 - A.2.3 Adding Other Drivers and Modifying Setting Files A-10
 - A.3 Installing a RIS Image onto a Client Server A-13

Preface

The *Sun Fire X2100 Server Getting Started Guide* provides the information that you need to set up, power on, and configure the server hardware and software.

How This Book Is Organized

This guide is organized into the following chapters:

[Chapter 1](#) contains instructions on unpacking, rackmounting, cabling, and powering on the server.

[Chapter 2](#) describes the operating systems supported by the Sun Fire X2100 Server and the supplemental drivers included with the system.

[Chapter 3](#) explains how to set up the preinstalled Solaris™ 10 Operating System and additional preinstalled software.

Shell Prompts

Shell	Prompt

Related Documentation

For a description of the document set for the Sun Fire™ X2100 server, see the product's documentation site at the following URL:

http://www.sun.com/products-n-solutions/hardware/docs/Servers/Workgroup_Servers/x2100/index.html

Translated versions of some of these documents are available at the web site described above in French, German, Japanese, Korean, Simplified Chinese, Traditional Chinese. English documentation is revised more frequently and might be more up-to-date than the translated documentation.

Product Updates, Documentation, Support, Training, and Warranty URLs

Sun provides updates to documentation, drivers, firmware, and CD-ROM .iso images through the Sun web site. The web site also provides access to technical support and training services. Use the links below to access these Sun services.

Sun Function	URL
Documentation	http://www.sun.com/documentation/
Updates, including firmware, drivers, and CD-ROM .iso images	http://www.sun.com/servers/entry/x2100/downloads.jsp

Training	http://www.sun.com/training/
Solaris™ Operating System documentation	http://docs.sun.com
Warranty	http://www.sun.com/service/support/warranty/index.html

Third-Party Web Sites

Sun is not responsible for the availability of third-party web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other materials that are available on or through such sites or resources. Sun will not be responsible or liable for any actual or alleged damage or loss caused by or in connection with the use of or reliance on any such content, goods, or services that are available on or through such sites or resources.

Sun Welcomes Your Comments

Sun is interested in improving its documentation and welcomes your comments and suggestions. You can submit your comments by going to:

<http://www.sun.com/hwdocs/feedback>

Please include the title and part number of your document with your feedback: *Sun Fire X2100 Server Getting Started Guide*, 819-3720-13

System Setup

This chapter provides information about the following topics:

- [Section 1.1, “Safety and Compliance Information” on page 1-1](#)
- [Section 1.2, “Planning the Installation Process” on page 1-2](#)
- [Section 1.3, “Package Contents Inventory” on page 1-3](#)
- [Section 1.4, “Installing the Server Into a Rack With Optional Slide-Rails” on page 1-4](#)
- [Section 1.5, “Cabling the Server” on page 1-17](#)
- [Section 1.6, “Powering On the Server” on page 1-20](#)
- [Section 1.7, “Powering Off the Server” on page 1-21](#)
- [Section 1.8, “Using Serial Console Redirection” on page 1-22](#)

1.1 Safety and Compliance Information

Refer to the following document for safety information regarding the Sun Fire™ X2100 Server:

- *Important Safety Information for Sun Hardware Systems*, 816-7190 (hardcopy document included in the ship kit)
- *Sun Fire X2100 Server Safety and Compliance Guide*, 819-3723, available on the Sun Fire X2100 Server web site.

1.2 Planning the Installation Process

Use the following flowchart as a process tool to help you install the Sun Fire X2100 Server.

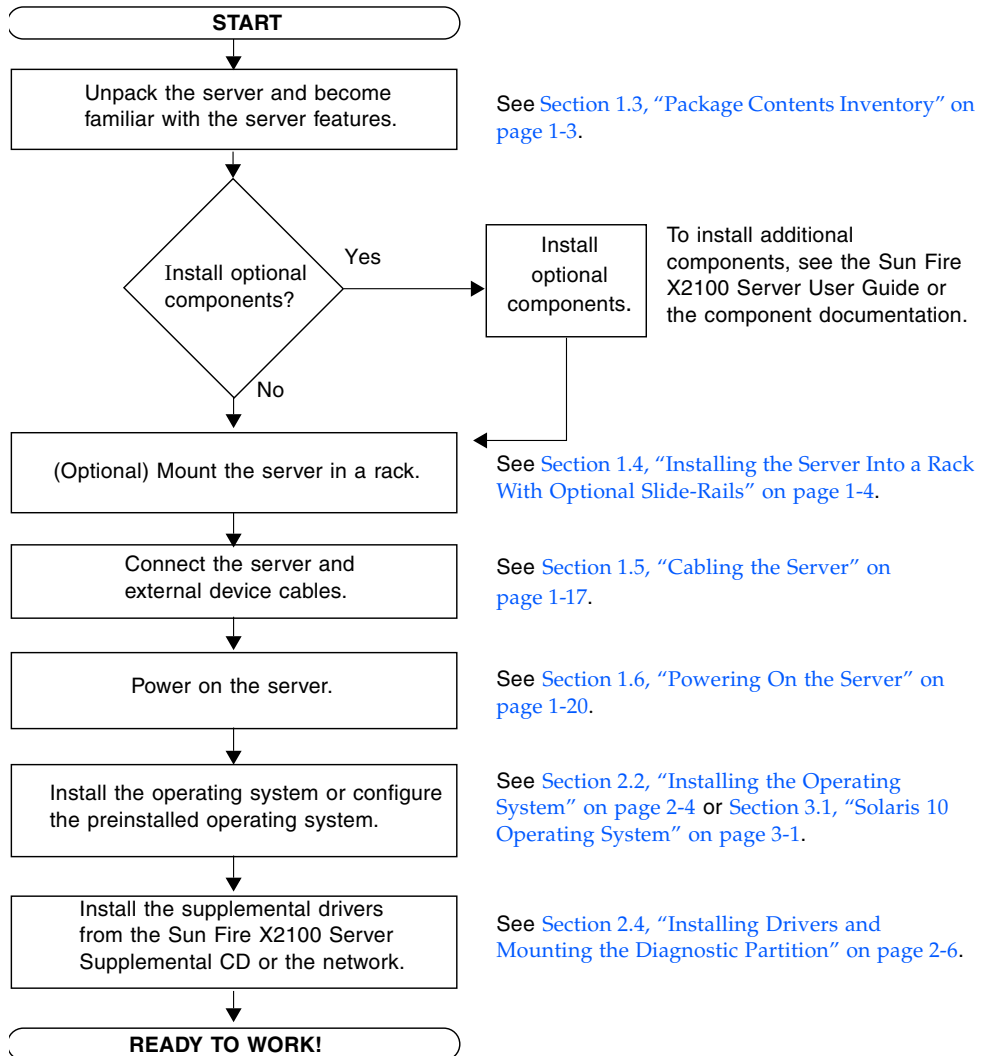

FIGURE 1-1 Process for Setting Up the Sun Fire X2100 Server

1.3 Package Contents Inventory

Carefully unpack all server components from the packing cartons. The following items are packaged with the Sun Fire X2100 Server:

- Sun Fire X2100 Server documentation:
 - *Sun Fire X2100 Server Setup Guide*
 - *Sun Fire X2100 Server Release Notes*
 - *Important Safety Information for Sun Hardware Systems*
 - *Sun Binary Code License*
- Sun Fire X2100 Server Supplemental CD (includes drivers and diagnostics software)
- (Optional) Rackmount kit

The country accessory kit (optional), which includes the power cable, keyboard, and mouse, is packaged separately from the other items.

1.4 Installing the Server Into a Rack With Optional Slide-Rails

Perform the procedures in this section, in the order in which they are listed, to install your server into a four-post rack using the orderable slide-rail options. These slide-rails are compatible with a wide range of equipment racks that meet the following standards:

- Four-post structure (mounting at both front and rear). Two-post racks are not compatible.
- Rack horizontal opening and unit vertical pitch conforming to ANSI/EIA 310-D-1992 or IEC 60927 standards.
- Distance between front and rear mounting planes between 610 mm and 915 mm (24 inches to 36 inches).
- Clearance depth (to front cabinet door) in front of front rack mounting plane at least 25.4 mm (1 inch).
- Clearance depth (to rear cabinet door) behind front rack mounting plane at least 800mm (31.5 inches), or 700 mm (27.5 inches), without cable management arm.
- Clearance width (between structural supports and cable troughs) between front and rear mounting planes at least 456 mm (18 inches).

Caution – Always load equipment into a rack from the bottom up so that the rack will not become top-heavy and tip over. Deploy your rack’s anti-tilt bar to prevent the rack from tipping during equipment installation.

Caution – Ensure that the temperature in the rack does not exceed the server’s maximum ambient rated temperatures. Consider the total airflow requirements of all equipment installed in the rack, to ensure that the equipment is operated within its specified temperature range.

1.4.1 Disassembling the Slide-Rails Before Installation

Use this procedure to remove the mounting brackets from the slide-rail assemblies.

1. Unpack the slide-rails.
2. Locate the slide-rail lock at the front of one of the slide-rail assemblies, as shown in [FIGURE 1-2](#).
3. Squeeze and hold the tabs at the top and bottom of the lock while you pull the mounting bracket out of the slide-rail assembly, until it reaches the stop. See [FIGURE 1-2](#).
4. Pull the mounting bracket release button toward the front of the mounting bracket, as shown in [FIGURE 1-2](#), and simultaneously withdraw the mounting bracket from the slide-rail assembly.
5. Repeat for the remaining slide-rail assembly.

FIGURE 1-2 Disassembling the Slide-Rail Before Installation

1.4.2 Installing the Mounting Brackets Onto the Server

Use this procedure to install the mounting brackets onto the sides of the server.

1. Position a mounting bracket against the chassis so that the slide-rail lock is at the server front, and the three keyed openings on the mounting bracket are aligned with the three locating pins on the side of the chassis.

FIGURE 1-3 Aligning the Mounting Bracket With the Server Chassis

2. With the heads of the three chassis locating pins protruding through the three keyed openings in the mounting bracket, pull the mounting bracket toward the front of the chassis until the mounting-bracket clip locks into place with an audible click. (See [FIGURE 1-3](#).)
3. Verify that the rear locating pin has engaged the mounting-bracket clip. (See [FIGURE 1-3](#).)
4. Repeat to install the remaining mounting bracket on the other side of the server.

1.4.3 Attaching the Slide-Rail Assemblies to the Rack

Use this procedure to install the slide-rail assemblies to the rack.

1. **Position a slide-rail assembly in your rack so that the brackets at each end of the slide-rail assembly are on the outside of the front and rear rack posts.** See [FIGURE 1-4](#).
2. **Attach the slide-rail assembly to the rack posts.**

The method used to attach the slide-rails varies depending on the type of rack:

- If your rack has threaded mounting holes in the rack posts, first determine whether the threads are metric or standard, and then insert the correct mounting screws through the slide-rail brackets and into the threaded holes.
- If your rack does not have threaded mounting holes, insert the mounting screws through both the slide-rail brackets and rack posts, and then secure them with the caged nuts.

FIGURE 1-4 Slide-Rail Assembly Mounting to Rack Post

3. **Repeat [Step 1](#) and [Step 2](#) for the remaining slide-rail assembly.**

4. From the front of the rack, set the proper width of the rails with spacer. (See [FIGURE 1-5](#).)

FIGURE 1-5 Setting the Rail Width

5. Tighten the screws on the brackets.
6. Remove the spacer and confirm that the rails are attached tightly to the rack.
7. Repeat [Step 4](#) through [Step 6](#) for rear of the rack.
8. If available, extend the anti-tip foot at the bottom of the rack. (See [FIGURE 1-6](#).)

Caution – If your rack does not have an anti-tip foot, there is some danger of the rack tipping.

FIGURE 1-6 Extending the Anti-tip Foot

1.4.4 Installing the Server Into the Slide-Rail Assemblies

Use this procedure to install the server chassis, with mounting brackets, into the slide-rail assemblies that are mounted to the rack.

Caution – This procedure requires a minimum of two people because of the weight of the server. Attempting this procedure alone could result in equipment damage or personal injury.

1. Push the slide-rails into the slide-rail assemblies as far as possible.
2. Raise the server so that the rear ends of the mounting brackets are aligned with the slide-rail assemblies that are mounted in the equipment rack. See [FIGURE 1-7](#).
3. Insert the mounting brackets into the slide-rails, and then push the server into the rack until the mounting brackets encounter the slide-rail stops (approximately 12 inches, or 30 cm).

FIGURE 1-7 Inserting the Server With Mounting Brackets Into the Slide-Rails

4. **Simultaneously pull and hold the slide-rail release buttons on each mounting bracket while you push the server into the rack. (See [FIGURE 1-7.](#)) Continue pushing until the slide-rail locks on the front of the mounting brackets engage the slide-rail assemblies.**

You will hear an audible click.

Caution – Before continuing to the next procedure, verify that the server is securely mounted in the rack and that the slide-rail locks are engaged with the mounting brackets.

1.4.5 Installing the Cable Management Assembly

Use this procedure to install an optional cable management assembly (CMA).

1. Unpack the CMA parts.
2. Take the CMA to the back of the equipment rack and ensure that you have adequate room to work around the back of the server.

Note – References to “left” or “right” in this procedure assume that you are facing the back of the equipment rack.

3. Locate the CMA rail extension and insert it into the left slide-rail until the extension locks into place with an audible click. (See [FIGURE 1-8](#).)

The CMA rail extension might be taped to the CMA assembly.

FIGURE 1-8 Inserting the CMA Rail Extension Into the Back of the Left Slide-Rail

4. Verify that the CMA rail extension engages the slide-rail, as shown in [FIGURE 1-9](#).

FIGURE 1-9 Detail of CMA Rail Extension Inserted Into the Left Slide-Rail

Caution – Support the CMA in the remaining installation steps. Do not allow the assembly to hang by its own weight until it is secured by all three of the attachment points.

5. Insert the CMA's mounting bracket connector into the right slide-rail until the connector locks into place with an audible click. (See [FIGURE 1-10](#).)

FIGURE 1-10 Inserting the CMA Mounting Bracket Into the Back of the Right Slide-Rail

6. Insert the right CMA slide-rail connector into the right slide-rail assembly until the connector locks into place with an audible click. (See [FIGURE 1-11.](#))

FIGURE 1-11 Inserting CMA Slide-Rail Connector Into Back of Right Slide-Rail Assembly

7. Insert the left CMA slide-rail connector into the left slide-rail assembly until the connector locks into place with an audible click. (See [FIGURE 1-12.](#))

FIGURE 1-12 Inserting CMA Slide-Rail Connector Into Back of Left Slide-Rail Assembly

8. Position the cable hangers in the appropriate mounting holes in the CMA and snap them into place. (See [FIGURE 1-13](#).)

For best results, place three hangers, evenly spaced, on the rear-facing side of the CMA, and three on the side facing the server.

FIGURE 1-13 Installing CMA Cable Hangers

1.4.6 Attaching and Routing Cables

Use this procedure to attach cables to your server and route them through the CMA.

1. Install cables to your server, as required.

Refer to [Section 1.5, “Cabling the Server” on page 1-17](#) for an illustration of the server back panel ports and a procedure for installing cables to your server.

2. Route the cables through the CMA cable hangers.

1.4.7 Verifying Operation of the Slide-Rails and CMA

Use this procedure to ensure that the slide-rails and CMA are operating correctly.

Note – This procedure can be performed more easily by two people: one to move the server in and out of the rack, and one to observe the cables and CMA.

1. Slowly pull the server out of the rack until the slide-rails reach their stops.
2. Inspect the attached cables for any binding or kinks.
3. Verify that the CMA extends fully from the slide-rails.
4. Push the server back into the rack.

When the server is fully extended, you must release two sets of slide-rail stops to return the server to the rack:

- a. The first set of stops are levers, located on the inside of each slide-rail, just behind the back panel of the server. These levers are labeled “PUSH.” Push in both levers simultaneously and slide the server toward the rack.

The server travels approximately 15 inches (38 cm) and stops.

Verify that the cables and the CMA retract without binding before continuing.

- b. The second set of stops are the slide-rail release buttons, located near the front of each mounting bracket. See [FIGURE 1-7](#). Simultaneously push or pull both of the slide-rail release buttons and push the server completely into the rack until both slide-rail locks engage.
5. Adjust the cable hangers and CMA as required.
 6. Continue with [Section 1.5, “Cabling the Server”](#) on page 1-17.

1.5 Cabling the Server

Connect the server and external devices in this order (see [FIGURE 1-14](#)):

1. Connect the server power cord to a grounded electrical outlet.
2. If needed, connect the keyboard and mouse to the USB connectors on the front or back panel.
3. If needed, connect the monitor cable to the onboard video connector.

Note – Keyboard, mouse and video are optional with an operating system that supports headless operation.

4. Connect a terminal to the serial port.

Note – The preinstall image is directed by default to the serial port (ttya) and nothing will show up on the monitor until the installation is completed and the system is reconfigured to allow video to the video port. See [Section 1.8, “Using Serial Console Redirection” on page 1-22](#) for instructions on setting up serial console redirection and redirecting video back to the onboard video display, if needed.

5. Connect Ethernet cables to the server’s gigabit Ethernet connectors.

See [Section 1.5.1, “Interconnecting Servers” on page 1-19](#) for information on how to interconnect servers and connect them to a LAN.

6. Connect any additional external devices to the server’s other connectors.

FIGURE 1-14 **FIGURE 1-14** depicts the back panel of the Sun Fire X2100 Server.

FIGURE 1-14 Back Panel

TABLE 1-1 Back Panel

Label	Connector/Slot	Label	Connector/Slot
1	Power connector	6	Onboard HD15 video connector
2	Locate LED	7	Ethernet connectors (2)
3	Service indicator LED	8	PCI EXPRESS x16 graphics slot
4	Power LED	9	USB connectors (4)
5	Serial connector		

1.5.1 Interconnecting Servers

FIGURE 1-15 shows how to connect multiple servers using the platform Ethernet (LAN) connectors.

If the service processor is installed, only LAN-1 can be used for the network interface. LAN-2 must be used for remote server management if you have the optional service processor (SP) card installed.

FIGURE 1-15 Interconnecting Servers

1.6 Powering On the Server

Tip – If you are installing optional internal components such as additional memory DIMMs, PCI cards, optical drives, or hard drives, install those components before you power on the server. If you are not installing optional components, you are ready to power on the server.

1. Ensure that a grounded AC power cord is connected to the AC power connector on the back of the server and into an AC power outlet. See [FIGURE 1-14](#).
2. Press and release the server Power button on the front panel (See [FIGURE 1-16](#)).

FIGURE 1-16 Front Panel

TABLE 1-2 Front Panel

Label	Button/LED/Port	Label	Button/LED/port
1	Locate button/LED	5	USB ports (2)
2	Status LED	6	DVD drive (optional)
3	Power LED	7	Hard disk drives (optional 0, 1, or 2)
4	Power button		

3. After several seconds, verify that the power LED next to the Power button lights. The power LED lights after the server begins the internal booting process. See [FIGURE 1-16](#) for the location of the power LED.
4. (Optional) Press the Locate button on the front of the server to activate the locate LEDs on the front and back of the server. The locate LED will help you to locate the server in a rack configuration.

Note – The locate LED will only display if you have the optional SDMC installed.

5. Continue with software setup tasks as described in [Section , “Software Installation”](#) on page 2-1 or [Section , “Setting Up the Preinstalled Software”](#) on page 3-1.

1.7 Powering Off the Server

1. Save your data and close any open applications.
2. Read all of the following power-off options before powering off the server:
 - Power off the server by using the operating system shutdown command or menu option.

In most cases, this powers off the operating system then turns off the power to the server.
 - If the server power does not shut off through the operating system command or this command is not available, press and release the power button (location shown in [FIGURE 1-16](#)).

This initiates an orderly shutdown of the operating system and powers off the server.

Caution – To avoid data loss, use the options in the first two bullets whenever possible.

- If the server does not shut off, press and hold the power button for approximately 4 seconds. See [FIGURE 1-16](#).

This shuts down the power to the server but does *not* initiate an orderly shutdown of the system. This method could result in data loss.

If the preceding options fail to power off the server, see the Troubleshooting section of the *Sun Fire X2100 Server User Guide*, 819-3721, for more options.

Note – After powering off the server, wait at least four seconds before powering on the server again.

1.8 Using Serial Console Redirection

1. To use serial console redirection with the Sun Fire X2100 Server, change the BIOS setting first, as follows:
 - a. Connect a local keyboard and monitor to the Sun Fire X2100 Server.
 - b. Reboot the server.
 - c. Press F2 when you see the Sun logo screen.
 - d. Select Advanced BIOS Features ->Console Redirect ->Enabled over COM1.

After the COM port is enabled, you can run an xterm window for console redirection if you are running a Solaris or Linux operating system.

Note – With a tip setup, you may need to press the ESC key twice when moving to a higher level window in the BIOS Setup utility.

Use the following key sequences for the function keys when using serial console redirection with BIOS version 1.7 or greater.

Function Key	New Key Sequences for BIOS Version 1.7
F1	F1+ F1
F2	F2+F2
F3	ESC+3
F4	ESC+4
F8	ESC+8
F12	ESC+B
ESC	ESC+ESC
CNTRL-ALT-DEL	ESC+C

2. Connect a terminal to the serial port if it is not already connected.
3. Power on the terminal system.
4. If you want to redirect the video output to the onboard video display, do the following:

- a. Open a terminal window on the console system and type the following:

```
eeeprom console=text  
/usr/dt/bin/dtconfig -e
```

- b. Reboot the server.
- c. Display output will be directed to the onboard video display.

Software Installation

This chapter includes the following sections:

- [Section 2.1, “Preparing for Installation” on page 2-1](#)
- [Section 2.2, “Installing the Operating System” on page 2-4](#)
- [Section 2.3, “Running the `up2date` Utility” on page 2-5](#)
- [Section 2.4, “Installing Drivers and Mounting the Diagnostic Partition” on page 2-6](#)

This chapter includes information on installing an operating system on your server, if you plan to use an operating system other than the Solaris™ 10 Operating System (OS) preinstalled on the Sun Fire X2100 Server.

Diagnostics software is also included on the Sun Fire X2100 Server Supplemental CD. Instructions for using the diagnostics software are provided in the *Sun Fire X2100 Server User Guide*, 819-3721.

2.1 Preparing for Installation

[FIGURE 2-1](#) for illustrates the process flow for installing an operating system on your server.

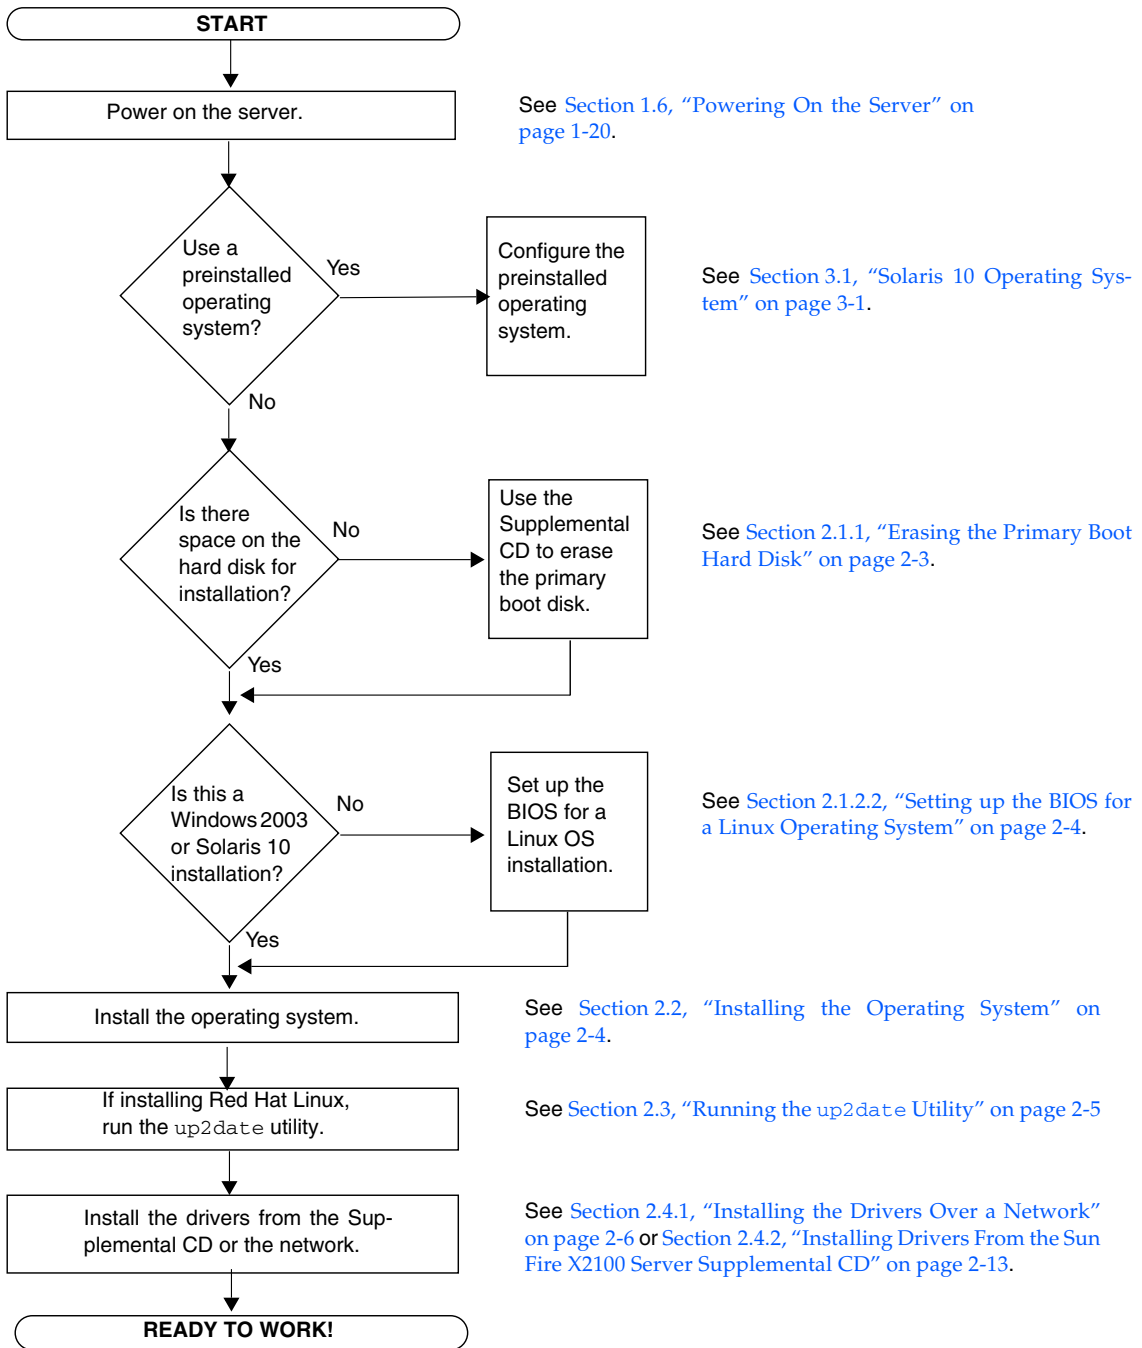

FIGURE 2-1 Installation Flow Diagram

2.1.1 Erasing the Primary Boot Hard Disk

If you do not have enough space on the boot partition to install an operating system, there is an Erase Primary Boot Hard Disk option on the Sun Fire X2100 Server Supplemental CD main menu, which enables you to erase other installed operating systems to make room for the new installation.

Caution – Selecting the Erase Primary Boot Hard Disk option from the Supplemental CD erases all partitions on the hard drive, with the exception of the diagnostic partition. All user data is lost. Be sure to back up all data on the hard drive before performing this action.

To erase the primary boot hard disk:

1. **Back up all data that you want to save on the hard drive.**
2. **Insert the Supplemental CD into the server's DVD drive.**
3. **When the main menu appears, select the following option from the Supplemental CD main menu:**
 3. Erase Primary Boot Hard Disk

This option erases all partitions currently located on the primary hard drive, except for the diagnostic partition. If the diagnostic partition is present, it remains untouched.

2.1.2 Setting up the BIOS for Operating System Installation

If you plan to install an operating system onto the Sun Fire X2100 Server, you need to make sure that the BIOS is set up correctly before you install the software. See the procedure that matches the operating system you plan to install.

2.1.2.1 Setting up the BIOS for Windows 2003 or Solaris 10 OS

The default for the Installed O/S option is Others. If the default has not been changed, you do not need to perform this setup for the Windows 2003 or Solaris 10 operating systems.

If the BIOS Installed O/S option has been changed from the default, do the following for Windows 2003 or Solaris 10 operating system:

1. Power on the server and press F2 at the Sun logo screen to enter the BIOS Setup menu.
2. Select the Advanced BIOS Features menu.
3. Change the Installed O/S option to Others.
4. Press F10 to save your changes and exit the BIOS.

2.1.2.2 Setting up the BIOS for a Linux Operating System

For Linux operating systems (Red Hat Enterprise Linux 3 and 4 and SUSE Linux Enterprise System), do the following:

1. Power on the server and press F2 at the Sun logo screen to enter the BIOS Setup menu.
2. Select the Advanced BIOS Features menu.
3. Change the Installed O/S option to Linux.
4. Press F10 to save your changes and exit the BIOS.

2.2 Installing the Operating System

If you do not wish to use the Solaris 10 Operating System preinstalled on your Sun Fire X2100 Server, you can install an operating system of your choosing.

[TABLE 2-1](#) shows the operating systems currently supported on the Sun Fire X2100 Server:

TABLE 2-1 Minimum Supported Operating Systems

Operating System	Minimum Version	Most Recent Update Supported	32-bit	64-bit	Vendor Certified?
Solaris™ 10 Operating System with Sun Java™ Enterprise System	HW1	HW 1	yes	yes	yes
Red Hat Enterprise Linux 3		Update 6	yes	yes	yes
Red Hat Enterprise Linux 4		Update 2	yes	yes	yes

TABLE 2-1 Minimum Supported Operating Systems

Operating System	Minimum Version	Most Recent Update Supported	32-bit	64-bit	Vendor Certified?
SUSE Linux Enterprise System 9	Dual core requires SP3	SP2 (single core) SP3 (dual core)	yes	yes	yes
Windows 2003 Server Standard/Enterprise Editions		SP1 for 32-bit	yes	yes	yes
Windows 2003 Server Web Edition			yes	no	yes

Please note the following items regarding operating systems:

- An updated list of supported operating systems is available at the following URL:
<http://www.sun.com/servers/entry/x2100/os.jsp>
- You can purchase Red Hat Enterprise Linux 3 or 4 or SUSE Linux Enterprise System 9 at the following URL:
<http://www.sun.com/software/linux/index.html>
- Instructions for installing available operating systems are available in the media sets that come with the operating system software. Instructions specific to the Sun Fire X2100 Server are provided in the *Sun Fire X2100 Server User Guide*.
- [Appendix A](#) contains instructions for Windows XP using the Remote Installation Service (RIS).

Note – The diagnostic partition is preinstalled on the Sun Fire X2100 Server. If the diagnostic partition is deleted from the server, refer to the *Sun Fire X2100 Server User Guide*, 819-3721, for information on how to use the Sun Fire X2100 Server Supplemental CD to reinstall the diagnostic partition.

2.3 Running the `up2date` Utility

If you are installing the Red Hat Enterprise Linux software, run the `up2date` utility *after* installing the operating system and *before* installing the video drivers from the Sun Fire X2100 Server Supplemental CD.

Note – If you have already installed the NVIDIA drivers, you must reinstall them after running `up2date`, because the kernel will be updated.

2.4 Installing Drivers and Mounting the Diagnostic Partition

After installing the operating system, install the drivers that correspond to your operating system over a network or run the installation script provided on the Sun Fire X2100 Server Supplemental CD.

The Sun Fire X2100 Server Supplemental CD is included with your Sun Fire X2100 Server. You can also download the Supplemental CD from the downloads link at:

<http://www.sun.com/servers/entry/x2100/>

If you have created a new diagnostic partition, you also need to run this script to mount the diagnostic partition for all supported operating systems. (See the *Sun Fire X2100 Server User Guide*, 817-6585, for information about how to create a diagnostic partition.) The diagnostic partition cannot be mounted on a Windows 2003 server.

This section covers the following topics:

- [Section 2.4.1, “Installing the Drivers Over a Network” on page 2-6](#)
- [Section 2.4.2, “Installing Drivers From the Sun Fire X2100 Server Supplemental CD” on page 2-13](#)

2.4.1 Installing the Drivers Over a Network

The following procedures describe how install the drivers over the network. This includes setting up a system to house the drivers, as well as connecting the Sun Fire X2100 Server to the system that houses the drivers to install them.

Use these procedures to install the drivers if you do not have a CD or DVD drive installed or connected to the system.

This section covers the following topics:

- [Section 2.4.1.1, “Create a Shared Drivers Directory” on page 2-7](#)
- [Section 2.4.1.2, “Copy the Drivers from the Supplemental CD” on page 2-10](#)
- [Section 2.4.1.3, “Install the Drivers onto the Target Sun Fire X2100 Server” on page 2-11](#)

2.4.1.1 Create a Shared Drivers Directory

This section describes how to create a shared folder on a server attached to the same subnet as the Sun Fire X2100. Use the procedure appropriate to the type of host system:

- [“Create a Shared Drivers Directory on a Solaris System” on page 7](#)
- [“Create a Shared Drivers Directory on a Linux System” on page 8](#)
- [“Create a Shared Drivers Directory on a Windows System” on page 9](#)

Note – Throughout this section, the variable *hostname* is used to refer to the system on which the shared drivers directory is installed.

Create a Shared Drivers Directory on a Solaris System

1. Log in as root (superuser) to the *hostname* system.
2. Create a drivers directory.

```
# mkdir /export/home/drivers
```

3. Change accessibility for the drivers directory to be viewable by all.

```
# chmod -R 555 /drivers
```

4. Change to the `/etc/dfs` directory.

```
# cd /etc/dfs
```

5. Open the `dfstab` file in a text editor.

```
# vi dfstab
```

6. Add the following line to the `dfstab` file:

```
share -F nfs /export/home/drivers
```

7. Save and exit the `dfstab` file.

8. At the command prompt type:

```
# shareall
```

9. The `/export/home/drivers` directory is now on the network as `/net/hostname/export/home/drivers`.
10. Copy the drivers as shown in [Section 2.4.1.2, "Copy the Drivers from the Supplemental CD"](#) on page 2-10.

Create a Shared Drivers Directory on a Linux System

1. Log in as root (superuser) on the *hostname* system.
Where *hostname* is the system on which the drivers were originally installed.
2. Create a `drivers` directory.

```
# mkdir /drivers
```

3. Change accessibility for the `drivers` directory to be viewable by all.

```
# chmod -R 555 /drivers
```

4. Change to the `/etc/dfs` directory.

```
# cd /etc/dfs
```

5. Open the `dfstab` file in a text editor.

```
# vi dfstab
```

6. Add the following line to the end of the `dfstab` file.

```
share -F nfs -o ro, /drivers
```

7. Save and exit the `dfstab` file.

8. Type the following command at the prompt:

```
# shareall
```

The `/drivers` directory will now be seen on the network as `/net/hostname/drivers`.

9. Copy the drivers as shown in [Section 2.4.1.2, “Copy the Drivers from the Supplemental CD”](#) on page 2-10.

Create a Shared Drivers Directory on a Windows System

1. Log in as administrator to the *hostname* system.
2. Make the directory `C:\drivers` from within Windows Explorer.
3. Right click on `C:\drivers` from within Windows Explorer.
4. Select Sharing and Security.
5. Click the Permissions button.
6. Select the Full Control option for Permissions for Everyone.
7. Click the Apply button.
8. Click the OK button.
9. Click the Apply button from within the drivers Properties window.
10. Click the OK button.
11. The `C:\drivers` directory will now be seen on the network as `\\hostname\drivers`.
12. Copy the drivers as shown in [Section 2.4.1.2, “Copy the Drivers from the Supplemental CD”](#) on page 2-10.

2.4.1.2 Copy the Drivers from the Supplemental CD

1. Insert the Supplemental CD into the CD/DVD drive of the *hostname* system.
2. Use the appropriate command for your operating system to copy the drivers directory into the shared folder created in [Section 2.4.1.1, "Create a Shared Drivers Directory" on page 2-7](#):

- For a Solaris system:

```
# cp -r /cdrom/cdrom0/drivers/* /export/home/drivers
```

- For a Linux system:

```
# cp -r cdrom-mount-point/drivers/* /drivers
```

Where *cdrom-mount-point* is the mount point for your Linux distribution.

- For a Windows system (assuming D: is the CD/DVD drive):

```
> copy D:\*.* C:\drivers
```

3. Log in to the Sun Fire X2100 system as superuser (Linux and Solaris) and administrator for Windows.
4. On a Sun Fire X2100 connect to the network share directory created in [Section 2.4.1.1, "Create a Shared Drivers Directory" on page 2-7](#), using the command that applies to the appropriate OS:

- For a Solaris system:

```
# cd /net/hostname/drivers
```

- For a Linux system:

```
# cd /net/hostname/drivers
```

- For a Windows system:

- i. Open Windows Explorer.
- ii. Select Tools from the pull down menu.

dd

iii. Select Map Network Drive.

iv. Tpe in `\\hostname\drivers`

5. Install the drivers as shown in [Section 2.4.1.3, “Install the Drivers onto the Target Sun Fire X2100 Server”](#) on page 2-11.

2.4.1.3 Install the Drivers onto the Target Sun Fire X2100 Server

Install the drivers onto the target Sun Fire X2100 server using the instructions for the appropriate operating system.

- [Install the Drivers onto a Target Solaris System](#)
- [Install the Drivers onto a Target Linux System](#)
- [Install the Drivers on a Target Windows System](#)

Install the Drivers onto a Target Solaris System

1. Log in as superuser.
2. Type the following command to install the drivers:

```
# /net/hostname/export/home/drivers/solx86/install.sh
```

The script installs the networking and sound drivers.

The script prompts you to reboot the system for changes to take effect.

3. Reboot the server.
4. When Xserver choices are displayed, select the default `Xorg`.
5. When prompted for networking information on your system, enter the networking information for your server.

Install the Drivers onto a Target Linux System

1. Login as superuser.
2. Type the following at the command line:

```
# init 3
```

3. Type the appropriate command to install the drivers:

- For a Red Hat Linux system:

```
# /net/hostname/drivers/linux/red_hat/install.sh
```

- For a SUSE system:

```
# /net/hostname/drivers/linux/suse/install.sh
```

If the drivers do not install properly, you have two other alternatives:

- Install the drivers using a CD-ROM connected to the USB port.
- If you are running a Red Hat Linux operating system, the drivers included with the OS might work. Sun does not support open source drivers.

Install the Drivers on a Target Windows System

Note – Read the instructions in [Section FIGURE 2-1, “Installation Flow Diagram” on page 2-3](#) before following this procedure. You might need to install additional drivers on your system before installing the chipset and display drivers.

If you plan to only install the Windows chipset and display drivers, follow this procedure.

1. **Browse to \\hostname\drivers\windows to get the drivers.**
2. **Install the drivers through the Device Manager.**

2.4.2 Installing Drivers From the Sun Fire X2100 Server Supplemental CD

If your server has an onboard DVD drive, you can install the drivers directly, using the Sun Fire X2100 Server Supplemental CD.

This section covers the following topics:

- [Section 2.4.2.1, “Installing Linux Operating System Drivers From a CD” on page 2-13](#)
- [Section 2.4.2.2, “Installing Solaris 10 OS Operating System Drivers from a CD” on page 2-15](#)
- [Section 2.4.2.3, “Installing Windows 2003 Server Operating System Drivers From a CD” on page 2-16](#)
- [Section , “Installing RAID Drivers Using the 2003Reburn Script” on page 2-17](#)

2.4.2.1 Installing Linux Operating System Drivers From a CD

The order of installation for Linux operating system and drivers is as follows:

1. Remove the preinstalled Solaris operating system from the server. See [Section , “Installing RAID Drivers Using the 2003Reburn Script” on page 2-17](#).
2. If necessary, set up the BIOS for Linux operating system installation. See [Section , “Installing RAID Drivers Using the 2003Reburn Script” on page 2-17](#).
3. Install the operating system.

Note – Make sure to keep the 55 MB diagnostic partition in place when doing the installation. If the diagnostic partition gets erased for some reason, use the Create Diagnostic Partition option in the Diagnostics section of the Sun Fire X2100 Server Supplemental CD. See the *Sun Fire X2100 Server User Guide* for more details.

4. If you installed a Red Hat Linux operating system, run the `up2date` utility as shown in [Section 2.3, “Running the up2date Utility” on page 2-5](#).
5. Install the drivers as shown in the following procedure.

To install the video drivers and mount the diagnostic partition when running a Linux operating system:

1. **Log in to the Sun Fire X2100 Server as superuser.**

2. Insert the Sun Fire X2100 Server Supplemental CD into the DVD drive and type:

```
cd /mountpoint/drivers/linux/operating_system
```

Where */mountpoint* is the directory to which the CD is mounted and *operating_system* is the type of Linux installed on the server.

- If the directory does not exist, the CD did not automount. You need to mount the CD and change to the correct directory as shown in [Step 3](#) and [Step 4](#).
- If you were able to access the *operating_system* directory, go to [Step 5](#).

3. If the CD does not automount, open a terminal window and mount the CD by typing the following command:

```
# mount -o ro /dev/cdrom /mountpoint
```

Where */mountpoint* is the appropriate mount point for the OS and optical drive type. For example:

```
# mount -o ro /dev/cdrom /mnt/dvdrom
```

4. Change to the */mountpoint/drivers/linux/operating_system* directory.

Where */mountpoint* is the directory that the CD is mounted to, and *operating_system* is the type of Linux installed on the server.

For example:

```
# cd /mnt/dvdrom/drivers/linux/red_hat
```

5. Run the installation script by typing the following command:

```
# sh install.sh
```

This script is not executed if the X server is running.

- If the script exits and you receive an error message, go to [Step 6](#).
- If the script executes correctly, go to [Step 7](#).

6. If the script exits and you receive an error message, do the following steps to disable the X server:

- a. Type the following command at the system prompt:

```
% init 3
```

- b. Log in as superuser.
 - c. Repeat [Step 4](#) and [Step 5](#).
7. Eject the CD after the driver installation completes.
 8. Reboot the server.

2.4.2.2 Installing Solaris 10 OS Operating System Drivers from a CD

The following instructions are for installing drivers if you are performing a fresh installation of the Solaris 10 operating system. You do not need to reinstall the drivers if you are using the preinstalled version of the operating system.

1. Remove the currently installed operating system from the server. See [Section 5](#), “Run the installation script by typing the following command:” on page 2-14.
2. If necessary, set up the BIOS for Solaris operating system installation. See [Section 5](#), “Run the installation script by typing the following command:” on page 2-14.
3. Install the operating system.
4. Install the drivers as shown in the following procedure.

To install the drivers and mount the diagnostic partition when running the Solaris 10 Operating System:

1. Log in to the Sun Fire X2100 Server as superuser.
2. Insert the Sun Fire X2100 Server Supplemental CD into the DVD drive.
The CD is automounted by the Solaris 10 Operating System.
3. Change to the `/cdrom/cdrom0/drivers/sx86` directory by typing the following command:

```
# cd /cdrom/cdrom0/drivers/sx86
```

4. Run the install script by typing the following command:

```
# sh install.sh
```

The networking and sound drivers are now installed.

The script prompts the user to reboot the system for changes to take effect.

5. Reboot the server.

6. When Xserver choices are displayed, select the default `Xorg`.

7. When prompted for networking information on your system, enter the networking information for your server.

2.4.2.3 Installing Windows 2003 Server Operating System Drivers From a CD

The Sun Fire X2100 Server Supplemental CD contains NVRAID, NVIDIA display, and NVIDIA chipset drivers for Windows 2003. If you are installing NVRAID drivers, you need to use the `2003Reburn` script to create a new Windows 2003 CD containing the necessary drivers or create a boot diskette to install the drivers *before* installing the Windows 2003 operating system.

The order of Windows 2003 server operating system and driver installation is as follows:

1. Remove the preinstalled Solaris operating system from the server. See [Section 2.1.1, “Erasing the Primary Boot Hard Disk” on page 2-3](#).
2. If necessary, set up the BIOS for the Windows 2003 Server operating system. See [Section 2.1.2, “Setting up the BIOS for Operating System Installation” on page 2-3](#).
3. If you plan to use the server RAID functionality, install the NVRAID drivers before installing the operating system, using one of the following methods:
 - [“Installing RAID Drivers Using the 2003Reburn Script” on page 17](#).
 - [“Installing RAID Drivers Using a Boot Diskette” on page 18](#).
4. Install the operating system.

Note – Make sure to keep the 55 MB diagnostic partition in place when doing the installation. If the diagnostic partition gets erased for some reason, use the Create Diagnostic Partion option in the Diagnostics section of the Sun Fire X2100 Server Supplemental CD. See the *Sun Fire X2100 Server User Guide* for more details.

5. Install the Ethernet and chipset drivers as shown in [“Installing Windows 2003 Drivers” on page 20](#).

Note – The Supplemental CD does not mount the diagnostic partition for Windows 2003.

Installing RAID Drivers Using the 2003Reburn Script

The Sun Fire X2100 Server Supplemental CD (705-1364) contains a script that allows you to create a new Windows 2003 CD with the necessary RAID drivers. After creating the new CD, you can boot it and install Windows 2003 normally. This new CD automatically installs the drivers, making it unnecessary to use a USB diskette drive and to install the NVRAID drivers.

For specific and current information on the 2003Reburn script, see the description at the top of the script. If you have version 1.3 of the Supplemental CD, the script is in the `/utilities/reburn` directory. On earlier versions of the Supplemental CD, the script was in the `/utilities/reburn` directory.

To install Windows 2003 using a RAID configuration, you need the following:

- A system running Solaris Operating System for x86 Platforms, Solaris Operating System (SPARC® Platform Edition), Red Hat Enterprise Linux 3 or 4, or SUSE Linux Enterprise System (SLES) 9
- Access to a CD burner
- A blank CD-R or CD-RW
- A Windows 2003 CD (retail media only—not an OEM version)
- An Sun Fire X2100 Server Supplemental CD

To create a Windows 2003 CD with the Sun Fire X2100 Server drivers:

1. **On a Solaris x86, Solaris OS (SPARC Platform Edition), Red Hat Enterprise Linux 3 or 4, or SLES 9 system, insert the Sun Fire X2100 Server Supplemental CD into a CD or DVD drive.**
2. **As superuser, create a temporary directory with at least 1.2 GB of space.**

For example:

```
# mkdir /files
```

3. Copy the 2003REBURN_*version*.zip file to that directory.

Where *version* is the current version of 2003Reburn.

For example:

```
# cp /utilities/reburn/2003reburn_1.2.zip
```

4. Eject the Supplemental CD and insert your retail Windows 2003 32 CD.

5. Unzip the 2003Reburn_*version*.zip file.

For example:

```
# unzip -q 2003REBURN_1.2.zip
```

6. Run the 2003Reburn script.

For example:

```
# ./files/2003Reburn
```

The script displays the driver files it expects to be located in the current directory. When all four driver files are downloaded into that directory, the script creates a new ISO image and then automatically burns that ISO image onto a CD if the system has a CD burner.

7. After the CD has been created, install Windows 2003 Professional on the Sun Fire X2100 Server.

8. When the OS installation is complete, install the Ethernet and chipset drivers as shown in [“Installing Windows 2003 Drivers”](#) on page 20.

Installing RAID Drivers Using a Boot Diskette

This section explains how to create a boot diskette for the NVIDIA RAID drivers using the Sun Fire X2100 Server Supplemental CD, and how to install the drivers onto your server.

To install the NVIDIA RAID drivers using a boot diskette, you need the following:

- A Windows system with a CD and diskette drive
- A preformatted blank diskette
- An Sun Fire X2100 Server Supplemental CD
- A USB floppy drive

- A Windows 2003 CD (retail media only—not an OEM version)

To create a boot diskette for Windows 2003 32-bit and 64-bit, you need a Windows system with a CD drive and a diskette drive.

1. **On a Windows system, insert the Sun Fire X2100 Server Supplemental CD.**
2. **Change to the following directory on the CD:**
D: \DRIVERS\WINDOWS\OS\CHIPSET
Where *OS* is 2003_32 or 2003_64.
3. **Unzip the appropriate file under the CHIPSET directory and extract the files to a local directory (for example C:\raid).**
 - For 2003_32, unzip the NFref_*_w2k.zip
 - For 2003_64, unzip CK804_*_w64.zip
4. **Insert a preformatted blank diskette into the server.**
5. **Change to the directory where the files were extracted (for example, C:\raid), then open the appropriate directory for your OS.**
For 2003_32, open IDE\WinXP\
For 2003_64, open IDE\Win2k\sataide
6. **Select all files in the directory and copy them to the diskette drive (a:).**
7. **Configure RAID in the Sun Fire X2100 Server BIOS.**
 - a. **Reboot the server and press the F2 key when you see the Sun logo screen.**
The BIOS Setup screen is displayed.
 - b. **Select Integrated Peripherals from the main menu.**
 - c. **Select RAID config.**
 - d. **Under RAID, change the setting to Enable.**
 - e. **Press the F10 key to save your changes and exit.**
8. **When prompted by the NVRAID BIOS, press the F10 key.**
 - a. **Select the type of RAID (mirror or stripe).**
 - b. **Select the disk drives for the array.**
 - c. **Press the F7 key.**
 - d. **Select boot (B).**
 - e. **Exit the NVRAID BIOS.**
 - f. **Press Control-X to save and exit the NVRAID BIOS.**

9. Attach a USB diskette drive to the server.
10. Insert a Windows 2003 32-bit or 64-bit installation CD into the DVD drive.
11. When prompted, press the F6 key to install the third-party RAID driver.
12. Press the S key and Enter to specify additional drivers and insert the diskette.
13. Select the NVIDIA NForce Storage Controller.
14. Press the S key and Enter to specify additional drivers.
15. Select the NVIDIA RAID CLASS DRIVER.
16. Press the Enter key to continue the Windows 2003 installation.
17. When the OS installation is complete, install the NVIDIA display and chipset drivers as explained in [“Installing Windows 2003 Drivers”](#) on page 20.

2.4.2.4 Installing Windows 2003 Drivers

Note – If you have used the 2003Reburn option to create a Windows 2003 CD containing the drivers, you do not need to install these drivers.

To install the Windows drivers from a CD, do the following:

1. Insert the Sun Fire X2100 Server Supplemental CD into the DVD drive.
2. Install the chipset drivers:
 - a. Change the directory on the Supplemental CD by typing the following command at a DOS prompt:

```
C:\> D:  
D:\> cd \DRIVERS\WINDOWS\OS\CHIPSET
```

Where OS is 2003_32 or 2003_64.

- b. Copy the .zip file in this directory to C:\NVIDIA.
- c. Unzip the file.
- d. Open the Windows Device Manager as follows:
 - i. Click on the Start button.
 - ii. Right click on the My Computer menu item, and select Message from the drop down menu.

- iii. Click on Device Manager.
 - e. Right click on any drivers that have an exclamation point on them and select Update Driver.
 - f. Proceed through the Update Driver screens.
 - Specify the driver location as C:\NVIDIA\Ethernet.
3. Install the Broadcom Ethernet drivers:
- a. Change to the directory on the Supplemental CD by typing the following command at a DOS prompt:

```
C:\> D:  
D:\> cd \DRIVERS\WINDOWS\OS\NIC
```

Where OS is 2003_32 or 2003_64.

- b. Copy the .zip file in this directory to C:\Broadcom
 - c. Unzip the file.
 - d. Open the Windows Device Manager as follows:
 - i. Click on the Start button.
 - ii. Right click on the My Computer menu item, and select Message from the drop down menu.
 - iii. Click on Device Manager.
 - e. Right click on any drivers that have an exclamation point on them and select Update Driver.
 - f. Proceed through the Update Driver screens.
 - Specify the driver location as C:\Broadcom\subdirectory, where subdirectory is the only subdirectory present.
4. Reboot the server.

Setting Up the Preinstalled Software

This chapter contains information on the software preinstalled on standard Sun Fire X2100 Server configurations that have installed hard drives.

This chapter contains the following sections:

- Section 3.1, “Solaris 10 Operating System” on page 3-1
- Section 3.2, “Java Enterprise System” on page 3-5
- Section 3.3, “Sun Studio Software” on page 3-7

3.1 Solaris 10 Operating System

The Solaris 10 Operating System is preinstalled on all Sun Fire X2100 Servers. This section contains instructions on configuring the operating system and using the software installed on the system.

3.1.1 Solaris 10 Operating System Configuration Overview

The Solaris Operating System version installed on your server requires no licensing fee. If you install a different version of Solaris software, you might be required to pay a licensing fee for the new software version. The Sun Fire X2100 Server requires Solaris 10 (HW 1), or a subsequent compatible version of Solaris software. For more information, refer to the following web site:

<http://www.sun.com/software/solaris/licensing/index.html>

The exact configuration that has been preinstalled is as follows:

- Hard drive root partition—14.0 Gbytes
- Hard drive swap partition—2.0 Gbytes
- Hard drive var partition—6.0 Gbytes
- Hard drive export partition—remainder of the disk

Use the flowchart in [FIGURE 3-1](#) to assist with setting up your operating environment.

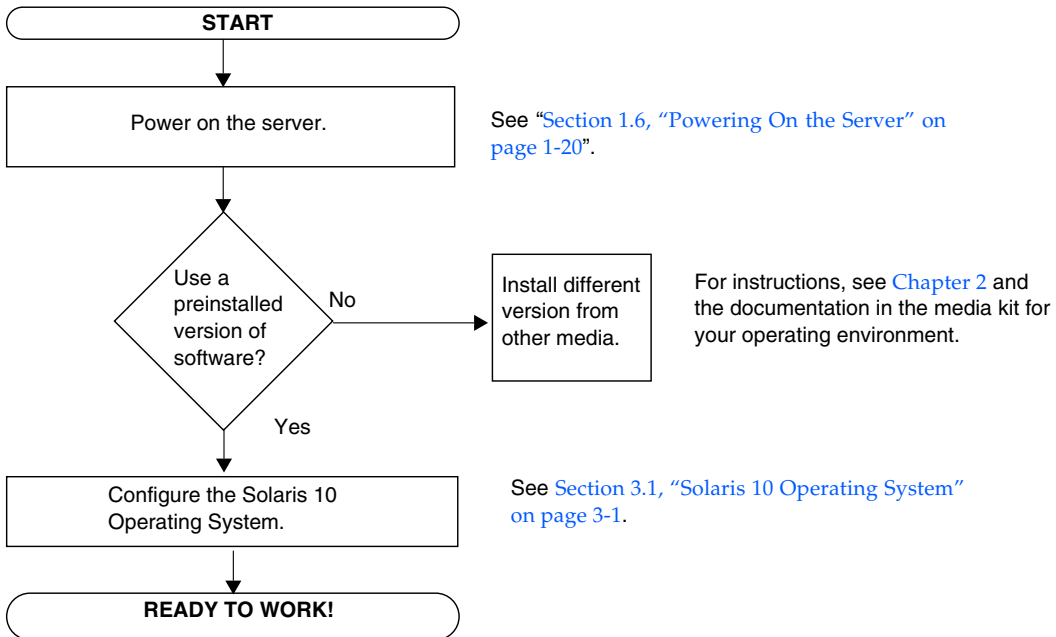

FIGURE 3-1 Installation Process Flow Diagram

3.1.2 Configuration Instructions

Complete the following steps to configure the preinstalled Solaris 10 x86 Platform Edition.

1. **Connect the Sun Fire X2100 Server serial port (COM 1) to a serial terminal and set up a terminal session.**

Note – The preinstall image is directed by default to the serial port (ttya) and nothing will show up on the monitor until the installation is completed and the system is reconfigured to allow video to the video port.

2. **Power on the server.**

See [Section 1.6, “Powering On the Server”](#) on page 1-20.

3. **Respond to the setup prompts by following the onscreen instructions.**

Using a copy of [TABLE 3-1](#), write down the information that you might need before setting up the Solaris 10 x86 operating system. To help you fill out the information in the table, your system administrator (SA) should provide you with information specific to your site before you begin. Some of the information might be available on your network; check with your SA.

When you are finished with the configuration set up, the server reboots and a login screen is displayed.

4. **Type your user name and password to log in and begin using the server.**
5. **Do the following steps to redirect the preinstalled image back to a video monitor connected to the Sun Fire X2100 Server:**
 - a. **Log in to the console system as root.**
 - b. **Type the following commands in a terminal window:**

```
eeeprom console=text
/usr/dt/bin/dtconfig -e
```

- c. **Reboot the system.**

The display output is directed to the video port and can be viewed on an attached monitor.

6. **Review the Solaris 10 Operating System Release Notes for any late-breaking information about your preinstalled software.**

The *Solaris 10 Operating System Release Notes* documentation is located at:

<http://docs.sun.com>

TABLE 3-1 Information for Preinstalled Solaris 10 Configuration

Setup Window	Explanation and Notes	Your Information
Select Language and Locale	Native language and locale to use for the server.	
Host Name	A name to give the server.	
Terminal Type	Type of terminal to use on the server.	
Network Connectivity (IP Address)	Network or stand-alone server protocols. A system administrator might be required to complete this section. Note: Depending on how you answer and what information is provided by your network, you might also be prompted for the server's IP address.	
Security Settings	Security settings and protocols.	
Name Service	Name service to use: NIS+, NIS, DNS, LDAP, or None. Note: This window is not displayed if the server is not connected to a network.	
Domain Name	NIS or NIS+ domain for this server. Note: This window is not displayed if the server is not using the NIS or NIS+ service.	
Name Server/ Subnet/ Subnet Mask	Name server (specify the server or have the server find one on a local subnet). Note: This window is not displayed if the server is not connected to a network. Note: Depending upon how you answer and what information is provided by your network, you might also be prompted for: - The subnet for the server - The subnet mask for the server	
Time Zone	Local time zone (select by geographic region, GMT offset, or a time zone file).	
Date and Time	Current date and time (accept the default or enter the current date and time).	
Root Password	Root (superuser) password for the server.	

3.2 Java Enterprise System

The Sun Java™ Enterprise System (Java ES), which is preinstalled on your server, is an integration of previously independent Sun software products into a single software system.

The Java ES installer is located in the following directory.

```
/var/spool/stage/JES_05Q1/Solaris-x86/installer
```

Run this installer *before* running Java ES.

The components of this system have been tested together to ensure interoperability. They are compatible with one another and are synchronized on a common set of shared libraries. The components also share a common installation and upgrade technology.

The components of Java ES and the infrastructure services they provide are described as follows:

- *Sun Cluster* software provides high availability and scalability services for the Java ES, the applications that run on top of the Java ES infrastructure, and the hardware environment in which both are deployed.
- *Sun ONE Application Server* provides J2EE™ container services for Enterprise JavaBeans™ (EJB) components, such as session beans, entity beans, and message-driven beans. The container provides the infrastructure services needed for tightly coupled distributed components to interact, making it a platform for the development and execution of e-commerce applications and web services. The Application Server also provides web container services.
- *Sun ONE Calendar Server* provides calendar and scheduling services to end users and groups of end users. Calendar Server includes a browser-based client that interacts with the server.
- *Sun ONE Directory Proxy Server* provides security services for Directory Server from outside a corporate firewall. Directory Proxy Server provides enhanced directory access control, schema compatibility, routing, and load balancing for multiple Directory Server instances.
- *Sun ONE Directory Server* provides a central repository for storing and managing intranet and Internet information such as identity profiles (employees, customers, suppliers, and so forth), user credentials (public key certificates, passwords, and pin numbers), access privileges, application resource information, and network resource information.

- *Sun ONE Identity Server* provides access management and digital identity administration services. Access management services include authentication (including single sign-on) and role-based authorization for access to applications and/or services. Administration services include centralized administration of individual user profiles, roles, groups, and policies.
- *Sun ONE Instant Messaging* provides secure, real-time communication between end users, such as instant messaging (chat), conferencing, alerts, news, polls, and file transfer. The service includes a presence manager that tells users who is currently online and includes a browser-based client that interacts with the server.
- *Sun ONE Message Queue* provides reliable, asynchronous messaging between loosely coupled distributed components and applications. Message Queue implements the Java Message Service (JMS) API specification and adds enterprise features such as security, scalability, and remote administration.
- *Sun ONE Messaging Server* provides secure, reliable, high-capacity store-and-forward messaging that supports email, fax, pager, voice, and video. It can concurrently access multiple message stores and provides content filtering to help reject unsolicited email and prevent virus attacks.
- *Sun ONE Portal Server* provides key portal services, such as content aggregation and personalization, to browser-based clients accessing business applications or services. Portal Server also provides a configurable search engine.
- *Sun ONE Portal Server, Secure Remote Access* provides secure Internet access from outside a corporate firewall to Portal Server content and services, including internal portals and Internet applications.
- *Sun ONE Web Server* provides Java 2 Platform, Enterprise Edition (J2EE™ platform) web container services for Java web components, such as Java Servlet and JavaServer Pages™ (JSP™) components. The Web Server also supports other web application technologies for delivering static and dynamic web content, such as CGI scripts and Active Server Pages.

For further information on the Java Enterprise System, see the Java ES documentation at:

<http://docs.sun.com>

3.3 Sun Studio Software

Your Sun Fire X2100 Server might have Sun Studio 11 software (or later version) installed.

Sun Studio software provides a comprehensive, productive environment for developing reliable, scalable, high-performance applications using C, C++, and Fortran for the Solaris Operating System. The software package includes compilers, performance analysis tools, and a powerful debugger, as well as an integrated development environment (IDE).

The Sun Studio IDE provides modules for creating, editing, building, debugging, and analyzing the performance of a C, C++, or Fortran application. It includes a set of basic Java™ language support modules that can be enabled if needed for JNI (Java Native Interface) development.

The Sun Studio software consists of two major components:

- The Sun Studio component, which includes the IDE, compilers, tools, and core platform.
- The Java 2 Platform, Standard Edition (J2SE) technology on which the core platform runs.

For information on Sun Studio software, go to:

<http://www.sun.com/studio>

More information on the Sun Studio software is available from the Sun Studio documentation at:

<http://docs.sun.com>

Creating Windows Images on a RIS Server and Installing RIS Images

This appendix describes how to create Sun Fire X2100 Server specific images on the Remote Installation Service (RIS) server for the following operating systems:

- Windows 2003 Server Standard or Enterprise Edition, SP1 32-bit
- Windows 2003 Server Standard or Enterprise Edition, 64-bit

Once created you can install the images on a client server.

This appendix contains the following sections:

[Appendix A.1, Creating a RIS Image of Windows 2003 Server 32-bit and Platform Drivers](#)

[Appendix A.2, Creating a RIS Image of Windows 2003 Server, 64-bit, and Platform Drivers](#)

[Appendix A.3, Installing a RIS Image onto a Client Server](#)

A.1 Creating a RIS Image of Windows 2003 Server 32-bit and Platform Drivers

This section tells you how to create a Windows 2003 Server 32-bit image on a RIS server and then add platform specific drivers to the image. The following sections apply to both the Standard and Enterprise editions. All drivers for this procedure are located on the Supplemental CD, version 1.3 or later.

Note – Before using this procedure, you must install the RIS onto a Windows 2003 server. See the following URL for complete instructions on how to install the RIS.

<http://support.microsoft.com/default.aspx?scid=kb;en-us;325862>

A.1.1 Creating the Windows 2003 Server 32-bit Image on the RIS Server

To copy Windows 2003 Server onto the RIS server, do the following steps. Click Next or Finished in each screen to advance to the next screen.

1. Insert the Windows 2003 Server 32-bit CD into the RIS server's CDROM drive.
2. In the Start menu, select Run.
3. To start the RIS setup program, type the following command:

```
c:\ rissetup.exe
```

Note – In all commands, c:\ is shown as the DOS command prompt.

4. In the “Welcome to the Remote Installation Services Setup Wizard” screen, click Next.
5. In the “Remote Installation Services Options” screen, choose “Add a new OS image to this remote installation server”.
6. In the Installation Source Files Location screen, choose the CDROM drive with the Windows 2003 Server 32-bit CD.

7. In the “Windows Installation Image Folder Name” screen, type a descriptive name for the Windows 2003 Server 32-bit CD image you are creating. For example:

```
Sun_Fire_X2100_Windows_XP_SP1_32-bit
```

8. In the “Friendly Description and Help Text” screen, type a description and help text (for future end-user reference).
9. In the “Previous Client Installation Screens Found” screen, choose “Use the old client installation screens”.
10. In the “Review Settings” screen, verify your settings.
11. After the image installs to the server, click Done.

A.1.2 Adding the NVIDIA Ethernet Drivers to the Windows Image

To add the NVIDIA Ethernet drivers to the Windows 2003 Server 32-bit CD image on the RIS server, do the following steps.

1. Insert the Supplemental CD into the RIS server’s CDROM drive.
2. Type the commands below to accomplish the following actions:
 - Copy the Windows 2003 Server 32-bit RIS NVIDIA Ethernet driver zip package to the RIS server.
 - Unzip the Ethernet driver zip package.
 - Copy the files to the Windows 2003 Server image.

```
c:\ copy cdrom_drive:\drivers\windows\RIS\2003_32\nvrisw2k.zip C:\temp\  
c:\ unzip c:\temp\nvrisw2k.zip -d c:\temp\nvrisw2k  
c:\ copy c:\temp\nvrisw2k\*. * ris_partition:\RemoteInstall\Setup\English\Images\  
image_dir\i386
```

Where *cdrom_drive* is the CDROM drive on the RIS server, *image_dir* is the image directory, and *ris_partition* is the drive where the RIS image is stored on the RIS server.

A.1.3 Adding Other Drivers and Modifying Setting Files

To modify settings files, create driver directories, and copy drivers to their directories in the Windows 2003 Server 32-bit image on the RIS server, do the following steps.

The `ristndrd.sif` file is located in the following directory on the RIS server:

```
ris_partition:\RemoteInstall\Setup\English\Images\image_dir\i386\
templates
```

1. Change these entries in the `ristndrd.sif` file to read as follows:

```
[Unattended]
  OemPreinstall = yes
[GuiUnattended]
  AdminPassword = "desired password"
```

2. Remove the following entry from the `ristndrd.sif` file:

```
[Identification]
  JoinDomain = %MACHINEDOMAIN%
  DoOldStyleDomainJoin = Yes
```

3. Add the following entries to the `ristndrd.sif` file:

```
[Unattended]
  DriverSigningPolicy = Ignore
  OemPnPDriversPath = "\\drivers\nic\broadcom;\drivers\nic\nvidia;
\drivers\sata_ide;\drivers\smbus"

[MassStorageDrivers]
  "Nvidia RAID CLASS DRIVER (required)"="OEM"
  "Nvidia nForce Storage Controller (required)"="OEM"

[OEMBootFiles]
  nvatabus.sys
  nvraid.cat
  nvraid.inf
  nvraid.sys
  txtsetup.oem

[UserData]
  ProductKey = XXXXX-XXXXX-XXXXX-XXXXX-XXXXX

[Identification]
  JoinWorkgroup = WORKGROUP
```

4. To create the `oem` directory for the RIS image, type the following command:

```
c:\ mkdir ris_partition:\RemoteInstall\Setup\English\Images\image_dir
```

The `oem` directory will have a subdirectory tree structure with the following directory names:

```
$1
  drivers
    nic
      broadcom
      nvidia
    sata_ide
    smbms

$$
  OemDir

textmode
```

5. To copy Windows 2003 Server 32-bit driver files from the Supplemental CD to the `oem` directory tree, type the following commands.

The drivers are located in the following directory on Supplemental CD.

```
cdrom_drive:\drivers\windows\2003_32\chipset\
```

- a. To copy the chipset zip package to the RIS server, type the following command:

```
c:\ copy cdrom_drive:\drivers\windows\2003_32\chipset\*.zip c:\temp
```

- b. To unzip the package, type the following command:

```
c:\ unzip c:\temp\nfref_670_w2k.zip c:\temp\nfref_670_w2k
```

6. To copy the chipset drivers to the proper directories, type the following commands:

```
c:\ copy c:\temp\nfref_670_w2kxp\ide\winxp\sataraid\*.dll ris_partition:\remoteinstall\
setup\english\images\image_dir\%oem%\%$%OemDir
```

```
c:\ copy c:\temp\nfref_670_w2kxp\ide\winxp\sataraid\* ris_partition:\remoteinstall\
setup\english\images\image_dir\%oem%\textmode
```

```
c:\ copy c:\temp\nfref_670_w2kxp\ide\winxp\sata_ide\* ris_partition:\remoteinstall\
setup\english\images\image_dir\%oem%\$1\drivers\sata_ide
```

```
c:\ copy c:\temp\nfref_670_w2kxp\ethernet\* ris_partition:\remoteinstall\setup\english\
images\image_dir\%oem%\$1\drivers\nic
```

```
c:\ copy c:\temp\nfref_670_w2kxp\audiodrv\* ris_partition:\remoteinstall\setup\english\
images\image_dir\%oem%\$1\drivers\audio
```

```
c:\ copy c:\temp\nfref_670_w2kxp\smbus\* ris_partition:\remoteinstall\setup\english\
images\image_dir\%oem%\$1\drivers\smbus\
```

7. The `txtsetup.oem` file is located in the following directory.

```
ris_partition:\RemoteInstall\Setup\English\Images\image_dir\%oem%\
textmode\
```

Add a semicolon to the beginning of each line for files that are of type `*.dll` in the `[Files.scsi.RAIDCLASS]` and `[Files.scsi.BUSDRV]` sections.

8. To enable the RIS server to distribute the RIS image you created, type the following commands:

```
c:\ net Stop binlsvc  
c:\ net Start binlsvc
```

A.2 Creating a RIS Image of Windows 2003 Server, 64-bit, and Platform Drivers

This section tells you how to create a Windows 2003 Server 64-bit image on a RIS server and then add platform specific drivers to the image. All drivers for this procedure located on the Supplemental CD, version 1.3 or later.

Note – Before using this procedure, you must install RIS onto a Windows 2003 server. See the following URL for complete instructions on how to install the RIS.

<http://support.microsoft.com/default.aspx?scid=kb;en-us;325862>

A.2.1 Installing Windows 2003 Server 64-bit onto the RIS Server

To copy the Windows 2003 Server 64-bit CD onto the RIS server, do the following steps. Click Next or Finished in each screen to advance to the next screen.

1. Insert the Windows 2003 Server 64-bit CD into the RIS server's CDROM drive.
2. In the Start menu, select Run.
3. To start the RIS setup program, type the following command:

```
c:\ rissetup.exe
```

Note – In all commands, c:\ is shown as the DOS command prompt.

4. In the “Welcome to the Remote Installation Services Setup Wizard” screen, click Next.
5. In the “Remote Installation Services Options” screen, choose “Add a new OS image to this remote installation server”.
6. In the “Installation Source Files Location” screen, choose the CDROM drive with the Windows 2003 Server 64-bit CD.

7. In the “Windows Installation Image Folder Name” screen, type a descriptive name for the Windows 2003 Server 64-bit CD image you are creating. For example:

```
Ultra_20_Windows_XP_64-bit
```

8. In the “Friendly Description and Help Text” screen, type a description and help text (for future end-user reference).
9. In the “Previous Client Installation Screens Found” screen, choose “Use the new client installation screens, and overwrite the old ones”.
10. In the “Review Settings” screen, verify your settings.
11. After the image installs to the server, click Done.

A.2.2 Adding the NVIDIA Ethernet Drivers to the Windows Image

To add the NVIDIA Ethernet drivers to the Windows 2003 Server 64-bit CD image on the RIS server, do the following steps.

1. Insert the Supplemental CD into the RIS server’s CDROM drive.
2. Type the commands below to accomplish the following actions.
 - Copy the Windows 2003 Server 64-bit RIS NVIDIA Ethernet driver zip package to the RIS server.
 - Unzip the Ethernet driver zip package.
 - Copy the files to the RIS image.

```
c:\ copy cdrom_drive:\drivers\windows\RIS\XP64\NVRISW64.ZIP C:\temp\  
c:\ unzip c:\temp\NVRISW64.zip -d c:\temp\NVRISW64  
c:\ copy c:\temp\NVRISW64\*. * ris_partition:\RemoteInstall\Setup\English\Images\  
image_dir\amd64
```

Where *cdrom_drive* is the CDROM drive on the RIS server, *image_dir* is the image directory, and *ris_partition* is the drive where the RIS image is stored on the RIS server.

A.2.3 Adding Other Drivers and Modifying Setting Files

To modify settings files, create driver directories, and copy drivers to their directories in the Windows 2003 Server 64-bit image on the RIS server, do the following steps.

The `ristndrd.sif` file is located in the following directory on the RIS server:

```
ris_partition:\RemoteInstall\Setup\English\Images\image_dir\i386\
templates
```

1. Change these entries in the `ristndrd.sif` file to read as follows:

```
[Unattended]
  OemPreinstall = yes
[GuiUnattended]
  AdminPassword = desired password
```

2. Remove the following entry from the `ristndrd.sif` file:

```
[Identification]
  JoinDomain = %MACHINEDOMAIN%
  DoOldStyleDomainJoin = Yes
```

3. Add the following entries to the `ristndrd.sif` file:

```
[Unattended]
  DriverSigningPolicy = Ignore
  OemPnPDriversPath = "\\drivers\audio;\drivers\nic;\drivers\sata_ide;\drivers\smbus"

[MassStorageDrivers]
  "Nvidia RAID CLASS DRIVER (required)"="OEM"
  "Nvidia nForce Storage Controller (required)"="OEM"

[OEMBootFiles]
  nvatax64.sys
  nvraid.cat
  nvrpx64.inf
  nvrpx64.sys
  txtsetup.oem

[UserData]
  ProductKey = XXXXX-XXXXX-XXXXX-XXXXX-XXXXX

[Identification]
  JoinWorkgroup = WORKGROUP
```

4. To create the `oem` directory for the RIS image, type the following command:

```
c:\ mkdir cdrom_drive:\RemoteInstall\Setup\English\Images\image_dir
```

The `oem` directory will have a subdirectory tree structure with the following directory names:

```
textmode
$1
  drivers
    audio
    nic
    sata_ide
    smbms
$$
  OemDir
```

5. To copy Windows 2003 Server 64-bit driver files into the `oem` directory tree, type the following commands.

The drivers are located in the following directory on the Supplemental CD:

```
cdrom_drive:\drivers\windows\xp64\chipset\
```

- a. To copy the zip package to the RIS server, type the following command:

```
c:\ copy cdrom_drive:\drivers\windows\xp64\chipset\*.zip c:\temp
```

- b. To unzip the package, type the following command:

```
c:\ unzip c:\temp\ck804_669_xp64.zip c:\temp\ck804_669_xp64
```

6. To copy the driver files to the proper directories, type the following commands:

```
c:\ copy c:\temp\ck804_669_xp64\ide\winxp\sataraid\*.dll ris_partition:\remoteinstall\
setup\english\images\image_dir\%oem%\$OemDir
```

```
c:\ copy c:\temp\ck804_669_xp64\ide\winxp\sataraid\* ris_partition:\remoteinstall\
setup\english\images\image_dir\%oem%\textmode
```

```
c:\ copy c:\temp\ck804_669_xp64\ide\winxp\sata_ide\* ris_partition:\remoteinstall\
setup\english\images\image_dir\%oem%\$1\drivers\sata_ide
```

```
c:\ copy c:\temp\ck804_669_xp64\ethernet\* ris_partition:\remoteinstall\setup\english\
images\image_dir\%oem%\$1\drivers\nic
```

```
c:\ copy c:\temp\ck804_669_xp64\audiodrv\* ris_partition:\remoteinstall\setup\english\
images\image_dir\%oem%\$1\drivers\audio
```

```
c:\ copy c:\temp\ck804_669_xp64\smbus\* ris_partition:\remoteinstall\setup\english\
images\image_dir\%oem%\$1\drivers\smbus\
```

7. The `txtsetup.oem` file is located in the following directory.

```
ris_partition:\RemoteInstall\Setup\English\Images\image_dir\%oem%\
textmode\
```

Add a semicolon to the beginning of each line for files that are of type `*.dll` in the `[Files.scsi.RAIDCLASS]` and `[Files.scsi.BUSDRV]` sections.

8. To enable the RIS server to distribute the RIS image you created, type the following commands:

```
c:\ net Stop binlsvc
c:\ net Start binlsvc
```

A.3 Installing a RIS Image onto a Client Server

This section tells you how to install a RIS image onto a client server using PXE boot.

- 1. Either power on or reboot the server.**
- 2. During POST, press the F12 key to enter PXE.**
The server looks for the RIS server on the network.
- 3. Type your name and password when the Windows RIS install screen appears.**
- 4. Choose the RIS image to install.**

Once selected, the OS installation begins and automatically continues until it completes.
