Sun Management Center 4.0 Version 5 Add-On Software Release Notes

This document contains release notes for the Sun™ Management Center 4.0 Version 5 add-on software (also known as the ELP Config-Reader or Common Config Reader) for SPARC Enterprise™, Sun Fire™, Sun Blade™, Sun Ultra™, Netra™, and Sun Netra™ systems. The document includes the following sections:

- “What’s New in This Release” on page 1
- “Related Documentation” on page 2
- “Supported Systems and Environments” on page 2
- “Recommended Patches” on page 4
- “Obtaining the Add-On Software” on page 5
- “Installation” on page 5
- “Issues and Workarounds” on page 8

What’s New in This Release

Sun Management Center 4.0 Version 5 add-on software adds support for Sun SPARC Enterprise T5440 servers and Sun Blade T6340 server modules.

Server and console packages for x86 consoles are now provided to allow SPARC® agent platforms to be monitored from x86 consoles. Support for x86 consoles is included beginning in core Sun Management Center 4.0.
Related Documentation

Use of the functionality provided by the Sun Management Center 4.0 Version 5 add-on software is described in Sun Management Center 3.6 Supplement for the Sun Fire, Sun Blade, and Netra Systems (819-1153). That document applies to systems that are using this software with Sun Management Center 3.6.1 or 4.0.

These release notes contain information to supplement the Sun Management Center 4.0 Installation and Configuration Guide (820-2215). Also refer to the preface of that document for a full list of related documentation for Sun Management Center 4.0.

You can find Sun Management Center 4.0 documentation and add-on software release notes at:

http://docs.sun.com/app/docs/coll/1734.1

Supported Systems and Environments

TABLE 1 lists the software versions required for Sun Management Center 4.0 Version 5 add-on software.

<table>
<thead>
<tr>
<th>Host</th>
<th>Required Software</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Server</strong></td>
<td><strong>Solaris™ Operating System ††</strong></td>
<td>8, 9, 10.</td>
</tr>
<tr>
<td></td>
<td>For x86 support, server and console require Solaris 10 11/06 or higher.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sun Management Center server base software</td>
<td>3.6.1 or 4.0 release required for systems not needing x86 support.</td>
</tr>
<tr>
<td></td>
<td>For x86 support, 4.0 core release is required.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sun Management Center ELP Config-Reader Monitoring add-on product software</td>
<td>4.0 Version 5 or later.</td>
</tr>
<tr>
<td><strong>Monitored platform</strong></td>
<td><strong>Solaris Operating System kernel update ††</strong></td>
<td>8 - kernel update 122702-02 or higher.</td>
</tr>
<tr>
<td></td>
<td>9 - kernel update 118558-26 or higher.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>10 - kernel update 119850-18 or higher.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sun Management Center base software</td>
<td>3.6.1 or 4.0 core release.</td>
</tr>
<tr>
<td></td>
<td>Sun Management Center ELP Config-Reader Monitoring add-on product software</td>
<td>4.0 Version 5 or higher.</td>
</tr>
</tbody>
</table>
Note – The Sun Management Center server and agent machines must use the same version of the add-on software.

Sun Management Center 4.0 Version 5 add-on software supports the following platforms:
- Netra 210 server
- Netra 240 server
- Netra 440 server
- Sun Netra T2000 server
- Sun Netra T5220 server
- Sun Netra T5440 server
- Sun Blade 1500 workstation
- Sun Blade 2500 workstation
- Sun Blade T6300 server
- Sun Blade T6320 server
- Sun Blade T6340 server
- Sun Fire V125 server
  Sun Management Center 4.0 Version 5 requires ALOM 1.6.7 or later on this system.
- Sun Fire V210 server
- Sun Fire V215 server
- Sun Fire V240 server

<table>

</table>

* Solaris Operating System distribution installed on the system must be at least “End User Systems Support.”
† The Solaris Operating System version is dependent on the supported platform. Refer to the platform documentation for details of the Solaris version supported by your platform.
- Sun Fire V245 server
- Sun Fire V250 server
- Sun Fire V440 server
- Sun Fire V445 server
- Sun Ultra 25 workstation
- Sun Ultra 45 workstation
- Sun Fire T1000 server
  
  Both single- and dual-drive versions of the Sun Fire T1000 server are supported.

- Sun Fire T2000 server
- Sun SPARC Enterprise T1000 server
- Sun SPARC Enterprise T2000 server
- Sun SPARC Enterprise T5120 server
- Sun SPARC Enterprise T5140 server
- Sun SPARC Enterprise T5220 server
- Sun SPARC Enterprise T5240 server
- Sun SPARC Enterprise T5440 server

---

**Recommended Patches**

Solaris software patches and Sun Management Center patches are available for the core Sun Management Center 4.0 application and for this add-on software. You must install all the patches required for your operating system before installing Sun Management Center 4.0 software and this add-on.

If you have a Sun service contract, you can download the patches from:

http://sunsolve.sun.com

For more information about the patches required for the latest update to Sun Management Center, see the *Sun Management Center 4.0 Software Release Notes* (820-2216) or the corresponding release notes supporting your Sun Management Center 3.6.1 release.
Obtaining the Add-On Software

The Sun Management Center add-on software packages are provided as a zipped file on the software download site:

http://www.sun.com/download/

Installation

This Sun Management Center 4.0 Version 5 add-on software is installed using a separate zip file, requiring a change to the installation procedure. FIGURE 1 shows the installation process.

FIGURE 1   Installation Process Flow

<table>
<thead>
<tr>
<th>New Installation or Update From 4.0 or later</th>
<th>Update from Sun Management Center 3.6.1</th>
</tr>
</thead>

</tbody>
</table>

Only install the Sun Management Center 4.0 Version 5 add-on software on core Sun Management Center 3.6.1 or Sun Management Center 4.0 or later.

- If you plan to install and set up the Sun Management Center 4.0 Version 5 add-on software on top of core Sun Management Center 4.0, refer to the Sun Management Center 4.0 Installation and Configuration Guide (820-2215).
Caution – Use the installation and setup scripts provided with the Sun Management Center software. Do not manually add packages or change configuration files.

- If you plan to continue using core Sun Management Center 3.6.1, uninstall any previously installed version of the add-on software before you install the Sun Management Center 4.0 Version 5 add-on software.

Installing Sun Management Center 4.0 Software

If you have not yet installed any core Sun Management Center 3.6.1 or 4.0 software, you must install that before installing this Version 5 add-on software.

Note – The installation process for Sun Management Center 4.0 software includes uninstallation of previous releases of Sun Management Center software. Refer to the Sun Management Center Installation and Configuration Guide for detailed information about upgrading from earlier releases.

▼ To Install Sun Management Center 4.0 Software

1. Refer to the Sun Management Center 4.0 Supplement for Sun Fire, Sun Blade, and Netra Systems for information about preparing for installation.

2. Refer to the Sun Management Center Installation and Configuration Guide for instructions for installing the core software.
   
   If you are updating a previous release of Sun Management Center software, read the information about updating the software from your currently installed release.

Note – Do not install ELP Config-Reader as part of this step.

In the course of performing this installation you will come to a dialog that allows you to select from a list of add-on products. Do not install the ELP Config-Reader (also called Common Config Reader) add-on product.

3. Perform the steps outlined in the procedure “To Install the 4.0 Version 5 Add-On Software” on page 7.
To Install the 4.0 Version 5 Add-On Software

1. Download the software.
   Refer to “Obtaining the Add-On Software” on page 5 of this document for information about obtaining the software.

2. Unzip the zip file to a directory.
   In this procedure, the path to that directory is named downloadpath.

3. Log in as superuser on the host machine.

4. Change the directory to the path where the core Sun Management Center 4.0 software is installed.
   The directory will look similar to this:
   installed_directory/SUNWsymon/sbin

5. Run the es-guiinst or es-inst installation script.
   You will be prompted to enter a pointer to the path named:
   downloadpath/disk1/image/
   where downloadpath is the directory path described in Step 2. You then see a list of add-on products that you can install.

6. Choose the ELP Config-Reader Monitoring add-on product.

7. Complete the remaining steps included in the installation script.

8. Follow the steps to set up the software.
   The installation wizard prompts you to set up the software. For more information, refer to the Sun Management Center Installation and Configuration Guide.

Updating Add-On Software When Using Sun Management Center 3.6.1 Software

If you have already installed core Sun Management Center 3.6.1 software on your server and console systems, use the following procedures:

- “To Uninstall Previous Versions of the Add-On Software” on page 8 — If the version of the add-on software included with the core Sun Management Center 3.6.1 software is installed on any systems in your configuration, you must follow this procedure. Otherwise, you can skip this step.

- “To Install the 4.0 Version 5 Add-On Software” on page 7 — Follow this procedure to install the Sun Management Center 4.0 Version 5 add-on software.
To Uninstall Previous Versions of the Add-On Software

- Refer to the Sun Management Center 4.0 Installation and Configuration Guide.

The appendixes of the guide provide instructions for uninstalling add-on products using the es-guiuninst wizard or the es-uninst command-line script. Uninstall only the ELP Config-Reader Monitor add-on software.

Issues and Workarounds

This section describes software issues and workarounds known at the time of this release that you might notice or that can affect the operation of Sun Management Center 4.0 Version 5 add-on software. These issues are in addition to those identified in the Sun Management Center Release Notes for your version of core software.

Alarm Tab in Details Window Is Not in Sync With Agent (CR 6548517)

This happens when an alarm is already available against an item (a processor status, a disk error count, a particular sensor value, etc.) and new alarm occurs on the same item. The alarm tab does not update the new alarm unless there is a change in the status value.

Console Falsely Displays Description Information (CR 6585734)

If an object is newly created without Description information, the Sun Management Center Console’s Info tab, instead of showing a blank entry in the field, displays information in the Description field of an existing object created with a non-blank Description field.

Workaround: Make sure that the Description information is included when creating new objects.
Sun Management Center Does Not Show NEM Entities (CR 6628809)

On Sun Blade servers, network expansion modules (NEM) do not appear in the Expansion Cards table portion in the Config Reader.

Workaround: None.

Physical View Does Not Display Service Processor (CR 6628816)

The physical view (front) of the Sun Blade T6320 server module should highlight the service processor (and display its properties in the right hand side window) when the mouse is moved over the image. Currently there’s no such information displayed in the physical view.

Workaround: The service processor properties are correctly displayed in the Other Components table.

Console Does Not Display SAN (MPXIO) for Sun Fire V440 Systems (CR 6655853)

Sun Management Center is unable to show SAN disk info for the Sun Fire V440 server.

Workaround: None.

Processors Table Does Not Appear in Web Console (CR 6662409)

The Web Console (browser based https://server_system:6789), to view an agent system, the Hardware -> Config Reader -> Device Information node might not expand to show the tables within that node (Processors, Media Devices, Network Interfaces, Indicators and Other Devices). If there is no triangle icon beside the Device Information node, then it cannot be expanded.

Workaround: Use the Java GUI Console instead of the Web Console.
System Table and Media Devices Table Show the Wrong Number of HDD (CR 6665401)

A Sun Netra T2000 server configured with two HDD incorrectly displays four HDD on the system table and media devices table. It will display the two non-existent HDD in unconfigured status.

Workaround: Treat HDD2 and HDD3 as nonexistent on a Sun Netra T2000 server configured with two HDD.

Sun Management Center Displays All Disks as Not Configured With LDoms Setup (CR 6666611)

With LDoms setup, the Sun Management Center Media devices table shows Not Configured as the Availability status for all disks. The physical path and type of the disk are also not displayed on the table. Without LDoms setup, the correct status (Running/Full power) is displayed. This issue occurs on Sun SPARC Enterprise T2000 servers.

Workaround: Use the cfdadm -al command to determine the status of the disks in LDoms environment.

Sun Management Center Updates Spare/No-intr Processors Incorrectly On LDoms System (CR 6730867)

When a CPU is made no-intr or spare (via psradm -n and psradm -s), the status returned by the LDoms controller software is incorrect. When the CPU is no-intr, the returned status is online, when the CPU is spare the returned status is offline.

Workaround: To know the exact status of processors in a LDoms system, rely on the psrinfo command.
Environmental Sensor Faults Not Reported Correctly at Threshold Values (CR 6738914)

When a temperature (or voltage) sensor’s value is a threshold value, a fault is not reported for LowWarn (non-critical) value; and a "Lower non-critical threshold exceeded" warning is reported for LowSoft (critical) value.

Config Reader Tables and Physical Views Do Not Display REM, FEM (CR 6746822)

On a Sun Blade T6320 server, the Expansion Cards table will not show Raid Expansion Modules (REMs) or Fabric Expansion Modules (FEMs). It will only show Expansion Modules (EMs), for blade systems. The Other Components table will show the REMs. In addition, the physical view (front) of the Sun Blade T6320 server module does not highlight the REM and FEM (and display their properties in the right hand side window) when the mouse is moved over the image. Currently, there is no such information displayed in the table or the physical view.

Workaround: None.

Processors Table Should Not Generate Blue Alarms for Free CPU Resources (CR 6751176)

The Sun Management Center processor table generates a blue alarm while there are free CPU resources available. The processor table generates alarms with status unknown when there are free CPUs that are not assigned to the primary domain or any LDomS domain. In fact, those CPUs are free and can be added to any domain.

Workaround: None.

Processors Table Changes With Configuring Primary Domain (CR 6751418)

On a system with LDomS, Sun Management Center dynamically updates the processors table while configuring the primary domain. The processors unallocated to the primary domain are forced to unknown state in the configuration mode itself. Since Sun Management Center makes the changes dynamically and LDomS makes the changes only on the next powercycle this leaves the two out of sync.
Workaround: Rely on `psrinfo` to check the correct state of processors in the configuration mode.

**System Processor Passes Incorrect Minspeed Value to `dpdump` (CR 6751419)**

The System Processor sends `s showenvironment` fan output value of Warn instead of Low for minspeed. The effect is that when the fan speed drops below the Warn value, Sun Management Center displays a critical alarm instead of a warning alarm. This appears on Sun Fire T1000 servers.

Workaround: Rely on the `showenvironment` command to check the correct threshold values.

**Network Interfaces Table Does Not Update When NIC Is Hot-Plugged (CR 6756972)**

The Network interfaces table is not updated when a network interface card (NIC) is hot-plugged into or out of a blade system.

Workaround: Restart the Sun Management Center agent after a NIC is hot-plugged to obtain a valid Network Interfaces table.
