ( T ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose \(=\mathrm{T}\) ranspose)

TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

N (input) The order of the matrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS >=0.

A (input) The originalN -by N m atrix A.

\section*{LD A (input)}

The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{AF (input)}

The factors L and U from the factorization \(\mathrm{A}=\) \(\mathrm{P} * \mathrm{~L} * \mathrm{U}\) as com puted by SGETRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, \mathbb{N})\).
\(\mathbb{P I V O T}\) (input)
The pivotindioes from SGETRF ; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P}\) IV OT (i).
\(B\) (input) The righthand side m atrix \(B\).
LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SGETRS. On exit, the im proved solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the array X . LD X >= \(\max (1, \mathbb{N})\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

BERR (output)
The com ponentw ise relative backw ard error of each solution vector X (j) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension \((3 * N)\)

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue

\# include <sunperfh>
void dgesdd (char jobz, intm, intn, double *a, int lda, double *s, double *u, int ldu, double *vt, int ldvt, int *info);
void dgesdd_64 (char jobz, long \(m\), long \(n\), double *a, long lda, double *s, double *u, long ldu, double *vt, long ldvt, long *info);

\section*{PURPOSE}
dgesdd com putes the singular value decom position (SVD ) of a real M -by -N m atrix A , optionally com puting the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm .

The SVD isw ritten
\(=U * S I G M A *\) transpose \((N)\)
where SIG M A is an \(M\) boy \(-\mathrm{N} m\) atrix which is zero except for its \(m\) in \((m, n)\) diagonal elem ents, \(U\) is an \(M\) boy \(-M\) orthogonal m atrix, and V is an N -by N orthogonalm atrix. The diagonal elem ents of SIGM A are the singular values ofA; they are realand non-negative, and are retumed in descending order. The firstm in ( \(m, n\) ) colum ns of \(U\) and \(V\) are the left and right singular vectors of \(A\).

N ote that the routine retums \(\mathrm{V} \mathrm{T}=\mathrm{V}\) ** T , not V .
The divide and conqueralgorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary m achines w thout guard digits w hich subtract like the C ray X M P , C ray Y M P , C ray C-90, orC ray-2. Itcould conceivably fail on hexadecim al or decim al \(m\) achines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}

JOBZ (input)
Specifies options for com puting allorpart of the matrix U :
= A': allm colum ns of U and all N row sof \(\mathrm{V} * * \mathrm{~T}\) are retumed in the amays \(U\) and \(V T ;=S\) : the firstm in \((M, N)\) colum nsof \(U\) and the firstm in \(M, N\) ) row \(S\) of \(V * * T\) are retumed in the amays \(U\) and \(V T\); \(=\mathrm{O}^{\prime}\) : IfM \(>=\mathrm{N}\), the first N columns of U are overw ritten on the array \(A\) and all row sofV \(* * T\) are retumed in the anay VT; otherw ise, all colum ns of \(U\) are retumed in the array \(U\) and the firstM row sofV **T are overw rilten in the aray VT ; \(=\mathrm{N}^{\text {': }}\) no colum ns of U or row sof \(\mathrm{V} * *\) T are com puted.

M (input) The num ber of row sof the inputm atrix \(A . M>=0\).
N (input) The num ber of Colmm ns of the inputm atrix \(\mathrm{A} . \mathrm{N}>=\) 0.

A (input/output)
On entry, the M -by -N m atrix A. On exit, if \(\mathrm{JOBZ}=\) \(0^{\prime}\) ', A is overw ritten \(w\) ith the first N colum ns of U (the left singularvectors, stored colum nw ise) if \(M>=N\); \(A\) is overw ritten \(w\) ith the firstM row \(s\) of \(V * * T\) the right singularvectors, stored row wise) otherw ise. if JOBZ ne. 0 ', the contents ofA are destroyed.

LD A (input)
The leading dim ension of the anay A. LDA >= \(\max (1, M)\).

S (output)
The singularvalues of \(A\), sorted so that \(S\) (i) >= S (i+1).

U (output)
\(\mathrm{UCOL}=\mathrm{M}\) if \(\mathrm{JOBZ}=\mathrm{A}\) 'orJOBZ \(=0\) 'and \(\mathrm{M}<\mathrm{N}\);
\(\mathrm{UCOL}=\mathrm{m}\) in \((\mathrm{M}, N)\) if \(\mathrm{JOBZ}=\mathrm{S}^{\prime}\). If \(\mathrm{JOBZ}=\mathrm{A}\) 'or
JOBZ \(=0\) 'and \(\mathrm{M}<\mathrm{N}\), U contains the M -by -M orthogonalm atrix U ; if \(\mathrm{JOB} \mathrm{Z}=\mathrm{S}\) ', U contains the firstm in \((M, N)\) colum ns of \(U\) the left singular vectors, stored colum nw ise); if \(\mathrm{JOBZ}=0\) 'and M \(>=N\), or \(J O B Z=N\) ', U is not referenced.

LD U (input)
The leading dim ension of the amay \(\mathrm{U} . \mathrm{LDU}>=1\);
if \(\mathrm{OBZ}=\mathrm{S}^{\prime}\) or \(\mathrm{A}^{\prime}\) or \(\mathrm{OBZ}=\mathrm{O}^{\prime}\) and \(\mathrm{M}<\mathrm{N}, \mathrm{LDU}\)
\(>=M\).

VT (output)
If \(\mathrm{OBZ}=\mathrm{A}\) ' or \(\mathrm{OBBZ}=\mathrm{D}^{\prime}\) 'and \(\mathrm{M}>=\mathrm{N}, \mathrm{VT}\) contains the N -by N orthogonalm atrix V **T ; if \(\mathrm{OB} \mathrm{BZ}=\) S',V T contains the firstm in \((M, N)\) row \(s\) of \(V * * T\) (the right singularvectors, stored row w ise); if \(\mathrm{JOBZ}=\mathrm{D}^{\prime}\) 'and \(\mathrm{M}<\mathrm{N}\), or \(\mathrm{OBZ}=\mathrm{N}^{\prime}\), VT is not referenced.

LDVT (input)
The leading dim ension of the aray V T. LDV T >=1;
if \(\mathrm{JOBZ}=\mathrm{A}^{\prime}\) 'or \(\mathrm{OBZ}=\mathrm{O}^{\prime}\) 'and \(\mathrm{M}>=\mathrm{N}, \mathrm{LDVT>=N} \mathrm{;} \mathrm{;}\)
if \(J O B Z=S^{\prime}, L D V T>=m\) in \((M, N)\).

\#include <sunperfh>
void dgesvd (char jंbu, char jobvt, intm, intn, double *a, int lda, double *sing, double *u, int ldu, double *vt, int ldvt, int *info);
void dgesvd_64 (char jobu, char jobvt, long m, long \(n\), double
*a, long lda, double *sing, double *u, long ldu, double *vt, long ldvt, long *info);

\section*{PURPOSE}
dgesvd com putes the singular value decom position (SVD ) of a real M -by -N m atrix A , optionally com puting the leftand/or right singularvectors. The SVD isw rilten \(=U * S \mathbb{G} M A *\) transpose \((N)\)
where SIG M A is an M -by \(-\mathrm{N} m\) atrix which is zero except for its \(m\) in \((m, n\) ) diagonal elem ents, \(U\) is an \(M\) by \(M\) orthogonal \(m\) atrix, and \(V\) is an \(N\) boy \(-N\) orthogonalm atrix. The diagonal elem ents of SIGM A are the singular values of A ; they are real and non-negative, and are retumed in descending order. The firstm in ( \(m, n\) ) colum ns of \(U\) and \(V\) are the left and right singularvectors ofA.

N ote that the routine retums \(\mathrm{V} * * \mathrm{~T}\), not V .

\section*{ARGUMENTS}
\(J 0 \mathrm{BU}\) (input)
Specifies options for com puting allor part of the \(m\) atrix U :
= \(A\) ': all M colum ns of U are retumed in array U :
\(=S^{\prime}\) : the firstm in \((m, n)\) colum ns of \(U\) (the left singular vectors) are retumed in the array \(U\); \(=\) \(O^{\prime}\) : the firstm in \((m, n)\) colum ns of \(U\) the left singular vectors) are overw ritten on the array A; \(=\mathrm{N}^{\prime}\) : no colum ns of U (no left singularvectors) are com puted.

JOBVT (input)
Specifies options for com puting allor part of the m atrix V **T :
= A : alln rowsofV**T are retumed in the aray VT;
\(=S^{\prime}\) : the firstm in \((m, n)\) row sofV \(* * T\) the right singular vectors) are retumed in the array VT ; \(=\) 0 ': the firstm in \((m, n)\) row s ofV **T the right singular vectors) are overw ritten on the array A; \(=\mathrm{N}^{\prime}\) : no row sofV \({ }^{* *} \mathrm{~T}\) (no right singular vectors) are com puted.

JO BVT and JOBU cannotboth be \(\mathrm{D}^{\prime}\).
\(M\) (input) The num ber of row s of the inputm atrix \(A . M>=0\).
N (input) The num ber of \(\propto\) lum ns of the inputm atrix \(\mathrm{A} . \mathrm{N}>=\) 0.

A (input/output)
On entry, the M -by -N m atrix A. On exit, if \(\mathrm{OBC}=\) \(O^{\prime}\) ' A is overw rilten w ith the firstm in \((m, n)\)
colum ns of (the left singular vectors, stored colum nw ise); if JOBVT = O',A is overw ritten \(w\) th the firstm in \((m, n)\) row sof \(V * * T\) the right singularvectors, stored row w ise); if JO BU ne. 0 'and JOBVT ne. O', the contents of A are destroyed.

LD A (input)
The leading dim ension of the anay A. LDA >= max (1,M).

SING (output)
The singularvalues ofA, sorted so that SING (i) \(>=S \mathbb{N} G(i+1)\).

U (input) ( \(L D U, M\) ) if \(J 0 B U=A\) 'or \((L D U, m\) in \(M, N)\) ) if \(J O B U=\)
\(S^{\prime}\). If \(\mathrm{OBU}=\mathrm{A}\) ', U contains the M -by -M orthogonalm atrix \(U\); if \(J O B U=S\) ', \(U\) contains the first \(m\) in \((m, n)\) colum ns of \(U\) (the left singular vectors, stored colum nw ise); if \(\mathrm{JOBU}=\mathrm{N}\) 'or \(\mathrm{O}^{\prime}\) ' U is not referenced.

LD U (input)
The leading dim ension of the array \(U . L D U \quad>=1\); if \(J 0 B U=S\) 'or \(A\) ', LD \(U>=M\).

VT (input)
If \(\mathrm{OOBVT}=\mathrm{A}\) ', VT contains the N -by-N orthogonal \(m\) atrix \(V * * T\); if \(J O B V T=S^{\prime}, V T\) contains the first
\(m\) in \((m, n)\) row sof \(V * * T\) (the right singularvectors, stored row wise); if JOBVT = N 'or \(\mathrm{D}^{\prime}\), VT is not referenced.

LDVT (input)
The leading din ension of the amray VT. LD V T >=1; if \(\mathrm{JOBVT}=\mathrm{A}, \mathrm{LDVT}>=\mathrm{N}\); if \(\mathrm{if} \mathrm{OBVT}=\mathrm{S}\) ',LDVT >= \(m\) in \(M, N\) ).
W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LDW ORK; if \(\mathbb{N} F O>0, W O R K(2 \mathbb{M} \mathbb{N} M, N)\) ) contains the unconverged superdiagonal elem ents of an upper bidiagonalm atrix B whose diagonal is in SIN G (not necessarily sorted). \(B\) satisfies \(A=U * B * V T\), so it has the same singular values as \(A\), and singular vectors related by \(U\) and V T.

LDW ORK (input)
The dim ension of the array \(W\) ORK. LDW ORK >= 1 . LDW ORK >= MAX ( \(3 \star \mathrm{M} \mathbb{N} M, N\) ) M AX \(M, N), 5 \star \mathrm{M} \mathbb{N} \mathbb{M}, \mathbb{N})\) ). For good perform ance, LD W ORK should generally be larger.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.
\(>0\) : if SBD SQR did not converge, \(\mathbb{N} F O\) specifies how \(m\) any superdiagonals of an interm ediate bidiagonalform B did not converge to zero. See the description ofW ORK above fordetails.

\section*{C INTERFACE}
\#include <sunperfh>
void dgesvx (char fact, chartransa, intn, intnrhs, double
*a, int lda, double *af, int ldaf, int *ipivot, charequed, double *r, double *c, double *b, int ldb, double *x, int ldx, double *roond, double * ferr, double *berr, int *info);
void dgesvx_64 (char fact, chartransa, long n, long nrhs, double *a, long lda, double *af, long ldaf, long *ịívot, char equed, double *r, double *c, double *b, long ldb, double *x, long ldx, double *rcond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
dgesvx uses the LU factorization to com pute the solution to a realsystem of linear equations
\(A * X=B\), where \(A\) is an \(N\) by \(-N m\) atrix and \(X\) and \(B\) are N -by-N R H S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are com puted to equilibrate
the system:
TRANS \(=\mathrm{N}^{\prime}: \operatorname{diag}(\mathbb{R}) * \mathrm{~A} * \operatorname{diag}(\mathrm{C}) \quad * \operatorname{inv}(\operatorname{diag}(\mathrm{C})) * \mathrm{X}=\) \(\operatorname{diag}(\mathbb{R}) * B\)

TRANS \(=T:(\operatorname{diag}(\mathbb{R}) \star A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C)*B

TRANS \(=C\) ': \((\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C)*B

W hether or not the system w illbe equilibrated depends on the
scaling of the m atrix A , but ifequilibration is used, A is
overw rilten by diag \((\mathbb{R}) \star A\) *diag \((C)\) and \(B\) by diag \((\mathbb{R}) \star B\) (if TRANS = N ) ordiag (C)*B (ifTRANS = T'or C).
2. IfFACT = N 'or E', the LU decomposition is used to factor the
\(m\) atrix A (afterequilibration ifFACT = E ) as
\[
A=P * L * U
\]
\(w\) here \(P\) is a perm utation \(m\) atrix, \(L\) is a unit low er triangular
\(m\) atrix, and \(U\) is upper triangular.
3. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix A. If the reciprocal of the condition num ber is less than m achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and compute error bounds as described below.
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (C) (ifTRANS = N ) ordiag \((\mathbb{R})\) (ifTRANS \(=T^{\prime}\) or C) so
that it solves the originalsystem before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, w hether them atrix A should be equilibrated before it is factored. = F': On entry, AF and IPIV OT contain the factored form of \(A\). IfEQUED is not \(N^{\prime}\), the \(m\) atrix A has been equilibrated \(w\) ith scaling factors given by R and \(\mathrm{C} . \mathrm{A}, \mathrm{AF}\), and \(\mathbb{P}\) IV OT are not m odified. \(=\mathrm{N}\) : Them atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) : The matrix A will be equilibrated if necessary, then copied to AF and factored.

TRANSA (input)
Specifies the form of the system of equations:
\(=N^{\prime}: A * X=B \quad\) N o transpose)
\(=T\) ': \(A * * T * X=B \quad\) ( ranspose)
\(=C: A * * H * X=B \quad\) (Transpose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE. N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X. NRHS \(>=0\).

A (input/output)
O n entry, the N -by -N m atrix A . IfFA CT \(=\mathrm{F}^{\prime}\) and EQUED is not \(N\) ', then A m usthave been equilibrated by the scaling factors in R and/orC. A is not modified if \(\mathrm{FACT}=\mathrm{F}^{\prime}\) or \(\mathrm{N}^{\prime}\), or if \(\mathrm{FACT}=\) E'and EQU ED = N 'on exit.

On exit, ifEQ UED ne. \(N\) ', A is scaled as follow s: \(\operatorname{EQUED}=\mathrm{R}: A:=\operatorname{diag}(\mathbb{R}) * A\)
\(E Q U E D=C\) ': A \(=A * \operatorname{diag}(C)\)
\(E Q U E D=B \prime A:=\operatorname{diag}(R) * A * \operatorname{diag}(C)\).

LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

AF (input/output)
If FACT \(=F^{\prime}\), then \(A F\) is an inputargum entand on entry contains the factors \(L\) and \(U\) from the factorization \(A=P * L * U\) as com puted by SGETRF. If EQUED ne. \(N^{\prime}\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix A.

IfFACT \(=N\) ', then AF is an output argum ent and on exit retums the factors \(L\) and \(U\) from the factorization \(A=P * L * U\) of the originalm atrix \(A\).

If \(F A C T=E\) ', then \(A F\) is an output argum ent and on exit retums the factors \(L\) and \(U\) from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) of the equilibrated m atrix A (see the description of \(A\) for the form of the equilibrated \(m\) atrix) .

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

PIVOT (inputoroutput)
IfFACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P I V O T}\) is an input argum ent and on entry contains the pivot indioes from the factorization \(A=P * L * U\) as com puted by SGETRF ; row \(i\) of the matrix was interchanged with row \(\mathbb{P I V O T}\) (i).

IfFACT = N', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivot indices from the factorization \(A=P * L * U\) of the originalm atrix \(A\).

IfFACT = E', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivot indices from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) of the equilibrated m atrix A.

EQUED (input/output)
Specifies the form of equilibration thatw as done. \(=\mathrm{N}\) ': No equilibration (alw ays true iffACT = \(\mathrm{N})\).
\(=R\) ': Row equilibration, ie., A has been prem ultiplied by diag \((R)\). = C ': C olum n equilibration, ie., A has been postm ultiplied by diag (C ). = B': B oth row and colum n equilibration, ie., A has been replaced by diag \((\mathbb{R})\) * A * diag (C). EQUED is an inputargum entifFACT= F '; otherw ise, it is an output argum ent.

R (input/output)
The row scale factors for \(A\). IfEQUED \(=R^{\prime}\) or B', A is multiplied on the left.by diag \((\mathbb{R})\); if EQUED = N 'or C', R is notaccessed. \(R\) is an input argum ent ifFACT = \(F\) '; otherw ise, \(R\) is an output argum ent. IfFACT = F'andEQUED = R'or \(B\) ',each elem entofR m ustbe positive.

C (input/output)
The colum n scale factors for \(A\). IfEQ UED = C 'or B', A ismultiplied on the rightby diag (C ) ; if EQUED \(=N\) 'or \(R\) ', \(C\) is notaccessed. \(C\) is an input argum ent ifFACT \(=F\) '; otherw ise, \(C\) is an outputargum ent. IfFACT = F'and EQUED = C'or \(B\) ', each elem entofC \(m\) ust.be positive.

B (input/output)
On entry, the N -by-NRHS righthand side m atrix \(B\). On exit, if EQUED = \(N\) ', \(B\) is notm odified; if TRANSA \(=N^{\prime}\) and EQUED \(=R^{\prime}\) or \(B^{\prime}, B\) is overw rilten by diag \((R) * B\); if TRANSA \(=T\) 'or \(C^{\prime}\) and EQUED \(=C^{\prime}\) or \(B^{\prime}, B\) is overw ritten by diag (C) *B.

LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\)-by-NRH \(S\) solution
\(m\) atrix \(X\) to the original system ofequations.
\(N\) ote that \(A\) and \(B\) are \(m\) odified on exit if EQUED
ne. N ', and the solution to the equilibrated
system is inv (diag (C))*X ifTRANSA = N 'and EQUED
\(=C\) 'or \(B\) ', orinv (diag \((R)) * X\) ifTRANSA \(=T\) 'or \(C^{\prime}\) 'and \(E Q U E D=R\) 'or \(B\) '.

LD X (input)
The leading dim ension of the aray X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num berof the matrix A after equilibration (if done). If
RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), them atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th colum n of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(1)\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost
alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( \(j\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exact solution).

W ORK (w orkspace)
dim ension ( \(4 * \mathrm{~N}\) ) On exit, W ORK (1) contains the reciprocal pivot grow th factornom (A)/norm (U). The "m ax absolute elem ent" norm is used. If W ORK (1) is m uch less than 1 , then the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also \(m\) eans that the solution X, condition estim atorRCOND, and forw ard error bound FERR could be unreliable. If factorization fails w ith \(0<\mathbb{N} F O<=N\), then \(W\) ORK (1) contains the reciprocal pivot grow th factor forthe leading \(\mathbb{N} F O\) colum nsofA.

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\)-i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has been completed, but the factor \(U\) is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num berof situations w here the com puted solution can bem ore accurate than the value ofRC O ND w ould suggest.

void dgetf2_64 (long m, long n, double *a, long lda, long *ị̀iv, long *info);

\section*{PURPOSE}
dgetf2 com putes an LU factorization of a general \(m\) boy-n \(m\) atrix A using partialpivoting \(w\) ith row interchanges.

The factorization has the form
\[
A=P * L * U
\]
\(w\) here \(P\) is a perm utation \(m\) atrix, \(L\) is low ertriangular \(w\) ith unit diagonal elem ents (low ertrapezoidalifm >n), and U is uppertriangular (uppertrapezoidalifm < n).

This is the right-looking Level2 B LA S version of the algorithm.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, them by \(n m\) atrix to be factored. On
exit, the factors \(L\) and \(U\) from the factorization \(A\)
\(=P * L * U\); the unitdiagonalelem ents of \(L\) are not stored.

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, M)\).
\(\mathbb{P} \mathbb{I V}\) (output)
The pivotindices; for \(1<=i<=m\) in \((M N)\), row i of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P} \mathbb{I V}\) (i).
\(\mathbb{I N}\) FO (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\mathrm{k}\), the \(k\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=k, U(k, k)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is
exactly singular, and division by zero will occur
if it is used to solve a system of equations.

\#include <sunperfh>
void dgetri(intn, double *a, int lda, int *ipivot, int *info);
void dgetri_64 (long n, double *a, long lda, long *ịívot, long *info);

\section*{PURPOSE}
dgetricom putes the inverse of am atrix using the LU factorization com puted by SGETRF .

Thism ethod inverts \(U\) and then com putes inv (A) by solving the system inv (A) \({ }^{(A L}=\operatorname{inv}(\mathbb{U})\) for inv (A).

\section*{ARGUMENTS}

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O n entry, the factors \(L\) and \(U\) from the factoriza-
tion \(A=P * L * U\) as com puted by SGETRF. On exit, if \(\mathbb{N} F O=0\), the inverse of the originalm atrix \(A\).

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).

IPIVOT (input)
The pivotindiges from SGETRF; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P}\) IV OT (i).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0\), then \(W\) ORK (1) retums the optim alLDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= \(\max (1, N)\). Foroptim alperform ance LDW ORK \(>=N * N B\), where NB is the optim al blocksize retumed by แAENV.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i, U(i, i)\) is exactly zero; the \(m\) atrix is singular and its inverse could notbe com puted.

\section*{PURPOSE}
dggbak form s the right or lefteigenvectors of a real generalized eigenvalue problem \(A{ }^{*} x=\) lam bda*B *x, by backw ard transform ation on the com puted eigenvectors of the balanced pair ofm atriges outputby SG G BA L .

\section*{ARGUMENTS}

JO B (input)
Specifies the type of backw ard transform ation
required:
\(=\mathrm{N}^{\prime}\) : do nothing, retum im m ediately;
\(=\mathrm{P}^{\prime}:\) do backw ard transform ation forperm utation
only;
= S ': do backw ard transform ation for scaling
only;
\(=\mathrm{B}^{\prime}\) : do backw ard transform ations forboth per\(m\) utation and scaling. OB B ustbe the sam e as the argum ent O B supplied to SG G BA L .

SIDE (input)
\(=R\) ': V contains righteigenvectors;
\(=\mathrm{L} \cdot: \mathrm{V}\) contains lefteigenvectors.

N (input) The num ber of row s of the m atrix \(\mathrm{V} . \mathrm{N}>=0\).

IIO (input)
The integers \(\mathbb{H O}\) and \(\mathbb{H}\) I determ ined by SGGBAL. 1
\(<=\mathbb{H} O<=\mathbb{H} I<=N\), if \(N>0\); \(\mathbb{H} O=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

IH I (input)
See the description for \(\mathbb{I} \mathrm{O}\).
LSCALE (input)
D etails of the perm utations and/or scaling factors applied to the left side of \(A\) and \(B\), as retumed by SG GBAL .

RSCALE (input)
D etails of the perm utations and/or scaling factors applied to the right side of \(A\) and \(B\), as retumed by SG GBAL.

M (input) The num ber of colum ns of the m atrix \(\mathrm{V} . \mathrm{M}>=0\).

V (input/output)
O \(n\) entry, the \(m\) atrix of rightor lefteigenvectors to be transform ed, as retumed by STGEVC. On exit, \(V\) is overw ritten by the transform ed eigenvectors.

LD V (input)
The leading din ension of the \(m\) atrix \(V\). LD \(V>=\) \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvahue.

void dggbal(char job, intn, double *a, int lda, double *b, int ldly, int *ilo, int *ini, double *lscale, double *rscale, int*info);
void dggbal 64 (char j’.b, long n, double *a, long lda, double
*b, long ldb, long *ilo, long *ihi, double
*lscale, double *rscale, long *info);

\section*{PURPOSE}
dggbalbalances a pair of general realm atrices ( \(A, B\) ). This involves, first, perm uting \(A\) and \(B\) by sim ilarity transform \(a-\) tions to isolate eigenvalues in the first1 to \(\Pi 0 \$-\$ 1\) and last IH I+1 to N elem ents on the diagonal; and second, applying a diagonalsim ilarity transform ation to row s and colum ns IIO to IH I to \(m\) ake the row s and colum ns as close in norm as possible. B oth steps are optional.

B alancing \(m\) ay reduce the 1-norm of the \(m\) atrices, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors in the generalized eigenvalue problem \(A{ }^{*} x=1 a m . b d a * B{ }^{*} x\).

\section*{ARGUMENTS}

JO B (input)
Specifies the operations to be perform ed on A and
B :
\(=\mathrm{N}^{\prime}\) : none: simply set \(\mathbb{H} 0=1, \mathbb{H} I=\mathrm{N}\), LSCALE (I) = 1.0 and RSCALE (I) = 1.0 for \(i=\)
\(1, \ldots, N .=P\) ': perm ute only;
\(=S\) ': scale only;
\(=B\) ': both perm ute and scale.

N (input) The order of the m atriges A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input/output)
On entry, the inputm atrix A. On exit, A is
overw ritten by the balanced \(m\) atrix. If \(\mathrm{OB}=\mathrm{N}^{\prime}\),

A is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).
\(B\) (input) On entry, the inputm atrix \(B\). On exit, \(B\) is overw rilten by the balanced \(m\) atrix. If \(J \mathrm{~B}=\mathrm{N}^{\prime}\), \(B\) is not referenced.

LD B (input)
The leading dim ension of the array \(B . L D B>=\) \(\max (1, \mathbb{N})\).

ШО (output)
IO O and \(\mathbb{H}\) Iare set to integers such thaton exit
\(A(i, j)=0\) and \(B(i, 1)=0\) if \(i>\) jand \(j=\) \(1, \ldots\), ILO O -1 or \(i=\mathbb{H}\) I \(+1, \ldots, N\). If \(J O B=N\) ' or \(\mathrm{S}^{\prime}, \mathrm{HO}=1\) and \(\mathbb{H} \mathrm{I}=\mathrm{N}\).

IH I (output)
See the description for ILO .
LSCALE (input)
D etails of the perm utations and scaling factors applied to the left side of A and B. IfP \((\mathcal{J})\) is the index of the row interchanged w ith row \(j\) and D ( \(j\) ) is the scaling factor applied to row \(j\) then LSCALE ( \()=\mathrm{P}(\mathrm{j})\) for \(\mathrm{J}=1, \ldots\), ILO-1 \(=\mathrm{D}(\boldsymbol{j})\) for \(J=\mathbb{L O}, \ldots, \mathbb{H} I=P(j) \quad\) for \(J=\mathbb{H} I+1, \ldots, N\). The order in w hich the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L O} \mathrm{O}\).

RSCALE (input)
D etails of the perm utations and scaling factors applied to the right side of \(A\) and \(B\). IfP \((\mathcal{F})\) is the index of the colum \(n\) interchanged with column \(j\) and \(D(j)\) is the scaling factorapplied to column \(j\) then LSCALE \((\mathcal{j})=P(\mathcal{i})\) for \(J=\) \(1, \ldots, \mathbb{H} O-1=D() \quad\) for \(J=\mathbb{H}, \ldots, \mathbb{H} I=P( \rangle)\) for \(J=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathrm{IH} \mathrm{I}+1\), then 1 to ㅍㅇㅇ․

W ORK (w orkspace)
dim ension ( \(6 * \mathrm{~N}\) )
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an ille-
galvahue.

\section*{C INTERFACE}
\#include <sunperfh>
void dgges(char jobvsl, char jobvsr, char sort, int(*delctg) (double,double,double), intn, double *a, int lda, double *b, int ldb, int *sdim, double *alphar, double *alphai, double *beta, double *vsl, int ldvsl, double *vss, int ldvsr, int *info);
void dgges_64 (char jobvsl, char jobvsi, char sort, long (*delctg) (double,double,double), long n, double *a, long lda, double *b, long ldo, long *sdim , double *alphar, double *alphai, double *beta, double *vsl, long ldvsl, double *vsr, long ldvsr, long *info);

\section*{PURPOSE}
dgges com putes for a pair of \(N\)-by -N real nonsym \(m\) etric \(m\) atrices ( \(A, B\) ), the generalized eigenvalues, the generalized realSchur form ( \(\mathrm{S}, \mathrm{T}\) ), optionally, the left and/or right \(m\) atrices of Schurvectors (VSL and V SR ). This gives the generalized Schur factorization
\[
(A, B)=(N S L) * S *(N S R) * * T,(N S L) * T *(N S R) * * T)
\]

Optionally, it also orders the eigenvalues so that a selected chuster of eigenvalues appears in the leading diagonalblocks of the upperquasi-triangularm atrix \(S\) and the upper triangularm atrix \(T\).The leading colum ns of V SL and V SR then form an orthonorm albasis for the comesponding left
and righteigenspaces (deflating subspaces).
(If only the generalized eigenvalues are needed, use the driverSG G EV instead, which is faster.)

A generalized eigenvalue for pairofm atrices \((A, B)\) is a scalar \(w\) or a ratio alpha/beta \(=w\), such that \(A-w\) *B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0 orboth being zero.

A pairofm atrices ( \(\mathrm{S}, \mathrm{T}\) ) is in generalized real Schur form if \(T\) is upper triangularw ith non-negative diagonal and \(S\) is block upper triangularw ith 1 -by-1 and 2 -by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2 -by- 2 blocks ofS w illbe "standardized" by making the corresponding elem ents of \(T\) have the form :
[ a 0 ]
[ 0 b ]
and the pair of corresponding 2 -by- 2 blocks in \(S\) and \(T\) will have a com plex conjugate pairof generalized eigenvalues.

\section*{ARGUMENTS}
\(J 0\) BV SL (input)
\(=N^{\prime}:\) do notcom pute the left:Schurvectors;
\(=\mathrm{V}\) : com pute the left:Schurvectors.
JO BV SR (input)
\(=\mathrm{N}\) ': do notcom pute the rightSchurvectors;
= V ': com pute the rightSchurvectors.
SORT (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the generalized Schur form . = N ': Eigenvalues are notordered;
= S': Eigenvalues are ordered (see D ELC TG );
DELCTG (input)
DELCTG m ustbe declared EX TERNAL in the calling subroutine. If SORT = N',DELCTG is notreferenced. If SORT = S',DELCTG is used to select eigenvalues to sort to the top leftof the Schur
form. A n eigenvalue (ALPHAR ( \()+\) A LPHA I ( \()\) ) BETA ( \()\) is selected ifD ELCTG (A LPHAR ( 7 ) A LPHAI ( \()\), BETA ( \(\mathbf{j}\) ) is true; ie. if either one of a com plex conjugate pair of eigenvalues is selected, then both com plex eigenvalues are selected.

N ote that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy DELCTG (ALPHAR ( ) \()\) ALPHAI \((\boldsymbol{\jmath})\), BETA ( \(\boldsymbol{j})=\operatorname{TRUE}\). after ordering. \(\mathbb{N} F O\) is to be set to \(N+2\) in this case.

N (input) The order of the m atrices A, B, VSL, and VSR. N \(>=0\).

A (input/output)
O \(n\) entry, the firstof the pair of \(m\) atrices. On
exit, A has been overw ritten by its generalized Schur form \(S\).
LDA (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).

B (input/output)
O \(n\) entry, the second of the pairofm atrices. On exit, B has been overw ritten by its generalized Schur form T.

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

SD \(\mathbb{M}\) (output)
If \(S O R T=N^{\prime}, S D \mathbb{M}=0\). IfSORT \(=S^{\prime}, S D \mathbb{M}=\)
num ber of eigenvalues (aftersorting) forw hich
DELCTG is true. (Complex conjugate pairs for which DELCTG is true foreithereigenvalue count as 2.)

ALPHAR (output)
On exil, (ALPHAR ( ) + ALPHAI ( ) *i) BETA ( ) , \(\dot{j} 1, \ldots, N\), w ill be the generalized eigenvalues.
 are the diagonals of the com plex Schur form ( \(\mathrm{S}, \mathrm{T}\) ) that w ould result if the 2 -by-2 diagonalblocks of the realSchur form of ( \(A, B\) ) w ere further reduced to triangular form using 2 -by -2 complex unitary transform ations. If A LPHA \(I()\) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and ( \(j+1\) )-steigenvalues are a com plex con \(j u-\) gate pair, w ith A LPHA I (j+1) negative.

Note: the quotients ALPHAR ( \()\) ) BETA ( \()\) and A LPHAI( ) BETA ( ) may easily over-or underflow, andBETA ( \(\mathcal{O}\) ) may even be zero. Thus, the user should avoid naively com puting the ratio. H ow ever, A LPH AR and A LPH A Iw illbe alw ays less than
and usually com parable \(w\) ith norm (A) in \(m\) agnitude, and BETA alw ays less than and usually com parable w th norm (B).

\section*{A LPH A I (output)}

See the description forA LPHAR.
BETA (output)
See the description forA LPHAR .
VSL (input)
If \(J 0 B V S L=V\) ',VSL willcontain the left Schur vectors. N ot referenced if \(\mathrm{JO} \mathrm{BVSL}=\mathrm{N}\) '.

\section*{LD V SL (input)}

The leading dim ension of the \(m\) atrix VSL. LDVSL
\(>=1\), and if JOBV SL = V', LD V SL >= N .
VSR (input)
If Jo BV SR = V', V SR w illcontain the right Schur vectors. N ot referenced if \(\mathrm{JO} \mathrm{BV} \mathrm{SR}=\mathrm{N}\) '.

LD V SR (input)
The leading dim ension of the \(m\) atrix \(V\) SR .LD \(V\) SR >= 1 , and if \(J O B V S R=V\) ', LD VSR \(>=N\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. LW ORK \(>=8 * N+16\).
IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LW ORK is issued by X ERBLA.
BW ORK (w orkspace)
dim ension \((\mathbb{N}) \mathrm{N}\) ot referenced if SORT \(=\mathrm{N}^{\prime}\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.
\(=1, \ldots, N\) : The Z Z teration failed. ( \(\mathrm{A}, \mathrm{B}\) ) are not in Schurform, butALPHAR ( \(\mathcal{j})\), ALPHAI \((\mathcal{j})\), and
BETA ( \()\) ) should be comect for \(\mathcal{j} \mathbb{N} F O+1, \ldots, N . \quad>\)
\(\mathrm{N}:=\mathrm{N}+1\) : other than Q Z iteration failed in
SHGEQZ.
\(=\mathrm{N}+2\) : after reordering, roundoff changed values of some com plex eigenvalues so that leading eigenvalues in the Generalized Schur form no longer satisfy DELCTG=TRUE. This could also be caused due to scaling. \(=\mathrm{N}+3\) : reordering failed in STG SEN .

\section*{PURPOSE}
dggesx com putes for a pair of N -by N real nonsym \(m\) etric \(m\) atrices \((A, B)\), the generalized eigenvalues, the realSchur form ( \(\mathrm{S}, \mathrm{T}\) ), and, optionally, the leftand/or right \(m\) atrices of Schurvectors (V SL and V SR ). This gives the generalized Schur factorization
A, B\()=(\mathrm{NSL}) \mathrm{S}(\mathrm{NSR}) * * T,(\mathrm{NSL}) \mathrm{T}(\mathrm{NSR}) * * T\) )
Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonalblocks of the upperquasi-triangularm atrix \(S\) and the upper triangular \(m\) atrix \(T\); com putes a reciprocalcondition num ber for the average of the selected eigenvalues (RCONDE); and com putes a reciprocal condition num ber for the right and left deflating subspaces corresponding to the selected eigenvalues (RCONDV). The leading colum ns ofVSL and VSR then form an orthonorm albasis for the corresponding left and righteigenspaces (deflating subspaces).

A generalized eigenvalue for a pairofm atrices \((A, B)\) is a scalar w or a ratio alphaゐbeta \(=\mathrm{w}\), such that \(A-w * B\) is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0 or forboth being zero.

A pairofm atrices ( \(S, T\) ) is in generalized real Schur form if \(T\) is upper triangularw th non-negative diagonal and \(S\) is block uppertriangularw ith 1-by-1 and 2 -by-2 blocks. 1-by-1 blocks comespond to real generalized eigenvalues, while 2-by-2 blocks of S w illbe "standardized" by making the comesponding elem ents of \(T\) have the form :
[ a 0 ]
[ 0 b ]
and the pairof corresponding 2 -by- 2 blocks in \(S\) and \(T\) will have a com plex conjugate pairof generalized eigenvalues.

\section*{ARGUMENTS}

JO BV SL (input)
= N : : do notcom pute the leftSchurvectors;
= V ': com pute the leftSchurvectors.
JO BV SR (input)
\(=\mathrm{N}^{\prime}\) : do not com pute the rightSchurvectors;
= V ': com pute the rightSchurvectors.

\section*{SORT (input)}

Specifies w hether ornot to order the eigenvalues on the diagonal of the generalized Schur form . = N ': Eigenvalues are not ordered;
= S': Eigenvahues are ordered (see D ELC TG ).
DELCTG (input)
DELCTG mustbe declaredEXTERNAL in the calling
subroutine. If \(S O R T=N\) ',DELCTG is not refer-
enced. IfSORT = S',DELCTG is used to select
eigenvalues to sort to the top leftof the Schur
form. A n eigenvalue (A LPHAR ( \(\mathfrak{j}+\mathrm{A}\) LPHA I ( \()\) ) BETA ( 1 )
is selected ifD ELCTG (ALPHAR ( \()\),ALPHAI( ) , BETA ( \(\mathfrak{j}\) )
is true; ie. if either one of a com plex conjugate
pair of eigenvalues is selected, then both com plex
eigenvalues are selected. \(N\) ote that a selected
complex eigenvalue may no longer satisfy
DELCTG (ALPHAR ( \(\mathcal{j}\), ALPHAI \((\mathcal{\jmath})\),BETA \((\mathcal{j})=\) TRUE. after
ordering, since ordering \(m\) ay change the value of
com plex eigenvalues (especially if the eigenvalue
is ill-conditioned), in this case \(\mathbb{N}\) FO is set to
\(\mathrm{N}+3\).

\#include <sunperfh>
void dggev (char jobvl, char jobvr, int \(n\), double *a, int
lda, double *b, intldb, double *alphar, double
*alphai, double *beta, double *vl, int ldvl, double *Vr, int ldvr, int *info);
void dggev_64 (char jobvl, char jobvr, long n, double *a, long lda, double *b, long ldb, double *alphar, double *alphai, double *beta, double *vl, long ldvl, double *vr, long ldvr, long *info);

\section*{PURPOSE}
dggev com putes for a pair of N -by -N real nonsym \(m\) etric \(m\) atrices ( \(A, B\) ) the generalized eigenvalues, and optionally, the leftand/or right generalized eigenvectors.

A generalized eigenvalue for a pair ofm atrices \((A, B)\) is a scalar lam bda or a ratio alpha/beta = lam bda, such thatA lam bda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0, and even forboth being zero.

The righteigenvectorv (i) corresponding to the eigenvalue lam bda ( \()\) ) of ( \(A, B\) ) satisfies
\[
A * v(\mathcal{j})=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * B * v(\mathcal{I})
\]

The lefteigenvectoru ( \(\mathcal{I}\) ) corresponding to the eigenvalue lam boda ( \(\mathcal{I}\) ) of \((A, B)\) satisfies
\[
u(j) \star * H * A=\operatorname{lam} \operatorname{bda}(j) * u(j) \star * H * B .
\]
where \(u(\mathfrak{\jmath}) * * H\) is the conjugate-transpose ofu ( \()\).

\section*{ARGUMENTS}

void dggevx_64 (charbalanc, char jobvl, char jobvr, char sense, long \(n\), double *a, long lda, double *b, long ldb, double *alphar, double *alphai, double *beta, double *vl, long ldvl, double *vr, long ldvr, long *ilo, long *ihi, double *lscale, double *rscale, double *abnm, double *bbnım, double *rconde, double *rcondv, long *info);

\section*{PURPOSE}
dggevx com putes for a pair of N boy -N real nonsymm etric \(m\) atrices ( \(A, B\) ) the generalized eigenvalues, and optionally, the left and/or rightgeneralized eigenvectors.

O ptionally also, itcom putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors (ILO , IH I, LSCALE, RSCALE, ABNRM , and BBNRM ), reciprocal condition num bers for the eigenvalues \((\mathbb{R C O N D E )}\), and reciprocal condition num bers for the righteigenvectors (RCONDV).

A generalized eigenvalue for a pair ofm atrices \((A, B)\) is a scalar lam boda or a ratio alphaßeta = lam bda, such thatA lam loda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0, and even forboth being zero. The righteigenvectorv (i) corresponding to the eigenvalue lam bda ( \()\) ) of ( \(\mathrm{A}, \mathrm{B}\) ) satisfies
\[
A \star v(\mathcal{J})=\operatorname{lam} \operatorname{bda}(\mathcal{j}) \star B * v(\mathcal{I}) .
\]

The lefteigenvectoru ( 7 ) comesponding to the eigenvalue lam bda ( \()\) ) of ( \(A, B\) ) satisfies
\(u(\mathcal{j}) * * H * A=\operatorname{lam} \operatorname{bda}(\mathfrak{j}) * u(\mathfrak{j}) * * H * B\).
where \(u(\mathfrak{j}) * * H\) is the conjugate-transpose of \(u(7)\).

\section*{ARGUMENTS}

BALANC (input)
Specifies the balance option to be perform ed. =
N ': do notdiagonally scale orperm ute;
= \(\mathrm{P}^{\prime}\) : perm ute only;
= S ': scale only;
\(=B^{\prime}\) : both perm ute and scale. C om puted reciprocal condition num bers \(w\) ill be forthem atrices afterperm uting and/orbalancing. Perm uting does not change condition num bers (in exactarith\(m\) etic), butbalancing does.

JO BVL (input)
\(=\mathrm{N}\) : do notcom pute the leftgeneralized eigen-
vectors;
\(=\mathrm{V}\) ': com pute the left generalized eigenvectors.
\(=N^{\prime}\) : do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvec-
tors.

SENSE (input)
D eterm ines which reciprocal condition num bers are
com puted. = N ': none are com puted;
\(=\mathrm{E}\) ': com puted for eigenvalues only;
\(=\mathrm{V}\) ': com puted foreigenvectors only;
\(=B\) ': com puted foreigenvalues and eigenvectors.
N (input) The order of the m atrices \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and \(\mathrm{VR} . \mathrm{N}>=\) 0.

A (input/output)
On entry, them atrix A in the pair ( \(A, B\) ). On
exit, A has been overw rilten. If \(\mathrm{JOBVL}=\mathrm{V}\) ' or
\(J O B V R=V\) 'orboth, then A contains the first part
of the realSchur form of the "balanced" versions
of the input \(A\) and \(B\).

LDA (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).
B (input/output)
On entry, them atrix \(B\) in the pair \((A, B)\). On exit, \(B\) has been overw ritten. If \(J O B V L=V\) 'or \(J 0 B V R=V\) 'orboth, then \(B\) contains the second part of the realSchur form of the "balanced" versions of the input \(A\) and \(B\).

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

\section*{ALPHAR (output)}
 \(\dot{于} 1, \ldots, \mathrm{~N}, \mathrm{w}\) ill be the generalized eigenvalues. IfA LPHA \(I(\mathcal{I})\) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and (j+1)-st eigenvalues are a com plex conjugate pair, w ith A LPHA I(j+1) negative.

Note: the quotients ALPHAR ( ) BETA ( ) and
A LPHAI ( \()\) BETA ( \()\) m ay easily over-orunderflow, andBETA \((\rightarrow)\) may even be zero. Thus, the user should avoid naively computing the ratio
A LPHA BETA. H ow ever, A LPHAR and ALPHAI w ill be alw ays less than and usually com parable w ith norm (A) in \(m\) agnitude, and BETA alw ays less than and usually com parable w ith nom (B).

A LPH A I (output)
See the description of A LPH A R .

BETA (output)
See the description of LPHAR.

VL (output)
If \(\mathrm{JOBVL}=\mathrm{V}\) ', the left eigenvectors \(\mathrm{u}(\mathrm{y})\) are stored one afteranother in the colum ns of V L, in the sam e order as theireigenvalues. If the \(j\) th eigenvalue is real, then \(u(j)=V L(:, ~), ~ t h e ~ j t h ~\) colum n ofVL. If the \(j\) th and ( \(j+1\) )-th eigenvalues form a complex conjugate pair, then \(u(\mathcal{l})=\) \(V L(:, \gamma+i \star V L(:, j+1)\) and \(u(j+1)=V L(:, \gamma)-\) i*VL (: \(\because\) jł1). Each eigenvectorw ill be scaled so the largest com ponent have abs (real part) + abs(mag. part) \(=1 . \operatorname{Not}\) referenced if \(J 0 \mathrm{BVL}=\) N '.

LDVL (input)
The leading dim ension of the \(m\) atrix \(V \mathrm{~L} . \mathrm{LD} \operatorname{VL}>=1\), and if \(\mathrm{JOBVL}=\mathrm{V}\) ', LDVL \(>=\mathrm{N}\).

VR (output)
If \(\mathrm{JOBVR}=\mathrm{V}\) ', the right eigenvectors \(\mathrm{v}(\mathrm{J})\) are stored one after another in the colum ns of VR, in the sam e order as theireigenvalues. If the jth eigenvalue is real, then \(v(j)=\operatorname{VR}(:, r)\), the \(j\) th colum \(n\) ofVR. If the \(j\) th and ( \(j+1\) )-th eigenvalues form a complex conjugate pair, then \(\mathrm{v}(\mathcal{1})=\) \(\operatorname{VR}(:, 1)+i \star V R(:, j+1)\) and \(V(j+1)=V R(:, j)-\) \(i \star V R(:, j+1)\). Each eigenvectorw ill be scaled so the largest com ponent have abs(real part) + abs(mag. part) \(=1\). N ot referenced if JO BVR \(=\) N '.

LDVR (input)
The leading dim ension of the \(m\) atrix V R .LD VR \(>=1\), and if \(J O B V R=V{ }^{\prime}, L D V R>=N\).

ㅍO (output)
IO and \(\mathbb{H}\) I are integer values such that on exit
\(A(i, j)=0\) and \(B(i, 7)=0\) if \(i>j\) jand \(j=\) \(1, \ldots, \mathbb{I} O-1\) or \(i=\mathbb{H} I+1, \ldots, N\). IfBALANC \(=N^{\prime}\) or \(\mathrm{S}^{\prime}, \mathrm{HO}=1\) and \(\mathbb{H} \mathrm{I}=\mathrm{N}\).

IH I (output)
See the description of ILO .

\section*{LSCALE (output)}

D etails of the perm utations and scaling factors applied to the left side of A and B. IfPL ( \()\) ) is the index of the row interchanged w ith row \(j\) and D L ( ) is the scaling factor applied to row \(j\) then LSCALE ( \(\mathfrak{j}\) ) = PL ( \(\mathfrak{j}\) ) for \(j=1, \ldots\), ILO-1 = DL ( \()\) for \(j=\mathbb{L} O, \ldots, \mathbb{H} I=P L(j)\) for \(j=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L} O-1\).

\section*{RSCALE (output)}

D etails of the perm utations and scaling factors applied to the right side of \(A\) and \(B\). IfPR () is the index of the colum \(n\) interchanged \(w\) th \(c o l m m\) \(j\) and \(\operatorname{DR}(j)\) is the scaling factor applied to column \(j\) then RSCALE ( \(\mathcal{j})=\operatorname{PR}(\mathcal{j})\) for \(j=\)
 for \(j=\mathbb{H} I+1, \ldots, N\) The order in which the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{I L O}-1\).

ABNRM (output)
The one-norm of the balanced m atrix A .

BBNRM (output)
The one-norm of the balanced \(m\) atrix B .

RCONDE (output)
If SENSE = E'or B', the reciprocal condition
num bers of the selected eigenvalues, stored in consecutive elem ents of the array. For a com plex conjugate pair of eigenvahues tw o consecutive ele\(m\) ents ofRCONDE are set to the sam e value. Thus RCONDE ( \(j\) ), RCONDV \((\boldsymbol{j})\), and the \(j\) th colum ns of \(L\) and VR allcorrespond to the sam e eigenpair but not in general the jth eigenpair, unless all eigenpairs are selected). If SEN SE = V', RCONDE is not referenced.

RCONDV (output)
If SEN SE = V 'or B ', the estim ated reciprocal condition num bers of the selected eigenvectors, stored in consecutive elem ents of the array. For a com plex eigenvector tw o consecutive elem ents of RCONDV are set to the sam e value. If the eigenvalues cannot be reordered to com pute RCONDV( \(\mathcal{j}\) ), RCONDV ( \(\mathcal{j}\) ) is set to 0 ; this can only occur when the true value would be very sm allanyw ay. If SENSE = E',RCONDV is notreferenced.

W ORK (w orkspace)

On exit, if \(\mathbb{N} F O=0, W\) ORK ( 1 ) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay W ORK. LW ORK >= \(\max (1,6 * N)\). If \(S E N S E=E\) ', LW ORK \(>=12 * N\). If SEN SE \(=\) V 'or B',LW ORK \(>=2 \star \mathrm{~N} * N+12 * N+16\).

IfLW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK amay, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IW ORK (w orkspace)
dim ension \((\mathbb{N}+6)\) IfSEN \(S E=E ', \mathbb{I W}\) ORK is notreferenced.

BW O RK (w orkspace)
dim ension \((\mathbb{N})\) If \(S E N S E=N^{\prime}, B W\) ORK is not referenced.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.
\(=1, \ldots, N\) : The Q Z iteration failed. N o eigenvec-
tors have been calculated, but ALPHAR ( \(\mathcal{I}\),
A LPHAI( 1 ), and BETA ( 1 ) should be conrect for \(\dot{F} \mathbb{N} F O+1, \ldots, N .>N:=N+1:\) other than Q Z iteration failed in SH G EQ Z .
\(=N+2\) : error retum from STGEVC.

\section*{FURTHER DETAILS}
\(B\) alancing a m atrix pair ( \(A, B\) ) includes, first, perm uting row \(s\) and colum ns to isolate eigenvalues, second, applying diagonal sim ilarity transform ation to the row s and colum ns to \(m\) ake the row sand colum ns as close in norm as possible. The com puted reciprocal condition num bers comespond to the balanced \(m\) atrix. Perm uting row \(s\) and colum ns w ill notchange the condition num bers (in exact arithm etic) but diagonal scaling w ill. For further explanation ofbalancing, see section 4.11 .12 of LA PA CK U sers'G uide.

A \(n\) approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue \(w\) and the corresponding exacteigenvalue lam bda is hord (w, lam bda) <= EPS * norm (A BNRM ,BBNRM) /RCONDE (I) A \(n\) approxim ate errorbound forthe angle betw een the \(i\)-th
com puted eigenvectorV L (i) orVR (i) is given by PS * norm (ABNRM , BBNRM) /D \(\mathbb{F}\) (i).

For furtherexplanation of the reciprocalcondition num bers
RCONDE and RCONDV , see section 4.11 ofLAPACK U sers G uide.

\#include <sunperfh>
void dggglm (intn, intm , intp, double *a, int lda, double
*b, int lda, double *d, double *x, double *y, int *info);
void dggglm _64 (long n, long m , long p, double *a, long lda, double *b, long ldb, double *d, double *x, double *y, long *info);

\section*{PURPOSE}
dggglm solves a general G auss M arkov linear model (G LM ) problem :
\(m\) inim ize \(\|y\| 2\) subject to \(d=A * x+B * y\)
x
where \(A\) is an \(N\) by \(M M\) atrix, \(B\) is an \(N\) by \(P m\) atrix, and \(d\) is a given N -vector. It is assum ed that \(\mathrm{M}<=\mathrm{N}<=\mathrm{M}+\mathrm{P}\), and
\[
\operatorname{rank}(A)=M \quad \text { and } \quad \operatorname{rank}(A B)=N .
\]

U nder these assum ptions, the constrained equation is alw ays consistent, and there is a unique solution x and a m inim al 2-norm solution \(y\), which is obtained using a generalized \(Q R\) factorization of \(A\) and \(B\).

In particular, ifm atrix \(B\) is square nonsingular, then the problem G LM is equivalent to the follow ing w eighted linear least squares problem
\(m\) iṅm ize \(\left\|\operatorname{inv}(B)^{\star}\left(d-A *_{x}\right)\right\| 2\)
x
where inv ( \(B\) ) denotes the inverse of \(B\).

\section*{ARGUMENTS}

N (input) The num ber of row sof the m atrioes A and \(\mathrm{B} . \mathrm{N}>=\) 0.

M (input) The num ber of colum ns of the m atrix \(\mathrm{A} .0<=\mathrm{M}<=\) N .
\(P\) (input) The num ber of colum ns of the \(m\) atrix \(B . P>=N-M\).

A (input/output)
O n entry, the \(N\) boy \(-M m\) atrix A. On exit, A is des troyed.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

B (input/output)
On entry, the \(N\) boy P m atrix B. On exit, B is destroyed.

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, N)\).

D (input/output)
O \(n\) entry, \(D\) is the lefthand side of the G LM equation. On exit, D is destroyed.

X (output)
On exit, \(X\) and \(Y\) are the solutions of the GLM problem.

Y (output)
See the description ofX .

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK ( 1 ) retums the optim al
LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK \(>=\) \(m\) ax \((1, N+M+P)\). Foroptim um perform ance, LD W ORK \(>=\) \(M+m\) in \((\mathbb{N}, P)+m\) ax \((\mathbb{N}, P) \star N B\), where \(N B\) is an upperbound for the optim al blocksizes forSGEQRF, SGERQF, SORM QR and SORMRQ .

If LD W ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim al size of
the W ORK aray, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LD W ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit.
\(<0\) : if \(\mathbb{N F O}=-i\), the \(i-\) th argum enthad an ille-
galvalue.

\section*{PURPOSE}
dgghrd reduces a pair of realm atrioes \((A, B)\) to generalized upper Hessenberg form using orthogonal transform ations, \(w\) here \(A\) is a generalm atrix and \(B\) is uppertriangular: \(Q\) '* \(A * Z=H\) and \(Q ' * B * Z=T\), where \(H\) is upper \(H\) essenberg, \(T\) is uppertriangular, and \(Q\) and \(Z\) are orthogonal, and ' \(m\) eans transpose.

The orthogonalm atrices \(Q\) and \(Z\) are determ ined as products of \(G\) ivens rotations. They \(m\) ay eitherbe form ed explicitly, or they \(m\) ay be postm ultiplied into inputm atrices Q 1 and \(\mathrm{Z1}\), so that
\(1 * A * Z 1{ }^{\prime}=\left(Q 1^{*}\right)^{*} H^{*}(Z 1 * Z)^{\prime}\)

\section*{ARGUMENTS}

COMPQ (input)
\(=\mathrm{N}\) ': do not com pute Q ;
\(=I^{\prime}: \mathrm{Q}\) is initialized to the unit m atrix, and the orthogonalm atrix \(Q\) is retumed; \(=V\) : \(: Q \mathrm{~m}\) ust contain an orthogonalm atrix Q 1 on entry, and the product \(\mathrm{Q} \mathrm{I}^{*} \mathrm{Q}\) is retumed.

COMPZ (input)
\(=\mathrm{N}\) ': do notcom pute Z ;
\(=I^{\prime}: Z\) is initialized to the unit \(m\) atrix, and the orthogonalm atrix Z is retumed; = \(\mathrm{V}^{\prime}: \mathrm{Z} \mathrm{m}\) ust contain an orthogonalm atrix Z1 on entry, and the product Z1*Z is retumed.

N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).

ㅍO (input)
It is assum ed thatA is already upper triangular
in row sand colum ns \(1: \mathbb{H O}-1\) and \(\mathbb{H} \mathrm{I}+1 \mathbb{N} . \mathbb{I} \mathrm{O}\) and
Hi I are norm ally setby a previous call to SG G BA L; otherw ise they should be setto 1 and \(N\) respec-
tively. \(1<=\mathbb{H O}<=\mathbb{H} I<=N\), if \(N>0 ; \mathbb{H O}=1\) and \(\mathbb{H} \mathrm{I}=0\), \(\dot{\text { if }} \mathrm{N}=0\).

IH I (input)
See the description of IIO .
A (input/output)
On entry, the N -by -N generalm atrix to be reduced.
On exit, the upper triangle and the first subdiagonalofA are overw ritten w th the upper \(H\) essenberg \(m\) atrix \(H\), and the rest is set to zero.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

B (input/output)
On entry, the \(\mathrm{N}-\) by -N upper triangular \(m\) atrix B .
On exit, the upper triangularm atrix \(T=Q\) ' Z . The elem ents below the diagonal are set to zero.

LD B (input)
The leading dim ension of the array \(B\). LD B \(>=\) \(\max (1, N)\).

Q (input/output)
If \(C O M P Q=N\) : \(Q\) is not referenced.
If COM PQ = 'I': on entry, Q need notbe set, and on exitit contains the orthogonalm atrix \(Q\), where \(Q\) ' is the product of the G ivens transform ations which are applied to \(A\) and \(B\) on the left. IfCOM \(P Q=V\) ': on entry, Q m ust contain an orthogonalm atrix Q 1 , and on exit this is overw rilten by \(Q 1 * Q\).

LD Q (input)
The leading dim ension of the array \(Q . L D Q>=N\) if \(\mathrm{COMPQ}=\mathrm{V}\) 'or I '; LD Q >= 1 otherw ise.

Z (input/output)
If \(C O M P Z=N^{\prime}: Z\) is not referenced.
If COM PZ= I': on entry, Z need notbe set, and on exititcontains the orthogonalm atrix \(Z\), which is the product of the G ivens transform ations which
are applied to \(A\) and \(B\) on the right. If \(\mathrm{COMPZ=V}\) : on entry, Z m ustcontain an orthogonal \(m\) atrix Z1, and on exit this is overw rilten by Z1*Z.

LD \(Z\) (input)
The leading dim ension of the array \(Z\). LD \(Z>=N\) if \(C O M P Z=V\) 'or I'; LD Z >= 1 otherw ise.
\(\mathbb{N F O}\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvahue.

\section*{FURTHER DETAILS}

This routine reduces \(A\) to \(H\) essenberg and \(B\) to triangular form by an unblocked reduction, as described in _M atrix_C om putations_, by G olub and V an Loan (Johns H opkins Press.)

\#include <sunperfh>
void dgglse (intm , intn, intp, double *a, intlda, double
*b, int ldlo, double * c , double *d, double *x, int *info);
void dgglse_64 (long m , long n, long p, double *a, long lda, double *b, long ldb, double *c, double *d, double *x, long *info);

\section*{PURPOSE}
dgglse solves the linear equality-constrained least squares (LSE ) problem :
\(m\) inim ize \(\left\|C-A *_{x}\right\| 2\) subject to \(B *_{x}=d\)
where \(A\) is an \(M\) boy \(N m\) atrix, \(B\) is a \(P\) boy \(N m\) atrix, \(c\) is a given M -vector, and d is a given P -vector. 化 is assum ed that
\(\mathrm{P}<=\mathrm{N}<=\mathrm{M}+\mathrm{P}\), and
\(\operatorname{rank}(B)=P\) and \(\operatorname{rank}((A))=N\).
( (B ) )

These conditions ensure that the LSE problem has a unique solution, which is obtained using a G RQ factorization of the \(m\) atrices \(B\) and A.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(A . M>=0\).

N (input) The num ber of colum ns of the \(m\) atrices \(A\) and \(B . N\) \(>=0\).

P (input) The num ber of row s of them atrix B. \(0<=\mathrm{P}<=\mathrm{N}<=\) \(\mathrm{M}+\mathrm{P}\) 。

A (input/output)
On entry, the M boy-N m atrix A. On exit, A is destroyed.

LD A (input)

The leading dimension of the array A. LD A >= \(\max (1, M)\).

B (input/output)
On entry, the \(P\)-by \(-N\) m atrix B. On exit, \(B\) is destroyed.

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, P)\).
\(C\) (input/output)
On entry, \(C\) contains the right hand side vector for the leastsquares part of the LSE problem. On exit, the residual sum of squares for the solution is given by the sum of squares of elem ents \(\mathrm{N}+\mathrm{P}+1\) to \(M\) ofvector \(C\).

D (input/output)
On entry, D contains the right hand side vector for the constrained equation. On exit, \(D\) is destroyed.

X (output)
On exit, \(X\) is the solution of the LSE problem .

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= \(m a x(1, M+N+P)\). For optim um perform ance LDW ORK >= \(P+m\) in \((M, N)+m\) ax \(M, N) * N B\), where \(N B\) is an upperbound for the optim al blocksizes forSGEQRF, SGERQF, SORM QR and SORMRQ.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit.
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum ent had an illegalvahue.

\section*{PURPOSE}
dggquf com putes a generalized Q \(R\) factorization of an \(N\) toy \(M\) \(m\) atrix \(A\) and an \(N\) boy \(P\) m atrix B :
\[
\mathrm{A}=\mathrm{Q} * \mathrm{R}, \quad \mathrm{~B}=\mathrm{Q} * \mathrm{~T} * \mathrm{Z},
\]
where \(Q\) is an \(N\) boy -N orthogonal matrix, \(Z\) is a \(P-b y-P\) orthogonalm atrix, and \(R\) and \(T\) assum e one of the form S :
```

ifN >= M , R = (R11)M , orifN < M , R = (R11 R12

``` ) N ,
( 0 ) N M
N \(\mathrm{M}-\mathrm{N}\)
M
w here R11 is upper triangular, and
if \(\mathrm{N}<=\mathrm{P}, \mathrm{T}=(0 \mathrm{~T} 12) \mathrm{N}\), orif \(\mathrm{N}>\mathrm{P}, \mathrm{T}=\) ( T 11 )
\(\mathrm{N} P\),
\[
\mathrm{P}-\mathrm{N} N \quad \text { (T21)P }
\]

P
w here T12 orT21 is upper triangular.

In particular, if \(B\) is square and nonsingular, the GQR factorization ofA and \(B\) im plicitly gives the \(Q R\) factorization of inv ( \(B\) ) *A:
\[
\operatorname{inv}(B) \star A=Z \star(\operatorname{inv}(T) \star R)
\]
where inv ( \(B\) ) denotes the inverse of the \(m\) atrix \(B\), and \(Z^{\prime}\) denotes the transpose of the \(m\) atrix \(Z\).

\section*{ARGUMENTS}

N (input) The num ber of row s of the m atrioes A and B. N >=
0.

M (input) The num ber of collm ns of the \(m\) atrix \(A . M>=0\).
\(P\) (input) The num ber of colum ns of the \(m\) atrix \(B . P>=0\).
A (input/output)
On entry, the \(N-b y-M m\) atrix A. On exit, the ele\(m\) ents on and above the diagonalof the aray contain the \(m\) in \((\mathbb{N}, M)-b y-M\) uppertrapezoidalm atrix \(R\) \((R\) is upper triangular if \(N>=M\) ); the elem ents below the diagonal, w ith the array TA U A , represent the orthogonal matrix \(Q\) as a productofm in \((\mathbb{N}, M\) ) elem entary reflectors (see FurtherD etails).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

TAUA (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix \(Q\) (see FurtherD etails).

B (input/output)
On entry, the \(N\) by P m atrix B. On exit, if \(N\) <= \(P\), the upper triangle of the subarray \(B(1 \mathbb{N}, P-\)
\(\mathrm{N}+1 \mathrm{P}\) ) contains the N -by N upper triangularm atrix
T ; if \(\mathrm{N}>\mathrm{P}\), the elem ents on and above the \((\mathbb{N}-\mathrm{P})\) th subdiagonal contain the N -by P upper trapezoidal \(m\) atrix \(T\); the rem aining elem ents, \(w\) ith the array TAUB, represent the orthogonalm atrix Z as a productofelem entary reflectors (see Further D etails).

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, N)\).

TAUB (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix Z (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= \(\max (1, N, M, \mathbb{P})\). For optim um perform ance LW ORK \(>=\) \(\max (\mathbb{N}, \mathrm{M}, \mathbb{P}) * \max (\mathbb{N} 1, N B 2, N B 3)\), where \(N B 1\) is the optim al blocksize forthe \(Q R\) factorization of an N -by -M m atrix, NB2 is the optim al blocksize for the RQ factorization of an \(N\)-by \(P m\) atrix, and NB3 is the optim alblocksize for a callof \(S O R M Q R\).

IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(n, m) .
\]

Each H (i) has the form
H (i) \(=I-\operatorname{tana} * V^{*} V^{\prime}\)
where taua is a real scalar, and \(v\) is a realvectorw ith \(v(1: i-1)=0\) and \(v(i)=1\); \(v(i+1 n)\) is stored on exit in A (i+1 \(n, i)\), and taua in TAUA (i).
To form \(Q\) explicitly, use LAPACK subroutine \(S O R G Q R\). To use \(Q\) to update another matrix, use LAPACK subroutine SORMQR.

Them atrix \(Z\) is represented as a product of elem entary reflectors
\[
Z=H(1) H(2) \ldots H(k), w h e r e k=m \text { in }(n, p) .
\]

Each H (i) has the form
\[
H(i)=I-\operatorname{tanb} * V^{*} V^{\prime}
\]
where taub is a real scalar, and \(v\) is a realvectorw ith \(v(p-k+i+1: p)=0\) and \(v(p-k+i)=1 ; v(1: p-k+i-1)\) is stored on
exitin \(B(n-k+i, 1 p-k+i-1)\), and taub in TA UB (i).
To form Z explicitly, use LAPACK subroutine SORGRQ.
To use \(Z\) to update another \(m\) atrix, use LAPACK subroutine SORMRQ.

*info);
void dggrqf_64 (long m, long p, long n, double *a, long lda, double *taua, double *b, long lalo, double *taub, long *info);

\section*{PURPOSE}
dggrof com putes a generalized RQ factorization of an \(M\) boy -N \(m\) atrix \(A\) and a \(P-b y-N m\) atrix \(B\) :
\[
\mathrm{A}=\mathrm{R} * \mathrm{Q}, \quad \mathrm{~B}=\mathrm{Z} * \mathrm{~T} * \mathrm{Q},
\]
where \(Q\) is an \(N\) boy -N orthogonal matrix, \(Z\) is a \(P-b y-P\) orthogonalm atrix, and \(R\) and \(T\) assum e one of the form \(s\) :
```

ifM <=N, R = (O R12)M, orifM > N, R = ( R11 )
M -N ,
N-M M (R21)N
N

```
w here R12 orR21 is uppertriangular, and
```

ifP >= N, T=(T11)N , orifP < N, T = (T11 T12

```
) P,
\((0) P-N\)
\(N\)\(\quad P \quad N P\)
w here T11 is upper triangular.

In particular, ifB is square and nonsingular, the GRQ factorization ofA and \(B\) im plicitly gives the \(R Q\) factorization of \(A\) *inv ( \(B\) ):
\[
A * \operatorname{inv}(B)=(R * \operatorname{inv}(T)) * Z^{\prime}
\]
where inv \((B)\) denotes the inverse of the \(m\) atrix \(B\), and \(Z^{\prime}\) denotes the transpose of the \(m\) atrix \(Z\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).
N (input) The num ber of colum ns of the \(m\) atrices \(A\) and \(B . N\) \(>=0\).

A (input/output)
On entry, the \(\mathrm{M}-\mathrm{by}-\mathrm{N} \mathrm{m}\) atrix A. On exit, if \(\mathrm{M}<=\)
N , the upper triangle of the subarray A ( \(1 \mathrm{M}, \mathrm{N}\) -
\(\mathrm{M}+1 \mathrm{~N}\) ) contains the M -by -M uppertriangularm atrix
\(R\); if \(M>N\), the elem ents on and above the ( \(M-N\) )th subdiagonal contain the M -by -N upper trapezoidal \(m\) atrix \(R\); the rem aining elem ents, \(w\) ith the array TAUA, represent the orthogonalm atrix \(Q\) as a product ofelem entary reflectors (see Further D etails).

LD A (input)
The leading dim ension of the array A. LDA >= \(m a x(1, M)\).

TAUA (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix \(Q\) (see FurtherD etails).

B (input/output)
On entry, the \(P-\) by -N m atrix B. On exit, the ele\(m\) ents on and above the diagonalof the array contain the \(m\) in \((P, N)-b y-N\) uppertrapezoidalm atrix \(T\) ( \(T\) is upper triangular if \(P>=N\) ); the elem ents below the diagonal, w ith the amay TA UB, represent the orthogonalm atrix Z as a productof elem entary reflectors (see FurtherD etails).

LD B (input)
The leading dim ension of the array \(B . L D B>=\) \(\max (1, P)\).

TAUB (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix Z (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= \(\max (1, N, M, P)\). For optim um perform ance LW ORK \(>=\) \(\max (\mathbb{N}, \mathbb{M}, \mathbb{P}){ }^{\star} \max (\mathbb{N} 1, N B 2, N B 3)\), where NB1 is the optim al blocksize forthe \(R Q\) factorization of an \(M\) by \(-N m\) atrix, NB2 is the optim al blocksize for the \(Q R\) factorization of \(a P-b y-N m\) atrix, and NB3 is the optim alblocksize for a callof \(S O R M R Q\).

IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N} F 0=-\) i, the \(i\)-th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(m, n) .
\]

Each H (i) has the form
H (i) \(=I-\operatorname{tana} * V^{*} V^{\prime}\)
w here taua is a real scalar, and \(v\) is a realvectorw ith \(v(n-k+i+1 m)=0\) and \(v(n-k+i)=1 ; v(1 n-k+i-1)\) is stored on exitin \(A(m-k+i, 1 m-k+i-1)\), and taua in TAUA (i).
To form \(Q\) explicitly, use LAPACK subroutine SORGRQ. To use \(Q\) to update another \(m\) atrix, use LAPACK subroutine SORMRQ.

Them atrix Z is represented as a product of elem entary reflectors
\[
Z=H(1) H(2) \ldots H(k), w \text { here } k=m \text { in }(p, n) .
\]

Each H (i) has the form
\[
H(i)=I-\operatorname{tanb} * V^{*} V^{\prime}
\]
where taub is a real scalar, and \(v\) is a realvectorw ith \(\mathrm{v}(1: i-1)=0\) and \(\mathrm{v}(\mathrm{i})=1\); \(\mathrm{v}(\mathrm{i}+1 \mathrm{p})\) is stored on exit in

B (i+1 p,i), and taub in TA UB (i).
To form Z explicitly, use LAPACK subroutine \(\operatorname{SORGQR\text {.}}\)
To use \(Z\) to update another \(m\) atrix, use LAPACK subroutine SORMQR.

\section*{C INTERFACE}
\#include <sunperfh>
void dggsvd (char jंbu, char jंbv, char jobq, intm, int n, int \(p\), int *k, int * \(l\), double *a, int lda, double *b, int ldb, double *alpha, double *beta, double
\({ }^{*} u\), int ldu, double \({ }^{*}\), int ldv, double * \(q\), int ldq, int *iw ork3, int *info);
void dggsvd_64 (char jंbu, char jंbv, char jंbq, long m, long n, long p, long *k, long *l, double *a, long lda, double *b, long ldb, double *alpha, double *beta, double *u, long ldu, double *v, long ldv, double *q, long ldq, long *íw ork3, long *info);

\section*{PURPOSE}
dggsvd com putes the generalized singular value decom position (G SV D ) of an \(M\) boy \(-N\) realm atrix \(A\) and \(P\) boy \(-N\) realm atrix \(B\) :
\[
U{ }^{*} A * Q=D 1^{*}(0 R), \quad V * B * Q=D 2^{*}(0 R)
\]
where \(\mathrm{U}, \mathrm{V}\) and Q are orthogonal m atriges, and Z ' is the transpose of \(Z\). LetK \(+L=\) the effective num erical rank of them atrix ( \(A\) ', \(B)^{\prime}\) ', then \(R\) is a \(K+L\) boy \(K+L\) nonsingular upper triangularm atrix, \(D 1\) and \(D 2\) are \(M-b y-(K+L)\) and \(P-b y-\) \((\mathbb{K}+\mathrm{L})\) "diagonal" \(m\) atrices and of the follow ing structures, respectively:

IfM \(-\mathrm{K}-\mathrm{C}=0\),
\begin{tabular}{|c|}
\hline \multirow[t]{4}{*}{} \\
\hline \\
\hline \\
\hline \\
\hline
\end{tabular}

K L
```

    D2 = L (0 S )
    P-工 (0 0)
        N-K\dashv K L
    (0R ) = K (0 R11 R12 )
L(0 0 R22)

```
where
\[
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, \text { A LPH }(\mathbb{K}+L)), \\
& S=\operatorname{diag}(\operatorname{BETA}(\mathbb{K}+1), \ldots, \operatorname{BETA}(\mathbb{K}+L)), \\
& C \star * 2+S * * 2=I .
\end{aligned}
\]
\(R\) is stored in \(A(1: K+L, N-K-1 \mathbb{N})\) on exit.

IfM \(\mathrm{K}-\mathrm{L}<0\),
\[
\begin{aligned}
& \text { K M K K + L } \mathrm{M} \\
& D 1=K\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& M K\left(\begin{array}{lll}
0 & C
\end{array}\right) \\
& \text { K M K K + L }-\mathrm{M} \\
& D 2=M K(0 S 0) \\
& \mathrm{K}+\mathrm{L} \mathrm{M} \text { ( } 0 \text { O I ) } \\
& \text { P }-\left(\begin{array}{lll}
0 & 0
\end{array}\right)
\end{aligned}
\]
```

                N-K\dashv K M K K +L M
    (0R ) = K (0 R11 R12 R13 )
M K (0 0 R22 R23 )
K+L-M (0 0 0 R33)

```
where
```

$C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(M))$,
$S=\operatorname{diag}(B E T A(K+1), \ldots, B E T A(M))$,
$C * * 2+S * * 2=I$.

```
(R11 R12 R13) is stored in A ( \(1 \mathrm{M}, \mathrm{N} \mathrm{K}-\mathrm{L}+1 \mathbb{N}\) ), and R 33 is stored
(0 R 22 R 23 )
in \(B(M-1: L, N+M-K+1 \mathbb{N})\) on exit.

The routine com putes \(C, S, R\), and optionally the orthogonal transform ation \(m\) atrices \(U, V\) and \(Q\).

In particular, if B is an N boy N nonsingular m atrix, then the G SVD ofA and B im plicitly gives the SVD ofA *inv \((B)\) :
\[
A * \operatorname{inv}(B)=U *(D 1 * \operatorname{inv}(D 2)) * V{ }^{\prime} .
\]

If ( \(A\) 'B )'has orthonorm alcolum ns, then the G SVD of A and \(B\) is also equal to the \(C S\) decom position of \(A\) and B.Further-
m ore, the G SVD can be used to derive the solution of the eigenvalue problem :

A *A \(\mathrm{x}=\operatorname{lam}\) bda* B *B x .
In som e literature, the G SVD of \(A\) and \(B\) is presented in the form

U *A * \(\mathrm{X}=(0 \mathrm{D} 1), \quad \mathrm{V}{ }^{*} \mathrm{~B} * \mathrm{X}=(0 \mathrm{D} 2)\)
\(w\) here \(U\) and \(V\) are orthogonal and \(X\) is nonsingular, \(D 1\) and \(D 2\) are "diagonal". The form erG SVD form can be converted to the latter form by taking the nonsingularm atrix X as
\[
\begin{aligned}
X= & Q *\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& (0 \operatorname{inv}(\mathbb{R})) .
\end{aligned}
\]

\section*{ARGUMENTS}
\(J O B U\) (input)
\(=\mathrm{U}:\) : O rthogonalm atrix U is com puted;
\(=\mathrm{N}\) : U is notcom puted.
JO BV (input)
\(=\mathrm{V}:\) : O rthogonalm atrix V is com puted;
\(=\mathrm{N}: \mathrm{V}\) is not com puted.
\(J O B Q\) (input)
= Q ': Orthogonalm atrix \(Q\) is com puted;
\(=\mathrm{N}\) ': Q is notcom puted.

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrioes A and B. N \(>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).

K (output)
On exit, \(K\) and L specify the dim ension of the subblocks described in the Pupose section. \(\mathrm{K}+\mathrm{L}=\) effective num erical rank of (A 'B )'.

L (output)
See the description of K .

A (input/output)
On entry, the M -by-N m atrix A. On exit, A contains the triangularm atrix \(R\), orpartofR. See
Purpose fordetails.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

B (input/output)
On entry, the \(P-b y-N\) m atrix B. On exit, B contains the triangularm atrix \(R\) if \(M K-4<0\). See Purpose fordetails.

LD B (input)
The leading dim ension of the array B. LD A >= \(\max (1, P)\).
ALPHA (output)
On exi, ALPHA and BETA contain the generalized singularvahue pairs of \(A\) and ; A LPHA \((1: K)=1\),
\(\operatorname{BETA}(1: K)=0\), and ifM \(K-\Psi=0\), ALPHA \((\mathbb{K}+1 \mathbb{K}+L)\)
= C,
BETA \((K+1 K+L)=S\), or if \(M-K-0\),
A LPHA \((\mathbb{K}+1 \mathrm{M})=\mathrm{C}, \mathrm{A}\) LPHA \((\mathrm{M}+1: \mathrm{K}+\mathrm{L})=0\)
\(\operatorname{BETA}(K+1 M)=S, \quad B E T A(M+1 \pi+L)=1\) and
A LPHA \((\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0\)
\(\operatorname{BETA}(\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0\)

\section*{BETA (output)}

See the description ofA LPH A .
U (output)
If \(\mathrm{JOBU}=\mathrm{U}\) ', U contains the M -by M orthogonal
\(m\) atrix \(U\). If \(J O B U=N ', U\) is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD \(U\) >= \(m a x(1, M)\) if \(J 0 B U=U ' ; L D U>=1\) otherw ise.

V (output)
If \(\mathrm{JOBV}=\mathrm{V}\) ', V contains the P -by P orthogonal \(m\) atrix \(V\). If \(J O B V=N ', V\) is not referenced.

LDV (input)
The leading dim ension of the array V . LDV >= \(\max (1, \mathrm{P})\) if \(\mathrm{JOBV}=\mathrm{V} ; \mathrm{LDV}>=1\) otherw ise.

Q (output)
If \(\mathrm{OOBQ}=\mathrm{Q}\) ', Q contains the N by-N orthogonal \(m\) atrix \(Q\). If \(J O B Q=N\) ', \(Q\) is not referenced.

LD Q (input)
The leading dimension of the array \(Q . L D Q>=\) \(\max (1, N)\) if \(J O B Q=Q ; L D Q>=1\) otherw ise.

W ORK (w orkspace)
dim ension \((\max (3 * N, M, P)+N)\)

IW ORK 3 (output)
dim ension \((\mathbb{N})\) On exit, \(\mathbb{I V}\) ORK 3 stores the sorting
inform ation. M ore precisely, the follow ing loop
w ill.sortALPHA for \(I=K+1\), \(m\) in \((M, K+L) ~ s w a p\)
A LPHA (I) and ALPHA ( \(\mathbb{I N}\) ORK 3 (I)) endfor such that

\#include <sunperfh>
void dggsvp (char jobu, char jobv, char jobg, intm, int p, int \(n\), double *a, int lda, double *b, int ldb, double tola, double tolb, int *k, int *l, double *u, int ldu, double *v, int ldv, double * \(q\), int ldq, int*info);
void dggsvp_64 (char jंbu, char j̀.bv, char jंbq, long m, long p, long \(n\), double *a, long lda, double *b, long ldlb, double tola, double tolb, long *k, long *l, double *u, long ldu, double *v, long ldv, double *q, long ldq, long *info);

\section*{PURPOSE}
dggsvp com putes orthogonalm atrices \(\mathrm{U}, \mathrm{V}\) and Q such that
L (0 0 A 23)
\(M\) K- ( \(0 \quad 0 \quad 0 \quad\) )

N-K L K L
\(\left.=\begin{array}{cc}K\left(\begin{array}{ll}0 & A 12 \\ M-K & \text { A } 13\end{array}\right) \text { ifM } K-L<0 ; ~ \\ 0 & 0 \\ \text { A } 23\end{array}\right)\).

N-K K L
\(\mathrm{V}{ }^{*} \mathrm{~B} * \mathrm{Q}=\mathrm{L}\left(\begin{array}{lll}0 & 0 & \mathrm{~B} 13\end{array}\right)\)
\(P-\left(\begin{array}{lll}0 & 0 & 0\end{array}\right)\)
where the K -by \(\mathrm{K} m\) atrix A 12 and L -by- L m atrix B13 are non-
singularuppertriangular; A 23 is L-by- L upper triangular if \(\mathrm{M} \mathrm{K-L} \mathrm{>=0}\),otherw ise A 23 is M K ) -by -L upper trapezoidal. \(K+L=\) the effective num erical rank of the \(M+P)\)-by \(-N \mathrm{~N}\) atrix
(A ', B )'. Z 'denotes the transpose of Z .

This decom position is the preprocessing step for com puting the Generalized Singular V alue D ecom position (GSVD), see subroutine SG G SV D .

\section*{ARGUMENTS}
\(J 0 \mathrm{BU}\) (input)
\(=\mathrm{U}:\) : O rthogonalm atrix U is com puted;
\(=N^{\prime}: U\) is notcom puted.
JO BV (input)
\(=\mathrm{V}\) : O rthogonalm atrix V is com puted;
= N ': V is not com puted.
\(J O B Q\) (input)
\(=Q\) : O rthogonalm atrix Q is com puted;
\(=N^{\prime}: Q\) is notcom puted.
M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).

N (input) The num ber of collm ns of the m atrioes A and B. N \(>=0\).

A (input/output)
On entry, the M by-N matrix A. On exit, A contains the triangular (or trapezoidal) matrix described in the Purpose section.

LDA (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the \(\mathrm{P}-\) by-N m atrix B. On exit, B contains the triangularm atrix described in the Purpose section.

LD B (input)
The leading dim ension of the aray \(B . L D B>=\) \(\max (1, P)\).

TO LA (input)
TOLA and TOLB are the thresholds to determ ine the effective num erical rank ofm atrix B and a subblock ofA. Generally, they are set to TO LA =
\(\operatorname{MAXM}(\mathbb{N}) \star\) norm (A)*MACHEPS, TOLB =
MAX \((P, N) \star\) norm ( \(B\) )*M ACHEPS. The size of TOLA and TO LB \(m\) ay affect the size of backw ard emors of the decom position.

\section*{TO LB (input)}

See the description of TO LA .

K (output)
O n exit, \(K\) and \(L\) specify the dim ension of the subblocks described in Punpose. \(\mathrm{K}+\mathrm{L}=\) effective num ericalrank of (A 'B )'.

L (output)
See the description of .
U (input) If \(\mathrm{OB} \mathrm{BU}=\mathrm{U}\) ', U contains the orthogonalm atrix U . If \(\mathrm{JO} \mathrm{BU}=\mathrm{N}\) ', U is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD U >= \(\mathrm{max}(1, \mathrm{M})\) if \(\mathrm{JOBU}=\mathrm{U}\) '; LD U >= 1 otherw ise.

V (input) If \(\mathrm{O} \mathrm{BV}=\mathrm{V}\) ', V contains the orthogonalm atrix V . If \(\mathrm{JO} \mathrm{BV}=\mathrm{N}\) ', V is not referenced.

\section*{LD V (input)}

The leading dim ension of the array V . LDV >= \(\max (1, \mathrm{P})\) if \(\mathrm{OOBV}=\mathrm{V}\) '; LDV \(>=1\) otherw ise.
\(Q\) (input) If \(J O B Q=Q\) ', \(Q\) contains the orthogonalm atrix \(Q\). If \(\mathrm{JOBQ}=\mathrm{N}, \mathrm{Q}\) is not referenced.

LD Q (input)
The leading dim ension of the aray \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}\) >= \(\max (1, N)\) if \(J O B Q=Q ; L D Q>=1\) otherw ise.

IN ORK (w orkspace)
dim ension \((\mathbb{N})\)

TAU (w orkspace)
dim ension (N)

W ORK (w orkspace)
dim ension MAX ( \(\left.3{ }^{\star} \mathrm{N}, \mathrm{M}, \mathrm{P}\right)\) )
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

The subroutine uses LA PACK subroutine SGEQPF for the QR factorization \(w\) ith \(c o l u m n\) pivoting to detect the effective num erical rank of the a \(m\) atrix. It \(m\) ay be replaced by a better rank determ ination strategy.

\(\mathbb{N}\) TEGER NEQNS,COLSTR (*),ROW \(\mathbb{N} D\left({ }^{*}\right)\),NRHS,LDRHS,
    OUTUNT,MSGLVL, \(\mathbb{E R}\)
CHARACTER*3 ORDMTHD
DOUBLE PRECISION VALUES (*),RHS (*)
DOUBLE PRECISION HANDLE (150)

\section*{PURPOSE}

DGSSFS -G eneral sparse solver one call interface.

\section*{PARAMETERS}
```

MTXTYP -CHARACTER*2
On entry, M TX TY P specifies the coefficientm atrix type. Specifically, the valid options are:

```

Sp 'or SP '-sym m etric structure, positive-definite values
ss'or SS '-sym m etric structure, sym m etric values
su'or SU '-sym m etric structure, unsym \(m\) etric values
uu 'or UU '-unsym \(m\) etric structure, unsym \(m\) etric values
U nchanged on exit.

\section*{PIVOT -CHARACTER*1}

On entry, pivot specifies w hether ornotpivoting is used in the course of the num eric factorization.
The valid options are:
h'or N '-no pivoting is used
(Pivoting is not supported forthis release).
U nchanged on exit.

NEQNS - \(\mathbb{N}\) TEGER
On entry, NEQN S specifies the num ber ofequations in the coefficientm atrix. NEQ NS m ustbe at leastone. U nchanged on exit.
\(\operatorname{COLSTR}\left(^{\star}\right)-\mathbb{N}\) TEGER array
On entry, \(\operatorname{COLSTR}\) ( \({ }^{*}\) ) is an array of size \((\mathbb{N} E Q \mathrm{~N}+1\) ), containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND ( \({ }^{\star}\) ) - \(\mathbb{N}\) TEG ER array
On entry, ROWIND ( \({ }^{*}\) ) is an array of size CO LSTR \(\mathbb{N E Q N S + 1 ) - 1 , ~ c o n t a i n i n g ~ t h e ~ i n d i c e s ~ o f ~ t h e ~}\) \(m\) atrix structure. U nchanged on exit.
\(\operatorname{VALUES}\) ( \(^{*}\) ) -D O UBLE PREC ISION aray
O \(n\) entry, VALUES (*) is an aray of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the non-zero num eric values of the sparse \(m\) atrix to be factored. U nchanged on exit.

NRHS - \(\mathbb{N}\) TEGER
On entry, N RH S specifies the num ber of righthand sides to solve for. U nchanged on exit.

RHS (*) -DOUBLE PRECISION anay
On entry, RHS (LDRHS,NRHS) contains the NRHS right hand sides. On exit, itcontains the solutions.

\section*{LDRHS - \(\mathbb{N}\) TEGER}

On entry, LD RH S specifies the leading dim ension of the RH S array. U nchanged on exit.

ORDMTHD -CHARACTER*3
On entry, ORDM THD specifies the fill-reducing ordering to be used by the sparse solver. Specifically, the valid options are:
hat'or NAT'-naturalordering (no ordering) mmd'or M M D '-m ultiplem inim um degree gnd 'or GND '-generalnested dissection
uso 'or U SO '-user specified ordering (see D G SSU O )
U nchanged on exit.

OUTUNT - \(\mathbb{N}\) TEGER
O utputunit. U nchanged on exit.
M SGLVL - \(\mathbb{N}\) TEGER
M essage level.
0 -no output from solver.
N o m essages supported for this release.)
U nchanged on exit.

HANDLE (150) -D OUBLE PREC IS IO N array
On entry, HANDLE (*) is an array of containing inform ation needed by the solver, and \(m\) ust.be passed unchanged to each sparse solver subroutine.
M odified on exit.
\(\mathbb{E R} \quad-\mathbb{N} T E G E R\)
E rrornum ber. If no emrorencountered, unchanged on
exit. If errorencountered, it is set to a non-zero
integer. Enrornum bers setby this subroutine:
-101 : Failure to dynam ically allocate m em ory.
-102 : Invalid m atrix type.
-103 : Invalid pivotoption.
-104 : N um berofnonzeros is less than N EQ N S .
-105: NEQNS < 1
-201: Failure to dynam ically allocate \(m\) em ory.
-301 : Failure to dynam ically allocate \(m\) em ory.
-401 : Failure to dynam ically allocate \(m\) em ory.
-402 : NRHS < 1
-403 :NEQNS > LDRHS
-666 : Intemalemor.

\mathbb{NTEGER NEQNS,COLSTR (*),ROW IND (*),OUTUNT,MSGLVL,\mathbb{ER}}\mathbf{N}\mathrm{ (*)}
DOUBLE PRECISION HANDLE (150)

```

\section*{PURPOSE}

DGSSIN -Initialize the sparse solver and input the \(m\) atrix
structure.

\section*{PARAMETERS}
```

MTXTYP -CHARACTER*2
On entry,M TX TY P specifies the coefficientm atrix
type. Specifically, the valid options are:
sp 'or SP '-symm etric structure, positive-definite values
ss'or SS'-symm etric structure, sym m etric values
su'or SU '-symm etric structure, unsym m etric values
uu 'or UU '-unsymm etric structure, unsym m etric values
U nchanged on exit.
PIVOT -CHARACTER*1
On entry,PIV OT specifies w hetherornotpivoting is
used in the course of the num eric factorization.

```

The valid options are:
h'or \(\mathrm{N}^{\text {' }}\)-no pivoting is used
(Pivoting is not supported for this release).
U nchanged on exit.

NEQNS - \(\mathbb{N}\) TEGER
On entry, NEQNS specifies the num ber of equations in the coefficientm atrix. NEQNS m ustibe at leastone. U nchanged on exit.
\(\operatorname{COLSTR}\) ( \(\left.^{( }\right)-\mathbb{N}\) TEGER aray
On entry, \(\operatorname{COLSTR}\left({ }^{*}\right)\) is an array of size \((\mathbb{N} E Q \mathrm{~N}+1)\), containing the pointers of them atrix structure. U nchanged on exit.

\section*{ROWIND (*) - \(\mathbb{N}\) TEG ER anay}

On entry, ROWIND ( \({ }^{*}\) ) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the indices of the \(m\) atrix structure. Unchanged on exit.

HANDLE (150) -D OUBLE PREC IS IO N array
On entry, HANDLE (*) is an array containing
inform ation needed by the solver, and \(m\) ust.be passed unchanged to each sparse solver subroutine.
M odified on exit.

OUTUNT - \(\mathbb{N} T E G E R\)
O utputunit. U nchanged on exit.

\section*{PARAMETERS}

NRHS - \(\mathbb{N}\) TEGER
On entry, N RH S specifies the num ber of righthand
sides to solve for. U nchanged on exit.

RHS (LDRHS,*) -D OUBLE PRECISION array
On entry, RH S (LDRHS,NRHS) contains the NRHS right hand sides. On exit, it contains the solutions.

LDRHS - \(\mathbb{N}\) TEGER
On entry, LD RH S specifies the leading dim ension of the RH S array. U nchanged on exit.

HANDLE (150) -D OUBLE PREC ISIO N aray
O n entry, HANDLE ( \({ }^{\star}\) ) is an array containing
inform ation needed by the solver, and \(m\) ustbe passed
unchanged to each sparse solver subroutine.
M odified on exit.

ER
- \(\mathbb{N}\) TEGER

Errornum ber. If no errorencountered, unchanged on
exit. If errorencountered, it is set to a non-zero
integer. Errornum bers setby this subroutine:
-400 : Invalid calling sequence - need to callD G SSFA first.
-401 : Failure to dynam ically allocate \(m\) em ory.
-402 : NRHS < 1
-403 : NEQN S > LD RHS

\section*{PURPOSE}
dgtoon estim ates the reciprocal of the condition num berofa real tridiagonalm atrix A using the LU factorization as com puted by SG TTRF.

A \(n\) estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND = \(1 /\) (ANORM * norm (inv (A))).

\section*{ARGUMENTS}

NORM (input)
Specifies w hether the 1-norm condition number or the infinity-norm condition num ber is required:
= 1 'or \(\mathrm{O}^{\prime}\) : 1 -nom ;
= I': Infinity-norm .
N (input) The order of the matrix \(A . N>=0\).
LOW (input)
The \((n-1) m\) ultipliers that define the \(m\) atrix \(L\) from the LU factorization of A as com puted by SG TTRF.

D IA G (input)

The n diagonalelem ents of the upper triangular \(m\) atrix \(U\) from the \(L U\) factorization ofA.

UP1 (input)
The ( \(n-1\) ) elem ents of the first superdiagonal of U.

UP2 (input)
The ( \(n-2\) ) elem ents of the second superdiagonal of U.
\(\mathbb{P I V O T}\) (input)
The pivotindioes; for \(1<=i<=n\), row \(i\) of the matrix was interchanged with row PIVOT (i). IPIVOT (i) will always be either \(i\) or i+1; PIVOT (i) = iindicates a row interchange \(w\) as not required.

ANORM (input)
IfNORM = I'orD', the 1-norm of the original \(m\) atrix \(A\). IfNORM = I', the infinity-nom of the originalm atrix A .

RCOND (output)
The reciprocal of the condition number of the \(m\) atrix \(A\), com puted as RCOND \(=1 /(A N O R M * A \mathbb{N} V N M)\), where \(A \mathbb{N} V N M\) is an estim ate of the 1 -nom of \(\operatorname{inv}(A)\) com puted in this routine.

W ORK (w orkspace)
dim ension \((2 * N)\)

IV ORK 2 (w orkspace)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvalue

\section*{PURPOSE}
dgtrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is tridiagonal, and provides enorbounds and backw ard enrorestim ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system of equations:
\(=N\) : A * \(\mathrm{X}=\mathrm{B} \quad \mathrm{N} \circ\) transpose)
= \(T\) ': A ** \(T\) * \(\mathrm{X}=\mathrm{B}\) ( T ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose \(=\mathrm{T}\) ranspose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

LOW (input)
The \((n-1)\) subdiagonalelem ents of .

D IA G (input)
The diagonalelem ents of A.
UP (input)
The \((n-1)\) superdiagonalelem ents of \(A\).
LOW \(F\) (input)
The ( \(n-1\) ) multipliers that define the \(m\) atrix \(L\) from the LU factorization of \(A\) as com puted by SG TTRF.

D IA GF (input)
Then diagonalelem ents of the upper triangular \(m\) atrix \(U\) from the \(L U\) factorization ofA.

UPF1 (input)
The ( \(n-1\) ) elem ents of the first superdiagonal of U.

UPF2 (input)
The ( \(n-2\) ) elem ents of the second superdiagonal of U.
\(\mathbb{P I V O T}\) (input)
The pivot indices; for \(1<=\mathrm{i}<=\mathrm{n}\), row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P I V O T}\) (i). PPIVOT (i) will alw ays be either \(i\) or i+1; PIV T (i) = iindicates a row interchange was not required.
\(B\) (input) The righthand side m atrix \(B\).
LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, \mathbb{N})\).

X (input/output)
O \(n\) entry, the solution \(m\) atrix \(X\), as com puted by SG TTRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay X . LD X >= \(\max (1, N)\).
FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\underset{)}{ })-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{j})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vector X (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvalue

void dgtsv_64 (long n, long nrhs, double *low , double *diag, double *up, double *b, long ldb, long *info);

\section*{PURPOSE}
dgtsv solves the equation
where \(A\) is an \(n\) by \(n\) tridiagonalm atrix, by \(G\) aussian elm ination \(w\) ith partialpivoting.

N ote that the equation \(A\) *X \(=\mathrm{B}\) m ay be solved by interchanging the order of the argum ents \(D U\) and \(D L\).

\section*{ARGUMENTS}

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num berof righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS >= 0 .

LOW (input/output)
On entry, LOW m ust contain the ( \(n-1\) ) sub-diagonal elem ents ofA.

On exit, LOW is overw ritten by the ( \(n-2\) ) elem ents of the second super-diagonal of the upper triangularm atrix \(U\) from the \(L U\) factorization of \(A\), in LOW (1), ..., LOW (n-2).

D IA G (input/output)
O n entry, D IA G m ustcontain the diagonal elem ents ofA.

On exit, D IA G is overw rilten by the \(n\) diagonal elem ents of \(U\).

UP (input/output)
O n entry, UP m ust contain the ( \(n-1\) ) super-diagonal elem ents of .

On exit, UP is overw ritten by the ( \(n-1\) ) elem ents of the first super-diagonal of \(U\).

B (input/output)
On entry, the N by NRH S m atrix of righthand side
matrix B. On exit, if \(\mathbb{N} F O=0\), the \(N\) by NRHS solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i, U(i, i)\) is exactly zero, and the solution has notbeen com puted. The factorization has notbeen com pleted unless \(i=N\).

\#include <sunperfh>
void dgtsvx (char fact, chartransa, intn, intnrhs, double
*low , double *diag, double *up, double *low f, double *diagf, double *upfl, double *upf2, int *ipivot, double *b, int ldb, double *x, int ldx, double *rcond, double *ferr, double *berr, int *info);
void dgtsvx_64 (char fact, chartransa, long n, long nrhs, double *low, double *diag, double *up, double * low f, double *diagf, double *upfl, double *upf2, long *ịíivot, double *b, long ldb, double *x, long ldx, double *rcond, double *ferr, double *benr, long *info);

\section*{PURPOSE}
dgtsvx uses the LU factorization to com pute the solution to a realsystem of linear equations \(A * X=B\) or \(A * T * X=B\), where \(A\) is a tridiagonalm atrix oforder \(N\) and \(X\) and \(B\) are N -by-N R H S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the LU decom position is used to factor the \(m\) atrix A
as \(A=L * U, w h e r e L\) is a product of perm utation and unitlow er
bidiagonal \(m\) atrices and \(U\) is upper triangular \(w\) ith nonzeros in
only the \(m\) ain diagonaland first tw o superdiagonals.
2. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the m atrix A. If the
reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for X and com pute error bounds as described below .
3.The system ofequations is solved for X using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
m atrix and calculate error bounds and backw ard enror estim ates for it.

\section*{ARGUMENTS}

FACT (input)
Specifies whether ornot the factored form of A has been supplied on entry.\(=F\) ': LOW F, D IA GF, UPF1, UPF2, and IPIVOT contain the factored form of \(A\); LOW, DIAG,UP,LOW F,D \(\mathbb{A} G F, U P F 1, U P F 2\) and \(\mathbb{P} \mathbb{V}\) O T w illnotbe m odified. \(=\mathrm{N}\) ': The m atrix w ill be copied to LOW F, D IA G F , and U PF1 and factored.

TRANSA (input)
Specifies the form of the system of equations:
\(=N: A * X=B \quad\) N \(\circ\) transpose)
\(=T\) ': A ** \(T\) * \(\mathrm{X}=\mathrm{B}\) ( T ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B}\) (C onjugate transpose = T ran-
spose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{N}\) TERFACE.

N (input) The order of them atrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrix B. NRH S \(>=0\).

LOW (input)
The ( \(\mathrm{n}-1\) ) subdiagonalelem ents ofA.

D IA G (input)
The n diagonalelem ents of A.
UP (input/output)
The ( \(n-1\) ) superdiagonalelem ents ofA.

LOW F (input/output)
IfFACT \(=F^{\prime}\), then LOW \(F\) is an inputargum ent and on entry contains the \((\mathrm{n}-1) \mathrm{m} u\) ultipliers that define the \(m\) atrix \(L\) from the \(L U\) factorization of \(A\) as com puted by SG TTRF .

IfFACT \(=N^{\prime}\) ', then LOW \(F\) is an outputargum entand on exitcontains the \((n-1) m\) ultipliers that define them atrix \(L\) from the LU factorization of \(A\).

D IA G F (input/output)
If \(F A C T=F\) ', then \(D I A G F\) is an inputargum ent and on entry contains the \(n\) diagonalelem ents of the uppertriangularm atrix \(U\) from the LU factorization ofA.

IfFACT \(=\mathrm{N}^{\prime}\), then D IAGF is an output argum ent and on exit contains the \(n\) diagonalelem ents of the upper triangularm atrix \(U\) from the LU factorization ofA .

UPF1 (input/output)
IfFACT = F', then UPF1 is an inputargum ent and on entry contains the ( \(n-1\) ) elem ents of the first superdiagonal of \(U\).

IfFACT \(=N\) ', then UPF1 is an output argum entand on exit contains the ( \(n-1\) ) elem ents of the first superdiagonalof .

UPF2 (input/output)
IfFACT \(=F^{\prime}\), then \(U P F 2\) is an input argum ent and
on entry contains the ( \(n-2\) ) elem ents of the second superdiagonalofU .

IfFACT \(=\mathrm{N}\) ', then UPF2 is an outputargum entand on exitcontains the ( \(n-2\) ) elem ents of the second superdiagonalofU .

PIVOT (input/output)
If \(F A C T=F '\), then \(\mathbb{P I V O T}\) is an input argum ent and on entry contains the pivotindioes from the LU factorization of A as com puted by SG TTRF. IfFACT = \(N\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indices from the LU factorization of \(A\); row iof the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P} \mathbb{I V O T}\) (i). \(\mathbb{P} \mathbb{I V O T}\) (i) w illalw ays be eitherior i+1; \(\mathbb{P} \mathbb{I V}\) OT (i) = iindicates a row interchange w as not required.

B (input) The N -by -N RH S righthand side m atrix B .

LD B (input)
The leading dim ension of the aray B . LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\) by -N RH \(S\) solution
\(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array \(\mathrm{X} . \mathrm{LD} \mathrm{X}>=\) \(\max (1, \mathbb{N})\).

RCOND (output)
The estim ate of the reciprocal condition num ber of the \(m\) atrix \(A\). IfRCOND is less than the \(m\) achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0.

FERR (output)
The estim ated forw ard enrorbound for each solution vector \(X()\) ) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O})\) FERR ( \()\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{j})\)-XTRUE) divided by the \(m\) agnitude of the largestelem entin \(\mathrm{X}(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X\) (i) (i.e., the \(s m\) allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).
W ORK (w orkspace)
dim ension \((3 * N)\)

W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has notbeen com pleted unless \(i=N\), but the factorU is exactly singular, so the solution and error bounds could notbe com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, but RCOND is less than \(m\) achine precision, meaning that the \(m\) atrix is singular to working precision. N evertheless, the solution and errorbounds are com puted because there are a num ber of sifuations where the com puted solution can be m ore accurate than the value of RCOND w ould suggest.

## PURPOSE

dgttrf com putes an LU factorization of a real tridiagonal $m$ atrix A using elim ination w ith partialpivoting and row interchanges.

The factorization has the form

$$
A=L * U
$$

where $L$ is a productof perm utation and unit low er bidiagonalm atrices and $U$ is uppertriangularw ith nonzeros in only them ain diagonal and first tw o superdiagonals.

## ARGUMENTS

N (input) The order of the m atrix A.

LOW (input/output)
On entry, LOW m ustcontain the ( $n-1$ ) sub-diagonal elem ents ofA.

On exit, LOW is overw ritten by the ( $n-1$ ) multipliers that define the $m$ atrix $L$ from the $L U$ factorization of A.

D IA G (input/output)
On entry, D IA G m ust contain the diagonal elem ents ofA.

On exit, D IA G is overw rilten by the $n$ diagonal elem ents of the upper triangularm atrix $U$ from the LU factorization ofA.

UP1 (input/output)
On entry, UP1 must contain the ( $n-1$ ) superdiagonalelem ents ofA.

On exit, UP1 is overw ritten by the ( $n-1$ ) elem ents of the first super-diagonalof $U$.

UP2 (output)
On exit, UP2 is overw rilten by the ( $n-2$ ) elem ents of the second super-diagonalofU.

IPIVOT (output)
The pivotindioes; for $1<=i<=n$, row $i$ of the matrix was interchanged w th row $\mathbb{P I V O T}$ (i). IPIVOT (i) will always be either $i$ or i+1; PIVOT (i) = iindicates a row interchange was not required.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0$ : if $\mathbb{N} F O=-k$, the $k$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=k, U(k, k)$ is exactly zero. The factorization has been com pleted, but the factor $U$ is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

## C INTERFACE

\#include <sunperfh>
void dhgeqz (char job, char com pq, char com pz, int n, int ilo, int ini, double *a, int lda, double *b, int ldb, double *alphar, double *alphai, double *beta, double *q, int ldq, double *z, int ldz, int *info);
void dhgeqz_64 (char job, charcom pq, char com pz, long n, long ilo, long ini, double *a, long lda, double *b, long ldb, double *alphar, double *alphai, double *beta, double *q, long ldq, double *z, long ldz, long *info);

## PURPOSE

dhgeqz im plem ents a single-/double-shift version of the Q Z $m$ ethod for finding the generalized eigenvalues $B$ is upper triangular, and A is block upper triangular, w here the diagonal blocks are either 1 -by-1 or 2 -by- 2 , the 2 -by- 2 blocks having com plex generalized eigenvalues (see the description of the argum entJo B.)

If $J 0 B=S$ ', then the pair $(A, B)$ is sim ultaneously reduced to Schur form by applying one orthogonal tranform ation (usually called Q ) on the left and another (usually called Z) on the right. The 2 -by -2 upper-triangular diagonalblocks ofB comesponding to 2 -by -2 blocks of A w ill be reduced to positive diagonal $m$ atrices. (Ie., if $A(j+1, j)$ is non-zero, then $B(j+1, j)=B(j j+1)=0$ and $B(j)$ and $B(j+1, j+1) w i l l$ be positive.)

If $\mathrm{JO} B=\mathrm{E}$ ', then ateach iteration, the sam e transform ations are com puted, but they are only applied to those parts of A and $B$ which are needed to com pute A LPHAR, A LPH A I, and BETAR .

If $J O B=S$ 'and $C O M P Q$ and COMPZ are $V$ ' or $I^{\prime}$ ', then the
orthogonal transform ations used to reduce ( $\mathrm{A}, \mathrm{B}$ ) are accum ulated into the arrays $Q$ and $Z$ s.t.:
(in) A (in) Z (in) ${ }^{\star}=\mathrm{Q}$ (out) A (out) Z (out)*

Ref: C B.M oler \& G W . Stew art, "A n A lgorithm for Generalized M atrixigenvalue Problem s", SIAM J. Num er. A nal, 10 (1973) „. 241-256.

## ARGUMENTS

JOB (input)
$=E$ ': com pute only A LPHAR, A LPH A I, and BETA. A and $B \mathrm{w}$ ill notnecessarily be putinto generalized
Schur form . = $S^{\prime}:$ putA and B into generalized
Schur form, as w ellas com puting A LPHAR,ALPHAI, and BETA .
COMPQ (input)
$=\mathrm{N}$ : do notm odify Q .
$=\mathrm{V}$ ':m ultiply the array Q on the right by the transpose of the orthogonaltranform ation that is applied to the left side of A and B to reduce them to Schur form . = 'I': like COM PQ = V ', except that Q w illbe initialized to the identily first.

COMPZ (input)
$=\mathrm{N}$ : do notm odify Z.
$=\mathrm{V}$ ': m ultiply the amray Z on the right by the orthogonal tranform ation that is applied to the right side of $A$ and $B$ to reduce them to Schur form . = I': like C OM PZ=V', exceptthatZ will be initialized to the identily first.

N (input) The order of the $m$ atrices $A, B, Q$, and $Z . N>=0$.

IIO (input)
It is assum ed thatA is already upper triangular in row s and colum ns $1: \Pi \mathrm{O}-1$ and $\mathrm{H} \mathrm{I}+1 \mathrm{~N} .1<=\Pi 0$ $<=\mathbb{H} I<=N$, if $N>0 ; \mathbb{H}=1$ and $\mathbb{H} I=0$, if $N=0$.

IH I (input)
See the description of IIO .

A (input) On entry, the $N$ boy- $N$ upper $H$ essenberg $m$ atrix $A$.
Elem ents below the subdiagonalm ustbe zero. If
$J O B=S$ ', then on exit $A$ and $B$ will have been
sim ultaneously reduced to generalized Schur form .
If $J O B=E$ ', then on exitA w ill have been des -
troyed. The diagonalblocks w illbe corect, but
the off-diagonalportion $w$ illbe $m$ eaningless.

LD A (input)
The leading din ension of the array A. LD A $>=\max$ ( $1, \mathrm{~N})$.
$B$ (input) On entry, the $N$ boy -N upper triangular $m$ atrix $B$. Elem ents below the diagonalm ustbe zero. 2 -by- 2 blocks in $B$ corresponding to 2 -by-2 blocks in A w illbe reduced to positive diagonal form . (I.e., if $(j+1, \gamma)$ is non-zero, then $B(j+1, j)=B(j j+1)=0$ and $B(j)$ ) and $B(j+1, j+1) w$ illlbe positive.) If JO $B=S$ ', then on exit $A$ and $B$ will have been sim ultaneously reduced to Schur form. If JO B=E', then on exith w illhave been destroyed. Elem ents corresponding to diagonal blocks of A w illlbe conect, but the off-diagonal portion w ill be m eaningless.

LD B (input)
The leading dim ension of the array $B . L D B>=m a x($ 1,N ).

ALPHAR (output)
A LPHAR ( $1 \mathbb{N}$ ) w illlbe set to realparts of the diagonalelem ents of $A$ thatw ould result from reducing $A$ and $B$ to Schur form and then further reducing them both to triangular form using unitary transform ations s.t.the diagonalof B was nonnegative real. Thus, if A ( $j, j$ is in a 1 by-1 block (i.e., $A(j+1, j)=A(j j+1)=0)$, then A LPHAR $(\mathcal{j})=A(j)$. N ote that the (realor com plex) values (ALPHAR ( $\mathcal{j}$ ) $+\mathrm{i}^{\star} A \operatorname{LPHAI}(\mathcal{j})$ )BETA ( $\mathcal{j}$, $j 1, \ldots, N$, are the generalized eigenvalues of the $m$ atrix pencill $-w B$.

## A LPHA I (output)

A LPH A I( $1: \mathbb{N}$ ) w illbe set to im aginary parts of the diagonal elem ents of A that would result from reducing $A$ and $B$ to Schur form and then further reducing them both to triangular form using unitary transform ations s.t. the diagonal of $B \mathrm{w}$ as non-negative real. Thus, ifA ( 7 ) is in a 1-by-1 block (i.e., $A(j+1, j)=A(j j+1)=0)$, then A LPHAR ( $\mathcal{j}=0$. N ote that the (real orcomplex)
 $\dot{F} 1, \ldots, N$, are the generalized eigenvalues of the $m$ atrix pencilA $-w B$.
$\operatorname{BETA}(1 \mathbb{N})$ w illbe set to the (real) diagonal ele$m$ ents of $B$ thatw ould result from reducing $A$ and $B$ to Schur form and then further reducing them both to triangular form using unitary transform ations s.t. the diagonal of $B$ was non-negative real. Thus, if A (j) is in a 1-by-1 block (ie., $A(j+1, j)=A(j j+1)=0)$, then BETA $(j=B(j)$. N ote that the (real or complex) values (A LPHAR ( $\mathcal{j}$ ) i*ALPHAI ( $\mathcal{I}$ ) ABETA ( $\mathcal{j}$, $\bar{j} 1, \ldots, N$, are the generalized eigenvalues of the $m$ atrix pencil $A-w B$. N ote thatBETA ( $1: \mathbb{N}$ ) w illalw ays be non-negative, and no BETA I is necessary .)

Q (input/output)
If $C O M P Q=N$ ', then $Q \mathrm{w}$ illnotbe referenced. If $C O M P Q=V^{\prime}$ or ' I ', then the transpose of the orthogonal transform ations w hich are applied to $A$ and $B$ on the leftw ill be applied to the array $Q$ on the right.

LD Q (input)
The leading dim ension of the array $\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1$. If $C O M P Q=V$ 'or $I$ ', then $L D Q>=N$.

Z (input/output)
If COM PZ=N', then Z w ill notbe referenced. If COM PZ=V' or 'I', then the orthogonal transform ations w hich are applied to $A$ and $B$ on the right w illbe applied to the array $Z$ on the right.

LD Z (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=1$. If $\mathrm{COM} \mathrm{MZ}=\mathrm{V}$ 'or I ', then LD $\mathrm{Z}>=\mathrm{N}$.

W ORK (w orkspace)
On exit, if $\mathbb{N}$ FO >= 0,W ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. LW ORK >= $\max (1, N)$.

IfLW O RK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{I N F O}$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue
$=1, \ldots, N$ : the QZ iteration did not converge. ( $\mathrm{A}, \mathrm{B}$ ) is not in Schur form, but A LPHAR (i), A LPHAI(i), and BETA (i), $i=\mathbb{N} F O+1, \ldots, N$ should be correct. $=\mathrm{N}+1, \ldots, 2 \star \mathrm{~N}$ : the shiftcalculation failed. ( $A, B$ ) is not in Schur form, but ALPHAR (i), ALPHAI(i), and BETA (i), $i=\mathbb{N F O}-$ $\mathrm{N}+1, \ldots, \mathrm{~N}$ should be conect. > 2*N: various "im possible" errors.

## FURTHER DETAILS

Iteration counters:

JITER - counts iterations.
ITER - counts iterations run since ILAST w as last
changed. This is therefore resetonly when a 1-
by-1 or
2-by-2 block deflates off the bottom .

## C INTERFACE

\#include <sunperfh>
void dhsein (char side, char eigsrc, char initv, int *select, intn, double *h, int ldh, double *W $r$, double *W i, double *Vl, int ldvl, double *Vr, int ldvr, int mm , int *m, int *ifaill, int *ifailr, int *info);
void dhsein_64 (charside, char eigsrc, char initv, long *select, long $n$, double *h, long ldh, double *W $r_{\text {, }}$ double *w i, double *vl, long ldvl, double *Vr, long ldvr, long mm, long *m, long *ifaill, long *ifailr, long *info);

## PURPOSE

dhsein uses inverse iteration to find specified rightand/or lefteigenvectors of a realupper H essenberg m atrix H .

The righteigenvectorx and the lefteigenvector $y$ of the $m$ atrix $H$ corresponding to an eigenvalue $w$ are defined by:

$$
\mathrm{H}^{\star} \mathrm{x}=\mathrm{w}^{\star} \mathrm{x}, \quad \mathrm{y}^{\star * \mathrm{~h}} \star \mathrm{H}=\mathrm{w}^{\star} \mathrm{y}^{\star *} \mathrm{~h}
$$

where $y^{\star *}$ h denotes the conjugate transpose of the vectory.

## ARGUMENTS

SID E (input)
$=R$ ': com pute righteigenvectors only;
$=\mathrm{L}$ ': com pute lefteigenvectors only;
$=\mathrm{B}$ ': com pute both right and lefteigenvectors.

E IG SRC (input)
Specifies the souroe of eigenvalues supplied in ( N R, W I):
= Q ': the eigenvalues were found using SHSEQR; thus, if H has zero subdiagonalelem ents, and so is block-triangular, then the jth eigenvalue can be assum ed to be an eigenvalue of the block containing the jth row /colum $n$. This property allow s SHSEIN to perform inverse iteration on justone diagonalblock. = N ': no assum ptions are $m$ ade on the correspondence betw een eigenvalues and diagonalblocks. In this case, SH SE $\mathbb{I N}$ m ustalw ays perform inverse tieration using the w hole $m$ atrix $H$.
$\mathbb{N} \mathbb{I T V}$ (input)
= N ': no initial vectors are supplied;
= U ': user-supplied initial vectors are stored in the arrays VL and/orVR.

## SELECT (input/output)

Specifies the eigenvectors to be com puted. To select the real eigenvector corresponding to a realeigenvalueW R ( $\mathcal{j}$ ), SELEC T ( 7 ) m ust be set to TRUE.. To select the complex eigenvector corresponding to a complex eigenvalue ( N R ( $\mathcal{j}$, N $\mathrm{I}(\mathcal{J})$ ), with complex conjugate

orboth m ustbe set to

N (input) The order of the matrix $\mathrm{H} . \mathrm{N}>=0$.

H (input) The upperH essenberg $m$ atrix H .

LD H (input)
The leading din ension of the amay H . LD H >= $\max (1, N)$.

W R (input/output)
On entry, the real and im aginary parts of the eigenvahues of H ; a complex conjugate pairof eigenvaluesm ustbe stored in consecutive elem ents
of W R and W I. On exit, W R m ay have been altered
since close eigenvalues are perturbed slightly in searching for independenteigenvectors.

W I (input)
See the description ofW R.

V L (input/output)
On entry, if $\mathbb{N} \operatorname{ITV}=\mathrm{U}$ 'and $S \mathbb{D E}=\mathrm{L}$ 'or $\mathrm{B}^{\prime}, \mathrm{VL}$
$m$ ust contain starting vectors for the inverse iteration for the lefteigenvectors; the starting vector for each eigenvectorm ustbe in the sam e colum $n(s)$ in which the eigenvectorw illbe stored. On exit, if $S \mathbb{D} E=$ L' or B', the lefteigenvectors specified by SELECT w ill.be stored consecutively in the colum ns ofV L, in the sam e order as their eigenvahues. A complex eigenvector corresponding to a com plex eigenvalue is stored in tw o consecutive colum ns , the first holding the real part and the second the im aginary part. If $S \mathbb{D E}=\mathrm{R}, \mathrm{VL}$ is notreferenced.

LDVL (input)
The leading dim ension of the array $\mathrm{VL} . \mathrm{LDVL}>=$ $\max (1, N)$ if $S \mathbb{D} E=L$ 'or $B^{\prime} ;$ LDVL $>=1$ other wise.

VR (input/output)
On entry, if $\mathbb{N}$ ITV $=U$ 'and $S \mathbb{D} E=R$ 'or $B^{\prime}, V R$ $m$ ust contain starting vectors for the inverse teration for the righteigenvectors; the starting vector for each eigenvectorm ustbe in the sam e colum $n(s)$ in $w$ hich the eigenvectorw ill.be stored. On exit, ifSIDE = R 'or B', the righteigenvectors specified by SELECT w ill.be stored consecutively in the colum ns ofVR, in the sam e order as their eigenvahues. A complex eigenvector corresponding to a com plex eigenvalue is stored in tw o conseculive colum ns , the first holding the real part and the second the im aginary part. If $S \mathbb{D E}=\mathbb{L}, \mathrm{VR}$ is notreferenced.

LDVR (input)
The leading dim ension of the array $V R$. LDVR >= $\max (1, N)$ if $S \mathbb{D} E=R$ 'or $B^{\prime} ; \operatorname{LDVR}>=1$ otherw ise.

M M (input)
The num ber of colum ns in the arrays $V L$ and/or $V R$. $M M>=M$.

M (output)
The num ber of colum $n s$ in the arrays $V L$ and/or VR required to store the eigenvectors; each selected realeigenvector occupies one column and each selected com plex eigenvector occupies tw o colum ns.

W ORK (w orkspace)
dim ension $(\mathbb{N}+2) * N)$

FAIIL (output)
 left eigenvector in the ith column of VL (comesponding to the eigenvalue w (J) failed to converge; $\mathbb{F A} \Pi L(i)=0$ ifthe eigenvectorconverged satisfactorily. If the i-th and (i+1)th colum ns of VL hold a com plex eigenvector, then FAIIL (i) and $\mathbb{F A} \Pi L$ (i+1) are set to the same value. If $S \mathbb{D} E=R$ ', $\mathbb{F} A \mathbb{I} L$ is notreferenced.

FAIIR (output)
If $S \mathbb{D} E=R$ 'or $B$ ', $\mathbb{F} A \mathbb{I} R(i)=j>0$ if the right eigenvector in the i-th colum $n$ of $V R$ (comesponding to the eigenvalue w (J) failed to converge; $\mathbb{F A} \Pi R(i)=0$ ifthe eigenvectorconverged satisfactorily. If the $i$ th and (i+1)th colum ns of VR hold a com plex eigenvector, then FAMR (i) and $\mathbb{F A} \Pi R(i+1)$ are set to the same value. IfS $\mathbb{E}=\mathbb{L}$ ', $\mathbb{F} A \mathbb{L}$ is notreferenced.
$\mathbb{I N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the i-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i$, $i$ is the num ber of eigenvectors w hich failed to converge; see IFA IIL and IFA IIR for further details.

## FURTHER DETAILS

Each eigenvector is norm alized so that the elem ent of largest $m$ agnitude has $m$ agnitude 1 ; here the $m$ agnitude of a com plex num ber $(x, y)$ is taken to be $|x|+|y|$.

void dhseqr(char job, char com pz, intn, int ilo, int ihi, double *h, int ldh, double *w r, double *w i, double *z, int ldz, int *info);
void dhseqr_64 (char jं.b, char com pz, long n, long ilo, long ini, double *h, long ldh, double *w r, double *w i, double *z, long ldz, long *info);

## PURPOSE

dhseqr com putes the eigenvalues of a real upper $H$ essenberg $m$ atrix $H$ and, optionally, the $m$ atrices $T$ and $Z$ from the Schurdecomposition $H=Z \mathrm{~T} \mathrm{Z**T}$, where T is an upper quasi-triangular $m$ atrix (the Schur form ), and $Z$ is the orthogonalm atrix of Schurvectors.

O ptionally Z m ay be postm ultiplied into an input orthogonal $m$ atrix $Q$, so that this routine can give the Schur factorization of a m atrix A which has been reduced to the $H$ essenberg form $H$ by the orthogonal $m$ atrix $Q: A=Q * H * Q * T=$ (Q Z) ${ }^{*} \mathrm{~T}^{*}(\mathrm{Q} Z){ }^{* *} \mathrm{~T}$.

## ARGUMENTS

JOB (input)
= E ': com pute eigenvalues only;
$=S^{\prime}$ : com pute eigenvalues and the Schur form T .

COMPZ (input)
$=\mathrm{N}$ ': no Schurvectors are com puted;
$=I^{\prime}: \mathrm{Z}$ is in inialized to the unit m atrix and
the m atrix Z of churvectors of H is retumed; $=$ V ': Z mustcontain an orthogonal matrix Q on entry, and the productQ *Z is retumed.

N (input) The order of the m atrix $\mathrm{H} . \mathrm{N}>=0$.

It is assum ed that H is already upper triangular in row s and colum ns 1: $\mathbb{T}-1$ and $\mathbb{H} \mathrm{I}+1 \mathrm{~N} . \mathbb{I} \mathrm{O}$ and $\mathbb{H}$ I are norm ally setby a previous call to SG EBA L, and then passed to SGEHRD w hen them atrix output by SG EBA $L$ is reduced to $H$ essenberg form. O therw ise HO and $\mathbb{H} I$ should be set to 1 and $N$ respectively. $1<=\mathbb{H O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H} \mathrm{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

IH I (input)
See the description of IIO .
H (input/output)
On entry, the upper H essenberg $m$ atrix H . On exit, if $J O B=S ', H$ contains the upper quasitriangularm atrix $T$ from the Schur decom position (the Schur form); 2-by-2 diagonal blocks (comesponding to com plex conjugate pairs of eigenvalues) are retumed in standard form, w ith $\mathrm{H}(i, i)=H(i+1, i+1)$ and $H(i+1, i) * H(i, i+1)<0$. If $\mathrm{JOB}=\mathrm{E}$ ', the contents of H are unspecified on exit.

LD H (input)
The leading din ension of the array H. LD H >= $\max (1, N)$.

W R (output)
The real and im aginary parts, respectively, of the com puted eigenvalues. Iftw o eigenvalues are com puted as a com plex conjugate pair, they are stored in consecutive elem ents of $W R$ and $W I$, say the $i$-th and (i+1)th, with W I(i) > 0 and $W$ I(i+1) < 0 . If $J 0 B=S$ ', the eigenvalues are stored in the sam e order as on the diagonal of the Schur form retumed in $H$, w ith $W$ R (i) $=\mathrm{H}(i, i)$ and, if H ( $i: i+1, i: i+1$ ) is a 2 -by -2 diagonalblock, $W$ I(i) $=$ squt $(\mathrm{H}(i+1, i) * H(i, i+1))$ and $W I(i+1)=-W I(i)$.

W I (output)
See the description ofW R .

Z (input) IfCOM PZ = N ': Z is not referenced.
If COM PZ = I': on entry, Z need notbe set, and on exit, $Z$ contains the orthogonalm atrix $Z$ of the Schurvectors of H . IfCOM PZ = V ': on entry Z m ust contain an N -by -N m atrix Q , which is assum ed to be equal to the unitm atrix except for the sub$m$ atrix $Z$ ( $\mathbb{H} O: \mathbb{H} I, \mathbb{I} O: \mathbb{H} I$ ); on exitZ contains $Q$ *Z . N orm ally $Q$ is the orthogonalm atrix generated by SORGHR after the call to SGEHRD which form ed the

H essenberg $m$ atrix $H$.

LD Z (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=$ $\max (1, N)$ if COMPZ = I'orV';LD $Z>=1$ otherwise.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= $\max (1, N)$.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0: successfulexit
<0: if $\mathbb{I N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=i, S H$ SEQR failed to com pute allof the eigenvalues in a total of 30* ( $\mathbb{H} \mathrm{I}-\mathbb{H O}+1$ ) iterations; elem ents 1 :ilo- 1 and i+ 1 m of $\mathrm{W} R$ and W I contain those eigenvalues w hich have been successfully com puted.

DESCRIPTION

A $<-A P$
$A<-A P^{\prime}$
( 'indicates m atrix transpose)
$w$ here perm utation $P$ is represented by an integervector $\mathbb{P} E R M$, such that $\mathbb{P E R M}(I)$ is equal to the position of the only nonzero elem entin row Iofperm utation $m$ atrix $P$.

N O TE : In orderto get a sym etrically perm uted jagged diagonal $m$ atrix P A P', one can explicitly perm ute the colum ns P A by calling

SJADRP ( $0, M, M, V A L, \mathbb{N} D X, P N T R, M A X N Z, \mathbb{P} E R M, W$ ORK,LW ORK)
where param eters $V A L, \mathbb{N D X}, P N T R, M A X N Z, \mathbb{P E R M}$ are the representation of $A$ in the jagged diagonal form at. The operation $m$ akes sense if the originalm atrix $A$ is square.

## ARGUMENTS

TRAN SP Indicates how to operate $w$ ith the perm utation $m$ atrix
0 : operate w ith m atrix
1 : operate $w$ ith transpose $m$ atrix

M $\quad \mathrm{N}$ um berof row $s$ in matrix A

K $\quad \mathrm{N}$ um ber of colum ns in matrix A

VAL () amay of length PNTR MAXNZ+1)-PNTR (1) consisting of entries ofA. VA L can be view ed as a colum $n m$ ajor ordering of a row perm utation of the E llpack representation of A, w here the Ellpack representation is perm uted so that the row $s$ are non-increasing in the num ber of nonzero entries. $V$ alues added for padding in Ellpack are not included in the Jagged - D iagonal form at.

INDX () array of length PN TR MAXNZ+1)-PNTR (1) consisting of the colum $n$ indices of the corresponding entries in VAL.

PNTR () array of length M AXNZ+1, where PNTR (I) PNTR (1)+1 points to the location in VA L of the firstelem ent in the row -perm uted E lhpack represenation of .

M A X N Z max num ber ofnonzeros elem ents per row.
$\mathbb{P} E R M$ ( integeramay of length $K$ such that $I=\mathbb{P} E R M$ ( $I$ ).

A ray $\mathbb{P} E R M$ represents a perm utation $P$, such that $\mathbb{P E R M}$ ( I ) is equal to the position of the only nonzero elem ent in row Iofperm utation $m$ atrix $P$.
Forexam ple, if
|001|
$\mathrm{P}=\left|\begin{array}{lll}1 & 0 & 0\end{array}\right|$
|010|
then $\mathbb{P E R M}=(3,1,2)$.

W ORK () scratch array of length LW ORK. LW ORK should be at leastK.

LW ORK length ofW ORK aray

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

& C<-A L P H A \text { Op (A)D B + BETA } C
\end{aligned}
$$

where A LPH A and BETA are scalar, $C$ and $B$ are $m$ by $n$ dense $m$ atrices, $D$ is a diagonalscaling $m$ atrix, $A$ is a unit, ornon-unit, upper or low ertriangularm atrix represented in jagged-diagonal form at and $o p(A)$ is one of $\operatorname{op}(A)=\operatorname{inv}(A)$ or op (A) $=\operatorname{inv}(A) \operatorname{or} \operatorname{op}(A)=\operatorname{inv}\left(\operatorname{conjg}\left(A^{\prime}\right)\right)$ (inv denotesm atrix inverse, 'indicates m atrix transpose)

## ARGUMENTS

TRAN SA Indicates how to operate $w$ th the sparse $m$ atrix 0 : operate $w$ ith $m$ atrix 1 : operate $w$ ith transpose $m$ atrix
2 : operate $w$ ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M $\quad N$ um berof row $s$ in $m$ atrix A

N $\quad N$ um berof colum ns in matrix $C$

UN ITD Type of scaling:
1 : Identity matrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum n scaling)
4 : A utom atic row scaling (see section N O TES for further details)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger anay D ESCRA (1) m atrix structure

0 : general
1 : symm etric ( $A=A$ )
2 : Herm ( $\mathrm{A}=\mathrm{CONJG}$ (A))
3 :Triangular
4 : Skew (A nti)-Symm etric ( $A=-A$ )
5 :D iagonal
6 : Skew Herm itian ( $\mathrm{A}=-\mathrm{CON}$ J ( A ) )
N ote:For the routine, DESCRA (1)=3 is only supported.
DESCRA (2) upper/low er triangular indicator
1: low er
2 : upper
DESCRA (3) m ain diagonaltype
0 :non-unit
1 : unit
DESCRA (4) A ray base $\mathbb{N} O T \mathbb{M}$ PLEM ENTED )
0 :C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? $\mathbb{N} O T \mathbb{I}$ PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL 0 array of length NNZ consisting of entries of A. VA L can be view ed as a colum $n m$ ajorordering of a row perm utation of the Ellpack representation of A, where the Ellpack representation is perm uted so that the row s are non-increasing in the num ber of nonzero entries. V alues added forpadding in E llpack are not included in the Jagged-D iagonal form at.
$\mathbb{N} D \mathrm{X} 0 \quad$ array of length NNZ consisting of the colum n indices of the comesponding entries in VAL.

PNTR 0) array of length M AXNZ +1 , where PNTR ( 1 ) PNTR (1) +1 points to the location in VA L of the firstelem ent in the row -perm uted $E$ lipack represenation of $A$.

MAXNZ max num berofnonzeros elem ents per row .
$\mathbb{P E R M}$ ) integer array of length M such that $\mathrm{I}=\mathbb{P} E R M$ ( I ), where row I in the originalE llpack representation corresponds to row I' in the perm uted representation. If $\operatorname{PERM}(\mathbb{1})=0$, its assum ed by convention that $\mathbb{P E R M}(\mathbb{I})=I . \mathbb{P E R M}$ is used to determ ine the order in which row s ofC are updated.

B 0 rectangular array w th first dim ension LD B.

LD B leading dim ension ofB
BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .
LD C leading dim ension of $C$

W ORK () scratch array of length LW ORK.
On exit, ifLW ORK $=-1, W$ ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK aray. LW ORK should be at least2*M.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on multiple processors, LW ORK $>=2 * \mathrm{M}$ *N_CPUS where N_CPUS is the maxim um num berof processors available to the program.

If LW ORK $=0$, the routine is to allocate $w$ orkspace needed.
IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

## SEE ALSO

N IST FORTRAN Sparse B las U ser's G uide available at:
http://m ath nistgov/m csd/Staff/k Rem ington/Ispblas/

http://w w w netlib .org/utk/papers/sparse.ps

## NOTES/BUGS

1. No test for singularity ornear-singularity is included in this routine. Such tests $m$ ust.be perform ed before calling this routine.
2. If U N ITD $=4$, the routine scales the row s ofA such that their 2 -norm s are one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK (1)=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here $i$ is the row num berw hich 2 -norm is exactly zero.
3. If $\operatorname{DESCRA}(3)=1$ and UN ITD < 4, the unitdiagonalelem ents $m$ ightorm ightnotbe referenced in the JA D representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD=4, the unit diagonalelem ents M U ST be referenced in the $\sqrt{A} D$ representation.
4.The routine can be applied for solving triangular system $s$ w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ust.be equal to 3 in this case.

## C INTERFACE

\#include < sunperfh>
void dlagtf(intn, double *a, double lam bda, double *b, double *c, double tol, double *d, int *in, int *info);
void dlagtf_ 64 long $n$, double *a, double lam bda, double *b, double *c, double tol, double *d, long *in, long *info);

## PURPOSE

dlagtf factorizes the $m$ atrix ( $I-l a m$ bda* $I$ ), where $T$ is an $n$ by $n$ tridiagonalm atrix and lam bda is a scalar, as w here $P$ is a perm utation $m$ atrix, $L$ is a unit lower tridiagonal $m$ atrix $w$ ith atm ostone non-zero sub-diagonalelem ents per colum $n$ and $U$ is an uppertriangularm atrix $w$ th atm ost tw o non-zero super-diagonalelem ents per colum $n$.

The factorization is obtained by $G$ aussian elim ination $w$ ith partialpivoting and im plicit row scaling.

The param eterLAMBDA is included in the routine so that SLAGTF may be used, in conjunction w ith SLAGTS, to obtain eigenvectors of $T$ by inverse iteration.

## ARGUMENTS

N (input) The orderof the m atrix T .

A (input/output)
On entry, A m ust contain the diagonalelem ents of T.

On exit, A is overw ritten by the $n$ diagonal ele$m$ ents of the upper triangularm atrix $U$ of the factorization of $T$.

LAM BDA (input)
O n entry, the scalar lam bda.
B (input/output)
O $n$ entry, $B m$ ust contain the ( $n-1$ ) super-diagonal
elem ents of $T$.

On exit, B is overw rilten by the ( $\mathrm{n}-1$ ) superdiagonal elem ents of the $m$ atrix $U$ of the factorization of $T$.

C (input/output)
On entry, C m ustcontain the ( $\mathrm{n}-1$ ) sub-diagonal elem ents of $T$.

On exit, $C$ is overw rilten by the ( $n-1$ ) subdiagonal elem ents of the $m$ atrix $L$ of the factorization of $T$.
TOL (input/output)
On entry, a relative tolerance used to indicate whetherornot the $m$ atrix ( $T$-lam bda*I) is nearly singular. TO L should norm ally be chose as approxi$m$ ately the largest relative emror in the elem ents of T.For exam ple, if the elem ents of T are comect to about 4 significant figures, then TO L should be set to about $5 * 10 * *(-4)$. If TOL is supplied as less than eps, w here eps is the relative $m$ achine precision, then the value eps is used in place of TOL .

D (output)
Onexit, $D$ is overw ritten by the ( $n-2$ ) second super-diagonal elem ents of the $m$ atrix $U$ of the factorization of $T$.
$\mathbb{N}$ (output)
On exit, $\mathbb{N}$ contains details of the perm utation $m$ atrix $P$. If an interchange occumed at the $k$ th step of the elim ination, then $\mathbb{N}(\mathbb{K})=1$, otherw ise $\mathbb{N}(k)=0$.The elem ent $\mathbb{N}(n)$ retums the sm allest positive integer jsuch that
abs(u (خز) ) le.nom ( (T -lam bda*I) (ך) )*TO L,
where norm (A $(\mathcal{J})$ ) denotes the sum of the absolute values of the th row of the $m$ atrix A. If no such jexists then $\mathbb{N}(n)$ is retumed as zero. If $\mathbb{I N}(n)$ is retumed as positive, then a diagonalelem ent of U is sm all, indicating that ( $\mathrm{T}-\mathrm{lam}$ bda*I) is singularornearly singular,
$\mathbb{N}$ FO (output)
= 0 : successfulexit

void dlarz_64 (char side, long m, long n, long l, double *v, long incv, double tau, double *c, long ldc);

## PURPOSE

dlarz applies a realelem entary reflector $H$ to a realM foy-N $m$ atrix $C$, from either the left or the right. $H$ is represented in the form

$$
H=I-\tan ^{\star} \mathrm{v}^{\star} \mathrm{v}^{\prime}
$$

$w$ here tau is a realscalar and $v$ is a realvector.

If tau $=0$, then $H$ is taken to be the unitm atrix.
$H$ is a product of $k$ elem entary reflectors as retumed by STZRZF.

## ARGUMENTS

STDE (input)
$=\mathbb{L}$ : form $H * C$
$=R$ ': form $C * H$

M (input) The num ber of row sof the $m$ atrix $C$.

N (input) The num ber of colum ns of the m atrix C .

L (input) The num ber ofentries of the vector $V$ containing the $m$ eaningful part of the $H$ ouseholdervectors. If $S \mathbb{D} E=L ', M>=L>=0$, if $S D E=R \prime, N>=L$ $>=0$.

V (input) The vector v in the representation of H as retumed by $S T Z R Z F . V$ is notused ifTA $U=0$.
$\mathbb{N} C V$ (input)
The increm entbetw een elem ents ofv. $\mathbb{N} C V$ <> 0.

TAU (input)
The value tau in the representation of $H$.
C (input/output)
On entry, the M -by -N m atrix C. On exit, C is overw ritten by the $m$ atrix $H$ * $C$ if $S \mathbb{D} E=L$ ', or C * H if $S \mathbb{D} E=R$ '.
LDC (input)
The leading dim ension of the array C.LD C >= $m a x(1, M)$.

W ORK (w orkspace)
$(\mathbb{N})$ if $S \mathbb{D} E=L^{\prime}$ or $\left.M\right)$ if $S \mathbb{D} E=R^{\prime}$

## C INTERFACE

\#include <sunperfh>
void dlarzt(char direct, char storev, intn, int $k$, double * $v$, int ldv, double *tau, double *t, int ldt);
void dlarzt_64 (chardirect, charstorev, long n, long k, double *v, long ldv, double *tau, double *t, long ldt);

## PURPOSE

dlarzt form s the triangular factor $T$ of a realblock reflector $H$ of order > $n$, which is defined as a productof $k$ elem entary reflectors.

IfD $\mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{H}=\mathrm{H}(1) \mathrm{H}(2) \ldots \mathrm{H}(\mathrm{k})$ and T is upper triangular;

IfD $\mathbb{R E C T}=\mathrm{B}^{\prime}, \mathrm{H}=\mathrm{H}(\mathrm{k}) \ldots \mathrm{H}(2) \mathrm{H}(1)$ and T is lower triangular.

IfSTOREV = C', the vector which defines the elem entary reflector $H$ (i) is stored in the $i$-th colum $n$ of the array $V$, and

$$
\mathrm{H}=\mathrm{I}-\mathrm{V} * \mathrm{~T} * \mathrm{~V}^{\prime}
$$

IfSTOREV = R', the vector which defines the elem entary reflectort (i) is stored in the $i$-th row of the array $V$, and

$$
H=I-V^{\prime *} T * V
$$

C unently, only STOREV = R'and D $\mathbb{R E C T}=\mathrm{B}$ 'are supported.

## ARGUMENTS

D $\mathbb{R E C T}$ (input)
Specifies the order in which the elem entary
reflectors are multiplied to form the block
reflector:
$=F^{\prime}: H=H(1) H(2) \ldots H(k)$ Forw ard, notsup-
ported yet)
$=B^{\prime}: H=H(k) \ldots H(2) H(1)$ (Backw ard)

## STOREV (input)

Specifies how the vectors w hich define the elem entary reflectors are stored (see also Further
D etails):
= R ': row w ise
N (input) The order of the block reflector $\mathrm{H} . \mathrm{N}>=0$.
$K$ (input) The order of the triangular factor $T \vDash$ the num ber of elem entary reflectors). $\mathrm{K}>=1$.
$V$ (input) ( $L D V, K$ ) if $S T O R E V=C^{\prime}(L D V, N)$ if $S T O R E V=R^{\prime}$ Them atrix $V$. See furtherdetails.

LD V (input)
The leading dim ension of the array V . If $\operatorname{STOREV}=$ $C$ ', LDV $>=\max (1, N)$; ifSTOREV = $R$ ', LDV $>=K$.

TAU (input)
TAU (i) must contain the scalar factor of the elem entary reflectort (i).
$T$ (input) The $k$ by $k$ triangular factor $T$ of the block reflector. If $\mathrm{D} \mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{T}$ is upper triangular; if $\mathrm{D} \mathbb{R E C T}=\mathrm{B}$ ', T is low er triangular. The restof the aray is notused.

LD T (input)
The leading dim ension of the array T.LD T >=K.

## FURTHER DETAILS

B ased on contributions by
A. Petitet, C om puter Science D ept., U niv. of Tenn., K noxville, U SA

The shape of the $m$ atrix $V$ and the storage of the vectors which define the $H$ (i) is bestillustrated by the follow ing exam ple w th $\mathrm{n}=5$ and $\mathrm{k}=3$. The elem ents equal to 1 are not stored; the comesponding aray elem ents arem odified but restored on exit. The restof the array is notused.

void dopm tr_64 (char side, char uplo, char trans, long m, long n, double *ap, double *tau, double *c, long ldc, long *info);

## PURPOSE

dopm troverw rites the general real M boy-N matrix C with TRANS = T: $\quad \mathrm{Q} * * \mathrm{~T} * \mathrm{C} \quad \mathrm{C} * \mathrm{Q} * * \mathrm{~T}$
where $Q$ is a realorthogonalm atrix of ordernq, $w$ ith $n q=m$ if $S \mathbb{D} E=L$ 'and $n q=n$ if $S \mathbb{D} E=R$ '. $Q$ is defined as the product of nq-1 elem entary reflectors, as retumed by SSPTRD using packed storage:
if $U P L O=U ', Q=H(n q-1) \ldots$ (2) $H(1) ;$
if UPLO = L', $\mathrm{Q}=\mathrm{H}(1) \mathrm{H}(2) \ldots \mathrm{H}(\mathrm{nq}-1)$.

## ARGUMENTS

STDE (input)
$=\mathrm{L}$ ': apply Q orQ ${ }^{* *}$ T from the Left;
= R ': apply Q orQ ${ }^{* * T}$ from the R ight.

UPLO (input)
= U ':U ppertriangular packed storage used in previous call to SSPTRD ; = L':Low ertriangular packed storage used in previous call to SSPTRD .

TRANS (input)
$=\mathrm{N}$ ': N o transpose, apply Q ;
$=T$ ': Transpose, apply $Q * * T$.
TRANS is defaulted to $N$ 'forF $95 \mathbb{N}$ TERFACE .

M (input) The num ber of row s of the $m$ atrix $\mathrm{C} . \mathrm{M}>=0$.

N (input) The num ber of colum ns of the m atrix $\mathrm{C} . \mathrm{N}>=0$.
AP (input)
$(M *(M+1) / 2)$ if $S D E=L(\mathbb{N} *(N+1) / 2)$ if $S D E=$
$R$ ' The vectors which define the elem entary
reflectors, as retumed by SSP TRD . A P ism odified
by the routine but restored on exit.
TAU (input)
or $(\mathbb{N}-1)$ if $S \mathbb{D} E=R^{\prime} T A U(i)$ must contain the scalar factor of the elem entary reflectorH (i), as retumed by SSPTRD.
C (input/output)
On entry, the M by -N m atrix C. On exit, C is overw ritten by Q * C or $\mathrm{Q} * \mathrm{~T}^{*} \mathrm{C}$ or $\mathrm{C}^{*} \mathrm{Q} * * \mathrm{~T}$ or $\mathrm{C}{ }^{\mathrm{Q}} \mathrm{Q}$.

LD C (input)
The leading dim ension of the array C.LD C >= $\max (1, \mathrm{M})$.

W ORK (w orkspace)
$(\mathbb{N})$ if $S \mathbb{D} E=L^{\prime}(M)$ if $S \mathbb{D} E=R^{\prime}$
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an ille-
galvalue

CHARACTER (LEN=1) ::VECT
$\mathbb{N} T E G E R(8):: M, N, K, L D A, L W O R K, \mathbb{N} F O$

## C INTERFACE

\#include <sunperfh>
void dorgbr(charvect, intm, intn, int $k$, double *a, int lda, double *tau, int *info);
void dorgbr_64 (charvect, long m, long $n$, long $k$, double *a, long lda, double *tau, long *info);

## PURPOSE

dorgbrgenerates one of the realorthogonal matrices $Q$ or $\mathrm{P} * * \mathrm{~T}$ determ ined by $S G E B R D$ when reducing a realm atrix $A$ to bidiagonal form : $A=Q * B * P * * T . Q$ and $P * * T$ are defined as products of elem entary reflectors $H$ (i) orG (i) respectively.

IfVECT $=Q$ ', $A$ is assum ed to have been an $M$ boy $K m$ atrix, and $Q$ is of orderM :
ifm $>=k, Q=H(1) H(2) \ldots H(k)$ and $S O R G B R$ retums the firstn colum ns of $Q$, where $m>=n>=k$;
ifm $<k, Q=H(1) H(2) \ldots H(m-1)$ and $S O R G B R$ retums $Q$ as an $M$ boy $-M$ matrix.

IfVECT $=P$ ', A is assum ed to have been a K -by -N m atrix, and $P{ }^{* *} \mathrm{~T}$ is oforderN:
if $k<n, P * * T=G(k) \ldots G(2) G(1)$ and $S O R G B R$ retums the firstm row $\operatorname{sof} P * * T$, where $n>=m>=k$; ifk $>=n, P * * T=G(n-1) \ldots G(2) G(1)$ and $S O R G B R$ retums $P * * T$ as an $N$ boy $N$ m atrix.

## ARGUMENTS

VECT (input)
Specifies w hether the matrix $Q$ orthem atrix $P * * T$
is required, as defined in the transform ation
applied by SGEBRD :
= Q ': generate Q ;
$=\mathrm{P}^{\prime}:$ generate $\mathrm{P} * * \mathrm{~T}$.

M (input) The num ber of row s of the $m$ atrix $Q$ orP**T to be retumed. $\mathrm{M}>=0$.

N (input) The num ber of colum ns of the $m$ atrix Q or $\mathrm{P} * * T$ to
be retumed. $\mathrm{N}>=0$. IfVECT $=Q \mathrm{~V}^{\prime}, \mathrm{M}>=\mathrm{N}>=$ $m$ in $(M, K) ;$ ifVECT $=P^{\prime}, N>=M>=m$ in $(\mathbb{N}, K)$.
$K$ (input) IfVECT = Q ', the num berof colum ns in the original $M$ boy $K m$ atrix reduced by $S G E B R D$. IfVECT $=$ $P$ ', the num ber of row $s$ in the original $K$ boy $N$ m atrix reduced by SG EBRD . $\mathrm{K}>=0$.

A (input/output)
O n entry, the vectors w hich define the elem entary reflectors, as retumed by SGEBRD. On exit, the M łoy-N m atrix Q orP**T.

LD A (input)
The leading dim ension of the array $\mathrm{A} . \operatorname{LDA}>=$ $\max (1, M)$.

TAU (input)
$(m$ in $(\mathbb{M}, K))$ ifVECT = $Q^{\prime}(m$ in $(\mathbb{N}, K))$ ifVECT $=P^{\prime}$
TAU (i) m ustcontain the scalar factor of the ele$m$ entary reflectorH (i) orG (i), which determ ines Q or $\mathrm{P} * * \mathrm{~T}$, as retumed by $\mathrm{SG} E B R D$ in its array argu$m$ entTAUQ orTAUP.

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the amay W ORK. LW ORK >= $m$ ax $(1, m$ in $M, N))$. Foroptim um perform ance LW ORK >= $m$ in $(M, N) * N B, w h e r e N B$ is the optim alblocksize.

IfLW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i$ th argum enthad an illegalvalue

## C INTERFACE

\#include < sunperfh>
void dorgql(intm , intn, int k, double *a, int lda, double
*tau, int *info);
void dorgql_64 (long m , long n, long k, double *a, long lda, double *tau, long *info);

## PURPOSE

dorgqlgenerates an $M$ by N realm atrix Q with orthonorm al colum ns, which is defined as the lastN colum ns of a product ofK elem entary reflectors of orderM
$\mathrm{Q}=\mathrm{H}(\mathrm{k}) \ldots \mathrm{H}(2) \mathrm{H}(1)$
as retumed by SG EQ LF .

## ARGUMENTS

M (input) The num ber of row s of the m atrix $\mathrm{Q} . \mathrm{M}>=0$.

N (input) The num ber of colum ns of the matrix $\mathrm{Q} . \mathrm{M}>=\mathrm{N} \quad>=$ 0.

K (input) The num ber of elem entary reflectors whose product defines the m atrix $\mathrm{Q} . \mathrm{N}>=\mathrm{K}>=0$.

A (input/output)
On entry, the $(n-k+i)$-th columnmust contain the vector which defines the elem entary reflector H (i), for $i=1,2, \ldots, k$, as retumed by SG EQ LF in the last k colum ns of its anay argum entA. On exit, the $M$-by $-\mathrm{N} m$ atrix $Q$.

LD A (input)
The first dim ension of the array A. LDA >= max (1, M).

TAU (input)
TAU (i) must contain the scalar factor of the elem entary reflectort (i), as retumed by SG EQ LF .

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al
LDW ORK.
LDW ORK (input)
The dimension of the amay W ORK. LDW ORK >=
$m$ ax $(1, N)$. Foroptim um perform ance LD $W$ ORK $>=N * N B$, where NB is the optim alblocksize.

If LD W ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthas an illegalvalue

## C INTERFACE

\#include <sunperfh>
void dorm hr(charside, chartrans, intm , int n, int مlo, int ini, double *a, int lda, double *tau, double ${ }^{*} \mathrm{C}$, int $\mathrm{ld}_{\mathrm{l}}$, int *info);
void dorm hr 64 (charside, chartrans, long m, long n, long ilo, long ini, double *a, long lda, double *tau, double * c , long ldc, long *info);

## PURPOSE

dorm hroverw rites the general real $M-b y-N m a t r i x ~ C ~ w ~ i t h ~$ TRANS = T': $\mathrm{Q}^{* * T * C \quad C * Q * * T ~ T ~}$
where $Q$ is a real orthogonalm atrix of order nq, w ith nq = m if $S \mathbb{D} E=L$ 'and $n q=n$ if $S \mathbb{D} E=R$ '. Q is defined as the productof $\mathbb{H}$ I-HO elem entary reflectors, as retumed by SG EHRD :

## ARGUMENTS

SID E (input)
$=\mathrm{L}$ ': apply Q or $\mathrm{Q} * * \mathrm{~T}$ from the Left;
$=\mathrm{R}^{\prime}$ : apply Q orQ ${ }^{* *} \mathrm{~T}$ from the R ight.

TRANS (input)
$=\mathrm{N}^{\prime}: \mathrm{N}$ o transpose, apply Q ;
$=T$ ': Transpose, apply $\mathrm{Q} * * \mathrm{~T}$.

TRANS is defaulted to $N$ 'forF $95 \mathbb{N}$ TERFACE.

M (input) The num ber of row s of the m atrix $\mathrm{C} . \mathrm{M}>=0$.

N (input) The num ber of colum ns of the m atrix $\mathrm{C} . \mathrm{N}>=0$.

IIO (input)
IIO and IH Im usthave the sam evalues as in the
previous call of SGEHRD.Q is equal to the unit
$m$ atrix except in the subm atrix

Q (ilo+1:ihi,ilo+1: : ihi). IfS $\mathbb{D} E=4$ ', then $1<=$
$\mathbb{H O}<=\mathbb{H} I<=M$, if $M>0$, and $\mathbb{H O}=1$ and $\mathbb{H} I=$
0 , if $M=0$; if $S \mathbb{D} E=R$ ', then $1<=\mathbb{H O}<=\mathbb{H} I$
$<=\mathrm{N}$, if $\mathrm{N}>0$, and $\mathbb{H} \mathrm{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

IH I (input)
See the description of IIO .

A (input) (LDA,M) if $S \mathbb{D} E=L^{\prime}(\mathbb{L D A} N)$ if $S \mathbb{D} E=R^{\prime}$ The vectors which define the elem entary reflectors, as retumed by SGEHRD.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, M)$ ifSDE $=L ; \operatorname{LDA}>=\max (1, N)$ if $S \mathbb{D} E=$ R'.

TAU (input)
$(M-1)$ if $S \mathbb{D} E=L^{\prime}(\mathbb{N}-1)$ if $S \mathbb{D E}=R^{\prime} T A U(i)$ $m$ ust contain the scalar factor of the elem entary reflectorH (i), as retumed by SG EH RD .

C (input/output)
On entry, the $M-b y-N$ matrix C. On exit, $C$ is overw ritten by Q * C or $\mathrm{Q} * * \mathrm{~T} * \mathrm{C}$ or C * $\mathrm{Q} * \mathrm{~T}$ or C * Q .

LD C (input)
The leading dim ension of the aray C. LD C >= max (1, M).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al
LW ORK.

LW ORK (input)
The dim ension of the array $W$ ORK. IfSDE $=\mathrm{L}$ ', LW ORK >= max ( $1, N$ ); if $S \mathbb{D} E=R$ ', LW ORK $>=$ $\max (1, M)$. Foroptim um perform ance LW ORK $>=N * N B$ if $S \mathbb{D} E=L$ ', and LW ORK $>=M * N B$ if $S \mathbb{D} E=R$ ', w here NB is the optim alblocksize.

If LW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an ille-
galvalue

void dpbcon_64 (charuplo, long n, long kd, double *a, long lda, double anorm , double *roond, long *info);

## PURPOSE

dpboon estim ates the reciprocal of the condition num ber (in the 1 -norm ) of a real symm etric positive definite band $m$ atrix using the Cholesky factorization $A=U \star * T * U$ or $A=$ L*L**T com puted by SPB TRF.

A $n$ estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND = 1 / (ANORM * norm (inv (A))).

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U pper triangular factor stored in A ;
= L ': Low er triangular factor stored in A .

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

K D (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', or the num berof subdiagonals ifUPLO $=\mathrm{L}^{\prime} . \mathrm{KD}>=0$ 。

A (input) The triangular factorU or $L$ from the Cholesky
factorization $A=U * * T * U$ orA $=\mathrm{L} * \mathrm{~L} * * T$ of the band
$m$ atrix $A$, stored in the first $K D+1$ row $s$ of the array. The $j$ th colum n ofU orL is stored in the $j$ th colum $n$ of the array A as follow s: if UPLO
$=U \prime A(k d+1+i-j)=U(i, j)$ for $\max (1, j$
$\mathrm{kd})<=\dot{i}<=\dot{j}$ ifUPLO $=\mathrm{L}$ ', $A(1+i-j)=L(i, j)$
for $\dot{j}=i<=m$ in $(n, j+k d)$.

LD A (input)
The leading dim ension of the aray A. LDA >= K D +1 。
ANORM (input)
The 1-norm (or infinity-norm ) of the symm etric band $m$ atrix A.

## RCOND (output)

The reciprocal of the condition num ber of the $m$ atrix $A$, com puted as RCOND $=1 /(A N O R M \star A \mathbb{N V N M ) \text { , }}$ $w$ here $A \mathbb{N} V N M$ is an estim ate of the 1 -norm of inv (A) com puted in this routine.

W ORK (w orkspace)
dim ension ( $3 * N$ )

W ORK2 (w orkspace)

void dpbequ_64 (charuplo, long n, long kd, double *a, long lda, double *scale, double *scond, double *am ax, long *info);

## PURPOSE

dpbequ com putes row and colum n scalings intended to equilibrate a sym $m$ etric positive definite band $m$ atrix A and reduce its condition num ber (w ith respect to the tw o-norm ). S contains the scale factors, $S(i)=1 /$ squt (A (i,i)), chosen so that the scaled $m$ atrix $B \quad w$ ith elem ents $B(i, 1)=$ $S(i) \star A(i, j) * S(j)$ has ones on the diagonal. This choige of $S$ puts the condition num berofB $w$ ithin a factor $N$ of the sm allest possible condition num ber over allpossible diagonalscalings.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': Upper triangular ofA is stored;
= L ': Low ertriangularofA is stored.

N (input) The order of them atrix A. N $>=0$.

K D (input)
The num ber of superdiagonals of the $m$ atrix $A$ if U PLO $=\mathrm{U}$ ', orthe num ber of subdiagonals if U PLO $=\mathbb{L}^{\prime} . \mathrm{KD}>=0$ 。

A (input) The upper or low er triangle of the sym m etric band $m$ atrix $A$, stored in the firstK $D+1$ row $s$ of the array. The $j$ th colum n of $A$ is stored in the $j$ th colum $n$ of the array A as follow s: if UPLO = U',

A $(k d+1+i-j, j)=A(i, 7)$ for $\max (1, j k d)<=i<=j$ if UPLO $=L^{\prime}, A(1+i-j)=A(i, 7)$ for $\dot{j}=i<=m$ in $(n, \dot{j}+k d)$.

LD A (input)
The leading dim ension of the array A. LDA >= KD+1.

SCALE (output)
If $\mathbb{N} F O=0, S C A L E$ contains the scale factors for A.

SCOND (output)
If $\mathbb{N} F O=0, S C A$ LE contains the ratio of the sm allest SCA LE (i) to the largestSCA LE (i). If SCOND $>=0.1$ and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

AM AX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to under-
flow , the m atrix should be scaled.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvahue.
$>0$ : if $\mathbb{N F O}=$ i, the $i$-th diagonal elem ent is nonpositive.

*a, long lda, double *af, long ldaf, double *b, long ldb, double *x, long ldx, double *ferr, double *berr, long *info);

## PURPOSE

dpbrfs im proves the com puted solution to a system of linear equations $w$ hen the coefficientm atrix is sym $m$ etric positive definite and banded, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals ifUPLO $=\mathbb{L}^{\prime} . \mathrm{KD}>=0$ 。

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the m atrices $B$ and X. NRH S $>=0$.

A (input) The upper or low er triangle of the sym m etric band $m$ atrix $A$, stored in the firstKD +1 row s of the anay. The $j$ th colum $n$ ofA is stored in the $j$ th colum $n$ of the anray A as follow $s$ : if UPLO $=\mathrm{U}$ ', $A(k d+1+i-j, j)=A(i, j)$ for $m a x(1, j k d)<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}$ ', $A(1+i-j, \bar{j})=A(i, j)$ for $j<=i<=m$ in $(n, j+k d)$.

LDA (input)
The leading dim ension of the anay A. LDA >= K D +1.
AF (input)
The triangular factor $U$ or $L$ from the Cholesky factorization $A=U * * T * U$ orA $=\mathrm{L} * \mathrm{~L} * * T$ of the band $m$ atrix A as computed by SPBTRF, in the same storage form atas A (see A).

LDAF (input)
The leading dim ension of the array AF. LDAF >= K D +1 .
$B$ (input) The righthand side $m$ atrix $B$.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by SPB TRS. On exit, the im proved solution $m$ atrix X .

LD X (input)
The leading dim ension of the array X. LD X >= $\max (1, N)$.

## FERR (output)

The estim ated forw ard enorbound for each solution vectorX ( 7 ) the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(i), F E R R(i)$ is an estim ated upperbound forthe $m$ agnitude of the largest ele$m$ entin ( $X(\mathcal{J})-X$ TRUE) divided by the $m$ agninude of the largestelem entin X ( 7 ). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vectorX (i) (ie., the sm allest relative
change in any elem entofA orB thatm akes X ( 7 ) an exactsolution).

W ORK (w orkspace)
dim ension ( $3 * N$ )
W ORK 2 (w orkspace) dim ension $\mathbb{N}$ )

void dpbstf_64 (charuplo, long n, long kd, double *ab, long ldab, long *info);

## PURPOSE

dpbstf com putes a split C holesky factorization of a real sym $m$ etric positive definite band $m$ atrix $A$.

This routine is designed to be used in conjunction w ith SSBG ST .
The factorization has the form $A=S * * T * S$ where $S$ is a band $m$ atrix of the sam ebandw idth as A and the follow ing structure:

$$
\begin{aligned}
& S=(U \quad) \\
& \text { (M L ) }
\end{aligned}
$$

w here U is upper triangular of orderm $=(\mathrm{n}+\mathrm{kd}) / 2$, and L is low er triangular of ordern-m .

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U ppertriangle ofA is stored;
$=\mathrm{L}$ ': Low er triangle of A is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if
$\mathrm{UPLO}=\mathrm{U}$ ', orthe num ber of subdiagonals ifU PLO
$=\mathbb{L} . \mathrm{KD}>=0$ 。

A B (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the first kd+1 row s of the array. The $j$ th column of A is stored in the $j$ th colum $n$ of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{AB}(\mathrm{kd}+1+i-j, j)=A(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=\dot{i}<=\dot{j}$ ifUPLO $=\mathrm{L}$ ', AB $(1+i-j, j=A(i, j)$ for $j=i<=m$ in $(n, j+k d)$.

On exit, if $\mathbb{N F O}=0$, the factors from the split Cholesky factorization $A=S * * T * S$. See Further D etails.

LDAB (input)
The leading dim ension of the array AB. LD A B >= K D +1 .
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i$-th argum enthad an illegalvalue $>0:$ if $\mathbb{N} F O=$ i, the factorization could not be com pleted, because the updated elem enta (i,i) w as negative; the $m$ atrix $A$ is notposilive definite.

## FURTHER DETAILS

The band storage schem e is illustrated by the follow ing exam ple, w hen $N=7, K D=2$ :

| $\mathrm{S}=(\mathrm{s} 11 \mathrm{~s} 12 \mathrm{~s} 13$ |  |
| :---: | :---: |
| ( | s22 s23 s24 ) |
| ( | s33 s34 ) |
| ( | s44 ) |
| ( | s53 s54 s55 |
| ( | s64 s65 s66 ) |
| ( | s75 s76 s77) |

If $\mathrm{U} P \mathrm{O}=\mathrm{U}$ ', the amay A B holds:
on entry: on exit:

void dpbsv_64 (charuplo, long n, long ndiag, long nins, double *a, long lda, double *b, long ldb, long *info);

## PURPOSE

dpbsv com putes the solution to a realsystem of linear equations
$A * X=B, w h e r e A$ is an $N$ boy $N$ sym m etric positive defintie band $m$ atrix and X and B are N -by-N R H S m atrices. The Cholesky decom position is used to factorA as
$A=U * * T * U$, if $U P L O=U$ ', or
$\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, if $\mathrm{UPLO}=\mathrm{L}$ ',
$w$ here $U$ is an upper triangularband $m$ atrix, and $L$ is a low er triangular band $m$ atrix, $w$ ith the sam e num ber of superdiagonals or subdiagonals as A. The factored form of A is then used to solve the system ofequations $A * X=B$.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ : U Uper triangle ofA is stored;
$=\mathrm{L}$ ': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

ND IA G (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of subdiagonals if $\mathrm{U} P L O$
$=\mathbb{L}$ '. NDIAG > $=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS $>=0$.

A (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstN D IA $G+1$ row s of the array. The $j$ th colum n of A is stored in the jth colum $n$ of the anray $A$ as follow $s$ : if
 $\max (1, j \mathrm{jND} \mathrm{IAG})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{A}(1+i-j)$
$=A(i, j)$ for $j<i<=m$ in $(\mathbb{N}, j+N D$ IA G ). See below for furtherdetails.

On exit, if $\mathbb{N} F O=0$, the triangular factor $U$ orL
from the Cholesky factorization $A=U * * T * U$ or $A=$
$\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ of the band m atrix A , in the sam e storage form atas A.

LD A (input)
The leading dim ension of the aray A. LD A >= N D IA G +1.
B (input/output)
On entry, the N -by-NRHS righthand side m atrix B. On exit, if $\mathbb{N F O}=0$, the N boy -N RH S solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \operatorname{LD} \mathrm{B}>=$ $\max (1, N)$.

IN FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvałue $>0:$ if $\mathbb{N F O}=i$, the leading $m$ inoroforder iof $A$ is notpositive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

## FURTHER DETAILS

The band storage scheme is illustrated by the follow ing exam ple, w hen $N=6, N D I A G=2$, and $U P L O=U ':$

On entry: On exit:

*     * a13 a24 a35 a46 * * u13 u24 u35
u46

## C INTERFACE

\#include <sunperfh>
void dpbsvx (char fact, charuplo, int $n$, int ndiag, int nrhs, double *a, intlda, double *af, intldaf, char equed, double *s, double *b, int ldb, double ${ }^{*}{ }_{x}$, int $l d x$, double *roond, double *ferr, double *berr, int*info);
void dpbsvx_64 (char fact, charuplo, long n, long ndiag, long nrhs, double *a, long lda, double *af, long ldaf, charequed, double *s, double *b, long ldb, double *x, long ldx, double *rcond, double *ferr, double *berr, long *info);

## PURPOSE

dpbsvx uses the Cholesky factorization $A=U * * T * U$ or $A=$ L*L**T to com pute the solution to a realsystem of linear equations
$A * X=B, w$ here $A$ is an $N$ boy $-N$ sym $m$ etric positive definite band $m$ atrix and $X$ and $B$ are $N$ boy-N R H S m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=$ E', real scaling factors are computed to
equilibrate
the system :
$\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B$
W hether or not the system w illbe equilibrated depends on the scaling of the m atrix A, but if equilibration is used, A is
overw ritten by diag $(S) \star A * d i a g(S)$ and $B$ by diag $(S) * B$.
2. IfFACT = N 'or E ', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT = E) as
$A=U * * T * U$, ifUPLO $=U$ ', or
$\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, if $\mathrm{UPLO}=\mathrm{L}$ ',
$w$ here $U$ is an upper triangularband $m$ atrix, and $L$ is a
low er
triangularband $m$ atrix.
3. If the leading i-by-iprincipal m inor is not positive definite,
then the routine retums w ith $\mathbb{N} F O=$ i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the $m$ atrix
A. If the reciprocal of the condition num ber is less than $m$ achine precision, $\mathbb{N} F O=N+1$ is retumed as a w aming, but the routine
stillgoes on to solve for X and com pute errorbounds as described below .
4.The system of equations is solved for $X$ using the factored form of A.
4. Herative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.
5. Ifequilibration w as used, the $m$ atrix $X$ is prem ultiplied by diag (S) so that it solves the original system before equilibration.

## ARGUMENTS

## FACT (input)

Specifies w hether ornot the factored form of the $m$ atrix A is supplied on entry, and ifnot, w hether the m atrix A should be equilibrated before it is factored. = F : On entry, AF contains the factored form ofA. IfEQUED = $Y$ ', them atrix A has been equilibrated $w$ ith scaling factors given by $S$. A and AF w illnotbe m odified. $=\mathrm{N}$ ': Them atrix A w illbe copied to A F and factored.
= E : : The matrix A will be equilibrated if necessary, then copied to A F and factored.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of the matrix A. $\mathrm{N}>=0$.
ND IA G (input)
The num ber of superdiagonals of the matrix A if UPLO = U',orthe num berof subdiagonals ifU PLO
= L'. ND IAG >= 0 .

NRHS (input)
The num ber of right-hand sides, i.e., the num ber of collm ns of the matrices B and X. NRHS >= 0 .

A (input/output)
On entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstND IA G +1 row s of the array, except ifFACT = F'and EQUED $=Y$ ', then A m ust contain the equilibrated $m$ atrix diag $(S){ }^{*} A$ *diag $(S)$. The jth colum n of A is stored in the $j$ th colum $n$ of the array $A$ as follow $s$ : if UPLO = U', A NDIAG+1+i-ji) =A (i, $\boldsymbol{j}$ ) for $\max (1, j$ ND IAG $)<=i<=j$ if UPLO $=\mathrm{L}$ ', A ( $1+i-j, j)$ $=A(i, j)$ for $j=i<=m$ in $(\mathbb{N}, \dot{j}+N D \mathbb{I A} G)$. See below for furtherdetails.

Onexit, ifFACT = E' and EQUED = Y', A is overw rilten by diag (S)*A *diag (S).

LDA (input)
The leading dim ension of the array A. LDA >= ND IA G +1.

AF (input/output)
If FACT = F ', then $A F$ is an inputargum entand on entry contains the triangular factorU or $L$ from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=$
$L * L * * T$ of the band $m$ atrix $A$, in the sam e storage form atas A (see A). IfEQUED $=Y$ ', then $A F$ is the factored form of the equilibrated $m$ atrix A.

IfFACT $=N$ ', then AF is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=$ L*L**T。

IfFACT = E', then AF is an output argum ent and on exitretums the triangular factor $U$ or $L$ from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ of the equilibrated $m$ atrix $A$ (see the description of for the form of the equilibrated m atrix).
LD AF (input)
The leading dim ension of the array AF. LDAF >= $N D I A G+1$.

EQUED (input)
Specifies the form of equilibration thatw as done.
$=\mathrm{N}$ : N o equilibration (alw ays true iffACT = N 7 。
$=Y^{\prime}:$ Equilibration w as done, i.e., A has been replaced by diag $(\mathrm{S})$ * A * diag $(\mathrm{S})$. EQUED is an inputargum entifFACT = F'; otherw ise, it is an outputargum ent.

S (input/output)
The scale factors forA; notaccessed if EQUED = $N^{\prime} . S$ is an inputargum entifFACT = $F^{\prime}$; otherw ise, S is an outputargum ent. IfFACT $=\mathrm{F}^{\prime}$ and EQUED $=Y$ ', each elem entof m ustbe posilive.

B (input/output)
O n entry, the N Hoy-NRH S righthand side m atrix B.
On exit, if EQUED = $N^{\prime}$, $B$ is notm odified; if EQUED $=Y$ ', $B$ is overw ritten by diag $(S) * B$.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{I N F O}=\mathrm{N}+1$, the N -by-NRHS solution
$m$ atrix $X$ to the original system of equations.
$N$ ote that if EQUED $=Y$ ', A and $B$ arem odified on exit, and the solution to the equilibrated system is inv (diag (S ) ) *X .

## LD X (input)

The leading dim ension of the anay X . LD X >= $\max (1, N)$.

## RCOND (output)

The estim ate of the reciprocal condition num ber of the $m$ atrix $A$ after equilibration (if done). If RCOND is less than them achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to w orking precision. This condition is indicated by a retum code of $\mathbb{N} F O>0$.

FERR (output)
The estim ated forw ard emorbound for each solution vector $X(\mathcal{)}$ ) the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O})$, FERR ( $)$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $\mathrm{X}(\mathcal{i})-\mathrm{X}$ TRU E ) divided by the m agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vectorX (j) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension ( $3 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{N} F O$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N N}$ FO = -i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=i$, and $i$ is
<= N : the leading $m$ inoroforderiof $A$ is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1$ : U is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to $w$ orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould

```

void dpbtf2 (char uplo, intn, int kd, double *ab, int ldab, int*info);
void dpbtf2_64 (charuple, long n, long kd, double *ab, long ldab, long *info);

## PURPOSE

dpbtf2 com putes the C holesky factorization of a real sym $m$ etric positive definite band $m$ atrix A.

The factorization has the form

```
A = U'* U , ifUPLO = U',or
A = L * L', ifUPLO = L',
```

where $U$ is an uppertriangularm atrix, $U$ 'is the transpose ofU , and $L$ is low ertriangular.

This is the unblocked version of the algorithm, calling Level2 BLAS.

## ARGUMENTS

## UPLO (input)

Specifies w hether the upper or low er triangular
part of the sym $m$ etric $m$ atrix $A$ is stored:
= U ': U pper triangular
= L': Low er triangular

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of super-diagonals of the m atrix A if $\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of sub-diagonals if UPLO
$=\mathbb{L} . \mathrm{KD}>=0$ 。

A B (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstK $D+1$ row s of the array. The $j$ th colum n ofA is stored in the $j$ th colum n of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}$ ', AB $(k d+1+i-j, j)=A(i, j)$ for $\max (1, j$ $\mathrm{kd})<=i<=j$ ifUPLO $=\mathrm{L}$ ', AB $(1+i-j, j=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k d)$.

On exit, if $\mathbb{N} F O=0$, the triangular factor $U$ orL
from the Cholesky factorization $\mathrm{A}=\mathrm{U}$ * U or $\mathrm{A}=$ L * L ' of the band m atrix A , in the sam e storage form atas A.

LDAB (input)
The leading dim ension of the array AB. LD AB >= KD+1.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N} F O=-k$, the $k$-th argum enthad an illegalvalue $>0:$ if $\mathbb{N} F O=k$, the leading $m$ inoroforderk is notpositive definite, and the factorization could notbe com pleted.

## FURTHER DETAILS

The band storage scheme is illustrated by the follow ing exam ple, when $\mathrm{N}=6, \mathrm{KD}=2$, and $\mathrm{U} P L O=\mathrm{U}$ ':

On entry: On exit:

\section*{PURPOSE}
dpbtrf com putes the C holesky factorization of a real sym \(m\) etric positive definite band \(m\) atrix A.

The factorization has the form
\[
\begin{aligned}
& A=U * * T * U, \text { if } \mathrm{UPLO}=\mathrm{U}^{\prime} \text {, or } \\
& \mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}, \text { if } \mathrm{UPLO}=\mathrm{L}^{\prime},
\end{aligned}
\]
\(w\) here \(U\) is an uppertriangularm atrix and \(L\) is low er triangular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) : U ppertriangle of A is stored;
\(=\mathrm{L}\) ': Low er triangle of \(A\) is stored.

N (input) The order of them atrix \(A . N>=0\).

KD (input)
The num berof superdiagonals of the \(m\) atrix \(A\) if
\(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of subdiagonals if \(\mathrm{U} P L O\)
\(=L^{\prime} . K D>=0\) 。

A (input/output)
O n entry, the upper or low er triangle of the sym \(m\) etric band \(m\) atrix \(A\), stored in the firstK \(D+1\) row s of the array. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the amay \(A\) as follow \(s\) : if \(\mathrm{UPLO}=U ', A(k d+1+i-j, j)=A(i, j)\) for \(m a x(1, j\) \(\mathrm{kd})<=i<=j\) if \(\mathrm{UPLO}={ }^{\prime}\) ', \(A(1+i-j, j)=A(i, j)\) for \(j<=i<=m\) in \((n, j+k d)\).

On exit, if \(\mathbb{N F O}=0\), the triangular factor \(U\) orL from the Cholesky factorization \(A=U * * T * U\) or \(A=\) L*L**T of the band \(m\) atrix \(A\), in the same storage form atas A.

The leading dim ension of the array A. LDA >= K D +1 .
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the leading \(m\) inoroforder is notpositive definite, and the factorization could notbe com pleted.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(N=6, K D=2\), and \(U P L O=U:\)
On entry: On exit:
```

    * a13 a24 a35 a46 * * u13 u24 u35

void dpoequ_64 (long n, double *a, long lda, double *scale, double *scond, double *am ax, long *info);

\section*{PURPOSE}
dpoequ com putes row and colum \(n\) scalings intended to equilibrate a sym \(m\) etric positive definite \(m\) atrix A and reduce its condition num ber (w ith respect to the tw o-nom ). S contains the scale factors, \(S(i)=1 /\) squt \((A)(i, i))\), chosen so that the scaled \(m\) atrix \(B\) w ith elem ents \(B(i, j)=S(i) * A(i, j) * S(i)\) has ones on the diagonal. This choice of \(S\) puts the condition num berofB w ithin a factor \(N\) of the sm allestpossible condition num ber overallpossible diagonal scalings.

\section*{ARGUMENTS}

N (input) The order of the matrix A. \(\mathrm{N}>=0\).
A (input) The \(\mathrm{N}-\) by -N sym \(m\) etric positive definite \(m\) atrix whose scaling factors are to be com puted. O nly the diagonalelem ents ofA are referenced.

LD A (input)
The leading dim ension of the anay A. LDA >= \(\max (1, N)\).

SCA LE (output)
If \(\mathbb{N} F O=0\), SCA LE contains the scale factors for A.

SCOND (output)
If \(\mathbb{N} F O=0, S C A L E\) contains the ratio of the \(s m\) allest SCALE (i) to the largestSCA LE (i). IfSCOND \(>=0.1\) and AM AX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

AM AX (output)
A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the \(m\) atrix should be scaled.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\) i, the ith diagonal elem ent is nonpositive.

\section*{PURPOSE}
dporfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is sym \(m\) etric positive definite, and provides emorbounds and backw ard emoresti\(m\) ates for the solution.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathbb{L}\) ': Low ertriangle ofA is stored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber
of colum ns of the m atrices B and X. NRHS \(>=0\).

A (input) The sym \(m\) etric \(m\) atrix A. If \(\mathrm{UPLO}=\mathrm{U}\) ', the leading N -by -N uppertriangularpart of A contains the uppertriangularpant of the \(m\) atrix \(A\), and the strictly low ertriangularpart of \(A\) is notreferenced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by-N low er
triangularpart ofA contains the low er triangular partof the \(m\) atrix A, and the strictly upper triangular part ofA is not referenced.

LD A (input)
The leading dim ension of the anay A. LDA >= \(\max (1, N)\).

AF (input)
The triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{A}=\mathrm{L}{ }^{*} \mathrm{~L}{ }^{* *} \mathrm{~T}\), as com puted by SPO TRF.
LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, \mathbb{N})\).
\(B\) (input) The righthand side \(m\) atrix \(B\).
LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, \mathbb{N})\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SPO TRS. On exit, the im proved solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the array X . LD X >= \(\max (1, \mathbb{N})\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X\) ). If XTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{1})-\mathrm{XTRUE}\) ) divided by the magnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )

W ORK2 (w orkspace)
dim ension \(\mathbb{N}\) )

\section*{C INTERFACE}
\#include <sunperfh>
void dposvx (char fact, char uplo, intn, int nrhs, double
*a, int lda, double *af, int ldaf, char equed, double *s, double *b, int ldb, double *x, int ldx, double *rcond, double *ferr, double *berr, int *info);
void dposvx_64 (char fact, charuple, long n, long nrhs, double *a, long lda, double *af, long ldaf, char equed, double *s, double *b, long ldb, double *x, long ldx, double *roond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
dposvx uses the Cholesky factorization \(A=U * * T * U\) or \(A=\) L*L**T to compute the solution to a realsystem of linear equations
\(A * X=B, w\) here \(A\) is an \(N\) boy \(-N\) sym \(m\) etric posilive definte \(m\) atrix and \(X\) and \(B\) are \(N\) boy-N R H S \(m\) atrioes.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are computed to equilibrate
the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
W hether or not the system w illbe equilibrated depends on
the
scaling of the m atrix A , but ifequilibration is used, A is
overw rilten by diag \((\mathrm{S}) \star A\) *diag \((\mathrm{S})\) and B by diag \((\mathrm{S}) \star \mathrm{B}\).
2. IfFACT = N 'or E', the Cholesky decom position is used to
factorthem atrix A (afterequilibration ifFACT = E )
as
\[
\begin{aligned}
& A=U * * T * U, \text { if } U P L O=U ' \text {, or } \\
& A=L * L * * T, \text { if } U P L O=' L^{\prime},
\end{aligned}
\]
\(w\) here \(U\) is an upper triangularm atrix and \(L\) is a low er triangular
\(m\) atrix.
3. If the leading iboy-iprincipal \(m\) inor is not positive definite,
then the routine retums w ith \(\mathbb{N F O}=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine precision, \(\mathbb{N} F O=\mathrm{N}+1\) is retumed as a w aming, but the routine still goes on to solve for \(X\) and com pute emorbounds as described below .
4. The system ofequations is solved forX using the factored form
```

ofA.

```
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether or not the factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, w hether
the m atrix A should be equilibrated before it is factored. = F : O n entry, AF contains the factored form of \(A\). IfEQUED \(=Y\) ', the matrix A has been equilibrated \(w\) ith scaling factors given by \(S\). A and AF w illnot.be m odified. \(=\mathrm{N}\) ': The m atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) ': The matrix A w ill be equilibrated if necessary, then copied to A F and factored.

UPLO (input)
\(=U\) ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrices B and X. NRHS >=0.
A (input/output)
On entry, the sym m etric \(m\) atrix A, except ifFA C T = F' and EQUED = Y', then A mustcontain the equilibrated \(m\) atrix diag \((S) * A\) *diag \((S)\). If UPLO \(=\) U', the leading \(N\)-by -N uppertriangular partofA contains the upper triangularpart of the \(m\) atrix
A, and the strictly low ertriangularpartofA is not referenced. If U PLO \(=\mathrm{L}\) ', the leading N -by -N low er triangularpartofA contains the low ertriangularpart of the matrix A, and the strictly upper triangular partofA is not referenced. A is notm odified ifFACT = F or \(\mathrm{N}^{\prime}\), or if \(\mathrm{FACT}=\) E'and EQUED = N 'on exit.

On exit, ifFACT = E' and EQUED = \(\mathrm{Y}^{\prime}\), A is overw ritten by diag \((S) \star A\) *diag \((S)\).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{AF (input/output)}

If \(F A C T=F\) ', then \(A F\) is an inputargum ent and on entry contains the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\), in the sam e storage form at as A. IfEQUED ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix diag \((S) \star A * \operatorname{diag}(S)\).

IfFACT = N ', then \(A \mathrm{~F}\) is an output argum ent and on exit retums the triangular factor \(U\) or \(L\) from
the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\) of the originalm atrix A.

IfFACT \(=E\) ', then AF is an output argum ent and on exitretums the triangular factor \(U\) orL from the Cholesky factorization \(A=U * * T * U\) or \(A=\) \(L * L * * T\) of the equilibrated \(m\) atrix \(A\) (see the description ofA for the form of the equilibrated matrix) .

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=\mathrm{N}\) ': N o equilibration (alw ays true ifFACT = N 7 。
\(=Y\) ': Equilibration w as done, i.e., A has been
replaced by diag \((\mathrm{S})\) * \(A\) * diag \((\mathrm{S})\). EQUED is an inputargum entiffACT = \(\mathrm{F}^{\prime}\); otherw ise, it is an output argum ent.

S (input/output)
The scale factors forA; not accessed if EQUED =
\(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum entifFACT=F'; other-
W ise, S is an outputargum ent. IfFACT \(=\mathrm{F}^{\prime}\) and
\(E Q U E D=Y\) ', each elem entof m ust.be positive.

B (input/output)
On entry, the N boy-N RH S righthand side m atrix B.
On exit, if EQUED = \(N^{\prime}\) ', B is notm odified; if
EQUED \(=Y ', B\) is overw ritten by diag \((S) * B\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the N -by -N R H S solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that if EQ UED \(=Y\) ', \(A\) and \(B\) are m odified on
exit, and the solution to the equilibrated system
is inv \((\) diag \((S)) \star X\).

LD X (input)
The leading dim ension of the anay X . LD X >= \(\max (1, N)\).

The estim ate of the reciprocal condition num ber of the matrix A after equilibration (if done). If RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an ille-
galvalue
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
\(<=N\) : the leading \(m\) inor oforderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than \(m\) achine precision, m eaning that the \(m\) atrix is singularto w orking precision. Nevertheless, the solution and error bounds are com puted because there are a num berof situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

```
void dpotrf(charuple, int \(n\), double *a, int lda, int *info);
void dpotrf_64 (charuplo, long n, double *a, long lda, long *info);

\section*{PURPOSE}
dpotrf com putes the C holesky factorization of a real sym \(m\) etric posilive definite m atrix A .

The factorization has the form
\(A=U * * T * U\), if \(U P L O=U\) ', or
\(A=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\), if \(\mathrm{UPLO}=\mathrm{L}\) ',
\(w\) here \(U\) is an uppertriangularm atrix and \(L\) is low er triangular.

This is the block version of the algorithm, calling Level 3 BLAS .

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Upper triangle of A is stored;
\(=\mathbb{L}\) ': Low er triangle of \(A\) is stored.

N (input) The order of them atrix A. N \(>=0\).

A (input/output)
On entry, the sym m etric m atrix A. If UPLO \(=U\) ', the leading N -by N uppertriangularpartof u contains the uppertriangularpart of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If UPLO = 'L', the leading N -by N low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of A is not referenced.

On exit, if \(\mathbb{N} F O=0\), the factor \(U\) orL from the Cholesky factorization \(A=U * * T * U\) or \(A=L * L * * T\).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).
= 0: successfulexit
< 0 : if \(\mathbb{N}\) FO \(=-\)-i, the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the leading \(m\) inoroforder \(i\) is not positive definite, and the factorization could notbe com pleted.

## PURPOSE

dpprif im proves the com puted solution to a system of linear equations when the coefficientm atrix is sym $m$ etric positive definite and packed, and provides errorbounds and backw ard errorestim ates for the solution.

## ARGUMENTS

## UPLO (input)

$=\mathrm{U}$ : U pper triangle of A is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.
NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the m atrices B and X. NRH S >=0.
A (input) The upper or low er triangle of the sym metric $m$ atrix A, packed colum nw ise in a linear array. The $j$ th column of A is stored in the array A as

$$
\text { follow s: if UPLO = } U^{\prime}, A(i+(j 1) \star j 2)=A(i, 7)
$$

for $1<=i<=j$ ifUPLO $=\mathrm{L}$ ', A $(i+(j-1) *(2 n-j) / 2)$
$=A(i, 7)$ for $j=i<=n$.

## AF (input)

The triangular factor $U$ or $L$ from the Cholesky factorization $A=U * * T * U$ or $A=L * L * *$, as com puted by SPPTRF /CPPTRF, packed colum nw ise in a linear aray in the sam e form at as A (see A).
$B$ (input) The righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, N)$.
$X$ (input/output)
On entry, the solution $m$ atrix $X$, as com puted by SPPTRS. On exit, the im proved solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the aray X . LD X >= $\max (1, \mathbb{N})$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ (the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{O}), \operatorname{FERR}(\underset{)}{(1)}$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $\mathrm{X}(\mathcal{j})-\mathrm{XTRUE}$ ) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true enror.

## BERR (output)

The com ponentw ise relative backw ard emor of each
solution vector $X(\mathcal{j})$ (i.e., the sm allest relative
change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).

## C INTERFACE

\#include <sunperfh>
void dppsv (charuplo, intn, intnrhs, double *a, double *b, int ldb, int *info);
void dppsv_64 (charuple, long n, long nihs, double *a, double *b, long ldb, long *info);

## PURPOSE

dppsv com putes the solution to a real system of linear equations
A * $X=B$, where $A$ is an $N$-by-N sym m etric positive defintie $m$ atrix stored in packed form at and $X$ and $B$ are $N$ by $-N$ RH $S$ $m$ atrices.

The Cholesky decom position is used to factorA as
$A=U * * T * U$, if $U P L O=U '$, or
$\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, if $\mathrm{UPLO}=\mathrm{L}$ ',
$w$ here $U$ is an upper triangularm atrix and $L$ is a low er triangular $m$ atrix. The factored form of $A$ is then used to solve the system of equations $A * X=B$.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linear equations, ie., the order of the matrix A. $N>=0$.

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of them atrix B. NRHS $>=0$.

A (input/output)
O $n$ entry, the upper or low ertriangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The $j$ th colum $n$ of $A$ is stored in the array A as follows: if UPLO $=U^{\prime}, \mathrm{A}(i+(j$
 $(j-1)^{*}(2 n-j / 2)=A(i, 7)$ for $\dot{j}=i<=n$. See below for further details.

On exit, if $\mathbb{N F O}=0$, the factor $U$ orL from the Cholesky factorization $A=U * * T * U$ or $A=L * L * * T$, in the sam e storage form at as A.

B (input/output)
On entry, the N -by-NRHS righthand side m atrix B. On ex弌, if $\mathbb{N F O}=0$, the N boy $-\mathrm{NRH} S$ solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the anay $\mathrm{B} . \operatorname{LDB}>=$ $\max (1, N)$.
$\mathbb{N}$ FO (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i-$ th argum enthad an illegalvalue
$>0:$ if $\mathbb{N}$ FO $=i$, the leading $m$ inoroforder iof $A$ is notposilive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

## FURTHER DETAILS

The packed storage schem e is illustrated by the follow ing exam ple when $N=4, \mathrm{UPLO}=\mathrm{U}$ ':

Tw o-dim ensional storage of the sym $m$ etric $m$ atrix A :

```
al1 a12 al3 a14
    a22 a23 a24
        a33 a34 (aij= con\g (aï))
        a44
```

Packed storage of the upper triangle ofA:
$A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]$

## C INTERFACE

\#include <sunperfh>
void dppsvx (char fact, char uplo, intn, int nrhs, double *a, double *af, charequed, double *s, double *b, int ldlb, double *x, int ldx, double *rcond, double *ferr, double *berr, int *info);
void dppsvx_64 (char fact, charuplo, long n, long nrhs, double *a, double *af, charequed, double *s, double *b, long ldb, double *x, long ldx, double *rcond, double *ferr, double *berr, long *info);

## PURPOSE

dppsvx uses the Cholesky factorization $A=U * * T * U$ or $A=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ to com pute the solution to a realsystem of linear equations
$A * X=B$, where $A$ is an $N$ boy $-N$ sym m etric positive defintem atrix stored in packed form atand $X$ and $B$ are $N$ foy-N RH S m atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
$\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B$
W hether or not the system w illbe equilibrated depends on the
scaling of the m atrix A , but ifequilibration is used, A
overw rilten by diag $(\mathrm{S}) \star A$ *diag $(\mathrm{S})$ and B by diag $(\mathrm{S}) \star$ B .
2. IfFACT = N 'or E', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT =E)
as

$$
\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}, \text { if } \mathrm{UPLO}=\mathrm{U} \text { ', or }
$$

$\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, ifUPLO = L ',
w here U is an upper triangularm atrix and L is a low er triangular
$m$ atrix.
3. If the leading i-by-iprincipal m inor is not positive definite,
then the routine retums $w$ ith $\mathbb{N F O}=$ i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the $m$ atrix
A. If the reciprocal of the condition num ber is less than $m$ achine
precision, $\mathbb{N} F O=N+1$ is retumed as a w aming, but the routine
still goes on to solve forX and com pute errorbounds as described below .
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration $w$ as used, the $m$ atrix $X$ is prem ultiplied by
diag (S) so that it solves the original system before equilibration.

## ARGUMENTS

FACT (input)
Specifies w hether or not the factored form of the $m$ atrix $A$ is supplied on entry, and if not, whether them atrix A should be equilibrated before it is factored. = F': On entry, AF contains the fac-
tored form ofA. IfEQUED $=Y$ ', them atrix $A$ has been equilibrated $w$ ith scaling factors given by $S$. A and AF w illnotbe m odified. $=\mathrm{N}$ ': Them atrix A w illbe copied to A F and factored.
$=\mathrm{E}$ : The matrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
= U : U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The num ber of linear equations, i.e., the order of them atrix A. $N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrices B and X. NRHS >=0.
A (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array, exceptifFACT = F'and EQUED = $Y^{\prime}$ ', then A $m$ ust contain the equilibrated $m$ atrix diag $(S) * A * \operatorname{diag}(S)$. The $j$ th column ofA is stored in the array A as follow s: if UPLO = U', A (i+ $(j-1) * j 2)=A(i, 7)$ for $1<=i<=j$ if $U P L O=L \prime$, $A(i+(j-1) *(2 n-j) / 2)=A(i, j)$ for $j=i<=n$. See below for further details. A is not $m$ odified if FACT = F' or $\mathrm{N}^{\prime}$, orifFACT = E'andEQUED = N 'on exit.

On exit, ifFACT = E' and EQUED = $\mathrm{Y}^{\prime}$, A is overw ritten by diag (S)*A *diag (S).

AF (input/output)
$(\mathbb{N} *(N+1) / 2)$ IfFACT $=F$ ', then $A F$ is an input argum ent and on entry contains the triangular factor $U$ orL from the Cholesky factorization $\mathrm{A}=$ $U{ }^{*} U$ or $A=L * L$ ', in the sam e storage form atas $A$. IfEQUED ne. $N$ ', then $A F$ is the factored form of the equilibrated $m$ atrix $A$.

IfFACT = N ', then AF is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization $\mathrm{A}=\mathrm{U}$ * U orA $=\mathrm{L} \star \mathrm{L}$ 'of the originalm atrix A.

IfFACT=E', then AF is an output argum ent and on exit retums the triangular factor $U$ orL from the Cholesky factorization $\mathrm{A}=\mathrm{U}$ * U orA $=\mathrm{L}$ * L 'of the equilibrated $m$ atrix A (see the description of

A for the form of the equilibrated $m$ atrix).

EQUED (input)
Specifies the form of equilibration thatw as done.
$=N^{\prime}:$ No equilibration (alw ays true ifFA CT = N).
$=Y$ ': Equilibration w as done, i.e., A has been replaced by diag (S) * A * diag (S). EQUED is an input argum ent ifFACT = F '; otherw ise, it is an outputargum ent.

S (output)
The scale factors forA ; not accessed if EQUED = $\mathrm{N}^{\prime} . \mathrm{S}$ is an inputargum ent ifFACT = $\mathrm{F}^{\prime}$; otherw ise, S is an outputargum ent. IfFACT $=\mathrm{F}^{\prime}$ and EQUED = Y', each elem entofS m ustbe positive.
B (input/output)
On entry, the $N-b y-N R H S$ righthand side m atrix $B$.
On exit, if EQUED = N ', B is notm odified; if
EQUED $=Y$ ', $B$ is overw ritten by diag $(S) * B$.

LD B (input)
The leading dim ension of the aray B. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=N+1$, the $N$-by-NRHS solution
$m$ atrix $X$ to the original system of equations.
$N$ ote that if EQUED = $Y$ ', A and B arem odified on exit, and the solution to the equilibrated system is inv (diag $(S)) * X$.

LD X (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

## RCOND (output)

The estim ate of the reciprocal condition num ber of the matrix A afterequilibration (if done). If
RCOND is less than them achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to w orking precision. This condition is indicated by a retum code of $\mathbb{N} \mathrm{FO}>0$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X(\neg)$ the $j$ th colum $n$ of the solution matrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})$ is an estim ated upperbound for the $m$ agnitude of the largest ele-
$m$ ent in $(X(\mathcal{O})$ X TRUE $)$ divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector $X(\mathcal{)}$ ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).
W ORK (w orkspace)
dím ension ( $3 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
<0: if $\mathbb{N N}$ FO = -i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=i$, and $i$ is
$<=\mathrm{N}$ : the leading m inor oforderiof A is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{U}$ is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singularto working precision. Nevertheless, the solution and error bounds are com puted because there are a num berof siluations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

## FURTHER DETAILS

The packed storage schem e is illustrated by the follow ing exam plewhen $\mathrm{N}=4, \mathrm{UPLO}=\mathrm{U}$ ':

Tw o-dim ensional storage of the sym $m$ etric $m$ atrix A :

```
al1 a12 al3 a14
    a22 a23 a24
        a33 a34 (aij= conjg (aji))
```

            a44
    Packed storage of the upper triangle ofA :
$A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]$

void dpptrf_64 (charuplo, long n, double *a, long *info);

## PURPOSE

dpptrf com putes the C holesky factorization of a real sym $m$ etric positive definite $m$ atrix A stored in packed form at.

The factorization has the form
$A=U * * T * U$, if $U P L O=U '$ 'or
$A=L \star L^{* *} \mathrm{~T}$, ifUPLO $=\mathrm{L} \prime$,
$w$ here $U$ is an upper triangularm atrix and $L$ is low er triangular.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U pper triangle ofA is stored;
= L': Low er triangle of A is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear amray. The jth colum n of $A$ is stored in the anay $A$ as follows: if UPLO $=U '$ 'A (i+ (j 1) $j^{2} 2$ ) $=A(i, j)$ for $1<=i<=j$ ifUPLO $=~ L '$ ' A ( $i+$ $(j-1) *(2 n-j / 2)=A(i, j)$ for $j=i<=n$. See below for further details.

On exit, if $\mathbb{N} F O=0$, the triangular factor $U$ orL
from the Cholesky factorization $A=U * * T * U$ or $A=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, in the sam e storage form atas A .
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i$ th argum enthad an illegalvałue
$>0:$ if $\mathbb{N} F O=i$, the leading $m$ inoroforder is notpositive definite, and the factorization could notbe com pleted.

## FURTHER DETAILS

The packed storage schem e is illustrated by the follow ing exam ple w hen $N=4, \mathrm{UPLO}=\mathrm{U}$ ':

Tw o-dim ensionalstorage of the sym $m$ etric $m$ atrix A :

```
a11 a12 a13 a14
    a22 a23 a24
        a33 a34 (aij= a\ddot{i})
        a44
```

Packed storage of the upper triangle ofA :

$$
A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]
$$

## C INTERFACE

\#include <sunperfh>
void dpteqr(char com pz, intn, double *d, double *e, double * $z$, intldz, int *info);
void dpteqr_64 (charcom pz, long n, double *d, double *e, double *z, long ldz, long *info);

## PURPOSE

dpteqr computes all eigenvalues and, optionally, eigenvectors of a symm etric positive definite tridiagonal $m$ atrix by first factoring the $m$ atrix using SPTTRF, and then calling SBD SQR to com pute the singularvalues of the bidiagonal factor.

This routine com putes the eigenvalues of the positive definite tridiagonal m atrix to high relative accuracy. This $m$ eans that if the eigenvalues range overm any orders ofm agnitude in size, then the sm alleigenvalues and corresponding eigenvectorsw illlbe com puted m ore accurately than, for exam ple, w th the standard $Q R$ m ethod.

The eigenvectors of a fullorband sym $m$ etric positive definthe $m$ atrix can also be found ifSSY TRD, SSPTRD, orSSBTRD has been used to reduce this $m$ atrix to tridiagonal form . (The reduction to tridiagonal form, how ever, $m$ ay preclude the possibility of obtaining high relative accuracy in the sm all eigenvalues of the originalm atrix, if these eigenvalues range overm any orders ofm agnitude.)

## ARGUMENTS

COMPZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only.
$=\mathrm{V}$ ': C om pute eigenvectors of original sym $m$ etric
m atrix also. A ray Z contains the orthogonal $m$ atrix used to reduce the originalm atrix to tridiagonal form . = I': C om pute eigenvectors of tridiagonalm atrix also.

N (input) The order of the m atrix. $\mathrm{N}>=0$.

D (input/output)
O n entry, the n diagonalelem ents of the tridiagonalm atrix. On norm alexit, $D$ contains the eigenvalues, in descending order.

E (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonal matrix. On exit, E hasbeen destroyed.

Z (input) On entry, if $\mathrm{COMPZ}=\mathrm{V}$ ', the orthogonal m atrix used in the reduction to tridiagonal form. On exit, if $C O M P Z=V$ ', the orthonorm aleigenvectors of the original sym $m$ etric $m$ atrix; if $C O M P Z=I$ ', the orthonorm aleigenvectors of the tridiagonal $m$ atrix. If $\mathbb{N} F O>0$ on exit, $Z$ contains the eigenvectors associated with only the stored eigenvalues. If $C O M P Z=N$ ', then $Z$ is not referenced.

LD Z (input)
The leading din ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and ifCOM PZ $=V$ 'or $I$ ', $L D Z>=m a x(1, N)$.

W ORK (w orkspace)
dim ension (4*N )
$\mathbb{N} F O$ (output)
= 0: successfulexit.
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an illegalvahue.
> 0: if $\mathbb{N} F O=i$, and $i$ is: <= $N$ the Cholesky factorization of the $m$ atrix could notbe perform ed because the $i$-th principalm inorw as not positive definite. > N the SVD algorithm failed to converge; if $\mathbb{N} F O=\mathrm{N}+$ i, ioff-diagonal elem ents of the bidiagonal factor did not converge to zero.

## C INTERFACE

\#include < sunperfh>
void dptsvx (char fact, intn, int nirhs, double *diag, double *sub, double *diagf, double *subf, double *b, int ldb, double *x, int ldx, double *rcond, double * ferrs, double *berr, int *info);
void dptsvx_64 (char fact, long n, long nrhs, double *diag, double *sub, double *diagf, double *subf, double *b, long lalb, double *x, long ldx, double *rcond, double *ferr, double *berr, long *info);

## PURPOSE

dptsvx uses the factorization $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ to com pute the solution to a real system of linear equations $A * X=B$, where $A$ is an $N-b y-N$ symmetric positive definite tridiagonal $m$ atrix and $X$ and $B$ are $N$ by-N RH S $m$ atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=N$ ', the $m$ atrix $A$ is factored as $A=L * D * L * * T$, where L
is a unit low erbidiagonalm atrix and $D$ is diagonal. The factorization can also be regarded as having the form
$\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{D} * \mathrm{U}$.
2. If the leading i-by-iprincipal m inor is not positive definite,
then the routine retums w ith $\mathbb{N} F O=$ i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the
m atrix
A. If the reciprocal of the condition num ber is less than $m$ achine
precision, $\mathbb{N}$ FO $=\mathrm{N}+1$ is retumed as a w aming, but the routine
still goes on to solve for X and com pute emorbounds as described below .
3.The system ofequations is solved forX using the factored form of A.
3. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of $A$ has been supplied on entry. = F': On entry, D IA GF and SUBF contain the factored form of A.
D IA G , SUB, D IA G F , and SUBF w illnotbe m odified.
$=N$ ': Them atrix A w illbe copied to D IA GF and SUBF and factored.

N (input) The order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the $m$ atriges $B$ and X. NRHS $>=0$.

D IA G (input)
The $n$ diagonalelem ents of the tridiagonal matrix A.

SU B (input)
The ( $n-1$ ) subdiagonalelem ents of the tridiagonal $m$ atrix A.

D IA GF (input/output)
IfFACT = $\mathrm{F}^{\prime}$, then $D \mathrm{IAGF}$ is an inputargum entand on entry contains the $n$ diagonalelem ents of the diagonalm atrix D IA G from the $L$ *D IA G *L **T factorization ofA. IfFACT $=N$ ', then D IA GF is an outputargum entand on exitcontains the $n$ diagonal
elem ents of the diagonal $m$ atrix $D \mathbb{I A}$ from the $\mathrm{L} * \mathrm{D}$ IA $G * \mathrm{~L} * *$ T factorization ofA.

## SU BF (input/output)

IfFACT $=\mathrm{F}^{\prime}$, then SUBF is an inputargum ent and on entry contains the ( $n-1$ ) subdiagonalelem ents of the unit bidiagonal factor $L$ from the $\mathrm{L} * \mathrm{D} \mathbb{I A}{ }^{*} \mathrm{~L} * * \mathrm{~T}$ factorization of A . If $\mathrm{FACT}=\mathrm{N}^{\prime}$, then SUBF is an outputargum entand on exit contains the ( $n-1$ ) subdiagonalelem ents of the unit bidiagonal factorL from the $L * D \operatorname{IAG} * L * * T$ factorization ofA.
$B$ (input) The N by -N RH S righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ of $\mathbb{N} F O=N+1$, the N -by-NRHS solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the amay X . LD X >= $\max (1, N)$.

## RCOND (output)

The reciprocalcondition num berof the $m$ atrix $A$. If RCOND is less than the $m$ achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to working precision. This condition is indicated by a retum code of $\mathbb{N}$ FO $>0$.

FERR (output)
The forw ard emorbound foreach solution vector $X$ (j) (the $j$ th colum $n$ of the solution $m$ atrix $X$ ). IfXTRUE is the true solution comesponding to $X(\mathcal{j})$, FERR $(\mathcal{j})$ is an estim ated upperbound for the $m$ agnitude of the largestelem ent in (X ( $)$-X TRU E) divided by the $m$ agnitude of the largestelem ent in $\mathrm{X}(\underset{)}{ }$.

BERR (output)
The com ponentw ise relative backw ard emorof each solution vector $X(\mathcal{j})$ (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension $(2 * N)$
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=i$, and $i$ is
$<=N$ : the leading $m$ inor oforderiof $A$ is not positive definite, so the factorization could not
be com pleted, and the solution has not been com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{U}$ is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. Nevertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRC OND w ould suggest.

## PURPOSE

dpters solves a tridiagonal system of the form
A * $\mathrm{X}=\mathrm{B}$ using the $\mathrm{L} * \mathrm{D}$ *L 'factorization of A com puted by SPTTRF. $D$ is a diagonalm atrix specified in the vectorD, $L$ is a unitbidiagonalm atrix $w$ hose subdiagonal is specified in the vector $E$, and $X$ and $B$ are $N$ by NRH S $m$ atrices.

## ARGUMENTS

N (input) The order of the tridiagonalm atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrix B. NRHS $>=0$.

D IA G (input)
Then diagonalelem ents of the diagonal matrix
D IA G from the $L * D \mathbb{I A}$ * $L$ 'factorization of $A$.

OFFD (input/output)
The ( $n-1$ ) subdiagonalelem ents of the unitbidiagonal factor L from the $L$ *D IA G *L 'factorization of A. OFFD can also be regarded as the superdiagonal of the unitbidiagonal factor $U$ from the factorization $A=U$ *D $\mathbb{A} G * U$.

B (input/output)
On entry, the righthand side vectors B for the system of linearequations. On exit, the solution vectors, $X$.

LD B (input)
The leading dim ension of the array $B$. LD B >= $\max (1, N)$.
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-\mathrm{k}$, the k -th argum ent had an illegalvalue

void dptts2 (intn, intnrhs, double *d, double *e, double
void dptts2_64 (long n, long nihs, double *d, double *e, double *b, long ldb);

## PURPOSE

dptts2 solves a tridiagonal system of the form
A * $\mathrm{X}=\mathrm{B}$ using the L *D *L 'factorization of A com puted by SPTTRF. D is a diagonalm atrix specified in the vectorD, $L$ is a unitbidiagonalm atrix $w$ hose subdiagonal is specified in the vectorE, and X and B are N by N RH S m atrioes.

## ARGUMENTS

N (input) The order of the tridiagonalm atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrix B. NRHS $>=0$.
$D$ (input) The $n$ diagonalelem ents of the diagonal $m$ atrix $D$ from the $L * D$ ${ }^{*}$ 'factorization ofA.

E (input) The ( $\mathrm{n}-1$ ) subdiagonalelem ents of the unitbidiagonal factor $L$ from the $L * D * L$ 'factorization of $A$. E can also be regarded as the superdiagonal of the unit bidiagonal factor $U$ from the factorization $A$ $=U * D * U$.

B (input/output)
O $n$ entry, the righthand side vectors $B$ for the system of linearequations. On exit, the solution vectors, X .

LD B (input)
The leading dim ension of the anay $B$. LD B $>=$ $\max (1, N)$.

*a, long lda, double *w, double *z, long ldz, long
*info);

## PURPOSE

dsbev com putes all the eigenvalues and, optionally, eigenvectors of a real sym m etric band $m$ atrix A .

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}^{\prime}$ : C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
= U ': U pper triangle ofA is stored;
= LL': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. $\mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO = U',orthe num berof subdiagonals ifU PLO = L'. KD >= 0 .

A (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the first $K D+1$ row s of the array. The $j$ th colum $n$ of $A$ is stored in the jth colum $n$ of the anray A as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{A}(\mathrm{kd}+1+i-j, j)=A(i, j)$ for max $(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)$ for $j<=i<=m$ in $(n, j+k d)$.

On exit, A is overw rilten by values generated during the reduction to tridiagonal form . If $\mathrm{PLO}=$

U', the firstsuperdiagonal and the diagonal of the tridiagonal m atrix T are retumed in row sK D and $K D+1$ ofA, and if $U P L O=\Sigma$ ', the diagonaland first subdiagonal of $T$ are retumed in the first tw o row sofA.

LD A (input)
The leading dim ension of the array A. LD A >=KD + 1.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $\mathcal{O B Z}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, Z$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated with W (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading din ension of the amay $\mathrm{Z} . \operatorname{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
dim ension MAX ( $1,3 * \mathrm{~N}-2)$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit
< 0: if $\mathbb{I N}$ FO = -i, the i-th argum ent had an illegalvalue
> 0 : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include < sunperfh>
void dsbevd (char jobz, char uplo, intn, intkd, double *ab, int ldab, double *w, double *z, intldz, int *info);
void dsbevd_64 (char jobz, charuplo, long n, long kd, double *ab, long ldab, double *w , double *z, long ldz, long *info);

## PURPOSE

dsbevd com putes all the eigenvalues and, optionally, eigenvectors of a realsym $m$ etric band $m$ atrix $A$. If eigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conqueralgorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray X M P , C ray Y M P , C ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al $m$ achines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}^{\prime}$ : C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.
UPLO (input)
$=\mathrm{U}$ :: U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.
$K D$ (input)
The num ber of superdiagonals of the $m$ atrix A if
UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if UPLO
$=L^{\prime} . K D>=0$.

AB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstK $D+1$ row s of the amay. The $j$ th colum $n$ of $A$ is stored in the jth colum $n$ of the array AB as follow s: if $\mathrm{UPLO}=\mathrm{U}$ ', $\mathrm{AB}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{j}(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j, j)=A(i, 7)$ for $j<=i<=m$ in $(n, j+k d)$.

On exit, AB is overw rilten by values generated during the reduction to tridiagonal form. If PLO = U', the first superdiagonal and the diagonal of the tridiagonal m atrix T are retumed in row SKD and $K D+1$ of $B$, and if $U P L O=L$ ', the diagonal and first subdiagonal of $T$ are retumed in the first tw o row sofA B.

LDAB (input)
The leading dim ension of the array AB. LD AB $>=K D$ +1 .

W (output) If $\mathbb{N}$ FO $=0$, the eigenvalues in ascending order.

Z (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated w ith $W$ (i). If $J O B Z=N$ ', then $Z$ is not referenced.

LD Z (input)
The leading dim ension of the amay $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\max (1, N)$.

W ORK (w orkspace)
dim ension (LW ORK) On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim allW ORK.

LW ORK (input)
The dim ension of the array $\mathrm{W} O R \mathrm{~K}$. If $\mathrm{N}<=1$, LW ORK must.be at least1. If 0 BZ $=N$ 'and $N>$
2, LW ORK mustbe at least $2 * \mathrm{~N}$. If $\mathrm{JOBZ}=\mathrm{V}$ 'and
$\mathrm{N}>2$,LW ORK mustbe at least ( $1+5 * \mathrm{~N}+2 \mathrm{~N}_{\mathrm{N}}$ **2
).
If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of
the W ORK amray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERB LA .

IN ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I V}$ ORK (1) retums the optim al LIN ORK.
LIV ORK (input)
The dim ension of the array LIN ORK. If $\mathrm{JOBZ}=\mathrm{N}^{\prime}$ or $\mathrm{N}<=1$, LIN ORK mustbe at least1. If $\operatorname{JOBZ}=$ $V$ 'and $N>2$, LIN ORK m ust.be at least $3+5 * N$.

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the IV ORK array, retums this value as the first entry of the $\mathbb{I V}$ ORK array, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by XERBLA.
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum ent had an illegalvalue
> 0 : if $\mathbb{N} F O=$ i, the algonithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## PURPOSE

dsbevx com putes selected eigenvalues and, optionally, eigenvectors of a realsym $m$ etric band $m$ atrix A. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

```
JO BZ (input)
    = N ': C om pute eigenvalues only;
    = V ': C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w ill.be found;
= V ::alleigenvalues in the half-open interval
(NL,VU] will be found; = ' 1 ': the \(\mathbb{I}\)-th through
\(\mathbb{I U}\)-th eigenvaluesw illle found.
```

UPLO (input)
= U ': U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO = U',orthe num berof subdiagonals ifU PLO $=\mathbb{L} \cdot \mathrm{KD}>=0$.

A (input/output)
On entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstKD +1 row s of the amay. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum n of the amay $A$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{A}(\mathrm{kd}+1+\mathrm{i}-j, j)=A(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)$ for $j<=i<=m$ in $(n, j+k d)$.

On exit, A is overw rilten by values generated during the reduction to tridiagonal form. If $\mathrm{PLO}=$ U ', the first superdiagonal and the diagonal of the tridiagonal m atrix T are retumed in row SKD and KD +1 of , and if $\mathrm{PLO}=\mathrm{L}$ ', the diagonal and first subdiagonal of T are retumed in the first two row sofA.

LD A (input)
The leading dim ension of the array A. LD A >=KD + 1.

Q (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', the $\mathrm{N}-$ by N orthogonal m atrix used in the reduction to tridiagonal form. If $\mathrm{JO} \mathrm{BZ}=$ N ', the array Q is not referenced.

LD Q (input)
The leading dim ension of the array $Q$. If $J 0 B Z=$ V ', then LD $Q>=\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU. N ot referenced ifRANGE = A 'or I'.

VU (input)
Se the description of V L .
II (input)

If RA N GE=I', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{H}<=\mathbb{Z}<=N$, if $N>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE $=$ A 'or V'.

IU (input)
See the description of II.

ABTOL (input)
The absolute emortolerance forthe eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged w hen itis determ ined to lie in an interval [a,b]
of w idth less than orequal to
$A B T O L+E P S * \max (a|, b|)$,
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS*|I|will.be used in its place, w here $\mathrm{F} \mid$ is the 1 -norm of the tridiagonal m atrix obtained by reducing A to tridiagonalform .

E igenvalues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold 2*SLAMCH (S ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to 2*SLAM CH (S ).

See "C om puting Sm allSingularV alues of B idiagonal M atrices $w$ ith G uaranteed H igh Relative A ccuracy," by D em m eland K ahan, LAPA CK W orking N ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. $0<=$
NFOUND <= N. IfRANGE = A', NFOUND = N, and if RANGE $=$ 'I', NFOUND $=\mathbb{I}-\mathbb{L}+1$ 。

W (output)
The first NFOUND elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $\mathrm{OB} Z=V^{\prime}$, then if $\mathbb{N} F O=0$, the first $N F O U N D$ colum ns of $Z$ contain the orthonorm aleigenvectors of the matrix A corresponding to the selected eigenvalues, w ith the $i-$ th colum n of $Z$ holding the eigenvector associated w ith $W$ (i). If an eigenvector fails to converge, then that colum n of Z contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in

ㅍAII. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.
$N$ ote: the user must ensure that at least
$m$ ax ( $1, N F O U N D$ ) colum ns are supplied in the array $Z$;
if RANGE $=V$ ', the exactvalue ofNFOUND is not know $n$ in advance and an upperbound $m$ ustbe used.
LD Z (input)
The leading dim ension of the array Z. LD Z $>=1$, and if $\mathrm{OBB}=\mathrm{V}^{\prime}$, LD Z > = $\mathrm{max}(1, N)$.

W ORK (w orkspace)
dim ension $(7 \star \mathrm{~N})$

IW ORK 2 (w orkspace)

FAII (output)
If $\mathrm{OBZ}=\mathrm{V}^{\prime}$ ', then if $\mathbb{N F O}=0$, the first NFOUND
elements of $\mathbb{F A} I L$ are zero. If $\mathbb{N F O}>0$, then
IFA II contains the indices of the eigenvectors
that failed to converge. If $\mathrm{OBZ}=\mathrm{N}$ ', then
$\mathbb{F} A \mathbb{I}$ is notreferenced.
$\mathbb{N}$ FO (output)
= 0: successfulexit.
$<0$ : if $\mathbb{N} F O=-i$, the i-th argum enthad an illegalvalue.
$>0:$ if $\mathbb{N} F O=i$, then ieigenvectors failed to converge. Their indiges are stored in array正AII.

## C INTERFACE

\#include <sunperfh>
void dsbogst(charvect, charuplo, intn, int ka, int kb, double *ab, int ldab, double *bb, int labb, double * $x$, int ldx $x$, int *info);
void dsbgst_64 (charvect, charuplo, long n, long ka, long kb, double *ab, long ldab, double *bb, long ldbb, double *x, long ldx, long *info);

## PURPOSE

dsogst reduces a real sym $m$ etric-definite banded generalized eigenproblem $A * x=\operatorname{lam}$ bda*B*x to standard form $C * y=$ lam bda*y, such thatC has the sam e bandw idth asA .

B m usthave been previously factorized as $\mathrm{S}^{* *} \mathrm{~T} * \mathrm{~S}$ by SPBSTF, using a split Cholesky factorization. A is overw ritten by C $=\mathrm{X} * * \mathrm{~T} * \mathrm{~A} * \mathrm{X}$, where $\mathrm{X}=\mathrm{S} * *(-1) * \mathrm{Q}$ and Q is an orthogonal $m$ atrix chosen to preserve the bandw idth ofA.

## ARGUMENTS

## VECT (input)

$=N$ ': do not form the transform ation $m$ atrix $X$;
= V ': form X .

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrioes A and $\mathrm{B} . \mathrm{N}>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO = U',orthe num berof subdiagonals ifUPLO $=L^{\prime} . K A>=0$.

K B (input)
The num ber of superdiagonals of the $m$ atrix $B$ if
UPLO = U',orthe num berof subdiagonals ifU PLO
$=L^{\prime} . K A>=K B>=0$.

AB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the amay. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum $n$ of the amay $A B$ as follows: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(k a+1+i-j)=A(i, j)$ for $m a x(1, j$ $\mathrm{ka})<=\mathrm{i}<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $j<=i<=m$ in $(n, j+k a)$.

On exit, the transform ed matrix $X * * T * A * X$, stored in the sam e form at as $A$.

LD AB (input)
The leading dim ension of the array $A B$. LD AB >= KA+1.

BB (input)
The banded factors from the split Cholesky factorization ofB, as retumed by SPBSTF, stored in the first $K B+1$ row sof the array.

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.

X (output)
IfVECT = $V$ ', the $n-b y-n m$ atrix $X$. If VECT $=$ N ', the array X is not referenced.

LD X (input)
The leading dim ension of the aray X . LD X >= $\max (1, N)$ if VECT $=V$ ';LD X >= 1 otherw ise.

W ORK (w orkspace)
dim ension $(2 * N)$
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvahue.

## PURPOSE

dsogv com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym $m$ etric-definite banded eigenproblem, of the form $A$ *x $=(l a m ~ b d a) * B * x$. H ere A and B are assum ed to be sym $m$ etric and banded, and $B$ is also positive definite.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.
UPLO (input)
$=\mathrm{U}$ ': U ppertriangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.
$N$ (input) The order of the $m$ atrices $A$ and $B . N>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if P PLO
$=\mathbb{L} \cdot \mathrm{KA}>=0$.

KB (input)
The num ber of superdiagonals of the $m$ atrix $B$ if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if UPLO $=\mathbb{L} \cdot \mathrm{KB}>=0$.

AB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the array AB as follow s: if UPLO = U',AB $(k a+1+i-j)=A(i, j)$ for max ( $1, j$ $\mathrm{ka})<=\mathrm{i}<=j$; if UPLO $=\mathrm{L}, \mathrm{AB}(1+i-j, 7)=A(i, j)$ for $j<=i<=m$ in $(n, j+k a)$.

On exit, the contents of $A B$ are destroyed.
LDAB (input)
The leading dim ension of the array AB. LD AB >= KA+1.

BB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $B$, stored in the first kb+1 row sof the array. The $j$ th colum n of $B$ is stored in the $j$ th colum $n$ of the array $B B$ as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(\mathrm{kb}+1+\mathrm{i}-j)=\mathrm{j}(1,7)$ for $\mathrm{max}(1, j$ $\mathrm{kb})<=\mathrm{i}<=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{BB}(1+i-j, j)=B(i, 7)$ for $j<=i<=m$ in $(n, j+k b)$.

On exit, the factors from the splitCholesky factorization $B=S * * T * S$, as retumed by SPBSTF .

## LD BB (input)

The leading dim ension of the array BB. LD BB >= K B+1.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $\mathrm{OOBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ ith the $i$-th colum $n$ of Z holding the eigenvector associated w ith W (i). The eigenvectors are norm alized so that $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=$ I. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >= N .

W ORK (w orkspace)
dim ension ( $3 * \mathrm{~N}$ )
$\mathbb{N} F O$ (output)
= 0: successfulexit
<0: if $\mathbb{N N}$ FO = -i, the i-th argum ent had an illegalvalue
$>0$ : if $\mathbb{N} F O=i$, and $i$ is:
<= N : the algorithm failed to converge: i offdiagonal elem ents of an interm ediate tridiagonal form did notconverge to zero; $>\mathrm{N}$ : if $\mathbb{N} F \mathrm{FO}=\mathrm{N}$ +i , for $1<=\mathrm{i}<=\mathrm{N}$, then SPBSTF
retumed $\mathbb{N} F O=i: B$ is not positive definite. The factorization ofB could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

\#include <sunperfh>
void dsbgvd (char jobz, charuple, intn, int ka, int kb, double *ab, int ldab, double *bb, int ldbb, double *W , double *z, int ldz, int *info);
void dsogvd_64 (char jobz, charuplo, long n, long ka, long kb, double *ab, long ldab, double *bb, long ldbb, double *w, double *z, long ldz, long *info);

## PURPOSE

dsogvd com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym $m$ etric-definite banded eigenproblem, of the form $A * x=(\operatorname{lam} b d a) * B * x$. H ere A and B are assum ed to be sym $m$ etric and banded, and $B$ is also positive definite. If eigenvectors are desired, it uses a divide and conqueralgorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w th a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray X M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

## ARGUMENTS

JOBZ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.
$=\mathrm{U}:$ : U pper triangles of $A$ and $B$ are stored;
= L': Low ertriangles ofA and B are stored.
N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

KA (input)
The num ber of superdiagonals of the matrix A if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if UPLO
$=\mathrm{L}$ '. KA >= 0 .

KB (input)
The num ber of superdiagonals of the $m$ atrix $B$ if UPLO = U',orthe num berof subdiagonals ifU PLO $=\mathbb{L}^{\prime} . \mathrm{KB}>=0$.
AB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum n of the array AB as follows: if $\mathrm{UPLO}=\mathrm{U}$ ', AB $(k a+1+i-j)=A(i, 1)$ for $m a x(1, j$ $\mathrm{ka})<=i<=j ;$ ifUPLO $=\mathrm{L}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $j=i<=m$ in $(n, j+k a)$.

On exit, the contents of $A B$ are destroyed.

LDAB (input)
The leading dim ension of the array AB. LDAB >= KA+1.

BB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $B$, stored in the first kb+1 row sof the array. The $j$ th colum n of $B$ is stored in the jth colum $n$ of the array $B B$ as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(k a+1+i-j)=\mathrm{B}(i, j)$ for $\max (1, j$ $\mathrm{kb})<=\mathrm{i}<=\dot{j}$ if P PLO $=\mathrm{L}, \mathrm{BB}(1+i-j, j)=B(i, 7)$ for $j=i<=m$ in $(n, j+k b)$.

On exit, the factorS from the splitCholesky factorization $B=S * * T * S$, as retumed by SPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $\mathcal{O B Z}=\mathrm{V}^{\prime}$, then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ ith the $i$-th colum n of
$Z$ holding the eigenvector associated $w$ ith $W$ (i). The eigenvectors are norm alized so $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading dm ension of the array Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. If $\mathrm{N}<=1$, LW ORK >= 1. If JOBZ $=N$ 'and $N>1$,LW ORK $>=$ 3*N. If $\operatorname{OOBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$,LW ORK >=1 + 5*N + $2 * N * * 2$ 。

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if LIN ORK > 0, $\mathbb{I N}$ ORK (1) retums the optim all IV ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N} O R K$. If $0 \mathrm{OBZ}=\mathrm{N}^{\prime}$ orN <=1,L $\mathbb{I N} O R K>=1$. If $J O B Z=V$ 'and $N>1$, LIN ORK >= $3+5 * N$.

If LIV ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK array, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by X ERBLA.
$\mathbb{I N F O}$ (output)
= 0 : successfinlexit
<0: if $\mathbb{N N}$ FO = -i, the i-th argum ent had an illegalvalue
> 0 : if $\mathbb{N F O}=\mathrm{i}$, and is:
$<=\mathrm{N}$ : the algorithm failed to converge: i offdiagonal elem ents of an interm ediate tridiagonal form did not converge to zero; > N : if $\mathbb{N} F O=\mathrm{N}$ $+i$, for $1<=i<=N$, then SPBSTF
retumed $\mathbb{N} F O=i: B$ is not positive definite. The factorization ofB could notbe com pleted and
no eigenvalues oreigenvectors w ere com puted.

## PURPOSE

d.sogvx com putes selected eigenvalues, and optionally , eigenvectors of a real generalized sym m etric-definite banded eigenproblem, of the form $A * x=(l a m ~ b d a) * B * x . H$ ere $A$ and $B$ are assum ed to be sym $m$ etric and banded, and $B$ is also positive definite. Eigenvahues and eigenvectors can be selected by specifying either alleigenvalues, a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

JO BZ (input)
$=\mathrm{N}$ : C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found.
$=V$ ': alleigenvalues in the half-open interval
(VL, VU] w ill be found. = I': the IL th through $\mathbb{I U}$-th eigenvalues $w$ illbe found.

UPLO (input)
$=U U^{\prime}:$ Uppertriangles of $A$ and $B$ are stored;
$=\mathbb{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of them atriges $A$ and $B . N>=0$.
KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if
$\mathrm{UPLO}=\mathrm{U}$ ', orthe num berof subdiagonals ifU PLO
$=\mathbb{L}^{\prime} . \mathrm{KA}>=0$ 。

K B (input)
The num ber of superdiagonals of the $m$ atrix $B$ if U PLO $=\mathrm{U}$ ', orthe num ber of subdiagonals if U PLO
$=L^{\prime} . \mathrm{KB}>=0$ 。

A B (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum n ofA is stored in the $j$ th colum $n$ of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}$ ', AB $(k a+1+i-j)=A(i, j)$ for $m a x(1, j$ $\mathrm{ka})<=i<=j$ ifUPLO $={ }^{\prime}$ ', AB $(1+i-j, j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k a)$.

On exit, the contents of A B are destroyed.

LD A B (input)
The leading dim ension of the array AB. LDAB >= $K A+1$.

BB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $B$, stored in the firstkb+1 row s of the anray. The $j$ th colum n of $B$ is stored in the $j$ th colum n of the array BB as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(\mathrm{ka}+1+i-j)=\mathrm{B}(1,1)$ for $\mathrm{max}(1, j$ $\mathrm{kb})<=\dot{i}<=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{BB}(1+i-j, j)=B(i, 7)$ for $j<=i<=m$ in $(n, j+k b)$.

On exit, the factors from the splitCholesky factorization $B=S * * T * S$, as retumed by SPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD B B >= K B +1 .

Q (output)
If $\mathrm{OBBZ}=\mathrm{V}^{\prime}$, the $\mathrm{n}-\mathrm{by}-\mathrm{n}$ matrix used in the reduction of $A{ }_{x}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{~B} *_{x}$ to standard form, i.e. $\mathrm{C} *_{\mathrm{x}}=(\operatorname{lam} . \mathrm{bda}){ }^{*} \mathrm{x}$, and consequently C to tridiagonal form. If $\operatorname{OBB}=\mathrm{N}$ ', the amray $Q$ is not referenced.

LD Q (input)
The leading dim ension of the array $Q$. If $J B Z=$ $N^{\prime}, L D Q>=1$. If $O B Z=V^{\prime}, L D Q>=\max (1, N)$.

VL (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. VL < VU. N otreferenced ifRANGE=A'or I'.

V U (input)
See the description ofV L .

II (input)
If RA N GE= I', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=N$, if $N>0 ; \Pi=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE $=$ A 'or V'.

IU (input)
See the description of II .

ABSTOL (input)
The absolute emortolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged $w$ hen it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABSTOL + EPS * max $(|,||$,$) ,$
where EPS is them achine precision. IfABSTOL is less than or equal to zero, then EPS* $\mid$ | w illbe used in its place, w here $\mathrm{F} \mid$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonalform.

E igenvalues w illbe com puted m ostaccurately when ABSTOL is set to tw ice the underflow threshold $2 *$ SLA M CH (S ), not zero. If this routine retums w ith $\mathbb{N} F O>0$, indicating that som e eigenvectors did not converge, try setting ABSTO L to $2 \star$ SLAM CH (S ).

M (output)
The totalnum ber ofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=A \prime, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{I}-\mathbb{L}+1$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

Z (input) If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ th the $i$-th colum $n$ of $Z$ holding the eigenvector associated $w$ ith $W$ (i). The eigenvectors are norm alized so $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}$. If $J O B Z=N$ ', then $Z$ is not referenced.

LD Z (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
dim ension ( $7 * \mathrm{~N}$ )

IN ORK (w orkspace/output)
dim ension $(5 * N)$

FAII (input)
If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the firstM ele-
$m$ ents of $\mathbb{F} A \mathbb{I}$ are zero. If $\mathbb{N} F O>0$, then $\mathbb{F} A \mathbb{I}$
contains the indioes of the eigenvalues that
failed to converge. If $\mathrm{JOBZ}=\mathrm{N}$ ', then $\mathbb{F} A \mathbb{I}$ is
not referenced.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0$ : if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue
$<=\mathrm{N}:$ if $\mathbb{N} \mathrm{FO}=\mathrm{i}$, then ieigenvectors failed to converge. Their indioes are stored in $\mathbb{F A} \mathbb{I} .>\mathrm{N}$ :SPBSTF retumed an errorcode; ie., if $\mathbb{N N} F=\mathrm{N}$
$+i$, for $1<=i<=N$, then the leading $m$ inor of orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

\#include <sunperfh>
void dsbm $v$ (charuplo, intn, intk, double alpha, double *a, int lda, double *x, int incx, double beta, double *y, intincy);
void dsbm v_64 (charuplo, long $n$, long $k$, double alpha, double *a, long lda, double *x, long incx, double beta, double *y, long incy);

## PURPOSE

dsom v perform sthe $m$ atrix-vector operation $y:=$ alpha*A *x + beta* $y$, w here alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ ent vectors and $A$ is an $n$ by $n$ sym $m$ etric band $m$ atrix, $w$ ith k super-diagonals.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the band $m$ atrix $A$ is being supplied as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' The upper triangularpart of $A$ is being supplied.

UPLO = L'or I' The low er triangularpart of A is being supplied.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

K (input)
On entry, $K$ specifies the number of superdiagonals of them atrix A.K $>=0$. U nchanged on
exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or G ', the leading ( $k+1$ ) by $n$ part of the array A $m$ ust contain the upper triangular band part of the symmetric $m$ atrix, supplied colum $n$ by colum $n$, $w$ th the leading diagonal of the $m$ atrix in row ( $k+1$ ) of the array, the first super-diagonalstarting atposition 2 in row $k$, and so on. The top left $k$ by $k$ triangle of the anray $A$ is not referenced. The follow ing program segm entw illtransfer the upper triangular part of a sym $m$ etric band $m$ atrix from conventional fullm atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

Before entry w ith UPLO = L 'or 1', the leading ( $\mathrm{k}+1$ ) by n partof the array A m ustcontain the low er triangular band part of the symmetric $m$ atrix, supplied colum $n$ by colum $n$, $w$ th the leading diagonalof them atrix in row 1 of the amay, the first sub-diagonalstarting atposition 1 in row 2 , and so on. The bottom right k by $k$ triangle of the array $A$ is not referenced. The follow ing program segm entw illtransfer the low ertriangular part of a sym $m$ etric band $m$ atrix from conventional fullm atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \mathrm{CONTINUE}
\end{aligned}
$$

U nchanged on exit.

LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A $>=$ (
$\mathrm{k}+1$ ). Unchanged on exit.
X (input)
$(1+(n-1) * a b s(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the vectorx.
U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

Y (input/output)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ m ustcontain the vectory. On exit, $Y$ is overw ritten by the updated vectory.
$\mathbb{N C Y}$ (input)
O n entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y$. $\mathbb{N C Y}$ <> 0 . Unchanged on exit.

\#include <sunperfh>
void dsbtrd (charvect, charuplo, intn, int kd, double *ab, int ldab, double *d, double *e, double *q, int ldq, int *info);
void dsotrd_64 (charvect, charuplo, long n, long kd, double *ab, long ldab, double *d, double *e, double *q, long ldq, long *info);

## PURPOSE

dsbtrd reduces a real sym $m$ etric band $m$ atrix $A$ to sym $m$ etric tridiagonal form T by an orthogonalsim ilarity transform ation: $\mathrm{Q} * * \mathrm{~T} * A * Q=T$.

## ARGUMENTS

VECT (input)
$=\mathrm{N}$ : do notform Q ;
$=\mathrm{V}$ : form Q ;
$=U$ : update a $m$ atrix $X$, by form ing $X * Q$.

UPLO (input)
$=\mathrm{U}$ ': Uppertriangle of A is stored;
$=\mathbb{L}:$ Low ertriangle ofA is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of subdiagonals ifUPLO $=\mathbb{L}^{\prime} . \mathrm{KD}>=0$ 。

A B (input/output)
O n entry, the upper or low ertriangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstK $D+1$ row s of the array. The $j$ th colum n of A is stored in the $j$ th colum n of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}$ ', AB $(k d+1+i-j, j)=A(i, j)$ for $m a x(1, j$
$\mathrm{kd})<=i<=\dot{j}$ ifUPLO $=\mathrm{L}, \mathrm{AB}(1+i-j)=A(i, 7)$ for $j=i<=m$ in $(n, j+k d)$. O $n$ exit, the diagonalele$m$ ents of AB are overw ritten by the diagonalele$m$ ents of the tridiagonalm atrix $T$; if $K D>0$, the elem ents on the first superdiagonal (if UPLO = U ) or the first subdiagonal (ifU PLO = L ) are overw ritten by the off-diagonalelem ents of $T$; the restofA $B$ is overw ritten by values generated during the reduction.

LD AB (input)
The leading dim ension of the array AB. LD AB >= K D +1 .

D (output)
The diagonalelem ents of the tridiagonalm atrix T .
E (output)
The off-diagonal elem ents of the tridiagonal $m$ atrix $T: E(i)=T(i, i+1)$ if $U P L O=U ; E(i)=$ $T(i+1, i)$ if $\mathrm{PLO}=\mathrm{L}^{\prime}$.

Q (input/output)
On entry, ifVECT $=U$ ', then Q must contain an N by $-\mathrm{N} m$ atrix X ; if $\mathrm{VECT}=\mathrm{N}$ 'or $V$ ', then $Q$ need notbe set.

On exit: if $\mathrm{VECT}=\mathrm{V}$ ', Q contains the N -by -N orthogonalm atrix $Q$; if VECT $=U$ ', $Q$ contains the product $\mathrm{X} * \mathrm{Q}$; ifVECT $=\mathrm{N}$ ', the array Q is not referenced.

LDQ (input)
The leading dim ension of the array $\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1$, and $L D Q>=N$ ifVECT $=V$ 'or $U '$.

W ORK (w orkspace)
dim ension (N)
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
< $0:$ if $\mathbb{N} F O=-i$, the $i$-th argum enthad an illegalvalue

``` (inv denotesm atrix inverse, 'indicatesm atrix transpose)

\section*{ARGUMENTS}

TRA N SA Indicates how to operate \(w\) ith the sparse \(m\) atrix 0 : operate \(w\) ith \(m\) atrix
1 : operate w th transpose \(m\) atrix
2 : operate \(w\) th the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M \(\quad N\) um ber of row \(s\) in matrix A
\(N \quad N\) um berof colum \(n s\) in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identily \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum n scaling)
4 :A utom atic row orcolum n scaling (see section N O TES for further details)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D .

ALPHA Scalarparam eter
```

D ESCRA () D escriptor argum ent. Fi̇ve elem entinteger anay
DESCRA (1) m atrix structure
0 :general
1 : symm etric (A=A)
2:H erm itian (A = CON JG (A ))
3:Triangular
4 : Skew (A nti)-Symm etric (A=-A )
5 :D iagonal
6:Skew Herm itian (A= CON JG (A ) )
N ote: For the routine, D ESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 :unit
DESCRA (4) A nay base $\mathbb{N} O T \mathbb{M}$ PLEM ENTED)
$0: C / C++$ com patible
1 :Fortran com patible
DESCRA (5) repeated indices? (NOT $\mathbb{M}$ PLEM ENTED)
0 : unknown
1 : no repeated indices

```

VAL () array contain the nonzeros ofA in skyline profile form .
Row -oriented ifD ESCRA (2) = 1 (low er triangular), colum n oriented ifD ESCRA (2) \(=2\) (upper triangular) .

PN TR () integer array of length \(M+1\) (low ertriangular) or
\(\mathrm{K}+1\) (upper triangular) such thatPN TR (I)-PN TR (1)+1 points to the location in VAL of the firstelem ent of the skyline profile in row (colum n) I.

B 0 rectangular anay w ith first dim ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch amay of length LW ORK.
On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .

Forgood perform ance, LW O RK should generally be larger.

For optim um perform ance on \(m\) ultiple processors, LW ORK \(>=M\) *N _CPU S where N_CPUS is the m axim um num berof processors available to the program .

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

AP (input/output)
D ouble precision aray, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2)\) On
entry, the upper or low er triangle of the sym -
\(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear
array. The \(j\) th column of \(A\) is stored in the array AP as follow \(s\) : if UPLO \(=U ', A P(i+(j\)
 \(+(j-1)^{\star}(2 \star n-j / 2)=A(i, 7)\) for \(j<=i<=n\).

On exit, AP is overw rilten by values generated during the reduction to tridiagonal form. If PLO \(=U\) ', the diagonal and first superdiagonal of the tridiagonal \(m\) atrix \(T\) overw rite the corresponding elem ents ofA, and if UPLO = L', the diagonal and first subdiagonal of \(T\) overw rite the comesponding elem ents ofA.
W (output)
D ouble precision array, dim ension \(\mathbb{N}\) ) If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.
\(Z\) (input) \(D\) ouble precision array, dim ension ( \(\mathrm{LD} \mathrm{Z}, \mathrm{N}\) ) If O B Z \(=\mathrm{V}\) ', then if \(\mathbb{N} F O=0, \mathrm{Z}\) contains the orthonorm aleigenvectors of the \(m\) atrix \(A\), \(w\) ith the \(i\)-th column of Z holding the eigenvector associated w th W (i). If \(\mathrm{OBZ}=\mathrm{N}\) ', then Z is not referenced.

LD \(Z\) (input)
The leading dim ension of the array \(Z\). LD \(Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
Realarray, dim ension (LW ORK)On exit, if \(\mathbb{N} F O=\) \(0, W\) ORK (1) retums the optim allW ORK .

LW ORK (input)
The dim ension of the array \(\mathrm{W} O R \mathrm{O}\). If \(\mathrm{N}<=1\), LW ORK must be at least1. If \(\mathrm{JOBZ}=\mathrm{N}\) 'and \(\mathrm{N}>\) \(1, L W\) ORK m ustbe at least \(2{ }^{*} \mathrm{~N}\). If \(\mathcal{J O} \mathrm{BZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1\), LW ORK mustbe at least \(1+6 * \mathrm{~N}+\mathrm{N} * * 2\).

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
Integer array, dim ension (L IN ORK) On exit, if \(\mathbb{I N}\) FO \(=0, \mathbb{I V}\) ORK (1) retums the optim alL IV ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I N} O R K\). If \(J O B Z=N^{\prime}\) or \(N<=1, L \mathbb{I N} O R K\) mustbe at least1. If JOBZ \(=\)

V'and N > 1,LIN ORK m ustbe at least \(3+5 * N\).

IfLIW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK aray, and no errorm essage related to LIN ORK is issued by XERBLA .
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue.
\(>0:\) if \(\mathbb{N F O}=i\), the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero.

\section*{PURPOSE}
dspevx com putes selected eigenvalues and, optionally , eigenvectors of a real symm etric \(m\) atrix A in packed storage. E igenvalues/vectors can be selected by specifying either a range of vahues or range of indices for the desired eigenvalues.

\section*{ARGUMENTS}

JOBZ (input)
\(=\mathrm{N}\) : C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found;
\(=\mathrm{V}\) ::alleigenvalues in the half-open interval
(VL, VU] w ill be found; = \(\mathrm{I}^{\prime}\) : the \(I \mathrm{I}\)-th through
\(\mathbb{I U}\)-th eigenvalues w ill be found.

UPLO (input)
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathbb{L}\) ': Low er triangle of A is stored.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
AP (input/output)
D ouble precision array, dim ension \(\mathbb{N} * \mathbb{N}+1\) )/2) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The \(j\) th colum \(n\) of \(A\) is stored in the aray AP as follow s: if UPLO = U', AP (i + \((j\)
 \(+(j-1)^{\star}(2 * n-j / 2)=A(i, 7)\) for \(j<=i<=n\).

On exit, AP is overw ritten by values generated during the reduction to tridiagonal form. If PLO
= U', the diagonal and first superdiagonal of the tridiagonal \(m\) atrix \(T\) overw rite the corresponding elem ents ofA, and if UPLO = 5 ', the diagonal and first subdiagonal of \(T\) overw rite the comesponding elem ents ofA.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A 'or I '.

VU (input)
See the description of V L .

II (input)
If RANGE= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{Z}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE= A 'or V'.

IU (input)
See the description of II.

ABTOL (input)
The absolute error tolerance for the eigenvalues. A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABTOL + EPS * max ( \(k|\),\(| |) ,\)
\(w\) here EPS is the m achine precision. If ABTOL is less than or equalto zero, then EPS* \(\mid\) | w illube used in its place, w here \(|T|\) is the 1 -norm of the tridiagonalm atrix obtained by reducing AP to tri-
diagonal form .
E igenvahues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold \(2 \star\) SLAM CH (S ), notzero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABTOL to \(2 *\) SLAM CH (S ).

See "C om puting Sm allSingularV alues ofB idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by D em m eland \(K\) ahan, LA PA CK W orking \(N\) ote \#3. NFOUND (output)

The total num ber of eigenvalues found. \(0<=\) NFOUND <= N. IfRANGE = A', NFOUND = N, and if RANGE \(=I^{\prime}\), NFOUND \(=\mathbb{U}-\mathbb{L}+1\).

W (output)
D ouble precision array, dim ension \(\mathbb{N}\) ) If \(\mathbb{N} F O=0\), the selected eigenvalues in ascending order.

Z (output)
D ouble precision array, dim ension (LD Z, max (1, M ))
If \(J O B Z=V\) ', then if \(\mathbb{N} F O=0\), the firstNFOUND colum ns of \(Z\) contain the orthonorm al eigenvectors of the \(m\) atrix A comesponding to the selected eigenvalues, \(w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith \(W\) (i). If an eigenvector fails to converge, then thatcolum \(n\) of \(Z\) contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F A} \mathbb{I}\). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced. \(N\) ote: the user must ensure that at least m ax (1,NFOUND) colum ns are supplied in the anay \(Z\); ifRANGE = V', the exact value of FOUND is not know \(n\) in advance and an upperbound \(m\) ustbe used.

LD \(Z\) (input)
The leading \(d i m\) ension of the array \(Z\). LD \(Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >= \(\mathrm{max}(1, N)\).

W ORK (w orkspace)
D ouble precision array, dim ension ( \(8 * N\) )
IV ORK 2 (w orkspace)
Integer amay, dim ension ( 5 *N )
FA \(\mathbb{I}\) (output)
Integer array, dim ension \((\mathbb{N})\) If JO B Z \(=\mathrm{V}\) ', then if
\(\mathbb{N} F O=0\), the firstNFOUND elem ents of \(\mathbb{F} A \mathbb{I}\) are
zero. If \(\mathbb{N F O}>0\), then \(\mathbb{F A} I I\) contains the
indices of the eigenvectors that failed to converge. If \(J 0 B Z=N\) ', then \(\mathbb{F A} \mathbb{I}\) is not referenced.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N F O}=-i\), the \(i\)-th argum ent had an illegal value
\(>0\) : if \(\mathbb{N F O}=\mathrm{i}\), then ieigenvectors failed to converge. Their indioes are stored in array FAI.

void dspgst_64 (long itype, charuplo, long n, double *ap, double *bp, long *info);

\section*{PURPOSE}
dspgst reduces a real sym \(m\) etric-definite generalized eigenproblem to standard form, using packed storage.

If ITY PE \(=1\), the problem is \(A * x=\) lam bda*B \({ }^{*} \mathrm{X}\), and \(A\) is overw ritten by inv \((U * * T) * A * \operatorname{inv}(U)\) or inv ( \((\mathrm{A})\) *A *inv ( \((\mathrm{L} * * \mathrm{~T})\)
If ITYPE \(=2\) or 3 , the problem is \(A * B *_{x}=\) lam bda* x or \(B *_{A} *_{X}=\operatorname{lam}\) bda* \(x\), and \(A\) is overw ritten by \(U * A * U * * T\) or L**T*A*L。

B m usthave been previously factorized as U ** T * U or \(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\) by SPPTRF.

\section*{ARGUMENTS}

ITYPE (input)
\(=1:\) compute \(\quad \operatorname{inv}(\mathrm{U} * * T) \star A * \operatorname{inv}(\mathrm{U})\) or
\(\operatorname{inv}(\amalg) \star A\) *inv \((\amalg * * T)\);
\(=2\) or 3 : com pute \(\mathrm{U} * \mathrm{~A} * \mathrm{U} * * \mathrm{~T}\) orL \({ }^{* *} \mathrm{~T} * \mathrm{~A} * \mathrm{~L}\).

UPLO (input)
\(=U^{\prime}\) : Uppertriangle of \(A\) is stored and \(B\) is factored as \(\mathrm{U} * * \mathrm{~T} * \mathrm{U} ;=\mathrm{L}\) : L Low er triangle ofA is stored and B is factored as \(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\).

N (input) The order of the \(m\) atriges \(A\) and \(B . N>=0\).

A P (input/output)
D ouble precision array, dim ension \((\mathbb{N} *(\mathbb{N}+1) / 2)\) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear amay. The \(j\) th column of \(A\) is stored in the array AP as follow s: if UPLO \(=\mathrm{U}\) ', AP (i \(+(j\) 1) \(\star j 2\) ) \(=A(i, 7)\) for \(1<=i<=j\) ifUPLO \(=L^{\prime}, A P(i\) \(+(j-1)^{\star}(2 n-j / 2)=A(i, j)\) for \(j=i<=n\).

On exit, if \(\mathbb{N F O}=0\), the transform ed \(m\) atrix, stored in the sam e form at as A.

BP (input)
D ouble precision array, dim ension \((\mathbb{N} *(N+1) / 2)\) The triangular factor from the Cholesky factorization ofB, stored in the sam e form atasA, as retumed by SPPTRF.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue

\section*{C INTERFACE}
\#include <sunperfh>
void dspgvd (int itype, char jobz, charuplo, int n, double
*ap, double *bp, double *w, double *z, int ldz, int*info);
void dspgvd_64 (long itype, char jobz, char uplo, long n, double *ap, double *bp, double *w , double *z, long ldz, long *info);

\section*{PURPOSE}
dspgvd com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym \(m\) etric-definite eigenproblem, of the form \(A * x=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{~B} * \mathrm{x}, \mathrm{A} * \mathrm{~B}\) x \(=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\), or \(B * A * x=\left(\operatorname{lam}\right.\) bda) \({ }^{*} x\). Here \(A\) and \(B\) are assum ed to be sym \(m\) etric, stored in packed form at, and \(B\) is also positive definite. Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conqueralgorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) ithout guard digits w hich subtract like the \(C\) ray X M P , C ray Y M P , C ray C-90, or C ray-2. It could conceivably fail on hexadecim al or decim al \(m\) achines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A{ }^{*} \mathrm{X}=\left(\operatorname{lam}\right.\) bda)\({ }^{*} \mathrm{~B}^{*} \mathrm{X}\)
\(=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B * A * x=(\operatorname{lam} . b d a){ }^{*} \mathrm{x}\)

JOBZ (input)
= N ': C om pute eigenvahues only;
\(=\mathrm{V}:\) : C om pute eigenvahues and eigenvectors.

UPLO (input)
\(=\mathrm{U}\) ': U pper triangles of \(A\) and \(B\) are stored;
\(=\mathrm{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).
AP (input/output)
D ouble precision array, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The \(j\) th colum \(n\) of \(A\) is stored in the array AP as follow s: if UPLO = U', AP (i \(+(j\) \(1) \star \dot{j} 2)=A(i, 7)\) for \(1<=i<=j\) ifUPLO \(=L^{\prime}, A P(i\) \(\left.+(j-1)^{\star}\left(2{ }^{*} n-j\right) / 2\right)=A(i, 7)\) for \(j=i<=n\).

On exit, the contents ofA \(P\) are destroyed.
BP (input/output)
D ouble precision anay, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(B\), packed colum nw ise in a linear anray. The jth column of \(B\) is stored in the array BP as follow s: if UPLO \(=\mathrm{U}\) ', \(\mathrm{BP}(i+(j\) \(\left.1)^{\star} \mathfrak{j} 2\right)=\mathrm{B}(i, 7)\) for \(1<=\mathrm{i}<=\dot{j}\) if \(\mathrm{UPLO}=\mathrm{L}, \mathrm{BP}(i\) \(\left.+(j-1)^{*}(2 \star n-j) / 2\right)=B(i, 7)\) for \(j=i<=n\).

On exit, the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{B}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\), in the sam e storage form at as \(B\).

W (output)
D ouble precision array, dim ension \(\mathbb{N}\) ) If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

Z (output)
D ouble precision array, dim ension (LD Z,N) If JO B Z
\(=\mathrm{V}^{\prime}\), then if \(\mathbb{N} \mathrm{FO}=0, \mathrm{Z}\) contains the m atrix Z
of eigenvectors. The eigenvectors are norm alized
as follow s : if ITY \(\mathrm{PE}=1\) or \(2, \mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}\); if \(\operatorname{ITYPE}=3, Z * * T * \operatorname{inv}(B) * Z=I\). If \(J O B Z=N\) ', then \(Z\) is not referenced.

LD Z (input)
The leading dim ension of the array \(Z . L D Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)\).

W ORK (w orkspace/output)
D ouble precision array, dim ension (LW ORK) O n exit, if \(\mathbb{N F O}=0, \mathrm{~W} O \mathrm{RK}(1)\) retums the optim alLW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. If \(\mathrm{N}<=1\), LW ORK \(>=1\). If \(\mathrm{OBZ}=\mathrm{N}\) 'and \(\mathrm{N}>1\), LW ORK \(>=\) \(2 * N\). If \(\mathrm{OBZ}=\mathrm{V}\) 'and \(\mathrm{N}>1\),LW ORK \(>=1+6 * N+\) \(2 * N * * 2\) 。

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
Integer array, dim ension ( \((\mathbb{I}\) W ORK) On exit, if \(\mathbb{N}\) FO \(=0, \mathbb{I W}\) ORK (1) retums the optim alL \(\mathbb{I N}\) ORK.

LIV ORK (input)
The dim ension of the anay \(\mathbb{I W}\) ORK. If \(O B Z=N^{\prime}\) or \(\mathrm{N}<=1, \mathrm{~L} \mathbb{W} O R K>=1\). If \(\mathrm{OBZ}=\mathrm{V}\) 'and \(N>1\), LIW ORK \(>=3+5 \star \mathrm{~N}\) 。

IfLIW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I W}\) ORK is issued by XERBLA.

INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue
>0: SPPTRF orSSPEVD retumed an emorcode: \(<=\mathrm{N}:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{SSPEVD}\) failed to converge; i offf-diagonal elem ents of an interm ediate tridiagonal form did notconverge to zero; \(>\mathrm{N}\) : if \(\mathbb{N F O}\) \(=N+i\), for \(1<=i<=N\), then the leading \(m\) inor oforderiofB is not positive definite. The factorization of \(B\) could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

\section*{PURPOSE}
dspgvx com putes selected eigenvalues, and optionally , eigenvectors of a realgeneralized sym \(m\) etric-definite eigenproblem, of the form \(A * x=(l a m . b d a) * B * x, A * B x=(l a m . b d a) * x\), or \(B{ }^{\star} A{ }^{*} x=(\operatorname{lam} . b d a){ }^{\star} x\). H ere \(A\) and \(B\) are assum ed to be sym \(m\) etric, stored in packed storage, and \(B\) is also positive definite.
E igenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvahues.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A *_{\mathrm{x}}=(\operatorname{lam} \mathrm{bda}){ }^{*} \mathrm{~B}{ }^{*} \mathrm{x}\)
\(=2: A * B{ }^{*} \mathrm{x}=(\operatorname{lam} \mathrm{bda}){ }^{\star} \mathrm{x}\)
\(=3: \mathrm{B}^{\star} \mathrm{A}{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda})^{\star} \mathrm{X}\)

JOBZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w illbe found.
\(=\mathrm{V}\) ::alleigenvalues in the half-open interval ( \(\mathrm{L}, \mathrm{VU}] \mathrm{w}\) ill be found. = 'I': the \(\mathbb{I}\)-th through \(\mathbb{I U}\)-th eigenvaluesw illbe found.

UPLO (input)
= U ': U ppertriangle of A and B are stored;
= L ': Lowertriangle of A and B are stored.
\(N\) (input) The order of the \(m\) atrix pencil \((A, B) . N>=0\).
AP (input/output)
D ouble precision array, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix A, packed colum nw ise in a linear array. The \(j\) th colum \(n\) of \(A\) is stored in the array AP as follow s: if UPLO = U', AP (i + (j \(\left.1)^{\star} \mathfrak{j} 2\right)=A(i, j)\) for \(1<=i<=j\) ifUPLO \(=L^{\prime}, A P(i\) \(\left.+(j-1)^{\star}(2 \star n-j) / 2\right)=A(i, 7)\) for \(j<=i<=n\).

On exit, the contents ofAP are destroyed.
BP (input/output)
D ouble precision array, dim ension \(\mathbb{N}^{*}(\mathbb{N}+1) / 2\) ) On entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(B\), packed colum nw ise in a linear array. The \(j\) th colum \(n\) of \(B\) is stored in the array BP as follow s: if \(\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{BP}(i+(j\)
 \(+(j-1)^{\star}\left(2{ }^{\star} n-j / 2\right)=B(i, j)\) for \(j=i<=n\).

On exit, the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) orB \(=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\), in the sam e storage form atas \(B\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
See the description of V L .

II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be
retumed. \(1<=\mathbb{I}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{I}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A 'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute errortolerance for the eigenvalues.
A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * max ( \(\mid\) |, \(\mid\) ) ,
where EPS is them achine precision. IfA BSTOL is less than or equal to zero, then EPS* \(\mid\) | w illbe used in its place, where \(T\) | is the 1 -nom of the tridiagonal \(m\) atrix obtained by reducing \(A\) to tridiagonalform.

E igenvalues w illbe com puted m ost accurately when ABSTOL is set to tw ice the underflow threshold \(2 *\) SLAM CH ( S ), not zero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABSTO L to \(2 *\) SLAM CH (S ).

M (output)
The total num ber of eigenvalues found. \(0<=\mathrm{M}\) <= N . IfRANGE \(=\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{L}+1\).

W (output)
D ouble precision array, dim ension \(\mathbb{N}\) ) On norm al exit, the first \(M\) elem ents contain the selected eigenvalues in ascending order.

Z (output)
D ouble precision array, dim ension (LD Z, max (1, M )) If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced. If JOBZ \(=\mathrm{V}\) ', then if \(\mathbb{N} F O=0\), the first \(M\) colum ns of \(Z\) contain the orthonom aleigenvectors of the \(m\) atrix A comesponding to the selected eigenvalues, w ith the i-th colum \(n\) of \(Z\) holding the eigenvectorassociated w ith W (i). The eigenvectors are norm alized as follows: if ITYPE \(=1\) or \(2, Z * * T * B * Z=I\); if TTYPE \(=3, Z * * T * \operatorname{inv}(B) * Z=I\).

If an eigenvector fails to converge, then that colum \(n\) of \(Z\) contains the latestapproxim ation to
the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F A} \mathbb{I}\). N ote: the userm ustensure that at leastm ax \((1, M)\) colum ns are supplied in the aray \(Z\); ifRANGE = V', the exactvalue of \(M\) is notknow \(n\) in advance and an upper bound \(m\) ust be used.
LD \(Z\) (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >= \(\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
D ouble precision array, dim ension ( \(8{ }^{\star} \mathrm{N}\) )
IV ORK (w orkspace)
Integer anay, dim ension ( 5 *N )
FAII (output)
Integer array, dim ension \(\mathbb{N}\) ) If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N} F O=0\), the firstM elem ents of \(\mathbb{F} A \mathbb{I}\) are zero. If \(\mathbb{N F O}>0\), then \(\mathbb{F A} \mathbb{I}\) contains the indices of the eigenvectors that failed to converge. If \(\mathrm{JOBZ}=\mathrm{N}\) ', then \(\mathbb{F} A \mathbb{I}\) is not referenced.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
> 0: SPPTRF orSSPEVX retumed an errorcode: \(<=N\) : if \(\mathbb{N} F O=i, S S P E V X\) failed to converge; i eigenvectors failed to converge. Their indices are stored in array \(\mathbb{F} A \mathbb{I} .>N\) : if \(\mathbb{N} F O=N+\) \(i\), for \(1<=i<=N\), then the leading \(m\) inorof orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

O n entry, N specifies the order of the m atrix A . \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
\((1+(n-1) \star a b s(\mathbb{N} C X))\). Before entry, the increm ented array X must contain the n elem ent vectorx. U nchanged on exit.
\(\mathbb{N C X}\) (input)

On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents ofX. \(\mathbb{N} C X<>0\). U nchanged on exit.

A (input/output)
\(\left(\left(n^{*}(n+1)\right) / 2\right)\). Before entry \(w\) ith UPLO \(=\) U ' or G ', the anay A m ustcontain the upper triangularpartof the symm etric \(m\) atrix packed sequentially, column by colum n, so thatA (1) containsa(1,1), A (2) and A (3) contain a( 1,2 ) and a (2,2) respectively, and so on. On exit, the array A is overw rilten by the upper triangular part of the updated \(m\) atrix. Before entry with UPLO = L'or I', the array A m ust contain the low er triangularpart of the sym \(m\) etric \(m\) atrix packed sequentially, colum \(n\) by colum \(n\), so that A ( 1 ) contains a ( 1,1 ), A (2) and A (3) contain \(a(2,1)\) and \(a(3,1)\) respectively, and so on. On exit, the array A is overw ritten by the low er triangular part of the updated \(m\) atrix.

\section*{PURPOSE}
dsprfs in proves the com puted solution to a system of linear equations \(w\) hen the coefficientm atrix is sym \(m\) etric indefinite and packed, and provides errorbounds and backw ard error estim ates forthe solution.

\section*{ARGUMENTS}

UPLO (input)
= U ': U pper triangle ofA is stored;
= LL': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the m atrices B and X. NRHS >=0.

AP (input)
D ouble precsion array, dim ension \((\mathbb{N} *(N+1) / 2)\) The upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The jth colum \(n\) of A is stored in the array A as follow s:
if UPLO \(=U U^{\prime}, A P(i+(j-1) \star j 2)=A(i, j)\) for
\(1<=i<=j\) ifUPLO \(=L \prime\) ' AP \(\left(i+(j-1)^{*}(2 * n-j) / 2\right)=\)
A \((i, j)\) for \(j=i<=n\).
AF (input)
D ouble precsion amay, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) The factored form of them atrix A. AF contains the block diagonalm atrix D and the multipliers used to obtain the factorU orL from the factorization \(A=U * D * U * * T\) or \(A=L * D * L * * T\) as computed by SSPTRF, stored as a packed triangularm atrix.
\(\mathbb{P I V O T}\) (input)
Integer array, dim ension \(\mathbb{N}\) ) D etails of the interchanges and the block structure ofD as determ ined by SSPTRF.

B (input) D ouble precision amray, dim ension (LDB,NRHS) The right hand side \(m\) atrix \(B\).

LD B (input)
The leading din ension of the array \(B\). LD B >= \(\max (1, N)\).

X (input/output)
D ouble precision array, dim ension (LDX,NRHS) On entry, the solution \(m\) atrix \(X\), as com puted by SSPTRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay X . LDX >= \(\max (1, \mathbb{N})\).

FERR (output)
D ouble precision array, dimension (NHS) The estim ated forw ard enror bound foreach solution vectorX ( \(\mathcal{F}\) ) the \(j\) th column of the solution \(m\) atrix \(X)\). If XTRUE is the true solution corresponding to \(\mathrm{X}(\mathcal{j})\), FERR ( \(\mathcal{1}\) ) is an estim ated upper bound for the \(m\) agnitude of the largestele\(m\) ent in ( \(\mathrm{X}(\mathcal{\nu})-\mathrm{X}\) TRUE) divided by the m agnitude of the largest elem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
D ouble precision aray, dim ension (NRHS) The componentw ise relative backw ard error of each solution vector X ( ) (i.e., the smallest relative change in any elem entof \(A\) orB thatm akes \(X(\mathcal{j})\) an
exactsolution).

W ORK (w orkspace)
D ouble precision array, dim ension ( \(3 \star \mathrm{~N}\) )

W ORK2 (w orkspace)
Integer aray, dim ension \((\mathbb{N})\)
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue

void dspsv_64 (charuplo, long n, long nrhs, double *a, long *ịivot, double *b, long ldb, long *info);

\section*{PURPOSE}
dspsv com putes the solution to a real system of linearequations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) symm etric \(m\) atrix stored in packed form at and \(X\) and \(B\) are \(N\) boy \(-N\) RH S \(m\) atrices.

The diagonalpivoting \(m\) ethod is used to factorA as
\(A=U * D * U * * T\), if \(U P L O=U\) ', or
\(A=L * D * L * * T\), if \(U P L O=L '\),
w here U (orL) is a productof perm utation and unit upper (low er) triangularm atrioes, \(D\) is sym m etric and block diagonalw th 1 -by -1 and 2 -by -2 diagonal blocks. The factored form ofA is then used to solve the system of equations A * \(X=B\).

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathrm{L}\) ': Low er triangle of A is stored.

N (input) The num ber of linearequations, ie., the order of them atrix A. N >=0.

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of them atrix B. NRH S \(>=0\).

A (input/output)
D ouble precision aray, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2)\) On
entry, the upper or low er triangle of the sym -
\(m\) etric \(m\) atrix A, packed colum nw ise in a linear
aray. The \(j^{\text {th }}\) column of \(A\) is stored in the array A as follow s: if UPLO \(=U\) ', A (i \(+(j\)
 \((j-1) *(2 n-j / 2)=A(i, j)\) for \(j=i<=n\). See below for furtherdetails.

On exit, the block diagonalm atrix \(D\) and the \(m u l\) tipliers used to obtain the factor \(U\) orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by SSPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atasA.

IPIVOT (output)
Integer anray, dim ension \(\mathbb{N}\) ) D etails of the interchanges and the block structure of \(D\), as determ ined by SSPTRF. If IP IV OT (k) > 0, then row s and colum nsk and \(\mathbb{P} \mathbb{I} O T(k)\) were interchanged, and \(D(k, k)\) is a 1-by-1 diagonalblock. If \(U P L O=U^{\prime}\) and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k-1)<0\), then row sand colum nsk-1 and \(-\mathbb{P} \mathbb{I V}\) OT(k) were interchanged and D (k-1 \(k, k-1 k)\) is a \(2-b y-2\) diagonalblock. If \(\mathrm{UPLO}=\mathrm{L}\) 'and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0\), then row s and colum ns \(k+1\) and \(-\mathbb{P}\) IV OT ( \(k\) ) were interchanged and \(D(k: k+1, k: k+1)\) is a \(2-b y-2\) diagonal block.

B (input/output)
D ouble precision array, dim ension (LD B, NRHS) On entry, the N -by-NRHS righthand sidem atrix B. On exit, if \(\mathbb{N} F O=0\), the N -by-NRHS solution matrix X.

LD B (input)
The leading dim ension of the anay \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{FURTHER DETAILS}

The packed storage scheme is illustrated by the follow ing exam ple when \(\mathrm{N}=4, \mathrm{UPLO}=\mathrm{U}\) ':

Tw o-dim ensional storage of the sym m etric m atrix A:
```

a11 a12 a13 a14
a22 a23 a24
a33 a34 (aij= aj̈)
a44

```

Packed storage of the upper triangle ofA :
\[
A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]
\]

\section*{C INTERFACE}
\#include <sunperfh>
void dspsvx (char fact, charuplo, intn, int nrhs, double
*a, double *af, int*ipivot, double *b, int ldb, double *x, int ldx, double *roond, double *ferr, double *berr, int*info);
void dspsvx_64 (char fact, charuplo, long n, long nrhs, double *a, double *af, long *ipivot, double *b, long ldb, double *x, long ldx, double *roond, double *ferr, double *berr, long *info);

\section*{PURPOSE}

D SPSVX uses the diagonalpivoting factorization \(A=U * D * U * * T\) or \(A=L \star D * L * * T\) to com pute the solution to a realsystem of linear equations \(A * X=B\), where \(A\) is an \(N\) boy -N symm etric \(m\) atrix stored in packed form atand \(X\) and \(B\) are \(N\) boy-NRHS \(m\) atrices.

E morbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to factorA as
\(A=U * D * U * * T\), if \(U P L O=U\) ', or
\(A=L * D * L * * T\), ifUPLO \(=L^{\prime}\) ',
where \(U\) (orL) is a product ofperm utation and unitupper (low er)
triangularm atrioes and \(D\) is sym \(m\) etric and block diagonal w ith
1-by-1 and 2 -by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums w ith \(\mathbb{N}\) FO \(=\) i. \(O\) therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and com pute error bounds as described below.
3. The system ofequations is solved for \(X\) using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

FACT (input)
Specifies whether ornot the factored form of A has been supplied on entry. = F : O O entry, A F and \(\mathbb{P} \mathbb{I V O T}\) contain the factored form of A. AP, AF and \(\mathbb{P} \mathbb{I} O T \mathrm{w}\) ill not be modified. \(=\mathrm{N}\) : The \(m\) atrix A w illlbe copied to A F and factored.

UPLO (input)
\(=\mathrm{U}:\) : U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linear equations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber
of collum ns of the \(m\) atrices \(B\) and \(X\). NRHS \(>=0\).
AP (input)
D ouble precision array, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) The upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\),
packed colum nw ise in a linear array. The \(j\) th
colum \(n\) ofA is stored in the array AP as follow \(s\) :
ifUPLO = U',AP \((i+(j-1) * j 2)=A(i, j)\) for
\(1<=\mathrm{i}<=\dot{j}\) ifUPLO \(=\mathrm{L}\) ', AP \(\left(i+(j-1)^{*}\left(22^{*}-j\right) / 2\right)=\)
A \((i, 1)\) for \(j=i<=n\). See below for further details.

AF (input/output)
D ouble precision array, dim ension \(\mathbb{N}^{*}(\mathbb{N}+1) / 2\) ) If FACT = \(F^{\prime}\), then \(A F\) is an inputargum ent and on entry contains the block diagonalm atrix \(D\) and the m ultipliers used to obtain the factorU orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by SSPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atas \(A\).

IfFACT \(=N\) ', then \(A F\) is an output argum ent and on exit contains the block diagonalm atrix \(D\) and the m ultipliers used to obtain the factorU or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by SSPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

IPIVOT (inputoroutput)
Integer array, dim ension (N) IfFACT = F', then \(\mathbb{P} \mathbb{V O T}\) is an inputargum ent and on entry contains details of the interchanges and the block structure ofD, as determ ined by SSPTRF. If \(\mathbb{P} \mathbb{V} O T(k)\) \(>0\), then row sand colum nsk and \(\mathbb{P} \mathbb{I} O T(k)\) were interchanged and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1 -by-1 diagonal block. If \(\mathrm{PLO}=\mathrm{U}\) 'and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{V} O T(k-1)\) \(<0\), then row s and colum ns k-1 and - \(\mathbb{P}\) IV O T (k) w ere interchanged and \(D(k-1 k, k-1 k)\) is a 2 -by-2 diagonal block. If UPLO \(=\mathbb{L}\) ' and \(\mathbb{P} \mathbb{I V O T}(k)=\) PIVOT \((k+1)<0\), then row \(s\) and colum ns \(k+1\) and \(-\mathbb{P} \mathbb{I V O T}(k)\) were interchanged and \(D(k: k+1, k: k+1)\) is a 2 -by-2 diagonalblock.

IfFACT = \(\mathrm{N}^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by SSPTRF.

B (input) D ouble precision array, dim ension (LDB,NRHS) The N -by-N RH S righthand side m atrix B .

LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, \mathbb{N})\).

\section*{X (output)}

D ouble precision anray, dim ension (LD X, NRHS) If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\)-by \(-N\) RH S solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay \(\mathrm{X} . \mathrm{LD} \mathrm{X}>=\) \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num ber of the \(m\) atrix A. IfRCOND is less than them achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N F O}\) > 0.

FERR (output)
D ouble precision array, dimension (NRHS) The estim ated forw ard error bound foreach solution vectorX ( \(\mathcal{j}\) ) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{D})\), FERR ( \(\mathcal{H}\) ) is an estim ated upper bound for the \(m\) agnitude of the largestele\(m\) ent in ( \(X(\mathcal{\nu})\)-X TRU E) divided by the \(m\) agnitude of the largest elem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

D ouble precision array, dim ension (NRHS) The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{O}\) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(})\) an exactsolution).

W ORK (w orkspace)
D ouble precision array, dim ension ( \(3{ }^{*} \mathrm{~N}\) )
W ORK 2 (w orkspace)
Integer anay, dim ension (N)
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{D}(i, i)\) is exactly zero. The factorization has been completed but the factorD is exactly singular, so the solution and error bounds could
not be com puted. \(\mathrm{RCOND}=0\) is retumed. \(=\mathrm{N}+1: \mathrm{D}\) is nonsingular, butRCOND is less than \(m\) achine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing
exam plewhen \(\mathrm{N}=4, \mathrm{UPLO}=\mathrm{U}\) ':
Tw o-dim ensional storage of the sym \(m\) etric \(m\) atrix A :
```

a11 a12 a13 a14
a22 a23 a24
a33 a34 (aij= aj̈)
a44

```

Packed storage of the upper triangle ofA :
\(A P=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]\)

are stored as an upper or low er triangularm atrix.
\(=\mathrm{U}\) : : U ppertriangular, form is \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\);
\(=\mathrm{L}\) ': Low ertriangular, form is \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\).

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS >=0.

AP (input)
D ouble precision array, dim ension \(\mathbb{N} *(\mathbb{N}+1) / 2\) ) The
block diagonal \(m\) atrix \(D\) and the \(m\) ultipliers used to obtain the factorU orL as com puted by D SPTRF, stored as a packed triangularm atrix.

PIVOT (input)
Integer array, dim ension \(\mathbb{N}\) ) D etails of the interchanges and the block structure ofD as determ ined by D SPTRF.

B (input/output)
D ouble precision anay, dim ension (LD B ,NRHS) On
entry, the righthand side m atrix B. On exit, the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{PURPOSE}
dstebz com putes the eigenvalues of a sym metric tridiagonal \(m\) atrix T. The userm ay ask for alleigenvalues, alleigenvalues in the half-open interval \(N L, V U]\), or the \(\Pi\)-th through \(\mathbb{I U}\) th eigenvalues.

To avoid overflow, the m atrix m ustbe scaled so that its largestelem ent is no greater than overflow ** (1/2) * underflow ** (1/4) in absolute value, and forgreatest accuracy, itshould notbe m uch sm aller than that.

See W . K ahan "A ccurate Eigenvalues of a Sym m etric TridiagonalM atrix", ReportC S41, C om puterScience D ept., Stanford U niversity, July 21, 1966.

\section*{ARGUMENTS}

RANGE (input)
= A ': ("A ll") alleigenvalues w illbe found.
= V ': ("V alue") alleigenvalues in the half-open interval \(\mathrm{VL}, \mathrm{V}\) U ] w illbe found. = ' I ': ("Index") the \(\mathbb{I}\)-th through \(\mathbb{I U}\)-th eigenvalues (of the entire m atrix) w illbe found.

ORDER (input)
= B ': ("By B lock") the eigenvalues will be grouped by split-off block (see \(\mathbb{B L O C K}\), ISPLIT) and ordered from sm allest to largest w ithin the block. = E ': ("Entire m atrix") the eigenvalues for the entire m atrix w illbe ordered from sm allest to largest.

N (input) The order of the tridiagonalm atrix \(\mathrm{T} . \mathrm{N}>=0\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvahues. Eigenvalues less than or equal to \(V L\), or greater than VU, will not be retumed. VL < VU. N ot referenced ifRANGE=A'or 'I'.

VU (input)
See the description of L .

IL (input)
If RA N GE= ' I ', the indices (in ascending order) of the smallest and largest eigenvahues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(N=0\). \(N\) otreferenced ifRANGE \(=\) A'or V'.

IU (input)
See the description of \(\Pi\).

ABSTOL (input)
The absolute tolerance for the eigenvalues. A n eigenvalue (or cluster) is considered to be located if ithas been determ ined to lie in an intervalw hose w idth is A BSTOL or less. IfA BSTOL is less than orequal to zero, then \(U L P *|\mid w i l l\) be used, w here \(I \mid m\) eans the 1 -norm of \(T\).

E igenvalues w illbe com puted m ost accurately w hen ABSTOL is set to tw ige the underflow threshold 2*SLAM CH (S ), notzero.

D (input) The \(n\) diagonalelem ents of the tridiagonal \(m\) atrix T.

E (input) The \((n-1)\) off-diagonalelem ents of the tridiagonal m atrix T.

M (output)

The actual num berofeigenvahues found. \(0<=\mathrm{M}\) <= N. (Se also the description of \(\mathbb{N} F O=2,3\).)

NSPLIT (output)
The num ber of diagonalblocks in the m atrix T. 1
<= NSPLIT <= N .

W (output)
On exit, the firstM elem ents of \(W\) will contain the eigenvalues. (SSTEBZ may use the rem aining N M elem ents as w orkspace.)

BBLOCK (output)
A teach row /collm n jw here \(E()\) is zero or sm all, the m atrix T is considered to split into ablock diagonalm atrix. On exit, if \(\mathbb{N F O}=0, \mathbb{B L O C K}\) (i) specifies to which block (from 1 to the num ber of blocks) the eigenvalue W (i) belongs. (SSTEBZ may use the rem aining N M elem ents as w orkspace.)

ISPLIT (output)
The splitting points, atw hich \(T\) breaks up into subm atrices. The first subm atrix consists of row s/columns 1 to ISPLIT (1), the second of row s/colum ns ISPL IT (1)+1 through ISPLIT (2), etc., and the NSPLIT-th consists of row s/colum ns ISPLIT \((\mathbb{N}\) SPLIT-1) +1 through ISPLIT \((\mathbb{N} S P L I T)=N\). (Only the firstN SPLIT elem entsw ill actually be used, but since the user cannot know a prioriw hat value NSPLIT w ill have, N w ordsm ust be reserved for ISPLIT.)

W ORK (w orkspace)
dim ension ( \(4 * \mathrm{~N}\) )
IN ORK (w orkspace)
dim ension \((3 * N)\)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue
> 0: som e orall of the eigenvalues failed to converge or
w ere not com puted:
\(=1\) or 3 : B isection failed to converge for som e eigenvalues; these eigenvalues are flagged by a negative block num ber. The effect is that the eigenvalues \(m\) ay notbe as accurate as the absolute and relative tolerances. This is generally caused
by unexpectedly inaccurate arithm etic. \(=2\) or 3 :
RANGE=I'only:N otallof the eigenvalues \(\mathbb{I}: \mathbb{U}\) w ere found.
Effect: \(M<\mathbb{U}+1-\mathbb{I}\)
C ause: non-m onotonic arithm etic, causing the Sturm sequence to be non-m onotonic. Cure: recalculate, using \(R\) A N G E= A ', and pick
outeigenvalues \(\mathbb{I L}: \mathbb{Z U} .=4: \quad\) RANGE= I', and the
G ershgorin interval initially used w as too sm all.
N o eigenvahues w ere com puted.

void dstedc_64 (char com pz, long n, double *d, double *e, double *z, long ldz, long *info);

\section*{PURPOSE}
dstedc com putes alleigenvalues and, optionally, eigenvectors of a sym \(m\) etric tridiagonalm atrix using the divide and conquerm ethod. The eigenvectors of a full or band real sym metric \(m\) atrix can also be found ifSSY TRD orSSPTRD or SSBTRD hasbeen used to reduce this \(m\) atrix to tridiagonal form.

This code \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. It w illw ork on \(m\) achines \(w\) ith a guard digit in add/subtract, or on those binary machines w thout guard digits which subtract like the C ray X \(-\mathrm{M} P\), C ray \(Y\) M P , C ray C-90, or C ray-2. Itcould conœívably fail on hexadecim al or decin al machines w thout guard digits, butw e know of none. Se SLAED 3 for details.

\section*{ARGUMENTS}

COMPZ (input)
\(=\mathrm{N}\) ': C om pute eigenvalues only .
= I': C om pute eigenvectors of tridiagonalm atrix also.
\(=\mathrm{V}\) : C om pute eigenvectors of original dense symmetric \(m\) atrix also. On entry, \(Z\) contains the orthogonalm atrix used to reduce the original \(m\) atrix to tridiagonal form .

N (input) The dim ension of the sym \(m\) etric tridiagonalm atrix.
\(\mathrm{N}>=0\).

D (input/output)
On entry, the diagonalelem ents of the tridiagonal m atrix. On exit, if \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

E (input/output)
O n entry, the subdiagonalelem ents of the tridiagonalm atrix. On exit, E hasbeen destroyed.

Z (input) On entry, if COMPZ = V', then Z contains the orthogonal m atrix used in the reduction to tridiagonal form. On exit, if \(\mathbb{I N F O}=0\), then if \(C O M P Z\) \(=\mathrm{V}\) ', Z contains the orthonorm aleigenvectors of the original sym \(m\) etric \(m\) atrix, and if \(C O M P Z=I\) ', \(Z\) contains the orthonorm al eigenvectors of the sym \(m\) etric tridiagonalm atrix. If \(\mathrm{COMPZ}=\mathrm{N}\) ', then Z is not referenced.

LD Z (input)
The leading din ension of the array Z . LD \(\mathrm{Z}>=1\).
If eigenvectors are desired, then LD Z \(>=\mathrm{max}(1, \mathrm{~N})\).
W ORK (w orkspace)
dim ension (LW ORK)Onexit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim allW ORK.

LW ORK (input)
The dim ension of the aray \(W\) ORK. IfCOMPZ \(=N^{\prime}\) orN <= 1 then LW ORK m ustbe at least1. If COM PZ \(=\mathrm{V}\) 'and \(\mathrm{N}>1\) then LW ORK m ustbe at least ( \(1+\) \(3 * \mathrm{~N}+2{ }^{*} \mathrm{~N} * \lg \mathrm{~N}+3 * \mathrm{~N} * * 2\) ), where \(\lg (\mathrm{N})=\mathrm{sm}\) allest integerk such that \(2 * * k>=\mathrm{N}\). If \(\mathrm{COM} \operatorname{PZ}=\) 'I' and N > 1 then LW ORK m ustbe at least ( \(1+\) \(4 * \mathrm{~N}+\mathrm{N} * * 2\) ).

IfLW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
On exit, if \(\mathbb{N F} F=0, \mathbb{I N}\) ORK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I N} O R K\). IfCOMPZ \(=N^{\prime}\) or \(N\) <= 1 then LIW ORK m ustbe at least 1. If

COMPZ \(=V\) 'and \(N>1\) then \(L \mathbb{I V}\) ORK m ustbe at least

then LIN ORK must.be at least ( \(3+5{ }^{*} \mathrm{~N}\) ).

If LIV ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim al size of
the \(\mathbb{I V}\) ORK array, retums this value as the first entry of the \(\mathbb{I V}\) ORK amay, and no errorm essage related to LIN ORK is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.
>0: The algonithm failed to com pute an eigenvalue while w orking on the subm atrix lying in row s and colum \(n s \mathbb{N} F O / \mathbb{N}+1\) ) through \(m\) od ( \(\mathbb{N} F O, N+1\) ).

\section*{PURPOSE}
dstegrb) Com pute the eigenvalues, lam bda_j, of L_i D_i L_i^T to high relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose" sigm a_i close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D_i L_i^T, com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization. The desired accuracy of the output can be specified by the inputparam eterA BSTO L.

Form ore details, see "A new O ( \(\mathrm{n}^{\wedge} 2\) ) algorithm for the sym m etric tridiagonal eigenvalue/eigenvector problem ", by Inder\#̈̈tD hillon, C om puterScience D ìision TechnicalR eport N o.U CB C SD -97-971, U C Berkeley, M ay 1997.

N ote 1 : Curently SSTEGR is only setup to find A LL the \(n\) eigenvalues and eigenvectors of \(T\) in \(0\left(n^{\wedge} 2\right)\) tim e N ote 2 :Cumently the routine SSTE \(\mathbb{N}\) is called when an appropriate sigm a_i cannot be chosen in step (c) above.

SSTE \(\mathbb{I N}\) invokes m odified Gram -Schm idt when eigenvalues are close.
N ote 3 :SSTEGR w orks only on \(m\) achines which follow ieec-754 floating-point standard in their handling of infinities and NaN s. N orm alexecution of SSTEGR \(m\) ay create \(N a N s\) and infinities and hence \(m\) ay abort due to a floating point exception in environm ents w hich do not conform to the ieee standard.

\section*{ARGUMENTS}

JOBZ (input)
= N ': C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illibe found.
= V : alleigenvalues in the half-open interval
( L L, VU ] will be found. = I': the \(\mathbb{I}\)-th through
IU -th eigenvaluesw illube found.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).
D (input/output)
O n entry, the n diagonalelem ents of the tridiagonalm atrix T.On exit, D is overw ritten.

E (input/output)
O \(n\) entry, the ( \(n-1\) ) subdiagonal elem ents of the tridiagonal m atrix T in elem ents 1 to \(\mathrm{N}-1\) of E ; \(\mathrm{E}(\mathbb{N})\) need notbe set. On exit, E is overw rilten.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N GE = A' 'or I'.

VU (input)
Se the description of V L .

II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{H}<=\mathbb{U}<=N\), ifn \(>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE= A 'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute error tolerance for the eigenvalues/eigenvectors. \(\mathbb{F} J \mathrm{OBZ}=\mathrm{V}\) ', the eigenvalues and eigenvectors outputhave residual norm s bounded by ABSTOL, and the dotproducts betw een different eigenvectors are bounded by ABSTOL. If ABSTOL is less than N *EPS*|T \(\mid\), then N *EPS*|T|w illbe used in its place, where EPS is the \(m\) achine precision and \(F\) is the 1 -norm of the tridiagonalm atrix. The eigenvalues are com puted to an accuracy ofEPS* 1 |imespective of A BSTOL . If high relative accuracy is im portant, setA B STO L to DLAM CH (Safem inim um '). See Barlow and Dem mel "C om puting A ccurate Eigensystem s of Scaled D iagonally D om inantM atrioes", LA PA CK W orking N ote \#7 for a discussion of \(w\) hich \(m\) atrioes define their eigenvalues to high relative accuracy .

M (output)
The total num berofeigenvalues found. \(0<=\mathrm{M}\) <= N . IfRANGE \(=A \prime, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{I U}-\mathbb{H}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(J O B Z=V^{\prime}\), then if \(\mathbb{N F O}=0\), the first \(M\) colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix T comesponding to the selected eigenvalues, \(w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). If \(\mathrm{JO} \mathrm{BZ}=\mathrm{N}\) ', then \(Z\) is not referenced. N ote: the userm ust ensure that at leastm ax ( \(1, M\) ) colum ns are supplied in the array \(Z\); ifRANGE = V', the exact value of M is not know n in advance and an upperbound m ust be used.

LD \(Z\) (input)
The leading dim ension of the array \(Z . L D Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >= \(\mathrm{max}(1, N)\).

ISU PPZ (output)
The support of the eigenvectors in \(Z\), i.e., the indices indicating the nonzero elem ents in \(Z\). The i-th eigenvector is nonzero only in elem ents ISU PPZ (2*i-1 ) through ISU PPZ (2*i).

W ORK (w orkspace)

On exit, if \(\mathbb{N F O}=0, W\) ORK ( 1 ) retums the optim al (and minim al) LW ORK .

\section*{LW ORK (input)}

The dimension of the aray W ORK. LW ORK >= \(\max (1,18 * N)\)
IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I W}\) ORK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the aray \(\mathbb{I W}\) ORK. L \(\mathbb{I W}\) ORK >= \(\max (1,10 \star N)\)

IfLIW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I W}\) ORK is issued by X ERBLA.

INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N F O}=1\), intemalemor in SLARRE, if \(\mathbb{N} F O=2\), intemalemor in SLARRV.

\#include <sunperfh>
void dstein (intn, double *d, double *e, intm, double \({ }^{*}\), int *iblock, int *isplit, double * \(z\), int ldz, int
*ifail, int*info);
void dstein_64 (long n, double *d, double *e, long m, double
* \(_{\text {w }}\), long *iblock, long *isplit, double *z, long
ldz, long *ifail, long *info);

\section*{PURPOSE}
dstein com putes the eigenvectors of a realsym \(m\) etric tridiagonal m atrix T corresponding to specified eigenvalues, using inverse iteration.

The m axim um num ber of terations allow ed foreach eigenvector is specified by an intemal param eterM A X ITS (currently set to 5).

\section*{ARGUMENTS}

N (input) The order of the \(m\) atrix. \(\mathrm{N}>=0\).

D (input) The \(n\) diagonalelem ents of the tridiagonal \(m\) atrix
T.

E (input) The ( \(\mathrm{n}-1\) ) subdiagonalelem ents of the tridiagonal \(m\) atrix \(T\), in elem ents 1 to \(N-1\). \(E(\mathbb{N})\) need notbe set.

M (input) The num ber of eigenvectors to be found. \(0<=\mathrm{M}<=\) N .

W (input) The firstM elem ents ofW contain the eigenvalues for which eigenvectors are to be com puted. The eigenvalues should be grouped by split-off block and ordered from smallest to largestw ithin the block. (The output anay \(W\) from SSTEBZ w ith ORDER = B'is expected here.)

BLOCK (input)
The subm atrix indiges associated with the corresponding eigenvalues in \(W\); \(\mathbb{B L O C K}(i)=1\) if eigenvalue \(W\) (i) belongs to the first subm atrix from the top, \(=2\) ifW (i) belongs to the second subm atrix, etc. (The output array \(\mathbb{B L O C K}\) from SSTEBZ is expected here.)

\section*{ISPLIT (input)}

The splitting points, atw hich \(T\) breaks up into subm atrices. The first subm atrix consists of row s/columns 1 to ISPLIT ( 1 ), the second of row s/Colum ns ISPLIT ( 1 )+1 through ISPLIT (2), etc. (The outputaray ISPLIT from SSTEBZ is expected here.)
Z (output)
The com puted eigenvectors. The eigenvector associated w ith the eigenvalue \(W\) (i) is stored in the \(i-t h\) colum \(n\) of \(Z\). A ny vectorw hich fails to converge is set to its current iterate afterM AX ITS iterations.

LD \(Z\) (input)
The leading dim ension of the aray \(Z\). LD \(Z \quad>=\) \(\max (1, N)\).

W ORK (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )
IV ORK (w orkspace)
dim ension (N)
FFA II (output)
On norm alexit, allelem ents of \(\mathbb{F} A \mathbb{I}\) are zero. If one orm ore eigenvectors fail to converge after
M AXITS iterations, then their indices are stored in array \(\mathbb{F A} \mathbb{I}\).
\(\mathbb{I N F O}\) (output)
\(=0\) : successfulexit.
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), then \(i\) eigenvectors failed to converge in M AX ITS iterations. Their indiges are stored in array \(\mathbb{F}\) A II.

\section*{PURPOSE}
dstevd com putes alleigenvahues and, optionally, eigenvectors of a realsym \(m\) etric tridiagonalm atrix. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conqueralgorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w th a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray \(X-M P, C\) ray \(Y \neq M P, C\) ray \(C-90\), orC ray-2. It could conceivably fail on hexadecim al or decim al \(m\) achines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}

JO BZ (input)
\(=\mathrm{N}\) ': C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvahues and eigenvectors.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).
D (input/output)
O n entry, the n diagonalelem ents of the tridiagonal \(m\) atrix \(A\). On exit, if \(\mathbb{N F O}=0\), the eigenvalues in ascending order.

E (input/output)
O \(n\) entry, the ( \(n-1\) ) subdiagonal elem ents of the tridiagonal \(m\) atrix A, stored in elem ents 1 to \(N-1\) of \(E\); \(E \mathbb{N}\) ) need notbe set, but is used by the
routine. On exit, the contents ofe are destroyed.
\(Z\) (input) If \(J O B Z=V '\), then if \(\mathbb{N} F O=0, Z\) contains the orthonorm aleigenvectors of the \(m\) atrix \(A, w\) th the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w th D (i). If JOBZ \(=N^{\prime}\) ', then \(Z\) is not referenced.

LD \(Z\) (input)
The leading din ension of the amay Z . LD \(\mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >= \(\max (1, N)\).
W ORK (w orkspace)
dim ension ( \(\mathbb{L} W\) ORK)On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim alLW O RK .

LW ORK (input)
The dim ension of the array \(W\) ORK. If \(J O B Z=N^{\prime}\) or \(\mathrm{N}<=1\) then LW ORK m ustbe at least1. If JO B Z \(=\mathrm{V}\) 'and \(\mathrm{N}>1\) then LW ORK m ust.be at least ( \(1+\) \(4 * N+N * * 2)\).

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I V} O R K(1)\) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I N} O R K\). If \(J O B Z=N^{\prime}\) orN <= 1 then LIW ORK m ustbe at least1. If JO B Z \(=V\) 'and \(N>1\) then \(L \mathbb{I}\) ORK must be at least \(3+5 * N\).

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the IV ORK array, retums this value as the first entry of the \(\mathbb{I N}\) ORK amray, and no errorm essage related to \(L \mathbb{I N} O R K\) is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}\), the algorithm failed to con-
verge; i off-diagonalelem ents ofe did not con-
verge to zero.

\section*{C INTERFACE}
\#include <sunperfh>
void dstevr(char jojbz, char range, intn, double *d, double
*e, double vl , double vu, int il, int iul, double abstol, int *m, double * w , double \({ }^{\text {* }}\), int ldz, int *isuppz, int*info);
void dstevr_64 (char jobz, char range, long n, double *d, double *e, double vl, double vu, long il, long in, double abstol, long *m , double *w , double *z, long ldz, long *isuppz, long *info);

\section*{PURPOSE}
dstevr com putes selected eigenvalues and, optionally, eigenvectors of a realsym \(m\) etric tridiagonalm atrix T. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

W heneverpossible, SSTEV R calls SSTEGR to com pute the eigenspectrum using Relatively Robust Representations. SSTEGR com putes eigenvalues by the dqds algorithm, while orthogonaleigenvectors are com puted from various "good" L D L^T representations (also known as Relatively Robust Representations). G ram -Schm idtorthogonalization is avoided as far as possible. M ore specifically, the various steps of the algorithm are as follow s.For the i-th unreduced block ofT,
(a) Com pute \(T\)-sigm a_i= L_iD_iL_i^T, such that L_i D_iL_i^T
is a relatively robust representation,
(b) C om pute the eigenvalues, lam bda_jof of_i D _i L_i^T to high
relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvahues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D_i L_i^T,
com pute the comesponding eigenvectorby form ing a rank-revealing tw isted factorization. The desired accuracy of the output can be specified by the inputparam eterABSTOL.

Form ore details, see "A new \(\mathrm{O}\left(\mathrm{n}^{\wedge} 2\right)\) algorithm for the sym m etric tridiagonal eigenvalue/eigenvector problem ", by Inder \#̈tD hillon, C om puter Science D ìvision TechnicalReport No.UCB/C SD -97-971, UC Berkeley, M ay 1997.

N ote 1 :SSTEVR calls SSTEGR when the full spectrum is requested on \(m\) achines \(w\) hich conform to the iee-754 floating pointstandard. SSTEVR callsSSTEBZ and SSTE IN on non-ieee m achines and when partial spectrum requests are \(m\) ade.

N orm alexecution of SSTEGR m ay create NaNs and infinities and hence \(m\) ay abort due to a floating point exception in environm ents which do nothandle N aN s and infinities in the ieee standard defaultm anner.

\section*{ARGUMENTS}

JOBZ (input)
\(=\mathrm{N}\) ': C om pute eigenvalues only;
= V : C om pute eigenvalues and eigenvectors.
RANGE (input)
= A : alleigenvalues \(w\) illbe found.
= V : alleigenvahues in the half-open interval
( \(\mathrm{L}, \mathrm{V} \mathrm{U}]\) will be found. = 'I': the \(\mathbb{I}\)-th through
\(\mathbb{I U}\)-th eigenvaluesw illlbe found.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).

D (input/output)
O n entry, the n diagonalelem ents of the tridiagonal \(m\) atrix A. On exit, D m ay be multiplied by a constant factor chosen to avoid over/underflow in com puting the eigenvalues.

E (input/output)
O \(n\) entry, the ( \(n-1\) ) subdiagonal elem ents of the tridiagonal m atrix A in elem ents 1 to \(\mathrm{N}-1\) ofe;

E(N) need notbe set. On exit, E may be multiplied by a constant factor chosen to avoid over/underflow in com puting the eigenvahues.

\section*{VL (input)}

IfRANGE=V ', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
See the description of V L .

II (input)
IfRA NGE= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A'or V'.
\(\mathbb{U}\) (input)
See the description of II.

ABSTOL (input)
The absolute error tolerance for the eigenvalues.
A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * \(\max (|k|, \mid)\) ),
\(w\) here EPS is the m achine precision. IfA BSTOL is less than or equalto zero, then EPS* \(\mid\) | w illbe used in its place, where \(\mid T\) is the 1 -norm of the tridiagonal \(m\) atrix obtained by reducing A to tridiagonal form .

See "C om puting Sm allSingularV ahues of B idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by Dem m eland K ahan, LA PA CK W orking N ote \#3.

If high relative accuracy is im portant, setA BSTO L to SLAM CH (Safe minim um '). D oing so will guarantee thateigenvalues are com puted to high relative accuracy when possible in future releases. The current code does not make any guarantees about high relative accuracy, but future releases w ill. See J. B arlow and J. D em m el, "C om puting A ccurate E igensystem s of Scaled D iagonally D om inantM atrioes", LA PA CK W orking N ote \#7, for a discussion of \(w\) hich \(m\) atrices define their
eigenvalues to high relative accuracy .

M (output)
The total num berofeigenvalues found. \(0<=\mathrm{M}\) <=
N . IfRANGE \(=A^{\prime}, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{U}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(\mathcal{J O B Z}=\mathrm{V}^{\prime}\), then if \(\mathbb{N F O}=0\), the first \(M\) colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, w ith the i -th colum n of \(Z\) holding the eigenvector associated \(w\) ith \(W\) (i). \(N\) ote: the user \(m\) ust ensure that at leastm ax ( \(1, \mathrm{M}\) ) colum ns are supplied in the array \(Z\); ifRANGE = \(V\) ', the exact value of \(M\) is not know \(n\) in advance and an upper bound \(m\) ustbe used.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, \mathrm{~N})\).

\section*{ISU PPZ (output)}

The support of the eigenvectors in \(Z\), i.e., the indices indicating the nonzero elem ents in \(Z\). The \(i\)-th eigenvector is nonzero only in elem ents ISU PPZ (2*i-1 ) through ISU PPZ (2*i).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al (andminim al) LW ORK .

LW ORK (input)
The dim ension of the array \(W\) ORK. LW ORK \(>=20 * N\).
If LW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) ORK (1) retums the optim al (andminim al) LINORK.

LIN ORK (input)
The dim ension of the anay \(\mathbb{I N}\) ORK. LIN ORK \(>=10 * N\).

If LIW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I V}\) ORK anray, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I W}\) ORK is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue
> 0: Intemalemor

\section*{PURPOSE}
dstevx com putes selected eigenvalues and, optionally, eigenvectors of a realsym \(m\) etric tridiagonalm atrix A. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

\section*{ARGUMENTS}

JO BZ (input)
\(=\mathrm{N}\) : C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found.
\(=\mathrm{V}\) ': alleigenvalues in the half-open interval
(VL, VU] w ill be found. = I': the IL th through IU th eigenvalues w ill.be found.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).

D IA G (input/output)

O n entry, the n diagonalelem ents of the tridiagonal \(m\) atrix A. On exit, D IA G m ay be multiplied by a constant factor chosen to avoid over/undenflow in com puting the eigenvalues.

OFFD (input/output)
O \(n\) entry, the ( \(n-1\) ) subdiagonal elem ents of the tridiagonalm atrix \(A\) in elem ents 1 to \(N-1\) of FFD ; OFFD \(\mathbb{N}\) ) need notbe set. On exit, OFFD may be m ultiplied by a constant factor chosen to avoid over/underflow in com puting the eigenvalues.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A 'or I'.

VU (input)
See the description of V L .
II (input)
IfRA N G E= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{U}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A 'or V'.

IU (input)
See the description of II .
ABTOL (input)
The absolute error tolerance for the eigenvalues. A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABTOL + EPS * \(\max (\nmid,||\),\() ,\)
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS* \(\mid\) | w illbe used in its place, where \(F \mid\) is the 1 -norm of the tridiagonalm atrix.

E igenvalues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold 2*SLAM CH (S ), notzero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABTOL to \(2 *\) SLAM CH ( S ).

See "C om puting Sm allSingularV ahes ofB idiagonal
\(M\) atrices w th G uaranteed H igh Relative A ccuracy," by Dem m eland \(K\) ahan, LA PA CK W orking \(N\) ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. \(0<=\) NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE \(=I ', N F O U N D=\mathbb{U}-\mathbb{H}+1\).

W (output)
The firstNFOUND elem ents contain the selected eigenvalues in ascending order.

Z (input) If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N} F O=0\), the first NFOUND colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, \(w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith \(W\) (i). If an eigenvector fails to converge ( \(\mathbb{N}\) FO \(>0\) ), then that colum \(n\) of \(Z\) contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F A} I I\). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced. N ote: the userm ustensure that at leastm ax (1,NFOUND) colum ns are supplied in the array \(Z\); ifRANGE = \(V\) ', the exactvalue ofNFOUND is not know \(n\) in advance and an upperbound \(m\) ust.be used.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=V^{\prime}\), LD \(Z>=\max (1, N)\).

W ORK (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )

IW ORK 2 (w orkspace)
FFII (output)
If \(\mathrm{JOBZ}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), the first NFOUND
elem ents of \(\mathbb{F A} I I\) are zero. If \(\mathbb{N F O}>0\), then
FAII contains the indices of the eigenvectors
that failed to converge. If \(\mathrm{JOB}=\mathrm{N}^{\prime}\), then
IFA II is not referenced.
\(\mathbb{N} F O\) (output)
= 0 : successfinlexit
<0: if \(\mathbb{N N}\) FO \(=-\) i, the i-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=\) i, then ieigenvectors failed to converge. Their indioes are stored in array
ㅍFAI.

\section*{PURPOSE}
disttrs com putes the solution to a real system of linear equations \(A * X=B\), where \(A\) is an \(N\) boy \(-N\) symm etric tridiagonalm atrix and X and B are N -by-N R H S m atrioes.

\section*{ARGUMENTS}

N (input) \(\mathbb{N}\) TEGER
The order of them atrix \(A . N>=0\).

NRHS (input)
\(\mathbb{N}\) TEGER
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B.NRH S >=0.
\(L\) (input) REAL aray, dim ension \((\mathbb{N}-1)\)
O n entry, the subdiagonalelem ents ofLL and D D.

D (input) REAL array, dim ension \(\mathbb{N}\) )
O n entry, the diagonalelem ents ofD D .

SUBL (input)
REA L array, dim ension (N-2)
O n entry, the second subdiagonalelem ents of LL .

B (input/output)
REA L array, dim ension
(LDB, NRHS) On entry, the N boy NRHS right hand side \(m\) atrix \(B\). On exit, if \(\mathbb{N F O}=0\), the N -byNRHS solution m atrix X .

LD B (input)
IN TEGER
The leading dim ension of the aray B. LD B >= \(\max (1, N)\)

IPIV (output)
\(\mathbb{N}\) TEGER array, dim ension \(\mathbb{N}\) )
D etails of the interchanges and block pivot. If \(\mathbb{P} \mathbb{V}(\mathbb{K})>0,1\) by 1 pìvot, and if \(\mathbb{P} \mathbb{V}(\mathbb{K})=K+1\) an interchange done; If \(\mathbb{P} \mathbb{I V}(\mathbb{K})<0,2\) by 2
pivot, no interchange required.

\section*{PURPOSE}
dsyev com putes alleigenvalues and, optionally, eigenvectors of a realsym m etric m atrix A.

\section*{ARGUMENTS}

JOBZ (input)
\(=\mathrm{N}^{\prime}\) : C om pute eigenvalues only;
\(=\mathrm{V}:\) : C om pute eigenvalues and eigenvectors.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
On entry, the symm etricm atrix A. If UPLO = U', the leading \(\mathrm{N}-\) by -N upper triangularpartofA contains the upper triangular part of the \(m\) atrix \(A\). If UPLO = L', the leading N -by -N low er triangular partofA contains the low er triangular part of the \(m\) atrix \(A\). On exit, if \(J O B Z=V\) ', then if \(\mathbb{N} F O=0, A\) contains the orthonorm al eigenvectors of them atrix \(A\). If \(J O B Z=N\) ', then on exit the low er triangle (if \(\mathrm{PLO}=\mathrm{L}\) ) or the upper triangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, \mathbb{N})\).

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length of the amray W ORK. LDW ORK >= \(\mathrm{max}(1,3 \star \mathrm{~N}-1)\). For optim alefficiency, LDW ORK \(>=\) \((\mathbb{N B}+2)^{\star} \mathrm{N}\), where NB is the blocksize for SSY TRD retumed by ILAENV.

IfLD W ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i-\) th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\) i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

void dsyevd_64 (char jobz, charuplo, long n, double *a, long lda, double *w , long *info);

\section*{PURPOSE}
dsyevd com putes alleigenvalues and, optionally, eigenvectors of a real symm etric matrix A. Ifeigenvectors are desired, ituses a divide and conqueralgorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray X M P , C ray Y M P , C ray C-90, orC ray-2. Itcould conceivably fail on hexadecim al or decim al \(m\) achines \(w\) ithout guard digits, butw e know of none.

Because of large use ofBLAS of level3, SSY EV D needs N**2 m ore w orkspace than SSY EVX .

\section*{ARGUMENTS}

JOBZ (input)
= N ': C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.

UPLO (input)
= U : : U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)

On entry, the symm etric \(m\) atrix \(A\). If \(\mathrm{PLO}=\mathrm{U}\) ', the leading N -by -N uppertriangularpart of A contains the upper triangular part of the \(m\) atrix \(A\). If U PLO = L', the leading \(N\) by -N low er triangular partofA contains the low er triangular part of the \(m\) atrix \(A\). On exit, if \(J O B Z=V\) ', then if \(\mathbb{N} F O=0, A\) contains the orthonorm al eigenvectors of them atrix \(A\). If \(J O B Z=N\) ', then on exit the low er triangle (if \(\mathrm{PLLO}=\mathrm{L}\) ) or the upper triangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

\section*{W ORK (w orkspace)}
dim ension (LW ORK)On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim alLW ORK.

\section*{LW ORK (input)}

The dim ension of the array W ORK. If \(\mathrm{N}<=1\), LW ORK must be at least1. If \(\mathrm{JOBZ}=\mathrm{N}\) 'and \(\mathrm{N}>\) 1, LW ORK mustbe at least \(2{ }^{*} \mathrm{~N}+1\). If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1\), LW ORK must be atleast \(1+6 \star \mathrm{~N}+\) \(2 \star \mathrm{~N} * * 2\).

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) O RK (1) retums the optim al
LIV ORK.
LIV ORK (input)
The dim ension of the array \(\mathbb{I N}\) ORK. If \(\mathrm{N}<=1\), LIN ORK mustbe at least1. If JOBZ \(=\mathrm{N}\) 'and \(\mathrm{N}>\) \(1, L \mathbb{I}\) ORK m ustbe at least 1. If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1, \mathrm{LIV}\) ORK must.be at least3 \(+5 * \mathrm{~N}\).

If LIV ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the IW ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage
related to LIN ORK is issued by XERB LA.
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=\) i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

\section*{PURPOSE}
dsyevr com putes selected eigenvalues and, optionally, eigenvectors of a realsym \(m\) etric tridiagonalm atrix \(T\). Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

W heneverpossible, SSY EVR calls SSTEGR to com pute the eigenspectrum using Relatively Robust Representations. SSTEGR com putes eigenvalues by the dqds algorithm, while orthogonaleigenvectors are com puted from various "good" L D \(L^{\wedge} \mathrm{T}\) representations (also known as Relatively Robust Representations). G ram -Schm idtorthogonalization is avoided as far as possible. M ore specifically, the various steps of the algorithm are as follow s. For the \(i\)-th unreduced block oft,
(a) Com pute \(T\)-sigm a_i= L_iD_iL_i^T, such that L_i D_iL_i^T
is a relatively robust representation,
(b) C om pute the eigenvalues, lam bda_j, of L_i D_i L_i^T to high
relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D_i L_i^T, com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization.
The desired accuracy of the output can be specified by the inputparam eterABSTOL.

Form ore details, see "A new O ( \(n^{\wedge} 2\) ) algorithm for the sym \(m\) etric tridiagonal eigenvahue/eigenvector problem ", by Inder屰D hillon, \(C\) om puter Science D ivision TechnicalR eport N o.U CB /C SD -97-971, U C Berkeley, M ay 1997.
N ote 1 :SSYEVR calls SSTEGR when the full spectum is requested on \(m\) achines \(w\) hich conform to the ieee-754 floating pointstandard. SSYEVR calls SSTEBZ and SSTE \(\mathbb{N}\) on non-ieee \(m\) achines and
when partialspectrum requests are m ade.

N orm alexecution of SSTEGR m ay create NaNs and infinities and hence \(m\) ay abort due to a floating pointexception in environm ents which do nothandle N aN s and infinities in the ieee standard defaultm anner.

\section*{ARGUMENTS}

JOBZ (input)
\(=\mathrm{N}\) : C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found.
\(=\mathrm{V}\) ::alleigenvalues in the half-open interval
( \(\mathrm{L}, \mathrm{V} \mathrm{U}] \mathrm{w}\) ill be found. = I ': the II th through
IU th eigenvahes w illbe found.

UPLO (input)
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathbb{L}\) ': Low er triangle of A is stored.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O n entry, the symm etric \(m\) atrix A. If UPLO \(=U '\), the leading N -by N uppertriangularpartof u contains the upper triangular part of the \(m\) atrix \(A\).

If UPLO \(=\mathrm{L}\) ', the leading N -by N low er triangular partofA contains the low er triangular part of the matrix A. On exit, the low ertriangle (if \(\mathrm{UPLO}=\mathrm{L}\) ) or the uppertriangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) of A , including the diagonal, is destroyed.

LDA (input)
The leading dim ension of the amay A. LDA >= \(\max (1, \mathbb{N})\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
See the description of V L .

II (input)
If RA NGE= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE= A 'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute error tolerance for the eigenvalues. A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * max ( \(\mid\) |, \(\mid\) |),
where EPS is them achine precision. IfABSTOL is less than or equalto zero, then EPS* \(\mid\) |w illbe used in its place, where \(T\) is the 1 -nom of the tridiagonal \(m\) atrix obtained by reducing \(A\) to tridiagonal form .

See "C om puting Sm allSingularV alues of \(B\) idiagonal M atrices with G uaranteed H igh Relative A ccuracy," by D em meland K ahan, LA PA CK W orking N ote \#3.

If high relative accuracy is im portant, setA B STO L to SLAM CH (Safe minim um' ). D oing so will guarantee thateigenvalues are com puted to high relative accuracy when possible in future
releases. The cument code does not \(m\) ake any guarantees abouthigh relative accuracy, but funutre releasesw ill. See J.B arlow and J. Demmel, "C om puting A ccurate E igensystem s of Scaled D iagonally D om inantM atrices", LA PA CK W orking N ote \#7, for a discussion of which \(m\) atrices define their eigenvalues to high relative accuracy .

M (output)
The total num berofeigenvalues found. \(0<=\mathrm{M}\) <= N . IfRANGE \(=A \prime, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{L}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(\mathcal{O B Z}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), the first M colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, \(w\) ith the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then \(Z\) is not referenced. N ote: the userm ust ensure that at leastm ax ( \(1, \mathrm{M}\) ) colum ns are supplied in the amay \(Z\); ifRANGE = V', the exact value of M is not know n in advance and an upperbound m ust be used.

LD Z (input)
The leading din ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)\).

ISU PPZ (output)
The support of the eigenvectors in \(Z\), ie., the indices indicating the nonzero elem ents in Z . The i-th eigenvector is nonzero only in elem ents \(\operatorname{ISUPPZ}(2 \star i-1)\) through \(\operatorname{ISU} \operatorname{PPZ}(2 * i)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. LW ORK >= \(\max (1,26 * N)\). For optim al efficiency, LW ORK >= (NB+6)*N, where NB is the m ax of the blocksize for SSY TRD and SORM TR retumed by \(\mathbb{L} A E N V\).

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of
the W ORK amray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA .
IV ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) O RK (1) retums the optim al LW ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I N}\) ORK. LIV ORK >= \(\max (1,10 \star N)\).

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the IV ORK array, and no errorm essage related to LIN ORK is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0: Intemalerror

*info);
void dsygv_64 (long itype, char j̀bz, charuplo, long n, double *a, long lda, double *b, long ldlb, double *w , long *info);

\section*{PURPOSE}
dsygv com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym \(m\) etric-definite eigenproblem, of the form \(A * x=\left(\operatorname{lam}\right.\) bda) \({ }^{*}{ }^{*} x, A * B x=(\operatorname{lam} b d a){ }^{*} x\), or \(B{ }^{*} A{ }^{*} x=(\operatorname{lam} . b d a){ }^{*} x\). H ere \(A\) and \(B\) are assum ed to be sym m etric and \(B\) is also
positive definite.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A{ }^{*} \mathrm{X}=(\operatorname{lam} . \mathrm{bda}){ }^{\star} \mathrm{B}{ }^{*} \mathrm{X}\)
\(=2: A * B *_{x}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B{ }^{*} A{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda}){ }^{*} \mathrm{X}\)

JOBZ (input)
\(=\mathrm{N}^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.

UPLO (input)
\(=U\) ': U ppertriangles of \(A\) and \(B\) are stored;
\(=\mathrm{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.

N (input) The order of them atrioes A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input/output)
On entry, the sym \(m\) etric \(m\) atrix A. If UPLO \(=U '\), the leading N -by N uppertriangularpart of A con-
tains the upper triangular part of the \(m\) atrix \(A\). If U PLO = L', the leading N -by N low er triangular partofA contains the low er triangular part of the m atrix \(A\).

On exit, if \(J O B Z=V^{\prime}\), then if \(\mathbb{N F O}=0\), \(A\) contains the \(m\) atrix \(Z\) ofeigenvectors. The eigenvectors are norm alized as follow s: if ITYPE \(=1\) or \(2, Z * * T * B * Z=I\); if \(T T Y P E=3, Z * * T * \operatorname{inv}(B) * Z=I\). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then on exit the uppertriangle (if \(\mathrm{U} P L O=\mathrm{U}\) ) or the low er triangle (if \(\mathrm{U} P L O=\mathrm{L}\) ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, \mathbb{N})\).

B (input/output)
O \(n\) entry, the sym \(m\) etric positive definite \(m\) atrix \(B\). If \(U P L O=U\) ', the leading \(N\) by \(N\) uppertriangularpartofB contains the upper triangular part of the m atrix B. IfU PLO = L', the leading N toy-N lowertriangularpart of B contains the low er triangularpart of the \(m\) atrix \(B\).

On exit, if \(\mathbb{N} F O<=N\), the part of \(B\) containing the \(m\) atrix is overw rilten by the triangular factor \(U\) orL from the Cholesky factorization \(B=U * * T * U\) or \(B=L *\) \(\mathrm{L}^{* *} \mathrm{~T}\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

W (output)
If \(\mathbb{N}\) FO \(=0\), the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length of the array \(W\) ORK. LDW ORK >= \(\mathrm{max}(1,3 \star \mathrm{~N}-1)\). For optim alefficiency, LDW ORK >= \((N B+2) * N\), where \(N B\) is the blocksize for SSY TRD retumed by ILAENV .

If LD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
>0: SPOTRF orSSYEV retumed an emorcode:
\(<=\mathrm{N}\) : if \(\mathbb{N} F \mathrm{O}=\mathrm{i}, \mathrm{SSYEV}\) failed to converge; i off-diagonal elements of an interm ediate tridiagonal form did not converge to zero; > N : if \(\mathbb{N} F O=N+i\), for \(1<=i<=N\), then the leading m inoroforderiofB is not positive definite. The factorization ofB could notbe com pleted and no eigenvalues oreigenvectors w ere com puted.

void dsygvd_64 (long itype, char jobz, char uplo, long n, double *a, long lda, double *b, long ldb, double *W, long *info);

\section*{PURPOSE}
dsygvd com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym \(m\) etric-definite eigenproblem, of the form \(A * x=(\operatorname{lam} . b d a) * B * x, A * B x=(\operatorname{lam} . b d a){ }^{*} x\), or \(B *^{A} *^{x}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} x\). Here \(A\) and \(B\) are assum ed to be sym \(m\) etric and \(B\) is also positive definite. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w th a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray \(X-M P, C\) ray \(Y \neq M P, C\) ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A{ }^{*} \mathrm{x}=\left(\operatorname{lam}\right.\) bda)\({ }^{\mathrm{B}} \mathrm{B}^{*} \mathrm{x}\)
\(=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=(\operatorname{lam} \mathrm{bda}){ }^{*} \mathrm{x}\)
\(=3: B * A * x=\left(l a m\right.\) bda) \({ }^{*} \mathrm{X}\)

JOBZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.

UPLO (input)
\(=\mathrm{U}\) ': U ppertriangles of \(A\) and \(B\) are stored;
\(=\mathrm{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).
A (input/output)
On entry, the sym m etric \(m\) atrix \(A\). If \(U P L O=U '\), the leading \(\mathrm{N}-\) by -N uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\). If UPLO = L', the leading N by -N low er triangular partofA contains the low er triangular part of the \(m\) atrix \(A\).

On exit, if \(\mathrm{JOBZ}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), A contains the \(m\) atrix \(Z\) ofeigenvectors. The eigenvectors are norm alized as follow s: if ITYPE = 1 or 2, \(\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}\); if \(\mathrm{IT} Y \mathrm{PE}=3, \mathrm{Z} * * \mathrm{~T} * \operatorname{inv}(\mathrm{~B}) * \mathrm{Z}=\mathrm{I}\). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then on exit the upper triangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) or the low er triangle (if \(\mathrm{UPLO}=\mathrm{L}\) ) of A, including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

B (input/output)
On entry, the symm etric \(m\) atrix \(B\). If \(\operatorname{PLO}=U\) ', the leading N -by N uppertriangularpartofB contains the upper triangular part of the \(m\) atrix \(B\). If U PLO = L', the leading N by -N low er triangular partofB contains the low er triangular part of the \(m\) atrix \(B\).

On exit, if \(\mathbb{N} F O<=N\), the part of \(B\) containing the \(m\) atrix is overw rilten by the triangular factor \(U\) orL from the C holesky factorization \(B=U * * T * U\) orB \(=\mathrm{L}\) * \(\mathrm{L} * * \mathrm{~T}\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. If \(N<=1\), LW ORK \(>=1\). If \(\mathrm{OBZ}=\mathrm{N}^{\prime}\) and \(\mathrm{N}>1\), LW ORK \(>=\) \(2 \star \mathrm{~N}+1\). If \(\mathrm{OBZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1\),LW ORK \(>=1+6 * \mathrm{~N}\) \(+2 \star \mathrm{~N} * * 2\) 。

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) ORK (1) retums the optim al LIW ORK.

LIV ORK (input)
The dim ension of the amay \(\mathbb{I W} O R K\). If \(\mathrm{N}<=1\), LIW ORK >=1. If \(O B Z=N\) 'andN \(>1\),LIW ORK \(>=\) 1. If \(\mathrm{OBZ}=\mathrm{V}\) 'and \(\mathrm{N}>1\), LIN \(\mathrm{ORK}>=3+5 \star \mathrm{~N}\).

IfLIW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK aray, and no errorm essage related to \(L \mathbb{I} W\) ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-i\), the \(i\) th argum ent had an illegalvalue
> 0: SPO TRF orSSY EVD retumed an errorcode:
\(<=\mathrm{N}:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{SSYEVD}\) failed to converge; i offf-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero; > N : if \(\mathbb{N N F O}\) \(=N+i\), for \(1<=i<=N\), then the leading \(m\) inor oforderiofB is not positive definite. The factorization of \(B\) could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

\section*{PURPOSE}
dsygvx com putes selected eigenvalues, and optionally , eigenvectors of a realgeneralized sym \(m\) etric-definite eigenproblem, of the form \(A * x=\left(l a m\right.\) bda) \({ }^{*} B * x, A * B x=(l a m \text { bda })^{*} x\), or \(B{ }^{\star} A{ }^{*} X=(\operatorname{lam} \text { bda })^{*} x\). \(H\) ere \(A\) and \(B\) are assum ed to be sym \(m\) etric and \(B\) is also posilive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or range of indices forthe desired eigenvalues.

\section*{ARGUMENTS}

\section*{ITYPE (input)}

Specifies the problem type to be solved:
\(=1: A{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda}){ }^{\mathrm{B}}{ }^{*} \mathrm{X}\)
\(=2: \mathrm{A} * \mathrm{~B} * \mathrm{X}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B * A * x=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
JOBZ (input)
\(=\mathrm{N}^{\prime}\) : C om pute eigenvalues only;
\(=\mathrm{V}:\) : C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w ill.be found.
= V : alleigenvahues in the half-open interval ( \(\mathrm{L}, \mathrm{V}, \mathrm{J}]\) will be found. = I ': the I -th through \(\mathbb{I U}\)-th eigenvaluesw illlbe found.

UPLO (input)
= U ': U ppertriangle of A and B are stored;
= L': Low ertriangle of A and B are stored.
N (input) The order of the \(m\) atrix pencil \((A, B) . N>=0\).
A (input/output)
On entry, the symm etric m atrix \(A\). If UPLO = U', the leading N -by -N uppertriangularpart of A contains the upper triangular part of the \(m\) atrix \(A\). If UPLO \(=\mathrm{L}\) ', the leading N -by N low er triangular partofA contains the low er triangular part of them atrix A.

On exit, the low er triangle (ifU PLO = L) or the upper triangle (if \(\mathrm{PLO}=\mathrm{U}\) ) ofA, including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

B (input/output)
On entry, the symm etric \(m\) atrix \(B\). If \(U P L O=U\) ', the leading N -by N uppertriangular partofB contains the upper triangularpart of the \(m\) atrix \(B\). If UPLO = L', the leading N -by -N low er triangular partofB contains the low er triangular part of the matrix B .

On exit, if \(\mathbb{N F O}<=N\), the part of \(B\) containing the \(m\) atrix is overw rilten by the triangular factor U orL from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(B=L{ }^{\star} L^{\star *}{ }^{\mathrm{T}}\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. \(\mathrm{VL}<\mathrm{VU}\). N ot referenced ifRANGE=A 'or 'I'.

VU (input)
See the description ofV L .
IU (input)
IfRA NGE= I', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{U}=1\) and \(\mathbb{U}=0\) if \(N=0\). \(N\) otreferenced ifRANGE \(=\) A'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute emortolerance forthe eigenvalues.
A \(n\) approxim ate eigenvalue is accepted as converged \(w\) hen it is determ ined to lie in an interval [a,b] of w idth less than orequal to
\(A B S T O L+E P S * \max (|a|,||\),\() ,\)
where EPS is them achine precision. IfA BSTOL is less than or equal to zero, then EPS*|I w illbe used in its place, w here \(T\) | is the 1 -norm of the tridiagonal \(m\) atrix obtained by reducing \(A\) to tridiagonalform.

E igenvahues w ill.be com puted m ostaccurately w hen ABSTOL is set to tw ige the underflow threshold 2*D LAM CH (S ), notzero. Ifthis routine retums w ith \(\mathbb{N} \mathrm{FO}>0\), indicating thatsom e eigenvectors did not converge, try setting ABSTOL to \(2 *\) SLAM CH (S ).

M (output)
The totalnum ber ofeigenvalues found. \(0<=\mathrm{M}<=\) N . IfRANGE=A', M=N, and ifRANGE= 'I'M = \(\mathbb{U}-\mathbb{L}+1\) 。

W (output)
O n norm alexit, the firstM elem ents contain the selected eigenvahues in ascending order.
\(Z\) (input) If \(\mathrm{OBB}=\mathrm{N}^{\prime}\), then Z is notreferenced. If OBZ \(=V\) ', then if \(\mathbb{N} F O=0\), the firstM colum ns of \(Z\) contain the orthonorm aleigenvectors of the \(m\) atrix A corresponding to the selected eigenvalues, w ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). The eigenvectors are norm alized as follow s: if ITYPE \(=1\) or \(2, Z * * T * B * Z=I\); if \(\operatorname{ITYPE}=3, Z * * T * \operatorname{inv}(B) * Z=I\).
If an eigenvector fails to converge, then that colum \(n\) of \(Z\) contains the latestapproxim ation to the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F} A \mathbb{I}\). N ote: the userm ustensure that at leastm ax ( \(1, M\) ) colum ns are supplied in the amay \(Z\); ifRANGE = V', the exactvalue ofM is notknow \(n\) in advance and an upper bound m ust be used.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{OBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK ( 1 ) retums the optim al LW ORK.

\section*{LW ORK (input)}

The length of the array \(W\) ORK. LW ORK >= \(\mathrm{max}(1,8 * \mathrm{~N})\). For optim al efficiency, LW ORK >= \((\mathbb{N B}+3) \star \mathrm{N}\), where NB is the blocksize for SSY TRD retumed by \(\amalg \mathrm{LA} E \mathrm{EN}\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)
dim ension ( \(5 \star \mathrm{~N}\) )

FAII (output)
If \(O B Z=V^{\prime}\), then if \(\mathbb{N F O}=0\), the firstM ele\(m\) ents of \(\mathbb{F} A \mathbb{I}\) are zero. If \(\mathbb{N} F O>0\), then \(\mathbb{F} A \mathbb{H}\) contains the indices of the eigenvectors that failed to converge. If \(\mathrm{OOBZ}=\mathrm{N}\) ', then \(\mathbb{F} A \mathbb{I}\) is notreferenced.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvahue
> 0: SPO TRF orSSY EVX retumed an errorcode:
\(<=N:\) if \(\mathbb{N} F O=i, S S Y E V X\) failed to converge; i eigenvectors failed to converge. Their indices are stored in array \(\mathbb{F A} \mathbb{I} .>N\) : if \(\mathbb{N} F O=N+\) \(i\), for \(1<=i<=N\), then the leading \(m\) inor of orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

void dsym m _64 (charside, charuplo, long m, long n, double alpha, double *a, long lda, double *b, long ldb, double beta, double *c, long ldc);

\section*{PURPOSE}
dsymm perform sone of the \(m\) atrix \(m\) atrix operations \(C:=\) alpha*A *B + beta* C or \(\mathrm{C}:=\) alpha*B *A + beta* C where alpha and beta are scalars, \(A\) is a sym \(m\) etric \(m\) atrix and \(B\) and \(C\) are \(m\) by \(n m\) atrices.

\section*{ARGUMENTS}

SID E (input)
O n entry, SIDE specifiesw hether the sym metric \(m\) atrix A appears on the leftorright in the operation as follow s:
\(S \mathbb{D E}=\) L'or I' \(C:=\) a耳pha*A *B + beta* \(C\),

SIDE = R 'or 'r' C : alpha*B *A + beta*C ,

U nchanged on exit.

\section*{UPLO (input)}

On entry, UPLO specifies whether the upper or lower triangular part of the symm etric \(m\) atrix \(A\) is to be referenced as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or L ' Only the upper triangularpart of the sym \(m\) etric \(m\) atrix is to be referenced.
\(\mathrm{UPLO}=\mathrm{L}\) 'or \(\mathrm{I}^{\prime}\) ' O nly the low ertriangularpart of the sym \(m\) etric \(m\) atrix is to be referenced.

U nchanged on exit.
M (input)
O \(n\) entry, M specifies the num ber of row sof the \(m\) atrix \(C . M\) M \(=0\). U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the \(m\) atrix \(C . N>=0\). Unchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.
A (input)
DOUBLE PRECISION array ofD \(\mathbb{M}\) ENSION (LDA, ka ), where ka is \(m\) when \(S \mathbb{D} E=\mathbb{L}\) 'or \(I^{\prime}\) and is \(n\)
otherw ise.
Before entry with SDDE \(=\mathrm{L}\) 'or 1 ', the \(m\) by
m part of the aray A mustcontain the sym\(m\) etric \(m\) atrix, such thatw hen UPLO \(=U\) 'or 4 ', the leading \(m\) by \(m\) uppertriangular part of the array A mustcontain the upper triangular part of the symm etric \(m\) atrix and the strictly lower triangularpart of A is not referenced, and \(w\) hen UPLO = L' or \({ }^{1}\) ', the leading \(m\) by \(m\) low er triangularpart of the array A m ust contain the lower triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangular partof \(A\) is not referenced.

Before entry with \(S D E=R\) 'or \(r\) ', the \(n\) by \(n\) part of the aray A mustcontain the sym\(m\) etric \(m\) atrix, such thatw hen UPLO \(=U\) 'or L ', the leading \(n\) by \(n\) uppertriangularpart of the aray A mustcontain the upper triangular part of the symm etric \(m\) atrix and the strictly lower triangularpart of \(A\) is not referenced, and when UPLO = L' or 1 ', the leading \(n\) by \(n\) low er triangularpart of the array A must contain the lower triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangular part of A is not referenced.

U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen
\(S \mathbb{D} E=\mathbb{L}\) 'or 1 ' then LD \(A>=m a x(1, m)\), otherw ise LDA \(>=\mathrm{max}(1, \mathrm{n})\). U nchanged on exit.

B (input)
D OUBLE PREC ISION array ofD \(\mathbb{I M}\) ENSION (LDB, n ).
Before entry, the leading \(m\) by \(n\) partof the array \(B m\) ustcontain the \(m\) atrix \(B\). Unchanged on exit.

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. LD B \(>=\max (1, m)\). U nchanged on exit.
BETA (input)
O n entry, BETA specifies the scalar beta. W hen
BETA is supplied as zero then C need notbe set on input. U nchanged on exit.

C (input/output)
DOUBLE PRECISION anay ofD \(\mathbb{I M}\) ENSION (LDC, n ).
Before entry, the leading \(m\) by \(n\) partof the array \(\mathrm{C} m\) ust contain the m atrix C , except when beta is zero, in which case \(C\) need notbe set on entry. On exit, the array \(C\) is overw rilten by the \(m\) by \(n\) updated \(m\) atrix.

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C \(>=m a x(1, m)\). U nchanged on exit.

void dsy_2k_64 (charuplo, char transa, long n, long k, double alpha, double *a, long lda, double *b, long ldb, double beta, double *C, long ldc);

\section*{PURPOSE}
dsy 22 k perform s one of the sym \(m\) etric rank 2 k operations \(\mathrm{C}:=\) alpha*A *B' + alpha*B*A'+ beta*C or C : alpha*A *B + alpha*B *A + beta*C w here alpha and beta are scalars, C is an \(n\) by \(n\) symmetric \(m\) atrix and \(A\) and \(B\) are \(n\) by \(k\) \(m\) atrices in the first case and \(k\) by \(n m\) atrices in the second case.

\section*{ARGUMENTS}

\section*{UPLO (input)}

On entry, UPLO specifies whether the upper
or lower triangular part of the array \(C\) is
to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular partof C is to be referenced.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=\mathrm{N}^{\prime}\) or \(\mathrm{h}^{\prime} \mathrm{C}:=\) alpha*A *B '+ alpha*B*A '
+ beta*C.

TRANSA = T'ort' \(\mathrm{C}:=\) alpha*A *B + alpha*B *A + beta*C.

TRANSA \(=\) C 'or C' \(C:=\) alpha*A *B + alpha*B *A + beta*C .

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input)
O n entry, \(N\) specifies the order of the \(m\) atrix C. N m ust.be at least zero. U nchanged on exit.
\(K\) (input)
On entry w ith TRANSA = N 'or h', K specifies the num ber of colum ns of the \(m\) atrioes \(A\) and \(B\), and on entry \(w\) ith TRANSA \(=T\) 'or t'or \(C^{\prime}\) or \(k^{\prime}, \mathrm{K}\) specifies the num ber of row sof the \(m\) atrices \(A\) and \(B\). \(K\) must be at least zero. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
D OUBLE PRECISION aray ofD \(\mathbb{M}\) ENSION (LDA, ka ), where ka isk when TRANSA = N 'or h ', and is
n otherw ise. Before entry w ith \(\mathrm{TRANSA}=\mathrm{N}^{\prime}\) or
h', the leading \(n\) by k partof the amay A
m ustcontain the m atrix \(A\), otherw ise the leading
k by n partof the aray \(A\) mustcontain the \(m\) atrix A. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program.
W hen TRANSA \(=N\) 'or h'then LDA must be at least \(\max (1, n)\), otherw ise LD A m ustbe at least \(\max (1, k)\). U nchanged on exit.

B (input)
D OUBLE PRECISION aray ofD \(\mathbb{M} E N S I O N(L D B, k b)\), where kb isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith TRANSA \(=\mathrm{N}^{\prime}\) or
\(h\) ', the leading \(n\) by k part of the anray \(B\) \(m\) ust contain the \(m\) atrix \(B\), otherw ise the leading k by n part of the aray \(B \mathrm{~m}\) ustcontain the \(m\) atrix B. U nchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program.
\(W\) hen TRANSA \(=N\) 'or \(h\) 'then LDB must be at least \(\max (1, n)\), otherw ise LD B m ustbe at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
D OUBLE PRECISION aray ofD \(\mathbb{M} E N S I O N \quad(L D C, n)\).

Before entry with UPLO = U 'or G ', the leading \(n\) by \(n\) upper triangularpart of the array \(C\) \(m\) ustcontain the upper triangular part of the sym \(m\) etric \(m\) atrix and the strictly low er triangularpartofC is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated \(m\) atrix.

Before entry w ith UPLO = L 'or I', the leading \(n\) by \(n\) low er triangular part of the array \(C\) \(m\) ustcontain the low er triangular part of the sym \(m\) etric \(m\) atrix and the strictly uppertriangularpartof C is not referenced. On exit, the low er triangularpart of the array \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

LD C (input)
O n entry, LD C specifies the first dim ension of C as declared in the calling (sub) program.
LD C m ust be at leastm ax ( \(1, \mathrm{n}\) ). U nchanged on exit.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices \(B\) and X. NRH \(S>=0\).

A (input) The symm etric \(m\) atrix \(A\). If \(U P L O=U\) ', the leading \(N\) by -N uppertriangularpart ofA contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low ertriangular partofA is not refer-
enced. If UPLO = L', the leading N -by-N lower triangularpartofA contains the low er triangular part of the \(m\) atrix A, and the strictly upper triangularpart of A is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

AF (input)
The factored form of them atrix A. AF contains the block diagonal matrix D and themultipliers used to obtain the factor \(U\) or \(L\) from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by SSY TRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).
\(\mathbb{P I V O T}\) (input)
D etails of the interchanges and the block structure ofD as determ ined by SSY TRF.
\(B\) (input) The righthand side m atrix \(B\).
LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SSY TRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X(\mathcal{j})\) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(}\) ) an exactsolution).

\section*{PURPOSE}
dsyrk perform s one of the sym \(m\) etric rank \(k\) operations \(C:=\) alpha*A *A '+ beta*C orC \(:=\) alpha*A *A + beta*C where alpha and beta are scalars, \(C\) is an \(n\) by \(n\) sym \(m\) etric \(m\) atrix and \(A\) is an \(n\) by \(k m\) atrix in the first case and a \(k\) by \(n\) \(m\) atrix in the second case.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper
or low er triangular part of the amay \(C\) is
to be referenced as follow s:
\(U P L O=U\) 'or \(G^{\prime}\) Only the upper triangular part of \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular part of \(C\) is to be referenced.

U nchanged on exit.

TRANSA (input)
O n entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} \mathrm{C}:=\) alpha*A *A ' + beta*C.

TRANSA \(=\) T'ort' \(\mathrm{C}:=\) alpha*A *A + beta*C.

TRANSA \(=\) C 'or \(C^{\prime} C:=\) alpha*A *A + beta*C.

U nchanged on exit.
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input)
On entry, \(N\) specifies the order of the \(m\) atrix \(C\). N m ustbe at least zero. U nchanged on exit.

K (input)
On entry w ith TRANSA \(=N\) 'or \(h\) ', \(K\) specifies the number of columns of the matrix \(A\), and on entry with TRANSA = 'T'or t'or C' or \(\mathrm{E}^{\prime}\), \(K\) specifies the num ber of row sof the m atrix \(\mathrm{A} . \mathrm{K}\) m ustibe at least zero. U nchanged on exit.
A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
D OUBLE PRECISION array ofD \(\mathbb{I M} E N S I O N(L D A, k a)\),
where ka isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith TRANSA \(=\mathrm{N}\) ' or h ', the leading n by k part of the array \(A\) \(m\) ust contain the \(m\) atrix \(A\), otherw ise the leading k by n partof the aray A mustcontain the m atrix A. U nchanged on exit.

LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program.
W hen TRANSA \(=\mathrm{N}\) 'or h 'then LDA must be at least \(\max (1, n)\), otherw ise LDA \(m\) ustbe at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
D OUBLE PRECISION amay ofD \(\mathbb{M}\) ENSION (LDC,n).

Before entry w ith UPLO = U 'or l ', the leading \(n\) by \(n\) uppertriangularpart of the array \(C\) \(m\) ustcontain the upper triangular part of the sym \(m\) etric \(m\) atrix and the strictly low ertriangularpartofC is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated
m atrix.

Before entry w ith UPLO = L 'or I', the leading \(n\) by \(n\) low ertriangular part of the anray \(C\) m ust contain the low er triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangularpartof C is not referenced. On exit, the low er triangularpart of the amay \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastm ax ( \(1, \mathrm{n}\) ). U nchanged on exit.

void dsysv (charuplo, intn, intnrhs, double *a, int lda, int *ipiviv, double *b, int ldb, int *info);
void dsysv_64 (charuplo, long n, long nrhs, double *a, long lda, long *ipiv, double *b, long ldb, long *info);

\section*{PURPOSE}
dsysv com putes the solution to a realsystem of linearequations
\(A * X=B\), where \(A\) is an \(N\) boy-N symm etric \(m\) atrix and \(X\) and B are N -by-N RH S m atrices.

The diagonalpivoting \(m\) ethod is used to factorA as
\(A=U * D * U * * T\), if \(U P L O=U\) ', or
\(A=L * D * L * T\), if \(U P L O=L '\),
where \(U\) (orL) is a productof perm utation and unit upper (low er) triangular \(m\) atrioes, and \(D\) is sym \(m\) etric and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks. The factored form of \(A\) is then used to solve the system of equations \(A * X=B\).

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

A (input/output)
On entry, the sym m etric \(m\) atrix \(A\). If \(\mathrm{PLO}=\mathrm{U}\) ',
the leading N -by N uppertriangularpantofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart of \(A\) is not referenced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by -N low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly uppertriangularpart of A is notreferenced.

O n exit, if \(\mathbb{N F O}=0\), the block diagonalm atrix D and the \(m\) ultipliers used to obtain the factor \(U\) or L from the factorization \(A=U * D * U * * T\) or \(A=\) L*D *L**T as com puted by SSY TRF .
LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

IPIV (output)
D etails of the interchanges and the block structure ofD, as determ ined by SSY TRF. If \(\mathbb{P} \mathbb{I V}(k)>\) 0 , then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V}(k)\) w ere interchanged, and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1 -by-1 diagonalblock. If \(U P L O=U\) 'and \(\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I} V(k-1)<0\), then row \(s\) and columns \(k-1\) and \(-\mathbb{P} \mathbb{I V}(k)\) were interchanged and \(D(k-1 *, k-1: k)\) is a 2 -by -2 diagonal block. IfU PLO \(=\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I V}(k+1)<0\), then row \(s\) and colum nsk+1 and \(-\mathbb{P} \mathbb{I V}(k)\) w ere interchanged and \(D(k: k+1, k: k+1)\) is a 2 -by-2 diagonal block.

B (input/output)
O n entry, the N boy-N RHS righthand side m atrix B. On exit, if \(\mathbb{N F O}=0\), the N boy \(-\mathrm{NRH} S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length ofW ORK. LW ORK >=1, and forbestperform ance LW ORK \(>=N * N B, w h e r e N B\) is the optim al blocksize forSSY TRF .

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=\mathrm{i}, \mathrm{D}(i, i)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{PURPOSE}
dsysvx uses the diagonalpivoting factorization to com pute the solution to a realsystem of linear equations \(A * X=B\), \(w\) here \(A\) is an \(N\) boy \(N\) sym \(m\) etric \(m\) atrix and \(X\) and \(B\) are \(N\) boyN R H S m atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to factorA.
The form of the factorization is
\(A=U * D * U * * T\), if \(U P L O=U '\) or
\(A=L * D * L * * T\), if \(U P L O=L \prime\)
where \(U\) (orL) is a productofperm utation and unitupper
(low er)
triangularm atrices, and \(D\) is sym \(m\) etric and block diago-

\section*{nalw th}

1-by-1 and 2-by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums w ith \(\mathbb{N F O}=\) i. O therw ise, the factored form of A is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N}\) FO \(=\mathrm{N}+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and com pute error bounds as described below .
3.The system ofequations is solyed for \(X\) using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornot the factored form of A has been supplied on entry. = \(\mathrm{F}^{\prime}:\) O n entry, \(\mathrm{A} F\) and \(\mathbb{P I V O T}\) contain the factored form of A. AF and \(\mathbb{P} \mathbb{I V}\) O T w illnotbe m odified. \(=\mathrm{N}\) ': Them atrix A w illbe copied to A F and factored.

UPLO (input)
= U ': U pper triangle ofA is stored;
\(=L^{\prime}\) : Low er triangle of \(A\) is stored.
N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS >=0.

A (input) The symm etricm atrix \(A\). If UPLO \(=U\) ', the leading \(N\) by -N uppertriangularpartofA contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low ertriangularpartofA is not refer-
enced. If UPLO = L', the leading N -by-N lower triangularpartofA contains the low er triangular part of the \(m\) atrix A, and the strictly upper triangularpart ofA is not referenced.

LDA (input)
The leading dim ension of the anay A. LDA >= \(\max (1, N)\).

AF (input/output)
If FACT = F ', then \(A F\) is an inputargum ent and on entry contains the block diagonalm atrix D and the m ultipliers used to obtain the factor \(U\) orL from the factorization \(A=U * D * U * * T\) orA \(=L * D * L * * T\) as com puted by SSY TRF .
If FA C T = N ', then AF is an output argum ent and on exit retums the block diagonalm atrix \(D\) and the multipliers used to obtain the factorU or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

IPIVOT (inputoroutput)
If FACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P} \mathbb{I} O T\) is an input argum ent and on entry contains details of the interchanges and the block structure of D, as determ ined by SSY TRF. If \(\mathbb{P} \operatorname{IV} O T(k)>0\), then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V O T}(k)\) were interchanged and \(D(k, k)\) is a 1 -by-1 diagonal block. If UPLO \(=U '\) and \(\mathbb{P} \mathbb{I} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0\), then row sand colum ns \(\mathrm{k}-1\) and \(-\mathbb{P} \mathbb{I V O T}(\mathrm{k})\) were interchanged and \(\mathrm{D}(\mathrm{k}-\) \(1 \mathrm{k}, \mathrm{k}-1 \mathrm{k}\) ) is a 2 -by-2 diagonalblock. IfUPLO = L 'and \(\mathbb{P} \mathbb{I V} O T(k)=\mathbb{P} \mathbb{I V} O T(k+1)<0\), then row \(s\) and colum nsk+1 and \(-\mathbb{P} \operatorname{IV} O T(k)\) were interchanged and D \(k: k+1, k: k+1)\) is a 2 -by-2 diagonalblock.

If \(\mathrm{FACT}=\mathrm{N}\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exitcontains details of the interchanges and the block structure of D, as determ ined by SSY TRF .

B (input) The N by -N R H S righthand side m atrix B .

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, \mathbb{N})\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the N -by-NRH S solution
\(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num ber of the matrix A. IfRCOND is less than them achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0.

\section*{FERR (output)}

The estim ated forw ard emrorbound for each solution vector \(X()\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector X (i) (i.e., the sm allest relative change in any elem entof \(A\) or \(B\) thatm akes \(X(\mathcal{J})\) an exactsolution).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >= 3*N , and for best perform ance LDW ORK \(>=N * N B\), where \(N B\) is the optim alblocksize forSSY TRF.

If LDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{D}(i, i)\) is exactly zero. The factorization
has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : D is nonsingular, butRCOND is less than \(m\) achine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRC O N D w ould suggest.

\section*{PURPOSE}
dsytff com putes the factorization of a realsym \(m\) etric \(m\) atrix A using the Bunch \(-K\) aufm an diagonalpivoting \(m\) ethod:
\[
A=U * D * U^{\prime} \text { or } A=L * D * L^{\prime}
\]
where U (orL) is a productof perm utation and unit upper (low er) triangularm atrioes, U 'is the transpose of U , and D is sym \(m\) etric and block diagonalw ith 1 -by -1 and 2 -by -2 diagonalblocks.

This is the unblocked version of the algorithm , calling Level2 BLAS.

\section*{ARGUMENTS}

UPLO (input)
Specifies w hether the upper or low er triangular part of the sym \(m\) etric \(m\) atrix \(A\) is stored:
\(=\mathrm{U}\) ': Uppertriangular
= L': Low ertriangular

N (input) The order of the matrix A. N \(>=0\).

A (input/output)
O \(n\) entry, the sym m etric \(m\) atrix A. If \(\mathrm{U} P \mathrm{O}=\mathrm{U}\) ', the leading \(n-b y-n\) upper triangularpartofA contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If UPLO \(=\mathbb{L}\) ', the leading \(n-b y-n\) low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of \(A\) is notreferenced.

On exit, the block diagonalm atrix D and the mul
tipliers used to obtain the factorU orl (see below for further details).

LDA (input)
The leading dim ension of the anray A. LD A >= \(\max (1, \mathbb{N})\).

IPIV (output)
D etails of the interchanges and the block structure ofD. If \(\mathbb{P} \mathbb{I V}(k)>0\), then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V}(k)\) were interchanged and \(D(k, k)\) is a 1 -by-1 diagonalblock. IfUPLO \(=U\) 'and \(\mathbb{P} \mathbb{I V}(k)\) \(=\mathbb{P} \mathbb{V}(k-1)<0\), then row \(s\) and colmm ns \(k-1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k-1 * k, k-1 *)\) is a 2 -by-2 diagonalblock. IfUPLO \(=\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V}(k)\)
\(=\mathbb{P} \mathbb{I}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k, k+1, k \mathrm{k}+1)\) is a 2-by-2 diagonalblock.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\mathrm{k}\), the k -th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=k, D(k, k)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

\section*{FURTHER DETAILS}

\section*{1-96 -B ased on m odifications by J.Lew is, Boeing Com puter}

\section*{Services}

Com pany
If U PLO \(=\mathrm{U}\) ', then \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}\) ', where
\(U=P(n) \star U(n) * \ldots * P(k) U(k) * \ldots\),
i.e., \(U\) is a productof term \(S P(k) * U(k)\), where \(k\) decreases from \(n\) to 1 in steps of 1 or2, and \(D\) is ablock diagonal \(m\) atrix \(w\) ith 1 -by -1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{V}(k)\), and \(U(k)\) is a unituppertriangularm atrix, such that if the diagonal block \(D(k)\) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( I v 0 ) k-s } \\

If U PLO \(=\mathrm{U}\) ', the m atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(n-1) \ldots H(2) H(1) .
\]

Each \(H\) (i) has the form
\[
H(i)=I-\tan * V^{*} v^{\prime}
\]
where tau is a real scalar, and \(v\) is a realvectorw ith \(v(i+1 m)=0\) and \(v(i)=1 ; v(1: i-1)\) is stored on exitin

A ( \(1: i-1, i+1)\), and tau in TAU (i).
IfU PLO \(=\mathrm{L}\) ', the m atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(n-1) .
\]

Each \(H\) (i) has the form
H (i) \(=I-\tan { }^{*} V^{*} V^{\prime}\)
where tau is a real scalar, and \(v\) is a realvectorw ith \(\mathrm{v}(1: i)=0\) and \(\mathrm{v}(i+1)=1 ; \mathrm{v}(i+2 \mathrm{n})\) is stored on exit in A (i+2m,i), and tau in TAU (i).
The contents of A on exitare illustrated by the follow ing exam plesw ith \(\mathrm{n}=5\) :
```

ifUPLO = U ': ifUPLO = L :

```
    ( d e v2 v3 v4 ) ( d
)
    ( d e v3 v4 ) ( e d
)
    ( d e v4 ) (v1 e d
)
    ( d e ) ( v1 v2 e d
)
( d ) (v1 v2 v3 e d
)
where \(d\) and e denote diagonal and off-diagonal elem ents of \(T\), and videnotes an elem entof the vectordefining \(H\) (i).

\#include <sunperfh>
void dsytrf(charuplo, int \(n\), double *a, int lda, int
*ịivot, int*info);
void dsytrf_64 (char uplo, long n, double *a, long lda, long
*ịíivot, long *info);

\section*{PURPOSE}
dsytrf com putes the factorization of a realsym \(m\) etric \(m\) atrix A using the Bunch \(-K\) aufm an diagonalpivoting \(m\) ethod. The form of the factorization is
\[
A=U * D * U * * T \text { or } A=L * D * L * * T
\]
where \(U\) (orL) is a product of perm utation and unit upper (low er) triangular \(m\) atrices, and \(D\) is sym \(m\) etric and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading N -by -N uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low ertriangularpart of A is not referenced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by -N low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly
upper triangularpartofA is not referenced.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{IPIVOT (output)}

D etails of the interchanges and the block structure of D. If \(\mathbb{P I V O T}(k)>0\), then row sand columnsk and \(\mathbb{P I V O T}(k)\) were interchanged and \(D(k, k)\) is a \(1-b y-1\) diagonalblock. If \(U P L O=U^{\prime}\) and \(\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)<0\), then row \(s\) and colum ns \(k-1\) and - \(\mathbb{P I V O T}(k)\) were interchanged and D ( \(k-1 * k, k-1 k)\) is a \(2-b y-2\) diagonal block. If UPLO \(=\mathrm{L}\) 'and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V} O T(k)\) were interchanged and \(D(k k+1, k k+1)\) is a \(2-b y-2\) diagonal block.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >=1. Forbestperfor\(m\) ance LDW ORK >=N *NB, where NB is the block size retumed by \(\amalg A E N V\).

IfLDW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfinlexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

\section*{FURTHER DETAILS}

If \(\mathrm{ULO}=\mathrm{U}\) ', then \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}\) ', where
\(U=P(n) \star U(n)^{\star} \ldots{ }^{\star} P(k) U(k)^{\star} \ldots\),
ie., \(U\) is a product ofterm \(\operatorname{sP}(k) * U(k)\), where \(k\) decreases from \(n\) to 1 in steps of 1 or 2 , and \(D\) is a block diagonal \(m\) atrix w ith 1 -by-1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(\mathrm{k})\), and \(\mathrm{U}(\mathrm{k})\) is a unituppertriangularm atrix, such that if the diagonal block D (k) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=\left(\begin{array}{lll}
0 & I
\end{array}\right) s \\
& \text { ( } 000 \text { I ) n-k } \\
& \mathrm{k}-\mathrm{s} \text { s n-k }
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(1 k-\) \(1, k\) ). If \(s=2\), the upper triangle ofD \((k)\) overw rites \(A(k-\) \(1, k-1), A(k-1, k)\), and \(A(k, k)\), and \(V\) overw rites \(A(1 k-2, k-\) \(1 \mathrm{k})\).

If \(\mathrm{UPLO}=\mathrm{L}\) ', then \(A=\mathrm{L} * \mathrm{D} * \mathrm{~L}\) ', where
\(L=P(1) \star L(1)^{\star} \ldots * P(k) \star L(k) * \ldots\)
ie., \(L\) is a productofterm \(s P(k) * L(k)\), where \(k\) increases
from 1 to n in steps of 1 or 2 , and D is a block diagonal \(m\) atrix \(w\) th 1 -by -1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(k)\), and \(L(k)\) is a unitlow ertriangularm atrix, such that if the diagonal
block \(D(k)\) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( } \left.\begin{array}{llll}
I & 0 & 0
\end{array}\right) k-1 \\
& L(k)=\left(\begin{array}{lll}
0 & I & 0
\end{array}\right) s \\
& \text { ( } 0 \mathrm{~V} \text { I ) } \mathrm{n}-\mathrm{k}-\mathrm{s}+1 \\
& \mathrm{k}-1 \text { s } \mathrm{n}-\mathrm{k}-\mathrm{s}+1
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(k+1 m, k)\). If \(s=2\), the low ertriangle ofD \((k)\) overw rites \(A(k, k), A(k+1, k)\), and \(A(k+1, k+1)\), and \(v\) overw rites A \((k+2 m, k: k+1)\).

void dttom v_64 (charuplo, chartransa, char diag, long n, long \(k\), double *a, long lda, double *y, long incy);

\section*{PURPOSE}
dtbm \(v\) perform s one of the \(m\) atrix-vectoroperations \(x: A * x\), or \(x:=A\) * \(x\), where \(x\) is an \(n\) elem ent vectorand \(A\) is an \(n\) by \(n\) unit, or non-unit, upper or low er triangular band \(m\) atrix, \(w\) ith \((k+1)\) diagonals.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or L ' \(A\) is an upper triangular \(m\) atrix.

UPLO = L' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) 'or \(h^{\prime} \mathrm{x}:=\mathrm{A} * \mathrm{x}\).
TRANSA \(=\) T'ort' \(x:=A * x\).

TRANSA \(=\) C'ort' \(\mathrm{x}:=\mathrm{A}\) * x .

U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)

O n entry, D IA G specifies w hether ornotA is unit triangular as follow \(s\) :

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
\(K\) (input)
On entry w th UPLO \(=U\) 'or L ', K specifies the num ber of super-diagonals of them atrix \(A\). On entry w ith UPLO = L' or I', K specifies the num ber of sub-diagonals of the \(m\) atrix \(A . K>=0\). U nchanged on exit.

A (input)
Before entry w th UPLO = U 'or G ', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the upper triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row ( \(k+1\) ) of the anay, the firstsuper-diagonal starting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the amay A is not referenced. The follow ing program segm entw ill transfer an upper triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINE } \\
& 20 \text { CONTINUE }
\end{aligned}
\]

Before entry w ith UPLO = L 'or I', the leading ( \(k+1\) ) by \(n\) part of the amay A \(m\) ust contain the low er triangularband part of the \(m\) atrix of coefficients, supplied colum n by colum n, w th the leading diagonal of the \(m\) atrix in row 1 of the array, the firstsub-diagonal starting atposition 1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the amay A is not referenced. The follow ing program segm entw ill transfer a low er
triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \operatorname{CONTINUE} \\
& 20 \mathrm{CONTINUE}
\end{aligned}
\]
\(N\) ote thatw hen D \(\mathbb{A} G=U\) 'or L 'the elem ents of the array A comesponding to the diagonalelem ents of the \(m\) atrix are not referenced, but are assum ed to be unity. U nchanged on exit.
LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A \(>=\) ( \(\mathrm{k}+1\) ). U nchanged on exit.

Y (input/output)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. On exit, \(Y\) is overw rilten \(w\) th the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
O n entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
dtbrif provides errorbounds and backw ard error estim ates forthe solution to a system of linear equationsw ith a triangularband coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by STBTRS or some other \(m\) eans before entering this routine. STBRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': A is upper triangular;
\(=\mathbb{L} ': A\) is low ertriangular.

TRANSA (input)
Specifies the form of the system ofequations:
\(=\mathrm{N}^{\prime}: A * X=B \quad\) (No transpose)
\(=T T^{\prime}: A * T * X=B \quad\) ( ranspose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran -
spose)

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N}\) TERFACE .

D IA G (input)
\(=N^{\prime}: A\) is non-unittriangular;
\(=\mathrm{U}\) : A is unit triangular.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num ber of superdiagonals or subdiagonals of the triangularband m atrix A. KD \(>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the \(m\) atrices \(B\) and X. NRHS \(>=0\).

A (input) The upper or low er triangular band matrix A, stored in the firstkd+1 row s of the amay. The \(j\) th column of \(A\) is stored in the \(j\) th column of
the anray A as follow s: if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{A}(\mathrm{kd}+1+\mathrm{i}\) \(j, j)=A(i, j)\) for \(\max (1, j k d)<=i<=j\) if \(U P L O=\) \(L^{\prime}, A(1+i-j, j=A(i, j)\) for \(j<=i<=m\) in \((n, j+k d)\). IfD IA G \(=\mathrm{U}\) ', the diagonalelem ents of A are not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the array A. LDA >= K D +1 .
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (input) The solution \(m\) atrix X .

LD X (input)
The leading dim ension of the anay X. LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard emorbound for each solution vector \(X\) ( 1\()\) (the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{J}), \operatorname{FERR}(\mathcal{I})\) is an estim ated upperbound forthem agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{1})-\mathrm{XTRUE}\) ) divided by the magnitude of the largestelem ent in X ( 7 ) . The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X\) ( \(\mathcal{j}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes \(X(\mathcal{J})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvalue

\section*{PURPOSE}
dtbsv solves one of the system sofequations \(A * x=b\), or \(A\) * \(x=b\), where \(b\) and \(x\) are \(n\) elem ent vectors and \(A\) is an \(n\) by \(n\) unit, or non-unit, upper or low er triangular band \(m\) atrix, \(w\) ith ( \(k+1\) ) diagonals.

N o test forsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix.

UPLO = L' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
O n entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A * x=b\).
TRANSA \(=T^{\prime}\) or \(t^{\prime} A^{*} x=b\).

TRANSA \(=C^{\prime}\) ort' \(\mathrm{C}^{*} \mathrm{x}=\mathrm{b}\).

U nchanged on exit.

TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

D IA G (input)
On entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D \(\mathbb{I}\) G \(=U\) 'or \(\mathrm{l}^{\prime} A\) is assum ed to be unit triangular.

D IA G = N 'or h' A is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

K (input)
On entry with UPLO \(=U\) 'or U ', \(K\) specifies the num ber of super-diagonals of them atrix \(A\). On entry w th UPLO = L' or I', K specifies the num ber of sub-diagonals of the \(m\) atrix \(A . K>=0\). U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the upper triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row ( \(k+1\) ) of the aray, the firstsuper-diagonalstarting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the array A is not referenced. The follow ing program segm entw illtransfer an upper triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:

D O 20, J=1, N
\(\mathrm{M}=\mathrm{K}+1-\mathrm{J}\)
DO \(10, I=M A X(1, J-K), J\)
\(A(M+I, J)=m \operatorname{atrix}(I, J)\)
10 CONTINUE
20 CONTINUE
Before entry w ith UPLO = L 'or 1', the leading ( \(k+1\) ) by \(n\) part of the array A m ustcontain the low er triangularband part of the \(m\) atrix of coefficients, supplied column by colum n, w th the
leading diagonal of the m atrix in row 1 of the array, the firstsub-diagonalstarting atposition 1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the array A is not referenced. The follow ing program segm entw ill transfer a low er triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, \mathrm{~J}=1, \mathrm{~N} \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \mathrm{CONTINUE}
\end{aligned}
\]
\(N\) ote thatw hen D IA G = U 'or L'the elem ents of the amay A comesponding to the diagonalelem ents of the \(m\) atrix are not referenced, but are assum ed to be unity. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A >= ( \(k+1\) ). U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent right-hand side vectorb. On exit, \(Y\) is overw ritten \(w\) ith the solution vector \(x\).
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(Y\). \(\mathbb{N C Y}<>0\). U nchanged on exit.

\section*{PURPOSE}
dtgevc com putes som e orall of the right and/or left generalized eigenvectors of a pair of realuppertriangular \(m\) atrices \((A, B)\).

The rightgeneralized eigenvectorx and the leftgeneralized eigenvectory of ( \(A, B\) ) corresponding to a generalized eigenvalue w are defined by:
\[
(A-w B)^{*} x=0 \text { and } Y^{\star *} H *(A-w B)=0
\]
where \(y^{* * H}\) denotes the conjugate tranpose ofy.

If an eigenvalue \(w\) is determ ined by zero diagonal elem ents of both A and B, a unit vector is retumed as the corresponding eigenvector.

If alleigenvectors are requested, the routine \(m\) ay either retum the \(m\) atriges \(X\) and/or \(Y\) of rightor lefteigenvectors of \((A, B)\), or the products \(Z * X\) and/or \(Q * Y\), where \(Z\) and \(Q\) are input orthogonal \(m\) atrices. If \((A, B) w\) as obtained from the generalized real-Schur factorization of an originalpair of \(m\) atrices
\((A 0, B 0)=Q * A * Z * * H, Q * B * Z * * H)\),
then \(Z\) *X and \(Q\) *Y are the \(m\) atriges of right or lefteigenvectors of A.

A m ustbe block uppertriangular, w ith \(1-b y-1\) and \(2-b y-2\) diagonal blocks. C orresponding to each 2 -by-2 diagonal block is a com plex conjugate pair ofeigenvalues and eigenvectors; only one
eigenvector of the pair is com puted, nam ely the one corresponding to the eigenvalue \(w\) ith positive im aginary part.

\section*{ARGUMENTS}

SID E (input)
\(=R\) ': com pute righteigenvectors only;
\(=\mathrm{L}\) ': com pute lefteigenvectors only;
\(=\mathrm{B}\) ': com pute both rightand lefteigenvectors.

HOW M NY (input)
= 'A ': com pute all right and/or lefteigenvectors;
\(=\mathrm{B}\) ': com pute all right and/or lefteigenvectors, and backtransform them using the inputm atrices supplied in VR and/orVL; = S ': com pute selected right and/or lefteigenvectors, specified by the logicalaray SELECT.

SELECT (input)
If HOW M NY = S', SELECT specifies the eigenvectors to be com puted. If HOW M NY=A 'or B', SELECT is notreferenced. T o select the real eigenvector corresponding to the real eigenvalue w ( \()\), SELECT (J) m ustbe setto .TRUE. To select the com plex eigenvector corresponding to a com plex conjugate pairw ( 7 ) and w ( \(\mathfrak{j}+1\) ), either SELECT ( 7 ) orSELECT (j+1\()\) m ustbe setto .TRUE..

N (input) The order of the m atriges A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input) The upperquasi-triangularm atrix A.

LD A (input)
The leading dim ension of array A. LD A \(>=\max (1\), N) 。

B (input) The uppertriangularm atrix B. IfA has a 2 -by -2 diagonal block, then the corresponding \(2-b y-2\) block ofB m ustbe diagonal w ith posilive ele\(m\) ents.

LD B (input)
The leading dimension of array B . LDB \(>=\) \(\max (1, N)\).

VL (input/output)
On entry, ifS \(\mathrm{D} E=\mathrm{L}^{\prime}\) or \(\mathrm{B}^{\prime}\) 'and HOW MNY = B',
VL must contain an N -by N m atrix Q (usually the orthogonalm atrix Q of leftSchurvectors retumed by SHGEQZ). On exit, ifS \(\mathbb{D} E=L^{\prime}\) 'or \(B^{\prime}\) 'VL contains: if HOW M NY = \(A\) ', them atrix \(Y\) of left eigenvectors of \((A, B)\); if HOW M NY = \(B\) ', the matrix Q *Y ; if HOW M NY = \(S^{\prime}\) ', the left eigenvectors of (A ,B ) specified by SELEC T, stored consecutively in the colum ns of V , in the same order as their eigenvalues. If \(S \mathbb{D} E=R \prime, V L\) is notreferenced.

A com plex eigenvector corresponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the firstholding the realpart, and the second the im aginary part.

LDVL (input)
The leading dimension of array VL . LDVL >= \(\max (1, N)\) if \(S \mathbb{D} E=L\) 'or \(B^{\prime} ; L D V L>=1\) otherw ise.

VR (input/output)
On entry, ifS \(\mathrm{D}=\mathrm{R}\) 'or \(\mathrm{B}^{\prime}\) 'and HOW MNY = B ', VR m ust contain an N -by -N m atrix Q (usually the orthogonal matrix \(Z\) of right Schur vectors retumed by \(S H G E Q Z\) ). On exit, if \(S \mathbb{D} E=R\) 'or \(B\) ', VR contains: if HOW MNY = A', the matrix X of right eigenvectors of \((A, B)\); if HOW M NY \(=B\) ', the m atrix \(\mathrm{Z} * \mathrm{X}\); if H O W M NY = S ', the right eigenvectors of ( \(A, B\) ) specified by SELECT, stored consecutively in the colum \(n s\) ofVR, in the sam e order as their eigenvalues. If \(S \mathbb{D} E=\mathbb{L}, \mathrm{VR}\) is not referenced.

A com plex eigenvector corresponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the firstholding the realpart and the second the im aginary part.

LDVR (input)
The leading dim ension of the array VR . LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R\) 'or \(B^{\prime} ; L D V R>=1\) otherwise.

M M (input)
The num berof colum ns in the arrays VL and/or VR.
M M >= M .

M (output)
The num ber of colum ns in the arrays VL and/or VR actually used to store the eigenvectors. If
HOW M NY = A 'or B', M is set to N. Each selected real eigenvector occupies one colmm \(n\) and each selected com plex eigenvector occupies tw o colum ns.

W ORK (w orkspace)
dim ension (6*N )
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue.
> 0 : the 2 -by-2 block ( \(\mathbb{N}\) FO : \(\mathbb{N}\) FO +1) does nothave a com plex eigenvalue.

\section*{FURTHER DETAILS}

A llocation of w orkspace:

W ORK \((j)=1\)-norm of \(j\) th column of, above the diagonal
W ORK \((N+j)=1\)-norm of \(j\) th colum \(n\) ofB , above the diagonal
W ORK \((2 * \mathrm{~N}+1: 3 * \mathrm{~N})=\) realpartofeigenvector
W ORK ( \(3 * \mathrm{~N}+1: 4{ }^{*} \mathrm{~N}\) ) = im aginary partofeigenvector
W ORK ( \(4 * \mathrm{~N}+1: 5 * \mathrm{~N})\) = realpartofback-transform ed eigenvector
W ORK ( \(5 * \mathrm{~N}+1\) :6*N ) = im aginary part of back-transform ed eigenvector

Row w ise vs. colum nw ise solution m ethods:

Finding a generalized eigenvector consists basically of solving the singular triangular system
(A -w B) \(x=0\) (for right) or: (A -w B)**H \(y=0\)
(forleft)

Consider finding the i-th right eigenvector (assume all eigenvalues are real). The equation to be solved is: \(0=\operatorname{sum} C(j k) v(k)=\operatorname{sum} C(j k) v(k) \quad\) for \(j=i,\). ., 1
where \(C=(A-w B)\) (The com ponents \(v(i+1\) n \()\) are 0 .)

The "row w ise" m ethod is:
(1) \(\mathrm{v}(\mathrm{i}):=1\)
for \(j=i-1, \ldots, 1\) :
i
(2) com pute \(s=-\) sum \(C(j k) \vee(k)\) and \(\mathrm{k}=\mathrm{j}+1\)
(3) \(\vee(1)=s / C(j)\)

Step 2 is som etim es called the "dotproduct" step, since it is an innerproduct.betw een the jth row and the portion of the eigenvector that has been com puted so far.

The "colum nw ise" \(m\) ethod consists basically in doing the sum \(s\) forall the row \(s\) in parallel. A s each \(v(j)\) is com puted, the contribution ofv \((\mathcal{j})\) tim es the \(j\) th colum \(n\) of \(C\) is added to the partial sum s. Since FORTRAN anays are stored colum nw ise, this has the advantage that at each step, the elem ents of \(C\) that are accessed are adjacent to one another, w hereas w ith the row w ise \(m\) ethod, the elem ents accessed at a step are spaced LD A (and LD B ) w ords apart.

W hen finding lefteigenvectors, the \(m\) atrix in question is the transpose of the one in storage, so the row w isem ethod then actually accesses colum ns of A and B ateach step, and \(s o\) is the preferred \(m\) ethod.

\section*{PURPOSE}
dtgexc reorders the generalized realS churdecom position of a real \(m\) atrix pair ( \(A, B\) ) using an orthogonalequivalence transform ation
so that the diagonalblock of ( \(A, B\) ) w ith row index \(\mathbb{F} S T\) is m oved to row IIST.
(A , B ) m ustbe in generalized realSchurcanonical form (as retumed by SGGES), i.e.A is block uppertriangularw ith \(1-b y-1\) and \(2-b y-2\) diagonalblocks. \(B\) is uppertriangular.

O ptionally, the m atrices Q and Z of generalized Schur vectors are updated.

Q (in) * A (in) * Z (in) \({ }^{\prime}=\mathrm{Q}\) (out) * A (out) * Z (out)'
Q (in) * B (in) * Z (in) \({ }^{\prime}=\mathrm{Q}\) (out) * \(\mathrm{B}(\) out \() ~ * Z(\text { out })^{\prime}\)

\section*{ARGUMENTS}

W ANTQ (input)
W ANTZ (input)
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input/output)

On entry, the m atrix A in generalized real Schur canonical form. On exit, the updated \(m\) atrix A, again in generalized realSchur canonical form .

LD A (input)
The leading dim ension of the aray A. LD A >= \(\max (1, N)\).

B (input/output)
On entry, the m atrix B in generalized real Schur canonical form ( \(A, B\) ). On exit, the updated \(m\) atrix \(B\), again in generalized realSchur canonical form ( \(A, B\) ).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

Q (input/output)
On entry, ifW ANTQ = TRUE, the orthogonalm atrix \(Q\). On exit, the updatedmatrix \(Q\). If W ANTQ \(=\) FALSE., Q is not referenced.

LD Q (input)
The leading dim ension of the array \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1\).
IfW ANTQ = TRUE., LDQ \(>=\mathrm{N}\).
Z (input/output)
On entry, ifW ANTZ = TRUE., the orthogonalm atrix Z . On exit, the updatedm atrix Z . If W ANTZ \(=\) FALSE., Z is not referenced.

LD \(Z\) (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\).
IfW ANTZ = .TRUE, ,LD Z >=N.
IFST (input/output)
Specify the reordering of the diagonal blocks of ( \(A, B\) ). The block w th row index \(\mathbb{F} S T\) ism oved to row ILST, by a sequence of Sw apping betw een adjacentblocks. On exit, if IFST pointed on entry to the second row of a 2 -by- 2 block, it is changed to point to the first row ; ILST alw ays points to the firstrow of the block in its final position (which \(m\) ay differ from its inputvalue by +1 or \(-1) .1<=\mathbb{F} S T, \mathbb{L} S T<=N\).

\section*{IST (input/output)}

See the description of \(\mathbb{F S T}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay W ORK.LW ORK >=4*N + 16.

IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK amay, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
=0: successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.
=1: The transform ed m atrix pair ( \(A\), B) w ould be too far from generalized Schur form ; the problem is ill-conditioned. (A , B ) m ay have been partially reordered, and ILST points to the first row of the currentposition of the block being m oved.

\section*{PURPOSE}
dtgsen reorders the generalized realSchur decom position of a real matrix pair (A, B) (in term sofan orthonorm al
equivalence trans-form ation \(Q^{\prime} *(A, B)\) * \(Z\) ), so that a selected cluster of eigenvalues appears in the leading diagonalblocks of the upperquasi-triangularm atrix A and the upper triangular B. The leading colum ns of \(Q\) and \(Z\) form orthonorm albases of the corresponding left and righteigenspaces (deflating subspaces). (A,B) m ustbe in generalized realSchurcanonical form (as retumed by SG GES), ie.A is block upper triangular w ith 1 -by-1 and 2 -by-2 diagonal blocks.B is upper triangular.

D TG SEN also com putes the generalized eigenvalues
\[
w(\mathcal{j})=\left(\operatorname{ALPHAR}(\mathcal{j})+i^{\star} \operatorname{ALPHAI}(\mathcal{j})\right) B E T A(\mathcal{j})
\]
of the reordered \(m\) atrix pair ( \(A, B\) ).
Optionally, D TGSEN com putes the estim ates of reciprocal condition num bers foreigenvalues and eigenspaces. These are D ifu [ \(A 11, B 11\) ), (A 22, B 22)] and D ifl[ (A 11, B11), (A 22, B22)], i.e. the separation ( \(s\) ) betw een the \(m\) atrix pairs ( \(A 11, B 11\) ) and (A 22,B22) that correspond to the selected cluster and the eigenvalues outside the cluster, resp., and norm sof "pro jections" onto left and right eigenspaces w r.t. the selected cluster in the ( 1,1 )-block.

\section*{ARGUMENTS}
```

INO B (input)
Specifies w hether condition num bers are required
for the cluster ofeigenvalues (PL and PR) orthe
deflating subspaces (D ifu and D ifl):

m}\mathrm{ ate
(D IF (1:2)). A bout5 tim es as expensive as INO B =
2. =4: Com pute PL,PR and D FF (ie.0,1 and 2
above): Econom ic version to get it all. =5: C om -
putePL,PR and D FF (i.e.0,1 and 3 above)

```
W ANTQ (input)

\section*{SELECT (input)}

SELEC T specifies the eigenvalues in the selected cluster. To select a real eigenvalue w ( \(\mathcal{j}\) ), SELECT ( \(j\) ) must be set to \(\mathrm{w}(\mathcal{j})\) and \(\mathrm{w}(j+1)\), corresponding to a 2 -by-2 diagonalblock, either SELECT ( \(\ddagger\) ) orSELECT ( \(j+1\) ) orboth \(m\) ust be set to either both included in the cluster or both excluded.

N (input) The order of the m atrioes A and \(\mathrm{B} . \mathrm{N}>=0\).
A (input/output)
On entry, the upper quasi-triangular \(m\) atrix \(A\), w ith (A, B) in generalized realSchur canonical form. On exit, A is overw rilten by the reordered \(m\) atrix A.

\section*{LD A (input)}

The leading dim ension of the aray A. LD A >= \(\max (1, N)\).

B (input/output)
O n entry, the uppertriangularm atrix \(B\), \(w\) th \(A\), B) in generalized realSchurcanonical form. On exit, \(B\) is overw ritten by the reordered \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, \mathbb{N})\).

ALPHAR (output)
On exit, (ALPHAR ( ) + ALPHAI ( ) *i) BETA ( ) , \(\dot{j} 1, \ldots, N, w i l l\) be the generalized eigenvalues. A LPHAR \((\mathcal{Z})+\) ALPHAI \((\boldsymbol{j} *\) iand BETA \((\mathcal{j}), \dot{于} 1, \ldots, N\) are the diagonals of the com plex Schur form \((S, T)\) that w ould result if the 2 -by-2 diagonalblocks of the real generalized Schur form of ( \(A, B\) ) w ere further reduced to triangular form using com plex unitary transform ations. If A LPHA I( \()\) is zero, then the \(j\) th eigenvalue is real; ifpositive, then the \(j\) th and ( \(j+1\) )-steigenvahues are a com plex con \(j \mu-\) gate pair, w ith A LPH A I(j+1) negative.

\section*{A LPH A I (output)}

See the description of A LPHAR.
BETA (output)
See the description of A LPHAR.
Q (input/output)

On entry, if \(W\) ANTQ = TRUE., \(Q\) is an \(N\)-by \(N\) \(m\) atrix. On exit, \(Q\) has been postm ultiplied by the left orthogonal transform ation \(m\) atrix which reorder ( \(A\), B); The leading \(M\) colum ns of f form orthonorm albases for the specified pair of left eigenspaces (deflating subspaces). If \(W\) ANTQ \(=\) FALSE., Q is notreferenced.

LD Q (input)
The leading dim ension of the array \(\mathrm{Q} . \mathrm{LD} Q>=1\); and ifW ANTQ = .TRUE.,LDQ >=N.

Z (input/output)
On entry, if \(W\) ANTZ \(=\).TRUE., \(Z\) is an \(N\) by \(-N\) \(m\) atrix. O n exit, Z has been postm ultiplied by the left orthogonal transform ation \(m\) atrix \(w\) hich reorder ( \(A\), B); The leading \(M\) colum ns of \(Z\) form orthonorm albases for the specified pair of left eigenspaces (deflating subspaces). If W ANTZ = FALSE., Z is notreferenced.

LD Z (input)
The leading dim ension of the array Z . LD \(\mathrm{Z}>=1\); If \(W A N T Z=. T R U E, \operatorname{LDZ}>=N\).

M (output)
The dim ension of the specified pair of left and right eigen-spaces (deflating subspaces). \(0<=\mathrm{M}\) \(<=N\).

PL (output)
If \(\mathrm{IJOB}=1,4\) or \(5, \mathrm{PL}, \mathrm{PR}\) are low er bounds on the reciprocal of the norm of "projections" onto leftand righteigenspaces w ith respect to the selected cluster. \(0<\mathrm{PL}, \mathrm{PR}<=1\). IfM \(=0\) orM \(=N, P L=P R=1\). IfIOOB \(=0,2\) or \(3, P L\) and \(P R\) are not referenced.

PR (output)
See the description ofPL .

D \(\mathbb{F}\) (output)
If IUO B >=2,D \(\mathbb{F}(1: 2)\) store the estim ates ofD ifu and \(D\) iff.
If \(\mathrm{IHO} B=2\) or \(4, D \mathbb{F}(1: 2)\) are F -norm Hoased upper bounds on
\(D\) ifu and \(D\) ifl. If \(I N O B=3\) or \(5, D \mathbb{F}(1: 2)\) are \(1-\)
norm -based estim ates ofD ifu and \(D\) ifl. \(\mathrm{If} M=0\)
orN , \(D \mathbb{F}(1: 2)=F-n o r m([A, B])\). If \(I J O B=0\) or \(1, D\) IF is notreferenced.

W ORK (w orkspace)
If \(\mathrm{IJOB}=0, \mathrm{~W} O R K\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay \(W\) ORK. LW ORK \(>=4 * N+16\). If \(\mathrm{LJO} B=1,2\) or 4, LW ORK \(>=\mathrm{MAX}(4 * N+16,2 * \mathrm{M} * \mathbb{N}-\) \(\mathrm{M})\) ). If \(\mathrm{IJOB}=3\) or 5 , LW ORK \(>=\mathrm{MAX}(4 * \mathrm{~N}+16\), \(4 * M *(N-M))\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the \(W\) ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
If \(\mathrm{IJO} B=0, \mathbb{I V} O R K\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, \mathbb{I V}\) ORK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I V}\) ORK.LIIN ORK >=1. If \(\mathrm{IJOB}=1,2\) or \(4, \mathrm{~L} \mathbb{I}\) ORK \(>=\mathrm{N}+6\). If IJOB \(=3\) or \(5, L \mathbb{N}\) ORK \(>=M A X(2 * M * \mathbb{N}+M), N+6)\).

If LIV ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I V}\) ORK array, retums this value as the first entry of the \(\mathbb{I N}\) ORK array, and no errorm essage related to \(L \mathbb{I N} O R K\) is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
=0: Successfiulexit.
\(<0:\) If \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegal value.
\(=1\) : Reordering of ( \(A, B\) ) failed because the transform ed \(m\) atrix pair ( \(A, B\) ) w ould be too far from generalized Schur form ; the problem is very ill-conditioned. (A, B) m ay have been partially reordered. If requested, 0 is retumed in D IF (*), \(P L\) and \(P R\).

\section*{FURTHER DETAILS}

D TG SEN first collects the selected eigenvalues by com puting orthogonal \(U\) and \(W\) thatm ove them to the top leftcomerof (A,B). In otherw ords, the selected eigenvalues are the
eigenvalues of (A11, B 11) in:
\[
\begin{gathered}
U *(A, B) * W=(A 11 A 12)(B 11 B 12) n 1 \\
(0 \text { A 22),(0 B22) n2 } \\
n 1 \mathrm{n} 2 \quad \mathrm{n} 1 \mathrm{n} 2
\end{gathered}
\]
w here \(\mathrm{N}=\mathrm{n} 1+\mathrm{n} 2\) and U ' m eans the transpose of U . The first n1 colum ns of \(U\) and \(W\) span the specified pair of left and righteigenspaces (deflating subspaces) of \((A, B)\).

If ( \(A, B\) ) has been obtained from the generalized real Schur decom position of a matrix pair ( \(C, D\) ) \(=Q\) * \((A, B) * Z\) ', then the reordered generalized realSchur form of ( \(C, D\) ) is given by
\[
(C, D)=(Q * U)^{\star}(U \star(A, B) * W) *(Z * W)^{\prime},
\]
and the firstn1 colum ns of Q * U and \(\mathrm{Z} * \mathrm{~W}\) span the comesponding deflating subspaces of ( \(C, D\) ) \(Q\) and \(Z\) store \(Q * U\) and Z *W, resp.).

N ote that if the selected eigenvalue is sufficiently illconditioned, then its value \(m\) ay differ significantly from its value before reordering.

The reciprocalcondition num bers of the left and right eigenspaces spanned by the firstn1 colum ns ofU and \(W\) (or \(\mathrm{Q} * \mathrm{U}\) and \(\mathrm{Z} * \mathrm{~W}) \mathrm{m}\) ay be retumed in \(\mathrm{D} \mathbb{F}(1: 2)\), corresponding to \(D\) ifu and \(D\) ifll, resp.

The D ifu and D iflare defined as:
ifu \([\) A 11, B11), (A 22, B22) \(]=\operatorname{sigm}\) am in ( Zu )
and
where sigm a-m in ( 2 u ) is the sm allest singular value of the ( \(2 *_{n} 1 *{ }_{n} 2\) )-by- \(\left(2 *_{n} 1 *_{n} 2\right.\) ) m atrix
\(\mathrm{u}=[\mathrm{kron}(\mathrm{In} 2, \mathrm{~A} 11)-\mathrm{kron}(\mathrm{A} 22\) ', In1) ]
[kron(In2,B11) kron (B22', In1)].
H ere, \(\operatorname{In} x\) is the identity \(m\) atrix of size \(n x\) and \(A 22\) 'is the transpose of A 22. kron ( \(X, Y\) ) is the \(K\) roneckerproduct betw een the \(m\) atrices \(X\) and \(Y\).

W hen D IF (2) is sm all, sm all changes in (A, B) can cause large changes in the deflating subspace. A \(n\) approxim ate (asym ptotic) bound on them axim um angularemor in the com puted deflating subspaces is PS * norm ( \((A, B)\) )/D \(\mathbb{F}(2)\),
where EPS is the \(m\) achine precision.

The reciprocal norm of the pro jectors on the left and right eigenspaces associated with (A 11, B 11) m ay be retumed in PL and PR. They are com puted as follow s. First we com pute \(L\) and \(R\) so that \(P\) * \((A, B){ }^{\star} Q\) is block diagonal, w here
\(=(I-\amalg) n 1 \quad Q=(I R) n 1\)
\[
\begin{array}{lll}
(0 \text { I) n2 } & \text { and } & (0 I) n 2 \\
\text { n1 n2 } & \text { n1 n2 }
\end{array}
\]
and ( \(L, R\) ) is the solution to the generalized Sylvester equation \(11 * \mathrm{R}-\mathrm{L} *\) A \(22=-\mathrm{A} 12\)

Then PL \(=(F \text {-norm }(L) * * 2+1)^{* *}(-1 / 2)\) and \(P R=(F-\) norm \((\mathbb{R}) * * 2+1) * *(-1 / 2)\). A n approxim ate (asym ptotic) bound on the average absolute error of the selected eigenvalues is PS * norm ( \((A, B)) / P L\).

There are also globalemorbounds which valid forperturbations up to a œertain restriction: A low erbound \((x)\) on the sm allest \(F\)-norm ( \(E, F\) ) forw hich an eigenvalue of (A 11, B 11) \(m\) ay \(m\) ove and coalesce \(w\) th an eigenvalue of (A 22,B22) under perturbation \((\mathbb{E})\), (i.e. \((A+E, B+F)\), is
\(\mathrm{x}=\)

A \(n\) approxim ate bound on \(x\) can be com puted from \(D \mathbb{F}(1: 2)\), PL and PR .

If \(y=(F-\) norm \((E, F) / x)<=1\), the angles betw een the per turbed (L', R) and unperturbed ( \(L, R\) ) left and right deflating subspaces associated \(w\) ith the selected cluster in the \((1,1)\)-blocks can be bounded as
max-angle \((L, L)<=\arctan (y * P L /(1-y *(1-P L *\) PL)** (1/2))
\(\max -\operatorname{angle}(R, R)<=\arctan (y * P R /(1-y *(1-P R *\)
\(\operatorname{PR}) * *(1 / 2))\)
See LA PA CK U ser's G uide section 4.11 or the follow ing references form ore inform ation.

N ote that if the default \(m\) ethod for com puting the Frobenius-norm - based estim ate D \(\mathbb{F}\) is not wanted (see SLA TDF), then the param eter ID \(\mathbb{F} \cdot \mathcal{B}\) (see below) should be changed from 3 to 4 (routine SLA TDF (LOB \(=2 \mathrm{w}\) illbe used)). See STG SY L form ore details.

\#include < sunperfh>
void dtgsja (char jobu, char jobv, char jobq, intm, int p, int n , int k , int l, double *a, int lda, double *b, int ldd, double tola, double tolb, double *alpha, double *beta, double *u, intldu, double * v , int ldv, double *q, int ldq, int *ncycle, int *info);

p, long \(n\), long k, long ll double *a, long lda, double *b, long ldb, double tola, double tolb, double *alpha, double *beta, double *u, long ldu, double *v, long ldv, double *q, long ldq, long *ncycle, long *info);

\section*{PURPOSE}
dtgsja com putes the generalized singular value decom position (GSVD) of tw o real upper triangular (or trapezoidal) \(m\) atrices \(A\) and \(B\).

On entry, it is assum ed thatm atrioes \(A\) and \(B\) have the follow ing form \(s\), which \(m\) ay be obtained by the preprocessing subroutine SG GSVP from a generalM by -N m atrix A and \(\mathrm{P}-\) by -N \(m\) atrix B :
```

        N-K- K L
    A = K (0 A12 A13) ifM K 乙 >= 0;
L (0 0 A23)
M K-工(0 0 0 )

```
```

            N-K-L L
    A = K (0 A12 A 13) ifM K L<0;
MK(0 0 A 23)

```
        N K K K
\(B=L\left(\begin{array}{lll}0 & 0 & B 13\end{array}\right)\)
    P-工 ( \(0 \quad 0 \quad 0 \quad\) )
where the K -by-K m atrix A 12 and L-by- m atrix B 13 are nonsingular upper triangular; A 23 is L-by- upper triangular if \(M-K->=0\), otherw ise \(A 23\) is \((M-K)\)-by -4 uppertrapezoidal.

On exit,
\[
U{ }^{*} A * Q=D 1 *(0 R), \quad V{ }^{*} B * Q=D 2 *(0 R)
\]
where \(U, V\) and \(Q\) are orthogonal matrioes, \(Z\) ' denotes the transpose of \(Z, R\) is a nonsingularupper triangularm atrix, and D 1 and D 2 are 'diagonal"m atrices, which are of the follow ing structures:

If \(M-\mathrm{K}->=0\),
```

            K L
    DI= K(IO)
L (0 C )
M K-工(0 0)

```
            K L
D \(2=\mathrm{L} \quad(0 \mathrm{~S})\)
    P - ( 0 0)
            NK- K L
( 0 R ) \(=\mathrm{K}\) ( 0 R11 R12) K
    L ( 0 O R22) L
w here
\[
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(K+L)), \\
& S=\operatorname{diag}(\operatorname{BETA}(\mathbb{K}+1), \ldots, \operatorname{BETA}(\mathbb{K}+L)), \\
& C \star * 2+S \star \star 2=I .
\end{aligned}
\]
\(R\) is stored in \(A(1: K+L, N-K+1 \mathbb{N})\) on exit.

IfM K- < 0,

K M K K + L M
\(D 1=K\left(\begin{array}{lll}I & 0\end{array}\right)\)
\(M-K\left(\begin{array}{lll}(0 C O\end{array}\right)\)
```

            K M K K +L-M
    D2 = M K (0 S 0 )
K+L-M (0 0 I )
P-(0 0 0 )

```
            \(\mathrm{N} K \dashv \mathrm{~K} \quad \mathrm{M}\) K \(\mathrm{K}+\mathrm{L} \mathrm{M}\)
    \(M\) K (0 O R22 R23)
    \(\mathrm{K}+\mathrm{L} \mathrm{M}\) (0 0 (0 R33)
w here
\(C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(M))\),
\(S=\operatorname{diag}(B E T A(K+1), \ldots, B E T A(M))\),
\(C * * 2+S * * 2=I\).
\(R=(R 11 R 12 R 13)\) is stored in \(A(1 M, N\) K \(\mathrm{N}+1 \mathbb{N})\) and \(R 33\) is stored
( 0 R22R23)
in \(B(M-K+1: L, N+M-\longleftarrow+1 N)\) on exit.

The com putation of the orthogonal transform ation \(m\) atrices \(U\), \(V\) or \(Q\) is optional. These \(m\) atrices \(m\) ay eitherbe form ed explicitly, or they \(m\) ay be postm ultiplied into input \(m\) atrices \(\mathrm{U} 1, \mathrm{~V} 1\), or Q 1 .
STG SJA essentially uses a variant of \(K\) ogbetliantz algorithm to reduce \(m\) in ( \((, M-K)\)-by -4 triangular (ortrapezoidal) \(m\) atrix A 23 and \(\mathrm{L}-\mathrm{by}-\mathrm{m}\) atrix B 13 to the form :

U 1 *A 13*Q \(1=\mathrm{C} 1 * \mathrm{R} 1\); V 1 *B13*Q \(1=\mathrm{S} 1 * \mathrm{R} 1\), w here \(\mathrm{U} 1, \mathrm{~V} 1\) and Q 1 are orthogonalm atrix, and \(Z '\) is the transpose of Z. C1 and S1 are diagonalm atrices satisfying \(\mathrm{C} 1 * * 2+\mathrm{S} 1 * * 2=\mathrm{I}\),
and R1 is an \(\mathrm{L}-\mathrm{by}-\mathrm{L}\) nonsingularuppertriangularm atrix.

\section*{ARGUMENTS}
\(J 0 \mathrm{BU}\) (input)
\(=\mathrm{U}\) ': U m ustcontain an orthogonalm atrix U 1 on entry, and the product \(\mathrm{I} * \mathrm{U}\) is retumed; = I ': U is initialized to the unitm atrix, and the orthogonal matrix U is retumed; = N ': U is notcom puted.

JOBV (input)
\(=\mathrm{V}\) : V m ustcontain an orthogonalm atrix V 1 on entry, and the product V 1*V is retumed; = I ': V is initialized to the unitm atrix, and the onthogonal matrix \(V\) is retumed; \(=\mathrm{N}: \mathrm{V}\) is notcom puted.
\(J O B Q\) (input)
\(=\mathrm{Q}: \mathrm{Q}\) mustcontain an orthogonalm atrix Q 1 on entry, and the product \(\mathrm{Q} \mathrm{I}^{*} \mathrm{Q}\) is retumed; = \(\mathrm{I}^{\prime}: \mathrm{Q}\) is initialized to the unitm atrix, and the orthogonal matrix Q is retumed; \(=\mathrm{N}\) : Q is not com puted.

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).
N (input) The num ber of collm ns of the \(m\) atrices \(A\) and \(B\). \(N\) \(>=0\).
\(K\) (input) \(K\) and \(L\) specify the subblocks in the input \(m\) atrices \(A\) and \(B\) :
\(\mathrm{A} 23=\mathrm{A}(\mathrm{K}+1 \mathbb{M} \mathbb{N}(\mathrm{~K}+\mathrm{L}, \mathrm{M}), \mathbb{N}-\mathrm{L}+1 \mathbb{N})\) and \(\mathrm{B} 13=\) \(B(1: L, N-\Psi+1 \mathbb{N})\) of \(A\) and \(B\),whose \(G S V D\) is going to be com puted by STG SJA. Se Further details.

L (input) See the description of K .
A (input/output)
On entry, the M -by -N matrix A. On exit, A \(\mathbb{N}\) \(K+1 \mathbb{N}, \mathbb{1} M \mathbb{N}(K+L, M)\) ) contains the triangular \(m\) atrix \(R\) orpartofR. See Punpose for details.

LDA (input)
The leading dim ension of the aray A. LD A >= max (1,M).

B (input/output)
On entry, the \(P\)-by \(-N\) m atrix B. On exit, if necessary, \(B(M+1: L, N+M-\Psi+1 \mathbb{N}\) ) contains a partofR . See Purpose for details.

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, P)\).

TO LA (input)
TO LA and TO LB are the convergence criteria for the Jacobi- K ogbetliantz tieration procedure. Generally, they are the sam e as used in the preprocessing step, say TOLA \(=\max (\mathrm{M}, N) \star\) norm (A) ) M A CHEPS, \(T O L B=\max (P, N){ }^{\star}\) norm (B)\()^{\star} \operatorname{MCHEPS}\).

TO LB (input)
See the description of TO LA .

A LPHA (output)
On exit, ALPHA and BETA contain the generalized singular value pairs of \(A\) and ; A LPHA \((1 K)=1\), \(\operatorname{BETA}(1: K)=0\), and ifM \(K-L>=0\), ALPHA \((\mathbb{K}+1 \mathbb{K}+\mathrm{L})\)
\(=\operatorname{diag}(\mathrm{C})\),
\(\operatorname{BETA}(\mathbb{K}+1 \mathrm{~K}+\mathrm{L})=\operatorname{diag}(\mathrm{S})\), or if \(\mathrm{M} \mathrm{K}-\mathrm{L}<0\),
A LPHA \((\mathbb{K}+1 \mathrm{M})=\mathrm{C}\), ALPHA \((\mathrm{M}+1 \mathrm{~K}+\mathrm{L})=0\)
BETA \((K+1 M)=S, B E T A(M+1: K+L)=1\). Furtherm ore, if \(K+L<N, A L P H A(K+L+1 \mathbb{N})=0\) and
BETA \((K+L+1 \mathbb{N})=0\).
BETA (output)
See the description of A LPH A .
U (input) On entry, if \(\mathrm{JOBU}=\mathrm{U}\) ', U m ustcontain a matrix
U 1 (usually the orthogonal matrix retumed by SGGSVP). On exit, if \(J 0 B U=\) ' \(I\) ', \(U\) contains the orthogonalm atrix U ; if \(\mathrm{OOBU}=\mathrm{U}\) ', U contains the product \(\mathrm{U} 1 * \mathrm{U}\). If \(\mathrm{JOBU}=\mathrm{N}\) ', U is notreferenced.

LD U (input)
The leading dim ension of the aray \(U\). LD U >= \(m\) ax \((1, M)\) if \(\mathcal{O B} B=U\) '; LD \(U>=1\) otherw ise.

V (input) On entry, if \(J \mathrm{O} B V=\mathrm{V}\) ', V m ustcontain a matrix V1 (usually the orthogonal \(m\) atrix retumed by SGGSVP). On exit, if \(\mathrm{JOBV}=\mathrm{I}^{\prime}, \mathrm{V}\) contains the orthogonalm atrix \(V\); if \(\mathrm{JOBV}=\mathrm{V}, \mathrm{V}\) contains the product \(\mathrm{V} 1 * \mathrm{~V}\). If \(\mathrm{JOBV}=\mathrm{N}, \mathrm{V}\) is notreferenced.

LD V (input)
The leading dim ension of the aray V. LDV >= \(\mathrm{max}(1, \mathrm{P})\) if \(\mathrm{JOBV}=\mathrm{V}\); LDV \(>=1\) otherw ise.
\(Q\) (input) \(O n\) entry, if \(J O B Q=Q\) ', \(Q\) mustcontain a matrix Q 1 (usually the orthogonal \(m\) atrix retumed by SGGSVP). On exit, if \(\mathcal{O B Q}=I^{\prime}, Q\) contains the orthogonalm atrix \(Q\); if \(J O B Q=Q ', Q\) contains the product \(\mathrm{Q} 1^{*} \mathrm{Q}\). If \(\mathrm{JOBQ}=\mathrm{N}^{\prime}, \mathrm{Q}\) is notreferenced.

LD Q (input)
The leading dim ension of the aray \(Q . L D Q>=\) \(\max (1, N)\) if \(J O B Q=Q ; L D Q>=1\) otherw ise.

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
NCYCLE (output)
The num ber of cycles required for convergence.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N ~ F O ~}=-\) i, the i-th argum enthad an illegalvalue.
\(=1\) : the procedure does not converge after M A X IT cycles.

\section*{PURPOSE}
dtgsna estim ates reciprocal condition num bers for specified eigenvalues and/or eigenvectors of a m atrix pair ( \(A, B\) ) in generalized realSchur canonicalform (or of any m atrix pair Q *A *Z', Q *B *Z \()\) w ith orthogonalm atrices Q and Z , w here \(\mathrm{Z}^{\prime}\) denotes the transpose of \(Z\).
( \(\mathrm{A}, \mathrm{B}\) ) m ustbe in generalized realSchur form (as retumed by SGGES), i.e.A is block uppertriangularw ith 1 toy-1 and 2-by-2 diagonalblocks.B is upper triangular.

\section*{ARGUMENTS}

\section*{JOB (input)}

Specifies w hether condition num bers are required
foreigenvalues (S) oreigenvectors (D \(\mathbb{F}\) ):
\(=\mathrm{E}\) ': foreigenvalues only (S);
\(=\mathrm{V}\) ': foreigenvectors only (D \(\mathbb{F})\);
= B ': forboth eigenvalues and eigenvectors ( S and D \(\mathbb{F}\) ).

HOW MNT (input)
= 'A ': com pute condition num bers for all eigenpairs;
= \(S^{\prime}\) : com pute condition num bers for selected eigenpairs specified by the array SELEC T .

\section*{SELECT (input)}

If HOW MNT = S', SELECT specifies the eigenpairs for which condition num bers are required. To select condition num bers for the eigenpair comesponding to a realeigenvalue w ( \(\mathcal{\nu}\), SELECT ( \()\) m ustibe set to .TRU E ..To selectcondition num bers corresponding to a complex conjugate pair of eigenvaluesw ( 7 ) and w ( \(\ddagger+1\) ), either SELECT ( 7 ) or SELECT ( \(j+1\) ) or both, mustbe setto .TRUE .. If HOW MNT = A', SELECT is notreferenced.

N (input) The order of the square \(m\) atrix pair ( \(\mathrm{A}, \mathrm{B}\) ). \(\mathrm{N} \quad>=\) 0.

A (input) The upperquasi-triangularm atrix \(A\) in the pair \((A, B)\).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).
\(B\) (input) The upper triangularm atrix \(B\) in the pair \((A, B)\).

LD B (input)
The leading dim ension of the array \(B . L D B>=\) \(\max (1, N)\).

VL (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VL mustcontain left eigenvectors of \((A, B)\), comesponding to the eigenpairs specified by H OW M NT and SELEC T. The eigenvectors \(m\) ust be stored in consecutive colum ns of \(V \mathrm{~L}\), as retumed by STGEVC . If JOB \(=V\) ', \(V L\) is not referenced.

The leading dim ension of the array VL. LD VL \(>=1\). If \(\mathrm{JOB}=\mathrm{E}\) 'or \(\mathrm{B}^{\prime}\), LDVL \(>=\mathrm{N}\).

VR (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VR m ust contain right eigenvectors of ( \(A, B\) ), comesponding to the eigenpairs specified by HOW M NT and SELECT. The eigenvectors m ust be stored in consecutive colum ns ov VR, as retumed by \(S T G E V C\). If \(J O B=V ', V R\) is not referenced.
LDVR (input)
The leading dim ension of the array VR.LD VR >= 1 . If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', LDVR \(>=\mathrm{N}\).

S (output)
If \(J O B=E\) ' or \(B\) ', the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the array. For a com plex conjugate pair of eigenvalues tw o consecutive ele\(m\) ents of \(S\) are set to the sam e value. Thus \(S(\mathcal{j})\), D \(\mathbb{F}(\mathcal{j})\), and the \(j\) th colum ns ofVL and VR all comespond to the sam e eigenpair (butnot in general the jth eigenpair, unless alleigenpairs are selected). If \(70 \mathrm{~B}=\mathrm{V}\) ', S is not referenced.

D \(\mathbb{F}\) (output)
If \(\mathrm{JO} \mathrm{B}=\mathrm{V}\) 'or B ', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. For a complex eigenvector tw o consecutive elem ents of \(D \mathbb{F}\) are set to the sam e value. If the eigenvalues cannot be reordered to com pute \(D \mathbb{F}(\mathcal{I}), \mathrm{D} \mathbb{F}()\) is set to 0 ; this can only occurw hen the true value would be very sm allanyw ay. If \(\mathrm{JO} B=\mathrm{E}, \mathrm{D} \mathbb{F}\) is not referenced.

M M (input)
The num berof elem ents in the arrays \(S\) and \(D \mathbb{F} . M M\) \(>=\mathrm{M}\).

M (output)
The num berof elem ents of the arrays \(S\) and \(D \mathbb{F}\) used to store the specified condition num bers; for each selected realeigenvalue one elem ent is used, and for each selected com plex conjugate pair of eigenvalues, tw o elem ents are used. If HOW M NT = A', M is set to \(N\).

W ORK (w orkspace)
If \(\mathrm{JOB}=\mathrm{E}\) ', W ORK is not referenced. O therw ise,
on exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LW ORK.

\section*{LW ORK (input)}

The dim ension of the anay \(W\) ORK .LW ORK >= N. If JOB = V 'or B 'LW ORK >= 2*N * \(N+2\) ) +16 .
If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)
dim ension \((\mathbb{N}+6)\) If \(\mathcal{O B}=\mathrm{E}^{\prime}, \mathbb{I N} \mathrm{ORK}\) is not referenced.
\(\mathbb{N} F O\) (output)
=0: Successfulexit
\(<0:\) If \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegal value

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of a generalized eigenvalue \(w=(a, b)\) is defined as \((w)=(\mu A v|\star * 2+\mu \mathrm{Bv}| \star * 2)^{* *}(1 / 2) /\left(\right.\) norm \((u){ }^{*}\) norm (v))
\(w\) here \(u\) and \(v\) are the left and righteigenvectors of (A, B) comesponding to \(\mathrm{w} ;|z|\) denotes the absolute value of the com plex num ber, and norm (u) denotes the 2 -norm of the vector u. The pair ( \(a, b\) ) corresponds to an eigenvalue \(w=a \nless \vDash\) \(u\) Av/uBv) of the m atrix pair ( \(A, B\) ). If both \(a\) and \(b\) equal zero, then \((A B)\) is singular and \(S(I)=-1\) is retumed.

A n approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue \(w\) and the comesponding exacteigenvalue lam bda is hord (w , lam bda) <= EPS * norm (A , B) /S (I)
where EPS is the \(m\) achine precision.

The reciprocal of the condition num ber D \(\mathbb{F}\) (i) of right eigenvector \(u\) and lefteigenvectorv comesponding to the generalized eigenvalue \(w\) is defined as follow s:
a) If the \(i\)-th eigenvalue \(w=(a, b)\) is real

Suppose U and V are orthogonal transform ations such that
\(U *(A, B) * V=(S, T)=(a *)(b *)\)
1
\[
(0 \mathrm{~S} 22),(0 \mathrm{~T} 22)
\]
n-1
\[
1 \mathrm{n}-1 \quad 1 \mathrm{n}-1
\]

Then the reciprocalcondition num berD \(\mathbb{F}(i)\) is
D ifl( \((\mathrm{a}, \mathrm{b}),(\mathrm{S} 22, \mathrm{~T} 22))=\operatorname{sigm} \mathrm{a}-\mathrm{m}\) in \((\mathrm{Z} 1)\),
where sigm a-m in (Zl) denotes the sm allest singular value of the
\(2(n-1)\)-by-2 (n-1) m atrix
```

Zl= [kron (a, In-1) kron (1,S22) ]
[kron(b, In-1) -kron(1,T22)].

```

H ere \(\mathrm{In}-1\) is the identily \(m\) atrix of size \(\mathrm{n}-1 . \operatorname{kron}(X, Y)\) is the
\(K\) roneckerproductbetw een the \(m\) atrices \(X\) and \(Y\).

N ote that if the defaultm ethod for com puting D IF (i) is w anted
(see SLA TDF), then the param eter D FPD RI (see below) should be
changed from 3 to 4 (routine SLATD F (LJO B \(=2 \mathrm{w}\) ill be used)).
See STG SY L form ore details.
b) If the \(i\)-th and (i+1)-th eigenvalues are com plex conjugate pair,

Suppose U and V are orthogonal transform ations such that
\(U^{*}(A, B) * V=(S, T)=(S 11 *)(T 11 *\)
) 2
\[
(0 \quad S 22),(0
\]

T22) \(n-2\)
\[
\begin{array}{llll}
2 & n-2 & n-2
\end{array}
\]
and (S11, T11) comesponds to the com plex conjugate eigenvalue
pair ( \(w\), con \(\dot{g}(w)\) ). There exist unitary \(m\) atrices \(U 1\) and V1 such
that
U 1 *S11*V1 = (s11 s12 ) and U 1 *T11*V \(1=(\mathrm{t} 11 \mathrm{t} 12\)
)
\[
\text { ( } 0 \text { s22) ( } 0 \text { t22 }
\]
)
w here the generalized eigenvalues \(\mathrm{w}=\mathrm{s} 11\) t11 and con \({ }^{g}(w)=s 22\) t 22 .

Then the reciprocalcondition num berD \(\mathbb{F}\) (i) is bounded by
\[
\mathrm{m} \text { in }(\mathrm{d} 1, \mathrm{~m} \text { ax }(1, \text { real(s11)/real(s22)|)*d2 ) }
\]
where, \(\mathrm{d} 1=\mathrm{D}\) ifl( \((\mathrm{s} 11, \mathrm{t} 11),(\mathrm{s} 22, \mathrm{t} 22))=\) sigm a-m in \((\mathrm{Z} 1)\), where
Z 1 is the com plex 2 -by -2 m atrix
```

Z1 = [s11 -s22]
[t11 -t22 ],

```

This is done by com puting (using realarithm etic) the roots of the characteristicalpolynom ialdet(Z1'* Z1 lam bda I),
where Z1'denotes the conjugate transpose of Z1 and \(\operatorname{det}(X)\) denotes the determ inantof \(X\).
and d2 is an upperbound on D ifl((S11,T11), (S22,T22)), ie.an
upperbound on sigm a-m in ( \(Z 2\) ), where \(Z 2\) is ( \(2 n-2\) )-by-( \(2 n-\) 2)
\[
\begin{aligned}
& \mathrm{Z} 2=[\mathrm{kron}(\mathrm{~S} 11 \text { ', In-2) } \mathrm{kron}(\mathrm{I}, \mathrm{~S} 22)] \\
& \text { [kron(T11', In-2) kron (12, T22) ] }
\end{aligned}
\]
\(N\) ote that if the default \(m\) ethod for com puting \(D\) IF is w anted (see
SLA TD F), then the param eterD IFD R I (see below ) should be changed
from 3 to 4 (routine SLA TDF (INO B \(=2\) w ill be used)). See STGSYL
form ore details.

For each eigenvaluekector specified by SE LEC T, D IF stores a Frobenius norm -based estim ate ofD ifl.

A \(n\) approxim ate errorbound forthe i-th com puted eigenvector VL (i) orVR (i) is given by

> EPS * nom (A, B) /D IF (i).

See ref. [2-3] form ore details and further references.

\section*{C INTERFACE}
\#include <sunperfh>
void dtgsyl(chartrans, int ijob, intm, intn, double *a, int lda, double *b, int ldb, double \({ }^{*}\) c, int ldc, double *d, int ldd, double *e, int lde, double *f, int ldf, double *scale, double *dif, int *info);
void dtgsyl_64 (chartrans, long ijob, long m, long n, double *a, long lda, double *b, long ldb, double *c, long ldc, double *d, long ldd, double *e, long lde, double *f, long ldf, double *scale, double *dif, long *info);

\section*{PURPOSE}
dtgsylsolves the generalized Sylvesterequation:
\(A * R-L * B=\) scale * C
\(D * R-L * E=\) scale \(* F\)
(1)
where \(R\) and \(L\) are unknow \(n m\)-by- \(n m\) atrices, ( \(A, D\) ), ( \(B, E\) ) and ( \(C, F\) ) are given \(m\) atrix pairs of size \(m-b y-m, n-b y-n\) and \(m\)-by- \(n\), respectively, with realentries. ( \(A, D\) ) and ( \(B, E\) ) m ust be in generalized (real) Schur canonical form, ie. A, \(B\) are upperquasi triangularand D, E are uppertriangular.

The solution \((\mathbb{R}, \mathrm{L})\) overw rites ( \(\mathrm{C}, \mathrm{F}\) ). \(0<=\mathrm{SCA} \mathrm{LE}<=1\) is an output scaling factor chosen to avoid overflow .

In \(m\) atrix notation (1) is equivalent to solve \(\mathrm{Zx}=\) scale b , where \(Z\) is defined as
\[
\begin{aligned}
Z= & {\left[\operatorname{kron}(\operatorname{In}, A) \operatorname{kron}\left(B^{\prime}, \operatorname{Im}\right)\right] } \\
& {\left[\operatorname{kron}(\operatorname{In}, D) \operatorname{kron}\left(E^{\prime}, \operatorname{Im}\right)\right] . }
\end{aligned}
\]

H ere \(\mathbb{k}\) is the identily \(m\) atrix of size \(k\) and X 'is the transpose of \(X\). kron ( \(X, Y\) ) is the \(K\) roneckerproduct.betw een the \(m\) atrices \(X\) and \(Y\).

If TRANS = T', STGSY L solves the transposed system Z "y = scale*b, which is equivalent to solve for \(R\) and \(L\) in
\[
\begin{aligned}
& A^{\prime} * R+D^{\prime *} L=\text { scale * C } \\
& R B^{\prime}+L E^{\prime}=\text { scale * }(F)
\end{aligned}
\]
(3)

This case (TRANS = T) is used to com pute an one-norm -based estim ate of \(D\) if \([(A, D),(B, E)]\), the separation betw een the \(m\) atrix pairs \((A, D)\) and \((B, E)\), using SLA CON.

If IJO B >= 1, STG SY L com putes a Frobenius norm -based esti\(m\) ate ofD if \([(A, D),(B, E)]\). That is, the reciprocal ofa low er
bound on the reciprocal of the sm allest singular value of \(Z\).
See [1-2] form ore inform ation.

This is a level3 BLA S algorithm .

\section*{ARGUMENTS}

TRANS (input)
= N ', solve the generalized Sylvester equation (1). = T', solve the transposed 'system (3).

IJOB (input)
Specifies whatkind of functionality to be per-
form ed. \(=0\) : solve (1) only.
\(=1\) : The functionality of 0 and 3 .
\(=2\) : The functionality of 0 and 4 .
\(=3: 0\) nly an estim ate ofD if \([(A, D),(B, E)]\) is computed. (look ahead strategy IJO B \(=1\) is used). \(=4: 0\) nly an estim ate ofD if \([(A, D),(B, E)]\) is computed. ( SGECON on sub-system s is used). N ot referenced if TRANS = \(T\) '.
\(M\) (input) The order of the \(m\) atrioes \(A\) and \(D\), and the row dim ension of the \(m\) atrices \(C, F, R\) and \(L\).
\(N\) (input) The order of the \(m\) atrices \(B\) and \(E\), and the \(c o l u m n\) dim ension of the \(m\) atrioes \(C, F, R\) and \(L\).

A (input) The upperquasitriangularm atrix A.

LDA (input)
The leading dim ension of the aray A. LDA >= \(m a x(1, M)\).
\(B\) (input) The upperquasitriangularm atrix \(B\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).
C (input/output)
On entry, \(C\) contains the right-hand-side of the first \(m\) atrix equation in (1) or (3). On exit, if IJOB \(=0,1\) or \(2, C\) has been overw ritten by the solution R. If \(\mathrm{IO} B=3\) or 4 and TRANS \(=N^{\prime}\), C holds \(R\), the solution achieved during the com putation of the \(D\) if-estim ate.

LD C (input)
The leading dim ension of the aray C. LD C >= max (1, M).

D (input) The upper triangularm atrix D.

\section*{LD D (input)}

The leading dim ension of the aray D. LDD >= \(m a x(1, M)\).

E (input) The upper triangularm atrix E .

LDE (input)
The leading dim ension of the aray E. LDE >= \(\max (1, N)\).

F (input/output)
On entry, F contains the right-hand-side of the second \(m\) atrix equation in (1) or (3). On exit, if IJO B \(=0,1\) or \(2, F\) has been overw ritten by the solution L. If IOB \(=3\) or 4 and TRANS \(=N^{\prime}, F\) holds L , the solution achieved during the com putation of the D if-estim ate.

LD F (input)
The leading dim ension of the array F. LDF >= max (1, M).

\section*{SCALE (output)}

On exitSCALE is the reciprocal of a low er bound of the reciprocal of the \(D\) if-function, ie. SCALE is an upper bound of \(D\) if \([(A, D)\), ( \(B, E)]=\) sigm a_m in \((Z)\), where \(Z\) as in \((2)\). If IJO \(B=0\) or TRANS = T', SCALE is not touched.
D \(\mathbb{F}\) (output)
On exitSCALE is the reciprocal of a low er bound
of the reciprocal of the \(D\) if-function, ie. SCALE
is an upper bound of \(D\) if \([(A, D),(B, E)]=\) sigm a_m in \((Z)\), where \(Z\) as in (2). If IJO \(B=0\) or TRANS = T', SCALE is nottouched.

\section*{W ORK (w orkspace)}

If \(\mathrm{IJOB}=0, \mathrm{~W} O R K\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the aray \(W\) ORK.LW ORK \(>=1\). If \(\mathrm{IJOB}=1\) or 2 and TRANS \(=\mathrm{N}^{\prime}, \mathrm{LW}\) ORK \(>=2 * \mathrm{M} * \mathrm{~N}\).

If LW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)
dim ension \((M+N+2)\)
\(\mathbb{N}\) FO (output)

void dtpm v_64 (charuplo, chartransa, char diag, long n, double *a, double *y, long incy);

\section*{PURPOSE}
dtpm \(v\) perform s one of the \(m\) atrix-vector operations \(x:=A * x\), or \(\mathrm{x}:=A{ }^{*} \mathrm{x}\), where x is an n elem entvectorand \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangular m atrix, supplied in packed form .

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whetherthem atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or 4 ' A is an upper triangular \(m\) atrix.

UPLO = L' or 'I' A is a lower triangular m atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} \mathrm{x}:=\mathrm{A}{ }^{*} \mathrm{x}\).

TRANSA \(=\) T'ort' \(x:=A * x\).

TRANSA \(=\) C'or \(匕^{\prime} \mathrm{x}:=\mathrm{A} * \mathrm{x}\).
U nchanged on exit.

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit tri-
angular.
\(D \mathbb{A G}=N\) 'or \(h\) ' \(A\) is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
O n entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

A (input)
( \((n *(n+1)) / 2)\). Before entry with UPLO = \(U\) ' or \(L\) ', the amay A m ustcontain the upper triangularm atrix packed sequentially, colum \(n\) by colum \(n\), so thatA (1) contains a (1, 1), A (2) and \(A(3)\) contain \(a(1,2)\) and \(a(2,2)\) respectively, and so on. Before entry w ith UPLO = L' or I', the anray A m ust contain the low er triangular m atrix packed sequentially, colum \(n\) by colum \(n\), so thatA (1) contains a (1,1),A(2) and \(A(3)\) contain \(a(2,1)\) and \(a(3,1)\) respec tively, and so on. N ote thatw hen D IA G \(=U U^{\prime}\) or \(G\) ', the diagonal elem ents of A are notreferenced, butare assum ed to be unity. U nchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. O n exit, \(Y\) is overw ritten \(w\) ith the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(. \mathbb{N} C Y<>0\). U nchanged on exit.

\section*{PURPOSE}
dtprifs provides errorbounds and backw ard error estim ates forthe solution to a system of linear equations w ith a triangular packed coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by STPTRS or some other \(m\) eans before entering this routine. STPRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=U\) ': A is upper triangular;
= \({ }^{L}\) ': A is low er triangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}^{\prime}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad\) (N o transpose)
\(=T\) ': \(A * * T * X=B \quad\) ( ranspose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran spose)

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}\) : A is non-unit triangular;
\(=\mathrm{U}\) ': A is unit triangular.

N (input) The orderof the matrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS \(>=0\).

A (input) The upper or low er triangular m atrix A, packed colum nw ise in a linear array. The jth colum \(n\) of A is stored in the array A as follow s: if UPLO = \(U^{\prime}, A(i+(j-1) * j 2)=A(i, j)\) for \(1<=i<=j\); if UPLO = L', A ( \(\left.i+(j-1)^{*}(2 \star n-j) / 2\right)=A(i, j)\) for \(j=i<=n\). IfD \(\mathbb{A} G=U\) ', the diagonalelem ents of A are not referenced and are assum ed to be 1 .
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

X (input) The solution \(m\) atrix X .

LD X (input)
The leading dim ension of the amay X . LD X >= \(\max (1, \mathbb{N})\).

\section*{FERR (output)}

The estim ated forw ard enrorbound for each solution vector \(X()\) ) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\neg)\), FERR \((\neg)\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{\nu})-\mathrm{X}\) TRU E ) divided by the \(m\) agnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

BERR (output)
The com ponentw ise relative backw ard error of each solution vector \(X(j)\) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)

\section*{PURPOSE}
dtpsv solves one of the system s of equations \(A{ }^{*} x=b\), or \(A\) * \(x=b\), where \(b\) and \(x\) are \(n\) elem entvectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangular m atrix, supplied in packed form .

N o testforsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or U ' \(A\) is an upper triangular m atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA = T'ort'A *x = b.

TRANSA \(=C^{\prime}\) or \(\mathrm{C}^{\prime} A{ }^{*} \mathrm{x}=\mathrm{b}\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
\(\left(\left(\mathrm{n}^{*}(\mathrm{n}+1)\right) / 2\right)\). Before entry w th \(\mathrm{UPLO}=\) \(U\) ' or U ', the array A m ustcontain the upper triangularm atrix packed sequentially, colum \(n\) by colum n , so that A (1) contains a ( 1,1 ), A (2) and \(A(3)\) contain \(a(1,2)\) and \(a(2,2)\) respectively, and so on. Before entry w ith UPLO = \(\mathrm{L}^{\prime}\) or 1 ', the amay A m ust contain the low er triangular \(m\) atrix packed sequentially, colum \(n\) by colum n, so thatA (1) contains a (1,1), A (2) and \(A\) ( 3 ) contain a \((2,1)\) and a \((3,1)\) respectively, and so on. N ote thatw hen D IA G \(=\) U' or G ', the diagonal elem ents of A are notreferenced, but are assum ed to be unity. Unchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y \mathrm{~m}\) ust contain the n elem ent righthand side vectorb. O \(n\) exit, \(Y\) is overw ritten \(w\) ith the solution vector \(x\).
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of. \(\mathbb{I N} C Y\) <> 0 . U nchanged on exit.

void dtptrs_64 (charuplo, chartransa, char diag, long n, long nihs, double *a, double *b, long ldb, long *info);

\section*{PURPOSE}
dtpters solves a triangular system of the form
w here \(A\) is a triangularm atrix of order \(N\) stored in packed form at, and B is an N boy-NRH S m atrix. A check ism ade to verify thatA is nonsingular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) : A is upper triangular;
\(=\mathbb{L}^{\prime}: A\) is low er triangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}^{\prime}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad\) (Notranspose)
\(=T{ }^{\prime}: A * * T * X=B \quad\) ( ranspose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran spose)

D IA G (input)
\(=\mathrm{N}^{\prime}: A\) is non-unittriangular;
\(=U\) ': A is unittriangular.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber
of colum ns of the m atrix B. NRHS \(>=0\).

A (input) The upper or low er triangular matrix A, packed colum nw ise in a linear amay. The jth colum n of
A is stored in the aray A as follow s: ifUPLO =
\(U ', A(i+(j-1) \star j 2)=A(i, j)\) for \(1<=i<=j\) if
\(\mathrm{UPLO}=\mathrm{L}, \mathrm{A}\left(i+(j-1)^{\star}\left(2{ }^{\star} \mathrm{n}-\mathrm{j}\right) / 2\right)=A(i, j)\) for
\(j=\mathrm{i}<=\mathrm{n}\) 。

B (input/output)
On entry, the righthand side m atrix B. On exit, if \(\mathbb{N} F O=0\), the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
<0: if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the \(i\)-th diagonalelem ent of \(A\) is zero, indicating that the \(m\) atrix is singular and the solutions \(X\) have notbeen com puted.

\section*{C INTERFACE}
\#include <sunperfh>
void dtrevc (charside, charhow my, int *select, intn, double *t, int ldt, double *Vl, int ldvl, double *Vr, int ldvr, intm \(m\), int *m, int*info);
void dtrevc_64 (charside, charhow m ny, long *select, long n, double *t, long ldt, double *vl, long ldvl, double *Vr, long ldvr, long m m , long *m , long *info);

\section*{PURPOSE}
dtrevc com putes som e orall of the rightand/or left eigenvectors of a realupperquasi-triangularm atrix T.

The righteigenvectorx and the left eigenvector y of \(T\) corresponding to an eigenvalue w are defined by:
\[
\mathrm{T}^{\star} \mathrm{x}=\mathrm{w}^{\star} \mathrm{x}, \quad \mathrm{y}^{\star} \mathrm{T}=\mathrm{w}^{\star} \mathrm{y}^{\prime}
\]
w here y'denotes the conjugate transpose of the vectory.

If alleigenvectors are requested, the routine \(m\) ay either retum the \(m\) atrioes \(X\) and/or \(Y\) of rightor lefteigenvectors of \(T\), or the products \(Q * X\) and/or \(Q * Y\), where \(Q\) is an input orthogonal
\(m\) atrix. If \(T\) w as obtained from the real-Schur factorization of an originalm atrix \(A=Q * T * Q\) ', then \(Q * X\) and \(Q * Y\) are the \(m\) atrices of right or lefteigenvectors of \(A\).

T m ustbe in Schurcanonical form (as retumed by SH SEQR), thatis, block upper triangularw ith 1-boy-1 and \(2-b y-2\) diagonalblocks; each 2 -by-2 diagonal block has its diagonal elem ents equal and its off-diagonalelem ents of opposite sign. C omesponding to each 2 -by-2 diagonalblock is a com plex conjugate pair ofeigenvalues and eigenvectors; only one eigenvector of the pair is com puted, nam ely the one corresponding to the eigenvalue \(w\) ith posilive im aginary part.

\section*{ARGUMENTS}

STDE (input)
\(=\mathrm{R}\) : com pute righteigenvectors only;
= L ': com pute lefteigenvectors only;
\(=\mathrm{B}\) ': com pute both right and lefteigenvectors.

HOW MNY (input)
= A ': com pute all right and/or left eigenvec-
tors;
= B ': com pute all right and/or left eigenvec-
tors, and backtransform them using the input m atrices supplied in VR and/orV L; \(=\mathrm{S}\) ': com pute selected right and/or left eigenvectors, specified by the logicalamay SELEC T .

\section*{SELECT (input/output)}

If H OW M NY = S', SELEC T specifies the eigenvectors
to be com puted. IfHOW M NY = A 'or B', SELECT is
not referenced. To select the real eigenvector
corresponding to a realeigenvalue w ( \(\mathcal{j}\), SELECT ( \()\)
m ustibe set to TRUE.. To select the complex eigenvector comesponding to a com plex conjugate
pair w ( \(\mathcal{j}\) ) and w ( \(j+1\) ), either SELECT ( \(\mathcal{j}\) ) or
SELECT (j+1) must be setto TRUE.; then on exit
SELECT ( \(\mathfrak{j}\) ) is TRUE. and SELECT ( \(\mathfrak{j}+1\) ) is FALSE ..

N (input) The order of the m atrix \(\mathrm{T} \cdot \mathrm{N}>=0\).
T (input/output)
The upper quasi-triangular \(m\) atrix \(T\) in Schur canonicalform.

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, \mathbb{N})\).

VL (input/output)
On entry, ifSDE = L'or B'and HOW M NY = B',
VL must contain an \(N\)-by N m atrix Q (usually the orthogonalm atrix \(Q\) of Schurvectors retumed by SH SEQR). On ex斗, if \(S \mathbb{D} E=\mathrm{L}\) 'or B',VL contains: if HOW M NY = A', the matrix Y of left eigenvectors of \(T\); VL has the sam equasi-low er triangular form as T'. If T ( \(i, i\) i) is a real eigenvalue, then the \(i\)-th columnVL (i) ofVL is its comesponding eigenvector. If \(T\) ( \(i: i+1, i: i+1\) ) is a 2 -by-2 block whose eigenvalues are complexconjugate eigenvalues of T , then VL (i)+sqıt(
1)*V L (i+1) is the com plex eigenvector comesponding to the eigenvalue \(w\) ith positive realpart. if HOW M NY = B', them atrix Q *Y ; ifHOW M NY = S', the lefteigenvectors of \(T\) specified by SELEC T, stored consecutively in the colum ns ofV \(L\), in the sam \(e\) order as their eigenvalues. A com plex eigenvector comesponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the first holding the real part, and the second the im aginary part. If \(S \mathbb{D E}=\mathrm{R}, \mathrm{VL}\) is not referenced.

LD V L (input)
The leading dim ension of the aray VL. LDVL >= \(\max (1, N)\) if \(S \mathbb{D} E=L\) 'or \(B^{\prime} ;\) LDVL \(>=1\)
otherw ise.

VR (input/output)
On entry, if \(S \mathbb{D} E=R\) 'or \(B\) 'and HOW M NY = B', VR m ust contain an N -by -N m atrix Q (usually the orthogonalm atrix \(Q\) of Schurvectors retumed by SH SEQR). On exit, if \(S \mathbb{D} E=R\) 'or \(B\) ', \(V R\) contains: ifHOW MNY = A', the \(m\) atrix \(X\) of right eigenvectors of \(T\); VR has the sam equasi-upper triangular form as \(T\). If \(T(i, i)\) is a real eigenvalue, then the \(i\)-th colmmnVR (i) ofVR is its comesponding eigenvector. If \(T(i: i+1, i: i+1)\) is a 2 -by-2 block whose eigenvalues are complexconjugate eigenvalues of T, then VR (i)+sqrt(1)*VR(i+1) is the com plex eigenvector corresponding to the eigenvalue w th positive realpart. if HOW M NY = B', them atrix Q *X; if HOW MNY = S', the right eigenvectors of \(T\) specified by SELECT, stored consecutively in the colum ns of \(V R\), in the sam e order as their eigenvalues. A com plex eigenvector corresponding to a com plex eigenvahue is stored in tw o consecutive colum ns, the firstholding the real part and the second the im aginary part. If \(S \mathbb{D} E=\Sigma \prime, V R\) is not referenced.

LDVR (input)
The leading dim ension of the array VR. LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R\) 'or B';LDVR >= 1 otherw ise.

M M (input)
The num berof colum ns in the arrays VL and/or VR. M M >=M.

M (output)
The num berof colum ns in the arrays VL and/or VR
actually used to store the eigenvectors. If HOW MNY = A 'or \(B\) ', M is set to N. Each selected real eigenvector occupies one colmm \(n\) and each selected com plex eigenvector occupies tw o colum ns.

W ORK (w orkspace)
dim ension ( \(3{ }^{*}\) N )
\(\mathbb{N}\) FO (output)
= 0 : successfinlexit
< 0 : if \(\mathbb{N F O}=-i\), the \(i\)-th argum ent had an illegal value

\section*{FURTHER DETAILS}

The algorithm used in this program is basically backw ard (forw ard) substitution, \(w\) th scaling to \(m\) ake the the code robustagainst possible overflow .

E ach eigenvector is norm alized so that the elem ent of largest \(m\) agnitude has \(m\) agnitude 1 ; here the \(m\) agnitude of a com plex num ber \((x, y)\) is taken to be \(|x|+|y|\).

\section*{C INTERFACE}
\#include <sunperfh>
void dtrm \(m\) (charside, charuplo, chartransa, chardiag, int m , int \(n\), double alpha, double *a, int lda, double *b, int ldb);
void dtrm m _64 (charside, charuplo, char transa, char diag, long \(m\), long \(n\), double alpha, double *a, long lda, double *b, long ldb);

\section*{PURPOSE}
dtrm \(m\) perform s one of the \(m\) atrix-m atrix operations \(B:=\) alpha*op ( \(A\) ) *B , orB \(:=\) alpha*B*op (A ) where alpha is a scalar, \(B\) is an \(m\) by \(n m\) atrix, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix and op (A ) is one of
\[
o p(A)=A \text { or } o p(A)=A^{\prime}
\]

\section*{ARGUMENTS}

SIDE (input)
On entry, SIDE specifies w hether op (A ) m ultiplies B from the leftor rightas follow s:
\(S \mathbb{D E}=\mathbb{L}\) 'or I' B := alpha*op (A )*B .
\(S \mathbb{D E}=\mathrm{R}^{\prime}\) or \(r^{\prime} \mathrm{B}:=\) alpha*B*op (A) .

U nchanged on exit.

UPLO (input)
O n entry, UPLO specifies w hether the m atrix A is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or U ' \(A\) is an upper triangular \(m\) atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRAN SA specifies the form ofop (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N^{\prime}\) or \(h^{\prime}\) op(A) \(=A\).
TRANSA = T'or \(\mathrm{t}^{\prime}\) op(A) \(=\mathrm{A}^{\prime}\).

TRANSA = C'ort' op(A) = A'.

U nchanged on exit.

TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.
D IA G (input)
O n entry, D IA G specifies w hether or notA is unit triangular as follow s:

D \(\mathbb{A} G=U\) 'or \(u\) ' \(A\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, M specifies the num ber of row s of B. M >= 0 . U nchanged on exit.
\(N\) (input)
O \(n\) entry, \(N\) specifies the num ber of colum ns of \(B\).
\(\mathrm{N}>=0\). U nchanged on exit.

A LPHA (input)
On entry, A LPH A specifies the scalar alpha.W hen alpha is zero then A is notreferenced and B need notbe setbefore entry. U nchanged on exit.

A (input)
DOUBLE PRECISION array OfD \(\mathbb{I M}\) ENSION (LDA, k), where \(k\) is \(m\) when \(S \mathbb{D E}=\mathbb{L}\) 'or \(I\) ' and is \(n\) when \(S D E=R\) 'or \(\mathrm{r}^{\prime}\).

Before entry \(w\) ith UPLO = U 'or L ', the leading \(k\) by \(k\) upper triangularpart of the array A \(m\) ustcontain the upper triangularm atrix and the strictly low ertriangularpartofA is not refer-
enced.

Before entry w ith UPLO = L 'or I', the leading \(k\) by \(k\) low ertriangularpart of the array \(A\) \(m\) ust contain the low ertriangularm atrix and the strictly uppertriangularpart of \(A\) is not referenced.

N ote thatw hen D IA G = U 'or L', the diagonal elem ents ofA are notreferenced either, butare assum ed to be one. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen \(S \mathbb{D E}=' \mathrm{~L}\) 'or \(\mathrm{I}^{\prime}\) then LD \(A>=\mathrm{max}(1, m)\), when \(S \mathbb{D E}=R^{\prime}\) or \(r^{\prime}\) then LDA \(>=\max (1, n)\). U nchanged on exit.

B (input/output)
D OUBLE PRECISION amay ofD \(\mathbb{I}\) ENSION (LDB, n ).
Before entry, the leading \(m\) by \(n\) part of the array Bm ustcontain the \(m\) atrix B , and on exit is overw rilten by the transform ed \(m\) atrix.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program.
LD B \(>=\max (1, m)\). U nchanged on exit.

\section*{PURPOSE}
dtmes provides emorbounds and backw ard error estim ates forthe solution to a system of linear equations w ith a triangular coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by STRTRS or some other \(m\) eans before entering this routine. STRRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}: \mathrm{A}\) is upper triangular;
\(=\mathbb{L}^{\prime}: A\) is low ertriangular.

TRANSA (input)
Specifies the form of the system ofequations:
\(=\mathrm{N}^{\prime}: A * X=B \quad\) (Notranspose)
\(=T T^{\prime}: A * T * X=B \quad\) ( ranspose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran -
spose)

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N}\) TERFACE .

D IA G (input)
\(=\mathrm{N}\) : A is non-unit triangular;
\(=\mathrm{U}: \mathrm{A}\) is unit triangular.
N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrices \(B\) and X. NRHS \(>=0\).
A (input) The triangularm atrix A . If \(\mathrm{PLO}=\mathrm{U}\) ', the leading N -by -N upper triangularpart of the array A contains the upper triangular \(m\) atrix, and the strictly low ertriangularpartofA is not referenced. IfU PLO = L', the leading N -by-N lower triangular part of the array A contains the low er triangularm atrix, and the strictly upper triangular part ofA is not referenced. IfD \(\mathbb{I A} G=U\) ', the diagonalelem ents ofA are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the anay A. LDA >= \(\max (1, \mathbb{N})\).
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, \mathbb{N})\).
\(X\) (input) The solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th column of the solution matrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{\nu})-\mathrm{X}\) TRU E ) divided by the m agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(}\) ) an exactsolution).
W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit

\section*{C INTERFACE}
\#include <sunperfh>
void dtrsen (char j̀b, char com pq, int *select, intn, double
*t, int ldt, double *q, int ldq, double *w r , double *wi, int \({ }^{*}\) m, double \({ }^{\text {s }}\), double \({ }^{\text {sepp, int }}\) *info);
void dtrsen_64 (char jo.b, charcom pq, long *select, long n, double *t, long ldt, double *q, long ldq, double *w r, double *w i, long *m, double *s, double *sep, long *info);

\section*{PURPOSE}
dtrsen reorders the real Schur factorization of a real \(m\) atrix \(A=Q * T * Q * * T\), so that a selected chuster of eigenvalues appears in the leading diagonalblocks of the upper quasi-triangularm atrix \(T\), and the leading colum ns of \(Q\) form an orthonorm albasis of the corresponding right invariant subspace.

Optionally the routine com putes the reciprocal condition num bers of the cluster of eigenvalues and/or the invariant subspace.

T m ustbe in Schurcanonical form (as retumed by SH SEQR), that is, block uppertriangularw ith 1 -by -1 and 2 -by- 2 diagonalblocks; each 2-by-2 diagonal block has its diagonal elem nts equal and its off-diagonal elem ents of opposite sign.

\section*{ARGUMENTS}

JO B (input)
Specifies w hether condition num bers are required for the cluster ofeigenvalues ( S ) or the invariantsubspace (SEP):
= N ':none;
= E ': foreigenvalues only ( S );
\(=\mathrm{V}\) : for invariant subspace only (SEP);
= B ': forboth eigenvalues and invariant subspace ( S and SEP).

COMPQ (input)
= V ': update the m atrix Q ofSchurvectors;
\(=N\) ': do notupdate Q .
SELECT (input)
SELEC T specifies the eigenvalues in the selected cluster. To select a real eigenvalue w ( \(\mathcal{j}\), SELECT (j) must be set to w (i) and w (j+1), corresponding to a 2 -by-2 diagonalblock, either SELECT (i) orSELECT (j+1) orboth \(m\) ust be set to either both included in the cluster or both excluded.

N (input) The order of the m atrix \(\mathrm{T} . \mathrm{N}>=0\).
T (input/output)
O \(n\) entry, the upperquasi-triangularm atrix \(T\), in Schur canonical form. On exit, T is overw rilten by the reordered \(m\) atrix \(T\), again in Schur canonical form, w ith the selected eigenvalues in the leading diagonalblocks.

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, \mathbb{N})\).

Q (input) \(O n\) entry, if \(C O M P Q=V\) ', the \(m\) atrix \(Q\) of Schur vectors. On exit, if COMPQ = V', Q hasbeen postm ultiplied by the orthogonal transform ation \(m\) atrix which reorders \(T\); the leading \(M\) colum ns of \(Q\) form an orthonorm al basis for the specified invariant subspace. If COM PQ \(=N^{\prime}\) ', Q is not referenced.

LD Q (input)

The leading dim ension of the array \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1\);
and if \(C O M P Q=V\) ', LD \(Q>=N\).
W R (output)
The realand im aginary parts, respectively, of the reordered eigenvalues of \(T\). The eigenvalues are stored in the sam e order as on the diagonal of \(T\), w th \(\mathrm{W} R(i)=T(i, i)\) and, if \(T(i: i+1, i: i+1)\) is a 2 -by-2 diagonalblock, W I(i) > 0 and W I(i+1) = -W I(i). N ote that if a com plex eigenvalue is sufficiently ill-conditioned, then its value may differ significantly from its value before reordering.

\section*{W I (output)}

See the description ofW R .
M (output)
The dim ension of the specified invariant subspace. \(0<=\mathrm{M}<=\mathrm{N}\).

S (output)
If \(J 0 B=E\) 'or \(B ', S\) is a lower bound on the reciprocal condition num ber for the selected clusterofeigenvalues. S cannot underestim ate the true reciprocal condition num berby \(m\) ore than a factor of sqrt \(\mathbb{N}\) ). If \(M=0\) or \(N, S=1\). If \(\mathcal{O D} B=\) N 'or V ', S is not referenced.

\section*{SEP (output)}

If \(\mathrm{JOB}=\mathrm{V}\) 'or B ', SEP is the estim ated reciprocal condition number of the specified invariant subspace. If \(M=0\) or \(N\), \(S E P=\) norm ( \(T\) ). If \(J O B=\) N 'or E ', SEP is notreferenced.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. If JOB \(=N\) ', LW ORK >= max ( \(1, N\) ); if \(J O B=E \prime\), LW ORK \(>=M * \mathbb{N}-M)\); if \(J O B=V\) 'or \(B\) ', LW ORK \(>=2 \star M *(N+M)\).

If LW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IW ORK (w orkspace/output)
If \(\mathrm{OB}=\mathrm{N}\) 'or E ', \(\mathbb{I W}\) ORK is notreferenced.

LIW ORK (input)
The dim ension of the anay \(\mathbb{I V}\) ORK. If \(O B=N\) 'or E', LIW ORK >=1; if \(\mathrm{OBB}=\mathrm{V}\) 'or B',LIWORK \(>=\) \(M *(\mathbb{N}-\mathrm{M})\) 。

If LIW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the IV ORK amay, retums this value as the first entry of the \(\mathbb{I W}\) ORK aray, and no errorm essage related to \(\mathrm{L} \mathbb{I W}\) ORK is issued by X ERBLA.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
= 1: reordering of T failed because some eigenvalues are too close to separate the problem is very ill-conditioned); T m ay have been partially reordered, and W R and W I contain the eigenvalues in the same order as in T; S and SEP (if requested) are set to zero.

\section*{FURTHER DETAILS}

STRSEN firstcollects the selected eigenvalues by com puting an orthogonaltransform ation \(Z\) to \(m\) ove them to the top left comer of T. In otherw ords, the selected eigenvalues are the eigenvalues of T11 in:
\[
\begin{gathered}
\mathrm{Z} * \mathrm{~T} * \mathrm{Z}=(\mathrm{T} 11 \mathrm{~T} 12) \mathrm{n} 1 \\
(0 \mathrm{~T} 22) \mathrm{n} 2 \\
\mathrm{n} 1 \mathrm{n} 2
\end{gathered}
\]
w here \(\mathrm{N}=\mathrm{n} 1+\mathrm{n} 2\) and Z ' m eans the transpose of Z . The first n1 colum ns of \(Z\) span the specified invariant subspace of \(T\).

If \(T\) has been obtained from the realSchur factorization of a \(m\) atrix \(A=Q * T * Q '\), then the reordered realSchur factorization of \(A\) is given by \(A=(Q * Z)^{*}\left(Z{ }^{*} T * Z\right)^{*}(Q * Z)\) ', and the first n 1 colum ns of Q *Z span the comesponding invariant subspace ofA .

The reciprocalcondition num ber of the average of the eigenvalues of T11 m ay be retumed in S.S lies betw een 0 (very badly conditioned) and 1 (very w ellconditioned). It is com puted as follow s. Firstw e com pute R so that
\[
\begin{gathered}
P=\left(\begin{array}{l}
\text { I R }) ~ n 1 ~ \\
(0 \quad 0) n 2 \\
n 1 n 2
\end{array}\right.
\end{gathered}
\]
is the pro jector on the invariant subspace associated w ith T11. R is the solution of the Sylvesterequation:
\[
\mathrm{T} 11 * \mathrm{R}-\mathrm{R} * \mathrm{~T} 22=\mathrm{T} 12 .
\]

LetF-norm M) denote the Frobenius-norm of \(M\) and 2 -norm \(M\) ) denote the tw o-norm ofM. Then \(S\) is com puted as the low er bound
\[
(1+\text { F-norm }(R) * * 2)^{* *}(-1 / 2)
\]
on the reciprocal of 2 -norm (P), the true reciprocal condition number. S cannotunderestim ate \(1 / 2\)-norm (P) by m ore than a factor of squt (N).

A \(n\) approxim ate errorbound forthe com puted average of the eigenvalues of T11 is
EPS * norm (T) /S
where EPS is the m achine precision.
The reciprocalcondition num ber of the right invariant subspace spanned by the firstn1 colum nsofZ (orofQ *Z) is retumed in SEP. SEP is defined as the separation of T11 and T 22 :
\[
\operatorname{sep}(T 11, T 22)=\text { sigm a-m in (C ) }
\]
where sigm a-m in (C) is the sm allest singularvalue of the \(\mathrm{n} 1{ }^{*} \mathrm{n} 2-b y-n 1 * n 2 \mathrm{~m}\) atrix
\[
C=\operatorname{kprod}(I(n 2), T 11)-\operatorname{kprod}(\text { transpose }(I 22), I(n 1))
\]

Im ) is an \(m\) by \(m\) identity \(m\) atrix, and kprod denotes the \(K\) ronecker product. \(W\) e estim ate sigm a-m in (C ) by the reciprocalof an estim ate of the 1 -norm of inverse (C). The true reciprocal 1-norm of inverse ( \(C\) ) cannot differ from sigm a\(m\) in (C) by \(m\) ore than a factor of sqrt (n1*n2).

W hen SEP is sm all, sm all changes in \(T\) can cause large changes in the invariantsubspace. A \(n\) approxim ate bound on the maxim um angularemor in the com puted right invariant subspace is

void dtrsm _64 (char side, charuplo, chartransa, char diag, long \(m\), long \(n\), double alpha, double *a, long lda, double *b, long ldb);

\section*{PURPOSE}
dtrem solves one of the matrix equations op (A )*X = alpha*B, or \(\mathrm{X} *\) op ( A ) = alpha*B w here alpha is a scalar, X and \(B\) are \(m\) by \(n m\) atriges, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix and op (A ) is one of
\[
\text { op }(A)=A \text { or } o p(A)=A^{\prime}
\]

Them atrix X is overw rilten on B .

\section*{ARGUMENTS}

SID E (input)
O n entry, SID E specifiesw hetherop (A ) appears on the left or rightofX as follow s:

SDE = 'L or I' op (A ) *X = a pha*B.
\(S \mathbb{D} E=R\) 'or \(r^{\prime} X^{*} o p(A)=\) alpha*B.

U nchanged on exit.

UPLO (input)
O n entry, UPLO specifies w hether the m atrix \(A\) is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime}\) ' \(A\) is an upper triangular m atrix .
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the form of op (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow s:

TRANSA \(=N\) 'or \(h^{\prime}\) op (A) \(=A\).

TRANSA = T'or \(t^{\prime} \mathrm{op}(\mathrm{A})=\mathrm{A}\) '.

TRANSA = C'ort' op (A) =A'.

U nchanged on exit.
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D \(\mathbb{A} G=U\) 'or \(U^{\prime} A\) is assum ed to be unit triangular.

D IA G \(=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, \(M\) specifies the num ber of row s of \(B . M\) \(>=0\). U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of \(B\). \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, A LPH A specifies the scalar alpha. W hen alpha is zero then \(A\) is notreferenced and \(B\) need notbe setbefore entry. U nchanged on exit.

A (input)
D OUBLE PRECISION amay ofD \(\mathbb{I M} E N S I O N(L D A, k)\), where \(k\) is \(m\) when \(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathbb{I}^{\prime}\) and is \(n\)
when \(S \mathbb{D} E=R\) 'or \(r^{\prime}\).
Before entry with UPLO = U 'or \(G\) ', the leading \(k\) by \(k\) uppertriangularpart of the aray A
\(m\) ustcontain the upper triangularm atrix and the
strictly low ertriangularpartofA is not refer-
enced.
Before entry with UPLO = L'or 1', the leading \(k\) by \(k\) low er triangularpart of the array \(A\) \(m\) ustcontain the low er triangularm atrix and the strictly uppertriangularpartofA is not referenced.
N ote thatw hen D IA G = U 'or ' U ', the diagonal elem ents of A are not referenced either, butare assum ed to be one. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen
SDEE = 'L 'or I' then LD A >=max ( \(1, \mathrm{~m}\) ), when \(S \mathbb{D} E=R^{\prime}\) or \(\mathrm{r}^{\prime}\) then LDA \(>=\max (1, \mathrm{n})\). U nchanged on exit.

B (input/output)
D OUBLE PRECISION anay ofD \(\mathbb{I M}\) ENSION (LDB, n ).
Before entry, the leading \(m\) by \(n\) partof the array \(B\) must contain the righthand side \(m\) atrix \(B\), and on exit is overw ritten by the solution \(m\) atrix \(X\).

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. LD B \(>=m a x(1, m)\). U nchanged on exit.

\section*{C INTERFACE}
\#include <sunperfh>
void dtrsna (char job, charhow my, int *select, intn, double *t, int ldt, double *Vl, int ldvl, double *Vr, int ldvr, double *s, double *sep, intm m, int *m, int ldw ork, int *info);
void dtrsna_64 (char job, charhow m ny, long *select, long n, double *t, long ldt, double *vl, long ldvl, double
*Vr, long ldvr, double *s, double *sep, long mm, long *m, long ldw ork, long *info);

\section*{PURPOSE}
dtrsna estim ates reciprocalcondition num bers for specified eigenvalues and/or right eigenvectors of a real upper quasi-triangularm atrix T (or of any \(m\) atrix Q *T *Q **T w ith Q orthogonal).

T m ustbe in Schur canonical form (as retumed by SH SEQR), that is, block upper triangularw th 1-by-1 and 2 -by-2 diagonalblocks; each 2 -by -2 diagonal block has its diagonal elem ents equal and its off-diagonalelem ents of opposite sign.

\section*{ARGUMENTS}

JOB (input)
Specifies w hethercondition num bers are required foreigenvalues (S) oreigenvectors (SEP):
= E ': foreigenvalues only ( S );
= V ': foreigenvectors only (SEP);
= B ': forboth eigenvalues and eigenvectors ( S and SEP).

HOW MNY (input)
= A': com pute condition num bers for all eigenpairs;
\(=S^{\prime}\) : com pute condition num bers for selected eigenpairs specified by the amray SELEC T.

\section*{SELECT (input)}

If H OW M NY = S',SELECT specifies the eigenpairs for which condition numbers are required. To select condition num bers for the eigenpair corresponding to a realeigenvalue w ( \(\mathcal{\nu}\), SELECT ( ) m ustbe set to .TRUE .. To selectcondition num bers conresponding to a complex conjugate pair of eigenvaluesw ( 7 ) and w ( \(j+1\) ), either SELECT ( \(j\) ) or SELECT ( \(j+1\) ) or both, mustbe set to TRUE .. If HOW MNY = A', SELECT is notreferenced.

N (input) The order of the matrix \(\mathrm{T} \cdot \mathrm{N}>=0\).
T (input) The upper quasi-triangular \(m\) atrix \(T\), in Schur canonical form .

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, N)\).

VL (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VL mustcontain left eigenvectors of \(T\) (orofany \(Q * T{ }^{*} Q * T\) w th \(Q\) orthogonal), comesponding to the eigenpairs specified by HOW M NY and SELECT. The eigenvectorsm ustbe stored in consecutive colum ns of \(V L\), as retumed by SHSEIN orSTREVC. If \(J O B=V\) ', VL is notreferenced.

LDVL (input)
The leading dim ension of the array VL. LD V L >=1; and if \(J 0 B=E\) 'or \(B ', L D V L>=N\).

VR (input)
If \(\mathrm{OB}=\mathrm{E}\) 'or B ', VR m ust contain right eigenvectors of \(T\) (orofany \(Q * T * Q * T\) w ith \(Q\) orthogonal), comesponding to the eigenpairs specified by HOW M NY and SELECT. The eigenvectors m ustbe stored in consecutive columns of \(V R\), as retumed by

SHSEIN orSTREVC. If \(J O B=V\) ', VR is notreferenced.

LDVR (input)
The leading dim ension of the amay VR. LDVR >=1; and if \(\mathrm{OB}=\mathrm{E}\) 'or \(\mathrm{B}^{\prime}, \mathrm{LDVR}>=\mathrm{N}\).

S (output)
If \(\mathrm{OB}=\mathrm{E}^{\prime}\) or \(\mathrm{B}^{\prime}\), the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the aray. For a com plex conjugate pair of eigenvalues two consecutive elem ents of \(S\) are set to the same value. Thus \(S(\mathcal{I}, \operatorname{SEP}(\mathcal{I})\), and the \(j\) th colum ns of VL and VR all correspond to the sam e eigenpair but not in general the jth eigenpair, unless alleigenpairs are selected). If \(\mathrm{OB}=V^{\prime}, \mathrm{S}\) is not referenced.

SEP (output)
If \(\mathrm{OB}=\mathrm{V}\) 'or B', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. For a com plex eigenvector two consecutive elem ents of SEP are set to the sam e value. If the eigenvalues cannot be reordered to com pute \(\operatorname{SEP}(7)\), \(\operatorname{SEP}(7)\) is set to 0 ; this can only occurw hen the true value w ould be very sm allanyw ay. If \(\mathrm{JOB}=\mathrm{E}\) ', SEP is notreferenced.

M M (input)
The num berofelem ents in the arrays S (if \(\mathrm{OB}=\)
E' or B') and/orSEP (if \(\mathrm{OB}=\mathrm{V}\) 'or B).M M
\(>=M\).

M (output)
The num ber of elem ents of the arays \(S\) and/or SEP actually used to store the estim ated condition
num bers. If H O W M NY = 'A', M is setto \(N\).

W ORK (w orkspace)
dim ension (LD W ORK, \(N+1\) ) If \(O B=E \prime\), W ORK is not
referenced.

LDW ORK (input)
The leading dim ension of the array W ORK. LDW ORK \(>=1\); and if \(\mathrm{OB}=\mathrm{V}^{\prime}\) or \(\mathrm{B}^{\prime}, \mathrm{LDW}\) ORK \(>=\mathrm{N}\).

W ORK1 (w orkspace)
dim ension \((\mathbb{N})\) If \(O B=E\) ', W ORK 1 is not referenced.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of an eigenvalue lam bda is defined as
\[
S(\operatorname{lam} \text { bda })=N^{*} u \mid /(\text { norm }(u) * \text { norm }(v))
\]
\(w\) here \(u\) and \(v\) are the right and left eigenvectors of \(T\) comesponding to lam bda; v 'denotes the conjugate-transpose of \(v\), and norm (u) denotes the Euclidean norm. These reciprocal condition num bers alw ays lie betw een zero (very badly conditioned) and one (very w ell conditioned). If \(\mathrm{n}=1\), S (lam bda) is defined to be 1.

A \(n\) approxim ate errorbound for a com puted eigenvalue \(W\) (i) is given by
EPS * norm (T) /S (i)
where EPS is the \(m\) achine precision.

The reciprocal of the condition num ber of the right eigenvectoru corresponding to lam bda is defined as follow s. Suppose
\[
\begin{gathered}
\mathrm{T}=(\operatorname{lam} \text { bda } \mathrm{c}) \\
\left(\begin{array}{ll}
\mathrm{O} & \mathrm{~T} 22
\end{array}\right)
\end{gathered}
\]

Then the reciprocalcondtion num ber is
SEP ( lam bda, T22 ) = sigm a-m in ( T22 -lam bda^I )
where sigm a-m in denotes the sm allest singular value. We approxim ate the sm allest singular value by the reciprocal of an estim ate of the one-norm of the inverse of T22 lam bda*I. If \(n=1\), SEP ( 1 ) is defined to be abs ( \((1,1)\) ).

A \(n\) approxim ate errorbound for a com puted right eigenvector VR (i) is given by
```

EPS * norm (T) /SEP (i)

```

*a, int lda, double *y, intincy);
void dtrsv_64 (charuplo, chartransa, char diag, long n, double *a, long lda, double *y, long incy);

\section*{PURPOSE}
dtrsv solves one of the system s ofequations \(A * x=b\), or \(A{ }^{*} x=b, w\) here \(b\) and \(x\) are \(n\) elem entvectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix. N o testforsingularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or G ' \(A\) is an upper triangular m atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A{ }^{*} x=b\).

TRANSA \(=T\) 'or \(t^{\prime} A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA \(=C^{\prime}\) ort' \(A^{*} x=b\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
Before entry w ith UPLO = U 'or L ', the leading n by n upper triangularpart of the array A m ust contain the upper triangular \(m\) atrix and the strictly low ertriangularpartofA is not referenced. Before entry w ith UPLO = L' 'or I', the leading \(n\) by \(n\) low er triangularpart of the array A \(m\) ust contain the low ertriangularm atrix and the strictly uppertriangularpartofA is not referenced. N ote thatw hen D IAG \(=\mathrm{U}\) ' or L ', the diagonal elem ents of \(A\) are not referenced either, but are assum ed to be unity. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program . LD A \(>=\) \(m a x(1, n)\). U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent right-hand side vectorb. 0 n exit, Y is overw ritten \(w\) th the solution vectorx.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

void dtrsyl_64 (chartrana, chartranb, long isgn, long m, long n, double *a, long lda, double *b, long ldb, double *c, long ldc, double *scale, long *info);

\section*{PURPOSE}
dtrsylsolves the realSylvesterm atrix equation:
\(o p(A) * X+X * o p(B)=s c a l e * C\) or \(\mathrm{op}(A) \star X-X\) * \(\mathrm{op}(B)=\) scale* \({ }^{*}\),
where op (A) \(=A\) or \(A * * T\), and \(A\) and \(B\) are both upper quasitriangular. \(A\) is \(M\)-by \(M\) and \(B\) is \(N\) by \(-N\); the righthand side C and the solution X are M -by -N ; and scale is an output scale factor, set <= 1 to avoid overflow in X .

A and B m ustbe in Schur canonical form (as retumed by SH SEQR ), that is, block uppertriangularw ith 1 -by-1 and 2-by-2 diagonalblocks; each 2-by-2 diagonal block has its diagonal elem ents equal and its off-diagonalelem ents of opposite sign.

\section*{ARGUMENTS}

TRANA (input)
Specifies the option op (A):
\(=N: \operatorname{op}(A)=A \quad\) \(\circ\) otranspose)
\(=T \mathrm{~T}: \mathrm{op}(\mathrm{A})=\mathrm{A} * * \mathrm{~T}\) ( T ranspose)
= C ': op (A) \(=\mathrm{A} * * \mathrm{H}\) (C onjugate transpose \(=\mathrm{T}\) ranspose)

TRANB (input)
Specifies the option op (B):
\(=N\) : op \((B)=B \quad(N \circ\) transpose)
\(=T\) ': op (B) = B**T (Transpose)
\(=C: o p(B)=B * * H \quad\) (Conjugate transpose \(=T\) ran spose)

ISGN (input)
Specifies the sign in the equation:
\(=+1\) : solve op (A )*X \(+X\) *op \((B)=s c a l e * C\)
\(=-1\) : solve op (A)*X \(-X\) *op \((B)=\) scale \({ }^{*} C\)
\(M\) (input) The order of the m atrix \(A\), and the num berof row s in the \(m\) atrioes X and \(\mathrm{C} . \mathrm{M}>=0\).

N (input) The order of the \(m\) atrix \(B\), and the num ber of colum ns in the m atrices X and \(\mathrm{C} . \mathrm{N}>=0\).

A (input) The upper quasi-triangular matrix A, in Schur canonical form.
LD A (input)
The leading dim ension of the aray A. LD A >= max (1, M).
\(B\) (input) The upper quasi-triangular \(m\) atrix \(B\), in Schur canonical form .

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, \mathbb{N})\).

C (input/output)
On entry, the M -by-N righthand side m atrix C. On exit, \(C\) is overw rilten by the solution \(m\) atrix \(X\).

LD C (input)
The leading dim ension of the anay C. LD C >= \(\max (1, M)\)

SCALE (output)
The scale factor, scale, set < = 1 to avoid overflow in \(X\).
\(\mathbb{I N} F \mathrm{O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue
\(=1\) : \(A\) and \(B\) have com \(m\) on or very close eigenvalues; perturbed values w ere used to solve the equation (but the \(m\) atrices \(A\) and \(B\) are unchanged).

\section*{PURPOSE}
dtrtres solves a triangular system of the form
where \(A\) is a triangularm atrix of order \(N\), and \(B\) is an \(N\) -by-NRHS matrix. A check ism ade to verify thatA is nonsingular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}: \mathrm{A}\) is uppertriangular;
= L': A is low ertriangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=N\) : A * X = B N o transpose)
\(=T: A * * T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose \(=\mathrm{T}\) ranspose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}: \mathrm{A}\) is non-unit triangular;
\(=\mathrm{U}: \mathrm{A}\) is unit triangular.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of them atrix B. NRHS \(>=0\).

A (input) The triangularm atrix A . If \(\mathrm{PLO}=\mathrm{U}\) ', the leading N -by -N upper triangularpart of the array A contains the upper triangular \(m\) atrix, and the
strictly low ertriangularpantofA is notreferenced. IfUPLO \(=\mathrm{L}\) ', the leading N -by N lower triangular part of the array A contains the low er triangularm atrix, and the strictly upper triangular part of \(A\) is notreferenced. IfD \(\mathbb{A} G=U '\), the diagonal elem ents ofA are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).
B (input/output)
On entry, the right hand side \(m\) atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LDB}>=\) \(\max (1, N)\).

IN FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N ~ F O ~}=\) i, the \(i\)-th diagonalelem ent of \(A\) is zero, indicating that the \(m\) atrix is singular and the solutions X have notbeen com puted.

\section*{PURPOSE}
dtzrqf routine is deprecated and has been replaced by routine STZRZF .

STZRQF reduces the M -by-N ( \(\mathrm{M}<=\mathrm{N}\) ) real upper trapezoidal \(m\) atrix \(A\) to upper triangular form by \(m\) eans of orthogonal transform ations.

The upper trapezoidalm atrix \(A\) is factored as
\(A=\left(\begin{array}{ll}R & 0\end{array}\right)^{*} Z\),
where Z is an N -by -N orthogonalm atrix and R is an M boy M upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix A. M >=0.

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=\mathrm{M}\).

A (input/output)
O \(n\) entry, the leading M łoy -N upper trapezoidal part of the array A m ustcontain the m atrix to be factorized. On exit, the leading \(M\) boy -M upper triangularpart of A contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row s of \(A\), w ith the array \(T A U\), represent the orthogonalm atrix \(Z\) as a product of \(M\) elem entary reflectors.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

TAU (output)
The scalar factors of the elem entary reflectors.

INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an ille-

\section*{FURTHER DETAILS}

The factorization is obtained by H ouseholdersm ethod. The \(k\) th transform ation \(m\) atrix, \(Z(k)\), w hich is used to introduce zeros into the ( \(m-k+1\) )th row ofA, is given in the form
\[
\begin{gathered}
\mathrm{Z}(\mathrm{k})=\left(\begin{array}{ll}
\mathrm{I} & 0
\end{array}\right), \\
\left(\begin{array}{l}
\mathrm{O}(\mathrm{k})
\end{array}\right)
\end{gathered}
\]
where
\[
\begin{gathered}
\left.T(k)=I-\tan { }^{*} u(k) * u(k)\right), \quad u(k)=\left(\begin{array}{ll}
1
\end{array}\right), \\
\left(\begin{array}{l}
0
\end{array}\right) \\
(z(k))
\end{gathered}
\]
tau is a scalar and \(z(k)\) is an ( \(n-m\) ) elem ent vector. tau and \(\mathrm{z}(\mathrm{k})\) are chosen to annihilate the elem ents of the kth row of .

The scalartau is retumed in the \(k\) th elem entofTA \(U\) and the vectoru ( \(k\) ) in the \(k\) th row of \(A\), such that the elem ents of \(z(k)\) are in \(a(k, m+1), \ldots, a(k, n)\). The elem ents ofR are retumed in the upper triangularpartofA.
\(Z\) is given by
\[
Z=Z(1) * Z(2) * \ldots * Z(m) .
\]

void dtzrzf(intm, intn, double *a, intlda, double *tau, int*info);
void dtzrzf_64 (long m, long n, double *a, long lda, double *tau, long *info);

\section*{PURPOSE}
dtzrzfreduces the M -by -N ( \(\mathrm{M}<=\mathrm{N}\) ) real upper trapezoidal \(m\) atrix \(A\) to upper triangular form by \(m\) eans of orthogonal transform ations.

The upper trapezoidalm atrix \(A\) is factored as
\[
A=\left(\begin{array}{ll}
R & 0
\end{array}\right) * Z,
\]
\(w\) here \(Z\) is an \(N\) boy \(-N\) orthogonalm atrix and \(R\) is an \(M\) boy \(-M\) upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of collm ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
On entry, the leading M -by -N upper trapezoidal part of the amay A m ust contain them atrix to be factorized. On exit, the leading M -by -M upper triangularpart ofA contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row s of \(A\), w th the array TAU, represent the orthogonalm atrix Z as a product of M elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors.
W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

The dimension of the array \(W\) ORK. LW ORK >= \(m\) ax \((1, M)\). Foroptim um perform anœ \(L W O R K>=M * N B\), w here NB is the optim alblocksize.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value

\section*{FURTHER DETAILS}

B ased on contributions by
A. Petitet, C om puterScience D ept., U niv . of Tenn., K noxville, U SA

The factorization is obtained by H ouseholdersm ethod. The \(k\) th transform ation \(m\) atrix, \(Z(k)\), which is used to introduce zeros into the ( \(m-k+1\) )th row ofA, is given in the form
\[
\begin{gathered}
\mathrm{Z}(\mathrm{k})=\left(\begin{array}{ll}
\mathrm{I} & 0
\end{array}\right), \\
\binom{\mathrm{O}}{\mathrm{~T}(\mathrm{k})}
\end{gathered}
\]
where
\[
\begin{gathered}
\left.T(k)=I-\tan { }^{*} u(k) * u(k)\right), \quad u(k)=\left(\begin{array}{ll}
1
\end{array}\right), \\
\left(\begin{array}{l}
0
\end{array}\right) \\
(z(k))
\end{gathered}
\]
tau is a scalar and \(z(k)\) is an ( \(n-m\) ) elem ent vector. tau and \(\mathrm{z}(\mathrm{k})\) are chosen to annihilate the elem ents of the kth row of .

The scalartau is retumed in the kth elem entofTAU and the vectoru ( \(k\) ) in the kth row of A, such that the elem ents of \(z(k)\) are in \(a(k, m+1), \ldots, a(k, n)\). The elem ents ofR are retumed in the upper triangularpartofA.
\(Z\) is given by
\[
Z=Z(1) * Z(2) * \ldots * Z(m) .

\section*{DESCRIPTION}
C <-alpha op (A) B + beta C
where A LPHA and BETA are scalar, \(C\) and \(B\) are \(m\) atrices, A is a m atrix represented in variableblock sparse row form at and op (A ) is one of
\(o p(A)=A\) or \(o p(A)=A^{\prime}\) or \(o p(A)=\operatorname{con} \dot{g}\left(A^{\prime}\right)\).
( 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRAN SA Indicates how to operate \(w\) ith the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) th the conjugate transpose ofm atrix.
2 is equivalent to 1 if the \(m\) atrix is real.

M B \(\quad\) um berofblock row sin matrix A
N \(\quad\) Num berof colum ns in \(m\) atrix \(C\)

KB \(\quad\) um berofblock colum ns in m atrix A

A LPH A Scalarparam eter
DESCRA () D escriptor argum ent. Five elem ent integer array
DESCRA (1) m atrix structure
0 : general
1 : symmetric ( \(A=A\) )
2: Herm Aian ( \(\mathrm{A}=\mathrm{CONJG}\) (A))
3 :Triangular
4 : Skew (Anti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\operatorname{CONJG}(\mathrm{A})\) )

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 : unit
DESCRA (4) A ray base \(N\) OT \(\mathbb{M}\) PLEM ENTED)
0 :C C++ com patible
1 :Fortran com patible
DESCRA (5) repeated indices? NOT IM PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL ( scalar array of length NN Z consisting of the block entries of A w here each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NN Z is the total num berof pointentries in all nonzero block entries of am atrix A.
\(\mathbb{N} D \mathrm{X}\) () integer anray of length BNN Z +1 where BNNZ is the num berof block entries of a m atrix A such that the I-th elem entof \(\mathbb{N}\) D X [] points to the location in VAL of the \((1,1)\) elem ent of the I-th block entry.

B IND X () integer array of length BNN Z consisting of the block colum \(n\) indiges of the block entries of \(A\) where BNNZ is the num berblock entries of a m atrix A.

RPN TR 0) integer amay of length M B+1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the \(I\)-th block
row .
RPN TR \(M B+1\) ) is set to \(M+\operatorname{RPN} \operatorname{TR}(1)\) where \(M\) is the num ber of row \(s\) in \(m\) atrix \(A\).
Thus, the num berof point row sin the I-th block row is RPNTR (I+1)RPNTR (I).

CPN TR 0 integer array of length \(K B+1\) such that CPN TR (J)-CPN TR (1)+1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR ( \(K B+1\) ) is set to \(K+C P N T R(1)\) where \(K\) is the num ber of \(c o l u m n s\) in \(m\) atrix \(A\). Thus, the num ber of point \(\infty 0\) lum ns in the \(J\) th block colum n is CPNTR ( \(\mathrm{J}+1\) )-CPNTR ( \(J\) ).

BPNTRB () integer array of length \(M B\) such thatBPNTRB (I) BPNTRB (1) +1 points to location in B IND X of the first.block entry of the I-th block row of A.

BPNTRE 0 integer anay of length \(M B\) such that BPN TRE (I) BPNTRB (1) points to location in B \(\mathbb{N}\) D X of the lastblock entry of the I-th block row of A.

B 0 rectangular array w ith firstdin ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter
C 0 rectangular anray w ith firstdim ension LD C .

LD C leading dim ension ofC
W ORK () scratch array of length LW ORK.W ORK is not referenced in the cumentversion.

LW ORK length ofW ORK array. LW ORK is not referenced in the cumentversion.

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) th the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(\sin m\) atrix \(A\)

N \(\quad\) Num berof colum ns in matrix C

UN ITD Type of scaling:
1 : Identity \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum \(n\) block scaling)

DV () A rray containing the block entries of the block diagonalm atrix D. The size of the Jth block is RPN TR ( \(\mathrm{J}+1\) )-RPN TR (J) and each block containsm atrix entries stored colum n-m ajor. The total length of aray DV is given by the form ula:
sum over J from 1 to M B:

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem ent integer array
DESCRA (1) m atrix structure
0 :general
1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm itian ( \(\mathrm{A}=\mathrm{CONJG}(\mathrm{A})\) )
3 :Triangular
4 : Skew (Anti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\mathrm{CON}\) J ( A ) )
N ote: For the routine, DESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) main diagonal type
0 : non-identity blocks on the \(m\) ain diagonal
1 : identily diagonalblock
2 : diagonalblocks are densem atrices
DESCRA (4) A ray base \(\mathbb{N} O T \mathbb{I}\) PLEM ENTED )
0 :C C++ com patible
1 :Fortran com patible
D ESCRA (5) repeated indices? NOT IM PLEM EN TED )
0 : unknown
1 :no repeated indices
VAL 0 scalar array of length NN Z consisting of the block entries ofA where each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NN Z is the total num berof pointentries in allnonzero block entries of a m atrix A.
\(\mathbb{I N}\) D X 0 integer array of length BNN Z +1 where BNN \(Z\) is the num ber block entries of a \(m\) atrix A such that the I-th elem ent of \(\mathbb{N} D \mathrm{X}[]\) points to the location in VAL of the \((1,1)\) elem ent of the I-th block entry.
\(B \mathbb{N} D\) X () integer array of length BNNZ consisting of the block colum \(n\) indioes of the block entries of A where BNN Z is the num berblock entries of a m atrix A. B lock colum n indices M U ST be sorted in increasing order foreach block row .

RPN TR 0) integer aray of length M B +1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the I-th block
row.
RPN TR \(M B+1\) ) is set to \(M+R P N T R(1)\) where \(M\) is the num ber of row \(s\) in square triangularm atrix \(A\).

Thus, the num berof point row s in the I-th block row is RPNTR (I+1)RPNTR (I).

NOTE: For the cumentversion CPN TR m ustequalRPN TR and a single array can be passed forboth argum ents

CPNTR 0 integeramay of length \(M B+1\) such thatCPN TR (J)-CPN TR (1) +1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR M B+1) is set to M +CPN TR (1). Thus, the num ber of pointcolum ns in the J-th block colum n is CPNTR ( \(\mathrm{J}+1\) )-CPNTR (J).

NO TE: For the current version CPN TR m ustequal RPN TR and a single aray can be passed forboth argum ents
BPN TRB 0 integer aray of length \(M B\) such thatBPN TRB (I)-BPNTRB (1)+1 points to location in B IND X of the firstblock entry of the I-th block row of A.

BPN TRE () integer array of length \(M B\) such thatBPN TRE (I) BPN TRB (1) points to location in B \(\mathbb{N} D \mathrm{X}\) of the last.block entry of the I-th block row of A.

B 0 rectangular aray w th first dim ension LD B.

LD B leading dim ension ofB
BETA Scalarparam eter
C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC
W ORK 0 scratch array of length LW ORK. On exit, ifLW ORK = -1,W ORK (1) retums the optim um size of LW ORK.

LW ORK length of ORK array. LW ORK should be at least \(\mathrm{M}=\mathrm{RPNTR} \mathrm{M} \mathrm{B}+1)\) RPNTR (1).

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M} * \mathrm{~N}\) _CPUS where N _CPUS is the \(m\) axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK amray, and no enrorm essage related to LW ORK is issued

void ezfflt 64 long \(n\), float *r, float azero, float *a, float*b, float *W save);

\section*{ARGUMENTS}

N (input) Length of the sequence to be transform ed. The m ethod is m ostefficientw hen N is the product of smallprim es. \(N>=0\).

R (output)
A realamay of length N containing the sequence to be transform ed. On exit, \(R\) is unchanged.

AZERO (output)
On exit, the sum from \(i=1\) to \(i=n\) ofr \((i) / n\).
A (input/output)
On entry, amays that contain the rem aining Fourier coefficients. On exit, these amays are unchanged.

B (input/output)
On entry, amays that contain the rem aining Fourier coefficients. On exit, these arrays are unchanged.

W SAVE (input)
O n entry, an array with dim ension of at least (3 * \(\mathrm{N}+15\) ), in inialized by E ZFFTI.

\section*{NAME}
fft-FastFouriertransform subroutines

\section*{OVERVIEW}

The signal processing softw are in Sun Perform ance Library includes a set of routines based on public dom ain packages FFTPACK and VFFPACK that computes the Fast Fourier \(T\) ransform. These routines are now being replaced by a new interface (Perfib interface).

\section*{MAPPING}

Below is a mapping of routines from the FFTPA CK interface and the new Perflib interface. See individualm an pages for m ore detail.

FFTPACK interface Perflib interface
RFFTF (DFFTF) SFFTC (DFFTZ)

RFFTB (DFFTB) CFFTS (ZFFTD)
CFFTF (ZFFTF) CFFTC (ZFFTZ)
EZFFTF DEZFFTF) SFFTC (DFFTZ)

\hline
\end{tabular}

\section*{NOTES}

U nlike the FFTPA CK interface, the Perflib interface does not provide separate routines for initialization. C om putation and initialization can be selected by an argum ent in the calling sequence of each routine. Sim ilarto the FFTPA CK routines, the w eight and factor tables need to be initialized once for a particulartransform length. O nce these tables are initialized, they can be used repeatedly to com pute the forw ard and inverse tranform s fordifferent data sets until, of course, the transform length is changed. The appropriate transform routine is then called to initialize the tables for the new length.

The Perflib interface gives the user the option of com puting the FFT in-place (inputoverw ritten by transform results) or out-of-place (inputunchanged) in every routine. W hen an out-of-place transform is requested, the input and output arraysm ust not overlap in \(m\) em ory. In-place transform \(s\) require that there be perfectoverlay betw een the input and output amays. That is, the arraysm ustbegin at the sam e m em ory location. The routines assum e (and therefore do not check) that these conditions are satisfied. In som e cases, the dim ension (s) of the inputand output amays are related to each other. Below is a sum \(m\) ary of requirem ents of the array dim ensions. LD X 1 and LD X are leading dim ensions of the input arrays and LD Y 1 and LD Y are leading dim ensions of the outputarays. LD X 2 and LD Y 2 are the second dim ensions of the input and output anays, respectively. N 1 and N 2 are the first and second actualdim ensions of the problem .

Routine name in-place out-of-place

SFFTCM, DFFTZM LDX \(=2 \star\) LD Y LDX \(>=\) N 1
LD Y \(>=\mathrm{N} 1 / 2+1\) LD \(Y>=\mathrm{N} 1 / 2+1\)
```

CFFTSM,ZFFTDM LDX >=N 1/2+1 LDX >=N 1/2+1
LDY = 2*LDX LDY >=N 1
CFFTCM,ZFFTZM LDX >=N1 LDX >=N 1
LDY = LD X LDY >= N 1

```
SFFTC2,DFFTZ2 LDX = 2*LDY LDX >=N 1
    LD Y \(>=N 1 / 2+1\) LDY \(>=N 1 / 2+1\)
CFFTS2,ZFFTD 2 LDX \(>=N 1 / 2+1\) LDX \(>=N 1 / 2+1\)
    LD \(Y=2 * L D X \quad L D Y>=2 * L D X ; L D Y\) is even
CFFTC2,ZFFTZ2 LDX >=N1 LDX >=N1
    LD Y = LD X LD Y >= N 1
CFFTS3, ZFFTD 3 LDX1>=N1/2+1 LDX1 >=N \(1 / 2+1\)
    LDX2>=N2 LDX2>=N2
    LDY1 = 2*LDX1 LDY1 >= 2*LDX1; LDY1 is
even
    LD Y \(2=\operatorname{LD} X 2\) LD Y \(2>=\) N 2
CFFTC 3,2 ZFTZ3 LDX1>=N1 LDX1>=N1
    LDX2 >=N2 LDX2>=N2
    LDY1 = LDX1 LDY1>=N1
    LDY2 \(=\) LD 2 LDY2 \(2=N 2\)
```

SFFTC3,DFFTZ3 LDX1=2*LDY1 LDX1>=N1
LDX2>=N2 LDX2>=N2
LDY 1 >= N 1/2+1 LD Y 1 >= N 1/2+1
LDY2 = LDX2 LDY 2 >= N 2

```

In routines that com pute transform sbetw een com plex and real data type such as SFFTC 2 orCFFTS3 even though the transform length is N 1 , only \(\mathbb{N} 1 / 2+1\) ) com plex data points are referenced or computed. These data points \(m\) ake up the positive-frequency half of the spectrum of the D iscrete Fourier Transform . The rem aining \(\mathrm{N} 1-\mathbb{N} 1 / 2+1\) ) data points can be easily derived since they are com plex conjugates and therefore are not stored or referenced.

        n2, intn3, intn4);
long ilaenv_64 (long ispec, char *nam e, char *opts, long n1, long n2, long n3, long n4);

\section*{PURPOSE}
ilaenv is called from the LAPACK routines to choose problem-dependent param eters for the localenvironm ent. See ISPEC fora description of the param eters.

This version provides a setof param eters which should give good, butnotoptim al, penform ance on \(m\) any of the currently available com puters. U sers are encouraged to m odify this subroutine to set the tuning param eters for theirparticular \(m\) achine using the option and problem size inform ation in the argum ents.
This routine w illnot function correctly if it is converted to all low er case. C onverting it to allupper case is allow ed.

\section*{ARGUMENTS}

ISPEC (input)
Specifies the param eter to be retumed as the value of \(\amalg\) AENV . = 1 : the optim alblocksize; if this value is 1 , an unblocked algorithm will give the bestperform ance. \(=2\) : the \(m\) inim um block size forw hich the block routine should be used; if the usable block size is less than this value, an unblocked routine should be used. \(=3\) : the crossover point (in a block routine, for \(N\) less than this value, an unblocked routine should be used) = 4: the num ber of shifts, used in the nonsym \(m\) etric eigenvalue routines \(=5\) : the \(m\) inim um colum \(n\) dim ension for blocking to be used; rectangularblocks \(m\) usthave dim ension at least \(k\) by \(m\), where \(k\) is given by \(\mathbb{L A E N V}(2, \ldots)\) and \(m\) by \(\mathbb{L A E N V}(5, \ldots)=\) 6: the crossoverpoint for the SVD (w hen reducing an \(m\) by \(n m\) atrix to bidiagonal form, if \(m\) ax \((m, n)\) fr in \((m, n)\) exceeds this value, \(a Q R\) factorization is used first to reduce the \(m\) atrix to a triangular form .) \(=7\) : the num ber of processors = 8: the crossover point for the \(m\) ultishift \(Q R\) and \(Q Z \mathrm{~m}\) ethods fornonsym \(m\) etric eigenvalue problem \(s\). = 9:m axim um size of the subproblem sat the bottom of the com putation tree in the divide-and-conquer algorithm (used by xGELSD and xGESDD) =10: ieee N aN arithm etic can be trusted not to trap
\(=11\) : infinity arithm etic can be trusted not to trap

NAME (input)
The nam ef the calling subroutine, in either upper case or low er case.

OPTS (input)
The character options to the subroutine NAM E, concatenated into a single characterstring. For exam ple, \(\mathrm{UPLO}=\mathrm{U}\) ', TRANS \(=T\) ', and D \(\mathbb{A} G=\mathrm{N}^{\prime}\) for a triangular routine w ould be specified as OPTS = UTN '.

N 1 (input)
\(\mathbb{N}\) TEGER

N 2 (input)
\(\mathbb{N}\) TEGER
N 3 (input)
\(\mathbb{N}\) TEGER

N 4 (input)
\(\mathbb{N}\) TEGER
N 1, N 2, N 3, N 4 are problem dim ensions for the subroutine NAM E; these m ay not allbe required.
\(>=0\) : the value of the param eter specified by ISPEC
< 0: if ILAENV \(=-\mathrm{k}\), the k -th argum ent had an illegalvalue. < 0: if ILAENV \(=-k\), the \(k\)-th argum ent had an illegalvahue.

\section*{FURTHER DETAILS}

The follow ing conventions have been used w hen calling IIA EN V from the LAPACK routines:
1) OPTS is a concatenation of allof the character options to
subroutine NAM E, in the sam e order that they appear in the
argum ent list forN AM E, even if they are not used in determ ining
the value of the param eter specified by ISPEC.
2) The problem dim ensions \(1, N 2, N 3, N 4\) are specified in the order
that they appear in the argum ent list forNAME. N1 is used
first, N 2 second, and so on, and unused problem dim ensions are
passed a value of -1 .
3) The param etervalue retumed by ILAENV is checked for validity in
the calling subroutine. For exam ple, ILA EN V is used to retrieve
the optim alblocksize forSTRTR I as follow s:

NB = \(\amalg \operatorname{LAENV}(1, \operatorname{STRTRI}, \mathrm{UPLO} / / \mathrm{D} \operatorname{IA}, \mathrm{N},-1,-1,-1)\) \(\mathbb{F}(\mathrm{NB} L E 1) \mathrm{NB}=\mathrm{MAX}(1, \mathrm{~N})\)

\section*{ARGUMENTS}

PLACE (input)
Character. IfPLA CE = 'I'or i' (for in-place), the input and outputdata are stored in array A. IfPLACE = 0 ' or \(b^{\prime}\) (for out-of-place), the input data is stored in anray \(B\) while the output is stored in A.
\(M\) (input) Integer specifying the number of row s to be transform ed. It is m ost efficientw hen M is a productofsm allprin es. \(\mathrm{M}>=0\); when \(\mathrm{M}=0\), the subroutine retums im mediately w ithout changing any data.

N (input) Integer specifying the num ber of colum ns to be transform ed. It is \(m\) ostm ostefficientw hen \(N\) is a productofsm allprim es. \(\mathrm{N}>=0\); when \(\mathrm{N}=0\), the subroutine retums im \(m\) ediately \(w\) ithout changing any data.

A (input/output)
Realarray ofdim ension (LDA N). On entry, the tw o-dim ensional array A (LD A , N) contains the input data to be transform ed if an in-place transform is requested. O therw ise, it is not referenced. U pon exit, results are stored in \(A(1 \mathbb{M}, 1 \mathbb{N})\).

LD A (input)
Integer specifying the leading dim ension ofA. If an out-of-place transform is desired LDA \(>=M\). Else if an in-place transform is desired LDA >= \(2 * M / 2+1\) ).

B (input/output)
Realarray ofdim ension ( \(2 *\) LD \(B, N\) ). On entry, if an out-of-place transform is requested \(B\) contains the input data. O therw ise, \(B\) is not referenced. \(B\) is unchanged upon exit.

LD B (input)
Integer. If an out-of-place transform is desired, \(2 *\) LD B is the leading dim ension of the amay B which contains the data to be transform ed and \(2 * \operatorname{LDB}>=2 *(2+1)\). O therw ise it is notreferenced.

W ORK (input/output)
O ne-dim ensional real array of length at least LW ORK. On input, W ORK m usthave been initialized by RFFT2I.

LW ORK (input)
Integer. LW ORK >= \(M+2 \star \mathrm{~N}+\mathrm{MAX} \mathrm{M}, 2 \star \mathrm{~N})+30\) )

\section*{ARGUMENTS}

PLACE (input)
Character. IfPLA CE = I'or i' (for in-place), the input and outputdata are stored in anray A. IfPLACE = \(0^{\prime}\) or \(b^{\prime}\) (for out-of-place), the input data is stored in aray B while the output is stored in A.

FULL (input)
Indicates \(w\) hether or not to generate the full result \(m\) atrix. \(F^{\prime}\) or 'f'w ill cause RFFT \(2 F\) to generate the filll resultm atrix. O therw ise only a partial \(m\) atrix that takes advantage of sym \(m\) etry w illbe generated.

M (input) Integer specifying the num ber of row \(s\) to be transform ed. It is m ost efficientw hen M is a productofsm allprim es. \(M>=0\); when \(M=0\), the subroutine retums im mediately w ithoutchanging any data.

N (input) Integerspecifying the num ber of colum ns to be transform ed. It ism ostm ostefficientw hen N is a productofsm allprim es. \(\mathrm{N}>=0\); when \(\mathrm{N}=0\), the subroutine retums im \(m\) ediately \(w\) thout changing any data.

A (input/output)
O n entry, a tw o-dim ensional aray A (LDA \(N\) ) that contains the data to be transform ed. U pon exit, A is unchanged if an out-of-place transform is done. If an in-place transform \(w\) ith partial result is requested, \(A(1:(M / 2+1) * 2,1 \mathbb{N})\) w ill contain the transform ed results. If an in-place transform
w th full result is requested, \(\mathrm{A}(1: 2 \star \mathrm{M}, 1 \mathrm{~N}) \mathrm{w}\) ill contain com plete transform ed results.

LD A (input)
Leading dim ension of the array containing the data to be transform ed. LDA must be even if the transform ed sequences are to be stored in A.
IfPLACE \(=\left(D^{\prime}\right.\) orb) LDA \(>=M\)
IfPLACE \(=\) (I'or li) LDA mustbe even. If
\(F U L L=\left(F^{\prime}\right.\) or \({ }^{\prime}\) ) \(), L D A>=2 * M\)
FULL is not ( \(\mathrm{F}^{\prime}\) or \(\mathrm{I}^{\prime}\) ), LDA \(>=(\mathrm{M} / 2+1\) ) 2
B (input/output)
U pon exit, a tw o-dim ensionalamay B ( \(2 *\) LD B , N ) that
contains the transform ed results if an out-of-
place transform is done. O therw ise, \(B\) is not used.
If an out-of-place transform is done and FULL is
not \(\mathrm{F}^{\prime}\) or \(\mathrm{'}^{\prime}\) ' \(\left.\mathrm{B}(1: M / 2+1) * 2,1 \mathbb{N}\right)\) w illcontain the partial transform ed results. IfFU LL \(=F\) 'or ' f ', \(\mathrm{B}(1: 2 * \mathrm{M}, 1 \mathbb{N})\) w ill contain the com plete transform ed results.

LD \(B\) (input)
\(2 * L D B\) is the leading dim ension of the array \(B\). If
an in-place transform is desired LD B is ignored.
IfPLACE is ( 0 'or \(b^{\prime}\) ) and
FULL is ( \(\mathrm{F}^{\prime}\) or \({ }^{\prime} \mathrm{F}\) ), LDB \(>=\mathrm{M}\)
FULL is not ( F ' or ' f ), LD B \(>=\mathrm{M} / 2+1\)
\(N\) ote thateven though LD \(B\) is used in the argum ent list, \(2 *\) LD B is the actual leading dim ension ofB .

W ORK (input/output)
O ne-dim ensional real anray of length at least
LW ORK. On input, W ORK m usthave been initialized by RFFT2I.

LW ORK (input)
Integer. LW ORK >= \(M+2 \star N+M A X M, 2 \star N)+30\) )

\section*{ARGUMENTS}

PLACE (input)
Selectan in-place ('I'or li) or out-of-place ( D 'or b') transform .

FU LL (input)
Selecta full ( F ' or ' f ) or partial (' )
representation of the results. If the caller
selects full representation then an M xN xK real array will transform to produce an \(\mathrm{M} \times N \times \mathrm{K}\) com plex array. If the caller does not select full representation then an \(\mathrm{M} x \mathrm{NXK}\) real array will transform to a \(M / 2+1) x N x K\) complex aray that takes advantage of the sym \(m\) etry properties of a transform ed realsequence.
\(M\) (input) Integer specifying the num ber of row s to be transform ed. It is \(m\) ost efficientw hen \(M\) is a productofsm allprim es. \(\mathrm{M}>=0\); when \(\mathrm{M}=0\), the subroutine retums im mediately w ithout changing any data.

N (input) Integerspecifying the num ber of colum ns to be transform ed. It is m ost efficientw hen N is a product ofsm allprim es. \(\mathrm{N}>=0\); when \(\mathrm{N}=0\), the subroutine retums im mediately w ithout changing any data.
\(K\) (input) Integerspecifying the num ber of planes to be transform ed. It is \(m\) ost efficientw hen \(K\) is a productofsm allprim es. \(\mathrm{K}>=0\); when \(\mathrm{K}=0\), the subroutine retums im m ediately withoutchanging any data.

A (input/output)
O n entry, a three-dim ensional array A (LDA, N, K) that contains input data to be transform ed. On exit, if an in-place transform is done and FU LL is not \(\mathrm{F}^{\prime}\) or \(\left.\mathrm{I}^{\prime}, \mathrm{A}\left(1: 2^{*} \mathrm{M} / 2+1\right), 1 \mathrm{~N}, 1: \mathrm{K}\right) \mathrm{w}\) ill contain the partial transform ed results. If \(F U L L=\) F 'or \(\mathrm{I}^{\prime}, \mathrm{A}(1: 2 \star \mathrm{M}, 1: \mathbb{N}, 1: K)\) w illcontain the com plete transform ed results.

LD A (input)
Leading dim ension of the array containing the data to be transform ed. LD A must be even if the transform ed sequences are to be stored in A.
IfPLACE \(=(\mathrm{D}\) 'or b) LDA \(>=\mathrm{M}\)
IfPLACE \(=\) ( \(I\) 'or \({ }^{\prime \prime}\) ) LD A m ustbe even. If
FULL \(=\left(\mathrm{F}^{\prime}\right.\) or ' \({ }^{\text {f }}\) ), LD \(\mathrm{A}>=2 \star \mathrm{M}\)
FULL is not ( F 'or \({ }^{\prime}\) ' ), LD A \(>=2 * \mathrm{M} / 2+1\) )
B (input/output)
U pon exit, a three-dim ensional array B ( \(2 *\) LD B , \(N, K\) ) that contains the transform ed results if an out-of-place transform is done. O therw ise, \(B\) is not used.
If an out-of-place transform is done and FU LL is not \(\mathrm{F}^{\prime}\) or \(\left.\mathrm{f}^{\prime}, \mathrm{B}\left(1 \cdot 2^{*} \mathrm{M} / 2+1\right), 1 \mathbb{N}, 1 \mathrm{~K}\right) \mathrm{w}\) illcontain the partialtransform ed results. If FU LL \(=\) F 'or 'f', B ( \(1: 2 \star \mathrm{M}, 1 \mathrm{~N}, 1 \mathrm{~K})\) w ill contain the com plete transform ed results.

LD B (input)
\(2 *\) LD B is the leading dim ension of the array \(B\). If an in-place transform is desired LD \(B\) is ignored.
IfPLACE is ( 0 'or \(b^{\prime}\) ) and
FULL is ( F 'or \({ }^{\prime} \mathrm{F}\) ), then \(\mathrm{LDB}>=\mathrm{M}\)
FULL is not ( F ' or ' f '), then LD B \(>=\mathrm{M} / 2+1\)
\(N\) ote thateven though LD \(B\) is used in the argum ent list, 2*LD B is the actual leading dim ension ofB.

W ORK (input/output)
O ne-dim ensional real array of length at least
LW ORK. W ORK m usthave been initialized by RFFT 3I.

LW ORK (input)
Integer. LW ORK >= \(\left.\left.M+2^{\star} \mathbb{N}+K\right)+4 * K+45\right)\).

REAL,D \(\mathbb{M}\) ENSION (:) ::W SAVE

SU BROUTINE FFTI_64 \(\mathbb{N}, \mathrm{W}\) SAVE)
\(\mathbb{N}\) TEGER (8) :: N
REAL,D \(\mathbb{M}\) ENSION (:) ::W SAVE

\section*{C INTERFACE}
\#include <sunperfh>
void rffli(intn, float *w save);
void rffti_ 64 (long n, float *w save);

\section*{ARGUMENTS}

N (input) Length of the sequence to be transform ed. \(\mathrm{N}>=0\).

W SAVE (input)
O n entry, an array ofdim ension ( 2 * \(\mathrm{N}+15\) ) or greater. RFFTI needs to be called only once to initialize array \(W\) ORK before calling RFFTF and/or RFFTB if \(N\) and W SAVE rem ain unchanged betw een these calls. Thus, subsequent transform \(s\) or inverse transform s of sam e size can be obtained faster than the first since they do not require indialization of the w orkspace.

\section*{NAME}
rfftopt-com pute the length of the closest fastFFT

\section*{SYNOPSIS}
\(\mathbb{N}\) TEGER FUNCTION RFFTOPT (LEN)
\(\mathbb{N}\) TEGER LEN
\(\mathbb{N}\) TEGER*8 FUNCTION RFFTOPT_64 (LEN)
\(\mathbb{N}\) TEGER*8 LEN

F95 INTERFACE
INTEGER FUNCTION RFFTOPT (LEN)
\(\mathbb{N}\) TEGER ::LEN
\(\mathbb{N}\) TEGER (8) FUNCTION RFFTOPT_64 (LEN)
\(\mathbb{N} T E G E R(8):: L E N\)
C INTERFACE
\#include <sunperfh>
int rfftopt(int len);
long rfftopt_64 (long len);

\section*{PURPOSE}

Fourier transform algorithm s , including those used in Perform ance L ibrary, w ork bestw ith vector lengths that are products of sm all prim es. Forexam ple, an FFT of length \(32=2 * * 5 \mathrm{w}\) ill run fasterthan an FFT of prime length 31 because 32 is a productofsm allprim es and 31 is not. If your application is such that you can taper or zero pad your vector to a larger length then this function \(m\) ay help you select a better length and run your FFT faster.

RFFTOPT w ill retum an integerno sm aller than the input argum ent N that is the closestnum ber that is the product of sm allprim es. RFFTO PT w ill retum 16 for an input of \(\mathrm{N}=16\) and retum 18=2*3*3 for an inputof \(\mathrm{N}=17\).

N ote that the length com puted here is not guaranteed to be optim al, only to be a
product of sm allprim es. A lso, the value retumed \(m\) ay change as the underlying
FFT sbecom e capable of handling larger prim es. For exam ple, passing in \(N=51\) to day \(w\) ill retum \(52=2 \star 2 \star 13\) rather than \(51=3 * 17\) because the FFT s in Perform ance Library do not have fast radix 17 code. In the future, radix 17 code m ay be added
and then \(\mathrm{N}=51 \mathrm{w}\) ill retum 51 .

void sodsdc_64 (charuplo, char com pq, long n, float *d, float *e, float *u, long ldu, float *vt, long ldvt, float *q, long *iq, long *info);

\section*{PURPOSE}
sbdsdc com putes the singular value decom position (SVD ) of a realN -by -N (upper or low er) bidiagonalm atrix \(\mathrm{B}: \mathrm{B}=\mathrm{U} * \mathrm{~S}\) * V T, using a divide and conquerm ethod, where \(S\) is a diagonalm atrix w ith non-negative diagonalelem ents the singular values ofB ), and U and V T are orthogonalm atrioes of left and right singularvectors, respectively. SBD SD C can be used to com pute all singular values, and optionally, singular vectors or singularvectors in com pact form .

This code \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. It willw ork on m achines w ith a guard digit in add/subtract, or on those binary machines w thout guard digits which subtract like the C ray \(\mathrm{X}-\mathrm{M} \mathrm{P}, \mathrm{C}\) ray Y M P, C ray \(\mathrm{C}-90\), or Cray-2. Itcould conœívably fail on hexadecim al or decin al machines w thout guard digits, butw e know of none. See SLA SD 3 fordetails.

The code currently callSLA SD Q if singularvalues only are desired. H ow ever, it can be slightly \(m\) odified to com pute singular values using the divide and conquerm ethod.

\section*{ARGUMENTS}
```

UPLO (input)
$=\mathrm{U}$ ': B is upperbidiagonal.
= L ': B is low erbidiagonal.

```

COMPQ (input)
Specifies w hether singularvectors are to be com puted as follow s:
= N ': C om pute singular values only;
\(=P^{\prime}:\) C om pute singularvalues and com pute singular vectors in compact form; = 'I': C om pute singular vahues and singular vectors.

N (input) The order of the m atrix \(\mathrm{B} . \mathrm{N}>=0\).

D (input/output)
O n entry, the n diagonalelem ents of the bidiagonal \(m\) atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the singular values ofB.
E (input/output)
O n entry, the elem ents of \(E\) contain the offdiagonalelem ents of the bidiagonalm atrix whose SVD is desired. On exit, E has been destroyed.

U (output)
If \(C O M P Q=' I \prime\), then: \(O n\) exit, if \(\mathbb{N} F O=0, U\) contains the left singular vectors of the bidiagonalm atrix. Forothervalues of \(C O M P Q, U\) is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD U >= 1 . If singular vectors are desired, then LD U \(>=\max\) ( 1, N ).

VT (output)
If \(C O M P Q=I^{\prime}\), then: \(O n\) exit, if \(\mathbb{N} F O=0, V T '\) contains the right singularvectors of the bidiagonalm atrix. Forothervalues of COM PQ,VT is not referenced.

LDVT (input)
The leading dim ension of the array V T . LD V T >= 1 . If singularvectors are desired, then LDV T \(>=\mathrm{max}\) ( \(1, \mathrm{~N})\).
\(Q\) (input) If \(C O M P Q=P\) ', then: \(O n\) exit, if \(\mathbb{N} F O=0, Q\) and IQ contain the leftand rightsingularvectors in a com pact form, requiring \(O(N \log N\) ) space instead of \(2 * \mathrm{~N} * * 2\). In particular, \(Q\) contains all theREAL data in LDQ >= \(\mathrm{N}^{*}(11+2 * S M\) LSZ + \(8 * \mathbb{N}\) T (LO G_2 \(\mathbb{N} /(\) SM LSIZ+1)))) w ords ofm em ory, where SM LSIZ is retumed by ILAENV and is equal to the maxim um size of the subproblem sat the bottom of
the com putation tree (usually about 25). For othervahes of COM PQ, Q is notreferenced.

IQ (output)
If \(C O M P Q=P^{\prime}\), then: On exit, if \(\mathbb{N} F O=0, Q\) and IQ contain the leftand rightsingularvectors in a com pact form, requiring \(O \mathbb{N}\) log \(N\) ) space instead of \(2 * N * * 2\). In particular, IQ contains all \(\mathbb{N T E G E R}\) data in LD IQ \(>=N *(3+\) \(3 * \mathbb{N}\) T (LOG_2 \(\mathbb{N} /(\) SM LSIZ+1)))) w ords ofm em ory, where SM LSIZ is retumed by \(\mathbb{L A} E N V\) and is equal to the \(m\) axim um size of the subproblem s at the bottom of the com putation tree (usually about 25). For other values of COM PQ, \(\mathbb{Q}\) is notreferenced.

W ORK (w orkspace)
IfCOMPQ \(=N\) 'then LW ORK \(>=(2 * N)\). IfCOMPQ \(=\)
\(P^{\prime}\) then \(L W O R K>=(6 * N)\). IfCOMPQ \(=\) I'then
LW ORK >= ( \(3 * N * * 2+4 * N)\) 。

IV ORK (w orkspace)
dim ension ( \(8 * N\) )
\(\mathbb{I N F O}\) (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N ~ F O ~}=-\) i, the ith argum enthad an illegalvalue.
\(>0\) : The algorithm failed to com pute an singular value. The update process ofdivide and conquer failed.

\]
where ALPHA and BETA are scalar, \(C\) and \(B\) are m by \(n\) dense matrices, \(D\) is ablock diagonalm atrix, \(A\) is a unit, ornon-unit, upperor low ertriangularm atrix represented in block Elhoack form at and op (A ) is one of \(\operatorname{op}(A)=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}(A) \operatorname{or} \operatorname{op}(A)=\operatorname{inv}\left(\operatorname{conjg}\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix 0 : operate \(w\) ith \(m\) atrix 1 : operate \(w\) th transpose \(m\) atrix 2 : operate \(w\) ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(s\) in \(m\) atrix \(A\)

N \(\quad N\) um berof colum ns in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identity \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum n scaling)

DV () A may of the length M B *LB *LB consisting of the block entries ofblock diagonalm atrix \(D\) w here each block is stored in standard colum n-m ajor form .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger anay
DESCRA (1) m atrix structure
0 :general

1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2: Herm itian ( \(A=\operatorname{CONJ}(A)\) )
3 :Triangular
4 : Skew (A nti)-Symm etric ( \(\mathrm{A}=-\mathrm{A}\) )
5 :D iagonal
6 : Skew Herm titian ( \(A=-\operatorname{CON}\) J ( \(A\) ) )
N ote: For the routine, D ESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 : upper
DESCRA (3) m ain diagonal type
0 : non-identity blocks on the \(m\) ain diagonal
1 : identity diagonalblocks
2 : diagonalblocks are dense \(m\) atrices
DESCRA (4) A ray base \(\mathbb{N O T} \mathbb{M}\) PLEM ENTED )
0 : C C C+ com patible
1 :Fortran com patible
DESCRA (5) repeated indices? \(\mathbb{N} O T \mathbb{M}\) PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL () scalar array of length LB *LB *BLD A *M A X BN Z containing \(m\) atrix entries, stored colum \(n-m\) ajorw thin each dense block.

B \(\mathbb{N}\) D X () tw o-dim ensionalintegerB LD A boy-M A X BN Z array such B IND X ( \(i\), : ) consists of the block colum \(n\) indices of the nonzero blocks in block row i, padded by the integer value iif the num ber ofnonzero blocks is less than M A X BN Z. The block colum \(n\) indioesM U ST be sorted in increasing order foreach block row.

BLDA leading dim ension ofB INDX (:,:).

M AXBNZ max num berofnonzerosblocks per row .
LB row and colum \(n\) dim ension of the dense blocks com posing A.

B 0 rectangular array w ith first dim ension LD B .

LD B leading dim ension of \(B\)

BETA Scalarparam eter

C 0 rectangular aray w ith first dim ension LD C .

LD C leading dim ension of C

W ORK () scratch array of length LW ORK.
On exit, ifLW ORK \(=-1, W\) ORK (1) retums the minim um
size ofLW ORK.

LW ORK length ofW ORK anay.LW ORK should be at least M B *LB.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M} \mathrm{B} * \mathrm{LB} * \mathrm{~N}\) _CPU \(S\) where \(\mathrm{N} \_\)CPUS is the \(m\) axim um num berof processors available to the program .

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W O RK array, and no errorm essage related to LW ORK is issued by XERBLA .

\section*{DESCRIPTION}
\[
\begin{aligned}
& C<-A L P H A \text { Op (A) B + BETA } C \quad C<-A L P H A D \text { op (A)B+BETA C } \\
& C<-A L P H A \text { OP (A)D B + BETA } C
\end{aligned}
\]
where ALPHA and BETA are scalar, \(C\) and \(B\) are \(m\) by \(n\) dense \(m\) atrices, \(D\) is ablock diagonalm atrix, \(A\) is a unit, ornon-unit, upperor low ertriangularm atrix represented in block sparse row form at form atand op (A ) is one of \(\operatorname{op}(A)=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}(A)\) or op (A) \()=\operatorname{inv}\left(\operatorname{conjg}\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix 0 : operate \(w\) ith \(m\) atrix 1 : operate \(w\) th transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(s\) in \(m\) atrix \(A\)
\(N \quad N\) um berof colum \(n s\) in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum n block scaling)

DV () A rray of the length M B *LB *LB consisting of the block entries ofblock diagonalm atrix \(D\) w here each
block is stored in standard colum n-m ajor form .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem ent integer anay
DESCRA (1) m atrix structure
0 : general

1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2: Herm itian ( \(\mathrm{A}=\mathrm{CONJG}(\mathrm{A})\) )
3 :Triangular
4 : Skew (A nti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\operatorname{CONJG}(\mathrm{A})\) )
N ote: For the routine, D ESCRA \((1)=3\) is only supported.
D ESCRA (2) upper/low er triangular indicator
1: low er
2 : upper
DESCRA (3) m ain diagonal type
0 : non-identity blocks on the \(m\) ain diagonal
1 : identily diagonalblocks
2 : diagonalblocks are densem atrices
DESCRA (4) A ray base NOT IM PLEM ENTED )
0 : C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? NOT IM PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL () scalar aray of length LB *LB *BNN Z consisting of the block entries stored colum \(n\)-m ajorw thin each dense block.
\(B \operatorname{IN}\) X ( integer array of length BNNZ consisting of the block colum n indices of the block entries of A. The block colum n indices M U ST be sorted in increasing order foreach block row .

BPN TRB () integer array of length \(M B\) such that BPN TRB (J) BPN TRB (1)+1 points to location in B IND X of the firstblock entry of the J-th block row of A.

BPN TRE ( integer array of length \(M B\) such that BPN TRE (J)-BPN TRB (1) points to location in B IND X of the last.block entry of the J-th block row of A.

LB dim ension of dense blocks com posing A.
B 0 rectangular array w th first dim ension LD B.
LD B leading dim ension ofB
BETA Scalarparam eter
C 0 rectangular array w ith first dim ension LD C.
LD C leading dim ension of \(C\)

W ORK 0 scratch array of length LW ORK. On exit, if LW ORK \(=-1, W\) ORK (1) retums the optim um size ofLW ORK.

LW ORK length ofW ORK array. LW ORK should be at least M B*LB.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M} \mathrm{B} * \mathrm{LB} * \mathrm{~N}\) _CPU \(S\) where \(N\) _CPUS is the \(m\) axim um num berof processors available to the program .

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SEE ALSO}

N IST FORTRAN Sparse B las U sers G uide available at: http://m ath nistgov/m cso/Staff/k Rem ington/tspblas/

htyp://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. No test for singularity ornear-singularity is included in this routine. Such tests \(m\) ustbe perform ed before calling this routine.
2. If \(D E S C R A\) ( 3 )=0, the low erorupper triangularpart of each diagonalblock is used by the routine depending on DESCRA (2).
3. If \(\operatorname{DESCRA}\) (3)=1, the unitdiagonalblocksm ightorm ight not.be referenced in the BSR representation of a sparse \(m\) atrix. They are notused anyw ay .
4. If \(D E S C R A(3)=2\), diagonalblocks are considered as dense m atrices and the LU factorization w th partialpivoting is used by the routine. WORK (1)=0 on retum if the factorization for alldiagonalblocks has been com pleted
successfully, otherw ise WORK (1) = -iw here i is the block
num ber forw hich the LU factorization could notbe com puted.
5. The routine can be applied for solving triangular system \(s\) w hen the upper or low er triangle of the general sparse m atrix A is used. H ow erver DESCRA (1) m ustbe equal to 3 in this case.
2. It is know \(n\) that there exists another representation of the block sparse row form at (see forexam ple Y Saad, "Iterative M ethods forSparse LinearSystem S", W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. Them ain difference is that only one array, \(\mathbb{I A}\), containing the pointers to the beginning of each block row in the amays VAL and B \(\mathbb{N D}\) D is used instead of tw o arrays BPN TRB and BPN TRE. To use the routine w ith this kind ofblock sparse row form at the follow ing calling sequence should be used

\section*{PURPOSE}
scnvcorcom putes the convolution or comelation of realvectors.

\section*{ARGUMENTS}

CNVCOR (input)
\(V\) 'or \(V^{\prime}\) if convolution is desired, \(R\) ' or ' \(r\) ' if comelation is desired.

FOUR (input)
T'or t'if the Fourier transform \(m\) ethod is to be used, D 'or d'ifthe com putation should be done directly from the definition. The Founier transform m ethod is generally faster, but itm ay introduce noticeable errors into certain results, notably w hen both the filter and data vectors consistentirely of integers or vectors where ele\(m\) ents of either the filtervector or a given data vectordiffer significantly in \(m\) agnitude from the 1 -norm of the vector.

NX (input)
Length of the filtervector. \(\mathrm{NX}>=0\). SCNVCOR w ill retum im m ediately if \(\mathrm{N}=0\).

X (input)
Filtervector.

IFX (input)
Index of the firstelem entofX. \(\mathrm{NX}>=\mathbb{F} \mathrm{X}>=1\).
\(\mathbb{N} C X\) (input)
Stride betw een elem ents of the filtervector in X . \(\mathbb{N} C X>0\).

NY (input)
Length of the inputvectors. NY >= 0. SCNVCOR w ill retum im m ediately if \(\mathrm{N} Y=0\).
NPRE (input)
The num ber of im plicit zeros prepended to the \(Y\) vectors. NPRE \(>=0\).

M (input)
N um berof inputvectors. \(\mathrm{M}>=0\). SCNVCOR will retum imm ediately if \(M=0\).

Y (input)
Inputvectors.

FY (input)
Index of the firstelem entof \(. \mathrm{NY}>=\mathbb{F} Y>=1\).
\(\mathbb{N} C 1 Y\) (input)
Stride betw een elem ents of the inputvectors in Y.
\(\mathbb{I N C} 1 \mathrm{Y}>0\).
\(\mathbb{N} C 2 Y\) (input)
Stride betw een the inputvectors in Y. \(\mathbb{N} C 2 Y>0\).

N Z (input)
Length of the outputvectors. NZ \(>=0\). SCNVCOR
\(w\) ill retum im m ediately if \(\mathrm{NZ}=0\). See the N otes section below for inform ation abouthow this argu\(m\) ent interacts \(w\) ith \(N X\) and \(N Y\) to control circular versus end-off shifting.

K (input)
N um berof Z vectors. \(\mathrm{K}>=0\). If \(\mathrm{K}=0\) then SCNVCOR will retum immediately. If \(K<M\) then only the firstK inputvectors w ill.be processed. If \(K>M\) then \(M\) inputvectors \(w\) ill.be processed.

Z (output)
Resultvectors.

FZ (input)
Index of the firstelem entofZ. NZ >= \(\mathbb{F Z}\) >=1.
\(\mathbb{N} C 1 Z\) (input)
Stride betw een elem ents of the output vectors in Z. \(\mathbb{N} C 1 Z>0\).
\(\mathbb{N} C 2 Z\) (input)
Stride betw een the outputvectors in Z. \(\mathbb{N N}\) C 2 Z > 0 .

W ORK (input/output)
Scratch space. Before the first call to SCNVCOR w ith particular values of the integer argum ents the firstelem entofW ORK m ustbe set to zero. If W ORK is w ritten between calls to SCNVCOR or if SCNVCOR is called w th different values of the integer argum ents then the firstelem entofW ORK m ustagain be set to zero before each call. If W ORK has notbeen w rilten and the sam e values of the integer argum ents are used then the firstele\(m\) entofW ORK to zero. This can avoid certain initializations that store their results into \(W\) ORK, and avoiding the intialization can \(m\) ake SCN V COR nun faster.

LW ORK (input)
Length ofW ORK. LW ORK >= 4*m ax NX,NPRE+NY,NZ)+15.

\section*{NOTES}

If any vector overlaps a w ritable vector, eitherbecause of argum ent aliasing or ill-chosen values of the various \(\mathbb{I N} C\) argum ents, the results are undefined and \(m\) ay vary from one nun to the next.

Them ost com \(m\) on form of the com putation, and the case that executes fastest, is applying a filter vectorX to a series of vectors stored in the colum ns of \(Y\) w ith the resultplaced into the colum nsof \(Z\). In that case, \(\mathbb{N} C X=1, \mathbb{N} C 1 Y=1\), \(\mathbb{N} C 2 Y>=N Y, \mathbb{N} C 1 Z=1, \mathbb{N} C 2 Z>=N Z\). A nothercomm on form is applying a filtervectorX to a series of vectors stored in the row sof \(Y\) and store the result in the row of \(Z\), in which case \(\mathbb{N} C X=1, \mathbb{N} C 1 Y>=N Y, \mathbb{N} C 2 Y=1, \mathbb{N} C 1 Z>=N Z\), and \(\mathbb{N} C 2 Z=1\).

\section*{PURPOSE}
scnvcor2 com putes the convolution or correlation of real \(m\) atrices.

\section*{ARGUMENTS}

CNVCOR (input)
V 'or f'to com pute convolution, R 'or \(\mathrm{I}^{\prime}\) to com pute comelation.

METHOD (input)
T'or t'if the Fourier transform \(m\) ethod is to be used, D 'or d'to com pute directly from the
definition.

TRANSX (input)
\(N\) 'or h'ifX is the filterm atrix, \(T\) ' or \(t^{\prime}\) if transpose \((X)\) is the filterm atrix.

SCRATCHX (input)
N 'or h 'ifX m ustbe preserved, S 'or S 'ifX can be used as scratch space. The contents ofX are undefined after retuming from a call in which \(X\) is allow ed to be used for scratch.

TRANSY (input)
N 'or h'ify is the inputm atrix, \(T\) 'or \(\mathrm{t}^{\prime}\) if transpose \((Y)\) is the inputm atrix.

\section*{SCRATCHY (input)}

N 'or h'ifY mustbe preserved, S'or S'ifY can be used as scratch space. The contents of \(Y\) are undefined after retuming from a call in which \(Y\) is allow ed to be used for scratch.

M X (input)
N um ber of row s in the filterm atrix. \(\mathrm{M} \mathrm{X}>=0\).

NX (input)
N um ber of Colum ns in the filterm atrix. \(\mathrm{NX}>=0\).

X (input) dim ension (LD X ,N X )
O \(n\) entry, the filterm atrix. Unchanged on exit if SCRATCHX is N' or h', undefined on exitif SCRATCHX is S'or \({ }^{\prime}\) '.

LD X (input)
Leading dim ension of the array that contains the filterm atrix.

M Y (input)
N um ber of row s in the inputm atrix. \(\mathrm{M} \mathrm{Y}>=0\).

NY (input)
\(N\) um ber of colum ns in the inputm atrix. \(N Y>=0\).

M PRE (input)
N um ber of im plicit zeros to prepend to each row of the inputm atrix. M PRE \(>=0\).

NPRE (input)
\(N\) um ber of im plicit zeros to prepend to each colum n of the inputm atrix. NPRE \(>=0\).

Y (input) dim ension (LD Y ,*)
Inputm atrix. U nchanged on exit if SCRATCHY is

or \(\mathrm{s}^{\prime}\).

LD Y (input)
Leading dim ension of the aray that contains the inputm atrix.
M Z (input)
N um ber of row s in the output m atrix. \(\mathrm{M} \mathrm{Z} \mathrm{>=0} 0\).
SCNVCOR2 w ill retum im m ediately ifM Z \(=0\).

N Z (input)
N um ber of colum ns in the outputm atrix. \(\mathrm{NZ}>=0\). SCN V COR 2 w ill retum im m ediately if \(\mathrm{Z} Z=0\).

Z (output)
dim ension (LD Z,*)
Resultm atrix.

LD Z (input)
Leading dim ension of the array that contains the resultm atrix. LD Z >= M AX (1, M Z).

W ORK \(\mathbb{N}\) (input/output)
(input/scratch) dim ension (LW ORK)
On entry for the first call to SCNVCOR2, REAL (WORK \(\mathbb{N}\) (1)) m ustcontain 0.0. A fter the first call, REAL (W ORK \(\mathbb{N}\) (1)) m ustbe set to 0.0 iff \(W\) ORK \(\mathbb{N}\) has been altered since the last call to this subroutine or if the sizes of the arays have changed.

LW ORK (input)
Length of the w ork vector. The upperbound of the w orkspace length requirem ent is 2 * \(M Y C+N Y C)+\) 15, where \(M Y C=M A X(M A X(M X, N X)\), \(M A X(M Y, N Y)+N P R E)\) and \(N Y C=M A X(M A X(M X, N X), M A X(M Y, N Y)+M P R E)\). If LW ORK indicates a w orkspace that is too sm all, the routine will allocate its ow n w ork.space. If the
FFT is notused, the value of LW ORK is unim portant.

\section*{NOTES/BUGS}

It is know \(n\) that there exists another representation of the com pressed sparse colum n form at (see forexam ple Y Saad, "IterativeM ethods forSparse LinearSystem s", W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. Them ain difference is that only one array, \(\mathbb{I A}\), containing the pointers to the beginning of each colum \(n\) in the arrays VA L and \(\mathbb{N} D \mathrm{X}\) is used instead oftw o arraysPN TRB and PN TRE.To use the routine \(w\) th this kind of sparse colum \(n\) form at the follow ing calling sequence should be used

http://w w w netlib.org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. No test for singularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.
2. If U N ITD \(=4\), the routine scales the row sofA such that their 2 -norm sare one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD \(=2\) should be used for the next calls to the routine w ith overw ritten VA L and DV .

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise \(W O R K(1)=-i w\) here \(i\) is the row num berw hich 2 -norm is exactly zero.
3. If \(D E S C R A(3)=1\) and \(U N\) ITD \(<4\), the unitdiagonalelem ents m ightorm ightnotbe referenced in the D IA representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD = 4, the unit diagonalelem ents M U ST be referenced in the \(D \mathbb{I A}\) representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse
m atrix \(A\) is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

void sdisna (char job, intm , intn, float *d, float *sep, int*info);
void sdisna_64 (char jंjb, long m, long n, float *d, float *sep, long *info);

\section*{PURPOSE}
sdisna com putes the reciprocal condition num bers for the eigenvectors of a realsym m etric or com plex H erm itian m atrix orforthe left or rightsingular vectors of a general m-by-n matrix. The reciprocalcondition num ber is the gap' betw een the corresponding eigenvalue or singular value and the nearest other one.

The bound on the error, \(m\) easured by angle in radians, in the I-th com puted vector is given by

SLAMCH (E')* (ANORM /SEP (I))
where ANORM \(=2\) norm \((A)=m a x(\operatorname{abs}(D(\mathcal{D}))\) ). SEP (I) is not allow ed to be sm allerthan SLAM CH (E')*ANORM in orderto lim it the size of the errorbound.

SD ISN A m ay also be used to com pute enrorbounds for eigenvectors of the generalized sym \(m\) etric definite eigenproblem .

\section*{ARGUMENTS}

JOB (input)
Specifies forw hich problem the reciprocal condition num bers should be com puted:
\(=\mathrm{E}\) ': the eigenvectors of a sym m etric/H erm titian m atrix;
= IL ': the leftsingular vectors of a general
\(m\) atrix;
\(=\mathrm{R}\) ': the rightsingularvectors of a general \(m\) atrix.
\(M\) (input) The num ber of row \(s\) of the \(m\) atrix. \(M>=0\).

N (input) If \(\mathrm{OB}=\mathrm{L}\) 'or R ', the num ber of colum ns of the \(m\) atrix, in which case \(N>=0\). Ignored if \(J O B=\) E'

D (input) dim ension ( \(m\) in \(M, N\) )) if \(30 B=L\) ' or \(R^{\prime}\) The eigenvalues (if \(\mathrm{JOB}=\mathrm{E}\) ) or singular values (if \(J O B=L\) ' or \(R\) ) of the matrix, in either increasing or decreasing order. If singular values, they \(m\) ustbe non-negative.

SEP (output)
dimension ( \(m\) in \((M, N)\) ) if \(J O B=L^{\prime}\) or \(R^{\prime}\) The reciprocal condition num bers of the vectors.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value.

C 0 rectangular array w ith first dim ension LD C .
LD C leading dim ension ofC

```
    W ORK () scratch amay of length LW ORK.
        On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .
Forgood penform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M}\) *N_CPUS where N_CPUS is the m axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of theW ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SEE ALSO}

N IST FO RTRA N Sparse B las U ser's G uide available at:
http://m ath nistgov/m cso/Staff/k Rem ington/tspblas/

htep://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such tests \(m\) ustbe perform ed before calling this routine.
2. IfUN ITD \(=4\), the routine scales the row s of \(A\) such that their 2 -nom s are one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the row num berw hich 2 -norm is exactly zero.
3. If \(\operatorname{DESCRA}(3)=1\) and U N ITD < 4, the unitdiagonalelem ents \(m\) ightorm ightnotbe referenced in the ELL representation of a sparse m atrix. They are notused anyw ay in these cases.

ButifUN ITD \(=4\), the unit diagonalelem ents M U ST be referenced in the ELL representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

\section*{C INTERFACE}
\#include <sunperfh>
void sfftc_ (int*iopt, int *n, float *scale, float * x , com plex *y, float *trigs, int *ifac, float *w ork, int *lw ork, int *ient);
void sfftc_64_ long *iopt, long *n, float *scale, float *x, com plex *y, float *trigs, long *ifac, float *w ork, long *lw ork, long *ienc);

\section*{PURPOSE}
sfftc initializes the trigonom etric w eight and factor tables or com putes the forw ard FastFourier Transform of a real sequence as follow \(s\) :

N-1
\(Y(k)=\) scale * SUM W *X (i)
\(=0\)
where
\(k\) ranges from 0 to \(N-1\)
\(i=\operatorname{sqrt}(-1)\)
isign \(=-1\) for forw ard transform
\(W=\exp \left(i s i g n \star i^{\star} j^{\star} k \star 2 * p i N N\right)\)
In real-to-com plex transform of length \(N\), the \((\mathbb{N} / 2+1)\) com plex output data points stored are the positive-frequency half of the spectrum of the D iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is notstored.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:

IO PT \(=0\) com putes the trigonom etric \(w\) eight table and factor table
IO PT = -1 com putes forw ard FFT

N (input)
Integer specifying length of the input sequence X . N is \(m\) ostefficientw hen it is a product of sm all prim es. \(\mathrm{N}>=0\). U nchanged on exit.

SCALE (input)
Real scalarby w hich transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 \(\mathbb{I N}\) TERFACE.

X (input) On entry, X is a realaray whose first N elem ents contain the sequence to be transform ed.

Y (output)
C om plex array w hose first \(\mathbb{N} / 2+1\) ) elem ents contain the transform results. \(X\) and \(Y m\) ay be the sam \(e\) array starting at the sam e mem ory location, in which case the dimension of X ust.be at least \(2^{*}(\mathbb{N} / 2+1)\). O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

TR IG S (input/output)
Realarray of length \(2 * \mathrm{~N}\) that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called with IOPT = 0 and they are used in subsequent calls when IOPT \(=-1\). U nchanged on exit.

FAC (input/output)
Integer array of dim ension at least 128 that contains the factors of \(N\). The factors are com puted when the routine is called w ith IO PT = 0 and they are used in subsequent calls where \(10 P T=-1\). U nchanged on exit.

W ORK (w orkspace)
Realarray of dim ension at leastN. The user can also choose to have the routine allocate its ow n w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. If LW ORK \(=0\), the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E} R R\) has one of the follow ing
values:
0 = norm alretum
\(-1=10 P T\) is not 0 or -1
\(-2=\mathrm{N}<0\)
\(-3=(L W O R K\) is not 0) and (LW ORK is less than N)
\(-4=m\) em ory allocation forw orkspace failed

In real-to-com plex transform of length N 1 , the \(\mathbb{N} 1 / 2+1\) ) com -
plex output data points stored are the positive-frequency
half of the spectrum of the \(D\) iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is not stored.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric weight table and factor table
IO PT = -1 com putes forw ard FFT
N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es \(\mathrm{N} 2>=0\). U nchanged on exit.

SCA LE (input)
Real scalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 \(\mathbb{I N}\) TERFACE.

X (input) X is a com plex array ofdim ensions (LD \(\mathrm{X}, \mathrm{N} 2)\) that contains input data to be transform ed. X and Y can be the sam e array.

LD X (input)
Leading dim ension of X . LD X >=N1 if X is not the sam e aray as Y.Else, LD X = 2*LD Y. U nchanged on exit.

Y (output)
Y is a com plex array ofdim ensions (LD Y,N2) that contains the transform results. \(X\) and \(Y\) can be the sam e array starting at the sam \(e m e m\) ory location, in which case the inputdata are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y (input)

Leading dim ension of \(Y\). LD \(Y>=N 1 / 2+1\) U nchanged on exit.

TRIGS (input/output)
Real array of length \(2 *(N 1+N 2)\) that contains the trigonom etric weights. The weights are com puted when the routine is called w ith IO PT = 0 and they are used in subsequent calls when IOPT \(=-1\).
U nchanged on exit.
IFAC (input/output)
Integerarray ofdim ension at least \(2 * 128\) that contains the factors of 1 and N2. The factors are com puted when the routine is called w ith IO PT
= 0 and they are used in subsequent calls w hen
IO PT \(=-1\). U nchanged on exit.
W ORK (w orkspace)
Real array of dimension at least MAX N1, \(2 *\) N 2 ) \({ }^{\text {N }}\) CPU S, where NCPU \(S\) is the num berof threads used to execute the routine. The user can also choose to have the routine allocate its own w orkspace (see LW ORK).

LW ORK (input)
Integer specifying workspace size. If LW ORK = 0, the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=\mathbb{I O P T}\) is not0 or -1
\(-2=\mathrm{N} 1<0\)
\(-3=N 2<0\)
\(-4=(L D X<N 1)\) or (LD X notequal2*LD \(Y\) when \(X\) and
\(Y\) are sam e array)

W \(3=\exp \left(\right.\) isign*i* \(\left.{ }^{2} * k 3 * 2 * p i N 3\right)\)

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric weight table and factor table
IO \(P T=-1\) com putes forw ard FFT

N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a product ofsm allprim es. N \(2>=0\). U nchanged on exit.
N 3 (input)
Integer specifying length of the transform in the third dim ension. N 3 ism ostefficientw hen it is a productofsm allprim es. N \(3>=0\). U nchanged on exit.

SCALE (input)
Realscalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 \(\mathbb{N}\) TERFACE.

X (input) X is a real array ofdim ensions (LD X 1, LD X 2, N 3)
that contains inputdata to be transform ed. \(X\) can be sam e array as \(Y\).

LD X 1 (input)
first dim ension ofX. If \(X\) is notsame array as
Y, LDX1 >= N1 Else, LDX1 = 2*LD Y 1 Unchanged on exit.

LD X 2 (input)
second dim ension of X. LD X 2 >= N 2 U nchanged on exit.

Y (output)
Y is a com plex aray of dim ensions (LD Y 1, LD Y 2,
N 3 ) that contains the transform results. \(X\) and \(Y\)
can be the sam e array starting at the sam e \(m\) em ory location, in which case the input data are overw rilten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y 1 (input)
firstdin ension ofY. LD Y \(1>=\mathrm{N} 1 / 2+1\) U nchanged on
exit.
LD Y 2 (input)
second dim ension of \(Y\). If \(X\) and \(Y\) are the sam \(e\) aray, LD Y 2 = LD X 2 Else LD Y 2 >= N 2 U nchanged on exit.

TR IG S (input/output)
Realarray of length \(2 *(\mathbb{N} 1+\mathrm{N} 2+\mathrm{N} 3\) ) that contains the trigonom etric w eights. The weights are com puted w hen the routine is called w ith \(\mathbb{I D}\) PT \(=0\) and they are used in subsequent calls when IO PT \(=-1\). U nchanged on exit.

IFAC (input/output)
Integeramay ofdim ension at least \(3 * 128\) that contains the factors of N1, N2 and N3. The factors are com puted w hen the routine is called w ith IOPT \(=0\) and they are used in subsequent calls when \(\mathbb{I O P T}=-1\). U nchanged on exit.

W ORK (w orkspace)
Realarray of dim ension at least MAX \(\mathbb{N}, 2 * N 2,2 * N 3\) )
\(+16 * N 3)\) * NCPUS where NCPUS is the num berof
threads used to execute the routine. The user can
also choose to have the routine allocate its ow \(n\)
w orkspace (see LW ORK).
LW ORK (input)
Integer specifying w orkspace size. If LW ORK = 0, the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=10\) PT is not 0 or -1
\(-2=\mathrm{N} 1<0\)
\(-3=\) N \(2<0\)
\(-4=\) N \(3<0\)
\(-5=(\mathbb{L D X} 1<\mathrm{N} 1)\) or ( \(\mathbb{L D} \mathrm{X}\) notequal \(2 *\) LD Y when X
and \(Y\) are sam e array)
\(-6=(\mathrm{LDX} 2<\mathrm{N} 2)\)
\(-7=(\mathbb{L D} Y 1<N 1 / 2+1)\)
\(-8=(L D Y 2<N 2)\) or (LDY 2 notequal LD X 2 when \(X\) and \(Y\) are sam e anray)
\(-9=(L W O R K\) not equal 0) and (LW ORK <
(MAX (N,2*N2,2*N3) + 16*N 3) *N CPUS)
\(-10=m\) em ory allocation failed

\section*{SEE ALSO}
ff

\section*{CAUTIONS}

This routine uses \(Y(\mathbb{N} 1 / 2+1)+1: \operatorname{LD} Y 1,:,:\) ) as scratch space. Therefore, the original contents of this subaray w illbe
lost upon retuming from routine while subaray Y \((1: N 1 / 2+1,1 \mathbb{N} 2,1: N 3)\) contains the transform results.

*ldy, float *trigs, long *ifac, float *w ork, long
*ly ork, long *ienr);

\section*{PURPOSE}
sfftom initializes the trigonom etric weight and factor tables orcom putes the one-dim ensional forw ard FastFourier Transform of a set of real data sequences stored in a tw o-dim ensionalarray:

N 1-1
\(Y(k, l)=\) scale * SUM W *X (jl)
\[
\dot{j} 0
\]
where
\(k\) ranges from 0 to N 1-1 and lranges from 0 to N 2-1
\(i=\operatorname{sqrt}(-1)\)
isign \(=-1\) for forw ard transform
\(W=\exp \left(i s i g n * i^{\star}{ }^{j} \star k * 2 \star\right.\) piN 1)
In real-to-com plex transform of length \(N 1\), the \((N 1 / 2+1)\) com -
plex output data points stored are the positive-frequency half of the spectrum of the discrete Fourier transform. The other half can be obtained through com plex conjugation and therefore is not stored.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric weight table and factor table
IO \(P T=-1\) com putes forw ard FFT

N 1 (input)
Integer specifying length of the input sequences. N 1 is m ostefficientw hen it is a productofsm all prim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integerspecifying num ber of input sequences. N 2 \(>=0\). U nchanged on exit.

SCALE (input)
Real scalarby which transform results are scaled. U nchanged on exit. SCA LE is defaulted to 1.0 for F95 \(\mathbb{I N}\) TERFACE.

X (input) X is a realarray of dim ensions (LD \(\mathrm{X}, \mathrm{N} 2\) ) that contains the sequences to be transform ed stored in its colum ns.

LD X (input)
Leading dim ension of \(X\). If \(X\) and \(Y\) are the same aray, LDX \(=2 *\) LD E Else LD \(\mathrm{X}>=\mathrm{N} 1\) U nchanged on exit.

Y (output)
\(Y\) is a com plex array ofdim ensions (LD Y ,N 2) that contains the transform results of the input sequences. \(X\) and \(Y\) can be the sam e array starting at the sam e \(m\) em ory location, in which case the input sequences are overw rilten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD \(Y\) (input)
Leading dim ension of \(\mathrm{Y} . \operatorname{LD} \mathrm{Y}>=\mathrm{N} 1 / 2+1\) U nchanged on exit.

TRIG S (input/output)
Realarray of length \(2 * \mathrm{~N} 1\) that contains the trigonom etric w eights. The w eights are com puted w hen
the routine is called \(w\) ith IO PT \(=0\) and they are used in subsequent calls when IOPT \(=-1\). U nchanged on exit.

FAC (input/output)
Integer array of dim ension at least 128 that contains the factors of 1 . The factors are com puted when the routine is called w ith IO PT = 0 and they are used in subsequent calls when IOPT \(=-1\). U nchanged on exit.

W ORK (w orkspace)
Real array ofdim ension at least 1 1. The user can also choose to have the routine allocate its ow \(n\) w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. If LW ORK = 0,
the routine w illallocate its ow n w orkspace.
ERR (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
\(0=\) norm alretum
\(-1=\mathbb{1 O P T}\) is not 0 or -1
\(-2=\mathrm{N} 1<0\)
\(-3=N 2<0\)
\(-4=(\mathbb{L D X}<\mathrm{N} 1)\) or (LDX notequal2*LD \(Y\) when \(X\) and
Y are sam e array)
\(-4=(\mathbb{L D Y}<\mathrm{N} 1 / 2+1)\)

\section*{PURPOSE}
sgbbrd reduces a realgeneralm \(-b y-n\) band \(m\) atrix \(A\) to upper bidiagonal form B by an orthogonaltransform ation: Q '* A * \(P=B\).

The routine com putes B, and optionally form s Q or P', or com putes \(Q\) *C for given \(m\) atrix \(C\).

\section*{ARGUMENTS}

\section*{VECT (input)}

Specifies w hether ornot the \(m\) atrices \(Q\) and \(P\) 'are
to be form ed. = N ': do not form Q orP ';
\(=Q\) ': form Q only;
= P ': form P 'only;
= B ': form both.

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of Colm ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NCC (input)
The num berof colum ns of the m atrix C. NCC \(>=0\).

KL (input)
The num ber of subdiagonals of them atrix A . K L >= 0.

KU (input)
The num ber of superdiagonals of the m atrix A. K U \(>=0\).

AB (input/output)
REA L array, dim ension (LD A B N ) On entry, the m -by-n band \(m\) atrix \(A\), stored in row \(s 1\) to \(K L+K U+1\). The \(j\) th column ofA is stored in the \(j\) th column of the array AB as follow s: AB \((k u+1+i-j)=A(i, j)\) form ax \((1, j k u)<=i<=m\) in \((m, j+k l)\). On exit, \(A\) is overw ritten by values generated during the reduction.

LDAB (input)
The leading dim ension of the array A. LD AB >= K L+KU+1.

D (output)
REAL array, dim ension ( \(m\) in \(M, N\) )) The diagonal ele\(m\) ents of the bidiagonalm atrix B .

E (output)
REAL array, dim ension ( \(m\) in \(M, N\) )-1) The superdiagonalelem ents of the bidiagonalm atrix \(B\).

Q (output)
REAL array, dim ension (LD Q M ) IfVECT = Q 'or B', the \(m\) by \(m\) orthogonalm atrix \(Q\). IfVECT \(=N\) 'or P ', the array Q is not referenced.

LDQ (input)
The leading dim ension of the array \(Q\). LDQ >= \(m a x(1, M)\) ifVECT \(=Q\) 'or \(B\) '; LD \(Q>=1\) otherw ise.

PT (output)
REAL array, dim ension (LDPT,N) If VECT = P' or B ', the n -by-n orthogonalm atrix \(\mathrm{P}^{\prime}\). IfVECT \(=\) \(N\) 'or \(Q\) ', the anay PT is not referenced.

LDPT (input)
The leading dim ension of the array PT. LD PT >= \(\max (1, N)\) if VECT = P'or B ; LDPT >= 1 otherw ise.

C (input/output)
REAL array, dim ension (LD C NCC) On entry, an m-byncc \(m\) atrix \(C\). On exit, \(C\) is overw ritten by \(Q\) *C .
\(C\) is not referenced if \(\mathrm{NCC}=0\).
LD C (input)

The leading dim ension of the array \(C\). LD \(C>=\) \(\max (1, M)\) if \(N C C>0 ; L D C>=1\) if \(N C C=0\).
W ORK (w orkspace)
REAL array, dim ension ( \(2 *\) M AX M \(N\) ))
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.

\#include <sunperfh>
void sgbcon (charnorm, intn, intnsub, int nsuper, float
*a, int lda, int *ipivot, float anorm, float
*rcond, int*info);
void sgbcon_64 (charnorm , long n, long nsub, long nsuper, float *a, long lda, long *ipivot, floatanorm, float *roond, long *info);

\section*{PURPOSE}
sgbcon estim ates the reciprocal of the condition num ber of a real general band m atrix A, in either the 1 -nom orthe infinity-norm, using the LU factorization computed by SGBTRF .

A \(n\) estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as
\(\operatorname{RCOND}=1 /(\operatorname{norm}(A) * \operatorname{norm}(\operatorname{inv}(A)))\).

\section*{ARGUMENTS}

NORM (input)
Specifies w hether the 1-norm condition num ber or the infinity-norm condition num ber is required:
= I'or \(\mathrm{D}^{\prime}\) : 1-norm;
= \(\mathrm{I}^{\prime}: \quad\) Infinity-norm .

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

N SUB (input)
The num ber of subdiagonals \(w\) thin the band of \(A\).
N SUB \(>=0\) 。

\section*{N SU PER (input)}

The num ber of superdiagonals w ithin the band of A. N SU PER \(>=0\).

A (input) D etails of the LU factorization of the band \(m\) atrix A, as com puted by SGBTRF. U is stored as an upper triangularband \(m\) atrix \(w\) ith N SU B \(+N\) SU PER superdiagonals in row s 1 to NSUB+NSUPER+1, and them ultipliers used during the factorization are stored in row sN SU B +N SU PER + 2 to \(2 *\) N SU B + N SU PER +1 .

LD A (input)
The leading dim ension of the anay A. LDA >= \(2 *\) N SU B + N SU PER +1 .
\(\mathbb{P I V O T}\) (input)
The pivot indices; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P}\) IV OT (i).

ANORM (input)
IfNORM = ' 1 'or 0 ', the 1 -norm of the original \(m\) atrix \(A\). IfNORM = \(I\) ', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition number of the \(m\) atrix \(A\), com puted as RCOND \(=1 /(\) norm (A) * nom (inv (A))).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )

void sgbequ_64 (long m, long n, long kl, long ku, float *a, long lda, float * \(r\), float * c, float *row cn, float *colen, float *am ax, long *info);

\section*{PURPOSE}
sgbequ com putes row and colum \(n\) scalings intended to equilibrate an M boy-N band m atrix A and reduce its condition num ber. \(R\) retums the row scale factors and \(C\) the colum \(n\) scale factors, chosen to try to \(m\) ake the largestelem ent in each row and colum \(n\) of the \(m\) atrix \(B \quad w\) ith elem ents \(B(i, j)=R(i) \star A(i, j) * C(i)\) have absolute value 1.

R (i) and C (i) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N UM = largestsafe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

K L (input)
The num ber of subdiagonals \(w\) thin the band of \(A\). \(\mathrm{KL}>=0\) 。

KU (input)
The num ber of superdiagonals \(w\) thin the band of \(A\). \(K U>=0\) 。

A (input) The band \(m\) atrix \(A\), stored in row 1 to \(K L+K U+1\). The \(j\) th colum \(n\) of \(A\) is stored in the \(j\) th column of the array \(A\) as follow s: A \((k u+1+i-j, j)=A(i, j)\)
form ax \((1, j \mathrm{j} k)<=i<=m\) in \((m, j+k l)\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(K L+K U+1\).

R (output)
If \(\mathbb{N} F O=0\), or \(\mathbb{N} F O>M, R\) contains the row scale
factors forA.
C (output)
If \(\mathbb{N} F O=0, C\) contains the colum \(n\) scale factors forA.
ROW CN (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R O W C N\) contains the ratio
of the sm allest \(R\) (i) to the largest \(R\) (i). If
ROW CN >= 0.1 and AM AX is neither too large nor too
sm all, it is notw orth scaling by \(R\).
COLCN (output)
If \(\mathbb{N} F O=0, C O L C N\) contains the ratio of the sm allest C (i) to the largestC (i). IfC OLCN >=0.1, it is notw orth scaling by \(C\).

\section*{AM AX (output)}

A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the m atrix should be scaled.
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum ent had an illegalvalue
>0: if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{M}\) : the i-th row ofA is exactly zero
> M : the ( \(j-\mathrm{M}\) ) -th collum n ofA is exactly zero

\#include <sunperfh>
void sgbm v (chartransa, intm, intn, intnsub, int nsuper, float alpha, float *a, int lda, float *x, int incx, floatbeta, float *y, int incy);
void sgbm v_64 (chartransa, long m, long n, long nsub, long nsuper, float alpha, float *a, long lda, float *x, long incx, floatbeta, float *y, long incy);

\section*{PURPOSE}
sgbom v perform s one of the \(m\) atrix-vector operations \(y:=\) alpha*A *x + beta*y ory := alpha*A *x + beta*y, w here alpha and beta are scalars, \(x\) and \(y\) are vectors and \(A\) is an \(m\) by \(n\) band m atrix, w ith nsub sub-diagonals and nsupersuperdiagonals.

\section*{ARGUMENTS}

TRANSA (input)
On entry, TRAN SA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} y:=\) alpha*A * \(\mathrm{x}+\) beta* \(^{\mathrm{y}}\).

TRANSA \(=\) T'or \(t^{\prime} \mathrm{y}:=\) alpha*A \({ }^{*} \mathrm{x}+\) beta* y .

TRANSA \(=C^{\prime}\) or \(C^{\prime} y:=\) alpha*A *x + beta* \(y\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input)
O n entry, M specifies the num ber of row s of the \(m\) atrix \(A . M>=0\). U nchanged on exit.

N (input)

O n entry, \(N\) specifies the num ber of colum ns of the \(m\) atrix \(A . N>=0\). U nchanged on exit.

NSUB (input)
On entry, NSUB specifies the number of subdiagonals of them atrix A.NSUB \(>=0\). U nchanged on exit.

N SU PER (input)
On entry, N SU PER specifies the num ber of superdiagonals of the m atrix A. N SU PER \(>=0\). U nchanged on exit.
ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry, the leading (nsub + nsuper+1) by \(n\) part of the array A m ust contain the matrix of coefficients, supplied colum \(n\) by colum \(n\), with the leading diagonal of the \(m\) atrix in row (nsuper+ 1 ) of the array, the first super-diagonal starting at position 2 in row nsuper, the firstsubdiagonal starting atposition 1 in row (nsuper + 2 ), and so on. Elem ents in the array A that do not comespond to elem ents in the band matrix (such as the top leftnsuperby nsupertriangle) are not referenced. The follow ing program segm ent w ill transfer a band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\text { DO } 20, \mathrm{~J}=1, \mathrm{~N}
\]
\[
K=N S U P E R+1-J
\]
\[
\text { DO } 10, I=\text { M AX }(1, J-N \text { SU PER }), M \mathbb{N}(M, J+
\]
N SUB )
\[
A(K+I, J)=m \operatorname{atrix}(I, J)
\]

10 CONTINUE
20 CONTINUE
U nchanged on exit.
LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A \(>=\) (
nsub + nsuper+ 1 ). U nchanged on exit.
X (input)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C X))\) when TRANSA \(=\mathrm{N}\) 'or
\(h^{\prime}\) and at least \((1+(m-1) * a b s(\mathbb{N} C X))\)
otherw ise. Before entry, the increm ented amay \(X\)
m ustcontain the vectorx. U nchanged on exit.
\(\mathbb{N C X}\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents ofX. \(\mathbb{N} C X<>0\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then \(Y\) need notbe set on input. U nchanged on exit.

Y (input/output)
\((1+(m-1) \star \operatorname{abs}(\mathbb{N} C Y))\) when TRANSA \(=\mathrm{N}\) 'or \(h^{\prime}\) and at least \((1+(n-1) * a b s(\mathbb{N} C Y))\)
otherw ise. Before entry, the increm ented array \(Y\) m ust contain the vectory. On exit, Y is overw ritten by the updated vectory.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
sgbris im proves the com puted solution to a system of linear equations when the coefficientm atrix is banded, and provides errorbounds and backw ard error estim ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system ofequations:
\(=\mathrm{N}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad(\mathrm{N}\) o transpose)
\(=T{ }^{\prime}: A * * T X=B \quad\) (Transpose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran -
spose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

K L (input)

The num berof subdiagonals w ithin the band of A. \(K L>=0\).

KU (input)
The num ber of superdiagonals within the band of A. \(K U>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrioes \(B\) and \(X\). NRH \(S>=0\).

A (input) The originalband m atrix A, stored in row s 1 to \(K L+K U+1\). The \(j\) th column ofA is stored in the \(j\) th colum n of the array A as follow s: A (ku+1+i\(j, j)=A(i, j)\) form ax \((1, j \mathrm{jku})<=i<=m\) in \((n, j+k l)\).

LD A (input)
The leading dim ension of the array A. LDA >= K L+KU+1.

AF (input)
D etails of the LU factorization of the band \(m\) atrix A , as com puted by SG BTRF. U is stored as an upper triangularband \(m\) atrix \(w\) th \(K L+K U\) superdiagonals in row \(s 1\) to \(K L+K U+1\), and the \(m\) ultipliers used during the factorization are stored in row S \(K L+K U+2\) to \(2 * K L+K U+1\).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(2 * K L * K U+1\).
\(\mathbb{P I V O T}\) (input)
The pivotindices from SGBTRF; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P}\) IV OT (i).
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SGBTRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X . LDX >= \(\max (1, N)\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O}), \operatorname{FERR}(\underset{)}{(1)}\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in \((X(\mathcal{J})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(\mathrm{X}(\mathcal{j})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard emror of each solution vector \(X\) (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)

\section*{PURPOSE}
sgbsv com putes the solution to a real system of linearequations A * \(X=B\), where A is a band \(m\) atrix of orderN w th K L subdiagonals and \(K U\) superdiagonals, and \(X\) and \(B\) are \(N\)-byN RH S m atriges.

The LU decom position \(w\) ith partialpivoting and row interchanges is used to factorA asA \(=\mathrm{L} * \mathrm{U}\), where L is a product of perm utation and unit low er triangularm atrices \(w\) ith \(K L\) subdiagonals, and \(U\) is uppertriangularw ith K L+K U superdiagonals. The factored form of \(A\) is then used to solve the system of equations \(A * X=B\).

\section*{ARGUMENTS}

N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

KL (input)
The num ber of subdiagonals w ithin the band of A. \(K L>=0\).

KU (input)
The num ber of superdiagonals \(w\) ithin the band of \(A\). \(K U>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS >=0.

A (input/output)
On entry, the m atrix A in band storage, in row s
\(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the anay need notbe set. The \(j\) th column of A is stored in the \(j\) th collumn of the array A as follows: \(A(K L+K U+1+i-j, j)=A(i, j)\) for \(\max (1, j\) \(K U)<=i<=m\) in ( \(N, j+K L\) ) On exit, details of the factorization: \(U\) is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row \(s 1\) to \(K L+K U+1\), and the \(m\) ultipliers used during the factorization are stored in rows \(K L+K U+2\) to \(2 \star K L+K U+1\). See below for further details.

LD A (input)
The leading dim ension of the array A. LDA >= \(2 * K L+K U+1\).
\(\mathbb{P I V O T}\) (output)
The pivot indices that define the perm utation \(m\) atrix \(P\); row i of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P I V O T}\) (i).

B (input/output)
On entry, the \(N-b y-N R H S\) righthand sidem atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the \(N\) by \(-N R H S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i, U(i, i)\) is exactly zero. The factorization has been com pleted, but the factor U is exactly singular, and the solution has notbeen com puted.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(M=N=6, K L=2, K U=1\) :

On entry: Onexit:
u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55 u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65 * a31 a42 a53 a64 * * m31 m 42 m 53 m 64 * *

A rray elem entsm arked * are notused by the routine; ele\(m\) entsm arked + need notbe seton entry, but are required by the routine to store elem ents of \(U\) because of fill-in resulting from the row interchanges.

\section*{C INTERFACE}
\#include <sunperfh>
void sgbsvx (char fact, chartransa, intn, intkl, int ku, int nrhs, float *a, int lda, float * af, int ldaf, int *ipivot, charequed, float * \(r\), float * C , float *b, int ldb, float *x, intldx, float*roond, float *ferr, float *berr, int *info);
void sgbsvx_64 (char fact, chartransa, long n, long kl, long
ku, long nıhs, float *a, long lda, float *af, long ldaf, long *ipivot, char equed, float *r, float *C, float*b, long ldb, float *x, long ldx, float *rcond, float *ferr, float *berr, long *info);

\section*{PURPOSE}
sgbsvx uses the LU factorization to com pute the solution to a real system of linear equations \(A * X=B, A * * T * X=B\), or \(A * * H * X=B, w h e r e A\) is aband \(m\) atrix of orderN w ith \(K L\) subdiagonals and KU superdiagonals, and X and B are N -byN R H S m atrioes.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed by this subroutine:
1. IfFACT \(=\) E', real scaling factors are com puted to equilibrate
the system :
TRANS \(=N^{\prime}: \operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C) \quad * \operatorname{inv}(\operatorname{diag}(C)) \star X=\) \(\operatorname{diag}(R) * B\)
\(\operatorname{TRANS}=T::(\operatorname{diag}(\mathbb{R}) \star A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C)*B

TRANS \(=C\) ': \((\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) \star X=\) diag (C)*B

W hether or not the system w illbe equilibrated depends on the scaling of the m atrix A , but ifequilibration is used, A is overw ritten by diag \((\mathbb{R}) \star A\) *diag \((C)\) and \(B\) by diag \((R) * B\) (if TRANS = N ) ordiag (C)*B (if TRANS = T'or C).
2. IfFACT \(=N\) 'or \(E\) ', the LU decomposition is used to factor the
\(m\) atrix A (afterequilibration ifFACT = E ) as
\[
A=L \star U
\]
where \(L\) is a productof perm utation and unit low er triangular
m atrioes w ith \(\mathrm{K} L\) subdiagonals, and U is upper triangular w ith
\(\mathrm{K} \mathrm{L}+\mathrm{K} \mathrm{U}\) superdiagonals.
3. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N F O}=i .0\) therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix A. If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N}\) FO \(=N+1\) is retumed as a w aming, but the routine stillgoes on
to solve for \(X\) and com pute error bounds as described below.
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for 五.
6. If equilibration w as used, the \(m\) atrix \(X\) is prem ultiplied by
\(\operatorname{diag}(C)\) (iftRANS = N ) ordiag \((\mathbb{R})\) (ifTRANS = T' or
C) so
that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether or not the factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, whether them atrix A should be equilibrated before it is factored. = \(\mathrm{F}^{\prime}:\) On entry, AF and \(\mathbb{P} \mathbb{I V O T}\) contain the factored form of . IfEQUED is not \(N\) ', the \(m\) atrix A has been equilibrated w ith scaling factors given by R and \(\mathrm{C} . \mathrm{A}, \mathrm{AF}\), and \(\mathbb{P}\) IV OT are not m odified. \(=\mathrm{N}\) ': Them atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) : The matrix A w ill be equilibrated if necessary, then copied to A F and factored.
TRANSA (input)
Specifies the form of the system ofequations. =
\(\mathrm{N}^{\prime}: A * X=\mathrm{B} \quad\) (Notranspose)
\(=T ': A * * T * X=B \quad\) ( ranspose)
\(=C\) ': \(A * * H * X=B \quad\) (Transpose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The num ber of linearequations, ie., the order of them atrix A. N >=0.

K L (input)
The num ber of subdiagonals \(w\) thin the band of \(A\). \(K L>=0\) 。

KU (input)
The num ber of superdiagonals \(w\) thin the band of \(A\).
\(K U>=0\) 。

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X . NRH S \(>=0\).

A (input/output)
O n entry, the \(m\) atrix A in band storage, in row s 1 to \(K L+K U+1\). The \(j\) th colum \(n\) ofA is stored in the \(j\) th colum \(n\) of the array A as follow s: A (KU+1+i\(j, j)=A(i, j)\) form ax \((1, j K U)<=i<=m\) in \((\mathbb{N}, j+k l)\)

IfFACT = F'and EQUED is not \(N\) ', then \(A\) must have been equilibrated by the scaling factors in \(R\) and/orC. A is notm odified if \(\mathrm{FACT}=\mathrm{F}^{\prime}\) or \(\mathrm{N}^{\prime}\),
orifFACT = E'andEQUED = N'on exit.

Onexit, ifEQUED ne. \(N\) ', A is scaled as follow s: \(E Q U E D=R 1: A:=\operatorname{diag}(R) * A\) EQUED = C': A :=A * diag (C)
EQUED \(=B: A=\operatorname{diag}(R) * A * \operatorname{diag}(C)\).

LD A (input)
The leading dim ension of the array A. LDA >= \(K L+K U+1\).

AF (input/output)
If \(F A C T=F\) ', then \(A F\) is an inputargum entand on entry contains details of the LU factorization of the band \(m\) atrix A, as com puted by SGBTRF. U is stored as an upper triangularband \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row \(s 1\) to \(K L+K U+1\), and the m ultipliers used during the factorization are stored in row \(s K L+K U+2\) to \(2 * K L+K U+1\). If EQUED ne. \(N\) ', then AF is the factored form of the equilibrated \(m\) atrix A.

IfFACT = N ', then \(A F\) is an output argum ent and on exit retums details of the LU factorization of A.

If \(F A C T=E\) ', then \(A F\) is an output argum ent and on exit retums details of the LU factorization of the equilibrated \(m\) atrix \(A\) (see the description of \(A\) for the form of the equilibrated \(m\) atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(2 * K L+K U+1\).

PIVOT (input)
IfFACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an input argum ent and on entry contains the pivot indioes from the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{U}\) as com puted by SGBTRF; row i of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P}\) IV OT (i).

IfFACT \(=\mathrm{N}\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indioes from the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{U}\) of the originalm atrix A .

IfFACT = E ', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivot indioes from the factorization \(A=L * U\) of the equilibrated \(m\) atrix A.

EQUED (input)
Specifies the form of equilibration thatw as done.
= \(\mathrm{N}^{\prime}\) : N o equilibration (alw ays true ifFACT =
N).
\(=R\) ': Row equilibration, ie., A has been
prem ultiplied by diag (R) = C ': C olum n equilibration, ie., A has been postm ultiplied by
diag (C). = B ': B oth row and colum \(n\) equilibra-
tion, ie., A has been replaced by diag \((\mathbb{R})\) * A * diag (C). EQUED is an inputargum entifFACT = F '; otherw ise, it is an output argum ent.
\(R\) (input/output)
The row scale factors forA. IfEQUED = R' or \(B\) ', \(A\) is multiplied on the left by diag \((R)\); if \(E Q U E D=N\) 'or \(C\) ', \(R\) is notaccessed. \(R\) is an input argum ent ifFACT = \(F\) '; otherw ise, \(R\) is an outputargum ent. IfFACT = \(\mathrm{F}^{\prime}\) and EQUED \(=\mathrm{R}\) 'or \(B\) ', each elem entofR m ustbe positive.

C (input/output)
The colum n scale factors for \(A\). IfEQ U ED = C 'or
B', A is multiplied on the rightby diag (C ) ; if EQUED = N 'or R', C is notaccessed. \(C\) is an input argum ent ifFACT=F'; otherw ise, \(C\) is an outputargum ent. IfFACT = F'and EQUED = C'or \(B\) ',each elem entof \(C\) ustbe positive.

B (input/output)
On entry, the righthand side m atrix B. On exit, ifEQUED \(=N^{\prime}\) ', \(B\) is notm odified; ifTRANSA \(=N^{\prime}\) and \(E Q U E D=R^{\prime}\) or \(B^{\prime}, B\) is overw ritten by \(\operatorname{diag}(R) * B\); ifTRANSA = T'or \(C^{\prime}\) and EQUED = \(C^{\prime}\) or \(B\) ', \(B\) is overw ritten by diag ( \(C\) )*B.

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, \mathbb{N})\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(\mathrm{N}-\) by -NRH S solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that \(A\) and \(B\) arem odified on exit if EQUED
ne. \(\mathrm{N}^{\prime}\), and the solution to the equilibrated
system is inv (diag (C ) ) \({ }^{2} \mathrm{X}\) if TRANSA \(=\mathrm{N}\) 'andEQUED
\(=C\) 'or \(B^{\prime}\),orinv \((\operatorname{diag}(R)) * X\) ifTRANSA \(=T\) 'or
\(C^{\prime}\) and \(E Q U E D=R\) 'or \(B '\).

LD X (input)
The leading dim ension of the array \(\mathrm{X} . \mathrm{LD} \mathrm{X}\) >= \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num ber of the \(m\) atrix \(A\) after equilibration (ifdone). If RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N} F O>0\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution conesponding to \(X(\mathcal{O})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{J})\)-X TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vector \(X\) ( \()\) ) (i.e., the \(s m\) allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 *\) N ) On exit, W ORK (1) contains the reciprocal pivot grow th factornorm (A)/nom (U). The "m ax absolute element" norm is used. If W ORK (1) ism uch less than 1 , then the stability of the LU factorization of the (equilibrated) m atrix A could be poor. This also \(m\) eans that the solution \(X\), condition estim atorRCOND, and forw ard error bound FERR could be unreliable. If factorization fails w ith \(0<\mathbb{N} F O<=N\), then \(W\) ORK (1) contains the reciprocal pivot grow th factor for the leading INFO colum nsofA.

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
< 0: if \(\mathbb{N N}\) FO = -i, the i-th argum ent had an illegalvahue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has been completed, but the factorU is exactly singular, so the solution and error bounds could
not be com puted. R COND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{PURPOSE}
sgbtf2 com putes an LU factorization of a real \(m\)-by-n band m atrix A using partialpivoting w ith row interchanges.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
KL (input)
The num ber of subdiagonals w ithin the band of A.
\(\mathrm{KL}>=0\).

KU (input)
The num ber of superdiagonals w ithin the band of A. \(K U>=0\).

AB (input/output)
O n entry, them atrix \(A\) in band storage, in row \(s\) \(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the anay need not.be set. The \(j\) th column ofA is stored in the \(j\) th column of the array AB as follows: \(A B(k l+k u+1+i-j, j)=A(i, j)\) for \(m a x(1, j\) \(\mathrm{ku})<=i<=m\) in \((\mathrm{m}, \mathrm{j}+\mathrm{kl})\)

On exit, details of the factorization: U is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row s 1 to \(K L+K U+1\), and the \(m u l-\) tipliers used during the factorization are stored in row s \(K L+K U+2\) to \(2 * K L+K U+1\). See below for furtherdetails.

The leading dim ension of the array A B . LD AB >=
\(2 * K L+K U+1\).

IPIV (output)
The pivot indices; for \(1<=i<=m\) in \(M, N\) ), row i of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P} \mathbb{V}\) (i).
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0\) : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue \(>0\) : if \(\mathbb{N} F O=+i, U(i, i)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, \(w\) hen \(M=N=6, K L=2, K U=1\) :

On entry: On exit:
```

    * * * + + + * * * u14 u25
    u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55
u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65
*
a31 a42 a53 a64 * * m 31 m 42 m 53 m 64 *

```
*

A ray elem entsm arked * are notused by the routine; ele\(m\) entsm arked + need notbe seton entry, but are required by the routine to store elem ents of \(U\), because of fill-in resulting from the row interchanges.

void sgbtrf(intm, intn, intkl, int ku, float *ab, int ldab, int *ipivot, int*info);
void sgbtrf_ 64 long m , long n, long kl, long ku, float *ab, long ldab, long *ipivot, long *info);

\section*{PURPOSE}
sgbtrf com putes an LU factorization of a real \(m\)-by-n band m atrix A using partialpivoting w ith row interchanges.

This is the blocked version of the algorithm, calling Level 3 BLAS.

\section*{ARGUMENTS}

M (input) Integer
The num ber of row s of the m atrix A. M \(>=0\).
N (input) Integer
The num berof 00 lum ns of the \(m\) atrix \(A . N>=0\).

K L (input) Integer
The num ber of subdiagonals w ithin the band of A. \(K L>=0\).

KU (input) Integer
The num ber of superdiagonals \(w\) ith in the band of A.
\(K U>=0\).
AB (input/output) Realarray ofdim ension (LD AB,N).
On entry, the \(m\) atrix \(A\) in band storage, in row \(s\) \(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the array need notbe set. The \(j\) th colum n of \(A\) is stored in the \(j\) th column of the array AB as follows: AB \((\mathbb{K} L+K U+1+I J, J)=A(I, N)\) for MAX \((1, J\) \(K U)<=\mathbb{K}=M \mathbb{N}(M, N+K L)\)

O n exit, details of the factorization: U is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row s 1 to \(K L+K U+1\), and the \(m u l-\) tipliers used during the factorization are stored in row \(S K+K U+2\) to \(2 * K L+K U+1\). See below for furtherdetails.

LD AB (input) Integer
The leading dim ension of the array AB. LDAB >= \(2 * K L+K U+1\).
\(\mathbb{P} \mathbb{I V O T}\) (output) Integerarray ofdim ension \(M \mathbb{I N} M, N\) )
The pivotindioes; for \(1<=I<=M \mathbb{N} M, N\) ), row \(I\) of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P I V O T}\) (I).
\(\mathbb{N}\) FO (output) Integer
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) I, the I-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=+\mathbb{I}, U(I, I)\) is exactly zero. The factorization has been com pleted, but the factorU is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(M=N=6, K L=2, K U=1\) :

On entry: On exit:
* * * + + + * * * u14 u25
u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55
u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65
*
a31 a42 a53 a64 * * m31 m 42 m 53 m 64 *
*

A ray elem entsm arked * are notused by the routine; ele\(m\) entsm arked + need notbe seton entry, but are required by the routine to store elem ents of \(U\) because of fill-in resulting from the row interchanges.

\section*{C INTERFACE}
\#include <sunperfh>
void sgebal(char jjb, intn, float *a, int lda, int *io, int *ihi, float *scale, int *info);
void sgebal 64 (char j̣b, long n, float*a, long lda, long *ilo, long *ihi, float *scale, long *info);

\section*{PURPOSE}
sgebalbalances a general real m atrix A. This involves, first, perm uting A by a sim ilarity transform ation to isolate eigenvalues in the first1 to \(\mathbb{H O}-1\) and last IH I+1 to N ele\(m\) ents on the diagonal; and second, applying a diagonalsim ilarity transform ation to row s and colum ns \(\mathbb{H} O\) to \(\mathbb{H}\) Ito \(m\) ake the row s and colum ns as close in norm aspossible. Both steps are optional.
\(B\) alancing \(m\) ay reduce the 1 -norm of the \(m\) atrix, and im prove the accuracy of the com puted eigenvalues and/or eigenvectors.

\section*{ARGUMENTS}

JOB (input)
Specifies the operations to be perform ed on A:
\(=\mathrm{N}^{\prime}\) : none: simply set \(\Pi \mathrm{O}=1, \mathrm{H} I=\mathrm{N}\), SCALE (I) \(=1.0\) for \(i=1, \ldots, N ;=P ':\) perm ute only;
\(=\mathrm{S}\) ': scale only;
\(=B\) ': both perm ute and scale.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O n entry, the inputm atrix A. On exit, A is overw rilten by the balanced \(m\) atrix. If \(\mathrm{OB}=\mathrm{N}^{\prime}\), A is not referenced. See FurtherD etails.

LD A (input)
The leading dim ension of the aray A. LD A >= \(\max (1, N)\).

ILO (output)
IHO and \(\mathbb{H}\) I are set to integers such thaton exit
\(A(i, j)=0\) if \(i>j a n d j=1, \ldots, I L O-1\) or \(I=\)
\(\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\). If \(\mathrm{OB}=\mathrm{N}\) 'or \(\mathrm{S}^{\prime}, \mathbb{I} \mathrm{HO}=1\) and \(\mathbb{H} \mathrm{I}\)
\(=\mathrm{N}\).
IH I (output)
See the description for IIO .
SCALE (output)
D etails of the perm utations and scaling factors applied to \(A\). IfP ( \(j\) ) is the index of the row and colum \(n\) interchanged \(w\) th row and colum \(n\) jand \(D(1)\) is the scaling factorapplied to row and column \(j\) then SCALE \((j)=P(j) \quad\) for \(j=1, \ldots, I L O-1=D(j)\) for \(j=\mathbb{L O}, \ldots, \mathbb{H} I=P(j) \quad\) for \(j=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L O} \mathrm{O}\).
\(\mathbb{I N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

The perm utations consist of row and column interchanges which put the \(m\) atrix in the form
\[
\left.\begin{array}{c}
(\mathrm{T} 1 \mathrm{X} \\
\mathrm{PAP}
\end{array}\right)=\left(\begin{array}{ll}
0 & \mathrm{~B} \\
\mathrm{P}
\end{array}\right) .
\]
where T1 and T2 are uppertriangularm atrices whose eigenvalues lie along the diagonal. The colum \(n\) indices \(\Pi \mathrm{HO}\) and IH Im ark the starting and ending colum ns of the subm atrix B. Balancing consists of applying a diagonal sim ilarity transform ation inv \((D) * B * D\) to \(m\) ake the 1 -norm \(s\) of each row of \(B\) and its comesponding colum n nearly equal. The outputm atrix is
\(\left(\begin{array}{lll}(11 & X * D & Y\end{array}\right)\)
\(\left(\begin{array}{lll}0 & \operatorname{inv}(D) * B * D & \operatorname{inv}(D) * Z\end{array}\right)\).
\(\left(\begin{array}{lll}0 & 0 & T 2\end{array}\right)\)

Inform ation about the perm utations P and the diagonalm atrix \(D\) is retumed in the vectorSCA LE.

This subroutine is based on the E ISPACK routine BA LANC.

void sgebrd_64 (long m, long n, float *a, long lda, float *d, float *e, float *tauq, float *taup, long *info);

\section*{PURPOSE}
sgebrd reduces a general realM -by \(-\mathrm{N} m\) atrix A to upper or low er bidiagonal form \(B\) by an orthogonaltransform ation: \(\mathrm{Q} * * \mathrm{~T} * \mathrm{~A} * \mathrm{P}=\mathrm{B}\).

Ifm \(>=n, B\) is upperbidiagonal; if \(m<n, B\) is low er bidiagonal.

\section*{ARGUMENTS}

M (input) The num ber of row s in the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns in them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the \(M-b y-N\) generalm atrix to be reduced. On exit, if \(m>=n\), the diagonal and the first superdiagonal are overw rilten w ith the upperbidiagonal m atrix B ; the elem ents below the diagonal, w th the array TAUQ , represent the orthogonal \(m\) atrix \(Q\) as a productofelem entary reflectors, and the elem ents above the first superdiagonal, w ith the amay TAUP, represent the orthogonal \(m\) atrix \(P\) as a productofelem entary reflectors; if \(\mathrm{m}<\mathrm{n}\), the diagonal and the first subdiagonalare overw ritten \(w\) ith the low er bidiagonal \(m\) atrix B; the elem ents below the first subdiagonal, w ith the array TAUQ, represent the orthogonalm atrix \(Q\) as a product ofelem entary reflectors, and the elem ents above the diagonal, with the array TA U \(P\), represent the orthogonalm atrix \(P\) as a product of elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= \(m a x(1, M)\).

D (output)
The diagonalelem ents of the bidiagonalm atrix B:
\(D(i)=A(i, i)\).

E (output)
The off-diagonalelem ents of the bidiagonalm atrix
\(B:\) ifm \(>=n, E(i)=A(i, i+1)\) for \(i=1,2, \ldots, n-\)
\(1 ;\) ifm \(<n, E(i)=A(i+1, i)\) for \(i=1,2, \ldots m-1\).

TAUQ (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix Q. See FurtherD etails.
TAUP (output)
The scalar factors of the elem entary reflectors which represent the orthogonal \(m\) atrix P. See FurtherD etails.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the aray \(W\) ORK. LW ORK \(>=\) \(\max (1, M, N)\). For optim um perform ance LW ORK >= \((M+N) \star N B, w h e r e N B\) is the optim alblocksize.

If LW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anay, retums this value as the first entry of the W ORK array, and no emorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

Them atrices \(Q\) and \(P\) are represented as products of elem entary reflectors:

Ifm \(>=n\),
\[
Q=H(1) H(2) \ldots H(n) \text { and } P=G(1) G(2) \ldots G(n-1)
\]

Each H (i) and G (i) has the form:
\(H(i)=I-\operatorname{tanq} * v^{*} v^{\prime}\) and \(G(i)=I-\operatorname{taup} * u^{*} u^{\prime}\)
w here tauq and taup are real scalars, and \(v\) and \(u\) are real vectors; \(\mathrm{v}(1: i-1)=0, \mathrm{v}(\mathrm{i})=1\), and \(\mathrm{v}(\mathrm{i}+1 \mathrm{~m})\) is stored on exitin \(A(i+1 \mathrm{~m}, \mathrm{i}) ; \mathrm{u}(1: i)=0, u(i+1)=1\), and \(u(i+2 \mathrm{~m})\) is stored on exit in A ( \(\mathbf{i}, \mathrm{i}+2 \mathrm{n}\) ); tauq is stored in TA U Q (i) and taup in TA UP (i).

Ifm \(<\mathrm{n}\),
\(Q=H(1) H(2) \ldots H(m-1)\) and \(P=G(1) G(2) \ldots G(m)\)

Each H (i) and G (i) has the form :
\(H(i)=I-\operatorname{tanq} * v^{*} v^{\prime}\) and \(G(i)=I-\operatorname{tanp} * u^{*} u^{\prime}\)
\(w\) here tauq and taup are realscalars, and \(v\) and \(u\) are real vectors; \(\mathrm{v}(1: i)=0, \mathrm{v}(\mathrm{i}+1)=1\), and \(\mathrm{v}(\mathrm{i}+2 \mathrm{~m})\) is stored on exitin \(A(i+2 m, i) ; u(1: i-1)=0, u(i)=1\), and \(u(i+1 m)\) is stored on exitin A ( \(\mathbf{i}, \mathrm{i}+1 \mathrm{n}\) ); tauq is stored in TA U Q (i) and taup in TA UP (i).

The contents ofA on exitare illustrated by the follow ing exam ples:
```

m = 6 and n=5 (m>n): m=5 and n=6 (m<n):
(d e ul ul u1) (d u1 u1 u1 u1
u1 )
( v1 d e u2 u2 ) ( e d u2 u2 u2
u2 )
( v1 v2 d e u3 ) ( v1 e d u3 u3
u3 )
( v1 v2 v3 d e ) ( v1 v2 e d u4
u4 )
( v1 v2 v3 v4 d ) ( v1 v2 v3 e d
u5 )
( v1 v2 v3 v4 v5 )

```
w here d and e denote diagonal and off-diagonal elem ents of \(B\), videnotes an elem ent of the vectordefining \(H\) (i), and ui an elem ent of the vectordefining G (i).

\section*{PURPOSE}
sgecon estim ates the reciprocal of the condition num berof a general real \(m\) atrix \(A\), in either the 1 -nom or the infinity-norm, using the LU factorization com puted by SGETRF.

A \(n\) estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as
\(\operatorname{RCOND}=1 /(\operatorname{norm}(A) *\) norm (inv (A))).

\section*{ARGUMENTS}

NORM (input)
Specifies w hether the 1-nom condition num ber or the infinity-norm condition num ber is required:
= 1 'or \(0^{\prime}\) : 1 -nom ;
= I': Infinity-norm .

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
A (input) The factors \(L\) and \(U\) from the factorization \(A=\) \(P * L * U\) as com puted by SGETRF.

LD A (input)
The leading dim ension of the amay A. LDA >= \(\max (1, \mathbb{N})\).

\section*{ANORM (input)}

IfNORM = 1 'or 0 ', the 1 -nom of the original
\(m\) atrix \(A\). IfNORM = \(I\) ', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition num ber of the
\(m\) atrix \(A\), computed as RCOND \(=1 /(\) norm (A) * norm (inv (A))).

W ORK (w orkspace)
dim ension ( \(4 * N\) )

W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvalue

\#include <sunperfh>
void sgeequ (intm , intn, float *a, int lda, float * \(r\), float
*c, float *row cn, float *colen, float *am ax, int *info);
void sgeequ_64 (long m, long n, float*a, long lda, float * \(r_{\text {, }}\) float * c, float *row cn, float *colen, float *am ax, long *info);

\section*{PURPOSE}
sgeequ com putes row and colum \(n\) scalings intended to equilibrate an M -by-N m atrix A and reduce its condition num ber. R retums the row scale factors and \(C\) the column scale factors, chosen to try to \(m\) ake the largestelem ent in each row and column of the \(m\) atrix \(B \quad w\) ith elements \(B(i, j)=R(i) \star A(i, j) \star C(i)\) have absolute value 1.

R (i) and C (i) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N UM = largest,safe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input) The \(M\) boy -N m atrix w hose equilibration factors are to be com puted.

LD A (input)
The leading dim ension of the amay A. LDA >= \(\max (1, M)\).

R (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R\) contains the row scale
factors forA.

C (output)

If \(\mathbb{N} F O=0, C\) contains the colum \(n\) scale factors forA.

ROW CN (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R O W C N\) contains the ratio of the sm allest \(R\) (i) to the largest \(R\) (i). If ROW CN >= 0.1 and AM AX is nether too large nortoo sm all, it is notw orth scaling by R .

COLCN (output)
If \(\mathbb{N} F O=0, C O L C N\) contains the ratio of the sm allest C (i) to the largestC (i). IfC O LCN >=0.1, it is notw orth scaling by \(C\).
AMAX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to underflow , the m atrix should be scaled.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvahue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{M}\) : the i-th row ofA is exactly zero
> M : the ( \((-\mathrm{M})\) )-th collum n ofA is exactly zero

void sgees (char jobz, char sortev, int (*select) (float,float), int n, float *a, int lda, int *nout, float *W r, float *W i, float *z, int ldz, int*info);
void sgees_64 (char jobz, char sortev, long (*select) (float,float), long n, float *a, long lda, long *nout, float*W r, float *w i, float *z, long ldz, long *info);

\section*{PURPOSE}
sgees com putes for an \(N\) boy- N realnonsym \(m\) etric \(m\) atrix \(A\), the eigenvalues, the real Schur form \(T\), and, optionally, the \(m\) atrix of Schurvectors \(Z\). This gives the Schur factorization \(A=Z * T *(Z * * T)\).

Optionally, italso orders the eigenvalues on the diagonal of the realSchur form so that selected eigenvalues are at the top left. The leading colum ns of \(Z\) then form an orthonorm albasis for the invariant subspace corresponding to the selected eigenvalues.

A matrix is in real Schur form if it is upper quasitriangularw th 1 -by-1 and 2 -by-2 blocks. 2 -by-2 blocks w ill be standardized in the form
[ a b ]
[ \(\left.\begin{array}{ll}\mathrm{c} & \mathrm{a}\end{array}\right]\)
where \(\mathrm{b}^{*} \mathrm{c}<0\). The eigenvalues of such a block are a +squt(bc).

\section*{ARGUMENTS}

JO BZ (input)
\(=\mathrm{N}\) ': Schurvectors are notcom puted;
\(=\mathrm{V}\) : Schurvectors are com puted.

SORTEV (input)
Specifies w hether or not to order the eigenvalues
on the diagonalof the Schur form . = N ': Eigenvalues are notordered;
\(=S\) ': Eigenvalues are ordered (see SELECT).

SELECT (input)
SELECT m ustbe declared EXTERNAL in the calling subroutine. If SORTEV \(=S^{\prime}\), SELECT is used to selecteigenvalues to sort to the top leftof the Schur form. If SORTEV = \(N^{\prime}\), SELECT is not referenced. A n eigenvalue W R ( 1\()+\operatorname{sqnt}(-1) * W I(1)\) is selected ifSELECT (W R ( 7 ) , \(\mathrm{N} I(\mathcal{j})\) ) is tue; ie., if either one of a com plex conjugate pair of eigenvalues is selected, then both com plex eigenvalues are selected. N ote that a selected com plex eigenvalue m ay no longer satisfy SELECT \((\mathbb{W} R(\mathcal{J}) \mathbb{W} I(\mathcal{J})=\) .TRUE.afterordering, since ordering may change the value of com plex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case \(\mathbb{N}\) FO is set to \(N+2\) (see \(\mathbb{N}\) FO below).

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).

A (input/output)
On entry, the \(N\) boy -N m atrix A. On exit, A has been overw ritten by its realSchur form \(T\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

NOUT (output)
If SORTEV = N',NOUT = 0. IfSORTEV = S', NOUT
= num ber of eigenvalues (aftersorting) forw hich
SELECT is true. (C om plex conjugate pairs forw hich
SELECT is true foreithereigenvalue countas 2.)

\section*{W R (output)}

W R and W I contain the real and im aginary parts, respectively, of the com puted eigenvahues in the sam e order that they appear on the diagonal of the output Schur form T. C om plex conjugate pairs of eigenvalueswill appear consecutively w ith the
eigenvalue having the positive in aginary part first.

W I (output)
See the description forW \(R\).
Z (output)
If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{Z}\) contains the orthogonalm atrix Z of Schurvectors. If \(J 0 \mathrm{BZ}=\mathrm{N}^{\prime}, \mathrm{Z}\) is notreferenced.
LD Z (input)
The leading dim ension of the array Z . LD \(\mathrm{Z}>=1\); if \(\mathrm{JO} \mathrm{BZ}=\mathrm{V}\) ', LD \(\mathrm{Z}>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) contains the optim al LDW ORK.

LDW ORK (input)
The dimension of the amay \(W\) ORK. LDW ORK >= \(m a x(1,3 \star N)\). For good perform ance, LDW ORK must generally be larger.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 3 (w orkspace)
dim ension ( N\() \mathrm{N}\) ot referenced if \(S O\) RTEV \(=\mathrm{N}^{\prime}\).
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
\(<=N\) : the Q R algorithm failed to com pute all the eigenvalues; elem ents \(1: \mathbb{H}-1\) and i+ \(1 \mathbb{N}\) ofW R and W I contain those eigenvalues which have converged; if \(J O B Z=V^{\prime}, Z\) contains the \(m\) atrix which reduces \(A\) to its partially converged Schur form . \(=\mathrm{N}+1\) : the eigenvalues could not be reordered because som e eigenvalues w ere too close to separate (the problem is very ill-conditioned); \(=\mathrm{N}+2\) : after reordering, roundoff changed values of som e com plex eigenvalues so that leading eigenvalues in the Schur form no longersatisfy SELECT=TRUE. This could also be caused by underflow due to scaling.

lda, float *W \(r\), float * w i, float * v , long ldvl, float *vr, long ldvr, long *info);

\section*{PURPOSE}
sgeev com putes for an \(N\)-by -N realnonsym \(m\) etric \(m\) atrix \(A\), the eigenvalues and, optionally, the left and/or righteigenvectors.

The righteigenvectorv \((\mathcal{I})\) of A satisfies
\[
\text { A * v ( } \mathcal{j})=\operatorname{lam} \operatorname{bda}(\mathcal{I}) * v(\mathcal{j})
\]
where lam bda ( \()\) ) is its eigenvalue.
The lefteigenvectoru ( \(\mathcal{F}\) ) of A satisfies
\(u()^{* *} \mathrm{H} * \mathrm{~A}=\operatorname{lam} \operatorname{bda}(\mathrm{\jmath}){ }^{*} \mathrm{u}()^{* * *} \mathrm{H}\)
where \(u(\mathcal{j}){ }^{* *}\) H denotes the conjugate transpose of \(u(j)\).
The com puted eigenvectors are norm alized to have Euclidean norm equal to 1 and largestcom ponent real.

\section*{ARGUMENTS}
\(J 0 \mathrm{BVL}\) (input)
\(=N\) : lefteigenvectors of A are not com puted;
= V': lefteigenvectors of A are com puted.
JOBVR (input)
= N ': righteigenvectors of A are not com puted;
= V ': righteigenvectors of A are com puted.
N (input) The order of the matrix A. \(\mathrm{N}>=0\).
A (input/output)
On entry, the \(\mathrm{N}-\) by -N m atrix A. On exit, A has been overw ritten.

LD A（input）
The leading dim ension of the array A．LDA＞＝ \(\max (1, N)\) ．

\section*{W R（output）}

W R and W Icontain the real and im aginary parts， respectively，of the com puted eigenvalues．Com－ plex conjugate pairs of eigenvalues appear con－ secutively w ith the eigenvalue having the positive im aginary part first．

W I（output）
See the description forW R ．
VL（output）
If \(\mathrm{OOBVL}=\mathrm{V}\)＇，the left eigenvectors \(u(1)\) are stored one afteranother in the colum ns of VL，in the sam e order as theireigenvahues．If \(\mathrm{OBVL}=\) \(N^{\prime}, \mathrm{VL}\) is notreferenced．If the \(j\) th eigenvalue is real，then \(u(J)=V L(:, ~ J)\) ，the \(j\) th column of \(V L\) ．If the \(j\) th and（ \(j+1\) ）－steigenvalues form \(a\) com plex conjugate pair，then \(u(i)=V L(:, i)+\) i＊VL（：, \(\mathfrak{j}+1\) ）and
\(u(j+1)=V L(: っ)-i^{*} V L(:, j+1)\) ．

LD V L（input）
The leading dim ension of the aray \(\mathrm{V} \mathrm{L} . \mathrm{LDVL}>=1\) ；
if \(J O B V L=V ', L D V L>=N\) 。

VR（input）
If \(\mathrm{OBVR}=\mathrm{V}\)＇，the right eigenvectors \(\mathrm{V}(\mathcal{1})\) are stored one after another in the colum ns of VR，in the sam e order as theireigenvahues．If \(\mathrm{OBVR}=\) \(N^{\prime}, V R\) is notreferenced．If the \(j\) th eigenvalue is real，then \(v(\mathcal{I})=V R(:, \mathcal{I})\) ，the \(j\) th colum \(n\) of VR．If the \(j\) th and（ \(j+1\) ）－steigenvalues form a complex conjugate pair，then \(\mathrm{V}(\mathcal{j})=\operatorname{VR}(:, 7)+\) i＊VR（：, j＋1）and \(\mathrm{V}(j+1)=\mathrm{VR}(:, \boldsymbol{j})-\mathrm{i}^{\star} \mathrm{VR}(:, j+1)\).

LDVR（input）
The leading dim ension of the array \(V\) R．LD VR＞＝1； if \(\mathrm{JOBVR}=\mathrm{V}^{\prime}, \mathrm{LDVR}>=\mathrm{N}\) 。

W ORK（w orkspace）
On exiv，if \(\mathbb{N F O}=0, W\) ORK（ 1 ）retums the optim al LDWORK．

LDW ORK（input）
The dim ension of the amay W ORK．LDW ORK＞＝
\(\max (1,3 * N)\), and if \(\mathrm{OBVL}=\mathrm{V}^{\prime}\) or \(\mathrm{OBCR}=\mathrm{V}^{\prime}\),
LDW ORK \(>=4 * N\). Forgood penform ance, LDW ORK must generally be larger.

If LD W ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LD W ORK is issued by XERBLA.
INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue.
\(>0:\) if \(\mathbb{N F O}=\) i, the \(Q \mathrm{R}\) algorithm failed to com pute all the eigenvalues, and no eigenvectors have been com puted; elem ents i+ 1 N ofW R and \(W\) Icontain eigenvalues w hich have converged.

\section*{C INTERFACE}
\#include <sunperfh>
void sgeevx (charbalanc, char jobvl, char jobvr, char sense, int \(n\), float *a, int lda, float * W r, float * W i, float*vl, intldvl, float *vr, int ldvr, int *ilo, int*ihi, float*scale, float*abnm, float *rcone, float *rconv, int*info);
void sgeevx_64 (charbalanc, char jobvl, char jobvr, char sense, long \(n\), float *a, long lda, float * w r, float *W i, float* *l, long ldvl, float *vr, long ldvr, long *ilo, long *ihi, float*scale, float *abnm, float *rcone, float *rconv, long *info);

\section*{PURPOSE}
sgeevx com putes for an \(N\) boy- \(N\) real nonsym \(m\) etric \(m\) atrix \(A\), the eigenvalues and, optionally, the left and/or right eigenvectors.

Optionally also, it com putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( \(\mathbb{L} O, \mathbb{H}\) I, SCA LE , and A BN RM ), reciprocal condition num bers for the eigenvalues (RCONDE), and reciprocal condition num bers for the right eigenvectors (RCONDV).

The righteigenvectorv (i) ofA satisfies
\[
A * v(\mathcal{J})=\operatorname{lam} \operatorname{bda}(\mathcal{J}) * v(\mathcal{I})
\]
w here lam bda ( 7 ) is its eigenvalue.
The lefteigenvectoru ( \()\) ) of A satisfies
\[
\mathrm{u}()^{*}{ }^{*} \mathrm{H} * \mathrm{~A}=\operatorname{lam} \operatorname{bda}(\mathrm{\jmath}) * \mathrm{u}()^{* *} \mathrm{H}
\]
where \(u(\mathcal{j}){ }^{* *} \mathrm{H}\) denotes the conjugate transpose of \(u(\mathcal{j})\).
The com puted eigenvectors are norm alized to have Euclidean norm equal to 1 and largest com ponent real.

B alancing a \(m\) atrix \(m\) eans perm uting the row sand colum ns to m ake itm ore nearly upper triangular, and applying a diagonalsim ilarity transform ation \(D\) * \(A\) * \(D\) ** \((-1)\), where \(D\) is a diagonalm atrix, to \(m\) ake its row \(s\) and colum ns closer in norm and the condition num bers of its eigenvalues and eigenvectors sm aller. The com puted reciprocalcondition num bers comespond to the balanced \(m\) atrix. Perm uting row \(s\) and colum ns will not change the condition num bers (in exact arithm etic) butdiagonalscaling w ill. For further explanation of balancing, see section 4.102 of the LA PACK U sers' G uide.

\section*{ARGUMENTS}

BALANC (input)
Indicates how the inputm atrix should be diagonally scaled and/orperm uted to im prove the conditioning of its eigenvalues. \(=\mathrm{N}\) ': D o not diagonally scale orperm ute;
\(=\mathrm{P}\) ':Perform perm utations to m ake the m atrix m ore nearly upper triangular. D o notdiagonally scale; = S ': D iagonally scale the m atrix, ie. replace \(A\) by \(D\) *A *D ** \((-1)\), where \(D\) is a diagonal \(m\) atrix chosen to \(m\) ake the row \(s\) and colum ns of \(A\) m ore equal in norm .D o notperm ute; \(=\mathrm{B}\) ':Both diagonally scale and perm ute A.

C om puted reciprocalcondition num bers w illbe for the \(m\) atrix afterbalancing and/orperm uting. Per\(m\) uting does not change condition num bers (in exact arithm etic), butbalancing does.

JO BVL (input)
\(=\mathrm{N}\) ': lefteigenvectors of A are not com puted;
\(=\mathrm{V}\) ': lefteigenvectors of A are com puted. If
SEN SE = E 'or B', JO BV L m ust= V'.

JO BVR (input)
\(=\mathrm{N}\) ': righteigenvectors of A are not com puted;
\(=\mathrm{V}\) ': righteigenvectors of A are com puted. If

SENSE \(=\) E'or B', JOBVR m ust \(=\) V'.

SEN SE (input)
D eterm ines which reciprocal condition num bers are com puted. = N ': N one are com puted;
\(=\mathrm{E}\) : C om puted foreigenvalues only;
\(=\mathrm{V}\) : C om puted for righteigenvectors only;
= B : \(: \mathrm{C}\) om puted foreigenvalues and right eigenvectors.

If SEN \(S E=E\) 'or \(B\) ', both left and right eigenvectors must also be computed ( \(\mathrm{JOBVL}=\mathrm{V}\) 'and JOBVR = V ).

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
On entry, the \(N-b y-N\) m atrix A. On exit, A has
been overw ritten. If JOBVL = V'orJOBVR=V', A contains the realSchur form of the balanced version of the inputm atrix \(A\).

LDA (input)
The leading din ension of the array A. LD A >= \(\max (1, N)\).

\section*{W R (output)}

W R and W Icontain the real and im aginary parts, respectively, of the com puted eigenvalues. Com plex conjugate pairs of eigenvalues w ill appear consecutively \(w\) ith the eigenvalue having the positive im aginary part first.

W I (output)
See the description forW R.

VL (output)
If \(\mathrm{JOBVL}=\mathrm{V}\) ', the left eigenvectors \(u(i)\) are stored one afteranother in the colum ns of V L, in the sam e order as theireigenvalues. If \(00 \mathrm{BVL}=\) N ', VL is not referenced. If the \(j\) th eigenvalue is real, then \(u(\eta)=V L(: r)\), the \(j\) th colum \(n\) of \(V L\). If the \(j\) th and ( \(j+1\) )-steigenvalues form a com plex conjugate pair, then \(u(\mathcal{J})=V L(:, 7)+\) \(i^{\star} V L(: j+1)\) and \(u(j+1)=V L(:, ~>)-i \star V L(:, j+1)\).

LD V L (input)
The leading dim ension of the array V L. LD V L >=1; if JO BVL \(=\mathrm{V}\) ', LD VL >= N .

\section*{VR (output)}

If JO BVR \(=\mathrm{V}\) ', the right eigenvectors \(\mathrm{v}(\mathrm{J})\) are stored one after another in the colum ns of VR, in the sam e order as theireigenvalues. If \(J O B V R=\) \(N^{\prime}, \mathrm{VR}\) is not referenced. If the \(j\) th eigenvalue is real, then \(v(j)=V R(: 1)\), the \(j\) th column of \(V R\). If the \(j\) th and ( \(j+1\) )-steigenvalues form a com plex conjugate pair, then \(\operatorname{V}(\mathcal{j})=\operatorname{VR}(:, 7)+\) i*VR (:, \(\mathrm{j}+1\) ) and \(\mathrm{V}(j+1)=\operatorname{VR}(:, \boldsymbol{\jmath})-\mathrm{i} \star \mathrm{VR}(:, \mathfrak{j}+1)\).
LDVR (input)
The leading dim ension of the array V R . LD V R >=1, and if \(J O B V R=V ', L D V R>=N\).

ㅍㅇ (output)
IO and \(\mathbb{H}\) I are integervalues determ ined when \(A\) w as balanced. The balanced \(\mathrm{A}(\mathrm{i}, \mathrm{J})=0\) if I> J and \(J=1, \ldots, \mathbb{I L} O-1\) or \(I=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\).

IH I (output)
See the description of ILO .

SCALE (output)
D etails of the perm utations and scaling factors applied w hen balancing A. IfP ( \()\) ) is the index of the row and column interchanged \(w\) ith row and colum \(n j\) and \(D(j)\) is the scaling factorapplied to row and colum \(n j\) then SCA LE \((J)=P(J)\), for \(J=1, \ldots\), IUO \(-1=\mathrm{D}(J)\), for \(J=\mathbb{H O}, \ldots, \mathbb{H} I=\) \(P\) (J) for \(J=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} \mathrm{I}+1\), then 1 to [10-1.

ABNRM (output)
The one-nom of the balanced \(m\) atrix (the \(m\) axim um of the sum of absolute values of elem ents of any colum n).

RCONE (output)
RCONE ( \()\) ) is the reciprocalcondition num ber of the \(j\) th eigenvalue.

RCONV (output)
RCONV ( 7 ) is the reciprocalcondition num ber of the jth righteigenvector.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the anay \(W\) ORK. IfSENSE \(=N^{\prime}\)
or E', LDW ORK >= max ( \(1,2 \star \mathrm{~N}\) ), and if \(\mathrm{JOBVL}=\mathrm{V}^{\prime}\) or \(\operatorname{JOBVR}=\mathrm{V}^{\prime}\), LD W ORK \(>=3{ }^{\star} \mathrm{N}\). IfSENSE \(=\mathrm{V}^{\prime}\) or B', LD W ORK >= \(N *(N+6)\). Forgood perform ance, LDW ORK m ust generally be larger.

IfLDW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

IW ORK 2 (w orkspace)
dim ension ( \(2 * \mathrm{~N}-2\) ) IfSEN SE \(=\mathrm{N}\) 'or E ', notreferenced.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.
> 0 : if \(\mathbb{N} F O=i\), the \(Q R\) algorithm failed to com pute all the eigenvalues, and no eigenvectors or condition num bers have been com puted; elem ents \(1: I H O-1\) and i+ \(1 \mathbb{N}\) ofW R and W Icontain eigenvalues which have converged.

void sgegs_64 (char jobvsll, char jobvssr, long n, float *a, long lda, float *b, long ldb, float *alphar, float *alphai, float *beta, float *vsl, long ldvsl, float *vsr, long ldvss, long *info);

\section*{PURPOSE}
sgegs routine is deprecated and has been replaced by routine SG GES.

SGEGS com putes for a pair of \(N\) by -N real nonsym \(m\) etric \(m\) atrices A, B: the generalized eigenvalues (alphar+/alphai*i, beta), the realSchur form (A, B), and optionally left and/or right Schurvectors ( V SL and V SR).
(Ifonly the generalized eigenvalues are needed, use the driverSGEGV instead.)

A generalized eigenvalue for a pairof \(m\) atrioes ( \(A, B\) ) is, roughly speaking, a scalar w ora ratio alpha/beta \(=\mathrm{w}\), such that A -w *B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta \(=0\), and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G.Golub \& C .van Loan (Johns H opkins U .Press)

The (generalized) Schur form of a pair of \(m\) atrioes is the result of \(m\) ultiplying both \(m\) atrices on the leftby one orthogonalm atrix and both on the rightby another orthogonalm atrix, these tw o orthogonalm atrices being chosen so as to bring the pairofm atrices into (real) Schur form .

A pair ofm atrices \(A, B\) is in generalized realSchur form if \(B\) is upper triangularw th non-negative diagonaland \(A\) is block uppertriangularw ith 1-by-1 and 2 -by-2 blocks. 1-by-1 blocks comespond to real generalized eigenvalues,
while 2-by-2 blocks ofA willbe "standardized" by making the corresponding elem ents ofB have the form :
[ a 0 ]
[ 0 b ]
and the pair of corresponding 2 -by -2 blocks in \(A\) and \(B\) w ill have a com plex conjugate pair of generalized eigenvalues.

The left and rightSchurvectors are the colum ns ofV SL and VSR, respectively, where VSL and VSR are the orthogonal \(m\) atrices \(w\) hich reduce \(A\) and \(B\) to Schur form :

Schurform of \((A, B)=((N S L) * * T A(N S R),(N S L) * * T B(N S R))\)

\section*{ARGUMENTS}

JO BV SL (input)
= N ': do notcom pute the leftSchurvectors;
\(=\mathrm{V}\) : com pute the leftSchurvectors.
\(J O B V S R\) (input)
\(=N\) ': do notcom pute the rightSchurvectors;
\(=\mathrm{V}\) : com pute the rightSchurvectors.
N (input) The order of the m atrices A , B , V SL, and V SR. N \(>=0\).

A (input/output)
O \(n\) entry, the first of the pair ofm atrioes whose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the general ized Schur form of A. N ote: to avoid overflow, the Frobenius norm of the \(m\) atrix A should be less than the overflow threshold.

LD A (input)
The leading dim ension ofA . LD A \(>=\max (1, \mathbb{N})\).
B (input/output)
O \(n\) entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the generalized Schur form of B. N ote: to avoid overflow, the Frobenius norm of the matrix B should be less than the overflow threshold.

LD B (input)
The leading dim ension ofB . LD B \(>=m\) ax \((1, N)\).

ALPHAR (output)
On exit, (ALPHAR ( ) + ALPHAI ( 1 *i) BETA ( \(\boldsymbol{\lambda}\) ) ,于1,...,N, will be the generalized eigenvalues.
ALPHAR ( \() ~+~ A L P H A I(\beth * i, ~ j 1, \ldots, N\) and BETA ( 7\(), 1, \ldots, N\) are the diagonals of the com plex Schur form ( \(\mathrm{A}, \mathrm{B}\) ) thatw ould result if the 2-by-2 diagonal blocks of the realSchur form of ( \(A, B\) ) w ere further reduced to triangular form using 2 łoy -2 com plex unitary transform ations. If A LPHAI( \(\mathcal{j})\) is zero, then the \(j\) th eigenvalue is real; if positive, then the jth and (j+1)-st eigenvahues are a com plex conjugate pair, w ith A LPH A I(j+1) negative.

N ote: the quotients \(A \operatorname{LPHAR}\) ( 1 ) BETA ( \()\) ) and A LPHAI ( ) , BETA ( \()\) m ay easily over-orunderflow, and BETA (ㄱ) m ay even be zero. Thus, the user should avoid naively computing the ratio alpha/beta. H ow ever, A LPH AR and A LPH A I w ill be alw ays less than and usually com parable w ith norm (A) in magnitude, and BETA alw ays less than and usually com parable \(w\) ith norm (B).

\section*{A LPH A I (output)}

See the description forA LPH A R .

\section*{BETA (output)}

\section*{C INTERFACE}
\#include <sunperfh>
void sgegv (char jobvl, char j.jbvr, intn, float *a, int lda, float *b, int lalo, float *alphar, float*alphai, float *beta, float *vl, intldvl, float *vr, int ldvr, int*info);
void sgegv_64 (char j̣bvl, char jobvr, long n, float *a, long lda, float *b, long ldb, float*aliphar, float *alphai, float *beta, float*vl, long ldvl, float *vr, long ldvr, long *info);

\section*{PURPOSE}
sgegv routine is deprecated and has been replaced by routine SG GEV .

SG EGV com putes for a pair of \(n-b y-n\) real nonsymm etric \(m\) atrices A and B, the generalized eigenvalues (alphar +/alphai*i, beta), and optionally, the left and/or right generalized eigenvectors ( L and VR).

A generalized eigenvalue for a pair of \(m\) atrices \((A, B)\) is, roughly speaking, a scalar w ora ratio alpha/beta \(=\mathrm{w}\), such that A -w *B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta \(=0\), and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G .G olub \& C.van Loan (Johns H opkins U .Press)

A right generalized eigenvector corresponding to a generalized eigenvalue w fora pair ofm atrices \((A, B)\) is a vector \(r\) such that ( \(A-w B\) ) \(r=0\). A left generalized eigenvector is a vectorlsuch that \(1 * * H\) * \((A-w B)=0\), where \({ }^{1 * *} \mathrm{H}\) is the conjugate-transpose of l.

N ote: this routine perform s "fullbalancing" on A and B see "FurtherD etails", below .

\section*{ARGUMENTS}

JO BVL (input)
\(=\mathrm{N}\) ': do notcom pute the leftgeneralized eigenvectors;
\(=\mathrm{V}\) ': com pute the leftgeneralized eigenvectors.

JO BVR (input)
\(=\mathrm{N}\) : : do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvectors.

N (input) The order of the m atriges \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and \(\mathrm{VR} . \mathrm{N}>=\) 0.

A (input/output)
O n entry, the first of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents w ill have been destroyed. Fora description of the contents of A on exit, see "FurtherD etails", below .)

LD A (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).

B (input/output)
O n entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents will have been destroyed. Fora description of the contents of B on exit, see "FurtherD etails", below .)

LD B (input)
The leading dim ension ofB. LD \(B>=m a x(1, N)\).

\section*{ALPHAR (output)}

On exit, (ALPHAR ( ) + ALPHAI ( 1 *i) BETA ( 1 ), \(j 1, \ldots, N\), w ill be the generalized eigenvalues. IfA LPH A I( \(\mathfrak{j}\) ) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and ( \(j+1\) )-st eigenvahues are a com plex conjugate pair, w ith A LPH A I (j+1) negative.

Note: the quotients ALPHAR ( 7 ) BETA ( \()\) and A LPHAI( ) BETA ( \()\) m ay easily over-orunderflow, and BETA ( 7 ) m ay even be zero. Thus, the user should avoid naively computing the ratio alpha/beta. H ow ever, A LPH AR and A LPHAI w ill be
alw ays less than and usually com parable w ith norm (A) in magnitude, and BETA alw ays less than and usually com parable w ith norm (B).

\section*{A LPH A I (output)}

See the description of A LPH AR .

BETA (output)
See the description of A LPH AR .
VL (output)
If \(30 \mathrm{BVL}=\mathrm{V}\) ', the left generalized eigenvectors.
(See "Purpose", above.) Realeigenvectors take one colum n, com plex take tw o colum ns, the first for the realpart and the second for the im aginary part. Complex eigenvectors correspond to an eigenvalue w ith posilive im aginary part. Each eigenvectorw illbe scaled so the largest com ponent w ill have abs (realpart) + abs(im ag. part) \(=1\), *except* that for eigenvalues \(w\) ith alpha=beta=0, a zero vectorw illbe retumed as the comesponding eigenvector. N ot referenced if JOBVL = N '.

LDVL (input)

\(=\mathrm{N}+10\) : enor retum from SLA SC L (various calls)

\section*{FURTHER DETAILS}

Balancing

This driver calls SG G B A L to both perm ute and scale row s and colum ns of \(A\) and \(B\). The perm utations \(P L\) and \(P R\) are chosen so that \(\mathrm{PL}{ }^{*} \mathrm{~A} * P R\) and \(P L * B * R\) w illbe upper triangular except for the diagonal blocksA (i:ji:j) and B (i:ji:j) w ith i and jas close together as possible. The diagonal scaling \(m\) atrices DL and DR are chosen so that the pair \(D L * P L * A * P R * D R, D L * P L * B * P R * D R\) have elem ents close to one (except for the elem ents that start out zero.)

A fter the eigenvalues and eigenvectors of the balanced
\(m\) atrices have been com puted, SG G BA K transform s the eigenvectors back to what they w ould have been (in perfect arithm etic) ifthey had notbeen balanced.

Contents of \(A\) and \(B\) on Exit

If any eigenvectors are com puted (either \(J O B V L=V\) ' or JO BVR=V' or both), then on exit the arrays \(A\) and \(B\) w ill contain the realSchur form [ \({ }^{\star}\) ] of the "balanced" versions of A and B. If no eigenvectors are com puted, then only the diagonalblocks w illbe comect.
[*] See SH GEQ Z, SGEGS, or read the book "M atrix Com putations",
by G olub \& van Loan, pub. by Johns H opkins U .Press.

void sgehrd_64 (long n, long ilo, long ihi, float *a, long lda, float *tau, long *info);

\section*{PURPOSE}
sgehrd reduces a realgeneralm atrix A to upper H essenberg
form \(H\) by an orthogonalsim ilarity transform ation: Q '* A * \(Q=H\).

\section*{ARGUMENTS}

N (input) The order of the matrix \(A . N>=0\).
ㅍO (input)
It is assum ed that A is already upper triangular in row s and colum ns \(1: \mathbb{I L O - 1}\) and \(\mathbb{H} \mathrm{I}+1 \mathbb{N} . \mathbb{W}\) and \(\mathbb{H}\) I are norm ally setby a previous call to SG EBA L; otherw ise they should be set to 1 and \(N\) respectively. See FurtherD etails.

IH I (input)
See the description of IIO .
A (input/output)
O \(n\) entry, the N -by -N generalm atrix to be reduced.
On exit, the upper triangle and the first subdiagonalofA are overw rilten w ith the upper H essenberg \(m\) atrix \(H\), and the elem ents below the first subdiagonal, w ith the array TAU, represent the orthogonal \(m\) atrix \(Q\) as a productof elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

TAU (output)
The scalar factors of the elem entary reflectors (see Further Details). Elem ents 1:THO-1 and IH IN -1 of TA U are setto zero.

W ORK \(\mathbb{N}\) (w orkspace)

On exit, if \(\mathbb{N F O}=0, W O R K \mathbb{N}\) (1) retums the optim allW ORK \(\mathbb{N}\).

LW ORK \(\mathbb{N}\) (input)
The length of the array \(W O R K \mathbb{N}\). LW ORK \(\mathbb{N}>=\) \(\max (1, \mathbb{N})\). For optim um perform ance LW ORK \(\mathbb{N}>=\) \(\mathrm{N} * \mathrm{NB}\), where NB is the optim alblocksize.

If LW ORK \(\mathbb{N}=-1\), then a workspace query is assum ed; the routine only calculates the optim al size of the \(W\) ORK \(\mathbb{N}\) array, retums this value as the firstentry of the \(W\) ORK \(\mathbb{N}\) array, and no error \(m\) essage related to LW ORK \(\mathbb{N}\) is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a productof (hi-ib) ele\(m\) entary reflectors
\[
Q=H \text { ( } 0 \text { ) H (ib+1) . . H (ihi-1) . }
\]

Each H (i) has the form
\[
H(i)=I-\tan * V^{*} V^{\prime}
\]
where tau is a real scalar, and \(v\) is a realvectorw ith \(\mathrm{v}(1: i)=0, v(i+1)=1\) and \(v\) (init 1 n\()=0\); \(\mathrm{v}(\mathrm{i}+2\) : ihi) is stored on exitin A (i+2:ihi,i), and tau in TA U (i).

The contents of A are illustrated by the follow ing exam ple, w ith \(\mathrm{n}=7\), il = \(=2\) and ihi= 6:
```

on entry, on exit,

```
(a a a a a a a) (a a h h h h a) ( a a a a a a) ( a h h h ha) ( a a a a a a) ( \(h\) h h h h h ) ( a a a a a a) ( v2 h \(h \mathrm{~h} h \mathrm{~h})(\mathrm{a}\) a a a a a) ( v2 v3 h h h h ) ( a a a a a a) ( v2 v3 v4 h h h) (
a) (

> a)
\(w\) here a denotes an elem ent of the original \(m\) atrix \(A, h\) denotes a \(m\) odified elem ent of the upper \(H\) essenberg \(m\) atrix \(H\), and videnotes an elem ent of the vector defining \(H\) (i).

\#include <sunperfh>
void sgels (char, int, int, int, float*, int, float*, int, int*);
void sgels_64 (char, long, long, long, float*, long, float*, long, long*);

\section*{PURPOSE}
sgels solves overdeterm ined or underdeterm ined real linear system \(s\) involving an \(M\)-by -N m atrix \(A\), or its transpose, using a QR orLQ factorization ofA. It is assum ed that A has full rank.

The follow ing options are provided:
1. IfTRANS \(=N\) 'and \(m>=n\) : find the leastsquares solution of
an overdeterm ined system , i.e., solve the least squares problem
\[
\mathrm{m} \text { inim ize }\|\mathrm{B}-\mathrm{A} * \mathrm{X}\| .
\]
2. IfTRAN \(S=N\) 'and \(m<n\) : find the \(m\) inim um norm solution of an underdeterm ined system \(A * X=B\).
3. IfTRANS \(=T\) 'and \(m>=n\) : find the \(m\) in \(m\) um norm solution of
an undeterm ined system \(A * * T * X=B\).
4. IfTRANS = T'and \(\mathrm{m}<\mathrm{n}\) : find the least squares solution of
an overdeterm ined system , ie., solve the least squares problem
\[
\mathrm{m} \text { inim ize }\|\mathrm{B}-\mathrm{A} * * \mathrm{~T} * \mathrm{X}\| .
\]

Several righthand side vectors \(b\) and solution vectors x can be handled in a single call; they are stored as the colum ns of the M by-NRHS righthand side m atrix B and the N -by-NRHS solution \(m\) atrix \(X\).

\section*{ARGUMENTS}

TRANSA (input)
\(=N^{\prime}\) : the linearsystem involves A;
\(=T\) ': the linear system involves \(A * * T\).

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input) The num ber of row s of the matrix A. M >=0.

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrioes B and X .NRH S \(>=0\).
A (input/output)
On entry, the M -by -N m atrix A. On exit, if \(\mathrm{M}>=\) \(\mathrm{N}, \mathrm{A}\) is overw ritten by details of its Q R factorization as retumed by SGEQRF; if \(M<N, A\) is overw rilten by details of its LQ factorization as retumed by SGELQF.

LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

B (input/output)
O n entry, the \(m\) atrix \(B\) of righthand side vectors,
stored colum nw ise; B is M byy-NRHS ifTRANSA = N',
orN boy-NRHS ifTRANSA = T'. On exit, B is
overw rilten by the solution vectors, stored colum nw ise: ifTRAN SA \(=\mathrm{N}\) 'and \(\mathrm{m}>=\mathrm{n}\), row s 1 to \(n\) ofB contain the least squares solution vectors; the residual.sum ofsquares for the solution in each colum \(n\) is given by the sum of squares of ele\(m\) ents \(N+1\) to \(M\) in thatcolumn; ifTRANSA \(=N\) 'and \(m<n\), row \(s 1\) to \(N\) ofB contain them inim um norm solution vectors; ifTRANSA \(=T\) 'and \(m>=n\), row \(s\) 1 to M ofB contain them inim um norm solution vectors; ifTRANSA \(=T\) 'and \(m<n\), row 1 to \(M\) of \(B\) contain the least squares solution vectors; the residual.sum of squares forthe solution in each colum \(n\) is given by the sum of squares of elem ents \(M+1\) to \(N\) in that colum \(n\).

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) M AX ( \(1, \mathrm{M}, N\) ) 。

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (output)
The dim ension of the amay W ORK. LDW ORK >= \(\max (\)
1, \(\mathrm{M} N+\max (\mathrm{M} N, \mathrm{NRHS})\) ). Foroptim alperfor
\(m\) ance, LDW ORK \(>=\max (1, M N+\max (M N, N R H S) * N B\)
). where \(M N=m\) in \(M N\) ) and \(N B\) is the optim um
block size.

IfLD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LD W ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an ille-
galvalue

\#include <sunperfh>
void sgelsd (intm, intn, intnrhs, float *a, int lda, float
*b, int ldb, float *s, float roond, int * rank, int *info);
void sgelsd_64 (long m, long n, long nihs, float *a, long lda, float *b, long ldb, float *s, float roond, long *rank, long *info);

\section*{PURPOSE}
sgelsd com putes the \(m\) inim um -norm solution to a real linear least squares problem :
\(m\) inim ize 2 -norm (|b-A *x )
using the singularvalue decom position (SVD) ofA.A is an M -by-N m atrix which \(m\) ay be rank-deficient.

Several righthand side vectors b and solution vectors \(x\) can be handled in a single call; they are stored as the colum ns of the M -by-NRHS righthand sidem atrix \(B\) and the \(N\)-by-NRH S solution \(m\) atrix \(X\).

The problem is solved in three steps:
(1) Reduce the coefficientm atrix A to bidiagonal form \(w\) ith H ouseholder transform ations, reducing the originalproblem
into a "bidiagonal least squares problem " (BLS)
(2) Solve the BLS using a divide and conquer approach.
(3) A pply back all the \(H\) ouseholder tranform ations to solve the original least squares problem .

The effective rank of A is determ ined by treating as zero those singular values which are less than RCO ND tim es the largest singularvalue.

The divide and conqueralgorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary m achines w ithout guard digits w hich subtract like the C ray

X - M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines \(w\) thout guard digits, butw e know of none.

\section*{ARGUMENTS}

M (input) The num ber of row sofA. \(\mathrm{M}>=0\).
N (input) The num ber of colum nsofA . \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrices \(B\) and X.NRHS \(>=0\).
A (input/output)
On entry, the M -by -N m atrixA. On exit, A has been destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, M)\).

B (input/output)
On entry, the M -by \(-N\) RH \(S\) righthand side \(m\) atrix \(B\).
On exit, B is overw ritten by the \(N\) by-NRHS solution \(m\) atrix \(X\). Ifm \(>=n\) and RANK \(=n\), the residual sum-of-squares for the solution in the \(i\)-th colum \(n\) is given by the sum of squares of elem ents \(\mathrm{n}+1 \mathrm{~m}\) in thatcolum n .

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, m a x(M, N))\).

S (output)
The singularvalues of A in decreasing order. The condition number of \(A\) in the 2 -norm \(=\) \(S(1) / S(m\) in \((m, n))\).

RCOND (input)
RCOND is used to determ ine the effective rank of A. Singularvalues \(S\) (i) <= RCOND *S (1) are treated as zero. IfRCOND \(<0, \mathrm{~m}\) achine precision is used instead.

RANK (output)
The effective rank of A, i.e., the num ber of singular values w hich are greater than RCO N D *S (1).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK.LW ORK \(>=1\). The exact \(m\) inim um am ount of w orkspace needed depends on M , N and NRHS. As long as LW ORK is at least \(12 * \mathrm{~N}+2 * \mathrm{~N} * \mathrm{SM} \mathrm{LSIZ}+8 * \mathrm{~N} * \mathrm{NLVL}+\mathrm{N} * \mathrm{NRHS}\) * (SMLSLZ +1 ) \({ }^{* *} 2\), ifM is greater than orequal to \(N\) or \(12 * \mathrm{M}+2 * \mathrm{M} * \mathrm{SMLSIZ}+8 * \mathrm{M} * \mathrm{NLVL}+\mathrm{M}\) *NRHS + (SM LSIZ + 1) **2, ifM is less than N , the code will execute correctly. SM LSIZ is retumed by ILA ENV and is equal to the \(m\) axim um size of the subproblems at the bottom of the com putation tree (usually about 25) , and \(\mathrm{NLVL}=\mathbb{N} T\left(\mathrm{LOG} \_2\right.\) ( \(\mathrm{M} \mathbb{N}(\mathrm{M}, \mathbb{N}\) )/(SM LSIZ+1) ) ) + 1 Forgood penform ance, LW ORK should generally be larger.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)

\(M \mathbb{N} M N=M \mathbb{N}(M, N)\) 。

IN FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvahue.
\(>0\) : the algorithm forcom puting the SVD failed to converge; if \(\mathbb{N} F O=\) i, ioff-diagonalelem ents of an interm ediate bidiagonalform did not converge to zero.

\#include <sunperfh>
void sgelsx (intm, intn, intnrhs, float *a, int lda, float
*b, int ldlb, int * j íivot, float rcond, int *irank, int*info);
void sgelsx_64 (long m, long n, long nrhs, float *a, long
lda, float *b, long ldb, long * jpivot, float rcond, long *irank, long *info);

\section*{PURPOSE}
sgelsx routine is deprecated and has been replaced by routine SGELSY .

SG ELSX com putes the minim um -norm solution to a real linear
least squares problem :
m inim ize \(\| \mathrm{A}\) * \(\mathrm{X}-\mathrm{B} \|\)
using a com plete orthogonal factorization of A. A is an Mby \(-\mathrm{N} m\) atrix \(w\) hich \(m\) ay be rank-deficient.

Several righthand side vectors \(b\) and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-N RH S righthand side m atrix B and the N -by-NRHS solution \(m\) atrix \(X\).

The routine firstcom putes \(a Q R\) factorization \(w\) th \(c o l u m n\) pivoting:
\[
A * P=Q *[R 11 R 12]
\]
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix whose estim ated condition num ber is less than \(1 \not R C O N D\). The order ofR11,RAN \(K\), is the effective rank ofA.

Then, R 22 is considered to be negligible, and R 12 is annihilated by orthogonal transform ations from the right, ariving at the com plete orthogonal factorization:
\[
A * P=Q *[T 110] * Z
\]
[ 0 0 \(]\)
Them inim um norm solution is then
\(\mathrm{X}=\mathrm{P} * \mathrm{Z}^{\prime}[\operatorname{inv}(\mathrm{T} 11) * \mathrm{Q} 1\) * B\(]\)
where Q 1 consists of the firstRA K colum ns of Q .

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of collm ns of the m atrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns ofm atrices \(B\) and \(X\).NRH \(S>=0\). A (input/output)

On entry, the M -by -N m atrix A. On exit, A has been overw rilten by details of its complete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, M)\).

B (input/output)
On entry, the M by -N RH S righthand side \(m\) atrix \(B\).
On exit, the N -by-N RH S solution \(m\) atrix X . Ifm >= \(n\) and \(\mathbb{R A N K}=\mathrm{n}\), the residual sum -of-squares for the solution in the \(i\)-th colum \(n\) is given by the sum of squares of elem ents \(N+1 \mathrm{M}\) in that colum \(n\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, M, N)\).

JPIVOT (input/output)
On entry, if \(\mathbb{P} \mathbb{I V O T}\) (i) ne.0, the i-th colum n of \(A\) is an initial colum \(n\), otherw ise it is a free colum \(n\). Before the \(Q R\) factorization of \(A\), all initial colum ns are perm uted to the leading positions; only the rem aining free colum ns are m oved as a result of colum \(n\) pivoting during the factorization. On exit, if JPIV OT \((i)=k\), then the \(i\)-th colum \(n\) of A *P was the \(k\)-th collm \(n\) of A.

RCOND (input)
RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest leading triangular subm atrix R 11 in the \(Q R\) factorization w ith pivoting ofA , whose estim ated condition num ber \(<1\) RCOND.

IRANK (output)
The effective rank ofA, ie., the order of the subm atrix R11. This is the sam e as the order of the subm atrix T11 in the com plete orthogonal factorization of A.

\section*{C INTERFACE}
\#include < sunperfh>
void sgelsy (intm, intn, intnrhs, float *a, int lda, float *b, int ldb, int *jpt, float rcond, int *rank, int*info);
void sgelsy_64 (long m, long n, long nrhs, float *a, long lda, float*b, long ldb, long * pivt, float rcond, long *rank, long *info);

\section*{PURPOSE}
sgelsy com putes the \(m\) inim um norm solution to a real linear least squares problem :
\(m\) inim ize \(\|A * X-B\|\)
using a com plete orthogonal factorization ofA. A is an M by \(-\mathrm{N} m\) atrix \(w\) hich \(m\) ay be rank-deficient.

Several righthand side vectors b and solution vectors \(x\) can be handled in a single call; they are stored as the colum ns of the M by-NRHS righthand side m atrix \(B\) and the \(N\) by-NRHS solution \(m\) atrix \(X\).

The routine firstcom putes \(a Q R\) factorization \(w\) th \(c o l u m n\) pivoting:
\(A * P=Q *[R 11 R 12]\)
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix whose estim ated condition num ber is less than 1RCOND. The order ofR11, RAN \(K\), is the effective rank ofA.

Then, R 22 is considered to be negligible, and R 12 is anninilated by orthogonal transform ations from the right, amiving at the com plete orthogonal factorization:
\[
\begin{gathered}
A * P=Q *[T 110] * Z \\
{\left[\begin{array}{ll}
0 & 0
\end{array}\right]}
\end{gathered}
\]

Them inim um norm solution is then
\(\mathrm{X}=\mathrm{P} * \mathrm{Z}^{\prime}[\operatorname{inv}(\mathrm{T} 11) * \mathrm{Q} 1\) *B]
[ 0 ]
where Q 1 consists of the firstRANK collum ns of Q .

This routine is basically identical to the original xG ELSX except three differences:
o The call to the subroutine xGEQPF has been substituted by the
the call to the subroutine xG EQP3.This subroutine is a B las-3
version of the \(Q R\) factorization \(w\) ith colum \(n\) pivoting.
0 M atrix B (the righthand side) is updated w ith B las -3 . - The perm utation ofm atrix B (the right hand side) is fasterand m ore sim ple.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of collm ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns ofm atrices B and X.NRHS \(>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, A has been overw rilten by details of its com plete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the M \(-b y-N\) RH S righthand side m atrix B . On exit, the N -by-N RH S solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= max (1, M N \()\).

JPVT (input/output)
On entry, if JPV T (i) ne. 0, the i-th collm n of A is perm uted to the frontof \(P\), otherw ise colum \(n\) i is a free colum n. On exit, if JPV T (i) = k, then the \(i\)-th colum \(n\) of AP \(w\) as the \(k\)-th colum \(n\) of \(A\).

RCOND (input)
RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest
leading triangularsubm atrix R 11 in the Q R factorization w ith pivoting ofA , w hose estim ated condition num ber<1/RCOND.

RANK (output)
The effective rank ofA, ie., the order of the subm atrix R11. This is the sam e as the order of the subm atrix T11 in the com plete orthogonal factorization of A.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the aray W ORK. The unblocked strategy requires that: LW ORK \(>=\mathrm{MAX}(\mathrm{MN}+3 * \mathrm{~N}+1\), \(2 * M N+N R H S)\), where \(M N=m\) in ( \(M, N\) ). The block algorithm requires that: LWORK >= MAX ( \(\mathrm{M} N+2 * N+N B *(\mathbb{N}+1), 2 * \mathrm{MN}+\mathrm{NB} * \mathrm{NRHS}\) ), where NB is an upper bound on the blocksize retumed by HAENV for the routines SGEQP3, STZRZF, STZRQF, SORMQR, and SORM RZ .

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) If \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue.

void sgem m _64 (chartransa, chartransb, long m, long n, long k, float alpha, float *a, long lda, float *b, long ldlo, floatbeta, float * c, long ldc);

\section*{PURPOSE}
sgem \(m\) perform sone of the \(m\) atrix-m atrix operations \(C:=\) alpha*op (A )*op (B) + beta*C where op (X ) is one of
\[
o p(X)=X \quad \text { or } o p(X)=X^{\prime},
\]
alpha and beta are scalars, and A , B and C are matrices, with op (A ) an m by kmatrix, op (B) a k by \(n m a t r i x\) and \(C\) an \(m\) by \(n m\) atrix.

\section*{ARGUMENTS}

TRANSA (input)
On entry, TRANSA specifies the form of op (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N^{\prime}\) or \(h^{\prime}\), op (A) \(=A\).

TRANSA = T'or \(t^{\prime}, ~ o p(A)=A '\).

TRANSA = C 'or \(C^{\prime}\), op (A) \(=\) A '.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{N}\) TERFACE.

TRANSB (input)
O n entry, TRAN SB specifies the form ofop (B) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSB = N 'or h', op (B) = B.
TRANSB \(=T\) 'or \(\mathrm{t}^{\prime}, \mathrm{op}(\mathrm{B})=\mathrm{B}\) '.
TRANSB = C'or \(\mathrm{t}^{\prime}, \mathrm{op}(\mathrm{B})=\mathrm{B}\) '.
U nchanged on exit.
TRANSB is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input)
On entry, M specifies the num ber of rows of the matrix op (A ) and of the matrix C.M \(m\) ust be at least zero. U nchanged on exit.
N (input)
O n entry, N specifies the num ber of colum ns of the \(m\) atrix \(o p(B)\) and the num ber of colum ns of the m atrix C. . m ustbe at least zero. U nchanged on exit.

K (input)
On entry, \(K\) specifies the num berof colum ns of the \(m\) atrix \(o p\) ( \(A\) ) and the num ber of row s of the \(m\) atrix op ( B ). K must be at least zero. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
REAL array ofD \(\mathbb{M}\) ENSION (LDA, ka), where ka isk when TRANSA = N 'or \(h\) ', and is \(m\) otherw ise. Before entry w ith TRANSA = N 'or \(h\) ', the leading \(m\) by \(k\) part of the array A mustcontain the \(m\) atrix \(A\), otherw ise the leading \(k\) by \(m\) part of the array \(A\) must contain the matrix A. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA \(=N\) 'or \(h\) 'then LDA \(>=m a x(1, m)\), otherw ise LDA \(>=\max (1, k)\). U nchanged on exit.

B (input)
REAL array ofD \(\mathbb{I M}\) ENSION (LD B , kb ), where kb is n w hen TRANSB = N 'or h ', and is k otherw ise.
Before entry \(w\) ith TRANSB \(=N\) 'or \(h\) ', the lead-
ing \(k\) by \(n\) partof the anay \(B\) mustcontain the \(m\) atrix \(B\), otherw ise the leading \(n\) by \(k\) part of the array \(B\) must contain the \(m\) atrix \(B\). U nchanged on exit.

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program . W hen TRANSB \(=N^{\prime}\) 'or h'then LD B \(>=m a x(1, k)\), otherw ise LD \(B>=m a x(1, n)\). U nchanged on exit.
BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need notbe set on input. U nchanged on exit.

C (input/output)
REAL array ofD \(\mathbb{M}\) ENSION (LD C, n). Before entry, the leading \(m\) by \(n\) partof the anay \(C\) ust contain them atrix \(C\), except when beta is zero, in which case \(C\) need notbe seton entry. On exit, the array \(C\) is overw ritten by the \(m\) by n matrix (alpha*op (A )*op (B ) + beta*C ).

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program . LD C
\(>=m a x(1, m)\). U nchanged on exit.

\section*{PURPOSE}
sgeqlf com putes a Q L factorization of a real M boy-N m atrix \(A: A=Q\) * \(L\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix A. M >=0.
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the M -by N m atrix A . On exit, if \(\mathrm{m}>=\) \(n\), the low er triangle of the subanray A ( \(m-\) \(\mathrm{n}+1 \mathrm{~m}, 1 \mathrm{~m}\) ) contains the N -by -N low er triangular \(m\) atrix L; ifm <= n, the elem ents on and below the ( \(n-m\) ) -th superdiagonal contain the \(M\) boy- N low er trapezoidalm atrix \(L\); the rem aining elem ents, w ith the array TA \(U\), represent the orthogonal \(m\) atrix \(Q\) as a product ofelem entary reflectors (see Further D etails).

LD A (input)
The leading dim ension of the array A. LDA >= \(m\) ax ( \(1, M\) ).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails) .

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LD W ORK.

LDW ORK (input)
The dim ension of the array \(W\) ORK. LDW ORK >= \(m a x(1, N)\). Foroptim um perform ance LDW ORK \(>=N * N B\), w here N B is the optim alblocksize.

If LD W ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(k) \ldots H(2) H(1), \text { where } k=m \text { in }(m, n) .
\]

Each \(H\) (i) has the form
\[
\mathrm{H}(\mathrm{i})=\mathrm{I}-\tan * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
\]
where tau is a real scalar, and \(v\) is a realvectorw ith \(v(m-k+i+1 m)=0\) and \(v(m-k+i)=1\); \(v(1 m-k+i-1)\) is stored on exitin A ( \(1 \mathrm{~m}-\mathrm{k}+\mathrm{i}-1, \mathrm{n}-\mathrm{k}+\mathrm{i}\) ), and tau in TAU (i).

\#include <sunperfh>
void sgeqp3 (intm , intn, float *a, int lda, int * jpvt, float *tau, int *info);
void sgeqp3_64 (long m, long n, float *a, long lda, long
* jpvt, float *tau, long *info);

\section*{PURPOSE}
sgeqp3 com putes a Q R factorization \(w\) ith colum n pivoting ofa \(m\) atrix \(A: A * P=Q * R\) using Level3 BLA \(S\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the M -by \(-N m\) atrix A. On exit, the upper triangle of the amay contains the \(m\) in \((M, N)\)-by \(-N\) upper trapezoidalm atrix R ; the elem ents below the diagonal, together w ith the aray TA \(U\), represent the orthogonalm atrix \(Q\) as a product of \(m\) in \((M, N)\) elem entary reflectors.

LDA (input)
The leading dim ension of the array A. LDA >= max (1, M).

JPV T (input/output)
On entry, if \(J P V T(J)\) ne. 0 , the Jth colum \(n\) of \(A\) is perm uted to the frontof \(A\) *P (a leading colum \(n\) ); if JPVT \((J)=0\), the \(J\) th column of \(A\) is a free column. On exit, if \(\mathbb{P V V T}(J)=K\), then the \(J\) th colum \(n\) of A *P w as the the \(K\) th colum \(n\) of A.

TAU (output)
The scalar factors of the elem entary reflectors.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al

LW ORK.

LW ORK (input)
The din ension of the anray \(W\) ORK. LW ORK \(>=3 * N+1\). For optim al perform ance LW ORK \(>=2 * N+(N+1) * N B\), w here NB is the optim alblocksize.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit.
< 0 : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(m, n) .
\]

Each H (i) has the form
H (i) \(=I-\tan * V^{*} V^{\prime}\)
w here tau is a real/com plex scalar, and \(v\) is a real/com plex vectorw th \(v(1: i-1)=0\) and \(v(i)=1 ; v(i+1 \mathrm{~m})\) is stored on exitin A ( \(+1+1 \mathrm{~m}, \mathrm{i})\), and tau in TAU (i).

\section*{PURPOSE}
sgeqpf routine is deprecated and has been replaced by routine SGEQP3.

SG EQPF com putes a QR factorization \(w\) ith colum \(n\) pivoting of a realM -by \(-N\) m atrix \(A: A * P=Q * R\).

\section*{ARGUMENTS}

M (input) The num ber of row sof the \(m\) atrix \(A . M>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} \cdot \mathrm{N}>=0\)

A (input/output)
On entry, the M by -N m atrix A. On exit, the upper triangle of the aray contains the \(m\) in \((M, N)\)-by \(-N\) upper triangularm atrix \(R\); the elem ents below the diagonal, together \(w\) ith the array TA \(U\), represent the orthogonalm atrix \(Q\) as a product of \(m\) in \((m, n)\) elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

JPIVOT (input/output)
On entry, if \(\mathbb{P} \mathbb{I V O T}\) (i) ne.0, the i-th colum n of \(A\) is perm uted to the front ofA *P (a leading colum n); if \(\mathbb{P} \mathbb{I V O T}\) (i) \(=0\), the i-th column ofA is a free column. On exit, if JPIVOT (i) \(=k\), then the i-th column of A *P was the \(k\)-th colum \(n\) of A.

TAU (output)
The scalar factors of the elem entary reflectors.

W ORK (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{I N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{I N}\) FO \(=-i\), the -th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

Them atrix Q is represented as a product of elem entary reflectors
```

Q = H (1)H(2) ...H (n)

```

Each H (i) has the form \(\mathrm{H}=\mathrm{I}-\tan { }^{*} \mathrm{v}^{*} \mathrm{v}^{\prime}\)
\(w\) here tau is a realscalar, and \(v\) is a real vectorw ith \(\mathrm{v}(1: i-1)=0\) and \(\mathrm{v}(\mathrm{i})=1 ; \mathrm{v}(\mathrm{i}+1 \mathrm{~m})\) is stored on exit in A (i+1 \(m, ~ i)\).

Them atrix \(P\) is represented in jpvtas follow \(s\) : If jut( 7 ) \(=i\)
then the th colum \(n\) ofP is the ith canonicalunitvector.

* ferr, float *berr, long *info);

\section*{PURPOSE}
sgerfs im proves the com puted solution to a system of linear equations and provides errorbounds and backw ard erroresti\(m\) ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}: A * X=B \quad\) (Notranspose)
\(=T\) ': A **T * \(\mathrm{X}=\mathrm{B} \quad\) ( T ranspose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran spose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrices B and X. NRH S >=0.

A (input) The original \(N\) foy N m atrix A .

\section*{LD A (input)}

The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{AF (input)}

The factors L and U from the factorization \(\mathrm{A}=\) \(\mathrm{P} * \mathrm{~L} * \mathrm{U}\) as com puted by SGETRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, \mathbb{N})\).
\(\mathbb{P I V O T}\) (input)
The pivotindioes from SGETRF ; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P}\) IV OT (i).
\(B\) (input) The righthand side m atrix \(B\).
LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SGETRS. On exit, the im proved solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the array X . LD X >= \(\max (1, \mathbb{N})\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

BERR (output)
The com ponentw ise relative backw ard error of each solution vector X (j) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension \((3 * N)\)

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue

\#include < sunperfh>
void sgesdd (char jobz, intm, int \(n\), float *a, int lda, float *s, float *u, int ldu, float *vt, int ldvt, int*info);
void sgesdd_64 (char jobz, long m, long \(n\), float *a, long lda, float *s, float *u, long ldu, float *vt, long ldvt, long *info);

\section*{PURPOSE}
sgesdd com putes the singular value decom position (SVD ) of a real \(\mathrm{M}-\mathrm{by}-\mathrm{N} \mathrm{m}\) atrix A , optionally com puting the left and right singularvectors. If singular vectors are desired, it uses a divide-and-conquer algorithm .

The SVD isw ritten
\(=\mathrm{U}\) * SIG M A * transpose ( V )
where S IG M A is an M -by \(-\mathrm{N} m\) atrix which is zero except for its \(m\) in ( \(m, n\) ) diagonal elem ents, \(U\) is an \(M\) by \(-M\) orthogonal \(m\) atrix, and \(V\) is an \(N\) by \(-N\) orthogonalm atrix. The diagonal elements of SIGMA are the singular values of A ; they are real and non-negative, and are retumed in descending order. The firstm in ( \(\mathrm{m}, \mathrm{n}\) ) colum ns of \(U\) and \(V\) are the left and right singular vectors of .

N ote that the routine retums \(\mathrm{VT}=\mathrm{V} * * \mathrm{~T}\), notV .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w th a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray X M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al \(m\) achines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}

JOBZ (input)
Specifies options for com puting allorpart of the
\(m\) atrix \(U\) :
= A ': allM colum ns of U and all N row sof V **T are retumed in the arrays \(U\) and \(V T ;=S\) : the firstm in \((M, N)\) colum ns of \(U\) and the firstm in \((M, N)\) row S of V **T are retumed in the arrays U and VT ;
\(=\mathrm{O}^{\prime}\) : If \(\mathrm{M}>=\mathrm{N}\), the first N colum ns of U are overw ritten on the array \(A\) and all row sofV **T are retumed in the amay VT ; otherw ise, all colum \(n s\) of \(U\) are retumed in the array \(U\) and the firstM row SofV **T are overw ritten in the amay \(\mathrm{VT} ;=\mathrm{N}^{\prime}\) : no colum ns of U or row sof \(\mathrm{V} * * \mathrm{~T}\) are com puted.

M (input) The num ber of row s of the inputm atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the inputm atrix \(\mathrm{A} . \mathrm{N}>=\) 0.

A (input/output)
On entry, the M -by -N m atrix A . On exit, if \(\mathrm{OB} \mathrm{Z}=\)
\(O^{\prime}, A\) is overw ritten \(w\) ith the first \(N\) colum ns of
U (the leftsingularvectors, stored colum nw ise)
if \(\mathrm{M}>=\mathrm{N}\); A is overw rilten w ith the firstM row s of \(\mathrm{V} * * \mathrm{~T}\) the right singularvectors, stored row wise) otherw ise. if OBZ ne. 0 ', the contents of A are destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

S (output)
The singularvalues ofA, sorted so that \(S\) (i) \(>=\) \(S(i+1)\) 。

U (output)
\(\mathrm{UCOL}=\mathrm{M}\) iff \(\mathrm{OBZ}=\mathrm{A}^{\prime}\) or \(\mathrm{OBZ}=\mathrm{D}^{\prime}\) 'and \(\mathrm{M}<\mathrm{N}\);
\(\mathrm{UCOL}=\mathrm{m}\) in \((\mathrm{M}, \mathrm{N})\) if \(J O B Z=S^{\prime}\). If \(\mathrm{OBZ}=\mathrm{A}^{\prime}\) or
JOBZ \(=0\) 'and \(M<N\), U contains the \(M\) boy \(M\) orthogonalm atrix U ; if \(\mathrm{OBZ}=\mathrm{S}\) ', U contains the firstm in \((M, N)\) colum ns of \(U\) (the left singular vectors, stored colum nw ise); if OB BZ \(=0\) 'and \(M\) \(>=\mathrm{N}\), or \(\mathrm{OBZ}=\mathrm{N}^{\prime}\), U is notreferenced.

LD U (input)
The leading dim ension of the aray \(U . L D U>=1\);
if \(\mathrm{OBZ}=\mathrm{S}^{\prime}\) or \(\mathrm{A}^{\prime}\) 'or \(\mathrm{OBZ}=\mathrm{O}^{\prime}\) 'and \(\mathrm{M}<\mathrm{N}, \mathrm{LDU}\) \(>=\mathrm{M}\).

VT (output)
If \(\mathrm{OBZ}=\mathrm{A}^{\prime}\) or \(\mathrm{OBBZ}=\mathrm{D}^{\prime}\) 'and \(\mathrm{M}>=\mathrm{N}, \mathrm{VT}\) contains the N boy N orthogonalm atrix \(\mathrm{V} * * \mathrm{~T}\); if \(\mathrm{OB} \mathrm{Z}=\) \(S\) ', V T contains the firstm in \((\mathrm{M}, \mathrm{N})\) row S of \(\mathrm{V} * * T\) (the right singularvectors, stored row w ise); if \(\mathrm{JOBZ}=\mathrm{O}\) 'and \(\mathrm{M}<\mathrm{N}\), orJOBZ \(=\mathrm{N}^{\prime}\) ', VT is not referenced.

LDVT (input)
The leading dim ension of the amay V T. LDV T >=1; if \(\mathrm{OOBZ}=\mathrm{A}\) 'or \(\mathrm{OBBZ}=\mathrm{O}^{\prime}\) 'andM \(>=\mathrm{N}, \mathrm{LDVT}>=\mathrm{N}\); if \(J O B Z=S^{\prime}, L D V T>=m\) in \((M)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al
LW ORK;

LW ORK (input)
The dim ension of the aray \(W\) ORK.LW ORK \(>=1\). If JOBZ \(=\mathrm{N}^{\prime}\), LWORK \(>=3 \star_{\mathrm{m}} \operatorname{in}(\mathrm{M}, N) \quad+\) \(\max (m \operatorname{ax}(\mathbb{M}, N), 6 \star m\) in \((M, N))\). If \(\mathrm{OBBZ}=\mathrm{O}^{\prime}, \mathrm{LW}\) ORK \(>=\) \(3{ }^{*} m\) in \((M, N){ }^{2} m\) in \((M, N)+\max \left(m a x(M, N), 5 \star_{m}\right.\) in \((M, N) \star\) \(m\) in \((M, N)+4{ }^{*} m\) in \((M N)\) ). If OBZ \(=S^{\prime}\) or \(A^{\prime}\) LW ORK \(>=3 *_{m}\) in \((M, N) \star_{m}\) in \((M, N)+m \operatorname{ax}\left(m \operatorname{ax}(M, N), 4 *_{m}\right.\) in \((M, N) *\) \(m\) in \((M, N)+4 * m\) in \((M, N))\). Forgood perform ance, LW ORK should generally be larger. If LW ORK < O but other input argum ents are legal, W ORK (1) retums optim alLW ORK .

IW ORK (w orkspace)
dim ension \((8 * \mathrm{M} \mathbb{N} \mathbb{M}, \mathbb{N}))\)

\section*{PURPOSE}
sgesv com putes the solution to a real system of linear equations
\(A * X=B, w h e r e A\) is an \(N\) boy \(-N m\) atrix and \(X\) and \(B\) are N -by -N R H S m atrices.

The LU decomposition w ith partial pivoting and row interchanges is used to factorA as
\(A=P * L * U\),
\(w\) here \(P\) is a perm utation \(m\) atrix, \(L\) is unit low er triangular, and \(U\) is upper triangular. The factored form of \(A\) is then used to solve the system ofequations \(A * X=B\).

\section*{ARGUMENTS}

N (input) The num ber of linear equations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input/output)
O n entry, the N boy -N coefficient m atrix A . On exit, the factors \(L\) and \(U\) from the factorization \(A\) \(=\mathrm{P} * \mathrm{~L} * \mathrm{U}\); the unitdiagonalelem ents of \(L\) are not stored.

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).

IPIVOT (output)
The pivot indices that define the perm utation \(m\) atrix \(P\); row \(i\) of the \(m\) atrix \(w\) as interchanged w th row \(\mathbb{P}\) IVOT (i).

B (input/output)
On entry, the N -by-N RH S m atrix of righthand side
\(m\) atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the \(N\) boy-NRHS solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{U}(i, i)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, so the solution could not be com puted.

\section*{PURPOSE}
sgesvd com putes the singularvalue decom position (SV D ) of a real M -by -N m atrix A , optionally com puting the leftand/or right singularvectors. The SVD isw rilten
\(=U *\) SIGMA * transpose \((V)\)
where SIG M A is an M by N m atrix which is zero except for its \(m\) in ( \(m, n\) ) diagonal elem ents, \(U\) is an \(M\) by \(M\) orthogonal \(m\) atrix, and \(V\) is an \(N\) by \(N\) orthogonalm atrix. The diagonal elem ents of SIGM A are the singular values of A ; they are real and non-negative, and are retumed in descending order. The firstm in ( \(m, n\) ) colum ns of \(U\) and \(V\) are the left and right singularvectors of A.
\(N\) ote that the routine retums \(V\) **T, not \(V\).

\section*{ARGUMENTS}

\section*{JOBU (input)}

Specifies options for com puting allor part of the \(m\) atrix U :
= A ': all M colum ns of U are retumed in amay
U :
\(=S\) ': the firstm in \((m, n)\) colum ns ofU the left singular vectors) are retumed in the array \(U\); \(=\) \(O^{\circ}\) : the firstm in \((m, n)\) colum ns of \(U\) the left singular vectors) are overw ritten on the array A; \(=\mathrm{N}\) ': no colum ns of U (no left singularvectors) are com puted.

JOBVT (input)
Specifies options for com puting allorpart of the m atrix V **T:
\(=\mathrm{A}\) ': alln rowsof \(\mathrm{V} * * \mathrm{~T}\) are retumed in the amay VT;
\(=S\) : the firstm in \((m, n)\) row sofV \(* * T\) the right singular vectors) are retumed in the array VT ; \(=\) \(\mathrm{O}^{\prime}\) : the firstm in \((m, n)\) row s of \(V * * T\) the right singular vectors) are overw ritten on the array A; \(=\mathrm{N}\) ': no row sof \(\mathrm{V}^{* *} \mathrm{~T}\) (no right singular vectors) are com puted.

JO BV T and JOBU cannotboth be \(0^{\prime}\) '.

M (input) The num ber of row s of the inputm atrix \(A . M>=0\).
N (input) The num ber of colum ns of the inputm atrix \(\mathrm{A} . \mathrm{N}>=\) 0.

A (input/output)
On entry, the \(M-b y-N\) m atrix A. On exit, if \(J O B U=\) \(O^{\prime}\), A is overw rilten w ith the firstm in \((m, n)\)
colum ns of (the left singular vectors, stored colum nw ise); if JOBVT = O',A is overw rilten w th the firstm in \((m, n)\) row sof \(V * * T\) the right singularvectors, stored row w ise); if JO BU ne. 0 'and JOBVT ne. O', the contents of A are destroyed.

LDA (input)
The leading dim ension of the anay A. LDA >= \(m a x(1, M)\).

\section*{SING (output)}

The singularvalues of A, sorted so that SIN G (i) \(>=S \mathbb{N} G(i+1)\).

U (input) ( \(\mathrm{LD} \mathrm{U}, \mathrm{M}\) ) if \(\mathrm{JOBU}=\mathrm{A}\) 'or ( \((\mathrm{LD} \mathrm{U}, \mathrm{m}\) in \((\mathrm{M}, \mathbb{N})\) ) if \(\mathrm{JOBU}=\) \(S^{\prime}\). If \(\mathrm{JOBU}=A\) ', U contains the M -by -M orthogonalm atrix \(U\); if \(J O B U=S\) ', \(U\) contains the first \(m\) in ( \(m, n\) ) colum ns of \(U\) (the left singular vectors, stored colum nw ise); if \(\mathrm{JOBU}=\mathrm{N}\) 'or \(\mathrm{O}^{\prime}\) ' U is not referenced.

LD U (input)
The leading dim ension of the array \(U . L D U>=1\); if JO BU = S'or A',LDU >= M.

VT (input)
If \(\mathrm{OOBVT}=\mathrm{A}\) ', VT contains the N -by-N orthogonal m atrix \(\mathrm{V} * * \mathrm{~T}\); if \(\mathrm{JO} \mathrm{BVT}=\mathrm{S}^{\prime}, \mathrm{VT}\) contains the first \(m\) in \((m, n)\) row s of \(V * * T\) (the right singularvectors,
stored row w ise); if \(\mathrm{JOBVT}=\mathrm{N}\) 'or \(\mathrm{D}^{\prime}, \mathrm{VT}\) is not referenced.

LDVT (input)
The leading dim ension of the array V T. LD V T >=1;
if JOBVT = A',LDVT >= N ; if JOBVT = S', LDVT >= \(m\) in \(M, N\) ).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK ; if \(\mathbb{N} F O>0, W\) ORK ( \(2 \mathbb{M} \mathbb{N} M, N\) )) contains the unconverged superdiagonal elem ents of an upper bidiagonalm atrix B whose diagonal is in SIN G (not necessarily sorted). B satisfies \(\mathrm{A}=\mathrm{U} * \mathrm{~B} * \mathrm{VT}\), so it has the sam e singular values as A, and singular vectors related by U and V T.

LD W ORK (input)
The dim ension of the array W ORK. LDW ORK >= 1.
 Forgood perform ance, LDW ORK should generally be larger.

If LD W ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum enthad an illegalvalue.
> 0 : if \(S B D S Q R\) did not converge, \(\mathbb{N F O}\) specifies
how \(m\) any superdiagonals of an interm ediate bidiagonal form B did not converge to zero. See the description ofW ORK above fordetails.

\section*{C INTERFACE}
\#include <sunperfh>
void sgesvx (char fact, char transa, intn, int nrhs, float
*a, int lda, float *af, int ldaf, int *ipivot, char equed, float *r, float * c , float *b, int ladb, float *x, int ldx, float *roond, float *ferr, float *berr, int *info);
void sgesvx_64 (char fact, chartransa, long n, long nihs, float *a, long lda, float *af, long ldaf, long *ipivot, charequed, float *r, float *c, float *b, long ldb, float *x, long ldx, float * roond, float * ferr, float *berr, long *info);

\section*{PURPOSE}
sgesvx uses the LU factorization to com pute the solution to a realsystem of linear equations
\(A * X=B\), where \(A\) is an \(N\) by \(-N m\) atrix and \(X\) and \(B\) are N -by-N R H S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are com puted to equilibrate
the system:
TRANS = \(\mathrm{N}^{\prime}: \operatorname{diag}(\mathrm{R}) * A * \operatorname{diag}(\mathrm{C}) \quad * \operatorname{inv}(\operatorname{diag}(\mathrm{C})) * \mathrm{X}=\) \(\operatorname{diag}(\mathbb{R}) * B\)

TRANS \(=T:(\operatorname{diag}(\mathbb{R}) \star A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C)*B

TRANS \(=C\) ': \((\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C)*B

W hether or not the system w illbe equilibrated depends on the
scaling of the m atrix A , but ifequilibration is used, A is
overw rilten by diag \((\mathbb{R}) \star A\) *diag \((C)\) and \(B\) by diag \((\mathbb{R}) \star B\) (if TRANS = N ) ordiag (C)*B (ifTRANS = T'or C).
2. IfFACT = N 'or E', the LU decomposition is used to factor the
\(m\) atrix A (afterequilibration ifFACT = E ) as
\[
A=P * L * U
\]
\(w\) here \(P\) is a perm utation \(m\) atrix, \(L\) is a unit low er triangular
\(m\) atrix, and \(U\) is upper triangular.
3. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix A. If the reciprocal of the condition num ber is less than m achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and compute error bounds as described below.
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (C) (ifTRANS = N ) ordiag \((\mathbb{R})\) (ifTRANS \(=T^{\prime}\) or C) so
that it solves the originalsystem before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, w hether them atrix A should be equilibrated before it is factored. = F': On entry, AF and IPIV OT contain the factored form of \(A\). IfEQUED is not \(N^{\prime}\), the \(m\) atrix A has been equilibrated \(w\) ith scaling factors given by R and \(\mathrm{C} . \mathrm{A}, \mathrm{AF}\), and \(\mathbb{P}\) IV OT are not m odified. \(=\mathrm{N}\) : Them atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) : The matrix A will be equilibrated if necessary, then copied to AF and factored.

TRANSA (input)
Specifies the form of the system of equations:
\(=N^{\prime}: A * X=B \quad\) N o transpose)
\(=T\) ': \(A * * T * X=B \quad\) ( ranspose)
\(=C: A * * H * X=B \quad\) (Transpose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE. N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X. NRHS \(>=0\).

A (input/output)
O n entry, the N -by -N m atrix A . IfFA CT \(=\mathrm{F}^{\prime}\) and EQUED is not \(N\) ', then A m usthave been equilibrated by the scaling factors in R and/orC. A is not modified if \(\mathrm{FACT}=\mathrm{F}^{\prime}\) or \(\mathrm{N}^{\prime}\), or if \(\mathrm{FACT}=\) E'and EQU ED = N 'on exit.

On exit, ifEQ UED ne. \(N\) ', A is scaled as follow s: \(\operatorname{EQUED}=\mathrm{R}: A:=\operatorname{diag}(\mathbb{R}) * A\)
\(E Q U E D=C\) ': A \(=A * \operatorname{diag}(C)\)
\(E Q U E D=B \prime A:=\operatorname{diag}(R) * A * \operatorname{diag}(C)\).

LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

AF (input/output)
If FACT \(=F^{\prime}\), then \(A F\) is an inputargum entand on entry contains the factors \(L\) and \(U\) from the factorization \(A=P * L * U\) as com puted by SGETRF. If EQUED ne. \(N^{\prime}\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix A.

IfFACT \(=N\) ', then AF is an output argum ent and on exit retums the factors \(L\) and \(U\) from the factorization \(A=P * L * U\) of the originalm atrix \(A\).

If \(F A C T=E\) ', then \(A F\) is an output argum ent and on exit retums the factors \(L\) and \(U\) from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) of the equilibrated m atrix A (see the description of \(A\) for the form of the equilibrated \(m\) atrix) .

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

PIVOT (inputoroutput)
IfFACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P I V O T}\) is an input argum ent and on entry contains the pivot indioes from the factorization \(A=P * L * U\) as com puted by SGETRF ; row \(i\) of the matrix was interchanged with row \(\mathbb{P I V O T}\) (i).

IfFACT = N', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivot indices from the factorization \(A=P * L * U\) of the originalm atrix \(A\).

IfFACT = E', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivot indices from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) of the equilibrated m atrix A.

EQUED (input/output)
Specifies the form of equilibration thatw as done. \(=\mathrm{N}\) ': No equilibration (alw ays true iffACT = \(\mathrm{N})\).
\(=R\) ': Row equilibration, ie., A has been prem ultiplied by diag \((R)\). = C ': C olum n equilibration, ie., A has been postm ultiplied by diag (C ). = B': B oth row and colum n equilibration, ie., A has been replaced by diag \((\mathbb{R})\) * A * diag (C). EQUED is an inputargum entifFACT= F '; otherw ise, it is an output argum ent.

R (input/output)
The row scale factors for \(A\). IfEQUED \(=R^{\prime}\) or B', A is multiplied on the left.by diag \((\mathbb{R})\); if EQUED = N 'or C', R is notaccessed. \(R\) is an input argum ent ifFACT = \(F\) '; otherw ise, \(R\) is an output argum ent. IfFACT = F'andEQUED = R'or \(B\) ',each elem entofR m ustbe positive.

C (input/output)
The colum n scale factors for \(A\). IfEQ UED = C 'or B', A ismultiplied on the rightby diag (C ) ; if EQUED \(=N\) 'or \(R\) ', \(C\) is notaccessed. \(C\) is an input argum ent ifFACT \(=F\) '; otherw ise, \(C\) is an outputargum ent. IfFACT = F'and EQUED = C'or \(B\) ', each elem entofC \(m\) ust.be positive.

B (input/output)
On entry, the N -by-NRHS righthand side m atrix \(B\). On exit, if EQUED = \(N\) ', \(B\) is notm odified; if TRANSA \(=N^{\prime}\) and EQUED \(=R^{\prime}\) or \(B^{\prime}, B\) is overw rilten by diag \((R) * B\); if TRANSA \(=T\) 'or \(C^{\prime}\) and EQUED \(=C^{\prime}\) or \(B^{\prime}, B\) is overw ritten by diag (C) *B.

LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\)-by-NRH \(S\) solution
\(m\) atrix \(X\) to the original system ofequations.
\(N\) ote that \(A\) and \(B\) are \(m\) odified on exit if EQUED
ne. N ', and the solution to the equilibrated
system is inv (diag (C))*X ifTRANSA = N 'and EQUED
\(=C\) 'or \(B\) ', orinv (diag \((R)) * X\) ifTRANSA \(=T\) 'or \(C^{\prime}\) 'and \(E Q U E D=R\) 'or \(B\) '.

LD X (input)
The leading dim ension of the aray X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num berof the matrix A after equilibration (if done). If
RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), them atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th colum n of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(1)\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost
alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( \(j\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exact solution).

W ORK (w orkspace)
dim ension ( \(4 * \mathrm{~N}\) ) On exit, W ORK (1) contains the reciprocal pivot grow th factornom (A)/norm (U). The "m ax absolute elem ent" norm is used. If W ORK (1) is m uch less than 1 , then the stability of the LU factorization of the (equilibrated) matrix A could be poor. This also \(m\) eans that the solution X, condition estim atorRCOND, and forw ard error bound FERR could be unreliable. If factorization fails w ith \(0<\mathbb{N} F O<=N\), then \(W\) ORK (1) contains the reciprocal pivot grow th factor forthe leading \(\mathbb{N} F O\) colum nsofA.

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\)-i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has been completed, but the factor \(U\) is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num berof situations w here the com puted solution can bem ore accurate than the value ofRC O ND w ould suggest.

void sgetrs_64 (char transa, long n, long nrhs, float *a, long lda, long *ipivot, float*b, long ldb, long *info);

\section*{PURPOSE}
sgetrs solves a system of linear equations
\(A * X=B\) or \(A^{\prime *} X=B\) w ith a generalN boy \(N \mathrm{~N}\) matrix \(A\) using the LU factorization com puted by SGETRF .

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system of equations:
\(=N: A * X=B \quad\) N otranspose)
\(=T\) ': \(A * X=B \quad\) (Transpose)
\(=C^{\prime}: A^{*} \mathrm{X}=\mathrm{B}\) (C onjugate transpose \(=\) Transpose)

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{N}\) TERFACE.

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input) The factors \(L\) and \(U\) from the factorization \(A=\) \(\mathrm{P} * \mathrm{~L} * \mathrm{U}\) as com puted by SG ETRF .

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).

IPIVOT (input)
The pivotindiaes from \(\operatorname{SGETRF}\); for \(1<=i<=N\), row \(i\)
of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P}\) IV OT (i).

B (input/output)
On entry, the right hand side \(m\) atrix \(B\). On exit, the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B . LD B >= \(\max (1, N)\).

IN FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N N}\) FO \(=-i\), the \(i\) th argum ent had an illegalvalue

\section*{PURPOSE}
sggbalbalances a pair of general realm atrioes ( \(A, B\) ). This involves, first, perm uting A and B by sim ilarity transform ations to isolate eigenvalues in the first1 to \(\mathbb{H O} \$-\$ 1\) and last IH I+ 1 to N elem ents on the diagonal; and second, applying a diagonal sim ilarity transform ation to row \(s\) and colum ns IIO to \(\mathbb{H}\) I to \(m\) ake the row \(s\) and colum ns as close in norm as possible. B oth steps are optional.

B alancing \(m\) ay reduce the 1 -norm of the \(m\) atrices, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors in the generalized eigenvalue problem \(A * x=1 a m\) bda*B \({ }^{*} x\).

\section*{ARGUMENTS}
\(J O B\) (input)
Specifies the operations to be perform ed on \(A\) and
B :
\(=\mathrm{N}\) ': none: smply set \(\mathbb{L} \mathrm{O}=1, \mathbb{H} \mathrm{I}=\mathrm{N}\), \(\operatorname{LSCALE}(\mathbb{I})=1.0\) and RSCALE (I) \(=1.0\) for \(i=\)
\(1, \ldots, N .=P\) ': perm ute only;
= S': scale only;
= \(\mathrm{B}:\) : both perm ute and scale.

N (input) The order of the m atriges A and B. \(\mathrm{N}>=0\).

A (input/output)
On entry, the inputm atrix A. On exit, A is overw rilten by the balanced \(m\) atrix. If \(J 0 B=N\) ', A is notreferenced.

LDA (input)
The leading dim ension of the array A. LD A >= \(\max (1, \mathbb{N})\).
\(B\) (input) On entry, the inputm atrix \(B\). On exit, \(B\) is overw ritten by the balanced \(m\) atrix. If \(\mathrm{JO} \mathrm{B}=\mathrm{N}\) ', \(B\) is notreferenced.

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

ㅍㅇ (output)
IO Ond \(\mathbb{H}\) Iare set to integers such thaton exit
\(A(i, j)=0\) and \(B(i, 7)=0\) if i> jand \(j=\) \(1, \ldots\), ILIO -1 or \(i=\mathbb{H}\) I \(+1, \ldots, N\). If \(J 0 B=N\) ' or \(S^{\prime}, \mathrm{HO}=1\) and \(\mathbb{H} \mathrm{I}=\mathrm{N}\).

IH I (output) See the description for IIO.

LSCALE (input)
D etails of the perm utations and scaling factors applied to the left side of \(A\) and \(B\). IfP \((\mathcal{O})\) is the index of the row interchanged with row \(j\) and D ( 7 ) is the scaling factor applied to row \(j\) then \(\operatorname{LSCALE}(\mathcal{O})=\mathrm{P}(\mathrm{O})\) for \(J=1, \ldots\), ILO \(-1=\mathrm{D}(\mathrm{y})\) for \(J=\mathbb{L} O, \ldots, \mathbb{H} I=P(j) \quad\) for \(J=\mathbb{H} I+1, \ldots, N\).
The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathrm{IO} \mathrm{O}-1\).

\section*{RSCALE (input)}

D etails of the perm utations and scaling factors applied to the right side of \(A\) and \(B\). IfP \((\mathcal{I})\) is the index of the colum \(n\) interchanged \(w\) ith colum \(n\) \(j\) and \(D(j)\) is the scaling factorapplied to column \(j\) then LSCALE \((j)=P(\mathcal{i})\) for \(J=\) \(1, \ldots, \mathbb{H} O-1=D(\mathcal{i})\) for \(J=\mathbb{H}, \ldots, \mathbb{H} I=P(\mathcal{J})\) for \(J=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\). The order in which the interchanges are m ade is N to \(\mathrm{IH} \mathrm{I}+1\), then 1 to

W ORK (w orkspace)
dim ension ( \(6 * \mathrm{~N}\) )
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
<0: if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvahue.

*a, long lda, float *b, long lolb, long *sdim, float *alphar, float *alphai, float *beta, float *vsl, long ldvsl, float *vsr, long ldvsr, long *info);

\section*{PURPOSE}
sgges com putes for a pair of N -by -N real nonsym \(m\) etric \(m\) atrices ( \(A, B\) ), the generalized eigenvalues, the generalized realSchur form ( \(\mathrm{S}, \mathrm{T}\) ), optionally, the left and/or right \(m\) atrices of Schurvectors (V SL and V SR ). This gives the generalized Schur factorization
\[
(A, B)=(N S L) * S * N S R) * * T,(N S L) * T * N S R) * * T)
\]

Optionally, it also orders the eigenvalues so that a selected chuster of eigenvalues appears in the leading diagonalblocks of the upperquasi-triangularm atrix \(S\) and the upper triangularm atrix \(T\).The leading colum ns of V SL and V SR then form an orthonorm albasis for the comesponding left and righteigenspaces (deflating subspaces).
(If only the generalized eigenvalues are needed, use the driverSG G EV instead, which is faster.)

A generalized eigenvalue for a pair ofm atrices \((A, B)\) is a scalar \(w\) or a ratio alphabeta \(=w\), such that \(A-w * B\) is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0 orboth being zero.

A pairofm atrices \((S, T)\) is in generalized real Schur form if \(T\) is upper triangularw ith non-negative diagonaland \(S\) is block uppertriangularw ith 1 Hoy -1 and 2 -by -2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while \(2-b y-2\) blocks ofS w illbe "standardized" by making the corresponding elem ents of \(T\) have the form :
\(\left[\begin{array}{lll}a & 0\end{array}\right]\)
[ 0 b ]
and the pair of corresponding 2 -by -2 blocks in \(S\) and \(T \mathrm{w}\) ill have a com plex conjugate pair of generalized eigenvalues.

\section*{ARGUMENTS}

JOBVSL (input)
\(=\mathrm{N}^{\prime}\) : do notcom pute the leftSchurvectors;
\(=\mathrm{V}\) ': com pute the leftSchurvectors.

JO BV SR (input)
\(=\mathrm{N}\) : do notcom pute the rightSchurvectors;
\(=\mathrm{V}^{\prime}\) : com pute the rightSchurvectors.

SORT (input)
Specifies w hether or not to order the eigenvalues
on the diagonal of the generalized Schur form . =
N ': Eigenvalues are notordered;
\(=S\) ': Eigenvalues are ordered (see SELCTG);

SELCTG (input)
SELCTG m ustbe declared EXTERNAL in the calling
subroutine. If \(\mathrm{SORT}=\mathrm{N}^{\prime}\) ', SELCTG is notrefer-
enced. IfSORT = S', SELCTG is used to select
eigenvalues to sort to the top leftof the Schur
form. A n eigenvalue (A LPHAR ( \()+A L P H A I(\mathcal{J})\) ) BETA ( \()\)
is selected ifSELCTG (A LPHAR ( ) , A LPHAI ( ) , BETA ( 7 )
is true; ie. if either one of a com plex conjugate
pair of eigenvalues is selected, then both com plex
eigenvahues are selected.

N ote that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy \(\operatorname{SELCTG}(A L P H A R(\mathcal{j}) A L P H A I(\lambda)\), BETA \((\mathcal{j})=\operatorname{TRUE}\).
after ordering. \(\mathbb{N} F O\) is to be set to \(N+2\) in this case.

N (input) The order of the m atrices A, B, V SL, and VSR. N
\[
>=0 .
\]

A (input/output)
O \(n\) entry, the firstof the pair of \(m\) atrices. On
exit, A has been overw ritten by its generalized Schur form \(S\).

LD A (input)
The leading dim ension ofA. LD \(A>=m\) ax \((1, N)\).

B (input/output)
O n entry, the second of the pair ofm atrices. On exit, B has been overw ritten by its generalized Schur form T.

LD B (input)
The leading dim ension ofB. LD B \(>=\max (1, \mathbb{N})\).
SD \(\mathbb{I M}\) (output)
If \(S O R T=N^{\prime}, S D \mathbb{I M}=0\). IfSORT \(=S^{\prime}, S D \mathbb{M}=\)
num ber of eigenvalues (aftersorting) forw hich
SELCTG is true. (Complex conjugate pairs for which SELCTG is true foreither eigenvalue count as 2.)

ALPHAR (output)
On exil, (ALPHAR ( ) + ALPHAI ( \() * i)\) BETA ( \()\), \(\dot{F} 1, \ldots, N\), will be the generalized eigenvalues.
 are the diagonals of the com plex Schur form ( \(\mathrm{S}, \mathrm{T}\) ) thatw ould result if the 2 -by-2 diagonalblocks of the real.Schur form of ( \(A, B\) ) w ere further reduced to triangular form using 2 -by-2 complex unitary transform ations. If A LPHA I \((\underset{)}{ })\) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and ( \(j+1\) )-steigenvahues are a com plex con \(j u-\) gate pair, w ith A LPH A I(j+1) negative.

Note: the quotients ALPHAR ( ) BETA ( ) \()\) and A LPHAI( ) BETA ( ) m ay easily over-or underflow, andBETA ( \(\mathcal{O}\) ) may even be zero. Thus, the user should avoid naively com puting the ratio. H ow -
ever, A LPH AR and A LPH A Iw illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable w ith norm ( \(B\) ).

\section*{A LPH A I (output)}

See the description forA LPH AR.

BETA (output)
See the description forA LPH AR .
VSL (input)
If JOBVSL = V',VSL willcontain the left Schur vectors. N ot referenced if \(\mathrm{OBVSL}=\mathrm{N}^{\prime}\).

LD V SL (input)
The leading dim ension of the \(m\) atrix VSL. LDV SL \(>=1\), and if \(\mathrm{OBVSL}=\mathrm{V}^{\prime}, \mathrm{LDV}\) SL \(>=\mathrm{N}\).

VSR (input)
If \(J O B V S R=V\) ', VSR willcontain the right Schur vectors. N ot referenced if \(\mathrm{OBVSR}=\mathrm{N}^{\prime}\).

LDVSR (input)
The leading dim ension of the \(m\) atrix \(V\) SR .LD V SR \(>=\) 1 , and if \(\mathrm{OBVSR}=\mathrm{V}\) ', LD V SR \(>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the option al LW ORK.

LW ORK (input)
The dim ension of the anray W ORK. LW ORK \(>=8 * \mathrm{~N}+16\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

BW ORK (w orkspace)
dim ension \((\mathbb{N}) N\) ot referenced if \(S O R T=N^{\prime}\).
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvalue.
\(=1, \ldots, N\) : The Q Z iteration failed. ( \(\mathrm{A}, \mathrm{B}\) ) are not in Schur form, butA LPHAR ( \(\mathcal{I}\), A LPHAI ( \(\mathcal{I}\) ) , and BETA ( 1 ) should be correct for \(\mathcal{F} \mathbb{N}\) FO \(+1, \ldots, N .>\)
\(\mathrm{N}:=\mathrm{N}+1\) : other than Q Z iteration failed in

SHGEQ Z.
\(=\mathrm{N}+2\) : after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the \(G\) eneralized Schur form no longer satisfy SELCTG=TRUE. This could also be caused due to scaling. \(=\mathrm{N}+3\) : reordering failed in STG SEN .

\#include <sunperfh>
void sggesx (char jojbvsl, char jobvsr, char sort, int(*selctg) (float,float,float), char sense, int n, float*a, int lda, float *b, int ldb, int *sdim, float*alphar, float*alphai, float*beta, float*vsl, int ldvsl, float *Vsr, int ldvsr, float *roonde, float *roondv, int *info);
void sggesx_64 (char jobvsl, char jobvsr, char sort, long (* selctg) (float,float,float), char sense, long n, float*a, long lda, float*b, long ldlo, long *sdim, float*alphar, float*alphai, float*beta, float*vsl, long ldvsl, float *vsr, long ldvsr, float *roonde, float *roondv, long *info);

\section*{PURPOSE}
\(m\) atrices ( \(A, B\) ), the generalized eigenvalues, the realSchur form ( \(S, T\) ), and, optionally, the leftand/or right \(m\) atrioes of Schurvectors (V SL and V SR). This gives the generalized Schur factorization
\(A, B)=((N S L) S(N S R) \star \star T,(N S L) T(V S R) * * T)\)

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonalblocks of the upperquasi-triangularm atrix \(S\) and the upper triangular \(m\) atrix \(T\); com putes a reciprocalcondition num ber for the average of the selected eigenvalues (RCONDE); and com putes a reciprocal condition num ber for the right and left deflating subspaces corresponding to the selected eigenvalues (RCONDV). The leading colum ns ofV SL andVSR then form an orthonorm albasis for the corresponding left and righteigenspaces (deflating subspaces).

A generalized eigenvalue for a pair ofm atrices \((A, B)\) is a scalar \(w\) or a ratio alpha/beta \(=w\), such that \(A-w * B\) is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0 or forboth being zero.

A pairofm atrices ( \(\mathrm{S}, \mathrm{T}\) ) is in generalized real Schur form if \(T\) is upper triangularw ith non-negative diagonaland \(S\) is block uppertriangularw ith \(1-b y-1\) and \(2-b y-2\) blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while \(2-b y-2\) blocks ofS w illbe "standardized" by making the corresponding elem ents of \(T\) have the form :
\(\left[\begin{array}{lll}a & 0\end{array}\right]\)
[ 0 b ]
and the pair of comesponding 2 -by -2 blocks in \(S\) and \(T\) w ill have a com plex conjugate pair of generalized eigenvalues.

\section*{ARGUMENTS}

JOBVSL (input)
\(=\mathrm{N}^{\prime}\) : do notcom pute the leftSchurvectors;
\(=\mathrm{V}^{\prime}:\) com pute the leftSchurvectors.

JOBVSR (input)
\(=\mathrm{N}\) : do notcom pute the rightSchurvectors;
\(=\mathrm{V}^{\prime}\) : com pute the rightSchurvectors.

SORT (input)
Specifies w hether or not to order the eigenvalues on the diagonal of the generalized Schur form . =

N ': Eigenvalues are notordered;
= S ': Eigenvalues are ordered (see SELCTG).

SELCTG (input)
SELCTG m ustbe declared EXTERNAL in the calling
subroutine. If \(\mathrm{SORT}=\mathrm{N}^{\prime}\) ', SELCTG is notrefer-
enced. IfSORT = S', SELCTG is used to select
eigenvalues to sort to the top leftof the Schur
form. A n eigenvalue (ALPHAR ( \(\mathfrak{j})+A\) LPHAI( \()\) ) BETA ( \()\)
is selected ifSELCTG (A LPHAR ( 7 ) A LPHAI( ) , BETA ( \(\mathfrak{j}\) )
is true; i.e. if either one of a com plex conjugate
pair ofeigenvalues is selected, then both com plex
eigenvalues are selected. N ote that a selected
complex eigenvalue may no longer satisfy
SELCTG (ALPHAR ( \()\), ALPHAI ( \()\), BETA ( \(\mathcal{j})\) ) = TRUE. after
ordering, since ordering \(m\) ay change the value of
com plex eigenvalues (especially if the eigenvalue
is ill-conditioned), in this case \(\mathbb{N ~ F O ~ i s ~ s e t ~ t o ~}\)
\(\mathrm{N}+3\).

SEN SE (input)
D eterm ines which reciprocal condition num bers are com puted. \(=\mathrm{N}^{\prime}: \mathrm{N}\) one are com puted;
\(=E^{\prime}:\) C om puted for average of selected eigen-
values only;
\(=V^{\prime}: C\) om puted forselected deflating subspaces
only;
\(=B^{\prime}:\) Com puted forboth. IfSENSE = E', \(V\) ',
or B', SO RT m ustequal S'.

N (input) The order of the m atrioes A , B , V SL, and V SR. N
\[
>=0 .
\]

A (input/output)
O \(n\) entry, the first of the pair of \(m\) atrices. O \(n\)
exit, A has been overw rilten by its generalized Schurform \(S\).

LD A (input)
The leading dim ension ofA. LD \(A>=\max (1, N)\).

B (input/output)
O \(n\) entry, the second of the pair ofm atrices. On exit, B has been overw rilten by its generalized Schurform \(T\).

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

SD \(\mathbb{I M}\) (output)

If \(S O R T=N^{\prime}, S D \mathbb{M}=0\). IfSORT \(=S^{\prime}, S D \mathbb{M}=\) num ber of eigenvahues (aftersorting) forw hich SELCTG is tue. (Complex conjugate pairs for which SELCTG is tue foreithereigenvalue count as 2.)

ALPHAR (output)
On exit, (ALPHAR ( ) + ALPHAI ( 1 *i) BETA ( ) ,于1,...,N, w ill be the generalized eigenvalues.
 the diagonals of the com plex Schur form \((S, T)\) that w ould result if the 2 -by - 2 diagonalblocks of the real Schur form of ( \(\mathrm{A}, \mathrm{B}\) ) w ere further reduced to triangular form using 2 -by-2 complex unitary transform ations. If A LPHA I( \()\) is zero, then the \(j\) th eigenvalue is real; ifpositive, then the \(j\) th and ( \(j+1\) )-steigenvalues are a com plex conjugate pair, w ith A LPH A I( \(\mathfrak{j}+1\) ) negative.

N ote: the quotients ALPHAR ( \(\mathcal{I}\) ) BETA ( \(\mathcal{O}\) ) and A LPHAI (Э) BETA (ㄱ) may easily over-orunderflow, and BETA ( 1 ) m ay even be zero. Thus, the user should avoid naively com puting the ratio. H ow ever, A LPH AR and A LPH A Iw illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable with norm ( \(B\) ).

*vr, long ldvr, long *info);

\section*{PURPOSE}
sggev com putes for a pair of \(N\) Hoy N real nonsymm etric \(m\) atrices ( \(A, B\) ) the generalized eigenvalues, and optionally, the leftand/or right generalized eigenvectors.

A generalized eigenvalue for pair ofm atrices \((A, B)\) is a scalar lam bda or a ratio alpha/beta = lam boda, such thatA lam boda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta \(=0\), and even forboth being zero.

The righteigenvectorv (i) corresponding to the eigenvalue lam bda ( \()\) ) of ( \(A, B\) ) satisfies
\[
A * v(\mathcal{J})=\operatorname{lam} \operatorname{bda}(\mathcal{J}) * B * v(\mathcal{j})
\]

The lefteigenvectoru ( \(\mathcal{I}\) ) corresponding to the eigenvalue lam bda ( \()\) ) of ( \(A, B\) ) satisfies
\[
u(j) \star * H * A=\operatorname{lam} \operatorname{bda}(j) * u(j) * * H * B .
\]
where \(u(\mathfrak{\jmath}) * * H\) is the conjugate-transpose ofu ( \()\).

\section*{ARGUMENTS}

\section*{JOBVL (input)}
\(=\mathrm{N}\) ': do not com pute the leftgeneralized eigenvectors;
= \(\mathrm{V}^{\prime}\) : com pute the left generalized eigenvectors.
JO BVR (input)
\(=\mathrm{N}^{\prime}\) : do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) ': com pute the right generalized eigenvectors.

N (input) The order of the m atrices \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and V R. N >= 0.

A (input/output)
On entry, them atrix \(A\) in the pair \((A, B)\). On exit, A has been overw rilten.

\section*{LD A (input)}

The leading dim ension ofA. LD A \(>=\max (1, N)\).
B (input/output)
On entry, them atrix \(B\) in the pair \((A, B)\). On
exit, B has been overw rilten.
LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

\section*{ALPHAR (output)}

On exit, (ALPHAR ( ) + ALPHAI ( ) *i) BETA ( \(\mathcal{7}\), \(\dot{j} 1, \ldots, N, w i l l\) be the generalized eigenvalues. If A LPHAI \((\mathcal{J})\) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and (j+1)-st eigenvalues are a com plex conjugate pair, w ith A LPH A I(j+1 ) negative.

Note: the quotients ALPHAR ( ) BETA ( ) \()\) and A LPHAI ( ) BETA ( ) m ay easily over-or underflow, and BETA ( \()\) may even be zero. Thus, the user should avoid naively computing the ratio alpha/beta. H ow ever, A LPHAR and A LPHA I w ill be alw ays less than and usually com parable w ith norm (A) in \(m\) agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

\section*{A LPHA I (output)}

\#include < sunperfh>
void sggevx (charbalanc, char j̀bvl, char jobvr, charsense, intn, float *a, int lda, float *b, int ldb, float *alphar, float*alohai, float *beta, float *vl, int ldvl, float *vr, int ldvr, int *ilo, int *ihi, float *lscale, float *rscale, float *abnm, float *bbnm, float * rconde, float *rcondv, int *info);
void sggevx_64 (charbalanc, char jobvl, char jobvr, char sense, long n, float *a, long lda, float *b, long ldb, float *alphar, float *alphai, float *beta, float *vl, long ldvl, float *vr, long ldvr, long *ilo, long *ihi, float *lscale, float *rscale, float *abnım, float*bbnrm, float*roonde, float *rcondv, long *info);

\section*{PURPOSE}
sggevx com putes for a pair of N -by -N real nonsym \(m\) etric \(m\) atrices ( \(A, B\) ) the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

O ptionally also, it com putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( \(\mathbb{H} O, \mathbb{H} I, L S C A L E, R S C A L E, A B N R M\), and BBNRM ), reciprocal condition num bers for the eigenvalues (RCONDE), and reciprocalcondition num bers for the righteigenvectors (RCONDV).

A generalized eigenvalue for a pairofm atrices ( \(A, B\) ) is a scalar lam bda or a ratio alpha/beta \(=\) lam bda, such that A lam bda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta= 0 , and even forboth being zero. The righteigenvectorv ( \(\mathcal{j}\) ) comesponding to the eigenvalue \(\operatorname{lam}\) bda ( \()\) ) of ( \(A, B\) ) satisfies
\[
A * v(\mathcal{I})=\operatorname{lam} \operatorname{bda}(\mathcal{I}) * B * v(\mathcal{I}) .
\]

The lefteigenvectoru ( \(\mathcal{j}\) ) corresponding to the eigenvalue lam bda ( \()\) ) of ( \(A, B\) ) satisfies
\[
\mathrm{u}(\boldsymbol{j}) * \star_{\mathrm{H}} * \mathrm{~A}=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * \mathrm{u}(\boldsymbol{j}) * * \mathrm{H} * \mathrm{~B} .
\]
where \(u()^{* *}{ }^{*}\) is the conjugate-transpose ofu ( ) .

\section*{ARGUMENTS}

BALANC (input)
Specifies the balance option to be perform ed. =
N ': do not diagonally scale orperm ute;
= P ': perm ute only;
= S : scale only;
= B ': both perm ute and scale. C om puted reciprocal condition num bers \(w i l l\) be forthe \(m\) atrices afterperm uting and/orbalancing. Perm uting does not change condition num bers (in exactarithm etic), but.balancing does.

JOBVL (input)
\(=\mathrm{N}^{\prime}\) : do not com pute the left generalized eigenvectors;
= V ': com pute the left generalized eigenvectors.

JO BVR (input)
\(=\mathrm{N}^{\prime}\) : do not com pute the right generalized
eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvec-
tors.

SEN SE (input)
D eterm ines which reciprocal condition num bers are com puted. = N ': none are com puted;
= E ': com puted for eigenvalues only;
= V ': com puted foreigenvectors only;
= \(\mathrm{B}^{\prime}\) : com puted foreigenvalues and eigenvectors.

N (input) The order of the m atrioes A , B , V L , and VR. N >= 0.

A (input/output)
Onentry, them atrix A in the pair \((A, B)\). On
exit, \(A\) has been overw rilten. If \(\mathrm{JO} \mathrm{BVL}=\mathrm{V}\) 'or
JO BVR=V 'orboth, then A contains the first part
of the realSchur form of the "balanced" versions
of the input \(A\) and \(B\).
LD A (input)
The leading dim ension ofA. LDA \(>=\max (1, \mathbb{N})\).
B (input/output)
On entry, them atrix B in the pair \((A, B)\). On exit, B has been overw ritten. If \(\mathrm{JO} \mathrm{BVL}=\mathrm{V}\) 'or JO BVR=V 'orboth, then B contains the second part of the realSchur form of the "balanced" versions of the inputA and \(B\).

LD B (input)
The leading dim ension ofB . LD B \(>=\mathrm{max}(1, \mathbb{N})\).
ALPHAR (output)
On exil, (ALPHAR ( \()\) + ALPHAI ( \()\) *i) BETA ( \(\mathcal{(})\), \(\dot{j} 1, \ldots, N, w i l l\) be the generalized eigenvalues. IfA LPHAI( \(\mathcal{I})\) is zero, then the \(j\) th eigenvalue is real; if positive, then the \(j\) th and (j+1)-st eigenvalues are a com plex conjugate pair, w ith A LPHA I (j+1) negative.

Note: the quotients ALPHAR ( ) BETA ( ) ( and A LPHAI ( \()\) BETA ( \()\) m ay easily over-orunderflow, andBETA ( \(\mathcal{O}\) ) may even be zero. Thus, the user should avoid naively computing the ratio A LPHA BETA.How ever, ALPHAR and ALPHAI w ill be alw ays less than and usually com parable w th norm (A) in \(m\) agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

See the description of A LPH AR .
BETA (output)
See the description of LP LP AR .
VL (output)
If \(J O B V L=V\) ', the left eigenvectors \(u(y)\) are stored one after another in the colum ns of V L, in the sam e order as theireigenvalues. If the \(j\) th eigenvalue is real, then \(u(j)=V L(:, ~)\), the \(j\) th colum \(n\) ofV L. If the \(j\) th and ( \(j+1\) )-th eigenvalues form a complex conjugate pair, then \(u(1)=\) VL \((:, 1)+i \star V L(:, j+1)\) and \(u(j+1)=V L(:, i)-\) i*VL (:, jł1). Each eigenvectorw illbe scaled so the largest com ponent have abs(real part) + abs(in ag. part) \(=1 . \mathrm{N}\) ot referenced if \(\mathrm{JOBVL}=\) N '.

LDVL (input)
The leading dim ension of the \(m\) atrix \(V \mathrm{~L} . \mathrm{LD} V \mathrm{~L}>=1\), and if \(\mathrm{JOBVL}=\mathrm{V}\) ', LDVL >= N .

\section*{VR (output)}

If JO BVR \(=\mathrm{V}\) ', the right eigenvectors \(\mathrm{v}(\mathrm{f})\) are stored one after another in the colum ns of \(V R\), in the sam e order as theireigenvalues. If the \(j\) th eigenvalue is real, then \(v(i)=\operatorname{VR}(:, 7)\), the \(j\) th colum \(n\) ofVR. If the \(j\) th and ( \(j+1\) )-th eigenvalues form a complex conjugate pair, then \(\mathrm{v}(\mathcal{)})=\) \(\operatorname{VR}(:, 1)+i \star V R(:, j+1)\) and \(V(j+1)=V R(:, j)-\) i*VR (:, jł1). Each eigenvectorw illbe scaled so the largest com ponent have abs(real part) + abs(im ag. part) \(=1 . \mathrm{N}\) ot referenced if JO BV R \(=\) N '.

LDVR (input)
The leading dim ension of the \(m\) atrix \(V R\).LD V \(\mathrm{P}>=1\), and if \(J 0 B V R=V\) ', LDVR \(>=N\).

ㅍO (output)
HO and \(\mathbb{H}\) Iare integervalues such that on exit
\(A(i, j)=0\) and \(B(i, j)=0\) if i> jand \(j=\)
\(1, \ldots, \mathbb{L} O-1\) ori \(=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\). IfBALANC \(=\mathrm{N}^{\prime}\) or \(S^{\prime}, \mathbb{L} O=1\) and \(\mathbb{H} I=N\).

IH I (output)
See the description of IIO .

D etails of the perm utations and scaling factors applied to the left side of A and B. IfPL ( \()\) ) is the index of the row interchanged with row \(j\) and D L ( \()\) is the scaling factor applied to row \(j\), then \(\operatorname{LSCALE}(\mathcal{j})=\mathrm{PL}(\mathcal{j})\) for \(j=1, \ldots\), ILO \(-1=\mathrm{DL}(\mathcal{j})\) for \(j=\mathbb{H}, \ldots, \mathbb{H} I=P L(j)\) for \(j=\mathbb{H} I+1, \ldots, N\). The order in \(w\) hich the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L O} \mathrm{-}\).

\section*{RSCALE (output)}

D etails of the perm utations and scaling factors applied to the right side of \(A\) and \(B\). IfPR \((\mathcal{)})\) is the index of the colum \(n\) interchanged with column \(j\) and \(D R(j)\) is the scaling factor applied to
column \(j\) then RSCALE \((j)=\operatorname{PR}(\mathcal{i})\) for \(j=\) \(1, \ldots\), IHO-1 \(=\operatorname{DR}(j)\) for \(j=\mathbb{H O}, \ldots\), H \(I=\operatorname{PR}(\mathcal{j})\) for \(j=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\) The order in which the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L} \mathrm{O}-1\).

\section*{ABNRM (output)}

The one-norm of the balanced \(m\) atrix A.

BBNRM (output)
The one-norm of the balanced \(m\) atrix \(B\).

RCONDE (output)
IfSENSE = E'or B', the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the array. For a com plex conjugate pair of eigenvalues tw o consecutive ele\(m\) ents of RCONDE are set to the sam e value. Thus RCONDE ( \()\), RCONDV ( 1 ), and the \(j\) th colum ns of L and VR allcorrespond to the same eigenpair but not in general the jth eigenpair, unless all eigenpairs are selected). IfSENSE = V', RCONDE is not referenced.

RCONDV (output)
If SEN SE = V 'or B ', the estim ated reciprocal
condition num bers of the selected eigenvectors, stored in consecutive elem ents of the array. For a complex eigenvector tw o consecutive elem ents of RCONDV are set to the sam evalue. If the eigenvalues cannot be reordered to com pute RCONDV ( 7 ), RCONDV \((\mathcal{j})\) is set to 0 ; this can only occur when the true value would be very sm allanyw ay. If SENSE = E',RCONDV is not referenced.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al

LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= \(\max (1,6 * \mathrm{~N})\). If SENSE = E',LW ORK \(>=12 \star \mathrm{~N}\). If SEN SE \(=\mathrm{V}\) 'or B ', LW ORK \(>=2 * \mathrm{~N} * \mathrm{~N}+12 * \mathrm{~N}+16\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace)
dim ension \((N+6)\) IfSEN \(S E=E\) ', IV ORK is not referenced.

BW ORK (w orkspace)
dim ension \((\mathbb{N})\) If SEN SE \(=N\) ', BW ORK is not referenced.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\) th argum enthad an illegalvalue.
\(=1, \ldots, N\) : The Q Z iteration failed. N o eigenvec-
tors have been calculated, but A LPHAR ( \(\mathcal{7}\),
A LPHAI ( \()\), and BETA ( \(\mathcal{j}\) ) should be comect for
\(\dot{F} \operatorname{FO}+1, \ldots, N .>N:=N+1\) : other than \(Q Z\) iteration failed in SH G EQ Z.
\(=\mathrm{N}+2\) : error retum from STGEVC.

\section*{FURTHER DETAILS}

B alancing a m atrix pair ( \(A, B\) ) includes, first, perm uting row \(s\) and colum ns to isolate eigenvalues, second, applying diagonalsim ilarity transform ation to the row s and colum ns to \(m\) ake the row sand colum ns as close in norm as possible. The com puted reciprocal condition num bers comespond to the balanced \(m\) atrix. Perm uting row \(s\) and colum ns will not change the condition num bers (in exact arithm etic) but diagonal scaling will. For further explanation ofbalancing, see section 4.11 .12 of LA PA CK U sers'G uide.

A n approxim ate errorbound on the chordal distance betw een the \(i\)-th computed generalized eigenvalue \(w\) and the comesponding exacteigenvalue lam bda is hord (w, lam bda) <= EPS * norm (ABNRM, BBNRM) /RCONDE (I) A \(n\) approxim ate errorbound forthe angle betw een the \(i\)-th com puted eigenvectorV L (i) orVR (i) is given by

PS * norm (ABNRM,BBNRM)/D \(\mathbb{F}\) (i).
For firtherexplanation of the reciprocalcondition num bers RCONDE and RCONDV , see section 4.11 of LA PACK U sers G uide.

*b, int ldb, float *d, float *x, float *y, int
*info);
void sggglm _64 (long n, long m , long p, float *a, long lda, float *b, long ldb, float *d, float *x, float *y, long *info);

\section*{PURPOSE}
sggglm solves a general Gauss -M arkov linear model (G LM ) problem :
\(m\) inim ize \(\|y\| 2\) subject to \(d=A *_{x}+B^{*} y\)
X
where \(A\) is an \(N\) boy \(-M m\) atrix, \(B\) is an \(N\) boy \(P m\) atrix, and \(d\) is a given N -vector. It is assum ed that \(\mathrm{M}<=\mathrm{N}<=\mathrm{M}+\mathrm{P}\), and
\[
\operatorname{rank}(A)=M \quad \text { and } \quad \operatorname{rank}(A B)=N
\]

U nder these assum ptions, the constrained equation is alw ays consistent, and there is a unique solution \(x\) and a \(m\) inim al 2-nom solution \(y\), which is obtained using a generalized \(Q R\) factorization of \(A\) and \(B\).

In particular, ifm atrix \(B\) is square nonsingular, then the problem G LM is equivalent to the follow ing w eighted linear least squares problem
\(m\) inim ize \(\|\operatorname{inv}(B) *(d-A * x)\| 2\)
X
w here inv ( \(B\) ) denotes the inverse of \(B\).

\section*{ARGUMENTS}

\section*{N (input) The num ber of row s of the m atriges A and \(\mathrm{B} . \mathrm{N}>=\)} 0 .
\(M\) (input) The num ber of colum ns of them atrix A. \(0<=\mathrm{M}<=\) N .
\(P\) (input) The num ber of colum ns of the m atrix \(B . P>=N M\).

A (input/output)
On entry, the \(N\)-by \(-M\) m atrix A. On exit, A is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{PURPOSE}
sgghrd reduces a pair of realm atrioes \((A, B)\) to generalized upper H essenberg form using orthogonal transform ations, \(w\) here \(A\) is a generalm atrix and \(B\) is upper triangular: \(Q\) '* \(\mathrm{A} * \mathrm{Z}=\mathrm{H}\) and \(\mathrm{Q}{ }^{\prime} * \mathrm{~B} * \mathrm{Z}=\mathrm{T}\), where H is upper H essenberg, T is uppertriangular, and \(Q\) and \(Z\) are orthogonal, and ' \(m\) eans transpose.

The orthogonalm atrices \(Q\) and \(Z\) are determ ined as products of \(G\) ivens rotations. They \(m\) ay eitherbe form ed explicitly, or they \(m\) ay be postm ultiplied into inputm atrices Q 1 and Z1, so that
\(1 * A * Z 1{ }^{\prime}=\left(Q 1^{*}\right)^{*} H^{*}(Z 1 * Z)^{\prime}\)

\section*{ARGUMENTS}

COMPQ (input)
\(=\mathrm{N}\) ': do not com pute Q ;
\(=I^{\prime}: \mathrm{Q}\) is initialized to the unit m atrix, and the orthogonalm atrix \(Q\) is retumed; \(=V\) ': Q m ust contain an orthogonalm atrix Q 1 on entry, and the product \(\mathrm{Q} \mathrm{I}^{*} \mathrm{Q}\) is retumed.

COMPZ (input)
\(=\mathrm{N}\) ': do notcom pute Z ;
\(=I^{\prime}: Z\) is initialized to the unit matrix, and the orthogonalm atrix Z is retumed; = \(\mathrm{V}^{\prime}: \mathrm{Z} \mathrm{m}\) ust contain an orthogonalm atrix Z1 on entry, and the product Z1*Z is retumed.

N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).

ㅍO (input)
It is assum ed thatA is already upper triangular
in row sand colum ns \(1: \mathbb{H O}-1\) and \(\mathbb{H} \mathrm{I}+1 \mathbb{N} . \mathbb{I} \mathrm{O}\) and
Hi I are norm ally setby a previous call to SG G BA L; otherw ise they should be setto 1 and \(N\) respec-
tively. \(1<=\mathbb{H O}<=\mathbb{H} I<=N\), if \(N>0 ; \mathbb{H O}=1\) and \(\mathbb{H} \mathrm{I}=0\), \(\dot{\text { if }} \mathrm{N}=0\).

IH I (input)
See the description of IIO .
A (input/output)
On entry, the N -by -N generalm atrix to be reduced.
On exit, the upper triangle and the first subdiagonalofA are overw ritten w th the upper \(H\) essenberg \(m\) atrix \(H\), and the rest is set to zero.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

B (input/output)
On entry, the \(\mathrm{N}-\) by -N upper triangular \(m\) atrix B .
On exit, the upper triangularm atrix \(T=Q\) ' Z . The elem ents below the diagonal are set to zero.

LD B (input)
The leading dim ension of the array \(B\). LD B \(>=\) \(\max (1, N)\).

Q (input/output)
If \(C O M P Q=N\) : \(Q\) is not referenced.
If COM PQ = 'I': on entry, Q need notbe set, and on exitit contains the orthogonalm atrix \(Q\), where \(Q\) ' is the product of the G ivens transform ations which are applied to \(A\) and \(B\) on the left. IfCOM \(P Q=V\) ': on entry, Q m ust contain an orthogonalm atrix Q 1 , and on exit this is overw rilten by \(Q 1 * Q\).

LD Q (input)
The leading dim ension of the array \(Q . L D Q>=N\) if \(\mathrm{COMPQ}=\mathrm{V}\) 'or I '; LD Q >= 1 otherw ise.

Z (input/output)
If \(C O M P Z=N^{\prime}: Z\) is not referenced.
If COM PZ= I': on entry, Z need notbe set, and on exititcontains the orthogonalm atrix \(Z\), which is the product of the G ivens transform ations which
are applied to \(A\) and \(B\) on the right. If \(\mathrm{COMPZ=V}\) : on entry, Z m ustcontain an orthogonal \(m\) atrix Z1, and on exit this is overw rilten by Z1*Z.

LD \(Z\) (input)
The leading dim ension of the array \(Z\). LD \(Z>=N\) if \(C O M P Z=V\) 'or I'; LD Z >= 1 otherw ise.
\(\mathbb{N F O}\) (output)
= 0: successfulexit.

\#include <sunperfh>
void sgglse (intm, intn, intp, float*a, int lda, float
*b, int ldb, float * C , float *d, float * x , int
*info);
void sgglse_64 (long m, long n, long p, float *a, long lda, float *b, long ldb, float * C , float *d, float *x, long *info);

\section*{PURPOSE}
sgglse solves the linear equality-constrained least squares (LSE ) problem :
\(m\) inim ize \(\left\|C-A *_{X}\right\|_{2}\) subject to \(B *_{X}=d\)
where \(A\) is an \(M\) boy \(N m\) atrix, \(B\) is a \(P\) boy \(-N m\) atrix, \(c\) is a given \(M\)-vector, and \(d\) is a given \(P\)-vector. It is assum ed that \(\mathrm{P}<=\mathrm{N}<=\mathrm{M}+\mathrm{P}\), and
\(\operatorname{rank}(B)=P\) and \(\operatorname{rank}((A))=N\). ( (B) )

These conditions ensure that the LSE problem has a unique solution, which is obtained using a G RQ factorization of the \(m\) atrices \(B\) and A.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrioes A and B. N \(>=0\).

P (input) The num ber of row s of the m atrix B. \(0<=\mathrm{P}<=\mathrm{N}<=\) \(\mathrm{M}+\mathrm{P}\).

A (input/output)
On entry, the M boy- N m atrix A. On exit, A is destroyed.

LD A (input)
The leading dim ension of the array A.LDA >= \(\max (1, M)\).

B (input/output)
On entry, the \(P-b y-N\) m atrix B. On exit, B is destroyed.

LD B (input)
The leading dim ension of the aray B . LD B >= \(\max (1, \mathrm{P})\).

C (input/output)
On entry, \(C\) contains the right hand side vector for the least squares part of the LSE problem. On exit, the residual sum of squares for the solution is given by the sum of squares ofelem ents \(\mathrm{N}-\mathrm{P}+1\) to \(M\) ofvector \(C\).

D (input/output)
O n entry, \(D\) contains the right hand side vector for the constrained equation. On exit, \(D\) is destroyed.

X (output)
On exit, X is the solution of the LSE problem.
W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the anay W ORK. LDW ORK >= \(\max (1, M+N+P)\). For optim um perform ance LD \(W\) ORK \(>=\) \(P+m\) in \((M, N)+m \operatorname{ax}(M, N) * N B\), where \(N B\) is an upperbound for the optim al blocksizes forSGEQRF,SGERQF, SORM QR and SORMRQ.

If LD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LD W ORK is issued by XERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.

\#include < sunperfh>
void sggqrf(intn, intm, intp, float *a, int lda, float
*taua, float *b, int ldb, float * taub, int *info);
void sggqrf_64 (long \(n\), long \(m\), long \(p\), float *a, long lda, float *taua, float *b, long ldb, float *taub, long *info);

\section*{PURPOSE}
sggqrf com putes a generalized \(Q R\) factorization of an \(N\)-by \(-M\) \(m\) atrix \(A\) and an \(N\) by \(P m\) atrix \(B\) :
\[
A=Q * R, \quad B=Q * T * Z,
\]
where \(Q\) is an \(N\) boy -N orthogonal \(m\) atrix, \(Z\) is a \(P-b y-P\) orthogonalm atrix, and \(R\) and \(T\) assum e one of the form \(s\) :
```

ifN >=M, R = (R11)M , orifN < M, R = (R11 R12

```
) N,
( 0 ) N M
N \(\quad \mathrm{M}-\mathrm{N}\)
M
where R11 is upper triangular, and
if \(\mathrm{N}<=\mathrm{P}, \mathrm{T}=(0 \mathrm{~T} 12) \mathrm{N}\), orif \(\mathrm{N}>\mathrm{P}, \mathrm{T}=(\mathrm{T} 11)\)
\(\mathrm{N} P\),
P-N N (T21)P
P
where T12 orT21 is uppertriangular.
In particular, if \(B\) is square and nonsingular, the \(G Q R\) factorization of \(A\) and \(B\) im plicitly gives the \(Q R\) factorization of inv ( \(B\) ) *A :
\[
\operatorname{inv}(B) \star A=Z \text { * }(\operatorname{inv}(T) * R)
\]
where inv \((B)\) denotes the inverse of the \(m\) atrix \(B\), and \(Z\) ' denotes the transpose of the \(m\) atrix \(Z\).

\section*{ARGUMENTS}

N (input) The num ber of row sof the m atrioes A and \(\mathrm{B} . \mathrm{N}>=\) 0.

M (input) The num ber of collm ns of the \(m\) atrix \(A . M>=0\).
\(P\) (input) The num ber of colum ns of the \(m\) atrix \(B . P>=0\).

A (input/output)
On entry, the N -by M matrix A. On exit, the ele\(m\) ents on and above the diagonalof the amay contain the \(m\) in \((\mathbb{N}, M)-b y-M\) uppertrapezoidalm atrix \(R\) \((R\) is upper triangular if \(N>=M\) ); the elem ents below the diagonal, w ith the amay TA U A, represent the orthogonal matrix \(Q\) as a productofm in \((\mathbb{N}, M\) ) elem entary reflectors (see FurtherD etails).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

TAUA (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix \(Q\) (see FurtherD etails).

B (input/output)
On entry, the \(N\) by P m atrix B. On exit, if \(N\) <= \(P\), the upper triangle of the subarray \(B(1, N, P-\) \(\mathrm{N}+1 \mathrm{P}\) ) contains the N -by -N upper triangularm atrix T ; if \(\mathrm{N}>\mathrm{P}\), the elem ents on and above the \((\mathbb{N} \mathrm{P})\) th subdiagonal contain the N -by P upper trapezoidal \(m\) atrix \(T\); the rem aining elem ents, \(w\) ith the array TAUB, represent the orthogonalm atrix Z as a product ofelem entary reflectors (see Further D etails).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).

TAUB (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix Z (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the aray \(W\) ORK. LW ORK >= \(\max (1, N, M, \mathbb{P})\). For optim um perform ance LW ORK \(>=\)
\(\max (\mathbb{N}, \mathbb{M}, \mathbb{A})_{\max }(\mathbb{N B} 1, N B 2, N B 3)\), where NB1 is the optim al blocksize forthe \(Q R\) factorization of an N -by M m atrix, NB 2 is the optim al blocksize for the \(R Q\) factorization of an \(N\) by \(P m\) atrix, and NB3 is the optim alblocksize for a callof \(S O R M Q R\).

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), w \text { here } k=m \text { in }(n, m) .
\]

Each H (i) has the form
\[
\mathrm{H}(\mathrm{i})=\mathrm{I}-\operatorname{tana} * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
\]
where taua is a real scalar, and \(v\) is a realvectorw ith \(v(1: i-1)=0\) and \(v(i)=1 ; v(i+1 n)\) is stored on exit in \(A(i+1 m, i)\), and taua in TAUA (i). To form \(Q\) explicitly, use LAPACK subroutine \(S O R G Q R\). To use \(Q\) to update another \(m\) atrix, use LAPACK subroutine SORMQR.

Them atrix \(Z\) is represented as a product of elem entary reflectors
\[
Z=H(1) H(2) \ldots H(k), w h e r e k=m \text { in }(n, p) .
\]

Each H (i) has the form
H (i) = I-taub * v * v'
\(w\) here taub is a real scalar, and \(v\) is a realvectorw ith \(v(p-k+i+1: p)=0\) and \(v(p-k+i)=1 ; v(1: p-k+i-1)\) is stored on exit in B ( \(n-k+i, 1\) p \(-k+i-1\) ), and taub in TAUB (i).
To form Z explicitly, use LAPACK subroutine SORGRQ. To use \(Z\) to update another matrix, use LAPACK subroutine SORMRQ.

void sggrqf_64 (long m, long p, long n, float*a, long lda, float *taua, float *b, long ldb, float *taub, long *info);

\section*{PURPOSE}
sggrqf com putes a generalized RQ factorization of an \(M\)-by \(-\mathbb{N}\) \(m\) atrix \(A\) and \(a P-b y-N\) matrix \(B\) :
\[
A=R * Q, \quad B=Z * T * Q,
\]
where \(Q\) is an \(N\) by \(-N\) orthogonal \(m\) atrix, \(Z\) is a \(P\)-by \(P\) orthogonalm atrix, and \(R\) and \(T\) assum e one of the form \(s\) :
```

ifM <=N, R = (0 R12)M, orifM > N, R = (R11 )

```
\(\mathrm{M}-\mathrm{N}\),
\[
\begin{equation*}
\mathrm{N} \rightarrow \mathrm{M} \quad \mathrm{M} \tag{R21}
\end{equation*}
\]

\section*{N}
where R12 orR21 is upper triangular, and
if \(P>=N, T=(T 11) N, \quad\) orif \(P<N, T=(T 11 \quad T 12\) ) P,
\((0) P-N\)
\(N\)
where T11 is upper triangular.
In particular, ifB is square and nonsingular, the GRQ factorization ofA and \(B\) im plicitly gives the \(R Q\) factorization ofA *inv (B):
\[
A * \operatorname{inv}(B)=(R * \operatorname{inv}(T)) * Z^{\prime}
\]
where inv \((B)\) denotes the inverse of the \(m\) atrix \(B\), and \(Z\) ' denotes the transpose of the \(m\) atrix \(Z\).

\section*{ARGUMENTS}
\(M\) (input) The num ber of row sof the \(m\) atrix \(A . M>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).

N (input) The num ber of collm ns of the m atrioes A and B. N \(>=0\).

A (input/output)
O n entry, the M -by -N m atrix A. On exit, if M <=
N , the upper triangle of the subarray A ( \(1 \mathrm{M}, \mathrm{N}\) -
\(M+1 \mathbb{N}\) ) contains the \(M\)-by \(-M\) upper triangularm atrix
\(R\); if \(M>N\), the elem ents on and above the ( \(M-N\) )th subdiagonal contain the \(\mathrm{M}-\) by -N upper trapezoidal \(m\) atrix \(R\); the rem aining elem ents, \(w\) ith the array TAUA, represent the orthogonalm atrix \(Q\) as a product of elem entary reflectors (see Further D etails).
LD A (input)
The leading dim ension of the array A. LD A >= \(m a x(1, M)\).

TAUA (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix Q (see FurtherD etails).

B (input/output)
On entry, the P-by-N m atrix B. On exit, the ele\(m\) ents on and above the diagonal of the aray contain the \(m\) in \((\mathbb{P} N)\)-by -N uppertrapezoidalm atrix T ( \(T\) is upper triangular if \(P>=N\) ); the elem ents below the diagonal, w th the array TA U B, represent the orthogonalm atrix \(Z\) as a product of elem entary reflectors (see FurtherD etails).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, \mathrm{P})\).

TAUB (output)
The scalar factors of the elem entary reflectors which represent the orthogonal matrix Z (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al
LW ORK.
LW ORK (input)
The dim ension of the array W ORK. LW ORK >= \(m a x(1, N, M, \mathbb{R})\). For optim um perform ance LW ORK >= \(\max (\mathbb{N}, \mathrm{M}, \mathbb{P})^{\star} \max (\mathbb{N} 1, N B 2, N B 3)\), where \(N B 1\) is the
optim al blocksize forthe \(R Q\) factorization of an M by -N m atrix, NB2 is the optim al blocksize for the QR factorization of a \(P\) by \(-\mathrm{N} m\) atrix, and NB3 is the optim alblocksize for a call of \(S O R M R Q\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N} F \mathrm{O}\) (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N} F 0=-i\), the \(i\)-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(m, n) .
\]

Each H (i) has the form
H (i) \(=I-\operatorname{tana} * V^{*} V^{\prime}\)
where taua is a real scalar, and \(v\) is a realvectorw ith \(v(n-k+i+1 n)=0\) and \(v(n-k+i)=1 ; v(1 n-k+i-1)\) is stored on exit in \(A(m-k+i, 1 m-k+i-1)\), and taua in TAUA (i).
To form \(Q\) explicitly, use LAPACK subroutine SORGRQ. To use \(Q\) to update another \(m\) atrix, use LAPACK subroutine SORMRQ.

Them atrix Z is represented as a product of elem entary reflectors
\[
\mathrm{Z}=\mathrm{H}(1) \mathrm{H}(2) \ldots \mathrm{H}(\mathrm{k}), \text { where } k=m \text { in }(\mathrm{p}, \mathrm{n}) .
\]

Each H (i) has the form
H (i) \(=I-\operatorname{tanb} * V^{*} V^{\prime}\)
where taub is a real scalar, and \(v\) is a realvectorw ith \(\mathrm{v}(1: i-1)=0\) and \(\mathrm{v}(\mathrm{i})=1\); \(\mathrm{v}(\mathrm{i}+1 \mathrm{p})\) is stored on exit in B (i+1 \(\mathrm{p}, \mathrm{i})\), and taub in TAUB (i).
To form Z explicitly, use LAPACK subroutine SORGQR. To use \(Z\) to update another \(m\) atrix, use LAPACK subroutine SORM QR.

\#include <sunperfh>
void sggsvd (char j̀bu, char j̀bv, char j̀bq, intm, int n, int \(p\), int \({ }^{*} \mathrm{k}\), int \({ }^{*} \mathrm{l}\), float * a , int lda, float *b, int ldlb, float * alpha, float *beta, float *u, int ldu, float *v, int ldv, float *q, int ldq, int *íiv ork3, int *info);
void sggsvd_64 (char j̀jbu, char j̀bv, char joboq, long m , long n, long p, long *k, long *l, float *a, long lda, float*b, long ldb, float *alpha, float *beta, float *u, long ldu, float *v, long ldv, float *q, long ldq, long *íw ork3, long *info);

\section*{PURPOSE}
sggsvd com putes the generalized singularvalue decom position ( \(G\) SV D ) of an \(M\) by \(-N\) realm atrix \(A\) and \(P\) boy \(-N\) realm atrix \(B\) :
\(U{ }^{*} A * Q=D 1^{*}(0 R), \quad V * B * Q=D 2^{*}(0 R)\)
\(w\) here \(\mathrm{U}, \mathrm{V}\) and Q are orthogonal \(m\) atrioes, and Z ' is the transpose of \(Z . L e t K+L=\) the effective num erical rank of them atrix ( \(A\) ' \(B\) ' ', then \(R\) is a \(K+L-b y-K+L\) nonsingular upper triangularm atrix, \(D 1\) and \(D 2\) are \(M\)-by \(-(K+L)\) and \(P-b y-\) \((\mathbb{K}+L)\) "diagonal" \(m\) atrices and of the follow ing structures, respectively:

IfM \(-\mathrm{K}->=0\),
\begin{tabular}{|c|}
\hline \multirow[t]{4}{*}{} \\
\hline \\
\hline \\
\hline \\
\hline
\end{tabular}

K L
```

    D2 = L (0 S )
    P-工 (0 0)
        N-K\dashv K L
    (0R ) = K (0 R11 R12 )
L(0 0 R22)

```
where
\[
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, \text { A LPH }(\mathbb{K}+L)), \\
& S=\operatorname{diag}(\operatorname{BETA}(\mathbb{K}+1), \ldots, \operatorname{BETA}(\mathbb{K}+L)), \\
& C \star * 2+S * * 2=I .
\end{aligned}
\]
\(R\) is stored in \(A(1: K+L, N-K-1 \mathbb{N})\) on exit.

IfM \(\mathrm{K}-\mathrm{L}<0\),
\[
\begin{aligned}
& \text { K M K K + L } \mathrm{M} \\
& D 1=K\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& M K\left(\begin{array}{lll}
0 & C
\end{array}\right) \\
& \text { K M K K + L }-\mathrm{M} \\
& D 2=M K(0 S 0) \\
& \mathrm{K}+\mathrm{L} \mathrm{M} \text { ( } 0 \text { O I ) } \\
& \text { P }-\left(\begin{array}{lll}
0 & 0
\end{array}\right)
\end{aligned}
\]
```

                N-K\dashv K M K K +L M
    (0R ) = K (0 R11 R12 R13 )
M K (0 0 R22 R23 )
K+L-M (0 0 0 R33)

```
where
```

$C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(M))$,
$S=\operatorname{diag}(B E T A(K+1), \ldots, B E T A(M))$,
$C * * 2+S * * 2=I$.

```
(R11 R12 R13) is stored in A ( \(1 \mathrm{M}, \mathrm{N} \mathrm{K}-\mathrm{L}+1 \mathbb{N}\) ), and R 33 is stored
(0 R 22 R 23 )
in \(B(M-1: L, N+M-K+1 \mathbb{N})\) on exit.

The routine com putes \(C, S, R\), and optionally the orthogonal transform ation \(m\) atrices \(U, V\) and \(Q\).

In particular, if B is an N boy N nonsingular m atrix, then the G SVD ofA and B im plicitly gives the SVD ofA *inv \((B)\) :
\[
A * \operatorname{inv}(B)=U *(D 1 * \operatorname{inv}(D 2)) * V{ }^{\prime} .
\]

If ( \(A\) 'B )'has orthonorm alcolum ns, then the G SVD of A and \(B\) is also equal to the \(C S\) decom position of \(A\) and B.Further-
m ore, the G SVD can be used to derive the solution of the eigenvalue problem :

A *A \(\mathrm{x}=\operatorname{lam}\) bda* B *B x .
In som e literature, the G SVD of \(A\) and \(B\) is presented in the form

U *A * \(\mathrm{X}=(0 \mathrm{D} 1), \quad \mathrm{V}{ }^{*} \mathrm{~B} * \mathrm{X}=(0 \mathrm{D} 2)\)
\(w\) here \(U\) and \(V\) are orthogonal and \(X\) is nonsingular, \(D 1\) and \(D 2\) are "diagonal". The form erG SVD form can be converted to the latter form by taking the nonsingularm atrix X as
\[
\begin{aligned}
X= & Q *\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& (0 \operatorname{inv}(\mathbb{R})) .
\end{aligned}
\]

\section*{ARGUMENTS}
\(J O B U\) (input)
\(=\mathrm{U}:\) : O rthogonalm atrix U is com puted;
\(=\mathrm{N}\) : U is notcom puted.
JO BV (input)
\(=\mathrm{V}:\) : O rthogonalm atrix V is com puted;
\(=\mathrm{N}: \mathrm{V}\) is not com puted.
\(J O B Q\) (input)
= Q ': Orthogonalm atrix \(Q\) is com puted;
\(=\mathrm{N}\) ': Q is notcom puted.

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrioes A and B. N \(>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).

K (output)
On exit, \(K\) and L specify the dim ension of the subblocks described in the Pupose section. \(\mathrm{K}+\mathrm{L}=\) effective num erical rank of (A 'B )'.

L (output)
See the description of K .

A (input/output)
On entry, the M -by-N m atrix A. On exit, A contains the triangularm atrix \(R\), orpartofR. See
Purpose fordetails.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

B (input/output)
On entry, the \(P-b y-N\) m atrix B. On exit, B contains the triangularm atrix \(R\) if \(M K-4<0\). See Purpose fordetails.

LD B (input)
The leading dim ension of the array B. LD A >= \(\max (1, P)\).
ALPHA (output)
On exi, ALPHA and BETA contain the generalized singularvahue pairs of \(A\) and ; A LPHA \((1: K)=1\),
\(\operatorname{BETA}(1: K)=0\), and ifM \(K-\Psi=0\), ALPHA \((\mathbb{K}+1 \mathbb{K}+L)\)
= C,
BETA \((K+1 K+L)=S\), or if \(M-K-0\),
A LPHA \((\mathbb{K}+1 \mathrm{M})=\mathrm{C}, \mathrm{A}\) LPHA \((\mathrm{M}+1: \mathrm{K}+\mathrm{L})=0\)
\(\operatorname{BETA}(K+1 M)=S, \quad B E T A(M+1 \pi+L)=1\) and
A LPHA \((\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0\)
\(\operatorname{BETA}(\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0\)

\section*{BETA (output)}

See the description ofA LPH A .
U (output)
If \(\mathrm{JOBU}=\mathrm{U}\) ', U contains the M -by M orthogonal
\(m\) atrix \(U\). If \(J O B U=N ', U\) is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD \(U\) >= \(m a x(1, M)\) if \(J 0 B U=U ' ; L D U>=1\) otherw ise.

V (output)
If \(\mathrm{JOBV}=\mathrm{V}\) ', V contains the P -by P orthogonal \(m\) atrix \(V\). If \(J O B V=N ', V\) is not referenced.

LDV (input)
The leading dim ension of the array V . LDV >= \(\max (1, \mathrm{P})\) if \(\mathrm{JOBV}=\mathrm{V} ; \mathrm{LDV}>=1\) otherw ise.

Q (output)
If \(\mathrm{OOBQ}=\mathrm{Q}\) ', Q contains the N by-N orthogonal \(m\) atrix \(Q\). If \(J O B Q=N\) ', \(Q\) is not referenced.

LD Q (input)
The leading dimension of the array \(Q . L D Q>=\) \(\max (1, N)\) if \(J O B Q=Q ; L D Q>=1\) otherw ise.

W ORK (w orkspace)
dim ension \((\max (3 * N, M, P)+N)\)

IW ORK 3 (output)
dim ension \((\mathbb{N})\) On exit, \(\mathbb{I V}\) ORK 3 stores the sorting
inform ation. M ore precisely, the follow ing loop
w ill.sortALPHA for \(I=K+1\), \(m\) in \((M, K+L) ~ s w a p\)
A LPHA (I) and ALPHA ( \(\mathbb{I N}\) ORK 3 (I)) endfor such that
\(A \operatorname{LPHA}(1)>=A \operatorname{LPHA}(2)>=\ldots>=A L P H A(N)\).
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.
\(>0\) : if \(\mathbb{N F O}=1\), the Jacobi-type procedure failed to converge. For further details, see subroutine STG SJA.

            N-K-Ł K L
    V *B*Q = L (0 0 B13)
P-((0 0 0 )

```
where the K -by-K m atrix A 12 and L -by-L m atrix B13 are nonsingular uppertriangular; A 23 is L-by-L upper triangular if M K-L >=0, otherw ise A 23 is \(M-K\) )-by-L upper trapezoidal. \(K+L=\) the effective num erical rank of the \(M+P)\)-by \(-N \mathrm{~N}\) atrix
(A ', B )'. Z 'denotes the transpose of Z .

This decom position is the preprocessing step for com puting the Generalized Singular V alue D ecom position (GSVD), see subroutine SG G SV D .

\section*{ARGUMENTS}
\(J 0 \mathrm{BU}\) (input)
\(=\mathrm{U}:\) : O rthogonalm atrix U is com puted;
\(=N^{\prime}: U\) is notcom puted.
JO BV (input)
\(=\mathrm{V}\) : O rthogonalm atrix V is com puted;
= N ': V is not com puted.
\(J O B Q\) (input)
\(=Q\) : O rthogonalm atrix Q is com puted;
\(=N^{\prime}: Q\) is notcom puted.
M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).

N (input) The num ber of collm ns of the m atrioes A and B. N \(>=0\).

A (input/output)
On entry, the M by-N matrix A. On exit, A contains the triangular (or trapezoidal) matrix described in the Purpose section.

LDA (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the \(\mathrm{P}-\) by-N m atrix B. On exit, B contains the triangularm atrix described in the Purpose section.

LD B (input)
The leading dim ension of the aray \(B . L D B>=\) \(\max (1, P)\).

TO LA (input)
TOLA and TOLB are the thresholds to determ ine the effective num erical rank ofm atrix B and a subblock ofA. Generally, they are set to TO LA =
\(\operatorname{MAXM}(\mathbb{N}) \star\) norm (A)*MACHEPS, TOLB =
MAX \((P, N) \star\) norm ( \(B\) )*M ACHEPS. The size of TOLA and TO LB \(m\) ay affect the size of backw ard emors of the decom position.

\section*{TO LB (input)}

See the description of TO LA .

K (output)
O n exit, \(K\) and \(L\) specify the dim ension of the subblocks described in Punpose. \(\mathrm{K}+\mathrm{L}=\) effective num ericalrank of (A 'B )'.

L (output)
See the description of .
U (input) If \(\mathrm{OB} \mathrm{BU}=\mathrm{U}\) ', U contains the orthogonalm atrix U . If \(\mathrm{JO} \mathrm{BU}=\mathrm{N}\) ', U is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD U >= \(\mathrm{max}(1, \mathrm{M})\) if \(\mathrm{JOBU}=\mathrm{U}\) '; LD U >= 1 otherw ise.

V (input) If \(\mathrm{O} \mathrm{BV}=\mathrm{V}\) ', V contains the orthogonalm atrix V . If \(\mathrm{JO} \mathrm{BV}=\mathrm{N}\) ', V is not referenced.

\section*{LD V (input)}

The leading dim ension of the array V . LDV >= \(\max (1, \mathrm{P})\) if \(\mathrm{OOBV}=\mathrm{V}\) '; LDV \(>=1\) otherw ise.
\(Q\) (input) If \(J O B Q=Q\) ', \(Q\) contains the orthogonalm atrix \(Q\). If \(\mathrm{JOBQ}=\mathrm{N}, \mathrm{Q}\) is not referenced.

LD Q (input)
The leading dim ension of the aray \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}\) >= \(\max (1, N)\) if \(J O B Q=Q ; L D Q>=1\) otherw ise.

IN ORK (w orkspace)
dim ension \((\mathbb{N})\)

TAU (w orkspace)
dim ension (N)

W ORK (w orkspace)
dim ension MAX ( \(\left.3{ }^{\star} \mathrm{N}, \mathrm{M}, \mathrm{P}\right)\) )
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

The subroutine uses LA PACK subroutine SGEQPF for the QR factorization \(w\) ith \(c o l u m n\) pivoting to detect the effective num erical rank of the a \(m\) atrix. It \(m\) ay be replaced by a better rank determ ination strategy.

\(\mathbb{N}\) TEGER \(\quad\) NEQNS, COLSTR (*), ROW \(\mathbb{N D}(*), \mathbb{E R}\)
REAL VALUES (*)
DOUBLE PRECISION HANDLE (150)

\section*{PURPOSE}

SGSSFA -N um eric factorization of a sparse m atrix.

\section*{PARAMETERS}

NEQNS - \(\mathbb{N}\) TEGER
On entry, NEQNS specifies the num ber of equations in coefficientm atrix. U nchanged on exit.
\(\operatorname{COLSTR}\left(^{*}\right)-\mathbb{N}\) TEG ER array
On entry, \(\operatorname{COLSTR}\left(^{*}\right)\) is an array of size \((\mathbb{N} E \mathrm{~N}+1\) ), containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND ( \(\left.{ }^{( }\right)-\mathbb{N}\) TEGER aray
On entry, ROWIND ( \({ }^{*}\) ) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the indices of the \(m\) atrix structure. U nchanged on exit.

VALUES (*) -REA L array
On entry, VALUES (*) is an array of size
CO LSTR \(\mathbb{N E Q N S}+1\) )-1, containing the num eric values of
the sparse \(m\) atrix to be factored. U nchanged on exit.

HANDLE (150) -D OUBLE PRECISIO N array On entry, HANDLE (*) is an array containing inform ation needed by the solver, and \(m\) ust.be passed unchanged to each sparse solver subroutine. M odified on exit.
\(\mathbb{E R} \quad-\mathbb{N} T E G E R\)
Errornum ber. If no emrorencountered, unchanged on exit. If errorencountered, it is set to a non-zero integer. Enrornum bers set.by this subroutine:
-300 : Invalid calling sequence - need to callSG SSO R first.
-301 : Failure to dynam ically allocate \(m\) em ory. -666 : Intemalerror.

\section*{NAME}
sgssfs -G eneral.sparse solver one callinterface.

\section*{SYNOPSIS}
```

SUBROUT\mathbb{NE SGSSFS(M TXTYP,PIVOT,NEQNS,COLSTR,ROW IND,}
VALUES,NRHS ,RHS ,LDRHS,ORDMTHD,
OUTUNT,MSGLVL,HANDLE,\mathbb{ER)}

```
CHARACTER*2 M TXTYP
CHARACTER*1 PIVOT
\(\mathbb{N}\) TEGER NEQNS,COLSTR (*),ROW \(\mathbb{N} D\left({ }^{*}\right)\),NRHS,LDRHS,
    OUTUNT,MSGLVL, ER
CHARACTER*3 ORDMTHD
REAL VALUES (*),RHS (*)
DOUBLE PRECISION HANDLE (150)

\section*{PURPOSE}

SGSSFS -G eneral sparse solver one call interface.

\section*{PARAMETERS}
```

MTXTYP -CHARACTER*2
On entry, M TX TY P specifies the coefficientm atrix type. Specifically, the valid options are:

```

Sp 'or SP '-sym m etric structure, positive-definite values
ss'or SS '-sym m etric structure, sym m etric values
su 'or SU '-sym m etric structure, unsym \(m\) etric values
uu 'or UU '-unsym \(m\) etric structure, unsym \(m\) etric values

U nchanged on exit.

\section*{PIVOT -CHARACTER*1}

On entry, pivot specifies w hether ornotpivoting is used in the course of the num eric factorization.
The valid options are:
h'or N '-no pivoting is used
(Pivoting is not supported forthis release).
U nchanged on exit.

NEQNS - \(\mathbb{N}\) TEGER
On entry, NEQN S specifies the num ber ofequations in the coefficientm atrix. NEQ NS m ustbe at leastone. U nchanged on exit.
\(\operatorname{COLSTR}\left(^{\star}\right)-\mathbb{N}\) TEGER array
On entry, \(\operatorname{COLSTR}\) ( \({ }^{*}\) ) is an array of size \((\mathbb{N} E Q \mathrm{~N}+1\) ), containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND ( \({ }^{\star}\) ) - \(\mathbb{N}\) TEG ER aray
On entry, ROWIND (*) is an array of size COLSTR \(\mathbb{N} E Q N S+1)-1\), containing the indices of the \(m\) atrix structure. U nchanged on exit.

VALUES (*) -REA L array
O n entry, VALUES (*) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the non-zero num eric
values of the sparse \(m\) atrix to be factored.
U nchanged on exit.

NRHS - \(\mathbb{N}\) TEGER
On entry, NRH S specifies the num ber of righthand sides to solve for. U nchanged on exit.

RHS (*) -REAL amay
On entry, RH S (LDRHS,NRHS) contains the NRHS right hand sides. On exit, itcontains the solutions.

\section*{LDRHS - \(\mathbb{N}\) TEGER}

On entry, LD RH S specifies the leading dim ension of the RH S array. U nchanged on exit.

ORDMTHD -CHARACTER*3
On entry, ORDM THD specifies the fill-reducing ordering to be used by the sparse solver. Specifically, the valid options are:
hat'or NAT'-naturalordering (no ordering) mmd'or M M D '-m ultiplem inim um degree gnd 'or GND '-general nested dissection
uso 'or U SO '-user specified ordering (see SG SSU O )

U nchanged on exit.

sgssin - Initialize the general sparse solver.

\section*{SYNOPSIS}
```

SUBROUTINESGSSIN(MTXTYP,PIVOT,NEQNS,COLSTR,ROW IND,OUTUNT,
M SGLVL,HANDLE,\mathbb{ER )}
CHARACTER*2 M TXTYP
CHARACTER*1 PIVOT
\mathbb{NTEGER NEQNS,COLSTR (*),ROW IND (*),OUTUNT,MSGLVL,\mathbb{ER}}\mathbf{N}\mathrm{ (*)}
DOUBLE PRECISION HANDLE (150)

```

\section*{PURPOSE}

SGSSIN -Initialize the sparse solver and input the m atrix
structure.

\section*{PARAMETERS}
```

MTXTYP -CHARACTER*2
On entry,M TX TY P specifies the coefficientm atrix
type. Specifically, the valid options are:
sp 'or SP '-symm etric structure, positive-definite values
ss'or SS'-symm etric structure, sym m etric values
su'or SU '-symm etric structure, unsym m etric values
uu 'or UU '-unsymm etric structure, unsym m etric values
U nchanged on exit.
PIVOT -CHARACTER*1
On entry,PIV OT specifies w hetherornotpivoting is
used in the course of the num eric factorization.

```

The valid options are:
h'or \(\mathrm{N}^{\text {' }}\)-no pivoting is used
(Pivoting is not supported for this release).
U nchanged on exit.

NEQNS - \(\mathbb{N}\) TEGER
On entry, NEQNS specifies the num ber of equations in the coefficientm atrix. NEQNS m ustibe at leastone. U nchanged on exit.
\(\operatorname{COLSTR}\) ( \(\left.^{( }\right)-\mathbb{N}\) TEGER aray
On entry, \(\operatorname{COLSTR}\left({ }^{*}\right)\) is an array of size \((\mathbb{N} E Q \mathrm{~N}+1)\), containing the pointers of them atrix structure. U nchanged on exit.

\section*{ROWIND (*) - \(\mathbb{N}\) TEG ER anay}

On entry, ROWIND ( \({ }^{*}\) ) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the indices of the \(m\) atrix structure. Unchanged on exit.

HANDLE (150) -D OUBLE PREC IS IO N array
On entry, HANDLE (*) is an array containing
inform ation needed by the solver, and \(m\) ust.be passed unchanged to each sparse solver subroutine.
M odified on exit.

OUTUNT - \(\mathbb{N} T E G E R\)
O utputunit. U nchanged on exit.
M SGLVL - \(\mathbb{N}\) TEGER
M essage level.
0 -no output from solver.
(N om essages supported for this release.)

U nchanged on exit.
\(\mathbb{E R} \quad-\mathbb{N} T E G E R\)
E rrornum ber. If no emrorencountered, unchanged on exit. If emorencountered, it is set to a non-zero integer. Enrornum bers setby this subroutine:
-101 : Faihure to dynam ically allocate \(m\) em ory.
-102 : Invalid m atrix type.
-103 : Invalid pivotoption.
-104 :N um berofnonzeros less than N EQ N S .
-105: NEQNS < 1

*rcond, int*info);
void sgtcon_64 (charnorm , long n, float *low , float *diag, float*up1, float*up2, long *ipivot, floatanorm , float*roond, long *info);

\section*{PURPOSE}
sgtoon estim ates the reciprocal of the condition num ber of a realtridiagonalm atrix A using the LU factorization as com puted by SG TTRF .

An estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND \(=1\) / (ANORM * norm (inv (A))).

\section*{ARGUMENTS}

NORM (input)
Specifies w hether the 1-norm condition num ber or the infinity-norm condition num ber is required:
= ' 'or \(\mathrm{D}^{\prime}\) : 1-norm;
\(=\mathrm{I}^{\prime}: \quad\) Infinity-norm.

N (input) The order of the m atrix \(A . N>=0\).

LOW (input)
The \((n-1) \mathrm{m}\) ultipliers that define the \(m\) atrix \(L\) from the LU factorization of \(A\) as com puted by SGTTRF.

D IA G (input)

The n diagonalelem ents of the upper triangular \(m\) atrix \(U\) from the \(L U\) factorization ofA.

UP1 (input)
The ( \(n-1\) ) elem ents of the first superdiagonal of U.

UP2 (input)
The ( \(n-2\) ) elem ents of the second superdiagonal of U.
\(\mathbb{P I V O T}\) (input)
The pivotindioes; for \(1<=i<=n\), row \(i\) of the matrix was interchanged with row PIVOT (i). IPIVOT (i) will always be either \(i\) or i+1; PIVOT (i) = iindicates a row interchange \(w\) as not required.

ANORM (input)
IfNORM = I'orD', the 1-norm of the original \(m\) atrix \(A\). IfNORM = I', the infinity-nom of the originalm atrix A .

RCOND (output)
The reciprocal of the condition number of the \(m\) atrix \(A\), com puted as RCOND \(=1 /(A N O R M * A \mathbb{N} V N M)\), where \(A \mathbb{N} V N M\) is an estim ate of the 1 -nom of \(\operatorname{inv}(A)\) com puted in this routine.

W ORK (w orkspace)
dim ension \((2 * N)\)

IV ORK 2 (w orkspace)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvalue

\section*{PURPOSE}
sgtrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is tridiagonal, and provides emorbounds and backw ard error estim ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system of equations:
\(=N^{\prime}: A * X=B \quad\) Notranspose)
\(=T\) ': A**T * \(\mathrm{X}=\mathrm{B} \quad\) (Transpose)
\(=C\) : \(A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran -
spose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE .

N (input) The order of the matrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of them atrix B. NRHS \(>=0\).

LOW (input)
The \((n-1)\) subdiagonalelem ents of \(A\).

D IA G (input)
The diagonalelem ents ofA.

UP (input)
The ( \(n-1\) ) superdiagonalelem ents ofA .
LOW F (input)
The \((n-1) \mathrm{m} u l t i p l e r s\) that define the \(m\) atrix \(L\) from the LU factorization of \(A\) as com puted by SG TTRF .

D IA GF (input)
Then diagonalelem ents of the upper triangular \(m\) atrix \(U\) from the \(L U\) factorization ofA.

UPF1 (input)
The ( \(n-1\) ) elem ents of the first superdiagonal of U.

UPF2 (input)
The ( \(n-2\) ) elem ents of the second superdiagonal of U.

PIVOT (input)
The pivotindices; for \(1<=i<=n\), row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P I V O T}\) (i). IPIVOT (i) will always be either \(i\) or i+1;
PIVOT (i) = iindicates a row interchange was not required.

B (input) The righthand side m atrix \(B\).
LD B (input)
The leading dim ension of the anay B . LD B >= \(\max (1, \mathbb{N})\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SG TTRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard error bound for each solution vector \(X(\neg\) (the \(j\) th colum \(n\) of the solution matrix \(X)\). IfXTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{\nu})-\mathrm{X}\) TRU E ) divided by the \(m\) agnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emror.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( \(j\) ) (ie., the sm allest relative change in any elem entof \(A\) or \(B\) thatm akes \(X(\mathcal{J})\) an exactsolution).

\#include <sunperfh>
void sgtsvx (char fact, chartransa, intn, int nrhs, float
*low, float *diag, float*up, float*low f, float
*diagf, float *upfl, float *upf2, int *ipivot, float *b, int ldb, float *x, int ldx, float *rcond, float * ferr, float *berr, int *info);
void sgtsvx_64 (char fact, chartransa, long n, long nrhs, float *low, float*diag, float*up, float*low f, float *diagf, float *upfl, float *upf2, long *ípivot, float *b, long ldlo, float *x, long ldx, float *rcond, float *ferr, float *berr, long *info);

\section*{PURPOSE}
sgtsvx uses the LU factorization to com pute the solution to a realsystem of linearequations \(A * X=B\) orA \(* * T * X=B\), \(w\) here \(A\) is a tridiagonalm atrix of order \(N\) and \(X\) and \(B\) are N -by-N R H S m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=\mathrm{N}\) ', the LU decom position is used to factor the
\(m\) atrix \(A\)
as \(A=L * U\),where \(L\) is a product of perm utation and unitlow er
bidiagonal \(m\) atrices and \(U\) is upper triangular \(w\) ith nonzeros in
only the \(m\) ain diagonal and first tw o superdiagonals.
2. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N N F O}=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix A. If the reciprocal of the condition num ber is less than m achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a w aming, but the routine stillgoes on
to solve for \(X\) and com pute error bounds as described below.
3.The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}
```

FACT (input)
Specifies w hether ornot the factored form of $A$ has been supplied on entry $.=F ': L O W$ F , D IA GF, $\mathrm{UPF} 1, \mathrm{UPF} 2$, and $\mathbb{P} \mathbb{I V O T}$ contain the factored form of $A$; LOW , DIAG, UP,LOW F, DIAGF, UPF1, UPF2 and $\mathbb{P}$ IV O T w illnotbem odified. $=\mathrm{N}$ ': The m atrix
w ill be copied to LOW F , D IA GF, and UPF1 and factored.
TRAN SA (input)
Specifies the form of the system ofequations:
$=N$ : A * X $=\mathrm{B} \quad$ (N o transpose)
$=T$ ': $A * * T * X=B \quad$ ( ranspose)
$=C^{\prime}: A * * H * X=B \quad$ (C onjugate transpose $=T$ ran spose)

```

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N T E R F A C E . ~}\)

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

LOW (input)
The \((n-1)\) subdiagonalelem ents of \(A\).
D IA G (input)
The \(n\) diagonalelem ents of A.

UP (input/output)
The ( \(n-1\) ) superdiagonalelem ents of .
LOW F (input/output)
IfFACT = F', then LOW F is an inputargum ent and on entry contains the ( \(n-1\) ) multipliers that define the \(m\) atrix \(L\) from the \(L U\) factorization of \(A\) as com puted by SG TTRF .

IfFACT \(=\mathrm{N}^{\prime}\), then LOW F is an output argum ent and on exit contains the ( \(n-1\) ) m ultipliers that define them atrix \(L\) from the LU factorization of A.

D IA GF (input/output)
If FACT = F ', then D IAGF is an input argum ent and on entry contains the \(n\) diagonalelem ents of the upper triangularm atrix \(U\) from the LU factorization ofA.

IfFACT \(=N\) ', then \(D I A G F\) is an output argum ent and on exit contains the \(n\) diagonalelem ents of the uppertriangularm atrix \(U\) from the \(L U\) factorization ofA.

UPF1 (input/output)
IfFACT = \(\mathrm{F}^{\prime}\), then UPF 1 is an inputargum ent and on entry contains the ( \(n-1\) ) elem ents of the first superdiagonalofU .

IfFACT \(=\mathrm{N}^{\prime}\), then UPF1 is an output argum ent and on exit contains the ( \(n-1\) ) elem ents of the first superdiagonalof \(U\).

UPF2 (input/output)
IfFACT=F', then UPF2 is an input argum ent and on entry contains the ( \(n-2\) ) elem ents of the second superdiagonalofU .

IfFACT \(=N\) ', then UPF2 is an outputargum ent and
on exit contains the ( \(n-2\) ) elem ents of the second superdiagonalof \(U\).

PIVOT (input/output)
If \(F A C T=F '\), then \(\mathbb{P I V O T}\) is an input argum ent and on entry contains the pivotindioes from the LU factorization of A as com puted by SG TTRF.

IfFACT = N', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indices from the LU factorization of ; row iof the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P} \mathbb{I V O T}\) (i). \(\mathbb{P} \mathbb{I V O T}\) (i) w illalw ays be either ior i+ \(1 ; \mathbb{P} \mathbb{I V O T}(i)=\) indicates a row interchange \(w\) as not required.

B (input) The N by -N RH S righthand side m atrix B .

LD B (input)
The leading dim ension of the array B . LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N F O}=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the N -by-NRH S solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the aray X . LD X >= \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num berof the \(m\) atrix \(A\). IfRCOND is less than the \(m\) achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0.

FERR (output)
The estim ated forw ard enrorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(\mathrm{X}(\mathcal{)}\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{1})\)-X TRU E) divided by the magnitude of the largestelem entin \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

BERR (output)
The com ponentw ise relative backw ard error of each
solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
> 0 : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has notbeen com pleted unless \(i=N\), but the factor \(U\) is exactly singular, so the solution and error bounds could notbe com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, but RCOND is less than \(m\) achine precision, \(m\) eaning that the m atrix is singular to working precision. N evertheless, the solution and errorbounds are com puted because there are a num ber of situations where the com puted solution can be \(m\) ore accurate than the value of RCOND w ould suggest.

## PURPOSE

sgturfcom putes an LU factorization of a real tridiagonal $m$ atrix A using elim ination $w$ ith partialpivoting and row interchanges.

The factorization has the form

$$
A=L \star U
$$

where $L$ is a productofperm utation and unit low er bidiagonalm atrioes and $U$ is uppertriangularw ith nonzeros in only the $m$ ain diagonal and firsttw o superdiagonals.

## ARGUMENTS

N (input) The order of the $m$ atrix $A$.

LOW (input/output)
On entry, LOW m ustcontain the ( $\mathrm{n}-1$ ) sub-diagonal elem ents ofA.

On exit, LOW is overw rilten by the ( $n-1$ ) multipliers that define the $m$ atrix $L$ from the $L U$ factorization of A.

D IA G (input/output)
O n entry, D IA G m ust contain the diagonal elem ents of A.

On exit, D IA G is overw rilten by the $n$ diagonal elem ents of the upper triangularm atrix $U$ from the LU factorization of A.

UP1 (input/output)
On entry, UP1 must contain the $(n-1)$ superdiagonalelem ents of .

O n exit, UP1 is overw ritten by the ( $\mathrm{n}-1$ ) elem ents of the first super-diagonal of $U$.

UP2 (output)
On exit, UP2 is overw rilten by the ( $n-2$ ) elem ents of the second super-diagonalofU.

IPIVOT (output)
The pivotindioes; for $1<=i<=n$, row $i$ of the matrix was interchanged w th row $\mathbb{P I V O T}$ (i). IPIVOT (i) will always be either $i$ or i+1; PIVOT (i) = iindicates a row interchange was not required.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0$ : if $\mathbb{N} F O=-k$, the $k$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=k, U(k, k)$ is exactly zero. The factorization has been com pleted, but the factor $U$ is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

## PURPOSE

sgtters solves one of the system s of equations
$A * X=B$ or $A * X=B, w$ th a tridiagonalm atrix $A$ using the LU factorization com puted by SG TTRF.

## ARGUMENTS

TRANSA (input)
Specifies the form of the system of equations. =
N': A * X = B ( $\circ$ otranspose)
$=T$ ': A * $\mathrm{X}=\mathrm{B} \quad$ (Transpose)
$=C$ ': A * $\mathrm{X}=\mathrm{B}$ (C onjugate transpose $=$ Transpose)

TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.
N (input) The order of the $m$ atrix A.

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of them atrix B. NRHS $>=0$.
LOW (input)
The $(n-1) m$ ultipliers that define the $m$ atrix $L$ from the LU factorization ofA.

D IA G (input)
Then diagonalelem ents of the upper triangular
$m$ atrix $U$ from the $L U$ factorization ofA .

## UP1 (input)

The $(n-1)$ elem ents of the first super-diagonal of U .

UP2 (input)
The ( $n-2$ ) elem ents of the second super-diagonal of U.

IPIVOT (input)
The pivotindioes; for $1<=i<=n$, row $i$ of the $m$ atrix $w a s$ interchanged $w$ th row $\mathbb{P} \mathbb{I V O T}(i)$. IPIVOT (i) w ill always be either $i$ or i+1; IPIVOT (i) = iindicates a row interchange was not required.

B (input/output)
O n entry, the m atrix of righthand side vectors B . On exit, B is overw rilten by the solution vectors X .

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the i-th argum enthad an illegalvałue

## C INTERFACE

\#include <sunperfh>
void shgeqz (char job, char com pq, char com pz, int $n$, int
ilo, int ini, float *a, intlda, float*b, int ldlb, float * alphar, float *alphai, float *beta, float * $q$, int ldq, float * $z$, int ld $z$, int *info);
void shgeqz_64 (char job, charcom pq, char com pz, long n, long ilo, long ini, float*a, long lda, float*b, long lalo, float *ahphar, float *alphai, float *beta, float *q, long ldq, float*z, long ldz, long *info);

## PURPOSE

shgeqz im plem ents a single-/double-shiftversion of the Q Z $m$ ethod for finding the generalized eigenvalues B is upper triangular, and A isblock upper triangular, w here the diagonal blocks are either 1 foy-1 or 2 foy- 2 , the 2 foy- 2 blocks having com plex generalized eigenvalues (see the description of the argum entJOB.)

If $J O B=S$ ', then the pair $(A, B)$ is sim ultaneously reduced to Schur form by applying one orthogonaltranform ation (usually called Q ) on the left and another (usually called Z) on the right. The $2-$ boy -2 uppertriangular diagonalblocks ofB corresponding to 2 -by-2 blocks of A w illbe reduced to positive diagonal $m$ atrices. ( $1 . e .$, if $A(j+1, j)$ is non-zero, then $B(j+1, j)=B(j \mathfrak{j}+1)=0$ and $B(j)$ and $B(j+1, j+1) w$ ill be posilive.)

If $J O B=E$ ', then ateach iteration, the sam e transform ations are com puted, but they are only applied to those parts of A and $B$ which are needed to com pute $A$ LPH AR , ALPH A I, and BETAR.

If $J O B=S$ 'and $C O M P Q$ and $C O M P Z$ are $V^{\prime}$ or $I$ ', then the orthogonal transform ations used to reduce ( $\mathrm{A}, \mathrm{B}$ ) are accum u-
lated into the arays $Q$ and $Z$ s.t.:
(in) A (in) Z (in) ${ }^{\star}=\mathrm{Q}$ (out) A (out) Z (out)*

Ref: C B.M oler \& G IN . Stew art, "A n A lgorithm for Generalized M atrixigenvalue Problem s", SIAM J. Num er. A nal, 10 (1973) р. 241-256.

## ARGUMENTS

JOB (input)
$=E$ ': com pute only A LPHAR,A LPHAI, and BETA. A and $B$ w illnotnecessarily be put into generalized Schurform . = $S^{\prime}:$ putA and B into generalized Schur form, as wellas com puting A LPHAR, A LPHA I, and BETA .

COMPQ (input)
$=\mathrm{N}$ : do notm odify Q .
$=\mathrm{V}$ ':m ultiply the anay Q on the right by the transpose of the orthogonaltranform ation that is applied to the left side of A and B to reduce them to Schur form . = 'I': like C OM PQ = V ', except that Q w illbe initialized to the identity first.

COMPZ (input)
$=\mathrm{N}$ ': do notm odify Z.
$=\mathrm{V}$ ':m ultiply the array Z on the right by the orthogonal tranform ation that is applied to the rightside of $A$ and $B$ to reduce them to Schur form . = 'I': like C OM PZ = V ', except thatZ will be initialized to the identily first.

N (input) The order of the $m$ atrices $A, B, Q$, and $Z . N>=0$.

IIO (input)
It is assum ed thatA is already upper triangular in row s and colum ns $1: \mathbb{H} O-1$ and $\mathbb{H} \mathrm{I}+1 \mathrm{~N} .1<=\mathbb{L} 0$ $<=\mathbb{H} I<=N$, if $N>0 ; \mathbb{H}=1$ and $\mathbb{H} I=0$, if $N=0$.

IH I (input)
See the description of IIO .

A (input) On entry, the $N$ boy-N upper H essenberg $m$ atrix A.
Elem ents below the subdiagonalm ustbe zero. If $\mathrm{JOB}=\mathrm{S}$ ', then on exit $A$ and $B \mathrm{w}$ ill have been sim ultaneously reduced to generalized Schur form . If $J O B=E$ ', then on exitA w ill have been destroyed. The diagonalblocks w ill.be corect, but
the off-diagonalportion $w$ illbe $m$ eaningless.

LD A (input)
The leading din ension of the array A. LD A $>=\max$ ( $1, \mathrm{~N})$.
$B$ (input) On entry, the $N$ boy -N upper triangular $m$ atrix $B$. Elem ents below the diagonalm ustbe zero. 2 -by- 2 blocks in $B$ corresponding to 2 -by-2 blocks in A w illbe reduced to positive diagonal form . (I.e., if $(j+1, \gamma)$ is non-zero, then $B(j+1, j)=B(j j+1)=0$ and $B(j)$ ) and $B(j+1, j+1) w$ illlbe positive.) If JO $B=S$ ', then on exit $A$ and $B$ will have been sim ultaneously reduced to Schur form. If JO B=E', then on exith w illhave been destroyed. Elem ents corresponding to diagonal blocks of A w illlbe conect, but the off-diagonal portion w ill be m eaningless.

LD B (input)
The leading dim ension of the array $B . L D B>=m a x($ 1,N ).

ALPHAR (output)
A LPHAR ( $1 \mathbb{N}$ ) w illlbe set to realparts of the diagonalelem ents of $A$ thatw ould result from reducing $A$ and $B$ to Schur form and then further reducing them both to triangular form using unitary transform ations s.t.the diagonalof B was nonnegative real. Thus, if A ( $j, j$ is in a 1 by-1 block (i.e., $A(j+1, j)=A(j j+1)=0)$, then A LPHAR $(\mathcal{j})=A(j)$. N ote that the (realor com plex) values (ALPHAR ( $\mathcal{j}$ ) $+\mathrm{i}^{\star} A \operatorname{LPHAI}(\mathcal{j})$ )BETA ( $\mathcal{j}$, $j 1, \ldots, N$, are the generalized eigenvalues of the $m$ atrix pencill $-w B$.

## A LPHA I (output)

A LPH A I( $1: \mathbb{N}$ ) w illbe set to im aginary parts of the diagonal elem ents of A that would result from reducing $A$ and $B$ to Schur form and then further reducing them both to triangular form using unitary transform ations s.t. the diagonal of $B \mathrm{w}$ as non-negative real. Thus, ifA ( 7 ) is in a 1-by-1 block (i.e., $A(j+1, j)=A(j j+1)=0)$, then A LPHAR ( $\mathcal{j}=0$. N ote that the (real orcomplex)
 $\dot{F} 1, \ldots, N$, are the generalized eigenvalues of the $m$ atrix pencilA $-w B$.
$\operatorname{BETA}(1 \mathbb{N})$ w illbe set to the (real) diagonal ele$m$ ents of $B$ thatw ould result from reducing $A$ and $B$ to Schur form and then further reducing them both to triangular form using unitary transform ations s.t. the diagonal of $B$ was non-negative real. Thus, if A (j) is in a 1-by-1 block (ie., $A(j+1, j)=A(j j+1)=0)$, then BETA $(j=B(j)$. N ote that the (real or complex) values (A LPHAR ( $\mathcal{j}$ ) i*ALPHAI ( $\mathcal{I}$ ) ABETA ( $\mathcal{j}$, $\bar{j} 1, \ldots, N$, are the generalized eigenvalues of the $m$ atrix pencil $A-w B$. N ote thatBETA ( $1: \mathbb{N}$ ) w illalw ays be non-negative, and no BETA I is necessary .)
Q (input/output)
If $C O M P Q=N$ ', then $Q \mathrm{w}$ illlnotbe referenced. If $C O M P Q=V$ ' or ' $I$ ', then the transpose of the orthogonal transform ationsw hich are applied to $A$ and $B$ on the leftw illbe applied to the array $Q$ on the right.

LD Q (input)
The leading dim ension of the array $\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1$. If $C O M P Q=V$ 'or $I$ ', then $L D Q>=N$.

Z (input/output)
If $\mathrm{COM} \mathrm{MZ}=\mathrm{N}$ ', then Z w ill notbe referenced. If
$\mathrm{COM} P Z=\mathrm{V}^{\prime}$ or ' I ', then the orthogonaltransform ations w hich are applied to $A$ and $B$ on the right w ill be applied to the array $Z$ on the right.

LD $Z$ (input)
The leading $d i m$ ension of the array $Z . L D Z>=1$. If COM PZ=V 'or I', then LD Z >=N .

W ORK (w orkspace)
On exit, if $\mathbb{N}$ FO >= 0 , W ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= $\max (1, N)$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i$-th argum enthad an ille-
galvalue
$=1, \ldots, N$ : the QZ iteration did not converge. ( $\mathrm{A}, \mathrm{B}$ ) is not in Schur form, but ALPHAR (i), A LPHAI(i), and BETA (i), $i=\mathbb{N} F O+1, \ldots, N$ should be correct. $=\mathrm{N}+1, \ldots, 2 * \mathrm{~N}$ : the shiftcalculation failed. ( $A, B$ ) is not in Schur form, but ALPHAR (i), ALPHAI(i), and BETA (i), i= $\mathbb{N F O -}$ $\mathrm{N}+1, \ldots, \mathrm{~N}$ should be correct. > $2 \star \mathrm{~N}$ : various
"im possible" errors.

## FURTHER DETAILS

## Iteration counters:

JITER - counts iterations.
ITER - counts iterations nun since ILA ST w as last changed. This is therefore resetonly when a 1-by-1 or
$2-b y-2$ block deflates off the bottom .

## C INTERFACE

\#include <sunperfh>
void shsein (char side, chareigsre, char initv, int *select, int $n$, float *h, int ldh, float *W $r$, float *W i, float * Vl , int ldvl, float * Vr , int ldvr, int m m , int *m, int *ifaill, int *ifailr, int *info);
void shsein_64 (charside, char eigsrc, char initv, long
*select, long n, float*h, long ldh, float *w r, float *W i, float* vl , long ldvl, float *Vr, long ldvi, long mm, long *m, long *ifaill, long *ifailr, long *info);

## PURPOSE

shsein uses inverse teration to find specified rightand/or lefteigenvectors of a real upperH essenberg m atrix H.

The righteigenvectorx and the lefteigenvector $y$ of the $m$ atrix $H$ comesponding to an eigenvalue $w$ are defined by:

$$
H^{*} x=w^{*} x, \quad y^{\star * h} * H=w^{\star} y^{\star *} h
$$

where $y^{* *}$ h denotes the conjugate transpose of the vectory.

## ARGUMENTS

```
SID E (input)
\(=R\) ': com pute righteigenvectors only;
\(=\mathbb{L}\) ': com pute lefteigenvectors only;
\(=\mathrm{B}:\) com pute both right and lefteigenvectors.
```

E IG SRC (input)
Specifies the source of eigenvalues supplied in
(WR,WI):
$=Q$ ': the eigenvalues w ere found using SH SEQR; thus, if H has zero subdiagonalelem ents, and so is block-triangular, then the $j$ th eigenvalue can be assum ed to be an eigenvalue of the block containing the jth row /oolum n. Thisproperty allow s SHSEIN to perform inverse iteration on justone diagonalblock. $=N$ ': no assum ptions are $m$ ade on the comespondence betw een eigenvalues and diagonalblocks. In this case, SH SE $\mathbb{N}$ m ustalw ays perform inverse teration using the w holem atrix $H$.
$\mathbb{N} \operatorname{ITV}$ (input)
$=\mathrm{N}$ ': no initial vectors are supplied;
$=\mathrm{U}$ ': user-supplied initial vectors are stored in the arays $V L$ and/orV R.

## SELECT (input/output)

Specifies the eigenvectors to be com puted. To select the real eigenvector corresponding to a realeigenvalue $W$ R ( 1 ) , SELECT ( 7 ) m ust be set to .TRUE.. To select the complex eigenvector corresponding to a complex eigenvalue (WR $(\mathcal{j}), W I(j))$, w th complex conjugate (WR $(j+1), W I(j+1))$, eitherSELECT ( $\mathfrak{j}$ ) orSELECT ( $\mathfrak{j}+1$ )
orboth $m$ ust.be setto

N (input) The order of the m atrix $\mathrm{H} . \mathrm{N}>=0$.

H (input) The upperH essenberg $m$ atrix $H$.

## LD H (input)

The leading dim ension of the aray H . LD H >= $\max (1, N)$.

W R (input/output)
On entry, the real and im aginary parts of the eigenvalues of H ; a complex conjugate pair of eigenvalues m ustibe stored in consecutive elem ents
of W R and W I. On exit, W R m ay have been altered since close eigenvalues are perturbed slightly in searching for independenteigenvectors.

W I (input)
See the description of R R .

VI (input/output)
On entry, if $\mathbb{N} \mathbb{I T V}=\mathrm{U}$ 'and $S \mathbb{D} E=\mathrm{L}$ 'or $B$ ', VL $m$ ust contain starting vectors for the inverse iteration for the lefteigenvectors; the starting vector for each eigenvectorm ust.be in the sam e
colum $n(s)$ in which the eigenvectorw illibe stored. On exit, if $S \mathbb{D} E=$ L'or B', the lefteigenvectors specified by SELEC T w illbe stored consecutively in the colum ns of $V L$, in the sam e order as their eigenvalues. A complex eigenvector corresponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the first holding the real part and the second the im aginary part. If $S D E=R ', V L$ is not referenced.

LDVL (input)
The leading dim ension of the array VL. LDVL >= $\max (1, N)$ if $S \mathbb{D} E=L$ 'or $B$ '; LDVL >= 1 otherw ise.

VR (input/output)
On entry, if $\mathbb{N} \mathbb{T V}=\mathrm{U}$ 'and $S \mathbb{D} E=R$ 'or $B$ ', VR $m$ ust contain starting vectors for the inverse iteration for the righteigenvectors; the starting vector for each eigenvectorm ustbe in the sam e colum n(s) in which the eigenvectorw illbe stored. On exit, if $S \mathbb{D E}=\mathrm{R}$ 'or B ', the righteigenvectors specified by SELEC T w illbe stored consecutively in the colum ns of VR, in the sam e order as their eigenvahues. A complex eigenvector comesponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the first holding the real part and the second the im aginary part. If $S \mathbb{D E}=\mathrm{L}, \mathrm{VR}$ is notreferenced.

LDVR (input)
The leading dim ension of the array VR. LDVR >= $\max (1, N)$ if $S \mathbb{D} E=R$ 'or $B$ '; LDVR $>=1$ otherw ise.

M M (input)
The num berof colum ns in the arrays VL and/or VR. M M >= M .

M (output)
The num ber of colum ns in the anays VL and/or VR required to store the eigenvectors; each selected realeigenvector occupies one column and each selected com plex eigenvector occupies tw o colum ns.

W ORK (w orkspace)
dim ension $(\mathbb{N}+2) * \mathrm{~N}$ )

FFA ILL (output)
If $S \mathbb{D} E=L$ 'or $B ', \mathbb{F A}$ ILL $(i)=j>0$ if the
left eigenvector in the ith column of VL (comesponding to the eigenvalue $\mathrm{w}(\mathrm{j})$ failed to converge; $\mathbb{F A} \mathbb{I L L}(i)=0$ if the eigenvectorconverged satisfactorily. If the $i$-th and (i+1)th colum ns of VL hold a com plex eigenvector, then $\mathbb{F A} \mathbb{I L L}(i)$ and $\mathbb{F} A \mathbb{L} L(i+1)$ are set to the sam e value. If $S \mathbb{D} E=R ', \mathbb{F} A \mathbb{I} L$ is not referenced.
FFA ILR (output)
If $S \mathbb{D} E=R$ 'or $B$ ', $\mathbb{F A}$ ILR $(i)=j>0$ if the right eigenvector in the i-th colum $n$ of VR (comesponding to the eigenvalue w( $\mathcal{J}$ ) failed to converge; $\mathbb{F A} \mathbb{I L} R(i)=0$ if the eigenvectorconverged satisfactorily. If the $i$-th and (i+1)th colum ns of VR hold a com plex eigenvector, then $\mathbb{F A} \mathbb{I} R(i)$ and $\mathbb{F} A \mathbb{I} R(i+1)$ are set to the sam e value. IfSID $\mathrm{E}=\mathrm{L}^{\prime}$, , $\mathbb{F} A \mathbb{I} \mathrm{R}$ is not referenced.
$\mathbb{N} F O$ (output)
= 0 : successfiulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the i-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=i$, $i$ is the num ber of eigenvectors which failed to converge; see $\mathbb{F} A \mathbb{I} L$ and $\mathbb{F} A \mathbb{I} R$ for further details.

## FURTHER DETAILS

E ach eigenvector is nom alized so that the elem ent of largest $m$ agnitude has $m$ agnitude 1 ; here the $m$ agnitude of a com plex num ber $(x, y)$ is taken to be $|x+t y|$.

void shseqr_64 (char j̀b, charcom pz, long n, long ilo, long ihi, float *h, long ldh, float*w r, float *w i, float *z, long ldz, long *info);

## PURPOSE

shseqr com putes the eigenvalues of a real upper H essenberg $m$ atrix $H$ and, optionally, the $m$ atrices $T$ and $Z$ from the Schurdecomposition $H=Z \mathrm{~T} \mathrm{Z**T}$, where T is an upper quasi-triangular $m$ atrix the Schur form ), and $Z$ is the orthogonalm atrix of Schurvectors.

O ptionally Z m ay be postm ultiplied into an input orthogonal $m$ atrix $Q$, so that this routine can give the Schur factorization of a m atrix A which has been reduced to the $H$ essenberg form $H$ by the orthogonal $m$ atrix $Q: A=Q * H * Q * T=$ (Q Z)*T* $\mathrm{Q} Z)^{\star *} \mathrm{~T}$.

## ARGUMENTS

JOB (input)
= E ': com pute eigenvalues only;
$=S$ ': com pute eigenvalues and the Schur form T .

COM PZ (input)
$=\mathrm{N}$ ': no Schurvectors are com puted;
$=I^{\prime}: \mathrm{Z}$ is in inialized to the unit m atrix and
the m atrix Z of Schurvectors of H is retumed; $=$ V ': Z mustcontain an orthogonal matrix Q on entry, and the product Q * Z is retumed.

N (input) The order of the m atrix $\mathrm{H} . \mathrm{N}>=0$.

It is assum ed that H is already upper triangular in row s and colum ns 1: $\mathbb{T}-1$ and $\mathbb{H} \mathrm{I}+1 \mathrm{~N} . \mathbb{I} \mathrm{O}$ and $\mathbb{H}$ I are norm ally setby a previous call to SG EBA L, and then passed to SGEHRD w hen them atrix output by SG EBA $L$ is reduced to $H$ essenberg form. O therw ise HO and $\mathbb{H} I$ should be set to 1 and $N$ respectively. $1<=\mathbb{H O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H} \mathrm{O}=1$ and $\mathbb{H} \mathrm{I}=0$, if $\mathrm{N}=0$.

IH I (input)
See the description of IIO .
H (input/output)
On entry, the upper H essenberg $m$ atrix H . On exit, if $J O B=S ', H$ contains the upper quasitriangularm atrix $T$ from the Schur decom position (the Schur form); 2-by-2 diagonal blocks (comesponding to com plex conjugate pairs of eigenvalues) are retumed in standard form, w ith $\mathrm{H}(i, i)=H(i+1, i+1)$ and $H(i+1, i) * H(i, i+1)<0$. If $\mathrm{JOB}=\mathrm{E}$ ', the contents of H are unspecified on exit.

LD H (input)
The leading din ension of the array H. LD H >= $\max (1, N)$.

W R (output)
The real and im aginary parts, respectively, of the com puted eigenvalues. Iftw o eigenvalues are com puted as a com plex conjugate pair, they are stored in consecutive elem ents of $W R$ and $W I$, say the $i$-th and (i+1)th, with W I(i) > 0 and $W$ I(i+1) < 0 . If $J 0 B=S$ ', the eigenvalues are stored in the sam e order as on the diagonal of the Schur form retumed in $H$, w ith $W$ R (i) $=\mathrm{H}(i, i)$ and, if H ( $i: i+1, i: i+1$ ) is a 2 -by -2 diagonalblock, $W$ I(i) $=$ squt $(\mathrm{H}(i+1, i) * H(i, i+1))$ and $W I(i+1)=-W I(i)$.

W I (output)
See the description ofW R .

Z (input) IfCOM PZ = N ': Z is not referenced.
If COM PZ = I': on entry, Z need notbe set, and on exit, $Z$ contains the orthogonalm atrix $Z$ of the Schurvectors of H . IfCOM PZ = V ': on entry Z m ust contain an N -by -N m atrix Q , which is assum ed to be equal to the unitm atrix except for the sub$m$ atrix $Z$ ( $\mathbb{H} O: \mathbb{H} I, \mathbb{I} O: \mathbb{H} I$ ); on exitZ contains $Q$ *Z . N orm ally $Q$ is the orthogonalm atrix generated by SORGHR after the call to SGEHRD which form ed the

H essenberg $m$ atrix $H$.

LD Z (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=$ $\max (1, N)$ if COMPZ = I'orV';LD $Z>=1$ otherwise.
W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= $\max (1, N)$.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0: successfulexit
<0: if $\mathbb{I N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=i, S H$ SEQR failed to com pute allof the eigenvalues in a total of 30* ( $\mathbb{H} \mathrm{I}-\mathbb{H O}+1$ ) iterations; elem ents 1 :ilo- 1 and i+ 1 m of $\mathrm{W} R$ and W I contain those eigenvalues w hich have been successfully com puted.

2 : operate $w$ ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M $\quad \mathrm{N}$ um berof row s in $m$ atrix $A$
$N \quad N$ um berof colum $n s$ in $m$ atrix $C$

UN ITD Type of scaling:
1 : Identity $m$ atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum n scaling)
4 : A utom atic row scaling (see section N O TES for further details)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger anay D ESCRA (1) m atrix structure

0 : general
1 : symm etric ( $A=A$ )
2 : Herm ( $\mathrm{A}=\mathrm{CONJG}$ (A))
3 :Triangular
4 : Skew (A nti)-Symm etric ( $A=-A$ )
5 :D iagonal
6 : Skew Herm itian ( $\mathrm{A}=-\mathrm{CON}$ J ( A ) )
N ote:For the routine, DESCRA (1)=3 is only supported.
DESCRA (2) upper/low er triangular indicator
1: low er
2 : upper
DESCRA (3) m ain diagonaltype
0 :non-unit
1 : unit
DESCRA (4) A ray base $\mathbb{N} O T \mathbb{M}$ PLEM ENTED )
0 :C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? $\mathbb{N} O T \mathbb{I}$ PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL 0 array of length NNZ consisting of entries of A. VA L can be view ed as a colum $n m$ ajorordering of a row perm utation of the Ellpack representation of A, where the Ellpack representation is perm uted so that the row s are non-increasing in the num ber of nonzero entries. V alues added forpadding in E llpack are not included in the Jagged-D iagonal form at.
$\mathbb{N} D \mathrm{X} 0 \quad$ array of length NNZ consisting of the colum n indices of the comesponding entries in VAL.

PNTR 0) array of length M AXNZ +1 , where PNTR ( 1 ) PNTR (1) +1 points to the location in VA L of the firstelem ent in the row -perm uted $E$ lipack represenation of $A$.

MAXNZ max num berofnonzeros elem ents per row .
$\mathbb{P E R M}$ ) integer array of length M such that $\mathrm{I}=\mathbb{P} E R M$ ( I ), where row I in the originalE llpack representation corresponds to row I' in the perm uted representation. If $\operatorname{PERM}(\mathbb{1})=0$, its assum ed by convention that $\mathbb{P E R M}(\mathbb{I})=I . \mathbb{P E R M}$ is used to determ ine the order in which row s ofC are updated.

B 0 rectangular array w th first dim ension LD B.

LD B leading dim ension ofB
BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .
LD C leading dim ension of $C$

W ORK () scratch array of length LW ORK.
On exit, ifLW ORK $=-1, W$ ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK aray. LW ORK should be at least2*M.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on multiple processors, LW ORK $>=2 * \mathrm{M}$ *N_CPUS where N_CPUS is the maxim um num berof processors available to the program.

If LW ORK $=0$, the routine is to allocate $w$ orkspace needed.
IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

## SEE ALSO

N IST FORTRAN Sparse B las U ser's G uide available at:
http://m ath nistgov/m csd/Staff/k Rem ington/Ispblas/
"D ocum ent for the B asic LinearA lgebra Subprogram s (BLA S) Standard", U niversity of Tennessee, K noxville, Tennessee, 1996:
http://w w w netlib .org/utk/papers/sparse.ps

## NOTES/BUGS

1. No test for singularity ornear-singularity is included in this routine. Such tests $m$ ust.be perform ed before calling this routine.
2. If U N ITD $=4$, the routine scales the row s ofA such that their 2 -norm s are one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK (1)=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here $i$ is the row num berw hich 2 -norm is exactly zero.
3. If $\operatorname{DESCRA}(3)=1$ and UN ITD < 4, the unitdiagonalelem ents $m$ ightorm ightnotbe referenced in the JA D representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD=4, the unit diagonalelem ents M U ST be referenced in the $\sqrt{A} D$ representation.
4.The routine can be applied for solving triangular system $s$ w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ust.be equal to 3 in this case.

## C INTERFACE

\#include <sunperfh>
void slagtf(intn, float*a, float lam boda, float *b, float *C, floattol, float *d, int *in, int *info);
void slagtf_64 (long n, float *a, float lam bda, float *b, float *C, float tol, float *d, long *in, long *info);

## PURPOSE

slagtf factorizes the $m$ atrix ( $T$-lam bda* $I$ ), where $T$ is an $n$ by $n$ tridiagonalm atrix and lam bda is a scalar, as w here $P$ is a perm utation $m$ atrix, $L$ is a unit low er tridiagonal $m$ atrix $w$ ith atm ostone non-zero sub-diagonalelem ents per colum $n$ and $U$ is an uppertriangularm atrix $w$ ith atm ost tw o non-zero super-diagonalelem ents percolum $n$.

The factorization is obtained by G aussian elim ination with partialpivoting and im plicitrow scaling.

The param eterLAMBDA is included in the routine so that SLAGTF m ay be used, in conjunction w ith SLA GTS, to obtain eigenvectors of $T$ by inverse iteration.

## ARGUMENTS

N (input) The orderof the m atrix T .

A (input/output)
O $n$ entry, A m ust contain the diagonalelem ents of T.

On exit, A is overw rilten by the $n$ diagonal ele$m$ ents of the upper triangularm atrix $U$ of the factorization of $T$.

LAM BDA (input)
O n entry, the scalar lam bda.
B (input/output)
O $n$ entry, B m ustcontain the ( $n-1$ ) super-diagonal elem ents of $T$.

On exit, $B$ is overw rilten by the $(n-1)$ superdiagonal elem ents of the $m$ atrix $U$ of the factorization of $T$.

C (input/output)
On entry, C m ustcontain the ( $n-1$ ) sub-diagonal elem ents of $T$.

On exit, $C$ is overw ritten by the ( $n-1$ ) subdiagonal elem ents of the $m$ atrix $L$ of the factorization ofT.
TOL (input/output)
On entry, a relative tolerance used to indicate whether ornot the $m$ atrix ( $I$-lam bda*I) is nearly singular. TO L should norm ally be chose as approxi$m$ ately the largest relative error in the elem ents of T.For exam ple, if the elem ents of T are correct to about 4 significant figures, then TO L should be set to about $5 * 10 * *(-4)$. If TOL is supplied as less than eps, where eps is the relative m achine precision, then the value eps is used in place of TO L.

D (output)
On exit, $D$ is overw ritten by the ( $n-2$ ) second super-diagonal elem ents of the $m$ atrix $U$ of the factorization of $T$.
$\mathbb{N}$ (output)
On exit, $\mathbb{N}$ contains details of the perm utation $m$ atrix $P$. If an interchange occurred at the $k$ th step of the elm ination, then $\mathbb{N}(k)=1$, otherv ise $\mathbb{N}(k)=0$. The elem ent $\mathbb{N}(n)$ retums the sm allest positive integer jsuch that
abs(u) (j) ).le.norm ( ( I -lam bda*I) (ㄱ) )*TO L,
w here norm (A ( $)$ ) denotes the sum of the absolute values of the th row of them atrix $A$. If no such jexists then $\mathbb{I N}(n)$ is retumed as zero. If $\mathbb{I N}(n)$ is retumed as positive, then a diagonalelem ent of $U$ is $s m$ all, indicating that ( $(1-l a m b d a * I$ ) is singular ornearly singular,
$\mathbb{I N} F O$ (output)
= 0 : successfulexit

\section*{PURPOSE}
slarz applies a realelem entary reflector \(H\) to a realM -by-N \(m\) atrix \(C\), from either the left or the right. \(H\) is represented in the form
\[
H=I-\tan ^{\star} \mathrm{v}^{\star} \mathrm{v}^{\prime}
\]
\(w\) here tau is a realscalar and \(v\) is a realvector.

If tau \(=0\), then \(H\) is taken to be the unitm atrix.
\(H\) is a product of \(k\) elem entary reflectors as retumed by STZRZF.

\section*{ARGUMENTS}

SIDE (input)
\(=L^{\prime}:\) form \(H * C\)
\(=R\) ': form \(C * H\)

M (input) The num ber of row s of the \(m\) atrix \(C\).

N (input) The num ber of colum ns of the m atrix C .

L (input) The num ber ofentries of the vector \(V\) containing the \(m\) eaningful part of the \(H\) ouseholdervectors. If \(S \mathbb{D} E=L ', M>=L>=0\), if \(S \mathbb{D} E=R \prime, N>=L\) \(>=0\) 。

V (input) The vector v in the representation of H as retumed by STZRZF.V is notused ifTA \(U=0\).
\(\mathbb{N} C V\) (input)
The increm entbetw een elem ents ofv. \(\mathbb{N} C V\) <> 0.

TAU (input)
The value tau in the representation of \(H\).
C (input/output)
On entry, the M -by -N m atrix C. On exit, C is overw ritten by the \(m\) atrix \(H\) * \(C\) if \(S \mathbb{D} E=L\) ', or C * H if \(S \mathbb{D} E=R\) '.
LDC (input)
The leading dim ension of the array C.LD C >= \(m a x(1, M)\).

W ORK (w orkspace)
\((\mathbb{N})\) if \(S \mathbb{D} E=L^{\prime}\) or \(\left.M\right)\) if \(S \mathbb{D} E=R^{\prime}\)

void slarzt 64 (chardirect, charstorev, long n, long k, float *V, long ldv, float*tau,float*t, long ldt);

\section*{PURPOSE}
slarzt form s the triangular factor \(T\) of a realblock reflector \(H\) of order \(>\mathrm{n}\), which is defined as a product of \(k\) elem entary reflectors.

IfD \(\mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{H}=\mathrm{H}(1) \mathrm{H}(2) \ldots \mathrm{H}(\mathrm{k})\) and T is upper triangular;

IfD \(\mathbb{R E C T}=\mathrm{B}^{\prime}, \mathrm{H}=\mathrm{H}(\mathrm{k}) \ldots \mathrm{H}(2) \mathrm{H}(1)\) and T is lower triangular.

IfSTOREV = C', the vector which defines the elem entary reflector \(H\) ( \(i\) ) is stored in the i-th colum \(n\) of the array \(V\), and
\[
H=I-V * T * V^{\prime}
\]

IfSTOREV = R', the vector which defines the elem entary reflectorH (i) is stored in the \(i\)-th row of the array \(V\), and
\[
\mathrm{H}=\mathrm{I}-\mathrm{V}^{\prime} \star \mathrm{T} * \mathrm{~V}
\]

Currently, only STOREV = R'and D \(\mathbb{R E C T}=\mathrm{B}\) 'are supported.

\section*{ARGUMENTS}

D \(\mathbb{R E C T}\) (input)
Specifies the order in which the elem entary
reflectors are multiplied to form the block
reflector:
\(=F\) : H = H (1) H (2) . . H (k) Forw ard, notsup-
ported yet)
\(=B^{\prime}: H=H(k) \ldots H(2) H(1)\) Backw ard)

\section*{STOREV (input)}

Specifies how the vectors w hich define the elem entary reflectors are stored (see also Further
D etails):
= R ': row w ise
N (input) The order of the block reflector \(\mathrm{H} . \mathrm{N}>=0\).
\(K\) (input) The order of the triangular factor \(T \vDash\) the num ber of elem entary reflectors). \(\mathrm{K}>=1\).
\(V\) (input) ( \(L D V, K\) ) if \(S T O R E V=C^{\prime}(L D V, N)\) if \(S T O R E V=R^{\prime}\) Them atrix \(V\). See furtherdetails.

LD V (input)
The leading dim ension of the array V . If \(\operatorname{STOREV}=\) \(C\) ', LDV \(>=\max (1, N)\); ifSTOREV = \(R\) ', LDV \(>=K\).

TAU (input)
TAU (i) must contain the scalar factor of the elem entary reflectort (i).
\(T\) (input) The \(k\) by \(k\) triangular factor \(T\) of the block reflector. If \(\mathrm{D} \mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{T}\) is upper triangular; if \(\mathrm{D} \mathbb{R E C T}=\mathrm{B}\) ', T is low er triangular. The restof the aray is notused.

LD T (input)
The leading dim ension of the array T.LD T >=K.

\section*{FURTHER DETAILS}

B ased on contributions by
A. Petitet, C om puter Science D ept., U niv. of Tenn., K noxville, U SA

The shape of the \(m\) atrix \(V\) and the storage of the vectors which define the \(H\) (i) is bestillustrated by the follow ing exam ple w th \(\mathrm{n}=5\) and \(\mathrm{k}=3\). The elem ents equal to 1 are not stored; the comesponding aray elem ents arem odified but restored on exit. The restof the array is notused.

void sorgbr(charvect, intm, intn, intk, float *a, int lda, float *tau, int *info);
void sorgbr_64 (charvect, long m, long \(n\), long \(k\), float *a, long lda, float *tau, long *info);

\section*{PURPOSE}
sorgbrgenerates one of the real orthogonal \(m\) atrices \(Q\) or \(P * * T\) determ ined by SGEBRD when reducing a realm atrix \(A\) to bidiagonal form \(: A=Q * B * P * * T . Q\) and \(P * * T\) are defined as products of elem entary reflectors H (i) orG (i) respectively.

IfVECT \(=Q\) ', \(A\) is assum ed to have been an \(M\) boy \(K m\) atrix, and Q is of orderM :
ifm \(>=k, Q=H(1) H(2) \ldots H(k)\) and \(S O R G B R\) retums the firstn colum ns of \(Q\), where \(m>=n>=k\);
ifm \(<k, Q=H(1) H(2) \ldots H(m-1)\) and \(S O R G B R\) retums \(Q\) as an M -by \(M\) m atrix.

IfVECT \(=P\) ', A is assum ed to have been a K -by -N m atrix, and \(\mathrm{P} * * \mathrm{~T}\) is oforderN:
if \(k<n, P^{* *} T=G(k) \ldots G(2) G(1)\) and \(S O R G B R\) retums the firstm row \(\operatorname{sofP}\) **T, where \(\mathrm{n}>=\mathrm{m}>=\mathrm{k}\); ifk \(>=n, P * * T=G(n-1) \ldots G(2) G(1)\) and \(S O R G B R\) retums \(\mathrm{P} * * \mathrm{~T}\) as an N -by -N m atrix.

\section*{ARGUMENTS}

VECT (input)
Specifies w hether the m atrix \(Q\) orthem atrix \(P * * T\)
is required, as defined in the transform ation
applied by SGEBRD :
= Q ': generate Q ;
\(=P\) : generate \(\mathrm{P} * * \mathrm{~T}\).

M (input) The num ber of row s of the \(m\) atrix \(Q\) orP**T to be retumed. \(\mathrm{M}>=0\).

N (input) The num ber of colum ns of the \(m\) atrix Q or \(\mathrm{P} * * T\) to
be retumed. \(\mathrm{N}>=0\). IfVECT \(=Q \mathrm{~V}^{\prime}, \mathrm{M}>=\mathrm{N}>=\) \(m\) in \((M, K) ;\) ifVECT \(=P^{\prime}, N>=M>=m\) in \((\mathbb{N}, K)\).
\(K\) (input) IfVECT = Q ', the num berof colum ns in the original \(M\) boy \(K m\) atrix reduced by \(S G E B R D\). IfVECT \(=\) \(P\) ', the num ber of row \(s\) in the original \(K\) boy \(N\) m atrix reduced by SG EBRD . \(\mathrm{K}>=0\).

A (input/output)
O n entry, the vectors w hich define the elem entary reflectors, as retumed by SGEBRD. On exit, the M łoy-N m atrix Q orP**T.

LD A (input)
The leading dim ension of the array \(\mathrm{A} . \operatorname{LDA}>=\) \(\max (1, M)\).

TAU (input)
\((m\) in \((\mathbb{M}, K))\) ifVECT = \(Q^{\prime}(m\) in \((\mathbb{N}, K))\) ifVECT \(=P^{\prime}\)
TAU (i) m ustcontain the scalar factor of the ele\(m\) entary reflectorH (i) orG (i), which determ ines Q or \(\mathrm{P} * * \mathrm{~T}\), as retumed by \(\mathrm{SG} E B R D\) in its array argu\(m\) entTAUQ orTAUP.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the amay W ORK. LW ORK >= \(m\) ax \((1, m\) in \(M, N))\). Foroptim um perform ance LW ORK >= \(m\) in \((M, N) * N B, w h e r e N B\) is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the \(i\) th argum enthad an illegalvalue

void sorm rz (char side, char trans, intm, intn, intk, int l, float *a, intlda, float*tau, float *c, int ldc, int*info);
void sorm rz_64 (charside, chartrans, long m, long n, long
k, long l, float *a, long lda, float *tau, float
*c, long ldc, long *info);

\section*{PURPOSE}
sorm rz overw rites the general real M -by-N m atrix C with TRANS \(=T: \quad Q * * T C \quad C * Q * T\)
where \(Q\) is a realorthogonalm atrix defined as the product ofk elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k)
\]
as retumed by STZRZF.Q is oforderM if \(S \mathbb{D} E=L\) 'and of orderN if \(S \mathbb{D} E=R\).

\section*{ARGUMENTS}

STDE (input)
\(=\mathrm{L}\) ': apply Q orQ \({ }^{* *}\) T from the Left;
= R ': apply Q orQ **T from the R ight.
TRANS (input)
= N ': N o transpose, apply Q ;
= T': T ranspose, apply Q **T .

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{C} . \mathrm{M}>=0\).
N (input) The num ber of collum ns of the m atrix \(\mathrm{C} . \mathrm{N}>=0\).
\(K\) (input) The num ber of elem entary reflectors whose product defines the \(m\) atrix \(Q\). If \(S \mathbb{D} E=L^{\prime}, \mathrm{M}>=K>=0\);
if \(S \mathbb{D} E=R \prime, N>=K>=0\).

L (input) The num ber of colum ns of the \(m\) atrix A containing
the \(m\) eaningfulpart of the \(H\) ouseholder reflectors.
If \(S \mathbb{D} E=L \prime, M>=L>=0\), if \(S \mathbb{D} E=R \prime N>=L\)
\(>=0\) 。

A (input) (LDA, M) if \(S \mathbb{D} E=L \prime\) ( \(L D A, N\) ) if \(S \mathbb{D} E=R^{\prime}\) The \(i\)-th row \(m\) ustcontain the vectorw hich defines the elem entary reflector \(H\) ( \(i\) ), for \(i=1,2, \ldots, k\), as retumed by STZRZF in the lastk row s of its array argum entA. A is modified by the routine but restored on exit.

LD A (input)
The leading dim ension of the array \(\mathrm{A} . \mathrm{LDA}>=\) \(\max (1, K)\).

TAU (input)
TAU (i) m ust contain the scalar factor of the ele\(m\) entary reflector H (i), as retumed by STZRZF.

C (input/output)
On entry, the \(M\) boy -N m atrix C . On exit, C is overw ritten by Q * C or \(\mathrm{Q} * * \mathrm{H} * \mathrm{C}\) or \(\mathrm{C} \mathrm{Q}^{*}{ }^{*} \mathrm{H}\) or C * Q .

LD C (input)
The leading dim ension of the aray C.LDC >= \(\max (1, M)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. If \(S \mathbb{D} E=\mathbb{L}\) ', LW ORK >= max ( \(1, N\) ); if \(S \mathbb{D} E=R \prime\) LW ORK >= \(m\) ax \((1, M)\). Foroptim um perform ance LW ORK \(>=N * N B\) if \(S \mathbb{D} E=L '\), and LW ORK \(>=M * N B\) if \(S D E=R \prime\), w here N B is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

INFO (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue

void spbequ_64 (charuplo, long n, long kd, float *a, long lda, float *scale, float *scond, float *am ax, long *info);

\section*{PURPOSE}
spbequ com putes row and colum n scalings intended to equilibrate a sym \(m\) etric positive definite band \(m\) atrix \(A\) and reduce its condition num ber ( \(w\) ith respect to the tw o-norm ) . S contains the scale factors, \(S(i)=1 /\) sqrt (A ( \(i, i)\) ), chosen so that the scaled matrix \(B \quad w\) ith elem ents \(B(i, j)=\) \(S(i) \star A(i, 7) * S(i)\) has ones on the diagonal. This choige of \(S\) puts the condition num berofB w ithin a factor \(N\) of the sm allest possible condition num ber over allpossible diagonalscalings.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Upper triangular ofA is stored;
\(=\mathbb{L}\) ': Low ertriangularofA is stored.

N (input) The order of them atrix A. \(\mathrm{N}>=0\).

K D (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if \(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of subdiagonals ifUPLO \(=\mathbb{L} . \mathrm{KD}>=0\) 。

A (input) The upper or low er triangle of the sym \(m\) etric band \(m\) atrix \(A\), stored in the firstK \(D+1\) row s of the anay. The \(j\) th colum \(n\) ofA is stored in the \(j\) th colum \(n\) of the anray A as follow s : if UPLO = U',

A \((k d+1+i-j, j)=A(i, 7)\) for \(\max (1, j k d)<=i<=j\) if UPLO \(=L^{\prime}, A(1+i-j)=A(i, 7)\) for \(\dot{j}=i<=m\) in \((n, \dot{j}+k d)\).

LD A (input)
The leading dim ension of the array A. LDA >= KD+1.

SCALE (output)
If \(\mathbb{N} F O=0, S C A L E\) contains the scale factors for A.

SCOND (output)
If \(\mathbb{N} F O=0, S C A\) LE contains the ratio of the sm allest SCA LE (i) to the largestSCA LE (i). If SCOND \(>=0.1\) and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

AM AX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to under-
flow , the m atrix should be scaled.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvahue.
\(>0\) : if \(\mathbb{N F O}=\) i, the \(i\)-th diagonal elem ent is nonpositive.

\section*{PURPOSE}
spbrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is sym \(m\) etric positive definite and banded, and provides emorbounds and backw ard error estim ates forthe solution.

\section*{ARGUMENTS}

UPLO (input)
= U : : U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).
KD (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if UPLO \(=\mathrm{U}\) ', or the num berof subdiagonals if UPLO \(=\mathbb{L}^{\prime} . \mathrm{KD}>=0\) 。

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the m atrices B and X. NRH S \(>=0\).

A (input) The upper or low er triangle of the sym m etric band \(m\) atrix \(A\), stored in the firstKD +1 row s of the anay. The \(j\) th colum \(n\) ofA is stored in the \(j\) th colum \(n\) of the anray A as follow \(s\) : if UPLO \(=\mathrm{U}\) ', \(A(k d+1+i-j, j)=A(i, j)\) for \(m a x(1, j k d)<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}\) ', \(A(1+i-j, \bar{j})=A(i, j)\) for \(j<=i<=m\) in \((n, j+k d)\).

LDA (input)
The leading dim ension of the anay A. LDA >= K D +1.
AF (input)
The triangular factor \(U\) or \(L\) from the Cholesky factorization \(A=U * * T * U\) orA \(=\mathrm{L} * \mathrm{~L} * * T\) of the band \(m\) atrix A as computed by SPBTRF, in the same storage form atas A (see A).

LDAF (input)
The leading dim ension of the array AF. LDAF >= K D +1 .
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by SPB TRS. On exit, the im proved solution \(m\) atrix X .

LD X (input)
The leading dim ension of the array X. LD X >= \(\max (1, N)\).

\section*{FERR (output)}

The estim ated forw ard enorbound for each solution vectorX ( 7 ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(i), F E R R(i)\) is an estim ated upperbound forthe \(m\) agnitude of the largest ele\(m\) entin ( \(X(\mathcal{J})-X\) TRUE) divided by the \(m\) agninude of the largestelem entin X ( 7 ). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vectorX (i) (ie., the sm allest relative
change in any elem entofA orB thatm akes X ( 7 ) an exactsolution).

W ORK (w orkspace)

void spbstf_ 64 (charuplo, long n, long kd, float *ab, long ldab, long *info);

\section*{PURPOSE}
spbstf com putes a splitC holesky factorization of a real sym m etric positive definite band \(m\) atrix A.

This routine is designed to be used in conjunction with SSBG ST .
The factorization has the form \(A=S * * T * S\) where \(S\) is a band \(m\) atrix of the sam e bandw idth as A and the follow ing structure:
\[
\begin{array}{r}
S=\left(\begin{array}{ll}
U & ) \\
(M \quad L)
\end{array}, ~\right.
\end{array}
\]
w here U is upper triangular of orderm \(=(\mathrm{n}+\mathrm{kd}) / 2\), and L is low er triangular of ordern-m .

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': U ppertriangle ofA is stored;
\(=\mathrm{L}\) ': Low er triangle ofA is stored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if
\(\mathrm{UPLO}=\mathrm{U}\) ', orthe num ber of subdiagonals ifU PLO
\(=\mathbb{L} . \mathrm{KD}>=0\) 。

A B (input/output)
O n entry, the upper or low er triangle of the sym \(m\) etric band \(m\) atrix \(A\), stored in the first kd+1 row s of the amay. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the array A B as follow s: if \(\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{AB}(\mathrm{kd}+1+i-j, j)=A(i, j)\) for \(\mathrm{max}(1, j\) \(\mathrm{kd})<=i<=\dot{j}\) ifU PLO \(=L^{\prime}, \mathrm{AB}(1+i-j, j)=A(i, j)\) for \(j<=i<=m\) in \((n, j+k d)\).

On exit, if \(\mathbb{N F O}=0\), the factors from the split Cholesky factorization \(A=S * * T * S\). See Further D etails.

LDAB (input)
The leading dim ension of the array AB. LD A B >= K D +1 .
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=\) i, the factorization could not be com pleted, because the updated elem enta (i,i) w as negative; the \(m\) atrix \(A\) is notposilive definite.

\section*{FURTHER DETAILS}

The band storage schem e is illustrated by the follow ing exam ple, w hen \(N=7, K D=2\) :
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{\(\mathrm{S}=(\mathrm{s} 11 \mathrm{~s} 12 \mathrm{~s} 13\)} \\
\hline ( & s22 s23 s24 ) \\
\hline ( & s33 s34 ) \\
\hline ( & s44 ) \\
\hline ( & s53 s54 s55 \\
\hline ( & s64 s65 s66 ) \\
\hline ( & s75 s76 s77) \\
\hline
\end{tabular}

If \(\mathrm{U} P \mathrm{O}=\mathrm{U}\) ', the amay A B holds:
on entry: on exit:
* * a13 a24 a35 a46 a57 * * s13 s24 s53
s64 s75
* a12 a23 a34 a45 a56 a67 * s12 s23 s34 s54
s65 s76 a11 a22 a33 a44 a55 a66 a77 s11 s22 s33
s44 s55 s66 s77

IfU PLO = L', the array AB holds:
on entry: on exit:
```

a11 a22 a33 a44 a55 a66 a77 s11 s22 s33 s44 s55
s66 s77 a21 a32 a43 a54 a65 a76 * s12 s23 s34
s54 s65 s76 * a31 a42 a53 a64 a64 * * s13
s24 s53 s64 s75 * *

```

A may elem entsm arked * are notused by the routine.

void spbss_64 (charuplo, long n, long ndiag, long nihs, float *a, long lda, float *b, long ldb, long *info);

\section*{PURPOSE}
spbsv com putes the solution to a realsystem of linear equations
\(A * X=B, w h e r e A\) is an \(N\) boy \(N\) sym m etric positive defintie band \(m\) atrix and X and B are N -by-N R H S m atrices. The Cholesky decom position is used to factorA as
\(A=U * * T * U\), if \(U P L O=U\) ', or
\(A=L \star L \star * T\), if \(\mathrm{UPLO}=\mathrm{L}\) ',
\(w\) here \(U\) is an uppertriangularband \(m\) atrix, and \(L\) is a low er triangular band \(m\) atrix, w ith the sam e num ber of superdiagonals or subdiagonals as A. The factored form of A is then used to solve the system ofequations A * X \(=\mathrm{B}\).

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Uppertriangle of A is stored;
\(=\mathrm{L}\) ': Low ertriangle ofA is stored.

N (input) The num ber of linear equations, ie., the order of them atrix \(A . N>=0\).

ND IA G (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if \(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of subdiagonals ifU PLO
\(=\mathbb{L}\) '. NDIAG > \(=0\) 。

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input/output)
O n entry, the upper or low er triangle of the sym \(m\) etric band \(m\) atrix \(A\), stored in the firstN D IA \(G+1\) row s of the array. The jth colum n of A is stored in the \(j\) th colum \(n\) of the array \(A\) as follow \(s\) : if
 \(\max (1, j \mathrm{jND} \mathrm{IAG})<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{A}(1+i-j)\)
\(=A(i, j)\) for \(j<i<=m\) in \((\mathbb{N}, j+N D\) IA G ). See below for furtherdetails.

On exit, if \(\mathbb{N} F O=0\), the triangular factor \(U\) orL
from the Cholesky factorization \(A=U * * T * U\) or \(A=\)
\(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\) of the band m atrix A , in the sam e storage form atas A.

LD A (input)
The leading dim ension of the aray A. LD A >= N D IA G +1.
B (input/output)
On entry, the N -by-NRHS righthand side m atrix B. On exit, if \(\mathbb{N F O}=0\), the N boy -N RH S solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, N)\).

IN FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvałue \(>0:\) if \(\mathbb{N F O}=i\), the leading \(m\) inoroforder iof \(A\) is notpositive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

\section*{FURTHER DETAILS}

\#include <sunperfh>
void spbsvx (char fact, charuplo, int n, int ndiag, int nhs, float *a, int lda, float *af, int ldaf, char equed, float *s, float *b, int ldb, float *x, int ldx, float *roond, float *ferr, float *berr, int *info);
void spbsvx_64 (char fact, charuplo, long n, long ndiag, long nihs, float *a, long lda, float*af, long ldaf, charequed, float *s, float *b, long ldb, float *x, long ldx, float*roond, float*ferr, float *berr, long *info);

\section*{PURPOSE}
spbsvx uses the C holesky factorization \(A=U * * T * U\) or \(A=\) L*L**T to com pute the solution to a realsystem of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) sym m etric positive definite band \(m\) atrix and \(X\) and \(B\) are \(N\) boy-N RH S m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=\) E', real scaling factors are computed to
equilibrate
the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
W hether or not the system w illbe equilibrated depends on the scaling of the m atrix A, but if equilibration is used, A is
overw ritten by diag \((S) \star A * d i a g(S)\) and \(B\) by diag \((S) * B\).
2. IfFACT = N 'or E ', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT = E) as
\(A=U * * T * U\), ifUPLO \(=U\) ', or
\(\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\), if \(\mathrm{UPLO}=\mathrm{L}\) ',
\(w\) here \(U\) is an upper triangularband \(m\) atrix, and \(L\) is a
low er
triangularband \(m\) atrix.
3. If the leading i-by-iprincipal m inor is not positive definite,
then the routine retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine precision, \(\mathbb{N} F O=N+1\) is retumed as a w aming, but the routine
stillgoes on to solve for X and com pute errorbounds as described below .
4.The system of equations is solved for \(X\) using the factored form of A.
5. Herative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. Ifequilibration w as used, the \(m\) atrix \(X\) is prem ultiplied by diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether ornot the factored form of the \(m\) atrix A is supplied on entry, and ifnot, w hether the m atrix A should be equilibrated before it is factored. = F : On entry, AF contains the factored form ofA. IfEQUED = \(Y\) ', them atrix A has been equilibrated \(w\) ith scaling factors given by \(S\). A and AF w illnotbe m odified. \(=\mathrm{N}\) ': Them atrix A w illbe copied to A F and factored.
= E : : The matrix A will be equilibrated if necessary, then copied to A F and factored.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of the matrix A. \(\mathrm{N}>=0\).
ND IA G (input)
The num ber of superdiagonals of the matrix A if UPLO = U',orthe num berof subdiagonals ifU PLO
= L'. ND IAG >= 0 .

NRHS (input)
The num ber of right-hand sides, i.e., the num ber of collm ns of the matrices B and X. NRHS >= 0 .

A (input/output)
On entry, the upper or low er triangle of the sym \(m\) etric band \(m\) atrix \(A\), stored in the firstND IA G +1 row s of the array, except ifFACT = F'and EQUED \(=Y\) ', then A m ust contain the equilibrated \(m\) atrix diag \((S){ }^{*} A\) *diag \((S)\). The jth colum n of A is stored in the \(j\) th colum \(n\) of the array \(A\) as follow \(s\) : if UPLO = U', A NDIAG+1+i-ji) =A (i, \(\boldsymbol{j}\) ) for \(\max (1, j\) ND IAG \()<=i<=j\) if UPLO \(=\mathrm{L}\) ', A ( \(1+i-j, j)\) \(=A(i, j)\) for \(j=i<=m\) in \((\mathbb{N}, \dot{j}+N D \mathbb{I A} G)\). See below for furtherdetails.

Onexit, ifFACT = E' and EQUED = Y', A is overw rilten by diag (S)*A *diag (S).

LDA (input)
The leading dim ension of the array A. LDA >= ND IA G +1.

AF (input/output)
If FACT = F ', then \(A F\) is an inputargum entand on entry contains the triangular factorU or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{A}=\)
\(L * L * * T\) of the band \(m\) atrix \(A\), in the sam e storage form atas A (see A). IfEQUED \(=Y\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix A.

IfFACT \(=N\) ', then AF is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{A}=\) L*L**T。

IfFACT = E', then AF is an output argum ent and on exitretums the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\) of the equilibrated \(m\) atrix \(A\) (see the description of for the form of the equilibrated m atrix).
LD AF (input)
The leading dim ension of the array AF. LDAF >= \(N D I A G+1\).

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=\mathrm{N}\) : N o equilibration (alw ays true iffACT = N 7 。
\(=Y^{\prime}:\) Equilibration w as done, i.e., A has been replaced by diag \((\mathrm{S})\) * A * diag \((\mathrm{S})\). EQUED is an inputargum entifFACT = F'; otherw ise, it is an outputargum ent.

S (input/output)
The scale factors forA; notaccessed if EQUED = \(N^{\prime} . S\) is an inputargum entifFACT = \(F^{\prime}\); otherw ise, S is an outputargum ent. IfFACT \(=\mathrm{F}^{\prime}\) and EQUED \(=Y\) ', each elem entof m ustbe posilive.

B (input/output)
O n entry, the N Hoy-NRH S righthand side m atrix B.
On exit, if EQUED = \(N^{\prime}\), \(B\) is notm odified; if EQUED \(=Y\) ', \(B\) is overw ritten by diag \((S) * B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{I N F O}=\mathrm{N}+1\), the N -by-NRHS solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that if EQUED \(=Y\) ', A and \(B\) arem odified on exit, and the solution to the equilibrated system is inv (diag (S ) ) *X .

\section*{LD X (input)}

The leading dim ension of the anay X . LD X >= \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num ber of the \(m\) atrix \(A\) after equilibration (if done). If RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N} F O>0\).

FERR (output)
The estim ated forw ard emorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O})\), FERR ( \()\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{i})-\mathrm{X}\) TRU E ) divided by the m agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vectorX (j) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
< 0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
<= N : the leading \(m\) inoroforderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to \(w\) orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould

\section*{FURTHER DETAILS}

\section*{PURPOSE}
spbtf2 com putes the C holesky factorization of a real sym \(m\) etric positive definite band \(m\) atrix A.

The factorization has the form
```

A = U'* U , ifUPLO = U',or
A = L * L', ifUPLO = L',

```
where \(U\) is an uppertriangularm atrix, \(U\) 'is the transpose of \(U\), and \(L\) is low er triangular.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

\section*{UPLO (input)}

Specifies w hether the upper or low er triangular
part of the sym m etricm atrix A is stored:
= U ': U pper triangular
= L': Low er triangular

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num ber of super-diagonals of the m atrix A if UPLO \(=\mathrm{U}\) ', or the num ber of sub-diagonals if UPLO \(=\mathbb{L} . \mathrm{KD}>=0\) 。

A B (input/output)
O n entry, the upper or low er triangle of the sym \(m\) etric band \(m\) atrix \(A\), stored in the firstK \(D+1\) row s of the array. The \(j\) th colum n ofA is stored in the \(j\) th colum n of the array A B as follow s: if \(\mathrm{UPLO}=\mathrm{U}\) ', AB \((k d+1+i-j, j)=A(i, j)\) for \(\max (1, j\) \(\mathrm{kd})<=i<=\dot{j}\) ifUPLO \(=L ', A B(1+i-j, j)=A(i, j)\) for \(j<=i<=m\) in \((n, j+k d)\).

On exit, if \(\mathbb{N} F O=0\), the triangular factor \(U\) orL
from the Cholesky factorization \(\mathrm{A}=\mathrm{U}\) * U or \(\mathrm{A}=\) L * L ' of the band m atrix A , in the sam e storage form atas A.

LDAB (input)
The leading dim ension of the array AB. LD AB >= KD+1.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-k\), the \(k\)-th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=k\), the leading \(m\) inoroforderk is notpositive definite, and the factorization could notbe com pleted.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(\mathrm{N}=6, \mathrm{KD}=2\), and \(\mathrm{U} P L O=\mathrm{U}\) ':

On entry: On exit:

## PURPOSE

spbtrf com putes the C holesky factorization of a real sym $m$ etric positive definite band $m$ atrix A.

The factorization has the form

$$
\begin{aligned}
& A=U * * T * U, \text { if } \mathrm{UPLO}=\mathrm{U}^{\prime} \text {, or } \\
& \mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}, \text { if } \mathrm{UPLO}=\mathrm{L}^{\prime}
\end{aligned}
$$

$w$ here $U$ is an upper triangularm atrix and $L$ is low er triangular.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': Uppertriangle of $A$ is stored;
$=1 \mathrm{~L}$ ': Low er triangle of A is stored.

N (input) The order of them atrix $A . N>=0$.

KD (input)
The num berof superdiagonals of the $m$ atrix $A$ if
$\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of subdiagonals ifU PLO
$=L^{\prime} . K D>=0$ 。

A (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstKD +1 row s of the array. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the anay $A$ as follow $s$ : if $\mathrm{UPLO}=U ', A(k d+1+i-j, j)=A(i, j)$ for $m a x(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}={ }^{\prime}$ ', $A(1+i-j, j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k d)$.

On exit, if $\mathbb{N F O}=0$, the triangular factor $U$ orL from the Cholesky factorization $A=U * * T * U$ or $A=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ of the band m atrix A , in the sam e storage form atas A.

The leading dim ension of the array A. LDA >= K D +1 .
$\mathbb{N F O}$ (output)
= 0 : successfiulexit
<0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N} F O=i$, the leading $m$ inoroforder is notpositive definite, and the factorization could notbe com pleted.

## FURTHER DETAILS

The band storage scheme is illustrated by the follow ing exam ple, when $N=6, K D=2$, and $U P L O=U:$
On entry: On exit:

```
    * a13 a24 a35 a46 * * u13 u24 u35
u46
    * a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
    a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55
u66
```

Sim ilarly, if UPLO = L 'the form atofA is as follow s:
On entry: Onexit:
a11 a22 a33 a44 a55 a66 $111 \quad 122 \quad 133144 \quad 155$
166
a21 a32 a43 a54 a65 * $121 \quad 132143154165$
*
a31 a42 a53 a64 * * 131142153164 *
*

## C INTERFACE

\#include <sunperfh>
void spoequ (intn, float *a, int lda, float *scale, float
*scond, float *am ax, int *info);
void spoequ_64 (long n, float *a, long lda, float *scale, float *scond, float *am ax, long *info);

## PURPOSE

spoequ com putes row and colum n scalings intended to equilibrate a sym $m$ etric positive definite $m$ atrix $A$ and reduce its condition num ber (w ith respect to the tw o-nom ). S contains the scale factors, $S(i)=1 /$ squt $(A)(i, i))$, chosen so that the scaled $m$ atrix B w ith elem ents $B(i, j)=S(i) \star A(i, j) * S(i)$ has ones on the diagonal. This choice of $S$ puts the condition num berofB w ithin a factor $N$ of the sm allestpossible condition num ber overallpossible diagonal scalings.

## ARGUMENTS

N (input) The order of the matrix A. $\mathrm{N}>=0$.
A (input) The $\mathrm{N}-$ by -N sym $m$ etric positive definite $m$ atrix whose scaling factors are to be com puted. O nly the diagonalelem ents ofA are referenced.

LD A (input)
The leading dim ension of the anay A. LDA >= $\max (1, N)$.

SCA LE (output)
If $\mathbb{N} F O=0$, SCA LE contains the scale factors for A.

SCOND (output)
If $\mathbb{N} F O=0$, SCA LE contains the ratio of the sm allest SCALE (i) to the largestSCA LE (i). IfSCOND $>=0.1$ and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

AM AX (output)
A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the m atrix should be scaled.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=$ i, the ith diagonal elem ent is nonpositive.

## PURPOSE

sporfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is sym $m$ etric positive definite, and provides errorbounds and backw ard emoresti$m$ ates for the solution.

## ARGUMENTS

## UPLO (input)

$=\mathrm{U}$ ': U pper triangle ofA is stored;
$=\mathbb{L}$ ': Low ertriangle of $A$ is stored.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X. NRH S $>=0$.

A (input) The symm etricm atrix A. If $\mathrm{APLO}=\mathrm{U}$ ', the leading N -by -N uppertriangularpart of $A$ contains the upper triangularpart of the $m$ atrix $A$, and the strictly low ertriangularpartofA is notreferenced. IfUPLO = L', the leading N boy-N lower triangularpart ofA contains the low er triangular
part of the m atrix A, and the strictly upper triangularpart of A is not referenced.

LD A (input)
The leading dim ension of the array A. LD A >= $\max (1, N)$.

AF (input)
The triangular factor $U$ or $L$ from the Cholesky factorization $A=U * * T * U$ or $A=L * L * * T$, as com puted by SPO TRF .
LDAF (input)
The leading dim ension of the array AF. LDAF >= $\max (1, N)$.
$B$ (input) The righthand side m atrix B .

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (input/output)
O n entry, the solution $m$ atrix $X$, as com puted by SPO TRS. On exit, the im proved solution $m$ atrix X .

LD X (input)
The leading dim ension of the aray X. LDX >= $\max (1, N)$.

## FERR (output)

The estim ated forw ard emorbound for each solution vectorX ( 7 ) (the $j$ th colum $n$ of the solution $m$ atrix $X$ ). If XTRUE is the true solution corresponding to $X(\lambda), F E R R(i)$ is an estim ated upperbound for the m agnitude of the largest ele$m$ entin ( $\mathrm{X}(\mathcal{j})-\mathrm{X}$ TRUE) divided by the $m$ agnitude of the largestelem entin X ( $\mathrm{j}^{\prime}$ ) . The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vectorX (i) (ie., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
dim ension ( $3 * N$ )

W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i$-th argum ent had an illegal value

## PURPOSE

sposv com putes the solution to a realsystem of linearequations
$A * X=B$, where $A$ is an $N$ boy $-N$ sym m etric positive defintie $m$ atrix and $X$ and $B$ are $N$ boy $N$ R H S $m$ atrices.

The Cholesky decom position is used to factorA as
$A=U * * T * U$, if $U P L O=U$ ', or
$A=L * L \star * T$, if $\mathrm{UPLO}=\mathrm{L}$ ',
$w$ here $U$ is an uppertriangularm atrix and $L$ is a low er triangular $m$ atrix. The factored form of $A$ is then used to solve the system ofequations $A * X=B$.

## ARGUMENTS

UPLO (input)
$=U$ ': U pper triangle of $A$ is stored;
$=\mathbb{L}$ ': Low ertriangle of $A$ is stored.

N (input) The num ber of linearequations, i.e., the order of the matrix A. $N>=0$.

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atrix B. NRHS $>=0$.

A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading N -oy N uppertriangularpart of $A$ contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. If UPLO $=\mathrm{L}$ ', the leading N -by -N low er triangularpart of A contains the low er triangularpart of the m atrix A, and the strictly upper triangularpart of A is notreferenced.

On exit, if $\mathbb{N} F O=0$, the factor $U$ orL from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$.

LD A (input)
The leading dim ension of the anay A. LD A >= $\max (1, N)$.

B (input/output)
On entry, the N -by-NRHS righthand side matrix B.
On exi, if $\mathbb{N} F O=0$, the $N$ by $N$ RH S solution
matrix $X$.

LD B (input)
The leading dim ension of the aray B. LD B >= $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{I N}$ FO = -i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N F O}=\mathrm{i}$, the leading m inoroforderiof
A is notpositive definite, so the factorization could not.be com pleted, and the solution has not been com puted.

## C INTERFACE

\#include <sunperfh>
void sposvx (char fact, charuplo, intn, intnrhs, float *a, int lda, float *af, intllaf, charequed, float *s, float*b, int ldb, float*x, int ldx, float *rcond, float * ferr, float *berr, int*info);
void sposvx_64 (char fact, char uplo, long n, long nrhs, float *a, long lda, float*af, long ldaf, char equed, float*s, float*b, long ldb, float *x, long ldx, float *roond, float *ferr, float *berr, long *info);

## PURPOSE

sposvx uses the C holesky factorization $A=U * * T * U$ or $A=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ to com pute the solution to a realsystem of linear equations
$A * X=B, w h e r e A$ is an $N$ boy $-N$ sym m etric positive defintie $m$ atrix and $X$ and $B$ are N boy-N R H S m atrices.

E morbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
diag $(\mathrm{S})$ * A * diag $(\mathrm{S})$ * inv $(\operatorname{diag}(\mathrm{S}))$ * X $=\operatorname{diag}(\mathrm{S})$ * B
W hether or not the system w illbe equilibrated depends on
the
scaling of them atrix A , but if equilibration is used, A is
overw rilten by diag $(S) \star A * \operatorname{diag}(S)$ and $B$ by diag $(S) * B$.
2. IfFACT $=\mathrm{N}$ 'or E', the Cholesky decom position is used to
factor the $m$ atrix A (afterequilibration ifFACT $=\mathrm{E}$ )
as
$A=U * * T * U$, if $U P L O=U$ ', or
$A=L * L * * T$, if $U P L O=L^{\prime}$,
where $U$ is an uppertriangularm atrix and $L$ is a low er triangular
$m$ atrix.
3. If the leading i-by-iprincipal m inor is not positive definite, then the routine retums w ith $\mathbb{N} F O=i$. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the $m$ atrix
A. If the reciprocal of the condition num ber is less than $m$ achine
precision, $\mathbb{N F F O}=\mathrm{N}+1$ is retumed as a w aming, but the routine
still goes on to solve for X and com pute errorbounds as described below .
4.The system of equations is solved for $X$ using the factored form
of A.
4. Herative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.
5. Ifequilibration w as used, the $m$ atrix $X$ is prem ultiplied by diag (S) so that it solves the original system before equilibration.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of the $m$ atrix A is supplied on entry, and if not, whether the m atrix A should be equilibrated before it is
factored. = F ': On entry, AF contains the factored form of A. IfEQUED $=Y$ ', the matrix A has been equilibrated $w$ ith scaling factors given by $S$. A and $\mathrm{A} F \mathrm{w}$ illnotbe m odified. $=\mathrm{N}$ ': The m atrix
A w illlbe copied to A F and factored.
= E': The matrix A will be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the $m$ atrices $B$ and $X$. NRHS $>=0$.
A (input/output)
O n entry, the sym m etric $m$ atrix A, except ifFA C T = $\mathrm{F}^{\prime}$ and EQUED = Y ', then A mustcontain the equilibrated $m$ atrix diag $(S) \star A$ *diag $(S)$. If UPLO =
U', the leading N -by -N uppertriangular partofA contains the upper triangularpartof the $m$ atrix A, and the strictly low er triangular partofA is not referenced. IfU PLO = L' ', the leading N -by -N low er triangularpart of A contains the low er triangularpart of the matrix A, and the strictly upper triangular partofA is not referenced. A is notm odified ifFACT = F'or N', or ifFACT = E'and EQUED = N 'on exit.

Onexit, ifFACT = E' and EQUED = $\mathrm{Y}^{\prime}, \mathrm{A}$ is overw rilten by diag $(S) * A * d i a g(S)$.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

AF (input/output)
If $F A C T=F$ ', then $A F$ is an inputargum ent and on entry contains the triangular factorU or $L$ from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, in the sam e storage form atas A. IfEQUED ne. $N$ ', then $A F$ is the factored form of the equilibrated $m$ atrix diag $(S) * A$ *diag $(S)$.

If FA C T = N ', then AF is an output argum ent and on exit retums the triangular factor $U$ orL from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=$
$\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ of the originalm atrix A .

If FAC $\mathrm{T}=\mathrm{E}$ ', then AF is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization $\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{A}=$ $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ of the equilibrated m atrix A (see the description of $A$ for the form of the equilibrated $m$ atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= $\max (1, N)$.

## EQUED (input)

Specifies the form of equilibration thatw as done. = N ': N o equilibration (alw ays true iffA C T = N ${ }^{2}$.
$=Y^{\prime}:$ Equilibration $w$ as done, i.e., A has been
replaced by diag (S) * A * diag (S). EQUED is an inputargum ent if $F A C T=F$ '; otherw ise, it is an output argum ent.
$S$ (input/output)
The scale factors forA ; not accessed if EQUED = $\mathrm{N}^{\prime} . \mathrm{S}$ is an inputargum entifFACT=F'; otherw ise, S is an outputargum ent. IfFACT = $\mathrm{F}^{\prime}$ and EQUED = Y', each elem entofs m ustibe positive.

B (input/output)
On entry, the $\mathrm{N}-\mathrm{by}-\mathrm{NRH} \mathrm{S}$ righthand side m atrix B . On extr, if EQUED $=N$ ', $B$ is notm odified; if EQUED = $Y$ ', $B$ is overw ritten by diag ( S ) * B .

LD B (input)
The leading din ension of the aray $B$. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=N+1$, the $N$ by N RH $S$ solution
$m$ atrix $X$ to the original system of equations.
$N$ ote that ifEQUED $=Y$ ', $A$ and $B$ are $m$ odified on exit, and the solution to the equilibrated system is inv (diag (S) ) *X .

LD X (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

RCOND (output)
The estim ate of the reciprocal condition num ber of
the $m$ atrix $A$ afterequilibration (if done). If RCOND is less than the $m$ achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to w orking precision. This condition is indicated by a retum code of $\mathbb{N}$ FO >0.

FERR (output)
The estim ated forw ard errorbound for each solution vectorX ( $\mathcal{H}$ ) (the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O})$, FERR ( $)$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $\mathrm{X}(\mathcal{j})-\mathrm{X}$ TRUE) divided by the m agnitude of the largestelem ent in $X(\mathcal{H})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vectorX (i) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( $j$ ) an exactsolution).

W ORK (w orkspace)
dim ension ( $3 \star$ N )
W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{I N F O}=-$ i, the $i$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N F O}=\mathrm{i}$, and i is
<= N : the leading $m$ inor oforderiof $A$ is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{U}$ is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to $w$ orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void sppsv_64 (charuplo, long n, long nrhs, float *a, float *b, long ldb, long *info);

\section*{PURPOSE}
sppsv com putes the solution to a real system of linearequations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) sym \(m\) etric positive defintie \(m\) atrix stored in packed form at and \(X\) and \(B\) are \(N\) by-NRH S \(m\) atrices.

The Cholesky decom position is used to factorA as
\[
A=U * * T * U, \text { if } U P L O=U ' \text {,or }
\]
\[
\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}, \text { if } \mathrm{U} P \mathrm{LO}=\mathrm{L}^{\prime},
\]
\(w\) here \(U\) is an upper triangularm atrix and \(L\) is a low er triangular \(m\) atrix. The factored form of \(A\) is then used to solve the system ofequations \(A \mathrm{X}=\mathrm{B}\).

\section*{ARGUMENTS}

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of the \(m\) atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colm ns of them atrix B. NRHS \(>=0\).

A (input/output)
O \(n\) entry, the upper or low ertriangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The \(j\) th colum \(n\) of \(A\) is stored in the array A as follows: if UPLO \(=U^{\prime}, A(i+(j\)
 \((j-1) *(2 n-j / 2)=A(i, 7)\) for \(\dot{j}=i<=n\). See below for further details.

On exit, if \(\mathbb{N F O}=0\), the factor \(U\) orL from the Cholesky factorization \(A=U * * T * U\) or \(A=L * L * * T\), in the sam e storage form at as A.

B (input/output)
On entry, the N -by-NRHS righthand side m atrix B. On ex弌, if \(\mathbb{N F O}=0\), the N boy \(-\mathrm{NRH} S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the anay \(\mathrm{B} . \operatorname{LDB}>=\) \(\max (1, N)\).
\(\mathbb{N}\) FO (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the \(i-\) th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N}\) FO \(=i\), the leading \(m\) inoroforder iof \(A\) is notposilive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing exam ple when \(N=4, \mathrm{UPLO}=\mathrm{U}\) ':

Tw o-dim ensional storage of the sym \(m\) etric \(m\) atrix A :
```

al1 a12 al3 a14
a22 a23 a24
a33 a34 (aij= con\g (aï))
a44

```

Packed storage of the upper triangle ofA:
\(A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]\)

\section*{C INTERFACE}
\#include <sunperfh>
void sppsvx (char fact, charuplo, intn, intnrhs, float*a, float *af, char equed, float*s, float*b, int ldlb, float * \(x\), int ldx, float *roond, float * ferr, float*berr, int*info);
void sppsvx_64 (char fact, char uplo, long n, long nihs, float *a, float*af, charequed, float *s, float *b, long ldb, float *x, long ldx, float *rcond, float *ferr, float *berr, long *info);

\section*{PURPOSE}
sppsvx uses the C holesky factorization \(A=U * * T * U\) or \(A=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\) to com pute the solution to a realsystem of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) sym m etric positive defintem atrix stored in packed form atand \(X\) and \(B\) are \(N\) foy-N RH S m atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are computed to equiliorate
the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
W hether or not the system w illbe equilibrated depends on the
scaling of the m atrix A , but ifequilibration is used, A
overw rilten by diag \((\mathrm{S}) \star A\) *diag \((\mathrm{S})\) and B by diag \((\mathrm{S}) \star\) B .
2. IfFACT = N 'or E', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT =E)
as
\[
\mathrm{A}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}, \text { if } \mathrm{UPLO}=\mathrm{U} \text { ', or }
\]
\(\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}\), ifUPLO = L ',
w here U is an upper triangularm atrix and L is a low er triangular
\(m\) atrix.
3. If the leading i-by-iprincipal m inor is not positive definite,
then the routine retums \(w\) ith \(\mathbb{N F O}=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine
precision, \(\mathbb{N} F O=N+1\) is retumed as a w aming, but the routine
still goes on to solve forX and com pute errorbounds as described below .
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether or not the factored form of the \(m\) atrix \(A\) is supplied on entry, and if not, whether them atrix A should be equilibrated before it is factored. = F': On entry, AF contains the fac-
tored form ofA. IfEQUED \(=Y\) ', them atrix \(A\) has been equilibrated \(w\) ith scaling factors given by \(S\). A and AF w illnotbe m odified. \(=\mathrm{N}\) ': Them atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) : The matrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
= U : U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The num ber of linear equations, i.e., the order of them atrix A. \(N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrices B and X. NRHS >=0.
A (input/output)
O \(n\) entry, the upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array, exceptifFACT = F'and EQUED = \(Y^{\prime}\) ', then A \(m\) ust contain the equilibrated \(m\) atrix diag \((S) * A * \operatorname{diag}(S)\). The \(j\) th column ofA is stored in the array A as follow s: if UPLO = U', A (i+ \((j-1) * j 2)=A(i, 7)\) for \(1<=i<=j\) if \(U P L O=L \prime\), \(A(i+(j-1) *(2 n-j) / 2)=A(i, j)\) for \(j=i<=n\). See below for further details. A is not \(m\) odified if FACT = F' or \(\mathrm{N}^{\prime}\), orifFACT = E'andEQUED = N 'on exit.

On exit, ifFACT = E' and EQUED = \(\mathrm{Y}^{\prime}\), A is overw ritten by diag (S)*A *diag (S).

AF (input/output)
\((\mathbb{N} *(N+1) / 2)\) IfFACT \(=F\) ', then \(A F\) is an input argum ent and on entry contains the triangular factor \(U\) orL from the Cholesky factorization \(\mathrm{A}=\) \(U{ }^{*} U\) or \(A=L * L\) ', in the sam e storage form atas \(A\). IfEQUED ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix \(A\).

IfFACT = N ', then AF is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U}\) * U orA \(=\mathrm{L} \star \mathrm{L}\) 'of the originalm atrix A.

IfFACT=E', then AF is an output argum ent and on exit retums the triangular factor \(U\) orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U}\) * U orA \(=\mathrm{L}\) * L 'of the equilibrated \(m\) atrix A (see the description of

A for the form of the equilibrated \(m\) atrix).

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=N\) ': No equilibration (alw ays true ifFA CT = N \({ }^{2}\).
\(=Y\) ': Equilibration \(w\) as done, i.e., A has been replaced by diag (S) * A * diag (S). EQUED is an input argum ent ifFACT = F '; otherw ise, it is an outputargum ent.

S (input/output)
The scale factors forA ; not accessed if EQUED = \(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum ent ifFACT = F '; otherw ise, S is an outputargum ent. IfFACT \(=\mathrm{F}^{\prime}\) and
EQUED = Y', each elem entofS m ustbe positive.
B (input/output)
On entry, the N -by-N RH S righthand side m atrix B .
On exit, if EQUED = \(N\) ', \(B\) is notm odified; if
EQUED \(=Y\) ', \(B\) is overw ritten by diag \((S) * B\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\)-by-NRHS solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that if EQUED = \(Y\) ', A and B arem odified on exit, and the solution to the equilibrated system is inv (diag \((S)) * X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num ber of the matrix A afterequilibration (if done). If
RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N} \mathrm{FO}>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X(\neg)\) the \(j\) th colum \(n\) of the solution matrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele-
\(m\) ent in \((X(\mathcal{O})\) X TRUE \()\) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).
W ORK (w orkspace)
dím ension ( \(3 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{N}\) : the leading m inor oforderiof A is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singularto working precision. Nevertheless, the solution and error bounds are com puted because there are a num berof siluations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void spteqr(char com pz, intn, float *d, float *e, float *z, int ldz, int*info);
void spteqr_64 (charcom pz, long n, float *d, float *e, float *z, long ldz, long *info);

## PURPOSE

spteqr computes all eigenvalues and, optionally, eigenvectors of a sym $m$ etric positive definite tridiagonal $m$ atrix by first factoring the $m$ atrix using SPTTRF, and then calling SBD SQ R to com pute the singularvalues of the bidiagonal factor.

This routine com putes the eigenvalues of the positive definite tridiagonal $m$ atrix to high relative accuracy. This $m$ eans that if the eigenvalues range overm any orders ofm agnitude in size, then the sm alleigenvalues and corresponding eigenvectorsw illbe com puted m ore accurately than, for exam ple, w th the standard Q R m ethod.

The eigenvectors of a fullorband sym $m$ etric posilive defintie $m$ atrix can also be found ifSSY TRD, SSPTRD, orSSBTRD has been used to reduce this $m$ atrix to tridiagonal form . (The reduction to tridiagonal form, how ever, $m$ ay preclude the possibility of obtaining high relative accuracy in the sm all eigenvalues of the originalm atrix, ifthese eigenvalues range overm any orders ofm agnitude.)

## ARGUMENTS

COMPZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only .
$=\mathrm{V}:$ : Com pute eigenvectors of originalsym m etric
$m$ atrix also. A reay $Z$ contains the orthogonal $m$ atrix used to reduce the originalm atrix to tridiagonal form . = $I ':$ C om pute eigenvectors of tridiagonalm atrix also.

N (input) The order of the m atrix. $\mathrm{N}>=0$.

D (input/output)
O n entry, the n diagonalelem ents of the tridiagonalm atrix. On norm alexit, $D$ contains the eigenvalues, in descending order.

E (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonal matrix. On exit, E hasbeen destroyed.

Z (input) On entry, if $\mathrm{COMPZ}=\mathrm{V}$ ', the orthogonal m atrix used in the reduction to tridiagonal form. On exit, if $C O M P Z=V$ ', the orthonorm aleigenvectors of the original sym $m$ etric $m$ atrix; if $C O M P Z=I$ ', the orthonorm aleigenvectors of the tridiagonal $m$ atrix. If $\mathbb{N} F O>0$ on exit, $Z$ contains the eigenvectors associated with only the stored eigenvalues. If $C O M P Z=N$ ', then $Z$ is not referenced.

LD Z (input)
The leading din ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and ifCOM PZ $=V$ 'or $I$ ', $L D Z>=m a x(1, N)$.

W ORK (w orkspace)
dim ension (4*N )
$\mathbb{N} F O$ (output)
= 0: successfulexit.
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an illegalvahue.
> 0: if $\mathbb{N} F O=i$, and $i$ is: <= $N$ the Cholesky factorization of the $m$ atrix could notbe perform ed because the $i$-th principalm inorw as not positive definite. > N the SVD algorithm failed to converge; if $\mathbb{N} F O=\mathrm{N}+$ i, ioff-diagonal elem ents of the bidiagonal factor did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void sptrfs (intn, intnrhs, float *diag, float * offd, float *diagf, float *offdf, float *b, int ldb, float *x, int ldx, float * ferr, float *berr, int*info);
void sptrifs_64 (long n, long nihs, float *diag, float *offf, float *diagf, float *offdf, float *b, long ldb, float *x, long ldx, float * ferr, float *berr, long *info);

## PURPOSE

sptrfs im proves the com puted solution to a system of linear equations $w$ hen the coefficientm atrix is sym $m$ etric positive definite and tridiagonal, and provides error bounds and backw ard errorestim ates for the solution.

## ARGUMENTS

N (input) The order of them atrix A. $\mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRH S $>=0$.

D IA G (input)
The $n$ diagonalelem ents of the tridiagonal $m$ atrix
A.

OFFD (input)
The ( $n-1$ ) subdiagonalelem ents of the tridiagonal $m$ atrix $A$.

D IA GF (input)
The $n$ diagonalelem ents of the diagonal $m$ atrix
D IA G from the factorization com puted by SPTTRF .

OFFDF (input)
The ( $n-1$ ) subdiagonalelem ents of the unitbidiag-
onal factor $L$ from the factorization com puted by SPTTRF.
$B$ (input) The righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the anay $B$. LD B >= $\max (1, N)$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by SPTTRS. On exit, the im proved solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the anay X . LD X >= $\max (1, \mathbb{N})$.

FERR (output)
The forw ard errorbound foreach solution vector $X(j)$ (the $j$ th collm $n$ of the solution $m$ atrix $X$ ). If $X T R U E$ is the true solution corresponding to $X(\mathcal{j}), \operatorname{FERR}(\mathcal{J})$ is an estim ated upperbound for the $m$ agnitude of the largestelem ent in (X ( $)$-X TRU E) divided by the $m$ agnitude of the largestelem ent in $\mathrm{X}(\mathrm{J})$.

BERR (output)
The com ponentw ise relative backw ard error of each
solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akesX ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension $\left(2{ }^{*} \mathrm{~N}\right)$
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue

## NAME

sptsv - com pute the solution to a real system of linear equations $A * X=B$, where $A$ is an $N$ by $N$ symm etric positive definite tridiagonalm atrix, and X and B are N -by-NRHS m atrices.

## SYNOPSIS

```
SUBROUT\mathbb{NE SPTSV N,NRHS,D IAG,SUB,B,LDB,INFO)}
```

## C INTERFACE

\#include < sunperfh>
void sptsv (intn, intnrhs, float*diag, float *sub, float *b, int ldb, int *info);
void sptsv_64 (long n, long nrhs, float *diag, float *sub, float *b, long ldb, long *info);

## PURPOSE

sptsv com putes the solution to a realsystem of linear equations $A * X=B$, where $A$ is an $N$ boy $N$ symm etric positive definite tridiagonalm atrix, and $X$ and $B$ are $N$ boy-NRHS $m$ atrices.
$A$ is factored as $A=L * D * L * * T$, and the factored form of $A$ is then used to solve the system of equations.

## ARGUMENTS

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS $>=0$.

D IA G (input/output)
O n entry, the n diagonalelem ents of the tridiagonalm atrix A. On exit, the $n$ diagonalelem ents of the diagonalm atrix D IA G from the factorization $A$ $=\mathrm{L} * \mathrm{D} \mathbb{I} \mathrm{G} * \mathrm{~L} * * \mathrm{~T}$.

SU B (input/output)
O $n$ entry, the $(n-1)$ subdiagonal elem ents of the tridiagonalm atrix A. On exit, the ( $\mathrm{n}-1$ ) subdiagonalelem ents of the unit.bidiagonal factor $L$ from the L *D IA G *L**T factorization ofA. (SU B can also be regarded as the superdiagonal of the unit.bidiagonal factor $U$ from the $U * * T * D I A G * U$ factorization ofA.)

B (input/output)
O n entry, the N boy-N RH S righthand side m atrix B. On exit, if $\mathbb{N F O}=0$, the N by N RH S solution m atrix $X$.

LD B (input)
The leading dim ension of the array B. LD B >=
$\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0: successfulexit
