## C INTERFACE

\#include <sunperfh>
void sptsvx (char fact, intn, intnrhs, float *diag, float
*sub, float *diagf, float *subf, float*b, int
ldlb, float *x, int ldx, float *roond, float * ferr, float*berr, int*info);
void sptsvx_64 (charfact, long n, long nrhs, float *diag, float *sub, float*diagf, float*subf, float*b, long ldlb, float *x, long ldx, float *rcond, float * ferr, float *berr, long *info);

## PURPOSE

sptsvx uses the factorization $A=L * D * L * * T$ to com pute the solution to a realsystem of linearequations $A * X=B$, where A is an N boy N symm etric positive definite tridiagonal $m$ atrix and X and B are N Hy N R H S m atrioes.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=N$ ', them atrix $A$ is factored as $A=L * D * L * * T$, where L
is a unit low erbidiagonalm atrix and $D$ is diagonal. The factorization can also be regarded as having the form
$A=U * * T * D * U$.
2. If the leading iboy-iprincipal $m$ inor is not positive definite,
then the routine retums w ith $\mathbb{N F O}=$ i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the
m atrix
A. If the reciprocal of the condition num ber is less than $m$ achine
precision, $\mathbb{N}$ FO $=\mathrm{N}+1$ is retumed as a w aming, but the routine
still goes on to solve for X and com pute emorbounds as described below .
3.The system ofequations is solved forX using the factored form of A.
3. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of $A$ has been supplied on entry. = F': On entry, D IA GF and SUBF contain the factored form of A.
D IA G , SUB, D IA G F , and SUBF w illnotbe m odified.
$=N$ ': Them atrix A w illbe copied to D IA GF and SUBF and factored.

N (input) The order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the $m$ atriges $B$ and X. NRHS $>=0$.

D IA G (input)
The $n$ diagonalelem ents of the tridiagonal matrix A.

SU B (input)
The ( $n-1$ ) subdiagonalelem ents of the tridiagonal $m$ atrix A.

D IA GF (input/output)
IfFACT = $\mathrm{F}^{\prime}$, then $D \mathrm{IAGF}$ is an inputargum entand on entry contains the $n$ diagonalelem ents of the diagonalm atrix D IA G from the $L$ *D IA G *L **T factorization ofA. IfFACT $=N$ ', then D IA GF is an outputargum entand on exitcontains the $n$ diagonal
elem ents of the diagonal $m$ atrix $D \mathbb{I A}$ from the $\mathrm{L} * \mathrm{D}$ IA $G * \mathrm{~L} * *$ T factorization ofA.

## SU BF (input/output)

IfFACT $=\mathrm{F}^{\prime}$, then SUBF is an inputargum ent and on entry contains the ( $n-1$ ) subdiagonalelem ents of the unit bidiagonal factor $L$ from the $\mathrm{L} * \mathrm{D} \mathbb{I A}{ }^{*} \mathrm{~L} * * \mathrm{~T}$ factorization of A . If $\mathrm{FACT}=\mathrm{N}^{\prime}$, then SUBF is an outputargum entand on exit contains the ( $n-1$ ) subdiagonalelem ents of the unit bidiagonal factorL from the $L * D \operatorname{IAG} * L * * T$ factorization ofA.
$B$ (input) The N by -N RH S righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

X (output)
If $\mathbb{N} F O=0$ of $\mathbb{N} F O=N+1$, the N -by-NRHS solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the amay X . LD X >= $\max (1, N)$.

## RCOND (output)

The reciprocalcondition num berof the $m$ atrix $A$. If RCOND is less than the $m$ achine precision (in particular, ifRCOND $=0$ ), the $m$ atrix is singular to working precision. This condition is indicated by a retum code of $\mathbb{N}$ FO $>0$.

FERR (output)
The forw ard emorbound foreach solution vector $X$ (j) (the $j$ th colum $n$ of the solution $m$ atrix $X$ ). IfXTRUE is the true solution comesponding to $X(\mathcal{j})$, FERR $(\mathcal{j})$ is an estim ated upperbound for the $m$ agnitude of the largestelem ent in (X ( $)$-X TRU E) divided by the $m$ agnitude of the largestelem ent in $\mathrm{X}(\underset{)}{ }$.

BERR (output)
The com ponentw ise relative backw ard emorof each solution vector $X(\mathcal{j})$ (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{j}$ ) an exactsolution).

W ORK (w orkspace)
dim ension $(2 * N)$
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=i$, and $i$ is
$<=N$ : the leading $m$ inor oforderiof $A$ is not positive definite, so the factorization could not
be com pleted, and the solution has not been com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{U}$ is nonsingular, butRCOND is less than machine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. Nevertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRC OND w ould suggest.

REAL PARAM ( ${ }^{*}$ )

SU BROUTINE SROTM G_64 (D 1,D 2,B1,B2,PARAM)
REAL D 1, D 2, B1,B2
REAL PARAM ( ${ }^{*}$ )

## F95 INTERFACE

SU BROUTINE ROTM G (D1,D 2,B1,B2,PARAM)
REAL ::D 1, D 2, B1,B2
REAL,D IM ENSION (:) ::PARAM
SU BROUTINEROTM G_64D 1,D 2,B1,B2,PARAM)

REAL ::D 1,D 2,B1,B2
REAL,D $\mathbb{I}$ ENSION (:) ::PARAM

## C INTERFACE

\#include <sunperfh>
void srotm $g$ (float d1, floatd2, floatb1, float b2, float *param );
void srotm g_64 (floatd1, floatd2, floatb1, float.b2, float
*param );

## PURPOSE

srotm g C onstruct G entlem an Sm odified a G iven S plane rotation thatw illannihilate an elem entof a vector.

## ARGUMENTS

D 1 (input/output)
On entry, the first diagonal entry in the $H$ $m$ atrix. On exit, changed to reflect the effectof the transform ation.
D 2 (input/output)
On entry, the second diagonal entry in the $H$ $m$ atrix. On exit, changed to reflect the effect of the transform ation.

B1 (input/output)
O $n$ entry, the firstelem ent of the vector to which the $H$ matrix is applied. On exit, changed to reflect the effect of the transform ation.

B2 (input)
O $n$ entry, the second elem ent of the vector to which the H m atrix is applied. U nchanged on exit.

PARAM (output)
On exit, PARAM (1) describes the form of the rotation matrix $H$, and PARAM (2.5) contain the $H$ $m$ atrix.

IfPARAM (1) = -2 then $H=I$ and no elem ents of PARAM arem odified.

IfPARAM ( 1 ) = -1 then PARAM (2) $=$ h11, PARAM ( 3 ) = h21, PARAM (4) = h12, and PARAM (5) $=\mathrm{h} 22$.

IfPARAM $(1)=0$ then h11 = h22 = 1 , PARAM $(3)=$ $h 21$, and PARAM (4) $=$ h12.

IfPARAM $(1)=1$ then $\mathrm{h} 12=1, \mathrm{~h} 21=-1, \operatorname{PARAM}(2)=$ $h 11$, and PARAM (5) $=$ h22.

## PURPOSE

ssbev com putes all the eigenvalues and, optionally, eigenvectors of a realsym $m$ etric band $m$ atrix $A$.

## ARGUMENTS

JO B Z (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ ': Uppertriangle of A is stored;
= L ': Low er triangle ofA is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num ber of subdiagonals ifUPLO
$=\mathbb{L} . \mathrm{KD}>=0$.

A (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstKD +1 row s of the array. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the amay $A$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}$ ', $\mathrm{A}(k d+1+i-j, j)=A(i, j)$ for $m a x(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k d)$.

On exit, A is overw rilten by values generated during the reduction to tridiagonal form. IfUPLO = U ', the first superdiagonal and the diagonal of
the tridiagonal m atrix T are retumed in row SKD and $K D+1$ ofA, and if $U P L O=L$ ', the diagonaland first subdiagonal of T are retumed in the first tw o row sofA.

LD A (input)
The leading dim ension of the array A. LD A >= KD + 1.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V$ ', then if $\mathbb{N F O}=0, Z$ contains the orthonom aleigenvectors of the $m$ atrix $A, w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated w th $W$ (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading dm ension of the array Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
dim ension M A X ( $1,3 * \mathrm{~N}-2)$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum ent had an illegalvalue
> 0 : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void ssbevd (char jobz, charuplo, intn, int kd, float *ab, int ldab, float *w , float *z, int ldz, int *info);
void ssbevd_64 (char j̀bz, charuplo, long n, long kd, float *ab, long ldab, float * ${ }_{\mathrm{w}}$, float * z , long ldz , long *info);

## PURPOSE

ssbevd com putes all the eigenvalues and, optionally, eigenvectors of a realsym $m$ etric band $m$ atrix $A$. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray X -M P , C ray Y M P , C ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al $m$ achines $w$ thout guard digits, butw e know of none.

## ARGUMENTS

JOBZ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ : U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.
N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals of the $m$ atrix A if
UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if UPLO
= L'. KD >= 0 。

AB (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstK $D+1$ row s of the array. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the array $A B$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{kd}+1+i-j, j)=\mathrm{A}(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=\mathrm{i}<=\dot{j}$ ifUPLO $=\mathrm{L}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $j=i<=m$ in $(n, j+k d)$.

On exit, AB is overw rilten by values generated during the reduction to tridiagonal form. IfU PLO = U', the first superdiagonaland the diagonalof the tridiagonal m atrix T are retumed in row $\mathrm{SK} D$ and KD +1 of $A B$, and ifUPLO $=~ L '$ ', the diagonal and first subdiagonal of T are retumed in the first tw o row sofA B.

LDAB (input)
The leading dim ension of the array A B. LD A B >=KD +1 .

W (output)
If $\mathbb{N F} F=0$, the eigenvalues in ascending order.

Z (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ th the i-th colum $n$ of $Z$ holding the eigenvector associated w th $W$ (i). If $\mathrm{OOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading dim ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\max (1, N)$.

W ORK (w orkspace)
dim ension (LW ORK)On exit, if $\mathbb{N F O}=0, W$ ORK (1)
retums the optim alLW ORK.
LW ORK (input)
The dim ension of the array W ORK. If $\mathrm{N}<=1$, LW ORK mustibe at least1. If 0 BZ $=\mathrm{N}$ 'and $\mathrm{N}>$
2, LW ORK m ustbe at least $2{ }^{*} \mathrm{~N}$. If $\mathrm{JO} \mathrm{BZ}=\mathrm{V}$ 'and
$\mathrm{N}>2$,LW ORK mustbe at least ( $1+5 \star \mathrm{~N}+2{ }^{\star} \mathrm{N} * * 2$
).

IfLW O RK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al LIV ORK.
LIV ORK (input)
The dim ension of the array $L \mathbb{I N} O R K$. If $\operatorname{JOBZ}=\mathrm{N}^{\prime}$ or $\mathrm{N}<=1$, LIN ORK mustbe at least1. If $\operatorname{JOBZ}=$ $V$ 'and $N>2$, LIW ORK mustbe at least $3+5{ }^{*} \mathrm{~N}$.

If LIV ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I V}$ ORK amay, and no errorm essage related to LIIN ORK is issued by X ERBLA.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0$ : if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue
> 0 : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate
tridiagonal form did not converge to zero.

## PURPOSE

ssbevx com putes selected eigenvalues and, optionally, eigenvectors of a realsym $m$ etric band $m$ atrix A. Eigenvahues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=V$ ': C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w ill.be found;
= V ':alleigenvalues in the half-open interval
( $\mathrm{NL}, \mathrm{VU}]$ w ill be found; = I': the $\mathbb{I}$-th through
IU -th eigenvaluesw illbe found.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO = U',orthe num berof subdiagonals ifU PLO $=\mathbb{L} \cdot \mathrm{KD}>=0$.

A (input/output)
On entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstKD +1 row s of the amay. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum n of the amay $A$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{A}(\mathrm{kd}+1+\mathrm{i}-j, j)=A(i, j)$ for $\mathrm{max}(1, j$ $\mathrm{kd})<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)$ for $j<=i<=m$ in $(n, j+k d)$.

On exit, A is overw rilten by values generated during the reduction to tridiagonal form. If $\mathrm{PLO}=$ U ', the first superdiagonal and the diagonal of the tridiagonal m atrix T are retumed in row SKD and KD +1 of , and if $\mathrm{PLO}=\mathrm{L}$ ', the diagonal and first subdiagonal of T are retumed in the first two row sofA.

LD A (input)
The leading dim ension of the array A. LD A >=KD + 1.

Q (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', the $\mathrm{N}-$ by N orthogonal m atrix used in the reduction to tridiagonal form. If $\mathrm{JO} \mathrm{BZ}=$ N ', the array Q is not referenced.

LD Q (input)
The leading dim ension of the array $Q$. If $J 0 B Z=$ V ', then LD $Q>=\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU. N ot referenced ifRANGE = A 'or I'.

VU (input)
Se the description of V L .
II (input)

If RA N GE=I', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{H}<=\mathbb{Z}<=N$, if $N>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE $=$ A 'or V'.

IU (input)
See the description of II.

ABTOL (input)
The absolute emortolerance forthe eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged w hen itis determ ined to lie in an interval [a,b]
of w idth less than orequal to
$A B T O L+E P S * \max (a|, b|)$,
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS*|I|will.be used in its place, w here $\mathrm{F} \mid$ is the 1 -norm of the tridiagonal m atrix obtained by reducing A to tridiagonalform .

E igenvalues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold 2*SLAMCH (S ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to 2*SLAM CH (S ).

See "C om puting Sm allSingularV alues of B idiagonal M atrices $w$ ith G uaranteed H igh Relative A ccuracy," by D em m eland K ahan, LAPA CK W orking N ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. $0<=$
NFOUND <= N. IfRANGE = A', NFOUND = N, and if RANGE $=$ 'I', NFOUND $=\mathbb{I}-\mathbb{L}+1$ 。

W (output)
The first NFOUND elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $\mathrm{OB} Z=V^{\prime}$, then if $\mathbb{N} F O=0$, the first $N F O U N D$ colum ns of $Z$ contain the orthonorm aleigenvectors of the matrix A corresponding to the selected eigenvalues, w ith the $i-$ th colum n of $Z$ holding the eigenvector associated w ith $W$ (i). If an eigenvector fails to converge, then that colum n of Z contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in

ㅍAII. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.
$N$ ote: the user must ensure that at least
$m$ ax ( $1, N F O U N D$ ) colum ns are supplied in the array $Z$;
if RANGE $=V$ ', the exactvalue ofNFOUND is not know $n$ in advance and an upperbound $m$ ustbe used.
LD Z (input)
The leading dim ension of the array Z. LD Z $>=1$, and if $\mathrm{OBB}=\mathrm{V}^{\prime}$, LD Z > = $\mathrm{max}(1, N)$.

W ORK (w orkspace)
dim ension $(7 \star \mathrm{~N})$

IW ORK 2 (w orkspace)

FAII (output)
If $\mathrm{OBZ}=\mathrm{V}^{\prime}$ ', then if $\mathbb{N F O}=0$, the first NFOUND
elements of $\mathbb{F A} I L$ are zero. If $\mathbb{N F O}>0$, then
IFA II contains the indices of the eigenvectors
that failed to converge. If $\mathrm{OBZ}=\mathrm{N}$ ', then
$\mathbb{F} A \mathbb{I}$ is notreferenced.
$\mathbb{N}$ FO (output)
= 0: successfulexit.
$<0$ : if $\mathbb{N} F O=-i$, the i-th argum enthad an illegalvalue.
$>0:$ if $\mathbb{N} F O=i$, then ieigenvectors failed to converge. Their indiges are stored in array正AII.

## C INTERFACE

\#include <sunperfh>
void ssbogst(charvect, charuplo, intn, int ka, int kb, float *ab, int ldab, float *bb, int ldbb, float * $x$, int ldx $x$, int *info);
void ssbgst_64 (charvect, charuplo, long n, long ka, long kb, float *ab, long ldab, float *bb, long ldbb, float *x, long ldx, long *info);

## PURPOSE

ssogst reduces a real sym $m$ etric-definite banded generalized eigenproblem $A * x=\operatorname{lam}$ bda*B*x to standard form $C * y=$ lam bda*y, such thatC has the sam e bandw idth asA .

B m usthave been previously factorized as $S * * T$ *S by SPBSTF, using a split Cholesky factorization. A is overw ritten by C $=\mathrm{X} * * \mathrm{~T} * \mathrm{~A} * \mathrm{X}$, where $\mathrm{X}=\mathrm{S} * *(-1) * \mathrm{Q}$ and Q is an orthogonal $m$ atrix chosen to preserve the bandw idth ofA.

## ARGUMENTS

## VECT (input)

$=N$ ': do not form the transform ation $m$ atrix $X$;
$=\mathrm{V}$ ': form X .

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO $=\mathrm{U}$ ', ort the num berof subdiagonals if UPLO $=\mathbb{L}^{\prime} . \mathrm{KA}>=0$.

KB (input)
The num ber of superdiagonals of the $m$ atrix $B$ if
U PLO = U',orthe num berof subdiagonals ifU PLO
$=L^{\prime} . K A>=K B>=0$.

AB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the amay. The $j$ th colum $n$ of $A$ is stored in the $j$ th colum $n$ of the amay $A B$ as follows: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(k a+1+i-j)=A(i, j)$ for $m a x(1, j$ $\mathrm{ka})<=\mathrm{i}<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j, j)=A(i, j)$ for $j<=i<=m$ in $(n, j+k a)$.

On exit, the transform ed matrix $X * * T * A * X$, stored in the sam e form at as $A$.

LD AB (input)
The leading dim ension of the array $A B$. LD AB >= KA+1.

BB (input)
The banded factors from the split Cholesky factorization ofB, as retumed by SPBSTF, stored in the first $K B+1$ row sof the array.

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.

X (output)
IfVECT = $V$ ', the $n-b y-n m$ atrix $X$. If VECT $=$ N ', the array X is not referenced.

LD X (input)
The leading dim ension of the aray X . LD X >= $\max (1, N)$ if VECT $=V$ ';LD X >= 1 otherw ise.

W ORK (w orkspace)
dim ension $(2 * N)$
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvahue.

## PURPOSE

ssogv com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym $m$ etric-definite banded eigenproblem, of the form $A$ *x $=(\operatorname{lam} . b d a) * B * x$. H ere $A$ and $B$ are assum ed to be sym $m$ etric and banded, and $B$ is also positive definite.

## ARGUMENTS

$J 0 \mathrm{BZ}$ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
= U ': U ppertriangles of $A$ and $B$ are stored;
= L': Low ertriangles of A and B are stored.

N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix A if UPLO $=U$ ', orthe num berof subdiagonals if UPLO $=\mathrm{L} \cdot \mathrm{KA}>=0$.

K B (input)
The num ber of superdiagonals of the $m$ atrix $B$ if UPLO = U',orthe num berof subdiagonals ifU PLO = L' $\cdot \mathrm{KB}>=0$.

A B (input/output)

O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the array. The $j$ th colum n of $A$ is stored in the $j$ th colum $n$ of the array AB as follow s: if UPLO = U', AB $(k a+1+i-j)=A(i, j)$ for max $(1, j$ $\mathrm{ka})<=i<=j ;$ ifUPLO $=\mathrm{L}, \mathrm{AB}(1+i-j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k a)$.

On exit, the contents of $A$ are destroyed.

LDAB (input)
The leading dim ension of the array AB. LDAB >= KA+1.
BB (input/output)
On entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $B$, stored in the first kb+1 row sof the array. The $j$ th colum $n$ of $B$ is stored in the $j$ th colum $n$ of the amay BB as follow s: if UPLO $=U$ ', BB $(k b+1+i-j, j)=B(i, j)$ for $m a x(1, j$ $\mathrm{kb})<=\mathrm{i}<=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{BB}(1+i-j, j)=B(i, 7)$ for $\dot{j}=\mathrm{i}<=\mathrm{m}$ in $(n, j+k b)$.

On exit, the factors from the splitCholesky factorization $B=S * * T * S$, as retumed by SPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V '$, then if $\mathbb{N} F O=0, Z$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ ith the $i$-th colum n of Z holding the eigenvector associated with W (i). The eigenvectors are norm alized so that $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=$ I. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading din ension of the amray $\mathrm{Z} . \operatorname{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >=N.

W ORK (w orkspace)
dim ension ( $3 \star \mathrm{~N}$ )

## C INTERFACE

\#include <sunperfh>
void ssogvd (char jobz, charuplo, intn, int ka, int kb, float *ab, int ldab, float *bb, int ldbb, float *W , float * $z$, int ldz, int *info);
void ssbgvd_64 (char jobz, char uplo, long n, long ka, long kb, float *ab, long ldab, float *bb, long ldbb, float *W , float * z , long ldz, long *info);

## PURPOSE

ssogvd com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym $m$ etric-definite banded eigenproblem, of the form $A * x=(\operatorname{lam} b d a) * B * x$. Here $A$ and $B$ are assum ed to be sym $m$ etric and banded, and $B$ is also positive definite. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conqueralgorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray $X-M P, C$ ray $Y \neq M P, C$ ray $C-90$, or C ray-2. It could conceivably fail on hexadecim al or decim al machines w ithout guard digits, butw e know of none.

## ARGUMENTS

```
JOBZ (input)
\(=\mathrm{N}^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.
```

UPLO (input)
$=\mathrm{U}$ : : U pper triangles ofA and B are stored;
$=L^{\prime}:$ Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the matriges $A$ and $B . N>=0$.

KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num berof subdiagonals ifUPLO $=\mathbb{L}$ '. KA > $=0$ 。

K B (input)
The num ber of superdiagonals of the $m$ atrix $B$ if $\mathrm{UPLO}=\mathrm{U}$ ', orthe num ber of subdiagonals ifU PLO $=\mathbb{L}$ 'KB >=0.

A B (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row s of the anray. The $j$ th colum n of A is stored in the $j$ th colum $n$ of the array A B as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{ka}+1+i-j)=A(i, j)$ for $m a x(1, j$ $\mathrm{ka})<=\mathrm{i}<=j$ if $\mathrm{UPLO}=\mathrm{L}$ ', AB $(1+i-j, j)=A(i, j)$ for $\dot{j}=i<=m$ in $(n, j+k a)$.

O n exit, the contents ofA B are destroyed.

LDAB (input)
The leading dim ension of the array AB. LDAB >= K A +1 .

BB (input/output)
O n entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $B$, stored in the first $k b+1$ row s of the amay. The $j$ th colum n of $B$ is stored in the $j$ th colum $n$ of the array $B B$ as follow $s$ : if $\mathrm{UPLO}=\mathrm{U}$ ', $\mathrm{BB}(\mathrm{ka}+1+i-j)=\mathrm{B}(i, j)$ for $\max (1, j$ $\mathrm{kb})<=\dot{i}<=\dot{j}$ ifU PLO $=\mathrm{L}, \mathrm{BB}(1+i-j, j=\mathrm{j}(i, 7)$ for $j<=i<=m$ in $(n, j+k b)$.

On exit, the factors from the split Cholesky factorization $\mathrm{B}=\mathrm{S} * * \mathrm{~T} * \mathrm{~S}$, as retumed by SPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB $>=$ K B+1.

W (output)
If $\mathbb{N}$ FO $=0$, the eigenvalues in ascending order.

Z (input) If $\mathrm{OB} \mathrm{B}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, \mathrm{Z}$ contains the $m$ atrix $Z$ of eigenvectors, $w$ ith the $i$-th colum n of
$Z$ holding the eigenvector associated $w$ ith $W$ (i). The eigenvectors are norm alized so $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD $Z$ (input)
The leading dm ension of the array Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. If $\mathrm{N}<=1$, LW ORK >= 1. If JOBZ $=N$ 'and $N>1$,LW ORK $>=$ 3*N. If $\operatorname{OOBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$,LW ORK >=1 + 5*N + $2 * N * * 2$ 。

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if LIN ORK > 0, $\mathbb{I N}$ ORK (1) retums the optim all IV ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N} O R K$. If $0 \mathrm{OBZ}=\mathrm{N}^{\prime}$ orN <=1,L $\mathbb{I N} O R K>=1$. If $J O B Z=V$ 'and $N>1$, LIN ORK >= $3+5 * N$.

If LIV ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK array, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by X ERBLA.
$\mathbb{I N F O}$ (output)
= 0 : successfinlexit
<0: if $\mathbb{N N}$ FO = -i, the i-th argum ent had an illegalvalue
> 0 : if $\mathbb{N F O}=\mathrm{i}$, and is:
$<=\mathrm{N}$ : the algorithm failed to converge: i offdiagonal elem ents of an interm ediate tridiagonal form did not converge to zero; > N : if $\mathbb{N} F O=\mathrm{N}$ $+i$, for $1<=i<=N$, then SPBSTF
retumed $\mathbb{N} F O=i: B$ is not positive definite. The factorization ofB could notbe com pleted and
no eigenvalues oreigenvectors w ere com puted.

## PURPOSE

ssbgvx com putes selected eigenvalues, and optionally, eigenvectors of a real generalized symm etric-definite banded eigenproblem, of the form $A{ }^{*} x=(l a m . b d a){ }^{\star} B{ }^{*} x . H$ ere $A$ and $B$ are assum ed to be sym $m$ etric and banded, and $B$ is also positive definite. Eigenvahues and eigenvectors can be selected by specifying either alleigenvalues, a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvahues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues willbe found.
= V ': alleigenvalues in the half-open interval $\mathrm{NL}, \mathrm{VU}]$ will be found. = I ': the L -th through $\mathbb{I U}$-th eigenvaluesw illlbe found.

UPLO (input)
$=\mathrm{U}$ ': U ppertriangles of $A$ and $B$ are stored;
= L': Low ertriangles of A and B are stored.

N (input) The order of the matrioes A and B. $\mathrm{N}>=0$.
KA (input)
The num ber of superdiagonals of the $m$ atrix $A$ if UPLO $=U$ ', or the num berof subdiagonals ifUPLO
$=\mathrm{L} \cdot \mathrm{KA}>=0$.

KB (input)
The num ber of superdiagonals of the $m$ atrix $B$ if UPLO $=\mathrm{U}$ ', or the num berof subdiagonals if P PLO $=\mathrm{L}^{\prime} . \mathrm{KB}>=0$.

AB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstka+1 row sof the amay. The $j$ th colum $n$ of $A$ is stored in the jth colum n of the anray AB as follows: if $\mathrm{UPLO}=\mathrm{U}$ ', AB $(k a+1+i-j)=A(i, j)$ for $m a x(1, j$ $\mathrm{ka})<=i<=j ;$ ifUPLO $=\mathrm{L} \prime, \mathrm{AB}(1+i-j, j)=A(i, 7)$ for $j=i<=m$ in $(n, j+k a)$.

On exit, the contents of $A B$ are destroyed.
LDAB (input)
The leading dim ension of the array A B . LD A B >= KA+1.

BB (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $B$, stored in the first kb +1 row sof the array. The $j$ th colum n of $B$ is stored in the $j$ th colum $n$ of the array $B B$ as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(k a+1+i-j)=\mathrm{B}(i, 7)$ for $\max (1, j$ $\mathrm{kb})<=\mathrm{i}<=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{BB}(1+i-j, j)=\mathrm{B}(i, 7)$ for $j=i<=m$ in $(n, j+k b)$.

On exit, the factors from the split Cholesky factorization $B=S * * T * S$, as retumed by SPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.

Q (output)
If $J O B Z=V$ ', the $n-b y-n$ matrix used in the reduction of $A *=\left(l a m\right.$ bda) ${ }^{\mathrm{B}} \mathrm{K}_{\mathrm{x}} \mathrm{x}$ to standard form, i.e. $C{ }^{*} \mathrm{X}=\left(\mathrm{lam}\right.$ bda) ${ }^{\star} \mathrm{X}$, and consequently C to tridiagonal form. If JOBZ $=N$ ', the amay $Q$ is not referenced.

LD Q (input)
The leading dim ension of the array $Q$. If $J 0 B Z=$ $N^{\prime}, L D Q>=1$. If $J O B Z=V{ }^{\prime}, L D Q>=m a x(1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A 'or I'.

VU (input)
See the description of V L .
II (input)
IfRA N G E= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{Z}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE $=$ A'or V'.

IU (input)
See the description of $\mathbb{I L}$.
ABSTOL (input)
The absolute error tolerance for the eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABSTOL + EPS * $\max (|,||$,$) ,$
where EPS is the m achine precision. IfA BSTOL is less than or equal to zero, then EPS* $\mid$ |w illbe used in its place, where $F \mid$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonal form .

E igenvalues w illle com puted m ostaccurately when ABSTOL is set to tw ice the underflow threshold 2*SLAM CH (S ), not zero. If this routine retums w th $\mathbb{N} F O>0$, indicating that som e eigenvectors did not converge, try setting ABSTO L to $2 \star$ SLAM CH (S ).

M (output)
The total num ber ofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{U}-\mathbb{L}+1$.

W (output)
If $\mathbb{N}$ FO $=0$, the eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V '$, then if $\mathbb{N} F O=0, Z$ contains the $m$ atrix $Z$ ofeigenvectors, $w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated $w$ ith $W$ (i). The eigenvectors are norm alized so $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading dm ension of the array Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
dim ension ( $7 *_{\mathrm{N}}$ )

IV ORK (w orkspace/output)
dim ension ( $5 * \mathrm{~N}$ )
FAII (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the firstM ele$m$ ents of $\mathbb{F A} \mathbb{I}$ are zero. If $\mathbb{N} F O>0$, then $\mathbb{F} A \mathbb{I}$ contains the indioes of the eigenvalues that failed to converge. If $\mathrm{JOBZ}=\mathrm{N}$ ', then $\mathbb{F A} \mathbb{I}$ is not referenced.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue
<= N : if $\mathbb{N} F O=i$, then ieigenvectors failed to converge. Their indioes are stored in $\mathbb{F A} \mathbb{I} .>N$
: SPBSTF retumed an emorcode; ie., if $\mathbb{N} F O=N$
$+i$, for $1<=i<=N$, then the leading $m$ inor of orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void ssbm v (charuple, intn, intk, floatalpha, float *a, int lda, float *x, int incx, floatbeta, float *y, intincy);
void ssbom v_64 (charuplo, long n, long k, floatalpha, float
*a, long lda, float *x, long incx, floatbeta, float *y, long incy);

## PURPOSE

ssbom v perform s the $m$ atrix-vector operation $y:=a l p h a * A * x+$ beta* $y$, w here alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ entvectors and $A$ is an $n$ by $n$ sym $m$ etric band $m$ atrix, $w$ ith k superdiagonals.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the band $m$ atrix $A$ is being supplied as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' The upper triangularpart of $A$ is being supplied.

UPLO = L'or I'' The low er triangularpart of A is being supplied.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

K (input)
On entry, $K$ specifies the number of superdiagonals of them atrix A.K $>=0$. U nchanged on
exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or G ', the leading ( $k+1$ ) by $n$ part of the array A $m$ ust contain the upper triangular band part of the symmetric $m$ atrix, supplied colum $n$ by colum $n$, $w$ th the leading diagonal of the $m$ atrix in row ( $k+1$ ) of the array, the first super-diagonalstarting atposition 2 in row $k$, and so on. The top left $k$ by $k$ triangle of the anray $A$ is not referenced. The follow ing program segm entw illtransfer the upper triangular part of a sym $m$ etric band $m$ atrix from conventional fullm atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

Before entry w ith UPLO = L 'or 1', the leading ( $\mathrm{k}+1$ ) by n partof the array A m ustcontain the low er triangular band part of the symmetric $m$ atrix, supplied colum $n$ by colum $n$, $w$ th the leading diagonalof them atrix in row 1 of the amay, the first sub-diagonalstarting atposition 1 in row 2 , and so on. The bottom right k by $k$ triangle of the array $A$ is not referenced. The follow ing program segm entw illtransfer the low ertriangular part of a sym $m$ etric band $m$ atrix from conventional fullm atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \mathrm{CONTINUE}
\end{aligned}
$$

U nchanged on exit.

LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A $>=$ (
$\mathrm{k}+1$ ). Unchanged on exit.
X (input)
$(1+(n-1) * a b s(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the vectorx.
U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

Y (input/output)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ m ustcontain the vectory. On exit, $Y$ is overw ritten by the updated vectory.
$\mathbb{N C Y}$ (input)
O n entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y$. $\mathbb{N C Y}$ <> 0 . Unchanged on exit.

## C INTERFACE

\#include <sunperfh>
void ssbtrd (charvect, charuplo, intn, intkd, float *ab, int ldab, float*d, float*e, float * $q$, int ldq, int *info);
void ssbtrd_64 (charvect, charuplo, long n, long kd, float *ab, long ldab, float *d, float *e, float *q, long ldq, long *info);

## PURPOSE

ssbtrd reduces a real sym $m$ etric band $m$ atrix $A$ to sym $m$ etric tridiagonal form T by an orthogonalsim ilarity transform ation: $\mathrm{Q} * * \mathrm{~T} * A * Q=T$.

## ARGUMENTS

VECT (input)
$=\mathrm{N}$ : do notform $Q$;
$=\mathrm{V}$ : form Q ;
$=U$ : update a $m$ atrix $X$, by form ing $X * Q$.

UPLO (input)
$=\mathrm{U}$ : U ppertriangle ofA is stored;
$=\mathbb{L}:$ Low ertriangle ofA is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals of the $m$ atrix $A$ if
$\mathrm{UPLO}=\mathrm{U}$ ', or the num ber of subdiagonals if $\mathrm{U} P L O$
$=\mathbb{L}^{\prime} . \mathrm{KD}>=0$ 。

A B (input/output)
O $n$ entry, the upper or low er triangle of the sym $m$ etric band $m$ atrix $A$, stored in the firstK $D+1$ row s of the array. The $j$ th colum n of A is stored in the $j$ th colum n of the array AB as follow s: if $\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{kd}+1+i-j, j)=A(i, j)$ for $\mathrm{max}(1, j$
$\mathrm{kd})<=i<=\dot{j}$ ifUPLO $=\mathrm{L}, \mathrm{AB}(1+i-j)=A(i, 7)$ for $j=i<=m$ in $(n, j+k d)$. O $n$ exit, the diagonalele$m$ ents of AB are overw ritten by the diagonalele$m$ ents of the tridiagonalm atrix $T$; if $K D>0$, the elem ents on the first superdiagonal (if UPLO = U ) or the first subdiagonal (ifU PLO = L ) are overw ritten by the off-diagonalelem ents of $T$; the restofA $B$ is overw ritten by values generated during the reduction.

LD AB (input)
The leading dim ension of the array AB. LD AB >= K D +1 .

D (output)
The diagonalelem ents of the tridiagonalm atrix T .
E (output)
The off-diagonal elem ents of the tridiagonal $m$ atrix $T: E(i)=T(i, i+1)$ if $U P L O=U ; E(i)=$ $T(i+1, i)$ if $\mathrm{PLO}=\mathrm{L}^{\prime}$.

Q (input/output)
On entry, ifVECT $=U$ ', then Q must contain an N by $-\mathrm{N} m$ atrix X ; if $\mathrm{VECT}=\mathrm{N}$ 'or $V$ ', then $Q$ need notbe set.

On exit: if $\mathrm{VECT}=\mathrm{V}$ ', Q contains the N -by -N orthogonalm atrix $Q$; if VECT $=U$ ', $Q$ contains the product $\mathrm{X} * \mathrm{Q}$; ifVECT $=\mathrm{N}$ ', the array Q is not referenced.

LDQ (input)
The leading dim ension of the array $\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1$, and $L D Q>=N$ ifVECT $=V$ 'or $U '$.

W ORK (w orkspace)
dim ension (N)
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
< $0:$ if $\mathbb{N} F O=-i$, the $i$-th argum enthad an illegalvalue

## DESCRIPTION

$C<-A L P H A \quad O p(A) B+B E T A C \quad C<-A L P H A D O P(A) B+B E T A C$ $C<-A L P H A \operatorname{Op}(A) D B+B E T A C$ where A LPHA and BETA are scalar, $C$ and $B$ are $m$ by $n$ dense $m$ atrices, $D$ is a diagonalscaling $m$ atrix, $A$ is a unit, ornon-unit, upper or low er triangularm atrix represented in skyline form at and $o p(A)$ is one of
$o p(A)=\operatorname{inv}(A)$ or op $(A)=\operatorname{inv}(A)$ or op $(A)=\operatorname{inv}\left(\operatorname{con} \dot{g}\left(A^{\prime}\right)\right)$. (inv denotesm atrix inverse, 'indicatesm atrix transpose)

## ARGUMENTS

TRAN SA Indicates how to operate $w$ th the sparse $m$ atrix 0 : operate $w$ ith $m$ atrix
1 : operate w th transpose $m$ atrix
2 : operate $w$ ith the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M $\quad \mathrm{N}$ um berof row s in $m$ atrix $A$

N $\quad$ Num berof colum ns in matrix C

UN ITD Type of scaling:
1 : Identily matrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum $n$ scaling)
4 :A utom atic row or colum $n$ scaling (see section N O TES for further details)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D .

```
D ESCRA () D escriptor argum ent. Fi̇ve elem entinteger anay
DESCRA (1) m atrix structure
0 :general
1 : symm etric (A=A)
2:H erm itian (A = CON JG (A ))
3:Triangular
4 : Skew (A nti)-Symm etric (A=-A )
5 :D iagonal
6:Skew Herm itian (A= CON JG (A ) )
N ote: For the routine, D ESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 :unit
DESCRA (4) A nay base \(\mathbb{N} O T \mathbb{M}\) PLEM ENTED)
\(0: C / C++\) com patible
1 :Fortran com patible
DESCRA (5) repeated indices? (NOT \(\mathbb{M}\) PLEM ENTED)
0 : unknown
1 : no repeated indices
```

VAL () array contain the nonzeros ofA in skyline profile form .
Row -oriented ifD ESCRA (2) = 1 (low er triangular), colum n oriented ifD ESCRA (2) $=2$ (upper triangular) .

PN TR () integer array of length $M+1$ (low ertriangular) or
$\mathrm{K}+1$ (upper triangular) such thatPN TR (I)-PN TR (1)+1 points to the location in VAL of the firstelem ent of the skyline profile in row (colum n) I.

B 0 rectangular anay w ith first dim ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch amay of length LW ORK.
On exit, ifLW ORK $=-1, W$ ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .

Forgood perform ance, LW O RK should generally be larger.

For optim um perform ance on $m$ ultiple processors, LW ORK $>=M$ *N _CPU S where N_CPUS is the m axim um num berof processors available to the program .

If LW ORK $=0$, the routine is to allocate $w$ orkspace needed.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

## SEE ALSO

N IST FO RTRA N Sparse B las U ser'S G uide available at:
http://m ath nist.gov/m cso/Staff/K Rem ington/Espblas/

## NOTES /BUGS

1.A lso notsupported:
a. low er triangularm atrix A ofsizem by n wherem $>n$
b. upper triangularm atrix $A$ of size $m$ by $n$ where $m<n$
2. N o test for singularity ornear-singularity is included in this routine. Such tests m ust.be perform ed before calling this routine.
3. If U N ITD $=4$, the routine scales the row s of $A$ if $D E S C R A(2)=1$ and the colum ns ofA if $D E S C R A(2)=2$ such that their 2 -norm s are one. The scaling $m$ ay im prove the accuracy of the com puted solution. C orresponding entries of V A L are changed only in this particular case. O n retum D V m atrix stored as a vector contains the diagonalm atrix by w hich the row $s$ (colum ns) have been scaled. U N ITD = 2 if $D E S C R A(2)=1$ and UN ITD $=3$ if $D E S C R A(2)=2$ should be used for the next calls to the routine $w$ ith overw rilten $V A L$ and $D V$.

WORK $(1)=0$ on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the row (colum n) num berw hich 2 -norm is exactly zero.
4. If $D E S C R A(3)=1$ and $U \mathrm{~N}$ ITD $<4$, the unit diagonalelem ents
$m$ ightorm ightnotbe referenced in the SK Y representation of a sparse m atrix. They are not used anyw ay in these cases. ButifUN ITD = 4, the unit diagonalelem ents M U ST be referenced in the SK Y representation.
5.The routine can be applied for solving triangular system $s$ w hen the upper or low er triangle of the general sparse $m$ atrix $A$ is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

\#include < sunperfh>
void sspcon (charuplo, intn, float *ap, int *ipívot, float anorm, float*rcond, int*info);
void sspcon_64 (char uplo, long n, float *ap, long *ípívot, float anorm, float * rcond, long *info);

## PURPOSE

sspcon estim ates the reciprocal of the condition num ber (in the 1 -norm ) of a realsym $m$ etric packed $m$ atrix A using the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ com puted by SSPTRF.

A $n$ estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND $=1 /$ ANORM * norm (inv (A))).

## ARGUMENTS

UPLO (input)
Specifies w hether the details of the factorization
are stored as an upper or low er triangularm atrix.
$=\mathrm{U}$ ': U pper triangular, form is $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$;
= L': Low ertriangular, form is $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$.

N (input) The order of the matrix A. $\mathrm{N}>=0$.
AP (input)
Realarray, dim ension $(\mathbb{N} *+1) / 2$ ) The block diagonal $m$ atrix $D$ and the multipliers used to obtain the factorU orL as com puted by SSPTRF, stored as a packed triangularm atrix.

Integer anray, dim ension $\mathbb{N}$ ) D etails of the inter-
changes and the block structure ofD as determ ined by SSPTRF.

## ANORM (input)

The 1-norm of the originalm atrix A.

## RCOND (output)

The reciprocal of the condition num ber of the $m$ atrix $A$, com puted as RCOND $=1 /(A N O R M * A \mathbb{N} V N M)$, where $A \mathbb{N} V N M$ is an estim ate of the 1 -nom of inv (A) com puted in this routine.
W ORK (w orkspace)
Realamay, dim ension ( $2 \star \mathrm{~N}$ )
IV ORK 2 (w orkspace)
Integer array, dim ension ( $2 \star \mathrm{~N}$ )
$\mathbb{N F O}$ (output)
$=0$ : successfulexit
< 0: if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue

void sspev_64 (char j̣bz, charuplo, long n, float *ap, float *W , float * z, long ldz, long *info);

## PURPOSE

sspev com putes all the eigenvalues and, optionally, eigenvectors of a realsym $m$ etric $m$ atrix $A$ in packed storage.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ ': U pper triangle ofA is stored;
$=\mathbb{L}$ ': Low ertriangle ofA is stored.

N (input) The order of them atrix A. $\mathrm{N}>=0$.

A P (input/output)
Realarray, dim ension $(\mathbb{N} *(N+1) / 2)$ On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear amray. The jth colum $n$ of A is stored in the array AP as follow s: ifUPLO $=U$ ', AP $(i+(j-1) \star j 2)=A(i, j)$ for $1<=\dot{i}=j$ if $\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{AP}\left(i+(j-1)^{\star}\left(2{ }^{\star} \mathrm{n}-j\right) / 2\right)=$ A $(i, j)$ for $j<i<=n$.

On exit, AP is overw ritten by values generated during the reduction to tridiagonal form . IfU PLO $=\mathrm{U}$ ', the diagonal and first superdiagonal of the tridiagonal $m$ atrix $T$ overw rite the comesponding elem ents of $A$, and if UPLO = L', the diagonal and first subdiagonal of $T$ overw rite the corresponding elem ents ofA.

W (output)
Realaray, dim ension $(\mathbb{N})$ If $\mathbb{N F O}=0$, the eigenvalues in ascending order.

Z (output)
Realaray, dim ension (LD Z , N) If $\mathrm{JO} \mathrm{BZ}=\mathrm{V}$ ', then
if $\mathbb{N} F O=0, Z$ contains the orthonorm aleigenvectors of them atrix $A, w$ ith the $i$-th column of $Z$ holding the eigenvector associated w th W (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
Realarray, dim ension ( $3 * N$ )
$\mathbb{N F O}$ (output)
= 0: successfulexit.
$<0:$ if $\mathbb{N N F O}=-i$, the i-th argum enthad an illegalvalue.
> 0 : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

*W, float * $z$, int ldz, int *info);
void sspevd_64 (char j.bz, char uplo, long n, float *ap, float *W , float *z, long ldz, long *info);

## PURPOSE

sspevd com putes all the eigenvalues and, optionally, eigenvectors of a realsymm etric $m$ atrix $A$ in packed storage. If eigenvectors are desired, ituses a divide and conqueralgorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on m achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits $w$ hich subtract like the $C$ ray
 fail on hexadecim al or decim al machines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

JO B Z (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=V^{\prime}:$ C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ ': U pper triangle ofA is stored;
$=\mathbb{L}$ ': Low ertriangle ofA is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A P (input/output)
Realamay, dim ension $(\mathbb{N} *(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The jth
collum $n$ ofA is stored in the array AP as follow S : ifUPLO $=U{ }^{\prime}, A P(i+(j-1) * j 2)=A(i, j)$ for
$1<=i<=j$ ifUPLO $=\mathrm{L}$ ', AP $\left(i+(j-1)^{\star}(2 \star n-j) / 2\right)=$ A $(i, j)$ for $j=i<=n$.

On exit, AP is overw rilten by values generated during the reduction to tridiagonal form. If UPLO $=U$ ', the diagonal and first superdiagonal of the tridiagonal $m$ atrix $T$ overw rite the corresponding elem ents ofA, and if U PLO = L', the diagonal and first subdiagonal of $T$ overw rite the comesponding elem ents ofA.
W (output)
Realarray, dim ension $\mathbb{N}$ ) If $\mathbb{N} F O=0$, the eigenvalues in ascending order.
$Z$ (input) Realarray, dim ension ( $\mathrm{LD} \mathrm{Z}, \mathrm{N}$ ) If $\mathrm{JOB} \mathrm{Z}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, Z$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ ith the $i$-th column of $Z$ holding the eigenvector associated w ith W (i). If JO BZ $=N$ ', then $Z$ is not referenced.

LD $Z$ (input)
The leading din ension of the array $\mathrm{Z} . \operatorname{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
Realarray, dim ension ( $L W$ ORK) On exit, if $\mathbb{N F O}=$ $0, W$ ORK (1) retums the optim allW ORK .

LW ORK (input)
The dim ension of the array W ORK. If $\mathrm{N}<=1$, LW ORK must be at least1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>$ $1, \mathrm{LW} O R K \mathrm{~m}$ ust.be at least $2 * \mathrm{~N}$. If $\mathrm{JO} \mathrm{BZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1$, LW ORK mustbe at least $1+6 * \mathrm{~N}+\mathrm{N} * * 2$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
Integer array, dim ension (LIN ORK)On exit, if $\mathbb{I N} F O$ $=0, \mathbb{I N}$ ORK (1) retums the optim alL IV ORK.

LIN ORK (input)
The dim ension of the array IN ORK. If $\mathrm{OOBZ}=\mathrm{N}^{\prime}$ or $\mathrm{N}<=1, \mathrm{~L} \mathbb{I N}$ ORK mustbe at least1. If JOBZ $=$ $V$ 'and $N>1, L \mathbb{I N} O R K$ mustbe at least $3+5 * N$.

If LIV ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim al size of
the $\mathbb{I V} O R K$ array, retums this value as the first
entry of the $\mathbb{I W}$ ORK array, and no errorm essage
related to LIN ORK is issued by X ERBLA.
$\mathbb{N F O}$ (output)
$=0$ : successfulexit
<0: if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvahue.
>0: if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void sspevx (char jobz, char range, charuplo, int n, float *ap, float vl, float vu, intil, intin, float abtol, int *nfound, float * w , float * z , int ldz, int*ifail, int*info);
void sspevx_64 (char jंbz, char range, char uplo, long n, float *ap, floatvl, floatvu, long il, long iu, floatabtol, long *nfound, float *w, float *z, long ldz, long *ifail, long *info);

## PURPOSE

sspevx com putes selected eigenvalues and, optionally, eigenvectors of a real symm etric $m$ atrix A in packed storage. E igenvalues/vectors can be selected by specifying either a range of vahues or range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ : C om pute eigenvahues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found;
$=\mathrm{V}$ : alleigenvalues in the half-open interval
(VL, VU] w ill be found; = $\mathrm{I}^{\prime}$ : the $I \mathrm{I}$-th through
$\mathbb{I U}$-th eigenvalues w ill be found.

UPLO (input)
$=\mathrm{U}$ ': Upper triangle ofA is stored;
$=\mathbb{L} ':$ Low ertriangle ofA is stored.

N (input) The order of the m atrix A. $\mathrm{N}>=0$.
AP (input/output)
Realarray, dim ension $(\mathbb{N} *(N+1) / 2)$ On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The jth colum $n$ ofA is stored in the array AP as follow s : ifUPLO = U',AP $(i+(j-1) * j 2)=A(i, j)$ for
 A $(i, 7)$ for $j=i<=n$.

On exit, AP is overw rilten by values generated during the reduction to tridiagonal form. If PLO = U ', the diagonaland first superdiagonal of the tridiagonal m atrix T overw rite the comesponding elem ents ofA, and if UPLO = L', the diagonal and first subdiagonal of $T$ overw rite the corresponding elem ents ofA .

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
Se the description of V L .

II (input)
IfRA NGE= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE= A 'or V'.

IU (input)
See the description of II.

ABTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABTOL + EPS * max ( $\mathfrak{a}|\mathrm{b}|)$,
where EPS is them achine precision. If ABTOL is less than or equalto zero, then EPS* $\mid$ | w illibe used in its place, where $T$ is the 1 -nom of the tridiagonalm atrix obtained by reducing AP to tri-
diagonal form .
E igenvahues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold $2 \star$ SLAM CH (S ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to $2 *$ SLAM CH (S ).

See "C om puting Sm allSingularV alues ofB idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by Demmeland $K$ ahan, LA PA CK W orking $N$ ote \#3.

## NFOUND (output)

The total num ber of eigenvalues found. $0<=$ NFOUND <= N. IfRANGE = A', NFOUND = N, and if RANGE $=$ 'I',NFOUND $=\mathbb{U}-\mathbb{L}+1$.

W (output)
Real array, dim ension $\mathbb{N}$ ) If $\mathbb{N F O}=0$, the selected eigenvalues in ascending order.

Z (output)
Realarray, dim ension (LD $Z, \max (1, M))$ If $\operatorname{OBZ}=$ V ', then if $\mathbb{N} F O=0$, the firstNFOUND colum ns of $Z$ contain the orthonorm al eigenvectors of the $m$ atrix A comesponding to the selected eigenvalues, w th the ith column of $Z$ holding the eigenvector associated w ith W (i). If an eigenvector fails to converge, then that colum $n$ of $Z$ contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in $\mathbb{F A} \mathbb{I}$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced. $N$ ote: the user must ensure that at least m ax (1,NFOUND) colum ns are supplied in the anay $Z$; ifRANGE = V', the exact value of FOUND is not know $n$ in advance and an upperbound $m$ ustbe used.

LD $Z$ (input)
The leading $d i m$ ension of the array $Z$. LD $Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >= $\mathrm{max}(1, N)$.

W ORK (w orkspace)
Realarray, dim ension ( $8 * \mathrm{~N}$ )
$\mathbb{I N}$ ORK 2 (w orkspace)
Integer array, dim ension ( $5 * \mathrm{~N}$ )
FA $\mathbb{I}$ (output)
Integer array, dim ension $\mathbb{N}$ ) If JOB Z = $V$ ', then if $\mathbb{N} F O=0$, the firstNFOUND elem ents of $\mathbb{F A} \mathbb{I}$
are zero. If $\mathbb{N} F O>0$, then $\mathbb{F A} I I$ contains the
indices of the eigenvectors that failed to converge. If $J 0 B Z=N$ ', then $\mathbb{F A} \mathbb{I}$ is not referenced.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0$ : if $\mathbb{N F O}=-i$, the $i$-th argum ent had an illegal value
$>0$ : if $\mathbb{N F O}=\mathrm{i}$, then ieigenvectors failed to converge. Their indioes are stored in array FAI.

void sspgst(int itype, charuplo, intn, float *ap, float *bp, int *info);
void sspgst 64 (long itype, charuplo, long n, float *ap, float*bp, long *info);

## PURPOSE

sspgst reduces a realsym m etric-definite generalized eigenproblem to standard form, using packed storage.

If ITY PE $=1$, the problem is $A * x=$ lam bda*B ${ }^{*} \mathrm{X}$, and $A$ is overw ritten by inv $(U * * T) * A * \operatorname{inv}(U)$ or inv ( $(\mathrm{A})$ *A *inv ( $(\mathrm{L} * * \mathrm{~T})$
If ITYPE $=2$ or 3 , the problem is $A * B * x=$ lam bda* x or $B * A * x=\operatorname{lam}$ bda* $x$, and $A$ is overw rilten by $U * A * U * * T$ or L**T*A*L。

B m usthave been previously factorized as U ** T * U or $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$ by SPPTRF.

## ARGUMENTS

ITYPE (input)
$=1:$ compute $\quad \operatorname{inv}(\mathrm{U} * * T) \star A * \operatorname{inv}(\mathrm{U})$ or
$\operatorname{inv}(\amalg) \star A$ *inv $(\amalg * * T)$;
$=2$ or 3 : com pute $\mathrm{U} * \mathrm{~A} * \mathrm{U} * * \mathrm{~T}$ orL ${ }^{* *} \mathrm{~T} * \mathrm{~A} * \mathrm{~L}$.

UPLO (input)
$=U^{\prime}$ : Uppertriangle of $A$ is stored and $B$ is factored as $\mathrm{U} * * \mathrm{~T} * \mathrm{U} ;=\mathrm{L}:$ : Low er triangle of A stored and B is factored as $\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$.

N (input) The order of the $m$ atriges $A$ and $B . N>=0$.

AP (input/output)
Realanay, dim ension $\mathbb{N}^{*}(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The jth colum $n$ ofA is stored in the array AP as follow s: if $U P L O=U ', A P(i+(j 1) \star j 2)=A(i, j)$ for $1<=\dot{<}=\dot{j}$ if $\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{AP}(i+(j 1) *(2 n-j) / 2)=$ A $(i, j)$ for $j<=i<=n$.

On exit, if $\mathbb{N F O}=0$, the transform ed $m$ atrix, stored in the sam e form atas A.
$B P$ (input)
Realarray, dim ension $(\mathbb{N} * \mathbb{N}+1) / 2)$ The triangular factor from the Cholesky factorization of $B$, stored in the sam e form at as A, as retumed by SPPTRF.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue

ldz, long *info);

## PURPOSE

sspgv com putes all the eigenvalues and, optionally, the eigenvectors of a realgeneralized sym $m$ etric-definite eigenproblem, of the form $A * x=(\operatorname{lam} . b d a) * B * x, A * B x=\left(\operatorname{lam}\right.$ bda) ${ }^{*} x$, or $B *_{A} *_{x}=\left(l a m\right.$ bda) ${ }^{*} x$. H ere $A$ and $B$ are assum ed to be sym $m$ etric, stored in packed form at, and B is also positive definite.

## ARGUMENTS

ITYPE (input)
Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{X}=\left(\operatorname{lam}\right.$ bda) ${ }^{\star} \mathrm{B}{ }^{*} \mathrm{X}$
$=2: A * B *_{X}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{X}$
$=3: \mathrm{B}^{\star} \mathrm{A}{ }^{\star} \mathrm{x}=\left(\operatorname{lam}\right.$ bda)${ }^{\star} \mathrm{x}$

JOBZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ : U pper triangles of $A$ and $B$ are stored;
$=\mathbb{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the matriges A and $\mathrm{B} . \mathrm{N}>=0$.

A P (input/output)
Realarray, dim ension $(\mathbb{N} *(N+1) / 2)$ On entry, the
upper or low er triangle of the sym $m$ etric $m$ atrix $A$,
packed colum nw ise in a linear anray. The jth
colum $n$ of A is stored in the array AP as follow s:
if $\mathrm{UPLO}=U \mathrm{U}^{\prime}, \mathrm{AP}(i+(j-1) \star j 2)=A(i, j)$ for $1<=i<=j$ ifUPLO $=L '$ AP $(i+(j 1) *(2 * n-j) / 2)=$ A $(i, j)$ for $j<i<=n$.

On exit, the contents of AP are destroyed.

BP (input/output)
Realarray, dim ension $(\mathbb{N} *(N+1) / 2)$ On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $B$, packed colum nw ise in a linear array. The jth colum $n$ of $B$ is stored in the array BP as follow s: ifUPLO $=U{ }^{\prime}$, BP $(i+(j 1) * j 2)=B(i, 7$ for $1<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{BP}(i+(j 1) *(2 * n-j) / 2)=$ B $(i, j)$ for $j<i<=n$.

On exit, the triangular factor $U$ or L from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{B}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, in the sam e storage form at as B.

W (output)
Realarray, dim ension $\mathbb{N}$ ) If $\mathbb{N F O}=0$, the eigenvalues in ascending order.

Z (output)
Realarray, dim ension (LD Z, N) If $\mathrm{OB} \mathrm{B}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, Z$ contains them atrix $Z$ of eigenvectors. The eigenvectors are norm alized as follow s: if ITYPE $=1$ or $2, Z * * T * B * Z=I$; if $T T Y P E=3$, $Z * * T * \operatorname{inv}(B) * Z=I$. If $O B Z=N$ ', then $Z$ is not referenced.

LD Z (input)
The leading dim ension of the amay $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{OBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{m}$ ax $(1, N)$.

W ORK (w orkspace)
Realamay, dim ension ( $3 * N$ )
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$ th argum ent had an illegalvalue
> 0: SPPTRF orSSPEV retumed an errorcode:
$<=\mathrm{N}:$ if $\mathbb{N} F O=i, S S P E V$ failed to converge; $i$ offf-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero. $>\mathrm{N}$ : if $\mathbb{N} F O$ $=n+i$, for $1<=i<=n$, then the leading $m$ inor oforderiofB is not posilive definite. The factorization of $B$ could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void sspgvd (int itype, char jंbz, charuplo, int n, float
*ap, float *bp, float *w, float *z, int ldz, int *info);
void sspgvd_64 (long itype, char j̀jbz, char uplo, long n, float *ap, float *bp, float*w, float*z, long ldz, long *info);

## PURPOSE

sspgvd com putes all the eigenvahues, and optionally, the eigenvectors of a realgeneralized sym m etric-definite eigenproblem, of the form $A * x=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{~B}{ }^{*} \mathrm{x}, \mathrm{A} * \mathrm{~B} \mathrm{x}=(\operatorname{lam} \mathrm{bda}){ }^{*} \mathrm{x}$, or $B * A * x=\left(l a m\right.$ bda) ${ }^{*} x$. H ere A and B are assum ed to be sym $m$ etric, stored in packed form at, and B is also positive definite. Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ ithout guard digits w hich subtract like the $C$ ray $\mathrm{X}-\mathrm{M} P$, C ray $Y \mathrm{M} P$, C ray $\mathrm{C}-90$, or C ray- 2 . It could conceivably fail on hexadecim al or decim al machines $w$ thout guard digits, butw e know of none.

## ARGUMENTS

ITYPE (input)
Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{x}=(\operatorname{lam} . \mathrm{bda}){ }^{\star} \mathrm{B}{ }^{*} \mathrm{x}$
$=2: A * B *_{X}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{X}$
$=3: B{ }^{*} A{ }^{*} \mathrm{X}=\left(\operatorname{lam}\right.$ bda)${ }^{\star} \mathrm{x}$

JOBZ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}:$ : C om pute eigenvahues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ ': U pper triangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.
N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.
AP (input/output)
Realarray, dim ension $(\mathbb{N} *(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The $j$ th colum $n$ ofA is stored in the array AP as follow s: ifUPLO $=U$ ', AP $(i+(j-1) \star j 2)=A(i, j)$ for
 A $(i, j)$ for $j<=i<=n$.

On exit, the contents ofAP are destroyed.
BP (input/output)
Realarray, dim ension $\mathbb{N}^{*}(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $B$, packed colum nw ise in a linear array. The jth colum $n$ of $B$ is stored in the array BP as follow $s$ : if UPLO $=U$ ', BP $(i+(j-1) * j 2)=B(i, j)$ for $1<=i<=j$ ifUPLO $=\mathrm{L}, \mathrm{BP}\left(i+(j 1)^{\star}\left(2{ }^{\star} \mathrm{n}-\mathrm{j}\right) / 2\right)=$ B $(i, 7)$ for $j=i<=n$.

On exit, the triangular factor $U$ or $L$ from the Cholesky factorization $B=U * * T * U$ or $B=L * L * *$, in the sam e storage form atas $B$.

W (output)
Realaray, dim ension $\mathbb{N}$ ) If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

Z (output)
Realarray, dim ension ( $\mathrm{LD} Z, \mathrm{~N}$ ) If $\mathrm{JO} \mathrm{BZ}=\mathrm{V}$ ', then if $\mathbb{N} F O=0, Z$ contains them atrix $Z$ of eigenvectors. The eigenvectors are norm alized as follow $s$ : if $I T Y P E=1$ or $2, Z * * T * B * Z=I$; if $I T Y P E=3$, $Z * * T * \operatorname{inv}(B) * Z=I$. If $J O B Z=N$ ', then $Z$ is not referenced.

LD Z (input)
The leading dim ension of the array $Z$. LD $Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace/output)
Realarray, dim ension (LW ORK) On exit, if $\mathbb{N} F O=$ $0, W$ ORK (1) retums the optim allW ORK.

LW ORK (input)
The dim ension of the array $W$ ORK. If $N<=1$, LW $O R K>=1$. If $J O B Z=N$ 'and $N>1$,LW $O R K>=$ 2*N. If $\operatorname{JOBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$,LW ORK >=1 + 6*N + $2 * N * * 2$ 。

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
Integer array, dim ension ( $\llcorner\mathbb{I N}$ ORK) On exit, if $\mathbb{I N}$ FO $=0, \mathbb{I V}$ ORK (1) retums the optim all IV ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N} O R K$. If $J O B Z=N^{\prime}$ or $N<=1, L \mathbb{I W} O R K>=1$. If $J O B Z=V$ 'and $N>1$, LIN ORK >= $3+5{ }^{*} \mathrm{~N}$.

If $L \mathbb{I V} O R K=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the $\mathbb{I V}$ ORK array, retums this value as the first entry of the $\mathbb{W}$ ORK anay, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by X ERBLA.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N}$ FO = -i, the i-th argum ent had an illegalvalue
> 0: SPPTRF orSSPEVD retumed an errorcode: $<=\mathrm{N}:$ if $\mathbb{N} F O=i, S S P E V D$ failed to converge; i off-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero; $>\mathrm{N}$ : if $\mathbb{N F O}$ $=N+i$, for $1<=i<=N$, then the leading $m$ inor oforderiofB is not positive definite. The factorization of B could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void sspgvx (int itype, char jobz, char range, charuplo, int
n, float *ap, float *bp, floatvl, floatvu, int il, intin, float abstol, int *m, float *W , float * $z$, int ldz, int *ifail, int *info);
void sspgvx_64 (long itype, char jobz, char range, charuplo, long n, float *ap, float *bop, floatvl, floatvu, long il, long iu, float abstol, long *m , float *w , float *z, long ldz, long *ifail, long *info);

## PURPOSE

sspgvx com putes selected eigenvahues, and optionally, eigenvectors of a realgeneralized sym $m$ etric-definite eigenproblem, of the form $A * x=(l a m ~ b d a) * B * x, A * B x=(l a m ~ b d a) * x$, or $B{ }^{*} A{ }^{*} \mathrm{X}=(\operatorname{lam} \operatorname{bda}){ }^{\star} \mathrm{X}$. H ere A and B are assum ed to be sym $m$ etric, stored in packed storage, and $B$ is also positive definite. E igenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

## ITYPE (input)

Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{X}=\left(\mathrm{lam}\right.$ bda) ${ }^{\star} \mathrm{B}{ }^{*} \mathrm{X}$
$=2: A * B *_{x}=(\operatorname{lam} . b d a){ }^{*} \mathrm{x}$
$=3: B * A{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda}){ }^{\star} \mathrm{x}$

JO B Z (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}: \mathrm{C}$ om pute eigenvalues and eigenvectors.
RANGE (input)
= A : alleigenvalues $w$ illbe found.
= V ':alleigenvalues in the half-open interval
( L , VU ] will be found. = $I^{\prime}$ : the $\mathbb{I}$-th through $\mathbb{I U}$-th eigenvaluesw illlbe found.

UPLO (input)
$=\mathrm{U}$ :: U ppertriangle of $A$ and $B$ are stored;
= L': Low ertriangle of A and B are stored.
$N$ (input) The orderof the $m$ atrix pencil $(A, B) . N>=0$.
AP (input/output)
Realarray, dim ension $\mathbb{N}^{*}(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The jth colum $n$ ofA is stored in the array AP as follow $s$ : ifUPLO $=U{ }^{\prime}, A P(i+(j-1) * j 2)=A(i, j)$ for $1<=i<=j$ ifUPLO $=\mathrm{L}$ ', AP $\left(i+(j-1)^{\star}(2 \star \mathrm{n}-\bar{j}) / 2\right)=$ A $(i, 1)$ for $j=i<=n$.

On exit, the contents of AP are destroyed.

BP (input/output)
Realarray, dim ension $\mathbb{N} *(\mathbb{N}+1) / 2$ ) On entry, the upper or low ertriangle of the sym $m$ etric $m$ atrix $B$, packed colum nw ise in a linear array. The jth colum $n$ of is stored in the array $B P$ as follow $s$ : if UPLO $=U$ ', BP $(i+(j-1) * j 2)=B(i, j)$ for $1<=i<=j$ ifUPLO $=\mathrm{L}, \quad \mathrm{BP}\left(i+(j 1)^{*}\left(2{ }^{\star} \mathrm{n}-\mathrm{j}\right) / 2\right)=$ B $(i, 7)$ for $j=i<=n$.

On exit, the triangular factor $U$ or $L$ from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ orB $=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$, in the sam e storage form atas $B$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A 'or I'.

VU (input)
See the description of V L .
II (input)
IfRA N G E= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H}=1$
and $\mathbb{U}=0$ if $\mathrm{N}=0$. N otreferenced ifRANGE $=$ A 'or V'.

IU (input)
See the description of II .

ABSTOL (input)
The absolute emortolerance forthe eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged w hen it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
$A B S T O L+E P S * \max (|a|, \mid)$,
w here EPS is them achine precision. IfABSTOL is less than or equal to zero, then EPS* $\mid /$ w illbe used in its place, w here $|T|$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonalform.

E igenvalues w illbe com puted m ostaccurately when A BSTOL is set to tw ige the underflow threshold 2*SLAM CH (S ), notzero. If this routine retums w ith $\mathbb{N} \mathrm{FO}>0$, indicating that.som e eigenvectors did not converge, try setting ABSTOL to $2 *$ SLAM CH (S ).

M (output)
The totalnum ber ofeigenvalues found. $0<=\mathrm{M}<=$ N . IfRANGE=A', M=N, and ifRANGE= 'I'M = $\mathbb{U}-\mathbb{L}+1$ 。

W (output)
Realarray, dim ension $(\mathbb{N})$ On norm al exit, the first $M$ elem ents contain the selected eigenvahues in ascending order.

Z (output)
Realanay, dim ension ( $\mathrm{LD} \mathrm{Z}, \mathrm{m} \operatorname{ax}(1, \mathrm{M})$ ) If $\mathrm{OBZ}=$ $N^{\prime}$, then $Z$ is notreferenced. If $O B Z=V$ ', then if $\mathbb{N F O}=0$, the firstM colum ns of $Z$ contain the orthonorm al eigenvectors of the $m$ atrix $A$ corresponding to the selected eigenvalues, with the i-th colum $n$ of $Z$ holding the eigenvector associated w ith W (i). The eigenvectors are norm alized as follows: if ITYPE $=1$ or $2, Z * * T * B * Z=I$; if ITYPE $=3, Z * * T * \operatorname{inv}(B) * Z=I$ 。

If an eigenvector fails to converge, then that colum $n$ of $Z$ contains the latestapproxim ation to the eigenvector, and the index of the eigenvector
is retumed in $\mathbb{F A} \mathbb{I}$. N ote: the userm ustensure that at leastm ax $(1, M)$ ) 0 lum ns are supplied in the array $Z$; ifRANGE = V', the exactvalue ofM is not know $n$ in advance and an upper bound $m$ ust be used.

LD $Z$ (input)
The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z $>=\mathrm{max}(1, \mathrm{~N})$.

W ORK (w orkspace)
Realarray, dim ension ( $8 \star \mathrm{~N}$ )

IW ORK (w orkspace)
$\mathbb{N}$ TEGER anay, dim ension (5*N )
FAII (output)
$\mathbb{I N}$ TEGER array, dim ension $\mathbb{N}$ ) If $\operatorname{JO}$ B Z = $V$ ', then
if $\mathbb{N} F O=0$, the firstM elem ents of $\mathbb{F} A \mathbb{I}$ are
zero. If $\mathbb{N F O}>0$, then $\mathbb{F A} \mathbb{I}$ contains the indices of the eigenvectors that failed to con-
verge. If $J O B Z=N$ ', then $\mathbb{F A} \mathbb{I}$ is not referenced.
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0$ : if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvahue
> 0: SPPTRF orSSPEVX retumed an errorcode:
$<=\mathrm{N}:$ if $\mathbb{N} F O=\mathrm{i}, \mathrm{SSPEVX}$ failed to converge; i eigenvectors failed to converge. Their indices are stored in array $\mathbb{F} A \mathbb{I} .>N$ : if $\mathbb{N} F O=\mathrm{N}+$ $i$, for $1<=i<=N$, then the leading $m$ inor of orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

void sspm v (charuplo, intn, floatalpha, float *a, float * $x$, int incx, floatbeta, float *y, intincy);
void sspm v_64 (charuplo, long n, float alpha, float *a, float *x, long incx, floatbeta, float *y, long incy);

## PURPOSE

sspm v perform s the $m$ atrix-vector operation $y:=$ alpha*A *x + beta* $y$, w here alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ entvectors and $A$ is an $n$ by $n$ sym $m$ etric $m$ atrix, supplied in packed form.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the m atrix A is supplied in the packed aray A as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or U ' The uppertriangularpartof $A$ is supplied in A.
$\mathrm{UPLO}=\mathrm{L}$ 'or $\mathrm{I}^{\prime}$ ' The low er triangularpart of A is supplied in A.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
$((n *(n+1)) / 2)$. Before entry w ith UPLO = $U$ ' or $G$ ', the aray A m ustcontain the upper triangularpart of the sym $m$ etric $m$ atrix packed sequentially, colum $n$ by colum $n$, so thatA (1)
containsa(1,1), A (2) and A (3) contain a( 1,2 ) and a( 2,2 ) respectively, and so on. Before entry w ith UPLO = L'or 1', the array A $m$ ustcontain the low er triangularpartof the sym $m$ etric $m$ atrix packed sequentially, column by colum $n$, so thatA (1) contains a ( 1,1 ), A (2) and A (3) contain a $(2,1)$ and $a(3,1)$ respectively, and so on. U nchanged on exit.

X (input)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the $n$ elem ent vectorx. U nchanged on exit.
$\mathbb{N} C X$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX. $\mathbb{N} C X<>0$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then $Y$ need notbe seton input. U nchanged on exit.

Y (input/output)
$(1+(n-1) \star a b s(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ m ust contain the $n$ elem ent vectory. On exit, $Y$ is overw rilten by the updated vectory.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $Y . \mathbb{N} C Y$ <> 0 . U nchanged on exit.

## PURPOSE

ssprfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is sym $m$ etric indefinite and packed, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.

N (input) The order of the $m$ atrix $\mathrm{A} . \mathrm{N}>=0$.
NRHS (input)
The num ber of righthand sides, i.e., the num ber
of collm ns of the m atrioes B and X. NRHS $>=0$.
A (input) Realarray, dim ension $\mathbb{N}^{*}(\mathbb{N}+1) / 2$ ) The upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linearamay. The jth colum $n$ of A is stored in the amay A as follow S : if UPLO $=$ U',AP ( $i+(j-1) * j 2)=A(i, j)$ for $1<=i<=j$ if
$\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{AP}(i+(j-1) \star(2 \star \mathrm{n}-\mathrm{j} / 2)=\mathrm{A}(i, j)$ for $j<=\mathrm{i}<=\mathrm{n}$ 。

AF (input)
Realanray, dim ension $\left.\mathbb{N}^{*}(\mathbb{N}+1) / 2\right)$ The factored form of the m atrix A. AF contains the block diagonalm atrix $D$ and the $m$ ultipliers used to obtain the factor $U$ or $L$ from the factorization $A=$ $\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ orA $=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ as com puted by SSPTRF , stored as a packed triangularm atrix.

IPIVOT (input)
Integer array, dim ension $(\mathbb{N})$ D etails of the interchanges and the block structure of D as determ ined by SSPTRF .

B (input) Realamay, dim ension (LD B NRHS) The right hand side m atrix B .

LD B (input)
The leading dim ension of the array B . LD B $>=$ $\max (1, N)$.

X (input/output)
Realarray, dimension (LDX,NRHS) On entry, the solution matrix X , as com puted by SSPTRS. On exit, the im proved solution $m$ atrix $X$.

## LD X (input)

The leading dim ension of the array X. LD X >= $\max (1, N)$.

## FERR (output)

Realaray, dim ension $\mathbb{N}$ RH S) The estim ated forw ard error bound foreach solution vectorX ( $\mathcal{1}$ ) (the $j$ th colum $n$ of the solution $m$ atrix $X$ ). IfX TRUE is the true solution corresponding to $X(7), \operatorname{FERR}(7)$ is an estim ated upperbound for the $m$ agnitude of the largest elem entin (X ( 7 ) - X TRUE) divided by them agnitude of the largestelem ent in $X$ ( $\mathcal{I}$ ). The estim ate is as reliable as the estim ate forRCOND, and is alm ostalw ays a slight overestim ate of the true enror.

BERR (output)
Realarray, dimension $\mathbb{N} R H S)$ The com ponentw ise relative backw ard emor ofeach solution vector X (i) (ie., the sm allestrelative change in any elem ent of A orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
Realanray, dim ension ( $3 * N$ )

W ORK 2 (w orkspace)
Integer amay, dim ension $(\mathbb{N})$
INFO (output) Integer
= 0: successfulexit

void sspsv (charuplo, int n, int nrhs, float *ap, int *ipivot, float *b, int ldb, int *info);
void sspsv_64 (char uple, long n, long nrhs, float *ap, long *ịivot, float *b, long ldb, long *info);

## PURPOSE

sspsv com putes the solution to a realsystem of linear equations
$A$ * $X=B$, where $A$ is an $N$ boy $N$ sym m etric $m$ atrix stored in packed form at and X and B are N -by -N RH S m atrices.

The diagonalpivoting $m$ ethod is used to factorA as
$A=U * D * U * * T$, if $U P L O=U$ ', or
$A=L * D * L * * T$, if $U P L O=L '$,
where U (orL) is a productofperm utation and unit upper (low er) triangularm atrioes, $D$ is sym m etric and block diagonalw th 1-by-1 and 2 -by-2 diagonal blocks. The factored form ofA is then used to solve the system of equations A * $X=B$.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U pper triangle of A is stored;
= L': Low er triangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrix B. NRHS $>=0$.

A P (input/output)
Realamay, dim ension $(\mathbb{N} *(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear anray. The jth
column of A is stored in the array AP as follow s : ifUPLO $=U$ ',AP $(i+(j-1) * j 2)=A(i, j)$ for $1<=\mathrm{i}<=\dot{j}$ if UPLO = L',AP (i+ (j-1)* (2n-j)/2)= A $(i, j)$ for $j=i<=n$. See below for further details.

On exit, theblock diagonalm atrix $D$ and the $m u l$ tipliers used to obtain the factor $U$ orl from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ orA $=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ as com puted by SSPTRF, stored as a packed triangular $m$ atrix in the sam e storage form atasA.

## IPIVOT (output)

Integer anray, dim ension $\mathbb{N}$ ) D etails of the interchanges and the block structure of $D$, as determ ined by SSPTRF. If IPIV OT $(k)>0$, then row $s$ and colum nsk and $\mathbb{P} \mathbb{I} O T(k)$ were interchanged, and $D(k, k)$ is a 1-by-1 diagonalblock. If $U P L O=U^{\prime}$ and $\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0$, then row sand colum nsk-1 and $-\mathbb{P} \mathbb{I V O T}(k)$ were interchanged and D ( $k-1$ k, $k-1$ k) is a 2 -by-2 diagonalblock. If $\mathrm{UPLO}=\mathrm{L}$ 'and $\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{V} O \mathrm{~T}(k+1)<0$, then row s and colum ns $k+1$ and $-\mathbb{P}$ IV OT ( $k$ ) were interchanged and $D(k: k+1, k: k+1)$ is a $2-b y-2$ diagonal block.

B (input/output)
Realarray, dim ension (LDB , NRHS) On entry, the N -by-NRHS right hand side matrix B. On exit, if $\mathbb{N} F O=0$, the $N$-by-N RH S solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \mathrm{LD} \mathrm{B}>=$ $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{I N}$ FO = -i, the i-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, so the solution could notbe com puted.

## FURTHER DETAILS

The packed storage schem e is illustrated by the follow ing exam ple when $N=4$, UPLO = U':

Tw o-dim ensional storage of the sym m etric m atrix A:
a11 a12 a13 a14

```

## C INTERFACE

\#include <sunperfh>
void sspsvx (char fact, charuplo, int n, int nrhs, float
*ap, float *af, int*ipivot, float*b, int ldb, float*x, int ldx, float *rcond, float *ferr, float *berr, int*info);
void sspsvx_64 (char fact, char uplo, long n, long nrhs, float *ap, float *af, long *íivot, float *b, long ldb, float *x, long ldx, float *rcond, float * ferr, float *berr, long *info);

## PURPOSE

SSPSVX uses the diagonalpivoting factorization $A=U * D * U * * T$ or $A=L * D * L * * T$ to com pute the solution to a realsystem of linear equations $A * X=B$, where $A$ is an $N$ by $-N$ symm etric $m$ atrix stored in packed form atand $X$ and $B$ are $N$ boy-NRHS $m$ atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=N$ ', the diagonalpivoting $m$ ethod is used to factorA as
$A=U * D * U * * T$, if $U P L O=U$ ', or
$A=L * D * L * * T$, if $U P L O=L^{\prime}$ ',
where $U$ (orL) is a productofperm utation and unitupper (low er)
triangularm atrioes and $D$ is sym $m$ etric and block diagonal w ith

1-by-1 and 2 -by-2 diagonalblocks.
2. If som eD $(i, i)=0$, so thatD is exactly singular, then the routine
retums w ith $\mathbb{N}$ FO $=$ i. $O$ therw ise, the factored form of $A$ is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N} F O=N+1$ is retumed as a waming, but the routine stillgoes on
to solve for $X$ and com pute error bounds as described below.
3. The system ofequations is solved for $X$ using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies whether ornot the factored form of A has been supplied on entry. = F ': On entry, A F and $\mathbb{P} \mathbb{I V O T}$ contain the factored form of A. AP, AF and $\mathbb{P} \mathbb{I} O T \mathrm{w}$ ill not be modified. $=\mathrm{N}$ : The $m$ atrix A w illlbe copied to A F and factored.

UPLO (input)
$=\mathrm{U}:$ : U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linear equations, ie., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, ie., the num ber
of collum ns of the $m$ atrices $B$ and $X$. NRHS $>=0$.

AP (input)
Realarray, dimension $\mathbb{N}^{*}(\mathbb{N}+1) / 2$ ) The upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed
colum nw ise in a linearamay. The jth colum n of A is stored in the amray AP as follow s: if UPLO = U',AP $(i+(j-1) * j 2)=A(i, j)$ for $1<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{AP}(i+(j-1) \star(2 \star \mathrm{n}-\mathrm{J}) / 2)=\mathrm{A}(i, 7)$ for $j=i<=n$. See below for furtherdetails.

AF (input/output)
Realarray, dim ension $(\mathbb{N} *(N+1) / 2)$ If $F A C T=F^{\prime}$, then $A F$ is an inputargum ent and on entry contains the block diagonalm atrix D and the multipliers used to obtain the factor $U$ orL from the factorization $A=U * D * U * * T$ or $A=L * D{ }^{*} L * * T$ as com puted by SSPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

IfFACT $=\mathrm{N}$ ', then AF is an output argum ent and on exit contains the block diagonalm atrix D and the multipliers used to obtain the factorU or L from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=$ $\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ as com puted by SSPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

## IPIVOT (inputoroutput)

Integer aray, dim ension $\mathbb{N}$ ) IfFACT=F', then
$\mathbb{P} \mathbb{I} O T$ is an inputargum entand on entry contains details of the interchanges and the block structure ofD, as determ ined by SSPTRF. If $\mathbb{P} \mathbb{I V} O T(k)$ $>0$, then row sand colum nsk and $\mathbb{P} \mathbb{I} O T(k)$ were interchanged and $\mathrm{D}(\mathrm{k}, \mathrm{k})$ is a 1 -by -1 diagonal block. If $\mathrm{PLO}=\mathrm{U}$ 'and $\mathbb{P} \mathbb{I V O T}(\mathrm{k})=\mathbb{P} \mathbb{I V O T}(\mathrm{k}-1)$ $<0$, then row s and colum ns k-1 and - $\mathbb{P} \mathbb{I V}$ O T (k) w ere interchanged and $D(k-1 k, k-1 k)$ is a 2 -by-2 diagonal block. If UPLO = L ' and $\mathbb{P} \mathbb{I V O T}(\mathrm{k})=$ $\mathbb{P I V O T}(k+1)<0$, then row $s$ and colum ns $k+1$ and $-\mathbb{P}$ IV O T (k) w ere interchanged and $D(k \cdot k+1, k \cdot k+1)$ is a 2-by-2 diagonalblock.

IfFACT = $N$ ', then $\mathbb{P I V O T}$ is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by SSPTRF.
$B$ (input) Realarray, dimension (LDB,NRHS) The $N$ boy-NRHS righthand side $m$ atrix $B$.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, \mathbb{N})$.

X (output)

Realarray, dim ension (LDX,NRHS) If $\mathbb{N} F O=0$ or $\mathbb{N} F O=N+1$, the $N$-by-N RH S solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

RCOND (output)
The estim ate of the reciprocalcondition num ber of the $m$ atrix $A$. IfRCOND is less than the $m$ achine precision (in particular, if RCOND $=0$ ), the $m$ atrix is singular to working precision. This condition is indicated by a retum code of $\mathbb{N}$ FO > 0.

FERR (output)
Realarray, dim ension $\mathbb{N} R H S$ ) The estim ated forw ard error bound foreach solution vectorX ( $\mathcal{j}$ ) the $j$
th colum $n$ of the solution $m$ atrix $X$ ). IfX TRUE is the true solution comesponding to $X(\mathcal{j}), \operatorname{FERR}(\mathcal{)}$ is an estim ated upperbound for the $m$ agnitude of the largest elem ent in ( $X(\mathcal{j})$-X TRUE) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{j})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ostalw ays a slightoverestim ate of the true error.

## BERR (output)

Realarray, dim ension $\mathbb{N} R H S$ ) The com ponentw ise relative backw ard error ofeach solution vector
$\mathrm{X}(\mathcal{)})$ (i.e., the sm allestrelative change in any elem ent of A orB thatm akes X ( $\mathcal{j}$ ) an exact solution).

W ORK (w orkspace)
Realamay, dim ension ( $3{ }^{*} \mathrm{~N}$ )
W ORK 2 (w orkspace)
Integer array, dim ension (N)
$\mathbb{I N F O}$ (output)
$=0$ : successfulexit
$<0$ : if $\mathbb{I N F O}=-$ i, the $i$-th argum enthad an illegalvalue
>0: if $\mathbb{N F O}=i$, and $i$ is
$<=\mathrm{N}: \mathrm{D}(i, i)$ is exactly zero. The factorization has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1: \mathrm{D}$ is nonsingular, butRCOND is less than machine
precision, $m$ eaning that the $m$ atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

## FURTHER DETAILS

The packed storage schem e is illustrated by the follow ing exam ple when $N=4$, UPLO $=U$ ':

## PURPOSE

ssptrd reduces a realsym m etric matrix A stored in packed form to symm etric tridiagonal form T by an orthogonalsim ilarity transform ation: $\mathrm{Q} * * \mathrm{~T} * \mathrm{~A} * \mathrm{Q}=\mathrm{T}$.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle of A is stored.

N (input) The order of the matrix A. $\mathrm{N}>=0$.

AP (input)
Realarray, dim ension $(\mathbb{N} *(N+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The $j$ th colum $n$ ofA is stored in the array AP as follow s : ifUPLO $=U{ }^{\prime}, \mathrm{AP}(i+(j-1) * j 2)=A(i, j)$ for $1<=i<=j$ ifUPLO $=\mathrm{L}$ ', AP $\left(i+(j-1)^{*}\left(2{ }^{\star} \mathrm{n}-j\right) / 2\right)=$ A $(i, j)$ for $j=i<=n$. On exit, ifUPLO $=U '$, the diagonal and first superdiagonal of $A$ are overw ritten by the conesponding elem ents of the tridiagonal $m$ atrix $T$, and the elem ents above the first superdiagonal, w th the array TA U, represent the orthogonalm atrix $Q$ as a product ofelem entary reflectors; if UPLO $=\mathrm{L}$ ', the diagonal and first subdiagonal of A are over-w ritten by the corresponding elem ents of the tridiagonal m atrix T , and the elem ents below the firstsubdiagonal, w ith the array TAU, represent the orthogonal $m$ atrix $Q$ as a productofelem entary reflectors. See FurtherD etails.

D (output)
Realarray, dim ension $(\mathbb{N})$ The diagonalelem ents of the tridiagonalm atrix $T: D(i)=A(i, i)$.

E (output)
Realaray, dim ension $(\mathbb{N}-1)$ The off-diagonal ele$m$ ents of the tridiagonal $m$ atrix $T: E(i)=$ $A(i, i+1)$ if $U P L O=U^{\prime}, E(i)=A(i+1, i)$ if $U P L O=$ L'.

TAU (output)
Realaray, dim ension $\mathbb{N}-1$ ) The scalar factors of the elem entary reflectors (see FurtherD etails).
$\mathbb{I N} F O$ (output)
= 0 : successfiulexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the i-th argum enthad an illegalvalue

## FURTHER DETAILS

If $U$ PLO $=U$ ', the $m$ atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(n-1) \ldots H(2) H(1) .
$$

Each $H$ (i) has the form

$$
H(i)=I-\tan * v^{*} v^{\prime}
$$

where tau is a real scalar, and $v$ is a realvectorw ith $v(i+1 \mathrm{~m})=0$ and $v(i)=1$; $v(1: i-1)$ is stored on exitin AP, overw riting A ( $1:-1, i+1$ ), and tau is stored in TA U (i).

If $\mathrm{ULO}=\mathrm{L}$ ', the $m$ atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(n-1) .
$$

Each $H$ (i) has the form

$$
\mathrm{H}(\mathrm{i})=\mathrm{I}-\tan * \mathrm{v}^{*} \mathrm{v}^{\prime}
$$

where tau is a real scalar, and $v$ is a realvectorw ith $v(1: i)=0$ and $v(i+1)=1$; $v(i+2 n)$ is stored on exitin AP, overw riting A (i+2 $2 n, i$ ), and tau is stored in TAU (i).

\#include <sunperfh>
void ssptrf(charuplo, intn, float *ap, int *ipijot, int *info);
void ssptrf_64 (charuplo, long n, float *ap, long *ipivot, long *info);

## PURPOSE

ssptrf com putes the factorization of a realsym $m$ etric $m$ atrix A stored in packed form at using the Bunch $-K$ aufm an diagonal pivoting $m$ ethod:

$$
\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T} \text { or } \mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}
$$

where $U$ (orL) is a product of perm utation and unit upper (low er) triangular $m$ atrioes, and $D$ is sym $m$ etric and block diagonalw ith 1 -by-1 and 2 -by- 2 diagonalblocks.

## ARGUMENTS

```
UPLO (input)
```

= U ': U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
$N$ (input) The order of the matrix $A . N>=0$.

AP (input/output)
Realarray, dim ension $(\mathbb{N} *(\mathbb{N}+1) / 2$ ) On entry, the upper or low er triangle of the sym $m$ etric $m$ atrix $A$, packed colum nw ise in a linear array. The $j$ th colum $n$ ofA is stored in the array AP as follow s : ifUPLO $=U{ }^{\prime}, \mathrm{AP}(i+(j-1) \star j 2)=A(i, j)$ for $1<=\mathrm{i}<=\dot{j}$ if UPLO $=\mathrm{L}, \mathrm{A} A P(i+(j-1) *(2 n-j) / 2)=$ A ( $i, 7$ ) for $\dot{j}=\dot{j}=n$.

On exit, the block diagonalm atrix $D$ and the $m u l$ tipliers used to obtain the factorU orL, stored as a packed triangularm atrix overw riting A (see below for further details).

## IPIVOT (output)

Integer amay, dim ension $\mathbb{N}$ ) D etails of the interchanges and the block structure of D. If $\mathbb{P} \mathbb{I V O T}(\mathrm{k})>0$, then rows and colum ns k and IP IV O T $(k)$ w ere interchanged and $D(k, k)$ is a 1 -by-1 diagonalblock. IfUPLO $=\mathrm{U}^{\prime}$ and $\mathbb{P} \mathbb{I V O T}(k)=$ $\mathbb{P} \mathbb{I V O T}(k-1)<0$, then row s and colum nsk-1 and - $\mathbb{P}$ IV O T $(k)$ w ere interchanged and $D(k-1 * k, k-1 k)$ is a 2 -by-2 diagonal block. If UPLO = L'and $\mathbb{P} \mathbb{I V} \circ T(k)=\mathbb{P} \mathbb{I} \circ T(k+1)<0$, then row s and colum $n s$ $\mathrm{k}+1$ and $-\mathbb{P} \mathbb{I V O T}(\mathrm{k})$ were interchanged and D $(k: k+1, k: k+1)$ is a 2 -by -2 diagonalblock.

## $\mathbb{N} F O$ (output)

= 0: successfiulexit
$<0:$ if $\mathbb{N F O}=-i$, the $i$-th argum ent had an illegal value
$>0:$ if $\mathbb{N F O}=i, D(i, i)$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix D is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

## FURTHER DETAILS

C om pany

If $\mathrm{U} P \mathrm{LO}=\mathrm{U}$ ', then $A=U * D * U$ ', where
$U=P(n) \star U(n)^{\star} \ldots{ }^{*} P(k) U(k)^{\star} \ldots$,
i.e., $U$ is a productof term $s P(k) * U(k)$, where $k$ decreases from $n$ to 1 in steps of 1 or 2 , and $D$ is a block diagonal $m$ atrix $w$ ith 1 -by-1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V} O T(k)$, and $U(k)$ is a unituppertriangularm atrix, such that if the diagonal
block $D(k)$ is of orders $(s=1$ or 2 ), then

```
    ( I v 0 ) k-s
U (k)=(0 I 0 ) s
    ( 0 0 I ) n-k
        k-s s n-k
```

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(1, k-$ $1, k)$. If $s=2$, the uppertriangle of $(k)$ overw rites $A(k-$ $1, k-1), A(k-1, k)$, and $A(k, k)$, and $v$ overw rites $A(1 k-2, k-$ 1 k).

```
IfU PLO = L', then A = L *D *L',w here
    L = P (l)*L (l)* ... *P (k)*L (k)* ...,
```

i.e., $L$ is a productofterm $S P(k) * L(k)$, where $k$ increases from 1 to $n$ in steps of 1 or2, and $D$ is ablock diagonal $m$ atrix $w$ th 1 -by -1 and 2 -by- 2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V O T}(k)$, and $L(k)$ is a unit low ertriangularm atrix, such that if the diagonal block $D(k)$ is of orders ( $s=1$ or 2 ), then

```
    ( I 0 0 ) k-1
    L (k)=( 0 I 0 ) s
    ( 0 v I ) n-k-s+1
        k-1 s n-k-s+1
```

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites A $(k+1 n, k)$. If $s=2$, the low er triangle ofD ( $k$ ) overw rites A $(k, k), A(k+1, k)$, and $A(k+1, k+1)$, and $v$ overw rites $A(k+2 n, k k+1)$.

## C INTERFACE

\#include <sunperfh>
void sstebz (char range, char order, intn, float vl, float
vu, int il, intiu, floatabstol, float *d, float
*e, int*m, int*nsplit, float *w, int *iblock, int *isplit, int*info);
void sstebz_64 (char range, char order, long n, float vl, float vu, long il, long iu, floatabstol, float *d, float*e, long *m, long *nsplit, float *w, long *iblock, long *isplit, long *info);

## PURPOSE

sstebz com putes the eigenvalues of a sym m etric tridiagonal $m$ atrix T. The userm ay ask for alleigenvalues, alleigenvalues in the half-open interval $(\mathbb{L}, \mathrm{VU}]$, or the $\mathbb{I}$-th through $\mathbb{I U}$-th eigenvalues.

T o avoid overflow, the m atrix m ustbe scaled so that its largestelem ent is no greater than overflow ** (1/2) * underflow ** (1/4) in absolute value, and forgreatest accuracy, it should not.be m uch sm aller than that.

See W . K ahan "A ccurate E igenvalues of a Sym m etric TridiagonalM atrix", ReportC S41, C om puterScience D ept., Stanford U niversity, July 21, 1966.

## ARGUMENTS

RANGE (input)
= A : ("A ll") alleigenvalues w illbe found.
= V ': ("V alue") alleigenvalues in the half-open interval $\mathrm{VL}, \mathrm{V}$ U ] w illbe found. = ' I ': ("Index") the $\mathbb{I}$-th through $\mathbb{I U}$-th eigenvalues (of the entire m atrix) w illbe found.

ORDER (input)
= B ': ("By B lock") the eigenvalues will be grouped by split-off block (see $\mathbb{B L O C K}$, ISPLIT) and ordered from sm allest to largest w ithin the block. = E ': ("Entire m atrix") the eigenvalues for the entire m atrix w illbe ordered from sm allest to largest.

N (input) The order of the tridiagonalm atrix $\mathrm{T} . \mathrm{N}>=0$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvahues. Eigenvalues less than or equal to $V L$, or greater than VU, will not be retumed. VL < VU. N ot referenced ifRANGE=A'or 'I'.

VU (input)
See the description of L .

IL (input)
If RA N GE= ' I ', the indices (in ascending order) of the smallest and largest eigenvahues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $N=0$. $N$ otreferenced ifRANGE $=$ A'or V'.

IU (input)
See the description of $\Pi$.

ABSTOL (input)
The absolute tolerance for the eigenvalues. A n eigenvalue (or cluster) is considered to be located if ithas been determ ined to lie in an intervalw hose w idth is A BSTOL or less. IfA BSTOL is less than orequal to zero, then $U L P *|\mid w i l l$ be used, w here $I \mid m$ eans the 1 -norm of $T$.

E igenvalues w illbe com puted m ost accurately w hen ABSTOL is set to tw ige the underflow threshold 2*SLAM CH (S ), notzero.

D (input) The $n$ diagonalelem ents of the tridiagonal $m$ atrix T.

E (input) The $(n-1)$ off-diagonalelem ents of the tridiagonal m atrix T.

M (output)

The actual num berofeigenvahues found. $0<=\mathrm{M}$ <= N. (Se also the description of $\mathbb{N} F O=2,3$.)

NSPLIT (output)
The num ber of diagonalblocks in the m atrix T. 1
<= NSPLIT <= N .

W (output)
On exit, the firstM elem ents of $W$ will contain the eigenvalues. (SSTEBZ may use the rem aining N M elem ents as w orkspace.)

BBLOCK (output)
A teach row /collm n jw here $E()$ is zero or sm all, the m atrix T is considered to split into ablock diagonalm atrix. On exit, if $\mathbb{N F O}=0, \mathbb{B L O C K}$ (i) specifies to which block (from 1 to the num ber of blocks) the eigenvalue W (i) belongs. (SSTEBZ may use the rem aining N M elem ents as w orkspace.)

ISPLIT (output)
The splitting points, atw hich $T$ breaks up into subm atrices. The first subm atrix consists of row s/columns 1 to ISPLIT (1), the second of row s/colum ns ISPL IT (1)+1 through ISPLIT (2), etc., and the NSPLIT-th consists of row s/colum ns ISPLIT $(\mathbb{N}$ SPLIT-1) +1 through ISPLIT $(\mathbb{N} S P L I T)=N$. (Only the firstN SPLIT elem entsw ill actually be used, but since the user cannot know a prioriw hat value NSPLIT w ill have, N w ordsm ust be reserved for ISPLIT.)

W ORK (w orkspace)
dim ension ( $4 * \mathrm{~N}$ )
IN ORK (w orkspace)
dim ension $(3 * N)$
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue
> 0: som e orall of the eigenvalues failed to converge or
w ere not com puted:
$=1$ or 3 : B isection failed to converge for som e eigenvalues; these eigenvalues are flagged by a negative block num ber. The effect is that the eigenvalues $m$ ay notbe as accurate as the absolute and relative tolerances. This is generally caused
by unexpectedly inaccurate arithm etic. $=2$ or 3 :
RANGE=I'only:N otallof the eigenvalues $\mathbb{I}: \mathbb{U}$ w ere found.
Effect: $M<\mathbb{U}+1-\mathbb{I}$
C ause: non-m onotonic arithm etic, causing the Sturm sequence to be non-m onotonic. Cure: recalculate, using $R$ A N G E= A ', and pick
outeigenvalues $\mathbb{I L}: \mathbb{Z U} .=4: \quad$ RANGE= I', and the
G ershgorin interval initially used w as too sm all.
N o eigenvahues w ere com puted.

## C INTERFACE

\#include < sunperfh>
void sstedc (char com pz, intn, float *d, float *e, float *z, int ldz, int*info);
void sstedc_64 (charcom pz, long n, float *d, float*e, float *z, long ldz, long *info);

## PURPOSE

sstedc com putes alleigenvalues and, optionally, eigenvectors of a sym $m$ etric tridiagonalm atrix using the divide and conquerm ethod. The eigenvectors of a full or band real sym metric $m$ atrix can also be found ifSSY TRD orSSPTRD or SSBTRD hasbeen used to reduce this $m$ atrix to tridiagonal form.

This code $m$ akes very $m$ ild assum ptions about floating point arithm etic. It w illw ork on $m$ achines $w$ ith a guard digit in add/subtract, or on those binary machines w thout guard digits which subtract like the C ray X $-\mathrm{M} P$, C ray $Y$ M P , C ray C-90, or C ray-2. Itcould conœívably fail on hexadecim al or decin al machines w thout guard digits, butw e know of none. Se SLAED 3 for details.

## ARGUMENTS

COMPZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only .
= I': C om pute eigenvectors of tridiagonalm atrix also.
$=\mathrm{V}$ : C om pute eigenvectors of original dense symmetric $m$ atrix also. On entry, $Z$ contains the orthogonalm atrix used to reduce the original $m$ atrix to tridiagonal form .

N (input) The dim ension of the sym $m$ etric tridiagonalm atrix.
$\mathrm{N}>=0$.

D (input/output)
On entry, the diagonalelem ents of the tridiagonal m atrix. On exit, if $\mathbb{N} F O=0$, the eigenvalues in ascending order.

E (input/output)
O n entry, the subdiagonalelem ents of the tridiagonalm atrix. On exit, E hasbeen destroyed.

Z (input) On entry, if COMPZ = V', then Z contains the orthogonal m atrix used in the reduction to tridiagonal form. On exit, if $\mathbb{I N F O}=0$, then if $C O M P Z$ $=\mathrm{V}$ ', Z contains the orthonorm aleigenvectors of the original sym $m$ etric $m$ atrix, and if $C O M P Z=I$ ', $Z$ contains the orthonorm al eigenvectors of the sym $m$ etric tridiagonalm atrix. If $\mathrm{COMPZ}=\mathrm{N}$ ', then Z is not referenced.

LD Z (input)
The leading din ension of the array Z . LD $\mathrm{Z}>=1$.
If eigenvectors are desired, then LD Z $>=\mathrm{max}(1, \mathrm{~N})$.
W ORK (w orkspace)
dim ension (LW ORK)Onexit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim allW ORK.

LW ORK (input)
The dim ension of the aray $W$ ORK. IfCOMPZ $=N^{\prime}$ orN <= 1 then LW ORK m ustbe at least1. If COM PZ $=\mathrm{V}$ 'and $\mathrm{N}>1$ then LW ORK m ustbe at least ( $1+$ $3 * \mathrm{~N}+2{ }^{*} \mathrm{~N} * \lg \mathrm{~N}+3 * \mathrm{~N} * * 2$ ), where $\lg (\mathrm{N})=\mathrm{sm}$ allest integerk such that $2 * * k>=\mathrm{N}$. If $\mathrm{COM} \operatorname{PZ}=$ 'I' and N > 1 then LW ORK m ustbe at least ( $1+$ $4 * \mathrm{~N}+\mathrm{N} * * 2$ ).

IfLW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
On exit, if $\mathbb{N F} F=0, \mathbb{I N}$ ORK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N} O R K$. IfCOMPZ $=N^{\prime}$ or $N$ <= 1 then LIW ORK m ustbe at least 1. If

COMPZ $=V$ 'and $N>1$ then $L \mathbb{I V}$ ORK m ustbe at least

then LIN ORK must.be at least ( $3+5{ }^{*} \mathrm{~N}$ ).

If LIV ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim al size of
the $\mathbb{I V}$ ORK array, retums this value as the first entry of the $\mathbb{I V}$ ORK amay, and no errorm essage related to LIN ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0: successfulexit.
$<0$ : if $\mathbb{N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue.
>0: The algonithm failed to com pute an eigenvalue while w orking on the subm atrix lying in row s and colum $n s \mathbb{N} F O / \mathbb{N}+1$ ) through $m$ od ( $\mathbb{N} F O, N+1$ ).

## C INTERFACE

\#include <sunperfh>
void sstegr(char jobz, char range, intn, float *d, float
*e, float vl, float vu, int il, intiu, float abstol, int *m, float *w , float * $z$, int ldz, int *isuppz, int *info);
void sstegr_64 (char j̀jbz, char range, long n, float *d, float *e, float vl, floatvu, long il, long iu, floatabstol, long *m, float*w, float *z, long ldz, long *isuppz, long *info);

## PURPOSE

sstegrb) C om pute the eigenvahues, lam bda_j of L_i D_i L_i^T to high
relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D _i L_i^T, com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization. The desired accuracy of the output can be specified by the inputparam eterABSTOL.

Form ore details, see "A new O ( $n^{\wedge} 2$ ) algorithm for the sym $m$ etric tridiagonal eigenvahue/eigenvector problem ", by Inder进D hillon, C om puterScience D ivision TechnicalR epont N o. U CB C SD -97-971, U C B erkeley, M ay 1997.

N ote 1 : Cumently SSTEGR is only setup to find ALL the $n$ eigenvalues and eigenvectors of $T$ in $O\left(n^{\wedge} 2\right)$ tim e N ote 2 : Cumently the routine SSTE $\mathbb{N}$ is called when an appropriate sigm a_i cannot be chosen in step (c) above.

SSTE $\mathbb{I N}$ invokes m odified Gram -Schm idt when eigenvalues are close.
N ote 3 :SSTEGR w orks only on $m$ achines which follow ieec-754 floating-point standard in their handling of infinities and NaN s. N orm alexecution of SSTEGR $m$ ay create $N a N s$ and infinities and hence $m$ ay abort due to a floating point exception in environm ents w hich do not conform to the ieee standard.

## ARGUMENTS

JOBZ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illibe found.
= V : alleigenvalues in the half-open interval
( L L, VU ] will be found. = I': the $\mathbb{I}$-th through
IU -th eigenvaluesw illube found.

N (input) The order of the m atrix. $\mathrm{N}>=0$.
D (input/output)
O n entry, the n diagonalelem ents of the tridiagonalm atrix T.On exit, D is overw ritten.

E (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonal m atrix T in elem ents 1 to $\mathrm{N}-1$ of E ; $\mathrm{E}(\mathbb{N})$ need notbe set. On exit, E is overw rilten.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N GE = A' 'or I'.

VU (input)
Se the description of V L .

II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{H}<=\mathbb{U}<=N$, ifn $>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE= A 'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute error tolerance for the eigenvalues/eigenvectors. $\mathbb{F} J \mathrm{OBZ}=\mathrm{V}$ ', the eigenvalues and eigenvectors outputhave residual norm s bounded by ABSTOL, and the dotproducts betw een different eigenvectors are bounded by ABSTOL. If ABSTOL is less than N *EPS*|T $\mid$, then N *EPS*|T|w illbe used in its place, where EPS is the $m$ achine precision and $F$ is the 1 -norm of the tridiagonalm atrix. The eigenvalues are com puted to an accuracy ofEPS* 1 |imespective of A BSTOL . If high relative accuracy is im portant, setA B STO L to DLAM CH (Safem inim um '). See Barlow and Dem mel "C om puting A ccurate Eigensystem s of Scaled D iagonally D om inantM atrioes", LA PA CK W orking N ote \#7 for a discussion of $w$ hich $m$ atrioes define their eigenvalues to high relative accuracy .

M (output)
The total num berofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=A \prime, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{I U}-\mathbb{H}+1$.

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V^{\prime}$, then if $\mathbb{N F O}=0$, the first $M$ colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix T comesponding to the selected eigenvalues, $w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated w ith W (i). If $\mathrm{JO} \mathrm{BZ}=\mathrm{N}$ ', then $Z$ is not referenced. N ote: the userm ust ensure that at leastm ax ( $1, M$ ) colum ns are supplied in the array $Z$; ifRANGE = V', the exact value of M is not know n in advance and an upperbound m ust be used.

LD $Z$ (input)
The leading dim ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >= $\mathrm{max}(1, N)$.

ISU PPZ (output)
The support of the eigenvectors in $Z$, i.e., the indices indicating the nonzero elem ents in $Z$. The i-th eigenvector is nonzero only in elem ents ISU PPZ (2*i-1 ) through ISU PPZ (2*i).

W ORK (w orkspace)

On exit, if $\mathbb{N F O}=0, W$ ORK ( 1 ) retums the optim al (and minim al) LW ORK .

## LW ORK (input)

The dimension of the aray W ORK. LW ORK >= $\max (1,18 * N)$
IfLW O RK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I W}$ ORK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the aray $\mathbb{I W}$ ORK. L $\mathbb{I W}$ ORK >= $\max (1,10 \star N)$

IfLIW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK array, and no errorm essage related to $L \mathbb{I W}$ ORK is issued by X ERBLA.

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N F O}=1$, intemalemor in SLARRE, if $\mathbb{N} F O=2$, intemalemor in SLARRV.

## C INTERFACE

\#include <sunperfh>
void sstein (intn, float *d, float *e, intm, float *w, int *iblock, int *isplit, float *z, int ldz, int *ifail, int *info);
void sstein_ 64 (long n, float *d, float *e, long m,float *w , long *iblock, long *isplit, float*z, long ldz, long *ifail, long *info);

## PURPOSE

sstein com putes the eigenvectors of a realsym $m$ etric tridiagonal $m$ atrix $T$ comesponding to specified eigenvalues, using inverse iteration.

The m axim um num ber of terations allow ed foreach eigenvector is specified by an intemal param eterM A X ITS (currently set to 5).

## ARGUMENTS

N (input) The order of the $m$ atrix. $\mathrm{N}>=0$.

D (input) The n diagonalelem ents of the tridiagonal $m$ atrix
T.

E (input) The ( $\mathrm{n}-1$ ) subdiagonalelem ents of the tridiagonal $m$ atrix $T$, in elem ents 1 to $N-1 . E(\mathbb{N})$ need notbe set.

M (input) The num ber of eigenvectors to be found. $0<=\mathrm{M}<=$ N .

W (input) The firstM elem ents ofW contain the eigenvalues for which eigenvectors are to be com puted. The eigenvalues should be grouped by split-off block and ordered from smallest to largestw ithin the block. (The output array $W$ from SSTEBZ w th ORDER = B'is expected here.)

BLOCK (input)
The subm atrix indiges associated with the corresponding eigenvalues in $W$; $\mathbb{B L O C K}(i)=1$ if eigenvalue $W$ (i) belongs to the first subm atrix from the top, $=2$ ifW (i) belongs to the second subm atrix, etc. (The output array $\mathbb{B L O C K}$ from SSTEBZ is expected here.)

## ISPLIT (input)

The splitting points, atw hich $T$ breaks up into subm atrices. The first subm atrix consists of row s/columns 1 to ISPLIT ( 1 ), the second of row s/Colum ns ISPLIT ( 1 )+1 through ISPLIT (2), etc. (The outputaray ISPLIT from SSTEBZ is expected here.)
Z (output)
The com puted eigenvectors. The eigenvector associated w ith the eigenvalue $W$ (i) is stored in the $i-t h$ colum $n$ of $Z$. A ny vectorw hich fails to converge is set to its current iterate afterM AX ITS iterations.

LD $Z$ (input)
The leading dim ension of the aray $Z$. LD $Z \quad>=$ $\max (1, N)$.

W ORK (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )
IV ORK (w orkspace)
dim ension (N)
FFA II (output)
On norm alexit, allelem ents of $\mathbb{F} A \mathbb{I}$ are zero. If one orm ore eigenvectors fail to converge after
M AXITS iterations, then their indices are stored in array $\mathbb{F A} \mathbb{I}$.
$\mathbb{I N F O}$ (output)
$=0$ : successfulexit.
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=i$, then $i$ eigenvectors failed to converge in M AX ITS iterations. Their indiges are stored in array $\mathbb{F}$ A II.

## PURPOSE

ssteqram putes alleigenvalues and, optionally, eigenvectors of a sym $m$ etric tridiagonalm atrix using the in pliciti Q L orQ R m ethod. The eigenvectors of a fullorband sym m etric $m$ atrix can also be found ifSSY TRD orSSPTRD orSSBTRD has been used to reduce thism atrix to tridiagonal form .

## ARGUMENTS

COMPZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only .
$=\mathrm{V}$ : Com pute eigenvalues and eigenvectors of the original sym $m$ etric $m$ atrix. On entry, $Z \mathrm{~m}$ ust contain the orthogonalm atrix used to reduce the originalm atrix to tridiagonal form . = I': C om pute eigenvalues and eigenvectors of the tridiagonal m atrix. Z is initialized to the identity $m$ atrix.

N (input) The order of the m atrix. $\mathrm{N}>=0$.
D (input/output)
On entry, the diagonalelem ents of the tridiagonal m atrix. On exit, if $\mathbb{N} F O=0$, the eigenvalues in ascending order.

E (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonal matrix. On exit, E hasbeen destroyed.

Z (input) On entry, if $\mathrm{COMPZ}=\mathrm{V}$ ', then Z contains the orthogonal m atrix used in the reduction to tridiagonal form. On exit, if $\mathbb{N F O}=0$, then if COM PZ $=\mathrm{V}^{\prime}, \mathrm{Z}$ contains the orthonorm aleigenvectors of the original sym $m$ etric $m$ atrix, and ifCOMPZ = 'I',
$Z$ contains the orthonorm al eigenvectors of the sym $m$ etric tridiagonalm atrix. If COM PZ $=N^{\prime}$ ', then $Z$ is not referenced.

LD $Z$ (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=1$, and if eigenvectors are desired, then LD Z >= $\max (1, N)$.

W ORK (w orkspace)
dim ension (max ( $1,2 \star \mathrm{~N}-2$ )) If $\mathrm{COMPZ}=\mathrm{N}$ ', then W ORK is not referenced.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue

*z, long ldz, long *info);

## PURPOSE

sstevd com putes alleigenvalues and, optionally, eigenvectors of a realsym $m$ etric tridiagonalm atrix. If eigenvectors are desired, it uses a divide and conquer algo rithm .

The divide and conqueralgorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray $X-M P, C$ ray $Y \neq M P, C$ ray $C-90$, orC ray-2. It could conceivably fail on hexadecim al or decim al $m$ achines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

N (input) The order of the m atrix. $\mathrm{N}>=0$.
D (input/output)
O n entry, the $n$ diagonalelem ents of the tridiagonal m atrix A . On exit, if $\mathbb{N F} \mathrm{FO}=0$, the eigenvalues in ascending order.

E (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonal m atrix A, stored in elem ents 1 to $N-1$ of $E$; $E \mathbb{N}$ ) need notbe set, but is used by the
routine. On exit, the contents ofe are destroyed.
$Z$ (input) If $J O B Z=V '$, then if $\mathbb{N} F O=0, Z$ contains the orthonorm aleigenvectors of the $m$ atrix $A, w$ th the $i$-th colum $n$ of $Z$ holding the eigenvector associated w th D (i). If JOBZ $=N^{\prime}$ ', then $Z$ is not referenced.

LD $Z$ (input)
The leading din ension of the amay Z . LD $\mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD Z >= $\max (1, N)$.
W ORK (w orkspace)
dim ension ( $\mathbb{L} W$ ORK)On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim alLW O RK .

LW ORK (input)
The dim ension of the array $W$ ORK. If $J O B Z=N^{\prime}$ or $\mathrm{N}<=1$ then LW ORK m ustbe at least1. If JO B Z $=\mathrm{V}$ 'and $\mathrm{N}>1$ then LW ORK m ust.be at least ( $1+$ $4 * N+N * * 2)$.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IN ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I V} O R K(1)$ retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N} O R K$. If $J O B Z=N^{\prime}$ orN <= 1 then LIW ORK m ustbe at least1. If JO B Z $=V$ 'and $N>1$ then $L \mathbb{I}$ ORK must be at least $3+5 * N$.

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the IV ORK array, retums this value as the first entry of the $\mathbb{I N}$ ORK amray, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N F O}=-i$, the i-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=\mathrm{i}$, the algorithm failed to con-
verge; i off-diagonalelem ents ofe did not con-
verge to zero.

## C INTERFACE

\#include <sunperfh>
void sstevr(char jobz, char range, intn, float *d, float
*e, float vl, float vu, int il, intiu, float abstol, int *m, float * w , float * z , int ld z , int *isuppz, int *info);
void sstevr_64 (char j̀jbz, char range, long n, float *d, float *e, float vl, floatvu, long il, long iu, floatabstol, long *m, float*w, float *z, long ldz, long *isuppz, long *info);

## PURPOSE

sstevr com putes selected eigenvahues and, optionally, eigenvectors of a realsym m etric tridiagonalm atrix T. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

W heneverpossible, SSTEVR calls SSTEGR to com pute the eigenspectrum using Relatively Robust Representations. SSTEGR computes eigenvalues by the dqds algorithm, while orthogonaleigenvectors are com puted from various "good" L D $\mathrm{L}^{\wedge} \mathrm{T}$ representations (also known as Relatively Robust Representations).G ram -Schm idtorthogonalization is avoided as far as possible. M ore specifically, the various steps of the algorithm are as follow s.For the $i$-th unreduced block of $T$,
(a) C om pute $\mathrm{T}-$ sigm a_i= L_iD_iL_i^T, such that L_i D_iL_i^T
is a relatively robust representation,
(b) C om pute the eigenvalues, lam bda_j, of L_i D _i L_i^T to high
relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvahues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D_i L_i^T,
com pute the comesponding eigenvectorby form ing a rank-revealing tw isted factorization. The desired accuracy of the output can be specified by the inputparam eterABSTOL.

Form ore details, see "A new $\mathrm{O}\left(\mathrm{n}^{\wedge} 2\right)$ algorithm for the sym m etric tridiagonal eigenvalue/eigenvector problem ", by Inder \#̈tD hillon, C om puter Science D ìvision TechnicalReport No.UCB/C SD -97-971, UC Berkeley, M ay 1997.

N ote 1 :SSTEVR calls SSTEGR when the full spectrum is requested on $m$ achines $w$ hich conform to the iee-754 floating pointstandard. SSTEVR callsSSTEBZ and SSTE IN on non-ieee m achines and when partial spectrum requests are $m$ ade.

N orm alexecution of SSTEGR m ay create NaNs and infinities and hence $m$ ay abort due to a floating point exception in environm ents which do nothandle N aN s and infinities in the ieee standard defaultm anner.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
= V : C om pute eigenvalues and eigenvectors.
RANGE (input)
= A : alleigenvalues $w$ illbe found.
= V : alleigenvahues in the half-open interval
( $\mathrm{L}, \mathrm{V} \mathrm{U}]$ will be found. = 'I': the $\mathbb{I}$-th through
$\mathbb{I U}$-th eigenvaluesw illlbe found.

N (input) The order of the m atrix. $\mathrm{N}>=0$.

D (input/output)
O n entry, the n diagonalelem ents of the tridiagonal $m$ atrix A. On exit, D m ay be multiplied by a constant factor chosen to avoid over/underflow in com puting the eigenvalues.

E (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonal m atrix A in elem ents 1 to $\mathrm{N}-1$ ofe;

E(N) need notbe set. On exit, E may be multiplied by a constant factor chosen to avoid over/underflow in com puting the eigenvahues.

## VL (input)

IfRANGE=V ', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
See the description of V L .

II (input)
IfRA NGE= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE $=$ A'or V'.
$\mathbb{U}$ (input)
See the description of II.

ABSTOL (input)
The absolute error tolerance for the eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * $\max (|k|, \mid)$ ),
$w$ here EPS is the m achine precision. IfA BSTOL is less than or equalto zero, then EPS* $\mid$ | w illbe used in its place, where $\mid T$ is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing A to tridiagonal form .

See "C om puting Sm allSingularV ahues of B idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by Dem m eland K ahan, LA PA CK W orking N ote \#3.

If high relative accuracy is im portant, setA BSTO L to SLAM CH (Safe minim um '). D oing so will guarantee thateigenvalues are com puted to high relative accuracy when possible in future releases. The current code does not make any guarantees about high relative accuracy, but future releases w ill. See J. B arlow and J. D em m el, "C om puting A ccurate E igensystem s of Scaled D iagonally D om inantM atrioes", LA PA CK W orking N ote \#7, for a discussion of $w$ hich $m$ atrices define their
eigenvalues to high relative accuracy .

M (output)
The total num berofeigenvalues found. $0<=\mathrm{M}$ <=
N . IfRANGE $=A^{\prime}, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{U}-\mathbb{U}+1$.

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $\mathcal{J O B Z}=\mathrm{V}^{\prime}$, then if $\mathbb{N F O}=0$, the first $M$ colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, w ith the i -th colum n of $Z$ holding the eigenvector associated $w$ ith $W$ (i). $N$ ote: the user $m$ ust ensure that at leastm ax ( $1, \mathrm{M}$ ) colum ns are supplied in the array $Z$; ifRANGE = $V$ ', the exact value of $M$ is not know $n$ in advance and an upper bound $m$ ustbe used.

LD Z (input)
The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}$ ', LD $Z>=\mathrm{max}(1, \mathrm{~N})$.

## ISU PPZ (output)

The support of the eigenvectors in $Z$, i.e., the indices indicating the nonzero elem ents in $Z$. The $i$-th eigenvector is nonzero only in elem ents ISU PPZ (2*i-1 ) through ISU PPZ (2*i).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al (andminim al) LW ORK .

LW ORK (input)
The dim ension of the array $W$ ORK. LW ORK $>=20 * N$.
If LW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al (andminim al) LINORK.

LIN ORK (input)
The dim ension of the anay $\mathbb{I N}$ ORK. LIN ORK $>=10 * N$.

If LIW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I V}$ ORK anray, retums this value as the first entry of the $\mathbb{I W}$ ORK array, and no errorm essage related to $L \mathbb{I W}$ ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N} F O=-i$, the $i$ th argum enthad an illegalvalue
> 0: Intemalemor

## PURPOSE

sstevx com putes selected eigenvahues and, optionally , eigenvectors of a realsym m etric tridiagonalm atrix A. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## ARGUMENTS

JO BZ (input)
$=\mathrm{N}^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found.
$=\mathrm{V}$ ': alleigenvalues in the half-open interval
(VL, VU] will be found. = I': the IL th through IU th eigenvalues w illbe found.

N (input) The order of the m atrix. $\mathrm{N}>=0$.

D IA G (input/output)

O n entry, the n diagonalelem ents of the tridiagonal $m$ atrix A. On exit, D IA G m ay be multiplied by a constant factor chosen to avoid over/undenflow in com puting the eigenvalues.

OFFD (input/output)
O $n$ entry, the ( $n-1$ ) subdiagonal elem ents of the tridiagonalm atrix $A$ in elem ents 1 to $N-1$ of FFD ; OFFD $\mathbb{N}$ ) need notbe set. On exit, OFFD may be m ultiplied by a constant factor chosen to avoid over/underflow in com puting the eigenvalues.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A 'or I'.

VU (input)
See the description of V L .
II (input)
IfRA N G E= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{U}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{H}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE $=$ A 'or V'.

IU (input)
See the description of II .
ABTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABTOL + EPS * $\max (\nmid,||$,$) ,$
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS* $\mid$ | w illbe used in its place, where $F \mid$ is the 1 -norm of the tridiagonalm atrix.

E igenvalues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold 2*SLAM CH (S ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to $2 *$ SLAM CH ( S ).

See "C om puting Sm allSingularV ahes ofB idiagonal
$M$ atrices w th G uaranteed H igh Relative A ccuracy," by Dem m eland $K$ ahan, LA PA CK W orking $N$ ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. $0<=$ NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE $=I ', N F O U N D=\mathbb{U}-\mathbb{H}+1$.

W (output)
The firstNFOUND elem ents contain the selected eigenvalues in ascending order.

Z (input) If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N} F O=0$, the first NFOUND colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, $w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated w ith $W$ (i). If an eigenvector fails to converge ( $\mathbb{N}$ FO $>0$ ), then that colum $n$ of $Z$ contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in $\mathbb{F A} I I$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then Z is not referenced. N ote: the userm ustensure that at leastm ax (1,NFOUND) colum ns are supplied in the array $Z$; ifRANGE = $V$ ', the exactvalue ofNFOUND is not know $n$ in advance and an upperbound $m$ ust.be used.

LD Z (input)
The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=V^{\prime}$, LD $Z>=\max (1, N)$.

W ORK (w orkspace)
dim ension ( $5 * \mathrm{~N}$ )

IW ORK 2 (w orkspace)
FFII (output)
If $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the first NFOUND
elem ents of $\mathbb{F A} I I$ are zero. If $\mathbb{N F O}>0$, then
FAII contains the indices of the eigenvectors
that failed to converge. If $\mathrm{JOB}=\mathrm{N}^{\prime}$, then
IFA II is not referenced.
$\mathbb{N} F O$ (output)
= 0 : successfinlexit
<0: if $\mathbb{N N}$ FO $=-$ i, the i-th argum enthad an illegalvalue
> 0 : if $\mathbb{N F O}=$ i, then ieigenvectors failed to converge. Their indioes are stored in array
ㅍFAI.

void ssyev_64 (char jobz, char uplo, long n, float *a, long lda, float *w , long *info);

## PURPOSE

ssyev com putes alleigenvalues and, optionally, eigenvectors of a realsym m etric m atrix A.

## ARGUMENTS

JO BZ (input)
$=\mathrm{N}^{\prime}$ : C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}:$ : U pper triangle of A is stored;
= L': Low er triangle ofA is stored.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
A (input/output)
On entry, the symm etric $m$ atrix $A$. If UPLO $=U$ ', the leading $\mathrm{N}-$ by -N upper triangularpartofA contains the upper triangular part of the $m$ atrix $A$. If UPLO = L', the leading N -by -N low er triangular partofA contains the low er triangular part of the $m$ atrix $A$. On exit, if $J O B Z=V$ ', then if $\mathbb{N} F O=0, A$ contains the orthonorm al eigenvectors of them atrix $A$. If $J O B Z=N$ ', then on exit the low er triangle (if $\mathrm{PLO}=\mathrm{L}$ ) or the upper triangle (if $\mathrm{UPLO}=\mathrm{U}$ ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, \mathbb{N})$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length of the amray W ORK. LDW ORK >= $\mathrm{max}(1,3 \star \mathrm{~N}-1)$. For optim alefficiency, LDW ORK $>=$ $(\mathbb{N B}+2)^{\star} \mathrm{N}$, where NB is the blocksize for SSY TRD retumed by ILAENV.

IfLD W ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{I N F O}$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i-$ th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include <sunperfh>
void ssyevd (char jobz, charuplo, intn, float *a, int lda, float * ${ }_{W}$, int *info);
void ssyevd_64 (char jobz, charuplo, long n, float *a, long lda, float *w , long *info);

## PURPOSE

ssyevd com putes alleigenvalues and, optionally, eigenvectors of a real symm etric matrix A. Ifeigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits w hich subtract like the $C$ ray X M P , C ray Y M P , C ray C-90, orC ray-2. Itcould conceivably fail on hexadecim al or decim al $m$ achines $w$ ithout guard digits, butw e know of none.

Because of large use ofB LA S of level3, SSY EV D needs N**2 m ore w orkspace than SSY EVX .

## ARGUMENTS

JOBZ (input)
= N ': C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
= U : : U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The order of the matrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)

On entry, the symm etric $m$ atrix $A$. If $\mathrm{PLO}=\mathrm{U}$ ', the leading N -by -N uppertriangularpart of A contains the upper triangular part of the $m$ atrix $A$. If U PLO = L', the leading $N$ by -N low er triangular partofA contains the low er triangular part of the $m$ atrix $A$. On exit, if $J O B Z=V$ ', then if $\mathbb{N} F O=0, A$ contains the orthonorm al eigenvectors of them atrix $A$. If $J O B Z=N$ ', then on exit the low er triangle (if $\mathrm{PLLO}=\mathrm{L}$ ) or the upper triangle (if $\mathrm{UPLO}=\mathrm{U}$ ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

## W ORK (w orkspace)

dim ension (LW ORK)On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim alLW ORK.

## LW ORK (input)

The dim ension of the array W ORK. If $\mathrm{N}<=1$, LW ORK must be at least1. If $\mathrm{JOBZ}=\mathrm{N}$ 'and $\mathrm{N}>$ 1, LW ORK mustbe at least $2{ }^{*} \mathrm{~N}+1$. If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1$, LW ORK must be atleast $1+6 \star \mathrm{~N}+$ $2 \star \mathrm{~N} * * 2$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ O RK (1) retums the optim al
LIV ORK.
LIV ORK (input)
The dim ension of the array $\mathbb{I N}$ ORK. If $\mathrm{N}<=1$, LIN ORK mustbe at least1. If JOBZ $=\mathrm{N}$ 'and $\mathrm{N}>$ $1, L \mathbb{I}$ ORK m ustbe at least 1. If $\mathrm{JOBZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1, \mathrm{LIV}$ ORK must.be at least3 $+5 * \mathrm{~N}$.

If LIV ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the IW ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK array, and no errorm essage
related to LIN ORK is issued by XERB LA.
$\mathbb{N} F O$ (output)
$=0$ : successfulexit
< 0: if $\mathbb{N}$ FO = -i, the i-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N} F O=$ i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

## C INTERFACE

\#include < sunperfh>
void ssyevr(char jobz, char range, charuplo, int $n$, float
*a, int lda, float vl, float vu, int il, int in, float abstol, int *m, float * ${ }_{\mathrm{w}}$, float * z , int ldz, int*isuppz, int*info);
void ssyevr_64 (char jobz, char range, char uplo, long n, float *a, long lda, float vl, float vu, long il, long iu, float abstol, long ${ }^{m}$, float ${ }^{\text {w }}$, float *z, long ldz, long *isuppz, long *info);

## PURPOSE

ssyevr com putes selected eigenvalues and, optionally, eigenvectors of a realsym $m$ etric tridiagonalm atrix $T$. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

W heneverpossible, SSY EVR calls SSTEGR to com pute the eigenspectrum using Relatively Robust Representations. SSTEGR com putes eigenvalues by the dqds algorithm, while orthogonaleigenvectors are com puted from various "good" L D $L^{\wedge} \mathrm{T}$ representations (also known as Relatively Robust Representations). G ram -Schm idtorthogonalization is avoided as far as possible. M ore specifically, the various steps of the algorithm are as follow s. For the $i$-th unreduced block of T ,
(a) Com pute $T$-sigm a_i= L_iD_iL_i^T, such that L_i D_iL_i^T
is a relatively robustrepresentation,
(b) C om pute the eigenvalues, lam bda_j, of L_i D_i L_i^T to high
relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D_i L_i^T, com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization.
The desired accuracy of the output can be specified by the inputparam eterABSTOL.

Form ore details, see "A new O ( $n^{\wedge} 2$ ) algorithm for the sym $m$ etric tridiagonal eigenvahue/eigenvector problem ", by Inder屰D hillon, $C$ om puter Science D ivision TechnicalR eport N o.U CB /C SD -97-971, U C Berkeley, M ay 1997.
N ote 1 :SSYEVR calls SSTEGR when the full spectum is requested on $m$ achines $w$ hich conform to the ieee-754 floating pointstandard. SSYEVR calls SSTEBZ and SSTE $\mathbb{N}$ on non-ieee $m$ achines and
when partialspectrum requests are m ade.

N orm alexecution of SSTEGR m ay create NaNs and infinities and hence $m$ ay abort due to a floating pointexception in environm ents which do nothandle N aN s and infinities in the ieee standard defaultm anner.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ : C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found.
$=\mathrm{V}$ ::alleigenvalues in the half-open interval
( $\mathrm{L}, \mathrm{V} \mathrm{U}] \mathrm{w}$ ill be found. = I ': the II th through
IU th eigenvahes w illbe found.

UPLO (input)
$=\mathrm{U}$ ': Upper triangle ofA is stored;
$=\mathbb{L}$ ': Low er triangle of A is stored.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O n entry, the symm etric $m$ atrix A. If UPLO $=U '$, the leading N -by N uppertriangularpartof u contains the upper triangular part of the $m$ atrix $A$.

If UPLO $=\mathrm{L}$ ', the leading N -by N low er triangular partofA contains the low er triangular part of the matrix A. On exit, the low ertriangle (if $\mathrm{UPLO}=\mathrm{L}$ ) or the uppertriangle (if $\mathrm{UPLO}=\mathrm{U}$ ) of A , including the diagonal, is destroyed.

LDA (input)
The leading dim ension of the amay A. LDA >= $\max (1, \mathbb{N})$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

VU (input)
See the description of V L .

II (input)
If RA NGE= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=N$, if $N>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE= A 'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * max ( $\mid$ |, $\mid$ |),
where EPS is them achine precision. IfABSTOL is less than or equalto zero, then EPS* $\mid$ |w illbe used in its place, where $T$ is the 1 -nom of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonal form .

See "C om puting Sm allSingularV alues of $B$ idiagonal M atrices with G uaranteed H igh Relative A ccuracy," by D em meland K ahan, LA PA CK W orking N ote \#3.

If high relative accuracy is im portant, setA B STO L to SLAM CH (Safe minim um' ). D oing so will guarantee thateigenvalues are com puted to high relative accuracy when possible in future
releases. The cument code does not $m$ ake any guarantees abouthigh relative accuracy, but funutre releasesw ill. See J.B arlow and J. Demmel, "C om puting A ccurate E igensystem s of Scaled D iagonally D om inantM atrices", LA PA CK W orking N ote \#7, for a discussion of which $m$ atrices define their eigenvalues to high relative accuracy .

M (output)
The total num berofeigenvalues found. $0<=\mathrm{M}$ <= N . IfRANGE $=A \prime, \mathrm{M}=\mathrm{N}$, and ifRANGE $=\mathrm{I}^{\prime}, \mathrm{M}=$ $\mathbb{U}-\mathbb{L}+1$.

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $\mathcal{O B Z}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, the first M colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, $w$ ith the $i$-th colum $n$ of $Z$ holding the eigenvector associated w ith W (i). If $\mathrm{JOBZ}=\mathrm{N}$ ', then $Z$ is not referenced. N ote: the userm ust ensure that at leastm ax ( $1, \mathrm{M}$ ) colum ns are supplied in the amay $Z$; ifRANGE = V', the exact value of M is not know n in advance and an upperbound m ust be used.

LD Z (input)
The leading din ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)$.

ISU PPZ (output)
The support of the eigenvectors in $Z$, ie., the indices indicating the nonzero elem ents in Z . The i-th eigenvector is nonzero only in elem ents $\operatorname{ISUPPZ}(2 \star i-1)$ through $\operatorname{ISU} \operatorname{PPZ}(2 * i)$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. LW ORK >= $\max (1,26 * N)$. For optim al efficiency, LW ORK >= (NB+6)*N, where NB is the m ax of the blocksize for SSY TRD and SORM TR retumed by $\mathbb{L} A E N V$.

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of
the W ORK amray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA .
IV ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ O RK (1) retums the optim al LW ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N}$ ORK. LIV ORK >= $\max (1,10 \star N)$.

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the IV ORK array, and no errorm essage related to LIN ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N N}$ FO $=-$ i, the $i$-th argum enthad an illegalvalue
> 0: Intemalerror

## PURPOSE

ssyevx com putes selected eigenvalues and, optionally, eigenvectors of a real symm etric $m$ atrix A. Eigenvalues and eigenvectors can be selected by specifying either a range of values or range of indices for the desired eigenvalues.

## ARGUMENTS

JOBZ (input)
$=\mathrm{N}$ : C om pute eigenvalues only;
$=\mathrm{V}$ ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= 'A ': alleigenvalues w illbe found.
$=\mathrm{V}$ : alleigenvalues in the half-open interval
(VL, VU] w ill be found. = I': the II th through
$\mathbb{I U}$-th eigenvaluesw illbe found.

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
On entry, the symm etric $m$ atrix $A$. If $\operatorname{PLO}=U '$, the leading N -by N uppertriangularpartof A contains the upper triangular part of the $m$ atrix $A$. If UPLO = L', the leading N -by N low er triangular partofA contains the low er triangular part of the $m$ atrix $A$. On exit, the low ertriangle (if $\mathrm{UPLO}=\mathrm{L}$ ) or the uppertriangle (if $\mathrm{UPLO}=\mathrm{U}$ ) of A , including the diagonal, is destroyed.
LDA (input)
The leading dim ension of the array A. LD A >= $\max (1, \mathbb{N})$.

VL (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A 'or I'.

VU (input)
See the description of V L .

II (input)
IfRA NGE= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{L}=1$ and $\mathbb{U}=0$ if $\mathrm{N}=0$. N ot referenced ifRANGE $=$ A 'or V'.
$\mathbb{I U}$ (input)
See the description of II.

ABTOL (input)
The absolute error tolerance for the eigenvalues. A $n$ approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABTOL + EPS * max ( $\mathfrak{k}|, \mathrm{p}|)$,
where EPS is the m achine precision. If ABTOL is less than orequal to zero, then EPS* $\mid$ | w illbe used in its place, where $T$ | is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonal form .

E igenvalues w illbe com putedm ostaccurately when

ABTOL is set to tw ice the underflow threshold $2 *$ SLAM CH (S ), notzero. If this routine retums w ith $\mathbb{N}$ FO $>0$, indicating that som e eigenvectors did not converge, try setting ABTOL to $2 *$ SLAM CH (S ).

See "C om puting Sm allSingularV ahues of B idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by D em m eland K ahan, LA PA CK W orking N ote \#3. NFOUND (output)

The total num ber of eigenvalues found. $0<=$ NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE $=I^{\prime}$, NFOUND $=\mathbb{U}-\mathbb{L}+1$.

W (output)
On norm alexit, the firstN FOUND elem ents contain the selected eigenvalues in ascending order.
$Z$ (input) If $J O B Z=V^{\prime}$, then if $\mathbb{N F O}=0$, the first $N F O U N D$ colum ns of $Z$ contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, $w$ ith the i-th colum $n$ of $Z$ holding the eigenvector associated with $W$ (i). If an eigenvector fails to converge, then that colum n of $Z$ contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in FAII. If $J 0 B Z=N$ ', then $Z$ is not referenced. $N$ ote: the user must ensure that at least $m$ ax ( 1, NFO UND ) colum ns are supplied in the array $Z$; if RANGE = V', the exactvalue ofNFOUND is not know $n$ in advance and an upperbound $m$ ust.be used.

LD Z (input)
The leading dim ension of the array $Z . L D Z>=1$, and if $\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length of the array $W$ ORK. LDW ORK >= $\max (1,8 * N)$. For optim al efficiency, LDW ORK >= ( $\mathrm{N} B+3)^{*} \mathrm{~N}$, where $N B$ is the $m$ ax of the blocksize for SSY TRD and SORM TR retumed by IUAENV.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

IV ORK 2 (w orkspace)
ㅍFAII (output)
If $\mathrm{OBZ}=\mathrm{V}^{\prime}$, then if $\mathbb{N F O}=0$, the first NFOUND
elem ents of $\mathbb{F A} I I$ are zero. If $\mathbb{N} F O>0$, then
IFA II contains the indices of the eigenvectors
that failed to converge. If $\mathrm{OBZ}=\mathrm{N}$ ', then
$\mathbb{F} A \mathbb{I}$ is notreferenced.

INFO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$ th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=$ i, then ieigenvectors failed to converge. Their indices are stored in anay 팦.

void ssygv_64 (long itype, char jobz, char uplo, long n, float *a, long lda, float *b, long ldb, float *w , long *info);

## PURPOSE

ssygv com putes all the eigenvalues, and optionally, the eigenvectors of a realgeneralized sym m etric-definite eigenproblem, of the form $A{ }^{*} x=(\operatorname{lam} . b d a){ }^{*} B{ }^{*} x, A * B x=(\operatorname{lam} . b d a){ }^{*} x$, or $B *_{A} *_{x}=(\operatorname{lam} . b d a){ }^{*} x$. H ere $A$ and $B$ are assum ed to be sym $m$ etric and $B$ is also positive definite.

## ARGUMENTS

## ITYPE (input)

Specifies the problem type to be solved:
$=1: A *_{x}=(\operatorname{lam} . b d a){ }^{*} B{ }^{*}{ }_{x}$
$=2: A * B{ }^{*} \mathrm{x}=\left(\operatorname{lam}\right.$ bda) ${ }^{\star} \mathrm{x}$
$=3: B * A{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda}){ }^{\star} \mathrm{x}$

JO B Z (input)
$=\mathrm{N}$ ': C om pute eigenvalues only;
$=V^{\prime}:$ C om pute eigenvalues and eigenvectors.

UPLO (input)
$=U$ ': U ppertriangles of A and B are stored;
$=\mathbb{L}$ ': Low ertriangles of $A$ and $B$ are stored.

N (input) The order of the $m$ atriges $A$ and $B . N>=0$.

A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading N boy N uppertriangularpartofA contains the upper triangularpart of the $m$ atrix $A$.

If UPLO $=\mathrm{L}$ ', the leading N -by N low er triangular part ofA contains the low er triangular part of them atrix A.

On exit, if $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, A contains the $m$ atrix $Z$ of eigenvectors. The eigenvectors are norm alized as follow s: if ITYPE =1 or 2, $Z * * T * B * Z=I$; if $T T Y P E=3, Z * * T * i n v(B) * Z=I$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then on exit the uppertriangle (if $\mathrm{UPLO}=\mathrm{U}$ ) or the low er triangle (if $\mathrm{UPLO}=\mathrm{L}$ ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= max ( $1, \mathbb{N}$ ).
B (input/output)
O $n$ entry, the sym $m$ etric positive definite $m$ atrix $B$. If $\mathrm{UPLO}=\mathrm{U}$ ', the leading N -by N uppertriangularpartofB contains the upper triangular part of the $m$ atrix $B$. If $\mathrm{PLO}=\mathrm{L}$ ', the leading N by-N lowertriangularpart of B contains the low er triangularpart of the m atrix B .

On exit, if $\mathbb{N F O}<=N$, the part of $B$ containing the $m$ atrix is overw rilten by the triangular factor U orL from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $\mathrm{B}=\mathrm{L} * \mathrm{~L} * * \mathrm{~T}$.

LD B (input)
The leading dim ension of the amay $B$. LD B >= $\max (1, N)$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length of the array $W$ ORK. LDW ORK >= m ax $(1,3 * \mathrm{~N}-1)$. For optim alefficiency, LD W ORK >= $(N B+2)^{\star} N$, where $N B$ is the blocksize for SSYTRD retumed by ILAENV .

If LD W ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{I N} F O$ (output)
= 0: successfiulexit
$<0:$ if $\mathbb{N F O}=-$ i, the i-th argum enthad an illegalvalue
> 0: SPO TRF orSSYEV retumed an errorcode: $<=\mathrm{N}:$ if $\mathbb{N} F \mathrm{O}=\mathrm{i}$, SSYEV failed to converge; i off-diagonalelem ents of an interm ediate tridiagonalform did notconverge to zero; > N : if $\mathbb{N F O}$ $=N+i$, for $1<=i<=N$, then the leading $m$ inor of orderiofB is not positive definite. The factorization of B could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

void ssygvd_64 (long itype, char j̀jbz, char uple, long n, float *a, long lda, float*b, long ldb, float *w , long *info);

## PURPOSE

ssygvd com putes all the eigenvahues, and optionally, the eigenvectors of a realgeneralized sym m etric-definite eigenproblem, of the form $A * x=(\operatorname{lam} . b d a) * B{ }^{*} x, A * B x=(\operatorname{lam} b d a){ }^{*} x$, or $B * A * x=(\operatorname{lam} . b d a){ }^{\star} x$. H ere $A$ and $B$ are assum ed to be sym $m$ etric and $B$ is also positive definite. If eigenvectors are desired, ituses a divide and conqueralgorithm .

The divide and conquer algorithm $m$ akes very $m$ ild assum ptions about floating point arithm etic. Itw illw ork on $m$ achines w ith a guard digit in add/subtract, or on those binary $m$ achines $w$ thout guard digits $w$ hich subtract like the $C$ ray X M P , C ray Y M P , C ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al $m$ achines $w$ ithout guard digits, butw e know of none.

## ARGUMENTS

ITYPE (input)
Specifies the problem type to be solved:
$=1: A *_{\mathrm{x}}=(\operatorname{lam} \mathrm{bda}){ }^{*} \mathrm{~B}{ }^{*} \mathrm{x}$
$=2: A * B{ }^{*} \mathrm{x}=(\operatorname{lam} \mathrm{bda}){ }^{\star} \mathrm{x}$
$=3: B *^{*} *_{X}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{X}$

JOBZ (input)
$=N^{\prime}:$ C om pute eigenvalues only;
$=\mathrm{V}$ : C om pute eigenvalues and eigenvectors.

UPLO (input)
$=\mathrm{U}$ ': U ppertriangles of $A$ and $B$ are stored;
$=\mathrm{L}$ ': Low ertriangles of $A$ and $B$ are stored.
N (input) The order of the m atrices A and $\mathrm{B} . \mathrm{N}>=0$.
A (input/output)
On entry, the sym m etric $m$ atrix $A$. If $U P L O=U '$, the leading $\mathrm{N}-$ by -N uppertriangularpartofA contains the upper triangular part of the $m$ atrix $A$. If UPLO = L', the leading N by -N low er triangular partofA contains the low er triangular part of the $m$ atrix $A$.

On exit, if $\mathrm{JOBZ}=\mathrm{V}$ ', then if $\mathbb{N F O}=0$, A contains the $m$ atrix $Z$ ofeigenvectors. The eigenvectors are norm alized as follow s: if ITYPE = 1 or 2, $\mathrm{Z} * * \mathrm{~T} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}$; if $\mathrm{IT} Y \mathrm{PE}=3, \mathrm{Z} * * \mathrm{~T} * \operatorname{inv}(\mathrm{~B}) * \mathrm{Z}=\mathrm{I}$. If $\mathrm{JOBZ}=\mathrm{N}$ ', then on exit the upper triangle (if $\mathrm{UPLO}=\mathrm{U}$ ) or the low er triangle (if $\mathrm{UPLO}=\mathrm{L}$ ) of A, including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

B (input/output)
On entry, the symm etric $m$ atrix $B$. If $\operatorname{PLO}=U$ ', the leading N -by N uppertriangularpartofB contains the upper triangular part of the $m$ atrix $B$. If U PLO = L', the leading N by -N low er triangular partofB contains the low er triangular part of the $m$ atrix $B$.

On exit, if $\mathbb{N} F O<=N$, the part of $B$ containing the $m$ atrix is overw rilten by the triangular factor $U$ orL from the C holesky factorization $B=U * * T * U$ orB $=\mathrm{L}$ * $\mathrm{L} * * \mathrm{~T}$.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, N)$.

W (output)
If $\mathbb{N} F O=0$, the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array $W$ ORK. If $N<=1$, LW ORK $>=1$. If $\mathrm{OBZ}=\mathrm{N}^{\prime}$ and $\mathrm{N}>1$, LW ORK $>=$ $2 \star \mathrm{~N}+1$. If $\mathrm{OBZ}=\mathrm{V}^{\prime}$ and $\mathrm{N}>1$,LW ORK $>=1+6 * \mathrm{~N}$ $+2 \star \mathrm{~N} * * 2$ 。

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
On exit, if $\mathbb{N} F O=0, \mathbb{I N}$ ORK (1) retums the optim al LIW ORK.

LIV ORK (input)
The dim ension of the amay $\mathbb{I W} O R K$. If $\mathrm{N}<=1$, LIW ORK >=1. If $O B Z=N$ 'andN $>1$,LIW ORK $>=$ 1. If $\mathrm{OBZ}=\mathrm{V}$ 'and $\mathrm{N}>1$, LIN $\mathrm{ORK}>=3+5 \star \mathrm{~N}$.

IfLIW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I W}$ ORK array, retums this value as the first entry of the $\mathbb{I W}$ ORK aray, and no errorm essage related to $L \mathbb{I} W$ ORK is issued by XERBLA.
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0$ : if $\mathbb{N}$ FO $=-i$, the $i$ th argum ent had an illegalvalue
> 0: SPO TRF orSSY EVD retumed an errorcode:
$<=\mathrm{N}:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{SSYEVD}$ failed to converge; i offf-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero; > N : if $\mathbb{N N F O}$ $=N+i$, for $1<=i<=N$, then the leading $m$ inor oforderiofB is not positive definite. The factorization of $B$ could notbe com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void ssygvx (int itype, char jobz, char range, charuple, int n , float *a, int lda, float *b, int ldo, float vl, floatvu, int il, intiu, float abstol, int *m, float *W, float *z, int ldz, int*ifail, int *info);
void ssygvx_64 (long itype, char jobz, char range, charuplo, long $n$, float *a, long lda, float *b, long ldb, floatvl, float vu, long il, long iu, float abstol, long *m, float *W, float *z, long ldz, long *ifail, long *info);

## PURPOSE

ssygvx com putes selected eigenvalues, and optionally, eigenvectors of a realgeneralized sym $m$ etric-definite eigenproblem, of the form $A * x=(\operatorname{lam} b d a) * B{ }^{*} x, A * B x=(\operatorname{lam} b d a) * x$, or $B * A * x=(\operatorname{lam} . b d a){ }^{\star} x$. H ere $A$ and $B$ are assum ed to be sym $m$ etric and $B$ is also posilive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvahes.

## ARGUMENTS

## ITYPE (input)

Specifies the problem type to be solved:
$=1: A{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda}){ }^{\mathrm{B}}{ }^{*} \mathrm{X}$
$=2: \mathrm{A} * \mathrm{~B} * \mathrm{X}=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{x}$
$=3: B * A * x=\left(\operatorname{lam}\right.$ bda) ${ }^{*} \mathrm{x}$
JOBZ (input)
$=\mathrm{N}^{\prime}$ : C om pute eigenvalues only;
$=\mathrm{V}:$ : C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w ill.be found.
= V : alleigenvahues in the half-open interval ( $\mathrm{L}, \mathrm{V}, \mathrm{J}]$ will be found. = I ': the I -th through $\mathbb{I U}$-th eigenvaluesw illlbe found.

UPLO (input)
= U ': U ppertriangle of A and B are stored;
= L': Low ertriangle of A and B are stored.
N (input) The order of the $m$ atrix pencil $(A, B) . N>=0$.
A (input/output)
On entry, the symm etric m atrix $A$. If UPLO = U', the leading N -by -N uppertriangularpart of A contains the upper triangular part of the $m$ atrix $A$. If UPLO $=\mathrm{L}$ ', the leading N -by N low er triangular partofA contains the low er triangular part of them atrix A.

On exit, the low er triangle (ifU PLO = L) or the upper triangle (if $\mathrm{PLO}=\mathrm{U}$ ) ofA, including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.

B (input/output)
On entry, the symm etric $m$ atrix $B$. If $U P L O=U$ ', the leading N -by N uppertriangular partofB contains the upper triangularpart of the $m$ atrix $B$. If UPLO = L', the leading N -by -N low er triangular partofB contains the low er triangular part of the matrix B .

On exit, if $\mathbb{N F O}<=N$, the part of $B$ containing the $m$ atrix is overw rilten by the triangular factor U orL from the Cholesky factorization $\mathrm{B}=\mathrm{U} * * \mathrm{~T} * \mathrm{U}$ or $B=L{ }^{\star} L^{\star *}{ }^{\mathrm{T}}$.

LD B (input)
The leading dim ension of the aray B. LD B >= $\max (1, N)$.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. $\mathrm{VL}<\mathrm{VU}$. N ot referenced ifRANGE=A 'or 'I'.

VU (input)
See the description ofV L .
IU (input)
IfRA NGE= I', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. $1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}$, if $\mathrm{N}>0$; $\mathbb{U}=1$ and $\mathbb{U}=0$ if $N=0$. $N$ otreferenced ifRANGE $=$ A'or V'.

IU (input)
See the description of II.

ABSTOL (input)
The absolute emortolerance forthe eigenvalues.
A $n$ approxim ate eigenvalue is accepted as converged $w$ hen it is determ ined to lie in an interval [a,b] of w idth less than orequal to
$A B S T O L+E P S * \max (|a|,||$,$) ,$
where EPS is them achine precision. IfA BSTOL is less than or equal to zero, then EPS*|I w illbe used in its place, w here $T$ | is the 1 -norm of the tridiagonal $m$ atrix obtained by reducing $A$ to tridiagonalform.

E igenvahues w ill.be com puted m ostaccurately w hen ABSTOL is set to tw ige the underflow threshold 2*D LAM CH (S ), notzero. Ifthis routine retums w ith $\mathbb{N} \mathrm{FO}>0$, indicating thatsom e eigenvectors did not converge, try setting ABSTOL to $2 *$ SLAM CH (S ).

M (output)
The totalnum ber ofeigenvalues found. $0<=\mathrm{M}<=$ N . IfRANGE=A', M=N, and ifRANGE= 'I'M = $\mathbb{U}-\mathbb{L}+1$ 。

W (output)
O n norm alexit, the firstM elem ents contain the selected eigenvahues in ascending order.
$Z$ (input) If $\mathrm{OBB}=\mathrm{N}^{\prime}$, then Z is notreferenced. If OBZ $=V$ ', then if $\mathbb{N} F O=0$, the firstM colum ns of $Z$ contain the orthonorm aleigenvectors of the $m$ atrix A corresponding to the selected eigenvalues, w ith the i-th colum $n$ of $Z$ holding the eigenvector associated w ith W (i). The eigenvectors are norm alized as follow s: if ITYPE $=1$ or $2, Z * * T * B * Z=I$; if $\operatorname{ITYPE}=3, Z * * T * \operatorname{inv}(B) * Z=I$.
If an eigenvector fails to converge, then that colum $n$ of $Z$ contains the latestapproxim ation to the eigenvector, and the index of the eigenvector is retumed in $\mathbb{F} A \mathbb{I}$. N ote: the userm ustensure that at leastm ax ( $1, M$ ) colum ns are supplied in the amay $Z$; ifRANGE = V', the exactvalue ofM is notknow $n$ in advance and an upper bound m ust be used.

LD Z (input)
The leading dim ension of the array $\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1$, and if $\mathrm{OBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)$.

W ORK (w orkspace)
On exit, if $\mathbb{N F O}=0, W$ ORK ( 1 ) retums the optim al LW ORK.

## LW ORK (input)

The length of the array $W$ ORK. LW ORK >= $\mathrm{max}(1,8 * \mathrm{~N})$. For optim al efficiency, LW ORK >= $(\mathbb{N B}+3) \star \mathrm{N}$, where NB is the blocksize for SSY TRD retumed by $\amalg \mathrm{LA} E \mathrm{EN}$.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)
dim ension ( $5 \star \mathrm{~N}$ )

FAII (output)
If $O B Z=V^{\prime}$, then if $\mathbb{N F O}=0$, the firstM ele$m$ ents of $\mathbb{F} A \mathbb{I}$ are zero. If $\mathbb{N} F O>0$, then $\mathbb{F} A \mathbb{H}$ contains the indices of the eigenvectors that failed to converge. If $\mathrm{OOBZ}=\mathrm{N}$ ', then $\mathbb{F} A \mathbb{I}$ is notreferenced.
$\mathbb{N}$ FO (output)
= 0: successfulexit
<0: if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvahue
> 0: SPO TRF orSSY EVX retumed an errorcode:
$<=N:$ if $\mathbb{N} F O=i, S S Y E V X$ failed to converge; i eigenvectors failed to converge. Their indices are stored in array $\mathbb{F A} \mathbb{I} .>N$ : if $\mathbb{N} F O=N+$ $i$, for $1<=i<=N$, then the leading $m$ inor of orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

## C INTERFACE

\#include <sunperfh>
void ssym m (charside, charuplo, intm , intn, float alpha, float *a, int lda, float *b, int ldb, floatbeta, float* *, int ldc);
void ssym m _64 (charside, charuplo, long m, long n, float alpha, float *a, long lda, float*b, long ldb, floatbeta, float *c, long ldc);

## PURPOSE

ssym $m$ perform sone of the $m$ atrix-m atrix operations $C=$ alpha*A *B + beta* C or $\mathrm{C}:=$ alpha*B *A + beta* C where alpha and beta are scalars, $A$ is a sym $m$ etric $m$ atrix and $B$ and $C$ are $m$ by $n m$ atrices.

## ARGUMENTS

SIDE (input)
O n entry, SIDE specifiesw hether the sym metric $m$ atrix A appears on the leftorright in the operation as follow s:
$S \mathbb{D E}=$ L'or I' $C:=$ a耳pha*A *B + beta* $C$,

SIDE = R 'or 'r' C : alpha*B *A + beta*C ,

U nchanged on exit.

## UPLO (input)

On entry, UPLO specifies whether the upper or lower triangular part of the symm etric $m$ atrix $A$ is to be referenced as follow $s$ :
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' Only the upper triangularpart of the sym $m$ etric $m$ atrix is to be referenced.
$\mathrm{UPLO}=\mathrm{L}$ 'or $\mathrm{I}^{\prime}$ ' O nly the low ertriangularpart of the sym $m$ etric $m$ atrix is to be referenced.

U nchanged on exit.
M (input)
O $n$ entry, M specifies the num ber of row sof the $m$ atrix $C . M$ M $=0$. U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the $m$ atrix $C . N>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.
A (input)
REAL array ofD $\mathbb{M}$ ENSION (LDA, ka), where ka ism when $S \mathbb{D} E=\mathbb{L}$ 'or I ' and is n otherw ise.

Before entry with SDE = L'or I', the m by $m$ part of the array A mustcontain the sym $m$ etric $m$ atrix, such thatw hen UPLO $=U$ 'or $L^{\prime}$ ', the leading $m$ by $m$ uppertriangular part of the array A mustcontain the upper triangular part of the symm etric $m$ atrix and the strictly low er triangularpart of A is not referenced, and $w$ hen UPLO = L' or I', the leading $m$ by $m$ lowertriangularpart of the array A m ust contain the lower triangular part of the sym $m$ etric $m$ atrix and the strictly upper triangular part of A is not referenced.

Before entry with $S \mathbb{D E}=\mathrm{R}$ 'or 'r', the n by $n$ part of the amray A $m$ ustcontain the sym$m$ etric $m$ atrix, such thatw hen UPLO $=U$ 'or L ', the leading $n$ by $n$ upper triangularpart of the array A mustcontain the upper triangular part of the symm etricm atrix and the strictly low er triangularpartof $A$ is not referenced, and when UPLO = L' or I', the leading $n$ by $n$ low er triangularpart of the anray A must contain the lower triangular part of the sym $m$ etric $m$ atrix and the strictly upper triangular part of A is not referenced.

U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen $S \mathbb{D} E=\mathbb{L}$ 'or I ' then LD A $>=\mathrm{max}(1, \mathrm{~m})$, other-
w ise LD $\mathrm{A}>=\mathrm{max}(1, \mathrm{n})$. U nchanged on exit.
B (input)
REAL array ofD $\mathbb{M}$ ENSION (LDB, $n$ ). Before entry, the leading $m$ by $n$ partof the array $B$ ust contain the $m$ atrix B. U nchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. LD $B>=m a x(1, m)$. Unchanged on exit.
BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need not.be set on input. U nchanged on exit.

C (input/output)
REAL array ofD $\mathbb{I M}$ ENSION (LDC,n). Before entry, the leading $m$ by $n$ partofthe aray $C$ must contain the $m$ atrix $C$, except when beta is zero, in which case $C$ need notbe seton entry. On exit, the array $C$ is overw ritten by the $m$ by n updated m atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C $>=\max (1, m)$. U nchanged on exit.

void ssym v (charuplo, intn, float alpha, float *a, int lda, float *x, int incx, float beta, float*y, int incy);
void ssym v_64 (charuplo, long n, floatalpha, float *a, long lda, float *x, long incx, floatbeta, float *y, long incy);

## PURPOSE

ssym v perform sthe $m$ atrix-vector operation $y:=a \xi p h a \star A * x+$ beta* $y$, w here alpha and beta are scalars, $x$ and $y$ are $n$ ele$m$ entvectors and $A$ is an $n$ by $n$ sym $m$ etric $m$ atrix .

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the array $A$ is to be referenced as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' Only the upper triangularpart of A is to be referenced.
$\mathrm{UPLO}=\mathrm{L}$ 'or l' O nly the low ertriangularpart of A is to be referenced.

U nchanged on exit.

N (input)
O $n$ entry, $N$ specifies the order of the $m$ atrix $A$. $\mathrm{N}>=0$. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading
n by n upper triangularpart of the array A m ust contain the upper triangular part of the sym $m$ etric $m$ atrix and the strictly low ertriangularpartofA is not referenced. Before entry w ith UPLO = L' or '1', the leading $n$ by $n$ low er triangularpart of the array A m ust contain the low er triangular part of the sym $m$ etric $m$ atrix and the strictly uppertriangularpart of $A$ is not referenced. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A >= $\max (1, n)$. U nchanged on exit.

X (input)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the $n$ elem ent vectorx. U nchanged on exit.
$\mathbb{N} C X$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX . $\mathbb{N} C X<>0$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then Y need notbe seton input. U nchanged on exit.

Y (input/output)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. B efore entry, the increm ented array $Y$ m ust contain the $n$ elem ent vectory. On exit, $Y$ is overw rilten by the updated vectory.
$\mathbb{N C C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $. \mathbb{N} C Y<>0$. U nchanged on exit.

## C INTERFACE

\#include <sunperfh>
void ssyl2 (charuple, intn, float alpha, float *x, int incx, float *y, intincy, float *a, intlda);
void ssyl2_64 (charuplo, long n, floatalpha, float *x, long incx, float *y, long incy, float *a, long lda);

## PURPOSE

ssyl2 performs the symmetric rank 2 operation $A:=$ alpha* $x^{\star} y^{\prime}+$ alpha* $y^{\star} x^{\prime}+A$, w here alpha is a scalar, $x$ and $y$ are $n$ elem ent vectors and $A$ is an $n$ by $n$ sym $m$ etric $m$ atrix.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the array $A$ is to be referenced as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or L ' Only the upper triangularpant of $A$ is to be referenced.
$\mathrm{UPLO}=\mathrm{L}$ 'or l' O nly the low er triangularpart of A is to be referenced.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix $A$. $N>=0$. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C X))$. Before entry, the increm ented array $X$ must contain the $n$ elem ent vectorx. U nchanged on exit.
$\mathbb{N C X}$ (input)
On entry, $\mathbb{N} C X$ specifies the increm ent for the elem ents ofX . $\mathbb{N} C X<>0$. U nchanged on exit.

Y (input)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectory. U nchanged on exit.
$\mathbb{N C C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $. \mathbb{N} C Y<>0$. U nchanged on exit.
A (input/output)
Before entry w ith UPLO = U 'or L', the leading $n$ by $n$ upper triangularpart of the array A m ust contain the upper triangular part of the sym $m$ etric $m$ atrix and the strictly low er triangularpart of A is not referenced. On exit, the upper triangular part of the array A is overw rilten by the upper triangularpart of the updated $m$ atrix. Before entry w ith UPLO = L 'or I', the leading $n$ by $n$ low er triangularpart of the array A m ust contain the low er triangularpart of the sym $m$ etric $m$ atrix and the strictly uppertriangularpart of A is not referenced. On exit, the low er triangularpart of the array $A$ is overw rilten by the low er triangular part of the updated $m$ atrix.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A >= $\max (1, n)$. U nchanged on exit.

void ssyi2k_64 (charuplo, chartransa, long n, long $k$, float alpha, float *a, long lda, float*b, long ldb, float.beta, float * c , long ldc);

## PURPOSE

ssy 2 k perform s one of the sym $m$ etric rank 2 k operations $\mathrm{C}:=$ alpha*A*B'+ alpha*B*A'+ beta*C or C := alpha*A *B + alpha*B *A + beta*C w here alpha and beta are scalars, C is an $n$ by $n$ symmetric $m$ atrix and $A$ and $B$ are $n$ by $k$ $m$ atrices in the first case and $k$ by $n m$ atrices in the second case.

## ARGUMENTS

## UPLO (input)

On entry, UPLO specifies whether the upper
or lower triangular part of the array $C$ is
to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof $C$ is to be referenced.

UPLO = L'or I' Only the lower triangular partof C is to be referenced.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA $=\mathrm{N}^{\prime}$ or $\mathrm{h}^{\prime} \mathrm{C}:=$ alpha*A *B '+ alpha*B*A '

+ beta*C.

TRANSA = T'ort' $\mathrm{C}:=$ alpha*A *B + alpha*B *A + beta*C.

TRANSA = C 'or C' C : alpha*A *B + alpha*B *A + beta*C .

U nchanged on exit.

TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix C. N m ust.be at least zero. U nchanged on exit.
$K$ (input)
On entry w th TRANSA = N 'or h', K specifies the num ber of colum ns of the $m$ atrioes $A$ and $B$, and on entry $w$ ith TRANSA $=T$ 'or t'or $C^{\prime}$ or $k^{\prime}, \mathrm{K}$ specifies the num ber of row sof the $m$ atrices $A$ and $B$. $K$ must be at least zero. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
REAL array ofD $\mathbb{M} E N S \mathbb{O N}$ (LDA, ka) , where ka isk when TRANSA = N 'or h', and is n otherw ise. Before entry w ith $\mathrm{TRANSA}=\mathrm{N}^{\prime}$ or
h', the leading $n$ by k partof the amay A
m ustcontain the m atrix $A$, otherw ise the leading k by n partof the array $A$ mustcontain the $m$ atrix A. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA $=N$ 'or h'then LDA must be at least $\max (1, n)$, otherw ise LD A m ustbe at least $\max (1, k)$. U nchanged on exit.

B (input)
REAL array ofD $\mathbb{M E N S I O N}$ (LDB, kb ), where kb isk when TRANSA = N 'or h', and is n otherw ise. Before entry w ith TRANSA $=\mathrm{N}^{\prime}$ or $h$ ', the leading $n$ by k part of the array $B$ m ust contain the $m$ atrix $B$, otherw ise the leading $k$ by $n$ partof the aray $B$ mustcontain the $m$ atrix B. U nchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. $W$ hen TRANSA $=N$ 'or $h$ 'then LDB must be at least $\max (1, n)$, otherw ise LD B m ustbe at least $\max (1, k)$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
REAL amay ofD $\mathbb{M} E N S I O N(L D C, n)$.

Before entry w th UPLO = U'or L', the leading $n$ by $n$ uppertriangularpart of the anray $C$ $m$ ustcontain the upper triangular part of the sym $m$ etric $m$ atrix and the strictly low er triangularpartofC is not referenced. On exit, the upper triangularpart of the array $C$ is overw ritten by the upper triangularpart of the updated $m$ atrix.

Before entry w ith UPLO = L 'or I', the leading $n$ by $n$ low er triangular part of the array $C$ $m$ ustcontain the low er triangular part of the sym $m$ etric $m$ atrix and the strictly uppertriangularpartof C is not referenced. On exit, the low er triangularpart of the array $C$ is overw ritten by the low er triangularpart of the updated $m$ atrix.

LD C (input)
O n entry, LD C specifies the first dim ension of C as declared in the calling (sub) program.
LD C m ust be at leastm ax ( $1, \mathrm{n}$ ). U nchanged on exit.

## PURPOSE

ssyufs im proves the com puted solution to a system of linear equations w hen the coefficientm atrix is sym m etric indefinite, and provides errorbounds and backw ard error estim ates for the solution.

## ARGUMENTS

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The order of the matrix A. $\mathrm{N}>=0$.
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the $m$ atrioes $B$ and $X$. NRH $S>=0$.

A (input) The sym m etric $m$ atrix $A$. If $\mathrm{PLO}=\mathrm{U}$ ', the leading N -by N uppertriangularpart of A contains the upper triangularpart of the $m$ atrix $A$, and the strictly low ertriangularpartofA is not refer-
enced. If UPLO = L', the leading N -by-N lower triangularpartofA contains the low er triangular part of the $m$ atrix A, and the strictly upper triangularpart of A is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

AF (input)
The factored form of them atrix A. AF contains the block diagonal matrix D and themultipliers used to obtain the factor $U$ or $L$ from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ orA $=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$ as com puted by SSY TRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= $\max (1, N)$.
$\mathbb{P I V O T}$ (input)
D etails of the interchanges and the block structure ofD as determ ined by SSY TRF.
$B$ (input) The righthand side m atrix $B$.
LD B (input)
The leading dim ension of the array $B$. LD B >= $\max (1, N)$.

X (input/output)
On entry, the solution $m$ atrix $X$, as com puted by SSY TRS. On exit, the im proved solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the array X . LD X >= $\max (1, N)$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X(\mathcal{j})$ the $j$ th column of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{H})$, FERR ( $)$ ) is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{D})-X$ TRUE) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{)}$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)

The com ponentw ise relative backw ard error of each solution vector $X(\mathcal{)}$ (ie., the sm allest relative change in any elem entofA orB thatm akes X ( $\mathcal{(}$ ) an exactsolution).

W ORK (w orkspace)
dim ension ( $3 * \mathrm{~N}$ )
W ORK 2 (w orkspace)
dim ension (N)
$\mathbb{N} F O$ (output)
= 0: successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum ent had an illegalvalue

void ssyrk_64 (charuplo, chartransa, long n, long k, float alpha, float *a, long lda, floatbeta, float * C , long ldc);

## PURPOSE

ssyik perform s one of the sym $m$ etric rank $k$ operations $C:=$ alpha*A *A '+ beta*C orC $:=$ alpha*A *A + beta*C where alpha and beta are scalars, $C$ is an $n$ by $n$ sym $m$ etric $m$ atrix and $A$ is an $n$ by $k m$ atrix in the first case and $a k$ by $n$ $m$ atrix in the second case.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whether the upper
or lower triangular part of the amay $C$ is
to be referenced as follow s:
$U P L O=U$ 'or $G^{\prime}$ Only the upper triangular part of $C$ is to be referenced.

UPLO = L'or I' Only the lower triangular part of $C$ is to be referenced.

U nchanged on exit.

TRANSA (input)
O n entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA $=N^{\prime}$ or $h^{\prime} \mathrm{C}:=$ alpha*A *A ' + beta* C.

TRANSA $=$ T'ort' $\mathrm{C}:=$ alpha*A *A + beta*C.

TRANSA $=$ C 'or $C^{\prime} C:=$ alpha*A *A + beta*C.

U nchanged on exit.
TRANSA is defaulted to $N$ 'forF $95 \mathbb{I N}$ TERFACE.

N (input)
On entry, $N$ specifies the order of the $m$ atrix $C$. N m ustbe at least zero. U nchanged on exit.

K (input)
On entry w ith TRANSA $=N$ 'or $h$ ', $K$ specifies the number of columns of the matrix $A$, and on entry $w$ ith TRANSA $=$ ' 'or t'or $C^{\prime}$ or $\mathrm{E}^{\prime}$, $K$ specifies the num ber of row sof the m atrix $\mathrm{A} . \mathrm{K}$ m ustibe at least zero. U nchanged on exit.
A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
REAL aray ofD $\mathbb{I M}$ ENSION (LDA, ka ), where ka isk when TRANSA = N'orh', and is
n otherw ise. Before entry w th TRANSA $=\mathrm{N}$ ' or h ', the leading n by k part of the array $A$ $m$ ust contain the $m$ atrix $A$, otherw ise the leading k by n partofthe array A mustcontain the m atrix A. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA $=N$ 'orh'then LDA must be at least $\max (1, n)$, otherw ise LDA m ustbe at least $\max (1, k)$. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
REAL aray ofD $\mathbb{I}$ ENSION (LDC,n).
Before entry w ith UPLO = U 'or L ', the leading $n$ by $n$ uppertriangularpart of the array $C$ $m$ ustcontain the upper triangular part of the sym $m$ etric $m$ atrix and the strictly low ertriangularpartofC is not referenced. On exit, the upper triangularpart of the array $C$ is overw ritten by the upper triangularpart of the updated
m atrix.

Before entry w ith UPLO = L 'or I', the leading $n$ by $n$ low ertriangular part of the anray $C$ m ust contain the low er triangular part of the sym $m$ etric $m$ atrix and the strictly upper triangularpartof C is not referenced. On exit, the low er triangularpart of the amay $C$ is overw ritten by the low er triangularpart of the updated $m$ atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastm ax ( $1, \mathrm{n}$ ). U nchanged on exit.

## C INTERFACE

\#include <sunperfh>
void ssysv (charuplo, intn, intnrhs, float *a, int lda, int *ipivot, float *b, int ldb, int *info);
void ssysv_64 (char uplo, long n, long nrhs, float *a, long lda, long *ipivot, float *b, long ldb, long *info);

## PURPOSE

ssysv com putes the solution to a realsystem of linearequations
$A * X=B$, where $A$ is an $N$-by-N symm etric $m$ atrix and $X$ and $B$ are $N$-by $-N$ RH S $m$ atrices.

The diagonalpivoting $m$ ethod is used to factorA as
$A=U * D * U * *$, if $U P L O=U$ ', or
$A=L * D * L * T$, if UPLO $=L$ ',
where $U$ (orL) is a productof perm utation and unit upper (low er) triangular $m$ atrices, and $D$ is sym $m$ etric and block diagonalw ith 1 -by -1 and 2 -by -2 diagonalblocks. The factored form of $A$ is then used to solve the system of equations $A * X=B$.

## ARGUMENTS

## UPLO (input)

= U : U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linear equations, ie., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS $>=0$.

A (input/output)

On entry, the symm etric $m$ atrix $A$. If $\mathrm{PLO}=\mathrm{U}$ ', the leading N -by -N uppertriangularpart of A contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. If $\mathrm{UPLO}=\mathrm{L}$ ', the leading N -by -N low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangular partofA is not referenced.

On exit, if $\mathbb{N} F O=0$, the block diagonalm atrix $D$ and the multipliers used to obtain the factor $U$ or L from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=$ L *D *L**T as com puted by SSY TRF.
LDA (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

IPIV (output)
D etails of the interchanges and the block structure ofD, as determ ined by SSY TRF. If $\mathbb{P} \mathbb{I V}(k)>$ 0 , then row $s$ and colum ns $k$ and $\mathbb{P} \mathbb{I V}(k)$ were interchanged, and $\mathrm{D}(\mathrm{k}, \mathrm{k})$ is a 1-by-1 diagonalblock. If $U P L O=U$ 'and $\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I}(k-1)<0$, then rows and colum ns $k-1$ and $-\mathbb{P} I V(k)$ were interchanged and $D(k-1 *, k-1 * k)$ is a $2-b y-2$ diagonal block. IfU PLO = L'and $\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I V}(k+1)<0$, then row $s$ and colum ns $k+1$ and - $\mathbb{P}$ IV ( $k$ ) w ere interchanged and $D(k: k+1, k \cdot k+1)$ is a $2-b y-2$ diagonal block.

B (input/output)
On entry, the N -by-NRH S righthand side m atrix B . On exit, if $\mathbb{N} F O=0$, the $N$-by $-N$ RH $S$ solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the aray B. LD B $>=$ $\max (1, N)$.

W ORK (w orkspace)
On exit, if $\mathbb{N F}$ F $=0, \mathrm{~W}$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length ofW ORK. LW ORK >=1, and forbestperform ance LW ORK >=N*NB, where NB is the optim al blocksize forSSY TRF.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of
the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
$\mathbb{I N F O}$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N} F O=-$ i, the $i$-th argum ent had an illegalvalue
$>0:$ if $\mathbb{N} F O=i, D(i, i)$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, so the solution could notbe com puted.

## C INTERFACE

\#include <sunperfh>
void ssysvx (char fact, charuplo, intn, intnrhs, float*a, int lda, float*af, int ldaf, int *ipivot, float *b, int ldlb, float *x, int ldx, float *roond, float *ferr, float *berr, int *info);
void ssysvx_64 (char fact, char uplo, long n, long nrhs, float *a, long lda, float*af, long ldaf, long *ipivot, float *b, long ldb, float *x, long ldx, float *rcond, float *ferr, float *berr, long *info);

## PURPOSE

ssysvx uses the diagonalpivoting factorization to com pute the solution to a realsystem of linear equations $A * X=B$, $w$ here $A$ is an $N$ boy $N$ sym $m$ etric $m$ atrix and $X$ and $B$ are $N$ boyN R H S m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:

1. IfFACT $=N$ ', the diagonalpivoting $m$ ethod is used to factorA.
The form of the factorization is
$A=U * D * U * * T$, if $U P L O=U \prime$, or
$A=L * D * L * * T$, if $U P L O=L \prime$
where U (orL) is a product ofperm utation and unitupper
(low er)
triangularm atrices, and $D$ is sym $m$ etric and block diago-

## nalw th

1-by-1 and 2-by-2 diagonalblocks.
2. If som eD $(i, i)=0$, so thatD is exactly singular, then the routine
retums w ith $\mathbb{N F O}=$ i. O therw ise, the factored form of A is used
to estim ate the condition num ber of the $m$ atrix $A$. If the reciprocal of the condition num ber is less than $m$ achine precision,
$\mathbb{N}$ FO $=\mathrm{N}+1$ is retumed as a waming, but the routine stillgoes on
to solve for $X$ and com pute error bounds as described below .
3.The system ofequations is solyed for $X$ using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
$m$ atrix and calculate error bounds and backw ard error estim ates
for it.

## ARGUMENTS

FACT (input)
Specifies w hether ornot the factored form of A has been supplied on entry. = $\mathrm{F}^{\prime}:$ O n entry, $\mathrm{A} F$ and $\mathbb{P I V O T}$ contain the factored form of A. AF and $\mathbb{P} \mathbb{I V}$ O T w illnotbe m odified. $=\mathrm{N}$ ': Them atrix A w illbe copied to A F and factored.

UPLO (input)
= U ': U pper triangle ofA is stored;
$=L^{\prime}$ : Low er triangle of $A$ is stored.
N (input) The num ber of linear equations, i.e., the order of them atrix $A . N>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS >=0.

A (input) The symm etricm atrix $A$. If UPLO $=U$ ', the leading $N$ by -N uppertriangularpartofA contains the upper triangularpart of the $m$ atrix $A$, and the strictly low ertriangularpartofA is not refer-
enced. If UPLO = L', the leading N -by-N lower triangularpartofA contains the low er triangular part of the $m$ atrix A, and the strictly upper triangularpart ofA is not referenced.

LDA (input)
The leading dim ension of the anay A. LDA >= $\max (1, N)$.

AF (input/output)
If FACT = F ', then $A F$ is an inputargum ent and on entry contains the block diagonalm atrix D and the m ultipliers used to obtain the factor $U$ orL from the factorization $A=U * D * U * * T$ orA $=L * D * L * * T$ as com puted by SSY TRF .
If FA C T = N ', then AF is an output argum ent and on exit retums the block diagonalm atrix $D$ and the multipliers used to obtain the factorU or L from the factorization $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}$ or $\mathrm{A}=$ $\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}$.

LDAF (input)
The leading dim ension of the array AF. LDAF >= $\max (1, N)$.

IPIVOT (inputoroutput)
If FACT = $\mathrm{F}^{\prime}$, then $\mathbb{P} \mathbb{I} O T$ is an input argum ent and on entry contains details of the interchanges and the block structure of D, as determ ined by SSY TRF. If $\mathbb{P} \operatorname{IV} O T(k)>0$, then row $s$ and colum ns $k$ and $\mathbb{P} \mathbb{I V O T}(k)$ were interchanged and $D(k, k)$ is a 1 -by-1 diagonal block. If UPLO $=U '$ and $\mathbb{P} \mathbb{I} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0$, then row sand colum ns $\mathrm{k}-1$ and $-\mathbb{P} \mathbb{I V O T}(\mathrm{k})$ were interchanged and $\mathrm{D}(\mathrm{k}-$ $1 \mathrm{k}, \mathrm{k}-1 \mathrm{k}$ ) is a 2 -by-2 diagonalblock. IfUPLO = L 'and $\mathbb{P} \mathbb{I V} O T(k)=\mathbb{P} \mathbb{I V} O T(k+1)<0$, then row $s$ and colum nsk+1 and $-\mathbb{P} \operatorname{IV} O T(k)$ were interchanged and D $k: k+1, k: k+1)$ is a 2 -by-2 diagonalblock.

If $\mathrm{FACT}=\mathrm{N}$ ', then $\mathbb{P} \mathbb{I V O T}$ is an output argum ent and on exitcontains details of the interchanges and the block structure of D, as determ ined by SSY TRF .

B (input) The N by -N R H S righthand side m atrix B .

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, \mathbb{N})$.

X (output)
If $\mathbb{N} F O=0$ or $\mathbb{N} F O=\mathrm{N}+1$, the N -by-NRH S solution
$m$ atrix $X$.

LD X (input)
The leading dim ension of the anay X . LD X >= $\max (1, N)$.

RCOND (output)
The estim ate of the reciprocal condition num ber of the matrix A. IfRCOND is less than them achine precision (in particular, if RCOND $=0$ ), the $m$ atrix is singular to working precision. This condition is indicated by a retum code of $\mathbb{N}$ FO > 0.

## FERR (output)

The estim ated forw ard emrorbound for each solution vector $X()$ ) the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution corresponding to $X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{D})-X$ TRU $E$ ) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each solution vector X (i) (i.e., the sm allest relative change in any elem entof $A$ or $B$ thatm akes $X(\mathcal{J})$ an exactsolution).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >= 3*N , and for best perform ance LDW ORK $>=N * N B$, where $N B$ is the optim alblocksize forSSY TRF.

If LDW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension $(\mathbb{N})$
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N F O}=-$ i, the $i$-th argum enthad an illegalvalue
$>0$ : if $\mathbb{N F O}=i$, and $i$ is
$<=\mathrm{N}: \mathrm{D}(i, i)$ is exactly zero. The factorization
has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND $=0$ is retumed. $=\mathrm{N}+1$ : D is nonsingular, butRCOND is less than $m$ achine precision, $m$ eaning that the $m$ atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRC O N D w ould suggest.

void ssytd2 (charuplo, intn, float *a, intlda, float *d, float *e, float *tau, int *info);
void ssytd2_64 (charuplo, long n, float *a, long lda, float *d, float *e, float *tau, long *info);

## PURPOSE

ssytd2 reduces a real sym $m$ etric $m$ atrix A to sym $m$ etric tridiagonal form $T$ by an orthogonal sim ilarity transform ation: Q ' * $A * Q=T$.

## ARGUMENTS

UPLO (input)
Specifies w hether the upper or low er triangular part of the sym $m$ etricm atrix A is stored:
= U ': U ppertriangular
= L': Low ertriangular

N (input) The orderof the matrix A. $\mathrm{N}>=0$.
A (input) $O n$ entry, the sym $m$ etric $m$ atrix $A$. If $U P L O=U '$, the leading $n-b y-n$ upper triangularpart of $A$ contains the uppertriangular part of the $m$ atrix $A$, and the strictly low ertriangularpart of A is not referenced. If UPLO = ' L ', the leading $\mathrm{n}-\mathrm{by}-\mathrm{n}$ low er triangularpart of $A$ contains the low ertriangularpart of the m atrix A, and the strictly upper triangular part of A is not referenced. On exit, if UPLO = U ', the diagonal and first superdiagonalofA are overw rilten by the corresponding elem ents of the tridiagonalm atrix $T$, and the ele$m$ ents above the first superdiagonal, $w$ ith the array TAU, represent the orthogonalm atrix $Q$ as a product of elem entary reflectors; if $\mathrm{IPLO}=\mathrm{L}$ ', the diagonaland firstsubdiagonalofA are overw ritten by the comesponding elem ents of the tridiagonalm atrix $T$, and the elem ents below the first subdiagonal, $w$ ith the amay TA $U$, represent the orthogonalm atrix $Q$ as a product of elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, \mathbb{N})$.

D (output)
The diagonalelem ents of the tridiagonalm atrix T :
D $(i)=A(i, i)$.

E (output)
The off-diagonal elem ents of the tridiagonal $m$ atrix $T: E(i)=A(i, i+1)$ if $U P L O=U ', E(i)=$ A $(\mathbf{i}+1, i)$ ifUPLO $=L$.

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).
$\mathbb{N} F O$ (output)
= 0 : successfiulexit
<0: if $\mathbb{N N F O}=-i$, the $i$-th argum ent had an illegalvalue.

## FURTHER DETAILS

If $U P L O=U$ ', the $m$ atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(n-1) \ldots H(2) H(1) .
$$

Each H (i) has the form

$$
H(i)=I-\tan * v^{*} v^{\prime}
$$

where tau is a real scalar, and $v$ is a realvectorw ith $v(i+1 m)=0$ and $v(i)=1 ; v(1: i-1)$ is stored on exitin A ( $1:-1, i+1)$, and tau in TAU (i).

If $U P L O=L$ ', the $m$ atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(n-1) .
$$

Each H (i) has the form

$$
H(i)=I-\tan * v^{*} v^{\prime}
$$

$w$ here tau is a real scalar, and $v$ is a realvectorw ith $\mathrm{v}(1: i)=0$ and $\mathrm{v}(\mathrm{i}+1)=1 ; \mathrm{v}(\mathrm{i}+2 \mathrm{n})$ is stored on exit in A (i+2n,i), and tau in TAU (i).

```
exam ples w ith n = 5:
```

```

void ssytf2 (charuplo, intn, float *a, int lda, int *ipiv, int*info);
void ssytf2_64 (charuplo, long n, float*a, long lda, long *ịiv, long *info);

## PURPOSE

ssytf2 com putes the factorization of a realsym $m$ etric $m$ atrix
A using the Bunch $K$ aufm an diagonalpivoting $m$ ethod:

$$
A=U * D * U^{\prime} \text { or } A=L * D * L^{\prime}
$$

where U (orL) is a productof perm utation and unit upper (low er) triangularm atrioes, U 'is the transpose of U , and D is sym $m$ etric and block diagonalw ith 1 -by -1 and 2 -by -2 diagonalblocks.

This is the unblocked version of the algorithm , calling Level2 BLAS .

## ARGUMENTS

UPLO (input)
Specifies w hether the upper or low er triangular part of the sym $m$ etric $m$ atrix $A$ is stored:
$=\mathrm{U}$ ': U pper triangular
= L': Low ertriangular

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input/output)
O $n$ entry, the sym m etric $m$ atrix A. If $\mathrm{U} P \mathrm{O}=\mathrm{U}$ ', the leading $n-b y-n$ upper triangularpart ofA contains the upper triangularpart of the $m$ atrix $A$, and the strictly low er triangularpart of A is not referenced. If $U P L O=L '$, the leading $n-b y-n$ low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of $A$ is notreferenced.

O n exit, the block diagonalm atrix D and the m ul
tipliers used to obtain the factorU orl (see below for further details).

LDA (input)
The leading dim ension of the anray A. LD A >= $\max (1, \mathbb{N})$.

IPIV (output)
D etails of the interchanges and the block structure ofD. If $\mathbb{P} \mathbb{I V}(k)>0$, then row $s$ and colum ns $k$ and $\mathbb{P} \mathbb{I V}(k)$ were interchanged and $D(k, k)$ is a 1 -by-1 diagonalblock. IfUPLO $=U$ 'and $\mathbb{P} \mathbb{I V}(k)$ $=\mathbb{P} \mathbb{V}(k-1)<0$, then row $s$ and colmm ns $k-1$ and $-\mathbb{P} \mathbb{V}(k)$ w ere interchanged and $D(k-1 * k, k-1 *)$ is a 2 -by-2 diagonalblock. IfUPLO $=\mathbb{L}$ 'and $\mathbb{P} \mathbb{I V}(k)$
$=\mathbb{P} \mathbb{I}(k+1)<0$, then row sand colum ns $k+1$ and $-\mathbb{P} \mathbb{V}(k)$ w ere interchanged and $D(k, k+1, k \mathrm{k}+1)$ is a 2-by-2 diagonalblock.
$\mathbb{N F O}$ (output)
$=0$ : successfulexit
$<0:$ if $\mathbb{N} F O=-\mathrm{k}$, the k -th argum enthad an illegalvalue $>0:$ if $\mathbb{N} F O=k, D(k, k)$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

## FURTHER DETAILS

## 1-96 -B ased on m odifications by J.Lew is, Boeing Com puter

## Services

Com pany
If U PLO $=\mathrm{U}$ ', then $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}$ ', where
$U=P(n) \star U(n) * \ldots * P(k) U(k) * \ldots$,
i.e., $U$ is a productof term $S P(k) * U(k)$, where $k$ decreases from $n$ to 1 in steps of 1 or2, and $D$ is ablock diagonal $m$ atrix $w$ ith 1 -by -1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{V}(k)$, and $U(k)$ is a unituppertriangularm atrix, such that if the diagonal block $D(k)$ is of orders ( $s=1$ or 2 ), then

$$
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& \mathrm{U}(\mathrm{k})=(0 \mathrm{I} 0) \mathrm{s} \\
& \text { ( } 0 \text { O I ) } \mathrm{n}-\mathrm{k} \\
& \mathrm{k}-\mathrm{s} \mathrm{~s} \mathrm{n}-\mathrm{k}
\end{aligned}
$$

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(1 k-$
$1, k)$. If $s=2$, the upper triangle ofD ( $k$ ) overw rites $A(k-$ $1, k-1)$, A $(k-1, k)$, and $A(k, k)$, and $v$ overw rites A ( 1 k- $2, k-$ $1 \mathrm{k})$.

If $\operatorname{PLO}=\mathrm{L}$ ', then $\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L}$ ', where
$\mathrm{L}=\mathrm{P}(1) \star \mathrm{L}(1){ }^{*} \ldots * \mathrm{P}(k) \star \mathrm{L}(k)^{*} \ldots$,
i.e., $L$ is a product of term $S P(k) * L(k)$, where $k$ increases from 1 to $n$ in steps of 1 or 2, and $D$ is a block diagonal $m$ atrix $w$ ith 1 -by -1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{V}(k)$, and $L(k)$ is a unit low ertriangularm atrix, such that if the diagonal
block D (k) is of orders ( $s=1$ or2), then

$$

void ssytrd_64 (charuplo, long n, float*a, long lda, float *d, float *e, float *tau, long *info);

## PURPOSE

ssytrd reduces a realsym $m$ etric $m$ atrix A to real sym $m$ etric tridiagonal form T by an orthogonal sim ilarity transform ation: $Q * * T * A * Q=T$.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ ': U pper triangle ofA is stored;
$=\mathbb{L}$ ': Low ertriangle of A is stored.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input) On entry, the symm etric matrix A. IfUPLO = $\mathrm{U}^{\prime}$, the leading N boy N uppertriangularpartofA contains the uppertriangularpart of the $m$ atrix $A$, and the strictly low er triangularpart of $A$ is not referenced. If $\mathrm{UPLO}=\mathrm{L}$ ', the leading N -by -N low er triangularpant of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangular partofA is notreferenced. On exit, if UPLO = U ', the diagonal and firstsuperdiagonal of A are overw ritten by the comesponding elem ents of the tridiagonalm atrix $T$, and the ele$m$ ents above the first superdiagonal, $w$ ith the anray TAU, represent the orthogonalm atrix $Q$ as a product of elem entary reflectors; if U PLO $=\mathrm{L}$ ', the diagonal and firstsubdiagonal of A are overw ritten by the corresponding elem ents of the tridiagonalm atrix $T$, and the elem ents below the first subdiagonal, w ith the amay TA U, represent the orthogonalm atrix $Q$ as a productofelem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

D (output)
The diagonalelem ents of the tridiagonalm atrix T :
D $(i)=A(i, i)$.

E (output)
The off-diagonal elem ents of the tridiagonal $m$ atrix $T: E(i)=A(i, i+1)$ if $U P L O=U^{\prime}, E(i)=$ A $(\mathbf{i}+1, i)$ if $\mathrm{UPLO}=\mathrm{L}$.

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array $W$ ORK. LW ORK >=1. For optim um perform ance $L W$ ORK $>=N * N B$, where $N B$ is the optim alblocksize.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
$\mathbb{I N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{N}$ FO $=-$ i, the i-th argum ent had an illegalvalue

## FURTHER DETAILS

If U PLO $=\mathrm{U}$ ', the m atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(n-1) \ldots H(2) H(1) .
$$

Each $H$ (i) has the form

$$
H(i)=I-\tan * V^{*} v^{\prime}
$$

where tau is a real scalar, and $v$ is a realvectorw ith $v(i+1 m)=0$ and $v(i)=1 ; v(1: i-1)$ is stored on exitin

A ( $1: i-1, i+1)$, and tau in TAU (i).
IfU PLO $=\mathrm{L}$ ', the m atrix $Q$ is represented as a product of elem entary reflectors

$$
Q=H(1) H(2) \ldots H(n-1) .
$$

Each $H$ (i) has the form
H (i) $=I-\tan { }^{*} V^{*} V^{\prime}$
where tau is a real scalar, and $v$ is a realvectorw ith $\mathrm{v}(1: i)=0$ and $\mathrm{v}(i+1)=1 ; \mathrm{v}(i+2 \mathrm{n})$ is stored on exit in A (i+2m,i), and tau in TAU (i).
The contents of A on exitare illustrated by the follow ing exam plesw ith $\mathrm{n}=5$ :

```
ifUPLO = U ': ifUPLO = L :
```

    ( d e v2 v3 v4 ) ( d
    )
( d e v3 v4 ) ( e d
)
( d e v4 ) (v1 e d
)
( d e ) ( v1 v2 e d
)
( d ) (v1 v2 v3 e d
)
where $d$ and e denote diagonal and off-diagonal elem ents of $T$, and videnotes an elem entof the vectordefining $H$ (i).

## C INTERFACE

\#include <sunperfh>
void ssytrf(char uplo, int $n$, float *a, int lda, int *ịívot, int*info);
void ssytrf_64 (charuplo, long n, float *a, long lda, long
*ịívot, long *info);

## PURPOSE

ssytrf com putes the factorization of a realsym $m$ etric $m$ atrix A using the Bunch $-K$ aufm an diagonalpivoting $m$ ethod. The form of the factorization is

$$
\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T} \text { or } \mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}
$$

where $U$ (orL) is a productof perm utation and unit upper (low er) triangular $m$ atrices, and $D$ is sym $m$ etric and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

## ARGUMENTS

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.
A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading N -by -N uppertriangularpartofA contains the upper triangular part of the $m$ atrix $A$, and the strictly low er triangularpartofA is not referenced. If $\mathrm{UPLO}=\mathrm{L}$ ', the leading N -by -N low er triangularpart of $A$ contains the low ertriangularpartof the m atrix A, and the strictly upper triangularpartofA is not referenced.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.

## IPIVOT (output)

D etails of the interchanges and the block structure of D. If $\mathbb{P I V O T}(k)>0$, then row sand columnsk and $\mathbb{P I V O T}(k)$ were interchanged and $D(k, k)$ is a $1-b y-1$ diagonalblock. If $U P L O=U^{\prime}$ and $\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)<0$, then row $s$ and colum ns $k-1$ and - $\mathbb{P I V O T}(k)$ were interchanged and D ( $k-1 * k, k-1 k)$ is a $2-b y-2$ diagonal block. If UPLO $=\mathrm{L}$ 'and $\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0$, then row sand colum ns $k+1$ and $-\mathbb{P} \mathbb{V} O T(k)$ were interchanged and $D(k k+1, k k+1)$ is a $2-b y-2$ diagonal block.

W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, \mathrm{~W}$ ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >=1. Forbestperfor$m$ ance LDW ORK >=N *NB, where NB is the block size retumed by $\amalg A E N V$.

IfLDW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
= 0 : successfinlexit
$<0:$ if $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})$ is exactly zero. The factorization has been com pleted, but the block diagonalm atrix $D$ is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

## FURTHER DETAILS

If $\mathrm{ULO}=\mathrm{U}$ ', then $\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}$ ', where
$U=P(n) \star U(n)^{\star} \ldots{ }^{\star} P(k) U(k)^{\star} \ldots$,
ie., $U$ is a product ofterm $\operatorname{sP}(k) * U(k)$, where $k$ decreases from $n$ to 1 in steps of 1 or 2 , and $D$ is a block diagonal $m$ atrix w ith 1 -by-1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V O T}(\mathrm{k})$, and $\mathrm{U}(\mathrm{k})$ is a unituppertriangularm atrix, such that if the diagonal block D (k) is of orders ( $s=1$ or 2 ), then

$$
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=\left(\begin{array}{lll}
0 & I
\end{array}\right) s \\
& \text { ( } 000 \text { I ) n-k } \\
& \mathrm{k}-\mathrm{s} \text { s n-k }
\end{aligned}
$$

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(1 k-$ $1, k$ ). If $s=2$, the upper triangle ofD $(k)$ overw rites $A(k-$ $1, k-1), A(k-1, k)$, and $A(k, k)$, and $V$ overw rites $A(1 k-2, k-$ $1 \mathrm{k})$.

If $\mathrm{UPLO}=\mathrm{L}$ ', then $A=\mathrm{L} * \mathrm{D} * \mathrm{~L}$ ', where
$L=P(1) \star L(1)^{\star} \ldots * P(k) \star L(k) * \ldots$
ie., $L$ is a productofterm $s P(k) * L(k)$, where $k$ increases
from 1 to n in steps of 1 or 2 , and D is a block diagonal $m$ atrix $w$ th 1 -by -1 and 2 -by-2 diagonalblocks $D(k) . P(k)$ is a perm utation $m$ atrix as defined by $\mathbb{P} \mathbb{I V O T}(k)$, and $L(k)$ is a unitlow ertriangularm atrix, such that if the diagonal
block $D(k)$ is of orders ( $s=1$ or 2 ), then

$$
\begin{aligned}
& \text { ( } \left.\begin{array}{llll}
I & 0 & 0
\end{array}\right) k-1 \\
& L(k)=\left(\begin{array}{lll}
0 & I & 0
\end{array}\right) s \\
& \text { ( } 0 \mathrm{~V} \text { I ) } \mathrm{n}-\mathrm{k}-\mathrm{s}+1 \\
& \mathrm{k}-1 \text { s } \mathrm{n}-\mathrm{k}-\mathrm{s}+1
\end{aligned}
$$

If $s=1, D(k)$ overw rites $A(k, k)$, and $v$ overw rites $A(k+1 m, k)$. If $s=2$, the low ertriangle ofD $(k)$ overw rites $A(k, k), A(k+1, k)$, and $A(k+1, k+1)$, and $v$ overw rites A $(k+2 m, k: k+1)$.

## C INTERFACE

\#include <sunperfh>
void stom v (charuplo, char transa, chardiag, intn, int $k$, float *a, int lda, float *y, int incy);
void stbm v_64 (charuplo, chartransa, char diag, long n, long $k$, float *a, long lda, float * $y$, long incy);

## PURPOSE

stom $v$ perform s one of them atrix-vector operations $x: A * x$, or $x:=A{ }^{*} x$, where $x$ is an $n$ elem entvectorand $A$ is an $n$ by $n$ unit, or non-unit, upper or low er triangular band $m$ atrix, with ( $k+1$ ) diagonals.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies w hether the $m$ atrix is an upper or low er triangularm atrix as follow s :
$\mathrm{UPLO}=\mathrm{U}$ 'or G ' $A$ is an upper triangular $m$ atrix.

UPLO = L' or I' A is a lower triangular $m$ atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA $=N^{\prime}$ 'or $h^{\prime} \mathrm{x}:=\mathrm{A} * \mathrm{x}$.

TRANSA $=$ T'ort' $x=A$ * $x$.

TRANSA = C'ort' $\mathrm{x}:=\mathrm{A}$ * x .
U nchanged on exit.

TRANSA is defaulted to N 'forF $95 \mathbb{I N}$ TERFACE.
D IA G (input)
On entry, D IA G specifies w hether or notA is unit
triangular as follow s:

D IA G = U'or 4 ' A is assum ed to be unit triangular.

D $\mathbb{A} G=N$ 'or $h$ ' $A$ is notassum ed to be unit triangular.

U nchanged on exit.
$N$ (input)
On entry, N specifies the order of the m atrix A . $\mathrm{N}>=0$. U nchanged on exit.

K (input)
On entry with UPLO $=$ U 'or L', K specifies the num ber of super-diagonals of them atrix $A$. On entry w ith UPLO = L' or I', K specifies the num ber of sub-diagonals of the $m$ atrix $A . K>=0$. U nchanged on exit.

A (input)
Before entry w th UPLO = U 'or G ', the leading ( $k+1$ ) by $n$ part of the array A $m$ ustcontain the upper triangularband partof the $m$ atrix of coefficients, supplied colum $n$ by colum $n$, w ith the leading diagonal of the $m$ atrix in row ( $k+1$ ) of the array, the firstsuper-diagonal starting at position 2 in row $k$, and so on. The top leftk by $k$ triangle of the array A is not referenced. The follow ing program segm entw ill transfer an upper triangular band $m$ atrix from conventional full $m$ atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

Before entry w ith UPLO = L 'or 1', the leading (
$k+1$ ) by $n$ part of the amay A $m$ ust contain the low er triangularband part of the $m$ atrix of coefficients, supplied colum n by colum n, w th the leading diagonal of the m atrix in row 1 of the array, the firstsub-diagonal starting atposition 1 in row 2 , and so on. The bottom right $k$ by $k$ triangle of the amay A is not referenced. The follow ing program segm entw ill transfer a low er
triangular band $m$ atrix from conventional full $m$ atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \mathrm{A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \operatorname{CONTINUE} \\
& 20 \mathrm{CONTINUE}
\end{aligned}
$$

$N$ ote thatw hen D $\mathbb{A} G=U$ 'or L 'the elem ents of the array A comesponding to the diagonalelem ents of the $m$ atrix are not referenced, but are assum ed to be unity. U nchanged on exit.
LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A $>=$ ( $\mathrm{k}+1$ ). U nchanged on exit.

Y (input/output)
$(1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectorx. On exit, $Y$ is overw rilten $w$ th the tranform ed vector $x$.
$\mathbb{N C Y}$ (input)
O n entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of. $\mathbb{N} C Y$ <> 0 . U nchanged on exit.

## PURPOSE

stbrfs provides emorbounds and backw ard emor estim ates forthe solution to a system of linear equations $w$ th a triangularband coefficientm atrix.

The solution $m$ atrix X m ustbe com puted by STBTRS or some other $m$ eans before entering this routine. STBRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

## ARGUMENTS

## UPLO (input)

$=\mathrm{U}$ ': A is uppertriangular;
= L ': A is low ertriangular.

TRANSA (input)
Specifies the form of the system of equations:
$=\mathrm{N}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad$ N $\circ$ transpose)
$=T$ ': A ** $T$ * $\mathrm{X}=\mathrm{B}$ ( T ranspose)
$=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad$ (C onjugate transpose $=\mathrm{T}$ ran-
spose)

TRANSA is defaulted to N 'forF95 $\mathbb{I N}$ TERFACE.

D IA G (input)
$=N$ : A is non-unit triangular;
$=U: A$ is unittriangular.

N (input) The order of the m atrix A. $\mathrm{N}>=0$.
KD (input)
The num berof superdiagonals or subdiagonals of the triangularband $m$ atrix $A . K D>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the $m$ atrices $B$ and $X$. NRH $S>=0$.
A (input) The upper or low er triangular band $m$ atrix $A$, stored in the firstkd+1 row sof the amay. The $j$ th column of A is stored in the $j$ th column of the anay A as follow s: if UPLO = U',A (kd+1+ij기) $=A(i, j)$ for $\max (1, j \mathrm{kd})<=i<=j$ if UPLO $=$ L', A $(1+i-j\rangle)=A(i, 7)$ for $j<=i<=m$ in $(n, j+k d)$. IfD $I A G=U$ ', the diagonalelem ents of $A$ are not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the array A. LDA >= K D +1 .
$B$ (input) The righthand side $m$ atrix $B$.
LD B (input)
The leading dim ension of the aray $B$. LD B >= $\max (1, \mathbb{N})$.

X (input) The solution $m$ atrix X .
LD X (input)
The leading dim ension of the array X . LD $\mathrm{X}>=$ $\max (1, \mathbb{N})$.

## FERR (output)

The estim ated forw ard enrorbound for each solution vector $X(\mathcal{)}$ ) the $j$ th colum $n$ of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{H})$-XTRUE) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

## BERR (output)

The com ponentw ise relative backw ard emor of each
solution vectorX (i) (ie., the sm allest relative
change in any elem entofA orB thatm akes X ( $\mathcal{I}$ ) an exact.solution).

W ORK (w orkspace)
dim ension ( $3 * N$ )
W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N ~ F O ~}=-i$, the i-th argum enthad an illegalvalue

void stbsv (charuplo, char transa, chardiag, intn, int $k$, float *a, int lla, float *y, int incy);
void stbsv_64 (charuplo, chartransa, char diag, long n, long $k$, float *a, long lda, float * $y$, long incy);

## PURPOSE

stbsv solves one of the system sof equations $A * x=b$, or $A{ }^{*} x=b, w$ here $b$ and $x$ are $n$ elem entvectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or low er triangular band $m$ atrix, $w$ ith ( $k+1$ ) diagonals.

N o test forsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies whetherthem atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or L ' A is an upper triangular $m$ atrix.

UPLO = L' or I' A is a lower triangular $m$ atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA $=N$ 'or $h^{\prime} A * x=b$.
TRANSA $=\mathrm{T}^{\prime}$ or $\mathrm{t}^{\prime} \mathrm{A}{ }^{*} \mathrm{x}=\mathrm{b}$.

TRANSA = C'ort' A*x=b.
U nchanged on exit.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D $\mathbb{A G G}=\mathrm{U}$ 'or $\mathrm{L}^{\prime} \mathrm{A}$ is assum ed to be unit triangular.

D $\mathbb{A G}=N$ 'or $h$ ' $A$ is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O $n$ entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

K (input)
On entry with UPLO $=$ U 'or L', $K$ specifies the num ber of super-diagonals of them atrix $A$. On entry w ith UPLO = L' or I', K specifies the num ber of sub-diagonals of the $m$ atrix $A . K>=0$. U nchanged on exit.

A (input)
Before entry w th UPLO $=U$ 'or L ', the leading ( $k+1$ ) by $n$ part of the array A m ust contain the upper triangularband part of the $m$ atrix of coefficients, supplied colum $n$ by colum $n$, w ith the leading diagonal of the $m$ atrix in row ( $k+1$ ) of the aray, the firstsuper-diagonalstarting at position 2 in row $k$, and so on. The top leftk by $k$ triangle of the array A is not referenced. The follow ing program segm entw ill transfer an upper triangular band $m$ atrix from conventional full $m$ atrix storage to band storage:

$$
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{MAX}(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \mathrm{~A}(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINE } \\
& 20 \text { CONTINUE }
\end{aligned}
$$

Before entry w ith UPLO = L 'or 1', the leading ( $k+1$ ) by $n$ part of the array A must contain the low er triangularband part of the $m$ atrix of coefficients, supplied colum $n$ by colum n, w ith the leading diagonal of the $m$ atrix in row 1 of the
array, the firstsub-diagonal starting atposition 1 in row 2, and so on. The bottom right $k$ by $k$ triangle of the array A is not referenced. The follow ing program segm entw ill transfer a low er triangular band $m$ atrix from conventional full $m$ atrix storage to band storage:

D O 20, J=1, N
M = 1 -J
D O $10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{N}, \mathrm{J}+\mathrm{K})$
A $(M+I, J)=m \operatorname{atrix}(I, J)$
10 CONTINUE
20 CONTINUE
$N$ ote thatw hen D $\mathbb{A} G=U$ 'or L'the elem ents of the array A comesponding to the diagonalelem ents of the $m$ atrix are not referenced, butare assum ed to be unity. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A $>=$ ( $k+1$ ). U nchanged on exit.

Y (input/output)
$(1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))$. Before entry, the increm ented aray $Y \mathrm{~m}$ ust contain the n elem ent righthand side vectorb. On exit, $Y$ is overw ritten $w$ ith the solution vector $x$.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $\mathrm{Y} . \mathbb{N} C Y<>0$. U nchanged on exit.

void stbtrs_64 (charuplo, chartransa, char diag, long n, long kd, long nrhs, float *a, long lda, float *b, long ldlo, long *info);

## PURPOSE

stbtes solves a triangular system of the form
$w$ here $A$ is a triangularband $m$ atrix of order $N$, and $B$ is an N boy NRHS m atrix. A check is m ade to verify thatA is nonsingular.

## ARGUMENTS

UPLO (input)
$=\mathrm{U}$ : A is upper triangular;
$=\mathbb{L}$ ': A is low ertriangular.

TRANSA (input)
Specifies the form the system of equations:
$=\mathrm{N}^{\prime}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad$ (No transpose)
$=T: A * * T X=B \quad$ ( $r$ ranspose)
$=C$ ': $A * * H * X=B \quad$ (C onjugate transpose $=T$ ran -
spose)

D IA G (input)
$=\mathrm{N}$ : A is non-unit triangular;
$=\mathrm{U}: \mathrm{A}$ is unit triangular.

N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.

KD (input)
The num ber of superdiagonals or subdiagonals of the triangularband $m$ atrix A. KD $>=0$.

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRH S $>=0$.

A (input) The upper or low er triangular band matrix A, stored in the first kd+1 row sofA. The jth column ofA is stored in the $j$ th column of the aray A as follow s: if UPLO = U',A (kd+1+i-j) = A $(i, j)$ form ax $(1, j k d)<=i<=\dot{j}$ if UPLO $=\mathrm{L}$ ', $A(1+i-j)=A(i, j)$ for $j=i<=m$ in $(n, j+k d)$. If $D \mathbb{A G}=U$ ', the diagonalelem ents of $A$ are not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the array A. LDA >= K D +1.

B (input/output)
On entry, the righthand side m atrix B. On exit, if $\mathbb{N} F O=0$, the solution $m$ atrix $X$.

LD B (input)
The leading dim ension of the anay B . LD B $>=$ $\max (1, N)$.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
< 0: if $\mathbb{N}$ FO = -i, the i-th argum enthad an illegalvalue
$>0:$ if $\mathbb{N} F O=i$, the $i$-th diagonalelem ent of $A$ is zero, indicating that the $m$ atrix is singular and the solutions $X$ have notbeen com puted.

## C INTERFACE

\#include < sunperfh>
void stgevc (char side, char how my, int *select, int $n$, float *a, intlda, float*b, intldb, float *vl, int ldvl, float * $\mathrm{Vr}_{\text {, int }}$ int $\operatorname{ldvr}$, int m , int * m , int *info);
void stgevc_64 (char side, charhow m ny, long *select, long n, float *a, long lda, float *b, long ldb, float *vl, long ldvl, float *vr, long ldvr, long mm, long *m , long *info);

## PURPOSE

stgevc com putes som e orallof the right and/or left generalized eigenvectors of a pair of realupper triangular $m$ atrices $(A, B)$.

The right generalized eigenvectorx and the left generalized eigenvectory of $(A, B)$ corresponding to a generalized eigenvaluew are defined by:

$$
(A-w B) * x=0 \text { and } y^{* * H} *(A-w B)=0
$$

$w$ here $\mathrm{y}^{* *}{ }_{\mathrm{H}}$ denotes the conjugate tranpose of y .
If an eigenvalue w is determ ined by zero diagonal elem ents of both A and B, a unit vector is retumed as the comesponding eigenvector.

If alleigenvectors are requested, the routine $m$ ay either retum the $m$ atrices $X$ and/or $Y$ of rightor lefteigenvectors of $(A, B)$, or the products $Z * X$ and/or $Q * Y$, where $Z$ and $Q$ are input orthogonal $m$ atrices. If ( $A, B$ ) w as obtained from the generalized real-Schur factorization of an original pair of $m$ atrices ( $0, B 0$ ) $=Q * A * Z * * H, Q * B * Z * * H)$, then $Z * X$ and $Q * Y$ are the $m$ atrioes of right or lefteigenvec-

A m ustbe block uppertriangular, w ith 1 -by -1 and $2-b y-2$ diagonal blocks. C orresponding to each $2-b y-2$ diagonal block is a com plex conjugate pair ofeigenvalues and eigenvectors; only one eigenvector of the pair is com puted, nam ely the one corresponding to the eigenvalue $w$ ith posilive im aginary part.

## ARGUMENTS

SIDE (input)
$=R$ : com pute righteigenvectors only;
$=\mathbb{L}$ ': com pute lefteigenvectors only;
= B': com pute both rightand lefteigenvectors.
HOW M NY (input)
= 'A ': com pute all right and/or lefteigenvectors;
$=\mathrm{B}$ ': com pute all rightand/or lefteigenvectors, and backtransform them using the inputm atrices supplied in VR and/orVL; = S ': com pute selected right and/or lefteigenvectors, specified by the logical anay SELECT.

## SELECT (input)

If H OW M NY = $S^{\prime}$, SELECT specifies the eigenvectors
to be com puted. If HOW M NY = A 'or B', SELECT is
notreferenced. To select the real eigenvector
corresponding to the real eigenvalue w ( $)$, SELECT ( 7 ) mustbe setto .TRUE. To select the complex eigenvector corresponding to a complex conjugate pairw ( 1 ) and w ( $j+1$ ), either SELECT ( 7 ) orSELECT (j+1) m ustbe setto .TRUE..

N (input) The order of the m atriges $A$ and $B . N>=0$.

A (input) The upperquasi-triangularm atrix A.

LD A (input)
The leading dim ension of anay A. LD A $>=\max (1$, N) 。

B (input) The uppertriangularm atrix B. IfA has a 2 -by -2 diagonal block, then the corresponding 2 -by-2 block of $B$ m ustbe diagonal $w$ ith positive elem ents.

LD B (input)

The leading dimension of array B. LDB >= $\max (1, \mathbb{N})$.

VL (input/output)
On entry, if $S \mathbb{D} E=L^{\prime}$ 'or $B$ 'and HOW MNY = B', VL must contain an $N$-by N m atrix $Q$ (usually the orthogonalm atrix $Q$ of leftSchurvectors returmed by SHGEQZ). On exit, ifSDE = L'or B',VL contains: if HOW MNY = A', thematrix $Y$ of left eigenvectors of $(A, B)$; if HOW M NY = $B$ ', the matrix $Q * Y$; if HOW M NY $=S^{\prime}$, the left eigenvectors of (A , B ) specified by SELEC T , stored consecutively in the colum nsofVL, in the same order as their eigenvalues. If $S \mathbb{D} E=R \prime, V L$ is not referenced.

A com plex eigenvector comesponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the firstholding the realpart, and the second the im aginary part.

LDVL (input)
The leading dimension of array VL. LDVL >= $\max (1, N)$ if $S \mathbb{D} E=L$ 'or $B$ '; LDVL $>=1$ other w ise.

VR (input/output)
On entry, if $S D E=R$ 'or $B$ 'and $H O W M N Y=B$ ', $V R$ must contain an $N$ by $-N \mathrm{~m}$ atrix $Q$ (usually the orthogonal matrix $Z$ of right Schur vectors retumed by $S H G E Q Z$ ). On exit, if $S \mathbb{D} E=R$ 'or $B^{\prime}, \mathrm{VR}$ contains: if HOW MNY = $A$ ', the $m$ atrix $X$ of right eigenvectors of $(A, B)$; if HOW M NY $=B$ ', them atrix $Z * X$; if H OW M NY $=S^{\prime}$, the right eigenvectors of $(A, B)$ specified by SELECT, stored consecutively in the colum ns of V $R$, in the sam e order as their eigenvalues. If $S \mathbb{D} E=\mathrm{L}, \mathrm{VR}$ is not referenced.

A com plex eigenvector corresponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the firstholding the realpart and the second the im aginary part.

LDVR (input)
The leading dim ension of the array VR. LDVR >= $\max (1, N)$ if $S \mathbb{D} E=R$ 'or $B$ '; LDVR $>=1$ otherw ise.

M M (input) The num ber of colum ns in the arrays $V L$ and/or VR.
$M M>=M$.

M (output)
The num ber of colum ns in the arrays $V \mathrm{~L}$ and/or VR actually used to store the eigenvectors. If HOW M NY = A 'or B', M is set to N. Each selected real eigenvector occupies one colum $n$ and each selected com plex eigenvector occupies tw o colum ns. W ORK (w orkspace)
dim ension $(6 * N)$
$\mathbb{N}$ FO (output)
= 0: successfiulexit.
$<0:$ if $\mathbb{N} F O=-i$, the $i$ th argum enthad an illegalvalue.
 a com plex eigenvalue.

## FURTHER DETAILS

A llocation of w orkspace:

W ORK ( $j$ ) $=1$-norm of $j$ th colum $n$ ofA, above the diagonal

W ORK $(N+j)=1$-norm of $j$ th colum $n$ of $B$, above the diagonal

W ORK $(2 * \mathrm{~N}+1: 3 \star \mathrm{~N})=$ realpartofeigenvector
W ORK $(3 * N+1: 4 * N)=$ im aginary partofeigenvector
W ORK ( $4 * N+1: 5 \star \mathrm{~N})=$ realpartofback-transform ed eigenvector

W ORK $(5 * N+1: 6 * N)=$ im aginary part of back-transform ed eigenvector

R ow w ise vs. colum nw ise solution m ethods:

Finding a generalized eigenvector consists basically of solving the singular triangular system

$$
(A-w B) x=0 \quad \text { (for right) or: }(A-w B)^{\star *} H \quad y=0
$$

(forleft)

C onsider finding the i-th right eigenvector (assume all eigenvalues are real). The equation to be solved is: $0=\operatorname{sum} C(j k) v(k)=\operatorname{sum} C(j k) v(k) \quad$ for $j=i, .$. .1
$k=j \quad k=j$
where $C=(A-w B) \quad$ (The com ponents $v(i+1 n)$ are 0.$)$

The "row w ise" m ethod is:
(1) $\mathrm{v}(\mathrm{i}):=1$
for $j=i-1, \ldots, 1$ :
i
(2) com pute $s=-$ sum $C(j k) \vee(k)$ and $k=j+1$
(3) $\vee(\mathcal{j})=s / C(j)$

Step 2 is som etim es called the "dotproduct" step, since it is an innerproduct.betw een the jth row and the portion of the eigenvector that has been com puted so far.

The "colum nw ise" $m$ ethod consists basically in doing the sum $s$ forall the row $s$ in parallel. A s each $v(j)$ is com puted, the contribution of $v(i)$ tim es the $j$ th colum $n$ of $C$ is added to the partial sum s. Since FO RTRAN amays are stored colum nw ise, this has the advantage that ateach step, the elem ents of $C$ that are accessed are adjacent to one another, w hereas w ith the row w ise m ethod, the elem ents accessed at a step are spaced LD A (and LD B ) w ords apart.

W hen finding lefteigenvectors, the $m$ atrix in question is the transpose of the one in storage, so the row w ise $m$ ethod then actually accesses colum ns of A and B ateach step, and so is the prefered $m$ ethod.

\#include <sunperfh>
void stgexc (intw antq, intw antz, intn, float*a, int lda, float *b, int ldb, float * q , int ldq, float * z , int ldz, int *ifst, int *ilst, int *info);
void stgexc_64 (long w antr, long w antz, long n, float *a, long lda, float *b, long ldb, float *q, long ldq, float*z, long ldz, long *ifst, long *ilst, long *info);

## PURPOSE

stgexc reorders the generalized realSchurdecom position of a real matrix pair ( $A, B$ ) using an orthogonalequivalence transform ation
so that the diagonalblock of $(A, B)$ w ith row index $\mathbb{F} S T$ is m oved to row $\mathbb{L} S T$.
(A , B ) m ustbe in generalized realSchur canonical form (as retumed by SGGES), ie.A isblock uppertriangularw ith 1-by-1 and 2 -by-2 diagonalblocks.B is uppertriangular.

Optionally, the m atrioes $Q$ and $Z$ ofgeneralized Schur vectors are updated.

Q (in) * A (in) * Z (in) ${ }^{\prime}=\mathrm{Q}$ (out) * A (out) * Z (out)'
Q (in) * B (in) * Z (in) ${ }^{\prime}=\mathrm{Q}$ (out) * B (out) * Z (out) '

## ARGUMENTS

W ANTQ (input)

W ANTZ (input)

N (input) The order of the m atriges A and $\mathrm{B} . \mathrm{N}>=0$.

A (input/output)
O n entry, the m atrix A in generalized real Schur
canonical form. On exit, the updated m atrix A, again in generalized realSchur canonical form .

LD A (input)
The leading dim ension of the aray A. LDA >= $\max (1, N)$.

B (input/output)
O n entry, the m atrix B in generalized real Schur canonical form ( $A, B$ ). On exit, the updated $m$ atrix $B$, again in generalized realSchur canonical form ( $\mathrm{A}, \mathrm{B}$ ).
LD B (input)
The leading dim ension of the array $\mathrm{B} . \mathrm{LD} \mathrm{B}>=$ $\max (1, N)$.

Q (input/output)
On entry, ifW ANTQ = TRUE , the orthogonalm atrix Q . On exit, the updatedmatrix Q . If $\mathrm{W} A N T Q=$ FA LSE., Q is not referenced.

LD Q (input)
The leading dim ension of the array $\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1$. IfW ANTQ $=$ TRUE., LDQ $>=N$.

Z (input/output)
On entry, ifW ANTZ = TRUE., the orthogonalm atrix $Z$. On exit, the updatedm atrix $Z$. If $\mathrm{ANTZ}=$ FALSE., Z is not referenced.

LD Z (input)
The leading $d i m$ ension of the array $Z$. LD $Z>=1$. IfW ANTZ $=$.TRUE., LD Z $>=N$.

IFST (input/output)
Specify the reordering of the diagonal blocks of ( $A, B$ ). The block $w$ ith row index $\mathbb{F} S T$ ism oved to row ILST, by a sequence ofsw apping betw een adj ${ }^{-}-$ cent.blocks. On exit, if IFST pointed on entry to the second row of a 2 -by- 2 block, it is changed to point to the first row ; ILST alw ays points to the firstrow of the block in its final position (which $m$ ay differ from its inputvalue by +1 or $-1) \cdot 1<=\mathbb{F S T}, \mathbb{L} S T<=\mathrm{N}$.

ㄴST (input/output)
See the description of $\mathbb{F S T}$.
W ORK (w orkspace)
On exit, if $\mathbb{N F F O}=0, \mathrm{~W}$ ORK (1) retums the optim al

LW ORK.

LW ORK (input)
The dim ension of the anay W ORK. LW ORK >= 4*N + 16.

If LW ORK $=-1$, then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
$\mathbb{N} F O$ (output)
=0: successfulexit.
<0: if $\mathbb{N F O}=-$ i, the $i$-th argum ent had an illegalvahue.
=1: The transform ed $m$ atrix pair ( $A, B$ ) w ould be too far from generalized Schur form ; the problem is ill-conditioned. (A,B) may have been partially reordered, and IIST points to the first row of the current position of the block being $m$ oved.

    (PL andPR). = 2:U pperbounds on D ifu and D ifl.
    F-norm -based estim ate
    (D \mathbb{F (1:2)).}
    =3:Estim ate ofD ifu and D ifl.1-norm -based esti-
    m}\mathrm{ ate
    (D IF (1:2)). A bout5 tim es as expensive as INO B =
    2. =4: Com pute PL,PR and D FF (ie.0,1 and 2
    above): Econom ic version to get it all. =5: C om -
    putePL,PR and D FF (i.e.0,1 and 3 above)
```

W ANTQ (input)

## SELECT (input)

SELEC T specifies the eigenvalues in the selected cluster. To select a real eigenvalue w ( $\mathcal{j}$ ), SELECT ( $j$ ) must be set to $\mathrm{w}(\mathcal{j})$ and $\mathrm{w}(j+1)$, corresponding to a 2 -by-2 diagonalblock, either SELECT ( $\ddagger$ ) orSELECT ( $j+1$ ) orboth $m$ ust be set to either both included in the cluster or both excluded.

N (input) The order of the m atrioes A and $\mathrm{B} . \mathrm{N}>=0$.
A (input/output)
On entry, the upper quasi-triangular $m$ atrix $A$, w ith (A, B) in generalized realSchur canonical form. On exit, A is overw rilten by the reordered $m$ atrix A.

## LD A (input)

The leading dim ension of the aray A. LD A >= $\max (1, N)$.

B (input/output)
O n entry, the uppertriangularm atrix $B$, $w$ th $A$, B) in generalized realSchurcanonical form. On exit, $B$ is overw ritten by the reordered $m$ atrix $B$.

LD B (input)
The leading dim ension of the array B. LD B >= $\max (1, \mathbb{N})$.

ALPHAR (output)
On exit, (ALPHAR ( ) + ALPHAI ( ) *i) BETA ( ) , $\dot{j} 1, \ldots, N, w i l l$ be the generalized eigenvalues. A LPHAR $(\mathcal{Z})+$ ALPHAI $(\boldsymbol{j} *$ iand BETA $(\mathcal{j}), \dot{于} 1, \ldots, N$ are the diagonals of the com plex Schur form $(S, T)$ that w ould result if the 2 -by-2 diagonalblocks of the real generalized Schur form of ( $A, B$ ) w ere further reduced to triangular form using com plex unitary transform ations. If A LPHA I( $)$ is zero, then the $j$ th eigenvalue is real; ifpositive, then the $j$ th and ( $j+1$ )-steigenvahues are a com plex con $j \mu-$ gate pair, w ith A LPH A I(j+1) negative.

## A LPH A I (output)

See the description of A LPHAR.
BETA (output)
See the description of A LPHAR.
Q (input/output)

On entry, if $W$ ANTQ = TRUE., $Q$ is an $N$-by $N$ $m$ atrix. On exit, $Q$ has been postm ultiplied by the left orthogonal transform ation $m$ atrix which reorder ( $A$, B); The leading $M$ colum ns of f form orthonorm albases for the specified pair of left eigenspaces (deflating subspaces). If $W$ ANTQ $=$ FALSE., Q is notreferenced.

LD Q (input)
The leading dim ension of the array $\mathrm{Q} . \mathrm{LD} Q>=1$; and ifW ANTQ = .TRUE.,LDQ >=N.

Z (input/output)
On entry, if $W$ ANTZ $=$.TRUE., $Z$ is an $N$ by $-N$ $m$ atrix. O n exit, Z has been postm ultiplied by the left orthogonal transform ation $m$ atrix $w$ hich reorder ( $A$, B); The leading $M$ colum ns of $Z$ form orthonorm albases for the specified pair of left eigenspaces (deflating subspaces). If W ANTZ = FALSE., Z is notreferenced.

LD Z (input)
The leading dim ension of the array Z . LD $\mathrm{Z}>=1$; If $W A N T Z=. T R U E, \operatorname{LDZ}>=N$.

M (output)
The dim ension of the specified pair of left and right eigen-spaces (deflating subspaces). $0<=\mathrm{M}$ $<=N$.

PL (output)
If $\mathrm{IJOB}=1,4$ or $5, \mathrm{PL}, \mathrm{PR}$ are low er bounds on the reciprocal of the norm of "projections" onto leftand righteigenspaces w ith respect to the selected cluster. $0<\mathrm{PL}, \mathrm{PR}<=1$. IfM $=0$ orM $=N, P L=P R=1$. IfIOOB $=0,2$ or $3, P L$ and $P R$ are not referenced.

PR (output)
See the description ofPL .

D $\mathbb{F}$ (output)
If IUO B >=2,D $\mathbb{F}(1: 2)$ store the estim ates ofD ifu and $D$ iff.
If $\mathrm{IHO} B=2$ or $4, D \mathbb{F}(1: 2)$ are F -norm Hoased upper bounds on
$D$ ifu and $D$ ifl. If $I N O B=3$ or $5, D \mathbb{F}(1: 2)$ are $1-$
norm -based estim ates ofD ifu and $D$ ifl. $\mathrm{If} M=0$
orN , $D \mathbb{F}(1: 2)=F-n o r m([A, B])$. If $I J O B=0$ or $1, D$ IF is notreferenced.

W ORK (w orkspace)
If $\mathrm{IJOB}=0, \mathrm{~W} O R K$ is not referenced. O therw ise, on exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay $W$ ORK. LW ORK $>=4 * N+16$. If $\mathrm{LJO} B=1,2$ or 4, LW ORK $>=\mathrm{MAX}(4 * N+16,2 * \mathrm{M} * \mathbb{N}-$ $\mathrm{M})$ ). If $\mathrm{IJOB}=3$ or 5 , LW ORK $>=\mathrm{MAX}(4 * \mathrm{~N}+16$, $4 * M *(N-M))$.

IfLW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the $W$ ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
If $\mathrm{IJO} B=0, \mathbb{I V} O R K$ is not referenced. O therw ise, on exit, if $\mathbb{N} F O=0, \mathbb{I V}$ ORK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array $\mathbb{I N}$ ORK.LIIN ORK >=1. If $\mathrm{IJOB}=1,2$ or $4, \mathrm{~L} \mathbb{I}$ ORK $>=\mathrm{N}+6$. If IJOB $=3$ or $5, L \mathbb{N}$ ORK $>=M A X(2 * M * \mathbb{N}+M), N+6)$.

If LIV ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the $\mathbb{I V}$ ORK array, retums this value as the first entry of the $\mathbb{I N}$ ORK array, and no errorm essage related to $L \mathbb{I N} O R K$ is issued by XERBLA.
$\mathbb{I N} F O$ (output)
=0: Successfulexit.
$<0:$ If $\mathbb{N} F O=-i$, the $i$-th argum enthad an illegal value.
$=1$ : Reordering of ( $A, B$ ) failed because the transform ed $m$ atrix pair ( $A, B$ ) w ould be too far from generalized Schur form ; the problem is very ill-conditioned. (A, B) m ay have been partially reordered. If requested, 0 is retumed in D IF (*), $P L$ and $P R$.

## FURTHER DETAILS

STG SEN firstcollects the selected eigenvalues by com puting orthogonal $U$ and $W$ thatm ove them to the top leftcomerof (A,B). In otherw ords, the selected eigenvalues are the
eigenvalues of (A11, B 11) in:

$$
\begin{gathered}
U *(A, B) * W=(A 11 A 12)(B 11 B 12) n 1 \\
(0 \text { A 22),(0 B22) n2 } \\
n 1 \mathrm{n} 2 \quad \mathrm{n} 1 \mathrm{n} 2
\end{gathered}
$$

w here $\mathrm{N}=\mathrm{n} 1+\mathrm{n} 2$ and U ' m eans the transpose of U . The first n1 colum ns of $U$ and $W$ span the specified pair of left and righteigenspaces (deflating subspaces) of $(A, B)$.

If ( $A, B$ ) has been obtained from the generalized real Schur decom position of a matrix pair ( $C, D$ ) $=Q$ * $(A, B) * Z$ ', then the reordered generalized realSchur form of ( $C, D$ ) is given by

$$
(C, D)=(Q * U)^{\star}(U \star(A, B) * W) *(Z * W)^{\prime},
$$

and the firstn1 colum ns of Q * U and $\mathrm{Z} * \mathrm{~W}$ span the comesponding deflating subspaces of ( $C, D$ ) $Q$ and $Z$ store $Q * U$ and Z *W, resp.).

N ote that if the selected eigenvalue is sufficiently illconditioned, then its value $m$ ay differ significantly from its value before reordering.

The reciprocalcondition num bers of the left and right eigenspaces spanned by the firstn1 colum ns ofU and $W$ (or $\mathrm{Q} * \mathrm{U}$ and $\mathrm{Z} * \mathrm{~W}) \mathrm{m}$ ay be retumed in $\mathrm{D} \mathbb{F}(1: 2)$, corresponding to $D$ ifu and $D$ ifll, resp.

The D ifu and D iflare defined as:
ifu $[$ A 11, B11), (A 22, B22) $]=\operatorname{sigm}$ am in ( Zu )
and
where sigm a-m in ( 2 u ) is the sm allest singular value of the ( $2 *_{n} 1 *{ }_{n} 2$ )-by- $\left(2 *_{n} 1 *_{n} 2\right.$ ) m atrix
$\mathrm{u}=[\mathrm{kron}(\mathrm{In} 2, \mathrm{~A} 11)-\mathrm{kron}(\mathrm{A} 22$ ', In1) ]
[kron(In2,B11) kron (B22', In1)].
H ere, $\operatorname{In} x$ is the identity $m$ atrix of size $n x$ and $A 22$ 'is the transpose of A 22. kron ( $X, Y$ ) is the $K$ roneckerproduct betw een the $m$ atrices $X$ and $Y$.

W hen D IF (2) is sm all, sm all changes in (A, B) can cause large changes in the deflating subspace. A $n$ approxim ate (asym ptotic) bound on them axim um angularemor in the com puted deflating subspaces is PS * norm ( $(A, B)$ )/D $\mathbb{F}(2)$,
where EPS is the $m$ achine precision.

The reciprocal norm of the pro jectors on the left and right eigenspaces associated with (A 11, B 11) m ay be retumed in PL and PR. They are com puted as follow s. First we com pute $L$ and $R$ so that $P$ * $(A, B){ }^{\star} Q$ is block diagonal, w here
$=(I-\amalg) n 1 \quad Q=(I R) n 1$

$$
\begin{array}{lll}
(0 \text { I) n2 } & \text { and } & (0 I) n 2 \\
\text { n1 n2 } & \text { n1 n2 }
\end{array}
$$

and ( $L, R$ ) is the solution to the generalized Sylvester equation $11 * \mathrm{R}-\mathrm{L} *$ A $22=-\mathrm{A} 12$

Then PL $=(F \text {-norm }(L) * * 2+1)^{* *}(-1 / 2)$ and $P R=(F-$ norm $(\mathbb{R}) * * 2+1) * *(-1 / 2)$. A n approxim ate (asym ptotic) bound on the average absolute error of the selected eigenvalues is PS * norm ( $(A, B)) / P L$.

There are also globalemorbounds which valid forperturbations up to a œertain restriction: A low erbound $(x)$ on the sm allest $F$-norm ( $E, F$ ) forw hich an eigenvalue of (A 11, B 11) $m$ ay $m$ ove and coalesce $w$ th an eigenvalue of (A 22,B22) under perturbation $(\mathbb{E})$, (i.e. $(A+E, B+F)$, is
$\mathrm{x}=$

A $n$ approxim ate bound on $x$ can be com puted from $D \mathbb{F}(1: 2)$, PL and PR .

If $y=(F-$ norm $(E, F) / x)<=1$, the angles betw een the per turbed (L', R) and unperturbed ( $L, R$ ) left and right deflating subspaces associated $w$ ith the selected cluster in the $(1,1)$-blocks can be bounded as
max-angle $(L, L)<=\arctan (y * P L /(1-y *(1-P L *$ PL)** (1/2))
$\max -\operatorname{angle}(R, R)<=\arctan (y * P R /(1-y *(1-P R *$
$\operatorname{PR}) * *(1 / 2))$
See LA PA CK U ser's G uide section 4.11 or the follow ing references form ore inform ation.

N ote that if the default $m$ ethod for com puting the Frobenius-norm - based estim ate D $\mathbb{F}$ is not wanted (see SLA TDF), then the param eter ID $\mathbb{F} \cdot \mathcal{B}$ (see below) should be changed from 3 to 4 (routine SLA TDF (LOB $=2 \mathrm{w}$ illbe used)). See STG SY L form ore details.

## C INTERFACE

\#include <sunperfh>
void stgsja (char jobu, char jobv, char jobq, intm, int p, int n , int k , int l, float *a, int lda, float *b, int ldb, floattola, float tolb, float *alpha, float *beta, float *u, int ldu, float *v, int ldv, float *q, int ldq, int *ncycle, int *info);
void stgsj’_64 (char jobu, char jobv, char jobq, long m, long p, long $n$, long $k$, long $l$, float *a, long lda, float*b, long ldb, float tola, float tolb, float *alpha, float *beta, float *u, long ldu, float *v, long ldv, float *q, long ldq, long *ncycle, long *info);

## PURPOSE

stgsja com putes the generalized singularvalue decom position
(G SVD) of two real upper triangular (or trapezoidal) $m$ atrices $A$ and $B$.

On entry, it is assum ed thatm atrices $A$ and $B$ have the follow ing form $s$, which $m$ ay be obtained by the preprocessing subroutine SG G SV P from a generalM by -N m atrix A and P -by N $m$ atrix B :

```
        N-K-L K L
A = K (0 A12 A13) ifM K-工 >= 0;
        L (0 0 A23)
    M K-L(0 0 0 )
```

```
    NK工 K L
A = K (0 A12 A13) ifM K L < 0;
    M K (0 0 A23)
    NK工 K L
B L L (0 0 B13)
    P-L(0 0 0 )
```

w here the K －by K m atrix A 12 and L－by－ m atrix B 13 are non－ singularuppertriangular；A 23 is L－by - uppertriangular if $\mathrm{M}-\mathrm{K}->=0$ ，otherw ise A 23 is $(\mathrm{M}-\mathrm{K})$－by－工 uppertrapezoidal．

On exit，

$$
U{ }^{*} A * Q=D 1 *(0 R), \quad V{ }^{*} B * Q=D 2^{*}(0 R)
$$

where $U, V$ and $Q$ are orthogonal $m$ atrioes，$Z$＇denotes the transpose of $Z, R$ is a nonsingular upper triangularm atrix， and D 1 and D 2 are＇＂diagonal＂m atrices，which are of the follow ing structures：
IfM $K-\longleftarrow>=0$ ，

$$
\begin{aligned}
& \text { K L } \\
& \text { D } 1=K(\mathrm{I} 0) \\
& \text { L ( } 0 \text { C ) } \\
& \text { M K ـ ( } 0 \text { O) }
\end{aligned}
$$

K L
D $2=\mathrm{L} \quad(0 \mathrm{~S})$
$\mathrm{P}-(0 \quad 0)$
$N \mathrm{~K}$ K K
（0R）$=\mathrm{K}$（0 R11 R12）$K$
L（ 0 O R22）L
where

$$
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, \text { A LPH A }(\mathbb{K}+L)), \\
& S=\operatorname{diag}(\operatorname{BETA}(\mathbb{K}+1), \ldots, \text { BETA }(K+L)), \\
& C * * 2+S * * 2=I .
\end{aligned}
$$

$R$ is stored in $A(1: K+L, N-K-1+\mathbb{N})$ on exit．

IfM K 工＜0，

K M K K＋L M
$D 1=K\left(\begin{array}{lll}\text { I } 0\end{array}\right)$
$M-K(0 C O)$

K M K K＋L M

```
D2 = MK (0S O )
    K+L-M (0 O I )
    P-(0 0 0 )
```

    N K \(\mathrm{L} \quad \mathrm{K} \quad \mathrm{M}-\mathrm{K} \quad \mathrm{K}+\mathrm{L} \mathrm{M}\)
    \(M-K(0 \quad 0 \quad R 22 R 23)\)
    \(K+L+M(0 \quad 0 \quad 0 \quad R 33)\)
    where
$C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(M))$, $S=\operatorname{diag}(\operatorname{BETA}(K+1), \ldots, \operatorname{BETA}(\mathbb{M}))$, $C * * 2+S * * 2=I$.
$R=(R 11 R 12 R 13)$ is stored in $A(1 \mathbb{M}, N-K-1+1 \mathbb{N})$ and $R 33$ is stored
( 0 R22R23)
in $B(M-K+1: L, N+M-K-1 \pm N)$ on exit.

The com putation of the orthogonaltransform ation $m$ atrices $U$, $V$ or $Q$ is optional. These $m$ atrices $m$ ay eitherbe form ed explicitly, or they $m$ ay be postm ultiplied into input $m$ atrices U 1 , V 1 , or Q 1 .
STG SJA essentially uses a variant of $K$ ogbetliantz algorithm to reduce $m$ in ( $L, M-K$ ) -by -4 triangular (or trapezoidal) $m$ atrix A 23 and L -by -m atrix B 13 to the form :

$$
\mathrm{U} 1{ }^{*} \mathrm{~A} 13^{*} \mathrm{Q} 1=\mathrm{C} 1 * \mathrm{R} 1 ; \mathrm{V} 1 * \mathrm{~B} 13^{*} \mathrm{Q} 1=\mathrm{S} 1 * \mathrm{R} 1
$$ where $\mathrm{U} 1, \mathrm{~V} 1$ and Q 1 are orthogonalm atrix, and $Z^{\prime}$ is the transpose of Z. C1 and S1 are diagonalm atrices satisfying

$$
\mathrm{C} 1 * * 2+\mathrm{S} 1 * * 2=\mathrm{I}
$$

and R1 is an L-by -L nonsingularupper triangularm atrix.

## ARGUMENTS

JOBU (input)
$=\mathrm{U}$ ': U m ustcontain an orthogonalm atrix U 1 on entry, and the productU $1 * \mathrm{U}$ is retumed; = I': U is initialized to the unitm atrix, and the orthogonal matrix U is retumed; = $\mathrm{N}^{\prime}$ : U is notcom puted.

JOBV (input)
$=\mathrm{V}$ ': V m ustcontain an orthogonalm atrix V 1 on entry, and the product V 1*V is retumed; = I ': V is initialized to the unitm atrix, and the orthogonal m atrix V is retumed; $=\mathrm{N}: \mathrm{V}$ is notcom puted.

JOBQ (input)
$=\mathrm{Q}: \mathrm{Q}$ m ustcontain an orthogonalm atrix Q 1 on entry, and the product $\mathrm{Q} \mathrm{I}^{*} \mathrm{Q}$ is retumed; = $\mathrm{I}^{\prime}: \mathrm{Q}$ is initialized to the unitm atrix, and the orthogonal matrix Q is retumed; $=\mathrm{N}$ ': Q is notcom puted.

M (input) The num ber of row s of the $m$ atrix $A . M>=0$.
$P$ (input) The num ber of row sof the $m$ atrix $B . P>=0$.

N (input) The num ber of colum ns of the m atrioes A and B. N $>=0$.
$K$ (input) $K$ and $L$ specify the subblocks in the input $m$ atrices A and B :
$\mathrm{A} 23=\mathrm{A}(\mathrm{K}+1 \mathbb{M} \mathbb{N}(\mathrm{~K}+\mathrm{L}, \mathrm{M}), \mathbb{N}-\mathrm{L}+\mathbb{N})$ and $\mathrm{B} 13=$ $B(1: L, N-\Psi+1 \mathbb{N})$ of $A$ and $B$, whose $G S V D$ is going to be com puted by STG SJA. Se Furtherdetails.
$L$ (input) See the description ofK .

A (input/output)
On entry, the $M-b y-N$ matrix $A$. On exit, $A \mathbb{N}-$ $K+1 \mathbb{N}, \mathbb{M} \mathbb{N}(\mathbb{K}+\mathrm{L}, \mathrm{M})$ ) contains the triangular $m$ atrix $R$ orpartofR. See Purpose for details.

LDA (input)
The leading dim ension of the array A. LD A >= max (1, M).

B (input/output)
On entry, the P -by-N m atrix B. On exit, if necessary, $B(M-K+1: L, N+M-K+1 \mathbb{N}$ ) contains a partofR . See Purpose for details.

LD B (input)
The leading dim ension of the array $\mathrm{B} . \operatorname{LD} \mathrm{B}>=$ $\max (1, \mathrm{P})$.

TO LA (input)
TO LA and TO LB are the convergence criteria for the Jacobi- K ogbetliantz teration procedure. Generally, they are the sam e as used in the preprocessing step, say TOLA $=m a x M, N) *$ norm (A)*M ACHEPS, TOLB $=\max (\mathbb{P}, N) \star$ norm (B)*M ACHEPS.

## TOLB (input)

See the description of TO LA .
ALPHA (output)
On exit, A LPHA and BETA contain the generalized
singular value pairs of $A$ and $B$; ALPHA $(1: K)=1$, BETA $(1: K)=0$, and ifM $K-L>=0$, ALPHA $(K+1 \mathbb{K}+L)$
$=\operatorname{diag}(\mathrm{C})$,
BETA $(K+1 K+L)=\operatorname{diag}(S)$, or if $M-\mathrm{K}<0$,
A LPHA $(\mathbb{K}+1 \mathrm{M})=\mathrm{C}$, A LPHA $\mathrm{M}+1 \mathrm{~K}+\mathrm{L})=0$
BETA $(K+1 M)=S, B E T A(M+1 \mathbb{K}+L)=1$. Furtherm ore,
if $\mathrm{K}+\mathrm{L}<\mathrm{N}, \mathrm{A}$ LPHA $(\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0$ and
BETA $(K+L+1 \mathbb{N})=0$.
BETA (output)
See the description of A LPH A.
U (input) On entry, if $\mathrm{JOBU}=\mathrm{U}$ ', U m ustcontain a matrix U 1 (usually the orthogonal matrix retumed by SGGSVP). On exit, if $\mathrm{JOBU}=\mathrm{I}^{\prime}$, U contains the orthogonalm atrix $U$; if $\operatorname{JOBU}=\mathrm{U}$ ', U contains the productU $1 * \mathrm{U}$. If $\mathrm{JOBU}=\mathrm{N}$ ', U is not referenced.

LD U (input)
The leading dim ension of the aray U. LD U >= $\mathrm{max}(1, \mathrm{M})$ if $\mathrm{OOBU}=\mathrm{U}$ '; LD U >= 1 otherw ise.

V (input) On entry, if $\mathrm{JOBV}=\mathrm{V}^{\prime}, \mathrm{V}$ m ustcontain a matrix
V1 (usually the orthogonal $m$ atrix retumed by SGGSVP). On exit, if $30 \mathrm{BV}=I^{\prime}, \mathrm{V}$ contains the orthogonalm atrix V ; if $\mathrm{JOBV}=\mathrm{V}, \mathrm{V}$ contains the product $\mathrm{V} 1 * \mathrm{~V}$. If $\mathrm{JO} \mathrm{BV}=\mathrm{N}, \mathrm{V}$ is not referenced.

LD V (input)
The leading dim ension of the array V. LDV >= $\mathrm{max}(1, \mathrm{P})$ if $\mathrm{JOBV}=\mathrm{V}$; LDV $>=1$ otherw ise.

Q (input) $O n$ entry, if $J O B Q=Q$ ', Q mustcontain a matrix Q 1 (usually the orthogonal $m$ atrix retumed by SGGSVP). On exit, if $\mathcal{O B Q}=I^{\prime}, Q$ contains the orthogonalm atrix $Q$; if $J B Q=Q$ ', $Q$ contains the product $\mathrm{Q} 1 * \mathrm{Q}$. If $J O B Q=N$ ', $Q$ is not referenced.

LD Q (input)
The leading dim ension of the array $Q . L D Q>=$ $\max (1, N)$ if $J O B Q=Q ; L D Q>=1$ otherw ise.

W ORK (w orkspace)
dim ension ( $2 \star \mathrm{~N}$ )
NCYCLE (output)
The num ber of cycles required for convergence.
$\mathbb{N} F O$ (output)
= 0 : successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an ille-
galvahue.
= 1: the procedure does not converge after M A X IT cycles.

## C INTERFACE

\#include <sunperfh>
void stgsna (char job, charhow mnt, int *select, intn, float
*a, int lda, float *b, int ldb, float *vl, int
ldvl, float *vr, int ldvr, float*s, float *dif,
intm $m$, int* $m$, int*info);
void stgsna_64 (char job, char how m nt, long *select, long n, float *a, long lda, float *b, long ldb, float *vl, long ldvl, float *vr, long ldvr, float *s, float *dif, long m m , long *m, long *info);

## PURPOSE

stgsna estim ates reciprocal condition num bers for specified eigenvalues and/or eigenvectors of a m atrix pair ( $A, B$ ) in generalized realSchur canonical form (or of any m atrix pair Q *A *Z', Q *B *Z $)$ w ith orthogonalm atrices Q and Z , w here $\mathrm{Z}^{\prime}$ denotes the transpose of $Z$.
( $\mathrm{A}, \mathrm{B}$ ) m ustbe in generalized realSchur form (as retumed by SGGES), i.e.A is block uppertriangularw ith 1 toy -1 and 2-by-2 diagonalblocks.B is upper triangular.

## ARGUMENTS

## JOB (input)

Specifies w hether condition num bers are required
foreigenvalues (S) oreigenvectors (D $\mathbb{F}$ ):
$=\mathrm{E}$ ': foreigenvalues only (S);
$=\mathrm{V}$ ': foreigenvectors only (D $\mathbb{F})$;
= B ': forboth eigenvalues and eigenvectors ( S and D $\mathbb{F}$ ).

HOW MNT (input)
= 'A ': com pute condition num bers for all eigenpairs;
= $S^{\prime}$ : com pute condition num bers for selected eigenpairs specified by the array SELEC T .

## SELECT (input)

If HOW MNT = S', SELECT specifies the eigenpairs for which condition num bers are required. To select condition num bers for the eigenpair comesponding to a realeigenvalue w ( $\mathcal{\nu}$, SELECT ( $)$ m ustibe set to .TRU E ..To selectcondition num bers corresponding to a complex conjugate pair of eigenvaluesw ( 7 ) and w ( $\ddagger+1$ ), either SELECT ( 7 ) or SELECT ( $j+1$ ) or both, mustbe setto .TRUE .. If HOW MNT = A', SELECT is notreferenced.

N (input) The order of the square $m$ atrix pair ( $\mathrm{A}, \mathrm{B}$ ). $\mathrm{N} \quad>=$ 0.

A (input) The upperquasi-triangularm atrix $A$ in the pair $(A, B)$.

LD A (input)
The leading dim ension of the array A. LDA >= $\max (1, N)$.
$B$ (input) The upper triangularm atrix $B$ in the pair $(A, B)$.

LD B (input)
The leading dim ension of the array $B . L D B>=$ $\max (1, N)$.

VL (input)
If $\mathrm{JOB}=\mathrm{E}$ 'or B ', VL mustcontain left eigenvectors of $(A, B)$, comesponding to the eigenpairs specified by H OW M NT and SELEC T. The eigenvectors $m$ ust be stored in consecutive colum ns of $V \mathrm{~L}$, as retumed by STGEVC . If JOB $=V$ ', $V L$ is not referenced.

The leading dim ension of the array VL. LD VL $>=1$. If $\mathrm{JOB}=\mathrm{E}$ 'or $\mathrm{B}^{\prime}$, LDVL $>=\mathrm{N}$.

VR (input)
If $\mathrm{JOB}=\mathrm{E}$ 'or B ', VR m ust contain right eigenvectors of ( $A, B$ ), comesponding to the eigenpairs specified by HOW M NT and SELECT. The eigenvectors m ust be stored in consecutive colum ns ov VR, as retumed by $S T G E V C$. If $J O B=V ', V R$ is not referenced.
LDVR (input)
The leading dim ension of the array VR.LD VR >= 1 . If $\mathrm{JOB}=\mathrm{E}$ 'or B ', LDVR $>=\mathrm{N}$.

S (output)
If $J O B=E$ ' or $B$ ', the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the array. For a com plex conjugate pair of eigenvalues tw o consecutive ele$m$ ents of $S$ are set to the sam e value. Thus $S(\mathcal{j})$, D $\mathbb{F}(\mathcal{j})$, and the $j$ th colum ns ofVL and VR all comespond to the sam e eigenpair (butnot in general the jth eigenpair, unless alleigenpairs are selected). If $70 \mathrm{~B}=\mathrm{V}$ ', S is not referenced.

D $\mathbb{F}$ (output)
If $\mathrm{JO} \mathrm{B}=\mathrm{V}$ 'or B ', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. For a complex eigenvector tw o consecutive elem ents of $D \mathbb{F}$ are set to the sam e value. If the eigenvalues cannot be reordered to com pute $D \mathbb{F}(\mathcal{I}), \mathrm{D} \mathbb{F}()$ is set to 0 ; this can only occurw hen the true value would be very sm allanyw ay. If $\mathrm{JO} B=\mathrm{E}, \mathrm{D} \mathbb{F}$ is not referenced.

M M (input)
The num berof elem ents in the arrays $S$ and $D \mathbb{F} . M M$ $>=\mathrm{M}$.

M (output)
The num berof elem ents of the arrays $S$ and $D \mathbb{F}$ used to store the specified condition num bers; for each selected realeigenvalue one elem ent is used, and for each selected com plex conjugate pair of eigenvalues, tw o elem ents are used. If HOW M NT = A', M is set to $N$.

W ORK (w orkspace)
If $\mathrm{JOB}=\mathrm{E}$ ', W ORK is not referenced. O therw ise,
on exit, if $\mathbb{N F} F=0, W$ ORK (1) retums the optim al LW ORK.

## LW ORK (input)

The dim ension of the anay $W$ ORK .LW ORK >= N. If JOB = V 'or B 'LW ORK >= 2*N * $N+2$ ) +16 .
If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IW ORK (w orkspace)
dim ension $(\mathbb{N}+6)$ If $\mathcal{O B}=\mathrm{E}^{\prime}, \mathbb{I N} \mathrm{ORK}$ is not referenced.
$\mathbb{N} F O$ (output)
=0: Successfulexit
$<0:$ If $\mathbb{N}$ FO $=-$ i, the $i$-th argum enthad an illegal value

## FURTHER DETAILS

The reciprocal of the condition num ber of a generalized eigenvalue $w=(a, b)$ is defined as $(w)=(\mu A v|\star * 2+\mu \mathrm{Bv}| \star * 2)^{* *}(1 / 2) /\left(\right.$ norm $(u){ }^{*}$ norm (v))
$w$ here $u$ and $v$ are the left and righteigenvectors of (A, B) comesponding to $\mathrm{w} ;|z|$ denotes the absolute value of the com plex num ber, and norm (u) denotes the 2 -norm of the vector u. The pair ( $a, b$ ) corresponds to an eigenvalue $w=a \nless \vDash$ $u$ Av/uBv) of the m atrix pair ( $A, B$ ). If both $a$ and $b$ equal zero, then $(A B)$ is singular and $S(I)=-1$ is retumed.

A n approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue $w$ and the comesponding exacteigenvalue lam bda is hord (w , lam bda) <= EPS * norm (A , B) /S (I)
where EPS is the $m$ achine precision.

The reciprocal of the condition num ber D $\mathbb{F}$ (i) of right eigenvector $u$ and lefteigenvectorv comesponding to the generalized eigenvalue $w$ is defined as follow s:
a) If the $i$-th eigenvalue $w=(a, b)$ is real

Suppose U and V are orthogonal transform ations such that
$U *(A, B) * V=(S, T)=(a *)(b *)$
1

$$
(0 \mathrm{~S} 22),(0 \mathrm{~T} 22)
$$

n-1

$$
1 \mathrm{n}-1 \quad 1 \mathrm{n}-1
$$

Then the reciprocalcondition num berD $\mathbb{F}(i)$ is
D ifl( $(\mathrm{a}, \mathrm{b}),(\mathrm{S} 22, \mathrm{~T} 22))=\operatorname{sigm} \mathrm{a}-\mathrm{m}$ in $(\mathrm{Z} 1)$,
where sigm a-m in (Zl) denotes the sm allest singular value of the
$2(n-1)$-by-2 (n-1) m atrix

```
Zl= [kron (a, In-1) kron (1,S22) ]
            [kron(b, In-1) -kron(1,T22)].
```

H ere $\mathrm{In}-1$ is the identily $m$ atrix of size $\mathrm{n}-1 . \operatorname{kron}(X, Y)$ is the
$K$ roneckerproductbetw een the $m$ atrices $X$ and $Y$.

N ote that if the defaultm ethod for com puting D IF (i) is w anted
(see SLA TDF), then the param eter D FPD RI (see below) should be
changed from 3 to 4 (routine SLATD F (LJO B $=2 \mathrm{w}$ ill be used)).
See STG SY L form ore details.
b) If the $i$-th and (i+1)-th eigenvalues are com plex conjugate pair,

Suppose U and V are orthogonal transform ations such that
$U^{*}(A, B) * V=(S, T)=(S 11 *)(T 11 *$
) 2

$$
(0 \quad S 22),(0
$$

T22) $n-2$

$$
\begin{array}{llll}
2 & n-2 & n-2
\end{array}
$$

and (S11, T11) comesponds to the com plex conjugate eigenvalue
pair ( $w$, con $\dot{g}(w)$ ). There exist unitary $m$ atrices $U 1$ and V1 such
that
U 1 *S11*V1 = (s11 s12 ) and U 1 *T11*V $1=(\mathrm{t} 11 \mathrm{t} 12$
)

$$
\text { ( } 0 \text { s22) ( } 0 \text { t22 }
$$

)
w here the generalized eigenvalues $\mathrm{w}=\mathrm{s} 11$ t11 and con ${ }^{g}(w)=s 22$ t 22 .

Then the reciprocalcondition num berD $\mathbb{F}$ (i) is bounded by

$$
\mathrm{m} \text { in }(\mathrm{d} 1, \mathrm{~m} \text { ax }(1, \text { real(s11)/real(s22)|)*d2 ) }
$$

where, $\mathrm{d} 1=\mathrm{D}$ ifl( $(\mathrm{s} 11, \mathrm{t} 11),(\mathrm{s} 22, \mathrm{t} 22))=$ sigm a-m in $(\mathrm{Z} 1)$, where
Z 1 is the com plex 2 -by -2 m atrix

```
Z1 = [s11 -s22]
    [t11 -t22 ],
```

This is done by com puting (using realarithm etic) the roots of the characteristicalpolynom ialdet(Z1'* Z1 lam bda I),
where Z1'denotes the conjugate transpose of Z1 and $\operatorname{det}(X)$ denotes the determ inantof $X$.
and d2 is an upperbound on D ifl((S11,T11), (S22,T22)), ie.an
upperbound on sigm a-m in ( $Z 2$ ), where $Z 2$ is ( $2 n-2$ )-by-( $2 n-$ 2)

$$
\begin{aligned}
& \mathrm{Z} 2=[\mathrm{kron}(\mathrm{~S} 11 \text { ', In-2) } \mathrm{kron}(\mathrm{I}, \mathrm{~S} 22)] \\
& \text { [kron(T11', In-2) kron (12, T22) ] }
\end{aligned}
$$

$N$ ote that if the default $m$ ethod for com puting $D$ IF is w anted (see
SLA TD F), then the param eterD IFD R I (see below ) should be changed
from 3 to 4 (routine SLA TDF (INO B $=2$ w ill be used)). See STGSYL
form ore details.

For each eigenvaluekector specified by SE LEC T, D IF stores a Frobenius norm -based estim ate ofD ifl.

A $n$ approxim ate errorbound forthe i-th com puted eigenvector VL (i) orVR (i) is given by

> EPS * nom (A, B) /D IF (i).

See ref. [2-3] form ore details and further references.

## C INTERFACE

\#include <sunperfh>
void stgsyl(chartrans, int ijob, intm, int $n$, float *a, int lda, float *b, int ldb, float * c , int ldc, float*d, int ldd, float*e, int lde, float *f, int ldf, float *scale, float *dif, int*info);
void stgsyl 64 (Char trans, long ijob, long m, long n, float
*a, long lda, float *b, long ldb, float *c, long
ldc, float *d, long ldd, float *e, long lde, float
*f, long ldf, float *scale, float *dif, long
*info);

## PURPOSE

stgsylsolves the generalized Sylvesterequation:
$A * R-L * B=$ scale $* C$
$D * R-L * E=$ scale $* F$
(1)
where $R$ and $L$ are unknow $n m-b y-n m$ atrices, ( $A, D$ ), (B, E) and ( $C, F$ ) are given $m$ atrix pairs of size $m-b y-m, n-b y-n$ and $m$-by- $n$, respectively, $w$ ith realentries. ( $A, D$ ) and ( $B, E$ ) m ust be in generalized (real) Schur canonical form ,ie.A, $B$ are upperquasitriangular and D, E are upper triangular.

The solution $(\mathbb{R}, L)$ overw rites ( $C, F) .0<=$ SCALE $<=1$ is an output scaling factor chosen to avoid overflow .

In $m$ atrix notation (1) is equivalent to solve $\mathrm{Zx}=$ scale b , where $Z$ is defined as

$$
\begin{aligned}
Z= & {\left[\operatorname{kron}(\operatorname{In}, A) \operatorname{kron}\left(B^{\prime}, \operatorname{Im}\right)\right] } \\
& {\left[\operatorname{kron}(\operatorname{In}, D) \operatorname{kron}\left(E^{\prime}, \operatorname{Im}\right)\right] . }
\end{aligned}
$$

H ere $\mathbb{k}$ is the identily $m$ atrix of size $k$ and X 'is the transpose of $X$. kron ( $X, Y$ ) is the $K$ roneckerproduct.betw een the $m$ atrices $X$ and $Y$.

If TRANS = T', STGSY L solves the transposed system Z "y = scale*b, which is equivalent to solve for $R$ and $L$ in

$$
\begin{aligned}
& A^{\prime} * R+D^{\prime *} L=\text { scale * C } \\
& R B^{\prime}+L E^{\prime}=\text { scale * }(F)
\end{aligned}
$$

(3)

This case (TRANS = T) is used to com pute an one-norm -based estim ate of $D$ if $[(A, D),(B, E)]$, the separation betw een the $m$ atrix pairs $(A, D)$ and $(B, E)$, using SLA CON.

If IJO B >= 1, STG SY L com putes a Frobenius norm -based esti$m$ ate ofD if $[(A, D),(B, E)]$. That is, the reciprocal ofa low er
bound on the reciprocal of the sm allest singular value of $Z$.
See [1-2] form ore inform ation.

This is a level3 BLA S algorithm .

## ARGUMENTS

TRANS (input)
= N ', solve the generalized Sylvester equation (1). = T', solve the transposed 'system (3).

IJOB (input)
Specifies whatkind of functionality to be per-
form ed. $=0$ : solve (1) only.
$=1$ : The functionality of 0 and 3 .
$=2$ : The functionality of 0 and 4 .
$=3: 0$ nly an estim ate ofD if $[(A, D),(B, E)]$ is computed. (look ahead strategy IJO B $=1$ is used). $=4: 0$ nly an estim ate ofD if $[(A, D),(B, E)]$ is computed. ( SGECON on sub-system s is used). N ot referenced if TRANS = $T$ '.
$M$ (input) The order of the $m$ atrioes $A$ and $D$, and the row dim ension of the $m$ atrices $C, F, R$ and $L$.
$N$ (input) The order of the $m$ atrices $B$ and $E$, and the $c o l u m n$ dim ension of the $m$ atrioes $C, F, R$ and $L$.

A (input) The upperquasitriangularm atrix A.

LDA (input)
The leading dim ension of the aray A. LDA >= $m a x(1, M)$.
$B$ (input) The upperquasitriangularm atrix $B$.

LD B (input)
The leading dim ension of the aray B. LD B >= $\max (1, N)$.
C (input/output)
On entry, $C$ contains the right-hand-side of the first $m$ atrix equation in (1) or (3). On exit, if IJOB $=0,1$ or $2, C$ has been overw ritten by the solution R. If $\mathrm{IO} B=3$ or 4 and TRANS $=N^{\prime}$, C holds $R$, the solution achieved during the com putation of the $D$ if-estim ate.

LD C (input)
The leading dim ension of the aray C. LD C >= max (1, M).

D (input) The upper triangularm atrix D.

## LD D (input)

The leading dim ension of the aray D. LDD >= $m a x(1, M)$.

E (input) The upper triangularm atrix E .

LDE (input)
The leading dim ension of the aray E. LDE >= $\max (1, N)$.

F (input/output)
On entry, F contains the right-hand-side of the second $m$ atrix equation in (1) or (3). On exit, if IJO B $=0,1$ or $2, F$ has been overw ritten by the solution L. If IOB $=3$ or 4 and TRANS $=N^{\prime}, F$ holds L , the solution achieved during the com putation of the D if-estim ate.

LD F (input)
The leading dim ension of the array F. LDF >= max (1, M).

D $\mathbb{F}$ (output)
On exitSCALE is the reciprocalof a low er bound of the reciprocal of the $D$ if-function, ie. SCA LE is an upper bound of $D$ if $[(A, D),(B, E)]=$ sigm a_m in (Z), where $Z$ as in (2). If $I J O B=0$ or TRANS = T', SCALE is nottouched.
SCALE (output)
On exitSCA LE is the reciprocalofa lower bound of the reciprocal of the $D$ if-function, ie. SCA LE is an upper bound of $D$ if $[(A, D),(B, E)]=$ sigm a_m in (Z), where $Z$ as in (2). If $I J O B=0$ or TRANS = T', SCALE is not touched.

W ORK (w orkspace)
If $\mathrm{IJOB}=0, \mathrm{~W} O R K$ is not referenced. O therw ise, on exit, if $\mathbb{N} F O=0, W$ ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array $W$ ORK. LW ORK $>=1$. If $\mathrm{IJOB}=1$ or 2 and TRANS $=\mathrm{N}^{\prime}$, LW ORK $>=2 * \mathrm{M} * \mathrm{~N}$ 。

If LW ORK $=-1$, then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IV ORK (w orkspace)
dim ension $M+N+2$ )
$\mathbb{I N F O}$ (output)
$=0$ : successfulexit
$<0:$ If $\mathbb{N}$ FO $=-$ - , the $i$-th argum enthad an illegal
value.
$>0$ : $A, D)$ and $(B, E)$ have com $m$ on orclose eigenvalues.

## C INTERFACE

\#include < sunperfh>
void stpcon (charnorm, char uplo, chardiag, int n, float
*a, float *rcond, int *info);
void stpcon_64 (charnorm , char uplo, char diag, long n, float *a, float *roond, long *info);

## PURPOSE

stpcon estim ates the reciprocal of the condition num berof a packed triangular matrix A, in ettherthe 1-norm orthe infinity-norm .

The norm ofA is com puted and an estim ate is obtained for norm (inv (A )), then the reciprocal of the condition num ber is com puted as
$\operatorname{RCOND}=1 /(\operatorname{norm}(A) *$ nom (inv (A))).

## ARGUMENTS

NORM (input)
Specifies w hether the 1-norm condition num ber or the infinity-norm condition num ber is required:
= 1'or $^{0}$ ': 1-nom ;
= I : $\quad$ Infinity-norm .

UPLO (input)
$=\mathrm{U}$ : A is uppertriangular;
$=\mathrm{L}$ ': A is low ertriangular.
D IA G (input)
$=\mathrm{N}$ : A is non-unit triangular;
$=\mathrm{U}$ ': A is unit triangular.
N (input) The order of the m atrix $\mathrm{A} . \mathrm{N}>=0$.

A (input) The upper or low er triangular m atrix A, packed colum nw ise in a linear array. The jth colum n of A is stored in the aray A as follow s: if UPLO = $U^{\prime}, A(i+(j-1) * j 2)=A(i, j)$ for $1<=i<=j$; if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(i+(j-1) *(2 n-j) / 2)=A(i, j)$ for $j=i<=n$. IfD $\mathbb{A} G=U$ ', the diagonalelem ents of $A$ are not referenced and are assum ed to be 1 .

RCOND (output)
The reciprocal of the condition num ber of the $m$ atrix $A$, computed as RCOND $=1 /($ noim (A) * norm (inv (A))).
W ORK (w orkspace)
dim ension $(3 * N)$

W ORK 2 (w orkspace)
dim ension $\mathbb{N}$ )
$\mathbb{N} F O$ (output)
= 0 : successfulexit
<0: if $\mathbb{I N}$ FO $=-$ i, the $i$-th argum ent had an illegalvalue

```

C INTERFACE
\#include < sunperfh>
void stpom v (charuplo, char transa, chardiag, int n, float
*a, float *y, int incy);
void stpm v_64 (charuple, chartransa, char diag, long n, float*a, float *y, long incy);

## PURPOSE

stpm $v$ perform s one of them atrix-vector operations $x: A * x$, or $x:=A * x$, where $x$ is an $n$ elem entvectorand $A$ is an $n$ by $n$ unit, ornon-unit, upper or low er triangular $m$ atrix, supplied in packed form .

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies w hether the $m$ atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or ${ }^{\prime}$ ' A is an upper triangular $m$ atrix.

UPLO = L' or I' A is a lower triangular $m$ atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA $=N^{\prime}$ or $h^{\prime} \mathrm{x}:=\mathrm{A}{ }^{*} \mathrm{x}$.

TRANSA = T'or $t^{\prime} x:=A * x$.

TRANSA $=$ C'or $匕^{\prime} \mathrm{x}:=\mathrm{A} * \mathrm{x}$.
U nchanged on exit.

TRANSA is defaulted to N 'forF $95 \mathbb{I N}$ TERFACE.

D IA G (input)
On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D $\mathbb{I}$ G $=$ U'or $\mathrm{L}^{\prime} A$ is assum ed to be unit tri-
angular.
$D \mathbb{A G}=N$ 'or $h$ ' $A$ is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
O n entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.

A (input)
( $(n *(n+1)) / 2)$. Before entry with UPLO = $U$ ' or $L$ ', the amay A m ustcontain the upper triangularm atrix packed sequentially, colum $n$ by colum $n$, so thatA (1) contains a (1, 1), A (2) and $A(3)$ contain $a(1,2)$ and $a(2,2)$ respectively, and so on. Before entry w ith UPLO = L' or I', the anray A m ust contain the low er triangular m atrix packed sequentially, colum $n$ by colum $n$, so thatA (1) contains a (1,1),A(2) and $A(3)$ contain $a(2,1)$ and $a(3,1)$ respec tively, and so on. N ote thatw hen D IA G $=U U^{\prime}$ or $G$ ', the diagonal elem ents of A are notreferenced, butare assum ed to be unity. U nchanged on exit.

Y (input/output)
$(1+(n-1) * a b s(\mathbb{N} C Y))$. Before entry, the increm ented array $Y$ must contain the $n$ elem ent vectorx. O n exit, $Y$ is overw ritten $w$ ith the tranform ed vector $x$.
$\mathbb{N C Y}$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of $. \mathbb{N} C Y<>0$. U nchanged on exit.

## C INTERFACE

\#include <sunperfh>
void stprfs (charuplo, chartransa, chardiag, int $n$, int nihs, float *a, float*b, int ldb, float * $x$, int ldx, float * ferr, float *berr, int *info);
void stprfs_64 (charuplo, chartransa, char diag, long n, long nrhs, float *a, float *b, long ldb, float *x, long ldx, float * ferr, float *berr, long *info);

## PURPOSE

stprfs provides errorbounds and backw ard error estim ates for the solution to a system of linear equations w ith a triangular packed coefficientm atrix.

The solution $m$ atrix $X$ m ustbe com puted by STPTRS or some other $m$ eans before entering this routine. STPRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

## ARGUMENTS

UPLO (input)
= U ': A is uppertriangular;
= LL': A is low ertriangular.

TRAN SA (input)
Specifies the form of the system of equations:
$=N$ : A * $\mathrm{X}=\mathrm{B} \quad$ N $\circ$ transpose)
= T': A**T * X = B (T ranspose)
= C': A **H * X = B (C onjugate transpose = Transpose)

TRANSA is defaulted to $N$ 'forF95 $\mathbb{N}$ TERFACE.

D IA G (input)
= N ': A is non-unit triangular;
$=\mathrm{U}: \mathrm{A}$ is unit triangular.
N (input) The order of them atrix $\mathrm{A} . \mathrm{N}>=0$.
NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices $B$ and X. NRH $S>=0$.

A (input) The upper or low er triangular m atrix A, packed colum nw ise in a linear anray. The jth colum n of A is stored in the array A as follow s: if UPLO = $U^{\prime}, A(i+(j-1) * j 2)=A(i, j)$ for $1<=i<=j$ if $\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(i+(j-1) *(2 \star n-7) / 2)=A(i, 7)$ for $j=i<=n$. IfD $\mathbb{A} G=U '$, the diagonalelem ents of A are not referenced and are assum ed to be 1 .
$B$ (input) The righthand side $m$ atrix $B$.

LD B (input)
The leading dim ension of the aray B. LD B $>=$ $\max (1, N)$.
$X$ (input) The solution $m$ atrix $X$.

LD X (input)
The leading dim ension of the amay X . LD X >= $\max (1, \mathbb{N})$.

FERR (output)
The estim ated forw ard errorbound for each solution vector $X()$ ) the $j$ th colum n of the solution $m$ atrix X). If XTRUE is the true solution comesponding to $X(\mathcal{O})$, FERR ( $)$ is an estim ated upperbound for the $m$ agnitude of the largest ele$m$ ent in ( $X(\mathcal{D})-X$ TRUE) divided by the $m$ agnitude of the largestelem ent in $X(\mathcal{J})$. The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

## BERR (output)

The com ponentw ise relative backw ard error of each
solution vectorX ( $\mathcal{j}$ ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
dim ension $\left(3^{*} N\right)$
W ORK 2 (w orkspace)
dim ension ( N )
$\mathbb{N}$ FO (output)
= 0: successfulexit
$<0:$ if $\mathbb{N}$ FO $=-i$, the $i$-th argum enthad an illegalvalue

*a, float * $y$, int incy);
void stpsv_64 (charuplo, chartransa, char diag, long n, float*a, float *y, long incy);

## PURPOSE

stpsv solves one of the system sof equations $A *_{x}=b$, or $A$ * $x=b$, where $b$ and $x$ are $n$ elem entvectors and $A$ is an $n$ by $n$ unit, ornon-unit, upper or low er triangular $m$ atrix, supplied in packed form .

N o test forsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

## ARGUMENTS

UPLO (input)
On entry, UPLO specifies w hether the $m$ atrix is an upper or low er triangularm atrix as follow s:
$\mathrm{UPLO}=\mathrm{U}$ 'or G ' $A$ is an upper triangular $m$ atrix.

UPLO = L' or $\mathrm{I}^{\prime} \mathrm{A}$ is a lower triangular $m$ atrix.

U nchanged on exit.
TRANSA (input)
O n entry, TRANSA specifies the equations to be solved as follow s:

TRANSA $=N^{\prime}$ or $h^{\prime} A * x=b$.
TRANSA $=$ T'ort' $A * x=b$.

TRANSA $=C^{\prime}$ ort' $\mathrm{A}^{*} \mathrm{x}=\mathrm{b}$.
U nchanged on exit.
TRANSA is defaulted to N 'forF $95 \mathbb{I N}$ TERFACE.

D IA G (input)

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D $\mathbb{A G G}=\mathrm{U}$ 'or $\mathrm{L}^{\prime} \mathrm{A}$ is assum ed to be unit triangular.
$D \mathbb{A} G=N$ 'or $h$ ' $A$ is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O $n$ entry, $N$ specifies the order of the $m$ atrix A. $\mathrm{N}>=0$. U nchanged on exit.
A (input)
$\left(\left(\mathrm{n}^{*}(\mathrm{n}+1)\right) / 2\right)$. Before entry w th $\mathrm{UPLO}=$ $U$ ' or U ', the array A m ustcontain the upper triangularm atrix packed sequentially, colum $n$ by colum n , so that A (1) contains a ( 1,1 ), A (2) and $A(3)$ contain $a(1,2)$ and $a(2,2)$ respectively, and so on. Before entry w ith UPLO = $\mathrm{L}^{\prime}$ or 1 ', the amay A m ust contain the low er triangular $m$ atrix packed sequentially, colum $n$ by colum n, so thatA (1) contains a (1,1), A (2) and $A$ ( 3 ) contain a $(2,1)$ and a $(3,1)$ respectively, and so on. N ote thatw hen D IA G $=$ U' or G ', the diagonal elem ents of A are notreferenced, but are assum ed to be unity. Unchanged on exit.

Y (input/output)
$(1+(n-1) * a b s(\mathbb{N} C Y))$. Before entry, the increm ented array $Y \mathrm{~m}$ ust contain the n elem ent righthand side vectorb. O $n$ exit, $Y$ is overw ritten $w$ ith the solution vector $x$.
$\mathbb{N} C Y$ (input)
On entry, $\mathbb{N} C Y$ specifies the increm ent for the elem ents of. $\mathbb{I N} C Y$ <> 0 . U nchanged on exit.

\section*{PURPOSE}
stpters solves a triangular system of the form
w here \(A\) is a triangularm atrix of order \(N\) stored in packed form at, and B is an N boy-NRH S m atrix. A check ism ade to verify thatA is nonsingular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) : A is upper triangular;
\(=\mathbb{L}^{\prime}: A\) is low er triangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}^{\prime}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad\) (Notranspose)
\(=T{ }^{\prime}: A * * T * X=B \quad\) ( ranspose)
\(=C^{\prime}: A * * H * X=B \quad\) (C onjugate transpose \(=T\) ran spose)

D IA G (input)
\(=\mathrm{N}^{\prime}: A\) is non-unittriangular;
\(=\mathrm{U}\) : A is unit triangular.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber
of colum ns of the m atrix B. NRHS \(>=0\).

A (input) The upper or low er triangular matrix A, packed colum nw ise in a linear amay. The jth colum n of
A is stored in the aray A as follow s: ifUPLO =
\(U ', A(i+(j-1) \star j 2)=A(i, j)\) for \(1<=i<=j\) if
\(\mathrm{UPLO}=\mathrm{L}, \mathrm{A}\left(i+(j-1)^{\star}\left(2{ }^{\star} \mathrm{n}-\mathrm{j}\right) / 2\right)=A(i, j)\) for
\(j=\mathrm{i}<=\mathrm{n}\) 。

B (input/output)
On entry, the righthand side m atrix B. On exit, if \(\mathbb{N} F O=0\), the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
<0: if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the \(i\)-th diagonalelem ent of \(A\) is zero, indicating that the \(m\) atrix is singular and the solutions \(X\) have notbeen com puted.

\section*{C INTERFACE}
\#include < sunperfh>
void strevc (charside, char how my, int *select, int n, float *t, int ldt, float *Vl, int ldvl, float *Vr, int ldvr, intm \(m\), int * \(m\), int *info);
void strevc_64 (charside, charhow m ny, long *select, long n, float *t, long ldt, float *vl, long ldvl, float
*Vr, long ldvr, long m m , long *m, long *info);

\section*{PURPOSE}
strevc com putes som e orallof the rightand/or left eigenvectors of a realupperquasi-triangularm atrix \(T\).

The righteigenvectorx and the left eigenvector y of \(T\) corresponding to an eigenvalue w are defined by:
\[
\mathrm{T}^{\star} \mathrm{X}=\mathrm{w}^{\star} \mathrm{x}, \quad \mathrm{y}^{\star} \mathrm{T}=\mathrm{w}^{\star} \mathrm{y}^{\prime}
\]
w here y'denotes the conjugate transpose of the vectory.

If alleigenvectors are requested, the routine \(m\) ay either retum the \(m\) atrioes \(X\) and/or \(Y\) of rightor lefteigenvectors of \(T\), or the products \(Q * X\) and/or \(Q * Y\), where \(Q\) is an input orthogonal
\(m\) atrix. If \(T\) w as obtained from the real-Schur factorization of an originalm atrix \(A=Q * T * Q\) ', then \(Q * X\) and \(Q * Y\) are the \(m\) atrices of right or lefteigenvectors of \(A\).

T m ustbe in Schur canonical form (as retumed by SH SEQR), thatis, block upper triangularw ith 1-boy-1 and \(2-b y-2\) diagonalblocks; each 2-by-2 diagonal block has its diagonal elem ents equal and its off-diagonalelem ents of opposite sign. C orresponding to each 2 -by-2 diagonalblock is a com plex conjugate pair ofeigenvalues and eigenvectors; only one eigenvector of the pair is com puted, nam ely the one corresponding to the eigenvalue \(w\) ith posilive im aginary part.

\section*{ARGUMENTS}

STDE (input)
\(=\mathrm{R}\) : com pute righteigenvectors only;
= L ': com pute lefteigenvectors only;
\(=\mathrm{B}\) ': com pute both right and lefteigenvectors.

HOW MNY (input)
= A ': com pute all right and/or left eigenvec-
tors;
= B ': com pute all right and/or left eigenvec-
tors, and backtransform them using the input m atrices supplied in VR and/orV L; \(=\mathrm{S}\) ': com pute selected right and/or left eigenvectors, specified by the logicalamay SELEC T .

\section*{SELECT (input/output)}

If H OW M NY = S', SELEC T specifies the eigenvectors
to be com puted. IfHOW M NY = A 'or B', SELECT is
not referenced. To select the real eigenvector
corresponding to a realeigenvalue w ( \(\mathcal{j}\), SELECT ( \()\)
m ustibe set to TRUE.. To select the complex eigenvector comesponding to a com plex conjugate
pair w ( \(\mathcal{j}\) ) and w ( \(j+1\) ), either SELECT ( \(\mathcal{j}\) ) or
SELECT (j+1) must be setto TRUE.; then on exit
SELECT ( \(\mathfrak{j}\) ) is TRUE. and SELECT ( \(\mathfrak{j}+1\) ) is FALSE ..

N (input) The order of the m atrix \(\mathrm{T} \cdot \mathrm{N}>=0\).
T (input/output)
The upper quasi-triangular \(m\) atrix \(T\) in Schur canonicalform.

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, \mathbb{N})\).

VL (input/output)
On entry, ifSDE = L'or B'and HOW M NY = B',
VL must contain an \(N\)-by N m atrix Q (usually the orthogonalm atrix \(Q\) of Schurvectors retumed by SH SEQR). On ex斗, if \(S \mathbb{D} E=\mathrm{L}\) 'or B',VL contains: if HOW M NY = A', the matrix Y of left eigenvectors of \(T\); VL has the sam equasi-low er triangular form as T'. If T ( \(i, i\) i) is a real eigenvalue, then the \(i\)-th columnVL (i) ofVL is its comesponding eigenvector. If \(T\) ( \(i: i+1, i: i+1\) ) is a 2 -by-2 block whose eigenvalues are complexconjugate eigenvalues of T , then VL (i)+sqıt(
1)*V L (i+1) is the com plex eigenvector comesponding to the eigenvalue \(w\) ith positive realpart. if HOW M NY = B', them atrix Q *Y ; ifHOW M NY = S', the lefteigenvectors of \(T\) specified by SELEC T, stored consecutively in the colum ns ofV \(L\), in the sam \(e\) order as their eigenvalues. A com plex eigenvector comesponding to a com plex eigenvalue is stored in tw o consecutive colum ns, the first holding the real part, and the second the im aginary part. If \(S \mathbb{D E}=\mathrm{R}, \mathrm{VL}\) is not referenced.

LD V L (input)
The leading dim ension of the aray VL. LDVL >= \(\max (1, N)\) if \(S \mathbb{D} E=L\) 'or \(B^{\prime} ;\) LDVL \(>=1\)
otherw ise.

VR (input/output)
On entry, if \(S \mathbb{D} E=R\) 'or \(B\) 'and HOW M NY = B', VR m ust contain an N -by -N m atrix Q (usually the orthogonalm atrix \(Q\) of Schurvectors retumed by SH SEQR). On exit, if \(S \mathbb{D} E=R\) 'or \(B\) ', \(V R\) contains: ifHOW MNY = A', the \(m\) atrix \(X\) of right eigenvectors of \(T\); VR has the sam equasi-upper triangular form as \(T\). If \(T(i, i)\) is a real eigenvalue, then the \(i\)-th colmmnVR (i) ofVR is its comesponding eigenvector. If \(T(i: i+1, i: i+1)\) is a 2 -by-2 block whose eigenvalues are complexconjugate eigenvalues of T, then VR (i)+sqrt(1)*VR(i+1) is the com plex eigenvector corresponding to the eigenvalue w th positive realpart. if HOW M NY = B', them atrix Q *X; if HOW MNY = S', the right eigenvectors of \(T\) specified by SELECT, stored consecutively in the colum ns of \(V R\), in the sam e order as their eigenvalues. A com plex eigenvector corresponding to a com plex eigenvahue is stored in tw o consecutive colum ns, the firstholding the real part and the second the im aginary part. If \(S \mathbb{D} E=\Sigma \prime, V R\) is not referenced.

LDVR (input)
The leading dim ension of the array VR. LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R\) 'or B';LDVR >= 1 otherw ise.

M M (input)
The num berof colum ns in the arrays VL and/or VR. M M >=M.

M (output)
The num berof colum ns in the arrays VL and/or VR
actually used to store the eigenvectors. If HOW MNY = A 'or \(B\) ', M is set to N. Each selected real eigenvector occupies one colmm \(n\) and each selected com plex eigenvector occupies tw o colum ns.

W ORK (w orkspace)
dim ension ( \(3{ }^{*}\) N )
\(\mathbb{N}\) FO (output)
= 0 : successfinlexit
< 0 : if \(\mathbb{N F O}=-i\), the \(i\)-th argum ent had an illegal value

\section*{FURTHER DETAILS}

The algorithm used in this program is basically backw ard (forw ard) substitution, \(w\) th scaling to \(m\) ake the the code robustagainst possible overflow .

E ach eigenvector is norm alized so that the elem ent of largest \(m\) agnitude has \(m\) agnitude 1 ; here the \(m\) agnitude of a com plex num ber \((x, y)\) is taken to be \(|x|+|y|\).

\section*{PURPOSE}
strm \(m\) penform sone of the \(m\) atrix \(m\) atrix operations \(B:=\) alpha*op ( \(A\) ) *B , orB \(:=\) alpha*B*op (A ) where alpha is a scalar, \(B\) is an \(m\) by \(n m\) atrix, \(A\) is a unit, ornon-unit, upper or low er triangularm atrix and op (A ) is one of
\[
o p(A)=A \quad \text { or } \quad o p(A)=A^{\prime}
\]

\section*{ARGUMENTS}

SIDE (input)
On entry, SIDE specifies w hether op (A ) m ultiplies B from the leftor rightas follow s:
\(S \mathbb{D E}=\mathbb{L}\) 'or I' B := alpha*op (A )*B .
\(S \mathbb{D E}=\mathrm{R}^{\prime}\) or \(r^{\prime} \mathrm{B}:=\) alpha*B*op (A) .

U nchanged on exit.

UPLO (input)
O n entry, UPLO specifies w hether the m atrix A is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or U ' \(A\) is an upper triangular \(m\) atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRAN SA specifies the form ofop (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N^{\prime}\) 'or \(h^{\prime}\) op(A) \(=A\).
TRANSA = T'or \(\mathrm{t}^{\prime}\) op(A) \(=\mathrm{A}^{\prime}\).

TRANSA = C'ort' op(A) = A'.
U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N}\) TERFACE.
D IA G (input)
O n entry, D IA G specifies w hether or notA is unit triangular as follow s:

D \(\mathbb{A} G=U\) 'or \(u\) ' \(A\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, M specifies the num ber of row s of B. M >= 0 . U nchanged on exit.
\(N\) (input)
O \(n\) entry, \(N\) specifies the num ber of colum ns of \(B\). \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, A LPH A specifies the scalar alpha.W hen alpha is zero then A is notreferenced and B need notbe setbefore entry. U nchanged on exit.

A (input)
REAL array ofD \(\mathbb{I}\) ENSION (LDA, \(k\) ), where \(k\) is \(m\) when \(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathbb{I}\) ' and is \(n\) when \(S \mathbb{D} E=\) R 'or 'r'.

Before entry \(w\) ith UPLO = U 'or L ', the leading \(k\) by \(k\) upper triangularpart of the array A \(m\) ustcontain the upper triangularm atrix and the strictly low ertriangularpartofA is not refer-
enced.

Before entry w ith UPLO = L'or I', the leading \(k\) by \(k\) low ertriangularpart of the array \(A\) \(m\) ust contain the low ertriangularm atrix and the strictly uppertriangularpart of \(A\) is not referenced.

N ote thatw hen D IA G = U 'or L', the diagonal elem ents of A are notreferenced either, butare assum ed to be one. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen \(S \mathbb{D E}=' \mathrm{~L}\) 'or \(\mathrm{I}^{\prime}\) then LD \(A>=\mathrm{max}(1, m)\), when \(S \mathbb{D E}=R^{\prime}\) or \(r^{\prime}\) then LDA \(>=\max (1, n)\). U nchanged on exit.

B (input/output)
REAL array ofD \(\mathbb{I M} E N S \mathbb{I O N}\) (LD B , n ). Before entry, the leading \(m\) by \(n\) partof the array \(B m u s t c o n-\) tain the m atrix B, and on exit is overw ritten
by the transform ed \(m\) atrix.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program.
LD B \(>=\max (1, m)\). U nchanged on exit.

*a, int lda, float *y, int incy);
void strm v_64 (charuplo, chartransa, char diag, long n, float*a, long lda, float *y, long incy);

\section*{PURPOSE}
strm \(v\) perform s one of the \(m\) atrix-vector operations \(x:=A * x\), or \(\mathrm{x}:=A{ }^{*} \mathrm{x}\), where x is an n elem entvectorand \(A\) is an n by \(n\) unit, ornon-unit, upper or low ertriangularm atrix.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{U}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or I' A is a lower triangular m atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} x:=A * x\).

TRANSA = T'ort' \(\mathrm{x}:=\mathrm{A}^{*} \mathrm{x}\).

TRANSA = C'orと' \(\mathrm{x}:=A^{*} \mathrm{x}\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D IA G = U'or L ' \(A\) is assum ed to be unit triangular.
\(D \mathbb{A G}=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
On entry, N specifies the order of the m atrix A . \(\mathrm{N}>=0\). U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading \(n\) by \(n\) upper triangular part of the array A m ust contain the upper triangular \(m\) atrix and the strictly low er triangular part of A is not referenced. Before entry with UPLO = L 'or 1', the leading \(n\) by \(n\) low er triangularpart of the aray A m ustcontain the low er triangular \(m\) atrix and the strictly upper triangularpartofA is not referenced. N ote thatw hen \(\mathrm{D} \mathbb{I A G}=\mathrm{U}\) ' or L ', the diagonal elem ents of \(A\) are not referenced either, but are assum ed to be unity. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program . LD A \(>=\) \(\max (1, n)\). U nchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. On exit, \(Y\) is overw rilten \(w\) ith the tranform ed vectorx.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(Y . \mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
strmfs provides errorbounds and backw ard enror estim ates for the solution to a system of linear equations \(w\) th a triangular coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by STRTRS or some other \(m\) eans before entering this routine. STRRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) : A is uppertriangular;
\(=\mathrm{L}\) ': A is low er triangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=N\) : A * \(\mathrm{X}=\mathrm{B} \quad \mathrm{N} \circ\) transpose)
\(=T: A * * T\) * \(X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose \(=\mathrm{T}\) ranspose)

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.
\(=\mathrm{N}: A\) is non-unit triangular;
\(=\mathrm{U}: \mathrm{A}\) is unit triangular.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the m atrioes B and X. NRH S \(>=0\).

A (input) The triangularm atrix A. IfU PLO = U', the lead-
ing N -by -N upper triangularpart of the aray A
contains the upper triangular \(m\) atrix, and the strictly low ertriangularpart of A is notrefer-
enced. IfUPLO = \(\mathbb{L}\) ', the leading N -oy N low er triangular part of the anray A contains the low er triangularm atrix, and the strictly upper triangular part ofA is notreferenced. IfD IA \(G=U^{\prime}\) ', the diagonalelem ents of A are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

B (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(X\) (input) The solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the aray X. LD X >= \(\max (1, N)\).

\section*{FERR (output)}

The estim ated forw ard emorbound for each solution vectorX ( 1 ) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X\) ). If XTRUE is the true solution corresponding to \(X(\mathcal{J}), \operatorname{FERR}(\mathcal{I})\) is an estim ated upperbound forthem agnitude of the largest ele\(m\) entin \((X(j)-X\) TRUE) divided by the \(m\) agnitude of the largestelem entin X ( 7 ). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vectorX (i) (i.e., the sm allest relative
change in any elem entofA orB thatm akes X ( 7 ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(3 * N\) )

W ORK2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i-\) th argum enthad an illegalvalue

\#include <sunperfh>
void strsen (char job, char com pq, int *select, intn, float
*t, int ldt, float *q, intldq, float *w r, float
*W i, int *m, float *s, float *sep, int *info);
void strsen_64 (char j.b. char com pq, long *select, long n, float *t, long ldt, float *q, long ldq, float *w r, float * \({ }_{\mathrm{w}} \mathrm{i}\), long \({ }^{\mathrm{m}} \mathrm{m}\), float *s, float *sep, long *info);

\section*{PURPOSE}
strsen reorders the real Schur factorization of a real \(m\) atrix \(A=Q * T * Q * * T\), so that a selected chuster of eigenvalues appears in the leading diagonalblocks of the upper quasi-triangularm atrix \(T\), and the leading colum ns of form an orthonorm albasis of the corresponding right invariant subspace.

Optionally the routine com putes the reciprocal condition num bers of the cluster of eigenvalues and/or the invariant subspace.

T m ustbe in Schurcanonical form (as retumed by SH SEQR), that is, block uppertriangularw ith 1 -by-1 and 2-by-2 diagonalblocks; each 2-by-2 diagonal block has its diagonal elem nts equal and its off-diagonal elem ents of opposite sign.

\section*{ARGUMENTS}
\(J O B\) (input)
Specifies w hether condition num bers are required
for the cluster ofeigenvalues (S) orthe invari-
antsubspace (SEP):
= N ': none;
= E': foreigenvalues only (S);
\(=\mathrm{V}\) ': for invariant subspace only (SEP);
\(=B\) ': forboth eigenvalues and invariant subspace (S and SEP).

COMPQ (input)
= V ': update the m atrix Q ofSchurvectors;
= N ': do notupdate Q .
SELECT (input)
SELEC T specifies the eigenvalues in the selected cluster. To select a real eigenvalue w ( \(\mathcal{j}\), SELECT ( \(\mathcal{j}\) ) must be set to \(\mathrm{w}(\mathcal{j})\) and \(\mathrm{w}(j+1)\), corresponding to a 2 -by-2 diagonalblock, either SELECT ( \(\ddagger\) ) orSELECT ( \(\ddagger+1\) ) orboth m ust be set to either both included in the cluster or both excluded.

N (input) The order of the m atrix \(\mathrm{T} . \mathrm{N}>=0\).

T (input/output)
On entry, the upperquasi-triangularm atrix T , in Schur canonical form. On exit, T is overw ritten by the reordered \(m\) atrix \(T\), again in Schur canonical form, w ith the selected eigenvalues in the leading diagonalblocks.

LD \(T\) (input)
The leading dim ension of the array \(\mathrm{T} . \mathrm{LD} \mathrm{T}>=\) \(\max (1, \mathbb{N})\).

Q (input) \(O n\) entry, if \(C O M P Q=V\) ', them atrix \(Q\) of Schur vectors. On exit, if \(C O M P Q=V\) ', Q has been postm ultiplied by the orthogonal transform ation \(m\) atrix which reorders \(T\); the leading \(M\) colum ns of \(Q\) form an orthonorm al basis for the specified invariant subspace. If COM PQ \(=N^{\prime}, \mathrm{Q}\) is not referenced.

LD Q (input)
The leading din ension of the array \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1\);
and if \(C O M P Q=V\) ', LD \(Q>=N\).

\section*{W R (output)}

The realand im aginary parts, respectively, of the reordered eigenvalues of \(T\). The eigenvalues are stored in the sam e order as on the diagonal of \(T\), w ith \(\mathrm{W} R(i)=T(i, i)\) and, if \(T(i: i+1, i: i+1)\) is a 2 -by-2 diagonalblock, \(W \mathrm{I}(\) (i) \(>0\) and \(\mathrm{W} \mathrm{I}(\mathrm{i}+1)=\) -W I(i). N ote that if a com plex eigenvalue is sufficiently ill-conditioned, then its value \(m\) ay differ significantly from its value before reordering.

\section*{W I (output)}

See the description of R .
M (output)
The dim ension of the specified invariant subspace. \(0<=M<=N\).

S (output)
If \(J 0 B=E\) 'or \(B ', S\) is a lower bound on the reciprocal condition num ber for the selected clusterofeigenvalues. S cannot underestim ate the true reciprocal condition num berby \(m\) ore than a factorofsqut \(\mathbb{N})\). If \(M=0\) or \(N, S=1\). If \(\operatorname{OBB}=\) N 'or V ', S is not referenced.

SEP (output)
If \(\mathrm{DOB}=\mathrm{V}\) 'or B ', SEP is the estim ated reciprocal condition number of the specified invariant subspace. IfM \(=0\) orN, \(\mathrm{SEP}=\) norm ( T ). If \(\mathrm{JO} B=\) N 'or E ', SEP is not referenced.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. If JOB = N ', LW ORK \(>=\max (1, N)\); if \(\operatorname{JOB}=\mathrm{E}^{\prime}, \mathrm{LW}\) ORK \(\left.>=\mathrm{M} * \mathbb{N}-\mathrm{M}\right)\); if \(\mathrm{JOB}=\mathrm{V}\) 'or \(B \prime\) ', LW ORK \(>=2 \star M * \mathbb{N}-M)\).

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
If \(\mathrm{JOB}=\mathrm{N}\) 'or E ', \(\mathbb{I W} O R K\) is not referenced.

LIV ORK (input)
The dim ension of the array \(\mathbb{I N} O R K\). If \(\mathrm{OB}=\mathrm{N}\) 'or E', LIN ORK >=1; if \(\mathrm{O} O \mathrm{~B}=\mathrm{V}\) 'or \(\mathrm{B}^{\prime}\), LIN ORK \(>=\) \(M *(N+M)\).

If \(L \mathbb{I V} O R K=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the \(\mathbb{I N}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK arnay, and no errorm essage related to LIV ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
\(=1\) : reordering of T failed because som e eigenvalues are too close to separate the problem is very ill-conditioned); T m ay have been partially reordered, and W R and W I contain the eigenvalues in the same order as in T; S and SEP (if requested) are set to zero.

\section*{FURTHER DETAILS}

STRSEN first collects the selected eigenvalues by com puting an orthogonal transform ation \(Z\) to \(m\) ove them to the top left comerof T. In otherw ords, the selected eigenvalues are the eigenvalues of T11 in:
\[
\begin{gathered}
\mathrm{Z} * \mathrm{~T} * \mathrm{Z}=(\mathrm{T} 11 \mathrm{~T} 12) \mathrm{n} 1 \\
(0 \mathrm{~T} 22) \mathrm{n} 2 \\
\mathrm{n} 1 \mathrm{n} 2
\end{gathered}
\]
w here \(\mathrm{N}=\mathrm{n} 1+\mathrm{n} 2\) and Z ' m eans the transpose of Z . The first n1 colum ns of \(Z\) span the specified invariant subspace of \(T\).

If \(T\) has been obtained from the realSchur factorization of a matrix \(\mathrm{A}=\mathrm{Q} * \mathrm{~T} * \mathrm{Q}\) ', then the reordered realSchur factorization of \(A\) is given by \(A=(Q * Z) *(Z \text { * } T * Z)^{*}(Q * Z)\) ', and the first n 1 colum ns of \(\mathrm{Q} * \mathrm{Z}\) span the corresponding invariant subspace ofA .

The reciprocalcondition num ber of the average of the eigenvalues of T11 m ay be retumed in S.S lies betw een 0 (very badly conditioned) and 1 (very w ell conditioned). It is com puted as follow s. Firstw e com pute \(R\) so that
\[
\begin{gathered}
P=\left(\begin{array}{l}
\text { I R }) \mathrm{n} 1 \\
(0 \quad 0) n 2 \\
\mathrm{n} 1 \mathrm{n} 2
\end{array}\right.
\end{gathered}
\]
is the projector on the invariant subspace associated w ith T11. R is the solution of the Sylvesterequation:
\[
\mathrm{T} 11 * \mathrm{R}-\mathrm{R} * \mathrm{~T} 22=\mathrm{T} 12 .
\]

LetF-norm (M) denote the Frobenius-norm of \(M\) and 2 -norm \(M\) ) denote the tw o-norm of . Then \(S\) is com puted as the low er bound
\[
(1+F-\operatorname{nom}(R) * * 2)^{\star *}(-1 / 2)
\]
on the reciprocal of 2 -norm ( P ), the true reciprocal condition number. S cannotunderestim ate \(1 / 2\)-norm (P) by m ore than a factorof sqrit \()\).

A n approxim ate errorbound for the com puted average of the eigenvalues of T11 is
```

EPS * norm (T)/S

```
where EPS is the \(m\) achine precision.

The reciprocal condition num ber of the right invariant subspace spanned by the firstn1 colum nsofZ (orofQ *Z) is retumed in SEP. SEP is defined as the separation of T11 and T22:
\[
\operatorname{sep}(T 11, T 22)=\text { sigm } a-m \text { in (C ) }
\]
where sigm a-m in (C) is the sm allest singularvalue of the \(\mathrm{n} 1 \star_{\mathrm{n}} 2-\)-by-n1*n2 m atrix
\[
C=\operatorname{kprod}(I(n 2), T 11)-\operatorname{kprod}(\operatorname{transpose}(I 22), I(n 1))
\]

I( \(m\) ) is an \(m\) by \(m\) identity \(m\) atrix, and kprod denotes the K ronecker product. W e estim ate sigm a-m in (C ) by the reciprocalofan estim ate of the 1 -norm of inverse (C). The true reciprocal 1-norm of inverse ( ) cannot differ from sigm a\(m\) in (C) by \(m\) ore than a factorof sqrt (n1*n2).

W hen SEP is sm all, sm all changes in T can cause large changes in the invariant subspace. A \(n\) approxim ate bound on the maxim um angularerrorin the com puted right invariant subspace is

void strsm (char side, charuplo, chartransa, chardiag, int m , int n , float alpha, float*a, int lda, float
*b, int ldb);
void strsm _64 (char side, charuplo, char transa, char diag, long m, long n, floatalpha, float*a, long lda, float*b, long lab);

\section*{PURPOSE}
strsm solves one of the \(m\) atrix equations op (A ) \(A X=\) alpha*B, or \(X\) *op ( \(A\) ) = alpha*B w here alpha is a scalar, \(X\) and \(B\) are \(m\) by \(n m\) atriges, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix and op (A ) is one of
\[
\text { op }(A)=A \text { or } o p(A)=A^{\prime}
\]

Them atrix X is overw rilten on B .

\section*{ARGUMENTS}

SID E (input)
O n entry, SID E specifiesw hetherop (A ) appears on the left or rightofX as follow s:

SIDE = L'or I' op (A ) *X = alpha*B.
\(S \mathbb{D} E=R\) 'or \(r{ }^{\prime} X^{*}\) op (A) \(=\) alpha*B.

U nchanged on exit.

UPLO (input)
O n entry, UPLO specifies w hether the m atrix \(A\) is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime}\) ' \(A\) is an upper triangular m atrix .
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the form of op (A ) to be used in the m atrix \(m\) ultiplication as follow s:

TRANSA \(=N\) 'or \(h^{\prime}\) op (A) \(=A\).

TRANSA = ' 'ort'op (A) =A'.

TRANSA = C'ort' op (A) =A'.

U nchanged on exit.
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D \(\mathbb{A} G=U\) 'or \(U^{\prime} A\) is assum ed to be unit triangular.
\(D \mathbb{A G}=N\) 'or \(h\) ' \(A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, \(M\) specifies the num ber of row s of \(B . M\) \(>=0\). U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of \(B\). \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, A LPH A specifies the scalar alpha. W hen alpha is zero then \(A\) is notreferenced and \(B\) need notbe setbefore entry. U nchanged on exit.

A (input)
REAL array ofD \(\mathbb{M} E N S I O N(L D A, k)\), where \(k\) is \(m\) when \(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathbb{I}^{\prime}\) and is \(n\) when \(S \mathbb{D} E=R\) 'or \(r^{\prime}\).
Before entry with UPLO = U 'or \(G\) ', the leading \(k\) by \(k\) upper triangularpart of the aray \(A\) \(m\) ustcontain the upper triangularm atrix and the
strictly low ertriangularpartofA is not referenced.
Before entry w ith UPLO = L'or 1', the leading \(k\) by \(k\) low er triangularpart of the array \(A\) \(m\) ustcontain the low er triangularm atrix and the strictly uppertriangularpartofA is not referenced.
\(N\) ote thatw hen D IA G = U 'or U ', the diagonal elem ents of A are not referenced either, butare assum ed to be one. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen
SDDE = L'or I' then LD A \(>=\max (1, m)\), when \(S \mathbb{D} E=R^{\prime}\) or \(\mathrm{r}^{\prime}\) then LDA \(>=\max (1, \mathrm{n})\). U nchanged on exit.

B (input/output)
REAL array ofD \(\mathbb{M}\) ENSION (LDB, n). Before entry, the leading \(m\) by \(n\) partof the array \(B\) must contain the righthand side \(m\) atrix \(B\), and on exit is overw ritten by the solution \(m\) atrix \(X\).

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. LD B \(>=m a x(1, m)\). U nchanged on exit.

void stresna (char job, charhow m ny, int *select, intn, float
*t, int ldt, float*vl, int ldvl, float*vr, int
ldvr, float *s, float *sep, intm m, int *m, int ldw ork, int *info);
void strsna_64 (char j̀.b, charhow my, long *select, long n, float *t, long ldt, float*vl, long ldvl, float
*vr, long ldvr, float*s, float *sep, long mm, long *m, long ldw ork, long *info);

\section*{PURPOSE}
strsna estim ates reciprocal condition num bers for specified eigenvalues and/or right eigenvectors of a real upper quasi-triangularm atrix T (or of any matrix Q * T * \(\mathrm{Q} * * \mathrm{~T}\) w ith Q orthogonal).

T m ustbe in Schurcanonical form (as retumed by SH SEQR), that is, block upper triangularw ith 1-by-1 and 2 -by-2 diagonalblocks; each 2 -by -2 diagonal block has its diagonal elem ents equal and its off-diagonalelem ents of opposite sign.

\section*{ARGUMENTS}

JOB (input)
Specifies w hethercondition num bers are required foreigenvalues (S) oreigenvectors (SEP):
= E ': foreigenvalues only ( S );
= V ': foreigenvectors only (SEP);
= B ': forboth eigenvalues and eigenvectors ( S and SEP).

HOW MNY (input)
= A': com pute condition num bers for all eigenpairs;
\(=S^{\prime}\) : com pute condition num bers for selected eigenpairs specified by the amray SELEC T.

\section*{SELECT (input)}

If H OW M NY = S',SELECT specifies the eigenpairs for which condition numbers are required. To select condition num bers for the eigenpair corresponding to a realeigenvalue w ( \(\mathcal{\nu}\), SELECT ( ) m ustbe set to .TRUE .. To selectcondition num bers conresponding to a complex conjugate pair of eigenvaluesw ( 7 ) and w ( \(j+1\) ), either SELECT ( \(j\) ) or SELECT ( \(j+1\) ) or both, mustbe set to TRUE .. If HOW MNY = A', SELECT is notreferenced.

N (input) The order of the matrix \(\mathrm{T} \cdot \mathrm{N}>=0\).
T (input) The upper quasi-triangular \(m\) atrix \(T\), in Schur canonical form .

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, N)\).

VL (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VL mustcontain left eigenvectors of \(T\) (orofany \(Q * T{ }^{*} Q * T\) w th \(Q\) orthogonal), comesponding to the eigenpairs specified by HOW M NY and SELECT. The eigenvectorsm ustbe stored in consecutive colum ns of \(V L\), as retumed by SHSEIN orSTREVC. If \(J O B=V\) ', VL is notreferenced.

LDVL (input)
The leading dim ension of the array VL. LD V L >=1; and if \(J 0 B=E\) 'or \(B ', L D V L>=N\).

VR (input)
If \(\mathrm{OB}=\mathrm{E}\) 'or B ', VR m ust contain right eigenvectors of \(T\) (orofany \(Q * T * Q * T\) w ith \(Q\) orthogonal), comesponding to the eigenpairs specified by HOW M NY and SELECT. The eigenvectors m ustbe stored in consecutive columns of \(V R\), as retumed by

SHSEIN orSTREVC. If \(J O B=V\) ', VR is notreferenced.

LDVR (input)
The leading dim ension of the amay VR. LDVR >=1; and if \(\mathrm{OB}=\mathrm{E}\) 'or \(\mathrm{B}^{\prime}, \mathrm{LDVR}>=\mathrm{N}\).

S (output)
If \(\mathrm{OB}=\mathrm{E}^{\prime}\) or \(\mathrm{B}^{\prime}\), the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the aray. For a com plex conjugate pair of eigenvalues two consecutive elem ents of \(S\) are set to the same value. Thus \(S(\mathcal{I}, \operatorname{SEP}(\mathcal{I})\), and the \(j\) th colum ns of VL and VR all correspond to the sam e eigenpair but not in general the jth eigenpair, unless alleigenpairs are selected). If \(\mathrm{OB}=V^{\prime}, \mathrm{S}\) is not referenced.

SEP (output)
If \(\mathrm{OB}=\mathrm{V}\) 'or B', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. For a com plex eigenvector two consecutive elem ents of SEP are set to the sam e value. If the eigenvalues cannot be reordered to com pute \(\operatorname{SEP}(7)\), \(\operatorname{SEP}(7)\) is set to 0 ; this can only occurw hen the true value w ould be very sm allanyw ay. If \(\mathrm{JOB}=\mathrm{E}\) ', SEP is notreferenced.

M M (input)
The num berofelem ents in the arrays S (if \(\mathrm{OB}=\)
E' or B') and/orSEP (if \(\mathrm{OB}=\mathrm{V}\) 'or B).M M
\(>=M\).

M (output)
The num ber of elem ents of the arays \(S\) and/or SEP actually used to store the estim ated condition
num bers. If H O W M NY = 'A', M is setto \(N\).

W ORK (w orkspace)
dim ension (LD W ORK, \(N+1\) ) If \(O B=E \prime\), W ORK is not
referenced.

LDW ORK (input)
The leading dim ension of the array W ORK. LDW ORK \(>=1\); and if \(\mathrm{OB}=\mathrm{V}^{\prime}\) or \(\mathrm{B}^{\prime}, \mathrm{LDW}\) ORK \(>=\mathrm{N}\).

W ORK1 (w orkspace)
dim ension \((\mathbb{N})\) If \(O B=E\) ', W ORK 1 is not referenced.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of an eigenvalue lam bda is defined as
\[
S(\operatorname{lam} \text { bda })=N^{*} u \mid /(\text { norm }(u) * \text { norm }(v))
\]
\(w\) here \(u\) and \(v\) are the right and left eigenvectors of \(T\) comesponding to lam bda; v 'denotes the conjugate-transpose of \(v\), and norm (u) denotes the Euclidean norm. These reciprocal condition num bers alw ays lie betw een zero (very badly conditioned) and one (very w ell conditioned). If \(\mathrm{n}=1\), S (lam bda) is defined to be 1.

A \(n\) approxim ate errorbound for a com puted eigenvalue \(W\) (i) is given by
EPS * norm (T) /S (i)
where EPS is the \(m\) achine precision.

The reciprocal of the condition num ber of the right eigenvectoru corresponding to lam bda is defined as follow s. Suppose
\[
\begin{gathered}
\mathrm{T}=(\operatorname{lam} \text { bda } \mathrm{c}) \\
\left(\begin{array}{ll}
\mathrm{O} & \mathrm{~T} 22
\end{array}\right)
\end{gathered}
\]

Then the reciprocalcondtion num ber is
SEP ( lam bda, T22 ) = sigm a-m in ( T22 -lam bda^I )
where sigm a-m in denotes the sm allest singular value. We approxim ate the sm allest singular value by the reciprocal of an estim ate of the one-norm of the inverse of T22 lam bda*I. If \(n=1\), SEP ( 1 ) is defined to be abs ( \((1,1)\) ).

A \(n\) approxim ate errorbound for a com puted right eigenvector VR (i) is given by
```

EPS * norm (T) /SEP (i)

```

*a, int lda, float *y, int incy);
void strisv_64 (charuplo, chartransa, char diag, long n, float *a, long lda, float *y, long incy);

\section*{PURPOSE}
strisv solves one of the system sof equations \(A * x=b\), or \(A\) * \(x=b\), where \(b\) and \(x\) are \(n\) elem entvectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix. N o test forsingularity ornear-singularity is included in this routine. Such testsm ust.be perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or L ' \(A\) is an upper triangular \(m\) atrix.

UPLO = L' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A * x=b\).
TRANSA \(=\) T'ort' \(A * x=b\).

TRANSA \(=C^{\prime}\) ort' \(\mathrm{A}^{*} \mathrm{x}=\mathrm{b}\).

U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
Before entry w ith UPLO = U 'or L ', the leading n by n upper triangularpart of the array A m ust contain the upper triangular \(m\) atrix and the strictly low ertriangularpartofA is not referenced. Before entry w ith UPLO = L' 'or I', the leading \(n\) by \(n\) low er triangularpart of the array A \(m\) ust contain the low ertriangularm atrix and the strictly uppertriangularpartofA is not referenced. N ote thatw hen D IAG \(=\mathrm{U}\) ' or L ', the diagonal elem ents of \(A\) are not referenced either, but are assum ed to be unity. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program . LD A \(>=\) \(m a x(1, n)\). U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent right-hand side vectorb. 0 n exit, Y is overw ritten \(w\) th the solution vectorx.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
strti2 com putes the inverse of a realupper or low er triangularm atrix.

This is the Level2 B LAS version of the algorithm .

\section*{ARGUMENTS}

UPLO (input)
Specifies w hether the m atrix A is upper or low er
triangular. = U ': U pper triangular
= L': Low ertriangular

D IA G (input)
Specifies w hether ornot the m atrix A is unittriangular. \(=\mathrm{N}\) ': N on-unittriangular
\(=\mathrm{U}\) ': Unittriangular

N (input) The order of them atrix A. \(\mathrm{N}>=0\).

A (input/output)
O n entry, the triangularm atrix A. If \(\mathrm{U} P \mathrm{O}=\mathrm{U}\) ', the leading \(n\) by \(n\) uppertriangularpart of the array A contains the uppertriangularm atrix, and the strictly low er triangular part of A is not referenced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading n by n low er triangularpart of the array A contains the low ertriangularm atrix, and the strictly upper triangularpart ofA is not referenced. IfD IA G \(=\) U', the diagonal elem ents of A are also not referenced and are assum ed to be 1 .

On exit, the (triangular) inverse of the original \(m\) atrix, in the sam e storage form at.

LD A (input)
The leading dim ension of the aray A. LD A >= \(\max (1, N)\).

IN FO (output)
= 0: successfulexit
< 0: if \(\mathbb{N N}\) FO \(=-\mathrm{k}\), the k -th argum enthad an illegalvalue

*info);
void stzrqf_64 (long m, long n, float *a, long lda, float
*tau, long *info);

\section*{PURPOSE}
stzrqf routine is deprecated and has been replaced by routine STZRZF .

STZRQF reduces the M -by-N ( \(\mathrm{M}<=\mathrm{N}\) ) real upper trapezoidal \(m\) atrix \(A\) to upper triangular form by \(m\) eans of orthogonal transform ations.

The upper trapezoidalm atrix \(A\) is factored as
\(A=\left(\begin{array}{ll}R & 0\end{array}\right) * Z\),
\(w\) here Z is an N boy N orthogonalm atrix and R is an M boy M upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix A. M >=0.

N (input) The num ber of colum ns of the \(m\) atrix \(A . N>=M\).

A (input/output)
O n entry, the leading M foy-N upper trapezoidal part of the array A m ustcontain the \(m\) atrix to be factorized. On exit, the leading \(M\) boy -M upper triangularpart of A contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row s of \(A\), \(w\) th the array \(T A U\), represent the orthogonalm atrix \(Z\) as a product of \(M\) elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, M)\).

TAU (output)
The scalar factors of the elem entary reflectors.

INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an ille-

\section*{FURTHER DETAILS}

The factorization is obtained by H ouseholdersm ethod. The \(k\) th transform ation \(m\) atrix, \(Z(k)\), w hich is used to introduce zeros into the ( \(m-k+1\) )th row ofA, is given in the form
\[
\begin{gathered}
\mathrm{Z}(\mathrm{k})=\left(\begin{array}{ll}
\mathrm{I} & 0
\end{array}\right), \\
\left(\begin{array}{l}
\mathrm{O}(\mathrm{k})
\end{array}\right)
\end{gathered}
\]
where
\[
\begin{gathered}
\left.T(k)=I-\tan { }^{*} u(k) * u(k)\right), \quad u(k)=\left(\begin{array}{ll}
1
\end{array}\right), \\
\left(\begin{array}{l}
0
\end{array}\right) \\
(z(k))
\end{gathered}
\]
tau is a scalar and \(z(k)\) is an ( \(n-m\) ) elem ent vector. tau and \(\mathrm{z}(\mathrm{k})\) are chosen to annihilate the elem ents of the kth row of .

The scalartau is retumed in the \(k\) th elem entofTA \(U\) and the vectoru ( \(k\) ) in the \(k\) th row of \(A\), such that the elem ents of \(z(k)\) are in \(a(k, m+1), \ldots, a(k, n)\). The elem ents ofR are retumed in the upper triangularpartofA.
\(Z\) is given by
\[
Z=Z(1) * Z(2) * \ldots * Z(m) .
\]

void stzrzf(intm, intn, float *a, int lda, float *tau, int *info);
void stzrzf_64 (long m, long n, float *a, long lda, float *tau, long *info);

\section*{PURPOSE}
stzrzf reduces the M -by -N ( \(\mathrm{M}<=\mathrm{N}\) ) real upper trapezoidal \(m\) atrix \(A\) to upper triangular form by \(m\) eans of orthogonal transform ations.

The upper trapezoidalm atrix \(A\) is factored as
\[
A=\left(\begin{array}{ll}
R & 0
\end{array}\right)^{*} Z
\]
w here Z is an N -by -N orthogonalm atrix and R is an M boy -M upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
On entry, the leading M -by -N upper trapezoidal part of the array A m ustcontain them atrix to be factorized. On exit, the leading M -by -M upper triangularpart ofA contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row s of \(A\), w th the array TAU, represent the orthogonalm atrix Z as a product of M elem entary reflectors.

LD A (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAU (output)
The scalar factors of the elem entary reflectors.
W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

The dimension of the array \(W\) ORK. LW ORK >= \(m\) ax \((1, M)\). Foroptim um perform anœ \(L W O R K>=M * N B\), w here NB is the optim alblocksize.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value

& \text { form atand op (A ) is one of }
\end{aligned}
\]
op (A) \()=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}\left(\infty n \dot{g}\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(\sin m\) atrix \(A\)

N \(\quad\) Num berof colum ns in matrix C

UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum \(n\) block scaling)

DV () A rray containing the block entries of the block diagonalm atrix D. The size of the Jth block is RPN TR ( \(\mathrm{J}+1\) )-RPN TR (J) and each block containsm atrix entries stored colum n-m ajor. The total length of aray DV is given by the form ula:
sum over J from 1 to M B:

A LPH A Scalarparam eter

DESCRA ( D escriptor argum ent. Five elem ent integer amay
DESCRA (1) m atrix structure
0 : general
1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm Aian ( \(\mathrm{A}=\mathrm{CONJG}\) (A))
3 :Triangular
4 : Skew (A nti)-Symm etric ( \(\mathrm{A}=-\mathrm{A}\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\mathrm{CONJ}\) ( A ) )
N ote:For the routine, D ESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1: low er
2 : upper
DESCRA (3) m ain diagonal type
0 : non-identity blocks on the \(m\) ain diagonal
1 : identily diagonalblock
2 : diagonalblocks are dense \(m\) atrices
DESCRA (4) A ray base (NOT IM PLEM ENTED)
0 : C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? \(\mathbb{N} O T \mathbb{I}\) PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL ( scalar array of length NN Z consisting of the block entries ofA where each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NNZ is the total num berof pointentries in allnonzero block entries of am atrix A.
\(\operatorname{INDX}\) () integer array of length BNN Z+1 where BNN Z is the num ber block entries of a \(m\) atrix A such that the I-th elem ent of \(\mathbb{N}\) D X [] points to the location in V A L of the ( 1,1 ) elem ent of the I-th block entry.

B \(\mathbb{N}\) DX () integer array of length BNN Z consisting of the block colum \(n\) indices of the block entries of \(A\) where BNN \(Z\) is the num berblock entries of a m atrix A. B lock colum \(n\) indices M U ST be sorted in increasing order foreach block row .

RPN TR () integer array of length M B +1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the I-th block row .
RPNTR \(M B+1\) ) is set to \(M+R P N T R(1)\) where \(M\) is the num ber
of row s in square triangularm atrix A. Thus, the num ber of point row s in the I-th block row is RPN TR (I+1)RPN TR (I).

NOTE: For the current version CPN TR m ustequalRPNTR and a single array can be passed forboth argum ents

CPN TR 0) integer array of length M B+1 such that CPN TR (J)-CPN TR (1)+1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR M B+1) is set to M +CPN TR (1). Thus, the num ber of point \(c o l u m\) ns in the \(J\) th block \(\propto 0\) lum \(n\) is CPN TR ( \(\mathrm{J}+1\) )-CPNTR ( \(J\) ).

NOTE:For the cumentversion CPNTR m ustequal RPN TR and a single array can be passed forboth argum ents
BPNTRB 0 integer aray of length \(M B\) such thatBPNTRB (I)-BPNTRB (1)+1
points to location in B IND X of the firstblock entry of the I-th block row of A.

BPNTRE () integer array of length \(M B\) such thatBPN TRE (I) BPNTRB (1) points to location in B \(\mathbb{N}\) D X of the lastblock entry of the I-th block row of A.

B 0 rectangular anay w th first dim ension LD B .

LD B leading dim ension ofB
BETA Scalarparam eter
C \(0 \quad\) rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC
W ORK 0 scratch array of length LW ORK. On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um size ofLW ORK.

LW ORK length ofW ORK array. LW ORK should be at least \(\mathrm{M}=\operatorname{RPNTR} \mathrm{M} \operatorname{B+1})\) RPNTR (1).

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=M\) *N_CPUS where N_CPUS is the m axim um num berof processors available to the program.

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK
array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SYNOPSIS}

SUBROUTINE VCFFTIN,W SAVE)
COM PLEX W SAVE (*)
\(\mathbb{I N}\) TEGER N
SUBROUTINEVCFFTI_64 \(\mathbb{N}\),W SAVE)

COM PLEX W SAVE (*)
\(\mathbb{N}\) TEGER*8N

F95 INTERFACE
SUBROUTINE VFFTIN, W SAVE)

COM PLEX,D \(\mathbb{M}\) ENSION (:) ::W SAVE \(\mathbb{N} T E G E R:: N\)

SU BROUTINE VFFTI_64 \(\mathbb{N}, \mathrm{W}\) SAVE)
COM PLEX,D \(\mathbb{M}\) ENSION (:) ::W SAVE \(\mathbb{N}\) TEGER (8) :: N

\section*{C INTERFACE}
\#include <sunperfh>
void vcffti(intn, com plex *w save);
void vcffti_ 64 (long n, com plex *w save);

\section*{ARGUMENTS}

N (imput) Length of the sequence to be transform ed. \(\mathrm{N}>=0\).

W SAVE (input)
O n entry, an array of dim ension ( \(2{ }^{*} \mathrm{~N}+15\) ) or greater. V CFFTI needs to be called only once to initialize W SAVE before calling VCFFTF and/or VCFFTB if \(N\) and W SAVE rem ain unchanged betw een these calls. Thus, subsequent transform \(s\) or inverse transform s of sam e size can be obtained faster than the first since they do not require indialization of the w orkspace.

http://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such tests \(m\) ustbe perform ed before calling this routine.
2. If \(D E S C R A\) (3)=0, the low erorupper triangularpart of each diagonalblock is used by the routine depending on DESCRA (2).
3. If \(D E S C R A\) (3)=1, the unit diagonalblocksm ightorm ight notbe referenced in the BD I representation of a sparse \(m\) atrix. They are notused anyw ay .
4. If \(D E S C R A(3)=2\), diagonalblocks are considered as dense \(m\) atrices and the LU factorization \(w\) ith partialpivoting is used by the routine. WORK (1)=0 on retum if the factorization for alldiagonalblocks has been com pleted successfully, otherw ise WORK (1) = -iw here is the block
num ber forw hich the LU factorization could notbe com puted.
5. The routine can be applied for solving triangular system \(s\) w hen the upper or low er triangle of the general.sparse m atrix \(A\) is used. H ow erver \(D E S C R A\) (1) m ustbe equal to 3 in this case.

\section*{PURPOSE}
zbdsqr com putes the singularvalue decom position (SV D ) of a realN Hoy-N (upper or low er) bidiagonalm atrix B: B = Q * S * \(P^{\prime}\left(P^{\prime}\right.\) denotes the transpose of \(\left.P\right)\), w here \(S\) is a diagonal \(m\) atrix \(w\) ith non-negative diagonal elem ents the singular values of \(B\) ), and \(Q\) and \(P\) are orthogonalm atrices.

The routine com putes \(S\), and optionally com putes \(U * Q, P^{\prime} \star\) \(\mathrm{V} T\), or \(Q^{\prime *} \mathrm{C}\), forgiven com plex inputm atrices \(\mathrm{U}, \mathrm{V}\) T , and C.

See "C om puting Sm allSingularV ahues ofB idiagonalM atrioes W ith G uaranteed H igh R elative A ccuracy," by J. Dem m eland W . K ahan, LAPACK W orking N ote \#3 (orSIAM J. Sci. Statist. C om put.vol.11, no.5, pp. 873-912, Sept1990) and
"A ccurate singular values and differential qd algorithm \(s\),"
by B. Parlett and V.Femando, TechnicalReportCPAM -554, \(M\) athem atics \(D\) epartm ent, U niversity of \(C\) alifomia at Berkeley, July 1992 for a detailed description of the algorithm .

\section*{ARGUMENTS}
```

UPLO (input)
$=U$ ': B is upperbidiagonal;
$=1 \mathrm{~L}$ ': B is low erbidiagonal.

```

N (input) The order of the m atrix \(\mathrm{B} . \mathrm{N}>=0\).

NCVT (input)
The num berof colum ns of the m atrix V T.NCV T >=0.

NRU (input)
The num berof row s of the \(m\) atrix \(U . N R U>=0\).

NCC (input)
The num ber of colum ns of the m atrix C . N CC \(>=0\).

D (input/output)
O n entry, the n diagonalelem ents of the bidiagonal matrix B. On exit, if \(\mathbb{N F O}=0\), the singular values ofB in decreasing order.

E (input/output)
On entry, the elem ents of \(E\) contain the offdiagonalelem ents of of the bidiagonalm atrix w hose SV D is desired. On nom alexit ( \(\mathbb{N F O}=0\) ), E is destroyed. If the algorithm does not converge ( \(\mathbb{N}\) FO \(>0\) ), D and E w ill contain the diagonal and superdiagonal elem ents of a bidiagonalm atrix orthogonally equivalent to the one given as input. E (N) is used forw orkspace.

VT (input/output)
On entry, an N -by-N CV T m atrix VT. On exit, VT is overw rilten by \(\mathrm{P}^{\prime *} \mathrm{VT} . \mathrm{VT}\) is notreferenced if \(\mathrm{NCVT}=0\).

LDVT (input)
The leading dim ension of the array VT. LDV T >= \(\max (1, N)\) if NCV T > 0;LDVT >= 1 ifNCVT = 0 .

U (input/output)
On entry, an NRU -by N m atrix U. On exit, U is overw rilten by \(U * Q . U\) is not referenced ifNRU \(=0\).

LD U (input)
The leading dim ension of the array \(U\). LD U >= max (1,NRU).

C (input/output)
On entry, an N-by -NCC matrix C. On exit, C is overw ritten by \(Q\) '* C . C is not referenced if N C C \(=0\).

LD C (input)
The leading dim ension of the aray C. LD C >= \(m a x(1, N)\) if \(N C C>0 ; L D C>=1\) ifNCC \(=0\).

W ORK (w orkspace)
dim ension \((4 * N)\)
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) If \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
>0: the algorithm did notconverge; D and E contain the elem ents of a bidiagonalm atrix which is orthogonally sim ilar to the input matrix B; if \(\mathbb{N F O}=\) i, ielem ents ofE have not converged to zero.

\section*{PURPOSE}
zanvoor com putes the convolution or correlation of com plex vectors.

\section*{ARGUMENTS}

CNVCOR (input)
\(V\) 'or \(\mathrm{V}^{\prime}\) if convolution is desired, \(\mathrm{R}^{\prime}\) or \(\mathrm{r}^{\prime}\) if comelation is desired.

FOUR (input)
\(T\) 'or t'if the Founier transform \(m\) ethod is to be used, D 'or d'ifthe com putation should be done directly from the definition. The Fourier transform m ethod is generally faster, but itm ay introduce noticeable errors into certain results, notably w hen both the realand im aginary parts of the filter and data vectors consist entirely of integers or vectors w here elem ents of either the filtervector or a given data vectordiffer significantly in \(m\) agnitude from the 1 -norm of the vector.

NX (input)
Length of the filtervector. NX >= 0. ZCNVCOR
w ill retum im m ediately if \(\mathrm{X}=0\).
X (input) dim ension (*)
Filtervector.

FFX (input)
Index of the firstelem entofX. \(\mathrm{NX}>=\mathbb{F X}>=1\).
\(\mathbb{N C X}\) (input)
Stride betw een elem ents of the filtervector in \(X\).
\(\mathbb{N} C X>0\).

NY (input)
Length of the inputvectors. NY >=0. ZCNVCOR w ill retum im m ediately if \(\mathrm{N} Y=0\).

NPRE (input)
The num ber of im plicit zeros prepended to the \(Y\) vectors. NPRE >=0.

M (input)
Num berof inputvectors. M >= 0. ZCNVCOR will retum imm ediately if \(M=0\).

Y (input) dim ension ( \({ }^{*}\) )
Inputvectors.
IFY (input)
Index of the firstelem entof Y . \(\mathrm{N} Y>=\mathbb{F Y}>=1\).
\(\mathbb{N} C 1 Y\) (input)
Stride betw een elem ents of the inputvectors in \(Y\). \(\mathbb{N} C 1 \mathrm{Y}>0\).
\(\mathbb{N} C 2 Y\) (input)
Stride betw een the inputvectors in \(Y . \mathbb{N} C 2 Y>0\).

NZ (input)
Length of the output vectors. NZ >= 0. ZCNVCOR w ill retum im m ediately if \(\mathrm{N}=0\). See the N otes section below for inform ation abouthow this argu\(m\) ent interactsw ith NX and NY to control circular versus end-off shifting.

K (input)
\(N\) um berof \(Z\) vectors. \(K>=0\). If \(K=0\) then ZCNVCOR will retum immediately. If \(K<M\) then only the firstK inputvectors \(w\) ill be processed. If \(K>M\) then \(M\) inputvectors \(w\) illbe processed.

Z (output)
dim ension (*)
Resultvectors.

FZ (input)
Index of the firstelem entof \(Z . N Z>=\mathbb{F Z}>=1\).
\(\mathbb{N C} 1 Z\) (input)
Stride betw een elem ents of the output vectors in Z. \(\mathbb{N} C 1 Z>0\).
\(\mathbb{N C} 2 \mathrm{Z}\) (input)
Stride betw een the output vectors in Z. \(\mathbb{N C}\) C 2 Z > 0 .

W ORK (input/output)
(input/scratch) dim ension (LW ORK)
Scratch space. Before the first call to ZCNVCOR
w ith particular values of the integer argum ents the firstelem entofW ORK mustbe set to zero. If \(\mathrm{W} O R K\) is w rilten betw een calls to ZCNVCOR or if ZCNVCOR is called \(w\) ith different values of the integer argum ents then the firstelem entofW ORK m ustagain be set to zero before each call. If W ORK has notbeen w rilten and the sam e values of the integer argum ents are used then the firstelem entofW ORK to zero. This can avoid certain initializations that store their results into \(\mathrm{W} O R K\), and avoiding the initialization can \(m\) ake ZCNVCOR nun faster.

LW ORK (input)
Length of ORK . LW ORK \(>=2 \star \mathrm{MAX} \mathbb{N} X, N Y, N Z)+8\).

\section*{PURPOSE}
zcnvoor2 com putes the convolution or correlation of com plex m atrices.

\section*{ARGUMENTS}

CNVCOR (input)
V 'or も'to com pute convolution, R 'or 'r' to com pute comelation.

METHOD (input)
T 'or t'if the Fourier transform \(m\) ethod is to be used, D 'or d'to com pute directly from the definition.

TRANSX (input)
\(N\) 'or \(h\) 'if \(X\) is the filterm atrix, \(T\) ' or \(t^{\prime}\)
if transpose \((X)\) is the filterm atrix.

SCRATCHX (input)
N 'or h'ifX m ustbe preserved, S'or s 'if X can be used as scratch space. The contents ofX are undefined after retuming from a callin which X is allow ed to be used for scratch.

TRANSY (input)
N 'or h'ify is the inputm atrix, \(T\) 'or \(\mathrm{t}^{\prime}\) if transpose \((Y)\) is the inputm atrix.
SCRATCHY (input)
N 'or h'ifY m ustbe preserved, S'or s 'ify can be used as scratch space. The contents of \(Y\) are undefined after retuming from a callin which Y is allow ed to be used for scratch.

M X (input)
N um ber of row s in the filterm atrix. M X >=0.
NX (input)
Num ber of colum ns in the filterm atrix. NX \(>=0\).
\(X\) (input) dim ension (LD X,\(N X\) )
O n entry, the filterm atrix. U nchanged on exitif SCRATCHX is N' or h', undefined on exitif SCRATCHX is S'or \(\mathrm{s}^{\prime}\).

LD X (input)
Leading dim ension of the amay that contains the filterm atrix.

M Y (input)
\(N\) um ber of row \(s\) in the inputm atrix. \(M Y>=0\).
NY (input)
\(N\) um berof \(\infty 0\) lum \(n s\) in the inputm atrix. \(N Y>=0\).

M PRE (input)
N um ber of im plicit zeros to prepend to each row of the inputm atrix. M PRE \(>=0\).

NPRE (input)
\(N\) um berof im plicit zeros to prepend to each colum n of the inputm atrix. NPRE \(>=0\).

Y (input) din ension (LD Y ,*)

Inputm atrix. U nchanged on exit if SCRATCHY is \(N^{\prime}\) or \(h^{\prime}\), undefined on exitifSCRATCHY is \(S^{\prime}\) or \(s^{\prime}\).

LD Y (input)
Leading dim ension of the array that contains the inputm atrix.

M Z (input)
N um ber of row s in the output m atrix. \(\mathrm{M} \mathrm{Z}>=0\). ZCNVCOR2 will retum im m ediately if M \(\mathrm{Z}=0\).

N Z (input)
N um ber of colum ns in the outputm atrix. \(\mathrm{NZ}>=0\). ZCNVCOR2 w ill retum imm ediately if \(\mathrm{NZ}=0\).

Z (output)
dim ension ( \(\ddagger \mathrm{LD} Z, \star\) )
Resultm atrix.

LD Z (input)
Leading dim ension of the array that contains the resultm atrix. LD Z >= M AX ( \(1, \mathrm{M} \mathrm{Z}\) ).

W ORK \(\mathbb{N}\) (input/output)
(input/scratch) dim ension (LW ORK)
O n entry for the first call to ZCNVCOR2,W ORK \(\mathbb{N}(1)\)
\(m\) ust contain CM PLX ( \(0.0,0.0\) ). A fter the first call, W ORK \(\mathbb{N}\) (1) m ustbe set to CM PLX (0.0,0.0) iff
W ORK \(\mathbb{N}\) has been altered since the last call to this subroutine or if the sizes of the arrays have
changed.

LW ORK (input)
Length of the w ork vector. If the FFT is to be used then forbestperform ance LW ORK should be at least 30 w ords longer than the am ount of \(m\) em ory needed to hold the trig tables. If the FFT is not used, the value ofLW ORK is unim portant.

\section*{NOTES/BUGS}

It is know \(n\) that there exists another representation of the com pressed sparse colum n form at (see forexam ple Y Saad, "IterativeM ethods forSparse LinearSystem s", W PS, 1996). Its data structure consists of three array instead of the fourused in the current im plem entation. Them ain difference is that only one array, \(\mathbb{I A}\), containing the pointers to the beginning of each colum \(n\) in the arrays VA L and \(\mathbb{N} D \mathrm{X}\) is used instead oftw o arraysPN TRB and PN TRE.To use the routine \(w\) th this kind of sparse colum \(n\) form at the follow ing calling sequence should be used

where A LPHA and BETA are scalar, \(C\) and \(B\) are \(m\) by \(n\) dense \(m\) atrices, \(D\) is a diagonalscaling \(m\) atrix, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix represented in diagonal form at and op (A ) is one of
\(\mathrm{op}(\mathrm{A})=\operatorname{inv}(\mathrm{A})\) or op (A) \(=\operatorname{inv}(A)\) or op (A) \()=\operatorname{inv}\left(\right.\) (oonjg ( \(\left.\left.A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicatesm atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) ith the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate w th transpose m atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M \(\quad N\) um berof row \(s\) in \(m\) atrix A

N \(\quad N\) um berof colum ns in matrix C
UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 :Scale on left (row scaling)
3 : Scale on right (colum \(n\) scaling)
4 :A utom atic row scaling (see section NOTES for furtherdetails)

DV 0 A ray of length M containing the diagonalentries of the scaling diagonalm atrix D .

A LPH A Scalarparam eter
DESCRA 0 D escriptor argum ent. Five elem ent integer aray
DESCRA (1) m atrix structure
0 : general

1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm itian ( \(A=C O N J(A)\) )
3 :Triangular
4 : Skew (A nti)-Symm etric ( \((A=-A\) )
5 :D iagonal
6 : Skew Herm titian ( \(A=-\operatorname{CON}\) J ( \(A\) ) )
N ote: For the routine, only D ESCRA (1)=3 is supported.

D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 :unit
DESCRA (4) A ray base \(\mathbb{N O T} \mathbb{M}\) PLEM ENTED )
0 :C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? (NOT \(\mathbb{M}\) PLEM ENTED)
0 : unknown
1 : no repeated indices
VAL () tw o-dim ensionalLD A boy-ND IA G aray such thatVAL(:,I) consists of non-zero elem ents on diagonal ID IA G (I) of A. D iagonals in the low er triangularpart of A are padded from the top, and those in the upper triangularpart are padded from the bottom.

LDA leading dim ension ofVAL, m ustbe GE.M \(\mathbb{N}(M, K)\)

ID IA G () integer anay of length ND IA G consisting of the corresponding diagonaloffsets of the non-zero diagonals ofA in VAL. Low ertriangular diagonals have negative offsets, them ain diagonalhas offset 0 , and uppertriangular diagonals have positive offset. Elem ents of \(\mathbb{D}\) IA G ofM UST be sorted in increasing order.

ND IA G num berofnon-zero diagonals in A.

B 0 rectangular array w ith firstdim ension LD B .

LD B leading dim ension of \(B\)

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch amay of length LW ORK. On exit, if LW ORK = -1,W ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK aray. LW ORK should be at leastM.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=M\) *N_CPU \(S\) where \(N\) _CPU \(S\) is the \(m\) axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK anray, retums this value as the firstentry of theW ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SEE ALSO}

N IST FO RTRA N Sparse B las U ser's G uide available at:
http://m ath nistgov fn csd/Staff/k Rem ington/tspoblas/
"D ocum ent for the Basic LinearA lgebra Subprogram s (BLA S) Standard", U niversity of Tennessee, K noxville, Tennessee, 1996:
http://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. No test for singularity ornear-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.
2. If U N ITD \(=4\), the routine scales the row sofA such that their 2 -norm are one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD \(=2\) should be used for the next calls to the routine w ith overw ritten VA L and DV .

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise \(W O R K(1)=-i w\) here \(i\) is the row num berw hich 2 -norm is exactly zero.
3. If \(D E S C R A(3)=1\) and \(U N\) ITD \(<4\), the unitdiagonalelem ents m ightorm ightnotbe referenced in the D IA representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD = 4, the unit diagonalelem ents M U ST be referenced in the \(D \mathbb{I A}\) representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse
m atrix \(A\) is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

```
    W ORK () scratch amay of length LW ORK.
        On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .
Forgood penform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M}\) *N_CPUS where N_CPUS is the m axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of theW ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SEE ALSO}

N IST FO RTRA N Sparse B las U ser's G uide available at:
http://m ath nistgov/m cso/Staff/k Rem ington/tspblas/

htep://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such tests \(m\) ustbe perform ed before calling this routine.
2. IfUN ITD \(=4\), the routine scales the row s of \(A\) such that their 2 -nom s are one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK ( 1 )=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the row num berw hich 2 -norm is exactly zero.
3. If \(\operatorname{DESCRA}(3)=1\) and U N ITD < 4, the unitdiagonalelem ents \(m\) ightorm ightnotbe referenced in the ELL representation of a sparse m atrix. They are notused anyw ay in these cases.

ButifUN ITD \(=4\), the unit diagonalelem ents M U ST be referenced in the ELL representation.
4.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

A (input/output)
O n entry, a three-dim ensionalarray A \(M, N, K\) ) that contains the sequences to be transform ed.

LDA (input)
Leading dim ension of the amay containing the data to be transform ed. LD A >=M.

LD 2A (input)
Second dim ension of the array containing the data to be transform ed. LD 2A >=N .

W ORK (input)
On input, w orkspace W ORK musthave been initialized by ZFFT 3I.

LW ORK (input)
The dim ension of the anay W ORK. LW ORK >= (4* M + \(\mathrm{N}+\mathrm{K})+45\) ).

\section*{C INTERFACE}
\#include <sunperfh>
void zffftd (int*iopt, int*n, double *scale, doublecom plex
*x, double *y, double *trigs, int*ifac, double
*W ork, int *lw ork, int *ien);
void zfftd_64_ (long *iopt, long *n, double *scale, doublecom plex *x, double *y, double *trigs, long *ifac, double *W ork, long *lw ork, long *ienc);

\section*{PURPOSE}
zfftd initializes the trigonom etric \(w\) eight and factor tables or com putes the inverse FastF ourier T ransform of a double com plex sequence as follow s:

\section*{N-1}
\(Y(k)=\) scale * SUM W *X (i)
\(=0\)
where
k ranges from 0 to \(\mathrm{N}-1\)
\(i=\operatorname{sqnt}(-1)\)
isign \(=1\) for inverse transform or -1 for forw ard transform
\(W=\exp \left(i s i g n \star i^{\star} j^{\star} k * 2 * p i N N\right)\)
In com plex-to-realtransform of length \(N\), the \((\mathbb{N} / 2+1)\) com plex input data points stored are the positive-frequency half of the spectrum of the \(D\) iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is notstored. Furtherm ore, due to sym \(m\) etries the im aginary of the com ponentof \(\mathrm{X}(0)\) and \(\mathrm{X} \mathbb{N} / 2\) ) (if N is even in the latter) is assum ed to be zero and is notreferenced.

\section*{ARGUMENTS}

IOPT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric weight table and factor table
IO PT = 1 com putes inverse FFT
N (input)
Integer specifying length of the input sequence \(X\).
N ism ostefficientw hen it is a product of sm all prim es. \(\mathrm{N}>=0\). U nchanged on exit.

SCALE (input)
D ouble precision scalariby which transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF \(95 \mathbb{N}\) TERFACE.
\(X\) (input) \(O n\) entry, \(X\) is a double com plex anay whose first \((N / 2+1)\) elem ents are the input sequence to be transform ed.
Y (output)
D ouble precision array of dim ension at least \(N\) that contains the transform results. X and Y m ay be the sam e array starting at the sam e mem ory location. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

\section*{TRIGS (input/output)}

D ouble precision amay of length \(2 \star \mathrm{~N}\) that contains the trigonom etric weights. The weights are com puted w hen the routine is called w ith \(\mathbb{I D} P T=0\) and they are used in subsequent calls w hen IOPT \(=1\). U nchanged on exit.

FAC (input/output)
Integer array of dim ension at least 128 that contains the factors of \(N\). The factors are com puted when the routine is called \(w\) ith \(\mathbb{I O}\) PT \(=0\) and they are used in subsequent calls where IOPT \(=1\). U nchanged on exit.

W ORK (w orkspace)
D ouble precision array ofdim ension at least N . The user can also choose to have the routine allocate its ow n w orkspace (see LW ORK).

LW ORK (input)
Integer specifying workspace size. If LW ORK \(=0\), the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)

On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=10\) PT is not 0 or 1
\(-2=\mathrm{N}<0\)
\(-3=(\mathbb{L W}\) ORK is not 0 ) and (LW ORK is less than \(N\) )
\(-4=m\) em ory allocation forw orkspace failed

\section*{PURPOSE}
zfftd2 initializes the trigonom etric weight and factor tables or com putes the tw o-dim ensional inverse FastF ourier \(T\) ransform of a tw o-dim ensional double com plex anay. In com puting the tw o-dim ensionalFFT, one-dim ensionalFFT s are com puted along the row s of the input array. O ne-dim ensional FFT s are then com puted along the colum ns of the interm ediate results.

> N1-1 N 2-1

Y (k1,k2) = scale * SUM SUM W 2*W 1*X (1, 1, 2)
\(j=0 \quad \mathfrak{l}=0\)
where
k 1 ranges from 0 to \(\mathrm{N} 1-1\) and k 2 ranges from 0 to \(\mathrm{N} 2-1\)
\(i=\operatorname{sqrt}(-1)\)
isign \(=1\) for inverse transform
W \(1=\exp \left(\right.\) isign*i* \(\left.{ }^{1} * k 1 * 2 * p i / N 1\right)\)
W \(2=\exp (\) isign*i* \(2 * k 2 * 2 * p i N 2)\)
In com plex-to-real transform of length \(N 1\), the \((\mathbb{N} 1 / 2+1\) ) com -
plex input data points stored are the positive-frequency half of the spectrum of the D iscrete Fourier T ransform. The other half can be obtained through com plex conjugation and therefore is not stored.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric weight table and factor table
IO \(\mathrm{PT}=1\) com putes inverse FFT

N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es. N \(2>=0\). U nchanged on exit.

SCALE (input)
D ouble precision scalarby which transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF \(95 \mathbb{N}\) TERFACE .

X (input) X is a double com plex aray of din ensions (LD X , N 2 ) that contains inputdata to be transform ed.

LD X (input)
Leading dim ension of \(\mathrm{X} . \operatorname{LDX}>=\mathbb{N} 1 / 2+1)\) U nchanged on exit.

Y (output)
Y is a double precision anay of dim ensions (LD Y, N 2 ) that contains the transform results. X and Y can be the sam e array starting at the sam e \(m\) em ory location, in which case the input data are overw rilten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y (input)
Leading dimension of \(Y\). If \(X\) and \(Y\) are the same
aray, LD \(=2 *\) LD \(X\) Else LD \(Y>=2 * L D X\) and LD \(Y\) must be even. U nchanged on exit.

TR IG S (input/output)
D ouble precision array of length 2* (N1+N2) that contains the trigonom etric w eights. The w eights are com puted when the routine is called w ith IO PT = 0 and they are used in subsequent calls w hen IO PT \(=1\). U nchanged on exit.

IFAC (input/output)
Integer anray ofdim ension at least \(2 * 128\) that contains the factors of 1 and N2. The factors are com puted when the routine is called w ith IO PT
\(=0\) and they are used in subsequent calls w hen
IO PT \(=1\). U nchanged on exit.
W ORK (w orkspace)
D ouble precision array of dim ension at least
\(\operatorname{MAX}(\mathbb{N} 1,2 \star \mathrm{~N} 2)\) where \(\mathrm{NCPU} S\) is the num berof threads
used to execute the routine. The user can also
choose to have the routine allocate its own w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. If LW ORK = 0, the routine w illallocate its ow n w orkspace.

\section*{\(\mathbb{E R R}\) (output)}

On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=\mathbb{O P T}\) is not 0,1
\(-2=\mathrm{N} 1<0\)
\(-3=N 2<0\)
\(-4=(\operatorname{LD~X}<\mathrm{N} 1 / 2+1)\)
\(-5=\) LD \(Y\) notequal \(2 *\) LD \(X\) when \(X\) and \(Y\) are same array
\(-6=(\mathbb{L D} Y<2 * L D X\) orLD \(Y\) odd) when \(X\) and \(Y\) are
sam e array
\(-7=(L W\) ORK not equal 0) and (LWORK <
MAX (N1,2*N2))
\(-8=m\) em ory allocation failed

\section*{SEE ALSO}

> N 3-1 N 2-1 N 1-1
\(Y(k 1, k 2, k 3)=\) scale＊SUM SUM SUM W 3＊W 2＊W 1＊X（1，飞，³）
\[
\mathfrak{j}=0 \quad \mathfrak{2}=0 \quad \mathfrak{j}=0
\]
w here
k 1 ranges from 0 to \(\mathrm{N} 1-1 ; k 2\) ranges from 0 to \(\mathrm{N} 2-1\) and \(k 3\)
ranges from 0 to \(\mathrm{N} 3-1\)
\(i=\operatorname{sqnt}(-1)\)
isign \(=1\) for inverse transform
W \(1=\exp \left(i \operatorname{sign} * i^{\star} j 1 * k 1 * 2 * p i N 1\right)\)

W \(2=\exp \left(\right.\) isign*i* \(\mathbf{2}^{*}\) k2*2*piN 2)
W \(3=\exp (\) isign*i* \(3 * k 3 * 2 * p i N 3\) )

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric \(w\) eight table
and factor table
IO \(\mathrm{PT}=+1\) com putes inverse FFT
N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 ism ostefficientw hen it is a productofsm allprim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es. N \(2>=0\). U nchanged on exit.

N 3 (input)
Integer specifying length of the transform in the third dim ension. N 3 ism ostefficientw hen it is a productofsm allprim es. N \(3>=0\). U nchanged on exit.

SCALE (input)
D ouble precision scalarby which transform results are scaled. Unchanged on exit. SCA LE is defaulted to 1.0 D 0 forF \(95 \mathbb{I N}\) TERFACE.

X (input) X is a double com plex anray of dim ensions (LD X 1, LDX2, N3) that contains input data to be transform ed.

LD X 1 (input)
firstdim ension of . LD X \(1>=\) N 1/2+1 U nchanged on exit.

LD X 2 (input)
second dim ension of X . LD X \(2>=\mathrm{N} 2\) U nchanged on exit.

Y (output)
\(Y\) is a double com plex array of dim ensions (LD Y 1,

LD Y 2, N 3) that contains the transform results. X and \(Y\) can be the sam e array starting at the sam e \(m\) em ory location, in which case the input data are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y 1 (input)
firstdim ension of \(Y\). If \(X\) and \(Y\) are the same aray, LD Y \(1=2 *\) LD X 1 Else LD Y \(1>=2 *\) LD X 1 and LD Y 1
is even U nchanged on exit.

LD Y 2 (input)
second dim ension of \(Y\). If \(X\) and \(Y\) are the sam \(e\) array, LD Y 2 = LD X 2 Else LD Y 2 >= N 2 U nchanged on exit.

TR IG S (input/output)
D ouble precision array of length \(2 *(\mathbb{N} 1+N 2+N 3)\) that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith IO PT
= 0 and they are used in subsequent calls w hen
IO PT \(=1\). U nchanged on exit.

FAC (input/output)
Integer array ofdim ension at least \(3 * 128\) that
contains the factors of \(1, \mathrm{~N} 2\) and N 3 . The factors are com puted w hen the routine is called w ith IO PT \(=0\) and they are used in subsequent calls when IO PT = 1. Unchanged on exit.

W ORK (w orkspace)
D ouble precision array of dim ension at least MAX \(\left.\left.\mathbb{N}, 2{ }^{\star} \mathrm{N} 2,2{ }^{\star} \mathrm{N} 3\right)+16 \star \mathrm{~N} 3\right)\) * \(\mathrm{NCPU} S\) where NCPUS is the num ber of threads used to execute the routine. The user can also choose to have the routine allocate its ow n w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. If LW ORK \(=0\), the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=10 \mathrm{PT}\) is not 0 or 1
\(-2=N 1<0\)
\(-3=\mathrm{N} 2<0\)
\(-4=\mathrm{N} 3<0\)
\(-5=(\operatorname{LLD} 1<\mathrm{N} 1 / 2+1)\)
\(-6=(\operatorname{LDX} 2<\mathrm{N} 2)\)
-7 = LD Y 1 notequal \(2 \star\) LD X 1 when \(X\) and \(Y\) are same aray
\(-8=(\mathrm{LD}\) Y \(1<2 * \mathrm{LD} \mathrm{X} 1)\) or (LD Y 1 is odd) w hen X and Y are not sam e array
\(-9=(\mathbb{L D} Y 2<N 2)\) or (LD Y 2 notequalLD X 2) when X and \(Y\) are same array
\(-10=(L W\) ORK not equal 0) and ( \((L W\) ORK <
M AX (N, \(2 *\) N \(2,2 * N 3)+16 * N 3) * N C P U S)\)
\(-11=m\) em ory allocation failed

\section*{C INTERFACE}
\#include < sunperfh>
void zfftdm _ (int*iopt, int *m, int *n, double *scale, doublecom plex *x, int*ldx, double *y, int*ldy, double *trigs, int *ifac, double *work, int *lw ork, int *ien);
void zfftdm _64_ (long *iopt, long *m, long *n, double *scale, doublecom plex *x, long *ldx, double *y, long *ldy, double *trigs, long *ifac, double *w ork, long *lw ork, long *ien);

\section*{PURPOSE}
zfftdm initializes the trigonom etric weight and factor tables orcom putes the one-dim ensional inverse FastFourier Transform of a setofdouble com plex data sequences stored in a tw o-dim ensionalarray:

> N 1-1
\(Y(k, l)=\) scale * SUM W *X (jl)
\[
\dot{j} 0
\]
where
\(k\) ranges from 0 to N 1-1 and lranges from 0 to N 2-1
\(i=\operatorname{sqrt}(-1)\)
isign \(=1\) for inverse transform
\(W=\exp \left(i s i g n * i^{\star}{ }^{j} \star k * 2 \star \operatorname{piN} 1\right)\)
In com plex-to-real transform of length \(N 1\), the \((N 1 / 2+1)\) com plex input data points stored are the positive-frequency half of the spectrum of the \(D\) iscrete Fourier \(T\) ransform. The other half can be obtained through com plex conjugation and therefore is not stored. Furthem ore, due to sym \(m\) etries the
im aginary of the com ponent of \(\mathrm{X}(0,0 \mathbb{N} 2-1)\) and \(\mathrm{X}(\mathbb{N} 1 / 2,0\) N 2-1) (ifN 1 is even in the latter) is assum ed to be zero and is not referenced.

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric weight table and factortable
IO PT = 1 com putes inverse FFT

N 1 (input)
Integer specifying length of the input sequences.
N 1 ism ostefficientw hen it is a product ofsm all prim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying num ber of input sequences. N 2 \(>=0\). U nchanged on exit.
SCALE (input)
D ouble precision scalarby which transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF \(95 \mathbb{N}\) TERFACE .
\(X\) (input) \(X\) is a double com plex aray of din ensions (LD \(X\), \(N\) 2) that contains the sequences to be transform ed stored in its colum ns in \(X(0 \mathbb{N} 1 / 2,0\) N 2-1).

LD X (input)
Leading dim ension ofX . LD X >= \(\mathbb{N} 1 / 2+1\) ) U nchanged on exit.

Y (output)
Y is a double precision array ofdim ensions (LD Y,
N 2 ) that contains the transform results of the input sequences in \(Y(0 \mathbb{N} 1-1,0\) N \(2-1\) ). \(X\) and \(Y\) can be the same array starting at the sam emem ory location, in which case the input sequences are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y (input)
Leading dim ension of \(Y\). If \(X\) and \(Y\) are the same array, LDY \(=2 * L D X\) Else LD Y >=N 1 U nchanged on exit.

TR IG S (input/output)
double precision array of length \(2 \star \mathrm{~N} 1\) that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith IO PT \(=0\) and they are used in subsequent calls when IO PT = 1. U nchanged on exit.

IFAC (input/output)
Integer array ofdim ension at least 128 that contains the factors of N 1 . The factors are com puted when the routine is called w ith IO PT \(=0\) and they are used in subsequent calls when IOPT \(=1\). U nchanged on exit.

W ORK (w orkspace)
double precision array of dim ension at least N 1.
The user can also choose to have the routine allocate its ownw orkspace (see LW ORK).

LW ORK (input)
Integer specifying workspace size. IfLW ORK \(=0\), the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=10 \mathrm{PT}\) is not 0 or 1
\(-2=\mathrm{N} 1<0\)
\(-3=N 2<0\)
\(-4=(\operatorname{LDX}<\mathrm{N} 1 / 2+1)\)
\(-5=(\mathrm{LD} \mathrm{Y}<\mathrm{N} 1)\) or (LD Y notequal2*LD X when X and
Y are sam e array)
\(-6=(\mathbb{L W}\) ORK notequal0) and (LW ORK < N 1)
\(-7=m\) em ory allocation failed

INTEGER FUNCTION ZFFTOPT (LEN)
\(\mathbb{I N T E G E R L E N}\)
\(\mathbb{I N}\) TEGER*8 FUNCTION ZFFTOPT_64 (LEN)
\(\mathbb{N}\) TEGER *8 LEN

F95 INTERFACE
INTEGER FUNCTION ZFFTOPT (LEN)
\(\mathbb{N}\) TEGER ::LEN

INTEGER (8) FUNCTION ZFFTOPT_64 (LEN)
\(\mathbb{N}\) TEGER (8) :: LEN

C INTERFACE
\#include <sunperfh>
int zfflopt(int len);
long zfftopt_64 (long len);

\section*{PURPOSE}

Fourier transform algorithm s , including those used in Perform ance Library, w ork bestw ith vector lengths that are products of sm all prim es. Forexam ple, an FFT of length \(32=2 * * 5 \mathrm{w}\) ill nun fasterthan an FFT of prime length 31 because 32 is a productofsm allprim es and 31 is not. If your application is such that you can taper or zero pad your vector to a larger length then this function \(m\) ay help you select a better length and run your FFT faster.

ZFFTOPT w ill retum an integerno sm aller than the input argum entN that is the closestnum ber that is the product of sm allprim es. ZFFTOPT w ill retum 16 foran input of \(\mathrm{N}=16\) and retum 18=2*3*3 foran inputof \(\mathrm{N}=17\).

N ote that the length com puted here is not guaranteed to be optim al, only to be a
product of sm allprim es. A lso, the value retumed \(m\) ay change as the underlying
FFT sbecom e capable of handling larger prim es. For exam ple, passing in \(N=51\) to day \(w\) ill retum \(52=2 \star 2 \star 13\) rather than \(51=3 * 17\) because the FFT s in Perform ance Library do not have fast radix 17 code. In the future, radix 17 code m ay be added
and then \(\mathrm{N}=51 \mathrm{w}\) ill retum 51 .

W \(2=\exp \left(i \operatorname{sign} * i^{\star} 2 * k 2 * 2 * \mathrm{pi}\right.\) N 2\()\)

\section*{ARGUMENTS}

IO PT (input)
Integer specifying the operation to be perform ed:
IO PT \(=0\) com putes the trigonom etric \(w\) eight table
and factor table
IO PT \(=-1\) com putes forw ard FFT
IO \(\mathrm{PT}=+1\) com putes inverse FFT

N 1 (input)
Integer specifying length of the transform in the first dim ension. N 1 is m ostefficientw hen it is a productofsm allprim es. N \(1>=0\). U nchanged on exit.

N 2 (input)
Integer specifying length of the transform in the second dim ension. N 2 is m ostefficientw hen it is a productofsm allprim es. N \(2>=0\). U nchanged on exit.
SCALE (input)
D ouble precision scalarby which transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF \(95 \mathbb{I N}\) TERFACE .
\(X\) (input) \(X\) is a double com plex aray of dim ensions (LD \(X\), N 2) that contains inputdata to be transform ed.

LD X (input)
Leading dim ension of X . LD X >= N 1 U nchanged on exit.

Y (output)
\(Y\) is a double com plex array of dim ensions (LD Y, N 2 ) that contains the transform results. X and \(Y\) can be the sam e array starting at the sam \(e m\) em ory location, in which case the input data are overw ritten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

LD Y (input)
Leading dim ension of \(Y\). If \(X\) and \(Y\) are the same aray, LD Y \(=\) LD X Else LD Y >=N 1 U nchanged on exit.

TR IG S (input/output)
D ouble precision array of length \(2 *(\mathbb{N} 1+\mathrm{N} 2)\) that
contains the trigonom etric w eights. The w eights are com puted when the routine is called w ith IO PT
= 0 and they are used in subsequent calls w hen
IO PT = 1 or \(\mathbb{I O} P T=-1\). Unchanged on exit.

IFAC (input/output)
Integer anray ofdim ension at least \(2 * 128\) that
contains the factors of N 1 and N 2 . The factors
are com puted when the routine is called w ith IO PT
= 0 and they are used in subsequent calls w hen
IO PT = 1 or IO PT =-1. Unchanged on exit.

W ORK (w orkspace)
D ouble precision array of dimension at least
\(2 * \operatorname{MAX}(\mathbb{N} 1, N 2) * N C P U S\) where NCPUS is the num berof
threads used to execute the routine. The usercan
also choose to have the routine allocate its ow \(n\)
w orkspace (see LW ORK).
LW ORK (input)
Integer specifying workspace size. IfLW ORK \(=0\),
the routine w illallocate its ow n w orkspace.
\(\mathbb{E R R}\) (output)
On exit, integer \(\mathbb{E R R}\) has one of the follow ing
values:
\(0=\) norm alretum
\(-1=\mathbb{O P P T}\) is not 0,1 or -1
\(-2=\mathrm{N} 1<0\)
\(-3=N 2<0\)
\(-4=(\mathbb{L D X}<\mathrm{N} 1)\)
\(-5=(\mathbb{L D} Y<N 1)\) or (LD Y notequalLD \(X\) when \(X\) and \(Y\)
are sam e aray)
\(-6=(L W\) ORK not equal 0) and (LWORK <
2*M AX (N1,N2)*NCPUS)
\(-7=m\) em ory allocation failed

\section*{SEE ALSO}

D ouble precision scalarby w hich transform results are scaled. Unchanged on exit. SCALE is defaulted to 1.0 D 0 forF95 \(\mathbb{I N}\) TERFACE.

X (input) X is a double com plex aray of dim ensions (LD X ,
N 2 ) that contains the sequences to be transform ed stored in its colum ns.

LD X (input)
Leading dim ension of X . LD X \(>=\) N 1 U nchanged on exit.

Y (output)
\(Y\) is a double com plex array of dim ensions (LD \(Y\), N 2 ) that contains the transform results of the inputsequences. \(X\) and \(Y\) can be the sam \(e\) array starting at the sam e \(m\) em ory location, in which case the input sequences are overw rilten by their transform results. O therw ise, it is assum ed that there is no overlap betw een \(X\) and \(Y\) in \(m\) em ory.

\section*{LD Y (input)}

Leading dimension of \(Y\). If \(X\) and \(Y\) are the same aray, LD Y \(=\) LD X Else LD Y >= N 1 U nchanged on exit.

\section*{TRIGS (input/output)}

D ouble precision array of length \(2 * N 1\) that contains the trigonom etric w eights. The w eights are com puted w hen the routine is called w ith IOPT \(=0\) and they are used in subsequent calls w hen ID PT = 1 or IO PT = -1. U nchanged on exit.

FAC (input/output)

Integer anay of dim ension at least 128 that contains the factors of N 1 . The factors are com puted w hen the routine is called w ith \(\mathbb{I O}\) PT \(=0\) and they are used in subsequent calls w hen IO PT \(=1\) or IO PT \(=-1\). U nchanged on exit.

W ORK (w orkspace)
D ouble precision anay of dimension at least
2*N 1*N CPUS where NCPUS is the num ber of threads
used to execute the routine. The user can also
choose to have the routine allocate its own
w orkspace (see LW ORK).

LW ORK (input)
Integer specifying w orkspace size. IfLW ORK \(=0\),
the routine w illallocate its ow n w ork.space.

ERR (output)
On exit, integer \(\mathbb{F} R \mathrm{R}\) has one of the follow ing
values:
0 = norm alretum
\(-1=10 P T\) is not 0,1 or -1
\(-2=\mathrm{N} 1<0\)
\(-3=N 2<0\)
\(-4=(\llbracket D X<N 1)\)
\(-5=(L D Y<N 1)\) or (LD Y notequalLD \(X w\) hen \(X\) and \(Y\)
are sam e array)
\(-6=(\mathbb{L}\) ORK notequal0) and (LW ORK \(<2 * \mathrm{~N} 1 * \mathrm{NCPUS})\)
\(-7=m\) em ory allocation failed

\section*{PURPOSE}
zgbbrd reduces a com plex generalm -by-n band \(m\) atrix \(A\) to realupperbidiagonal form \(B\) by a unitary transform ation: \(Q^{\prime}\)
* \(A * P=B\).

The routine com putes B, and optionally form s Q or P', or com putes \(Q\) *C for given \(m\) atrix \(C\).

\section*{ARGUMENTS}

\section*{VECT (input)}

Specifies w hether ornot the \(m\) atrices \(Q\) and \(P\) 'are
to be form ed. = N ': do not form Q orP';
\(=Q^{\prime}\) : form Q only;
\(=P^{\prime}:\) form \(P^{\prime}\) only;
\(=B^{\prime}\) : form both.

M (input) The num ber of row s of the \(m\) atrix \(A . M>=0\).

N (input) The num ber of colum ns of them atrix \(A . N>=0\).

NCC (input)

The num ber of colum ns of the \(m\) atrix \(\mathrm{C} . \mathrm{NCC}>=0\).
\(K L\) (input)
The num ber of subdiagonals of the m atrix A. \(\mathrm{KL}>=\) 0 .

KU (input)
The num ber of superdiagonals of the m atrix A. KU \(>=0\).

AB (input/output)
On entry, the \(m\)-by \(-n\) band \(m\) atrix \(A\), stored in row \(s\) 1 to \(\mathrm{KL}+\mathrm{KU}+1\). The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the array \(A B\) as follows: \(A B(k u+1+i-j)=A(i, j)\) for \(\max (1, j\) \(\mathrm{ku})<=i<=\mathrm{m}\) in \((\mathrm{m}, \dot{\mathrm{j}} \mathrm{kl} \mathrm{l})\). On exit, A is overw ritten by values generated during the reduction.

LDAB (input)
The leading dim ension of the anay A. LD AB >= \(K L+K U+1\).

D (output)
The diagonalelem ents of the bidiagonalm atrix B.

E (output)
The superdiagonal elem ents of the bidiagonal \(m\) atrix B.

Q (output)
If VECT \(=Q\) 'or \(B\) ', the \(m\)-by \(m\) unitary \(m\) atrix \(Q\).
If VECT \(=N\) 'or \(P\) ', the array \(Q\) is not referenced.

LD Q (input)
The leading dim ension of the amay \(Q\). LDQ >= \(m \operatorname{ax}(1, M)\) ifVECT \(=Q\) 'or \(B ; L D Q>=1\) otherw ise.

PT (output)
IfVECT \(=P^{\prime}\) or \(B^{\prime}\), the n -by-n unitary \(m\) atrix \(P^{\prime}\). If VECT \(=N\) 'or \(Q\) ', the amay PT is not referenced.

LDPT (input)
The leading dim ension of the array PT. LD PT >= \(\mathrm{max}(1, \mathrm{~N})\) if VECT \(=\mathrm{P}\) 'or \(\mathrm{B} ; \mathrm{LDPT}>=1\) otherw ise.

C (input/output)
On entry, an \(m\)-by-nocm atrix C. On exit, \(C\) is
overw ritten by Q *C. C is notreferenced if \(\mathrm{NCC}=\) 0 .

LD C (input)
The leading dim ension of the aray \(C\). LD C >= \(m a x(1, M)\) if \(N C C>0 ; L D C>=1\) if \(N C C=0\).
W ORK (w orkspace)
dim ension ( \(\mathrm{M} A X(M, N))\)

void zgbcon_64 (char norm , long n, long nsub, long nsuper, doublecom plex *a, long lda, long *ípivot, double anorm , double *rcond, long *info);

\section*{PURPOSE}
zgbcon estim ates the reciprocal of the condition num ber of a com plex general band m atrix \(A\), in either the 1 -norm or the infinity-norm, using the LU factorization computed by CGBTRF.

A \(n\) estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as
\(\operatorname{RCOND}=1 /(\operatorname{nom}(A) * \operatorname{norm}(\operatorname{inv}(A)))\).

\section*{ARGUMENTS}

\section*{NORM (input)}

Specifies w hether the 1 -norm condition num ber or the infinity-norm condition num ber is required:
= 1'or O': 1-norm;
\(=\mathrm{I}^{\prime}: \quad\) Infinity-norm.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

N SUB (input)
The num ber of subdiagonals w ithin the band of A. N SUB \(>=0\).

\section*{N SU PER (input)}

The num ber of superdiagonals w ithin the band of A. N SU PER \(>=0\).

A (input) D etails of the LU factorization of the band \(m\) atrix
A, as com puted by CGBTRF. U is stored as an upper triangularband \(m\) atrix \(w\) ith N SU B +N SU PER superdiagonals in rows 1 to NSUB+NSUPER+1, and them ultipliers used during the factorization are stored in row SN SU B + N SU PER +2 to \(2 *\) N SU B + N SU PER +1 .

\section*{LDA (input)}

The leading dim ension of the array A . LDA >= \(2 * N\) SU B + N SU PER +1 .

PIVOT (input)
The pivot indices; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P} \mathbb{I V}\) T (i).

ANORM (input)
IfNORM = I' or \(\mathrm{D}^{\prime}\) ', the 1 -norm of the original \(m\) atrix \(A\). IfNORM = 'I', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition number of the \(m\) atrix \(A\), computed as RCOND \(=1 /(\) norm (A) * norm (inv (A))).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue

void zgbequ_64 (long m, long n , long kl , long ku, doublecom plex *a, long lda, double *r, double *c, double *row cn, double *colen, double *am ax, long *info);

\section*{PURPOSE}
zgbequ com putes row and colum n scalings intended to equilibrate an M -by N band \(m\) atrix \(A\) and reduce its condition number. \(R\) retums the row scale factors and \(C\) the colum \(n\) scale factors, chosen to try to \(m\) ake the largestelem ent in each row and colum \(n\) of the \(m\) atrix \(B \quad w i t h\) elements B \((i, j)=R(i) \star A(i, 7) * C(i)\) have absolute value 1 .

R (i) and C (i) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N UM = largest safe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orksw ellin practice.

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of collm ns of the \(m\) atrix \(\mathrm{A} . \mathrm{N}>=0\).

KL (input)
The num ber of subdiagonals w ithin the band of A. \(\mathrm{KL}>=0\).

KU (input)
The num ber of superdiagonals w ithin the band of A.
K U >=0.

A (input) The band m atrix A, stored in row s 1 to \(K L+K U+1\).
The jth colum n of A is stored in the \(j\) th column
of the array A as follow s: A \((k u+1+i-j)=A(i, 7)\) form ax \((1, j \mathrm{jku})<=i<=m\) in \((m, j+k l)\).

LD A (input)
The leading dim ension of the aray A. LD A >= K L+KU +1.

R (output)
If \(\mathbb{N} F O=0\), or \(\mathbb{N} F O>M, R\) contains the row scale factors forA.
C (output)
If \(\mathbb{N} F O=0, C\) contains the colum \(n\) scale factors
forA.

ROW CN (output)
If \(\mathbb{I N F O}=0\) or \(\mathbb{N} F O>M, R O W C N\) contains the ratio
of the sm allest \(R(i)\) to the largest \(R\) (i). If
ROW CN >= 0.1 and \(A M A X\) is neither too large nortoo sm all, it is notw orth scaling by \(R\).

COLCN (output)
If \(\mathbb{N} F O=0, C O L C N\) contains the ratio of the sm allest C (i) to the largestC (i). IfC O LCN >=0.1, it is notw orth scaling by \(C\).

AM AX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to under-
flow , the \(m\) atrix should be scaled.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an ille-
galvalue
> 0 : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=\mathrm{M}\) : the i-th row ofA is exactly zero
\(>M\) : the ( -H ) -th colum n of A is exactly zero

\section*{C INTERFACE}
\#include < sunperfh>
void zgbm v (Chartransa, intm, intn, intnsub, int nsuper, doublecom plex *alpha, doublecom plex *a, int lda, doublecom plex *x, int incx, doublecom plex *beta, doublecom plex *y, int incy);
void zgbm v_64 (char transa, long m, long n, long nsub, long nsuper, doublecom plex *alpha, doublecom plex *a, long lda, doublecom plex *x, long incx, doublecom plex *beta, doublecom plex *y, long incy);

\section*{PURPOSE}
zgbm v perform s one of the \(m\) atrix-vector operations \(y:=\) alpha*A*x + beta*y, ory : alpha*A *x + beta*y, or \(y:=\) alpha*con'g (A')*x + beta*y where alpha and beta are scalars, \(x\) and \(y\) are vectors and \(A\) is an \(m\) by \(n\) band \(m\) atrix, w ith nsub sub-diagonals and nsuper super-diagonals.

\section*{ARGUMENTS}

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s :
TRANSA \(=\mathrm{N}^{\prime}\) or \(\mathrm{h}^{\prime} \mathrm{y}:=\) alpha*A \({ }^{*} \mathrm{x}+\) beta y y .
TRANSA \(=\) ' 'or \(t^{\prime} y=a l p h a * A ~ * x+b e t a * y\).
TRANSA = C'ort' \(y=\) alpha*cong (A')*x + beta*y.
U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

M (input)
O n entry, M specifies the num berof row s of the \(m\) atrix A. M mustbe at least zero. U nchanged on exit.

N (input)
On entry, N specifies the num ber of colum ns of the m atrix A. N m ustbe at least zero. U nchanged on exit.

NSUB (input)
On entry, NSUB specifies the num ber of subdiagonals of the matrix A.NSUB mustsatisfy 0 le. N SU B . U nchanged on exit.

N SU PER (input)
On entry, N SU PER specifies the num ber of superdiagonals of them atrix A.N SU PER m ust satisfy 0 le. N SU PER. U nchanged on exit.

\section*{A LPHA (input)}

On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry, the leading (nsub + nsuper+1) by \(n\) part of the array A m ust contain the matrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row (nsuper +1 ) of the array, the first super-diagonal starting at position 2 in row nsuper, the firstsubdiagonal starting atposition 1 in row (nsuper + 2 ), and so on. Elem ents in the aray A that do not conespond to elem ents in the band matrix (such as the top leftnsuperby nsupertriangle) are not referenced. The follow ing program segm ent \(w\) illtransfer a band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, \mathrm{~J}=1, \mathrm{~N} \\
& \mathrm{~K}=\mathrm{N} \text { SUPER }+1-\mathrm{J} \\
& \text { DO } 10, \mathrm{I}=\mathrm{MAX}(1, \mathrm{~J}-\mathrm{NSUPER}), \mathrm{M} \mathbb{N}(\mathrm{M}, \mathrm{~J}+ \\
& \text { NSUB }) \\
& \quad \text { A }(\mathrm{K}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(I, J) \\
& 10 \quad \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
\]

U nchanged on exit.

LDA (input)
O \(n\) entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A m ust be at least (nsub + nsuper+1). U nchanged on exit.

X (input)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C X))\) when TRANSA = N 'or h' and at least ( \(1+(m-1) * a b s(\mathbb{N C X})\) )
otherw ise. Before entry, the increm ented anray \(X\) \(m\) ust contain the vectorx. U nchanged on exit.
\(\mathbb{N C X}\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents of \(\mathrm{X} . \mathbb{N} C X\) m ustnotbe zero. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then \(Y\) need not.be seton input. U nchanged on exit.

Y (input/output)
\((1+(m-1) * \operatorname{abs}(\mathbb{N} C Y))\) when TRANSA \(=\mathrm{N}\) 'or \(h^{\prime}\) and at least ( \(\left.1+(\mathrm{n}-1)^{*} \mathrm{abs}(\mathbb{N} C Y)\right)\)
otherw ise. B efore entry, the increm ented anay \(Y\) \(m\) ustcontain the vectory. On exit, \(Y\) is overw ritten by the updated vectory.
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(Y . \mathbb{N} C Y\) m ustnotbe zero. U nchanged on exit.

void zgbsv_64 (long n, long kl, long ku, long nihs, doublecom plex *a, long lda, long *ìpívot, doublecom plex *b, long ldb, long *info);

\section*{PURPOSE}
zgbsv com putes the solution to a com plex system of linear equations \(A\) * \(\mathrm{X}=\mathrm{B}\), where A is a band m atrix of order N \(w\) ith \(K L\) subdiagonals and \(K U\) superdiagonals, and \(X\) and \(B\) are N -by-N R H S m atrices.

The LU decom position \(w\) ith partialpivoting and row interchanges is used to factorA as A \(=\mathrm{L} * \mathrm{U}\), where L is a product of perm utation and unit low er triangularm atrioes \(w\) ith \(K L\) subdiagonals, and \(U\) is upper triangularw ith \(K L+K U\) superdiagonals. The factored form ofA is then used to solve the system of equations \(A * X=B\).

\section*{ARGUMENTS}

N (input) The num ber of linearequations, i.e., the order of the matrix \(A . N>=0\).

KL (input)
The num berof subdiagonals w ithin the band of A. \(\mathrm{KL}>=0\).

KU (input)
The num ber of superdiagonals w ithin the band of A.
\(K U>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS >=0.

A (input/output)

On entry, them atrix A in band storage, in row \(s\) \(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the anray need notbe set. The \(j\) th column ofA is stored in the \(j\) th column of the array \(A\) as follows:
\(A(K L+K U+1+i-j, j)=A(i, j)\) for \(\max (1, j\) K \(U\) ) \(<=i<=m\) in ( \(N\), \(\mathfrak{j}+\mathrm{K} L\) ) On exit, details of the factorization: \(U\) is stored as an upper triangular band \(m\) atrix w ith \(K L+K U\) superdiagonals in row \(s\) to \(\mathrm{K} L+\mathrm{KU}+1\), and the \(\mathrm{m} u\) ltipliers used during the factorization are stored in rows KL+KU+2 to \(2 \star K L+K U+1\). See below for further details.

LD A (input)
The leading dim ension of the array A. LDA >= \(2 \star K L+K U+1\).
\(\mathbb{P I V O T}\) (output)
The pivot indices that define the perm utation \(m\) atrix \(P\); row i of the \(m\) atrix \(w\) as interchanged w th row \(\mathbb{P} \mathbb{I V O T}\) (i).

B (input/output)
On entry, the \(\mathrm{N}-\) by -N RH S righthand side m atrix B . On exit, if \(\mathbb{N} F O=0\), the \(N\)-by-NRHS solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the anay \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue \(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{U}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the factor U is exactly singular, and the solution has notbeen com puted.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, when \(M=N=6, K L=2, K U=1\) :

On entry: On exit:

> u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55 u66
a21 a32 a43 a54 a65 * m 21 m 32 m 43 m 54 m 65
*
a31 a42 a53 a64 * * m 31 m 42 m 53 m 64 *

A nay elem entsm arked * are notused by the routine; ele\(m\) entsm arked + need notbe seton entry, butare required by the routine to store elem ents of \(U\) because of fill-in resulting from the row interchanges.

\#include <sunperfh>
void zgbsvx (char fact, chartransa, intn, int \(k\) l, int ku, intnrhs, doublecom plex *a, int lda, doublecom plex
*af, int ldaf, int *ipivot, charequed, double *r, double \({ }^{*}\) c, doublecom plex *b, int ldb, doublecom plex *x, intldx, double *rcond, double *ferr, double *berr, int *info);
void zgbsvx_64 (char fact, char transa, long n, long kl, long ku, long nihs, doublecom plex *a, long lda, doublecom plex *af, long ldaf, long *ịíivot, char equed, double \({ }^{*}\) r, double \({ }^{*}\) c, doublecom plex \({ }^{*}\) b, long ldb, doublecomplex *x, long ldx, double *rcond, double * ferr, double *berr, long *info);

\section*{PURPOSE}
zgbsvx uses the LU factorization to com pute the solution to a complex system of linearequations \(A * X=B, A * * T\) * \(=\) \(B\), or \(A * * H * X=B\), where \(A\) is a band \(m\) atrix of order \(N\) w ith \(K L\) subdiagonals and \(K U\) superdiagonals, and \(X\) and \(B\) are \(N^{-}\) by-N RH S m atrices.

Enorbounds on the solution and a condition estim ate are
also provided.
The follow ing steps are perform ed by this subroutine:
1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
TRANS \(=N^{\prime}: \operatorname{diag}(R) * A * \operatorname{diag}(C) \quad * i n v(d i a g(C)) * X=\) \(\operatorname{diag}(\mathbb{R}) * B\)

TRANS \(=T:(\operatorname{diag}(R) * A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(R)) * X=\) diag (C ) *B

TRANS \(=C^{\prime}:(\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(\mathbb{R})) * X=\) diag (C) *B
W hether or not the system willbe equilibrated depends on the scaling of the m atrix A, but ifequilibration is used, A is overw rilten by \(\operatorname{diag}(\mathbb{R}) * A\) *diag \((C)\) and \(B\) by \(\operatorname{diag}(\mathbb{R}) * B\) (if TRANS \(=N\) )
ordiag (C)*B (if TRANS = T'or C).
2. IfFACT = N 'or E', the LU decom position is used to factor the \(m\) atrix A (afterequilibration ifFACT = E) as \(A=L * U\),
where \(L\) is a product of perm utation and unit low er triangular
m atrices w ith \(\mathrm{K} L\) subdiagonals, and U is upper triangular w ith
\(K L+K U\) superdiagonals.
3. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of A is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the
reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for X and com pute error bounds as described below .
4.The system of equations is solved for \(X\) using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
m atrix and calculate error bounds and backw ard error
6. If equilibration w as used, the m atrix \(X\) is prem ultiplied by diag (C) (if TRANS = N ) ordiag \((\mathbb{R})\) (ifTRANS = T' or C) so that itsolves the originalsystem before equilibration.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, whether them atrix A should be equilibrated before it is factored. = F': On entry, AF and IPIVOT contain the factored form of \(A\). IfEQUED is not \(N\) ', the \(m\) atrix A has been equilibrated \(w\) ith scaling factors given by R and \(\mathrm{C} . \mathrm{A}, \mathrm{AF}\), and IP IV OT are not m odified. \(=\mathrm{N}\) ': The m atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) : The matrix A will be equilibrated if necessary, then copied to AF and factored.

TRANSA (input)
Specifies the form of the system of equations. = \(\mathrm{N}: A * X=B \quad\) N o transpose)
\(=T\) ': \(A * * T * X=B \quad\) (Transpose)
\(=C\) ': \(A * * H * X=B \quad\) (C onjugate transpose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

K L (input)
The num ber of subdiagonals \(w\) thin the band of \(A\).
\(\mathrm{K} L>=0\) 。

KU (input)
The num ber of superdiagonals \(w\) ithin the band of \(A\).
\(K U>=0\) 。

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the \(m\) atriges B and X. NRH S \(>=0\).

A (input/output)
O n entry, the m atrix A in band storage, in row s 1
to \(K L+K U+1\). The \(j\) th colum \(n\) ofA is stored in the \(j\) th colum \(n\) of the array A as follow s: A ( \(K U+1+i-\) \(j, j)=A(i, j)\) form \(a x(1, j K U)<=i<=m\) in \((\mathbb{N}, j+k l)\)

IfFACT = F'andEQUED is not \(N\) ', then \(A\) must have been equilibrated by the scaling factors in \(R\) and/orC. A is notm odified ifFACT=F'or \(N^{\prime}\), or iffACT = E'and EQUED = N 'on exit.

On exit, ifEQ UED ne. \(N\) ', A is scaled as follow \(\mathrm{s}: \mathrm{EQUED}=\mathrm{R}\) : A \(:=\operatorname{diag}(\mathbb{R}) * A\)
EQUED = C ': A :=A * diag (C )
\(E Q U E D=B^{\prime}: A:=\operatorname{diag}(R) * A * \operatorname{diag}(C)\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(K L+K U+1\).

AF (input/output)
IfFACT = \(F\) ', then \(A F\) is an inputargum entand on entry contains details of the LU factorization of the band \(m\) atrix \(A\), as com puted by CGBTRF. U is stored as an upper triangularband \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row \(s 1\) to \(K L+K U+1\), and the m ultipliers used during the factorization are stored in row sKL+KU+2 to \(2 \star K L+K U+1\). If EQUED
ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix A.

IfFACT \(=N\) ', then \(A F\) is an output argum ent and on exit retums details of the LU factorization of A.

IfFACT = E', then AF is an output argum ent and on exit retums details of the LU factorization of the equilibrated \(m\) atrix \(A\) (see the description of A for the form of the equilibrated \(m\) atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(2 * K L+K U+1\).

IPIVOT (input)
IfFACT \(=\mathrm{F}^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an input argum ent and on entry contains the pivotindiges from the factorization \(A=L * U\) as com puted by CGBTRF; row i of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P}\) IV OT (i).

If \(\mathrm{FACT}=\mathrm{N}\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivotindioes from the
factorization \(\mathrm{A}=\mathrm{L} * \mathrm{U}\) of the originalm atrix A .

IfFACT = E', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivotindioes from the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{U}\) of the equilibrated m atrix A.

EQUED (input)
Specifies the form of equilibration thatw as done. \(=N^{\prime}: ~ N o\) equilibration (alw ays true iffACT = N).
\(=R\) ': Row equilibration, ie., A has been prem ultiplied by diag \((\mathbb{R})\). = C ': Column equilibration, ie., A has been postm ultiplied by diag (C ). = B': B oth row and colum \(n\) equilibration, ie., A has been replaced by diag \((\mathbb{R})\) * A * diag (C). EQUED is an inputargum entifFACT= F'; otherw ise, it is an outputargum ent.

R (input/output)
The row scale factors forA. IfEQUED = R' or \(B\) ', A is multiplied on the leftby diag \((\mathbb{R})\); if EQUED = N 'or C', R is notaccessed. \(R\) is an input argum ent if \(F A C T=F\) '; otherw ise, \(R\) is an output argum ent. IfFACT = F'and EQUED = R'or \(B\) ', each elem entofR m ustbe positive.

C (input/output)
The collm \(n\) scale factors for \(A\). If \(\mathrm{EQ} \mathrm{UED}=\mathrm{C}\) 'or
B', A is multiplied on the rightby diag (C ) ; if \(E Q U E D=N\) 'or \(R\) ', \(C\) is notaccessed. \(C\) is an input argum ent ifFACT = F '; otherw ise, C is an outputargum ent. IfFACT = \(\mathrm{F}^{\prime}\) and \(E Q U E D=C\) 'or \(B\) ', each elem entofC \(m\) ust.be positive.

B (input/output)
On entry, the righthand side m atrix B. On exit, ifEQUED \(=N^{\prime}\) ', \(B\) is notm odified; ifTRANSA \(=N^{\prime}\) and EQUED \(=R^{\prime}\) or \(B^{\prime}, B\) is overw rilten by \(\operatorname{diag}(\mathbb{R}) * B\); if TRANSA \(=T\) 'or \(C^{\prime}\) and \(E Q U E D=C^{\prime}\) or \(B\) ', \(B\) is overw ritten by diag ( \(C\) )*B .

LD B (input)
The leading dim ension of the array \(B\). LD B \(>=\) \(\max (1, \mathbb{N})\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the \(\mathrm{N}-\) by -NRH S solution
\(m\) atrix \(X\) to the original system ofequations.
\(N\) ote that \(A\) and \(B\) arem odified on exit if EQUED
ne. \(N\) ', and the solution to the equilibrated
system is inv (diag (C))*X ifTRANSA \(=N\) 'and EQUED
\(=C\) 'or \(B^{\prime}\) 'orinv \((\operatorname{diag}(R)) * X\) ifTRANSA \(=T\) 'or
\(C^{\prime}\) and \(E Q U E D=R\) 'or \(B '\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).
RCOND (output)
The estim ate of the reciprocal condition num ber of the matrix A after equilibration (if done). If RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N} F O>0\).

\section*{FERR (output)}

The estim ated forw ard emrorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{)})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(j)\) (i.e., the \(s m\) allest relative change in any elem entofA orB thatm akes \(X\) ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dimension (N) On exit, W ORK \(2(1)\) contains the reciprocal pivot grow th factornom (A)/norm (U). The " m ax absolute elem ent" norm is used. If W ORK \(2(1)\) is much less than 1 , then the stability of the LU factorization of the (equilibrated) \(m\) atrix A could be poor. This also \(m\) eans that the solution X, condition estim atorRC O ND, and forw ard error bound FERR could be unreliable. If factorization fails \(w\) ith \(0<\mathbb{N} F O<=N\), then \(W\) ORK 2 (1) contains the reciprocal pivot grow th factor for the leading \(\mathbb{N}\) FO colum ns of A.
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum ent had an illegalvalue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has been com pleted, but the factorU is exactly singular, so the solution and emror bounds could not be com puted. RC OND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and emror bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void zgbtfe_64 (long m , long n, long kl, long ku, doublecom plex *ab, long ldab, long *ịív, long *info );

\section*{PURPOSE}
zgbtf2 com putes an LU factorization of a com plex m -by-n band \(m\) atrix A using partialpivoting \(w\) ith row interchanges.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
KL (input)
The num ber of subdiagonals w ithin the band of A.
\(\mathrm{KL}>=0\).
KU (input)
The num ber of superdiagonals within the band of A. \(K U>=0\).

AB (input/output)
O n entry, them atrix \(A\) in band storage, in row \(s\) \(K L+1\) to \(2 * K L+K U+1\); row s 1 to \(K L\) of the anray need not.be set. The \(j\) th column ofA is stored in the \(j\) th column of the array AB as follows: \(A B(k l+k u+1+i-j, j)=A(i, j)\) for \(\max (1, j\) \(\mathrm{ku})<=i<=m\) in \((\mathrm{m}, \mathrm{j}+\mathrm{kl})\)

On exit, details of the factorization: U is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row s 1 to \(K L+K U+1\), and the \(m u l-\) tipliers used during the factorization are stored in row \(K L+K U+2\) to \(2 * K L+K U+1\). See below for furtherdetails.

The leading dim ension of the array AB. LDAB >=
\(2 * K L+K U+1\).

IPIV (output)
The pivot indices; for \(1<=i<=m\) in \(M, N\) ), row i of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P} \mathbb{V}\) (i).
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0\) : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue \(>0\) : if \(\mathbb{N} F O=+i, U(i, i)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

\section*{FURTHER DETAILS}

The band storage scheme is illustrated by the follow ing exam ple, \(w\) hen \(M=N=6, K L=2, K U=1\) :

On entry: On exit:
```

    * * * + + + * * * u14 u25
    u36
* * + + + + * * u13 u24 u35
u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55

\section*{PURPOSE}
zgbtrf com putes an LU factorization of a com plex \(m\)-by-n band \(m\) atrix A using partialpivoting \(w\) ith row interchanges.

This is the blocked version of the algorithm, calling Level 3 BLAS .

\section*{ARGUMENTS}

M (input) Integer
The num ber of row sof the m atrix A. M \(>=0\).
N (input) Integer
The num berof colum ns of the m atrix A. \(\mathrm{N}>=0\).

K L (input) Integer
The num ber of subdiagonals w ithin the band of A. \(K L>=0\).

KU (input) Integer
The num ber of superdiagonals \(w\) ithin the band of A.
\(K U>=0\).

AB (input/output) D ouble com plex array of dim ension (LD AB N ).
On entry, the matrix A in band storage, in row \(s\) \(K L+1\) to \(2 \star K L+K U+1\); row s 1 to \(K L\) of the array need not.be set. The \(j\) th colum n of A is stored in the \(j\) th column of the array \(A B\) as follows: AB \((\mathbb{K} L+K U+1+I J, J)=A(I, J)\) for MAX \((1, J\) \(K U)<=\mathbb{K}=M \mathbb{N}(M, J+K L)\)

O n exit, details of the factorization: U is stored as an upper triangular band \(m\) atrix \(w\) ith \(K L+K U\) superdiagonals in row s 1 to \(K L+K U+1\), and the \(m u l-\) tipliers used during the factorization are stored in row \(S K+K U+2\) to \(2 * K L+K U+1\). See below for further details.

LD AB (input) Integer
The leading dim ension of the anay A. LDA >= \(2 * K L+K U+1\).
\(\mathbb{P} \mathbb{V} O T\) (output) Integerarray ofdim ension \(M \mathbb{N} \mathrm{M}, \mathrm{N}\) )
The pívotindioes; for \(1<=I<=m\) in \(M, N\) ), row \(I\) of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P} \mathbb{I V O T}\) (I).
\(\mathbb{I N} F O\) (output) Integer
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) I, the I-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=+\mathbb{I}, U(I, I)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

\section*{FURTHER DETAILS}

\section*{PURPOSE}
zgebak form sthe rightor left eigenvectors of a com plex general \(m\) atrix by backw ard transform ation on the com puted eigenvectors of the balanced \(m\) atrix outputby CGEBA L .

\section*{ARGUMENTS}
\(J O B\) (input)
Specifies the type of backw ard transform ation required: = N ', do nothing, retum im \(m\) ediately; = P ', do backw ard transform ation for perm utation only; = S', do backw ard transform ation for scaling only; = B ', do backw ard transform ations for both perm utation and scaling. JOB m ustbe the sam e as the argum ent \(J 0\) B supplied to CG EBA L .

SIDE (input)
= R : : V contains righteigenvectors;
\(=\mathrm{L}: \mathrm{V}\) contains lefteigenvectors.

N (input) The num ber of row s of the m atrix \(\mathrm{V} . \mathrm{N}>=0\).

ㅍO (input)
The integer ILO determ ined by CGEBAL. \(1<=\mathbb{L O}\) <= \(\mathbb{H} I<=N\), if \(N>0 ; \mathbb{H}=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

HH I (input)
The integer \(\mathbb{H}\) Ideterm ined by CGEBAL. \(1<=\mathbb{L O}\) <= \(\mathbb{H} I<=N\), if \(N>0 ; \mathbb{O}=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

SCALE (input)
D etails of the perm utation and scaling factors, as retumed by CGEBAL.

M (input) The num ber of collm ns of the \(m\) atrix \(V . M>=0\).
V (input/output)
O \(n\) entry, the \(m\) atrix of right or lefteigenvectors to be transform ed, as retumed by CHSE IN or CTREVC. On ex㝳, \(V\) is overw ritten by the transform ed eigenvectors.

LD V (input)
The leading dim ension of the array \(V\). LDV >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvalue.

\section*{C INTERFACE}
\#include <sunperfh>
void zgebal(char jंb, intn, doublecom plex *a, int lda, int *ilo, int *ihi, double *scale, int *info);
void zgebal 64 (char job, long n, doublecom plex *a, long lda, long *ilo, long *ihi, double *scale, long *info);

\section*{PURPOSE}
zgebalbalances a general com plex m atrix A. This involves, first, perm uting A by a sim ilarity transform ation to isolate eigenvalues in the first 1 to \(\mathbb{I L O - 1}\) and last \(\mathbb{H}\) I+1 to N elem ents on the diagonal; and second, applying a diagonal sm ilarity transform ation to row sand colum ns \(\mathbb{I} O\) to \(\mathbb{H}\) I to \(m\) ake the rows and colum ns as close in norm as possible. B oth steps are optional.

B alancing \(m\) ay reduce the 1 -norm of the \(m\) atrix, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors.

\section*{ARGUMENTS}

JOB (input)
Specifies the operations to be perform ed on \(A\) :
= N ': none: simply set \(\mathbb{H}=1, \mathbb{H} \mathrm{I}=\mathrm{N}\), SCALE (I) = 1.0 fori=1,...N; \(=P^{\prime}:\) perm ute only;
= S ': scale only;
= B ': both perm ute and scale.
N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the inputm atrix A. On exit, A is overw rilten by the balanced \(m\) atrix. If \(\mathrm{JO}=\mathrm{N}\) ', \(A\) is not referenced. See FurtherD etails.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

IO and \(\mathbb{H}\) Iare set to integers such thaton exit A \((i, 7)=0\) if \(i>\) jand \(j=1, \ldots\), ILO-1 or \(I=\)
 \(=\mathrm{N}\).

HI I (output)
IO and \(\mathbb{H}\) Iare set to integers such thaton exit A \((i, j)=0\) if \(i>j a n d j=1, \ldots\), IL O-1 or \(I=\) \(\mathrm{HH} \mathrm{I}+1, \ldots, \mathrm{~N}\). If \(\mathrm{JOB}=\mathrm{N}\) 'or \(\mathrm{S}^{\prime}, \mathrm{LIO}=1\) and H I \(=\mathrm{N}\).

SCALE (output)
D etails of the perm utations and scaling factors applied to \(A\). IfP \((j)\) is the index of the row and colum \(n\) interchanged \(w\) th row and colum \(n\) jand \(D(1)\) is the scaling factor applied to row and column \(\mathfrak{j}\) then SCALE \((j)=P(j) \quad\) for \(j=1, \ldots, I L O-1=D(j)\) for \(j=\mathbb{L O}, \ldots, \mathbb{H} I=P(j) \quad\) for \(j=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{L} O-1\).
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

The perm utations consist of row and column interchanges which put the \(m\) atrix in the form
\[
\begin{gathered}
(\mathrm{T} 1 \mathrm{X} \\
\mathrm{PAP}=\left(\begin{array}{ll}
0 & \mathrm{~B}
\end{array}\right) \\
\left(\begin{array}{ll}
0 & \mathrm{O}
\end{array}\right)
\end{gathered}
\]
where T1 and T2 are uppertriangularm atrices whose eigenvalues lie along the diagonal. The colum \(n\) indioes \(\Pi 0\) and IH Im ark the starting and ending colum ns of the subm atrix B. Balancing consists of applying a diagonal sim ilarity transform ation inv (D) * \(B * D\) to \(m\) ake the 1 -norm \(s\) of each row of \(B\) and its comesponding colum n nearly equal. The outputm atrix is
\(\left(\begin{array}{lll}T 1 & X * D & Y\end{array}\right)\)
\(\left(\begin{array}{lll}0 & \operatorname{inv}(D) * B * D & \operatorname{inv}(D) * Z\end{array}\right)\).
\(\left(\begin{array}{lll}0 & 0 & T 2\end{array}\right)\)

Inform ation about the perm utations \(P\) and the diagonalm atrix D is retumed in the vectorSC A LE .

This subroutine is based on the E ISPA CK routine CBAL.

\section*{C INTERFACE}
\#include <sunperfh>
void zgebrd (intm, intn, doublecom plex *a, int lda, double
*d, double *e, doublecom plex *tauq, doublecom plex
*taup, int*info);
void zgebrd_64 (long m, long n, doublecom plex *a, long lda, double *d, double *e, doublecom plex *tauq, doublecom plex *taup, long *info);

\section*{PURPOSE}
zgebrd reduces a general com plex M -by-N m atrix A to upper or low er bidiagonal form B by a unitary transform ation: Q ** H * \(A * P=B\).

Ifm >= \(n, B\) is upperbidiagonal; ifm < \(n, B\) is low erbidiagonal

\section*{ARGUMENTS}

M (input) The num ber of row s in the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of 00 llm ns in them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the \(M-b y-N\) generalm atrix to be reduced. On exit, if \(m>=n\), the diagonal and the first superdiagonal are overw rilten w ith the upperbidiagonal m atrix B ; the elem ents below the diagonal, \(w\) ith the amay TAU \(Q\), represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors, and the elem ents above the first superdiagonal, w ith the array TAUP, represent the unitary \(m\) atrix \(P\) as a product ofelem entary reflectors; ifm < n, the diagonal and the first subdiagonalare overw rilten w ith the low erbidiagonalm atrix \(B\); the elem ents below the first subdiagonal, w ith the amay TAU Q, represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors, and the elem ents above the diagonal, w ith the array TA UP, represent the unitary \(m\) atrix \(P\) as a productofelem entary reflec-
tors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, M)\).

D (output)
The diagonalelem ents of the bidiagonalm atrix B :
\(D(i)=A(i, i)\).

E (output)
The off-diagonalelem ents of the bidiagonalm atrix
\(B\) : ifm \(>=n, E(i)=A(i, i+1)\) for \(i=1,2, \ldots, n-\)
1 ; ifm \(<n, E(i)=A(i+1, i)\) for \(i=1,2, \ldots, m-1\).
TAUQ (output)
The scalar factors of the elem entary reflectors which represent the unitary \(m\) atrix \(Q\). See Further D etails.

TAUP (output)
The scalar factors of the elem entary reflectors w hich represent the unitary m atrix P. See Further D etails.

W ORK (w orkspace)
On exiv, if \(\mathbb{N F O}=0, W\) ORK ( 1 ) retums the optim al LW ORK.

LW ORK (input)
The length of the amay \(W\) ORK. LW ORK >= \(\max (1, M, N)\). For optim um perform ance LW ORK >= \((M+N) \star N B\), w here N B is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfillexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

Them atrices \(Q\) and \(P\) are represented as products of elem entary reflectors:

Ifm \(>=n\),
\[
Q=H(1) H(2) \ldots H(n) \text { and } P=G(1) G(2) \ldots G(n-1)
\]

Each H (i) and G (i) has the form :
\[
H(i)=I-\operatorname{tanq}{ }^{\star} v^{\star} v^{\prime} \text { and } G(i)=I-\operatorname{taup} * u^{\star} u^{\prime}
\]
\(w\) here tauq and taup are com plex scalars, and \(v\) and \(u\) are complex vectors; \(v(1: i-1)=0, v(i)=1\), and \(v(i+1 m)\) is stored on exitin \(A(i+1 m, i) ; u(1: i)=0, u(i+1)=1\), and \(u(i+2 m)\) is stored on exitin A \((i, i+2 m)\); tauq is stored in TAUQ (i) and taup in TAUP (i).
Ifm < n,
\[
Q=H(1) H(2) \ldots H(m-1) \text { and } P=G(1) G(2) \ldots G(m)
\]

Each H (i) and G (i) has the form :
\[
H(i)=I-\operatorname{tanq}{ }^{\star} v^{\star} v^{\prime} \text { and } G(i)=I-\operatorname{taup}{ }^{\star} u^{\star} u^{\prime}
\]
\(w\) here tauq and taup are com plex scalars, and \(v\) and \(u\) are complex vectors; \(v(1: i)=0, v(i+1)=1\), and \(v(i+2 \mathrm{~m})\) is stored on exitin \(A(i+2 m, i) ; u(1: i-1)=0, u(i)=1\), and \(u(i+1 \mathrm{~m})\) is stored on exitin \(A(i, i+1 \mathrm{~m})\); tauq is stored in TAUQ (i) and taup in TA UP (i).

The contents of A on exitare illustrated by the follow ing exam ples:
\(m=6\) and \(n=5(m>n): \quad m=5\) and \(n=6(m<n):\)
( d e u1 u1 u1 ) ( d u1 u1 u1 u1
u1)
(v1 d e u2 u2) ( e d u2 u2 u2
u2 )
( v1 v2 d e u3) (v1 e d u3 u3
u3)
( v1 v2 v3 d e ) (v1 v2 e d u4 u4)
( v1 v2 v3 v4 d ) (v1 v2 v3 e d u5 )
( v1 v2 v3 v4 v5 )
where d and e denote diagonal and off-diagonal elem ents of \(B\), videnotes an elem ent of the vectordefining \(H\) (i), and ui an elem ent of the vectordefining \(G\) (i).

* \(r_{r}\) double * c , double *row cn, double *colen, double *am ax, int*info);
void zgeequ_64 (long m, long n, doublecom plex *a, long lda, double \({ }^{*} r_{r}\) double \({ }^{*}\) c, double *row cn, double *colen, double *am ax, long *info);

\section*{PURPOSE}
zgeequ com putes row and colum n scalings intended to equilibrate an M -by-N m atrix A and reduce its condition num ber. R retums the row scale factors and \(C\) the colum n scale factors, chosen to try to \(m\) ake the largestelem ent in each row and column of the \(m\) atrix \(B \quad w\) ith elements \(B(i, j)=R(i) \star A(i, j) * C(j)\) have absolute value 1.
\(R\) (i) and C (i) are restricted to be betw een SM LN UM = sm allest safe num ber and B IG N U M = largest safe num ber. U se of these scaling factors is notguaranteed to reduce the condition num berofA butw orks w ellin practice.

\section*{ARGUMENTS}

M (input) The num ber of row s of them atrix A. M >=0.

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input) The M -by- N m atrix w hose equilibration factors are to be com puted.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

R (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R\) contains the row scale factors forA.

C (output)
If \(\mathbb{N} F O=0, C\) contains the colum \(n\) scale factors forA.

ROW CN (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O>M, R O W C N\) contains the ratio
of the sm allest \(R\) (i) to the largestR (i). If
ROW CN >= 0.1 and AM AX is neither too large nortoo sm all, it is notw orth scaling by R .

COLCN (output)
If \(\mathbb{N} F O=0, C O L C N\) contains the ratio of the sm allest C (i) to the largestC (i). IfC O LCN >=0.1, it is notw orth scaling by \(C\).

AMAX (output)
A bsolute value of largestm atrix elem ent. IfA M A X
is very close to overflow orvery close to underflow , the m atrix should be scaled.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{M}\) : the i-th row of A is exactly zero
> M : the ( \(\mathrm{i}-\mathrm{M}\) ) -th colum n of A is exactly zero

\section*{PURPOSE}
zgees com putes foran N -by -N com plex nonsym \(m\) etric \(m\) atrix \(A\), the eigenvalues, the Schur form T, and, optionally, the \(m\) atrix of Schurvectors \(Z\). This gives the Schur factorization \(A=Z * T *(Z * * H)\).

Optionally, it also orders the eigenvalues on the diagonal of the Schur form so that selected eigenvalues are at the top left. The leading colum ns of \(Z\) then form an orthonorm al basis for the invariant subspace comesponding to the selected eigenvalues.

A com plex \(m\) atrix is in Schur form if it is uppertriangular.

\section*{ARGUMENTS}
\(=N\) ': Schurvectors are notcom puted;
\(=\mathrm{V}\) : Schurvectors are com puted.

\section*{SORTEV (input)}

Specifies w hether or not to order the eigenvalues
on the diagonalof the Schur form . = N ': Eigenvalues are notordered:
\(=S^{\prime}:\) Eigenvalues are ordered (see SELECT) .

SELECT (input)
SELECT m ustbe declared EXTERNAL in the calling subroutine. If SORTEV \(=S^{\prime}\) ', SELECT is used to selecteigenvalues to order to the top left of the Schurform. IfSORTEV \(=N^{\prime}\) ', SELECT is notreferenced. The eigenvalue \(W\) ( \()\) is selected if SELECT (W (J) is true.
N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the \(N\) boy -N m atrix A. On exit, A has been overw rilten by its Schur form \(T\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

NOUT (output)
If SORTEV \(=\mathrm{N}^{\prime}, \mathrm{NOUT}=0\). If SORTEV \(=\mathrm{S}^{\prime}, \mathrm{NOUT}\)
= num ber ofeigenvalues forw hich SELECT is tue.

W (output)
W contains the com puted eigenvalues, in the sam e order that they appear on the diagonal of the outputSchur form \(T\).

Z (output)
If \(\mathrm{OBBZ}=\mathrm{V}^{\prime}, \mathrm{Z}\) contains the untary \(m\) atrix \(Z\) of Schur vectors. If \(\mathrm{OBZ}=\mathrm{N}^{\prime}, \mathrm{Z}\) is notreferenced.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\); if \(\mathrm{OOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{N}\) 。

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDWORK.

LDW ORK (input)
The dimension of the aray W ORK. LDW ORK >=
\(\max (1,2 \star \mathrm{~N})\). For good perform ance, LDW ORK must generally be larger.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )

W ORK 3 (w orkspace)
dim ension (N) N ot referenced ifSORTEV = \(\mathrm{N}^{\prime}\).
\(\mathbb{I N} F O\) (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvahe.
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
<= N : the QR algorithm failed to com pute all the eigenvalues; elem ents \(1: \mathbb{I} \mathrm{O}_{-1}^{-1}\) and i+1 \(\mathbb{N}\) ofW contain those eigenvalues which have converged; if JOBZ \(=V\) ', \(Z\) contains the \(m\) atrix which reduces \(A\) to its partially converged Schur form . \(=\mathrm{N}+1\) : the eigenvalues could notbe reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned); \(=\mathrm{N}+2\) : after reordering, roundoff changed values of som e com plex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy SELECT = TRUE.. This could also be caused by underflow due to scaling.

\section*{PURPOSE}
zgeesx com putes for an \(N\) boy N com plex nonsym m etric \(m\) atrix \(A\), the eigenvalues, the Schur form \(T\), and, optionally, the \(m\) atrix of Schurvectors \(Z\). This gives the Schur factorization \(A=Z * T *(Z * * H)\).

Optionally, italso orders the eigenvalues on the diagonal of the Schur form so that selected eigenvalues are at the top left; com putes a reciprocal condition num ber for the average of the selected eigenvalues (RCONDE); and com putes a
reciprocal condition num ber for the right invariant subspace comesponding to the selected eigenvalues (RCONDV). The leading colum ns of \(Z\) form an orthonorm al basis for this invariant subspace.

For furtherexplanation of the reciprocalcondition num bers RCONDE and RCONDV, see Section 4.10 of the LAPACK U sers' G uide (w here these quantities are called s and sep respectively).

A com plex \(m\) atrix is in Schur form if it is upper triangular.

\section*{ARGUMENTS}

JOBZ (input)
\(=N\) ':Schurvectors are not com puted;
= V ':Schurvectors are com puted.
SORTEV (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the Schur form . = \(\mathrm{N}^{\prime}\) : Eigen-
values are not ordered;
= S': E igenvalues are ordered (see SELEC T).
SELECT (input)
SELECT mustbe declaredEXTERNAL in the calling
subroutine. If SORTEV \(=\) S', SELECT is used to
selecteigenvalues to order to the top left of the
Schurform. IfSORTEV = N', SELECT is notrefer-
enced. An eigenvalue \(W(\mathcal{H})\) is selected if
SELECT (N) ( \(\mathcal{j}\) ) is true.
SEN SE (input)
D eterm ines which reciprocal condition num bers are com puted. = N ': N one are com puted;
\(=\mathrm{E}:\) : C om puted for average of selected eigen-
values only;
= V ': C om puted for selected right invariant subspace only;
= B ': C om puted forboth. If SEN \(S E=\mathrm{E}^{\prime}, \mathrm{V}^{\prime}\) or B',SORTEV mustequal \(S^{\prime}\).

N (input) The order of the m atrix \(\mathrm{A} \cdot \mathrm{N}>=0\).

A (input/output)
On entry, the N toy- N m atrix A . On exit, A is overw rilten by its Schur form \(T\).

LD A (input)

The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

\section*{NOUT (output)}

If SORTEV = N',NOUT = 0. IfSORTEV = S', NOUT
= num ber ofeigenvalues forw hich SELEC \(T\) is true.
W (output)
W contains the com puted eigenvalues, in the same order that they appear on the diagonal of the outputSchur form \(T\).

Z (output)
If \(\mathrm{OOBZ}=\mathrm{V}^{\prime}, \mathrm{Z}\) contains the unitary m atrix Z of Schur vectors. If \(J O B Z=N^{\prime}, Z\) is not referenced.

LD \(Z\) (input)
The leading dm ension of the array Z . LD \(\mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >=N.

RCONE (output)
IfSENSE = E 'or B',RCONE contains the reciprocal condition number for the average of the selected eigenvalues. N ot referenced if SEN SE \(=\) N 'or V '.

RCONV (output)
If SEN SE = V 'or B ', RCONV contains the reciprocal condition num ber for the selected right invariant subspace. N ot referenced if \(\operatorname{SENSE}=\mathrm{N}^{\prime}\) or E'.

W ORK (w orkspace)
dim ension (LD W ORK) On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim allD W ORK .

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= \(\max \left(1,2 \star^{*}\right)\). A lso, ifSENSE = E'or V'or B',
LDW ORK >= \(2 \star\) NOUT* \((\mathbb{N}-N O U T)\), where NOUT is the num ber of selected eigenvalues com puted by this routine. N ote that \(2 * \mathrm{NOUT} *(\mathbb{N}-\mathrm{NOUT})<=\mathrm{N} * \mathrm{~N} / 2\). For good perform ance, LD W O RK m ustgenerally be larger.

\#include <sunperfh>
void zgeevx (char, char, char, char, int, doublecom plex*, int, doublecom plex*, doublecom plex*, int, doublecom plex*, int, int*, int*, double*, double*, double*, double*, int*);
void zgeevx_64 (char, char, char, char, long, doublecom plex*, long, doublecom plex*, doublecom plex*, long, doublecom plex*, long, long*, long*, double*, double*, double*, double*, long*);

\section*{PURPOSE}
zgeevx com putes for an N -by -N com plex nonsym m etric m atrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.

Optionally also, itcom putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( \(\mathbb{L} O, \mathbb{H}\) I, SCA LE , and A BN RM ), reciprocal condition num bers for the eigenvalues (RCONDE), and reciprocal condition num bers for the right
eigenvectors (RCONDV).

The righteigenvectorv (i) ofA satisfies
\[
A * v(\mathcal{J})=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * v(\mathcal{J})
\]
w here lam boda ( 7 ) is its eigenvalue.
The lefteigenvectoru (7) ofA satisfies
where \(u(\mathcal{j}) * * H\) denotes the conjugate transpose of \(u(\mathcal{j})\).
The com puted eigenvectors are norm alized to have Euclidean norm equalto 1 and largest com ponent real.

B alancing a \(m\) atrix \(m\) eans perm uting the row sand colum ns to m ake itm ore nearly upper triangular, and applying a diagonalsim ilarity transform ation \(D\) * \(A\) * \(D * *(-1)\), where \(D\) is a diagonalm atrix, to \(m\) ake its row \(s\) and colum ns closer in norm and the condition num bers of its eigenvalues and eigenvectors sm aller. The com puted reciprocalcondition num bers comespond to the balanced matrix. Perm uting row s and columns will not change the condition num bers (in exact arithm etic) butdiagonal scaling w ill. For further explanation of balancing, see section 4.102 of the LA PA CK U sers' G uide.

\section*{ARGUMENTS}

BALANC (input)
Indicates how the inputm atrix should be diagonally scaled and/orperm uted to im prove the conditioning of its eigenvalues. \(=\mathrm{N}\) ': D o not diagonally scale orperm ute;
\(=\mathrm{P}\) ': Perform permutations to m ake the m atrix m ore nearly upper triangular. D o notdiagonally scale; = S :: D iagonally scale the matrix, ie. replace \(A\) by \(D * A * D * *(-1)\), where \(D\) is a diagonal \(m\) atrix chosen to \(m\) ake the row \(s\) and colum ns of \(A\) m ore equal in norm .D o notperm ute; \(=\mathrm{B}\) ':Both diagonally scale and perm ute A.

C om puted reciprocalcondition num bers willbe for the \(m\) atrix afterbalancing and/orperm uting. Per\(m\) uting does not change condition num bers (in exact arithm etic), butbalancing does.

JOBVL (input)
\(=\mathrm{N}\) ': lefteigenvectors of A are notcom puted;
= V': lefteigenvectors of A are computed. If
SEN SE = E 'or B', JO BV L m ust= V'.
JO BVR (input)
\(=\mathrm{N}\) ': righteigenvectors of A are not com puted;
\(=\mathrm{V}\) ': righteigenvectors of A are com puted. If
SEN SE = E 'or B', JOBVR m ust= V'.

D eterm ines which reciprocal condition num bers are com puted. = N ':N one are com puted;
\(=\mathrm{E}\) : \(: \mathrm{C}\) om puted foreigenvalues only;
\(=\mathrm{V}\) : C om puted for righteigenvectors only;
= B ': C om puted foreigenvalues and right eigenvectors.

If SEN SE = E 'or B ', both leftand right eigenvectors must also be computed ( \(\mathrm{JOBVL}=\mathrm{V}\) 'and JobVR \(=V\) ) .

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the N -by -N m atrix A. On exit, A has been overw ritten. If JO BVL \(=\mathrm{V}\) 'orJOBVR \(=\mathrm{V}\) ', \(A\) contains the Schur form of the balanced version of the m atrix A.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

W (output)
W contains the com puted eigenvalues.

\section*{VL (output)}

If \(\operatorname{JOBVL}=\mathrm{V}\) ', the left eigenvectors \(\mathrm{u}(\mathrm{y})\) are stored one afteranother in the colum ns of V L, in the sam e order as their eigenvalues. If \(J 0 \mathrm{BVL}=\) \(N^{\prime}, \mathrm{VL}\) is not referenced. \(\mathrm{u}(\mathcal{j})=\mathrm{VL}(:, r)\), the \(j\) th © Clumn of VL.

LDVL (input)
The leading dim ension of the array V L. LD V L >=1; if \(\mathrm{JOBVL}=\mathrm{V}\) ', LDVL \(>=\mathrm{N}\) 。

VR (input)
If \(\mathrm{JOBVR}=\mathrm{V}\) ', the right eigenvectors \(\mathrm{v}(\mathrm{I})\) are stored one after another in the colum ns of VR, in the sam e order as theireigenvalues. If \(J O B V R=\) \(N^{\prime}, \operatorname{VR}\) is notreferenced. \(\left.\operatorname{V(~}\right)=\operatorname{VR}(:, 7)\), the \(j\) th colum n ofVR.

LDVR (input)
The leading dim ension of the array \(V R . L D V R>=1\); if \(J 0 B V R=V ', L D V R>=N\).

ㅍㅇ (output)

ㅍO and \(\mathbb{H}\) I are integervalues determ ined when \(A\) \(w\) as balanced. The balanced \(A(i, 7)=0\) if \(I>J\) and \(J=1, \ldots, I L O-1\) or \(I=\mathbb{H} I+1, \ldots, N\).

IH I (output)
HO and \(\mathbb{H}\) I are integervalues determ ined when \(A\) \(w\) as balanced. The balanced \(A(i, 7)=0\) if I> J and \(J=1, \ldots, I L O-1\) or \(I=\mathbb{H} I+1, \ldots, N\).

SCALE (output)
D etails of the perm utations and scaling factors applied w hen balancing \(A\). IfP ( 7 ) is the index of the row and column interchanged w ith row and colum \(n j\), and \(D(j)\) is the scaling factorapplied to row and column \(j\) then SCALE \((J)=P(J)\), for \(J=1, \ldots\), IIO \(-1=D(J)\), for \(J=\mathbb{L O}, \ldots, \mathbb{H} I=\) \(P(J) \quad\) for \(J=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} I+1\), then 1 to 핑․

\section*{ABNRM (output)}

The one-norm of the balanced \(m\) atrix the \(m\) axim um of the sum of absolute values of elem ents of any colum n).

RCONE (output)
RCONE ( \()\) ) is the reciprocalcondition num ber of the \(j\) th eigenvalue.

RCONV (output)
RCONV ( \(j\) ) is the reciprocalcondition num ber of the \(j\) th righteigenvector.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK ( 1 ) retums the optim al LDW ORK.

LDW ORK (output)
The dim ension of the array \(W\) ORK. IfSENSE \(=N^{\prime}\) or E', LDW ORK \(>=\mathrm{max}\left(1,2 \star^{*} \mathrm{~N}\right)\), and ifSENSE \(=\mathrm{V}^{\prime}\) or \(B\) ', LD W ORK \(>=N * N+2 * N\). Forgood perform ance, LDW ORK m ust generally be larger.

IfLDW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension (2*N)
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue.
\(>0:\) if \(\mathbb{N F O}=\) i, the Q R algorithm failed to com pute all the eigenvalues, and no eigenvectors or condition num bers have been com puted; elem ents 1: IHO-1 and i+1 N ofW contain eigenvalues which have converged.

\section*{C INTERFACE}
\#include <sunperfh>
void zgegs (char jobvsl, char jंbvsr, int n, doublecom plex
*a, int lda, doublecom plex *b, int ldb, doublecom -
plex *alpha, doublecom plex *beta, doublecom plex
*Vsl, int ldvsl, doublecom plex *vsr, int ldvsr, int*info);
void zgegs_64 (char jobvssl, char jobvssr, long n, doublecom plex *a, long lda, doublecom plex *b, long ldb, doublecom plex *alpha, doublecom plex *beta, doublecom plex *Vsl, long ldvsl, doublecom plex *Vsr, long ldvsr, long *info);

\section*{PURPOSE}
zgegs routine is deprecated and has been replaced by routine CGGES.

CGEGS com putes fora pair of N łoy-N com plex nonsymm etric \(m\) atrices A, B : the generalized eigenvalues (alpha, beta), the com plex Schur form (A,B), and optionally left and/or rightSchurvectors ( V SL and V SR).
(Ifonly the generalized eigenvalues are needed, use the driverCGEGV instead.)

A generalized eigenvalue for a pair of \(m\) atrices ( \(A, B\) ) is, roughly speaking, a scalar \(w\) ora ratio alpha/beta \(=\mathrm{w}\), such that A -w *B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta \(=0\), and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G.Golub \& C . van Loan (Johns H opkins U .Press)

The (generalized) Schur form of a pair of \(m\) atrices is the result ofm ultiplying both \(m\) atrices on the leftby one unitary \(m\) atrix and both on the rightby anotherunitary matrix,
these tw o unitary \(m\) atrices being chosen so as to bring the pair ofm atrioes into upper triangular form w ith the diagonal elem ents ofB being non-negative realnum bers this is also called com plex Schur form .)

The left and rightSchurvectors are the colum ns ofV SL and VSR, respectively, where VSL and VSR are the unitary \(m\) atrices
which reduce A and B to Schur form :

Schurform of \((A, B)=(N S L) \star * H A(N S R),(N S L) * * H B(N S R))\)

\section*{ARGUMENTS}

JO BV SL (input)
\(=N^{\prime}:\) do notcom pute the left:Schurvectors;
\(=\mathrm{V}\) ': com pute the leftSchur vectors.
\(J 0 B V S R\) (input)
\(=N\) : do notcom pute the rightSchurvectors;
\(=\mathrm{V}\) ': com pute the rightSchurvectors.
N (input) The order of the m atrices \(\mathrm{A}, \mathrm{B}, \mathrm{VSL}\), and VSR. N \(>=0\).

A (input/output)
O \(n\) entry, the first of the pairofm atrices w hose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the generalized Schur form of A.

LD A (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).
B (input/output)
O \(n\) entry, the second of the pair of \(m\) atrices \(w\) hose generalized eigenvalues and (optionally) Schur vectors are to be com puted. On exit, the generalized Schur form ofB.

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

\section*{ALPHA (output)}

On exit, ALPHA ( \(\mathcal{)}\) ) BETA ( \(\mathcal{J}\), \(\mathcal{=} 1, \ldots, N\), w illbe the generalized eigenvalues. A LPHA ( \(\mathcal{\rho}, \dot{于} 1, \ldots, N\) and BETA ( \(\mathcal{i}, \dot{于} 1, \ldots, N\) are the diagonals of the com plex Schur form ( \(A, B\) ) output by CGEGS. The

BETA ( \()\) w illlbe non-negative real.

N ote: the quotients A LPHA ( \(\mathcal{7}\) ) \(B\) ETA ( \()\) may easily over- orunderflow, and BETA ( \()\) m ay even be zero. Thus, the user should avoid naively com puting the ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable \(w\) th norm (B).

\section*{BETA (output)}

See the description of A LPH A .
VSL (input)
If 0 OVVSL = V',VSL willcontain the left Schur vectors. (See "Puppose", above.) N ot referenced if \(J 0 \mathrm{BV}\) SL \(=\mathrm{N}\) '.

LD V SL (input)
The leading dim ension of the \(m\) atrix V SL. LD V SL >= 1 , and if JO BV SL \(=\mathrm{V}\) ', LD V SL \(>=\mathrm{N}\).

VSR (input)
If \(J 0\) BV SR \(=V\) ', VSR willcontain the right Schur vectors. (See "Purpose", above.) N ot referenced if \(J 0 \mathrm{BV}\) SR = \(\mathrm{N}^{\prime}\).

LD VSR (input)
The leading dim ension of the \(m\) atrix \(V\) SR .LD V SR >= 1 , and if \(J O B V S R=V\) ', LD VSR \(>=N\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the aray \(W\) ORK. LDW ORK >= \(\max (1,2 \star \mathrm{~N})\). For good perform ance, LDW ORK must generally be larger. To com pute the optim alvahue of LDW ORK, call ILAENV to getblocksizes (for CGEQRF, CUNM QR, and CUNGQR.) Then com pute: NB as the MAX of the blocksizes forCGEQRF, CUNM \(Q R\), and CUNGQR; the optim allDW ORK is \(N\) * \(N B+1\) ).

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA .
dim ension ( \(3 * N\) )
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue.
\(=1, \ldots, N\) : The Q Z teration failed. (A , B ) are not in Schur form, butA LPHA ( 1 ) andBETA ( 1 ) should be correct for \(\mathcal{F} \mathbb{N} F O+1, \ldots, N .>N\) : errors that usually indicate LA PA C K problem s:
\(=\mathrm{N}+1\) : error retum from CGGBAL
\(=\mathrm{N}+2\) : error retum from \(C\) G EQRF
\(=\mathrm{N}+3\) : error retum from \(C U N M Q R\)
\(=\mathrm{N}+4\) : error retum from CUNGQR
\(=\mathrm{N}+5\) : error retum from CGGHRD
\(=\mathrm{N}+6\) : emor retum from CHGEQZ (otherthan failed
iteration) \(=\mathrm{N}+7\) : emor retum from CGGBAK (com put-
ing V SL )
\(=\mathrm{N}+8\) : error retum from CGGBAK (com puting VSR)

\section*{PURPOSE}
zgegv routine is deprecated and has been replaced by routine CGGEV .

CGEGV com putes for a pair of N boy- N com plex nonsym m etric \(m\) atrices A and B, the generalized eigenvalues (alpha, beta), and optionally, the left and/or right generalized eigenvectors (VL and VR).

A generalized eigenvahe for pair of \(m\) atriges \((A, B)\) is, roughly speaking, a scalar w or a ratio alpha/beta \(=\mathrm{w}\), such that \(A-w * B\) is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation forbeta=0, and even forboth being zero. A good beginning reference is the book, "M atrix C om putations", by G.G olub \& C .van Loan (Johns H opkins U .P ress)

A rightgeneralized eigenvector corresponding to a generalized eigenvalue \(w\) for pair ofm atriges ( \(A, B\) ) is a vector \(r\) such that \((A-w B) r=0\). A left generalized eigenvector is a vector lsuch that \(l^{* *} H *(A-w B)=0\), where l**H is the conjugate-transpose ofl.

N ote: this routine perform s "fullbalancing" on A and B. See "FurtherD etails", below .

\section*{ARGUMENTS}

JO BVL (input)
\(=\mathrm{N}\) ': do notcom pute the leftgeneralized eigenvectors;
\(=V^{\prime}\) : com pute the left generalized eigenvectors.

JO BVR (input)
\(=\mathrm{N}\) ': do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvectors.
N (input) The order of the m atrioes \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and VR. \(\mathrm{N}>=\) 0.

A (input/output)
O n entry, the first of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents will have been destroyed. Fora description of the contents of A on exit, see "FurtherD etails", below .)

LD A (input)
The leading dim ension ofA. LD \(A>=\max (1, N)\).

B (input/output)
O n entry, the second of the pair ofm atrices w hose generalized eigenvalues and (optionally) generalized eigenvectors are to be com puted. On exit, the contents will have been destroyed. Fora description of the contents of \(B\) on exit, see "FurtherD etails", below .)

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

ALPHA (output)
On exit, A LPHA ( 7 ) \(N L(\mathcal{7}), \dot{F} 1, \ldots, N\), will be the generalized eigenvahues.

N ote: the quotients ALPHA (J) NL (J) m ay easily over or underflow, and VL ( 7 ) \(m\) ay even be zero. Thus, the user should avoid naively com puting the
ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w th norm (A) in m agnitude, and VL alw ays less than and usually com parable \(w\) th norm (B).

BETA (output)
If \(\mathrm{JO} \mathrm{BVL}=\mathrm{V}\) ', the left generalized eigenvectors.
(See "Purpose", above.) Each eigenvectorw ill.be scaled so the largest com ponentw ill have abs (real part) + abs(mag. part) \(=1\), *exœept \({ }^{\star}\) that for eigenvalues \(w\) th alpha=beta=0, a zero vector \(w i l l\) be retumed as the corresponding eigenvector. N ot referenced if \(\mathrm{JOBVL}=\mathrm{N}^{\prime}\).
VL (output)
If \(\mathrm{JOBVL}=\mathrm{V}\) ', the left generalized eigenvectors.
(See "Pupose", above.) Each eigenvectorw ill.be scaled so the largest com ponentw ill have abs (real
part) \(+\mathrm{abs}(\) ( m ag. part) \(=1\), *exœept* that for eigenvalues w ith alpha=beta=0, a zero vector w ill be retumed as the comesponding eigenvector. N ot referenced if \(\mathrm{JO} \mathrm{BVL}=\mathrm{N}\) '.

LDVL (input)
The leading dim ension of the \(m\) atrix \(V \mathrm{~L} . \mathrm{LD} V \mathrm{~L}>=1\), and if \(\mathrm{JOBVL}=\mathrm{V}\) ', LDVL >=N.

\section*{VR (output)}

If \(\mathrm{JOBVR}=\mathrm{V}\) ', the right generalized eigenvectors. (See "Pupose", above.) Each eigenvector w illbe scaled so the largest com ponentw ill have abs(real part) +abs (im ag. part) \(=1\),*except* that foreigenvalues w th alph \(a=\) beta \(=0\), a zero vector \(w\) ill be retumed as the corresponding eigenvector. N ot referenced if \(\mathrm{JO} B V R=\mathrm{N}^{\prime}\).

LDVR (input)
The leading dim ension of the \(m\) atrix \(V R\).LD \(V R>=1\), and if \(J O B V R=V\) ', LDVR \(>=N\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the amray W ORK. LDW ORK >= \(\mathrm{max}(1,2 \star \mathrm{~N})\). For good perform ance, LDW ORK must generally be larger. To com pute the optim alvalue of LDW ORK, call IIA ENV to getblocksizes (for CGEQRF, CUNM QR, and CUNGQR.) Then com pute: NB as the MAX of the blocksizes forCGEQRF, CUNM \(Q R\), and

CUNGQR; The optim alldW ORK is MAX \((2 * N, N * \mathbb{N}+1)\)
).
IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
W ORK 2 (w orkspace)
dim ension ( \(8 * \mathrm{~N}\) )
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

Balancing

This driver calls C G G B A L to both perm ute and scale row s and colum ns of \(A\) and \(B\). The perm utationsPL and PR are chosen so that \(\mathrm{PL} * \mathrm{~A} * P R\) and \(P L * B * R\) w illlbe upper triangular except for the diagonal blocksA ( \(i: j i: j\) ) and \(B(i: j i: j\), w ith \(i\) and jas close together as possible. The diagonal scaling \(m\) atrices \(D L\) and \(D R\) are chosen so that the pair DL*PL*A*PR*DR,DL*PL*B*PR*DR have elem ents close to one (except for the elem ents that start out zero .)

A fter the eigenvalues and eigenvectors of the balanced \(m\) atrices have been com puted, C G G B A K transform s the eigenvectors back to \(w\) hat they w ould have been (in perfect arithm etic) if they had notbeen balanced.

Contents of \(A\) and \(B\) on Exit

If any eigenvectors are com puted (either \(J 0 B V L=V\) ' or JO \(B V R=V\) ' or both), then on exit the arrays \(A\) and \(B\) will contain the com plex Schur form [*] of the "balanced" versions of \(A\) and \(B\). If no eigenvectors are com puted, then only the diagonalblocksw illbe conect.
[ \(\star\) ] In otherw ords, uppertriangular form .

void zgehrd_64 (long n, long ilo, long ihi, doublecom plex *a, long lda, doublecom plex *tau, long *info);

\section*{PURPOSE}
zgehrd reduces a com plex generalm atrix A to upper \(H\) essenberg form \(H\) by a unitary sim ilarity transform ation: \(Q^{\prime *} A\) * \(\mathrm{Q}=\mathrm{H}\).

\section*{ARGUMENTS}

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).
ㅍO (input)
It is assum ed that A is already upper triangular in row s and colum ns \(1: \mathbb{I L O - 1}\) and \(\mathbb{H} \mathrm{I}+1 \mathrm{~N} . \mathbb{W}\) and IH I are norm ally setby a previous call to C G EBA L; otherw ise they should be set to 1 and \(N\) respectively. See FurtherD etails.

IH I (input)
See the description of IIO .
A (input/output)
O \(n\) entry, the N -by -N generalm atrix to be reduced.
O n exit, the upper triangle and the firstsubdiagonalofA are overw ritten \(w\) ith the upper H essenberg \(m\) atrix \(H\), and the elem ents below the first subdiagonal, w ith the array TAU, represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

TAU (output)
The scalar factors of the elem entary reflectors (see Further Details). Elem ents 1:IWO-1 and IH IN -1 of TAU are setto zero.

W ORK \(\mathbb{N}\) (w orkspace)

On exit, if \(\mathbb{N F O}=0, W O R K \mathbb{N}\) (1) retums the optim allW ORK \(\mathbb{N}\).

LW ORK \(\mathbb{N}\) (input)
The length of the array \(W O R K \mathbb{N}\). LW ORK \(\mathbb{N}>=\) \(\max (1, \mathbb{N})\). For optim um perform ance LW ORK \(\mathbb{N}>=\) N *N B , w here N B is the optim alblocksize.

If LW ORK \(\mathbb{N}=-1\), then a workspace query is assum ed; the routine only calculates the optim al size of the \(W\) ORK \(\mathbb{N}\) array, retums this value as the firstentry of the \(W\) ORK \(\mathbb{N}\) array, and no error \(m\) essage related to LW ORK \(\mathbb{N}\) is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the i-th argum enthad an illegalvahue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a productof (hi-ib) ele\(m\) entary reflectors

Each H (i) has the form
\[
\mathrm{H}(\mathrm{i})=\mathrm{I}-\tan * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
\]
\(w\) here tau is a com plex scalar, and \(v\) is a com plex vector w ith \(\mathrm{v}(1: i)=0, \mathrm{v}(i+1)=1\) and \(v(i h i+1 \mathrm{~m})=0 ; \mathrm{v}(i+2\) : ihi \()\) is stored on exitin A (i+2:ihi,i), and tau in TAU (i).

The contents ofA are illustrated by the follow ing exam ple, w ith \(\mathrm{n}=7\), \(\mathrm{il}=2\) and ihi \(=6\) :
```

on entry, on ex斗,

```
(a a a a a a a) (a a h h h h a) ( a a a a a a) ( a h h h \(h a)(a \operatorname{a} a \operatorname{a} a)(\mathrm{h} h \mathrm{~h}\) h h h ) ( a a a a a a) ( v2 h h h h h) ( a a a a a a) ( v2 v3 h h h h ) ( a a a a a a) ( v2 v3 v4 h h h ) (a) ( a)
where a denotes an elem ent of the original \(m\) atrix \(A, h\) denotes a \(m\) odified elem ent of the upper \(H\) essenberg \(m\) atrix \(H\), and videnotes an elem ent of the vector defining \(H\) (i).

void zgels (char, int, int, int, doublecom plex*, int, doublecom plex*, int, int*);
void zgels_64 (char, long, long, long, doublecom plex*, long, doublecom plex*, long, long*);

\section*{PURPOSE}
zgels solves overdeterm ined or underdeterm ined complex linear system \(s\) involving an \(M\) boy \(N \mathrm{~N}\) atrix \(A\), or its conjugate-transpose, using a QR orLQ factorization of A. It is assum ed thatA has full rank.

The follow ing options are provided:
1. If TRA \(\mathrm{N} S=\mathrm{N}\) 'and \(\mathrm{m}>=\mathrm{n}\) : find the least squares solution of
an overdeterm ined system, ie., solve the least squares problem
\[
\mathrm{m} \text { inim ize }\|\mathrm{B}-\mathrm{A} * \mathrm{X}\| .
\]
2. If TRA \(N S=N\) 'and \(m<n\) : find the \(m\) inim um norm solution of an underdeterm ined system \(A * X=B\).
3. If TRAN \(S=C\) 'and \(m>=n\) : find them inim um norm solution of
an undeterm ined system \(A * * H * X=B\).
4. IfTRAN \(S=C\) 'and \(m<n\) : find the least squares solution of
an overdeterm ined system, i.e., solve the least squares problem
\[
\mathrm{m} \text { inim ize }\|\mathrm{B}-\mathrm{A} * * \mathrm{H} * \mathrm{X}\| .
\]

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-NRHS righthand side m atrix B and the N boy-NRHS solution \(m\) atrix X .

\section*{ARGUMENTS}

TRANSA (input)
\(=\mathrm{N}\) : the linearsystem involves A;
\(=C\) ': the linear system involves \(A * * H\).

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input) The num ber of row s of the matrix A. M >=0.

N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X .NRH S >=0.
A (input/output)
On entry, the M boy-N m atrix A. ifM \(>=N, A\) is overw ritten by details of its \(Q R\) factorization as retumed by CGEQRF; ifM < N, A is overw ritten by details of its LQ factorization as retumed by CGELQF.

LDA (input)
The leading dim ension of the anay A. LDA >= \(\max (1, M)\).

B (input/output)
O n entry, the m atrix B of righthand side vectors,
stored colum nw ise; B is M byy-NRHS ifTRANSA = N',
orN byy-NRHS ifTRANSA = C'. On exit, B is
overw rilten by the solution vectors, stored colum nw ise: ifTRANSA \(=N\) 'and \(m>=n\), row 1 to n ofB contain the least squares solution vectors; the residual.sum ofsquares for the solution in each colum \(n\) is given by the sum of squares of ele\(m\) ents \(N+1\) to \(M\) in thatcolum \(n\); ifTRA \(N S A=N\) 'and \(m<n\), row \(s 1\) to \(N\) ofB contain them inim um norm solution vectors; ifTRANSA \(=C\) 'and \(m>=n\), row \(s\) 1 to M ofB contain them inim um norm solution vectors; ifTRANSA \(=C\) 'and \(m<n\), row 1 to \(M\) of \(B\) contain the least squares solution vectors; the residualsum of squares for the solution in each colum \(n\) is given by the sum of squares of elem ents \(M+1\) to \(N\) in that colum \(n\).

LD B (input)
The leading dim ension of the amay \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) M AX ( \(1, \mathrm{M}, N\) ) 。

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (output)
The dim ension of the amay W ORK. LDW ORK >= \(\max (\)
1, \(\mathrm{M} N+\max (\mathrm{M} N, \mathrm{NRHS})\) ). Foroptim alperfor
\(m\) ance, LDW ORK \(>=\max (1, M N+\max (M N, N R H S) * N B\)
). where \(M N=m\) in \(M N\) ) and \(N B\) is the optim um
block size.

IfLD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LD W ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an ille-
galvalue

\#include <sunperfh>
void zgelsd (intm, intn, intnrhs, doublecom plex *a, int lda, doublecom plex *b, int ldb, double *s, double roond, int *rank, int*info);
void zgelsd_64 (long m , long n, long nrhs, doublecom plex *a, long lda, doublecom plex *b, long ldb, double *s, double rcond, long *rank, long *info);

\section*{PURPOSE}
zgelsd com putes the m inim um -norm solution to a real linear least squares problem :
\(m\) inim ize 2 -norm (|, \(\mathrm{b}-\mathrm{A}\) * \(\mathrm{x} \mid\) )
using the singularvalue decom position (SVD ) ofA.A is an M -by-N m atrix which m ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-NRHS righthand side m atrix B and the N by-NRH S solution \(m\) atrix \(X\).

The problem is solved in three steps:
(1) Reduce the coefficientm atrix A to bidiagonal form \(w\) ith H ouseholder tranform ations, reducing the original problem
into a "bidiagonal least squares problem " (BLS)
(2) Solve the BLS using a divide and conquer approach.
(3) A pply back all the H ouseholder tranform ations to solve the original least squares problem .

The effective rank of A is determ ined by treating as zero those singular values which are less than RCOND tim es the largest singularvalue.

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray \(X-M P, C\) ray \(Y-M P, C\) ray \(C-90\), or C ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

\section*{ARGUMENTS}

M (input) The num ber of row sof the \(m\) atrix \(A . M>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRH S (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the \(m\) atrices \(B\) and X.NRHS \(>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, A has been destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the M-by-NRHS righthand sidem atrix B . On exit, B is overw ritten by the N -by-NRH S solution \(m\) atrix \(X\). If \(m>=n\) and RANK \(=n\), the residual sum -of-squares for the solution in the \(i\)-th colum \(n\) is given by the sum of squares of elem ents \(\mathrm{n}+1 \mathrm{~m}\) in thatcolumn.

LD B (input)
The leading dim ension of the amay \(B\). LD B >= \(\max (1, M, N)\).

S (output)
The singular values ofA in decreasing order. The condition number of \(A\) in the 2 -norm \(=\) \(S(1) / S(m\) in \((m, n))\).

RCOND (input)
RCOND is used to determ ine the effective rank of
A. Singularvalues \(S(i)<=\) RCOND *S ( 1 ) are treated as zero. IfRCOND \(<0, m\) achine precision is used instead.

RANK (output)
The effective rank of A, ie., the num ber of singular values w hich are greater than RCOND *S (1).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the anray \(W\) ORK. LW ORK \(>=1\). The exact \(m\) inim um am ount of \(w\) orkspace needed depends on \(\mathrm{M}, \mathrm{N}\) andNRHS. IfM >= N , LW ORK >= 2*N + \(N * N R H S\). If \(M<N\), LW ORK \(>=2 * M+M * N R H S\). For good penform ance, LW ORK should generally be larger.

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
IfM \(>=\mathrm{N}\), LRW ORK \(>=8{ }^{*} \mathrm{~N}+2{ }^{\star} \mathrm{N} *\) SM LSIZ \(+8{ }^{*} \mathrm{~N} * \mathrm{NLVL}+\) \(\mathrm{N} * \mathrm{~N}\) RHS. If \(\mathrm{M}<\mathrm{N}, \mathrm{LRW}\) ORK \(>=8 * \mathrm{M}+2 * \mathrm{M} *\) SM LSZ + \(8 * M * N L V L+M * N R H S . S M L S Z\) is retumed by HAENV and is equal to the \(m\) axim um size of the subproblem sat the bottom of the com putation tree (usually about 25), and NLVL= \(\mathbb{N} T\left(L O G \_2(M \mathbb{N}(M, N\right.\)
)/(SM LSTZ+1)) ) + 1
IV ORK (w orkspace)
LIV ORK >= \(3 * M \mathbb{N} M N * N L V L+11 * M \mathbb{N} M N\), where \(M \mathbb{N} M N=M \mathbb{N}(M, N)\).
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an illegalvalue.
>0: the algorithm forcom puting the SVD failed
to converge; if \(\mathbb{N} F O=\) i, ioff-diagonalelem ents of an interm ediate bidiagonal form did not converge to zero.

\section*{C INTERFACE}
\#include <sunperfh>
void zgelss (intm, intn, intnrhs, doublecom plex *a, int lda, doublecom plex *b, int ldb, double *sing, double roond, int *irank, int *info);
void zgelss_64 (long m, long n, long nrhs, doublecom plex *a, long lda, doublecom plex *b, long ldb, double *sing, double rcond, long *irank, long *info);

\section*{PURPOSE}
zgelss com putes the \(m\) inim um norm solution to a complex linear least squares problem :
\(M\) inin ize 2 -norm (|b-A *x \()\).
using the singularvalue decom position (SVD) ofA.A is an M -by-N m atrix which m ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-NRH S righthand sidem atrix \(B\) and the \(N\) by-NRH S solution \(m\) atrix \(X\).

The effective rank ofA is determ ined by treating as zero those singular values which are less than RCOND tim es the largest singularvalue.

\section*{ARGUMENTS}

M (input) The num ber of row sof the \(m\) atrix \(A . M>=0\).
\(N\) (input) The num ber of collm ns of the m atrix \(A . N>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the \(m\) atrioes \(B\) and \(X\).NRH \(S>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, the first \(m\) in \((m, n)\) row \(s\) of A are overw ritten \(w\) ith its right singularvectors, stored row w ise.

LD A (input)
The leading dim ension of the array A. LDA >= \(m a x(1, M)\).

B (input/output)
On entry, the M -by NRHS righthand side m atrix B .
On exit, B is overw ritten by the \(N\) by \(-\mathrm{NRH} S\) solution \(m\) atrix \(X\). Ifm \(>=n\) and \(\mathbb{R A N K}=n\), the residual sum -of-squares for the solution in the i-th colum \(n\) is given by the sum of squares of ele\(m\) ents \(n+1 m\) in that \(c o l u m n\).

LD B (input)
The leading dim ension of the anay \(B\). LD B >= \(\max (1, M, N)\).

\section*{SNN (output)}

The singularvalues ofA in decreasing order. The condition number of \(A\) in the 2 -norm \(=\) \(S \mathbb{N} G(1) / S \mathbb{N} G(m\) in \((m, n))\).

RCOND (input)
RCOND is used to determ ine the effective rank of
A. Singular values SING (i) <= RCOND *SING (1) are treated as zero. IfRCOND \(<0, \mathrm{~m}\) achine precision is used instead.

RANK (output)
The effective rank of A, i.e., the num ber of singular values which are greater than RCOND *SING (1).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the amray \(W\) ORK. LDW ORK \(>=1\), and also: LDW ORK \(>=2 \star_{m}\) in \(\left.(M, N)+m a x M, N, N R H S\right)\) For good perform ance, LDW ORK should generally be larger.

If LDW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK anay, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension \(\left(5{ }^{*} \mathrm{~m}\right.\) in \(\left.\mathrm{M}, \mathrm{N}\right)\) )
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
< 0: if \(\mathbb{N N}\) FO = -i, the i-th argum ent had an illegalvalue.
> 0: the algorithm forcom puting the SVD failed to converge; if \(\mathbb{N} F O=\) i, ioff-diagonalelem ents of an interm ediate bidiagonal form did not converge to zero.

\#include <sunperfh>
void zgelsx (intm, intn, intnrhs, doublecom plex *a, int lda, doublecom plex *b, int ldb, int * jipivot, double roond, int *irank, int *info);
void zgelsx_64 (long m, long n, long nrhs, doublecom plex *a, long lda, doublecom plex *b, long ldb, long * jipivot, double rcond, long *irank, long *info);

\section*{PURPOSE}
zgelsx routine is deprecated and has been replaced by routine CGELSY .

CGELSX computes the \(m\) inim um-norm solution to a complex linear least squares problem :
\(m\) inim ize \(\|A * X-B\|\)
using a com plete orthogonal factorization of A. A is an \(M-\) by-N m atrix w hich \(m\) ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M -by-NRH S righthand side m atrix B and the N boy-NRHS solution m atrix X .

The routine firstcom putes a QR factorization with colum \(n\) pivoting:
\(A * P=Q *[R 11 R 12]\)
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix whose estim ated condition num ber is less than \(1 \notin\) COND. The order ofR 11, RANK, is the effective rank ofA.

Then, R 22 is considered to be negligible, and R 12 is annihilated by unitary transform ations from the right, arriving at the com plete orthogonal factorization:
\(A * P=Q *[T 110] * Z\)
[ 0 0]
Them inim um norm solution is then
\(\mathrm{X}=\mathrm{P} * \mathrm{Z}\) ' [inv (T11)*Q 1 *B ]
[ 0 ]
where Q 1 consists of the firstRANK colum ns of Q .

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, ie., the num ber of collm ns ofm atrices B and X.NRHS \(>=0\).

A (input/output)
On entry, the \(M\)-by -N matrix A. On exit, A has been overw rilten by details of its complete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,M).

B (input/output)
On entry, the M-by-NRHS righthand sidem atrix B . On exit, the N -by-N RH S solution \(m\) atrix X . Ifm >= n and \(\mathbb{R} A N K=n\), the residual sum-of-squares for the solution in the \(i\)-th colum \(n\) is given by the sum of squares of elem ents \(N+1 \mathrm{M}\) in thatcolum \(n\).

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, M, N)\).

JPIVOT (input/output)
On entry, if \(\mathbb{P} \mathbb{I V O T}\) (i) ne.0, the i-th column of \(A\) is an initial colum \(n\), otherw ise it is a free colum \(n\). Before the \(Q R\) factorization of \(A\), all initial colum ns are perm uted to the leading positions; only the rem aining free colum ns are m oved as a resultof colum \(n\) pivoting during the factorization. On exit, if \(\mathbb{P} \operatorname{IVOT}(i)=k\), then the \(i\)-th colum \(n\) of A *P was the \(k\)-th collm \(n\) of A.

RCOND (input)

RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest leading triangular subm atrix R 11 in the \(Q\) R factorization w ith pivoting ofA , whose estim ated condition num ber \(<1\) RCOND.

RANK (output)
The effective rank of A, i.e., the order of the subm atrix R11. This is the sam e as the orderof the subm atrix T11 in the com plete orthogonal factorization of A.
W ORK (w orkspace)
\((m\) in \(M, N)+\max \left(N, 2 \star_{m}\right.\) in \(\left.\left.(M, N)+N R H S\right)\right)\),

W ORK 2 (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum enthad an ille-
galvalue

\section*{C INTERFACE}
\#include < sunperfh>
void zgelsy (intm, intn, intnrhs, doublecom plex *a, int lda, doublecom plex *b, int ldb, int * pivt, double rcond, int *rank, int *info);
void zgelsy_64 (long m, long n, long nihs, doublecom plex *a, long lda, doublecom plex *b, long ldb, long * jpvt, double rcond, long *rank, long *info);

\section*{PURPOSE}
zgelsy com putes the m inim um-norm solution to a com plex linear least squares problem :
\(m\) inim ize \(\|A * X-B\|\)
using a com plete orthogonal factorization of . A is an \(M\) -by-N \(m\) atrix \(w\) hich \(m\) ay be rank-deficient.

Several righthand side vectors b and solution vectors x can be handled in a single call; they are stored as the colum ns of the M by \(-N\) RH S righthand side \(m\) atrix \(B\) and the \(N\) by-NRHS solution \(m\) atrix \(X\).

The routine firstcom putes \(a Q R\) factorization \(w\) th \(c o l u m n\) pivoting:

A * \(\mathrm{P}=\mathrm{Q}\) * [R11R12]
[ 0 R22]
w ith R 11 defined as the largest leading subm atrix whose estim ated condition num ber is less than 1 RCOND. The order ofR11,RANK, is the effective rank ofA.

Then, R22 is considered to be negligible, and R 12 is annihilated by unitary transform ations from the right, amiving at the com plete orthogonal factorization:
\[
A * P=Q *[T 110] * Z
\]

Them inim um norm solution is then
\(\mathrm{X}=\mathrm{P}\) * Z ' [ inv (T11)*Q 1 *B ]
[ 0 ]
where Q 1 consists of the firstRANK colum ns of \(Q\).
This routine is basically identical to the original xG ELSX except three differences:
- The perm utation ofm atrix \(B\) (the right hand side) is faster and
m ore sim ple.
o The call to the subroutine \(x G E Q P F\) has been substituted by the
the call to the subroutine \(x G E Q P 3\). This subroutine is a B las-3
version of the \(Q R\) factorization \(w\) th colum \(n\) pivoting. \(O M\) atrix \(B\) (the righthand side) is updated \(w\) ith \(B\) las-3.

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of collm ns of the \(m\) atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRH S (input)
The num ber of righthand sides, ie., the num ber of colum ns ofm atrices \(B\) and \(X . N R H S>=0\).

A (input/output)
On entry, the M by -N matrix A. On exit, A has been overw ritten by details of its com plete orthogonal factorization.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathrm{M})\).

B (input/output)
On entry, the M -by - N RH S righthand side m atrix B . On exit, the \(N\)-by N RH S solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B . L D B>=\) \(\max (1, M, N)\).

JPVT (input/output)
On entry, if JPV T (i) ne. 0, the i-th collm n of A is perm uted to the frontofA \(P\), otherw ise colum n i is a free colum \(n\). On exit, if JPV \(T(i)=k\), then
the i-th column of A *P w as the \(k\)-th colum \(n\) of A.

\section*{RCOND (input)}

RCOND is used to determ ine the effective rank of A, which is defined as the order of the largest leading triangular subm atrix R 11 in the \(Q R\) factorization \(w\) th pivoting ofA , whose estim ated condition num ber \(<1\) RCOND.

\section*{RANK (output)}

The effective rank ofA, ie., the order of the subm atrix R11. This is the sam e as the orderof the subm atrix T11 in the complete orthogonal factorization of A.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. The unblocked strategy requires that: LW ORK >=MN+MAX (2*M N, \(\mathrm{N}+1, \mathrm{M} \mathrm{N}+\mathrm{NRH} \mathrm{S}\) ) where \(\mathrm{M} \mathrm{N}=\mathrm{m}\) in \(\mathrm{M}, \mathrm{N})\). The block algorithm requires that: LW ORK \(>=\mathrm{MN}+\mathrm{MAX}(2 * \mathrm{M} N\),
 upper bound on the blocksize retumed by IUA EN V for the routines CGEQP3, CTZRZF, CTZRQF, CUNM QR, and CUNMRZ.

If LW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension \((2 * N)\)
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum ent had an illegalvalue

\section*{PURPOSE}
zgem \(m\) perform s one of the \(m\) atrix-m atrix operations

C : alpha*op (A )*op (B ) + beta*C
where op (X ) is one of
op \((X)=X\) or \(o p(X)=X^{\prime}\) or \(o p(X)=\) con \(\dot{j}(X)\), alpha and beta are scalars, and \(A, B\) and \(C\) arem atrices, \(w\) ith op (A) an \(m\) by \(k m\) atrix, op (B) a \(k\) by \(n m\) atrix and \(C\) an \(m\) by \(n m\) atrix.

\section*{ARGUMENTS}

TRANSA (input)
On entry, TRAN SA specifies the form of op (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N\) 'or \(h\) ', op \((A)=A\).

TRANSA = T'ort', op (A) =A'.

TRANSA \(=C^{\prime}\) or \(E^{\prime}, o p(A)=\operatorname{conjg}\left(A^{\prime}\right)\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

TRANSB (input)
On entry, TRAN SB specifies the form of op (B) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s:\)

TRAN SB \(=\) N'or \(h\) ', op (B) \(=\mathrm{B}\).

TRANSB = T'or \(t^{\prime}\), op (B) \()=B^{\prime}\).

TRANSB = C'or \(C^{\prime}, ~ o p(B)=\) con \(\dot{g}\left(B^{\prime}\right)\).

U nchanged on exit.

TRAN SB is defaulted to \(N\) 'forF95 \(\mathbb{I N T E R F A C E .}\)

M (input)
O n entry, \(M\) specifies the num ber of rows of the \(m\) atrix op (A ) and of the \(m\) atrix C. \(M>=\) 0 . U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of the \(m\) atrix op ( B ) and the num ber of colum ns of the \(m\) atrix \(C . N>=0\). U nchanged on exit.

K (input)
On entry, \(K\) specifies the num ber of colum ns of the \(m\) atrix op (A) and the num ber of row s of the \(m\) atrix op (B).K \(>=0\). U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
COM PLEX *16 aray ofD \(\mathbb{M}\) ENSION (LDA, ka ), where ka is \(\mathrm{K} w\) hen TRANSA \(=\mathrm{N}\) 'or h ', and is M otherwise. Before entry w ith TRANSA = N 'or h', the leading \(M\) by \(K\) partof the array A m ust contain the \(m\) atrix \(A\), otherw ise the leading \(K\) by \(M\) part of the array A m ustcontain the m atrix A. U nchanged on exit.

LDA (input)
O n entry, LD A specifies the first dim ension of A as declared in the calling (sub) program .W hen TRANSA \(=N\) 'or \(h\) 'then LD \(A>=\max (1, M)\), otherw ise LD \(A>=\max (1, K)\). U nchanged on exit.

B (input)
COM PLEX *16 anay ofD \(\mathbb{I M} E N S I O N(L D B, k b)\), where
kb is n when TRANSB \(=\mathrm{N}\) 'or h ', and is k otherw ise. Before entry w th TRANSB \(=\mathrm{N}\) ' or h ', the leading k by n partof the array B \(m\) ustcontain the \(m\) atrix \(B\), otherw ise the leading \(n\) by \(k\) partof the aray B mustcontain the \(m\) atrix \(B\). U nchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdimension of B as declared in the calling (sub) program . W hen TRANSB \(=N^{\prime}\) 'or \(h\) 'then LD \(B>=m a x(1, k)\), otherw ise LDB \(>=\max (1, n)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need not.be set on input. U nchanged on exit.

C (input/output)
COM PLEX *16 array ofD \(\mathbb{M}\) ENSION (LD C, n). Before
entry, the leading \(m\) by \(n\) part of the amay \(C\)
\(m\) ustcontain the \(m\) atrix \(C\), exceptw hen beta is zero, in which case \(C\) need notbe seton entry. On exit, the array \(C\) is overw ritten by the \(m\) by \(\mathrm{n} m\) atrix (alpha*op (A ) *op (B ) + beta*C).

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C \(>=m a x(1, m)\). U nchanged on exit.

\({ }^{*}\) x, long incx, doublecom plex *beta, doublecom plex
*y, long incy);

\section*{PURPOSE}
zgem v perform sone of the \(m\) atrix-vector operations \(y:=\) alpha*A *x + beta* \(y\), ory \(:=\) alpha*A \({ }^{*} x+\) beta* \(y\), or \(y:=\) alpha*con \(\dot{9}\left(A^{\prime}\right)^{\star} x+b e t a * y ~ w h e r e ~ a l p h a ~ a n d ~ b e t a ~ a r e ~\) scalars, \(x\) and \(y\) are vectors and \(A\) is an \(m\) by \(n m\) atrix.

\section*{ARGUMENTS}

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} y:=\) alpha*A *x + beta* \(y\).

TRANSA \(=T^{\prime}\) or \(t^{\prime} y:=\) alpha*A * \(\mathrm{x}+\) beta* \(^{\mathrm{y}}\).

TRANSA = C'or \(\mathrm{C}^{\prime} \mathrm{y}:=\) alpha*con \(\dot{g}\left(\mathrm{~A}^{\prime}\right){ }^{*} \mathrm{x}+\) beta*y.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

M (input)
O n entry, M specifies the num ber of row s of the \(m\) atrix A. M >=0. U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\). Unchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry, the leading \(m\) by \(n\) part of the anay A must contain the matrix of coefficients. U nchanged on exit.
LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A >= \(\max (1, m)\). U nchanged on exit.

X (input)
\((1+(\mathrm{n}-1) \star \operatorname{abs}(\mathbb{N} C X))\) when TRANSA \(=\mathrm{N}\) 'or \(h^{\prime}\) and at least \((1+(m-1) * a b s(\mathbb{N} C X))\) otherw ise. Before entry, the increm ented array \(X\) \(m\) ustcontain the vectorx. U nchanged on exit.
\(\mathbb{N C X}\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents of \(\mathrm{X} . \mathbb{N} C X\) m ustnotbe zero. U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then \(Y\) need notbe set on input. U nchanged on exit.

Y (input/output)
\((1+(m-1) \star \operatorname{abs}(\mathbb{N} C Y))\) when TRANSA \(=N\) 'or \(h^{\prime}\) and at least \((1+(n-1) \star a b s(\mathbb{N} C Y))\)
otherw ise. Before entry w ith BETA non-zero, the increm ented array \(Y\) m ust contain the vectory. On exit, \(Y\) is overw rilten by the updated vectory.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(Y . \mathbb{N} C Y\) m ustnotbe zero. U nchanged on exit.

void zgeqlif_64 (long m, long n, doublecom plex *a, long lda, doublecom plex *tau, long *info);

\section*{PURPOSE}
zgeqlf com putes a Q L factorization of a com plex M -by-N \(m\) atrix \(A: A=Q * L\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix A. M \(>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, if \(m>=\) \(n\), the lower triangle of the subanay A ( \(m\) \(\mathrm{n}+1 \mathrm{~m}, 1 \mathrm{n}\) ) contains the N by N low er triangular \(m\) atrix \(L\); ifm <= \(n\), the elem ents on and below the ( \(n-m\) )-th superdiagonal contain the M -by -N lower trapezoidalm atrix \(L\); the rem aining elem ents, w th the anray \(T A U\), represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors (see Further D etails).

LD A (input)
The leading dim ension of the array A. LDA >= \(m a x(1, M)\).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= \(m\) ax \((1, N)\). Foroptim um perform ance LD \(W\) ORK \(>=N * N B\), where NB is the optim alblocksize.

IfLDW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(k) \ldots H(2) H(1), \text { where } k=m \text { in }(m, n) .
\]

Each \(H\) (i) has the form

H (i) \(=I-\tan * V^{*} V^{\prime}\)
\(w\) here tau is a com plex scalar, and \(v\) is a com plex vector w ith \(v(m-k+i+1 \mathrm{~m})=0\) and \(v(m-k+i)=1 ; v(1 m-k+i-1)\) is stored on exitin A ( \(1 \mathrm{~m}-\mathrm{k}+\mathrm{i}-1, \mathrm{n}-\mathrm{k}+\mathrm{i}\) ), and tau in TAU (i).

\section*{PURPOSE}
zgeqp3 com putes a \(Q R\) factorization \(w\) ith colum \(n\) pivoting of a \(m\) atrix \(A: A * P=Q * R\) using Level3 BLA \(S\).

\section*{ARGUMENTS}

M (input) The num ber of row sof the \(m\) atrix \(A . M>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input/output)
On entry, the \(M\)-by-N m atrix A. On exit, the upper triangle of the array contains the \(m\) in \((M, N)\)-by \(-N\) upper trapezoidalm atrix \(R\); the elem ents below the diagonal, together \(w\) th the array TA \(U\), represent the unitary \(m\) atrix \(Q\) as a productofm in \(M, N\) ) ele\(m\) entary reflectors.

LDA (input)
The leading dim ension of the array A. LDA >= \(m a x(1, M)\).

JPVT (input/output)
On entry, if \(\mathbb{P V} T(J)\) ne. 0 , the \(J\) th colum \(n\) of \(A\) is perm uted to the frontof \(A\) * (a leading colum \(n\) );
if JPVT \((J)=0\), the \(J\) th column of \(A\) is a free column. On exit, if \(\mathbb{J P V}(\mathcal{J})=\mathrm{K}\), then the J th colum \(n\) of A *P was the the \(K\)-th colum \(n\) of A.

TAU (output)
The scalar factors of the elem entary reflectors.
W ORK (w orkspace)
Onexit, if \(\mathbb{N} F O=0, \mathrm{~W}\) ORK (1) retums the optim al
LW ORK.

LW ORK (input)
The dim ension of the aray W ORK. LW ORK >= N+1. For optim alperform ance LW ORK >=( \(\mathrm{N}+1\) ) N B , where N B is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension ( \(2 \star \mathrm{~N}\) )
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit.
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), \text { where } k=m \text { in }(m, n) .
\]

Each \(H\) (i) has the form

H (i) \(=I-\tan * V^{*} V^{\prime}\)
w here tau is a real/com plex scalar, and \(v\) is a real/com plex vectorw ith \(v(1: i-1)=0\) and \(v(i)=1 ; v(i+1 \mathrm{~m})\) is stored on exit in A (i+1 \(m, i)\), and tau in TAU (i).

\section*{PURPOSE}
zgeqpf routine is deprecated and has been replaced by routine CGEQP3.

CGEQPF com putes a \(Q\) R factorization \(w\) ith colum \(n\) pivoting of a com plex \(M\) by \(-N\) m atrix \(A: A * P=Q * R\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix A. \(\mathrm{M}>=0\).
N (input) The num ber of colum ns of the \(m\) atrix \(\mathrm{A} \cdot \mathrm{N}>=0\)

A (input/output)
On entry, the M -by-N m atrix A. On exit, the upper triangle of the array contains the \(m\) in \((M, N)\)-by \(-N\) upper triangularm atrix \(R\); the elem ents below the diagonal, together w ith the array TAU, represent the unitary \(m\) atrix \(Q\) as a productofm in \((m, n)\) ele\(m\) entary reflectors.

LDA (input)
The leading dim ension of the array A. LD A >= \(m a x(1, M)\).

JPIVOT (input/output)
On entry, if \(\mathbb{P P I V O T}\) (i) ne. 0 , the \(i\)-th colum n of \(A\) is perm uted to the front of A *P (a leading colum n); if \(\mathbb{P P I V O T}\) (i) = 0, the i-th colum \(n\) of A is a free column. On exit, if \(\operatorname{PPIVOT}(i)=k\), then
the i-th colum \(n\) of \(A * P\) was the \(k\)-th colum \(n\) of \(A\).

TAU (output)
The scalar factors of the elem entary reflectors.

W ORK (w orkspace)
dim ension \(\mathbb{N}\) )

W ORK 2 (w orkspace)
dim ension ( \(2 \star \mathrm{~N}\) )
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N F O}=-\mathrm{i}\), the i -th argum ent had an illegal value

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\(Q=H(1) H(2) \ldots H(n)\)
Each \(H\) (i) has the form
\(\mathrm{H}=\mathrm{I}-\tan { }^{*} \mathrm{~V}^{*} \mathrm{~V}^{\prime}\)
\(w\) here tau is a com plex scalar, and \(v\) is a com plex vector with \(v(1: i-1)=0\) and \(v(i)=1 ; v(i+1 \mathrm{~m})\) is stored on exit in \(A(i+1 m, i)\).

The \(m\) atrix \(P\) is represented in jpvtas follow s: If put \((\mathcal{j})=i\)
then the th colum n ofP is the ith canonicalunitvector.

\section*{C INTERFACE}
\#include <sunperfh>
void zgerc (intm, intn, doublecom plex *alpha, doublecom plex
*x, int incx, doublecom plex *y, int incy, doublecom plex *a, int lda);
void zgerc_64 (long m, long n, doublecom plex *alpha, doublecom plex *x, long incx, doublecom plex *y, long incy, doublecom plex *a, long lda);

\section*{PURPOSE}
zgerc perform sthe rank 1 operation \(A:=a l p h a * x^{\star} c o n g\left(y^{\prime}\right)\)
\(+A\) where alpha is a scalar, \(x\) is an \(m\) elem entvector, \(y\) is an \(n\) elem entvector and \(A\) is an \(m\) by \(n m\) atrix.

\section*{ARGUMENTS}

M (input)
O n entry, \(M\) specifies the num ber of row s of the \(m\) atrix A. M >= 0 . U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\). U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

X (input)
\((1+(m-1) * a b s(\mathbb{N C X}))\). Before entry, the increm ented array \(X\) m ust contain the \(m\) elem ent vectorx. U nchanged on exit.
\(\mathbb{N} C X\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents of \(\mathrm{X} . \mathbb{N} C X \mathrm{~m}\) ustnotbe zero. U nchanged on exit.
\(Y\) (input)
\((1+(n-1) \star a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) m ust contain the \(n\) elem ent vectory. U nchanged on exit.
\(\mathbb{N C C Y}\) (input)

O n entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of Y. \(\mathbb{N} C Y\) m ustnotbe zero. U nchanged on exit.

A (input/output)
Before entry, the leading \(m\) by \(n\) part of the array
A must contain the matrix ofcoefficients. On exit, A is overw rilten by the updated \(m\) atrix.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A \(>=\) \(\max (1, m)\). U nchanged on exit.

\section*{PURPOSE}
zgerfs im proves the com puted solution to a system of linear equations and provides errorbounds and backw ard erroresti\(m\) ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system ofequations:
\(=N^{\prime}: A * X=B \quad\) (Notranspose)
\(=T\) ': \(A * * T * X=B \quad\) (Transpose)
\(=C\) ': A**H * X = B (C onjugate transpose)

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)

The num ber of righthand sides, i.e., the num ber of collm ns of the \(m\) atrioes \(B\) and \(X\). NRH \(S>=0\).

A (input) The originaln by N m atrix A .
LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

AF (input)
The factors \(L\) and \(U\) from the factorization \(\mathrm{A}=\) \(\mathrm{P} * \mathrm{~L} * \mathrm{U}\) as com puted by CGETRF.
LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, \mathbb{N})\).

PIVOT (input)
The pinot indices from CGETRF ; for \(1<=i<=N\), row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) ith row \(\mathbb{P}\) IV OT (i).
\(B\) (input) The righthand side \(m\) atrix \(B\).
LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, \mathbb{N})\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by CGETRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X. LD X >= \(\max (1, \mathbb{N})\).

FERR (output)
The estim ated forw ard enrorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})\)-XTRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard emor of each solution vector X (j) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace) dim ension ( \(2 * N\) )

W ORK 2 (w orkspace) dim ension \(\mathbb{N}\) )

\#include < sunperfh>
void zgerqf(intm, intn, doublecom plex *a, int lda, doub-
lecom plex *tau, int *info);
void zgerqf_64 (long m, long n, doublecom plex *a, long lda, doublecom plex *tau, long *info);

\section*{PURPOSE}
zgergf com putes an RQ factorization of a com plex \(M\)-by \(-\mathbb{N}\) \(m\) atrix \(A: A=R * Q\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of colum ns of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
Onentry, the \(M\) by N matrix A. On exit, if \(\mathrm{m}<=\) \(n\), the upper triangle of the subarray \(A(1 \mathrm{~m}, \mathrm{n}\) \(\mathrm{m}+1 \mathrm{n}\) ) contains the M boy -M upper triangularm atrix \(R\); if \(m>=n\), the elem ents on and above the \(m\) n )-th subdiagonalcontain the M -by -N upper trapezoidal \(m\) atrix \(R\); the rem aining elem ents, \(w\) ith the amay TA \(U\), represent the unitary \(m\) atrix \(Q\) as a product of \(m\) in \((m, n\) ) elem entary reflectors (see FurtherD etails).

LDA (input)
The leading dim ension of the amay A. LDA >= max (1,M).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the array \(W\) ORK. LDW ORK >= \(m \operatorname{ax}(1, M)\). Foroptim um perform ance LDW ORK \(>=M * N B\), where NB is the optim alblocksize.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) \text { 'H (2)' } \ldots H(k) \text { ', where } k=m \text { in }(m, n) \text {. }
\]

Each \(H\) (i) has the form

H (i) \(=I-\tan * V^{*} V^{\prime}\)
\(w\) here tau is a com plex scalar, and \(v\) is a com plex vector with \(v(n-k+i+1 n)=0\) and \(v(n-k+i)=1\); con \(\operatorname{jg}(v(1 n-k+i-1))\) is stored on exitin A \((m-k+i, 1 m-k+i-1)\), and tau in TAU (i).

\#include <sunperfh>
void zgesdd (char jंbz, intm, intn, doublecom plex *a, int lda, double *s, doublecom plex *u, int ldu, doublecom plex *vt, int ldvt, int *info);
void zgesdd_64 (char jobz, long m, long n, doublecom plex *a, long lda, double *s, doublecom plex *u, long ldu, doublecom plex *vt, long ldvt, long *info);

\section*{PURPOSE}
zgesdd com putes the singular value decom position (SVD ) of a complex M -by-N matrix A, optionally com puting the left and/orrightsingularvectors, by using divide-and-conquer \(m\) ethod. The SVD isw ritten \(=U * S I G M A *\) conjugate-transpose \(N\) )
where SIGM A is an \(M\)-by \(-N \mathrm{~m}\) atrix which is zero except for its \(m\) in \((m, n\) ) diagonal elem ents, \(U\) is an \(M\) by \(M\) unitary \(m\) atrix, and \(V\) is an \(N\)-by \(-N\) unitary \(m\) atrix. The diagonalelem ents of SIGMA are the singularvalues ofA; they are realand nonnegative, and are retumed in descending order. The first m in ( \(\mathrm{m}, \mathrm{n}\) ) colum \(n s\) of \(U\) and \(V\) are the left and right singular vectors of A.

N ote that the routine retums \(\mathrm{VT}=\mathrm{V}\) **H, notV .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) ithout guard digits which subtract like the \(C\) ray \(X-M P\), C ray Y \(-M P\), C ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines \(w\) thout guard

\section*{ARGUMENTS}

JOBZ (input)
Specifies options for com puting allorpart of the
m atrix U :
= \(A\) ': allM colum ns of U and all N row sof \(\mathrm{V} * * H\) are retumed in the arays \(U\) and \(V T ;=S\) : the firstm in \((M, N)\) colum ns of \(U\) and the firstm in \((M, N)\) row s of V ** H are retumed in the arrays U and VT ; \(=\mathrm{O}^{\prime}\) : If \(\mathrm{M}>=\mathrm{N}\), the first N colum ns of U are overw rilten on the array \(A\) and allrow sofV **H are retumed in the array VT; otherw ise, all colum \(n s\) of \(U\) are retumed in the anray \(U\) and the firstM row sofV \({ }^{* * H}\) are overw rilten in the amay \(\mathrm{VT} ;=\mathrm{N}\) ': no colum ns of U or row sof V ** H are com puted.

M (input) The num ber of row s of the inputm atrix \(A . M>=0\).

N (input) The num ber of colum ns of the inputm atrix \(\mathrm{A} . \mathrm{N}>=\) 0.

A (input/output)
On entry, the M -by-N m atrix A. On exit, if OBB = \(O^{\prime}\) ' \(A\) is overw rilten \(w\) ith the first \(N\) colum \(n s\) of
U (the leftsingularvectors, stored colum nw ise) if \(\mathrm{M}>=\mathrm{N}\); A is overw ritten w ith the firstM row S of \(V * * H\) the right singularvectors, stored row wise) otherw ise. if JOBZ ne. O', the contents of A are destroyed.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

S (output)
The singularvalues of \(A\), sorted so that \(S\) (i) \(>=\) \(S(i+1)\) 。

U (output)
\(\mathrm{UCOL}=\mathrm{M}\) if \(\mathrm{OBZ}=\mathrm{A}^{\prime}\) or \(\mathrm{OBZ}=\mathrm{D}^{\prime}\) 'and \(\mathrm{M}<\mathrm{N}\);
\(\mathrm{UCOL}=\mathrm{m}\) in \((\mathrm{M}, \mathrm{N})\) if \(J O B Z=S^{\prime}\). If \(\mathrm{OOBZ}=A^{\prime}\) or
JOBZ \(=0\) 'and \(M<N\), U contains the \(M\) boy \(M\) unitary \(m\) atrix \(U\); if \(J O B Z=S\) ', \(U\) contains the first
\(m\) in \((M, N)\) colum ns of \(U\) (the leftsingular vectors, stored colum nw ise); if \(\mathrm{OBBZ}=0\) 'and \(\mathrm{M}>=\mathrm{N}\), or
\(J O B Z=N ', U\) is not referenced.

LD U (input)
The leading dim ension of the array \(U\). LD U >= 1 ; if \(\mathrm{OBZ}=\mathrm{S}^{\prime}\) or A 'or \(\mathrm{OB} \mathrm{BZ}=\mathrm{O}^{\prime}\) 'and \(\mathrm{M}<\mathrm{N}\), LDU \(>=M\).

VT (output)
If \(\mathrm{JOBZ}=\mathrm{A}\) 'or \(\mathrm{JOBZ}=\mathrm{O}\) 'and \(\mathrm{M}>=\mathrm{N}, \mathrm{VT}\) contains the N -by N unitary m atrix \(\mathrm{V} * * \mathrm{H}\); if \(\mathrm{JOBZ}=\) \(S ', V T\) contains the firstm in \(M, N\) ) row s of \(V * * H\) (the right singularvectors, stored row w ise); if \(\mathrm{JOBZ}=\mathrm{O}\) 'andM \(<\mathrm{N}\), or \(\mathrm{OBBZ}=\mathrm{N}\) ', VT is not referenced.

LDVT (input)

\section*{PURPOSE}
zgesv com putes the solution to a com plex system of linear equations
\(A * X=B, w h e r e A\) is an \(N\) boy \(-N m\) atrix and \(X\) and \(B\) are N -by-N R H S m atrices.
The LU decom position w ith partialpivoting and row interchanges is used to factorA as
\(A=P * L * U\),
\(w\) here \(P\) is a perm utation \(m\) atrix, \(L\) is unit low er triangular, and \(U\) is upper triangular. The factored form of \(A\) is then used to solve the system ofequations \(A * X=B\).

\section*{ARGUMENTS}

N (input) The num ber of linear equations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input/output)
O n entry, the \(N\) boy -N coefficient \(m\) atrix \(A\). On exit, the factors \(L\) and \(U\) from the factorization \(A\) \(=\mathrm{P} * \mathrm{~L} * \mathrm{U}\); the unitdiagonalelem ents of \(L\) are not stored.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

IPIVOT (output)
The pivot indices that define the perm utation \(m\) atrix \(P\); row i of the \(m\) atrix \(w\) as interchanged w ith row \(\mathbb{P}\) IVOT (i).

B (input/output)
On entry, the N -by-N RH S m atrix of righthand side
\(m\) atrix \(B\). On exit, if \(\mathbb{N} F O=0\), the \(N\) boy-NRHS solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{U}(i, i)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, so the solution could not be com puted.

\section*{PURPOSE}
zgesvd com putes the singular value decom position (SVD ) of a complex M -by-N matrix A, optionally com puting the left and/or rightsingularvectors. The SVD isw ritten \(=U\) * SIGMA * conjugate-transpose \((N)\)
where SIG M A is an M -by -N m atrix which is zero except for its \(m\) in ( \(m, n\) ) diagonal elem ents, \(U\) is an \(M\) by \(M\) unitary \(m\) atrix, and \(V\) is an \(N\) by -N unitary \(m\) atrix. The diagonalelem ents of SIGM A are the singularvalues ofA ; they are realand nonnegative, and are retumed in descending order. The first m in ( \(\mathrm{m}, \mathrm{n}\) ) colum ns of U and V are the leftand rightsingular vectors ofA.

N ote that the routine retums V ** H , not V .

\section*{ARGUMENTS}
\(J 0\) BU (input)
Specifies options for com puting allorpart of the m atrix U :
= A ': allM colum ns ofU are retumed in array U :
= S ': the firstm in \((\mathrm{m}, \mathrm{n})\) colum nsofU the left singular vectors) are retumed in the array \(U\); \(=\) \(O^{\prime}\) ': the firstm in \((m, n)\) colum ns of \(U\) (the left
singular vectors) are overw ritten on the array A;
\(=\mathrm{N}\) : no colum ns of U (no leftsingularvectors) are com puted.

JO BVT (input)
Specifies options for com puting allorpart of the m atrix V ** H :
\(=A\) ': allN row sofV \({ }^{* *} \mathrm{H}\) are retumed in the amay VT;
\(=S\) : the firstm in \((m, n)\) row s ofV \(* * H\) (the right singular vectors) are retumed in the array \(\mathrm{VT} ;=\) \(O^{\prime}\) : the firstm in \((m, n)\) row s ofV **H the right singular vectors) are overw rilten on the array A; \(=\mathrm{N}^{\prime}\) : no row sofV \(* * \mathrm{H}\) (no right singular vectors) are com puted.

JO BVT and JOBU cannotboth be D'.
\(M\) (input) The num ber of row s of the inputm atrix \(A . M>=0\).

N (input) The num ber of colum ns of the inputm atrix \(\mathrm{A} . \mathrm{N}>=\) 0 .

A (input/output)
On entry, the M -by -N m atrix A . On exit, if \(\mathrm{OBU}=\) 0 , A is overw ritten \(w\) ith the firstm in \((m, n)\)
colum ns of \(U\) (the left singular vectors, stored colum nw ise); if \(\mathrm{JOBVT}=\mathrm{O}^{\prime}\), A is overw rilten w th the firstm in \((m, n)\) row s of \(V * * H\) (the right singularvectors, stored row w ise); if OB BU ne. O 'and JOBVT ne. 0 ', the contents of A are destroyed.

LDA (input)
The leading dim ension of the aray \(A . L D A>=\) \(\max (1, M)\).

SIN G (output)
The singularvalues of \(A\), sorted so that \(\operatorname{SING}\) (i) \(>=S \mathbb{N G}(i+1)\).

\(S^{\prime}\). If \(O B U=A \prime, U\) contains the \(M\)-by \(M\) unitary m atrix U ; if \(\mathrm{OB} \mathrm{B}=\mathrm{S}^{\prime}\), U contains the first \(m\) in ( \(m, n\) ) colum ns of \(U\) (the leftsingular vectors, stored colum nw ise); if JOBU = N 'or O', U is not referenced.

LD U (input)
The leading dim ension of the array \(\mathrm{U} . \mathrm{LDU}>=1\); if \(J O B U=S\) 'or \(A\) ',LDU >=M.

\section*{VT (input)}

If \(\mathrm{JOBVT}=\mathrm{A}\) ', VT contains the N -by-N unitary \(m\) atrix \(\mathrm{V} * * \mathrm{H}\); if \(\mathrm{JO} \mathrm{BV} \mathrm{T}=\mathrm{S}\) ', VT contains the first m in \((\mathrm{m}, \mathrm{n})\) row sof \(\mathrm{V} * * \mathrm{H}\) (the right singularvectors, stored row wise); if JOBVT = N 'or \(\mathrm{O}^{\prime}\) ', VT is not referenced.

LDVT (input)
The leading dim ension of the array V T. LD V T >=1; if \(\mathrm{JOBVT}=\mathrm{A}\) ', LDVT >= ; if \(\mathrm{if} \mathrm{OBVT}=\mathrm{S}\) ', LDVT >= \(m\) in \(M, N\) ).
W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dim ension of the array W ORK. LDW ORK >= 1 . LDW ORK >= \(2 * M \mathbb{N}(M, N)+M A X(M, N)\) Forgood perform ance, LD W ORK should generally be larger.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
D \(\mathbb{M}\) ENSION ( \(5 * \mathrm{M} \mathbb{N} \mathbb{M}, N)\) ). On exit, if \(\mathbb{N} F O>0\), W ORK \(2(\mathbb{M} \mathbb{N} \mathbb{M}, \mathbb{N})-1)\) contains the unconverged superdiagonal elem ents of an upper bidiagonal m atrix B whose diagonal is in \(\mathrm{S} \mathbb{N} G\) (notnecessarily sorted). \(B\) satisfies \(A=U * B * V T, s o\) it has the sam e singular values as A, and singular vectors related by \(U\) and \(V T\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit.
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum enthad an illegalvahue.
> 0 : ifCBD \(S Q R\) did notconverge, \(\mathbb{N F O}\) specifies how \(m\) any superdiagonals of an interm ediate bidiagonalform B did not converge to zero. See the description ofW ORK 2 above for details.

\#include <sunperfh>
void zgesvx (char fact, chartransa, intn, int nihs, doublecom plex *a, int lda, doublecom plex *af, int ldaf, int *ipivot, char equed, double *r, double \({ }^{*} \mathrm{c}\), doublecom plex *b, int ldb, doublecom plex *x, int ldx, double *roond, double *ferr, double *berr, int*info);
void zgesvx_64 (char fact, chartransa, long n, long nihs, doublecom plex *a, long lda, doublecom plex *af, long ldaf, long *ipívot, char equed, double *r, double *c, doublecom plex *b, long ldb, doublecom plex *x, long ldx, double *roond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zgesvx uses the LU factorization to com pute the solution to a com plex system of linear equations
\(A\) * \(X=B\), where \(A\) is an \(N\) boy \(N \mathrm{~m}\) atrix and \(X\) and \(B\) are N -by-N R H S m atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
TRANS \(=\mathrm{N}^{\prime}: \operatorname{diag}(\mathbb{R}) * \mathrm{~A} * \operatorname{diag}(\mathrm{C}) \quad * \operatorname{inv}(\operatorname{diag}(\mathrm{C})) * \mathrm{X}=\) \(\operatorname{diag}(\mathbb{R}) * B\)

TRANS \(=T^{\prime}:(\operatorname{diag}(R) * A * \operatorname{diag}(C)) * * T * \operatorname{inv}(\operatorname{diag}(R)) * X=\) diag (C) *B

TRANS \(=C^{\prime}:(\operatorname{diag}(R) * A * \operatorname{diag}(C)) * * H * \operatorname{inv}(\operatorname{diag}(R)) * X=\) diag (C) *B
W hether or not the system w illbe equilibrated depends on the
scaling of the m atrix A, but if equilibration is used, A is
overw ritten by diag \((\mathbb{R}) * A\) *diag ( \(C\) ) and \(B\) by \(\operatorname{diag}(R) * B\) (if TRANS \(=N\) )
ordiag (C)*B (if TRANS = T'orC).
2. IfFACT \(=N\) 'or \(E\) ', the LU decom position is used to factor the
\(m\) atrix A (afterequilibration ifFACT = E) as
\(A=P * L * U\),
\(w\) here \(P\) is a perm utation \(m\) atrix, \(L\) is a unit low er triangular
\(m\) atrix, and \(U\) is upper triangular.
3. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of A is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for X and com pute error bounds as described below .
4.The system ofequations is solved for X using the factored form
of A.
5. Herative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw and error estim ates
for 五.
6. Ifequilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (C) (iftRANS = N) ordiag \((\mathbb{R})\) (ifTRANS = \(T^{\prime}\) or C) so
that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies whether ornot the factored form of the \(m\) atrix A is supplied on entry, and if not, w hether the m atrix A should be equilibrated before it is factored. \(=\mathrm{F}\) ': On entry, AF and \(\mathbb{P I V O T}\) contain the factored form of A. IfEQUED is not \(N\) ', the \(m\) atrix A has been equilibrated \(w\) th scaling factors given by \(R\) and \(C . A, A F\), and \(\mathbb{P} I V O T\) are not m odified. \(=\mathrm{N}\) ': The m atrix A w illbe copied to AF and factored.
= E ': The matrix A will be equilibrated if necessary, then copied to AF and factored.
TRANSA (input)
Specifies the form of the system of equations:
\(=N: A * X=B \quad\) N \(\circ\) transpose)
\(=T\) ': A ** T * \(\mathrm{X}=\mathrm{B}\) ( T ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (Conjugate transpose)

N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS \(>=0\).

A (input/output)
On entry, the N -by -N m atrix A . IfFA CT = \(\mathrm{F}^{\prime}\) and EQUED is not \(N\) ', then \(A\) musthave been equilibrated by the scaling factors in R and/orC. A is not modified if FACT \(=\) F'or \(N\) ', or if FACT \(=\) E'and EQUED = N 'on exit.

Onexit, ifEQUED ne. \(N\) ', A is scaled as follows: EQUED \(=R\) ': \(A=\operatorname{diag}(R) * A\)
\(\mathrm{EQUED}=\mathrm{C}: \mathrm{A}:=\mathrm{A} * \operatorname{diag}(\mathrm{C})\)
EQUED = \(B^{\prime}: A:=\operatorname{diag}(\mathbb{R}) * A * \operatorname{diag}(C)\).
LDA (input)
The leading dim ension of the anay A. LDA >= \(\max (1, N)\).

AF (input/output)
If \(F A C T=F\) ', then \(A F\) is an inputargum ent and on
entry contains the factors \(L\) and \(U\) from the factorization \(A=P * L * U\) as com puted by CGETRF. If EQUED ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix \(A\).

If \(\mathrm{FACT}=\mathrm{N}\) ', then AF is an output argum ent and on exit retums the factors \(L\) and \(U\) from the factorization \(A=P * L * U\) of the originalm atrix \(A\).

IfFACT \(=\mathrm{E}\) ', then \(A F\) is an output argum ent and on exit retums the factors \(L\) and \(U\) from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) of the equilibrated m atrix A (see the description of \(A\) for the form of the equilibrated \(m\) atrix).

\section*{LDAF (input)}

The leading dim ension of the array AF. LD AF >= \(\max (1, N)\).

\section*{IPIVOT (inputoroutput)}

IfFACT=F', then \(\mathbb{P} \mathbb{V} O T\) is an input argum ent and on entry contains the pivot indioes from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) as com puted by CGETRF; row \(i\) of the \(m\) atrix \(w\) as interchanged \(w\) th row \(\mathbb{P} \mathbb{V} O T\) (i).

IfFACT \(=N\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indiges from the factorization \(\mathrm{A}=\mathrm{P} * \mathrm{~L} * \mathrm{U}\) of the originalm atrix A .

IfFACT=E', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains the pivot indices from the factorization \(A=P * L * U\) of the equilibrated \(m\) atrix A.

EQUED (input/output)
Specifies the form of equilibration thatw as done.
\(=N^{\prime}:\) N o equilibration (alw ays true ifFACT =
\(\mathrm{N})\).
\(=R\) ': Row equilibration, ie., A has been
prem ultiplied by diag \((R)\) ) = C': Colum n equilibration, ie., A has been postm ultiplied by diag (C ). = B ': B oth row and colum \(n\) equilibration, ie., A has been replaced by diag \((\mathbb{R})\) * A * diag (C). EQUED is an inputargum entifFACT= F '; otherw ise, it is an output argum ent.
\(R\) (input/output)
The row scale factors forA. IfEQUED = R' or
\(B\) ', A is multiplied on the leftby diag \((\mathbb{R})\); if
\(E Q U E D=N\) 'or \(C\) ', \(R\) is notaccessed. \(R\) is an
input argum ent if \(\mathrm{FACT}=\mathrm{F}\) '; otherw ise, R is an output argum ent. IfFACT = F'andEQUED = R'or \(B\) ',each elem entofR \(m\) ustbe positive.

C (input/output)
The colum \(n\) scale factors for \(A\). IfEQUED = C 'or
B ', A is multiplied on the right.by diag ( C ); if EQUED \(=N\) 'or \(R\) ', \(C\) is notaccessed. \(C\) is an input argum ent ifFACT = F '; otherw ise, C is an outputargum ent. IfFACT = F 'and \(\mathrm{EQUED}=\mathrm{C}\) 'or B ', each elem entofC m ustbe positive.
B (input/output)
On entry, the N -by-NRH S righthand side m atrix B .
On exit, if EQUED \(=N\) ', \(B\) is notm odified; if TRANSA \(=N^{\prime}\) and EQUED \(=R\) 'or \(B\) ', \(B\) is overw rilten by diag \((R) * B\); ifTRANSA \(=T^{\prime}\) 'or \(C^{\prime}\) and EQUED \(=C^{\prime}\) or \(B^{\prime}, B\) is overw ritten by diag (C) *B .

LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the N -by -N RH \(S\) solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that \(A\) and \(B\) arem odified on exit if EQUED
ne. \(N\) ', and the solution to the equilibrated
system is inv (diag (C ))*X ifTRANSA = N 'and EQUED
\(=C\) 'or \(B^{\prime}\), orinv (diag \(\left.(R)\right) * X\) ifTRANSA \(=T\) 'or \(C^{\prime}\) and EQUED \(=R\) 'or \(B\) '.

LD X (input)
The leading dim ension of the anay X . LD X >= \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num ber of the matrix A afterequilibration (if done). If
RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N} \mathrm{FO}>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{7})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele-
\(m\) ent in \((X(\mathcal{O})-X\) TRUE \()\) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (i.e., the sm allest relative change in any elem entof \(A\) orB thatm akes \(X(\mathcal{j})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension ( \(2 *\) N ) On exit, W ORK 2 (1) contains the reciprocal pivot grow th factornorm (A)/norm (U). The "max absolute elem ent" norm is used. If W ORK2(1) is much less than 1, then the stability of the LU factorization of the (equilibrated)
\(m\) atrix A could be poor. This also \(m\) eans that the solution X, condition estim atorRC OND, and forw ard error bound \(F E R R\) could be unreliable. If factorization fails \(w\) ith \(0<\mathbb{N} F O<=N\), then \(W\) ORK 2 (1) contains the reciprocalpivot grow th factor for the leading \(\mathbb{N}\) FO colum ns of A.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
<= N : U (i,i) is exactly zero. The factorization
has been com pleted, but the factorU is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1: \mathrm{U}\) is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void zggbal(char jं.b, int n, doublecom plex *a, int lda, doublecom plex *b, int ldlo, int*ilo, int*ihi, double *lscale, double *rscale, int *info);
void zggbal 64 (char jंb, long n, doublecom plex *a, long lda, doublecom plex *b, long ldlo, long *ilo, long *ihi, double *lscale, double *rscale, long *info);

\section*{PURPOSE}
zggbalbalances a pair of general com plex matrices ( \(A, B\) ). This involves, first, perm uting \(A\) and \(B\) by sim ilarity transform ations to isolate eigenvalues in the first 1 to IIO \$-\$1 and last \(\mathbb{H}\) I+1 to \(N\) elem ents on the diagonal; and second, applying a diagonal sim ilarity transform ation to row \(s\) and colum ns \(\mathbb{H} O\) to \(\mathbb{H}\) Ito \(m\) ake the row \(s\) and colum ns as close in norm as possible. B oth steps are optional.

B alancing \(m\) ay reduce the 1-norm of the \(m\) atrices, and im prove the accuracy of the com puted eigenvalues and/oreigenvectors in the generalized eigenvalue problem \(A{ }^{*} \mathrm{x}=\operatorname{lam} . \mathrm{bda}{ }^{*} \mathrm{~B}{ }^{*} \mathrm{x}\).

\section*{ARGUMENTS}

JO B (input)
Specifies the operations to be perform ed on A and
B :
\(=\mathrm{N}^{\prime}\) : none: simply set \(\mathbb{H} O=1, \mathbb{H} I=\mathrm{N}\), LSCALE \((\mathbb{I})=1.0\) and RSCALE \((\mathbb{I})=1.0\) fori=1,...N ;
\(=P^{\prime}\) : perm ute only;
\(=S\) ': scale only;
\(=B:\) both perm ute and scale.

N (input) The order of them atriges A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input/output)
On entry, the input \(m\) atrix A. On exit, A is overw rilten by the balanced \(m\) atrix. If \(\mathrm{OB}=\mathrm{N}^{\prime}\),

A is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).
\(B\) (input) On entry, the input \(m\) atrix \(B\). On exit, \(B\) is overw rilten by the balanced \(m\) atrix. If \(J 0 B=N\) ', \(B\) is not referenced.

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

ㅍO (output)
IOO and \(\mathbb{H}\) Iare set to integers such thaton exit
\(A(i, j)=0\) and \(B(i, 1)=0\) if \(i>\) jand \(j=\) \(1, \ldots\), ILO O -1 or \(i=\mathbb{H}\) I \(+1, \ldots, N\). If \(J O B=N\) ' or \(S^{\prime}, \mathrm{HO}=1\) and \(\mathbb{H} \mathrm{I}=\mathrm{N}\).

IH I (output)
IIO and \(\mathbb{H}\) I are set to integers such that on exit
\(A(i, j)=0\) and \(B(i, 7)=0\) if \(i>j a n d i=\)

LSCALE (input)
D etails of the perm utations and scaling factors applied to the left side of \(A\) and \(B\). IfP \((\mathcal{J})\) is the index of the row interchanged \(w\) ith row \(j\) and D ( \(j\) ) is the scaling factor applied to row \(j\) then LSCALE ( \()=\mathrm{P}(\mathcal{i}\) ) for \(J=1, \ldots\), ILO-1 \(=\mathrm{D}(\mathcal{j})\) for \(J=\mathbb{L O}, \ldots, \mathbb{H} I=P(\mathcal{O}) \quad\) for \(J=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{H} O-1\).

RSCALE (input)
D etails of the perm utations and scaling factors applied to the right side of \(A\) and \(B\). If \(P(i)\) is the index of the colum \(n\) interchanged \(w\) ith colum \(n\) \(j\) and \(D(j)\) is the scaling factorapplied to column \(j\) then RSCALE \((\mathcal{j})=P(\mathcal{j})\) for \(J=\)
 for \(J=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathrm{IH} \mathrm{I}+1\), then 1 to [ H - 1 .

W ORK (w orkspace)
dim ension (6*N )
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum enthad an illegalvalue.

\section*{C INTERFACE}
\#include <sunperfh>
void zgges (char jobvsl, char jobvsr, char sort, int(*delztg) (doublecom plex,doublecom plex), intn, doublecom plex *a, int lda, doublecom plex *b, int ldb, int *sdim , doublecom plex *alpha, doublecom plex *beta, doublecom plex *vsl, int ldvsl, doublecom plex *vsr, int ldvsr, int *info);
void zgges_64 (char jobvsl, char jobvssr, char sort, long (*delztg) (doublecom plex,doublecom plex), long n, doublecom plex *a, long lda, doublecom plex *b, long ldb, long *sdim, doublecom plex *alpha, doublecom plex *beta, doublecom plex *vsl, long ldvsl, doublecom plex *vsr, long ldvss, long *info);

\section*{PURPOSE}
zgges com putes for a pair of N -by-N com plex nonsym \(m\) etric \(m\) atrices ( \(A, B\) ), the generalized eigenvalues, the generalized com plex Schur form (S, T), and optionally left and/or right Schur vectors (NSL and VSR). This gives the generalized Schur factorization
\[
\left.\left.(A, B)=(N S L) * S^{\star}(N S R) * * H,(N S L) * T * N S R\right) * * H\right)
\]
where ( NSR\()^{\star *_{H}}\) is the conjugate-transpose of VR .

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonalblocks of the upper triangularm atrix \(S\) and the upper triangularm atrix T. The leading colum ns of V SL and V SR then form an unitary basis for the comesponding left and right eigenspaces (deflating subspaces).
(If only the generalized eigenvalues are needed, use the driverC G G EV instead, which is faster.)

A generalized eigenvalue for a pairofm atrices \((A, B)\) is a scalar w or a ratio alpha/beta \(=\mathrm{w}\), such that \(A-\mathrm{w} * \mathrm{~B}\) is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0, and even forboth being zero.

A pairofm atrices \((\mathrm{S}, \mathrm{T})\) is in generalized com plex Schur form if S and T are uppertriangularand, in addition, the diagonalelem ents of \(T\) are non-negative realnum bers.

\section*{ARGUMENTS}

JO BV SL (input)
= N ': do notcom pute the leftSchurvectors;
\(=\mathrm{V}\) : com pute the leftSchurvectors.

JO BV SR (input)
\(=\mathrm{N}\) ': do notcom pute the rightSchurvectors;
\(=\mathrm{V}\) ': com pute the rightSchurvectors.
SORT (input)
Specifies w hether ornot to order the eigenvalues on the diagonal of the generalized Schur form . =
N ': Eigenvalues are not ordered;
\(=S\) ': Eigenvalues are ordered (see D ELZTG).

DELZTG (input)
DELZTG mustbe declared EXTERNAL in the calling subroutine. If SORT \(=N\) ',DELZTG is notreferenced. IfSORT = S',DELZTG is used to select eigenvalues to sort to the top leftof the Schur form. A n eigenvalue A LPHA ( ) ( BETA ( \()\) ) is selected ifDELZTG (ALPHA ( \()\), BETA ( 7 ) is true.
\(N\) ote that a selected com plex eigenvalue \(m\) ay no
longer satisfy DELZTG (ALPHA ( \(\mathbf{j}\), BETA ( \(\boldsymbol{\jmath}\) ) = .TRUE.
afterordering, since ordering \(m\) ay change the value of com plex eigenvalues (especially if the eigenvalue is ill-conditioned), in this case \(\mathbb{N}\) FO is set to \(\mathrm{N}+2\) (See \(\mathbb{N}\) FO below ).

N (input) The order of the m atrices A, B, V SL, and V SR. N \(>=0\).

A (input/output)
O \(n\) entry, the firstof the pair of \(m\) atrices. On
exit, A has been overw ritten by its generalized Schur form \(S\).
LD A (input)
The leading dim ension ofA . LD A \(>=\max (1, \mathbb{N})\).
B (input/output)
O n entry, the second of the pairofm atrices. On exit, B has been overw ritten by its generalized Schur form T.

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).

SD \(\mathbb{I M}\) (output)
If \(S O R T=N^{\prime}, S D \mathbb{I M}=0\). IfSORT \(=S^{\prime}, S D \mathbb{M}=\) num ber of eigenvalues (aftersorting) forw hich DELZTG is true.

A LPHA (output)
On exit, A LPHA ( \(\mathfrak{j}\) ) BETA ( \(\mathcal{j}\) ) \(\mathfrak{j} 1, \ldots, N\), w illbe the generalized eigenvalues. A LPHA ( \(\mathcal{\jmath}), 1, \ldots, N\) and BETA ( \(\mathcal{i}, \dot{于} 1, \ldots, N\) are the diagonals of the com plex Schur form ( \(A, B\) ) output by CGGES. The BETA ( 7 ) w illbe non-negative real.

N ote: the quotients A LPHA ( \()\) ) BETA ( ) m ay easily over- or underflow, and BETA ( \()\) ) may even be zero. Thus, the user should avoid naively com puting the ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

BETA (output)
See description of A LPH A.
VSL (input)
If 0 OVVSL = V',VSL willcontain the left Schur
vectors. N ot referenced if O BV SL \(=\mathrm{N}^{\prime}\).

LD V SL (input)
The leading dim ension of the \(m\) atrix V SL.LD V SL >= 1 , and if \(\mathrm{OBVSL}=V^{\prime}, \mathrm{LDVSL}>=\mathrm{N}\).

VSR (input)
If \(\mathrm{OBV} \mathrm{BR}=\mathrm{V}\) ', VSR w illcontain the right Schur vectors. N ot referenced if \(\mathrm{OBV} \mathrm{BR}=\mathrm{N}^{\prime}\).

LDVSR (input)
The leading dim ension of the \(m\) atrix \(V\) SR .LD V SR >= 1 , and if \(\mathrm{OBVSR}=\mathrm{V}\) ', LDVSR \(>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK ( 1 ) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay \(W\) ORK. LW ORK \(>=\) \(\max (1,2 \star N)\). For good penform ance, LW ORK m ustgenerally be larger.

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension \((8 \star \mathrm{~N})\)

BW ORK (w orkspace)
dim ension \((\mathbb{N}) N\) ot referenced if \(S O R T=N^{\prime}\).
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue.
\(=1, \ldots, N\) : The \(\mathrm{Q} Z\) teration failed. ( \(\mathrm{A}, \mathrm{B}\) ) are not in Schur form, butA LPHA ( 1 ) andBETA ( 17 ) should be comect for \(\ddagger \mathbb{N} \mathrm{FO}+1, \ldots, \mathrm{~N} .>\mathrm{N}:=\mathrm{N}+1\) : other than Q Z iteration failed in CHGEQ Z
\(=N+2\) : after reordering, roundoff changed values of som e complex eigenvalues so thatleading eigenvalues in the Generalized Schur form no longer satisfy DELZTG=.TRUE. This could also be caused due to scaling. \(=\mathrm{N}+3\) : reordering falied in CTGSEN .

\section*{PURPOSE}
zggev com putes fora pair of \(N\)-by -N com plex nonsym \(m\) etric \(m\) atrices ( \(A, B\) ), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

A generalized eigenvalue for a pairofm atrices ( \(A, B\) ) is a scalar lam bda or a ratio alpha/beta = lam bda, such thatA lam bda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta \(=0\), and even forboth being zero.

The rightgeneralized eigenvectorv ( \()\) ) corresponding to the generalized eigenvalue lam boda ( \(\mathcal{I}\) ) of \((A, B)\) satisfies
\[
A * v(\mathcal{j})=\operatorname{lam} \operatorname{bda}(\mathcal{I}) * B * V(\mathcal{J} .
\]

The leftgeneralized eigenvector \(u(j)\) comesponding to the generalized eigenvalues lam bda ( \()\) ) of \((A, B\) ) satisfies
\[
\mathrm{u}(\mathcal{j}) * * \mathrm{H} * \mathrm{~A}=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * \mathrm{u}(\mathcal{j}) * * \mathrm{H} * \mathrm{~B}
\]
where \(u(\mathcal{j}) * * \mathrm{H}\) is the conjugate-transpose ofu ( \()\).

\section*{ARGUMENTS}

JO BVL (input)
\(=\mathrm{N}\) : : do notcom pute the leftgeneralized eigenvectors;
\(=\mathrm{V}\) : com pute the leftgeneralized eigenvectors.
\(J 0\) BVR (input)
\(=\mathrm{N}\) ': do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvectors.

N (input) The order of the \(m\) atriges \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and \(V \mathrm{R} . \mathrm{N}>=\) 0 .

A (input/output)
On entry, the \(m\) atrix \(A\) in the pair \((A, B)\). On exit, A has been overw rilten.

LD A (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).

B (input/output)
On entry, them atrix \(B\) in the pair \((A, B)\). On exit, B has been overw ritten.

LD B (input)
The leading dim ension ofB. LD B >=max \((1, N)\).

\section*{ALPHA (output)}

On exit, ALPHA ( 1 ) BETA ( 1 ) , \(1, \ldots, N\), w illbe the generalized eigenvahues.

N ote: the quotients A LPHA ( 1 ) BETA ( 1 ) m ay easily over- orunderflow, and BETA ( 7 ) m ay even be zero. Thus, the usershould avoid naively com puting the ratio alpha/beta. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in m agnitude, and BETA alw ays less than and usually com parable w th norm (B).

BETA (output)
See description of A LPH A.

VL (output)
If \(\mathrm{OBV} \mathrm{B}=\mathrm{V}\) ', the leftgeneralized eigenvectors \(u(j)\) are stored one after another in the colum ns ofVL, in the sam e order as their eigenvalues.

Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(m ag. part) \(=1\). N ot referenced if \(J 0 B V L=N '\).

LDVL (input)
The leading dim ension of the \(m\) atrix \(V \mathrm{~L}\). LD V L >=1, and if \(\mathrm{JOBVL}=\mathrm{V}\) ', LDVL \(>=\mathrm{N}\).
VR (output)
If JO BVR = V', the right generalized eigenvectors
\(\mathrm{v}(\mathrm{j})\) are stored one after another in the colum ns ofVR, in the sam e order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw ill have abs(real part) + abs(m ag. part) \(=1\). N ot referenced if \(J 0 B V R=N^{\prime}\).

LDVR (input)
The leading dim ension of the \(m\) atrix \(V R\).LD VR \(>=1\), and if \(J O B V R=V\) ', LDVR \(>=N\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al
LW ORK.

\section*{LW ORK (input)}

The dim ension of the array W ORK. LW ORK >= max ( \(1,2 * \mathrm{~N}\) ). For good perform ance, LW O RK m ustgenerally be larger.

If LW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{RW ORK (w orkspace)}
dim ension ( \(8 * \mathrm{~N}\) )
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvahue.

\section*{PURPOSE}
zggevx com putes for a pair of N -by-N com plex nonsym m etric \(m\) atrices \((A, B)\) the generalized eigenvalues, and optionally, the leftand/or right generalized eigenvectors.

O ptionally, italso com putes a balancing transform ation to im prove the conditioning of the eigenvalues and eigenvectors ( \(\mathbb{L} O, \mathbb{H} I, L S C A L E, R S C A L E, A B N R M\), and BBNRM ), reciprocal
 calcondition num bers for the righteigenvectors (RCONDV).

A generalized eigenvalue for a pairofm atrices ( \(A, B\) ) is a scalar lam bda or a ratio alpha/beta = lam bda, such thatA lam bda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0, and even forboth being zero.

The righteigenvectorv (i) comesponding to the eigenvalue lam bda \((\rightarrow)\) of \((A, B)\) satisfies
\[
A * v(\mathcal{j})=\operatorname{lam} \operatorname{bda}(\bar{j}) * B * v(\mathcal{j}) .
\]

The lefteigenvectoru ( \(\mathcal{I}\) ) corresponding to the eigenvalue lam bda ( \(\mathcal{F}\) ) of \((A, B)\) satisfies
\[
\mathrm{u}(\boldsymbol{j}) * * \mathrm{H} * \mathrm{~A}=\operatorname{lam} \operatorname{bda}(\mathcal{j}) * \mathrm{u}(\boldsymbol{j}) * * \mathrm{H} * \mathrm{~B} .
\]
where \(u(j) * * H\) is the conjugate transpose of \(u()\).

\section*{ARGUMENTS}

BALANC (input)
Specifies the balance option to be perform ed:
= N ': do notdiagonally scale orperm ute;
= \(\mathrm{P}^{\prime}\) : perm ute only;
= S ': scale only;
= B ': both perm ute and scale. C om puted reciprocal condition num bers \(w i l l\) be forthe \(m\) atrices afterperm uting and/orbalancing. Perm uting does not change condition num bers (in exactarithm etic), but.balancing does.

JO BVL (input)
= \(\mathrm{N}^{\prime}\) : do not com pute the left generalized eigenvectors;
\(=\mathrm{V}^{\prime}\) : com pute the left generalized eigenvectors.

JOBVR (input)
\(=\mathrm{N}^{\prime}\) : do not com pute the right generalized eigenvectors;
\(=\mathrm{V}\) : com pute the right generalized eigenvectors.

SENSE (input)
D eterm ines which reciprocal condition num bers are com puted. = N ': none are com puted;
= E ': com puted foreigenvalues only;
\(=\mathrm{V}\) : com puted foreigenvectors only;
= B ': com puted foreigenvalues and eigenvectors.
N (input) The order of the m atrices \(\mathrm{A}, \mathrm{B}, \mathrm{VL}\), and \(\mathrm{VR} . \mathrm{N}>=\) 0.

A (input/output)
Onentry, them atrix \(A\) in the pair \((A, B)\). On
exit, A has been overw ritten. If \(J 0 B V L=V\) 'or \(J O B V R=V\) 'orboth, then A contains the first part of the com plex Schur form of the "balanced" versions of the inputA and \(B\).

LDA (input)
The leading dim ension ofA. LD A \(>=\max (1, N)\).
B (input/output)
Onentry, them atrix \(B\) in the pair \((A, B)\). On exit, \(B\) has been overw rilten. If \(J O B V L=V\) 'or JO BVR=V 'orboth, then B contains the second part of the com plex Schur form of the "balanced" versions of the input \(A\) and \(B\).

LD B (input)
The leading dim ension ofB. LD B \(>=m\) ax \((1, N)\).
ALPHA (output)
On exit, ALPHA ( \(\rightarrow\) ) BETA \((\rightarrow\), \(\dot{=} 1, \ldots, N\), willbe the generalized eigenvalues.

N ote: the quotientA LPHA (J) BETA (j) ) may easily over- orunderflow, and BETA ( \()\) m ay even be zero. Thus, the user should avoid naively com puting the ratio A LPHA BETA. H ow ever, A LPH A w illbe alw ays less than and usually com parable w ith norm (A) in \(m\) agnitude, and BETA alw ays less than and usually com parable w ith norm (B).

BETA (output)
See description of A LPH A .

VL (output)
If \(\mathrm{OOBVL}=\mathrm{V}\) ', the leftgeneralized eigenvectors
\(u(7)\) are stored one after another in the colum ns of VL, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(im ag. part) \(=1\). N otreferenced if \(\mathrm{OOBVL}=\mathrm{N}^{\prime}\).

LDVL (input)
The leading dim ension of the m atrix \(\mathrm{VL} . \mathrm{LD} V \mathrm{~L}>=1\), and if \(\mathrm{JOBVL}=V^{\prime}, \mathrm{LDVL}>=\mathrm{N}\).

VR (output)
If O BVR \(=\mathrm{V}\) ', the right generalized eigenvectors
V (7) are stored one after another in the colum ns ofVR, in the sam e order as their eigenvalues. Each eigenvector will be scaled so the largest com ponentw illhave abs(real part) + abs(im ag. part) \(=1\). N otreferenced if \(\mathrm{OOBVR}=\mathrm{N}^{\prime}\).

LDVR (input)
The leading dim ension of the \(m\) atrix \(V R . L D V R>=1\), and if \(J O B V R=V ', L D V R>=N\).

IIO (output)
IUO is an integervalue such thaton exitA \((i, j)=\) 0 and \(B(i, j)=0\) if \(i>\) jand \(j=1, \ldots, \Pi O-1\) or \(i\)
\(=\mathbb{H} I+1, \ldots, N\). IfBALANC=N'or \(S^{\prime}, \Pi O=1\) and \(\mathbb{H} I=N\).

IH I (output)
\(\mathbb{H} I\) is an integervalue such that on exitA \((i, j)=\) 0 and \(B(i, j)=0\) if \(i>\) jand \(j=1, \ldots\), HO-1 ori
\(=\mathbb{H} I+1, \ldots, N\). IfBALANC \(=N^{\prime}\) or \(S^{\prime}, ~ I L O=1\) and \(\mathbb{H} I=N\).

LSCALE (output)
D etails of the perm utations and scaling factors applied to the left side of A and B. IfPL ( \()\) is the index of the row interchanged \(w\) ith row \(j\) and D L ( ) is the scaling factor applied to row \(j\) then \(\operatorname{LSCALE}(7)=P L(j)\) for \(j=1, \ldots\) ILO \(-1=D L(1)\) for \(j=\mathbb{H}, \ldots, \mathbb{H} I=P L(j)\) for \(j=\mathbb{H} I+1, \ldots, N\). The order in which the interchanges are m ade is N to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathrm{HO}-1\).

RSCALE (output)
D etails of the perm utations and scaling factors applied to the right side of \(A\) and \(B\). IfPR ( \()\) is the index of the colum \(n\) interchanged \(w\) ith colum \(n\)
\(j\) and \(\operatorname{DR}(\mathcal{j})\) is the scaling factor applied to
collmm \(j\) then RSCALE \((j)=\operatorname{PR}(\mathcal{j})\) for \(j=\)
 for \(j=\mathbb{H} \mathrm{I}+1, \ldots, \mathrm{~N}\) The order in \(w\) hich the interchanges are \(m\) ade is \(N\) to \(\mathbb{H} \mathrm{I}+1\), then 1 to \(\mathbb{I L O}-1\). ABNRM (output) The one-norm of the balanced m atrix A .

\section*{BBNRM (output)}

The one-norm of the balanced \(m\) atrix B .

\section*{RCONDE (output)}

IfSENSE = E'or B', the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the array. If SEN \(\mathrm{SE}=\) V',RCONDE is not referenced.

RCONDV (output)
If JO B \(=\mathrm{V}\) 'or B ', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. If the eigenvalues cannot be reordered to com pute RCONDV \((\mathcal{j})\),RCONDV ( \(\mathcal{j}\) ) is setto 0 ; this can only occurw hen the true value w ould be very sm allanyway. IfSENSE = E',RCONDV is not referenced. N ot referenced if \(\mathrm{JOB}=\mathrm{E}\) '.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, \mathrm{~W} O R K(1)\) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the anay \(W\) ORK. LW ORK >= m ax \(\left(1,2 \star^{*} \mathrm{~N}\right)\). If SEN \(S E=\mathrm{N}\) 'or E ', LW ORK \(>=2 \star \mathrm{~N}\). If SENSE \(=\mathrm{V}\) 'or \(\mathrm{B}^{\prime}\), LW ORK \(>=2 * \mathrm{~N} * \mathrm{~N}+2 \star \mathrm{~N}\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA .

RW ORK (w orkspace)
dim ension (6*N ) Realw orkspace.

IW ORK (w orkspace)
dim ension \((\mathbb{N}+2)\) If SEN \(S E=E ', \mathbb{I N} O R K\) is notreferenced.
BW ORK (w orkspace)
dim ension ( \(N\) ) If SENSE \(=N\) ', BW ORK is not refer-
enced.
\(\mathbb{N}\) FO (output)
= 0 : successfulexit
<0: if \(\mathbb{N N}\) FO = -i, the \(i\)-th argum ent had an illegalvahue.
\(=1, \ldots, N\) : The Q Z iteration failed. N o eigenvectors have been calculated, but A LPHA ( \(j\) ) and BETA ( \(\mathcal{j}\) ) should be comect for \(\mathcal{j} \mathbb{N} F O+1, \ldots, N .>\) \(\mathrm{N}:=\mathrm{N}+1\) : other than Q Z teration failed in CHGEQZ.
\(=\mathrm{N}+2\) : error retum from CTGEVC.

\section*{FURTHER DETAILS}

Balancing am atrix pair ( \(A, B\) ) includes, first, perm uting row \(s\) and colum ns to isolate eigenvalues, second, applying diagonal sim ilarity transform ation to the row s and colum ns to m ake the row s and colum ns as close in norm as possible. The com puted reciprocal condition num bers comespond to the balanced \(m\) atrix. Perm uting row sand colum ns w ill not change the condition num bers (in exact arithm etic) but diagonal scaling w ill. For further explanation of balancing, see section 4.11.12 of LAPACK U sers'G uide.

A n approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue \(w\) and the comesponding exacteigenvalue lam boda is hord (w, lam bda) <= EPS * norm (ABNRM,BBNRM) /RCONDE (I)

A \(n\) approxim ate errorbound for the angle betw een the \(i\)-th com puted eigenvectorV L (i) orVR (i) is given by PS * norm (ABNRM,BBNRM)/D \(\mathbb{F}\) (i).

For further explanation of the reciprocal condition num bers RCONDE and RCONDV, see section 4.11 ofLAPACK U sers G uide.

\section*{PURPOSE}
zggglm solves a general Gauss M arkov linear model (G LM ) problem :
\(m\) inim ize \(\|y\| 2\) subject to \(d=A *^{\prime} x+B * y\)
x
\(w\) here \(A\) is an \(N\) boy \(-M m\) atrix, \(B\) is an \(N\) boy \(P m\) atrix, and \(d\) is a given N -vector. It is assum ed thatM \(<=\mathrm{N}<=\mathrm{M}+\mathrm{P}\), and
\[
\operatorname{rank}(A)=M \quad \text { and } \quad \operatorname{rank}(A B)=N
\]

U nder these assum ptions, the constrained equation is alw ays consistent, and there is a unique solution \(x\) and \(a m\) inim al 2-norm solution \(y\), w hich is obtained using a generalized Q R factorization of \(A\) and \(B\).

In particular, ifm atrix \(B\) is square nonsingular, then the problem GLM is equivalent to the follow ing w eighted linear least squares problem
\(m\) inim ize \(\left\|\operatorname{inv}(B)^{\star}\left(d-A *_{x}\right)\right\| 2\)
x
w here inv \((B)\) denotes the inverse of \(B\).

\section*{ARGUMENTS}

N (input) The num ber of row s of the m atriges A and \(\mathrm{B} . \mathrm{N}>=\) 0 .
\(M\) (input) The num ber of colum ns of the m atrix A. \(0<=M<=\) N .
\(P\) (input) The num ber of colum ns of the \(m\) atrix \(B . P>=N-M\).
A (input/output)
On entry, the N -by -M m atrix A. On exit, A is destroyed.

LD A (input)
The leading din ension of the array A. LDA >= \(\max (1, N)\).

B (input/output)
On entry, the N -by Pm atrix B. On exit, B is destroyed.
LD B (input)
The leading dim ension of the array \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, N)\).

D (input/output)
O \(n\) entry, \(D\) is the lefthand side of the G LM equation. On exit, D is destroyed.

X (output)
On exit, X and Y are the solutions of the G LM problem.

Y (output)
On exit, \(X\) and \(Y\) are the solutions of the GLM problem.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the amay W ORK. LDW ORK >= \(m a x(1, N+M+P)\). Foroptim um perform ance, LD W ORK >= \(M+m\) in \((\mathbb{N}, P)+m\) ax \(\mathbb{N}, P)^{\star} N B\), where \(N B\) is an upperbound for the optim al blocksizes forCGEQRF, CGERQF, CUNMQR and CUNMRQ.

If LD W ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0: successfulexit.

\section*{PURPOSE}
zgghrd reduces a pair of com plex \(m\) atrices \((A, B)\) to generalized upper H essenberg form using unitary transform ations, \(w\) here \(A\) is a generalm atrix and \(B\) is upper triangular: \(Q\) '* \(A * Z=H\) and \(Q ' * B * Z=T\), where \(H\) is upper \(H\) essenberg, \(T\) is upper triangular, and Q and Z are unitary, and ' m eans conjugate transpose.

The unitary \(m\) atrioes \(Q\) and \(Z\) are determ ined as products of G ivens rotations. They m ay eitherbe form ed explicitly, or they \(m\) ay be postm ultiplied into inputm atrioes Q 1 and \(\mathrm{Z1}\), so that 1 * \(A * 1^{\prime}=(Q 1 * Q) * H *(Z 1 * Z) '\)

\section*{ARGUMENTS}

COMPQ (input)
\(=\mathrm{N}\) ': do not com pute Q ;
\(=\mathrm{I}: \mathrm{Q}\) is initialized to the unit m atrix, and the unitary matrix \(Q\) is retumed; = V : Q must contain a unitary \(m\) atrix \(Q 1\) on entry, and the product \(\mathrm{Q} 1 * \mathrm{Q}\) is retumed.

COMPZ (input)
\(=\mathrm{N}\) ': do not com pute Q ;
\(=I^{\prime}: Q\) is initialized to the unit \(m\) atrix, and the unitary m atrix Q is retumed; \(=\mathrm{V}: \mathrm{Q} \mathrm{m}\) ust contain a unitary \(m\) atrix \(Q 1\) on entry, and the product \(\mathrm{Q} 1 * \mathrm{Q}\) is retumed.

N (input) The order of the m atrioes A and \(\mathrm{B} . \mathrm{N}>=0\).
ㅍO (input)
It is assum ed thatA is already upper triangular in row sand colum ns \(1: \mathbb{I H}-1\) and \(\mathbb{H} \mathrm{I}+1 \mathbb{N} . \mathbb{H O}\) and HH I are norm ally set.by a previous callto C G G BA L; otherw ise they should be set to 1 and N respec-
tively. \(1<=\mathbb{L} \mathrm{O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{H} \mathrm{O}=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

IH I (input)
See description of IIO .

A (input/output)
O n entry, the N -by N generalm atrix to be reduced. On exit, the upper triangle and the first subdiagonalofA are overw rilten with the upper H essenberg \(m\) atrix \(H\), and the rest is set to zero.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, \mathbb{N})\).

B (input/output)
\(\mathrm{O} n\) entry, the \(\mathrm{N}-\) by -N upper triangular m atrix B .
On exit, the upper triangularm atrix \(T=Q\) ' B Z .
The elem entsbelow the diagonalare setto zero.
LD B (input)
The leading dim ension of the array B . LD B >= \(\max (1, \mathbb{N})\).

Q (input/output)
If COMPQ \(=\mathrm{N}^{\prime}: \mathrm{Q}\) is notreferenced.
If \(C O M P Q=\) ' \('\) : on entry, \(Q\) need notbe set, and on exit it contains the unitary \(m\) atrix \(Q\), where \(Q\) 'is the product of the \(G\) ivens transform ations which are applied to \(A\) and \(B\) on the left. If \(C O M P Q=V\) ': on entry, \(\mathrm{Q} m\) ustcontain a unitary m atrix Q 1 , and on exit this is overw rilten by \(\mathrm{Q} 1 * \mathrm{Q}\).

LD Q (input)
The leading dim ension of the array \(Q . L D Q>=N\) if COM PQ = V 'or I'' LD Q >= 1 otherw ise.

Z (input/output)
If COMPZ=N': Z is notreferenced.
If COM PZ = 'I': on entry, Z need not.be set, and on
exit it contains the unitary \(m\) atrix \(Z\), which is
the product of the \(G\) ivens transform ations which are applied to \(A\) and \(B\) on the right. If COMPZ=V': on entry, Z must contain a unitary \(m\) atrix \(Z 1\), and on exit this is overw ritten by Z1*Z.

LD \(Z\) (input)
The leading dim ension of the array \(\mathrm{Z} . \operatorname{LD} \mathrm{Z}>=\mathrm{N}\) if \(\mathrm{COM} \mathrm{PZ}=\mathrm{V}\) 'or I'; LD Z >= 1 otherw ise.
\(\mathbb{I N} F \mathrm{O}\) (output)
= 0: successfulexit.
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvahue.

\section*{FURTHER DETAILS}

This routine reduces \(A\) to \(H\) essenberg and \(B\) to triangular form by an unblocked reduction, as described in _M atrix_C om putations_, by G olub and van Loan (Johns H opkins Press).

void zgglse_64 (long m, long \(n\), long p, doublecom plex *a, long lda, doublecom plex *b, long ldb, doublecom plex *c, doublecom plex *d, doublecom plex *x, long *info);

\section*{PURPOSE}
zgglse solves the linearequally-constrained least squares (LSE ) problem :
\(m\) inim ize \(\left\|C-A *_{x}\right\| 2\) subject to \(B *_{x}=d\)
where \(A\) is an \(M\) boy \(N\) m atrix, \(B\) is a P-by \(N\) m atrix, \(c\) is a given \(M\)-vector, and \(d\) is a given \(P\)-vector. 化 is assum ed that
\(P<=N<=M+P\), and
\(\operatorname{rank}(B)=P\) and \(\operatorname{rank}((A))=N\).
( (B ) )

These conditions ensure that the LSE problem has a unique solution, w hich is obtained using a G RQ factorization of the \(m\) atrices \(B\) and \(A\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the matrix A. \(\mathrm{M}>=0\).

N (input) The num ber of colum ns of the \(m\) atrioes \(A\) and \(B . N\) \(>=0\).

P (input) The num ber of row s of the m atrix B. \(0<=\mathrm{P}<=\mathrm{N}<=\) \(M+P\).

A (input/output)
On entry, the M boy- N m atrix A. On exit, A is des troyed.

LD A (input)
The leading dim ension of the aray A. LD A >=
\(\max (1, \mathrm{M})\).
B (input/output)
On entry, the \(P\)-by \(-N\) m atrix B. On exit, B is destroyed.

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, P)\).

C (input/output)
On entry, C contains the right hand side vector for the leastsquares part of the LSE problem. On exit, the residual sum of squares for the solution is given by the sum of squares of elem ents \(\mathrm{N}+\mathrm{P}+1\) to \(M\) ofvector \(C\).

D (input/output)
O n entry, D contains the right hand side vector for the constrained equation. On exit, \(D\) is destroyed.

X (output)
On exit, \(X\) is the solution of the LSE problem .

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The dimension of the array W ORK. LDW ORK >= \(m a x(1, M+N+P)\). For optim um perform ance LDW ORK >= \(P+m\) in \((M, N)+m\) ax \(M, N) * N B\),w here \(N B\) is an upperbound for the optim al blocksizes forCGEQRF,CGERQF, CUNM QR and CUNMRQ.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit.
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum ent had an illegalvahue.

void zggqrf(intn, intm, intp, doublecom plex *a, int lda, doublecom plex *taua, doublecom plex *b, int ladb, doublecom plex *taub, int *info);
void zggqnf_64 (long \(n\), long m, long p, doublecom plex *a, long lda, doublecom plex *taua, doublecom plex *b, long lab, doublecom plex *taub, long *info);

\section*{PURPOSE}
zggqrf com putes a generalized \(Q R\) factorization of an \(N-b y-M\) \(m\) atrix \(A\) and an \(N\) by \(P m\) atrix \(B\) :
\[
A=Q * R, \quad B=Q * T * Z,
\]
where \(Q\) is an \(N\) boy \(N\) unitary \(m\) atrix, \(Z\) is a \(P\)-by \(P\) unitary \(m\) atrix, and \(R\) and \(T\) assum e one of the form \(s\) :
if \(N>=M, R=(R 11) M\), orif \(N<M, R=(R 11 R 12\)
) N ,
( 0 ) N M
N \(\mathrm{M}-\mathrm{N}\)
M
where R11 is uppertriangular, and
if \(\mathrm{N}<=\mathrm{P}, \mathrm{T}=(0 \mathrm{~T} 12) \mathrm{N}\), orifN \(>\mathrm{P}, \mathrm{T}=(\mathrm{T} 11\) )
\(\mathrm{N}-\mathrm{P}\),
\[
P \oplus N \quad N
\]
(T21) P
P
where T12 or T 21 is uppertriangular.
In particular, if \(B\) is square and nonsingular, the \(G Q R\) factorization of \(A\) and \(B\) im plicitly gives the \(Q R\) factorization of inv (B)*A :
\[
\operatorname{inv}(B) \star A=Z *(\operatorname{inv}(T) \star R)
\]
\(w\) here inv ( \(B\) ) denotes the inverse of the \(m\) atrix \(B\), and \(Z^{\prime}\) denotes the conjugate transpose ofm atrix \(Z\).

\section*{ARGUMENTS}

N (input) The num ber of row s of the m atrices A and B . \(\mathrm{N}>=\)
0.

M (input) The num ber of colum ns of the m atrix A. M >=0.
\(P\) (input) The num ber of colum ns of the \(m\) atrix \(B . P>=0\).

A (input/output)
On entry, the \(N\) boy \(M \mathrm{~m}\) atrix A. On exit, the ele\(m\) ents on and above the diagonal of the amay contain the \(m\) in \(\mathbb{N}, M\) )-by \(-M\) uppertrapezoidalm atrix \(R\) \((R\) is upper triangular if \(N>=M)\); the elem ents below the diagonal, w th the array TA U A , represent the unitary \(m\) atrix \(Q\) as a productofm in \((\mathbb{N}, M)\) ele\(m\) entary reflectors (see FurtherD etails).

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

TAUA (output)
The scalar factors of the elem entary reflectors \(w\) hich represent the unitary \(m\) atrix \(Q\) (see Further D etails).

B (input/output)
On entry, the N -by P m atrix B. On exit, if \(\mathrm{N}<=\) P , the upper triangle of the subaray \(B(\mathcal{N}, \mathrm{P}-\) \(\mathrm{N}+1: \mathrm{P}\) ) contains the N -by N uppertriangularm atrix
\(T\); ifN > P, the elem ents on and above the \((\mathbb{N} P)-\) th subdiagonal contain the N Hoy -P upper trapezoidal m atrix T ; the rem aining elem ents, w th the array TA UB, represent the unitary matrix Z as a product of elem entary reflectors (see Further D etails).

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, N)\).

TAUB (output)
The scalar factors of the elem entary reflectors which represent the unitary \(m\) atrix \(Z\) (see Further D etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay W ORK. LW ORK >=
\(\max (1, N, M, P)\). For optim um perform ance LW ORK \(>=\) \(\max (\mathbb{N}, \mathbb{M}, P){ }^{m} \max (\mathbb{N} 1, N B 2, N B 3)\), where \(N B 1\) is the optim al blocksize forthe QR factorization of an N toy -M m atrix, N B 2 is the optim al blocksize for the RQ factorization of an \(N\) boy \(P m\) atrix, and NB3 is the optim alblocksize for a call of CUNM QR .

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k), w \text { here } k=m \text { in }(n, m) .
\]

Each H (i) has the form
\[
H(i)=I-\operatorname{tana}{ }^{*} v^{*} v^{\prime}
\]
\(w\) here taua is a com plex scalar, and \(v\) is a com plex vector \(w\) ith \(v(1: i-1)=0\) and \(v(i)=1 ; v(i+1 m)\) is stored on exit in A \((i+1 m, i)\), and taua in TAUA (i).
To form Q explicitly, use LA PACK subroutine CUNGQR. To use Q to update another matrix, use LAPACK subroutine CUNM QR.

Them atrix \(Z\) is represented as a product of elem entary reflectors
\(Z=H(1) H(2) \ldots H(k), w\) here \(k=m\) in \((n, p)\).
Each H (i) has the form
\[
H(i)=I-\operatorname{taub} * v^{*} v^{\prime}
\]
\(w\) here taub is a com plex scalar, and \(v\) is a com plex vector \(w\) ith \(v(p-k+i+1 \mathrm{p})=0\) and \(v(p-k+i)=1 ; v(1 \mathrm{p}-k+i-1)\) is stored on exitin B ( \(n-k+i, 1\) p \(k+i-1\) ), and taub in TA U B (i). To form Z explicitly, use LAPACK subroutine CUNGRQ. To use Z to update another matrix, use LAPACK subroutine CUNMRQ.

\section*{C INTERFACE}
\#include < sunperfh>
void zggrqf(intm, intp, intn, doublecom plex *a, int lda, doublecom plex *taua, doublecom plex *b, int ladb, doublecom plex *taub, int*info);
void zggrqf_64 (long m, long p, long n, doublecom plex *a, long lda, doublecom plex *taua, doublecom plex *b, long ldb, doublecom plex *taub, long *info);

\section*{PURPOSE}
zggrqf com putes a generalized RQ factorization of an M by -N \(m\) atrix \(A\) and \(a P-b y-N m\) atrix \(B\) :
\[
A=R * Q, \quad B=Z * T * Q,
\]
where \(Q\) is an \(N\) boy \(N\) unitary \(m\) atrix, \(Z\) is a \(P\)-by \(P\) unitary \(m\) atrix, and \(R\) and \(T\) assum e one of the form \(s\) :
```

ifM <= N, R = (0 R12)M, orifM > N, R = ( R11 )

```
\(\mathrm{M}-\mathrm{N}\),
\[
\mathrm{N}-\mathrm{M} \mathrm{M} \quad \text { (R21)N }
\]

N
where R12 orR21 is upper triangular, and
if \(\mathrm{P}>=\mathrm{N}, \mathrm{T}=(\mathrm{T} 11) \mathrm{N}\), orifP \(<\mathrm{N}, \mathrm{T}=(\mathrm{T} 11 \mathrm{~T} 12\)
) P,
( 0 ) P-N
P NP
N
where T11 is upper triangular.
In particular, if \(B\) is square and nonsingular, the \(G R Q\) factorization ofA and \(B\) im plicitly gives the \(R Q\) factorization ofA *inv (B):
\[
A * \operatorname{inv}(B)=(R * \operatorname{inv}(I)) * Z^{\prime}
\]
where inv ( \(B\) ) denotes the inverse of the \(m\) atrix \(B\), and \(Z^{\prime}\) denotes the conjugate transpose of the \(m\) atrix \(Z\).

\section*{ARGUMENTS}

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).
N (input) The num ber of colum ns of the \(m\) atrioes \(A\) and \(B . N\) \(>=0\).

A (input/output)
On entry, the M -by -N m atrix A. On exit, if M <=
N , the upper triangle of the subaray A ( \(1 \mathrm{M}, \mathrm{N}\) -
\(\mathrm{M}+1 \mathrm{~N}\) ) contains the M -by -M uppertriangularm atrix
\(R\); if \(M>N\), the elem ents on and above the \(M-N\) )th subdiagonal contain the \(\mathrm{M}-\) by -N upper trapezoidal \(m\) atrix \(R\); the rem aining elem ents, \(w\) ith the amay TAUA, represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors (see Further D etails).
LDA (input)
The leading dim ension of the array A. LDA >= max (1, M).

TAUA (output)
The scalar factors of the elem entary reflectors which represent the unitary \(m\) atrix \(Q\) (see Further D etails).

B (input/output)
On entry, the \(P-b y-N m\) atrix B. On exit, the ele\(m\) ents on and above the diagonal of the array contain the \(m\) in \((\mathbb{P}, N)-b y-N\) uppertrapezoidalm atrix \(T\) ( \(T\) is upper triangular if \(P>=N\) ); the elem ents below the diagonal, w ith the amray TA U B, represent the unitary \(m\) atrix \(Z\) as a productofelem entary reflectors (see FurtherD etails).

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, P)\).

TAUB (output)
The scalar factors of the elem entary reflectors which represent the unitary \(m\) atrix \(Z\) (see Further D etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= \(m a x(1, N, M, \mathbb{P})\). For optim um perform ance LW \(O R K>=\)
\(\max (\mathbb{N}, \mathbb{M}, \mathbb{P})_{m a x}(N B 1, N B 2, N B 3)\), where NB1 is the optim al blocksize forthe \(R Q\) factorization of an M by \(-\mathrm{N} m\) atrix, NB2 is the optim al blocksize for the \(Q R\) factorization of \(P\)-by \(-N m\) atrix, and NB3 is the optim alblocksize for a callof \(C U N M R Q\).

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
< 0: if \(\mathbb{N F O}=-i\), the \(i\)-th argum enthad an illegal value.

\section*{FURTHER DETAILS}

Them atrix \(Q\) is represented as a product of elem entary reflectors
\(Q=H(1) H(2) \ldots H(k)\), where \(k=m\) in \((m, n)\).
Each H (i) has the form
\[
\mathrm{H}(\mathrm{i})=\mathrm{I}-\operatorname{tana} * \mathrm{~V}^{*} \mathrm{~V}^{\prime}
\]
where taua is a com plex scalar, and \(v\) is a complex vector \(w\) ith \(v(n-k+i+1 n)=0\) and \(v(n-k+i)=1 ; v(1 n-k+i-1)\) is stored on exitin A ( \(m-k+i, 1 n-k+i-1\) ), and taua in TAUA (i). To form \(Q\) explicitly, use LAPACK subroutine CUNGRQ. To use \(Q\) to update another \(m\) atrix, use LAPACK subroutine CUNMRQ.

Them atrix \(Z\) is represented as a product of elem entary reflectors
\[
Z=H(1) H(2) \ldots H(k), w \text { here } k=m \text { in }(p, n) .
\]

Each H (i) has the form
\[
\mathrm{H}(\mathrm{i})=\mathrm{I}-\operatorname{tanb} * \mathrm{~V}^{*} \mathrm{v}^{\prime}
\]
where taub is a com plex scalar, and \(v\) is a com plex vector w ith \(\mathrm{v}(1: i-1)=0\) and \(v(i)=1 ; \mathrm{v}(i+1: p)\) is stored on exit in B (i+1 \(\mathrm{P}, \mathrm{i}\) ), and taub in TA UB (i).
To form \(Z\) explicitly, use LAPACK subroutine CUNGQR. To use \(Z\) to update another matrix, use LAPACK subroutine CUNMQR.

\section*{C INTERFACE}
\#include < sunperfh>
void zggsvd (char j̀juu, char j̀bv, char jobq, intm, int n, int p , int *k, int *l, doublecom plex *a, int lda, doublecom plex *b, int ldb, double *alpha, double *beta, doublecom plex *u, int ldu, doublecom plex *v, int ldv, doublecom plex *q, int ldq, int *inv ork3, int*info);
void zggsvd_64 (char jobu, char jobv, char joboq, long m, long n , long p , long *k, long *l, doublecom plex *a, long lda, doublecom plex *b, long ldb, double *alpha, double *beta, doublecom plex *u, long ldu, doublecom plex *v, long ldv, doublecom plex *q, long ldq, long *iv ork3, long *info);

\section*{PURPOSE}
zggsvd com putes the generalized singularvalue decom position
(G SVD ) of an \(M-b y-N\) complex \(m\) atrix \(A\) and \(P-b y-N\) com plex \(m\) atrix B :
\[
U{ }^{*} A * Q=D 1^{*}(0 R), \quad V{ }^{*} B * Q=D 2^{\star}(0 R)
\]
\(w\) here \(U, V\) and \(Q\) are unitary \(m\) atrices, and \(Z\) ' \(m\) eans the conjugate transpose of \(Z\). Let \(K+L=\) the effective num erical rank of them atrix ( \(A\) ' \(B)^{\prime}\) ', then \(R\) is a \((K+L)\)-by- \((K+L)\) nonsingular upper triangularm atrix, D 1 and \(D 2\) are \(M\)-by-( \((\mathbb{K}+L)\) and \(\mathrm{P}-\mathrm{by}-(\mathrm{K}+\mathrm{L})\) "diagonal" \(m\) atrioes and of the follow ing structures, respectively:

If \(M \mathrm{~K}-\mathrm{L}>=0\),
```

            K L
    DI= K(I O)
            L (OC )
    M K 工 (O O )
            K L
    D2 = L (0 S )
    P-\leftharpoonup (0 0)
        NK\dashvK L
    (0R ) = K (0 R11 R12 )
L(0 0 R22)
where

```
```

C = diag(ALPHA (K+1), .., ALPHA (K+L)),
S = diag(BETA (K+1), ...,BETA (K+L)),
C**2+S**2 = I.
R is stored in A (1:K +L,N K 工+1 N ) on exit.

```

IfM \(\mathrm{K}-\mathrm{L}<0\),

K \(\mathrm{M}-\mathrm{K} \mathrm{K}+\mathrm{L}-\mathrm{M}\)
\(D 1=K\left(\begin{array}{ll}I & 0\end{array}\right)\)
\(M K(0 C 0)\)

K M -K K \(+\mathrm{L}+\mathrm{M}\)
\(D 2=M K(0 S 0)\)
\(\mathrm{K}+\mathrm{L} \mathrm{M}\) ( 0 O I )
\(\mathrm{P}-\left(\begin{array}{lll}0 & 0 & 0\end{array}\right)\)
\[
\begin{aligned}
& \mathrm{N} \text { K ـ K M K K + L } \mathrm{M} \\
& (0 R)=K(0 \quad R 11 R 12 R 13) \\
& M-K \text { ( } 0 \quad 0 \quad \text { R22 R23) } \\
& \mathrm{K}+\mathrm{L} \mathrm{M} \text { (0 0 0 R } 33 \text { ) }
\end{aligned}
\]
where
\[
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A M)), \\
& S=\operatorname{diag}(\operatorname{BETA}(K+1), \ldots, \text { BETA } M)), \\
& C \star \star 2+S \star \star 2=I .
\end{aligned}
\]
(R11 R12R13) is stored in \(A(\mathbb{M}, N-K-4+1 \mathbb{N})\), and R 33 is stored
( 0 R 22 R 23 )
in \(B(M-K+1: L, N+M-K-\longleftarrow+1 N)\) on exit.

The routine com putes \(C, S, R\), and optionally the unitary transform ation \(m\) atrices \(U, V\) and \(Q\).

In particular, if \(B\) is an \(N\) by N nonsingular \(m\) atrix, then the G SVD of A and B im plicitly gives the SVD of *inv (B):
\[
\mathrm{A} * \operatorname{inv}(\mathrm{~B})=\mathrm{U} \text { * (D 1*inv (D 2))*V '. }
\]

If ( \(A\) ' \(B\) )'has orthnorm alcolum ns, then the GSVD of A and \(B\) is also equal to the CS decom position of \(A\) and \(B\). Further\(m\) ore, the GSVD can be used to derive the solution of the eigenvalue problem :
A *A x = lam bda* B *B x.

In som e literature, the GSVD ofA and \(B\) is presented in the form
\[
\mathrm{U} * \mathrm{~A} * \mathrm{X}=(0 \mathrm{D} 1), \quad \mathrm{V} * \mathrm{~B} * \mathrm{X}=(0 \mathrm{D} 2)
\]
where U and V are orthogonaland X is nonsingular, and D 1 and D 2 are "diagonal". The form erGSVD form can be converted to the latter form by taking the nonsingularm atrix \(X\) as
\[
\begin{aligned}
X= & Q *\left(\begin{array}{ll}
I & 0
\end{array}\right) \\
& (0 \operatorname{inv}(R))
\end{aligned}
\]

\section*{ARGUMENTS}
\(J 0 \mathrm{BU}\) (input)
\(=\mathrm{U}\) : \(: \mathrm{U}\) nitary m atrix U is com puted;
\(=N^{\prime}: \mathrm{U}\) is not com puted.
\(J O B V\) (input)
\(=\mathrm{V}\) : U nitary m atrix V is com puted;
= N ': V is not com puted.
\(J O B Q\) (input)
\(=Q\) : U nitary \(m\) atrix \(Q\) is com puted;
\(=\mathrm{N}^{\prime}: \mathrm{Q}\) is notcom puted.

M (input) The num ber of row s of the m atrix \(\mathrm{A} . \mathrm{M}>=0\).
N (input) The num ber of collm ns of the \(m\) atrices \(A\) and \(B . N\) \(>=0\).
\(P\) (input) The num ber of row sof the \(m\) atrix \(B . P>=0\).

K (output)
On exit, \(K\) and L specify the dim ension of the subblocks described in Punpose. \(\mathrm{K}+\mathrm{L}=\) effective num ericalrank of (A 'B )'.

L (output)
On exit, \(K\) and \(L\) specify the dim ension of the subblocks described in Pupose. K \(+\mathrm{L}=\) effective num erical rank of (A 'B ').

A (input/output)
On entry, the M by-N m atrix A. On exit, A contains the triangularm atrix \(R\), orpartof \(R\). See
Purpose fordetails.

LD A (input)
The leading dim ension of the aray A. LDA >= \(m a x(1, M)\).

B (input/output)
On entry, the P -by-N m atrix B. On exit, B contains part of the triangularm atrix \(R\) if \(M K-4<\) 0 . Se Pupose fordetails.

LD B (input)
The leading dim ension of the array \(B . L D B>=\) \(\max (1, \mathrm{P})\).

ALPHA (output)
On exit, A LPHA and BETA contain the generalized singular value pairs of A andB;ALPHA \((1: K)=1\),
ALPHA \((1: K)=1\),
\(\operatorname{BETA}(1: K)=0\), and ifM \(K-L>=0\), ALPHA \((\mathbb{K}+1 \mathbb{K}+L)\)
= C,
BETA \((K+1 K+L)=S\), orifM \(K-L<0\), ALPHA \((K+1 M)=\)
C, ALPHA \(M+1: K+L)=0\)
\(\operatorname{BETA}(K+1 M)=S, B E T A(M+1: K+L)=1\) and
A LPHA \((\mathbb{K}+L+1 \mathbb{N})=0\)
\(\operatorname{BETA}(\mathbb{K}+\mathrm{L}+1 \mathbb{N})=0\)
BETA (output)
See description of A LPH A.

U (output)
If \(J O B U=U ', U\) contains the \(M-b y \neq M\) unitary
\(m\) atrix \(U\). If \(J O B U=N ', U\) is not referenced.
LD U (input)
The leading dim ension of the array \(U\). LD U >= \(m a x(1, M)\) if \(\mathrm{JOBU}=\mathrm{U}\) '; LD U >= 1 otherw ise.

V (output)
If \(\mathrm{JOBV}=\mathrm{V}\) ', V contains the P -by P unitary
m atrix V . If \(\mathrm{JO} \mathrm{BV}=\mathrm{N}\) ', V is not referenced.

LDV (input)
The leading dim ension of the array V . LDV >= \(\max (1, \mathrm{P})\) if \(\mathrm{JOBV}=\mathrm{V} ; \mathrm{LDV}>=1\) otherw ise.

Q (output)
If \(\mathrm{OOBQ}=\mathrm{Q}, \mathrm{Q}\) contains the N -by N unitary \(m\) atrix \(Q\). If \(J O B Q=N\) ', \(Q\) is not referenced.

LD Q (input)
The leading dimension of the array \(Q . L D Q>=\) \(\max (1, N)\) if \(J B Q=Q ; L D Q>=1\) otherw ise.

W ORK (w orkspace)
dim ension \(M A X(3 * N, M, P)+N)\)

W ORK 2 (w orkspac)
dim ension ( \(2 * \mathrm{~N}\) )

IV ORK 3 (output)
dim ension (N) On exit, \(\mathbb{I N}\) ORK 3 stores the sorting inform ation. M ore precisely, the follow ing loop w illsortA LPHA for \(I=K+1, m\) in \(M, K+L\) ) sw ap A LPHA (I) and ALPHA (IW ORK 3 (I)) endfor such that ALPHA (1) >=ALPHA (2) >= ... \(>=A L P H A(N)\).
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvahue.
\(>0\) : if \(\mathbb{N N F O}=1\), the Jacobi-type procedure failed to converge. For further details, see subroutine C TG SJA .

\#include <sunperfh>
void zggsvp (char j̀bu, char j̀bv, char jobq, intm, int p, int \(n\), doublecom plex *a, int lda, doublecom plex *b, int ldb, double tola, double tolb, int *k, int *l, doublecom plex *u, int ldu, doublecom plex *v, int ldv, doublecom plex *q, int ldq, int *info);
void zggsvp_64 (char jंbu, char jंbv, char jobq, long m, long p, long \(n\), doublecom plex *a, long lda, doublecom plex *b, long lab, double tola, double tolb, long *k, long *l, doublecom plex *u, long ldu, doublecom plex *v, long ldv, doublecom plex *q, long ldq, long *info);

\section*{PURPOSE}
zggsvp com putes unitary \(m\) atrices \(\mathrm{U}, \mathrm{V}\) and Q such that
L (0 A A23) M K \(\mathrm{L}\left(\begin{array}{lll}0 & 0 & 0\end{array}\right)\)

N K L K
\(=\mathrm{K}(0\) A12 A13) ifM \(\mathrm{K} \mathrm{L}<0\);
MK (0 0 A 23)
```

            N-KЧ K L
    V *B*Q = L (0 0 B13)
P-工 (0 0 0 )

```
where the K -by-K m atrix A 12 and L-by-L matrix B13 are nonsingularuppertriangular; A 23 is L-by-L uppertriangular if M K \(-\mathrm{l}=0\), otherw ise A 23 is \(\mathrm{M}-\mathrm{K}\) )-by-L upper trapezoidal. \(K+L=\) the effective num erical rank of the \(M+P\) )-by \(-\mathbb{N}\) m atrix
(A ', B )'. Z 'denotes the conjugate transpose of Z .

This decom position is the preprocessing step for com puting the Generalized Singular V alue D ecom position (GSVD ), see subroutine CG G SV D .

\section*{ARGUMENTS}

JOBU (input)
= U ': U nitary matrix U is com puted;
\(=\mathrm{N}^{\prime}: \mathrm{U}\) is not com puted.

JO BV (input)
\(=\mathrm{V}\) : U nitary m atrix V is com puted;
\(=\mathrm{N}: \mathrm{V}\) is not com puted.
\(J O B Q\) (input)
\(=Q\) : U nitary m atrix Q is com puted;
\(=\mathrm{N}^{\prime}: \mathrm{Q}\) is notcom puted.
M (input) The num ber of row s of the matrix \(\mathrm{A} . \mathrm{M}>=0\).

P (input) The num ber of row sof the matrix B. P \(>=0\).

N (input) The num ber of colum ns of the \(m\) atrioes \(A\) and \(B\). \(N\) \(>=0\).

A (input/output)
On entry, the M by-N matrix A. On exit, A contains the triangular (or trapezoidal) matrix described in the Purpose section.

LD A (input)
The leading dim ension of the array A. LD A >= max (1,M).

B (input/output)
On entry, the \(P-b y-N m\) atrix B. On exit, B contains the triangularm atrix described in the Purpose section.

LD B (input)
The leading dim ension of the array \(\mathrm{B} . \mathrm{LDB}>=\) \(\max (1, P)\).

\section*{TOLA (input)}

TOLA and TOLB are the thresholds to determ ine the effective num erical rank ofm atrix \(B\) and a subblock of A. Generally, they are set to TOLA = \(\mathrm{MAX}(\mathrm{M}, \mathrm{N}) \star\) norm ( A\() \star \mathrm{M}\) ACHEPS, TOLB = \(M A X(\mathbb{P} N){ }^{*}\) norm ( \(\left.B\right)^{*}\) M ACHEPS. The size of TOLA and TO LB m ay affect the size of backw ard errors of the decom position.

TOLB (input)
See description of TO LA .

K (output)
On exit, \(K\) and L specify the dim ension of the subblocks described in Purpose section. \(\mathrm{K}+\mathrm{L}=\) effective num erical rank of (A ', \(\mathrm{B}^{\prime}\) )'.

L (output)
See the description ofK .

U (input) If \(\mathrm{OB} \mathrm{U}=\mathrm{U}\) ', U contains the unitary matrix U . If \(\mathrm{OBBU}=\mathrm{N}\) ', U is notreferenced.

LD U (input)
The leading dim ension of the array \(\mathrm{U} . \operatorname{LDU}>=\) \(\max (1, M)\) if \(\mathrm{OB} U=U ' ; L D U>=1\) otherw ise.

V (input) If \(\mathrm{OBV}=\mathrm{V}\) ', V contains the unitary matrix V . If \(\mathrm{OBV}=\mathrm{N}^{\prime}\), \(V\) is notreferenced.

LDV (input)
The leading dim ension of the array \(\mathrm{V} . \mathrm{LDV}>=\) \(\mathrm{max}(1, \mathrm{P})\) if \(\mathrm{OBV}=\mathrm{V} ; \mathrm{LDV}>=1\) otherw ise.
\(Q\) (input) If \(O B Q=Q\) ' \(Q\) contains the unitary \(m\) atrix \(Q\). If \(\mathrm{OBQ}=\mathrm{N}^{\prime}, \mathrm{Q}\) is notreferenced.

LD Q (input)
The leading dim ension of the array \(\mathrm{Q} \cdot \mathrm{LDQ}>=\) \(\max (1, N)\) if \(\mathrm{OBQ}=\mathrm{Q} ; \mathrm{LD} Q>=1\) otherw ise.

IW ORK (w orkspace)
dim ension \(\mathbb{N}\) )

RW ORK (w orkspace)
dim ension \((2 * N)\)

TAU (w orkspace)
dim ension \((\mathbb{N})\)
W ORK (w orkspace)
dim ension \(M A X(3 * N, M, P))\)
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue.

\section*{FURTHER DETAILS}

The subroutine uses LA PACK subroutine CGEQPF for the QR factorization \(w\) ith column pivoting to detect the effective num erical rank of the a \(m\) atrix. It \(m\) ay be replaced by a better rank determ ination strategy.

zgssfa -G eneral sparse solvernum eric factorization.

\section*{SYNOPSIS}

SUBROUTINE ZGSSFA (NEQNS,COLSTR,ROW \(\mathbb{N D}, V A L U E S, H A N D L E, \mathbb{E R}\) )
\(\mathbb{N} T E G E R \quad\) NEQNS, COLSTR (*),ROW \(\mathbb{N D}(*), \mathbb{E R}\)
DOUBLE COM PLEX VALUES (*)
DOUBLE PRECISION HANDLE (150)

\section*{PURPOSE}

ZGSSFA -N um eric factorization of a sparse m atrix.

\section*{PARAMETERS}

NEQNS - \(\mathbb{N}\) TEGER
On entry, NEQNS specifies the num ber of equations in coefficientm atrix. U nchanged on exit.
\(\operatorname{COLSTR}\left(^{*}\right)-\mathbb{N}\) TEG ER array
On entry, \(\operatorname{COLSTR}\left(^{*}\right)\) is an array of size \((\mathbb{N} E \mathrm{~N}+1\) ), containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND ( \(\left.{ }^{( }\right)-\mathbb{N}\) TEGER array
On entry, ROWIND ( \({ }^{*}\) ) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the indices of the \(m\) atrix structure. U nchanged on exit.

VALUES (*) -D OUBLE COM PLEX aray
On entry, VALUES (*) is an array of size
CO LSTR (NEQNS+1)-1, containing the num eric values of
the sparse \(m\) atrix to be factored. U nchanged on exit.

HANDLE (150) -D OUBLE PRECISIO N array On entry, HANDLE (*) is an array containing inform ation needed by the solver, and \(m\) ust.be passed unchanged to each sparse solver subroutine. M odified on exit.
\(\mathbb{E R} \quad-\mathbb{N} T E G E R\)
Errornum ber. If no emrorencountered, unchanged on exit. If errorencountered, it is set to a non-zero integer. Enrornum bers set.by this subroutine:
-300 : Invalid calling sequence - need to call Z G SSO R first.
-301 : Failure to dynam ically allocate \(m\) em ory.
-666 : Intemalenror.

\section*{NAME}
zgssis -G eneral sparse solver one call interface.

\section*{SYNOPSIS}

> SUBROUTINE ZGSSFS (M TXTYP,PIVOT,NEQNS,COLSTR,ROW \(\mathbb{N} D\), VALUES,NRHS,RHS ,LDRHS,ORDMTHD, OUTUNT,MSGLVL,HANDLE, \(\mathbb{E R}\) )

CHARACTER*2 M TXTYP
CHARACTER*1 PIVOT
\(\mathbb{N}\) TEGER NEQNS,COLSTR (*),ROW \(\mathbb{N} D\left({ }^{*}\right)\),NRHS,LDRHS, OUTUNT,MSGLVL, \(\mathbb{E R}\)
CHARACTER*3 ORDMTHD
D OUBLE COM PLEX VALUES (*), RHS (*)
DOUBLE PRECISION HANDLE (150)

\section*{PURPOSE}

ZGSSFS -G eneral sparse solver one call interface.

\section*{PARAMETERS}

MTXTYP -CHARACTER*2
On entry, M TX TY P specifies the coefficientm atrix
type. Specifically, the valid options are:
Sp 'or SP '-sym m etric structure, H erm itian positive definite
values
ss'or SS '-sym m etric structure, sym \(m\) etric values
su 'or SU '-sym m etric structure, unsym \(m\) etric values
uu 'or UU '-unsym \(m\) etric structure, unsym \(m\) etric values
U nchanged on exit.

\section*{PIVOT -CHARACTER*1}

O n entry, pivot specifies w hether ornotpivoting is used in the course of the num eric factorization. The valid options are:
h'or \(\mathrm{N}^{\prime}\)-no pivoting is used
(Pivoting is not supported forthis release).
U nchanged on exit.

\section*{NEQNS - \(\mathbb{N}\) TEGER}

On entry, NEQNS specifies the num ber ofequations in the coefficientm atrix. N EQ N S m ustbe at leastone. U nchanged on exit.

\section*{\(\operatorname{COLSTR}\) ( \(\left.^{*}\right)-\mathbb{N}\) TEG ER anay}

On entry, COLSTR (*) is an array of size \(\operatorname{NEQNS+1),~}\) containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND (*) - \(\mathbb{N}\) TEG ER array
On entry, ROWIND ( \({ }^{\star}\) ) is an array of size COLSTR \(\mathbb{N E Q N S + 1 ) - 1 , ~ c o n t a i n i n g ~ t h e ~ i n d i c e s ~ o f ~ t h e ~}\) \(m\) atrix structure. U nchanged on exit.

\section*{VALUES (*) -D OUBLE COM PLEX aray}

On entry, VALUES (*) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1)-1\), containing the non-zero num eric values of the sparse \(m\) atrix to be factored. U nchanged on exit.

NRHS - \(\mathbb{N}\) TEGER
On entry, N RH S specifies the num ber of righthand sides to solve for. U nchanged on exit.

RHS (*) -DOUBLE COM PLEX amay
On entry, RH S (LD RH S NRHS) contains the NRH S right hand sides. On exit, it contains the solutions.

LDRHS - \(\mathbb{N}\) TEGER
On entry, LD RH S specifies the leading dim ension of the RH S array. U nchanged on exit.

ORDMTHD -CHARACTER*3
On entry, ORDM THD specifies the fill-reducing ordering to be used by the sparse solver.
Specifically, the valid options are:
hat'or NA T '-natural ordering (no ordering) mmd'or M M D'-multiplem inim um degree
gnd 'or GND '-general nested dissection
uso 'or USO '-user specified ordering (see ZG SSU O )
U nchanged on exit.

OUTUNT - \(\mathbb{N}\) TEGER
O utputunit. U nchanged on exit.
M SGLVL - \(\mathbb{N}\) TEGER
M essage level.

0 -no output from solver.
( \(N\) o m essages supported for this release.)
U nchanged on exit.
HANDLE (150) -DOUBLE PRECISIO N aray
On entry, HANDLE (*) is an array of containing
inform ation needed by the solver, and \(m\) ustbe passed
unchanged to each sparse solver subroutine.
M odified on exit.
\(\mathbb{E R} \quad-\mathbb{N} T E G E R\)
Enrornum ber. If no errorencountered, unchanged on
exit. If emorencountered, it is set to a non-zero
integer. Errornum bers set.by this subroutine:
-101: Failure to dynam ically allocate mem ory.
-102 : Invalid m atrix type.
-103 : Invalid pivotoption.
-104: N um berofnonzeros is less than N EQ N S .
-105: NEQNS < 1
-201 : Failure to dynam ically allocate \(m\) em ory.
-301 : Failure to dynam ically allocate \(m\) em ory.
-401 : Failure to dynam ically allocate \(m\) em ory.
-402 :NRHS < 1
-403 : NEQN S > LD RHS
-666 : Intemalerror.

\section*{Contents}

CHARACTER*1 PIVOT
\mathbb{NTEGER NEQNS,COLSTR (*),ROW IND (*),OUTUNT,MSGLVL,\mathbb{ER}}\mathbf{N}\mathrm{ (*)}
DOUBLE PRECISION HANDLE (150)

```

\section*{PURPOSE}

ZGSSIN -Initialize the sparse solver and input the m atrix
structure.

\section*{PARAMETERS}

\section*{MTXTYP -CHARACTER*2}

On entry, M TX TY P specifies the coefficientm atrix type. Specifically, the valid options are:

Sp 'or SP '-sym m etric structure, H erm itian positive definite
ss'or SS '-sym m etric structure, sym m etric values
su 'or SU '-sym m etric structure, unsym \(m\) etric values
uu 'or UU '-unsym \(m\) etric structure, unsym \(m\) etric values
U nchanged on exit.

On entry, PIV OT specifies whetherornotpivoting is
used in the course of the num eric factorization.
The valid options are:
h'or \(\mathrm{N}^{\prime}\)-no pivoting is used
(Pivoting is not supported forthis release).

U nchanged on exit.
NEQNS - \(\mathbb{N} T E G E R\)
On entry, NEQNS specifies the num berofequations in the coefficientm atrix. N EQ N S m ustbe at leastone. U nchanged on exit.
\(\operatorname{COLSTR}\) ( \(\left.^{*}\right)-\mathbb{N}\) TEG ER amay
On entry, \(\operatorname{COLSTR}\) ( \({ }^{*}\) ) is an array of size \(\mathbb{N E Q N S + 1 ) \text { , }}\) containing the pointers of them atrix structure.
U nchanged on exit.
ROWIND ( \({ }^{\star}\) ) - \(\mathbb{N}\) TEG ER array
On entry, ROWIND ( \({ }^{\star}\) ) is an array of size
CO LSTR \(\mathbb{N} E Q N S+1\) )-1, containing the indices of the \(m\) atrix structure. U nchanged on exit.

HANDLE (150) -D OUBLE PRECIS IO N array
On entry, \(H A N D L E\) (*) is an array containing inform ation needed by the solver, and \(m\) ust.be passed unchanged to each sparse solver subroutine. M odified on exit.

OUTUNT - \(\mathbb{N}\) TEGER
O utputunit. U nchanged on exit.

M SGLVL - \(\mathbb{N}\) TEGER
M essage level.
0 -no output from solver.
(N o m essages supported for this release.)
U nchanged on exit.
\(\mathbb{E R} \quad\) - \(\mathbb{N}\) TEGER
Enrornum ber. If no errorencountered, unchanged on
exit. If emrorencountered, it is set to a non-zero
integer. Enrornum bers setby this subroutine:
-101: Failure to dynam ically allocate mem ory.
-102 : Invalid m atrix type.
-103 : Invalid pivotoption.
-104 : N um berofnonzeros less than N EQ N S .
-105:NEQNS<1

\#include <sunperfh>
void zgtoon (charnorm, intn, doublecom plex *low, doublecom plex *diag, doublecom plex *up1, doublecom plex *up2, int*ipivot, double anorm, double *roond, int*info);
void zgtcon_64 (charnorm , long n, doublecom plex *low , doublecom plex *diag, doublecom plex *up1, doublecom plex *up2, long *ipivivot, double anorm, double *roond, long *info);

\section*{PURPOSE}
zgtcon estim ates the reciprocal of the condition num ber of a com plex tridiagonal matrix A using the LU factorization as com puted by CG TTRF.

A \(n\) estim ate is obtained fornorm (inv (A )), and the reciprocal of the condition num ber is com puted as RCOND \(=1 /\) (ANORM * norm (inv (A))).

\section*{ARGUMENTS}

NORM (input)
Specifies w hether the 1-norm condition number or
the infinity-norm condition num ber is required:
= 1 'or \(0^{\prime}\) : 1 -nom ;
= I': Infinity-norm.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

LOW (input)
The \((n-1) m\) ultipliers that define the \(m\) atrix \(L\)
from the LU factorization of \(A\) as com puted by
CGTTRF.

D IA G (input)
The \(n\) diagonalelem ents of the upper triangular \(m\) atrix \(U\) from the \(L U\) factorization ofA .

UP1 (input)
The ( \(n-1\) ) elem ents of the first superdiagonal of U .

UP2 (input)
The ( \(n-2\) ) elem ents of the second superdiagonal of U.

IPIVOT (input)
The pivotindiges; for \(1<=i<=n\), row \(i\) of the matrix was interchanged w ith row \(\mathbb{P I V O T}(i)\). \(\mathbb{P} \mathbb{V} O T\) (i) will alw ays be either \(i\) or \(i+1\); \(\mathbb{P} \mathbb{I V O T}\) (i) = iindicates a row interchange w as not required.

ANORM (input)
IfNORM = I'or \(\mathrm{D}^{\prime}\) ', the 1-norm of the original \(m\) atrix \(A\). If NORM = ' 1 ', the infinity-norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition num ber of the \(m\) atrix \(A\), com puted as \(R C O N D=1 /(A N O R M * A \mathbb{N V N M})\),
\(w\) here \(A \mathbb{N} V N M\) is an estim ate of the 1 -norm of inv (A) com puted in this routine.

W ORK (w orkspace)
dim ension \((2 * N)\)
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N ~ F O ~ = ~ - i , ~ t h e ~ i - t h ~ a r g u m ~ e n t h a d ~ a n ~ i l l e - ~}\) galvalue

\section*{PURPOSE}
zgtrfs im proves the com puted solution to a system of linear equations w hen the coefficientm atrix is tridiagonal, and provides errorbounds and backw ard errorestim ates for the solution.

\section*{ARGUMENTS}

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}\) ': A * \(\mathrm{X}=\mathrm{B} \quad\) ( o transpose)
\(=T\) ': A ** \(T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (Conjugate transpose)
TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS >=0.

LOW (input)
The \((n-1)\) subdiagonalelem ents of .

D IA G (input)
The diagonalelem ents ofA .

UP (input)
The \((n-1)\) superdiagonalelem ents of .
LOW \(F\) (input)
The ( \(n-1\) ) multipliers that define the \(m\) atrix \(L\) from the LU factorization of A as com puted by CGTTRF.

D IA GF (input)
Then diagonalelem ents of the upper triangular \(m\) atrix \(U\) from the LU factorization ofA.

UPF1 (input)
The \((n-1)\) elem ents of the first superdiagonal of U.

UPF2 (input)
The \((n-2)\) elem ents of the second superdiagonal of U.
\(\mathbb{P I V O T}\) (input)
The pivotindioes; for \(1<=i<=n\), row \(i\) of the \(m\) atrix \(w a s\) interchanged \(w\) th row \(\mathbb{P I V O T}(i)\). IPIVOT (i) will always be either \(i\) or i+1; PIVOT (i) = iindicates a row interchange was not required.
\(B\) (input) The righthand side \(m\) atrix \(B\).

\section*{LD B (input)}

The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).

\section*{X (input/output)}

O \(n\) entry, the solution \(m\) atrix \(X\), as com puted by CG TTRS. On exit, the im proved solution \(m\) atrix \(X\). LD X (input)

The leading dim ension of the array X. LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(\mathrm{X}(\mathcal{)}, \mathrm{FERR}(\mathcal{)}\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vector \(X(\mathcal{i})\) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )

W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N N}\) FO \(=-\) i, the i-th argum enthad an ille-
galvalue

\section*{PURPOSE}
zgtsv solves the equation
where \(A\) is an \(N\)-by \(\mathrm{N}_{\mathrm{N}}\) tridiagonalm atrix, by G aussian elim ination w ith partialpivoting.

Note that the equation A *X = B may be solved by interchanging the order of the argum ents \(\mathrm{D} U\) and \(\mathrm{D} L\).

\section*{ARGUMENTS}

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

LOW (input/output)
On entry, LOW m ust contain the ( \(n-1\) ) subdiagonal elem ents ofA. On exit, LOW is overw ritten by the ( \(n-2\) ) elem ents of the second superdiagonal of the upper triangular \(m\) atrix \(U\) from the \(L U\) factorization ofA, in LOW (1), ..., LOW (n-2).

D IA G (input/output)
On entry, D IA G m ust contain the diagonal elem ents of A. On exit, D IA G is overw rilten by the \(n\) diagonalelem ents ofU .

UP (input/output)
O n entry, UP m ust contain the ( \(n-1\) ) superdiagonal elem ents of A. On exit, UP is overw ritten by the \((n-1)\) elem ents of the first superdiagonalof \(U\).

B (input/output)
On entry, the \(N-b y-N R H S\) righthand side \(m\) atrix \(B\).
On exit, if \(\mathbb{N F O}=0\), the \(N\) by-NRH S solution \(m\) atrix \(X\).

The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{N F O}\) (output)
= 0 : successfiulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=\mathrm{i}, \mathrm{U}(i, i)\) is exactly zero, and the solution has notbeen com puted. The factorization has notbeen com pleted unless \(i=N\).

\#include <sunperfh>
void zgtsvx (char fact, chartransa, intn, int nihs, doublecom plex *low , doublecom plex *diag, doublecom plex *up, doublecom plex *low f, doublecom plex *diagf, doublecom plex *upfl, doublecom plex *upf2, int *ịíivot, doublecom plex *b, int ldb, doublecom plex *x, int ldx, double *roond, double *ferr, double *berr, int*info);
void zgtsvx_64 (char fact, char transa, long n, long nus, doublecom plex *low, doublecom plex *diag, doublecom plex *up, doublecom plex *low f, doublecom plex *diagf, doublecom plex *upfl, doublecom plex *upf2, long *ipìivot, doublecom plex *b, long lab, doublecom plex *x, long ldx, double *rcond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zgtsvx uses the LU factorization to com pute the solution to a complex system of linearequations \(\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{A} * * \mathrm{~T} * \mathrm{X}=\) \(B\), or \(A * * H\) * \(X=B\), where \(A\) is a tridiagonalm atrix of order

N and X and B are N boy N R H S m atrioes.

E morbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=\mathrm{N}\) ', the LU decom position is used to factor the \(m\) atrix A
as \(A=L * U\), where \(L\) is a product of perm utation and unitlow er
bidiagonal \(m\) atrices and \(U\) is upper triangular \(w\) ith nonzeros in
only the m ain diagonal and firsttw o superdiagonals.
2. If som e \(U(i, i)=0\), so that \(U\) is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the reciprocal of the condition num ber is less than machine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve forX and com pute error bounds as described below.
3.The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for 五.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornot the factored form of A
has been supplied on entry \(.=F ': L O W\) F , D IA GF, UPF1, UPF2, and IPIVOT contain the factored form of \(A\); LOW , D \(\mathbb{A} G\), UP, LOW F, D IA GF, UPF1, UPF2 and \(\mathbb{P} \mathbb{I V}\) O T w illnotbe m odified. \(=\mathrm{N}\) ': The m atrix w ill be copied to LOW F, D IA GF , and UPF1 and factored.

TRANSA (input)
Specifies the form of the system of equations:
\(=N\) ': A * \(\mathrm{X}=\mathrm{B} \quad\) (Notranspose)
\(=T: A * * T * X=B \quad\) ( ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

N (input) The order of the matrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the m atrix B. NRHS >=0.

LOW (input)
The \((n-1)\) subdiagonalelem ents ofA.
D IA G (input)
The \(n\) diagonalelem ents of \(A\).
UP (input/output)
The ( \(n-1\) ) superdiagonalelem ents of \(A\).
LOW F (input/output)
IfFACT = F ', then LOW F is an inputargum ent and on entry contains the ( \(n-1\) ) multipliers that define the \(m\) atrix \(L\) from the \(L U\) factorization of \(A\) as com puted by CGTTRF.

IfFACT \(=\mathrm{N}\) ', then LOW F is an outputargum ent and on exit contains the ( \(n-1\) ) m ultipliers that define them atrix \(L\) from the LU factorization of A.

D IA GF (input/output)
If \(F A C T=F\) ', then \(D I A G F\) is an input argum ent and on entry contains the n diagonalelem ents of the uppertriangularm atrix \(U\) from the LU factorization ofA.

IfFACT = \(N\) ', then \(D I A G F\) is an output argum ent and on exit contains the \(n\) diagonalelem ents of the upper triangularm atrix \(U\) from the \(L U\) factorization ofA .

UPF1 (input/output)
IfFACT = F ', then UPF 1 is an input argum ent and on entry contains the ( \(n-1\) ) elem ents of the first superdiagonalof \(U\).

IfFA C T = N ', then UPF1 is an outputargum ent and on exit contains the ( \(n-1\) ) elem ents of the first
superdiagonalofU.

UPF2 (input/output)
IfFACT = \(\mathrm{F}^{\prime}\), then UPF 2 is an input argum ent and on entry contains the ( \(n-2\) ) elem ents of the second superdiagonalofU .

IfFACT = \(N\) ', then UPF2 is an output argum ent and on exit contains the ( \(n-2\) ) elem ents of the second superdiagonalofU.

IPIVOT (input/output)
IfFACT= \(\mathrm{F}^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an input argum ent and on entry contains the pivot indices from the LU factorization of A as com puted by CGTTRF.

IfFACT \(=\mathrm{N}\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exit contains the pivot indioes from the LU factorization of ; row iof the \(m\) atrix \(w\) as inter changed w ith row \(\mathbb{P I V O T}\) (i). \(\mathbb{P} \mathbb{I V O T}\) (i) w illalw ays be either ior i+ \(1 ; \mathbb{P} \mathbb{V} O T(i)=i\) indicates a row interchange w as not required.
\(B\) (input) The \(N\) by -N RH \(S\) righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\)-by-NRH \(S\) solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the aray X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condtion num ber of the \(m\) atrix \(A\). IfRCOND is less than the \(m\) achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0 .

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})\) is an estim ated
upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{j})\)-XTRUE) divided by the magnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )

W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N}\) FO (output)
= 0 : successfulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvahue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{U}(i, i)\) is exactly zero. The factorization has notbeen com pleted unless \(i=N\), but the factorU is exactly singular, so the solution and error bounds could notbe com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, but RCOND is less than \(m\) achine precision, \(m\) eaning that the \(m\) atrix is singular to working precision. N evertheless, the solution and emorbounds are com puted because there are a num ber of situations where the com puted solution can be m ore accurate than the value ofRCON D w ould suggest.

void zgttrf_ 64 long \(n\), doublecom plex *low , doublecom plex *diag, doublecom plex *up1, doublecom plex *up2, long *ipivot, long *info);

\section*{PURPOSE}
zgttrf com putes an LU factorization of a com plex tridiagonal \(m\) atrix A using elim ination w ith partialpivoting and row interchanges.
The factorization has the form
\[
A=L * U
\]
where \(L\) is a product of perm utation and unit low er bidiagonalm atrices and \(U\) is upper triangularw ith nonzeros in only the \(m\) ain diagonal and first tw o superdiagonals.

\section*{ARGUMENTS}

N (input) The order of the m atrix A.
LOW (input/output)
On entry, LOW m ustcontain the ( \(n-1\) ) sub-diagonal elem ents ofA.

On exit, LOW is overw ritten by the ( \(n-1\) ) multipliers that define the \(m\) atrix \(L\) from the \(L U\) factorization of A.

D IA G (input/output)
On entry, D IA G m ust contain the diagonal elem ents of A.

On exit, D IA G is overw rilten by the n diagonal elem ents of the upper triangularm atrix \(U\) from the LU factorization ofA.

UP1 (input/output)
On entry, UP1 must contain the ( \(n-1\) ) superdiagonalelem ents ofA.

On exit, UP1 is overw rilten by the ( \(n-1\) ) elem ents of the first super-diagonalof \(U\).

UP2 (output)
On exit, UP2 is overw rilten by the ( \(n-2\) ) elem ents of the second super-diagonalofU .

IPIVOT (output)
The pivotindioes; for \(1<=i<=n\), row \(i\) of the \(m\) atrix \(w a s\) interchanged \(w\) th row \(\mathbb{P I V O T}\) (i). PIVOT (i) will alw ays be either \(i\) or i+1; PIVOT (i) = iindicates a row interchange \(w\) as not required.
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
< 0: if \(\mathbb{N} F O=-\mathrm{k}\), the k -th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=k, U(k, k)\) is exactly zero. The factorization has been com pleted, but the factor \(U\) is exactly singular, and division by zero will occur if it is used to solve a system ofequations.

zhbev com putes all the eigenvalues and, optionally, eigenvectors of a com plex H erm itian band m atrix A .

\section*{ARGUMENTS}

JOBZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.
UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
KD (input)
The num ber of superdiagonals of the \(m\) atrix A if UPLO = U',orthe num berof subdiagonals ifU PLO \(=\mathrm{L} \cdot \mathrm{KD}>=0\).

A (input/output)
O n entry, the upper or low ertriangle of the Her \(m\) itian band \(m\) atrix \(A\), stored in the firstK \(D+1\) row s of the amay. The \(j\) th colum \(n\) of A is stored in the \(j\) th colum n of the a may \(A\) as follow \(s\) : if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{A}(\mathrm{kd}+1+i-j)=A(i, j)\) for \(\mathrm{max}(1, j\) \(\mathrm{kd})<=i<=j\) if UPLO \(=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)\)
for \(\dot{j}=i<=m\) in \((n, j+k d)\).
On exit, A is overw rilten by values generated during the reduction to tridiagonal form. If P PLO = U ', the first superdiagonal and the diagonal of the tridiagonal \(m\) atrix \(T\) are retumed in row sK D and \(K D+1\) ofA, and if \(U P L O=L\) ', the diagonaland first subdiagonal of T are retumed in the first tw o row sofA.

LD A (input)
The leading dim ension of the array A. LD A >= KD + 1.

W (output) If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

Z (input) If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N F O}=0, \mathrm{Z}\) contains the orthonom aleigenvectors of the \(m\) atrix \(A, w\) ith the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w th \(W\) (i). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced.

LD Z (input)
The leading dim ension of the amray Z . LD \(\mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z \(>=\mathrm{max}(1, N)\).

W ORK (w orkspace)
dim ension (N)
W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
\(\mathbb{N} F O\) (output)
= 0 : successfulexit.
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvahue.
> 0 : if \(\mathbb{N} F O=\) i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

void zhbevd_64 (char jobz, charuplo, long n, long kd, doublecom plex *ab, long ldab, double *w , doublecom plex *z, long Idz, long *info);

\section*{PURPOSE}
zhbevd com putes all the eigenvalues and, optionally, eigenvectors of a com plex H erm titian band \(m\) atrix A. Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the C ray \(X-M P, C\) ray Y M P , C ray C-90, or C ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

\section*{ARGUMENTS}

JOBZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.
UPLO (input)
= U ': U pper triangle ofA is stored;
= L' : Low ertriangle ofA is stored.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
\(K D\) (input)
The num ber of superdiagonals of the \(m\) atrix A if UPLO \(=\mathrm{U}\) ', orthe num berof subdiagonals if UPLO \(=L^{\prime} . K D>=0\).

AB (input/output)
O \(n\) entry, the upper or low er triangle of the Her\(m\) itian band \(m\) atrix \(A\), stored in the firstKD +1 row sof the array. The \(j\) th colum n of \(A\) is stored in the \(j\) th colum \(n\) of the array \(A B\) as follow \(s\) : if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{j}(i, 1)\) for \(\mathrm{max}(1, j\) \(\mathrm{kd})<=i<=\dot{j}\) if \(\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j, 7)=A(i, j)\) for \(j=i<=m\) in \((n, j+k d)\).
On exit, AB is overw rilten by values generated during the reduction to tridiagonal form. IfU PLO \(=\mathrm{U}\) ', the first superdiagonal and the diagonal of the tridiagonal m atrix T are retumed in row sKD and \(K D+1\) of \(A B\), and if \(U P L O=L\) ', the diagonal and first subdiagonal of \(T\) are retumed in the first tw o row sofA B .

LDAB (input)
The leading dim ension of the array AB. LD A B > \(>=K D\) +1 .

W (output) If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.
\(Z\) (input) If \(\mathcal{O B Z}=\mathrm{V}\) ', then if \(\mathbb{N} F O=0, \mathrm{Z}\) contains the orthonorm aleigenvectors of the \(m\) atrix \(A, w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated \(w\) th \(W\) (i). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced.

LD \(Z\) (input)
The leading din ension of the array \(\mathrm{Z} . \operatorname{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z \(>=\mathrm{max}(1, N)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. If \(\mathrm{N}<=1\), LW ORK must be at least1. If \(J 0 B Z=N\) 'and \(N>\) 1, LW ORK m ust.be at leastN. If JO BZ \(=\mathrm{V}\) 'and N > 1, LW ORK m ustbe at least \(2 * N\) **2.

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On exit, if \(\mathbb{I N} F O=0, R W O R K(1)\)
retums the optim allRW ORK.
LRW ORK (input)
The dimension of array RW ORK. If \(\mathrm{N}<=1\), LRW ORK mustibe at least 1. If \(\mathrm{JOBZ}=\mathrm{N}\) 'and \(\mathrm{N}>\) 1, LRW ORK m ustbe at leastN. If JO B Z \(=\mathrm{V}\) 'and N > 1,LRW ORK m ust.be at least1 + 5*N + 2*N **2.

If LRW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK amray, retums this value as the first entry of the RW ORK amay, and no enorm essage related to LRW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N}\) FO \(=0, \mathbb{I N}\) ORK (1) retums the optim al LIN ORK.

LIN ORK (input)
The dim ension of array \(\mathbb{I N}\) ORK. If JOBZ = N 'or N \(<=1, \mathrm{LIV} O R K\) mustbe at least1. If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\) and \(N>1, L \mathbb{I}\) ORK m ustbe at least \(3+5{ }^{*} N\).

If \(L \mathbb{I V} O R K=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W} O R K\) array, and no errorm essage related to LIIN ORK is issued by X ERBLA.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit.
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvahue. > 0 : if \(\mathbb{N} F O=\) i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

\section*{PURPOSE}
zhbevx com putes selected eigenvalues and, optionally, eigenvectors of a com plex \(H\) erm itian band matrix A. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

\section*{ARGUMENTS}

JOBZ (input)
\(=\mathrm{N}\) ': C om pute eigenvahues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A : alleigenvalues w illibe found;
\(=\mathrm{V}\) ::alleigenvalues in the half-open interval
(NL,VU] will be found; = 'I': the \(\mathbb{L}\)-th through
\(\mathbb{I J}\)-th eigenvaluesw illlbe found.

UPLO (input)
= U ': U ppertriangle ofA is stored;
\(=\mathrm{L}\) ': Low er triangle of A is stored.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).
KD (input)
The num ber of superdiagonals of the \(m\) atrix A if UPLO = U', orthe num berof subdiagonals if UPLO \(=\mathbb{L}^{\prime} . \mathrm{KD}>=0\).

A (input/output)
On entry, the upper or low er triangle of the Her\(m\) itian band \(m\) atrix \(A\), stored in the firstKD +1 row sof the array. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the amay A as follows: if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{A}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{A}(i, j)\) for max \((1, j\) \(\mathrm{kd})<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}, \mathrm{A}(1+i-j, j)=A(i, j)\) for \(j=i<=m\) in \((n, j+k d)\).

On exit, A is overw rilten by values generated during the reduction to tridiagonal form .

LD A (input)
The leading dim ension of the amray A. LD A >=KD + 1.

Q (output)
If \(\mathrm{JOBZ}=\mathrm{V}\) ', the N -by-N unitary m atrix used in the reduction to tridiagonal form. If \(J 0 B Z=N\) ', the array Q is not referenced.

LD Q (input)
The leading dim ension of the array \(Q\). If \(\operatorname{JOBZ}=\) V ', then LD \(Q>=\max (1, N)\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU.
N ot referenced ifRANGE = A 'or I'.
VU (input)

IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA N G E = A' 'or I'.

II (input)
IfRA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{U}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE= A 'or V'.
UU (input)
IfRA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0 ; \mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE= A 'or V'.

ABTOL (input)
The absolute error tolerance for the eigenvalues. A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to \(l i e\) in an interval [a,b]
of w idth less than orequal to
ABTOL + EPS * \(\max (k|,||\),\() ,\)
where EPS is them achine precision. If ABTOL is less than or equal to zero, then EPS* \(\mid\) |w illbe used in its place, where \(T\) | is the 1 -norm of the tridiagonal m atrix obtained by reducing \(A\) to tridiagonalform .

E igenvalues w illbe com puted m ost accurately when
ABTOL is set to tw ice the underflow threshold \(2 * S L A M C H\) ( \({ }^{\eta}\) ), not zero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABTOL to 2 *SLAM CH (S ).

See "C om puting Sm allSingularV alues ofB idiagonal M atrices w ith G uaranteed H igh Relative A ccuracy," by D em m eland K ahan, LA PA CK W orking N ote \#3.

NFOUND (output)
The total num ber of eigenvalues found. \(0<=\)
NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE = 'I',NFOUND = \(\mathbb{U}-\mathbb{L}+1\).

W (output)
The firstNFOUND elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(J O B Z=V '\), then if \(\mathbb{N} F O=0\), the first \(N F O U N D\) colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A corresponding to the selected eigenvalues, \(w\) ith the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w ith \(W\) (i). If an eigenvector fails to converge, then that colum n of \(Z\) contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in FAII. If \(J O B Z=N\) ', then \(Z\) is not referenced.
\(N\) ote: the user must ensure that at least
\(\max (1, N F O U N D)\) colum ns are supplied in the anray \(Z\); if RANGE = V', the exact value ofNFOUND is not know \(n\) in advance and an upperbound \(m\) ustbe used.

LD Z (input)
The leading \(d i m\) ension of the array \(Z\). LD \(Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
dim ension (N)

W ORK 2 (w orkspace)
dim ension ( \(7 * \mathrm{~N}\) )

IV ORK 3 (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )
FFA II (output)
If \(\mathrm{JOBZ}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), the first NFOUND
elem ents of \(\mathbb{F A} I I\) are zero. If \(\mathbb{N} F O>0\), then
FAII contains the indices of the eigenvectors
that failed to converge. If \(\mathrm{JOBZ}=\mathrm{N}\) ', then
\(\mathbb{F A} \mathbb{I L}\) is not referenced.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
<0: if \(\mathbb{I N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=\) i, then ieigenvectors failed to converge. Their indioes are stored in array ㅍFAI.

\section*{PURPOSE}
zhbgvd com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized \(H\) erm itian-definite banded eigenproblem, of the form A *x=(lam bda)*B *x. H ere A and \(B\) are assum ed to be \(H\) erm titian and banded, and \(B\) is also positive definite. If eigenvectors are desired, it uses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines with a guard digit in add/subtract, or on those binary \(m\) achines \(w\) ithout guard digits \(w\) hich subtract like the \(C\) ray \(\mathrm{X}-\mathrm{M} P, C\) ray \(Y \mathrm{M} P\), C ray \(\mathrm{C}-90\), or C ray -2 . It could conceivably fail on hexadecim al or decim al machines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}

30 BZ (input)
= N ': C om pute eigenvalues only;
\(=\mathrm{V}: \mathrm{C}\) om pute eigenvalues and eigenvectors.

UPLO (input)
\(=\mathrm{U}\) ': U ppertriangles of \(A\) and \(B\) are stored;
\(=L^{\prime}\) : Low er triangles of \(A\) and \(B\) are stored.
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).
KA (input)
The num ber of superdiagonals of the \(m\) atrix A if UPLO \(=\mathrm{U}\) ', or the num berof subdiagonals if UPLO \(=L^{\prime} \cdot \mathrm{KA}>=0\).

KB (input)
The num ber of superdiagonals of the \(m\) atrix \(B\) if UPLO \(=\mathrm{U}\) ', or the num berof subdiagonals ifUPLO \(=\mathbb{L} \cdot \mathrm{KB}>=0\).

AB (input/output)
O n entry, the upper or low ertriangle of the Her\(m\) itian band \(m\) atrix \(A\), stored in the firstka+1 row sof the array. The \(j\) th colum n of A is stored in the jth colum \(n\) of the array \(A B\) as follow \(s\) : if \(\mathrm{UPLO}=\mathrm{U}\) ', AB \((k a+1+i-j)=A(i, j)\) for \(m a x(1, j\) \(\mathrm{ka})<=\mathrm{i}<=j\) if \(\mathrm{HPLO}=\mathrm{L}{ }^{\prime}, \mathrm{AB}(1+i-j, j)=A(i, 7)\) for \(\mathfrak{j}=i<=m\) in \((n, j+k a)\).

On exit, the contents of \(A B\) are destroyed.
LDAB (input)
The leading dim ension of the array \(A B\). LD AB \(>=\) KA+1.

BB (input/output)
O \(n\) entry, the upper or low er triangle of the Her \(m\) itian band \(m\) atrix \(B\), stored in the first kb+1 row sof the array. The \(j\) th colum n of \(B\) is stored in the jth colum \(n\) of the array \(B B\) as follow s: if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(k b+1+i-j)=\mathrm{B}(i, 7)\) for \(\mathrm{max}(1, j\) \(\mathrm{kb})<=\mathrm{i}<=\dot{j}\) if \(\mathrm{UPLO}=\mathrm{L}, \mathrm{BB}(1+i-j, j)=\mathrm{B}(i, 7)\) for \(\dot{j}=i<=m\) in \((n, j+k b)\).

On exit, the factors from the splitCholesky fac-
torization \(B=S * * H * S\), as retumed by CPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.
\(Z\) (input) If \(J O B Z=V\) ', then if \(\mathbb{N} F O=0, Z\) contains the \(m\) atrix \(Z\) ofeigenvectors, \(w\) ith the \(i\)-th colum n of Z holding the eigenvector associated w ith W (i). The eigenvectors are norm alized so that Z **H *B *Z = I. If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced.

LD Z (input)
The leading dim ension of the array \(Z\). LD \(Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(\mathrm{Z}>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

\section*{LW ORK (input)}

The dim ension of the array W ORK. If \(\mathrm{N}<=1\), LW ORK >=1. If JOBZ = N'and \(N>1\),LW ORK >=N. If \(\mathrm{JOBZ}=\mathrm{V}\) 'and \(\mathrm{N}>1\), LW \(O\) RK \(>=2 * \mathrm{~N} * * 2\) 。

IfLW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{RW ORK (w orkspace)}

On exit, if \(\mathbb{N} F O=0, R W\) ORK (1) retums the optim al LRW ORK.

LRW ORK (input)
The dim ension of aray RW ORK. If \(\mathrm{N}<=1\), LRW ORK >= 1. If \(J O B Z=N\) 'and \(N>1\),LRW ORK \(>=\) N . If JOBZ \(=\mathrm{V}\) 'and \(\mathrm{N}>1\),LRW \(O R K>=1+5 * \mathrm{~N}+\) \(2 * N * * 2\) 。

IfLRW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the RW ORK array, retums this value as the first entry of the RW ORK array, and no errorm essage related to LRW ORK is issued by X ERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N F O}=0, \mathbb{I N}\) ORK (1) retums the optim al LIN ORK.

LIN ORK (input)
The dim ension of array \(\mathbb{I N}\) ORK. If JO BZ \(=\mathrm{N}\) 'or N <= 1 , LIN \(O R K>=1\). If \(J O B Z=V\) 'and \(N>1\), LIN ORK \(>=3+5{ }^{*} N\).

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the IV ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK anay, and no errorm essage related to LIN ORK is issued by X ERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=i\), and \(i\) is:

\section*{PURPOSE}
zhbgvx com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized H erm tian-definite banded eigenproblem, of the form A *x= (lam bda)*B *x. H ere A and \(B\) are assum ed to be \(H\) erm itian and banded, and \(B\) is also positive definite. Eigenvalues and eigenvectors can be
selected by specifying either alleigenvalues, a range of values or a range of indices for the desired eigenvalues.

\section*{ARGUMENTS}

JOBZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w ill be found;
= V \(:\) :alleigenvahues in the half-open interval
( \(\mathrm{VL}, \mathrm{VU}]\) will be found; = I': the \(\mathbb{I}\)-th through \(\mathbb{I U}\)-th eigenvaluesw illlbe found.

UPLO (input)
\(=\mathrm{U}\) ': U ppertriangles of \(A\) and \(B\) are stored;
= L': Low ertriangles of A and B are stored.
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).
KA (input)
The num berof superdiagonals of the \(m\) atrix \(A\) if UPLO = U',orthe num berof subdiagonals if UPLO = L '.KA \(>=0\).

K B (input)
The num ber of superdiagonals of the \(m\) atrix \(B\) if \(\mathrm{UPLO}=\mathrm{U}\) ', orthe num berof subdiagonals if P PLO \(=L^{\prime} \cdot \mathrm{KB}>=0\).

AB (input/output)
O \(n\) entry, the upper or low ertriangle of the Her\(m\) itian band \(m\) atrix \(A\), stored in the firstka+1 row sof the array. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the amray AB as follow s: if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{ka}+1+\mathrm{i}-j)=\mathrm{A}(i, 7)\) for max \((1, j\) \(\mathrm{ka})<=i<=j\) ifUPLO \(=\mathrm{L} \prime, A B(1+i-j, j)=A(i, 1)\) for \(\dot{j}=i<=m\) in \((n, j+k a)\).

On exit, the contents of \(A B\) are destroyed.
LDAB (input)
The leading dim ension of the array AB. LD AB >= KA+1.

BB (input/output)
O n entry, the upper or low ertriangle of the Her -
\(m\) itian band \(m\) atrix \(B\), stored in the first \(k b+1\) row sof the anray. The \(j\) th colum \(n\) of \(B\) is stored in the jth colum \(n\) of the array \(B B\) as follow s: if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{BB}(\mathrm{kb}+1+\mathrm{i}-j, \bar{j})=\mathrm{B}(1, j)\) for \(\mathrm{max}(1, j\) \(\mathrm{kb})<=\mathrm{i}<=\dot{j}\) if P PLO \(=\mathrm{L}, \mathrm{\prime}, \mathrm{BB}(1+i-j)=\mathrm{i}(i, 7)\) for \(j=i<=m\) in \((n, j+k b)\).

On exit, the factors from the splitCholesky factorization \(\mathrm{B}=\mathrm{S} * * \mathrm{H} * \mathrm{~S}\), as retumed by CPBSTF .

LD BB (input)
The leading dim ension of the array BB. LD BB >= K B+1.
Q (output)
If \(\mathrm{OBZ}=\mathrm{V}^{\prime}\), the \(\mathrm{n}-\mathrm{by}-\mathrm{n}\) matrix used in the reduction of \(A \mathrm{X}=\left(\mathrm{lam}\right.\) bda) \(\mathrm{B}_{\mathrm{B}}{ }^{\mathrm{x}} \mathrm{x}\) to standard form, i.e. \(C * x=\left(l a m\right.\) bda) \({ }^{*} \mathrm{X}\), and consequently C to tridiagonal form. If \(J O B Z=N\) ', the array \(Q\) is not referenced.

LD Q (input)
The leading dim ension of the array \(Q\). If \(J 0 B Z=\) \(N^{\prime}, \operatorname{LD} Q>=1\). If \(\mathrm{JOB}=\mathrm{V}\) ', LD \(Q>=\mathrm{max}(1, N)\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA NGE = A 'or I'.

VU (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{I}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A'or V'.

IU (input)
If RA NGE= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues.

A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABSTOL + EPS * max ( \(\mid\) |, \(\mid\) |),
where EPS is them achine precision. IfA BSTOL is less than or equalto zero, then EPS* \(\mid\) | w illbe used in its place, where \(F \mid\) is the 1 -norm of the tridiagonalm atrix obtained by reducing AP to tridiagonal form .

E igenvalues w illbe com puted m ost accurately when ABSTOL is set to tw ine the underflow threshold \(2 \star\) SLAM CH ( \({ }^{\prime}\) ), notzero. If this routine retums w ith \(\mathbb{I N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABSTO L to \(2 *\) SLAM CH (S ).

M (output)
The total num ber ofeigenvalues found. \(0<=\mathrm{M}\) <= N . IfRANGE \(=A{ }^{\prime}, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{I U}-\mathbb{L}+1\).

W (output)
If \(\mathbb{N}\) FO \(=0\), the eigenvalues in ascending order.
\(Z\) (input) If \(\mathcal{O} B Z=V\) ', then if \(\mathbb{N} F O=0, Z\) contains the \(m\) atrix \(Z\) of eigenvectors, \(w\) ith the \(i\)-th colum \(n\) of Z holding the eigenvector associated with W (i). The eigenvectors are norm alized so that \(\mathrm{Z} * * \mathrm{H} * \mathrm{~B} * \mathrm{Z}=\) I. If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced.

LD \(Z\) (input)
The leading \(d i m\) ension of the array \(Z . L D Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >=N.

W ORK (w orkspace)
dim ension (N)
RW ORK (w orkspace)

\#include <sunperfh>
void zhbm v (charuple, intn, int k, doublecom plex *alpha, doublecom plex *a, int lda, doublecom plex *x, int incx, doublecom plex *beta, doublecom plex *y, int incy);
void zhbm v_64 (char uplo, long n, long k, doublecom plex *alpha, doublecom plex *a, long lda, doublecom plex
*x, long incx, doublecom plex *beta, doublecom plex
*y, long incy);

\section*{PURPOSE}
zhbm \(v\) perform \(s\) the \(m\) atrix-vector operation \(y:=a l p h a * A * x+\) beta* \(y\) where alpha and beta are scalars, \(x\) and \(y\) are \(n\) ele\(m\) ent vectors and \(A\) is an \(n\) by \(n\) herm itian band \(m\) atrix, \(w\) ith k super-diagonals.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies whether the upper or low er triangular part of the band \(m\) atrix \(A\) is being supplied as follow s:

UPLO = U 'or U ' The uppertriangularpartofA is being supplied.

UPLO = L'or 1' The low ertriangularpartofA is being supplied.

U nchanged on exit.

N (input)
On entry, N specifies the order of the m atrix A .
\(\mathrm{N}>=0\). U nchanged on exit.

K (input)

On entry, \(K\) specifies the number of superdiagonals of them atrix A. K m ust satisfy 0 le. K. U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or G ', the leading ( \(\mathrm{k}+1\) ) by n partof the array A m ustcontain the upper triangular band part of the herm tian \(m\) atrix, supplied colum \(n\) by colum \(n\), \(w\) th the leading diagonal of the matrix in row ( \(k+1\) ) of the array, the first super-diagonal starting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the array \(A\) is not referenced. The follow ing program segm entw ill transfer the upper triangular part of a herm itian band \(m\) atrix from conventional fullm atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, \mathrm{~J}=1, \mathrm{~N} \\
& \mathrm{M}=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{MAX}(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \quad \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
\]

Before entry w ith UPLO = L 'or 1', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the low er triangular band part of the herm itian \(m\) atrix, supplied colum \(n\) by colum \(n\), \(w\) th the leading diagonalof the \(m\) atrix in row 1 of the array, the first sub-diagonalstarting atposition 1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the anray \(A\) is not referenced. The follow ing program segm entw ill transfer the low ertriangular part of a herm itian band \(m\) atrix from conventional fullm atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{~N}, \mathrm{~J}+\mathrm{K}) \\
& \quad \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \text { CONTINUE }
\end{aligned}
\]
\(N\) ote that the im aginary parts of the diagonalele\(m\) ents need notbe set and are assum ed to be zero. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A \(>=\) ( \(\mathrm{k}+1\) ). U nchanged on exit.

X (input)
\((1+(n-1) \star \operatorname{abs}(\mathbb{N} C X))\). Before entry, the increm ented anray \(X\) must contain the vectorx. U nchanged on exit.
\(\mathbb{N C X}\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents of \(\mathrm{X} . \mathbb{I N C X ~ m ~ u s t n o t b e ~ z e r o . ~ U ~ n c h a n g e d ~}\) on exit.

BETA (input)
On entry, BETA specifies the scalar beta.
U nchanged on exit.
Y (input/output)
\((1+(\mathrm{n}-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) mustcontain the vectory. On exit, \(Y\) is overw ritten by the updated vectory.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of Y. \(\mathbb{N} C Y\) m ustnotbe zero. U nchanged on exit.

\#include < sunperfh>
void zhbtrd (charvect, char uple, intn, int kd, doublecom plex *ab, int ldab, double *d, double *e, doublecom plex *q, int ldq, int*info);
void zhbtrol_64 (char vect, charuplo, long n, long kd, doublecom plex *ab, long ldab, double *d, double *e, doublecom plex *q, long ldq, long *info);

\section*{PURPOSE}
zhbtrod reduces a com plex H erm itian band m atrix A to real symmetric tridiagonal form \(T\) by a unitary similarity transform ation: \(\mathrm{Q} * * \mathrm{H} * \mathrm{~A} * \mathrm{Q}=\mathrm{T}\).

\section*{ARGUMENTS}

VECT (input)
\(=\mathrm{N}\) : do not form \(Q\);
\(=\mathrm{V}\) : form Q ;
\(=\mathrm{U}\) : update a m atrix X , by form ing \(\mathrm{X} * \mathrm{Q}\).

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle of A is stored.

N (input) The order of the matrix A. \(\mathrm{N}>=0\).
KD (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if UPLO \(=\mathrm{U}\) ', or the num berof subdiagonals ifUPLO \(=\mathbb{L}^{\prime} . \mathrm{KD}>=0\) 。

AB (input/output)
O \(n\) entry, the upper or low er triangle of the \(H\) er\(m\) itian band \(m\) atrix \(A\), stored in the firstK \(D+1\)
row sof the anray. The \(j\) th colum n of \(A\) is stored in the \(j\) th colum \(n\) of the array AB as follow s: if \(\mathrm{UPLO}=\mathrm{U}, \mathrm{AB}(\mathrm{kd}+1+\mathrm{i}-j)=\mathrm{j}(i, 1)\) for \(\mathrm{max}(1, j\) \(\mathrm{kd})<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}, \mathrm{AB}(1+i-j)=A(i, 7)\) for \(\dot{j}=i<=m\) in \((n, \dot{j}+\mathrm{kd})\). O \(n\) exit, the diagonalele\(m\) ents of AB are overw ritten by the diagonalele\(m\) ents of the tridiagonalm atrix T ; if K D > 0, the elem ents on the first superdiagonal (if UPLO \(=\) U ) orthe first subdiagonal (ifU PLO = L ) are overw rilten by the off-diagonalelem ents of \(T\); the rest of A B is overw ritten by values generated during the reduction.

LDAB (input)
The leading dim ension of the array AB. LDAB >= K D +1 .

D (output)
The diagonalelem ents of the tridiagonalm atrix T .
E (output)
The off-diagonal elem ents of the tridiagonal m atrix \(\mathrm{T}: \mathrm{E}(\mathrm{i})=\mathrm{T}(\mathrm{i}, \mathrm{i}+1)\) if \(\mathrm{PLO}=\mathrm{U} ; \mathrm{E}(\mathrm{i})=\) \(T(i+1, i)\) if \(\mathrm{PLLO}=\mathrm{L}^{\prime}\) 。

Q (input/output)
Onentry, ifVECT = U', then \(Q \mathrm{must}\) contain an N by -N m atrix X ; if VECT \(=\mathrm{N}\) 'or V ', then Q need notbe set.

On exit: if \(\mathrm{VECT}=\mathrm{V}\) ', Q contains the N -by -N unitary matrix \(Q\); ifVECT = U', \(Q\) contains the product \(X\) * \(Q\); ifVECT \(=N\) ', the array \(Q\) is not referenced.

LD Q (input)
The leading \(d i m\) ension of the array \(Q . L D Q>=1\), and LDQ >= N ifVECT = V'or U'.

W ORK (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)

void zheev_64 (char jobz, charuplo, long n, doublecom plex *a, long lda, double *w , long *info);

\section*{PURPOSE}
zheev com putes alleigenvalues and, optionally, eigenvectors of a com plex \(H\) erm itian \(m\) atrix A .

\section*{ARGUMENTS}

JO B Z (input)
\(=\mathrm{N}\) : C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.

UPLO (input)
\(=U^{\prime}:\) U ppertriangle of \(A\) is stored;
\(=\mathrm{L}\) ': Low er triangle ofA is stored.

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O n entry, the H erm itian m atrix A. If UPLO = U', the leading N łoy N uppertriangularpart of A contains the upper triangularpart of the \(m\) atrix \(A\). If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N toy-N low er triangular part of A contains the low er triangular part of the \(m\) atrix \(A\). On exit, if \(J O B Z=V\) ', then if \(\mathbb{N} F O=0, A\) contains the orthonorm al eigenvectors of them atrix \(A\). If \(O B Z=N\) ', then on exit the low er triangle (if \(\mathrm{U} \mathrm{PLO}=\mathrm{L}\) ) or the upper triangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) of A , including the diagonal, is destroyed.

The leading dim ension of the array A. LDA >= \(\max (1, N)\).

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.
W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al
LDW ORK.
LDW ORK (input)
The length of the array W ORK. LDW ORK >= max \((1,2 * \mathrm{~N}-1)\). For optim alefficiency, LD W ORK >= \((N B+1) * N\), where \(N B\) is the blocksize for CHETRD retumed by ILAENV.

If LD W ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
\(\mathbb{N} F O\) (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N} F O=\) i, the algonithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

\#include <sunperfh>
void zheevd (char j̣bz, char uplo, intn, doublecom plex *a, int lda, double *W , int *info);
void zheevd_64 (char jobz, charuplo, long n, doublecom plex *a, long lda, double *W , long *info);

\section*{PURPOSE}
zheevd com putes alleigenvalues and, optionally, eigenvectors of a com plex H erm titian m atrix A. If eigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on m achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits which subtract like the \(C\) ray \(\mathrm{X}-\mathrm{M} P\), C ray \(Y \mathrm{M} \mathrm{P}\), C ray \(\mathrm{C}-90\), or C ray-2. It could conceivably fail on hexadecim al or decim al machines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}
```

JO B Z (input)
= N ': C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
UPLO (input)
= U ': U pper triangle ofA is stored;
= IL ': Low er triangle ofA is stored.
N (input) The order of them atrix A. N >=0.

```

A (input/output)
On entry, the \(H\) em itian m atrix A. If P PLO = U', the leading N -by -N uppertriangularpartofA contains the uppertriangularpart of the \(m\) atrix \(A\). If U PLO = L', the leading \(N\)-by N low er triangular part ofA contains the low er triangular part of the \(m\) atrix \(A\). On exit, if \(J O B Z=V\) ', then if \(\mathbb{N} F O=0, A\) contains the orthonorm al eigenvectors of the \(m\) atrix \(A\). If \(J O B Z=N\) ', then on exit the low er triangle (if \(\mathrm{PLLO}=\mathrm{L}\) ) or the upper triangle (if \(U P L O=U\) ) of \(A\), including the diagonal, is destroyed.

LDA (input)
The leading dim ension of the array A. LD A >= \(\max (1, \mathbb{N})\).

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the array \(\mathrm{W} O R K\). If \(\mathrm{N}<=1\), LW ORK mustibe at least 1. If \(\mathrm{JOBZ}=\mathrm{N}\) 'and \(\mathrm{N}>\) 1, LW ORK m ustbe at least \(\mathrm{N}+1\). If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1\), LW ORK m ustbe at least2*N + N **2.

If LW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On ex止, if \(\mathbb{N F F O}=0\), RW ORK (1) retums the optim alLRW ORK .

LRW ORK (input)
The dim ension of the aray RW ORK. If \(\mathrm{N}<=1\), LRW ORK m ustbe at least1. If \(\mathrm{JOBZ}=\mathrm{N}\) 'and \(\mathrm{N}>\) 1,LRW ORK m ust.be at leastN. If JOBZ \(=V^{\prime}\) and \(\mathrm{N}>1\),LRW ORK m ust.be at least1 + 5*N + 2*N **2.

If LRW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the RW ORK array, retums this value as the first entry of the RW ORK aray, and no enrorm essage
related to LRW ORK is issued by XERBLA.
IN ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I}\) O RK (1) retums the optim al LIN ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I N}\) ORK. If \(\mathrm{N}<=1\), LIN ORK must.be at least1. If \(J 0 \mathrm{BZ}=\mathrm{N}\) 'and \(\mathrm{N}>\) \(1, \mathrm{LIV}\) ORK m ustbe at least 1. If \(\mathrm{JOBZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1, \mathrm{~L} \mathbb{I} \mathrm{O}\) ORK mustbe at least \(3+5 * \mathrm{~N}\).

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the \(\mathbb{I V}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I N} O R K\) is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=\) i, the algonithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

\section*{C INTERFACE}
\#include <sunperfh>
void zheevr(char jobz, char range, charuplo, int n, doublecom plex *a, intlda, double vl, double vu, int il, intiu, double abstol, int *m, double \({ }^{\prime}\), , doublecom plex \({ }^{*} z\), int \(l d z\), int *isuppz, int *info);
void zheevr_64 (char jंbz, charrange, char uplo, long n, doublecom plex *a, long lda, double vl, double vu, long il, long iu, double abstol, long *m, double \({ }^{*}\) w, doublecom plex *z, long ldz, long *isuppz, long *info);

\section*{PURPOSE}
zheevr com putes selected eigenvalues and, optionally, eigenvectors of a com plex H erm itian tridiagonalm atrix T. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices forthe desired eigenvalues.

W heneverpossible, CHEEVR calls CSTEGR to com pute the eigenspectrum using Relatively Robust Representations.

CSTEGR com putes eigenvalues by the dqds algorithm, while orthogonaleigenvectors are com puted from various "good" L D \(L^{\wedge} T\) representations (also known as Relatively Robust Representations). G ram -Schm idtorthogonalization is avoided as far as possible. M ore specifically, the various steps of the algorithm are as follow s.For the i-th unreduced block oft,
(a) C om pute \(T\)-sigm a_i= L_iD _iL_i^T, such that L_i D_iL_i^T
is a relatively robust representation,
(b) C om pute the eigenvalues, lam bda_jof L_i D_i L_i^T to high
relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam bda_jofL_i D _i L_i^T,
com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization. The desired accuracy of the output can be specified by the inputparam eterA BSTOL.

Form ore details, see "A new O ( \(n^{\wedge} 2\) ) algorithm for the sym \(m\) etric tridiagonal eigenvalue/eigenvector problem ", by Inder前D hillon, C om puterScience D ivision TechnicalR epont N o. U CB //C SD -97-971, U C B erkeley, M ay 1997.

N ote 1 : CHEEVR calls CSTEGR when the fill spectrum is requested on \(m\) achines \(w\) hich conform to the ieee-754 floating pointstandard. CHEEVR calls SSTEBZ and CSTE IN on non-ieee \(m\) achines and
w hen partialspectrum requests arem ade.

N orm alexecution of CSTEG R m ay create \(\mathrm{NaN} s\) and infinities and hence \(m\) ay abort due to a floating pointexception in environm ents which do nothandle N aN s and infinities in the ieee standard defaultm anner.

\section*{ARGUMENTS}

JO B Z (input)
\(=\mathrm{N}^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvahues w illbe found.
\(=\mathrm{V}\) : alleigenvalues in the half-open interval
( \(\mathrm{LL}, \mathrm{VU}]\) w ill be found. = \(I^{\prime}\) : the \(\mathbb{I}\)-th through \(\mathbb{I U}\)-th eigenvaluesw illlbe found.

UPLO (input)
\(=\mathrm{U}:\) : U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
\(N\) (input) The order of the matrix A. \(N>=0\).
A (input/output)
\(\mathrm{O} n\) entry, the \(H\) erm itian \(m\) atrix \(A\). If \(\mathrm{UPLO}=\mathrm{U}\) ', the leading \(\mathrm{N}-\) by -N upper triangularpartofA contains the upper triangular part of the \(m\) atrix \(A\). If UPLO \(=\mathrm{L}\) ', the leading N -by N low er triangular partofA contains the low er triangular part of the matrix A. On exit, the low ertriangle (if
\(\mathrm{UPLO}=\mathrm{L}\) ) or the upper triangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) of A , including the diagonal, is destroyed.

LDA (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

VL (input)
IfRA N GE=V ', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE = A ' or I '.

VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU. N ot referenced ifRANGE=A 'or I'.

II (input)
If RA N GE= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{H}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A 'or V'.
\(\mathbb{I U}\) (input)
If RA N G E= I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{U}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE = A'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues. A \(n\) approxim ate eigenvalue is accepted as converged
when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * max ( \(\mid\) |, b|),
\(w\) here EPS is the m achine precision. IfA BSTOL is less than orequal to zero, then EPS* \(\mid\) | w illbe used in its place, where \(F \mid\) is the 1 -norm of the tridiagonal m atrix obtained by reducing \(A\) to tridiagonal form.

See "C om puting Sm allSingularV ahues of B idiagonal \(M\) atrices w ith G uaranteed H igh Relative A ccuracy," by D em m eland \(K\) ahan, LA PA CK W orking \(N\) ote \#3.

If high relative accuracy is im portant, setA BSTO L to SLAM CH (Safe minimum '). D oing so will guarantee thateigenvalues are com puted to high relative accuracy when possible in future releases. The current code does not \(m\) ake any guarantees abouthigh relative accuracy, but funutre releases will. See J.Barlow and J. Demmel, "C om puting A ccurate Eigensystem s of Scaled D iagonally D om inantM atrioes", LA PA CK W orking N ote \#7, for a discussion of which \(m\) atrices define their eigenvalues to high relative accuracy.

M (output)
The totalnum ber ofeigenvalues found. \(0<=\mathrm{M}\) <= N . IfRANGE \(=\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{L}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(J O B Z=V^{\prime}\), then if \(\mathbb{N F O}=0\), the first \(M\) colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, \(w\) ith the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). If \(\mathrm{JO} \mathrm{BZ}=\mathrm{N}\) ', then \(Z\) is not referenced. N ote: the userm ust ensure that at leastm ax ( \(1, M\) ) colum ns are supplied in the array \(Z\); ifRANGE = \(V\) ', the exact value of M is not know n in advance and an upperbound \(m\) ust be used.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, N)\).

ISU PPZ (output)
The support of the eigenvectors in \(Z, i . e .\), the indices indicating the nonzero elem ents in \(Z\). The i-th eigenvector is nonzero only in elem ents ISU PPZ (2*i-1 ) through ISU PPZ (2*i).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the array WORK. LW ORK >= \(\max (1,2 \star \mathrm{~N})\). For optim al efficiency, LW ORK \(>=\) ( \(\mathrm{N} B+1)^{*} \mathrm{~N}\), where \(N B\) is the \(m\) ax of the blocksize for CHETRD and forCUNM TR as retumed by HAENV.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of theW ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, R W\) ORK (1) retums the optim al (andm inim al) LRW ORK .

LRW ORK (input)
The length of the array RW ORK. LRW ORK >= \(\max (1,24 * N)\).

If LRW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK array, retums this value as the first entry of the RW ORK aray, and no enrorm essage related to LRW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) ORK (1) retums the optim al (and \(m\) inim al) \(L \mathbb{I N} O R K\).

LIN ORK (input)
The dim ension of the array \(\mathbb{I W} O R K\). LIN ORK >= \(\max (1,10 * \mathrm{~N})\).

If \(L \mathbb{I V}\) ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK array, and no errorm essage related to \(L \mathbb{I N} O R K\) is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0: Intemalemor

of w idth less than orequal to
ABTOL + EPS * max (k|, \(\mathrm{b} \mid)\),
where EPS is them achine precision. If ABTOL is less than orequal to zero, then EPS* \(|\mathbb{F}|\) w illbe used in its place, where \(F \mid\) is the 1 -norm of the tridiagonal m atrix obtained by reducing \(A\) to tridiagonal form .

E igenvalues w illbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold \(2 \star\) SLAM CH ( \({ }^{\prime}\) ), notzero. If this routine retums w ith \(\mathbb{N} F O>0\), indicating that som e eigenvectors did not converge, try setting ABTOL to \(2 *\) SLAM CH (S ).

See "C om puting Sm allSingularV ahues of B idiagonal \(M\) atrices \(w\) ith \(G\) uaranteed \(H\) igh Relative A ccuracy," by D em m eland K ahan, LA PA CK W orking N ote \#3.

\section*{NFOUND (output)}

The total num ber of eigenvalues found. \(0<=\) NFOUND <= N. IfRANGE = A',NFOUND =N, and if RANGE \(=I^{\prime}\) ', NFOUND \(=\mathbb{U}-\mathbb{U}+1\).

W (output)
On norm alexit, the firstN FOUND elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(\mathrm{OOBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N} F O=0\), the first NFOUND colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A corresponding to the selected eigenvalues, \(w\) ith the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). If an eigenvector fails to converge, then that colum n of \(Z\) contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in FAII. If \(J O B Z=N\) ', then \(Z\) is not referenced. \(N\) ote: the user must ensure that at least \(m\) ax ( 1, NFO UND ) colum ns are supplied in the aray \(Z\); if RANGE = V', the exactvalue ofNFOUND is not know \(n\) in advance and an upperbound \(m\) ustbe used.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}^{\prime}, \mathrm{LD} Z>=\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK ( 1 ) retums the optim al LDW ORK.

LDW ORK (input)
The length of the array \(W\) ORK. LDW ORK >= \(\max (1,2 \star \mathrm{~N})\). For optim al efficiency, LDW ORK \(>=\) \((N B+1) * N\), where \(N B\) is the \(m\) ax of the blocksize for CHETRD and forCUNM TR as retumed by HAENV.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension ( \(7 * \mathrm{~N}\) )
IV ORK 3 (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )
FAII (output)
If \(\mathrm{OBZ}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), the first NFOUND
elem ents of \(\mathbb{F A} I I\) are zero. If \(\mathbb{N F O}>0\), then
FFA IL contains the indices of the eigenvectors that failed to converge. If \(\mathrm{JOBZ}=\mathrm{N}\) ', then FA \(\mathbb{I L}\) is not referenced.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=\) i, then ieigenvectors failed to converge. Their indioes are stored in array
ㅍFAI.

\section*{PURPOSE}
zhegv com putes all the eigenvalues, and optionally, the eigenvectors of a com plex generalized H erm itian-definite eigenproblem, of the form \(A * x=(l a m ~ b d a) * B * x\), \(\mathrm{A} * \mathrm{~B} \mathrm{x}=(\operatorname{lam} . \mathrm{bda}){ }^{\star} \mathrm{x}\), or \(\mathrm{B} * \mathrm{~A} * \mathrm{X}=\left(\mathrm{lam}\right.\) bda) \({ }^{*} \mathrm{x}\). H ere A and B are assum ed to be \(H\) erm itian and \(B\) is also positive definite.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A{ }^{*} \mathrm{x}=\left(\mathrm{lam}\right.\) bda) \({ }^{\mathrm{B}}{ }^{*}{ }_{\mathrm{x}}\)
\(=2: \mathrm{A} * \mathrm{~B} * \mathrm{X}=\left(\mathrm{lam}\right.\) bda) \({ }^{*} \mathrm{X}\)
\(=3: B * A * X=(l a m ~ b d a){ }^{*} \mathrm{x}\)
\(J O B Z\) (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}:\) : C om pute eigenvalues and eigenvectors.

UPLO (input)
\(=\mathrm{U}\) ': U ppertriangles of \(A\) and \(B\) are stored;
\(=\mathrm{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.

N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).

A (input/output)
On entry, the \(H\) erm itian \(m\) atrix A. If UPLO = U', the leading N -by N upper triangularpartof A contains the upper triangularpart of the \(m\) atrix \(A\). If UPLO = L', the leading N -by-N low er triangular partofA contains the low er triangular part of the m atrix A.

On exit, if \(J \mathrm{OBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N} F O=0\), A contains the \(m\) atrix \(Z\) ofeigenvectors. The eigenvectors are norm alized as follow s: if ITYPE = 1 or \(2, Z * * H * B * Z=I ;\) if \(I T Y P E=3, Z * * H * i n v(B) * Z=I\). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then on exit the upper triangle (if \(\mathrm{U} P L O=\mathrm{U}\) ) or the low er triangle (if \(\mathrm{U} P L O=\mathrm{L}\) ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

B (input/output)
On entry, the \(H\) erm itian positive definite \(m\) atrix \(B\). If \(U P L O=U\) ', the leading \(N\) by \(N\) uppertriangularpartofB contains the upper triangular part of them atrix B. IfU PLO = L', the leading N toy -N low er triangularpart of B contains the low er triangularpart of the \(m\) atrix B .

On exit, if \(\mathbb{N} F O<=N\), the part of \(B\) containing the \(m\) atrix is overw rilten by the triangular factor U orL from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(B=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).

W (output)
If \(\mathbb{N}\) FO \(=0\), the eigenvalues in ascending order.

\section*{W ORK (w orkspace)}

On exit, if \(\mathbb{N} F O=0, W\) ORK ( 1 ) retums the optim al LDW ORK.

LDW ORK (input)
The length of the array \(W\) ORK. LDW ORK >= max \(\left(1,2^{\star} \mathrm{N}-1\right)\). For optim alefficiency, LD W ORK >= \((\mathrm{NB}+1) * \mathrm{~N}\), where NB is the blocksize for CHETRD retumed by LLAENV.

IfLD W ORK \(=-1\), then aw orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK anray, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
< \(0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue

\section*{PURPOSE}
zhegvd com putes allthe eigenvalues, and optionally, the eigenvectors of a com plex generalized \(H\) erm itian-definite eigenproblem, of the form \(A * x=(l a m ~ b d a) * B * x\), \(\mathrm{A} * \mathrm{~B} \mathrm{x}=(\operatorname{lam} \mathrm{bda}){ }^{*} \mathrm{x}\), or \(\mathrm{B} * \mathrm{~A} * \mathrm{X}=(\mathrm{lam} . \mathrm{bda}){ }^{*} \mathrm{x}\). H ere A and B are assum ed to be \(H\) erm itian and \(B\) is also positive definite. If eigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray X M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines without guard digits, butw e know of none.

\section*{ARGUMENTS}

ITYPE (input)

Specifies the problem type to be solved:
\(=1: A{ }^{*}=\left(\operatorname{lam}\right.\) bda) \({ }^{\mathrm{B}} \mathrm{A}^{*} \mathrm{x}\)
\(=2: A * B * x=\left(l a m\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B{ }^{*}{ }^{*}{ }^{x}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{X}\)

JOBZ (input)
\(=\mathrm{N}\) ': C om pute eigenvalues only;
\(=\mathrm{V}\) :: C om pute eigenvalues and eigenvectors.
UPLO (input)
\(=\mathrm{U}:\) : U pper triangles of \(A\) and \(B\) are stored;
= L': Low ertriangles of \(A\) and \(B\) are stored.
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).
A (input/output)
On entry, the \(H\) erm itian m atrix A. If UPLO = U', the leading N -by N uppertriangularpart of A contains the upper triangularpart of the \(m\) atrix \(A\). If UPLO = L', the leading N -by N low er triangular partofA contains the low er triangular part of them atrix \(A\).

Onexit, if \(J O B Z=V^{\prime}\), then if \(\mathbb{N} F O=0, A\) contains the \(m\) atrix \(Z\) of eigenvectors. The eigenvectors are norm alized as follow s: if ITYPE = 1 or \(2, Z * * H * B * Z=I ;\) if \(I T Y P E=3, Z * * H * i n v(B) * Z=I\). If \(J O B Z=N\) ', then on exit the upper triangle (if \(\mathrm{UPLO}=\mathrm{U}\) ) or the low er triangle (if \(\mathrm{UPLO}=\mathrm{L}\) ) of A , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).

B (input/output)
O n entry, the \(H\) erm itian m atrix B. If UPLO = U', the leading N -by N uppertriangularpart of B contains the upper triangularpart of the \(m\) atrix \(B\). If UPLO = L', the leading N by N low er triangular part ofB contains the low er triangular part of them atrix B .

Onexit, if \(\mathbb{N} F O<=N\), the part of \(B\) containing the \(m\) atrix is overw rilten by the triangular factor U orL from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(B=L * L^{* *} \mathrm{H}\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the amay \(W\) ORK. If \(N<=1\), LW ORK \(>=1\). If \(O B Z=N\) 'and \(N>1, L W O R K>=N\) +1 . If \(O B Z=V\) 'andN \(>1\), LW ORK \(>=2 * N+\) \(\mathrm{N} * * 2\) 。

If LW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

RW ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0\), RW ORK (1) retums the optim al LRW ORK.

LRW ORK (input)
The dim ension of the aray RW ORK. If \(\mathrm{N}<=1\), LRW ORK \(>=1\). If \(\mathrm{OBZ}=\mathrm{N}\) 'and \(\mathrm{N}>1\),LRW ORK \(>=\) N . If \(\mathrm{OBB}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1\),LRW ORK \(>=1+5 \star \mathrm{~N}+\) \(2 * N * * 2\) 。

If LRW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the RW ORK aray, retums this value as the first entry of the RW ORK array, and no errorm essage related to LRW ORK is issued by X ERBLA.

IW ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0\), \(\mathbb{I N}\) O RK (1) retums the optim al
LIW ORK.

LIW ORK (input)
The dim ension of the anay \(\mathbb{I N} O R K\). If \(\mathrm{N}<=1\), LIW ORK \(>=1\). If \(O B Z=N\) 'andN \(>1, L \mathbb{W} O R K>=\) 1. If \(\mathrm{OBBZ}=\mathrm{V}^{\prime}\) and \(\mathrm{N}>1, \mathrm{~L} \mathbb{I} \mathrm{ORK}>=3+5 * \mathrm{~N}\).

INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\) th argum enthad an illegalvalue
\(>0\) : CPOTRF orCHEEVD retumed an error code:

\#include <sunperfh>
void zhegvx (int itype, char j̀bz, char range, charuplo, int
n, doublecom plex *a, int lda, doublecom plex *b, int ldb, double vl, double vu, int il, int iu, double abstol, int \({ }_{\mathrm{m}}\), double \({ }_{\mathrm{w}}\), doublecom plex *z, int ldz, int *ifail, int *info);
void zhegvx_64 (long itype, char jobz, char range, char uplo, long n, doublecom plex *a, long lda, doublecom plex *b, long ldb, double vl, double vu, long il, long iu, double abstol, long *m, double \({ }^{\mathrm{w}} \mathrm{w}\), doublecom plex *z, long ldz, long *ifail, long *info);

\section*{PURPOSE}
zhegvx com putes selected eigenvalues, and optionally, eigenvectors of a com plex generalized \(H\) erm itian-definite eigenproblem, of the form \(A * x=(\operatorname{lam} . b d a) * B * x, A * B x=(l a m ~ b d a){ }^{*} x\), or \(B{ }^{A} A * X=\left(\operatorname{lam}\right.\) bda) \({ }^{*} X\). H ere \(A\) and \(B\) are assum ed to be \(H\) erm titian and \(B\) is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A{ }^{*} \mathrm{x}=\left(\operatorname{lam}\right.\) bda)\({ }^{\mathrm{B}}{ }^{*} \mathrm{x}\)
\(=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B * A * x=\left(l a m\right.\) bda) \({ }^{*} \mathrm{x}\)
JOBZ (input)
\(=\mathrm{N}\) ': C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.
RANGE (input)
= A : alleigenvalues w illbe found.
= V ': alleigenvalues in the half-open interval ( \(\mathrm{L}, \mathrm{VU}]\) w ill be found. = ' I ': the I -th through \(\mathbb{I U}\)-th eigenvaluesw illlbe found.

UPLO (input)
\(=\mathrm{U}\) ': U pper triangles of \(A\) and \(B\) are stored;
\(=\mathrm{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.
\(N\) (input) The order of the \(m\) atrices \(A\) and \(B . N>=0\).
A (input/output)
O n entry, the \(H\) erm itian \(m\) atrix \(A\). If \(U P L O=U '\), the leading N -by N uppertriangular partofA contains the upper triangular part of the \(m\) atrix \(A\). If UPLO = L', the leading N by -N low er triangular part ofA contains the low er triangular part of them atrix \(A\).

On exit, the low er triangle (if \(\mathrm{UPLO}=\mathrm{L}\) ) or the upper triangle (if \(\mathrm{U} P \mathrm{O}=\mathrm{U}\) ) of , including the diagonal, is destroyed.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

B (input/output)
O n entry, the \(H\) erm tian \(m\) atrix \(B\). If \(U P L O=U '\), the leading N -by N uppertriangular partofB contains the upper triangular part of the \(m\) atrix \(B\). If UPLO \(=\mathrm{L}\) ', the leading N -by -N low er triangular partofB contains the low er triangular part of the \(m\) atrix \(B\).

On exit, if \(\mathbb{N} F O<=N\), the part of \(B\) containing the \(m\) atrix is overw rilten by the triangular factor
U orL from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(B=L{ }^{*} \mathrm{~L}^{* *} \mathrm{H}\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRA NGE = A 'or I'.
VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU. N ot referenced ifRANGE=A 'or I '.

II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}\), ifN \(>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE \(=\) A'or V'.

IU (input)
If RA NGE= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{Z}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE \(=\) A'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues.
A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
of w idth less than orequal to
ABSTOL + EPS * max ( \(k|\),\(| b|),\)
where EPS is the m achine precision. IfA BSTOL is less than or equalto zero, then EPS* \(\mid\) | w illbe used in its place, where \(F \mid\) is the 1 -norm of the tridiagonal \(m\) atrix obtained by reducing \(A\) to tridiagonal form .

E igenvalues w illbe com puted m ost accurately when ABSTOL is set to tw ioe the underflow threshold \(2 *\) SLAM CH ( \(\mathrm{S}^{\prime}\) ), not zero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did
not converge, try setting ABSTOL to \(2 *\) SLAM CH (S ).
M (output)
The total num ber ofeigenvalues found. \(0<=\mathrm{M}<=\)
N . IfRANGE \(=\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}\), and ifRANGE \(=\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{L}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
Z (output)
If \(\mathrm{JOBZ}=\mathrm{N}\) ', then Z is not referenced. If JOBZ \(=\mathrm{V}\) ', then if \(\mathbb{N} F O=0\), the firstM columns of \(Z\) contain the orthonorm aleigenvectors of the \(m\) atrix A comesponding to the selected eigenvalues, \(w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvectorassociated \(w\) ith \(W\) (i). The eigenvectors are norm alized as follow s: if \(I T Y P E=1\) or \(2, Z * * T * B * Z=I\); if TTYPE \(=3, Z * * T * \operatorname{inv}(B) * Z=I\).

If an eigenvector fails to converge, then that colum \(n\) of \(Z\) contains the latestapproxim ation to the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F A} \mathbb{I}\). N ote: the userm ustensure that at leastm ax \((1, M)\) colum ns are supplied in the aray \(Z\); ifRANGE = V', the exactvalue of \(M\) is notknow \(n\) in advance and an upper bound \(m\) ust be used.

LD Z (input)
The leading dim ension of the array \(Z . L D Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, N)\).

W ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The length of the array \(W\) ORK. LW ORK >= \(\max \left(1,2{ }^{*} \mathrm{~N}-1\right)\). For optim al efficiency, LW ORK \(>=\) \((N B+1) * N\), where \(N B\) is the blocksize for CHETRD retumed by ILAENV.

If LW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
dim ension ( \(7 * \mathrm{~N}\) )

IV ORK (w orkspace)
dim ension ( \(5 * N\) )

FAII (output)
If \(J O B Z=V^{\prime}\), then if \(\mathbb{N F O}=0\), the firstM ele\(m\) ents of \(\mathbb{F} A \mathbb{I}\) are zero. If \(\mathbb{N} F O>0\), then \(\mathbb{F} A \mathbb{H}\) contains the indices of the eigenvectors that failed to converge. If \(\mathrm{OBB}=\mathrm{N}\) ', then \(\mathbb{F} A \mathbb{I}\) is notreferenced.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i-\) th argum enthad an illegalvalue
> 0: CPO TRF orCHEEVX retumed an errorcode:
\(<=\mathrm{N}:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{CHEEVX}\) failed to converge; i eigenvectors failed to converge. Their indices are stored in amay \(\mathbb{F A} \mathbb{I} .>N:\) if \(\mathbb{N F O}=\mathrm{N}+\) \(i\), for \(1<=i<=N\), then the leading \(m\) inor of orderiofB is notpositive definite. The factorization of \(B\) could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

\section*{PURPOSE}
zhem \(m\) perform sone of the \(m\) atrix \(m\) atrix operations \(C:=\) alpha*A *B + beta*C orC := alpha*B *A + beta*C where alpha and beta are scalars, \(A\) is an herm itian \(m\) atrix and \(B\) and \(C\) are \(m\) by \(n m\) atrices.

\section*{ARGUMENTS}

SID E (input)
On entry, SIDE specifiesw hether the herm itian \(m\) atrix A appears on the leftor right in the operation as follow s:
\(S \mathbb{D} E=\) L'or \(\mathrm{I}^{\prime} \mathrm{C}:=\) alpha*A *B + beta*C,
\(S \mathbb{D E}=\mathrm{R}\) 'or \(\mathrm{r}^{\prime} \mathrm{C}:=\) alpha*B*A + beta* C ,

U nchanged on exit.

UPLO (input)
On entry, UPLO specifies whether the upper
or lower triangular part of the herm itian
\(m\) atrix \(A\) is to be referenced as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or L ' Only the upper triangularpart of the herm itian m atrix is to be referenced.

UPLO = 'L 'or I' O nly the low er triangularpart
of the herm itian \(m\) atrix is to be referenced.

U nchanged on exit.

M (input)
O \(n\) entry, \(M\) specifies the num ber of row sof the \(m\) atrix \(C . M>=0\). U nchanged on exit.

N (input)
O n entry, N specifies the num ber of colum ns of the \(m\) atrix \(C . N>=0\). U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
COM PLEX *16 array ofD \(\mathbb{I M}\) ENSION (LDA, ka ), where ka ism when \(S \mathbb{D E}=\mathrm{L}\) 'or \(\mathrm{I}^{\prime}\) and is n otherw ise.

Before entry with SIDE = L'or I', the m by m partof the array A mustcontain the herm itian \(m\) atrix, such thatw hen UPLO \(=U\) ' or \(L\) ', the leading \(m\) by \(m\) uppertriangularpart of the array A mustcontain the upper triangular part of the herm itian \(m\) atrix and the strictly low er triangularpart of A is not referenced, and \(w\) hen UPLO = L' or \({ }^{\prime}\) ', the leading \(m\) by \(m\) low er triangularpart of the array A must contain the lowertriangularpart of the herm itian \(m\) atrix and the strictly upper triangular part of A is not referenced.

Before entry w ith \(S \mathbb{D E}=\mathrm{R}\) 'or r ', the n by \(n\) partof the amay A mustcontain the herm itian \(m\) atrix, such thatw hen UPLO \(=U\) ' or \(L^{\prime}\) ', the leading \(n\) by \(n\) uppertriangularpart of the array A mustcontain the upper triangular part of the herm titian \(m\) atrix and the strictly low er triangularpart of A is not referenced, and when UPLO = L' or 1 ', the leading \(n\) by \(n\) low er triangularpart of the array A must contain the lowertriangularpart of the herm itian \(m\) atrix and the strictly upper triangular part of A is not referenced.
\(N\) ote that the im aginary parts of the diagonal elem ents need notbe set, they are assum ed to be zero. U nchanged on exit.

LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen \(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathrm{I}^{\prime}\) then LD \(A>=m a x(1, m)\), otherw ise LD A \(>=\max (1, \mathrm{n})\). U nchanged on exit.

B (input)
COM PLEX *16 array ofD \(\mathbb{I M}\) ENSION (LD \(\mathrm{B}, \mathrm{n}\) ). Before
entry, the leading \(m\) by \(n\) partof the array \(B\) m ustcontain the \(m\) atrix \(B\). Unchanged on exit.
LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program.
LD B must be at leastmax ( \(1, \mathrm{~m}\) ). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then \(C\) need not.be set on input. U nchanged on exit.

C (input/output)
COM PLEX *16 aray ofD \(\mathbb{I M}\) ENSION (LD C, n ).
Before entry, the leading \(m\) by \(n\) part of the aray \(C\) mustcontain the \(m\) atrix \(C\), exceptw hen beta is zero, in which case \(C\) need notbe set on entry.

On exit, the array \(C\) is overw ritten by the \(m\) by n updated m atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastmax ( \(1, m\) ). U nchanged on exit.

\section*{ARGUMENTS}

UPLO (input)
O \(n\) entry, UPLO specifies whether the upper or low er triangular part of the array \(A\) is to be referenced as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or L ' Only the upper triangularpart of \(A\) is to be referenced.

UPLO = L 'or I' O nly the low ertriangularpart of A is to be referenced.

U nchanged on exit.

N (input)
O n entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)

Before entry w ith UPLO = U 'or L ', the leading \(n\) by \(n\) upper triangularpart of the array A \(m\) ust contain the upper triangular part of the herm itian \(m\) atrix and the strictly low er triangularpartofA is not referenced. Before entry \(w\) ith UPLO \(=\mathrm{L}^{\prime}\) or \({ }^{\prime}\) ', the leading \(n\) by \(n\) low er triangular part of the array A m ustcontain the low er triangular part of the herm itian \(m\) atrix and the strictly upper triangularpart of \(A\) is not referenced. N ote that the im aginary parts of the diagonalele\(m\) ents need notbe set and are assum ed to be zero. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A \(>=\) \(m a x(1, n)\). U nchanged on exit.
\(X\) (input)
\((1+(n-1) * a b s(\mathbb{N} C X))\). Before entry, the increm ented array \(X\) must contain the \(n\) elem ent vectorx. U nchanged on exit.
\(\mathbb{N} C X\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents ofX. \(\mathbb{N} C X<>0\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then \(Y\) need notbe set on input. U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) m ust contain the \(n\) elem ent vectory. On exit, \(Y\) is overw rilten by the updated vectory.
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N C Y}\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
zher2k perform s one of the H erm titian rank 2 k operations \(\mathrm{C}:=\) alpha*A *con \(\dot{g}\left(\mathrm{~B}^{\prime}\right)+\) con \(\dot{g}(a l p h a) * B * c o n \dot{g}\left(A^{\prime}\right)+\) beta*C orC \(:=\) alpha*con \(\dot{g}\left(A^{\prime}\right) \star B+\) con \(\dot{g}(a l p h a) \star c o n \dot{g}\left(B^{\prime}\right) \star A+\) beta*C w here alpha and beta are scalarsw ith beta real, \(C\) is an \(n\) by \(n H\) erm itian \(m\) atrix and \(A\) and \(B\) are \(n\) by \(k\) \(m\) atrices in the first case and \(k\) by \(n m\) atrioes in the second case.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangular part of the array \(C\) is to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular partof \(C\) is to be referenced.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) 'or \(h^{\prime} \quad C:=a l p h a * A * \infty n g\left(B^{\prime}\right)\)
+ cong (alpha \(){ }^{\star} \mathrm{B}^{*}\) con \(\dot{j}\left(\mathrm{~A}^{\prime}\right)+\) beta* C .
TRANSA = C'ort' \(C=a l p h a * \operatorname{conjg}\left(A^{\prime}\right) \star B\)
\(+\operatorname{con} \dot{g}(\) alpha \(){ }^{\star}\) oon \(\dot{g}\left(B^{\prime}\right) \star A+\) beta \({ }^{\star} C\).

U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE. N (input)

O n entry, \(N\) specifies the order of the \(m\) atrix \(C\). N m ustbe at least zero. U nchanged on exit.

K (input)
On entry w ith TRANSA \(=N\) 'or \(h\) ', \(K\) specifies the num ber of colum ns of the \(m\) atrices \(A\) and \(B\), and on entry \(w\) th TRANSA \(=C^{\prime}\) or \(\mathrm{t}^{\prime}\), K specifies the num ber of row sof the \(m\) atrices \(A\) and B. K m ustbe at least zero. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.
A (input)
COM PLEX *16 anay ofD \(\mathbb{I M} E N S I O N\) (LDA, ka ), where ka isk when TRANSA \(=\mathrm{N}\) 'or h ', and is
n otherw ise. Before entry with TRANSA \(=\mathrm{N}\) ' or
h ', the leading n by k partof the array \(A\)
\(m\) ustcontain the \(m\) atrix \(A\), otherw ise the leading
k by n partof the array A mustcontain the \(m\) atrix A. U nchanged on exit.

LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program.
W hen TRANSA \(=N\) 'or \(h\) 'then LDA must be at least \(\max (1, n)\), otherw ise LDA m ust.be at least \(\max (1, k)\). U nchanged on exit.

B (input)
COM PLEX *16 aray ofD \(\mathbb{I M}\) ENSION (LD B, kb ), where kb isk when TRANSA \(=\mathrm{N}\) 'or h ', and is
n otherw ise. Before entry w ith TRANSA \(=\mathrm{N}^{\prime}\) or \(h\) ', the leading \(n\) by k part of the array \(B\) \(m\) ust contain the \(m\) atrix \(B\), otherw ise the leading k by n part of the aray \(B \mathrm{~m}\) ustcontain the \(m\) atrix \(B\). U nchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. W hen TRANSA \(=N\) 'or \(h\) 'then LDB must be at least \(\max (1, n)\), otherw ise LD B m ustbe at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
COMPLEX*16 amay ofD \(\mathbb{I M} E N S I O N(L D C, n)\).

Before entry w th UPLO = U 'or L', the leading \(n\) by \(n\) upper triangular part of the array \(C\) \(m\) ustcontain the upper triangular part of the \(H\) erm itian \(m\) atrix and the strictly low ertriangularpart of C is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated \(m\) atrix.

Before entry w th UPLO = L'or I', the leading \(n\) by \(n\) low er triangular part of the amray \(C\) m ustcontain the low er triangular part of the \(H\) erm itian \(m\) atrix and the strictly upper triangularpartof C is not referenced. On exit, the low er triangularpart of the array \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

N ote that the im aginary parts of the diagonalele\(m\) ents need not be set, they are assum ed to be zero, and on exit they are set to zero.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C m ust be at leastm ax ( \(1, \mathrm{n}\) ). U nchanged on exit.

\section*{PURPOSE}
zherfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is Herm itian indefintite, and provides errorbounds and backw ard error estim ates forthe solution.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the \(m\) atrices \(B\) and \(X . N R H S>=0\).

A (input) The H erm itian m atrix A . If \(\mathrm{UPLO}=\mathrm{U}\) ', the leading \(N-b y-N\) uppertriangularpartofA contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low er triangular partofA is not referenced. IfU PLO = L', the leading N -by-N lower triangularpartofA contains the low er triangular part of the \(m\) atrix \(A\), and the strictly upper triangularpartofA is not referenced.

LD A (input)
The leading dim ension of the array A. LDA >= max (1,N).
AF (input)
The factored form of them atrix A. AF contains the block diagonal matrix D and themultipliers used to obtain the factor \(U\) orl from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}\) as com puted by CHETRF.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

PIVOT (input)
D etails of the interchanges and the block structure ofD as determ ined by CHETRF.
\(B\) (input) The righthand side m atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by CHETRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the amay X . LD \(\mathrm{X}>=\) \(\max (1, N)\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{)})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{j})\)-XTRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as
reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( \(j\) ) (ie., the sm allest relative change in any elem entof \(A\) or \(B\) thatm akes \(X(\mathcal{J})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
< 0: if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvalue

\section*{C INTERFACE}
\#include <sunperfh>
void zherk (charuplo, chartransa, int n, int \(k\), double alpha, doublecom plex *a, int lda, double beta, doublecom plex * \({ }^{\text {c }}\), int ldc);
void zherk_64 (charuplo, chartransa, long n, long k, double alpha, doublecom plex *a, long lda, double beta, doublecom plex *c, long ldc);

\section*{PURPOSE}
zherk penform s one of the \(H\) erm itian rank \(k\) operations \(C:=\) alpha*A *conjg ( \(A^{\prime}\) ) + beta*C orC := alpha*cong (A')*A + beta*C where alpha and beta are realscalars, C is an n by \(n\) Herm itian \(m\) atrix and \(A\) is an \(n\) by \(k\) matrix in the first case and \(\mathrm{a} k\) by n atrix in the second case.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper or lower triangular part of the array \(C\) is to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular partof \(C\) is to be referenced.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=\) N 'or h' \(\mathrm{C}:=\) alpha*A *oonjg (A') + beta*C .

TRANSA = C'or \(\boldsymbol{E}^{\prime} \mathrm{C}:=\) alpha*cong (A')*A +
beta*C .

U nchanged on exit.
TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

N (input)
On entry, \(N\) specifies the order of the \(m\) atrix \(C\).
N m ustbe at least zero. U nchanged on exit.
K (input)
On entry with TRANSA = N 'or h', K specifies the number of columns of the matrix \(A\), and on entry \(w\) ith TRANSA \(=C^{\prime}\) or \(\mathrm{C}^{\prime}\), \(K\) specifies the num ber of row sof the \(m\) atrix A. K m ustbe at least zero. U nchanged on exit.
ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
COM PLEX *16 aray ofD \(\mathbb{I M}\) ENSION (LDA, ka ), where ka isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w th TRANSA \(=\mathrm{N}\) ' or h ', the leading n by k part of the array \(A\) \(m\) ust contain the \(m\) atrix \(A\), otherw ise the leading k by n partof the array A mustcontain the \(m\) atrix A. U nchanged on exit.

LDA (input)
O \(n\) entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA \(=\mathrm{N}\) 'or h 'then LDA must be at least \(\max (1, n)\), otherw ise LDA m ust.be at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.

C (input/output)
COM PLEX *16 anay ofD \(\mathbb{I M}\) ENSION (LD C , n ) .
Before entry w ith UPLO = U 'or L ', the leading \(n\) by \(n\) upper triangularpart of the array \(C\) \(m\) ust contain the upper triangular part of the H erm itian \(m\) atrix and the strictly low ertriangularpartofC is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated
m atrix.

Before entry w ith UPLO = L 'or I', the leading \(n\) by \(n\) low er triangular part of the array \(C\) \(m\) ust contain the low er triangular part of the H erm itian \(m\) atrix and the strictly upper triangularpartof \(C\) is not referenced. On exit, the low er triangularpart of the amay \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

N ote that the im aginary parts of the diagonalele\(m\) ents need not be set, they are assum ed to be zero, and on exit they are set to zero.
LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program. LD C must be at leastm ax ( \(1, \mathrm{n}\) ). U nchanged on exit.

void zhesv_64 (charuplo, long n, long nrhs, doublecom plex *a, long lda, long *ípivot, doublecom plex *b, long ldb, long *info);

\section*{PURPOSE}
zhesv com putes the solution to a com plex system of linear equations
\(A * X=B, w h e r e A\) is an \(N\) boy- \(N\) H erm tian \(m\) atrix and \(X\) and \(B\) are N -by-N RH S m atrices.

The diagonalpivoting \(m\) ethod is used to factorA as
\[
\begin{aligned}
& A=U * D * U * * H, \text { if } U P L O=U ' \text {, or } \\
& A=L * D * L * * H, \text { if } U P L O=L^{\prime}
\end{aligned}
\]
where \(U\) (orL) is a productofperm utation and unit upper (low er) triangular matrioes, and D is H erm itian and block diagonalw ith 1 boy-1 and 2 -by-2 diagonalblocks. The factored form of \(A\) is then used to solve the system of equations \(\mathrm{A} * \mathrm{X}=\mathrm{B}\).

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) : U pper triangle ofA is stored;
\(=L^{\prime}\) : Low er triangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atrix B. NRH S \(>=0\).

A (input/output)
On entry, the \(H\) erm itian \(m\) atrix A. If UPLO = U', the leading \(\mathrm{N}-\) by -N uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart ofA is not referenced. If UPLO = L', the leading N -by-N low er triangularpartof \(A\) contains the low ertriangularpartof them atrix A, and the strictly upper triangular part of A is not referenced.

On exit, if \(\mathbb{N F O}=0\), the block diagonalm atrix \(D\) and the \(m\) ultipliers used to obtain the factor \(U\) or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) or \(\mathrm{A}=\) L*D *L**H as com puted by CHETRF.
LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

IPIVOT (output)
D etails of the interchanges and the block structure ofD, as determ ined by CHETRF. If \(\mathbb{P}\) IVOT (k) \(>0\), then row sand colum nsk and \(\mathbb{P} \mathbb{V} O T(k)\) were interchanged, and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1 -by- 1 diagonal block. If UPLO \(=\mathrm{U}\) 'and \(\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)\) \(<0\), then row s and colum nsk-1 and - \(\mathbb{P}\) IV OT (k) were interchanged and \(D(k-1 k, k-1 k)\) is a 2 -by-2 diagonal block. If UPLO \(=\mathbb{L}\) ' and \(\mathbb{P} \mathbb{I V O T}(k)=\) IP IV O \((k+1)<0\), then row s and colum ns \(k+1\) and \(-\mathbb{P}\) IV O T ( \(k\) ) w ere interchanged and \(D(k *+1, k k+1)\) is a 2 -by-2 diagonalblock.

B (input/output)
On entry, the N -by-NRH \(S\) righthand side \(m\) atrix \(B\). On exi, if \(\mathbb{N} F O=0\), the \(N\) by \(N\) RH solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the anay B . LD B >= \(\max (1, N)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, \mathrm{~W} O R K(1)\) retums the optim al LDW ORK.

LD W ORK (input)
The length of ORK . LDW ORK >= 1, and for best perform ance LDW ORK \(>=N * N B\), where \(N B\) is the optim alblocksize forCHETRF.

If LD W ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{I N} F O\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=\mathrm{i}, \mathrm{D}(i, i)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{C INTERFACE}
\#include <sunperfh>
void zhesvx (char fact, charuplo, int n, int nrhs, doublecom plex *a, int lda, doublecom plex *af, int ldaf, int *ipivot, doublecom plex *b, int ldb, doublecom plex *x, int ldx, double *rcond, double *ferr, double *berr, int *info);
void zhesvx_64 (char fact, char uplo, long n, long nrhs, doublecom plex *a, long lda, doublecom plex *af, long ldaf, long *ípivot, doublecom plex *b, long ldb, doublecom plex *x, long ldx, double *roond, double * ferr, double *berr, long *info);

\section*{PURPOSE}
zhesvx uses the diagonalpivoting factorization to com pute the solution to a com plex system of linear equations \(\mathrm{A} * \mathrm{X}=\) \(B\), where \(A\) is an \(N\) by \(-N\) H erm itian \(m\) atrix and \(X\) and \(B\) are \(N-\) by-N R H S m atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to
factorA.
The form of the factorization is
\[
\begin{aligned}
& A=U * D * U * * H, \text { if } U P L O=U ' \text {, or } \\
& A=L * D * L * * H, \text { if } U P L O=L \prime
\end{aligned}
\]
where \(U\) (orL) is a product of perm utation and unit upper (low er)
triangularm atrices, and \(D\) is Herm titian and block diagonalw ith
1-by-1 and 2-by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the
reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and com pute enror bounds as described below .
3.The system ofequations is solved for \(X\) using the factored form of A.
4. Herative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate emror bounds and backw ard enror estim ates
for it.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornot the factored form of A has been supplied on entry. = F ': On entry, A F and \(\mathbb{P}\) IV OT contain the factored form of A. A, AF and \(\mathbb{P} \mathbb{V O T}\) will not be modified. = N : The \(m\) atrix A w illlbe copied to A F and factored.

UPLO (input)
\(=\mathrm{U}:\) : U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix A. \(N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X . NRHS \(>=0\).

A (input) The \(H\) erm itian \(m\) atrix \(A\). IfUPLO \(=U\) ', the leading N -by- N uppertriangularpartofA contains the uppertriangularpart of the \(m\) atrix \(A\), and the strictly low ertriangularpart of A is notreferenced. IfUPLO = L', the leading N -by-N lower triangularpart ofA contains the low er triangular part of the m atrix A, and the strictly upper triangularpart ofA is notreferenced.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).
AF (input/output)
IfFACT \(=F^{\prime}\), then \(A F\) is an inputargum entand on entry contains the block diagonalm atrix D and the m ultipliers used to obtain the factor U orL from the factorization \(A=U * D * U * * H\) orA \(=L * D * L * * H\) as com puted by CHETRF .

IfFACT \(=N\) ', then \(A F\) is an output argum ent and on exit retums the block diagonalm atrix D and the m ultipliers used to obtain the factorU or L from the factorization \(A=U * D * U * * H\) or \(A=\) L*D*L**H.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

IPIVOT (inputoroutput)
IfFACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an input argum ent and on entry contains details of the interchanges and the block structure of D , as determ ined by CHETRF. If \(\mathbb{P} \mathbb{I V O T}(k)>0\), then row \(s\) and colum nsk and \(\mathbb{P} \mathbb{I V} O T(k)\) w ere interchanged and \(D(k, k)\) is a 1 boy-1 diagonal block. If \(\mathrm{UPLO}=\mathrm{U}\) ' and \(\mathbb{P} \operatorname{IV} \circ T(\mathrm{k})=\mathbb{P} \mathbb{I} \circ \mathrm{T}(\mathrm{k}-1)<0\), then row s and colum ns \(\mathrm{k}-1\) and \(-\mathbb{P} \mathbb{I V O T}(\mathrm{k})\) were interchanged and \(\mathrm{D}(\mathrm{k}-\) \(1 \mathrm{k}, \mathrm{k}-1 \mathrm{k}\) ) is a 2-by-2 diagonalblock. If \(\mathrm{PLO}=\) \(\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{V} O T(k+1)<0\), then row sand colum nsk+1 and -TP IVOT (k) w ere interchanged and D \((k: k+1, k: k+1)\) is a 2 -by-2 diagonalblock.

If \(\mathrm{FACT}=\mathrm{N}\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exitcontains details of the interchanges and the block structure of D , as determ ined by

CHETRF.

B (input) The N Hoy-N RHS righthand side m atrix B .

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N}\) FO \(=N+1\), the N -by -N RH S solution
m atrix \(X\).
LD X (input)
The leading dim ension of the array X. LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num ber of the matrix A. IfRCOND is less than them achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N F O}>\) 0 .

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X\) ( \()\) ) (the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(i), F E R R(i)\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) entin ( \(X(\mathcal{I})-X\) TRUE) divided by the \(m\) agninude of the largestelem entin X ( 7 ). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vectorX (i) (ie., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK \(>=2 * N\), and for best perform ance LDW ORK \(>=N * N B\), where \(N B\) is the optim alblocksize forCHETRF .

IfLDW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{D}(i, i)\) is exactly zero. The factorization
has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : D is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. Nevertheless, the solution and error bounds are com puted because there are a num berof situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void zhetf2 (charuple, intn, doublecom plex *a, int lda, int *ị̆̇v, int *info);
void zhetf2_64 (charuplo, long n, doublecom plex *a, long lda, long *ịiv, long *info);

\section*{PURPOSE}
zhetf2 com putes the factorization of a com plex H erm itian \(m\) atrix A using the Bunch-K aufm an diagonalpivoting \(m\) ethod:
\[
A=U * D * U^{\prime} \text { or } A=L * D * L^{\prime}
\]
where \(U\) (orL) is a product of perm utation and unit upper (low er) triangular m atrices, \(U\) 'is the conjugate transpose of \(U\), and \(D\) is \(H\) erm itian and block diagonalw ith 1 boy- 1 and 2-by-2 diagonalblocks.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

\section*{UPLO (input)}

Specifies w hether the upper or low er triangular part of the \(H\) erm itian \(m\) atrix \(A\) is stored:
\(=\mathrm{U}\) ': Upper triangular
\(=\mathrm{L}\) ': Low ertriangular

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
On entry, the \(H\) erm itian \(m\) atrix A. If \(\mathrm{U} P L O=\mathrm{U}\) ', the leading \(n-b y-n\) uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If UPLO \(=\mathbb{L}\) ', the leading \(n-b y-n\) low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of \(A\) is notreferenced.

On exit, the block diagonalm atrix D and the mul
tipliers used to obtain the factorU orl (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, \mathbb{N})\).

IPIV (output)
D etails of the interchanges and the block structure ofD. If \(\mathbb{P} \mathbb{I V}(k)>0\), then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V}(k)\) were interchanged and \(D(k, k)\) is a 1 -by-1 diagonalblock. IfUPLO \(=U\) 'and \(\mathbb{P} \mathbb{I V}(k)\) \(=\mathbb{P} \mathbb{I V}(k-1)<0\), then row \(s\) and colum ns \(k-1\) and \(-\mathbb{P} \mathbb{I V}(k)\) w ere interchanged and \(D(k-1 *, k-1 k)\) is a 2 -by-2 diagonalblock. IfUPLO \(=\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V}(k)\)
\(=\mathbb{P} \mathbb{I}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k, k+1, k \mathrm{k}+1)\) is a 2-by-2 diagonalblock.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\mathrm{k}\), the k -th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=k, D(k, k)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w ill occur if it is used to solve a system of equations.

\section*{PURPOSE}
zhetrd reduces a com plex \(H\) erm itian \(m\) atrix A to real sym \(m\) etric tridiagonal form \(T\) by a unitary sim ilarity transformation: Q ** \(\mathrm{H} * \mathrm{~A} * \mathrm{Q}=\mathrm{T}\).

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low er triangle ofA is stored.

N (input) The order of the matrix \(\mathrm{A} . \mathrm{N}>=0\).
A (input) \(O n\) entry, the \(H\) erm itian \(m\) atrix \(A\). If \(U P L O=U '\),
the leading \(\mathrm{N}-\) by -N uppertriangularpartofA con-
tains the upper triangular part of the \(m\) atrix \(A\), and the strictly low ertriangularpartofA is not referenced. If UPLO \(=\mathrm{L}\) ', the leading N -by -N
low er triangularpartofA contains the low ertriangularpart of the matrix A, and the strictly upper triangular part ofA is not referenced. On exit, if UPLO = U ', the diagonal and firstsuperdiagonalofA are overw rilten by the comesponding elem ents of the tridiagonalm atrix T , and the ele\(m\) ents above the first superdiagonal, \(w\) ith the array TAU, represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors; if UPLO \(=\mathrm{L}\) ', the diagonaland firstsubdiagonalofA are over-
w ritten by the comesponding elem ents of the tridiagonalm atrix \(T\), and the elem ents below the first subdiagonal, with the array TAU, represent the unitary \(m\) atrix \(Q\) as a product of elem entary reflectors. See FurtherD etails.

LD A (input)
The leading dim ension of the amay A. LDA >= \(\max (1, N)\).

D (output)
The diagonalelem ents of the tridiagonalm atrix T :
D (i) \(=A(i, i)\).
E (output)
The off-diagonal elem ents of the tridiagonal matrix \(T: E(i)=A(i, i+1)\) if \(U P L O=U^{\prime}, E(i)=\) A \((i+1, i)\) if \(U P L O=L\).

TAU (output)
The scalar factors of the elem entary reflectors (see FurtherD etails).

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, W\) ORK (1) retums the optim al
LW ORK.
LW ORK (input)
The dim ension of the array \(W\) ORK. LW ORK >=1. For optim um perform ance LW ORK >=N *NB, where NB is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

If \(\mathrm{PLO}=\mathrm{U}\) ', the \(m\) atrix \(Q\) is represented as a product of elem entary reflectors
\[
Q=H(n-1) \ldots H(2) H(1) .
\]

Each H (i) has the form
\(H(i)=I-\tan * V^{*} V^{\prime}\)
\(w\) here tau is a com plex scalar, and \(v\) is a com plex vector w ith \(\mathrm{v}(\mathrm{i}+1 \mathrm{n})=0\) and \(\mathrm{v}(\mathrm{i})=1\); \(\mathrm{v}(1: i-1)\) is stored on exit in
A ( \(1: i-1, i+1\) ), and tau in TAU (i).

If U PLO \(=\mathbb{L}\) ', them atrix Q is represented as a product of elem entary reflectors
\[
Q=H(1) H(2) \ldots H(n-1)
\]

Each H (i) has the form
\[
H(i)=I-\tan { }^{\star} v^{*} v^{\prime}
\]
where tau is a com plex scalar, and \(v\) is a com plex vector w ith \(\mathrm{v}(1: i)=0\) and \(\mathrm{v}(\mathrm{i}+1)=1 ; \mathrm{v}(\mathrm{i}+2 \mathrm{n})\) is stored on exit in \(A(i+2 m, i)\), and tau in TAU (i).

The contents ofA on exitare illustrated by the follow ing exam ples \(w\) ith \(n=5\) :
```

ifUPLO = U ': ifUPLO = L ':

```
    ( d e v2 v3 v4 ) (d
)
    ( d e v3 v4 ) ( e d
)
    ( d e v4 ) (v1 e d
)
    ( d e ) ( v1 v2 e d
)
    ( d ) (v1 v2 v3 e d
)
where d and e denote diagonal and off-diagonal elem ents of \(T\), and videnotes an elem ent of the vectordefining \(H\) (i).

\section*{PURPOSE}
zhetrf com putes the factorization of a complex Herm itian \(m\) atrix A using the B unch-K aufn an diagonalpivoting \(m\) ethod. The form of the factorization is
\[
\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H} \text { or } \mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}
\]
where \(U\) (orL) is a productof perm utation and unit upper (low er) triangular matrioes, and D is H erm itian and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. N >=0.

A (input/output)
On entry, the H erm itian matrix A . If UPLO = \(\mathrm{U}^{\prime}\), the leading \(\mathrm{N}-\) by -N uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart ofA is not referenced. If UPLO = L', the leading N -by-N low er triangularpart of \(A\) contains the low ertriangularpartof them atrix A, and the strictly upper triangular part of A is not referenced.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{IPIVOT (output)}

D etails of the interchanges and the block structure of D. If \(\mathbb{P I V O T}(k)>0\), then row sand columnsk and \(\mathbb{P I V O T}(k)\) were interchanged and \(D(k, k)\) is a \(1-b y-1\) diagonalblock. If \(U P L O=U^{\prime}\) and \(\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)<0\), then row \(s\) and colum ns \(k-1\) and - \(\mathbb{P I V O T}(k)\) were interchanged and D ( \(k-1 * k, k-1 k)\) is a \(2-b y-2\) diagonal block. If UPLO \(=\mathrm{L}\) 'and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V} O T(k)\) were interchanged and \(D(k: k+1, k k+1)\) is a \(2-b y-2\) diagonal block.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >=1. Forbestperfor\(m\) ance LDW ORK >=N *NB, where NB is the block size retumed by ㅍAENV .
\(\mathbb{I N}\) FO (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the i-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system ofequations.

\section*{FURTHER DETAILS}

If U PLO \(=\mathrm{U}\) ', then \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}\) ', where
\(U=P(n) \star U(n)^{\star} \ldots * P(k) U(k)^{\star} . . .\),
i.e., \(U\) is a product of term \(s P(k) * U(k)\), where \(k\) decreases
from \(n\) to 1 in steps of 1 or 2 , and \(D\) is a block diagonal \(m\) atrix \(w\) ith 1 -by- 1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(k)\), and \(U(k)\) is a unit uppertriangularm atrix, such that if the diagonal
block \(D(k)\) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=\left(\begin{array}{lll}
0 & I
\end{array}\right) s \\
& \text { ( } 0 \text { O I ) } n-k \\
& \mathrm{k}-\mathrm{s} \text { s } \mathrm{n}-\mathrm{k}
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(1 k-\) \(1, k)\). If \(s=2\), the uppertriangle of \((k)\) overw rites \(A(k-\) \(1, k-1), A(k-1, k)\), and \(A(k, k)\), and \(v\) overw rites \(A(1 k-2, k-\) 1 k).

If \(U P L O=L\) ', then \(A=L * D * L '\), where
\(L=P(1) \star L(1)^{\star} \ldots * P(k) \star L(k)^{\star} \ldots\),
ie., \(L\) is a product ofterm \(s P(k) * L(k)\), where \(k\) increases from 1 to \(n\) in steps of 1 or 2 , and \(D\) is a block diagonal \(m\) atrix \(w\) ith 1 -by -1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V} O T(k)\), and \(L(k)\) is a unitlow ertriangularm atrix, such that if the diagonal
block D (k) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( I 0 0 ) k-1 } \\
& L(k)=\left(\begin{array}{lll}
0 & I & 0
\end{array}\right) s \\
& \text { ( } 0 \text { v I ) n-k-s+1 } \\
& \mathrm{k}-1 \text { s } \mathrm{n}-\mathrm{k}-\mathrm{s}+1
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(k+1 m, k)\). If \(s=2\), the low ertriangle ofD \((k)\) overw rites \(A(k, k), A(k+1, k)\), and \(A(k+1, k+1)\), and \(v\) overw rites \(A(k+2 m, k: k+1)\).

\section*{PURPOSE}
zhgeqz im plem ents a single-shiftversion of the Q Z m ethod
for finding the generalized eigenvalues
w ( \(i=A L P H A\) (i) \(B E T A\) ( \((\mathbf{i})\) of the equation \(A\) are then
\(A \operatorname{LPHA}(1), \ldots, A \operatorname{LPHA}(\mathbb{N})\), and ofB areBETA \((1), \ldots, B E T A(\mathbb{N})\).

If \(\mathrm{JOB}=\mathrm{S}\) 'and COMPQ and COMPZ are V 'or 'I', then the unitary transform ations used to reduce ( \(\mathrm{A}, \mathrm{B}\) ) are accum ulated into the arays \(Q\) and \(Z\) s.t.:
(in) A (in) Z (in) \({ }^{*}=\mathrm{Q}\) (out) A (out) Z (out)*

Ref: C B.M oler \& G W . .Stew art, "A n A lgorithm for G eneralized M atrixigenvalue Problem s", SIAM J. Num er. A nal, 10 (1973) р. 241-256.

\section*{ARGUMENTS}

JOB (input)
\(=\mathrm{E}\) ': com pute only A LPHA andBETA. A and B w ill
not necessarily be put into generalized Schur
form . = S':putA and B into generalized Schur form, asw ell as com puting A LPHA and BETA.

COMPQ (input)
\(=\mathrm{N}\) : do notm odify Q .
\(=\mathrm{V}\) ': m ultiply the array Q on the right by the conjugate transpose of the unitary tranform ation that is applied to the left side of \(A\) and \(B\) to reduce them to Schur form . = I': like COMPQ=V', except thatQ w illbe initialized to the identity first.

COMPZ (input)
\(=\mathrm{N}\) : do notm odify Z.
\(=\mathrm{V}\) ': m ultiply the array Z on the right by the unitary tranform ation that is applied to the right side ofA and B to reduce them to Schur form . = 'I': like COM PZ=V', except thatZ w illbe initialized to the identity first.

N (input) The order of the \(m\) atrices \(A, B, Q\), and \(Z . N>=0\).

IIO (input)
It is assum ed thatA is already upper triangular
in row s and colum ns \(1: \mathbb{H O}-1\) and \(\mathrm{H} \mathrm{I}+1 \mathrm{~N} .1<=\Pi 0\)
\(<=\mathbb{H} I<=N\), if \(N>0 ; \Pi \mathrm{O}=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

IH I (input)
It is assum ed thatA is already upper triangular in row s and colum ns \(1: \mathbb{L O}-1\) and \(\mathrm{H} \mathrm{I}+1 \mathbb{N} .1<=\Pi 0\) \(<=\mathbb{H} I<=N\), if \(N>0 ; \Pi O=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

A (input) On entry, the \(N\) boy-N upper \(H\) essenberg \(m\) atrix \(A\).
Elem ents below the subdiagonalm ustbe zero. If
\(J O B=S\) ', then on exit A and B w ill have been sim ultaneously reduced to upper triangular form. If OB = E', then on exitA will have been destroyed.

LD A (input)
The leading dim ension of the anray A.LDA >= \(\max\) ( \(1, N\) ).
\(B\) (input) On entry, the \(N\) boy N upper triangular \(m\) atrix \(B\).
Elem ents below the diagonal must be zero. If

JO \(B=S\) ', then on exit \(A\) and \(B\) will have been sim ultaneously reduced to upper triangular form. If \(\mathrm{JOB}=\mathrm{E}\) ', then on exit B will have been destroyed.

LD B (input)
The leading dim ension of the array \(B . L D B>=m a x(\) \(1, N\) ).

ALPHA (output)
The diagonalelem ents of \(A\) when the pair \((A, B)\) has been reduced to Schur form. ALPHA (i) BETA (i) \(i=1, \ldots, N\) are the generalized eigenvalues.

\section*{BETA (output)}

The diagonalelem ents of \(B\) w hen the pair \((A, B)\) has been reduced to Schur form. ALPHA (i) BETA (i) \(i=1, \ldots, N\) are the generalized eigenvalues. A and B are norm alized so thatBETA (1),..,BETA \((\mathbb{N})\) are non-negative realnum bers.

Q (input/output)
If \(C O M P Q=N\) ', then \(Q\) willnotbe referenced. If \(C O M P Q=V\) ' or \(I\) ', then the conjugate transpose of the unitary transform ations w hich are applied to A and \(B\) on the leftw ill.be applied to the array \(Q\) on the right.

LD Q (input)
The leading dim ension of the array \(Q . L D Q>=1\). If \(C O M P Q=V\) 'or \(I\) ', then \(L D Q>=N\).

Z (input/output)
If \(C O M P Z=N\) ', then \(Z \mathrm{w}\) ill notbe referenced. If
COM PZ=V 'or 'I', then the unitary transform ations which are applied to \(A\) and \(B\) on the rightw ill be applied to the amay \(Z\) on the right.

LD Z (input)
The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\). If \(\mathrm{COM} \mathrm{MZ}=\mathrm{V}\) 'or I ', then LD \(\mathrm{Z}>=\mathrm{N}\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O>=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dimension of the array W ORK. LW ORK >= \(\max (1, N)\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no emorm essage related to LW ORK is issued by XERBLA.
RW ORK (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the \(i\)-th argum enthad an illegalvałue
\(=1, \ldots, N\) : the \(\mathrm{Q} Z\) teration did not converge.
\((A, B)\) is not in Schur form, butALPHA (i) and \(\mathrm{BETA}(\mathrm{i}), \mathrm{F}=\mathbb{N F O}+1, \ldots, \mathrm{~N}\) should be correct. \(=\) \(\mathrm{N}+1, \ldots, 2 * \mathrm{~N}\) : the shift calculation failed. (A , B ) is notin Schur form, but ALPHA (i) and BETA (i), \(i=\mathbb{N}\) FO \(-\mathrm{N}+1, \ldots, \mathrm{~N}\) should be comect. \(>2 \star \mathrm{~N}\) : various "im possible" errors.

\section*{FURTHER DETAILS}

W e assum e that com plex A BS w orks as long as its value is less than overflow .

\section*{PURPOSE}
zhpev com putes all the eigenvalues and, optionally, eigenvectors of a com plex H erm tiian m atrix in packed storage.

\section*{ARGUMENTS}

JO BZ (input)
= N ': C om pute eigenvalues only;
\(=\mathrm{V}:\) : om pute eigenvalues and eigenvectors.

UPLO (input)
\(=\mathrm{U}\) ': U ppertriangle of A is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O \(n\) entry, the upper or low ertriangle of the Her \(m\) tian \(m\) atrix \(A\), packed collm nw ise in a linear array. The jth column of A is stored in the array A as follows: if UPLO = U',A (i+ (j 1) \(\mathrm{j}^{2} 2\) ) \(=\mathrm{A}(i, 7)\) for \(1<=\mathrm{i}<=\dot{j}\) if UPLO \(=\mathrm{L}\) ', \(\mathrm{A}(i+\) \((j-1)^{*}(2 * n-j / 2)=A(i, 7)\) for \(j=i<=n\).

On exit, A is overw rilten by values generated during the reduction to tridiagonal form. If \(\mathrm{PLO}=\) U', the diagonal and firstsuperdiagonal of the tridiagonal \(m\) atrix \(T\) overw rite the corresponding elem ents ofA, and if UPLO \(=\mathrm{L}\) ', the diagonal and first subdiagonal of \(T\) overw rite the corresponding
elem ents ofA .

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

Z (input) If \(\operatorname{JOBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N F O}=0, \mathrm{Z}\) contains the orthonorm aleigenvectors of the \(m\) atrix \(A, w\) ith the \(i\)-th colum \(n\) of \(Z\) holding the eigenvector associated w ith \(W\) (i). If \(J O B Z=N\) ', then \(Z\) is not referenced.

LD Z (input)
The leading din ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, \mathrm{~N})\).
W ORK (w orkspace)
dim ension M AX ( \(1,2 * \mathrm{~N}-1)\) )
W ORK 2 (w orkspace)
dim ension (max (1,3*N-2))
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
<0: if \(\mathbb{N N}\) FO = -i, the i-th argum enthad an illegalvahue.
> 0 : if \(\mathbb{N} F O=\) i, the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did not converge to zero.

void zhpevd (char jobz, charuplo, intn, doublecom plex *ap, double \({ }_{\mathrm{w}}\), doublecom plex *z, int ldz, int *info);
void zhpevd_64 (char jobz, charuplo, long n, doublecom plex *ap, double *w, doublecom plex *z, long ldz, long *info);

\section*{PURPOSE}
zhpevd com putes all the eigenvalues and, optionally, eigenvectors of a com plex \(H\) erm itian \(m\) atrix \(A\) in packed storage. Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w ith a guard digit in add/subtract, or on those binary \(m\) achines \(w\) ithout guard digits w hich subtract like the C ray X M P , C ray Y M P , C ray C-90, orC ray-2. It could conceivably fail on hexadecim al or decim al \(m\) achines \(w\) ithout guard digits, butw e know of none.

\section*{ARGUMENTS}

JOBZ (input)
\(=N^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}\) ': C om pute eigenvalues and eigenvectors.
UPLO (input)
= U :: U ppertriangle ofA is stored;
= L' ': Low er triangle ofA is stored.
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

\section*{AP (input/output)}

O \(n\) entry, the upper or low ertriangle of the Her \(m\) itian matrix \(A\), packed colum nw ise in a linear array. The jth colum \(n\) of \(A\) is stored in the array AP as follows: ifUPLO = U',AP (i+ (j
 \(\left.+(j-1)^{\star}(2 * n-j) / 2\right)=A(i,>)\) for \(j=i<=n\).

On exit, AP is overw ritten by values generated during the reduction to tridiagonal form. IfU PLO = U', the diagonal and first superdiagonal of the tridiagonal m atrix T overw rite the comesponding elem ents ofA, and if UPLO \(=\mathrm{L}\) ', the diagonal and first subdiagonal of \(T\) overw rite the corresponding elem ents ofA.

W (output)
If \(\mathbb{N} F O=0\), the eigenvalues in ascending order.
Z (input) If \(\mathrm{OOBZ}=\mathrm{V}^{\prime}\), then if \(\mathbb{N} F O=0, \mathrm{Z}\) contains the orthonom aleigenvectors of the \(m\) atrix \(A, w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w th \(W\) (i). If \(J O B Z=N\) ', then \(Z\) is not referenced.

LD Z (input)
The leading \(\mathrm{d} m\) ension of the array Z . LD \(\mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z \(>=\mathrm{max}(1, N)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of array \(\mathrm{W} O R \mathrm{~K}\). If \(\mathrm{N}<=1\), LW ORK must be at least 1. If \(J 0 B Z=N\) 'and \(N>\) 1, LW ORK m ust.be at least N . If \(\mathrm{JOBZ}=\mathrm{V}\) 'and N > 1, LW ORK m ustbe at least \(2{ }^{\star} \mathrm{N}\).

If LW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On exit, if \(\mathbb{N} F O=0\), RW ORK (1) retums the optim allRW ORK.

LRW ORK (input)
The dim ension of aray RW ORK. If \(\mathrm{N}<=1\), LRW ORK m ustbe atleast1. If OBZ \(=\mathrm{N}\) 'and \(N>\) 1, LRW ORK m ustbe atleast \(N\). If \(\mathrm{OBB}=\mathrm{V}\) 'and N \(>1\), LRW ORK m ustbe at least \(1+5 * \mathrm{~N}+2 \star \mathrm{~N} * * 2\).

IfLRW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the RW ORK aray, retums this value as the first entry of the RW ORK anray, and no errorm essage related to LRW ORK is issued by XERBLA.

IW ORK (w orkspace/output)
O n exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) ORK (1) retums the optim al LIW ORK.

LIW ORK (input)
The dim ension of array \(\mathbb{I W}\) ORK. If JOBZ \(=\mathrm{N}\) 'orN \(<=1\), LIN ORK m ustbe at least1. If \(\mathrm{OBZ}=\mathrm{V}^{\prime}\) and \(N>1, L \mathbb{W}\) ORK m ustbe at least \(3+5 * N\).

If LIV ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK amay, and no errorm essage related to \(L \mathbb{I W} O R K\) is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i-\) th argum ent had an illegalvalue.
\(>0:\) if \(\mathbb{N F O}=i\), the algorithm failed to converge; ioff-diagonalelem ents of an interm ediate tridiagonal form did notconverge to zero.

\section*{PURPOSE}
zhpevx com putes selected eigenvalues and, optionally, eigenvectors of a com plex H erm itian m atrix A in packed storage. E igenvalues/vectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

\section*{ARGUMENTS}
```

JO B Z (input)
= N ': C om pute eigenvalues only;
= V ': C om pute eigenvalues and eigenvectors.

```

RANGE (input)
= A ': alleigenvalues w illbe found;
\(=\) V : alleigenvalues in the half-open interval

NL,VU] will be found; = I': the \(\mathbb{I}\)-th through \(\mathbb{I U}\)-th eigenvaluesw illbe found.

UPLO (input)
\(=\mathrm{U}:\) : U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The order of the matrix \(A . N>=0\).
A (input/output)
O \(n\) entry, the upper or low er triangle of the H erm itian matrix A, packed colum nw ise in a linear array. The jth colum \(n\) of \(A\) is stored in the array A as follows: if UPLO \(=U^{\prime}\), A (i+ ( \(j\) 1) \(* j 2\) ) \(=A(i, j)\) for \(1<=i<=j\) ifUPLO \(=L '\), A ( \(i+\) \((j-1) \star(2 \star n-y / 2)=A(i, 7)\) for \(j=i<=n\).
On exit, A is overw ritten by values generated during the reduction to tridiagonal form. If \(\mathrm{PLO}=\) U ', the diagonal and firstsuperdiagonal of the tridiagonal \(m\) atrix \(T\) overw rite the comesponding elem ents of A, and if U PLO = 5 ', the diagonal and first subdiagonal of \(T\) overw rite the coresponding elem ents ofA.

VL (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU. N ot referenced ifRANGE=A 'or I''.

VU (input)
IfRANGE=V', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU .
N ot referenced ifRANGE=A 'or I''.
II (input)
IfRA N G E= I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{U}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE= A'or V'.

IU (input)
IfRANGE= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{U}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{H}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE \(=\) A'or V'.

ABTOL (input)
The absolute error tolerance for the eigenvalues.

A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b]
ofw idth less than orequal to
ABTOL + EPS * max ( \(\mathfrak{a}|\),\(| b|),\)
\(w\) here EPS is them achine precision. If ABTOL is less than orequal to zero, then EPS* \(\mid\) | w illibe used in its place, where \(F \mid\) is the 1 -norm of the tridiagonal \(m\) atrix obtained by reducing \(A\) to tridiagonal form .

E igenvalues w illlbe com puted m ostaccurately when ABTOL is set to tw ice the underflow threshold \(2 *\) SLAM CH (S ), notzero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABTOL to \(2 *\) SLAM CH (S ).

See "C om puting Sm allSingularV ahues of B idiagonal M atrices with G uaranteed H igh Relative A ccuracy," by Dem m eland \(K\) ahan, LA PA CK W orking \(N\) ote \#3.

\section*{NFOUND (output)}

The total num ber of eigenvalues found. \(0<=\) NFOUND <= N. IfRANGE = A',NFOUND = N, and if RANGE = 'I',NFOUND = \(\mathbb{U}-\mathbb{L}+1\).

W (output)
If \(\mathbb{N}\) FO \(=0\), the selected eigenvalues in ascending order.
\(Z\) (input) If \(\mathrm{JOBZ}=\mathrm{V}\) ', then if \(\mathbb{N} F O=0\), the first NFOUND colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix A comesponding to the selected eigenvalues, \(w\) ith the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). If an eigenvector fails to converge, then that colum n of \(Z\) contains the latest approxim ation to the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F} A \mathbb{I}\). If \(J O B Z=N\) ', then \(Z\) is not referenced.
\(N\) ote: the user must ensure that at least
\(\max (1, N F O U N D)\) colum ns are supplied in the array \(Z\); if RANGE = V', the exactvalue ofNFOUND is not know \(n\) in advance and an upperbound \(m\) ustbe used.

LD Z (input)
The leading dim ension of the array \(Z\). LD \(Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, N)\).

W ORK (w orkspace)
dim ension (2*N)

W ORK 2 (w orkspace) dim ension ( \(7 * \mathrm{~N}\) )

IV ORK 3 (w orkspace) dim ension ( \(5 * N\) )
تAII (output)
If \(\mathrm{OBZ}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), the first NFOUND elem ents of \(\mathbb{F} A \mathbb{I}\) are zero. If \(\mathbb{N} F O>0\), then IFA II contains the indices of the eigenvectors that failed to converge. If \(\mathrm{OBZ}=\mathrm{N}\) ', then IFA II is notreferenced.
\(\mathbb{N}\) FO (output)
= 0 : successfiulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=\) i, then ieigenvectors failed to converge. Their indiges are stored in amay \(\mathbb{F}\) III.

\section*{C INTERFACE}
\#include <sunperfh>
void zhpgvd (int iype, char jobz, charuplo, int n, doublecom plex *ap, doublecom plex *bp, double *w , doublecom plex *z, int ldz, int*info);
void zhpgvd_64 (long itype, char jobz, char uplo, long n, doublecom plex *ap, doublecom plex *bp, double *w, doublecom plex *z, long ldz, long *info);

\section*{PURPOSE}
zhpgrd com putes all the eigenvalues and, optionally, the eigenvectors of a com plex generalized H erm itian-definite eigenproblem, of the form \(A * x=(l a m ~ b d a) * B * x\), \(\mathrm{A} * \mathrm{~B} x=(\operatorname{lam} \operatorname{bda}) * \mathrm{x}\), or \(\mathrm{B} * \mathrm{~A} * \mathrm{x}=(\mathrm{lam} . \mathrm{bda}) * \mathrm{x}\). H ere A and B are assum ed to be \(H\) erm itian, stored in packed form at, and \(B\) is also positive definite.
Ifeigenvectors are desired, ituses a divide and conquer algorithm .

The divide and conquer algorithm \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. Itw illw ork on \(m\) achines w th a guard digit in add/subtract, or on those binary \(m\) achines \(w\) thout guard digits w hich subtract like the \(C\) ray X M P , C ray Y M P , C ray C -90, orC ray-2. It could conceivably fail on hexadecim al or decim al machines w thout guard digits, butw e know of none.

\section*{ARGUMENTS}

ITYPE (input)

Specifies the problem type to be solved:
\(=1: \mathrm{A}{ }^{*} \mathrm{x}=\left(\mathrm{lam}\right.\) bda) \({ }^{\mathrm{B}} \mathrm{B}_{\mathrm{x}}\)
\(=2: \mathrm{A} * \mathrm{~B} * \mathrm{x}=\left(\mathrm{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B{ }^{*} \mathrm{~A} * \mathrm{X}=\left(\right.\) lam bda) \({ }^{*} \mathrm{X}\)

JOBZ (input)
\(=\mathrm{N}^{\prime}\) : C om pute eigenvalues only;
\(=\mathrm{V}\) : C om pute eigenvalues and eigenvectors.
UPLO (input)
\(=U\) ': U ppertriangles of \(A\) and \(B\) are stored;
\(=\mathrm{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.
N (input) The order of the \(m\) atrices \(A\) and \(B . N>=0\).
AP (input/output)
O \(n\) entry, the upper or low er triangle of the H er-
\(m\) itian matrix A, packed colum nw ise in a linear
array. The jth colum n of A is stored in the
array AP as follows: ifUPLO = U', AP (i+ (j

\(\left.+(j-1)^{\star}(2 \star n-j) / 2\right)=A(i, 7)\) for \(j=i<=n\).
On exit, the contents of AP are destroyed.

BP (input/output)
O \(n\) entry, the upper or low ertriangle of the Her \(m\) tian \(m\) atrix \(B\), packed colum nw ise in a linear array. The jth column of \(B\) is stored in the array BP as follows: if UPLO \(=\mathrm{U}^{\prime}, \mathrm{BP}(i+(j\)
 \(+(j-1)^{\star}(2 \star n-j / 2)=B(i, 7)\) for \(j=i<=n\).

On exit, the triangular factor \(U\) or \(L\) from the Cholesky factorization \(B=U * * H * U\) or \(B=L * L * * H\), in the sam e storage form at as \(B\).

W (output)
If \(\mathbb{N}\) FO \(=0\), the eigenvalues in ascending order.
\(Z\) (input) If \(\mathcal{O D B Z}=\mathrm{V}^{\prime}\), then if \(\mathbb{N} F O=0, \mathrm{Z}\) contains the m atrix Z of eigenvectors. The eigenvectors are norm alized as follows: if ITYPE \(=1\) or 2 , \(Z * * H * B * Z=I\); if IT \(Y P E=3, Z * * H * i n v(B) * Z=I\). If Jo \(\mathrm{BZ}=\mathrm{N}\) ', then Z is not referenced.

LD \(Z\) (input)
The leading \(d i m\) ension of the array \(Z . L D Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, N)\).

W ORK (w orkspace)

On exit, if \(\mathbb{N F} F=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of array \(\mathrm{W} O R \mathrm{~K}\). If \(\mathrm{N}<=1\), LW ORK \(>=1\). If \(\mathrm{JOBZ}=\mathrm{N}\) 'and \(N>1\), LW \(O R K>=N\). If \(\mathrm{OOBZ}=\mathrm{V}\) 'and \(\mathrm{N}>1\), LW ORK \(>=2 \star \mathrm{~N}\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of theW ORK ancay, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
On exit, if \(\mathbb{N}\) FO \(=0, R W\) ORK (1) retums the optim al LRW ORK.

LRW ORK (input)
The dimension of array RW ORK. If \(\mathrm{N}<=1\), LRW ORK >=1. IfJOBZ \(=N\) 'and \(N>1\),LRW ORK \(>=\) N. If JOBZ \(=\mathrm{V}\) 'and \(\mathrm{N}>1\),LRW ORK >=1 + 5*N + \(2 * N * * 2\) 。

If LRW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
the RW ORK array, retums this value as the first entry of the RW ORK aray, and no enrorm essage related to LRW ORK is issued by X ERBLA.

IN ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I N}\) ORK (1) retums the optim al
LIN ORK.

LIV ORK (input)
The dim ension of array \(\mathbb{I N}\) ORK. If JOBZ \(=\mathrm{N}\) 'orN
\(<=1\), LIV ORK >= 1. If JOBZ \(=V\) 'and \(N>1\), LIN ORK >= \(3+5 * N\) 。

If \(L \mathbb{I V} O R K=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I V}\) ORK array, retums this value as the first entry of the \(\mathbb{I W} O R K\) aray, and no errorm essage related to \(L \mathbb{I N} O R K\) is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
>0: CPPTRF orCHPEVD retumed an enrorcode:
<= N: if \(\mathbb{N F F O}=\mathrm{i}, \mathrm{CHPEVD}\) failed to converge; i off-diagonalelem ents of an interm ediate tridiagonal form did notconvergeto zero; > N : if \(\mathbb{N} F O=\) \(\mathrm{N}+\mathrm{i}\), for \(1<=\mathrm{i}<=\mathrm{n}\), then the leading m inorof orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

\section*{PURPOSE}
zhpgvx com putes selected eigenvalues and, optionally, eigenvectors of a com plex generalized \(H\) erm itian-definite eigenproblem, of the form \(A * x=(\operatorname{lam} . b d a) * B * x, A * B x=(\operatorname{lam} b d a) * x\), or \(B * A * x=(l a m\) boda \() * x\). \(H\) ere \(A\) and \(B\) are assum ed to be \(H\) erm itian, stored in packed form \(a t\), and \(B\) is also positive definite.
E igenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

\section*{ARGUMENTS}

ITYPE (input)
Specifies the problem type to be solved:
\(=1: A{ }_{\mathrm{X}}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{~B}{ }^{*} \mathrm{X}\)
\(=2: A * B *_{x}=\left(\operatorname{lam}\right.\) bda) \({ }^{*} \mathrm{x}\)
\(=3: B * A{ }^{*} \mathrm{X}=(\operatorname{lam} \mathrm{bda}){ }^{\star} \mathrm{x}\)

\section*{JO BZ (input)}
\(=\mathrm{N}^{\prime}:\) C om pute eigenvalues only;
\(=\mathrm{V}^{\prime}:\) C om pute eigenvalues and eigenvectors.

RANGE (input)
= A ': alleigenvalues w illbe found;
\(=V\) : alleigenvalues in the half-open interval
( \(\mathrm{L}, \mathrm{VU}] \mathrm{w}\) ill be found; = I': the \(I \mathrm{l}\)-th through
\(\mathbb{I U}\)-th eigenvalues w ill.be found.
UPLO (input)
\(=U\) ': U ppertriangles of \(A\) and \(B\) are stored;
\(=\mathbb{L}\) ': Low ertriangles of \(A\) and \(B\) are stored.

N (input) The order of the m atriges A and \(\mathrm{B} . \mathrm{N}>=0\).

AP (input/output)
O n entry, the upper or low er triangle of the H er\(m\) itian \(m\) atrix A, packed colum nw ise in a linear amay. The \(j\) th colum n of \(A\) is stored in the
anay AP as follow s: ifUPLO = U',AP (i+ (j
 \(\left.+(j-1)^{\star}(2 \star n-j) / 2\right)=A(i, j)\) for \(j=i<=n\).

On exit, the contents ofAP are destroyed.

BP (input/output)
O n entry, the upper or low ertriangle of the H er\(m\) titian \(m\) atrix \(B\), packed colum nw ise in a linear aray. The \(j\) th colum \(n\) of \(B\) is stored in the anay BP as follows: if UPLO \(=\mathrm{U}\) ', BP (i+ \((\ddagger\) \(1) \star j 2)=B(i, \gamma)\) for \(1<=i<=j ;\) if \(U P L O=L ', B P(i\) \(+(j-1) \star(2 * n-j / 2)=B(i, j)\) for \(j<=i<=n\).

On exit, the triangular factor U or L from the Cholesky factorization \(\mathrm{B}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{B}=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), in the sam e storage form at as B.

VL (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. \(\mathrm{VL}<\mathrm{VU}\).
N otreferenced ifRANGE=A 'or 'I'.

VU (input)
IfRANGE=V ', the low erand upper bounds of the interval to be searched foreigenvalues. VL < VU . N ot referenced ifRANGE=A'or I'.

II (input)
If RA NGE= 'I', the indioes (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=N\), if \(\mathrm{N}>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE= A 'or V'.
IU (input)
IfRA N G E= 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE= A 'or V'.

ABSTOL (input)
The absolute error tolerance for the eigenvalues. A \(n\) approxim ate eigenvalue is accepted as converged when it is determ ined to lie in an interval [a,b] of w idth less than orequal to

ABSTOL + EPS * max ( \(\mid\) |, \(\mid\) |),
where EPS is them achine precision. IfA BSTOL is less than or equalto zero, then EPS* \(\mid\) | w illbe used in its place, w here \(T\) | is the 1 -norm of the tridiagonalm atrix obtained by reducing A \(P\) to tridiagonal form .

E igenvalues w illbe com puted m ostaccurately when ABSTOL is set to tw ige the underflow threshold 2*SLAM CH ( S ), not zero. If this routine retums w ith \(\mathbb{N}\) FO \(>0\), indicating that som e eigenvectors did not converge, try setting ABSTO L to \(2 \star\) SLAM CH (S ).

M (output)
The total num berofeigenvalues found. \(0<=\mathrm{M}<=\) N . IfRANGE = \(\mathrm{A}^{\prime}, \mathrm{M}=\mathrm{N}\), and ifRANGE= \(\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{L}+1\).

W (output)
O n norm alexit, the firstM elem ents contain the selected eigenvalues in ascending order.

Z (input) If \(\mathrm{JO} \mathrm{BZ}=\mathrm{N}\) ', then Z is not referenced. If OOB Z \(=V '\), then if \(\mathbb{N} F O=0\), the firstM colum ns of \(Z\)
contain the orthonorm aleigenvectors of the \(m\) atrix

A comesponding to the selected eigenvalues, with the i-th colum \(n\) of \(Z\) holding the eigenvector associated w ith W (i). The eigenvectors are norm alized as follow s: if ITYPE \(=1\) or \(2, \mathrm{Z} * * \mathrm{H} * \mathrm{~B} * \mathrm{Z}=\mathrm{I}\); if \(\operatorname{ITYPE}=3, Z * * H * \operatorname{inv}(B) * Z=I\).

If an eigenvector fails to converge, then that colum \(n\) of \(Z\) contains the latestapproxim ation to the eigenvector, and the index of the eigenvector is retumed in \(\mathbb{F} A \mathbb{I}\). N ote: the userm ustensure that at leastm ax \((1, M)\) colum ns are supplied in the array \(Z\); ifRANGE = \(V\) ', the exactvalue of \(M\) is notknow \(n\) in advance and an upper bound \(m\) ust be used.

\section*{LD \(Z\) (input)}

The leading dim ension of the array \(\mathrm{Z} . \mathrm{LD} \mathrm{Z}>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD \(Z>=\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
dim ension \((2 * N)\)
RW ORK (w orkspace)
dim ension ( \(7 * \mathrm{~N}\) )
IN ORK (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )
FAII (output)
If \(\mathrm{JOBZ}=\mathrm{V}\) ', then if \(\mathbb{N F O}=0\), the firstM ele\(m\) ents of \(\mathbb{F A} \mathbb{I}\) are zero. If \(\mathbb{N} F O>0\), then \(\mathbb{F A} \mathbb{I}\) contains the indices of the eigenvectors that failed to converge. If \(J O B Z=N\) ', then \(\mathbb{F A} I\) is not referenced.
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum enthad an illegalvalue
> 0: CPPTRF orCHPEVX retumed an emorcode:
\(<=\mathrm{N}:\) if \(\mathbb{N} F O=\mathrm{i}, \mathrm{CH}\) PEVX failed to converge; i eigenvectors failed to converge. Their indices are stored in array \(\mathbb{F A} \mathbb{I} .>N\) : if \(\mathbb{N} F O=N+\) \(i\), for \(1<=i<=n\), then the leading \(m\) inorof orderiofB is notpositive definite. The factorization of B could not be com pleted and no eigenvalues or eigenvectors w ere com puted.

void zhpm v_64 (char uplo, long n, doublecom plex *alpha, doublecom plex *a, doublecom plex *x, long incx, doublecom plex *beta, doublecom plex *y, long incy);

\section*{PURPOSE}
zhpm \(v\) perform \(s\) the \(m\) atrix-vector operation \(y:=a l p h a * A * x+\) beta* \(y\) where alpha and beta are scalars, \(x\) and \(y\) are \(n\) ele\(m\) entvectors and \(A\) is an \(n\) by \(n\) hem itian \(m\) atrix, supplied in packed form.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper or low er triangularpart of the \(m\) atrix A is supplied in the packed array A as follow s:

UPLO = U'or L ' The uppertriangularpartofA is supplied in \(A\).

UPLO = L'or 1' The low ertriangularpartofA is supplied in A.

U nchanged on exit.

N (input)
On entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

A LPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
\(\left(\left(\mathrm{n}^{*}(\mathrm{n}+1)\right) / 2\right)\). Before entry w ith UPLO \(=\) \(U\) ' or G ', the anay A m ustcontain the upper triangularpart of the herm itian matrix packed
sequentially, column by colum \(n\), so that A (1) containsa(1,1), A (2) and A (3) contain a( 1,2 ) and a( 2,2 ) respectively, and so on. Before entry w ith UPLO = L'or I', the array A m ust contain the low er triangularpart of the her\(m\) tiian matrix packed sequentially, column by colum n, so thatA (1) contains a (1,1), A (2) and \(A(3)\) contain a \((2,1)\) and a \((3,1)\) respectively, and so on. N ote that the im aginary parts of the diagonalelem ents need notbe set and are assum ed to be zero. U nchanged on exit.

X (input)
\((1+(n-1) * a b s(\mathbb{N} C X))\). Before entry, the increm ented array \(X \mathrm{~m}\) ust contain the n elem ent vectorx. U nchanged on exit.
\(\mathbb{N} C X\) (input)
On entry, \(\mathbb{N} C X\) specifies the increm ent for the elem ents ofX. \(\mathbb{N C X}\) <> 0 . U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen
BETA is supplied as zero then \(Y\) need notbe seton input. U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectory. On exit, Y is overw rilten by the updated vectory.
\(\mathbb{N} C Y\) (input)
O n entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
zhprfs im proves the com puted solution to a system of linear equations w hen the coefficientm atrix is \(H\) erm itian indefintie and packed, and provides errorbounds and backw ard error estim ates for the solution.

\section*{ARGUMENTS}

UPLO (input)
\(=U\) ': U pper triangle of A is stored;
= LL': Low ertriangle ofA is stored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the m atrioes B and X. NRHS >=0.

A (input) The upper or low er triangle of the \(H\) erm titian \(m\) atrix \(A\), packed colum nw ise in a linear array.

The jth column of A is stored in the array A as follow s: if UPLO \(=U^{\prime}, A(i+(j-1) * j 2)=A(i, 7)\) for \(1<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}\) ', \(\mathrm{A}(i+(j-1) *(2 * \mathrm{n}-\mathrm{j} / 2)\) \(=A(i, j)\) for \(j=i<=n\).

\section*{AF (input)}

The factored form of them atrix A. AF contains the block diagonal matrix D and themultipliers used to obtain the factor \(U\) orL from the factorization \(A=U * D * U * * H\) orA \(=L * D * L * * H\) as com puted by CHPTRF, stored as a packed triangularm atrix.
\(\mathbb{P I V O T}\) (input)
D etails of the interchanges and the block structure ofD as determ ined by CHPTRF.
\(B\) (input) The righthand side m atrix \(B\).
LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by CHPTRS. On exit, the im proved solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the array X . LD X >= \(\max (1, N)\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{O})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{i})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vector \(X\) ( \(j\) ) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the \(i\)-th argum ent had an illegal value

void zhpsv_64 (char uplo, long n, long nrhs, doublecom plex
*a, long *ìipivot, doublecom plex *b, long ldb, long
*info);

\section*{PURPOSE}
zhpsv com putes the solution to a com plex system of linear equations
\(\mathrm{A} * \mathrm{X}=\mathrm{B}, \mathrm{w}\) here A is an N -by -N H erm itian m atrix stored in packed form at and X and B are N -by-N R H S m atrices.

The diagonal pivoting \(m\) ethod is used to factorA as
\[
A=U * D * U * * H \text {, if } U P L O=U \text { ', or }
\]
\[
\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}, \text { if } \mathrm{UPLO}=\mathrm{L},
\]
where \(U\) (orL) is a productof perm utation and unit upper (low er) triangularm atrices, D is H erm itian and block diagonalw ith 1-by-1 and 2-by-2 diagonal blocks. The factored form ofA is then used to solve the system of equations A * \(X=B\).

\section*{ARGUMENTS}

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

A (input/output)
On entry, the upper or low ertriangle of the Her \(m\) tian \(m\) atrix A, packed collm nw ise in a linear
array. The jth column of A is stored in the array A as follows: if UPLO = U',A (i+ (j)
 \((j-1) *(2 n-j / 2)=A(i, j)\) for \(j=i<=n\). See below for furtherdetails.

On exit, the block diagonalm atrix \(D\) and the \(m u l\) tipliers used to obtain the factor \(U\) orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}\) as com puted by CHPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atasA.

IPIVOT (output)
D etails of the interchanges and the block structure ofD, as determ ined by CHPTRF. If \(\mathbb{P} \mathbb{I V}\) OT (k) \(>0\), then row sand colum nsk and \(\mathbb{P} \mathbb{V} O T(k)\) were interchanged, and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1 -by- 1 diagonal block. If UPLO \(=\mathrm{U}\) 'and \(\mathbb{P} \mathbb{I V O T}(\mathrm{k})=\mathbb{P} \mathbb{V} O T(\mathrm{k}-1)\) \(<0\), then row \(s\) and colum ns \(k-1\) and \(-\mathbb{P}\) IV O T (k) w ere interchanged and \(D(k-1 * k, k-1 k)\) is a 2 -by-2 diagonal block. If UPLO \(=\) L' and \(\mathbb{P} \mathbb{V} O T(k)=\) \(\operatorname{PIVOT}(k+1)<0\), then row s and colum ns \(k+1\) and \(-\mathbb{P}\) IV O T ( \(k\) ) w ere interchanged and \(D(k: k+1, k \cdot k+1)\) is a 2 -by-2 diagonalblock.

B (input/output)
On entry, the \(\mathrm{N}-\mathrm{by}-\mathrm{NRH} \mathrm{S}\) righthand side m atrix B . On exit, if \(\mathbb{N F O}=0\), the \(N\) by \(-\mathbb{N}\) RH \(S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, \mathbb{N})\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing exam plew hen \(\mathrm{N}=4, \mathrm{UPLO}=\mathrm{U}\) ':

Tw o-dim ensional storage of the H erm itian m atrix A :
a11 a12 a13 a14
a22 a23 a24
a33 a34 (aij=cong \(\bar{g}(a \ddot{j}))\)
a44

Packed storage of the upper triangle of A :
\(A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]\)

\section*{C INTERFACE}
\#include <sunperfh>
void zhpsvx (char fact, charuplo, int n, int nrhs, doublecom plex *a, doublecom plex *af, int *ípivot, doublecom plex *b, intldb, doublecom plex *x, int ldx, double *roond, double *ferr, double *berr, int*info);
void zhpsvx_64 (char fact, char uplo, long n, long nihs, doublecom plex *a, doublecom plex *af, long *ipivot, doublecom plex *b, long ldb, doublecom plex *x, long \(l d x\), double *roond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zhpsvx uses the diagonalpivoting factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) or \(A=L * D * L * * H\) to com pute the solution to a com plex system of linear equations \(A * X=B\), where \(A\) is an \(N\) boy \(N\) H erm itian \(m\) atrix stored in packed form atand \(X\) and \(B\) are \(N\)-byN R H S m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to
factorA as
\(A=U * D * U * * H\), if \(U P L O=U\) ', or
\(A=L * D * L * * H\), if \(U P L O=L \prime\),
where \(U\) (orL) is a productofperm utation and unitupper (low er)
triangularm atrioes and D is H erm itian and block diagonal w ith

1 -by-1 and 2 -by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums \(w\) ith \(\mathbb{N N F O}=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the m atrix A. If the reciprocal of the condition num ber is less than m achine precision,
\(\mathbb{N} F O=\mathrm{N}+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and compute error bounds as described below.
3. The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for 五.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether ornot the factored form of \(A\) has been supplied on entry. = \(\mathrm{F}^{\prime}\) : On entry, AF and IP IV O T contain the factored form of A. AF and \(\mathbb{P}\) IV O T w illnotbe m odified. \(=\mathrm{N}\) : Them atrix A w illbe copied to A F and factored.
```

UPLO (input)

```
\(=\mathrm{U}\) ': Uppertriangle of \(A\) is stored;
\(=\mathrm{L}\) ': Low er triangle of A is stored.

N (input) The num ber of linearequations, ie., the order of them atrix A. N >=0.

NRHS (input)

The num ber of righthand sides, ie., the num ber of collm ns of the \(m\) atrioes B and X. NRH S >=0.

A (input) The upper or low er triangle of the H erm itian \(m\) atrix \(A\), packed colum nw ise in a lineararray. The jth column of A is stored in the array A as follows: if UPLO \(=U\) ', A \((i+(j-1) * j 2)=A(i, 7)\) for \(1<=i<=j\) if \(U P L O=L ', A(i+(j-1) *(2 * n-7 / 2)\) \(=A(i, j)\) for \(j=i<=n\). See below forfurther details.

AF (input/output)
If \(F A C T=F '\), then \(A F\) is an input argum ent and on entry contains the block diagonalm atrix \(D\) and the m ultipliers used to obtain the factor U orL from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) orA \(=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}\) as com puted by CHPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atas A.

IfFACT \(=N\) ', then AF is an output argum ent and on exit contains the block diagonalm atrix \(D\) and the m ultipliers used to obtain the factorU or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) or \(\mathrm{A}=\) L*D *L**H as com puted by CHPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

IPIVOT (inputoroutput)
IfFACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P I V O T}\) is an input argum ent and on entry contains details of the interchanges and the block structure of \(D\), as determ ined by CHPTRF. If \(\mathbb{P}\) IVOT \((k)>0\), then row s and colum nsk and \(\mathbb{P} \operatorname{IVOT}(k)\) w ere interchanged and \(D(k, k)\) is a 1 -by-1 diagonal block. If UPLO \(=U^{\prime}\) and \(\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{I V} O T(k-1)<0\), then row sand colum ns \(\mathrm{k}-1\) and \(-\mathbb{P} \mathbb{I V O T}(\mathrm{k})\) were interchanged and \(\mathrm{D}(\mathrm{k}-\) \(1 k, k-1 k)\) is a \(2-b y-2\) diagonalblock. IfU PLO \(=\) L 'and \(\mathbb{P} \mathbb{I V} \circ \mathrm{T}(\mathrm{k})=\mathbb{P} \mathbb{I V} \circ \mathrm{T}(k+1)<0\), then row s and colum nsk+1 and - \(\mathbb{P}\) IV OT (k) w ere interchanged and D \((k k+1, k k+1)\) is a 2 -by-2 diagonalblock.

IfFACT = N ', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by CHPTRF.
\(B\) (input) The \(N\)-by-N R H S righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the anay B . LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the \(N\) by -N RH \(S\) solution
\(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay \(\mathrm{X} . \mathrm{LD} \mathrm{X}\) >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num ber of the \(m\) atrix \(A\). IfRCOND is less than them achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0.

FERR (output)
The estim ated forw ard enrorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(\mathrm{X}(\mathcal{)}, \mathrm{FERR}(\mathcal{)})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each solution vector X ( \()\) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )

W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{I N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=i\), and \(i\) is
<= N : D (i,i) is exactly zero. The factorization has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : D is nonsingular, butRCOND is less than \(m\) achine
precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. N evertheless, the solution and error bounds are com puted because there are a num ber of situations w here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{FURTHER DETAILS}

\section*{PURPOSE}
zhptrs solves a system of linearequations A *X \(=\mathrm{B}\) with a com plex \(H\) erm itian \(m\) atrix A stored in packed form at using the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\) or \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}\) computed by CHPTRF.

\section*{ARGUMENTS}

UPLO (input)
Specifies w hether the details of the factorization
are stored as an upper or low er triangularm atrix.
\(=\mathrm{U}\) ': U ppertriangular, form is \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{H}\);
= L ': Low ertriangular, form is \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}\).

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS >=0.

A (input) The block diagonalm atrix \(D\) and the \(m\) ultipliers used to obtain the factorU orL as com puted by CH PTRF, stored as a packed triangularm atrix.

PIVOT (input)
D etails of the interchanges and the block structure ofD as determ ined by CHPTRF.

B (input/output)

O \(n\) entry, the right hand side \(m\) atrix \(B\). On exit, the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an illegalvalue

\section*{PURPOSE}
zhsein uses inverse iteration to find specified rightand/or lefteigenvectors of a com plex upper H essenberg m atrix H.

The righteigenvectorx and the lefteigenvector \(y\) of the \(m\) atrix \(H\) comesponding to an eigenvalue \(w\) are defined by:
\[
\mathrm{H}^{\star} \mathrm{x}=\mathrm{w}^{\star} \mathrm{x}, \quad \mathrm{y}^{\star * \mathrm{~h}} \star \mathrm{H}=\mathrm{w}^{\star} \mathrm{y}^{\star *} \mathrm{~h}
\]
where \(y^{\star *}\) h denotes the conjugate transpose of the vectory.

\section*{ARGUMENTS}
```

S\mathbb{DE (input)}
$=\mathrm{R}$ ': com pute righteigenvectors only;
= L ': com pute lefteigenvectors only;
= B ': com pute both right and lefteigenvectors.

```

E IG SRC (input)
Specifies the source of eigenvalues supplied in \(W\) :
= Q ': the eigenvalues were found using CHSEQR;
thus, if \(H\) has zero subdiagonalelem ents, and so is block-triangular, then the \(j\) th eigenvalue can be assum ed to be an eigenvalue of the block containing the jth row/collm \(n\). This property allow \(s\) CHSEIN to perform inverse iteration on justone diagonalblock. = N ': no assum ptions are m ade on the correspondence betw een eigenvalues and diagonalblocks. In this case, CHSE \(\mathbb{N}\) must alw ays perform inverse tieration using the whole \(m\) atrix H.

\section*{\(\mathbb{N}\) ITV (input)}
= N ': no initial vectors are supplied;
= U ': user-supplied initial vectors are stored in the arrays V L and/orV R .

\section*{SELECT (input)}

Specifies the eigenvectors to be com puted. To select the eigenvector comesponding to the eigenvalueW ( \(\boldsymbol{j}\) ) SELECT ( \(\boldsymbol{j}\) ) m ustbe set to TRUE..

N (input) The order of the m atrix \(\mathrm{H} . \mathrm{N}>=0\).

H (input) The upperH essenberg matrix H.

LD H (input)
The leading dim ension of the array \(H\). LD H >= \(\max (1, N)\).

W (input/output)
On entry, the eigenvalues of H . On exit, the real parts of \(W\) may have been altered since close eigenvalues are perturbed slightly in searching for independenteigenvectors.

VL (input/output)
On entry, if \(\mathbb{N} \mathbb{T T V}=\mathrm{U}\) 'and \(S \mathbb{D} E=\mathrm{L}\) 'or B ', VL \(m\) ust contain starting vectors for the inverse iteration for the lefteigenvectors; the starting
vector for each eigenvectorm ustbe in the sam e colum n in w hich the eigenvector w ill be stored. On exit, ifS \(\mathrm{D} E=\mathrm{L}\) 'or B ', the lefteigenvectors specified by SELECT w ill.be stored consecutively in the colum ns of V , in the sam e order as theireigenvalues. If \(S \mathbb{D E}=\mathrm{R}, \mathrm{VL}\) is not referenced.

LDVL (input)
The leading dim ension of the array VL . LDVL >= \(\max (1, N)\) if \(S \mathbb{D} E=L\) 'or \(B^{\prime} ; L D V L>=1\) otherwise.
VR (input/output)
On entry, if \(\mathbb{N}\) ITV \(=U\) 'and \(S \mathbb{D} E=R\) 'or \(B ', V R\) \(m\) ust contain starting vectors for the inverse iteration for the righteigenvectors; the starting vector for each eigenvectorm ustbe in the sam e colum \(n\) in \(w\) hich the eigenvector \(w i l l\) be stored. On exit, ifSIDE = R 'or B', the righteigenvectors specified by SELECT w ill.be stored consecutively in the colum ns ofVR, in the sam e order as theireigenvalues. If \(S \mathbb{D} E=L \prime, V R\) is not referenced.

LDVR (input)
The leading dim ension of the amay VR. LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R^{\prime}\) or \(B^{\prime} ; L D V R>=1\) otherw ise.

M M (input)
The num ber of colum \(n s\) in the amays \(V L\) and/or \(V R\).
M \(M\) > \(=\).

M (output)
The num ber of colum ns in the arays \(V \mathrm{~L}\) and/or VR required to store the eigenvectors \(\vDash\) the num ber of TRUE. elem ents in SELECT).

W ORK (w orkspace)
dim ension \((\mathbb{N} * N)\)

RW ORK (w orkspace)
dim ension \((\mathbb{N})\)

FAILL (output)
IfSIDE = L'or B', 平A ILL ( \(\mathbf{i}\) ) \(=j>0\) if the left eigenvector in the ith column of VL (corresponding to the eigenvalue w ( 1 ) failed to converge; \(\mathbb{F} A \amalg L(i)=0\) ifthe eigenvectorconverged satisfactorily. If \(S \mathbb{D} E=R ', \mathbb{F A} \mathbb{I} L\) is
not referenced.

FA \(\mathbb{I} R\) (output)
If \(S \mathbb{D} E=R\) 'or \(B ', \mathbb{F A} \| R(i)=j>0\) if the right eigenvector in the \(i\)-th colum \(n\) of \(V R\) (comesponding to the eigenvalue \(w(\mathcal{J})\) ) failed to converge; \(\mathbb{F A} \mathbb{I} R(i)=0\) if the eigenvectorconverged satisfactorily. IfSDE \(E=L ;\) FA \(\mathbb{I} R\) is not referenced.
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
>0: if \(\mathbb{N} F O=i\), \(i\) is the num ber of eigenvectors which failed to converge; see \(\mathbb{F} A \mathbb{L} L\) and \(\mathbb{F} A \mathbb{I L}\) for further details.

\section*{FURTHER DETAILS}

E ach eigenvector is nom alized so that the elem ent of largest \(m\) agnitude has \(m\) agnitude 1 ; here the \(m\) agnitude of a com plex num ber \((x, y)\) is taken to be \(|x|+t \mid\).

void zhseqr (char, char, int, int, int, doublecom plex*, int, doublecom plex*, doublecom plex*, int, int*);
void zhseqr_64 (char, char, long, long, long, doublecom plex*, long, doublecom plex*, doublecom plex*, long, long*);

\section*{PURPOSE}
zhseqr com putes the eigenvalues of a com plex upper \(H\) essenberg \(m\) atrix \(H\), and, optionally, the \(m\) atrices \(T\) and \(Z\) from the Schurdecom position \(\mathrm{H}=\mathrm{Z} \mathrm{T} \mathrm{Z**H}\),where T is an upper triangular \(m\) atrix (the \(S\) chur form ), and \(Z\) is the unitary \(m\) atrix of Schurvectors.

O ptionally Z m ay be postm ultiplied into an input unitary \(m\) atrix \(Q\), so that this routine can give the Schur factorization of a m atrix A which has been reduced to the \(H\) essenberg form \(H\) by the unitary \(m\) atrix \(Q: A=Q * H * Q * * H=\) (Q Z)*T* \(\mathrm{Q} Z)^{\star *} \mathrm{H}\).

\section*{ARGUMENTS}

JOB (input)
= E ': com pute eigenvahues only;
\(=S\) ': com pute eigenvalues and the Schur form \(T\).

COM PZ (input)
= N ': no Schurvectors are com puted;
= I': Z is in itialized to the unitm atrix and the
m atrix Z of Schurvectors of H is retumed; = V ':
\(Z \mathrm{~m}\) ustcontain an unitary m atrix Q on entry, and the product Q *Z is retumed.

N (input) The order of the m atrix \(\mathrm{H} . \mathrm{N}>=0\).

It is assum ed that H is already upper triangular in row s and colum ns 1: \(\mathrm{HO}-1\) and \(\mathbb{H} \mathrm{I}+1 \mathbb{N}\). \(\mathbb{}\) O and IH I are norm ally setby a previous call to C G EBA L, and then passed to CGEHRD when them atrix output by CGEBAL is reduced to \(H\) essenberg form . O therw ise HO and \(\mathbb{H}\) I should be set to 1 and N respectively. \(1<=\mathbb{H O}<=\mathbb{H} \mathrm{I}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{H} \mathrm{O}=1\) and \(\mathbb{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

IH I (input)
See the description of IIO .

H (input/output)
On entry, the upperH essenberg \(m\) atrix \(H\). On exit, if \(\mathrm{JOB}=\mathrm{S}\) ', H contains the uppertriangular \(m\) atrix \(T\) from the Schurdecom position the Schur form). If \(\mathrm{OB}=\mathrm{E}\) ', the contents of H are unspecified on exit.

LD H (input)
The leading dim ension of the array H.LDH >= max (1,N).

W (output)
The com puted eigenvalues. If \(\mathrm{JOB}=\mathrm{S}^{\prime}\) ', the eigenvalues are stored in the sam e order as on the diagonal of the Schur form retumed in \(H\), w ith W (i) \(=\mathrm{H}(\mathrm{i}, \mathrm{i})\).

Z (input) If \(\mathrm{COMPZ}=\mathrm{N}^{\prime}: \mathrm{Z}\) is not referenced.
If COM PZ = I': on entry, Z need notbe set, and on exit, \(Z\) contains the unitary \(m\) atrix \(Z\) of the Schurvectors of H . IfCOM PZ = V : on entry Z \(m\) ust contain an \(N\) by -N m atrix Q , which is assum ed to be equal to the unitm atrix except for the sub-
 N orm ally Q is the unitary m atrix generated by CUNGHR after the call to CGEH RD which form ed the \(H\) essenberg \(m\) atrix \(H\).

LD \(Z\) (input)
The leading dim ension of the aray Z . LD \(\mathrm{Z}>=\) \(\max (1, N)\) if COMPZ = I'or V';LD Z >=1 otherw ise.

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (output)

The dimension of the array \(W\) ORK. LW ORK >= \(\max (1, N)\).

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK amay, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\) i, CH SEQR failed to compute all the eigenvalues in a total of 30 * ( \(\mathbb{H} \mathrm{I}-\mathbb{H} \mathrm{O}+1\) ) tierations; elem ents 1 :ilo-1 and i+1 m of W contain those eigenvalues which have been successfully com puted.

DESCRIPTION

A \(<-A P\)
\(A<-A P^{\prime}\)
( 'indicates m atrix transpose)
\(w\) here perm utation \(P\) is represented by an integervector \(\mathbb{P} E R M\), such that \(\mathbb{P E R M}(I)\) is equal to the position of the only nonzero elem entin row Iofperm utation \(m\) atrix \(P\).

N O TE : In orderto get a sym etrically perm uted jagged diagonal \(m\) atrix P A P', one can explicitly perm ute the colum ns P A by calling

SJADRP ( \(0, M, M, V A L, \mathbb{N} D X, P N T R, M A X N Z, \mathbb{P} E R M, W\) ORK,LW ORK)
where param eters \(V A L, \mathbb{N D X}, P N T R, M A X N Z, \mathbb{P E R M}\) are the representation of \(A\) in the jagged diagonal form at. The operation \(m\) akes sense if the originalm atrix \(A\) is square.

\section*{ARGUMENTS}

TRAN SP Indicates how to operate \(w\) ith the perm utation \(m\) atrix
0 : operate w ith m atrix
1 : operate \(w\) ith transpose \(m\) atrix

M \(\quad \mathrm{N}\) um berof row \(s\) in matrix A

K \(\quad \mathrm{N}\) um ber of colum ns in matrix A

VAL () amay of length PNTR MAXNZ+1)-PNTR (1) consisting of entries ofA. VA L can be view ed as a colum \(n m\) ajor ordering of a row perm utation of the E llpack representation of A, w here the Ellpack representation is perm uted so that the row \(s\) are non-increasing in the num ber of nonzero entries. \(V\) alues added for padding in Ellpack are not included in the Jagged - D iagonal form at.

INDX () array of length PN TR MAXNZ+1)-PNTR (1) consisting of the colum \(n\) indices of the corresponding entries in VAL.

PNTR () array of length M AXNZ+1, where PNTR (I) PNTR (1)+1 points to the location in VA L of the firstelem ent in the row -perm uted E lhpack represenation of .

M A X N Z max num ber ofnonzeros elem ents per row.
\(\mathbb{P} E R M\) ( integeramay of length \(K\) such that \(I=\mathbb{P} E R M\) ( \(I\) ).

A ray \(\mathbb{P} E R M\) represents a perm utation \(P\), such that \(\mathbb{P E R M}\) ( I ) is equal to the position of the only nonzero elem ent in row Iofperm utation \(m\) atrix \(P\).
Forexam ple, if
|001|
\(\mathrm{P}=\left|\begin{array}{lll}1 & 0 & 0\end{array}\right|\)
|010|
then \(\mathbb{P E R M}=(3,1,2)\).

W ORK () scratch array of length LW ORK. LW ORK should be at leastK.

LW ORK length ofW ORK aray

If LW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

\[
\begin{aligned}
& C<-A L P H A \text { Op (A) B + BETA } C \quad C<-A L P H A D \text { Op (A) B + BETA C } \\
& C<-A L P H A \text { Op (A)D B + BETA } C
\end{aligned}
\]
where A LPH A and BETA are scalar, \(C\) and \(B\) are \(m\) by \(n\) dense \(m\) atrices, \(D\) is a diagonalscaling \(m\) atrix, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix represented in jagged-diagonal form at and \(o p(A)\) is one of op (A) \()=\operatorname{inv}(A)\) or op (A \()=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}\left(\infty n \dot{g}\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicates m atrix transpose)

\section*{ARGUMENTS}

TRAN SA Indicates how to operate \(w\) th the sparse \(m\) atrix 0 : operate \(w\) ith \(m\) atrix 1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) ith the conjugate transpose ofm atrix. 2 is equivalent to 1 ifm atrix is real.

M \(\quad N\) um berof row \(s\) in \(m\) atrix A

N \(\quad \mathrm{N}\) um berof colum ns in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identity \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum n scaling)
4 : A utom atic row scaling (see section N O TES for further details)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D .

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem entinteger anay D ESCRA (1) m atrix structure

0 : general
1 : symm etric ( \(A=A\) )
2 : Herm ( \(\mathrm{A}=\mathrm{CONJG}\) (A))
3 :Triangular
4 : Skew (A nti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\mathrm{CON}\) J ( A ) )
N ote:For the routine, DESCRA (1)=3 is only supported.
DESCRA (2) upper/low er triangular indicator
1: low er
2 : upper
DESCRA (3) m ain diagonaltype
0 :non-unit
1 : unit
DESCRA (4) A ray base \(\mathbb{N} O T \mathbb{M}\) PLEM ENTED )
0 :C C + + com patible
1 :Fortran com patible
DESCRA (5) repeated indices? \(\mathbb{N} O T \mathbb{I}\) PLEM ENTED )
0 : unknown
1 : no repeated indices
VAL 0 array of length NNZ consisting of entries of A. VA L can be view ed as a colum \(n m\) ajorordering of a row perm utation of the Ellpack representation of A, where the Ellpack representation is perm uted so that the row s are non-increasing in the num ber of nonzero entries. V alues added forpadding in E llpack are not included in the Jagged-D iagonal form at.
\(\mathbb{N} D \mathrm{X} 0 \quad\) array of length NNZ consisting of the colum n indices of the comesponding entries in VAL.

PNTR 0) array of length M AXNZ +1 , where PNTR ( 1 ) PNTR (1) +1 points to the location in VA L of the firstelem ent in the row -perm uted \(E\) lipack represenation of \(A\).

MAXNZ max num berofnonzeros elem ents per row .
\(\mathbb{P E R M}\) ) integer array of length M such that \(\mathrm{I}=\mathbb{P} E R M\) ( I ), where row I in the originalE llpack representation corresponds to row I' in the perm uted representation. If \(\operatorname{PERM}(\mathbb{1})=0\), its assum ed by convention that \(\mathbb{P E R M}(\mathbb{I})=I . \mathbb{P E R M}\) is used to determ ine the order in which row s ofC are updated.

B 0 rectangular array w th first dim ension LD B.

LD B leading dim ension ofB
BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .
LD C leading dim ension of \(C\)

W ORK () scratch array of length LW ORK.
On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK aray. LW ORK should be at least2*M.

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on multiple processors, LW ORK \(>=2 * \mathrm{M}\) *N_CPUS where N_CPUS is the maxim um num berof processors available to the program.

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

\section*{SEE ALSO}

N IST FORTRAN Sparse B las U ser's G uide available at:
http://m ath nistgov/m csd/Staff/k Rem ington/Ispblas/

http://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. No test for singularity ornear-singularity is included in this routine. Such tests \(m\) ust.be perform ed before calling this routine.
2. If U N ITD \(=4\), the routine scales the row s ofA such that their 2 -norm s are one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries ofV A L are changed only in the particular case. On retum DV m atrix stored as a vector contains the diagonalm atrix by w hich the row s have been scaled. U N ITD = 2 should be used for the next calls to the routine w ith overw ritten VAL and DV.

WORK (1)=0 on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here \(i\) is the row num berw hich 2 -norm is exactly zero.
3. If \(\operatorname{DESCRA}(3)=1\) and UN ITD < 4, the unitdiagonalelem ents \(m\) ightorm ightnotbe referenced in the JA D representation of a sparse m atrix. They are notused anyw ay in these cases. ButifUN ITD=4, the unit diagonalelem ents M U ST be referenced in the \(\sqrt{A} D\) representation.
4.The routine can be applied for solving triangular system \(s\) w hen the upper or low er triangle of the general sparse m atrix A is used. H ow ever DESCRA (1) m ust.be equal to 3 in this case.

void zlarz_64 (charside, long m, long n, long l, doublecom plex *v, long incv, doublecom plex *tau, doublecom plex *c, long ldc);

\section*{PURPOSE}
zlarz applies a com plex elem entary reflector \(H\) to a com plex \(M\) boy \(-\mathrm{N} m\) atrix \(C\), from eitherthe leftorthe right. \(H\) is represented in the form
\[
H=I-\tan { }^{\star} V^{*} V^{\prime}
\]
\(w\) here tau is a com plex scalar and \(v\) is a com plex vector.

If tau \(=0\), then \(H\) is taken to be the unitm atrix.

To apply H' (the conjugate transpose of H), supply conjg (tau) instead tau.
\(H\) is a product ofk elem entary reflectors as retumed by CTZRZF.

\section*{ARGUMENTS}

SID E (input)
\(=\mathrm{L}\) : form H * C
\(=R\) : form \(C * H\)

M (input) The num ber of row s of the \(m\) atrix \(C\).

N (input) The num ber of colum ns of the \(m\) atrix C .

L (input) The num ber ofentries of the vector \(V\) containing the m eaningful part of the \(H\) ouseholdervectors. If \(S \mathbb{D} E=L \prime, M>=L>=0\), if \(S \mathbb{D} E=R \prime N>=L\)
\(>=0\).

V (input) The vector v in the representation of H as retumed by CTZRZF. \(V\) is notused ifTA \(U=0\).
\(\mathbb{N} C V\) (input)
The increm entbetw een elem ents of \(v . \mathbb{I N} C V<>0\).

TAU (input)
The value tau in the representation of H.

C (input/output)
On entry, the \(\mathrm{M}-b y-\mathrm{N} m\) atrix C . On exit, C is overw ritten by them atrix \(\mathrm{H} * \mathrm{C}\) if \(S \mathbb{D} E=L\) ', or \(C * H\) if \(S \mathbb{D} E=R\) '.

LD C (input)
The leading dim ension of the array \(C . L D C>=\) \(\max (1, M)\).

W ORK (w orkspace)
\((\mathbb{N})\) if \(S \mathbb{D} E=L^{\prime}\) or \(M\) ) if \(S \mathbb{D} E=R^{\prime}\)

\section*{C INTERFACE}
\#include <sunperfh>
void zlarzt(chardirect, charstorev, intn, int \(k\), doublecom plex *V, int ldv, doublecom plex *tau, doublecom plex *t, int ldt);
void zlarzt_64 (chardirect, charstorev, long n, long k, doublecom plex *v, long ldv, doublecom plex *tau, doublecom plex *t, long ldt);

\section*{PURPOSE}
zlarzt form sthe triangular factor T of a com plex block reflectorH of order> n,which is defined as a product of \(k\) elem entary reflectors.

IfD \(\mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{H}=\mathrm{H}(1) \mathrm{H}(2) \ldots \mathrm{H}(\mathrm{k})\) and T is upper triangular;

IfD \(\mathbb{R E C T}=\mathrm{B}^{\prime}, \mathrm{H}=\mathrm{H}(\mathrm{k}) \ldots \mathrm{H}(2) \mathrm{H}(1)\) and T is lower triangular.

IfSTOREV = \(C\) ', the vector which defines the elem entary reflector \(H\) (i) is stored in the i-th colum \(n\) of the array \(V\), and
\[
H=I-V \star T \star V^{\prime}
\]

If \(S T O R E V=R\) ', the vector which defines the elem entary reflectorH (i) is stored in the \(i\)-th row of the amay \(V\), and
\(\mathrm{H}=\mathrm{I}-\mathrm{V}^{\prime} \star \mathrm{T} * \mathrm{~V}\)

C urrently, only STOREV = R'and D \(\mathbb{R E C T}=\mathrm{B}\) 'are supported.

\section*{ARGUMENTS}

D \(\mathbb{R E C T}\) (input)
Specifies the order in which the elem entary
reflectors are multiplied to form the block
reflector:
\(=F \cdot: H=H(1) H(2) \ldots H(k)\) Forw ard, notsup-
ported yet)
\(=B^{\prime}: H=H(k) \ldots H(2) H(1)\) (Backw ard)

STOREV (input)
Specifies how the vectors w hich define the elem entary reflectors are stored (see also Further D etails):
= R ': row wise
N (input) The order of the block reflector \(\mathrm{H} . \mathrm{N}>=0\).
\(K\) (input) The order of the triangular factor \(T \vDash\) the num ber of elem entary reflectors). \(\mathrm{K}>=1\).

V (input) (LDV,K) ifSTOREV = C'(LDV,N) if STOREV = R' Them atrix \(V\). See furtherdetails.
LDV (input)
The leading dim ension of the array V . If \(\operatorname{STOREV}=\) C',LDV >=max (1,N); ifSTOREV = R',LDV >=K .

TAU (input)
TAU (i) must contain the scalar factor of the elem entary reflector H (i).
\(T\) (input) The \(k\) by \(k\) triangular factor \(T\) of the block reflector. If \(\mathrm{D} \mathbb{R E C T}=\mathrm{F}^{\prime}, \mathrm{T}\) is upper triangular; if \(\mathrm{D} \mathbb{R E C T}=\mathrm{B}\) ', T is low er triangular. The restof the anay is notused.

LD \(T\) (input)
The leading dim ension of the array T .LD T >= K .

\section*{FURTHER DETAILS}

B ased on contributions by
A. Petitet, C om puterScience D ept, U niv . of Tenn., K noxville, U SA

The shape of the \(m\) atrix \(V\) and the storage of the vectors which define the \(H\) (i) is bestillustrated by the follow ing exam ple w th \(\mathrm{n}=5\) and \(\mathrm{k}=3\). The elem ents equal to 1 are not stored; the comesponding array elem ents are m odified but restored on exit. The restof the array is not used.

void zpbequ_64 (char uplo, long n, long kd, doublecom plex *a, long lda, double *scale, double *scond, double *am ax, long *info);

\section*{PURPOSE}
zpbequ com putes row and colum n scalings intended to equilibrate a H erm itian positive definite band m atrix A and reduce its condition num ber ( \(w\) ith respect to the tw o-norm ) . S contains the scale factors, \(S(i)=1 /\) sqnt \((A(i, i))\), chosen so that the scaled matrix B w ith elem ents \(B(i, j)=\) \(S(i) \star A(i, j) * S(j)\) has ones on the diagonal. This choige of \(S\) puts the condition num berofB \(w\) ithin a factor \(N\) of the sm allest possible condition num ber over allpossible diagonalscalings.

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=\mathrm{U}\) ': Upper triangularofA is stored;
= L ': Low er triangular of A is stored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if \(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of subdiagonals if U PLO \(=\mathbb{L}^{\prime} . \mathrm{KD}>=0\) 。

A (input) The upper or low er triangle of the \(H\) erm itian band
\(m\) atrix \(A\), stored in the firstK \(D+1\) row sof the array. The \(j\) th colum n of A is stored in the \(j\) th column of the amay A as follow s: if UPLO = U', A \((k d+1+i-j)=A(i, j)\) for \(\max (1, j k d)<=i<=j\) if UPLO \(=L \prime\) ', \(A(1+i-j)=A(i, 7)\) for \(\dot{j}=i<=m\) in \((n, \dot{j}+k d)\).

LD A (input)
The leading dim ension of the array A. LDA >= K D +1 .

SCALE (output)
If \(\mathbb{N} F O=0\), SCA LE contains the scale factors for A.

SCOND (output)
If \(\mathbb{N} F O=0, S C A\) LE contains the ratio of the sm allest SCA LE (i) to the largestSCA LE (i). If SCOND \(>=0.1\) and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

AMAX (output)
A bsolute value of largestm atrix elem ent. IfA M AX is very close to overflow orvery close to underflow , the \(m\) atrix should be scaled.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvahue.
\(>0\) : if \(\mathbb{N F O}=\) i, the \(i\)-th diagonal elem ent is nompositive.

of collm ns of the \(m\) atrices \(B\) and \(X . N R H S>=0\).

A (input) The upper or low er triangle of the \(H\) erm itian band \(m\) atrix \(A\), stored in the firstK \(D+1\) row s of the array. The \(j\) th colum \(n\) ofA is stored in the \(j\) th column of the array \(A\) as follow \(s:\) if \(U P L O=U\) ', \(A(k d+1+i-j, j)=A(i, 7)\) for \(m a x(1, j k d)<=i<=j\) if \(\mathrm{UPLO}=\mathrm{L}^{\prime}, \mathrm{A}(1+i-j)=A(i, 7)\) for j \(<=i<=m\) in \((n, j+k d)\).

LDA (input)
The leading dim ension of the array A. LDA >= K D+1.
AF (input)
The triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) orA \(=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) of the band \(m\) atrix \(A\) as com puted by CPBTRF, in the same storage form at as A (see A).

LDAF (input)
The leading dim ension of the array AF. LDAF >= K D +1.
\(B\) (input) The righthand side m atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by CPBTRS. On exit, the im proved solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard emrorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X\) ). If XTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{\nu})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each
solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(})\) an exactsolution).

void zpbstf_64 (charuplo, long n, long kd, doublecom plex *ab, long ldab, long *info);

\section*{PURPOSE}
zpbstf com putes a split C holesky factorization of a com plex H erm itian positive definite band \(m\) atrix \(A\).

This routine is designed to be used in conjunction w th CHBGST.
The factorization has the form \(A=S * * H * S\) where \(S\) is a band \(m\) atrix of the sam e bandw idth as A and the follow ing structure:
\[
\begin{array}{r}
S=\left(\begin{array}{ll}
U & ) \\
(M \quad L)
\end{array}, ~\right.
\end{array}
\]
w here \(U\) is upper triangular of orderm \(=(n+k d) / 2\), and \(L\) is low er triangular of ordern-m.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathrm{L}\) ': Low er triangle ofA is stored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if
\(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of subdiagonals if U PLO
\(=\mathbb{L}^{\prime} . \mathrm{KD}>=0\) 。

A B (input/output)
O n entry, the upper or low er triangle of the Her \(m\) titian band \(m\) atrix \(A\), stored in the first kd+1 row s of the amay. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the array A B as follow s: if \(\mathrm{UPLO}=\mathrm{U}^{\prime}, \mathrm{AB}(\mathrm{kd}+1+i-j, j)=A(i, j)\) for \(\mathrm{max}(1, j\) \(\mathrm{kd})<=\dot{i}<=\dot{j}\) ifUPLO \(=\mathrm{L}\) ', AB \((1+i-j, j=A(i, j)\) for \(\dot{j}=\dot{i}<=m\) in \((n, j+k d)\).

On exit, if \(\mathbb{N F O}=0\), the factors from the split Cholesky factorization \(A=S * * H * S\). See Further D etails.

LD A B (input)
The leading dim ension of the array AB. LD A B >= K D +1 .
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=\) i, the factorization could not be com pleted, because the updated elem enta (i,i) w as negative; the m atrix \(A\) is notposilive definite.

\section*{FURTHER DETAILS}

The band storage schem e is illustrated by the follow ing exam ple, w hen \(N=7, K D=2\) :
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{\(\mathrm{S}=(\mathrm{s} 11 \mathrm{~s} 12 \mathrm{~s} 13\)} \\
\hline ( & s22 s23 s24 ) \\
\hline ( & s33 s34 ) \\
\hline ( & s44 ) \\
\hline ( & s53 s54 s55 \\
\hline ( & s64 s65 s66 ) \\
\hline ( & s75 s76 s77) \\
\hline
\end{tabular}

If U PLO \(=\mathrm{U}\) ', the amay A B holds:
on entry: on exit:
* * a13 a24 a35 a46 a57 * * s13 s24 s53' s64's75'
* a12 a23 a34 a45 a56 a67 * s12 s23 s34 s54' s65's76' a11 a22 a33 a44 a55 a66 a77 s11 s22 s33 s44 s55 s66 s77

IfU PLO = L', the anay AB holds:
on entry: on exit:
```

a11 a22 a33 a44 a55 a66 a77 s11 s22 s33 s44 s55
s66 s77 a21 a32 a43 a54 a65 a76 * s12's23's34'
s54 s65 s76 * a31 a42 a53 a64 a64 * * s13'
s24's53 s64 s75 * *

```

A ray elem entsm arked * are notused by the routine; s12' denotes con \(\mathfrak{j}(s 12)\); the diagonalelem ents of \(S\) are real.

\section*{PURPOSE}
zpbsv com putes the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) Herm itian positive definite band \(m\) atrix and \(X\) and \(B\) are \(N\) by \(-N\) RH S m atriges.

The Cholesky decom position is used to factorA as
\[
\begin{aligned}
& A=U * * H * U, \text { if } U P L O=U ', \text { or } \\
& A=L * L * * H, \text { if } U P L O=L '
\end{aligned}
\]
\(w\) here \(U\) is an uppertriangularband \(m\) atrix, and \(L\) is a low er triangular band \(m\) atrix, \(w\) ith the sam e num ber of superdiagonals or subdiagonals as A. The factored form of A is then used to solve the system ofequations \(A * X=B\).

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathbb{L}\) ': Low ertriangle of is stored.

N (input) The num ber of linearequations, ie., the order of them atrix A. N >=0.

ND IA G (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if U PLO \(=\mathrm{U}\) ', or the num ber of subdiagonals ifU PLO \(=\mathbb{L} \cdot \mathrm{NDIAG>}>=0\) 。

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input/output)
O \(n\) entry, the upper or low ertriangle of the Her -
\(m\) itian band \(m\) atrix A, stored in the firstND IA G +1
row s of the anray. The \(j\) th colum n of A is stored in the \(j\) th colum \(n\) of the amay A as follow s: if \(\mathrm{UPLO}=\mathrm{U}\) ', \(A(\mathbb{N D I A G + 1 + i - j})=A(i, j\) for \(\max (1, j \mathrm{j} D \mathrm{IA} \mathrm{G})<=\dot{i}=\dot{j}\) if \(\mathrm{UPLO}=\mathrm{L}\) ', A ( \(1+i-j\) )
\(=A(i, j)\) for \(\dot{j}=\dot{i}=m\) in \((\mathbb{N}, j+N D\) IA G \()\). See below for furtherdetails.

On exit, if \(\mathbb{N} F O=0\), the triangular factor \(U\) orL from the Cholesky factorization \(A=U * * H * U\) or \(A=\) \(L \star L * * H\) of the band \(m\) atrix A, in the sam e storage form atasA.

LD A (input)
The leading dim ension of the aray A. LDA >= N D IA G +1.
B (input/output)
O n entry, the N -by-N RH S righthand side m atrix B. On exit, if \(\mathbb{N F O}=0\), the N -by-NRHS solution m atrix X .

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N F O}=-i\), the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N}\) FO \(=i\), the leading \(m\) inoroforder iof A is notpositive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

\section*{FURTHER DETAILS}

The band storage schem e is illustrated by the follow ing exam ple, when \(N=6, N D I A G=2\), and \(U P L O=U:\)

On entry: On exit:
```

    * * a13 a24 a35 a46 * * u13 u24 u35
    u46
* a12 a23 a34 a45 a56 * u12 u23 u34 u45
u56
a11 a22 a33 a44 a55 a66 u11 u22 u33 u44 u55

```
u66

Sim ilarly, if UPLO = 'L 'the form atofA is as follow s:
```

On entry: On exit:

```
```

    a11 a22 a33 a44 a55 a66 111 122 133 144 155
    166
a21 a32 a43 a54 a65 * 121 132 143 154 165
*
a31 a42 a53 a64 * * 131 142 153 164 *

```
A may elem entsm arked * are notused by the routine.

\section*{C INTERFACE}
\#include <sunperfh>
void zpbsvx (char fact, charuplo, int n, int ndiag, int nrhs, doublecom plex *a, int lda, doublecom plex *af, int ldaf, char equed, double *s, doublecom plex *b, int ladb, doublecom plex *x, int ldx, double *roond, double *ferr, double *berr, int *info);
void zpbsvx_64 (char fact, char uplo, long n, long ndiag, long nihs, doublecom plex *a, long lda, doublecom plex *af, long ldaf, charequed, double *s, doublecom plex *b, long ldb, doublecom plex *x, long \(l d x\), double *rcond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zpbsvx uses the C holesky factorization \(A=U * * H * U\) or \(A=\) \(\mathrm{L} * \mathrm{~L}^{\star *} \mathrm{H}\) to com pute the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\) by \(-N\) Herm itian positive definthe band \(m\) atrix and \(X\) and \(B\) are \(N\) boy \(-N\) RH \(S m\) atrices.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
W hether or not the system w illbe equilibrated depends on the
scaling of them atrix A , but if equilibration is used, A is
overw ritten by diag \((S) \star A\) *diag \((S)\) and \(B\) by diag \((S) * B\).
2. IfFACT = N 'or E', the Cholesky decom position is used to
factor the \(m\) atrix A (afterequilibration ifFACT \(=\mathrm{E}\) )
as
\(A=U * * H * U\), if \(U P L O=U\) ', or
\(\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), if \(\mathrm{UPLO}=\mathrm{L}\) ',
\(w\) here \(U\) is an upper triangularband \(m\) atrix, and \(L\) is a low er triangularband \(m\) atrix.
3. If the leading i-by-iprincipal \(m\) inor is not positive definite,
then the routine retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine precision, \(\mathbb{N F F O}=\mathrm{N}+1\) is retumed as a w aming, but the routine
still goes on to solve for X and com pute errorbounds as described below .
4.The system of equations is solved for X using the factored form of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw and error estim ates
for主.
6. Ifequilibration w as used, the \(m\) atrix \(X\) is prem ultiplied by diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether or not the factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, whether them atrix A should be equilibrated before it is factored. = \(\mathrm{F}^{\prime}\) : On entry, AF contains the factored form ofA. IfEQUED \(=Y\) ', the m atrix A has been equilibrated \(w\) ith scaling factors given by \(S\).
A and A F w illnotbe m odified. = N ': Them atrix A w illbe copied to AF and factored.
\(=\mathrm{E}\) ': The matrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
\(=\mathrm{U}:\) Upper triangle of \(A\) is stored;
\(=\mathbb{L}\) ': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix \(A . N>=0\).

ND IA G (input)
The num ber of superdiagonals of the \(m\) atrix \(A\) if \(\mathrm{UPLO}=\mathrm{U}\) ', orthe num ber of subdiagonals ifU PLO
\(=L^{\prime} . \mathrm{ND} \mathbb{I} \mathrm{G}>=0\) 。

NRHS (input)
The num ber of right-hand sides, i.e., the num ber of colum ns of the m atrices B and X . NRH S \(>=0\).

A (input/output)
O n entry, the upper or low er triangle of the H er\(m\) itian band \(m\) atrix A, stored in the firstND IA G +1 row s of the anay, exceptifFACT = \(\mathrm{F}^{\prime}\) and EQUED \(=Y\) ', then A m ustcontain the equilibrated \(m\) atrix diag \((S) \star A\) *diag \((S)\). The \(j\) th colum n of \(A\) is stored in the \(j\) th colum \(n\) of the amay \(A\) as follow \(s\) : if \(\mathrm{UPLO}=\mathrm{U} ', \mathrm{~A} \mathbb{N D I A G + 1 + i - j})=A(i, j\) for \(\max (1, j \mathrm{j} D \mathrm{IA} \mathrm{G})<=\dot{i}=\dot{j}\) if \(\mathrm{UPLO}=\mathbb{L}\) ', A ( \(1+i-j\) ) \(=A(i, j)\) for \(j=i<=m\) in \((\mathbb{N}, j+N D\) IAG \()\). See below for furtherdetails.

On exit, ifFACT = E' and EQUED = \(Y^{\prime}\), A is overw rilten by diag \((S) \star A\) *diag \((S)\).

LD A (input)
The leading dim ension of the array A. LD A >= N D IA G +1.

AF (input/output)

If \(F A C T=F '\), then \(A F\) is an inputargum ent and on entry contains the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(L * L * * H\) of the band \(m\) atrix \(A\), in the sam e storage form atas A (see A). IfEQUED = \(Y\) ', then AF is the factored form of the equilibrated \(m\) atrix A.

If FA C T = N ', then AF is an output argum ent and on exit retums the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) L*L** H .

If FACT = E', then AF is an output argum ent and on exit retums the triangular factorU orl from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(L * L * * H\) of the equilibrated \(m\) atrix \(A\) (see the description of \(A\) for the form of the equilibrated \(m\) atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= ND IA G +1.

EQUED (input)
Specifies the form of equilibration thatw as done. \(=\mathrm{N}\) ': N o equilibration (alw ays true iffA C T = N \({ }^{2}\).
\(=Y^{\prime}:\) Equilibration \(w\) as done, i.e., A has been
replaced by diag (S) * A * diag (S). EQUED is an inputargum ent if \(F A C T=F\) '; otherw ise, it is an outputargum ent.
\(S\) (input/output)
The scale factors forA; notaccessed if EQUED = \(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum entifFACT = F '; otherw ise, S is an outputargum ent. IfFACT = \(\mathrm{F}^{\prime}\) and EQUED = Y', each elem entofs m ustbe positive.

B (input/output)
On entry, the \(\mathrm{N}-\mathrm{by}-\mathrm{NRH} \mathrm{S}\) righthand side m atrix B . On exit, if EQUED \(=N\) ', \(B\) is notm odified; if EQUED = \(Y\) ', \(B\) is overw rilten by diag ( S ) * B .

LD B (input)
The leading dim ension of the anay B . LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the N -by-NRH S solution
\(m\) atrix \(X\) to the original system ofequations.
\(N\) ote that ifEQUED \(=Y\) ', A and \(B\) are m odified on exit, and the solution to the equilibrated system is inv (diag \((S)) * X\).

\section*{LD X (input)}

The leading dim ension of the array X . LD X >= \(\max (1, N)\).

\section*{RCOND (output)}

The estim ate of the reciprocal condition num berof the \(m\) atrix \(A\) afterequilibration (ifdone). If RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

\section*{FERR (output)}

The estim ated forw ard emrorbound for each solution vector \(X()\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})\)-XTRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector X (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

\section*{W ORK (w orkspace)}

\section*{PURPOSE}
zpbtf2 com putes the Cholesky factorization of a com plex H er\(m\) itian positive definite band \(m\) atrix \(A\).

The factorization has the form
\(A=U^{\prime} \star U\), if \(U P L O=U\) ', or
\(A=L * L \prime\) if \(\mathrm{U} P \mathrm{PLO}=\mathrm{L}\) ',
w here U is an uppertriangularm atrix, U 'is the conjugate transpose of \(U\), and \(L\) is low ertriangular.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

\section*{UPLO (input)}

Specifies w hether the upper or low er triangular
part of the \(H\) erm itian \(m\) atrix \(A\) is stored:
= U ': U pper triangular
= LL: Low er triangular

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

KD (input)
The num ber of super-diagonals of the m atrix A if \(\mathrm{UPLO}=\mathrm{U}\) ', or the num ber of sub-diagonals if UPLO
\(=\mathbb{L} . \mathrm{KD}>=0\) 。

A B (input/output)
O n entry, the upper or low er triangle of the H er\(m\) tiian band \(m\) atrix \(A\), stored in the firstKD +1 row s of the amay. The \(j\) th colum n of A is stored in the \(j\) th colum n of the array A B as follow s: if \(\mathrm{UPLO}=\mathrm{U}\) ', AB \((k d+1+i-j, j)=A(i, j)\) for \(\max (1, j\) \(\mathrm{kd})<=i<=\dot{j}\) ifUPLO \(=L ', A B(1+i-j, j)=A(i, j)\) for \(\dot{j}=i<=m\) in \((n, j+k d)\).

On exit, if \(\mathbb{N} F O=0\), the triangular factor \(U\) orL
from the Cholesky factorization \(\mathrm{A}=\mathrm{U}\) * U or \(\mathrm{A}=\) L * L ' of the band m atrix A , in the sam e storage form atas A.

LDAB (input)
The leading dim ension of the array AB. LD AB >= KD+1.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-k\), the \(k\)-th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=k\), the leading \(m\) inoroforderk is notpositive definite, and the factorization could notbe com pleted.

\section*{FURTHER DETAILS}

\section*{C INTERFACE}
\#include <sunperfh>
void zpoequ (intn, doublecom plex *a, int lda, double *scale, double *scond, double *am ax, int *info);
void zpoequ_64 (long n, doublecom plex *a, long lda, double *scale, double *scond, double *am ax, long *info);

\section*{PURPOSE}
zpoequ computes row and colum n scalings intended to equilibrate a Herm itian positive definite matrix \(A\) and reduce its condition num ber (w ith respect to the two-norm ). S contains the scale factors, \(S(i)=1 /\) sqrt (A \((i, i))\), chosen so that the scaled matrix B w ith elem ents \(\mathrm{B}(i, 1)=\) S (i)*A ( \(i, j\) ) \({ }^{\text {S }}\) ( \(\bar{j}\) ) has ones on the diagonal. This choice of \(S\) puts the condition num berofB \(w\) ithin a factor \(N\) of the sm allest possible condition num ber over allpossible diagonal scalings.

\section*{ARGUMENTS}

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
A (input) The N -by -N Herm tian positive definite m atrix whose scaling factors are to be com puted. Only the diagonalelem ents ofA are referenced.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

SCALE (output)
If \(\mathbb{N} F O=0, S C A L E\) contains the scale factors for A.

\section*{SCOND (output)}

If \(\mathbb{N} F O=0, S C A L E\) contains the ratio of the \(s m\) allest SCA LE (i) to the largestSCA LE (i). IfSCOND \(>=0.1\) and AMAX is neither too large nor too sm all, it is notw orth scaling by SCA LE .

A bsolute value of largestm atrix elem ent. If A M A X is very close to overflow orvery close to underflow , the \(m\) atrix should be scaled.
\(\mathbb{I N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
> 0 : if \(\mathbb{N F O}=\) i, the \(i\)-th diagonal elem ent is nonpositive.

\section*{PURPOSE}
zporfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is H erm tian positive definite, and provides errorbounds and backw ard erroresti\(m\) ates for the solution.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': U pper triangle of A is stored;
= \(\mathbb{L}\) ': Low ertriangle ofA is stored.

N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber
of colum ns of the m atrices B and X . NRHS \(>=0\).

A (input) The H erm Itian \(m\) atrix A . IfUPLO \(=\mathrm{U}\) ', the leading N -by- N uppertriangularpartof A contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low ertriangularpart ofA is not referenced. IfUPLO = 'L', the leading N boy N lower
triangularpart ofA contains the low er triangular part of the \(m\) atrix A, and the strictly upper triangular part ofA is not referenced.

LD A (input)
The leading dim ension of the anay A. LDA >= \(\max (1, N)\).

AF (input)
The triangular factor \(U\) or \(L\) from the Cholesky factorization \(A=U * * H * U\) orA \(=L{ }^{*} L^{* *}{ }^{*}\), as com puted by CPOTRF.
LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, \mathbb{N})\).
\(B\) (input) The righthand side \(m\) atrix \(B\).
LD B (input)
The leading dim ension of the aray \(B\). LD B \(>=\) \(\max (1, \mathbb{N})\).

X (input/output)
On entry, the solution \(m\) atrix \(X\), as com puted by CPO TRS. On exit, the im proved solution \(m\) atrix \(X\).

\section*{LD X (input)}

The leading dim ension of the array X . LDX >= \(\max (1, \mathbb{N})\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th column of the solution \(m\) atrix \(X\) ). If XTRUE is the true solution comesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{H})\)-XTRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

\section*{PURPOSE}
zposv com putes the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) H erm itian positive definte \(m\) atrix and \(X\) and \(B\) are \(N\)-by-N RH S \(m\) atrices.
The Cholesky decom position is used to factorA as
\(A=U * * H * U\), if \(U P L O=U\) ', or
\(A=L * L * * H\), if UPLO \(=L^{\prime}\) ',
where \(U\) is an upper triangularm atrix and \(L\) is a low ertriangular \(m\) atrix. The factored form ofA is then used to solve the system of equations \(A * X=B\).

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}\) ': U pper triangle of A is stored;
\(=\mathbb{L}\) ': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of the matrix A. \(N>=0\).

NRHS (input)
The num ber of right hand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).

A (input/output)
O n entry, the \(H\) erm itian m atrix A. If UPLO = \(U^{\prime}\), the leading N -oy N uppertriangularpart of \(A\) contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If UPLO \(=\mathrm{L}\) ', the leading N -by N low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of A is notreferenced.

On exit, if \(\mathbb{N F O}=0\), the factor \(U\) orL from the Cholesky factorization \(A=U * * H * U\) orA \(=L * L * * H\).

LD A (input)
The leading dim ension of the anay A. LD A >= \(\max (1, N)\).

B (input/output)
On entry, the N -by-NRHS righthand side matrix B.
On exi, if \(\mathbb{N} F O=0\), the \(N\) by \(N\) RH S solution
matrix \(X\).

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=\mathrm{i}\), the leading m inoroforderiof
A is notpositive definite, so the factorization could not.be com pleted, and the solution has not been com puted.

\section*{C INTERFACE}
\#include <sunperfh>
void zposvx (char fact, charuplo, int n, int nins, doublecom plex *a, int lda, doublecom plex *af, int ldaf, charequed, double *s, doublecom plex *b, int ldb, doublecom plex *x, int ldx, double *rcond, double * ferr, double *berr, int *info);
void zposvx_64 (char fact, char uplo, long n, long nrhs, doublecom plex *a, long lda, doublecom plex *af, long ldaf, char equed, double *s, doublecom plex *b, long ldb, doublecom plex *x, long ldx, double *rcond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zposvx uses the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) L*L**H to com pute the solution to a com plex system of linear equations
\(A\) * \(X=B\), where \(A\) is an \(N\)-by-N H erm itian positive definte m atrix and X and B are N -by-N RH S m atrioes.

Errorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are com puted to equilibrate
the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
\(W\) hether or not the system \(w\) illbe equilibrated depends on
the
scaling of the m atrix A , but ifequilibration is used, A is
overw rilten by diag \((\mathrm{S}) \star A\) *diag \((\mathrm{S})\) and B by diag \((\mathrm{S}) \star \mathrm{B}\).
2. IfFACT = N 'or E', the Cholesky decom position is used to
factorthem atrix A (afterequilibration ifFACT = E )
as
\[
\begin{aligned}
& A=U * * H * U, \text { if } U P L O=U ', \text { or } \\
& A=L * L * * H, \text { if } U P L O=L '
\end{aligned}
\]
\(w\) here \(U\) is an uppertriangularm atrix and \(L\) is a low er triangular
\(m\) atrix.
3. If the leading iboy-iprincipal \(m\) inor is not positive definite, then the routine retums w ith \(\mathbb{N F O}=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine precision, \(\mathbb{N} F O=\mathrm{N}+1\) is retumed as a w aming, but the routine still goes on to solve for \(X\) and com pute emorbounds as described below .
4. The system ofequations is solved forX using the factored form
```

ofA.

```
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether or not the factored form of the \(m\) atrix \(A\) is supplied on entry, and ifnot, w hether
them atrix A should be equilibrated before it is factored. = F : O n entry, AF contains the factored form of \(A\). IfEQUED \(=Y\) ', the \(m\) atrix \(A\) has been equilibrated \(w\) ith scaling factors given by \(S\). A and AF w illnotbe m odified. = N ': Them atrix A w illbe copied to A F and factored.
\(=\mathrm{E}\) ': The matrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
\(=U\) ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.
N (input) The num ber of linear equations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrices B and X. NRHS >=0.
A (input/output)
On entry, the \(H\) erm itian \(m\) atrix A, exceptifFA C T = \(\mathrm{F}^{\prime}\) and EQUED = Y ', then A m ust contain the equilibrated \(m\) atrix diag \((S) * A\) *diag \((S)\). If UPLO \(=\) U ', the leading N -by-N uppertriangular part of A contains the upper triangularpart of the \(m\) atrix
A, and the strictly low ertriangularpartofA is not referenced. If U PLO \(=\mathrm{L}\) ', the leading N -by -N low er triangularpartofA contains the low ertriangularpart of the matrix A, and the strictly upper triangular partofA is not referenced. A is notm odified ifFACT = F or \(\mathrm{N}^{\prime}\), or if \(\mathrm{FACT}=\) E'and EQUED = N 'on exit.

On exit, ifFACT = E' and EQUED = \(\mathrm{Y}^{\prime}, \mathrm{A}\) is overw ritten by diag \((S) \star A\) *diag \((S)\).

LD A (input)
The leading dim ension of the anay A. LDA >= \(\max (1, \mathbb{N})\).

AF (output)
IfFACT = \(\mathrm{F}^{\prime}\), then AF is an input argum entand on entry contains the triangular factor \(U\) orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), in the sam e storage form at as A. IfEQ U ED ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix diag \((S) \star A * \operatorname{diag}(S)\).

IfFACT = N ', then AF is an output argum ent and on exit retums the triangular factor \(U\) or \(L\) from
the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) of the originalm atrix A .

IfFACT = E', then AF is an output argum ent and on exitretums the triangular factor \(U\) orL from the Cholesky factorization \(A=U * * H * U\) or \(A=\) \(L * L * * H\) of the equilibrated \(m\) atrix \(A\) (see the description ofA for the form of the equilibrated m atrix).

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

EQUED (input)
Specifies the form of equilibration thatw as done.
\(=\mathrm{N}\) ': N o equilibration (alw ays true ifFACT = N 7 。
\(=Y\) ': Equilibration w as done, i.e., A has been
replaced by diag \((\mathrm{S})\) * \(A\) * diag \((\mathrm{S})\). EQUED is an inputargum entiffACT = \(\mathrm{F}^{\prime}\); otherw ise, it is an output argum ent.

S (input/output)
The scale factors forA; not accessed if EQUED =
\(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum entifFACT=F'; other-
W ise, S is an outputargum ent. IfFACT \(=\mathrm{F}^{\prime}\) and
\(E Q U E D=Y\) ', each elem entof m ust.be positive.

B (input/output)
On entry, the N boy-NRHS righthand side matrix B.
On exit, if EQUED = \(N^{\prime}\) ', B is notm odified; if
EQUED \(=Y ', B\) is overw ritten by diag \((S) * B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N}\) FO \(=0\) or \(\mathbb{N} F O=N+1\), the N -by -N R H S solution
\(m\) atrix \(X\) to the original system of equations.
\(N\) ote that ifEQUED \(=Y^{\prime}, A\) and \(B\) are \(m\) odified on
exit, and the solution to the equilibrated system
is inv \((\) diag \((S)) \star X\).

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

The estim ate of the reciprocal condition num ber of the matrix A after equilibration (if done). If RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) ) the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H})\), FERR ( \()\) ) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(j)\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension \((\mathbb{N})\)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\) i, the \(i\)-th argum enthad an ille-
galvalue
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
\(<=N\) : the leading \(m\) inor oforderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than machine precision, m eaning that the \(m\) atrix is singularto w orking precision. Nevertheless, the solution and error bounds are com puted because there are a num berof situationsw here the com puted solution can bem ore accurate than the value ofRC O N D w ould suggest.

void zpotrf(charuplo, intn, doublecom plex *a, int lda, int *info);
void zpotrf_64 (charuplo, long n, doublecom plex *a, long lda, long *info);

\section*{PURPOSE}
zpotrf com putes the Cholesky factorization of a com plex H er\(m\) itian posilive definite m atrix A .

The factorization has the form
\(A=U * * H * U\), if \(U P L O=U\) ', or
\(A=L * L^{* *} H\), if \(\mathrm{UPLO}=\mathrm{L}\) ',
\(w\) here \(U\) is an upper triangularm atrix and \(L\) is low er triangular.

This is the block version of the algorithm, calling Level 3 BLAS .

\section*{ARGUMENTS}

UPLO (input)
\(=U\) ': U pper triangle of \(A\) is stored;
\(=\mathbb{L}\) ': Low ertriangle of \(A\) is stored.

N (input) The order of them atrix A. N \(>=0\).

A (input/output)
O n entry, the H erm itian m atrix A. If UPLO = U', the leading N -by -N uppertriangularpartof A contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low er triangularpart of \(A\) is not referenced. If UPLO = 'L', the leading N -by N low er triangularpant of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of A is notreferenced.

On exit, if \(\mathbb{N F O}=0\), the factor U orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) orA \(=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\).

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).
= 0: successfulexit
< 0 : if \(\mathbb{N}\) FO \(=-\)-i, the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the leading \(m\) inoroforder \(i\) is not positive definite, and the factorization could notbe com pleted.

void zppsv_64 (charuplo, long n, long nrhs, doublecom plex
*a, doublecom plex *b, long ldo, long *info);

\section*{PURPOSE}
zppsv com putes the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\)-by \(-N\) H erm itian positive defintiem atrix stored in packed form at and X and B are N -by-N RH S \(m\) atrices.

The Cholesky decom position is used to factorA as
\[
\begin{aligned}
& A=U * * H * U, \text { if } U P L O=U ' \text { or } \\
& A=L * L * * H, \text { if } U P L O=L ',
\end{aligned}
\]
where \(U\) is an uppertriangularm atrix and \(L\) is a low er triangular \(m\) atrix. The factored form of \(A\) is then used to solve the system ofequations \(A *=B\).

\section*{ARGUMENTS}

UPLO (input)
= U ': U pper triangle ofA is stored;
= L': Low er triangle ofA is stored.
N (input) The num ber of linearequations, i.e., the order of them atrix \(A . N>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colm ns of them atrix B. NRHS \(>=0\).

A (input/output)
On entry, the upper or low ertriangle of the Her\(m\) tian \(m\) atrix A, packed colum nw ise in a linear array. The jth column of A is stored in the array A as follows: if UPLO \(=U U^{\prime}, A(i+(j\)
 \((j-1) *(2 n-j / 2)=A(i, 7)\) for \(\dot{j}=i<=n\). See below for further details.

On exit, if \(\mathbb{N} F O=0\), the factor \(U\) orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), in the sam e storage form at as A.

B (input/output)
On entry, the N -by -NRH S righthand side m atrix B. On exit, if \(\mathbb{N F O}=0\), the N boy \(-\mathrm{NRH} S\) solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N F O}=-i\), the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N}\) FO \(=i\), the leading \(m\) inoroforder iof \(A\) is notposilive definite, so the factorization could notbe com pleted, and the solution has not been com puted.

\section*{FURTHER DETAILS}

\section*{C INTERFACE}
\#include <sunperfh>
void zppsvx (char fact, charuplo, int n, int nins, doublecom plex *a, doublecom plex *af, char equed, double *s, doublecom plex *b, int ldb, doublecom plex *x, int ldx, double *roond, double *ferr, double *berr, int *info);
void zppsvx_64 (char fact, char uplo, long n, long nrhs, doublecom plex *a, doublecom plex *af, charequed, double *s, doublecom plex *b, long ldb, doublecom plex *x, long ldx, double *roond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zppsvx uses the C holesky factorization \(A=U * * H * U\) or \(A=\) L*L**H to com pute the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(N\) H erm itian positive defintem atrix stored in packed form atand \(X\) and \(B\) are \(N\) boy-N RHS m atrices.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT = E', real scaling factors are computed to equilibrate
the system :
\(\operatorname{diag}(S) * A * \operatorname{diag}(S) * \operatorname{inv}(\operatorname{diag}(S)) * X=\operatorname{diag}(S) * B\)
W hether or not the system w illbe equilibrated depends on the
scaling of the m atrix A , but ifequilibration is used, A
overw rilten by diag \((\mathrm{S}) \star A\) *diag \((\mathrm{S})\) and B by diag \((\mathrm{S}) \star\) B .
2. IfFACT = N 'or E', the Cholesky decom position is used to
factor them atrix A (afterequilibration ifFACT =E)
as
\(A=U{ }^{\star} U\), if \(U P L O=U\) ', or
\(A=L * L '\) if \(U P L O=L \prime\) ',
\(w\) here \(U\) is an upper triangularm atrix, \(L\) is a low er triangular
m atrix, and 'indicates conjugate transpose.
3. If the leading iboy-iprincipal \(m\) inor is not positive definite,
then the routine retums \(w\) ith \(\mathbb{N F O}=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine
precision, \(\mathbb{N} F O=N+1\) is retumed as a w aming, but the routine
stillgoes on to solve forX and com pute emorbounds as described below .
4. The system ofequations is solved forX using the factored form
of A.
5. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.
6. If equilibration \(w\) as used, the \(m\) atrix \(X\) is prem ultiplied by
diag (S) so that it solves the original system before equilibration.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornotthe factored form of the \(m\) atrix \(A\) is supplied on entry, and if not, whether them atrix A should be equilibrated before it is factored. = F': On entry, AF contains the fac-
tored form ofA. IfEQUED \(=Y\) ', them atrix \(A\) has been equilibrated \(w\) ith scaling factors given by \(S\). A and A F w illnotbe m odified. = N ': The m atrix A w illibe copied to A F and factored.
\(=\mathrm{E}\) : The matrix A w ill be equilibrated if necessary, then copied to AF and factored.

UPLO (input)
= U : U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The num ber of linear equations, i.e., the order of the matrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrices B and X. NRHS >=0.
A (input/output)
O \(n\) entry, the upper or low er triangle of the Her \(m\) itian matrix A, packed colum nw ise in a linear array, except ifFACT \(=F^{\prime}\) and \(E Q U E D=Y '\), then A \(m\) ust contain the equilibrated \(m\) atrix diag ( S ) \(\mathrm{A}^{\mathrm{A}}\) *diag ( S ). The jth column ofA is stored in the array A as follow s: if UPLO = U', A (i+ \((j-1) * \dot{j} 2)=A(i, 7)\) for \(1<=i<=j\) if \(U P L O=L^{\prime}\) ', A \((i+(j-1) *(2 n-j) / 2)=A(i, j)\) for \(j=i<=n\). See below for further details. A is not \(m\) odified if FACT = F' or \(\mathrm{N}^{\prime}\), orifFACT = E'andEQUED = N 'on exit.

On exit, ifFACT = E' and EQUED = \(\mathrm{Y}^{\prime}\), A is overw rilten by diag \((S) * A * d i a g(S)\).

AF (input/output)
If \(F A C T=F '\), then \(A F\) is an inputargum ent and on entry contains the triangular factorU orL from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\), in the sam e storage form at as A. IfEQ U ED ne. \(N\) ', then \(A F\) is the factored form of the equilibrated \(m\) atrix \(A\).

IfFACT = N ', then AF is an output argum ent and on exit retums the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{~L} * * \mathrm{H}\) of the originalm atrix A.

If \(F A C T=E\) ', then \(A F\) is an output argum ent and on exit retums the triangular factor \(U\) or \(L\) from the Cholesky factorization \(\mathrm{A}=\mathrm{U} * * \mathrm{H} * \mathrm{U}\) or \(\mathrm{A}=\) \(L * L * * H\) of the equilibrated \(m\) atrix \(A\) (see the
description of \(A\) for the form of the equilibrated \(m\) atrix).

EQUED (input)
Specifies the form of equilibration thatw as done.
= N ': N o equilibration (alw ays true ifFA C T = N \({ }^{1}\).
= Y': Equilibration w as done, i.e., A has been replaced by diag (S) * A * diag (S). EQUED is an inputargum ent if \(\mathrm{FACT}=\mathrm{F}\) '; otherw ise, it is an outputargum ent.

S (input/output)
The scale factors forA; not accessed if \(\mathrm{EQUED}=\) \(\mathrm{N}^{\prime} . \mathrm{S}\) is an inputargum entifFACT = F '; otherw ise, S is an outputargum ent. IfFACT \(=\mathrm{F}^{\prime}\) and EQUED = \(Y\) ', each elem entofs m ustbe positive.

B (input/output)
On entry, the N -by-NRH S righthand sidem atrix B. On exit, if EQUED \(=N\) ', \(B\) is notm odified; if EQUED = Y',B is overw rilten by diag \((S)\) * \(B\).

LD B (input)
The leading dim ension of the anay B . LD B >= max (1,N).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=N+1\), the N -by-NRHS solution
\(m\) atrix \(X\) to the original system ofequations.
\(N\) ote that if EQ UED \(=Y\) ', \(A\) and \(B\) are \(m\) odified on exit, and the solution to the equilibrated system is inv (diag (S))*X .

LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num berof the matrix A after equilibration (if done). If
RCOND is less than the \(m\) achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X(\mathcal{)}\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution
conesponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})\)-XTRUE) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true enror.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( \(\mathcal{j}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes \(X(\mathcal{j})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}\), and i is
\(<=N\) : the leading \(m\) inoroforderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, but RCOND is less than machine precision, m eaning that the \(m\) atrix is singularto \(w\) orking precision. Nevertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRC OND w ould suggest.

\section*{PURPOSE}
zptcon com putes the reciprocal of the condition num ber (in the 1 -norm ) of a com plex \(H\) erm tian positive definite tridiagonalm atrix using the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{H}\) or \(\mathrm{A}=\) \(\mathrm{U} * * \mathrm{H} * \mathrm{D} * \mathrm{U}\) com puted by CPTTRF.

Norm (inv (A )) is com puted by a direct method, and the reciprocal of the condition num ber is com puted as
```

RCOND =1 / (ANORM * nom (inv (A))).

```

\section*{ARGUMENTS}

N (input) The order of them atrix A. \(\mathrm{N}>=0\).

D IA G (input)
Then diagonalelem ents of the diagonal \(m\) atrix
D IA G from the factorization of \(A\), as com puted by
CPTTRF.

OFFD (input)
The ( \(n-1\) ) off-diagonalelem ents of the unit bidiagonal factorU orL from the factorization ofA, as com puted by CPTTRF .

ANORM (input)
The 1 -norm of the originalm atrix A.

RCOND (output)
The reciprocal of the condition num ber of the \(m\) atrix \(A\), com puted as RCOND \(=1 /(A N O R M * A \mathbb{N} V N M)\), where \(A \mathbb{I N V N M}\) is the 1 -norm of inv ( \(A\) ) com puted in this routine.

W ORK (w orkspace)
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

Them ethod used is described in N icholas J . H igham, "E fficient A lgorithm s for C om puting the C ondition N um berof a TridiagonalM atrix", SIA M J.Sci.Stat. C om put., V ol. 7, No. 1, January 1986.

\section*{PURPOSE}
zpteqr com putes alleigenvalues and, optionally, eigenvectors of a sym \(m\) etric posilive definite tridiagonalm atrix by first factoring the \(m\) atrix using SPTTRF and then calling CBD SQR to com pute the singularvalues of the bidiagonal factor.

This routine com putes the eigenvalues of the positive definte tridiagonal m atrix to high relative accuracy. This m eans that if the eigenvalues range overm any orders ofm agnitude in size, then the sm alleigenvalues and comesponding eigenvectors \(w\) illbe com puted m ore accurately than, for exam ple, w ith the standard \(Q R\) m ethod.

The eigenvectors of a fullorband positive definite Herm itian \(m\) atrix can also be found ifCHETRD, CHPTRD, orCHBTRD has been used to reduce this \(m\) atrix to tridiagonal form . (The reduction to tridiagonal form, how ever, \(m\) ay preclude the possibility of obtaining high relative accuracy in the sm all eigenvalues of the originalm atrix, if these eigenvalues range overm any orders ofm agnitude.)

\section*{ARGUMENTS}

COM PZ (input)
= N ': C om pute eigenvalues only .
\(=\mathrm{V}\) : C om pute eigenvectors of originalH erm itian \(m\) atrix also. A may \(Z\) contains the unitary \(m\) atrix used to reduce the originalm atrix to tridiagonal form . = I': C om pute eigenvectors of tridiagonal \(m\) atrix also.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).
D (input/output)
O n entry, the \(n\) diagonalelem ents of the tridiagonalm atrix. On norm alexit, D contains the eigenvalues, in descending order.

E (input/output)
O \(n\) entry, the ( \(n-1\) ) subdiagonal elem ents of the tridiagonal matrix. On exit, E hasbeen destroyed.

Z (input) \(O n\) entry, if \(C O M P Z=V\) ', the unitary \(m\) atrix used in the reduction to tridiagonal form. On exit, if \(C O M P Z=V\) ', the orthonorm aleigenvectors of the original Herm tian matrix; if COM PZ = I', the orthonorm al eigenvectors of the tridiagonal \(m\) atrix. If \(\mathbb{N} F O>0\) on exit, \(Z\) contains the eigenvectors associated with only the stored eigenvalues. If COMPZ \(=N\) ', then \(Z\) is not referenced.

LD Z (input)
The leading dim ension of the amray Z . LD \(\mathrm{Z}>=1\), and ifCOM PZ \(=V\) 'or \(I\) ', LD \(Z>=\max (1, N)\).

W ORK (w orkspace)
dim ension ( \(4 * \mathrm{~N}\) )
\(\mathbb{N} F O\) (output)
= 0: successfulexit.
< \(0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue.
> 0 : if \(\mathbb{N} F O=i\), and \(i\) is: <= \(N\) the Cholesky factorization of the \(m\) atrix could notbe perform ed because the \(i\)-th principalm inorw as not positive definite. > N the SVD algorithm failed to converge; if \(\mathbb{N} F O=N+\) i, ioff-diagonal elem ents of the bidiagonal factor did not converge to zero.

*berr, long *info);

\section*{PURPOSE}
zptsvx uses the factorization \(A=L * D * L * * H\) to com pute the solution to a com plex system of linear equations \(A * X=B\), where A is an N boy N H erm itian positive definite tridiagonal \(m\) atrix and \(X\) and \(B\) are \(N\) boy- N R H S \(m\) atrioes.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', them atrix \(A\) is factored as \(A=L * D * L * * H\), where L
is a unit low erbidiagonalm atrix and \(D\) is diagonal. The factorization can also be regarded as having the form
\(A=U * * H * D * U\).
2. If the leading iboy-iprincipal \(m\) inor is not positive
definite,
then the routine retums w ith \(\mathbb{N} F O=\) i. O therw ise, the factored
form ofA is used to estim ate the condition num ber of the \(m\) atrix
A. If the reciprocal of the condition num ber is less than \(m\) achine
precision, \(\mathbb{N N}\) FO = N +1 is retumed as a w aming, but the routine
still goes on to solve for X and com pute errorbounds as described below .
3.The system ofequations is solved for \(X\) using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornot the factored form of the \(m\) atrix \(A\) is supplied on entry. \(=F\) : On entry, \(D I A G F\) and SUBF contain the factored form of \(A\). D IA G, SUB, D IA GF, and SUBF w ill notbe m odified.
\(=N\) ': Them atrixA w illbe copied to D IA GF and SUBF and factored.

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, ie., the num ber
of collm ns of the m atrices B and X. NRHS >=0.
D IA G (input)
The \(n\) diagonalelem ents of the tridiagonal \(m\) atrix
A.

SU B (input)
The ( \(n-1\) ) subdiagonalelem ents of the tridiagonal \(m\) atrix A.

DIAGF (input/output)
If \(F A C T=F '\), then \(D I A G F\) is an input argum ent and
on entry contains the \(n\) diagonalelem ents of the diagonalm atrix D IA G from the L*D IA G *L**H factorization ofA. IfFACT = N', then D IA GF is an out putargum entand on exitcontains the n diagonal elem ents of the diagonal \(m\) atrix \(D\) IA G from the \(\mathrm{L} * \mathrm{D} \mathbb{I}\) G *L**H factorization of .

SUBF (input/output)
IfFACT = F ', then SUBF is an inputargum ent and on entry contains the ( \(n-1\) ) subdiagonalelem ents of the unit bidiagonal factor \(L\) from the \(\mathrm{L} * \mathrm{D}\) IA \(G * \mathrm{~L}^{* *} \mathrm{H}\) factorization of \(\mathrm{A} . \mathrm{IfFACT}=\mathrm{N}\) ', then SUBF is an outputargum entand on exit contains the ( \(n-1\) ) subdiagonalelem ents of the unit bidiagonal factor \(L\) from the \(L * D I A G * L * * H\) factorization of A.
\(B\) (input) On entry, the N -by-N RH S righthand side m atrix B.
U nchanged on exit.
LD B (input)
The leading din ension of the array \(B\). LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the \(\mathrm{N}-\) by -NRH S solution
\(m\) atrix \(X\).

LD X (input)
The leading dim ension of the amay X . LD X >= \(\max (1, N)\).

RCOND (output)
The reciprocalcondition num berof the \(m\) atrix \(A\). If RCOND is less than them achine precision (in particular, ifRCOND \(=0\) ), the \(m\) atrix is singular to w orking precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO \(>0\).

\section*{FERR (output)}

The forw ard errorbound foreach solution vector \(X\) (i) (the jth colum \(n\) of the solution \(m\) atrix \(X\) ). IfXTRUE is the true solution corresponding to \(X(\mathcal{J}), \operatorname{FERR}(\mathcal{J})\) is an estim ated upperbound for the \(m\) agnitude of the largestelem ent in (X ( \()\)-X TRU E) divided by the \(m\) agnitude of the largestelem ent in X ( \()\).

BERR (output)
The com ponentw ise relative backw ard emorof each
solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{j}\) ) an exactsolution).

W ORK (w orkspace)
dim ension (N)
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{I N F O}\) (output)
= 0 : successfulexit
<0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i\), and \(i\) is
\(<=N\) : the leading \(m\) inor oforderiof \(A\) is not positive definite, so the factorization could not be com pleted, and the solution has not been com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : U is nonsingular, butRCOND is less than machine precision, m eaning that the \(m\) atrix is singularto \(w\) orking precision. Nevertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

void zptts2 (int iuplo, intn, int nhs, double *d, doublecom plex *e, doublecom plex *b, int ldb);
void zptts2_64 (long iuplo, long n, long nihs, double *d, doublecom plex *e, doublecom plex *b, long ldb);

\section*{PURPOSE}
zptts2 solves a tridiagonal system of the form
\(A * X=B\) using the factorization \(A=U{ }^{*} D * U\) or \(A=\) L * D *L 'com puted by CPTTRF. D is a diagonalm atrix specified in the vectorD, U (orL) is a unitbidiagonalm atrix whose superdiagonal (subdiagonal) is specified in the vectore, and \(X\) and \(B\) are N by NRH S m atrioes.

\section*{ARGUMENTS}

IUPLO (input)
Specifies the form of the factorization and whether the vectorE is the superdiagonal of the upperbidiagonal factor \(U\) or the subdiagonal of the low erbidiagonal factor \(L .=1: A=U * D * U\), \(E\) is the superdiagonalof \(U\)
\(=0: A=L * D * L\) ' E is the subdiagonalof L
N (input) The order of the tridiagonalm atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atrix B. NRHS \(>=0\).
\(D\) (input) The \(n\) diagonalelem ents of the diagonal \(m\) atrix \(D\)
from the factorization \(A=U{ }^{*} D * U\) orA \(=L * D * L '\).
\(E\) (input) If \(\mathbb{U P L O}=1\), the \((n-1)\) superdiagonalelem ents of the unit bidiagonal factor \(U\) from the factorization \(A=U\) *D *U. If \(\mathbb{I} P L O=0\), the ( \(n-1\) ) subdiagonalelem ents of the unitbidiagonal factorL from the factorization \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L}\).

B (input/output)
On entry, the righthand side vectors \(B\) for the
system of linearequations. On exit, the solution
vectors, X .
LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

\[
C<-A L P H A \quad \text { op (A) B + BETA } C \quad C<-A L P H A D \text { op (A) B + BETA C }
\] \(C<-A L P H A \operatorname{Op}(A) D B+B E T A C\)
where A LPHA andBETA are scalar, \(C\) and \(B\) are \(m\) by \(n\) dense \(m\) atrices, \(D\) is a diagonalscaling \(m\) atrix, \(A\) is a unit, ornon-unit, upper or low er triangularm atrix represented in skyline form at and \(o p(A)\) is one of
```

op (A ) = inv (A ) or op (A ) = inv (A ) or op (A ) = inv (oonjg (A')).

``` (inv denotesm atrix inverse, 'indicatesm atrix transpose)

\section*{ARGUMENTS}

TRAN SA Indicates how to operate \(w\) th the sparse \(m\) atrix 0 : operate \(w\) ith \(m\) atrix
1 : operate w th transpose \(m\) atrix
2 : operate \(w\) th the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M \(\quad N\) um ber of row \(s\) in matrix A
\(N \quad N\) um berof colum \(n s\) in \(m\) atrix \(C\)

UN ITD Type of scaling:
1 : Identily \(m\) atrix (argum entD V [] is ignored)
2 : Scale on left (row scaling)
3 : Scale on right (colum \(n\) scaling)
4 :A utom atic row orcolum n scaling (see section N O TES for further details)

DV () A rray of length M containing the diagonalentries of the scaling diagonalm atrix D .

ALPHA Scalarparam eter
```

D ESCRA () D escriptor argum ent. Fi̇ve elem entinteger anay
DESCRA (1) m atrix structure
0 :general
1 : symm etric (A=A)
2:H erm itian (A = CON JG (A ))
3:Triangular
4 : Skew (A nti)-Symm etric (A=-A )
5 :D iagonal
6:Skew Herm itian (A= CON JG (A ) )
N ote: For the routine, D ESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) m ain diagonal type
0 :non-unit
1 :unit
DESCRA (4) A nay base $\mathbb{N} O T \mathbb{M}$ PLEM ENTED)
$0: C / C++$ com patible
1 :Fortran com patible
DESCRA (5) repeated indices? (NOT $\mathbb{M}$ PLEM ENTED)
0 : unknown
1 : no repeated indices

```

VAL () array contain the nonzeros ofA in skyline profile form .
Row -oriented ifD ESCRA (2) = 1 (low er triangular), colum n oriented ifD ESCRA (2) \(=2\) (upper triangular) .

PN TR () integer array of length \(M+1\) (low ertriangular) or
\(\mathrm{K}+1\) (upper triangular) such thatPN TR (I)-PN TR (1)+1 points to the location in VAL of the firstelem ent of the skyline profile in row (colum n) I.

B 0 rectangular anay w ith first dim ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter

C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC

W ORK () scratch amay of length LW ORK.
On exit, ifLW ORK \(=-1, W\) ORK (1) retums the optim um LW ORK.

LW ORK length ofW ORK array. LW ORK should be at leastM .

Forgood perform ance, LW O RK should generally be larger.

For optim um perform ance on \(m\) ultiple processors, LW ORK \(>=M\) *N _CPU S where N_CPUS is the m axim um num berof processors available to the program .

If LW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.

IfLW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

\section*{SEE ALSO}

\section*{NOTES /BUGS}
1.A lso notsupported:
a. low er triangularm atrix A ofsizem by n wherem \(>n\)
b. upper triangularm atrix \(A\) of size \(m\) by \(n\) where \(m<n\)
2. N o test for singularity ornear-singularity is included in this routine. Such tests m ust.be perform ed before calling this routine.
3. If U N ITD \(=4\), the routine scales the row s of \(A\) if \(D E S C R A(2)=1\) and the colum ns ofA if \(D E S C R A(2)=2\) such that their 2 -norm s are one. The scaling \(m\) ay im prove the accuracy of the com puted solution. C orresponding entries of V A L are changed only in this particular case. O n retum D V m atrix stored as a vector contains the diagonalm atrix by w hich the row \(s\) (colum ns) have been scaled. U N ITD = 2 if \(D E S C R A(2)=1\) and UN ITD \(=3\) if \(D E S C R A(2)=2\) should be used for the next calls to the routine \(w\) ith overw rilten \(V A L\) and \(D V\).

WORK \((1)=0\) on retum if the scaling has been com pleted successfully, otherw ise WORK (1) = -iw here i is the row (colum n) num berw hich 2 -norm is exactly zero.
4. If \(D E S C R A(3)=1\) and \(U \mathrm{~N}\) ITD \(<4\), the unit diagonalelem ents
\(m\) ightorm ightnotbe referenced in the SK Y representation of a sparse m atrix. They are not used anyw ay in these cases. ButifUN ITD = 4, the unit diagonalelem ents M U ST be referenced in the SK Y representation.
5.The routine can be applied for solving triangular system \(s\) w hen the upper or low er triangle of the general sparse \(m\) atrix \(A\) is used. H ow ever DESCRA (1) m ustbe equal to 3 in this case.

\section*{C INTERFACE}
\#include <sunperfh>
void zspsv (charuplo, intn, int nrhs, doublecom plex *ap, int *ipivot, doublecom plex *b, int ldl, int *info);
void zspsv_64 (charuplo, long n, long nrhs, doublecom plex *ap, long *ipivot, doublecom plex *b, long ldb, long *info);

\section*{PURPOSE}
zspsv com putes the solution to a com plex system of linear equations
\(A * X=B\), where \(A\) is an \(N\) boy \(-N\) symm etric \(m\) atrix stored in packed form at and X and B are N -by-N R H S m atrices.

The diagonalpivoting \(m\) ethod is used to factorA as
\(A=U * D * U * * T\), if \(U P L O=U\) ', or
\(A=L * D * L * * T\), if \(U P L O=L '\),
where U (orL) is a productofperm utation and unit upper
(low er) triangularm atrioes, D is sym \(m\) etric and block diagonalw th 1 boy-1 and 2 -by -2 diagonal blocks. The factored form of \(A\) is then used to solve the system of equations \(A\) * \(X=B\).

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}:\) Uppertriangle of \(A\) is stored;
= \(\mathrm{L}^{\prime}\) : Low er triangle of A is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix A. N >= 0 .

NRHS (input)
The num ber of righthand sides, ie., the num ber of colum ns of the m atrix B. NRH S >=0.

A P (input/output)
D ouble com plex aray, dim ension \(\left.\mathbb{N}^{*}(\mathbb{N}+1) / 2\right)\) On
entry, the upper or low ertriangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The jth column of \(A\) is stored in the array AP as follow s: if UPLO \(=U^{\prime}, A P(i+(j\) \(\left.1)^{\star} j 2\right)=A\left(i, 7\right.\) for \(1<=i<=j\) ifUPLO \(=L^{\prime}, A P(i\) \(+(j-1)^{\star}(2 n-j / 2)=A(i, j)\) for \(j=i<=n\). See below for furtherdetails.

On exit, the block diagonalm atrix D and the mul tipliers used to obtain the factor \(U\) orL from the factorization \(A=U * D * U * * T\) orA \(=L * D * L * * T\) as com puted by CSPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atasA.

IP IV O T (output)
Integer aray, dim ension \((\mathbb{N})\) D etails of the interchanges and the block structure of \(D\), as determ ined by \(C\) SPTRF. If \(\mathbb{P} \mathbb{I V O T}(k)>0\), then row \(S\) and colum nsk and \(\mathbb{P} \mathbb{I}\) OT \((k)\) w ere interchanged, and \(D(k, k)\) is a 1 -by -1 diagonalblock. If \(\mathrm{UPLO}=\mathrm{U}^{\prime}\) and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k-1)<0\), then row \(s\) and colum nsk-1 and - \(\mathbb{P} \mathbb{I V O T}(k)\) were interchanged and D ( \(k-1: k, k-1 k)\) is a 2 -by-2 diagonalblock. If \(\mathrm{UPLO}=\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V O T}(\mathrm{k})=\mathbb{P} \mathbb{I V O T}(\mathrm{k}+1)<0\), then row \(s\) and colum ns \(k+1\) and \(-\mathbb{P} \mathbb{I V} \circ T(k)\) were inter changed and \(D(k: k+1, k: k+1)\) is a \(2-b y-2\) diagonal block.

B (input/output)
D ouble complex array, dimension (LDB,NRHS) On entry, the N -by -N RH S righthand side m atrix B. On exit, if \(\mathbb{N ~ F O ~}=0\), the N -by-N R H S solution m atrix X .

LD B (input)
The leading dim ension of the aray B. LD B >= \(\max (1, N)\).
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum ent had an illegalvalue
\(>0\) : if \(\mathbb{N} F O=i, D(i, i)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{C INTERFACE}
\#include <sunperfh>
void zspsvx (char fact, charuplo, int n, int nrhs, doublecom plex *a, doublecom plex *af, int *ípivot, doublecom plex *b, intldb, doublecom plex *x, int \(l d x\), double *roond, double *ferr, double *berr, int*info);
void zspsvx_64 (char fact, char uplo, long n, long nrhs, doublecom plex *a, doublecom plex *af, long *ipívot, doublecom plex *b, long ldl, doublecom plex *x, long \(l d x\), double *roond, double *ferr, double *berr, long *info);

\section*{PURPOSE}
zspsvx uses the diagonalpivoting factorization \(A=U * D * U * * T\) or \(A=L * D * L * * T\) to com pute the solution to a com plex system of linear equations \(A * X=B\), where \(A\) is an \(N\) boy -N sym \(m\) etric \(m\) atrix stored in packed form atand \(X\) and \(B\) are \(N\)-byN R H S m atrioes.

Emorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to
factorA as
\(A=U * D * U * * T\), if \(U P L O=U\) ', or
\(A=L * D * L * * T\), if \(\mathrm{L} P \mathrm{LO}=\mathrm{L}\) ',
where \(U\) (orL) is a productofperm utation and unitupper (low er)
triangularm atrioes and \(D\) is sym \(m\) etric and block diagonal w ith

1 -by-1 and 2 -by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums \(w\) ith \(\mathbb{N N F O}=\) i. O therw ise, the factored form of \(A\) is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the reciprocal of the condition num ber is less than m achine precision,
\(\mathbb{N} \mathrm{FO}=\mathrm{N}+1\) is retumed as a w aming, but the routine stillgoes on
to solve for \(X\) and compute error bounds as described below.
3.The system ofequations is solved forX using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for 五.

\section*{ARGUMENTS}

\section*{FACT (input)}

Specifies w hether ornot the factored form of \(A\) has been supplied on entry \(.=F ':\) On entry, AF and \(\mathbb{P} \mathbb{I V O T}\) contain the factored form of A. A, AF and \(\mathbb{P} \mathbb{I V O T}\) w ill not be modified. = N : : The \(m\) atrix A w ill.be copied to A F and factored.
```

UPLO (input)

```
\(=\mathrm{U}\) ': Upper triangle ofA is stored;
\(=\mathrm{L}\) ': Low er triangle of A is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix A. N >=0.

NRHS (input)

The num ber of righthand sides, ie., the num ber of colum ns of the \(m\) atrices \(B\) and \(X . N R H S>=0\).

A (input) D ouble com plex array, dim ension \(\mathbb{N}^{*}(\mathbb{N}+1) / 2\) ) The upper or low er triangle of the sym \(m\) etric \(m\) atrix \(A\), packed colum nw ise in a linear array. The jth colum \(n\) of \(A\) is stored in the array \(A\) as follow \(s\) : ifUPLO \(=U^{\prime}, A(i+(j-1) * j 2)=A(i, j)\) for \(1<=i<=j\) if UPLO \(=L^{\prime}, A\left(i+(j-1)^{*}(2 * n-j) / 2\right)=\) A \((i, y)\) for \(j=i<=n\). See below for further details.

AF (input/output)
D ouble com plex array, dim ension \((\mathbb{N} *(\mathbb{N}+1) / 2\) ) If FACT \(=F^{\prime}\), then \(A F\) is an inputargum entand on entry contains the block diagonalm atrix D and the m ultipliers used to obtain the factor U or L from the factorization \(A=U * D * U * * T\) or \(A=L * D * L * * T\) as com puted by CSPTRF, stored as a packed triangular \(m\) atrix in the sam e storage form atas \(A\).

IfFACT = N ', then AF is an output argum ent and on exit contains the block diagonalm atrix \(D\) and the m ultipliers used to obtain the factor \(U\) or \(L\) from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by CSPTRF, stored as a packed triangularm atrix in the sam e storage form at as A.

PIVOT (inputoroutput)
Integer array, dim ension (N) IfFACT = \(\mathrm{F}^{\prime}\), then
\(\mathbb{P I V O T}\) is an inputargum entand on entry contains details of the interchanges and the block structure ofD, as determ ined by CSPTRF. If \(\mathbb{P} \mathbb{I V} O T(k)\) \(>0\), then row sand columnsk and \(\mathbb{P} \mathbb{I} O T(k)\) were interchanged and \(D(k, k)\) is a 1 -by- 1 diagonal
block. If UPLO \(=\mathrm{U}\) 'and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{V} O T(k-1)\) \(<0\), then row s and colum ns k-1 and - \(\mathbb{P} \mathbb{I V}\) O ( \(k\) ) w ere interchanged and \(D(k-1 k, k-1 k)\) is a \(2-b y-2\) diagonal block. If UPLO = L' and \(\mathbb{P} \mathbb{I V O T}(k)=\) \(\mathbb{P I V O T}(k+1)<0\), then row \(s\) and colum ns \(k+1\) and \(-\mathbb{P} \mathbb{I V O T}(k)\) were interchanged and \(D(k \cdot k+1, k \cdot k+1)\) is a 2-by-2 diagonalblock.

IfFACT = \(N\) ', then \(\mathbb{P I V O T}\) is an output argum ent and on exit contains details of the interchanges and the block structure of D, as determ ined by CSPTRF.

B (input) D ouble com plex aray, dim ension (LD B NRHS) The N by -N RH \(S\) righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (output)
D ouble com plex array, dim ension (LD X ,NRHS) If \(\mathbb{N}\) FO
\(=0\) or \(\mathbb{N} F O=N+1\), the N boy \(-\mathrm{NRH} S\) solution \(m\) atrix
X .

LD X (input)
The leading dim ension of the aray X. LD X >= \(\max (1, N)\).
RCOND (output)
The estim ate of the reciprocal condition num ber of
the matrix A. IfRCOND is less than the m achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to \(w\) orking precision. This condition is indicated by a retum code of \(\mathbb{N N F O ~ > ~}\) 0 .

FERR (output)
D ouble complex array, dimension \((\mathbb{N} H S\) ) The estim ated forw ard error bound foreach solution vectorX ( 7 ) (the \(j\) th colum \(n\) of the solution \(m\) atrix \(X)\). If XTRUE is the true solution corresponding to \(X(\mathcal{I}), \operatorname{FERR}(\mathcal{I})\) is an estim ated upper bound for the \(m\) agnitude of the largestele\(m\) entin ( \(X(\mathcal{)})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largest elem entin \(X\) ( 1 ). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

D ouble com plex array, dim ension \((\mathbb{N}\) RHS) The componentw ise relative backw ard emor of each solution vector X (i) (ie., the sm allest relative change in any elem entof \(A\) orB thatm akes \(X\) ( \()\) an exactsolution).

W ORK (w orkspace)
D ouble com plex array, dim ension (2*N )

W ORK2 (w orkspace)
Integer amay, dim ension \((\mathbb{N})\)

INFO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue
\(>0\) : if \(\mathbb{N F O}=\mathrm{i}\), and i is
\(<=\mathrm{N}: \mathrm{D}(i, i)\) is exactly zero. The factorization has been com pleted but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : D is nonsingular, butRCOND is less than \(m\) achine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. \(N\) evertheless, the solution and error bounds are com puted because there are a num ber of situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{FURTHER DETAILS}

The packed storage schem e is illustrated by the follow ing exam plew hen \(N=4, U P L O=U\) ':

Tw o-dim ensional storage of the sym m etric m atrix A :
```

a11 a12 a13 a14
a22 a23 a24
a33 a34 (aij= aj̈)
a44

```

Packed storage of the upper triangle ofA :
\(A=[a 11, a 12, a 22, a 13, a 23, a 33, a 14, a 24, a 34, a 44]\)

\section*{PURPOSE}
zsptres solves a system of linearequations \(A * X=B\) w th a com plex sym \(m\) etric \(m\) atrix A stored in packed form at using the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) com puted by ZSPTRF.

\section*{ARGUMENTS}

UPLO (input)
Specifies w hether the details of the factorization
are stored as an upper or low er triangularm atrix.
\(=\mathrm{U}\) ': U ppertriangular, form is \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\);
= L': Low ertriangular, form is \(\mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\).
N (input) The order of the m atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS >=0.

AP (input)
D ouble com plex array, dim ension \((\mathbb{N} * \mathbb{N}+1) / 2\) ) The block diagonal \(m\) atrix \(D\) and the \(m\) ultipliers used to obtain the factorU orL as com puted by ZSPTRF, stored as a packed triangularm atrix.
\(\mathbb{P I V O T}\) (input)
Integer anay, dim ension \(\mathbb{N}\) ) D etails of the interchanges and the block structure ofD as determ ined
by ZSPTRF.

B (input/output)
D ouble complex array, dimension (LDB,NRHS) On
entry, the right hand side \(m\) atrix \(B\). On exit, the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue

\section*{PURPOSE}
zstedc com putes alleigenvalues and, optionally, eigenvectors of a sym \(m\) etric tridiagonalm atrix using the divide and conquerm ethod. The eigenvectors of a fullorband com plex Herm itian matrix can also be found ifCHETRD orCHPTRD or CHBTRD has been used to reduce this \(m\) atrix to tridiagonal form.

This code \(m\) akes very \(m\) ild assum ptions about floating point arithm etic. It \(w\) illw ork on \(m\) achines \(w\) ith a guard digitin add/subtract, oron those binary \(m\) achines \(w\) thout guard digits which subtract like the C ray \(\mathrm{X}-\mathrm{M}\) P , C ray Y M P , C ray \(\mathrm{C}-90\), or C ray-2. Itcould conceivably fail on hexadecim al or decim al \(m\) achines \(w\) thout guard digits, butw e know of none. See SLA ED 3 for details.

\section*{ARGUMENTS}

COMPZ (input)
\(=\mathrm{N}^{\prime}:\) C om pute eigenvalues only .
= I': C om pute eigenvectors of tridiagonalm atrix
also.
\(=\mathrm{V}:\) C om pute eigenvectors of original H erm itian
\(m\) atrix also. On entry, \(Z\) contains the unitary
\(m\) atrix used to reduce the originalm atrix to tridiagonal form .

N (input) The dim ension of the sym \(m\) etric tridiagonalm atrix. \(\mathrm{N}>=0\).

D (input/output)
O n entry, the diagonalelem ents of the tridiagonal m atrix. On exit, if \(\mathbb{N} F O=0\), the eigenvalues in ascending order.

E (input/output)
O n entry, the subdiagonalelem ents of the tridiagonalm atrix. On exit, E has been destroyed.

Z (input) \(O n\) entry, if COMPZ \(=V\) ', then \(Z\) contains the unitary m atrix used in the reduction to tridiagonalform. On exit, if \(\mathbb{N F O}=0\), then if \(C O M P Z=\) V', Z contains the orthonorm aleigenvectors of the original H erm itian m atrix, and if \(\mathrm{COMPZ}=\mathrm{I}\) ', Z contains the orthonorm al eigenvectors of the sym m etric tridiagonalm atrix. If COMPZ \(=\mathrm{N}^{\prime}\) ', then Z is not referenced.

LD Z (input)
The leading din ension of the array Z . LD \(\mathrm{Z}>=1\). If eigenvectors are desired, then LD Z \(>=\mathrm{max}(1, \mathrm{~N})\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array W ORK. IfCOM PZ \(=\mathrm{N}^{\prime}\) or 'I', orN <=1,LW ORK mustbe at least1. If
COM PZ \(=V\) 'and \(N>1\), LW ORK m ust.be at least \(N * N\).

IfLW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of
theW ORK anray, retums this value as the first
entry of the W ORK array, and no errorm essage
related to LW ORK is issued by X ERBLA.

RW ORK (w orkspace)
dim ension (LRW ORK) On exit, if \(\mathbb{N} F O=0\), RW ORK (1) retums the optim allRW ORK .

LRW ORK (input)
The dim ension of the array RW ORK. IfCOMPZ \(=N^{\prime}\) or \(\mathrm{N}<=1\), LRW ORK mustbe at least1. IfCOMPZ \(=\)

V'and \(\mathrm{N}>1\),LRW ORK m ustbe atleast1 \(+3 * \mathrm{~N}+\) \(2 * N * \lg +3 * N * * 2\), where \(\lg (N)=s m\) allest integerk such that \(2 \star * \mathrm{k}>=\mathrm{N}\). IfCOM PZ \(=\) I'and \(\mathrm{N}>1\),LRW ORK mustbe at least \(1+4 * N+2 * N * * 2\).

If LRW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim al size of the RW ORK array, retums this value as the first entry of the RW ORK amay, and no emorm essage related to LRW ORK is issued by XERBLA.

IV ORK (w orkspace/output)
On exit, if \(\mathbb{N} F O=0, \mathbb{I W}\) ORK (1) retums the optim al LIW ORK.

LIW ORK (input)
The dim ension of the anay \(\mathbb{I W}\) ORK. IfCOMPZ \(=\mathrm{N}^{\prime}\) or \(\mathrm{N}<=1\), LIW ORK m ustbe at least1. IfCOMPZ \(=\) V 'orN > 1, LIW ORK mustbe at least \(6+6 * N+\) \(5 * N * \operatorname{N}\). IfCOMPZ = I'orN \(>1\), LIV ORK must be at least \(3+5 * N\).

IfLIW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK aray, and no errorm essage related to \(L \mathbb{I W} O R K\) is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit.
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue.
\(>0\) : The algorithm failed to com pute an eigenvalue while w orking on the subm atrix lying in row S and colum ns \(\mathbb{N}\) FO \(/ \mathbb{N}+1\) ) through \(m o d(\mathbb{N}\) FO, \(\mathbb{N}+1)\).

\section*{PURPOSE}
zstegrb) C om pute the eigenvalues, lam bda_j of L_i D_i L_i^T to high relative accuracy by the dqds algorithm,
(c) If there is a cluster of close eigenvalues, "choose"
sigm a_i
close to the cluster, and go to step (a),
(d) G iven the approxim ate eigenvalue lam boda_jofL_i D _i L_i^T,
com pute the corresponding eigenvectorby form ing a rank-revealing tw isted factorization.
The desired accuracy of the output can be specified by the inputparam eterA BSTOL.

Form ore details, see "A new O ( \(n^{\wedge} 2\) ) algorithm for the sym \(m\) etric tridiagonal eigenvahue/eigenvector problem ", by Inder吕D hillon, C om puterScience D ìvision TechnicalR eport N o. U CB C SD -97-971, U C Berkeley, M ay 1997.

N ote 1 : Cumently CSTEGR is only setup to find ALL the \(n\) eigenvalues and eigenvectors of \(T\) in \(O\left(n^{\wedge} 2\right)\) tim e

N ote 2 : Currently the routine CSTE \(\mathbb{N}\) is called when an appropriate sigm a_i cannot be chosen in step (c) above. CSTE IN invokesm odified G ram -Schm idt when eigenvalues are close.
N ote 3 : C STEGR w orks only on \(m\) achines \(w\) hich follow ieee-754 floating-point standard in their handling of infinities and N aN s. N orm alexecution of CSTEGR m ay create N aN s and infinities and hence \(m\) ay abortdue to a floating pointexception in environm ents w hich do notconform to the ieee standard.

\section*{ARGUMENTS}

JO B Z (input)
\(=\mathrm{N}:\) : Com pute eigenvalues only;
\(=\mathrm{V}^{\prime}:\) C om pute eigenvalues and eigenvectors.
RANGE (input)
= A ': alleigenvalues w illbe found.
\(=\mathrm{V}\) : alleigenvalues in the half-open interval (VL, VU ] w ill be found. = I': the II th through \(\mathbb{I U}\) th eigenvalues w illbe found.

N (input) The order of the m atrix. \(\mathrm{N}>=0\).

D (input/output)
O n entry, the \(n\) diagonalelem ents of the tridiagonalm atrix T.On exit, D is overw rilten.

E (input/output)
O \(n\) entry, the \((n-1)\) subdiagonal elem ents of the tridiagonal \(m\) atrix \(T\) in elem ents 1 to \(N-1\) of \(E\);
\(E(\mathbb{N})\) need notbe set. On exit, \(E\) is overw rilten.

VL (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. VL < V U . N ot referenced ifRANGE = A 'or I'.

VU (input)
IfRANGE=V', the low er and upper bounds of the interval to be searched foreigenvalues. \(\mathrm{VL}<\mathrm{VU}\). N ot referenced ifRANGE=A 'or 'I'.

II (input)
IfRA N G E = ' 1 ', the indiges (in ascending order) of the smallest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=N\), if \(N>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N otreferenced ifRANGE \(=\) A'or V'.

IU (input)
IfRA N G E = I', the indices (in ascending order) of the sm allest and largest eigenvalues to be retumed. \(1<=\mathbb{L}<=\mathbb{U}<=\mathrm{N}\), if \(\mathrm{N}>0\); \(\mathbb{L}=1\) and \(\mathbb{U}=0\) if \(\mathrm{N}=0\). N ot referenced ifRANGE= A 'or V'.

ABSTOL (input)
The absolute enror tolerance for the eigenvalues/eigenvectors. \(\mathbb{F} J O B Z=V^{\prime}\) ', the eigenvalues and eigenvectors output have residual norms bounded by ABSTOL, and the dotproducts betw een different eigenvectors are bounded by ABSTOL. If ABSTOL is less than N *EPS*| \(\mid\), then \(\mathrm{N} * E P S *|T| w\) ill be used in its place, w here EPS is the \(m\) achine precision and \(F \mid\) is the 1 -norm of the tridiagonalm atrix. The eigenvalues are com puted to an accuracy ofEPS* \(\mid\) |imespective of A BSTOL. If high relative accuracy is im portant, setA BSTO L to DLAMCH (Safem inim um '). See Barlow and Dem m el "C om puting A ccurate Eigensystem s of Scaled D iagonally D om inantM atrices", LA PA CK W orking N ote \#7 for a discussion of \(w\) hich \(m\) atrioes define their eigenvalues to high relative accuracy.

M (output)
The total num ber ofeigenvalues found. \(0<=\mathrm{M}\) <= N. IfRANGE = \(A\) ', \(M=N\), and ifRANGE = \(\mathrm{I}^{\prime}, \mathrm{M}=\) \(\mathbb{U}-\mathbb{I}+1\).

W (output)
The firstM elem ents contain the selected eigenvalues in ascending order.
\(Z\) (input) If \(\mathcal{O B Z}=\mathrm{V}^{\prime}\), then if \(\mathbb{N F O}=0\), the first M colum ns of \(Z\) contain the orthonorm aleigenvectors of them atrix T corresponding to the selected eigenvalues, w ith the i-th colum n of Z holding the eigenvector associated with W (i). If \(\mathrm{JOBZ}=\mathrm{N}\) ', then \(Z\) is not referenced. N ote: the userm ust ensure that at leastm ax ( \(1, \mathrm{M}\) ) colum ns are supplied in the array \(Z\); ifRANGE = V', the exact value of \(M\) is not know \(n\) in advance and an upperbound \(m\) ust be used.

LD Z (input)
The leading \(d i m\) ension of the array \(Z . L D Z>=1\), and if \(\mathrm{JOBZ}=\mathrm{V}\) ', LD Z >= \(\mathrm{max}(1, \mathrm{~N})\).

\section*{ISU PPZ (output)}

The support of the eigenvectors in \(Z\), i.e., the indices indicating the nonzero elem ents in Z . The i-th eigenvector is nonzero only in elem ents ISU PPZ ( \(2 * i-1\) ) through ISU PPZ (2*i).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK ( 1 ) retums the optim al (and minim al) LW ORK .

LW ORK (input)
The dim ension of the array W ORK. LW ORK >= \(\max (1,18 * N)\)

IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK aray, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{I W}\) ORK (w orkspace/output)
On exit, if \(\mathbb{N}\) FO \(=0, \mathbb{I W}\) ORK (1) retums the optim al LIW ORK.

LIV ORK (input)
The dim ension of the array \(\mathbb{I W}\) ORK. L \(\mathbb{I W}\) ORK >= \(\max (1,10 * N)\)

IfLIW ORK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W}\) ORK aray, and no errorm essage related to LIW ORK is issued by XERBLA .
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the i-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=1\), intemalerror in \(S L A R R E\), if \(\mathbb{N} F O=2\), intemalemor in CLARRV.

\section*{PURPOSE}
zstein com putes the eigenvectors of a realsym \(m\) etric tridiagonal \(m\) atrix \(T\) corresponding to specified eigenvahues, using inverse iteration.

Them axim um num ber of terations allow ed for each eigenvector is specified by an intemalparam eterM A X ITS (currently set to 5).

A though the eigenvectors are real, they are stored in a com plex array, which m ay be passed to CUNM TR orCUPM TR for back transform ation to the eigenvectors of a com plex H erm itian \(m\) atrix w hich \(w\) as reduced to tridiagonal form .

\section*{ARGUMENTS}

N (input) The order of the m atrix. \(\mathrm{N}>=0\).

D (input) The \(n\) diagonalelem ents of the tridiagonal \(m\) atrix T.

E (input) The ( \(\mathrm{n}-1\) ) subdiagonalelem ents of the tridiagonal \(m\) atrix \(T\), stored in elem ents 1 to \(N-1 ; E(\mathbb{N})\) need notbe set.

M (input) The num ber of eigenvectors to be found. \(0<=\mathrm{M}<=\) N .

W (input) The firstM elem ents of \(W\) contain the eigenvalues for which eigenvectors are to be com puted. The eigenvalues should be grouped by split-off block and ordered from sm allest to largestw ithin the block. (The output anay \(W\) from SSTEBZ w ith ORDER = B'is expected here.)

IBLOCK (input)
The subm atrix indices associated \(w\) ith the corresponding eigenvalues in W ; \(\mathbb{B L O C K}(i)=1\) if eigenvalueW (i) belongs to the first subm atrix from the top, \(=2\) ifW (i) belongs to the second subm atrix, etc. (The output array \(\mathbb{B L O C K}\) from SSTEBZ is expected here.)

ISPLIT (input)
The splilting points, atw hich \(T\) breaks up into subm atrices. The first subm atrix consists of row s/columns 1 to ISPLIT ( 1 ), the second of row s/colum ns ISPLIT ( 1 ) +1 through ISPLIT (2), etc. (The outputarray ISPLIT from SSTEBZ is expected here.)

\section*{Z (output)}

The com puted eigenvectors. The eigenvector associated w ith the eigenvalue W (i) is stored in the \(i-t h\) colum \(n\) of \(Z\). A ny vectorw hich fails to converge is set to its cument iterate afterM AXITS terations. The im aginary parts of the eigenvectors are set to zero.

\section*{LD Z (input)}

The leading dim ension of the aray \(Z\). LD \(Z \quad>=\) \(\max (1, N)\).

W ORK (w orkspace)
dim ension ( \(5 * \mathrm{~N}\) )
IN ORK (w orkspace)
dim ension (N)

IFA II (output)
On norm alexit, allelem ents of \(\mathbb{F} A \mathbb{I}\) are zero.
If one orm ore eigenvectors fail to converge after
M AX ITS iterations, then their indices are stored
in array \(\mathbb{F A} \mathbb{I}\).
\(\mathbb{N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an ille-
galvalue
\(>0:\) if \(\mathbb{N F O}=i\), then \(i\) eigenvectors failed to converge in M AXITS terations. Their indioes are stored in array \(\mathbb{F A} \mathbb{I I}\).

\({ }^{*} \mathrm{c}\), int ldc);
void zsym m _64 (char side, char uplo, long m , long n, doublecomplex *alpha, doublecom plex *a, long lda, doublecom plex *b, long ldlb, doublecom plex *beta, doublecom plex *c, long ldc);

\section*{PURPOSE}
zsymm perform sone of the \(m\) atrix \(m\) atrix operations \(C:=\) alpha*A *B + beta*C orC \(:=\) alpha*B*A + beta*C where alpha and beta are scalars, \(A\) is a sym \(m\) etric \(m\) atrix and \(B\) and \(C\) are \(m\) by \(n m\) atrices.

\section*{ARGUMENTS}

SID E (input)
On entry, SIDE specifies w hether the sym m etric \(m\) atrix A appears on the leftorright in the operation as follow s:
\(S \mathbb{D} E=\) L'or \(\mathrm{I}^{\prime} \mathrm{C}:=\) alpha*A *B + beta*C,
\(S D E=R\) 'or 'r' \(C:=\) alpha*B *A + beta* \(C\),

U nchanged on exit.

UPLO (input)
On entry, UPLO specifies whether the upper
or lower triangular part of the symm etric
\(m\) atrix \(A\) is to be referenced as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or L ' Only the upper triangularpart of the sym \(m\) etric \(m\) atrix is to be referenced.

UPLO = 'L 'or I' O nly the low er triangularpart
of the sym \(m\) etric \(m\) atrix is to be referenced.

U nchanged on exit.

M (input)
O n entry, M specifies the num ber of row s of the \(m\) atrix \(C . M>=0\). Unchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of the m atrix \(\mathrm{C} . \mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha. U nchanged on exit.

A (input)
COM PLEX *16 aray ofD \(\mathbb{M} E N S I O N\) (LDA, ka ), where ka ism when \(S \mathbb{D} E=\mathrm{L}\) 'or \(\mathrm{I}^{\prime}\) and is n otherw ise.

Before entry w ith \(S \mathbb{D E}=\mathrm{L}\) 'or \({ }^{2}\) ', the \(m\) by \(m\) part of the aray A m ustcontain the sym \(m\) etric \(m\) atrix, such thatw hen \(U P L O=U\) 'or \(L^{\prime}\), the leading \(m\) by \(m\) uppertriangularpart of the array A m ust contain the upper triangular part of the symm etricm atrix and the strictly lower triangularpart of \(A\) is not referenced, and when UPLO = L' or I', the leading m by m low ertriangularpart of the array A m ust contain the low er triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangular part of A is notreferenced.

Before entry with \(S \mathbb{D E}=\mathrm{R}\) 'or \(\mathrm{r}^{\prime}\) ', the n by \(n\) part of the aray A mustcontain the sym \(m\) etric \(m\) atrix, such thatw hen \(U P L O=U\) 'or 4 ', the leading \(n\) by \(n\) uppertriangularpart of the array A m ust contain the upper triangular part of the symm etricm atrix and the strictly lower triangularpart of \(A\) is not referenced, and \(w\) hen \(\mathrm{UPLO}=\mathrm{L}\) ' or I ', the leading n by n low er triangularpart of the array A must contain the lower triangular part of the sym \(m\) etric \(m\) atrix and the strictly upper triangular part of A is notreferenced.

U nchanged on exit.

LD A (input)

O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen SDE = L'or I' then LD A >= max ( \(1, \mathrm{~m}\) ), otherw ise LD \(\mathrm{A}>=\max (1, \mathrm{n})\). U nchanged on exit.

B (input)
COM PLEX *16 array ofD \(\mathbb{M}\) ENSION (LD B, n). Before
entry, the leading \(m\) by \(n\) part of the amay \(B\)
\(m\) ust contain the \(m\) atrix \(B\). Unchanged on exit.

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. LD \(B>=m a x(1, m)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. W hen BETA is supplied as zero then C need notbe set on input. U nchanged on exit.

C (input/output)
COM PLEX *16 aray ofD \(\mathbb{I M} E N S I O N(L D C, n)\). Before entry, the leading \(m\) by \(n\) partof the array \(C\) \(m\) ustcontain the \(m\) atrix \(C\), exceptw hen beta is zero, in which case \(C\) need notbe seton entry. On exit, the array \(C\) is overw ritten by the \(m\) by \(n\) updated \(m\) atrix.

LD C (input)
On entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C \(>=\max (1, m)\). U nchanged on exit.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whether the upper or lower triangular part of the array \(C\) is to be referenced as follow s:

UPLO = U'or L' Only the upper triangular partof \(C\) is to be referenced.

UPLO = L'or I' Only the lower triangular partof \(C\) is to be referenced.

U nchanged on exit.

TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} \quad C:=\) alpha*A* \(B^{\prime}+\) alpha*B*A ' + beta* \({ }^{*}\).

TRANSA \(=T^{\prime}\) or t' \(^{\prime}=\) alpha*A *B + alpha*B*A + beta*C.

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{N}\) TERFACE.

N (input)
O n entry, \(N\) specifies the order of the m atrix C. N m ust.be at least zero. U nchanged on exit.

K (input)
On entry w ith TRANSA \(=N\) 'or \(h\) ', \(K\) specifies the num ber of colum ns of the \(m\) atrioes \(A\) and \(B\), and on entry w th TRANSA \(=\) T' or \(t^{\prime}, \mathrm{K}\) specifies the num ber of row s of the m atriges A and B. K m ustbe at least zero. U nchanged on exit.

ALPHA (input)
On entry, ALPHA specifies the scalar alpha.
U nchanged on exit.

A (input)
COM PLEX *16 aray ofD \(\mathbb{I M} E N S I O N\) (LDA, ka ), where ka isk when TRANSA = N 'or h', and is n otherw ise. Before entry w ith \(\mathrm{TRANSA}=\mathrm{N}^{\prime}\) or
h', the leading \(n\) by k partof the amay A
\(m\) ustcontain the \(m\) atrix \(A\), otherw ise the leading k by n partof the amay \(A\) mustcontain the \(m\) atrix A. U nchanged on exit.

LDA (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen TRANSA \(=\mathrm{N}\) 'or h 'then LDA must be at least \(\max (1, n)\), otherw ise LD A m ustbe at least \(\max (1, k)\). U nchanged on exit.

B (input)
COM PLEX *16 aray ofD \(\mathbb{M}\) ENSION (LD B, kb ) , where kb isk when TRANSA = N 'or h', and is
n otherw ise. Before entry w ith \(\mathrm{TRANSA}=\mathrm{N}^{\prime}\) or
h ', the leading n by k partof the amay \(B\) \(m\) ustcontain the \(m\) atrix \(B\), otherw ise the leading k by n part of the aray \(B \mathrm{~m}\) ustcontain the \(m\) atrix \(B\). Unchanged on exit.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling (sub) program. \(W\) hen TRANSA \(=N\) 'or \(h\) 'then LDB must be at least \(\max (1, n)\), otherw ise LD B m ustbe at least \(\max (1, k)\). U nchanged on exit.

BETA (input)
On entry, BETA specifies the scalar beta. U nchanged on exit.
C (input/output)
COM PLEX *16 aray ofD \(\mathbb{M} E N S I O N\) (LD C , n ) .

Before entry w th UPLO = U 'or L ', the leading \(n\) by \(n\) upper triangular part of the array \(C\) \(m\) ustcontain the upper triangular part of the sym \(m\) etric \(m\) atrix and the strictly low ertriangularpartof C is not referenced. On exit, the upper triangularpart of the array \(C\) is overw ritten by the upper triangularpart of the updated \(m\) atrix.

Before entry w ith UPLO = L'or I', the leading \(n\) by \(n\) low er triangular part of the array \(C\) \(m\) ust contain the low er triangular part of the symm etric \(m\) atrix and the strictly upper triangularpartof C is not referenced. On exit, the low er triangularpart of the amay \(C\) is overw ritten by the low er triangularpart of the updated \(m\) atrix.

LD C (input)
O n entry, LD C specifies the firstdim ension of C as declared in the calling (sub) program.
LD C must be at leastm ax ( \(1, \mathrm{n}\) ). U nchanged on exit.

zsyrfs im proves the com puted solution to a system of linear equations when the coefficientm atrix is sym \(m\) etric indefinite, and provides errorbounds and backw ard error estim ates forthe solution.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= LL': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber
of colum ns of the \(m\) atrices \(B\) and \(X . N R H S>=0\).

A (input) The symm etric m atrix A. IfUPLO = U', the leading N -by -N uppertriangularpartofA contains the upper triangularpart of the \(m\) atrix \(A\), and the strictly low ertriangularpant of A is notreferenced. IfUPLO = L', the leading N -oy N lower triangularpart ofA contains the low er triangular part of them atrix A, and the strictly upper triangularpart of A is notreferenced.

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).
AF (input)
The factored form of them atrix A. AF contains the block diagonal \(m\) atrix D and the m ultipliers used to obtain the factorU orL from the factorization \(A=U * D * U * * T\) or \(A=L * D * L * * T\) as com puted by CSYTRF.

LD AF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

IPIVOT (input)
D etails of the interchanges and the block structure ofD as determ ined by CSY TRF .
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).

X (input/output)
O n entry, the solution \(m\) atrix \(X\), as com puted by CSY TRS. On exit, the im proved solution m atrix X .

LD X (input)
The leading dim ension of the array \(\mathrm{X} . \mathrm{LDX}>=\) \(\max (1, N)\).

\section*{FERR (output)}

The estim ated forw ard errorbound for each solution vector \(X(7)\) (the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution comesponding to \(X(\mathcal{i}), \operatorname{FERR}(\mathcal{)}\) is an estim ated upperbound forthe \(m\) agnitude of the largest ele\(m\) entin (X ( \()\)-X TRUE) divided by the m agnitude of the largestelem entin X ( 7 ). The estim ate is as
reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)
The com ponentw ise relative backw ard error of each solution vectorX ( \(j\) ) (ie., the sm allest relative change in any elem entof \(A\) or \(B\) thatm akes \(X(\mathcal{J})\) an exactsolution).

W ORK (w orkspace)

\section*{C INTERFACE}
\#include <sunperfh>
void zsysv (charuplo, intn, intnrhs, doublecom plex *a, int lda, int *ípívot, doublecom plex *b, int ldb, int *info);
void zsysv_64 (charuplo, long n, long nrhs, doublecom plex
*a, long lda, long *ípívot, doublecom plex *b, long ldlo, long *info);

\section*{PURPOSE}
zsysv com putes the solution to a com plex system of linear equations
\(A\) * \(X=B\), where \(A\) is an \(N\)-by-N symm etric \(m\) atrix and \(X\) and \(B\) are N -by-N RH S m atrices.

The diagonal pivoting \(m\) ethod is used to factorA as
\[
\begin{aligned}
& A=U * D * U * * T, \text { if } U P L O=U \prime \text {, or } \\
& A=L * D * L * * T, \text { if } U P L O=L \prime
\end{aligned}
\]
where \(U\) (orL) is a product of perm utation and unit upper (low er) triangular \(m\) atrioes, and \(D\) is sym \(m\) etric and block diagonalw ith 1 -by-1 and 2 -by- 2 diagonalblocks. The factored form of \(A\) is then used to solve the system of equations \(A * X=B\).

\section*{ARGUMENTS}

\section*{UPLO (input)}
= U :: U pper triangle ofA is stored;
\(=\mathrm{L}\) ': Low er triangle of A is stored.

N (input) The num ber of linearequations, i.e., the order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colm ns of them atrix B. NRHS \(>=0\).

A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading N -by -N uppertriangularpartofA contains the uppertriangular part of the \(m\) atrix \(A\), and the strictly low ertriangularpartofA is not referenced. If UPLO = L', the leading N -by-N low er triangularpart of A contains the low ertriangularpartof the m atrix A, and the strictly upper triangular part of A is not referenced.

On exit, if \(\mathbb{N F O}=0\), the block diagonalm atrix \(D\) and the \(m\) ultipliers used to obtain the factor \(U\) or L from the factorization \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T}\) or \(\mathrm{A}=\) \(\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}\) as com puted by CSY TRF.
LDA (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

IP IV (output)
D etails of the interchanges and the block structure ofD , as determ ined by CSY TRF. If IP IV (k) > 0 , then row \(s\) and colum ns \(k\) and \(\mathbb{P}\) IV ( \(k\) ) were interchanged, and \(\mathrm{D}(\mathrm{k}, \mathrm{k})\) is a 1-by-1 diagonalblock. If UPLO \(=U\) 'and \(\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I}(k-1)<0\), then row s and columns \(k-1\) and \(-\mathbb{P} \mathbb{I V}(k)\) were interchanged and \(D(k-1 k, k-1 k)\) is a \(2-b y-2\) diagonal block. IfU PLO = L'and \(\mathbb{P} \mathbb{I V}(k)=\mathbb{P} \mathbb{I}(k+1)<0\), then row \(s\) and \(c o l u m n s k+1\) and \(-\mathbb{P} \mathbb{I V}(k)\) w ere interchanged and \(\mathrm{D}(\mathrm{k} k+1, \mathrm{k} k+1)\) is a 2 -by-2 diagonal block.

B (input/output)
On entry, the N -by-NRH \(S\) righthand side \(m\) atrix \(B\). On exi, if \(\mathbb{N} F O=0\), the \(N\) by \(N\) RH solution \(m\) atrix X.

LD B (input)
The leading dim ension of the anay B . LD B >= max ( \(1, \mathbb{N}\) ).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, \mathrm{~W} O R K(1)\) retums the optim al LW ORK.

LW ORK (input)
The length ofW ORK. LW ORK >=1, and forbestperform ance LW ORK \(>=N * N B\), where \(N B\) is the optim al blocksize forC SY TRF.

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0:\) if \(\mathbb{N F O}=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N} F O=\mathrm{i}, \mathrm{D}(i, i)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, so the solution could notbe com puted.

\section*{C INTERFACE}
\#include <sunperfh>
void zsysvx (char fact, char uplo, int n, int nins, doublecom plex *a, int lda, doublecom plex *af, int ldaf, int *ipivot, doublecom plex *b, int ldb, doublecom plex *x, intldx, double *rcond, double * ferr, double *berr, int *info);
void zsysvx_64 (char fact, char uplo, long n, long nrhs, doublecom plex *a, long lda, doublecom plex *af, long ldaf, long *ipivot, doublecom plex *b, long ldb, doublecom plex *x, long ldx, double *roond, double * ferr, double *berr, long *info);

\section*{PURPOSE}
zsysvx uses the diagonalpivoting factorization to com pute the solution to a com plex system of linear equations \(A * X=\) \(B\), where \(A\) is an \(N\) boy \(N\) sym \(m\) etric \(m\) atrix and \(X\) and \(B\) are \(N-\) by-N R H S m atrices.

E rrorbounds on the solution and a condition estim ate are also provided.

The follow ing steps are perform ed:
1. IfFACT \(=N\) ', the diagonalpivoting \(m\) ethod is used to
factorA.
The form of the factorization is
\[
\begin{aligned}
& A=U * D * U * * T, \text { if } U P L O=U ' \text {, or } \\
& A=L * D * L * * T, \text { if } U P L O=L \prime
\end{aligned}
\]
where \(U\) (orL) is a product of perm utation and unit upper (low er)
triangularm atrices, and \(D\) is sym \(m\) etric and block diagonalw th
1-by-1 and 2-by-2 diagonalblocks.
2. If som eD \((i, i)=0\), so thatD is exactly singular, then the routine
retums with \(\mathbb{I N} F O=\) i. O therw ise, the factored form of A is used
to estim ate the condition num ber of the \(m\) atrix \(A\). If the
reciprocal of the condition num ber is less than \(m\) achine precision,
\(\mathbb{N} F O=N+1\) is retumed as a waming, but the routine stillgoes on
to solve for \(X\) and com pute enror bounds as described below .
3.The system ofequations is solved for \(X\) using the factored form of A.
4. Iterative refinem ent is applied to im prove the com puted solution
\(m\) atrix and calculate error bounds and backw ard error estim ates
for it.

\section*{ARGUMENTS}

FACT (input)
Specifies w hether ornot the factored form of A has been supplied on entry. = F ': On entry, A F and \(\mathbb{P}\) IV OT contain the factored form of A. A, AF and \(\mathbb{P} \mathbb{V O T}\) will not be modified. = N : The \(m\) atrix A w illlbe copied to A F and factored.

UPLO (input)
= U :: U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The num ber of linearequations, ie., the order of them atrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the m atriges B and X . NRHS \(>=0\).

A (input) The symm etric matrix A. IfUPLO = U', the leading N -by -N uppertriangularpart of A contains the uppertriangularpart of the \(m\) atrix \(A\), and the strictly low ertriangularpart of A is notreferenced. IfUPLO = L', the leading N -by-N lower triangularpart ofA contains the low er triangular part of the m atrix A, and the strictly upper triangularpart ofA is notreferenced.

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).
AF (input/output)
IfFACT \(=F^{\prime}\), then \(A F\) is an inputargum entand on entry contains the block diagonalm atrix \(D\) and the m ultipliers used to obtain the factor U orL from the factorization \(A=U * D * U * * T\) or \(A=L * D * L * * T\) as com puted by C SY TRF .

IfFACT \(=N\) ', then \(A F\) is an output argum ent and on exit retums the block diagonalm atrix D and the m ultipliers used to obtain the factorU or L from the factorization \(A=U * D * U * * T\) or \(A=\) L*D*L**T.

LDAF (input)
The leading dim ension of the array AF. LDAF >= \(\max (1, N)\).

IPIVOT (inputoroutput)
IfFACT = \(\mathrm{F}^{\prime}\), then \(\mathbb{P} \mathbb{I V O T}\) is an input argum ent and on entry contains details of the interchanges and the block structure of D , as determ ined by CSY TRF. If \(\mathbb{P} \mathbb{I V O T}(k)>0\), then row \(s\) and colum nsk and \(\mathbb{P} \mathbb{I V O T}(k)\) w ere interchanged and \(D(k, k)\) is a 1 boy-1 diagonal block. If \(\mathrm{UPLO}=\mathrm{U}\) ' and \(\mathbb{P} \operatorname{IV} \circ T(\mathrm{k})=\mathbb{P} \mathbb{I} \circ \mathrm{T}(\mathrm{k}-1)<0\), then row s and colum ns \(\mathrm{k}-1\) and - \(\mathbb{P}\) IVOT (k) were interchanged and \(\mathrm{D}(\mathrm{k}-\) \(1 \mathrm{k}, \mathrm{k}-1 \mathrm{k}\) ) is a 2-by-2 diagonalblock. If \(\mathrm{PLO}=\) \(\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V O T}(k)=\mathbb{P} \mathbb{V} O T(k+1)<0\), then row sand colum nsk+1 and -TP IVOT (k) w ere interchanged and D \((k: k+1, k: k+1)\) is a 2 -by-2 diagonalblock.

If \(\mathrm{FACT}=\mathrm{N}\) ', then \(\mathbb{P} \mathbb{I V O T}\) is an output argum ent and on exitcontains details of the interchanges and the block structure of \(D\), as determ ined by

CSY TRF.

B (input) The N -by -N RH S righthand side m atrix B .

LD B (input)
The leading dim ension of the array \(B\). LD B >= \(\max (1, N)\).

X (output)
If \(\mathbb{N} F O=0\) or \(\mathbb{N} F O=\mathrm{N}+1\), the N -by-NRHS solution \(m\) atrix \(X\).
LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, N)\).

RCOND (output)
The estim ate of the reciprocal condition num berof the \(m\) atrix \(A\). IfRCOND is less than the \(m\) achine precision (in particular, if RCOND \(=0\) ), the \(m\) atrix is singular to working precision. This condition is indicated by a retum code of \(\mathbb{N}\) FO > 0 .

\section*{FERR (output)}

The estim ated forw ard enrorbound for each solution vector \(X()\) ) the \(j\) th colum \(n\) of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{O}), \operatorname{FERR}(\mathcal{O})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{H})\)-XTRUE) divided by the magnitude of the largestelem ent in \(X(\mathcal{)}\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) ) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \()\) ) an exactsolution).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK \(>=2 * N\), and for best perform ance LDW ORK \(>=N * N B\), where \(N B\) is the optim alblocksize forCSY TRF.

IfLDW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.

W ORK 2 (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N F O}\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N F O}=i\), and \(i\) is
\(<=\mathrm{N}: \mathrm{D}(i, i)\) is exactly zero. The factorization
has been completed but the factorD is exactly singular, so the solution and error bounds could not be com puted. RCOND \(=0\) is retumed. \(=\mathrm{N}+1\) : D is nonsingular, butRCOND is less than machine precision, \(m\) eaning that the \(m\) atrix is singular to w orking precision. Nevertheless, the solution and error bounds are com puted because there are a num berof situationsw here the com puted solution can bem ore accurate than the value ofRCOND w ould suggest.

\section*{PURPOSE}
zsytf2 com putes the factorization of a com plex symm etric \(m\) atrix A using the B unch \(K\) aufm an diagonalpivoting \(m\) ethod:
\[
A=U * D * U{ }^{\prime} \text { or } A=L * D * L^{\prime}
\]
where U (orL) is a productofperm utation and unit upper (low er) triangularm atriges, U 'is the transpose of U , and D is sym \(m\) etric and block diagonalw ith 1 -by-1 and 2 -by-2 diagonalblocks.

This is the unblocked version of the algorithm, calling Level2 BLAS.

\section*{ARGUMENTS}

\section*{UPLO (input)}

Specifies w hether the upper or low er triangular part of the sym \(m\) etric \(m\) atrix \(A\) is stored:
\(=\mathrm{U}\) ': Upper triangular
\(=\mathrm{L}\) ': Low ertriangular

N (input) The order of them atrix \(\mathrm{A} . \mathrm{N}>=0\).

A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading \(n-b y-n\) uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If UPLO \(=\mathbb{L}\) ', the leading \(n-b y-n\) low er triangularpart of A contains the low ertriangularpart of the m atrix A, and the strictly upper triangularpart of \(A\) is notreferenced.

On exit, the block diagonalm atrix D and the mul
tipliers used to obtain the factorU orl (see below for further details).

LDA (input)
The leading dim ension of the anray A. LD A >= \(\max (1, \mathbb{N})\).

IPIV (output)
D etails of the interchanges and the block structure ofD. If \(\mathbb{P} \mathbb{I V}(k)>0\), then row \(s\) and colum ns \(k\) and \(\mathbb{P} \mathbb{I V}(k)\) were interchanged and \(D(k, k)\) is a 1 -by-1 diagonalblock. IfUPLO \(=U\) 'and \(\mathbb{P} \mathbb{I V}(k)\) \(=\mathbb{P} \mathbb{V}(k-1)<0\), then row \(s\) and colmm ns \(k-1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k-1 * k, k-1 *)\) is a 2 -by-2 diagonalblock. IfUPLO \(=\mathbb{L}\) 'and \(\mathbb{P} \mathbb{I V}(k)\)
\(=\mathbb{P} \mathbb{I}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V}(k)\) w ere interchanged and \(D(k, k+1, k \mathrm{k}+1)\) is a 2-by-2 diagonalblock.
\(\mathbb{N F O}\) (output)
\(=0\) : successfulexit
\(<0:\) if \(\mathbb{N} F O=-\mathrm{k}\), the k -th argum enthad an illegalvalue \(>0:\) if \(\mathbb{N} F O=k, D(k, k)\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

\section*{FURTHER DETAILS}

\section*{1-96 -B ased on m odifications by J.Lew is, Boeing Com puter}

\section*{Services}

Com pany
If U PLO \(=\mathrm{U}\) ', then \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}\) ', where
\(U=P(n) \star U(n) * \ldots * P(k) U(k) * \ldots\),
i.e., \(U\) is a productof term \(S P(k) * U(k)\), where \(k\) decreases from \(n\) to 1 in steps of 1 or2, and \(D\) is ablock diagonal \(m\) atrix \(w\) ith 1 -by -1 and 2 -by-2 diagonalblocks \(D(k) . \section*{C INTERFACE}
\#include <sunperfh>
void zsytrf(charuplo, intn, doublecom plex *a, int lda, int
*ịívot, int*info);
void zsytrf_64 (charuplo, long n, doublecom plex *a, long lda, long *ịíivot, long *info);

\section*{PURPOSE}
zsytrf com putes the factorization of a com plex sym m etric \(m\) atrix \(A\) using the \(B\) unch- \(K\) aufn an diagonalpivoting \(m\) ethod. The form of the factorization is
\[
\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U} * * \mathrm{~T} \text { or } \mathrm{A}=\mathrm{L} * \mathrm{D} * \mathrm{~L} * * \mathrm{~T}
\]
where \(U\) (orL) is a productof perm utation and unit upper (low er) triangular \(m\) atrices, and \(D\) is sym \(m\) etric and block diagonalw th w th 1 -by-1 and 2 -by- 2 diagonalblocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

\section*{ARGUMENTS}

UPLO (input)
= U ': U ppertriangle ofA is stored;
= L': Low ertriangle ofA is stored.

N (input) The order of the m atrix A. N >=0.

A (input/output)
O n entry, the sym m etric m atrix A. If UPLO = U', the leading \(\mathrm{N}-\) by -N uppertriangularpartofA contains the upper triangular part of the \(m\) atrix \(A\), and the strictly low er triangularpart of A is not referenced. If UPLO = L', the leading N -by-N low er triangularpart of \(A\) contains the low ertriangularpartof them atrix A, and the strictly upper triangular part of A is not referenced.

On exit, the block diagonalm atrix D and the multipliers used to obtain the factorU orL (see below for further details).

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

\section*{IPIVOT (output)}

D etails of the interchanges and the block structure of D. If \(\mathbb{P I V O T}(k)>0\), then row sand columnsk and \(\mathbb{P I V O T}(k)\) were interchanged and \(D(k, k)\) is a \(1-b y-1\) diagonalblock. If \(U P L O=U^{\prime}\) and \(\mathbb{P} \mathbb{V} O T(k)=\mathbb{P} \mathbb{V} O T(k-1)<0\), then row \(s\) and colum ns \(k-1\) and - \(\mathbb{P I V O T}(k)\) were interchanged and D ( \(k-1 * k, k-1 k)\) is a \(2-b y-2\) diagonal block. If UPLO \(=\mathrm{L}\) 'and \(\mathbb{P I V O T}(k)=\mathbb{P} \mathbb{I V O T}(k+1)<0\), then row sand colum ns \(k+1\) and \(-\mathbb{P} \mathbb{V} O T(k)\) were interchanged and \(D(k k+1, k k+1)\) is a \(2-b y-2\) diagonal block.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LDW ORK.

LDW ORK (input)
The length ofW ORK. LDW ORK >=1. Forbestperfor\(m\) ance LDW ORK >=N *NB, where NB is the block size retumed by \(\amalg A E N V\).

IfLDW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LDW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0 : successfinlexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum enthad an illegalvalue
\(>0:\) if \(\mathbb{N F O}=\mathrm{i}, \mathrm{D}(\mathrm{i}, \mathrm{i})\) is exactly zero. The factorization has been com pleted, but the block diagonalm atrix \(D\) is exactly singular, and division by zero w illoccur if it is used to solve a system of equations.

\section*{FURTHER DETAILS}

If \(\mathrm{ULO}=\mathrm{U}\) ', then \(\mathrm{A}=\mathrm{U} * \mathrm{D} * \mathrm{U}\) ', where
\(U=P(n) \star U(n)^{\star} \ldots{ }^{\star} P(k) U(k)^{\star} \ldots\),
ie., \(U\) is a product ofterm \(\operatorname{sP}(k) * U(k)\), where \(k\) decreases from \(n\) to 1 in steps of 1 or 2 , and \(D\) is a block diagonal \(m\) atrix w ith 1 -by-1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(\mathrm{k})\), and \(\mathrm{U}(\mathrm{k})\) is a unituppertriangularm atrix, such that if the diagonal block D (k) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( I v 0 ) k-s } \\
& U(k)=\left(\begin{array}{lll}
0 & I
\end{array}\right) s \\
& \text { ( } 000 \text { I ) n-k } \\
& \mathrm{k}-\mathrm{s} \text { s n-k }
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(1 k-\) \(1, k\) ). If \(s=2\), the upper triangle ofD \((k)\) overw rites \(A(k-\) \(1, k-1), A(k-1, k)\), and \(A(k, k)\), and \(V\) overw rites \(A(1 k-2, k-\) \(1 \mathrm{k})\).

If \(\mathrm{UPLO}=\mathrm{L}\) ', then \(A=\mathrm{L} * \mathrm{D} * \mathrm{~L}\) ', where
\(L=P(1) \star L(1)^{\star} \ldots * P(k) \star L(k) * \ldots\)
ie., \(L\) is a productofterm \(s P(k) * L(k)\), where \(k\) increases
from 1 to n in steps of 1 or 2 , and D is a block diagonal \(m\) atrix \(w\) th 1 -by -1 and 2 -by-2 diagonalblocks \(D(k) . P(k)\) is a perm utation \(m\) atrix as defined by \(\mathbb{P} \mathbb{I V O T}(k)\), and \(L(k)\) is a unitlow ertriangularm atrix, such that if the diagonal
block \(D(k)\) is of orders ( \(s=1\) or 2 ), then
\[
\begin{aligned}
& \text { ( } \left.\begin{array}{llll}
I & 0 & 0
\end{array}\right) k-1 \\
& L(k)=\left(\begin{array}{lll}
0 & I & 0
\end{array}\right) s \\
& \text { ( } 0 \mathrm{~V} \text { I ) } \mathrm{n}-\mathrm{k}-\mathrm{s}+1 \\
& \mathrm{k}-1 \text { s } \mathrm{n}-\mathrm{k}-\mathrm{s}+1
\end{aligned}
\]

If \(s=1, D(k)\) overw rites \(A(k, k)\), and \(v\) overw rites \(A(k+1 m, k)\). If \(s=2\), the low ertriangle ofD \((k)\) overw rites \(A(k, k), A(k+1, k)\), and \(A(k+1, k+1)\), and \(v\) overw rites A \((k+2 m, k: k+1)\).

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whetherthem atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or \(\mathrm{u}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix.

UPLO = L' or 1' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) 'or \(h^{\prime} \mathrm{x}:=\mathrm{A}{ }^{*} \mathrm{x}\).
TRANSA \(=\) T'ort' \(x:=A * x\).
TRANSA \(=\) C'ort \(^{\prime} \mathrm{x}:=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right){ }^{\star} \mathrm{x}\).
U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit
triangular as follow \(s\) :
D \(\mathbb{A} G=U\) 'or 4 ' \(A\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h^{\prime} A\) is notassumed to be unit triangular.

U nchanged on exit.
N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix \(A\). \(\mathrm{N}>=0\). U nchanged on exit.
\(K\) (input)
O n entry w ith UPLO \(=\) U 'or L', K specifies the num ber of super-diagonals of them atrix \(A\). On entry \(w\) th UPLO = L' or I', K specifies the num ber of sub-diagonals of the \(m\) atrix \(A . K>=0\). U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading ( \(k+1\) ) by n part of the array A mustcontain the upper triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row ( \(k+1\) ) of the aray, the firstsuper-diagonalstarting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the array A is not referenced. The follow ing program segm entw illtransfer an upper triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \text { M }=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \quad \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINE } \\
& 20 \text { CONTINUE }
\end{aligned}
\]

Before entry w ith UPLO = L 'or 1', the leading ( \(\mathrm{k}+1\) ) by n partof the array A m ust contain the low er triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum n, w th the leading diagonal of the \(m\) atrix in row 1 of the array, the first sub-diagonal starting atposition 1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the array \(A\) is not referenced. The
follow ing program segm entw ill transfer a low er triangular band \(m\) atrix from conventional full
\(m\) atrix storage to band storage:

DO \(20, J=1, N\)
\(M=1-J\)
DO \(10, I=J, M \mathbb{N}(N, J+K)\)
\(A(M+I, J)=m \operatorname{atrix}(I, J)\)
10 CONTINUE
20 CONTINUE
\(N\) ote thatw hen DIA G = U 'or 4 'the elem ents of the array A corresponding to the diagonalelem ents of the \(m\) atrix are not referenced, butare assum ed to be unity. U nchanged on exit.
LD A (input)
O n entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A \(>=\) ( \(\mathrm{k}+1\) ). U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) m ust contain the \(n\) elem ent vectorx. On exit, \(Y\) is overw ritten \(w\) th the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{I N C Y}\) specifies the increm ent for the elem ents of \(. \mathbb{N} C Y<>0\). U nchanged on exit.

\section*{PURPOSE}
ztbrfs provides errorbounds and backw ard error estim ates forthe solution to a system of linear equations \(w\) th a triangularband coefficientm atrix.

The solution \(m\) atrix \(X\) m ustibe com puted by CTBTRS or some other \(m\) eans before entering this routine. CTBRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

\section*{UPLO (input)}
= U : A is uppertriangular;
= L ': A is low ertriangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}: \mathrm{A} * \mathrm{X}=\mathrm{B} \quad\) N 0 transpose)
\(=T: A * * T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}\) : A is non-unit triangular;
\(=\mathrm{U}:\) : A is unit triangular.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
\(K D\) (input)
The num berof superdiagonals or subdiagonals of the triangularband \(m\) atrix \(A . K D>=0\).

NRHS (input)
The num ber of righthand sides, i.e., the num ber of collm ns of the m atrices B and X. NRHS \(>=0\).
A (input) The upper or low er triangular band \(m\) atrix \(A\), stored in the firstkd+1 row sof the amay. The \(j\) th column ofA is stored in the \(j\) th column of the anay A as follow s: if UPLO = U',A (kd+1+i\(j, 7)=A(i, j)\) for \(\max (1, j \mathrm{kd})<=i<=j\) if UPLO \(=\) L', A \((1+i-j\rangle)=A(i, 7)\) for \(j<=i<=m\) in \((n, j+k d)\). IfD \(\mathbb{I A}=U\) ', the diagonalelem ents of A are not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the anay A. LDA >= K D +1.
\(B\) (input) The righthand side m atrix \(B\).

LD B (input)
The leading dim ension of the array B . LD B >= \(\max (1, N)\).
\(X\) (input) The solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the anay X . LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard errorbound for each solution vector \(X()\) (the \(j\) th column of the solution \(m\) atrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(1)\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(X(\mathcal{D})-X\) TRU \(E\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{J})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true error.

BERR (output)

The com ponentw ise relative backw ard error of each solution vector \(X(\mathcal{)}\) (ie., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(}\) ) an exactsolution).

W ORK (w orkspace) dim ension \(\left(2{ }^{*} \mathrm{~N}\right.\) )

\section*{PURPOSE}
ztbsv solves one of the system sofequations \(A * x=b\), or \(A^{*} x=b\), orconjg ( \(A^{\prime}\) ) * \(x=b\) where \(b\) and \(x\) are \(n\) elem ent vectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularband \(m\) atrix, \(w\) ith ( \(k+1\) ) diagonals.

No test forsingularity ornear-singularity is included in this routine. Such testsm ustbe penform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or \(\mathrm{L'}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix.

UPLO = L' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A * x=b\).

TRANSA \(=\mathrm{T}^{\prime}\) or \(\mathrm{t}^{\prime} \mathrm{A}{ }^{*} \mathrm{x}=\mathrm{b}\).
TRANSA \(=C^{\prime}\) ort' cong \(\left(A^{\prime}\right) \star \mathrm{x}=\mathrm{b}\).

U nchanged on exit.

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornot A is unit triangular as follow s:

D \(\mathbb{I}\) G \(=U\) 'or 4 ' \(A\) is assum ed to be unit triangular.

D \(\mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.
N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix \(A\). \(\mathrm{N}>=0\). U nchanged on exit.

K (input)
On entry with UPLO \(=U\) 'or U ', \(K\) specifies the num ber of super-diagonals of them atrix \(A\). On entry w th UPLO = L' or I', K specifies the num ber of sub-diagonals of the \(m\) atrix \(A . K>=0\). U nchanged on exit.

A (input)
Before entry w ith UPLO = U 'or L ', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the upper triangularband part of the \(m\) atrix of coefficients, supplied colum \(n\) by colum \(n\), w ith the leading diagonal of the \(m\) atrix in row ( \(k+1\) ) of the aray, the firstsuper-diagonalstarting at position 2 in row \(k\), and so on. The top leftk by \(k\) triangle of the array A is not referenced. The follow ing program segm entw illtransfer an upper triangular band \(m\) atrix from conventional full m atrix storage to band storage:
\[
\begin{aligned}
& \text { DO } 20, J=1, N \\
& \mathrm{M}=\mathrm{K}+1-\mathrm{J} \\
& \mathrm{DO} 10, \mathrm{I}=\mathrm{M} A X(1, \mathrm{~J}-\mathrm{K}), \mathrm{J} \\
& \quad \text { A }(\mathrm{M}+\mathrm{I}, \mathrm{~J})=\mathrm{m} \operatorname{atrix}(\mathrm{I}, \mathrm{~J}) \\
& 10 \text { CONTINUE } \\
& 20 \mathrm{CONTINUE}
\end{aligned}
\]

Before entry w ith UPLO = L 'or 1', the leading ( \(k+1\) ) by \(n\) part of the array A m ust contain the low er triangularband part of the \(m\) atrix of coefficients, supplied column by colum n, w th the
leading diagonal of the \(m\) atrix in row 1 of the array, the first sub-diagonal starting atposition
1 in row 2 , and so on. The bottom right \(k\) by \(k\) triangle of the array \(A\) is not referenced. The follow ing program segm entw ill transfer a low er triangular band \(m\) atrix from conventional full \(m\) atrix storage to band storage:
\[
\text { D O } 20, \mathrm{~J}=1, \mathrm{~N}
\]
\(\mathrm{M}=1-\mathrm{J}\)
DO \(10, \mathrm{I}=\mathrm{J}, \mathrm{M} \mathbb{N}(\mathrm{N}, \mathrm{J}+\mathrm{K})\)
A \((M+I, J)=m \operatorname{atrix}(I, J)\)
10 CONTINUE
20 CONTINUE
\(N\) ote thatwhen D \(\mathbb{A} G=U\) 'or 4 'the elem ents of the array A corresponding to the diagonalelem ents of the \(m\) atrix are not referenced, but are assum ed to be unity. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program .LD A >=( \(\mathrm{k}+1\) ). U nchanged on exit.

Y (input/output)
\((1+(n-1) \star \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented aray \(Y\) must contain the \(n\) elem ent righthand side vectorb. On exit, \(Y\) is overw ritten \(w\) th the solution vectorx.
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(Y\). \(\mathbb{N C Y}\) <> 0. U nchanged on exit.

\section*{PURPOSE}
ztgevc com putes som e orallof the right and/or left generalized eigenvectors of a pair of com plex upper triangular \(m\) atrices \((A, B)\).

The right generalized eigenvectorx and the leftgeneralized eigenvectory of \((A, B)\) corresponding to a generalized eigenvalue w are defined by:
\[
(A-w B) * x=0 \text { and } y^{\star *} H *(A-w B)=0
\]
\(w\) here \(\mathrm{y}^{* *}{ }_{\mathrm{H}}\) denotes the conjugate tranpose of y .

If an eigenvalue w is determ ined by zero diagonal elem ents of both \(A\) and \(B\), a unit vector is retumed as the comesponding eigenvector.

If alleigenvectors are requested, the routine \(m\) ay either retum the \(m\) atrices \(X\) and/or \(Y\) of rightor lefteigenvectors of \((A, B)\), or the products \(Z * X\) and/or \(Q * Y\), where \(Z\) and \(Q\) are input unitary \(m\) atrioes. If \((A, B) w\) as obtained from the gen-
eralized Schur factorization of an original pair ofm atrices
\((A 0, B 0)=Q * A * Z * * H, Q * B * Z * * H)\), then \(Z * X\) and \(Q * Y\) are the \(m\) atrioes of right or lefteigenvectors of A.

\section*{ARGUMENTS}

\section*{STDE (input)}
\(=\mathrm{R}\) ': com pute righteigenvectors only;
\(=\mathrm{L}\) ': com pute lefteigenvectors only;
\(=\mathrm{B}\) ': com pute both right and lefteigenvectors.
HOW MNY (input)
= A ': com pute all right and/or lefteigenvectors;
= B':com pute all right and/or left eigenvectors, and backtransform them using the inputm atrices supplied in VR and/orV L; = 5 : com pute selected right and/or lefteigenvectors, specified by the logicalaray SELECT.

\section*{SELECT (input)}

If HOW M NY = S', SELECT specifies the eigenvectors to be computed. If HOW MNY=A 'or B', SELECT is not referenced. To select the eigenvector comesponding to the jth eigenvalue, SELECT ( \(\ddagger\) m ust.be set to .TRUE..

N (input) The order of the m atrioes A and B. \(\mathrm{N}>=0\).

A (input) The uppertriangularm atrix A .
LD A (input)
The leading dimension of array A. LDA >= \(\max (1, \mathbb{N})\).

B (input) The upper triangularm atrix B. B m ust have real diagonalelem ents.

LD B (input)
The leading dimension of array B. LD B >= \(\max (1, \mathbb{N})\).

VL (input/output)
On entry, if \(S D E=L\) 'or \(B\) 'and HOW M NY = B', VL must contain an \(N\)-by N m atrix \(Q\) (usually the unitary \(m\) atrix \(Q\) of left Schurvectors retumed by CHGEQZ). On exit, if \(S \mathbb{D} E=\mathrm{L}\) 'or \(\mathrm{B}^{\prime}, \mathrm{VL}\) contains: if HOW MNY = A', the matrix Y of left
eigenvectors of ( \(A, B\) ); if HOW M NY = \(B\) ', the matrix Q *Y ; ifHOW M NY = \(S^{\prime}\), the left eigenvectors of ( \(A, B\) ) specified by SELECT, stored consecutively in the colum ns of V , in the same order as their eigenvalues. If \(S \mathbb{D} E=R \prime, V L\) is not referenced.

LDVL (input)
The leading dimension of array VL . LDVL >= \(\max (1, N)\) if \(S \mathbb{D} E=L\) 'or \(B^{\prime} ; L D V L>=1\) otherw ise.
VR (input/output)
On entry, ifS \(\mathrm{D}=\mathrm{R}\) 'or \(\mathrm{B}^{\prime}\) 'and HOW MNY = \(\mathrm{B}^{\prime}\), VR m ust contain an N -by \(-\mathrm{N} m\) atrix Q (usually the unitary \(m\) atrix \(Z\) of rightSchur vectors retumed by CHGEQZ). On exit, if \(S \mathbb{D} E=R\) 'or \(B\) ', VR contains: if H OW M NY = A', them atrix X of right eigenvectors of \((A, B)\); if HOW MNY = \(B\) ', the matrix \(Z * X\); if HOW M NY \(=S\) ', the right eigenvectors of ( \(A\), B ) specified by SELEC T, stored consecutively in the colum ns ofVR, in the same order as their eigenvalues. If \(S \mathbb{D} E=L\) ', VR is not referenced.

LDVR (input)
The leading dim ension of the array VR . LDVR >= \(\max (1, N)\) if \(S \mathbb{D} E=R\) 'or \(B^{\prime} ; L D V R>=1\) other wise.

M M (input)
The num ber of colum ns in the arays V L and/or VR. \(M \mathrm{M}>=\mathrm{M}\).

M (output)
The num berof colum ns in the amays \(V \mathrm{~L}\) and/or VR actually used to store the eigenvectors. If
HOW M NY = A 'or B', M is set to N. Each selected eigenvector occupies one colum \(n\).

W ORK (w orkspace)
dim ension ( \(2 * N\) )

F-norm -based estim ate
(D \(\mathbb{F}(1: 2))\).
\(=3\) : Estim ate ofD ifiu and \(D\) ifl. 1 -norm -based esti-
\(m\) ate
(D IF (1:2)). About5 tim es as expensive as IJO B \(=\)
2. \(=4: C\) om pute \(P L, P R\) and \(D \mathbb{F}\) (i.e. 0,1 and 2 above) : Econom ic version to get itall. \(=5\) : C om pute PL, PR and D FF (ie. 0, 1 and 3 above)
}

\section*{SELECT (input)}

SELEC T specifies the eigenvalues in the selected
cluster. To selectan eigenvalue w ( \()\), SELECT ( \()\)
m ustbe set to
N (input) The order of the m atrices A and \(\mathrm{B} . \mathrm{N}>=0\).
A (input/output)
On entry, the upper triangularm atrix A, in generalized Schur canonical form. On exit, A is overw rilten by the reordered \(m\) atrix A.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

B (input/output)
O n entry, the upper triangularm atrix \(B\), in generalized Schur canonical form. On exit, \(B\) is overw ritten by the reordered \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the anay \(\mathrm{B} . \operatorname{LD} \mathrm{B}>=\) \(\max (1, \mathbb{N})\).

A LPHA (output)
The diagonalelem ents of \(A\) and \(B\), respectively, when the pair \((A, B)\) has been reduced to generalized Schur form. A LPHA (i),BETA (i) \(i=1, \ldots, N\) are the generalized eigenvalues.

BETA (output)
See the description of A LPH A .
Q (input/output)
On entry, if \(W\) ANTQ = TRUE., \(Q\) is an \(N\)-by \(N\) \(m\) atrix. On exit, \(Q\) has been postm ultiplied by the leftunitary transform ation \(m\) atrix which reorder ( \(\mathrm{A}, \mathrm{B}\) ); The leading \(M\) colum ns ofe form orthonor\(m\) albases for the specified pair of left eigenspaces (deflating subspaces). IfW ANTQ = FALSE., \(Q\) is notreferenced.

LDQ (input)
The leading dim ension of the array \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1\). IfW ANTQ = TRUE., LDQ >=N.

Z (input/output)

On entry, if \(W\) ANTZ = .TRUE., \(Z\) is an \(N\) Hy \(-N\) \(m\) atrix. O \(n\) exit, \(Z\) has been postm ultiplied by the leftunitary transform ation \(m\) atrix which reorder (A, B); The leading M colum ns of \(Z\) form orthonor\(m\) albases forthe specified pair of left eigenspaces (deflating subspaces). IfW ANTZ = FALSE., \(Z\) is notreferenced.

LD Z (input)
The leading \(d\) im ension of the array \(Z . L D Z>=1\). IfW ANTZ = .TRUE , LDZ \(>=N\).

M (output)
The dim ension of the specified pair of left and righteigenspaces, (deflating subspaces) \(0<=\mathrm{M}<=\) N.

PL (output)
IF \(\mathrm{IHOB}=1,4\), or \(5, \mathrm{PL}, \mathrm{PR}\) are low er bounds on
the reciprocal of the norm of "projections" onto leftand right eigenspace \(w\) ith respect to the selected chuster.
\(0<\mathrm{PL}, \mathrm{PR}<=1\). IfM \(=0\) orM \(=\mathrm{N}, \mathrm{PL}=\mathrm{PR}=1\) 。
If IO \(B=0,2\), or \(3 \mathrm{PL}, \mathrm{PR}\) are not referenced.

PR (output)
See the description ofPL .

D IF (output)
If IOO B \(>=2, D \mathbb{F}(1: 2)\) store the estim ates ofD ifu and \(D\) iff.
If \(I W B=2\) or \(4, D \mathbb{F}(1: 2)\) are \(F\)-norm -based upper
bounds on
\(D\) ifu and \(D\) ifl. If \(I O O B=3\) or \(5, D \mathbb{F}(1: 2)\) are \(1-\) norm - based estim ates of D ifu and D ifl, com puted using reversed comm unication w ith CLACON. IfM \(=\) 0 orN,\(D \mathbb{F}(1: 2)=F\)-norm ( \([A, B]\) ). If \(I J O B=0\) or \(1, D \mathbb{F}\) is notreferenced.

W ORK (w orkspace)
If \(I \mathrm{OOB}=0, \mathrm{~W} O R \mathrm{~K}\) is not referenced. O therw ise, on exit, if \(\mathbb{N F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay \(W\) ORK.LW ORK \(>=1\) If \(\mathrm{IJOB}=1,2\) or \(4, \mathrm{LW} O R K>=2 \star M *(\mathbb{N} M)\) If \(\mathrm{IJOB}=3\) or 5 , LW ORK \(>=4 * M *(\mathbb{N}-\mathrm{M})\)

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
IV ORK (w orkspace/output)
If \(\mathrm{IJO} B=0, \mathbb{I V} O R K\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, \mathbb{I V} O R K(1)\) retums the optim al LIV ORK.

LIN ORK (input)
The dim ension of the anray \(\mathbb{I W} O R K . L \mathbb{I W} O R K>=1\). If \(\mathrm{IJO} \mathrm{B}=1,2\) or \(4, \mathrm{~L} \mathbb{I N}\) ORK \(>=\mathrm{N}+2\); If IJOB \(=3\) or \(5, L \mathbb{I N}\) ORK >= MAX \(\mathbb{N}+2,2 * M * \mathbb{N}+\mathrm{M})\) );

If LIV ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of the \(\mathbb{I W}\) ORK array, retums this value as the first entry of the \(\mathbb{I W} O R K\) array, and no errorm essage related to LIIN ORK is issued by X ERBLA.
\(\mathbb{I N F O}\) (output)
=0: Successfulexit.
\(<0:\) If \(\mathbb{N}\) FO \(=-\) - , the \(i\)-th argum enthad an illegal
value.
\(=1\) : Reordering of ( \(A, B\) ) failed because the transform ed \(m\) atrix pair ( \(A, B\) ) w ould be too far from generalized Schur form ; the problem is very ill-conditioned. (A, B) \(m\) ay have been partially reordered. If requested, 0 is retumed in D \(\mathbb{F}\) (*), \(P L\) and \(P R\).

\section*{FURTHER DETAILS}

ZTG SEN firstcollects the selected eigenvalues by com puting unitary \(U\) and \(W\) thatm ove them to the top left comerof ( \(A\), B ). In otherw ords, the selected eigenvalues are the eigenvalues of (A11, B11) in
\[
\begin{gathered}
U *(A, B) * W=(A 11 A 12)(B 11 B 12) n 1 \\
(0 \text { A 22),(0 B22) n2 } \\
n 1 \text { n2 n1 n2 }
\end{gathered}
\]
where \(\mathrm{N}=\mathrm{n} 1+\mathrm{n} 2\) and U ' m eans the conjugate transpose of U . The first \(n 1\) colum ns of \(U\) and \(W\) span the specified pair of left and righteigenspaces (deflating subspaces) of ( \(A, B\) ).

If ( \(\mathrm{A}, \mathrm{B}\) ) has been obtained from the generalized real Schur decom position of a \(m\) atrix pair \((C, D)=Q *(A, B) * Z\) ', then the reordered generalized Schur form of ( \(\mathrm{C}, \mathrm{D}\) ) is given by
\[
(C, D)=(Q * U) \star(U *(A, B) \star W) \star(Z * W) ',
\]
and the firstn1 colum ns of Q * U and \(\mathrm{Z} * \mathrm{~W}\) span the corresponding deflating subspaces of ( \(C, D\) ) \(Q\) and \(Z\) store \(Q * U\) and Z *W , resp.).
N ote that if the selected eigenvalue is sufficiently illconditioned, then its value \(m\) ay differ significantly from its value before reordering.

The reciprocalcondition num bers of the left and right eigenspaces spanned by the firstn1 colum ns ofU and \(W\) (or \(\mathrm{Q} * \mathrm{U}\) and \(\mathrm{Z} * \mathrm{~W}) \mathrm{m}\) ay be retumed in \(\mathrm{D} \boldsymbol{F}(1: 2)\), comesponding to \(D\) ifu and \(D\) ifl, resp.

The D ifu and D iflare defined as:
ifu \([\) A 11, B11), (A 22, B22) \(]=\) sigm a-m in ( Zu )
and
where sigm a-m in \((\mathrm{Zu})\) is the sm allest singular value of the
\[
\left(2 \star_{\mathrm{n}} 1 *_{\mathrm{n}} 2\right)-\text { by }-\left(2 \star_{\mathrm{n}} 1 *_{\mathrm{n}} 2\right) \mathrm{m} \text { atrix }
\]
\(\mathrm{u}=[\mathrm{kron}(\mathrm{In} 2, \mathrm{~A} 11)-\mathrm{kron}(\mathrm{A} 22\) ', In1) ]
[kron(In2, B11) kron (B22', In1)].

H ere, \(\operatorname{In} x\) is the identily \(m\) atrix of size \(n x\) and A 22 ' is the transpose of A 22. kron ( \(X\), \(Y\) ) is the \(K\) roneckerproduct betw een the \(m\) atrices \(X\) and \(Y\).

W hen D IF (2) is sm all, sm allchanges in (A, B) can cause large changes in the deflating subspace. A \(n\) approxim ate (asym ptotic) bound on them axim um angularemor in the com puted deflating subspaces is PS * norm ( \((A, B)\) ) /D \(\mathbb{F}(2)\),
where EPS is the \(m\) achine precision.

The reciprocal norm of the pro jectors on the leftand right eigenspaces associated \(w\) ith (A 11, B 11) m ay be retumed in PL and PR. They are com puted as follow s. First we com pute L and \(R\) so that \(P\) * \((A, B){ }^{\star} Q\) is block diagonal, w here
\[
=(I-\Psi) n 1 \quad Q=(I R) n 1
\]
\[
(0 \mathrm{I}) \mathrm{n} 2 \text { and }(0 I) \mathrm{n} 2
\]
n1 n2
n1 n2
and \((\amalg, R)\) is the solution to the generalized Sylvester equation \(11 * \mathrm{R}-\mathrm{L} * \mathrm{~A} 22=-\mathrm{A} 12\)
 norm \((\mathbb{R}) * * 2+1) * *(-1 / 2)\). A n approxim ate (asym ptotic) bound on the average absolute error of the selected eigenvalues is EPS * norm ( \(\mathrm{A}, \mathrm{B})\) )/PL.

There are also globalemorbounds which valid forperturbations up to a certain restriction: A low erbound \((x)\) on the sm allest \(F\)-norm ( \(\mathbb{E}, F\) ) forw hich an eigenvalue of (A 11, B 11) \(m\) ay \(m\) ove and coalesce \(w\) th an eigenvalue of (A 22,B22) under perturbation \((\mathbb{E}, F)\), (ie. \((A+E, B+F)\), is
\(\mathrm{x}=\)

A \(n\) approxim ate bound on \(x\) can be com puted from \(D \mathbb{F}(1: 2)\), PL and PR .

If \(y=(F-\) norm \((E, F) / x)<=1\), the angles betw een the perturbed (L', R) and unperturbed ( \(L, R\) ) left and right deflating subspaces associated \(w\) ith the selected chuster in the \((1,1)\)-blocks can be bounded as
\(m a x-a n g l e(L, L)<=\arctan (y * P L /(1-y *(1-P L *\) PL)** (1/2))
\(\max \operatorname{angle}(R, R)<=\arctan (y * P R /(1-y *(1-P R *\) PR ) ** (1/2))

See LA PA CK U ser's G uide section 4.11 or the follow ing references form ore inform ation.

N ote that if the default \(m\) ethod for com puting the Frobenius-norm - based estim ate D \(\mathbb{F}\) is not wanted (see CLATDF), then the param eter \(\mathbb{D} \mathbb{F} \mathbb{B}\) (see below) should be changed from 3 to 4 (routine CLATDF (INOB \(=2 \mathrm{w}\) ill be used)). See C TG SY L form ore details.

\section*{PURPOSE}
ztgsja com putes the generalized singular value decom position (GSVD) of tw o complex upper triangular (or trapezoidal) \(m\) atrices \(A\) and \(B\).

On entry, it is assum ed thatm atrices \(A\) and \(B\) have the follow ing form s , which m ay be obtained by the preprocessing subroutine CGGSVP from a generalM by -N m atrix A and \(\mathrm{P}-b y-\mathrm{N}\)
m atrix B ：
```

            NK工 K L
    A = K (0 A12 A 13) ifM K-L >= 0;
L (0 0 A 23)
M K-工(0 0 0 )
N-K\dashv K L
A = K (0 A12 A13) ifM K L<0;
M-K(0 0 A 23)
N-K\dashvK L
B=L(0 0 B13}
P-工(0 0 0 )

```
where the \(K\) boy \(K\) m atrix A 12 and \(L\) boy－ m atrix B 13 are non－ singularupper triangular；A 23 is L－by－L upper triangular if \(M K-\rfloor>=0\) ，otherw ise A 23 is \((M-K)\)－by -4 uppertrapezoidal． On exit，
\(U^{*} A * Q=D 1^{*}(0 R), \quad V{ }^{*} B * Q=D 2^{*}(0 R)\),
where \(U, V\) and \(Q\) are unitary \(m\) atrices，\(Z\)＇denotes the conju－ gate transpose of \(Z, R\) is a nonsingular upper triangular \(m\) atrix，and D 1 and D 2 are＇＂diagonal＂m atriges，which are of the follow ing structures：

IfM \(K-工>=0\) ，
\[
\begin{aligned}
& \text { K L } \\
& \text { D } 1=K(I O) \\
& \text { L ( } 0 \text { C ) } \\
& M \text { K- ( } 00 \text { ) } \\
& \text { K L } \\
& D 2=L \quad(0 \mathrm{~S}) \\
& \mathrm{P}-\left(\begin{array}{ll}
0 & 0
\end{array}\right)
\end{aligned}
\]

N K孔 K L
\((0 R)=K \quad(0 \quad R 11 R 12) K\)
\(\mathrm{L}\left(\begin{array}{lll}0 & \mathrm{R} 22\end{array}\right) \mathrm{L}\)
where
\[
\begin{aligned}
& C=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A(K+L)), \\
& S=\operatorname{diag}(\operatorname{BETA}(K+1), \ldots, B E T A(K+L)), \\
& C * * 2+S * * 2=I .
\end{aligned}
\]
\(R\) is stored in \(A(1: K+L, N-K+1 \mathbb{N})\) on exit．

IfM K \(\mathrm{K}<0\),

> K M K K + L M
> \(\mathrm{D} 1=\mathrm{K}(\mathrm{I} 00\) )
> M K ( 0 C 0 )
> K M K K + L M
> \(\mathrm{D} 2=\mathrm{M} \mathrm{K}(0 \mathrm{~S} 0)\)
> K+L-M (0 O I )
> P- ( 0000 )

N K- \(\mathrm{K} \quad \mathrm{M}\) K \(\mathrm{K}+\mathrm{L} \mathrm{M}\)
\(M-K(0 \quad 0 \quad R 22 R 23)\)
\(\mathrm{K}+\mathrm{L} \mathrm{M}\) (0 0 (0 R33)
where
C \(=\operatorname{diag}(A L P H A(K+1), \ldots, A L P H A M))\),
\(S=\operatorname{diag}(\) BETA \((K+1), \ldots, B E T A(M))\),
\(\mathrm{C} * * 2+\mathrm{S} * * 2=\mathrm{I}\).
\(R=(R 11 R 12 R 13)\) is stored in A (1 M ,N K \(-\mathrm{L}+1 \mathbb{N}\) ) and R 33
is stored
( 0 R22R23)
in \(B(M-K+1: L, N+M-K-\perp+1 \mathbb{N})\) on exit.

The com putation of the unitary transform ation \(m\) atrioes \(U, V\) or \(Q\) is optional. These \(m\) atrioes \(m\) ay eitherbe form ed explicitly, or they \(m\) ay be postm ultiplied into input \(m\) atrices \(\mathrm{U} 1, \mathrm{~V} 1\), orQ 1 .

CTGSJA essentially uses a variant of \(K\) ogbetliantz algorithm to reduce \(m\) in ( \(L, M-K\) )-by-L triangular (ortrapezoidal) \(m\) atrix A 23 and \(L\)-by- \(m\) atrix B 13 to the form :
U 1 *A \(13 * \mathrm{Q} 1=\mathrm{C} 1 * \mathrm{R} 1\); V 1 *B13*Q \(1=\mathrm{S} 1 * \mathrm{R} 1\), where \(\mathrm{U} 1, \mathrm{~V} 1\) and Q 1 are unitary \(m\) atrix, and Z 'is the conjugate transpose of Z. C1 and S1 are diagonalm atrices satisfying
\(\mathrm{C} 1 * * 2+\mathrm{S} 1 * * 2=\mathrm{I}\),
and \(R 1\) is an \(L-b y-L\) nonsingular uppertriangularm atrix.

\section*{ARGUMENTS}
\(J 0 \mathrm{BU}\) (input)
\(=\mathrm{U}:\) : U m ustcontain a unitary matrix U 1 on entry, and the productU 1*U is retumed; = I': U is initialized to the unitm atrix, and the unitary \(m\) atrix \(U\) is retumed; \(=N\) : \(U\) is not com puted.
\(=\mathrm{V}^{\prime}\) : V m ustcontain a unitary matrix V1 on entry, and the product V 1*V is retumed; = I ': V is initialized to the unitm atrix, and the unitary m atrix V is retumed; \(=\mathrm{N}: \mathrm{V}\) is not com puted.

JOBQ (input)
\(=\mathrm{Q}\) ': Q m ustcontain a unitary matrix Q 1 on entry, and the product Q 1*Q is retumed; = I': Q is initialized to the unitm atrix, and the unitary m atrix Q is retumed; \(=\mathrm{N}\) : Q is not com puted.

M (input) The num ber of row s of the \(m\) atrix \(A . M>=0\).
\(P\) (input) The num ber of row s of the \(m\) atrix \(B . ~ P>=0\).

N (input) The num ber of colum ns of the \(m\) atrioes \(A\) and \(B\). \(N\) \(>=0\).
\(K\) (input) \(K\) and \(L\) specify the subblocks in the input \(m\) atrices \(A\) and \(B\) :
\(A 23=A(K+1 \mathbb{M} \mathbb{N}(K+L, M) \mathbb{N}-1+1 \mathbb{N})\) and \(B 13=\) \(B(1: L, N-\perp+1 \mathbb{N})\) of \(A\) and \(B, w h o s e G S V D\) is going to be com puted by CTGSJA. See the Further D etails section below .

L (input) See the description of K .

A (input/output)
On entry, the \(M\) boy -N matrix \(A\). On exit, \(A(\mathbb{N}-\) \(\mathrm{K}+1 \mathbb{N}, 1 \mathbb{M} \mathbb{N}(\mathrm{~K}+\mathrm{L}, \mathrm{M})\) ) contains the triangular \(m\) atrix \(R\) orpart ofR. See Punpose for details.

LD A (input)
The leading dim ension of the anay \(A . L D A>=\) \(\max (1, M)\).

B (input/output)
On entry, the \(\mathrm{P}-b y-N \mathrm{~N}\) atrix B. On exit, if neces sary, \(B(K+1: N+M-K+1 \mathbb{N}\) ) contains a partofR . See Purpose for details.

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, P)\).

TOLA (input)
TOLA and TOLB are the convergence criteria for the Jacobi- K ogbetliantz iteration procedure. Generally, they are the sam e as used in the preprocessing step, say TOLA \(=M A X(M, N) \star\) norm (A) \({ }^{*} M\) ACHEPS, \(T O L B=M A X(P, N)^{\star}\) norm \((B) \star\) M ACHEPS.

TO LB (input)
See the description of TO LA .

A LPHA (output)
On exi, ALPHA and BETA contain the generalized singularvalue pairs of \(A\) and \(B\); \(A\) LPHA \((1: K)=1\), \(\operatorname{BETA}(1: K)=0\), and ifM \(K-L>=0\), A LPHA \((K+1 \mathbb{K}+L)\)
\(=\operatorname{diag}(\mathrm{C})\),
BETA \((\mathbb{K}+1 \mathrm{~K}+\mathrm{L})=\operatorname{diag}(\mathrm{S})\), or if \(\mathrm{M}-\mathrm{K}-<0\),
ALPHA \((\mathbb{K}+1 \mathrm{M})=\mathrm{C}, \mathrm{ALPHA}(\mathrm{M}+1 \mathrm{~K}+\mathrm{L})=0\)
BETA \((\mathbb{K}+1 \mathrm{M})=\mathrm{S}, \operatorname{BETA}(\mathrm{M}+1: K+\mathrm{L})=1\). Furtherm ore, if \(\mathrm{K}+\mathrm{L}<\mathrm{N}\), ALPHA \((\mathrm{K}+\mathrm{L}+1 \mathbb{N})=0\)
\(\operatorname{BETA}(K+L+1 \mathbb{N})=0\).

BETA (output)
See the description of A LPH A .

U (input) On entry, if \(\mathrm{JOBU}=\mathrm{U}\) ', U mustcontain a matrix
U 1 (usually the unitary \(m\) atrix retumed by
CGGSVP). On exit, if \(J O B U=\) ' 1 , \(U\) contains the unitary matrix \(U\); if \(J O B U=U\) ', \(U\) contains the product \(\mathrm{U} 1 * \mathrm{U}\). If \(\mathrm{JOB} \mathrm{B}=\mathrm{N}\) ', U is notreferenced.

LD U (input)
The leading dim ension of the array U. LD U >= \(m\) ax \((1, M)\) if \(J O B U=U ' ; L D U>=1\) otherw ise.

V (input) On entry, if \(\mathrm{JO} \mathrm{BV}=\mathrm{V}\) ', V m ust contain a matrix V1 (usually the unitary matrix retumed by CGGSVP). On exit, if \(J O B V=I^{\prime}, V\) contains the unitary \(m\) atrix \(V\); if \(J O B V=V\) ', \(V\) contains the product \(\mathrm{V} 1 * \mathrm{~V}\). If \(\mathrm{JO} \mathrm{BV}=\mathrm{N}, \mathrm{V}\) is not referenced.

LD V (input)
The leading dim ension of the aray \(V\). LD \(V\) >= \(\max (1, \mathrm{P})\) if \(\mathrm{JOBV}=\mathrm{V} ;\);LDV >=1 otherw ise.

Q (input) \(O n\) entry, if \(J O B Q=Q\) ', Q m ustcontain a matrix Q 1 (usually the unitary matrix retumed by CGGSVP). On exit, if \(J O B Q=' I\) ', \(Q\) contains the unitary matrix \(Q\); if \(J O B Q=Q\) ', \(Q\) contains the product \(Q 1 * Q\). If \(J O B Q=N\) ', \(Q\) is not referenced.

LD Q (input)
The leading dim ension of the array \(Q . L D Q>=\) \(\max (1, N)\) if \(\mathcal{O} B Q=Q ; L D Q>=1\) otherw ise.

W ORK (w orkspace)
dim ension \((2 * N)\)

NCYCLE (output)
The num ber of cycles required for convergence.
\(\mathbb{N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue.
= 1: the procedure does not converge after M A X IT cycles.

\section*{PURPOSE}
ztgsna estim ates reciprocalcondition num bers for specified eigenvalues and/or eigenvectors of a m atrix pair ( \(A, B\) ).
( \(\mathrm{A}, \mathrm{B}\) ) m ustbe in generalized Schur canonical form, that is,
\(A\) and \(B\) are both upper triangular.

\section*{ARGUMENTS}

Specifies w hether condition num bers are required foreigenvalues (S) oreigenvectors (DF):
\(=\mathrm{E}\) ': foreigenvalues only (S);
= V ': foreigenvectors only ( \(\mathbb{P}\) );
\(=B\) ': forboth eigenvalues and eigenvectors ( S and \(D \mathbb{F}\) ).

HOW MNT (input)
= A ': com pute condition num bers for all eigenpairs;
\(=S^{\prime}\) : com pute condition num bers for selected eigenpairs specified by the array SELEC T .

SELECT (input)
If HOW MNT = S', SELECT specifies the eigenpairs
for which condition num bers are required. To select condition num bers for the comesponding j th eigenvalue and/oreigenvector, SELECT ( ) ) must be set to TRUE.. IfHOW MNT=A', SELECT is not referenced.

N (input) The order of the square \(m\) atrix pair ( \(A, B\) ). \(N \quad>=\) 0.

A (input) The uppertriangularm atrix \(A\) in the pair \((A, B)\).
LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, \mathbb{N})\).
\(B\) (input) The uppertriangularm atrix \(B\) in the pair \((A, B)\).
LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, N)\).

VL (input)
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', VL mustcontain left eigenvectors of \((A, B)\), comesponding to the eigenpairs specified by HOW M NT and SELECT. The eigenvectors
\(m\) ust be stored in consecutive colum ns of V , as retumed by CTGEVC. If JOB \(=V^{\prime}, V L\) is not referenced.

LDVL (input)
The leading din ension of the amray VL.LD VL >=1; and If \(J 0 B=E\) 'or \(B ', L D V L>=N\).

VR (input)
If \(J 0 B=E\) 'or \(B\) ', VR m ust contain right eigen-
vectors of ( \(A, B\) ), comesponding to the eigenpairs specified by H OW M NT and SELECT . The eigenvectors \(m\) ust be stored in consecutive colum ns ofVR, as retumed by CTGEVC. If JOB \(=V\) ', \(V R\) is not referenced.

LDVR (input)
The leading dim ension of the array VR.LD VR >= 1;
If \(\mathrm{JOB}=\mathrm{E}\) 'or B ', LDVR \(>=\mathrm{N}\).
S (output)
If \(J O B=E\) ' or \(B^{\prime}\) ', the reciprocal condition
num bers of the selected eigenvalues, stored in consecutive elem ents of the aray. If \(\mathrm{JO} \mathrm{B}=\mathrm{V}\) ', \(S\) is not referenced.

D \(\mathbb{F}\) (output)
If \(\mathrm{JOB}=\mathrm{V}\) ' or B ', the estim ated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elem ents of the array. If the eigenvalues cannot be reordered to com pute D \(\mathbb{F}(\mathcal{j}), \mathrm{D} \mathbb{F}(\mathrm{y})\) is set to 0 ; this can only occur w hen the true value w ould be very sm allanyw ay. Foreach eigenvalue/vector specified by SELECT, D \(\mathbb{F}\) stores a Frobenius norm -based estim ate of D ifl. If \(\mathrm{JOB}=\mathrm{E}, \mathrm{D} \mathbb{F}\) is not referenced.

M M (input)
The num berofelem ents in the anays \(S\) and \(D \mathbb{F} . M M\) \(>=\mathrm{M}\).

M (output)
The num berof elem ents of the arrays \(S\) and D \(\mathbb{F}\) used to store the specified condition num bers; for each selected eigenvalue one elem ent is used. If HOWMNT=A', M is setto \(N\).

W ORK (w orkspace)
If \(\mathrm{JOB}=\mathrm{E}\) ', \(\mathrm{W} O \mathrm{OR}\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay \(W\) ORK. LW ORK \(>=1\). If JOB \(=V\) 'or \(B '\) 'LW ORK \(>=2 * N * N\).

IW ORK (w orkspace)
dim ension \((\mathbb{N}+2)\) If \(J O B=E^{\prime}, \mathbb{I N} O R K\) is not referenced.
\(\mathbb{N F O}\) (output)

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of the \(i\)-th generalized eigenvalue \(w=(a, b)\) is defined as
\(S(\mathbb{I})=\left(v^{A} u|* * 2+|v B u| * * 2)^{* *}(1 / 2) /\right.\)
(norm (u)*norm (v))
\(w\) here \(u\) and \(v\) are the rightand lefteigenvectors of ( \(A, B\) ) comesponding to \(\mathrm{w} ;|z|\) denotes the absolute value of the com plex num ber, and norm (u) denotes the 2-norm of the vector \(u\). The pair \((a, b)\) comesponds to an eigenvaluew \(=a \neq\) \(v A u(N B u)\) of the \(m\) atrix pair ( \(A, B\) ). If both \(a\) and \(b\) equal zero, then \((A, B)\) is singular and \(S(I)=-1\) is retumed.

A \(n\) approxim ate errorbound on the chordal distance betw een the i-th computed generalized eigenvalue \(w\) and the comesponding exacteigenvalue lam bda is
\[
\text { chord }(w, \operatorname{lam} \text { bda) }<=\text { EPS * nom }(A, B) / S(I),
\]
where EPS is the \(m\) achine precision.

The reciprocal of the condition num ber of the right eigenvector \(u\) and lefteigenvectorv corresponding to the generalized eigenvalue w is defined as follow s. Suppose
\[
\begin{array}{rl}
(\mathrm{A}, \mathrm{~B}) & =(\mathrm{a} *)(\mathrm{b} *) 1 \\
& (0 \mathrm{~A} 22),(0 \mathrm{~B} 22) \mathrm{n}-1 \\
1 & \mathrm{n}-1 \\
1 \mathrm{n}-1
\end{array}
\]

Then the reciprocalcondition num berD \(\mathbb{F}(\mathbb{I})\) is
\[
\mathrm{D} \text { ifl }[(\mathrm{a}, \mathrm{~b}), \text { (A 22, B 22)] = sigm a-m in ( } \mathrm{Z} 1 \text { ) }
\]
where sigm a-m in (Z) denotes the sm allest singular value of
```

Z l= [kron (a, In-1) -kron(1,A 22) ]

```
[ kron (b, In-1) kron (1, B22) ].

H ere In - 1 is the identity \(m\) atrix of size \(n-1\) and \(X\) ' is the conjugate transpose of X . \(\mathrm{kron}(\mathrm{X}, \mathrm{Y})\) is the K roneckerproduct.betw een the \(m\) atrices \(X\) and \(Y\).

W e approxim ate the sm allestsingularvalue of Zl w th an
upperbound. This is done by C LA TD F.
A \(n\) approxim ate errorbound for com puted eigenvector \(V L\) (i) orVR(i) is given by
```

EPS * norm (A,B )/D \mathbb{F (i).}

```

\section*{C INTERFACE}
\#include <sunperfh>
void ztgsyl(chartrans, int ijob, intm, int n, doublecom plex *a, int lda, doublecom plex *b, int ldb, doublecom plex *c, int ldc, doublecom plex *d, int ldd, doublecom plex *e, int lde, doublecom plex *f, int ldf, double *scale, double *dif, int *info);
void ztgsyl 64 (chartrans, long ij.j. long m , long n, doublecom plex *a, long lda, doublecom plex *b, long ldb, doublecom plex *c, long ldc, doublecom plex *d, long ldd, doublecom plex *e, long lde, doublecom plex *f, long ldf, double *scale, double *dif, long *info);

\section*{PURPOSE}
ztgsylsolves the generalized Sylvesterequation:
\[
\begin{aligned}
& A * R-L * B=\text { scale * C } \\
& D * R-L * E=\text { scale } * F
\end{aligned}
\]
where \(R\) and \(L\) are unknow \(n m\) by-n \(m\) atrices, ( \(A, D\) ), ( \(B\), E) and ( \(C, F\) ) are given \(m\) atrix pairs of size \(m \rightarrow b y-m, n-b y-n\) and \(m\)-by-n, respectively, w ith com plex entries. A, B, D and E are upper triangular (i.e., \((A, D)\) and \((B, E)\) in generalized Schur form ).

The solution ( \(\mathrm{R}, \mathrm{L}\) ) overw rites ( \(\mathrm{C}, \mathrm{F}\) ). 0 <= SCALE <= 1 is an output scaling factor chosen to avoid overflow .

In \(m\) atrix notation (1) is equivalent to solve \(Z x=s c a l e * b\), where \(Z\) is defined as
\[
\begin{aligned}
Z= & {\left[\operatorname{kron}(\mathbb{I n}, A)-\operatorname{kron}\left(B^{\prime}, \mathbb{I}\right)\right] } \\
& {\left[\operatorname{kron}(\mathbb{I n}, D) \operatorname{dron}\left(E^{\prime}, \mathbb{I}\right)\right] }
\end{aligned}
\]

Here Ix is the identity m atrix of size x and X 'is the conjugate transpose of X . K ron \((X, Y)\) is the K roneckerproduct betw een the \(m\) atrioes \(X\) and \(Y\).

If TRAN \(S=C\) ', \(y\) in the conjugate transposed system \(Z\) * \(y=\) scale*b is solved for, which is equivalent to solve forR and \(L\) in
\[
\begin{align*}
& A^{\prime} * R+D^{\prime *} L=\text { scale * C }  \tag{3}\\
& \text { R * } \mathrm{B}^{\prime}+\mathrm{L} \text { * } \mathrm{E} \text { '= scale * } \mathrm{F}
\end{align*}
\]

This case (TRANS = C) is used to com pute an one-norm -based estim ate of \(D\) if \([(A, D),(B, E)]\), the separation betw een the \(m\) atrix pairs \((A, D)\) and \((B, E)\), using C LA CON .

If \(\mathrm{IJO} \mathrm{B}>=1, \mathrm{CTG}\) SY L com putes a F robenius norm -based esti\(m\) ate ofD if \([(A, D),(B, E)]\). That is, the reciprocalof a low er bound on the reciprocal of the sm allest singular value of \(Z\).

This is a level-3 BLA S algorithm .

\section*{ARGUMENTS}

TRANS (input)
\(=\mathrm{N}\) ': solve the generalized sylvester equation
(1).
= C':solve the "conjugate transposed" system
(3).

IJOB (input)
Specifies whatkind of functionality to be per-
form ed. \(=0\) : solve (1) only .
\(=1\) : The functionality of 0 and 3 .
\(=2\) : The functionality of 0 and 4 .
\(=3: 0\) nly an estim ate ofD if \([(A, D),(B, E)]\) is computed. (look ahead strategy is used). \(=4: 0 \mathrm{nly}\) an estim ate of \(D\) if \([(A, D),(B, E)]\) is com puted.
(CGECON on sub-system S is used). N ot referenced if TRANS = C'.
\(M\) (input) The order of them atrices \(A\) and \(D\), and the row dim ension of the \(m\) atrioes \(C, F, R\) and \(L\).
\(N\) (input) The order of the \(m\) atriges \(B\) and \(E\), and the colum \(n\) dim ension of the \(m\) atriges \(C, F, R\) and \(L\).

A (input) The uppertriangularm atrix A.

LD A (input)
The leading dim ension of the array A.LDA >= \(\max (1, M)\).

B (input) The uppertriangularm atrix B.

LD B (input)
The leading dim ension of the aray \(\mathrm{B} . \mathrm{LD} \mathrm{B}>=\) \(\max (1, N)\).

C (input/output)
On entry, \(C\) contains the right-hand-side of the first \(m\) atrix equation in ( 1 ) or ( \(\beta\) ). On exit, if IJO B \(=0,1\) or \(2, C\) has been overw rilten by the solution R. If IJOB \(=3\) or 4 and TRANS \(=N\) ', C holds \(R\), the solution achieved during the com putation of the \(D\) ifestim ate.

LD C (input)
The leading dim ension of the array \(C . \operatorname{LDC}>=\) \(\max (1, M)\).

D (input) The uppertriangularm atrix D.

LD D (input)
The leading dim ension of the aray \(D . \operatorname{LDD}>=\) \(\max (1, M)\).

E (input) The upper triangularm atrix E.

LD E (input)
The leading dim ension of the array \(\mathrm{E} . \mathrm{LDE}>=\) \(\max (1, N)\).

F (input/output)
On entry, \(F\) contains the right-hand-side of the second \(m\) atrix equation in (1) or (3). On exit, if IJO B \(=0,1\) or \(2, F\) has been overw ritten by the solution L. If IJOB=3 or 4 and TRANS \(=N^{\prime}, F\) holds L , the solution achieved during the com putation of the \(D\) ifestim ate.

LD F (input)
The leading dim ension of the array F. LDF >= \(m a x(1, M)\).

SCALE (output)
On exitSCALE is the reciprocalof a low er bound of the reciprocal of the \(D\) if-function, ie. SCA LE is an upperbound ofD if \([(A, D),(B, E)]=\) sigm a\(m\) in ( \(Z\) ), where \(Z\) as in (2). If \(I O B=0\) orTRAN \(S=\) \(C^{\prime}\),SCALE is not referenced.

D \(\mathbb{F}\) (output)
On exitSCA LE is the reciprocalofa lower bound of the reciprocal of the \(D\) if-function, i.e. SCA LE is an upperbound ofD if \([(A, D),(B, E)]=\) sigm a\(m\) in ( \(Z\) ), where \(Z\) as in (2). If IJO \(B=0\) orTRAN \(S=\) \(C\) ',SCALE is not referenced.

W ORK (w orkspace)
If \(I J O B=0, W O R K\) is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0\) then \(W\) ORK (1) retums the optim allW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. LW ORK > = 1. If \(\mathrm{IJOB}=1\) or 2 and TRANS \(=\mathrm{N}^{\prime}\), LW ORK >= \(2 * \mathrm{M} * \mathrm{~N}\) 。

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim alsize of theW ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.

IV ORK (w orkspace)
If \(I O B=0, \mathbb{I N} O R K\) is notreferenced.
\(\mathbb{N} F O\) (output)
=0: successfulexit
\(<0:\) If \(\mathbb{N}\) FO \(=-\) - , the \(i\)-th argum enthad an illegal value.
>0: \((A, D)\) and \((B, E)\) have com \(m\) on or very close eigenvalues.

void ztpm v_64 (charuplo, char transa, char diag, long n, doublecom plex *a, doublecom plex *y, long incy);

\section*{PURPOSE}
ztpm v perform s one of the \(m\) atrix-vector operations \(x: A * x\), or \(x:=A{ }^{*} x\), or \(x:=\) con \(\dot{g}\left(A^{\prime}\right)^{*} x\) where \(x\) is an \(n\) elem ent vectorand \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix, supplied in packed form .

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies whetherthem atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or G ' A is an upper triangular \(m\) atrix.

UPLO = L' or '1' A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} \mathrm{x}:=\mathrm{A}{ }^{*} \mathrm{x}\).

TRANSA \(=\) T'ort' \(x:=A * x\).

U nchanged on exit.

TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{I}\) G \(=\) U 'or L ' \(A\) is assum ed to be unit tri-
angular.
\(D \mathbb{A G}=N\) 'or \(h\) ' \(A\) is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
O n entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

A (input)
( \((n *(n+1)) / 2)\). Before entry with UPLO = \(U\) ' or \(L\) ', the amay A m ustcontain the upper triangularm atrix packed sequentially, colum \(n\) by colum \(n\), so thatA (1) contains a (1, 1), A (2) and \(A(3)\) contain \(a(1,2)\) and \(a(2,2)\) respectively, and so on. Before entry w ith UPLO = L' or I', the anray A m ust contain the low er triangular m atrix packed sequentially, colum \(n\) by colum \(n\), so thatA (1) contains a (1,1),A(2) and \(A(3)\) contain \(a(2,1)\) and \(a(3,1)\) respec tively, and so on. N ote thatw hen D IA G \(=U U^{\prime}\) or \(G\) ', the diagonal elem ents of A are notreferenced, butare assum ed to be unity. U nchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. O n exit, \(Y\) is overw ritten \(w\) ith the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(. \mathbb{N} C Y<>0\). U nchanged on exit.

\section*{PURPOSE}
ztprfs provides errorbounds and backw ard error estim ates forthe solution to a system of linear equations \(w\) th a triangular packed coefficientm atrix.

The solution m atrix X m ustbe com puted by CTPTRS or some other \(m\) eans before entering this routine. CTPRFS does not do iterative refinem entbecause doing so cannotim prove the backw ard error.

\section*{ARGUMENTS}

\section*{UPLO (input)}
= U ': A is uppertriangular;
= LL': A is low ertriangular.

TRANSA (input)
Specifies the form of the system of equations:
\(=\mathrm{N}\) ': A * \(\mathrm{X}=\mathrm{B} \quad\) N \(\circ\) transpose)
\(=T\) ': A ** \(T\) * \(\mathrm{X}=\mathrm{B} \quad\) ( r ranspose)
= C ': A **H * X = B (C onjugate transpose)

TRANSA is defaulted to \(N\) 'forF95 \(\mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}\) : A is non-unit triangular;
\(=\mathrm{U}:\) : A is unit triangular.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of the \(m\) atrices \(B\) and \(X\). NRH \(S>=0\).

A (input) The upper or low er triangular m atrix A, packed colum nw ise in a linear amay. The jth colum \(n\) of A is stored in the array A as follow s: if UPLO = \(U^{\prime}, A(i+(j-1) * j 2)=A(i, j)\) for \(1<=i<=j\); if UPLO = L', A ( \(\left.i+(j-1)^{*}(2 n-j) / 2\right)=A(i, j)\) for \(j=i<=n\). IfD \(\mathbb{A} G=U\) ', the diagonalelem ents of \(A\) are not referenced and are assum ed to be 1 .
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the aray \(B\). LD B >= \(\max (1, N)\).

X (input) The solution matrix X .
LD X (input)
The leading dim ension of the array X . LD X >= \(\max (1, \mathbb{N})\).

FERR (output)
The estim ated forw ard enrorbound for each solution vector \(X()\) ) the \(j\) th column of the solution matrix X). If XTRUE is the true solution corresponding to \(X(\mathcal{H}), \operatorname{FERR}(\mathcal{)})\) is an estim ated upperbound for the \(m\) agnitude of the largest ele\(m\) ent in ( \(\mathrm{X}(\mathcal{1})-\mathrm{XTRUE}\) ) divided by the \(m\) agnitude of the largestelem ent in \(X(\mathcal{j})\). The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slight overestim ate of the true emor.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each solution vector X ( \()\) (i.e., the sm allest relative change in any elem entofA orB thatm akes X (i) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )

W ORK2 (w orkspace)

\section*{PURPOSE}
ztpsv solves one of the system sofequations \(A * x=b\), or \(A^{\prime}{ }^{*} x=b, \operatorname{orcon} \dot{g}\left(A^{\prime}\right) * x=b\) where \(b\) and \(x\) are \(n\) elem ent vectors and A is an n by \(n\) unit, ornon-unit, upper or low er triangularm atrix, supplied in packed form .

N o test forsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
On entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:

UPLO = U'or L ' A is an upper triangular \(m\) atrix.

UPLO = L' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.
TRANSA (input)
On entry, TRANSA specifies the equations to be solved as follow s:

TRANSA \(=N\) 'or \(h\) ' \(A * x=b\).

TRANSA \(=\) T'ort' \(A * x=b\).

U nchanged on exit.
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
\(\left(\left(\mathrm{n}^{*}(\mathrm{n}+1)\right) / 2\right)\). Before entry w th \(\mathrm{UPLO}=\) \(U\) ' or U ', the array A m ustcontain the upper triangularm atrix packed sequentially, colum \(n\) by colum n , so that A (1) contains a ( 1,1 ), A (2) and \(A(3)\) contain \(a(1,2)\) and \(a(2,2)\) respectively, and so on. Before entry w ith UPLO = \(\mathrm{L}^{\prime}\) or 1 ', the amay A m ust contain the low er triangular \(m\) atrix packed sequentially, colum \(n\) by colum n, so thatA (1) contains a (1,1), A (2) and \(A\) ( 3 ) contain a \((2,1)\) and a \((3,1)\) respectively, and so on. N ote thatw hen D IA G \(=\) U' or G ', the diagonal elem ents of A are notreferenced, but are assum ed to be unity. Unchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y \mathrm{~m}\) ust contain the n elem ent righthand side vectorb. O \(n\) exit, \(Y\) is overw ritten \(w\) ith the solution vector \(x\).
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of. \(\mathbb{I N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
ztrcon estim ates the reciprocal of the condition num ber of a triangular \(m\) atrix \(A\), in either the 1 -norm or the infinity norm.

The norm ofA is com puted and an estim ate is obtained for norm (inv (A )), then the reciprocal of the condition num ber is com puted as
```

RCOND = 1 / (nom (A ) * nom (inv (A)) ).

```

\section*{ARGUMENTS}
```

NORM (input)
Specifies w hether the 1-nom condition number or
the infinity-norm condition num ber is required:
= I 'or O ': 1-nom ;
= I':}\quad\mathrm{ Infinity-norm .
UPLO (input)
= U ': A is uppertriangular;
= LL':A is low ertriangular.

```
D IA G (input)
\(=N^{\prime}\) : A is non-unit triangular;
\(=\mathrm{U}\) : A is unit triangular.

N (input) The order of the m atrix A. \(\mathrm{N}>=0\).

A (input) The triangularm atrix A . If \(\mathrm{PLO}=\mathrm{U}\) ', the leading N -by -N upper triangularpart of the amay A contains the upper triangular \(m\) atrix, and the strictly low ertriangular partofA is not referenced. IfUPLO = L', the leading N -by-N lower triangular part of the array A contains the low er triangularm atrix, and the strictly upper triangular part ofA is not referenced. IfD \(\mathbb{I A} G=U\) ', the diagonalelem ents ofA are also not referenced and are assum ed to be 1 .
LDA (input)
The leading dim ension of the array A. LDA >= \(\max (1, N)\).

RCOND (output)
The reciprocal of the condition num ber of the \(m\) atrix \(A\), computed as RCOND \(=1 /(\) norm (A) * norm (inv (A))).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )

\#include <sunperfh>
void ztrevc (char side, char how my, int *select, int n, doublecom plex *t, int ldt, doublecom plex *vl, int ldvl, doublecom plex *vr, int ldvr, intm \(m\), int *m, int*info);
void ztrevc_64 (charside, charhow m ny, long *select, long n, doublecom plex *t, long ldt, doublecom plex *vl, long ldvl, doublecom plex *vr, long ldvr, long m m, long *m, long *info);

\section*{PURPOSE}
ztrevc com putes som e or all of the right and/or left eigenvectors of a com plex upper triangularm atrix T .

The righteigenvectorx and the left eigenvector \(y\) of \(T\) comesponding to an eigenvalue \(w\) are defined by:
\[
\mathrm{T}^{*} \mathrm{x}=\mathrm{w} * \mathrm{x}, \quad \mathrm{y} * \mathrm{~T}=\mathrm{w}^{*} \mathrm{y}^{\prime}
\]
where y'denotes the conjugate transpose of the vectory.

If alleigenvectors are requested, the routine m ay either retum the \(m\) atrices \(X\) and/or \(Y\) of rightor lefteigenvectors of \(T\), or the products \(Q * X\) and/or \(Q * Y\), where \(Q\) is an input unitary
\(m\) atrix. If \(T\) w as obtained from the Schur factorization of an original matrix \(A=Q * T * Q\) ', then \(Q * X\) and \(Q * Y\) are the \(m\) atrices of right or lefteigenvectors of \(A\).

\section*{ARGUMENTS}

STDE (input)
= R ': com pute righteigenvectors only;
= L ': com pute lefteigenvectors only;
= B ': com pute both right and lefteigenvectors.

HOW M NY (input)
= A ': com pute all right and/or left eigenvec-
tors;
= B ': com pute all right and/or left eigenvectors, and backtransform them using the input \(m\) atrices supplied in VR and/orV L; = S ': com pute selected right and/or left eigenvectors, specified by the logicalamay SELEC T .

SELECT (input/output)
If HOW M NY = S', SELECT specifies the eigenvectors to be com puted. IfHOW M NY = A 'or B', SELECT is not referenced. To select the eigenvector corresponding to the jth eigenvalue, SELECT (j) mustbe setto .TRUE ..

N (input) The order of the m atrix \(\mathrm{T} . \mathrm{N}>=0\).

T (input/output)
The upper triangularm atrix T . T ism odified, but restored on exit.

LD T (input)
The leading dim ension of the aray T. LD T >= \(\max (1, N)\).

VL (input/output)
On entry, ifSDE \(=\mathrm{L}\) 'or B 'and HOW MNY = B',
VL must contain an \(N\) boy N matrix Q (usually the unitary matrix \(Q\) of Schur vectors retumed by CHSEQR). On exit, if \(S \mathbb{D} E=\) L'or B',VL contains: if HOW MNY = A', the matrix Y of left eigenvectors of T ; L is low ertriangular. The ith column VL (i) of VL is the eigenvector corresponding to \(T(i, i)\). if HOW MNY \(=B\) ', the \(m\) atrix \(Q\) *Y ; if H OW M N Y = S', the lefteigenvectors of T specified by SELEC \(T\), stored consecutively in the colum ns of VL, in the same order as their eigenvalues. If \(S \mathbb{D} E=R\) ', \(V L\) is not referenced.

LDVL (input)
The leading dim ension of the array VL. LDVL >= \(\max (1, \mathbb{N})\) if \(\mathrm{S} \mathbb{D} \mathrm{E}=\mathrm{L}\) 'or B'; LDVL >= 1 otherw ise.

VR (input/output)
On entry, if \(S \mathbb{D} E=R\) 'or \(B\) 'and HOW M NY = B', VR must contain an N -by -N m atrix Q (usually the unitary matrix \(Q\) of Schur vectors retumed by CHSEQR). On exit, if \(S \mathbb{D} E=R\) 'or \(B\) ', VR contains: ifHOW MNY = A', the matrix \(X\) of right eigenvectors of \(T\); \(V R\) is uppertriangular. The ith column VR (i) of VR is the eigenvector corresponding to \(\mathrm{T}(\mathrm{i}, \mathrm{i})\). if HOW M NY = B ', the \(m\) atrix \(Q * X\); if HOW M NY \(=S\) ', the right eigenvectors of \(T\) specified by SELECT, stored consecutively in the colum ns of \(V R\), in the sam e order as their eigenvalues. If \(\mathrm{SD} E=\mathrm{L}\) ', VR is not referenced.

LDVR (input)
The leading dim ension of the aray VR. LDVR >= \(\max (1, N)\) if \(S \mathbb{D}=R\) 'or \(B\) '; LDVR \(>=1\) otherw ise.

M M (input)
The num ber of colum ns in the arrays VL and/or VR. M M >= M .

M (output)
The num ber of colum ns in the arrays VL and/or VR actually used to store the eigenvectors. If HOW M NY = A 'or B',M is set to N. Each selected eigenvector occupies one colum \(n\).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )

RW ORK (w orkspace)
dim ension \(\mathbb{N}\) )
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue

\section*{FURTHER DETAILS}

The algorithm used in this program is basically backw ard (forw ard) substitution, \(w\) th scaling to \(m\) ake the the code robustagainstpossible overflow .

Each eigenvector is nom alized so that the elem ent of largest \(m\) agnitude has \(m\) agnitude 1 ; here the \(m\) agnitude of a com plex num ber \((x, y)\) is taken to be \(|x|+|y|\).

\section*{PURPOSE}
ztrm \(m\) perform sone of the \(m\) atrix \(m\) atrix operations \(B:=\) alpha*op ( A ) B , or \(\mathrm{B}:=\) alpha* B *op ( A ) where alpha is a scalar, \(B\) is an \(m\) by \(n m\) atrix, \(A\) is a unit, or non-unit, upper or low er triangularm atrix and op (A ) is one of op ( \(\mathrm{A})=\mathrm{A} \operatorname{orop}(\mathrm{A})=\mathrm{A}^{\prime} \operatorname{orop}(\mathrm{A})=\operatorname{conjg}\left(\mathrm{A}^{\prime}\right)\)

\section*{ARGUMENTS}

STDE (input)
On entry, SDE specifies whether op (A) m ultiplies \(B\) from the leftor right as follow \(s\) :

SDEE L'or I' B := alpha*op (A )*B.

U nchanged on exit.
UPLO (input)
On entry, UPLO specifies whether them atrix A is an upper or low er triangularm atrix as follow \(s\) :

UPLO = U'or 4 ' A is an upper triangular \(m\) atrix.

UPLO = L' or 1' A is a lower triangular
m atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the form of op (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow \(s\) :

TRANSA \(=N^{\prime}\) 'or \(h^{\prime}\) op (A) \()=A\).

TRANSA \(=\) T'ort'op \((A)=A\).

TRANSA \(=C^{\prime}\) or \(C^{\prime} o p(A)=c o n \dot{g}\left(A^{\prime}\right)\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.
D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:
\(D \mathbb{A G}=U\) 'or \(U^{\prime} A\) is assum ed to be unit triangular.

D IA G \(=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, \(M\) specifies the num ber of row \(s\) of \(B . M\) \(>=0\). U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of \(B\). \(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, A LPH A specifies the scalar alpha.W hen alpha is zero then \(A\) is notreferenced and \(B\) need notbe setbefore entry. U nchanged on exit.

A (input)
COM PLEX *16 aray ofD \(\mathbb{I M}\) ENSION (LDA,k), where \(k\) is \(m\) when \(S \mathbb{D E}=\mathbb{L}\) 'or I' and is \(n\) when \(S \mathbb{D E}=\mathrm{R}\) 'or \(\mathrm{r}^{\prime}\).

Before entry w th UPLO = U'or L', the leading \(k\) by \(k\) upper triangularpart of the aray \(A\) \(m\) ustcontain the upper triangularm atrix and the
strictly low ertriangularpartofA is not referenced.

Before entry with UPLO = L'or 1', the leading \(k\) by \(k\) low er triangularpart of the array A m ust contain the low er triangularm atrix and the strictly uppertriangularpartofA is not referenced.

N ote thatw hen \(\mathrm{D} \mathbb{I A} G=\mathrm{U}\) ' or U ', the diagonal elem ents of A are not referenced either, butare assum ed to be unity.

U nchanged on exit.
LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. W hen SDE \(=\) L'or 1 'then LD \(A>=\max (1, M)\), when \(S \mathbb{D} E\) \(=R^{\prime}\) or 'r'then LD A \(>=\max (1, N)\). U nchanged on exit.

B (input/output)
COM PLEX *16 aray ofD \(\mathbb{I M}\) ENSION (LD B,n). Before
entry, the leading \(M\) by \(N\) partof the array \(B\) m ust contain the \(m\) atrix \(B\), and on exit is overw rilten by the transform ed \(m\) atrix.

LD B (input)
O n entry, LD B specifies the firstdim ension of B as declared in the calling subprogram. LD B m ust be at leastm ax ( \(1, \mathrm{M}\) ). U nchanged on exit.

\(z\) trm \(v\) perform s one of the \(m\) atrix-vector operations \(x:=A{ }^{*} x\), or \(x:=A{ }^{*} x\), or \(x:=\) con \(\dot{g}\left(A^{\prime}\right) \star x w h e r e x\) is an \(n\) elem ent vectorand \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow \(s\) :
\(\mathrm{UPLO}=\mathrm{U}\) 'or G ' \(A\) is an upper triangular m atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the operation to be perform ed as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} x:=A * x\).

TRANSA \(=\) T'ort' \(x:=A{ }^{*} x\).

TRANSA \(=\) C'ort' \(\mathrm{x}:=\operatorname{conjg}\left(A^{\prime}\right) \star \mathrm{x}\).

U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)

On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{A G G}=\mathrm{U}\) 'or \(\mathrm{L}^{\prime} \mathrm{A}\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassumed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.
A (input)
Before entry w ith UPLO = U 'or L ', the leading n by n upper triangularpart of the array A m ust contain the upper triangular \(m\) atrix and the strictly low ertriangularpartofA is not referenced. Before entry w ith UPLO = L'or I', the leading \(n\) by \(n\) low er triangularpart of the anray A \(m\) ust contain the low ertriangularm atrix and the strictly uppertriangularpartofA is not referenced. N ote thatw hen D IAG \(=\mathrm{U}\) ' or L ', the diagonal elem ents of A are not referenced either, but are assum ed to be unity. U nchanged on exit.

LDA (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program . LD A \(>=\) \(m a x(1, n)\). U nchanged on exit.

Y (input/output)
\((1+(n-1) * \operatorname{abs}(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent vectorx. On exit, \(Y\) is overw rilten \(w\) th the tranform ed vector \(x\).
\(\mathbb{N C Y}\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents ofY. \(\mathbb{N C Y}\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
ztrnfs provides errorbounds and backw ard error estim ates for the solution to a system of linear equations \(w\) th a triangular coefficientm atrix.

The solution \(m\) atrix \(X\) m ustbe com puted by CTRTRS or some other \(m\) eans before entering this routine. CTRRFS does not do iterative refinem entbecause doing so cannot im prove the backw ard error.

\section*{ARGUMENTS}

\section*{UPLO (input)}
\(=\mathrm{U}\) : A is uppertriangular;
= L' ': A is low ertriangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=N^{\prime}: A * X=B \quad\) N o transpose)
\(=T\) : A ** \(\mathrm{T} * \mathrm{X}=\mathrm{B} \quad\) ( T ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=\mathrm{N}: A\) is non-unit triangular;
\(=U\) ': A is unit triangular.

N (input) The order of the matrix A. \(\mathrm{N}>=0\).

NRHS (input)
The num ber of right hand sides, ie., the num ber of colum ns of the m atrices B and X . NRH S >=0.

A (input) The triangularm atrix A. If \(\mathrm{U} P L O=\mathrm{U}\) ', the leading N -by- N upper triangularpart of the aray A contains the upper triangular \(m\) atrix, and the strictly low er triangular part of \(A\) is not referenced. IfUPLO = L ', the leading N -by- N low er triangular part of the amray A contains the low ertriangularm atrix, and the strictly upper triangularpart ofA is not referenced. IfD IA G = U', the diagonal elem ents of A are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).
\(B\) (input) The righthand side \(m\) atrix \(B\).

LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, N)\).
\(X\) (input) The solution \(m\) atrix \(X\).

LD X (input)
The leading dim ension of the array X. LD X >= \(\max (1, N)\).

FERR (output)
The estim ated forw ard emorbound for each solution vectorX (i) the \(j\) th colum \(n\) of the solution \(m\) atrix \(X)\). If \(X T R U E\) is the true solution comesponding to \(X(\mathcal{i}), \operatorname{FERR}(\mathcal{)}\) is an estim ated upperbound forthe \(m\) agnitude of the largest ele\(m\) entin (X ( \()\)-X TRUE) divided by the magninude of the largestelem entin X ( 7 ) . The estim ate is as reliable as the estim ate forRCOND, and is alm ost alw ays a slightoverestim ate of the true error.

\section*{BERR (output)}

The com ponentw ise relative backw ard error of each
solution vectorX (i) (i.e., the sm allest relative change in any elem entofA orB thatm akes X ( \(\mathcal{(})\) an exactsolution).

W ORK (w orkspace)
dim ension ( \(2 * \mathrm{~N}\) )
W ORK 2 (w orkspace)
dim ension (N)
\(\mathbb{N} F O\) (output)
= 0: successfulexit
< 0: if \(\mathbb{N}\) FO = -i, the i-th argum ent had an illegalvalue

\#include <sunperfh>
void ztrsen (char job, char com pq, int *select, intn, doublecom plex *t, int ldt, doublecom plex *q, int ldq, doublecom plex *w, int *m, double *s, double *sep, int*info);
void ztrsen_64 (char job, char com pq, long *select, long n, doublecom plex *t, long ldt, doublecom plex *q, long ldq, doublecom plex *w , long *m , double \({ }^{*}\) s, double *sep, long *info);

\section*{PURPOSE}
ztrsen reorders the Schur factorization of a com plex m atrix \(\mathrm{A}=\mathrm{Q} * \mathrm{~T} * \mathrm{Q} * * \mathrm{H}\), so that a selected clusterofeigenvalues appears in the leading positions on the diagonal of the upper triangularm atrix \(T\), and the leading colum ns ofQ form an orthonorm albasis of the comesponding right invariant subspace.

Optionally the routine com putes the reciprocal condition num bers of the cluster ofeigenvalues and/or the invariant subspace.

\section*{ARGUMENTS}
\(J O B\) (input)
Specifies w hether condition num bers are required for the cluster of eigenvalues (S) or the invari-
ant subspace (SEP):
= N ': none;
= E': foreigenvalues only (S);
= V ': for invariant subspace only (SEP);
= B ': forboth eigenvalues and invariant subspace (S and SEP).

COMPQ (input)
= V ': update the m atrix Q ofSchurvectors;
= N ': do notupdate Q .

\section*{SELECT (input)}

SELEC T specifies the eigenvalues in the selected
cluster. To select the \(j\) th eigenvalue, SELEC T (i) mustbe setto .TRUE ..

N (input) The order of the m atrix \(\mathrm{T} \cdot \mathrm{N}>=0\).
T (input/output)
O n entry, the uppertriangularm atrix T. On exit, \(T\) is overw rilten by the reordered \(m\) atrix \(T, w\) ith the selected eigenvalues as the leading diagonal elem ents.

LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, N)\).

Q (input) \(O n\) entry, if \(C O M P Q=V\) ', the \(m\) atrix \(Q\) of Schur vectors. On exit, if COMPQ = V', Q has been postm ultiplied by the unitary transform ation \(m\) atrix which reorders \(T\); the leading \(M\) colum ns of Q form an orthonorm al basis for the specified invariant subspace. If \(C O M P Q=N\) ', Q is not referenced.

LD Q (input)
The leading dim ension of the array \(\mathrm{Q} . \mathrm{LD} \mathrm{Q}>=1\); and ifCOM \(P Q=V\) ', LD \(Q>=N\).

W (output)
The reordered eigenvalues of \(T\), in the sam e order as they appear on the diagonalof \(T\).

M (output)
The dim ension of the specified invariant subspace. \(0<=\mathrm{M}<=\mathrm{N}\).

S (output)
If \(\mathrm{JOB}=\mathrm{E}\) 'or \(\mathrm{B}^{\prime}\) ', S is a lower bound on the reciprocal condition num ber for the selected clus-
ter ofeigenvalues. S cannot underestim ate the true reciprocal condition num berby \(m\) ore than a factorof sqit \(\mathbb{N}\) ). If \(M=0\) or \(N, S=1\). If \(J 0 B=\) N 'or V ', S is not referenced.

SEP (output)
If \(\mathrm{JO} \mathrm{B}=\mathrm{V}\) 'or B ', SEP is the estim ated reciprocal condition num ber of the specified invariant subspace. IfM \(=0\) orN, \(\mathrm{SEP}=\) norm ( T ). If \(\mathrm{JOB}=\) N 'or E',SEP is not referenced.
W ORK (w orkspace)
If \(\mathrm{JOB}=\mathrm{N}\) ', W ORK is not referenced. O therw ise, on exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the aray \(W\) ORK. If \(J O B=N\) ', LW ORK >=1; if \(\mathcal{O} O B=E \prime\), LW \(O R K=M * \mathbb{N}-M)\); if \(J O B\) \(=V\) 'or \(B\) ', LW ORK \(>=2 * M * \mathbb{N}-M)\).

IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim al size of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N F O}\) (output)
= 0: successfulexit
<0: if \(\mathbb{I N}\) FO = -i, the i-th argum ent had an illegalvalue

\section*{FURTHER DETAILS}

C TRSEN first collects the selected eigenvalues by com puting a unitary transform ation \(Z\) to \(m\) ove them to the top left comerofT. In otherw ords, the selected eigenvalues are the eigenvalues of T11 in:
\[
\begin{gathered}
\mathrm{Z} \text { * } \mathrm{T} * \mathrm{Z}=(\mathrm{T} 11 \mathrm{~T} 12) \mathrm{n} 1 \\
(0 \mathrm{~T} 22) \mathrm{n} 2 \\
\mathrm{n} 1 \mathrm{n} 2
\end{gathered}
\]
\(w\) here \(N=n 1+n 2\) and \(Z\) ' \(m\) eans the conjugate transpose of \(Z\). The firstn1 colum ns of \(Z\) span the specified invariantsubspace of \(T\).

If \(T\) hasbeen obtained from the Schur factorization of a \(m\) atrix \(A=Q * T * Q\) ', then the reordered Schur factorization of \(A\) is given by \(\left.A=Q * Z)^{*}\left(Z{ }^{*} T * Z\right)^{*} Q * Z\right)\) ', and the first \(n 1\) colum ns of Q * Z span the comesponding invariant subspace of
A.

The reciprocal condition num ber of the average of the eigenvalues of T11 may be retumed in S.S lies betw een 0 (very badly conditioned) and 1 (very w ellconditioned). It is com puted as follow s. Firstw e com pute \(R\) so that
\[
\begin{gathered}
P=\left(\begin{array}{l}
\text { I R }) ~ n 1 ~ \\
(00) n 2 \\
n 1 n 2
\end{array}\right.
\end{gathered}
\]
is the projector on the invariant subspace associated with T11. R is the solution of the Sylvesterequation:
\[
\mathrm{T} 11 * \mathrm{R}-\mathrm{R} * \mathrm{~T} 22=\mathrm{T} 12 .
\]

LetF-norm M) denote the Frobenius-norm of M and 2-norm (M) denote the tw o-norm of . Then \(S\) is com puted as the low er bound
\[
(1+F-\text { norm }(R) * * 2)^{* *}(-1 / 2)
\]
on the reciprocalof2-nom (P), the true reciprocal condition number. S cannotunderestim ate \(1 / 2\)-norm (P) by m ore than a factorof sqrt \(\mathbb{N}\) ).

A \(n\) approxim ate errorbound for the com puted average of the eigenvalues of T11 is
```

EPS * norm (T)/S

```
where EPS is the m achine precision.
The reciprocal condition num ber of the right invariant subspace spanned by the firstn1 colum nsof (orofQ *Z) is retumed in SEP. SEP is defined as the separation of T11 and T 22 :
```

sep(T11,T22 ) = sigm a-m in (C )

```
where sigm a-m in (C) is the sm allest singularvalue of the \(\mathrm{n} 1 * \mathrm{n} 2-b y-n 1 * n 2 \mathrm{~m}\) atrix
\[
C=\operatorname{kprod}(I(n 2), T 11)-k p r o d(t r a n s p o s e(T 22), I(n 1))
\]

I( \(m\) ) is an \(m\) by \(m\) identity \(m\) atrix, and kprod denotes the \(K\) ronecker product. W e estim ate sigm a-m in (C) by the reciprocalofan estim ate of the 1 -norm of inverse (C). The true reciprocal 1-norm of inverse (C ) cannotdiffer from sigm a\(m\) in (C) by \(m\) ore than a factor of sqrt (n1*n2).

W hen SEP is sm all, sm all changes in \(T\) can cause large changes in the invariantsubspace. A \(n\) approxim ate bound on the \(m\) axim um angularerrorin the com puted right invariant subspace is

EPS * norm (T) /SEP

\section*{PURPOSE}
ztrem solves one of the \(m\) atrix equations op (A )*X = alpha*B, or \(X *\) op (A ) \(=\) alpha*B w here alpha is a scalar, \(X\) and \(B\) are \(m\) by \(n m\) atriges, \(A\) is a unit, ornon-unit, upper or low ertriangularm atrix and op (A ) is one of
\(o p(A)=A\) or \(o p(A)=A^{\prime}\) or \(o p(A)=\operatorname{cong}(\) \(\left.A^{\prime}\right)\).

Them atrix \(X\) is overw ritten on \(B\).

\section*{ARGUMENTS}

SDE (input)
On entry, SID E specifies w hetherop (A ) appears on the left or right ofX as follow s:
\(S \mathbb{D} E=\mathbb{L}\) 'or \(\mathrm{I}^{\prime}\) op (A ) *X = a pha*B.
\(S \mathbb{D} E=R^{\prime}\) or \(r^{\prime} X^{*}\) op (A) \(=\) alpha*B.

U nchanged on exit.

UPLO (input)
O n entry, UPLO specifies w hether the m atrix A is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or G ' \(A\) is an upper triangular
m atrix.
\(\mathrm{UPLO}=\mathrm{L}\) ' or I' A is a lower triangular \(m\) atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the form ofop (A ) to be used in the \(m\) atrix \(m\) ultiplication as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime}\) op (A) \()=A\).

TRANSA = T'or \(t^{\prime} \mathrm{op}(A)=A\) '.

TRANSA \(=C^{\prime}\) or \(C^{\prime} o p(A)=c o n j g\left(A^{\prime}\right)\).
U nchanged on exit.

TRANSA is defaulted to \(N\) 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
O n entry, D IA G specifies w hether ornotA is unit triangular as follow s:

D IA G = U 'or \(\mathrm{U}^{\prime}\) A is assum ed to be unit triangular.
\(D \mathbb{A G}=N\) 'or \(h^{\prime} A\) is notassum ed to be unit triangular.

U nchanged on exit.

M (input)
O \(n\) entry, \(M\) specifies the num ber of row s of \(B . M\) \(>=0\). U nchanged on exit.

N (input)
O n entry, \(N\) specifies the num ber of colum ns of \(B\).
\(\mathrm{N}>=0\). U nchanged on exit.

ALPHA (input)
On entry, A LPH A specifies the scalar alpha. W hen alpha is zero then \(A\) is notreferenced and \(B\) need notbe setbefore entry. U nchanged on exit.

A (input)
COMPLEX *16 aray ofD \(\mathbb{I}\) ENSION (LDA, k) , \(w\) here \(k\) is \(m\) when \(S \mathbb{D E}=\mathbb{L}\) 'or \(\mathbb{I}^{\prime}\) and is \(n\) when \(S \mathbb{D} E=R\) 'or \(r^{\prime}\) '.

Before entry \(w\) th \(U P L O=U\) 'or \(u\) ', the leading \(k\) by \(k\) upper triangularpart of the array A m ustcontain the upper triangularm atrix and the strictly low ertriangularpartofA is not referenced.

Before entry with UPLO = L'or 1', the leading \(k\) by \(k\) low er triangularpart of the array \(A\) \(m\) ust contain the low er triangularm atrix and the strictly uppertriangular partofA is not referenced.
\(N\) ote thatw hen \(D \mathbb{A} G=U\) ' or L ', the diagonal elem ents of A are not referenced either, butare assum ed to be unity.

U nchanged on exit.
LD A (input)
On entry, LD A specifies the first dim ension of A as declared in the calling (sub) program. W hen \(S \mathbb{D} E=\mathrm{L}\) 'or I ' then LD \(A>=\mathrm{max}(1, \mathrm{M})\), when \(S \mathbb{D} E\) \(=R^{\prime}\) or ' \(r^{\prime}\) then LD \(A>=m a x(1, N)\). U nchanged on exit.

B (input/output)
COM PLEX *16 array ofD \(\mathbb{M}\) ENSION (LDB, n). B efore entry, the leading \(M\) by \(N\) part of the amay \(B m\) ust contain the righthand side \(m\) atrix \(B\), and on exit is overw rilten by the solution \(m\) atrix \(X\).

LD B (input)
On entry, LD B specifies the firstdim ension of B as declared in the calling subprogram. LD B >= max (1,M). U nchanged on exit.

void ztrsna (char job, char how my, int *select, intn, doublecom plex *t, int ldt, doublecom plex *vl, int ldvl, doublecom plex *vr, int ldvr, double *s, double *sep, intm \(m\), int *m, int ldw ork, int *info);
void ztrsna_64 (char j.b, charhow m ny, long *select, long n, doublecom plex *t, long ldt, doublecom plex *vl, long ldvl, doublecom plex *vr, long ldvr, double *s, double *sep, long mm, long *m, long ldw ork, long *info);

\section*{PURPOSE}
ztrsna estim ates reciprocalcondition num bers for specified eigenvahues and/or right eigenvectors of a com plex upper triangularm atrix T (orofany \(m\) atrix \(Q * T * Q * * H\) with \(Q\) uni tary).

\section*{ARGUMENTS}

JOB (input)
Specifies w hethercondition num bers are required
foreigenvahues (S) oreigenvectors (SEP):
\(=\mathrm{E}\) ': foreigenvahues only (S);
\(=V^{\prime}\) : foreigenvectors only (SEP);
\(=B\) ': forboth eigenvalues and eigenvectors ( \(S\) and SEP).

H OW M NY (input)
= 'A ': com pute condition num bers for all eigen-
pairs;
= S ': com pute condition num bers for selected eigenpairs specified by the array SELEC T .

SELECT (input)
If HOW M NY = S',SELECT specifies the eigenpairs
for which condition num bers are required. To
selectcondition num bers for the \(j\) th eigenpair,
SELECT ( \(\boldsymbol{\jmath}\) ) mustbe set to TRUE.. If HOW M NY = A',
SELECT is not referenced.

N (input) The order of the m atrix \(\mathrm{T} . \mathrm{N}>=0\).
T (input) The upper triangularm atrix T .
LD T (input)
The leading dim ension of the array T. LD T >= \(\max (1, \mathbb{N})\).

VL (input)
If \(\mathrm{O} \mathrm{B}=\mathrm{E}\) 'or B ', VL mustcontain left eigenvectors of \(T\) (orofany \(Q * T * Q * * H\) with \(Q\) unitary), corresponding to the eigenpairs specified by HOW M NY and SELECT.The eigenvectors m ustbe stored in consecutive columns of \(V L\), as retumed by \(C H S E I N\) orCTREVC. If \(J B=V\) ', \(V L\) is notreferenced.

LDVL (input)
The leading dim ension of the array VL. LD V L >=1; and if \(J 0 B=E\) 'or \(B ', L D V L>=N\).

VR (input)
If \(J 0 B=E\) 'or \(B\) ', VR m ust contain right eigenvectors of \(T\) (or of any \(Q * T * Q * * H\) with \(Q\) unitary), corresponding to the eigenpairs specified by HOW M NY and SELECT. The eigenvectors m ustbe stored in consecutive colum ns of VR, as retumed by \(C H S E I N\) orCTREVC. If \(O B=V\) ', VR is notreferenced.

LDVR (input)
The leading dim ension of the array VR. LD V R >=1; and if \(J 0 B=E\) 'or \(B ', L D V R>=N\).

S (output)
If \(\mathrm{JOB}=\mathrm{E}\) ' or B ', the reciprocal condition num bers of the selected eigenvalues, stored in consecutive elem ents of the aray. Thus \(S(\mathcal{)}\), \(\operatorname{SEP}(\mathcal{j})\), and the \(j\) th colum ns of VL and VR all comespond to the sam e eigenpair (butnot in gen-
eral the \(j\) th eigenpair, unless alleigenpairs are selected). If \(\mathrm{OB}=\mathrm{V}^{\prime}, \mathrm{S}\) is notreferenced.

SEP (output)
If \(\mathrm{OB}=\mathrm{V}\) 'or B', the estim ated reciprocalcondition numbers of the selected eigenvectors, stored in consecutive elem ents of the aray. If \(\mathrm{JOB}=\mathrm{E}\) ', SEP is notreferenced.
M M (input)
The num berofelem ents in the anays S (if \(\mathrm{OB}=\) \(E^{\prime}\) or B') and/orSEP (if \(\mathrm{OB}=\mathrm{V}\) 'or B).M M \(>=\mathrm{M}\) 。

M (output)
The num ber ofelem ents of the arays \(S\) and/or SEP
actually used to store the estim ated condition num bers. If HOW M NY = \(A\) ', M is setto \(N\).

W ORK (w orkspace)
dim ension (LDW ORK, \(N+1\) ) If \(O B=E\) ', WORK is not referenced.

LDW ORK (input)
The leading dim ension of the array \(W\) ORK. LDW ORK \(>=1\); and if \(\mathrm{OB}=\mathrm{V}\) 'or \(\mathrm{B}^{\prime}\), LDW ORK \(>=\mathrm{N}\).

W ORK1 (w orkspace)
dimension \(\mathbb{N}\) ) If OB = E', W ORK1 is not referenced.
\(\mathbb{I N F O}\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N}\) FO \(=-i\), the \(i\)-th argum enthad an illegalvalue

\section*{FURTHER DETAILS}

The reciprocal of the condition num ber of an eigenvalue lam boda is defined as
\[
S(\operatorname{lam} \text { bda })=f^{*} u \mid /(\text { norm }(u) * \text { norm }(v))
\]
\(w\) here \(u\) and \(v\) are the right and left eigenvectors of \(T\) corresponding to lam boda; v'denotes the conjugate transpose of \(v\), and norm (u) denotes the Euclidean norm . These reciprocal condition num bers alw ays lie betw een zero (very badly conditioned) and one (very w ell conditioned). If \(n=1\), \(S\) (lam bda) is defined to be 1 .

A \(n\) approxim ate errorbound for a com puted eigenvalue \(W\) (i) is
given by
EPS * norm (T) /S (i)
where EPS is the m achine precision.
The reciprocal of the condition num ber of the right eigenvectoru conesponding to lam bda is defined as follow s. Suppose
\[
\begin{gathered}
\mathrm{T}=\binom{\operatorname{lam} \mathrm{bda} \mathrm{c})}{\left(\begin{array}{cc}
\mathrm{T} 22
\end{array}\right)}
\end{gathered}
\]

Then the reciprocalcondition num ber is

SEP (lam bda, T22 \()=\) sigm a-m in (T22 -lam bda*I \()\)
where sigm a-m in denotes the sm allest singular value. \(W\) e approxim ate the sm allest singularvalue by the reciprocal of an estim ate of the one-norm of the inverse of T22 \(\operatorname{lam}\) bda* I . If \(\mathrm{n}=1, \operatorname{SEP}(1)\) is defined to be abs \((\mathrm{T}(1,1))\).

A \(n\) approxim ate errorbound for a com puted right eigenvector VR (i) is given by
EPS * norm (I) /SEP (i)

void ztrsv_64 (charuplo, chartransa, char diag, long n, doublecom plex *a, long lda, doublecom plex *y, long incy);

\section*{PURPOSE}
ztrsv solves one of the system s ofequations \(A * x=b\), or \(A^{*}{ }^{\prime} \mathrm{x}=\mathrm{b}\), orcon \(\mathrm{g}_{\mathrm{g}}\left(\mathrm{A}^{\prime}\right)^{\star} \mathrm{x}=\mathrm{b}\) where b and x are n elem ent vectors and \(A\) is an \(n\) by \(n\) unit, ornon-unit, upper or low er triangularm atrix.

N o testforsingularity or near-singularity is included in this routine. Such testsm ustbe perform ed before calling this routine.

\section*{ARGUMENTS}

UPLO (input)
O n entry, UPLO specifies w hether the \(m\) atrix is an upper or low er triangularm atrix as follow s:
\(\mathrm{UPLO}=\mathrm{U}\) 'or \(\mathrm{U}^{\prime} \mathrm{A}\) is an upper triangular \(m\) atrix .
\(\mathrm{UPLO}=\mathrm{L}\) ' or \(\mathrm{I}^{\prime}\) ' A is a lower triangular m atrix.

U nchanged on exit.

TRANSA (input)
On entry, TRAN SA specifies the equations to be solved as follow s:

TRANSA \(=N^{\prime}\) or \(h^{\prime} A{ }^{*} \mathrm{x}=\mathrm{b}\).

TRANSA = T'ort'A *x = b.

TRANSA \(=C^{\prime}\) or \(t^{\prime} \operatorname{cong}\left(A^{\prime}\right) \star x=b\).

U nchanged on exit.

TRANSA is defaulted to N 'forF95 \(\mathbb{I N}\) TERFACE.

D IA G (input)
On entry, D IA G specifies whether ornotA is unit triangular as follow s:

D \(\mathbb{I}\) G \(=U\) 'or 4 ' \(A\) is assum ed to be unit triangular.
\(D \mathbb{A} G=N\) 'or \(h\) ' \(A\) is notassum ed to be unit triangular.

U nchanged on exit.

N (input)
O \(n\) entry, \(N\) specifies the order of the \(m\) atrix A. \(\mathrm{N}>=0\). U nchanged on exit.

A (input)
Before entry \(w\) ith UPLO = U 'or L ', the leading \(n\) by \(n\) upper triangular part of the array A must contain the upper triangular \(m\) atrix and the strictly low ertriangularpartofA is not referenced. Before entry w ith UPLO = L 'or I', the leading \(n\) by \(n\) low er triangularpart of the anay A m ust contain the low er triangularm atrix and the strictly uppertriangularpartofA is not referenced. N ote thatw hen D \(\mathbb{A G}=\mathrm{U}\) ' or L ', the diagonal elem ents of A are not referenced either, butare assum ed to be unity. U nchanged on exit.

LD A (input)
On entry, LD A specifies the firstdim ension of A as declared in the calling (sub) program. LD A \(>=\) \(m a x(1, n)\). U nchanged on exit.

Y (input/output)
\((1+(n-1) * a b s(\mathbb{N} C Y))\). Before entry, the increm ented array \(Y\) must contain the \(n\) elem ent righthand side vectorb. On exit, \(Y\) is overw ritten \(w\) ith the solution vectorx.
\(\mathbb{N} C Y\) (input)
On entry, \(\mathbb{N} C Y\) specifies the increm ent for the elem ents of \(Y . \mathbb{N} C Y\) <> 0 . U nchanged on exit.

\section*{PURPOSE}
ztrsylsolves the com plex Sylvesterm atrix equation:
\(o p(A) * X+X * o p(B)=\) scale \({ }^{*} C\) or
op (A ) *X -X *op (B) \(=\) scale* \(C\),
where op \((A)=A\) or \(A * * H\), and \(A\) and \(B\) are both uppertriangular. \(A\) is \(M\) boy -M and B is N boy -N ; the righthand side C and the solution X are M -by -N ; and scale is an output.scale factor, set < = 1 to avoid overflow in X .

\section*{ARGUMENTS}

TRANA (input)
Specifies the option op (A):
\(=N^{\prime}: o p(A)=A \quad\) (Notranspose)
\(=C: \operatorname{op}(A)=A * * H \quad\) (C onjugate transpose)

TRANB (input)
Specifies the option op ( \(B\) ) :
\(=N^{\prime}: o p(B)=B \quad\) (N o transpose)
\(=C\) ': op \((B)=B * * H \quad\) (C onjugate transpose)

ISG N (input)
Specifies the sign in the equation:
\(=+1\) : solve op (A ) \({ }^{\text {( } X}+X\) *op \((B)=\) scale \(^{\star} C\)
\(=-1\) : solve op (A ) \({ }^{\star} X-X *\) op \((B)=\) scale \({ }^{\star} C\)
\(M\) (input) The order of the m atrix \(A\), and the num berof row \(s\) in the m atrioes X and \(\mathrm{C} . \mathrm{M}>=0\).
\(N\) (input) The orderof the \(m\) atrix \(B\), and the num ber of colum ns in the \(m\) atrices \(X\) and C. \(\mathrm{N}>=0\).

A (input) The upper triangularm atrix A.

LD A (input)
The leading dim ension of the aray A. LDA >= max (1, M).
\(B\) (input) The upper triangularm atrix \(B\).
LD B (input)
The leading dim ension of the array B. LD B >= \(\max (1, \mathbb{N})\).

C (input/output)
On entry, the \(M\)-by -N righthand side \(m\) atrix C . On exi, \(C\) is overw ritten by the solution \(m\) atrix \(X\).

LD C (input)
The leading dim ension of the aray C. LD C >= \(\max (1, M)\)

SCALE (output)
The scale factor, scale, set < = 1 to avoid overflow in X.
\(\mathbb{N} F O\) (output)
\(=0\) : successfulexit
< 0 : if \(\mathbb{N N F O}=-\) i, the \(i\)-th argum ent had an illegalvalue
\(=1\) : A and B have common or very close eigenvalues; perturbed values w ere used to solve the equation (but the \(m\) atrices \(A\) and \(B\) are unchanged).

\section*{PURPOSE}
ztates solves a triangular system of the form where \(A\) is a triangularm atrix of order \(N\), and \(B\) is an \(N\) -by-NRHS m atrix. A check ism ade to verify that A is nonsingular.

\section*{ARGUMENTS}

UPLO (input)
\(=\mathrm{U}: \mathrm{A}\) is uppertriangular;
= L': A is low ertriangular.
TRANSA (input)
Specifies the form of the system of equations:
\(=N\) ': A * \(\mathrm{X}=\mathrm{B} \quad\) ( o otranspose)
\(=T: A * * T * X=B \quad(T\) ranspose)
\(=\mathrm{C}: \mathrm{A} * * \mathrm{H} * \mathrm{X}=\mathrm{B} \quad\) (C onjugate transpose)
TRANSA is defaulted to N 'forF \(95 \mathbb{I N}\) TERFACE.

D IA G (input)
\(=N^{\prime}: A\) is non-unit triangular;
\(=\mathrm{U}\) : A is unit triangular.

N (input) The order of the \(m\) atrix \(\mathrm{A} . \mathrm{N}>=0\).
NRHS (input)
The num ber of righthand sides, i.e., the num ber of colum ns of them atrix B. NRHS \(>=0\).

A (input) The triangularm atrix A. If \(\mathrm{PLO}=\mathrm{U}\) ', the lead-
ing N -by -N upper triangularpart of the array A
contains the upper triangular \(m\) atrix, and the strictly low ertriangularpartofA is not refer-
enced. If \(\mathrm{UPLO}=\mathrm{L}\) ', the leading N -by N lower triangular part of the array A contains the low er triangularm atrix, and the strictly upper triangular part ofA is not referenced. IfD \(\mathbb{I A} G=U\) ', the diagonalelem ents of \(A\) are also not referenced and are assum ed to be 1 .

LD A (input)
The leading dim ension of the array A. LD A >= \(\max (1, N)\).

B (input/output)
On entry, the right hand side m atrix B. On exit, if \(\mathbb{N} F O=0\), the solution \(m\) atrix \(X\).

LD B (input)
The leading dim ension of the array \(B\). LD B \(>=\) \(\max (1, N)\).
\(\mathbb{I N} F O\) (output)
= 0 : successfulexit
\(<0\) : if \(\mathbb{N}\) FO \(=-\) i, the \(i\)-th argum ent had an illegalvalue
\(>0:\) if \(\mathbb{N} F O=i\), the \(i\)-th diagonalelem ent of \(A\) is zero, indicating that the \(m\) atrix is singular and the solutions \(X\) have notbeen com puted.

\section*{PURPOSE}
ztzrof routine is deprecated and has been replaced by routine CTZRZF.

CTZRQF reduces the M -by-N ( \(\mathrm{M}<=\mathrm{N}\) ) com plex upper trapezoidal \(m\) atrix \(A\) to upper triangular form by \(m\) eans of unitary transform ations.

The upper trapezoidalm atrix \(A\) is factored as
\[
A=\left(\begin{array}{ll}
R & 0
\end{array}\right)^{*} Z
\]
\(w\) here \(Z\) is an \(N\) boy \(-N\) unitary \(m\) atrix and \(R\) is an \(M\) boy \(M\) upper triangularm atrix.

\section*{ARGUMENTS}

M (input) The num ber of row s of the \(m\) atrix \(A . M>=0\).

N (input) The num ber of colum ns of the m atrix \(A . N>=M\).

A (input/output)
O n entry, the leading M -by-N upper trapezoidal part of the array A m ustcontain the \(m\) atrix to be factorized. On exit, the leading M -by M upper triangularpart of A contains the upper triangular \(m\) atrix \(R\), and elem ents \(M+1\) to \(N\) of the first \(M\) row \(s\) of \(A\), w th the anray \(T A U\), represent the unitary \(m\) atrix \(Z\) as a product of \(M\) elem entary reflectors.

LDA (input)
The leading dim ension of the aray A. LDA >= \(\max (1, M)\).

TAU (output)
The scalar factors of the elem entary reflectors.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N} F O=-i\), the \(i\)-th argum enthad an ille-

\section*{FURTHER DETAILS}

The factorization is obtained by H ouseholder'sm ethod. The k th transform ation \(m\) atrix, Z ( \(k\) ), w hose conjugate transpose is used to introduce zeros into the ( \(m-k+1\) ) th row of \(A\), is given in the form
\[
\left.\begin{array}{c}
\mathrm{Z}(\mathrm{k})=\left(\begin{array}{ll}
\mathrm{I} & 0
\end{array}\right), \\
\left(\begin{array}{l}
\mathrm{O}
\end{array} \mathrm{~T}(\mathrm{k})\right.
\end{array}\right),
\]
where
\[
\begin{gathered}
T(k)=I-\tan * u(k) * u(k))^{\prime} \quad u(k)=\left(\begin{array}{ll}
1
\end{array}\right), \\
\left(\begin{array}{l}
0
\end{array}\right) \\
(z(k))
\end{gathered}
\]
tau is a scalar and \(z(k)\) is an ( \(n-m\) ) elem ent vector. tau and \(\mathrm{z}(\mathrm{k})\) are chosen to annihilate the elem ents of the kth row of .

The scalartau is retumed in the \(k\) th elem entofTA \(U\) and the vectoru ( \(k\) ) in the \(k\) th row of \(A\), such that the elem ents of \(z(k)\) are in \(a(k, m+1), \ldots, a(k, n)\). The elem ents ofR are retumed in the upper triangularpartofA.
\(Z\) is given by
\[
Z=Z(1) * Z(2) * \ldots * Z(m) .
\]

N (input) The order of the m atrix \(\mathrm{Q} . \mathrm{N}>=0\).

IIO (input)
\(\mathbb{I} O\) and \(\mathbb{H}\) Im usthave the sam e values as in the previous call of CGEHRD.Q is equal to the unit \(m\) atrix except in the subm atrix
Q (ilo+1: ihi, ilo+1: ihi). \(1<=\mathbb{I} 0<=\mathbb{H} I<=N\), if \(\mathrm{N}>0 ; ~ \Pi \mathrm{O}=1\) and \(\mathrm{H} \mathrm{I}=0\), if \(\mathrm{N}=0\).

IH I (input)
See the description of \(\mathbb{H}\) I.

A (input/output)
O n entry, the vectors w hich define the elem entary reflectors, as retumed by CGEHRD. On exit, the N boy-N unitary m atrix Q .

LD A (input)
The leading dim ension of the aray A. LDA >= \(\max (1, N)\).

TAU (input)
TAU (i) m ust contain the scalar factor of the ele\(m\) entary reflectorH (i), as retumed by CGEHRD.

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al LW ORK.

The dim ension of the array \(W\) ORK. LW ORK >= \(\mathbb{H} I-\mathbb{H O}\). For optim um perform ance LW ORK \(>=(\mathbb{H} I-\mathbb{H} O)^{*} N B\), where NB is the optim alblocksize.

IfLW ORK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim al size of theW ORK ancay, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by X ERBLA.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
<0: if \(\mathbb{N F O}=-\) i, the \(i\)-th argum ent had an illegal value

void zungtr_64 (char uplo, long n, doublecom plex *a, long lda, doublecom plex *tau, long *info);

\section*{PURPOSE}
zungtrgenerates a com plex unitary \(m\) atrix \(Q\) which is defined as the product of \(n-1\) elem entary reflectors of order \(N\), as retumed by CHETRD :
if \(U P L O=U ', Q=H(n-1) \ldots H(2) H(1)\),

\section*{ARGUMENTS}

UPLO (input)
= U ':U ppertriangle of A contains elem entary
reflectors from CHETRD; = L':Low ertriangle of A
contains elem entary reflectors from CHETRD.
N (input) The order of the m atrix \(\mathrm{Q} . \mathrm{N}>=0\).
A (input/output)
On entry, the vectors which define the elem entary reflectors, as retumed by CHETRD. On exit, the N boy-N unitary m atrix Q .

LD A (input)
The leading dim ension of the array A .LD A \(>=\mathrm{N}\).
TAU (input)
TAU (i) m ust contain the scalar factor of the elem entary reflectort (i), as retumed by CH ETRD.

W ORK (w orkspace)
On exit, if \(\mathbb{N F F O}=0, \mathrm{~W}\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the array \(W\) ORK. LW ORK \(>=N-1\).
For optim um perform ance \(L W\) ORK \(>=(\mathbb{N}-1)^{\star} N B\), where

NB is the optim alblocksize.

IfLW O RK \(=-1\), then a w orkspace query is assum ed; the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N}\) FO (output)
= 0: successfulexit
\(<0\) : if \(\mathbb{N} F O=-i\), the \(i\) th argum enthad an illegalvalue

\(=\mathrm{R}\) ': apply Q orQ **H \(_{\mathrm{H}}\) from the R ight.

TRANS (input)
= N ': N o transpose, apply Q ;
= C ': C onjugate transpose, apply Q **H .
TRANS is defaulted to \(N\) 'forF95 \(\mathbb{N}\) TERFACE.

M (input) The num ber of row s of the \(m\) atrix \(\mathrm{C} . \mathrm{M}>=0\).

N (input) The num ber of colum ns of the m atrix C. \(\mathrm{N}>=0\).
\(K\) (input) The num ber of elem entary reflectors \(w\) hose product defines the \(m\) atrix \(Q\). If \(S \mathbb{D} E=L ', M \quad=K>=0\); if \(S \mathbb{D} E=R \prime, N>=K>=0\).
 \(i\)-th row m ustcontain the vectorw hich defines the elem entary reflector \(H\) ( \(i\) ), for \(i=1,2, \ldots, k\), as retumed by CGELQF in the firstk row sof its array argum entA. A ism odified by the routine but restored on exit.

LD A (input)
The leading dim ension of the array A. LDA >= \(\max (1, K)\).

TAU (input)
TAU (i) m ustcontain the scalar factor of the ele\(m\) entary reflectorH (i), as retumed by CG ELQ F.

C (input/output)
On entry, the \(M-b y-N m\) atrix \(C\). On exit, \(C\) is overw ritten by Q * C or \(\mathrm{Q} * * \mathrm{H} * \mathrm{C}\) or C * \(\mathrm{Q} * \mathrm{H}\) or C * Q .

LD C (input)
The leading dim ension of the array \(C . \operatorname{LDC}>=\) \(\max (1, M)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N} F O=0, W\) ORK (1) retums the optim al LW ORK.

LW ORK (input)
The dim ension of the amay W ORK. IfSIDE = L', LW ORK >= max ( \(1, N\) ); if \(S \mathbb{D} E=R\) ', LWORK >= \(\max (1, M)\). Foroptim um perform ance LW ORK \(>=N * N B\) if \(S \mathbb{D E} L^{\prime}\) ', and LW ORK \(>=M * N B\) if \(S \mathbb{D} E=R\) ',
w here N B is the optim alblocksize.

If LW ORK = -1 , then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first
entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.
\(\mathbb{N} F O\) (output)
= 0: successfulexit
\(<0:\) if \(\mathbb{N ~ F O ~}=-\) i, the i-th argum enthad an illegalvalue

k, long l, doublecom plex *a, long lda, doublecom plex *tau, doublecom plex *c, long ldc, long
*info);

\section*{PURPOSE}
zunm rz overw rites the general com plex M -by -N m atrix C w ith TRANS = C : \(\quad \mathrm{Q} * * \mathrm{H} * \mathrm{C} \quad \mathrm{C} * \mathrm{Q} * * \mathrm{H}\)
where \(Q\) is a com plex unitary \(m\) atrix defined as the product ofk elem entary reflectors
\[
Q=H(1) H(2) \ldots H(k)
\]
as retumed by CTZRZF. Q is of orderM ifSDE \(=\mathbb{L}\) 'and of order \(N\) if \(S \mathbb{D} E=R\) '.

\section*{ARGUMENTS}

SIDE (input)
\(=\mathrm{L}\) ': apply Q orQ \({ }^{* *} \mathrm{H}\) from the Left;
= R ': apply Q orQ **H from the Right.

TRANS (input)
= N ': N o transpose, apply Q ;
= C ': C onjugate transpose, apply Q **H .
M (input) The num ber of row s of the \(m\) atrix \(C . M>=0\).
\(N\) (input) The num ber of colum ns of the m atrix C. \(\mathrm{N}>=0\).
\(K\) (input) The num ber of elem entary reflectors \(w\) hose product defines them atrix Q . If \(S \mathbb{D} E=\mathbb{L}, \mathrm{M}>=\mathrm{K}>=0\); if \(S \mathbb{D} E=R \prime, N>=K>=0\).

L (input) The num ber of colum ns of the m atrix A containing the \(m\) eaningfilpart of the \(H\) ouseholder reflectors. If \(S \mathbb{D} E=L ', M>=L>=0\), if \(S \mathbb{D} E=R \prime, N>=L\) \(>=0\) 。

A (input) (LDA, M) if \(S \mathbb{D} E=L \prime\), (LDA, \(N\) ) if \(S \mathbb{D} E=R^{\prime}\) The \(i\)-th row m ustcontain the vectorw hich defines the elem entary reflector \(H\) (i), for \(i=1,2, \ldots, k\), as retumed by CTZRZF in the lastk row s of its array argum entA. A is modified by the routine but restored on exit.

LDA (input)
The leading dimension of the array A. LDA >= \(\max (1, K)\).

TAU (input)
TAU (i) m ustcontain the scalar factor of the elem entary reflectorH (i), as retumed by CTZRZF.

C (input/output)
On entry, the M boy- N matrix C . On exit, C is overw ritten by Q * C or \(\mathrm{Q} * * \mathrm{H} * \mathrm{C}\) or \(\mathrm{C} \mathrm{Q}^{*}{ }^{*} \mathrm{H}\) or \(\mathrm{C} * \mathrm{Q}\).

LD C (input)
The leading dim ension of the aray \(C . \operatorname{LDC}>=\) \(\max (1, M)\).

W ORK (w orkspace)
On exit, if \(\mathbb{N F O}=0, W\) ORK (1) retums the optim al
LW ORK.

LW ORK (input)
The dim ension of the aray \(W\) ORK. IfSIDE = L',
LW ORK >= max ( \(1, N\) ); if \(S \mathbb{D} E=R \prime\) LW ORK \(>=\) \(m\) ax \((1, M)\). Foroptim um perform ance LW ORK \(>=N * N B\) if \(S \mathbb{D} E=\mathbb{L}\) ', andLW ORK \(>=M * N B\) if \(S \mathbb{D} E=R \prime\), w here N B is the optim alblocksize.

IfLW O RK \(=-1\), then a w orkspace query is assum ed;
the routine only calculates the optim alsize of the W ORK array, retums this value as the first entry of the W ORK array, and no errorm essage related to LW ORK is issued by XERBLA.

INFO (output)
= 0: successfulexit

1 : no repeated indices
VAL ( scalar array of length NN Z consisting of the block entries of A w here each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NN Z is the total num berof pointentries in all nonzero block entries of am atrix A.
\(\mathbb{N} D \mathrm{X}\) () integer anray of length BNN Z +1 where BNNZ is the num berof block entries of a m atrix A such that the I-th elem entof \(\mathbb{N}\) D X [] points to the location in VAL of the \((1,1)\) elem ent of the I-th block entry.

B IND X () integer array of length BNN Z consisting of the block colum \(n\) indiges of the block entries of \(A\) where BNNZ is the num berblock entries of a m atrix A.

RPN TR 0) integer amay of length M B+1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the \(I\)-th block
row .
RPN TR \(M B+1\) ) is set to \(M+\operatorname{RPN} \operatorname{TR}(1)\) where \(M\) is the num ber of row \(s\) in \(m\) atrix \(A\).
Thus, the num berof point row sin the I-th block row is RPNTR (I+1)RPNTR (I).

CPN TR 0 integer array of length \(K B+1\) such that CPN TR (J)-CPN TR (1)+1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR ( \(K B+1\) ) is set to \(K+C P N T R(1)\) where \(K\) is the num ber of \(c o l u m n s\) in \(m\) atrix \(A\). Thus, the num ber of point \(\infty 0\) lum ns in the \(J\) th block colum n is CPNTR ( \(\mathrm{J}+1\) )-CPNTR ( \(J\) ).

BPNTRB () integer array of length \(M B\) such thatBPNTRB (I) BPNTRB (1) +1 points to location in B IND X of the first.block entry of the I-th block row of A.

BPNTRE 0 integer anay of length \(M B\) such that BPN TRE (I) BPNTRB (1) points to location in B \(\mathbb{N}\) D X of the lastblock entry of the I-th block row of A.

B 0 rectangular array w ith firstdin ension LD B .

LD B leading dim ension ofB

BETA Scalarparam eter
C 0 rectangular anray w ith firstdim ension LD C .

LD C leading dim ension ofC
W ORK () scratch array of length LW ORK.W ORK is not referenced in the cumentversion.

LW ORK length ofW ORK array. LW ORK is not referenced in the cumentversion.

\end{aligned}
\]
op (A) \()=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}(A)\) or op (A) \(=\operatorname{inv}\left(c o n g\left(A^{\prime}\right)\right)\) (inv denotesm atrix inverse, 'indicates \(m\) atrix transpose)

\section*{ARGUMENTS}

TRANSA Indicates how to operate \(w\) th the sparse \(m\) atrix
0 : operate \(w\) ith \(m\) atrix
1 : operate \(w\) ith transpose \(m\) atrix
2 : operate \(w\) th the conjugate transpose ofm atrix.
2 is equivalent to 1 ifm atrix is real.

M B \(\quad\) Num ber ofblock row \(\sin m\) atrix \(A\)

N \(\quad\) Num berof colum ns in matrix C

UN ITD Type of scaling:
1 : Identity m atrix (argum entD V [] is ignored)
2 : Scale on left (row block scaling)
3 : Scale on right (colum \(n\) block scaling)

DV () A rray containing the block entries of the block diagonalm atrix D. The size of the Jth block is RPN TR ( \(\mathrm{J}+1\) )-RPN TR (J) and each block containsm atrix entries stored colum n-m ajor. The total length of aray DV is given by the form ula:
sum over J from 1 to M B:

A LPH A Scalarparam eter

DESCRA () D escriptor argum ent. Five elem ent integer array
DESCRA (1) m atrix structure
0 :general
1 : symm etric ( \(\mathrm{A}=\mathrm{A}\) )
2 : Herm itian ( \(\mathrm{A}=\mathrm{CONJG}(\mathrm{A})\) )
3 :Triangular
4 : Skew (Anti)-Symm etric ( \(A=-A\) )
5 :D iagonal
6 : Skew Herm itian ( \(\mathrm{A}=-\mathrm{CON}\) J ( A ) )
N ote: For the routine, DESCRA (1)=3 is only supported.
D ESCRA (2) upper/low er triangular indicator
1 : low er
2 :upper
DESCRA (3) main diagonal type
0 : non-identily blocks on the \(m\) ain diagonal
1 : identity diagonalblocks
2 : diagonalblocks are densem atrices
DESCRA (4) A ray base \(\mathbb{N} O T \mathbb{I}\) PLEM ENTED )
0 :C C++ com patible
1 :Fortran com patible
D ESCRA (5) repeated indices? NOT IM PLEM EN TED )
0 : unknown
1 :no repeated indices
VAL 0 scalar array of length NN Z consisting of the block entries ofA where each block entry is a dense rectangularm atrix stored colum \(n\) by colum \(n\).
NN Z is the total num berof pointentries in allnonzero block entries of a m atrix A.
\(\mathbb{I N}\) D X 0 integer array of length BNN Z +1 where BNN \(Z\) is the num ber block entries of a \(m\) atrix A such that the I-th elem ent of \(\mathbb{N} D \mathrm{X}[]\) points to the location in VAL of the \((1,1)\) elem ent of the I-th block entry .
\(B \mathbb{N} D\) X () integer array of length BNNZ consisting of the block colum \(n\) indiges of the block entries of \(A\) where BNN \(Z\) is the num berblock entries of a m atrix A. B lock colum n indices M U ST be sorted in increasing order foreach block row .

RPN TR 0) integer aray of length M B +1 such thatRPN TR (I) RPN TR (1) +1 is the row index of the firstpoint row in the \(I\)-th block
row.
RPN TR \(M B+1\) ) is set to \(M+R P N T R(1)\) where \(M\) is the num ber of row \(s\) in square triangularm atrix \(A\).

Thus, the num berof point row s in the I-th block row is RPNTR (I+1)RPNTR (I).

NOTE: For the cumentversion CPN TR m ustequalRPN TR and a single array can be passed forboth argum ents

CPNTR 0 integeramay of length \(M B+1\) such thatCPN TR (J)-CPN TR (1) +1 is the colum \(n\) index of the firstpoint colum \(n\) in the \(J\) th block colum n. CPN TR M B+1) is set to M +CPN TR (1). Thus, the num ber of pointcolum ns in the J-th block colum n is CPNTR ( \(\mathrm{J}+1\) )-CPNTR (J).

NO TE: For the current version CPN TR m ustequal RPN TR and a single aray can be passed forboth argum ents
BPN TRB 0 integer aray of length \(M B\) such thatBPN TRB (I)-BPNTRB (1)+1 points to location in B IND X of the firstblock entry of the I-th block row of A.

BPN TRE () integer array of length \(M B\) such thatBPN TRE (I) BPN TRB (1) points to location in B \(\mathbb{N} D \mathrm{X}\) of the last.block entry of the I-th block row of A.

B 0 rectangular aray w th first dim ension LD B.

LD B leading dim ension ofB
BETA Scalarparam eter
C 0 rectangular array w ith first dim ension LD C .

LD C leading dim ension ofC
W ORK 0 scratch array of length LW ORK. On exit, ifLW ORK = -1,W ORK (1) retums the optim um size of LW ORK.

LW ORK length of ORK array. LW ORK should be at least \(\mathrm{M}=\mathrm{RPNTR} \mathrm{M} \mathrm{B}+1)\) RPNTR (1).

Forgood perform ance, LW ORK should generally be larger. Foroptim um perform ance on \(m\) ultiple processors, LW ORK \(>=\mathrm{M} * \mathrm{~N}\) _CPUS where N _CPUS is the \(m\) axim um num berof processors available to the program .

IfLW ORK \(=0\), the routine is to allocate \(w\) orkspace needed.
IfLW ORK = -1 , then a w orkspace query is assum ed; the routine only calculates the optim um size of the W ORK array, retums this value as the firstentry of the W ORK amray, and no enrorm essage related to LW ORK is issued

http://w w w netlib .org/utk/papers/sparse.ps

\section*{NOTES/BUGS}
1. N o test for singularity ornear-singularity is included in this routine. Such testsm ust.be perform ed before calling this routine.
2. If \(D E S C R A\) (3)=0, the low erorupper triangular part of each diagonalblock is used by the routine depending on DESCRA (2).
3. If \(D E S C R A(3)=1\), the unit diagonalblocksm ightorm ight not.be referenced in the VBR representation of a sparse \(m\) atrix. They are notused anyw ay .
4. If \(D E S C R A\) (3)=2, diagonalblocks are considered as dense \(m\) atrices and the LU factorization \(w\) ith partialpivoting is used by the routine. WORK (1)=0 on retum if the factorization for alldiagonalblocks has been com pleted successfully, otherw ise WORK (1) = -iw here is the block num ber forw hich the LU factorization could notbe com puted.
5.The routine can be applied for solving triangular system s w hen the upper or low er triangle of the general sparse m atrix A is used. H ow enver DESCRA (1) m ustbe equal to 3 .
6. It is know \(n\) that there exists another representation of the variable block sparse row form at (see forexam ple Y Saad, "Iterative M ethods forSparse LinearSystem s", W PS, 1996). Its data structure consists of six anay instead of the seven used in the current im plem entation. Them ain difference is that only one array, IA , containing the pointers to the beginning ofeach block row in the amay \(B \mathbb{N} D X\) is used instead of two arrays BPN TRB and BPN TRE.To use the routine w ith this kind of variable block sparse row form at the follow ing calling sequence should be used
