Preface

The Sun Fire X4150 Server Installation Guide provides detailed information about how to install the Sun Fire X4150™ server hardware and software. This book is intended for system administrators, network administrators, and service technicians who have an understanding of server systems.

How This Book Is Organized

This guide contains the following chapters:

<table>
<thead>
<tr>
<th>TABLE P-1</th>
<th>Installation Guide Chapters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>How to set up the Sun Fire X4150 server hardware.</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>How to place the Sun Fire X4150 server into a rack using the rail assembly.</td>
</tr>
<tr>
<td>Chapter 3</td>
<td>How to connect cables and power up the Sun Fire X4150 server for the first time.</td>
</tr>
<tr>
<td>Chapter 4</td>
<td>How to configure the Solaris™ 10 Operating System (OS) that might be preinstalled on your Sun Fire X4150 server.</td>
</tr>
<tr>
<td>Chapter 5</td>
<td>How to configure the Windows Operating System (OS) that might be preinstalled on your Sun Fire X4150 server.</td>
</tr>
<tr>
<td>Chapter 6</td>
<td>Troubleshooting information and how to apply and remove AC power to the Sun Fire X4150 Server. Support contacts are also included.</td>

</tr>
</tbody>
</table>
Sun Fire X4150 Server Documentation

To view the latest Sun Fire X4150 server documentation online, go to http://docs.sun.com, and then navigate to Sun Fire X4150 server documentation.

Related Documentation

A Where To Find Documentation sheet lists available documents for the Sun Fire X4150 server and describes the Sun Fire X4150 server document set. The Where to Find Documentation sheet is packed with your system and is also posted at the product's documentation site.

Translated versions of some of these documents are available at the web site described earlier in French, Simplified Chinese, Traditional Chinese, Korean, and Japanese. English documentation is revised more frequently and might be more up-to-date than the translated documentation.

Third-Party Web Sites

Sun is not responsible for the availability of third-party web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other materials that are available on or through such sites or resources. Sun will not be responsible or liable for any actual or alleged damage or loss caused by or in connection with the use of or reliance on any such content, goods, or services that are available on or through such sites or resources.

Safety and Compliance Information

Refer to the following documents for safety information regarding the Sun Fire X4150 server:

- Important Safety Information for Sun Hardware Systems, 816-7190: hard copy document included in the ship kit.
- Sun Fire X4150 Server Safety and Compliance Guide, 820-1856: available online by navigating to the Sun Fire X4150 server document page from:
  http://docs.sun.com
Sun Welcomes Your Comments

Sun is interested in improving its documentation and welcomes your comments and suggestions. You can submit your comments by going to:

http://www.sun.com/hwdocs/feedback/

Please include the title and part number of your document with your feedback. The part number of this Sun Fire X4150 Server Installation Guide is 820-1851-12.
Before You Begin

This chapter describes how to set up the Sun Fire X4150 server hardware. It includes the following topics:

- “Tools and Equipment Needed” on page 1
- “Installation Process Flowchart” on page 1
- “Unpacking the Boxes” on page 4
- “Sun Fire X4150 Server Description” on page 6

Tools and Equipment Needed

To install the system, you need the following tools:

- #2 Phillips screwdriver
- ESD mat and grounding strap
- Pencil, stylus, or other pointed device, for pushing front panel buttons.

You also need a system console device, such as one of the following:

- Sun workstation
- ASCII terminal
- Terminal server

Installation Process Flowchart

To install a typical server, follow the flowcharts in FIGURE 1-1 and FIGURE 1-2.
FIGURE 1-1  Sun Fire X4150 Server Installation Process (Part 1)

START

Unpack the server. Check for all items included in the box. Read all safety and installation documents.

Install additional components, if needed.

Prepare the slide rails for server installation.

Install the server into the rack.

Install the cable management arm. (Optional)

Verify slide rail and CMA operation. (Optional)

Connect the server and external device cables.

Configure the service processor.

Power on the system.

Install the Intel Proset Teaming Utility.

Continued on next page.

See:

“Unpacking the Boxes” on page 4

“Configuring the Preinstalled Solaris 10 Operating System” on page 45
or
“Configuring the Preinstalled Windows Server 2003 R2 Operating System” on page 57

Note: The preinstalled image can only convert to a 2-disk mirror RAID.
If you want to use any other RAID configuration, you will need to reinstall the OS. See *Sun Fire X4150, X4250, and X4450 Server Operating System Installation Guide.*

“Configuring the Preinstalled Solaris 10 Operating System” on page 45
or
“Configuring the Preinstalled Windows Server 2003 R2 Operating System” on page 57

Sun StorageTek: *Sun StorageTek RAID Manager User’s Guide*
or
LSI: *Sun LSI 106x RAID User’s Guide* for MSM
Unpacking the Boxes

Unpack all server components from the packing cartons.

Package Contents Inventory

- Sun Fire X4150 server
- Sun Fire X4150 server accessory kit, including the following documentation:
  - *Sun Fire X4150, X4250, and X4450 Servers Getting Started Guide*
  - *Important Safety Information for Sun Hardware Systems*
  - Additional license, safety, and registration documentation
  - DB9-RJ45 adapter (for serial system management port)
- Windows preinstall kit (only if Windows Server 2003 is preinstalled on the server).
- Optional rackmount kit
- Optional cable management kit

Power cables, keyboard, and mouse are packaged separately from the other items.

Options

The documentation and CD kit is a separate orderable option. This kit currently includes the following items:

- *Sun Fire X4150 Server Installation Guide* (this document)
- SunVTS Diagnostics CD
- Sun Fire X4150 Server Tools and Drivers DVD (includes drivers and additional firmware)
- Sun Installation Assistant CD

Standard server components are installed at the factory. However, ordered options such as additional memory or PCI-e cards are shipped separately. If possible, install optional components before installing the server in a rack.
Antistatic Precautions

Electronic equipment is susceptible to damage by static electricity. Use a grounded antistatic wriststrap, footstrap, or equivalent safety equipment to prevent electrostatic damage (ESD) when you install or service the server.

Caution – To protect electronic components from electrostatic damage, which can permanently disable the system or require repair by Sun service technicians, place components on an antistatic surface, such as an antistatic discharge mat, an antistatic bag, or a disposable antistatic mat. Wear an antistatic grounding strap connected to a metal surface on the chassis when you work on system components.
Sun Fire X4150 Server Description

This section shows the front and back of the Sun Fire X4150 server.

Front Panel Features

FIGURE 1-3 shows the front panel. TABLE 1-1 describes the front panel features.

Installing the Sun Fire X4150 Server Into a Rack with Slide-Rails

This chapter describes how to place the Sun Fire X4150 server into a rack using the rail assembly in the rackmount kit. Perform this procedure if the rail assembly is purchased.

This chapter includes the following topics:
- “Before You Install the Server” on page 9
- “Preparing the Slide Rails and Server for Installation” on page 11
- “Installing the Server Into the Slide-Rail Assemblies” on page 17
- “Installing the Cable Management Arm” on page 19
- “Verifying Operation of the Slide-rails and CMA” on page 26

Note – In this guide, the term rack means either an open rack or a closed cabinet.

Before You Install the Server

Read the overview and see the service label on the top cover before you begin to install the Sun Fire X4150 server.

Server Installation Process Overview

To install your server into a four-post rack using the slide-rail and cable management arm options, perform the following tasks in the order shown:
1. “Checking Compatibility” on page 10
2. “Disassembling Slide-Rails” on page 11
3. “Installing the Mounting-Brackets Onto the Server” on page 13
4. “Installing the Cable Management Arm” on page 19
5. “Verifying Operation of the Slide-rails and CMA” on page 26
6. “Connecting the Cables” on page 28

Rail Assemblies

The server might include either tool-less or bolt-on rail assemblies in rackmount kits. Instructions for both types are included in this chapter.

Service Label

Refer to the service label on the Sun Fire X4150 server top cover for instructions on how to install your server into a four-post rack, using the slide-rail and cable management arm options. The service label includes instructions for both tool-less and bolt-on rail assemblies.

Checking Compatibility

Check that your rack is compatible with the slide-rail and cable management arm (CMA) options. The optional slide-rails are compatible with a wide range of equipment racks that meet the following standards:

<table>
<thead>
<tr>
<th>Item</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structure</td>
<td>Four-post rack (mounting at both front and rear). Two-post racks are not compatible.</td>
</tr>
<tr>
<td>Rack horizontal opening and unit</td>
<td>Conforms to ANSI/EIA 310-D-1992 or IEC 60927 standards.</td>
</tr>
<tr>
<td>Rack vertical pitch</td>
<td></td>
</tr>
<tr>
<td>Distance between front and rear</td>
<td>Minimum 610 mm and Maximum 915 mm (24 inches to 36 inches).</td>
</tr>
<tr>
<td>mounting planes</td>
<td></td>
</tr>
<tr>
<td>Clearance depth in front</td>
<td>Distance to front cabinet door is at least 25.4 mm (1 inch).</td>
</tr>
<tr>
<td>mounting plane</td>
<td></td>
</tr>
</tbody>
</table>
Caution – Always load equipment into a rack from the bottom up so that it will not become top-heavy and tip over. Deploy your rack’s anti-tip bar to prevent the rack from tipping during equipment installation.

Caution – Ensure that the temperature in the rack does not exceed the server’s maximum ambient rated temperatures. Consider the total airflow requirements of all equipment installed in the rack to ensure that the equipment is operated within its specified temperature range.

Preparing the Slide Rails and Server for Installation

Disassembling Slide-Rails

Do one of the following procedures before installation:

- “Disassembling Bolt-On Slide-Rails” on page 12
- “Disassembling Tool-less Slide-Rails” on page 12
Disassembling Bolt-On Slide-Rails

To remove the mounting-brackets from the bolt-on slide-rail assemblies:

1. Unpack the slide-rails.

2. Locate the slide-rail lock at the front of one of the slide-rail assemblies, as shown in Figure 2-1.

3. Squeeze and hold the tabs at the top and bottom of the lock while you pull the mounting-bracket out of the slide-rail assembly until it reaches the stop. (See Figure 2-1).

4. Push the mounting-bracket release button toward the front of the mounting-bracket, as shown in Figure 2-1, and simultaneously withdraw the mounting-bracket from the slide-rail assembly.

5. Repeat for the remaining slide-rail assembly.

Figure 2-1  Disassembling the Bolt-on Slide-rail Before Installation

Disassembling Tool-less Slide-Rails

To remove the mounting-brackets from the tool-less slide-rail assemblies, refer to the install card instructions included with the kit.
Installing the Mounting-Brackets Onto the Server

To install the mounting-brackets onto the sides of the server:

1. Position a mounting-bracket against the chassis so that the slide-rail lock is at the server front, and the three keyed openings on the mounting-bracket are aligned with the three locating pins on the side of the chassis.

   **FIGURE 2-2**  Aligning the Mounting-bracket With the Server Chassis

2. With the heads of the four chassis locating pins protruding though the four keyed openings in the mounting-bracket, pull the mounting-bracket toward the front of the chassis until the mounting-bracket clip locks into place with an audible click. (See **FIGURE 2-2**.)

3. Verify that the rear locating pin has engaged the mounting-bracket clip. (See **FIGURE 2-2**.)

4. Repeat to install the remaining mounting-bracket on the other side of the server.
Attaching the Slide-Rail Assemblies to the Rack

Do one of the following procedures to attach the slide-rail assemblies to the rack:

- “Disassembling Bolt-On Slide-Rails” on page 12
- “Disassembling Tool-less Slide-Rails” on page 12

Attaching Bolt-On Slide-Rail Assemblies

To attach bolt-on slide-rail assemblies to the rack:

1. **Position a slide-rail assembly in your rack so that the brackets at each end of the slide-rail assembly are on the outside of the front and rear rack posts.** (See FIGURE 2-3.)

2. **Attach the slide-rail assembly to the rack posts, but do not tighten the screws completely.**

   Choose one of the following methods to attach the slide-rails. The method you use varies, depending on the type of rack:

   - If your rack has threaded mounting holes in the rack posts, first determine whether the threads are metric or standard, then insert the correct mounting screws through the slide-rail brackets and into the threaded holes.
   - If your rack does not have threaded mounting holes, insert the mounting screws through both the slide-rail brackets and rack posts, then secure them with the caged nuts.
3. Repeat Step 1 and Step 2 for the remaining slide-rail assembly.

4. From the front of the rack, set the proper width of the rails with the spacer. (See FIGURE 2-4.)
5. Tighten the screws on the brackets.
6. Remove the spacer and confirm that the rails are attached tightly to the rack.
7. Repeat Step 4 through Step 6 for rear of the rack.
8. If available, extend the anti-tip foot at the bottom of the rack. (See FIGURE 2-5.)

FIGURE 2-5  Extending the Anti-tip Foot

Caution – If your rack does not have an anti-tip foot, the rack could tip over.

Attaching Tool-less Slide-Rail Assemblies

To attach tool-less slide-rail assemblies to the rack, refer to the install card instructions included with the kit.

Installing the Server Into the Slide-Rail Assemblies

Use this procedure to install the server chassis, with mounting-brackets, into the slide-rail assemblies that are mounted to the rack.

Caution – This procedure requires a minimum of two people because of the weight of the server. Attempting this procedure alone could result in equipment damage or personal injury.
**Caution** – Always load equipment into a rack from the bottom up so that it will not become top-heavy and tip over. Extend your rack’s anti-tip foot to prevent the rack from tipping during equipment installation.

1. Push the slide-rails into the slide-rail assemblies in the rack as far as possible.

2. Raise the server so that the rear ends of the mounting brackets are aligned with the slide-rail assemblies that are mounted in the equipment rack. (See **FIGURE 2-6**.)

3. Insert the mounting brackets into the slide-rails, then push the server into the rack until the mounting brackets encounter the slide-rail stops (approximately 12 inches, or 30 cm).

**FIGURE 2-6**  Inserting the Server With Mounting-Brackets Into the Slide-Rails
4. Simultaneously push and hold the slide-rail release buttons on each mounting-bracket while you push the server into the rack. (See FIGURE 2-6.) Continue pushing until the slide-rail locks on the front of the mounting-brackets engage the slide-rail assemblies. You will hear an audible click.

**Caution** – Verify that the server is securely mounted in the rack and that the slide-rails locks are engaged with the mounting-brackets before continuing.

### Installing the Cable Management Arm

Use this procedure to install an optional cable management arm (CMA). FIGURE 2-7 shows the CMA.

**FIGURE 2-7** Cable Management Arm (CMA)

1. Unpack the cable management arm parts.
2. Take the CMA to the back of the equipment rack and ensure that you have adequate room to work around the back of the server.

**Note** – References to “left” or “right” in this procedure assume that you are facing the back of the equipment rack.
3. Remove tape to separate parts.
   The CMA rail extension might be taped to the CMA arm.

4. Attach the CMA rail extension into the left slide-rail until the extension locks into place with an audible click. (See FIGURE 2-8.)

FIGURE 2-8 Inserting the CMA Rail Extension Into the Back of the Left Slide-Rail
5. Verify that the CMA rail extension engages the slide-rail, as shown in FIGURE 2-9.

**FIGURE 2-9** Detail of CMA Rail Extension Inserted Into the Left Slide-Rail

---

**Note** – Support the CMA in the remaining installation steps. Do not allow the arm to hang by its own weight until it is secured by all three attachment points.
6. Insert the CMA’s mounting-bracket connector into the right slide-rail until the connector locks into place with an audible click. (See FIGURE 2-10.)

**FIGURE 2-10** Inserting the CMA Mounting-bracket Into the Back of the Right Slide-Rail

7. Insert the right CMA slide-rail connector into the right slide-rail assembly until the connector locks into place with an audible click. (See FIGURE 2-11).
FIGURE 2-11 Inserting CMA Slide-Rail Connector Into the Back of the Right Slide-Rail Assembly
8. Insert the left CMA slide-rail connector into the rail extension on the left slide-rail assembly until the connector locks into place with an audible click. (See FIGURE 2-12.)

FIGURE 2-12 Connecting the CMA Arm to the Rail Extension Connector

9. Install and route cables to your server, as required.
10. Attach the hook and loop straps to the CMA, and press them into place to secure the cables. (See FIGURE 2-13.)

For best results, place three hangers, evenly spaced, on the rear-facing side of the CMA and three on the side facing the server.

FIGURE 2-13 Installing CMA Cable Straps

11. Attach the right outer latch.

12. Attach the support latch to the left CMA extension.
Verifying Operation of the Slide-rails and CMA

Use this procedure to ensure that the slide-rails and CMA are operating correctly.

---

**Note** – Two people are recommended for this procedure: one to move the server in and out of the rack, and one to observe the cables and CMA.

---

1. Slowly pull the server out of the rack until the slide-rails reach their stops.
2. Inspect the attached cables for any binding or kinks.
3. Verify that the CMA extends fully from the slide-rails.
4. Push the server back into the rack, as described in the following sub-steps.
   - When the server is fully extended, you must release two sets of slide-rail stops to return the server to the rack:
     a. The first set of stops are levers, located on the inside of each slide-rail, just behind the back panel of the server. These levers are labeled “PUSH.” Push in both levers simultaneously and slide the server toward the rack.
        - The server will slide in approximately 18 inches (46 cm) and stop.
        - Verify that the cables and the CMA retract without binding before you continue.
     b. The second set of stops are the slide-rail release buttons, located near the front of each mounting-bracket. See FIGURE 2-6. Simultaneously push or pull both of the slide-rail release buttons, and push the server completely into the rack until both slide-rail locks engage.
5. Adjust the cable straps and CMA as required.
Setting Up the Sun Fire X4150 Server

This chapter describes how to connect cables and power up the Sun Fire X4150 server for the first time. It includes the following topics:

- “Connecting the Cables” on page 28
- “Service Processor Overview” on page 30
- “Connecting to the LOM Service Processor for the First Time” on page 33
- “Determining the LOM Service Processor IP Address” on page 34
- “Applying Power for the First Time” on page 41
Connecting the Cables

Connect the power and data cables from the server back panel to your system.

Connector Locations

See FIGURE 3-1 and TABLE 3-1 for the locations of the back panel connectors.

FIGURE 3-1 Back Panel Connectors

</tbody>
</table>
Cabling the Server

Connect the server power cables, and external cables in the following order:

1. Connect two grounded server power cords to grounded electrical outlets (1, 2).

   **Note** – Connect only one cable if your server does not have a redundant power supply.

2. Connect the two server power cords to the AC power connectors on the back panel of the server.
   
   In standby power mode, the Power/OK LED on the front panel flashes, indicating that the service processor (SP) is working as shown in **FIGURE 3-2**. At this point, before initial configuration, standby power is supplied only to the SP and power supply fans.

   **FIGURE 3-2**  Front Panel Power/OK LED

   ![Front Panel Power/OK LED]

   **Note** – Do *not* push the Power button at this time. Do not apply main power to the rest of the server until you are ready to install a platform operating system.

3. Connect a serial null modem cable to the serial management/RJ-45 serial port (4).
   
   See “Connecting to the LOM Service Processor for the First Time” on page 33 for more information about viewing system output from a serial console.

4. Connect Ethernet cables to the LOM SP NET MGT Ethernet port (5).

5. Connect Ethernet cables to the RJ-45 GigabitEthernet (LAN) connectors as needed (6) for OS support.

6. Connect any additional external devices, as required, to the server’s USB (7) and/or HD-15 Video (8) connectors (optional).
7. Connect to the Lights Out Manager (LOM) SP. See the next section.

---

**Caution** – Do not operate the server without all fans, component heatsinks, air baffles, and the cover installed. Severe damage to server components can occur if the server is operated without adequate cooling mechanisms.

---

### Service Processor Overview

The Sun Fire X4150 Server includes one of the following Lights Out Manager (LOM) service processor (SP) firmware types:

- **Embedded Lights Out Manager (ELOM) service processor (SP)**
  
  See “Embedded LOM Service Processor Software Overview” on page 30.
  
  Refer to the *Embedded Lights Out Manager (ELOM) Administration Guide*.

- **Integrated Lights Out Manager (ILOM) service processor (SP)**
  
  See “Integrated LOM Service Processor Software Overview” on page 32.
  
  Refer to the *Sun Integrated Lights Out Manager Users Guide*.

---

**Note** – For instructions on changing your service processor firmware type, refer to the *ELOM-to-ILOM Migration User’s Guide*.

---

Where ILOM and ELOM are mentioned in the text, the term LOM is used to indicate ILOM or ELOM, as included in your system.

---

### Embedded LOM Service Processor Software Overview

The Sun Fire X4150 Server Embedded Lights Out Manager (ELOM) SP consists of the following components:
### TABLE 3-2  Embedded LOM Service Processor Components

<table>
<thead>
<tr>
<th>Item</th>
<th>Port</th>
<th>Function</th>
</tr>
</thead>
</table>
| **1** | **ELOM hardware** | ELOM includes the following hardware components:  
  - An embedded SP chipset. The service processor monitors the status and configuration of field-replaceable components inside your server, such as fans, disk drives, and power supplies.  
  - Two back panel external connections: NET MGT Ethernet Connection, and serial management port/RJ-45 serial port. |
| **2** | **ELOM firmware** | Several system management firmware applications are preinstalled on the SP chipset. These operating system-independent firmware applications provide the following system management interfaces into your server:  
  - Web-based graphical interface  
  - Secure Shell (SSH) command-line interface  
  - IPMI v2.0 CLI  
  - Simple Network Management Protocol (SNMP) v3 interface  
  These interfaces call the same underlying system management functions on your SP. You can work with one or more of these interfaces to integrate with other management interfaces running in your data center. |
| **3** | **Remote Console application** | The Remote Console application allows remote clients to view the graphical console of your host server as though they were directly attached to its video connector. The Remote Console mirrors the video display from the server VGA device (up to 1280 x 1024 resolution) locally on the remote management system. The remote keyboard, mouse, CD drive, or diskette drive appear as standard USB devices.  
  The Remote Console application depends on the following requirements to run correctly. Client systems require a web browser (at least IE6, Mozilla, or Firefox) with Sun Java™ runtime environment (at least version 1.6 plug-ins) correctly installed. Java is available for free download at [http://java.sun.com](http://java.sun.com). |
| **4** | **Client-side Secure Shell application** | You must install a Secure Shell communications application on the remote client system (server, workstation, or laptop) to access the Embedded LOM through a remote Secure Shell (SSH).  
  Many Secure Shell communications applications are available from commercial or open-source distribution. Refer to [http://www.openssh.org](http://www.openssh.org) for information about open-source client-side SSH applications. |
| **5** | **Serial Redirection** | You can set the serial redirection to display system output or Embedded LOM output. A console can also be started to display system output. By default, the Embedded LOM output appears. The BIOS contains these serial redirection options.  
  Refer to the *Sun Fire X4150 Server Product Notes* and the *Embedded Lights Out Manager (ELOM) Administration Guide* or the to the *Sun Integrated Lights Out Manager Users Guide* for more information. |
Note – The factory has configured the service processor hardware and firmware on your server with the most common settings used in the field. You may not need to change these defaults.

Refer to the Embedded Lights Out Manager (ELOM) Administration Guide for detailed information.

Integrated LOM Service Processor Software Overview

Integrated Lights Out Manager (ILOM) is system management firmware that is preinstalled on some Sun server platforms.

Note – If your system is running ELOM firmware, and you want to update to ILOM firmware, refer to the ELOM-to-ILOM Migration User’s Guide for information.

ILOM enables you to actively manage and monitor components installed in your server system. With ILOM, you can monitor and manage your system proactively by viewing hardware configurations, monitoring system information, managing system alerts, and more.

ILOM provides a browser-based web interface and a command-line interface, as well as an SNMP user interface and an IPMI user interface. ILOM automatically initializes as soon as power is applied to your system. ILOM will continue to run regardless of the state of the host operating system, making it a “lights-out” management system.

Some key features of ILOM include:

- Runs on its own processor and resources
- Allows for management of the server without consuming system resources
- Continues to provide management using standby power even when the server is powered-off
- Provides an isolated management network separate from the data network
- Provides a concise view of hardware inventory and environmental
- Provides the ability to control power, manage components, and access the host console
- Serves as an integration point for other management tools, such as Sun N1 System Manager and third-party applications
- Enables the download of service processor (SP) firmware and BIOS changes
Manages the inventory of hot-pluggable system components
Refer to the Sun Integrated Lights Out Manager Users Guide for detailed information.

ILOM 3.0 Documentation

ILOM 3.0 is now available for the Sun Fire X4150 server. ILOM 3.0 documentation is available in the ILOM 3.0 documentation collection:

http://docs.sun.com/app/docs/coll/ilom3.0

ILOM 2.0 documentation is also available at:

http://docs.sun.com/app/docs/coll/ilom2.0

In addition, product-specific supplements are available for the Sun Fire X4150 server in the ILOM Supplements section of the Sun Fire X4150 server documentation set.

Connecting to the LOM Service Processor for the First Time

This section describes how to connect to the ILOM or the ELOM SP for initial setup and configuration. It also includes an overview on SP interfaces and connections.

Initial LOM Setup Overview

The following process allows a user to connect to the ILOM or ELOM SP for initial setup and configuration. Instructions are included for both ELOM and ILOM as required.

Use the following procedures to establish a serial connection to the LOM service processor and configure the LOM service processor IP address for the first time.

- “Connecting to the LOM Service Processor for the First Time” on page 33
  - “Method 1: Access the BIOS” on page 34
  - “Method 2: Connect to the Service Processor Using a Serial Connection” on page 35
- “Determining the LOM Service Processor IP Address” on page 34
  - “Method 2: Using the Serial Connection” on page 38
  - “Method 3: Using the Service Processor (SP) LOM Web Browser Interface” on page 40
About Service Processor Interfaces

After you configure the IP address to comply with your network IP scheme, you can access the LOM SP web interface using a Sun Microsystems supported web browser. You can also connect to the LOM SP through secure shell (SSH).

Choose from one of several LOM SP interfaces to support system management on your server. After you have determined the IP address of the SP, you can access SP firmware applications through the following LOM SP interfaces:

- Serial Port CLI
- Secure (command) shell (SSH) CLI
- Ethernet-based web browser

About LOM IP Addresses

The LOM SP is assigned a DHCP IP address by default. There are two requirements for DHCP IP address assignment to occur:

- Connection to your network must be through a NET MGT port.
- DHCP services must be present on your network infrastructure.

If a DHCP server cannot be reached after 3 DHCP requests, the LOM SP is assigned a static IP address based on the network management port MAC address. This IP address is always in the format 192.168.xxx.xxx.

Determining the LOM Service Processor IP Address

There are two methods to determine the IP address of the LOM SP. Choose one of the following methods:

- “Method 1: Access the BIOS” on page 34.
- “Method 2: Connect to the Service Processor Using a Serial Connection” on page 35

Method 1: Access the BIOS

To access the BIOS and view the service processor (SP) IP address:

1. Power on the server (or restart the server if it is running).
2. When the Sun Microsystems splash screen or text prompt appears during the Power On Self Test (POST) operation, press F2 to access the BIOS settings.

3. Navigate to the Server tab, using the left and right keyboard arrows.

5. Access the IP ADDRESS tab.

6. View the SP IP address.

**Tip** – If the IP address is in the form of 192.168.xxx.xxx, the DHCP server might not have assigned an address and the SP might use a static address.

---

**Method 2: Connect to the Service Processor Using a Serial Connection**

To establish a connection to the SP using a serial connection (system management port), perform the following steps:

1. Connect a terminal (or PC running terminal emulation software) to the server serial port.

2. Ensure that the server hardware is installed and cables are inserted.
   Ensure that the power is in standby mode and the green LED blinks. See “Connecting the Cables” on page 28.

3. Verify that your terminal, laptop, PC, or terminal server is operational.

4. Configure the terminal device or the terminal emulation software running on a laptop or PC to the following settings:
   - 8,N,1: eight data bits, no parity, one stop bit
   - 9600 baud
   - Disable hardware flow control (CTS/RTS)
   - Disable software flow control (XON/XOFF)

5. Connect a null serial modem cable from the RJ45 serial port on the server back panel to a terminal device (if not connected already).
   See FIGURE 1-4 for the position of the serial port on the back panel.

6. Press Enter on the terminal device to establish a connection between the terminal device and the LOM service processor (SP).
**Note** – If you connect to the serial port on the LOM before it has been powered on or during its power-on sequence, SP boot messages may be displayed.

The LOM displays a login prompt, after a short wait.

login:

7. Type the default user name `root`, and then type the default password `changeme` to log in to the LOM SP.

The LOM displays a default command prompt, indicating that you have successfully logged in:

`->`

8. Type the command `show /SP/network` to display the current SP IP address.

   **ELOM**: The IP information appears, as shown in the following sample:

```
/SP/network
Targets:  
Properties:  
MACaddress = 00:1B:24:1D:E6:26  
IPAddress = 129.148.53.158  
Netmask = 255.255.255.0  
Gateway = 129.148.53.248  
DNS = 0.0.0.0  
IPSource = dhcp  
Hostname = SUNSP001B241DE626
```

**ILOM**: The IP information appears, as shown in the following sample:

```
/SP/network
Targets:  
commitpending = (Cannot show property)  
ipaddress = 129.148.53.128  
ipdiscovery = static  
ipgateway = 129.148.53.248  
ipnetmask = 255.255.255.0  
macaddress = 00:1E:68:0F:4A:84  
pendingipaddress = 129.148.53.128  
pendingipdiscovery = static  
pendingipgateway = 129.148.53.248  
pendingipnetmask = 255.255.255.0
```

9. Be sure to record the IP address assigned to the LOM.
Modifying the Service Processor IP Address

The following examples show how to change the current IP address of the LOM service processor (SP).

Choose one of the following methods.

- “Method 1: Using the BIOS” on page 37
- “Method 2: Using the Serial Connection” on page 38
- “Method 3: Using the Service Processor (SP) LOM Web Browser Interface” on page 40

Method 1: Using the BIOS

To access the BIOS and view the service processor (SP) IP address:

1. **Power on the server (or restart the server if it is running).**
   
   See “Applying Power for the First Time” on page 41.

2. **When the Sun Microsystems splash screen or text prompt appears during the Power on self-test (POST) operation, press F2 to access the BIOS settings.**

3. **Navigate to the Server tab, using the left and right keyboard arrows.**

4. **Access the Server tab and AST2000 (LAN) CONFIGURATION. Press Enter.**

5. **Access the IP ADDRESS tab.**

6. **View the SP IP address.**

   **Tip** – If the IP address is in the form of 192.168.xxx.xxx, the DHCP server might not have assigned an address and the SP might use a static address.

7. **Highlight the existing IP address and type the new IP address.**

8. **Change the IP address mode from DHCP to static.**

9. **Save and exit the BIOS Setup Utility.**
Method 2: Using the Serial Connection

Example 1

To change the SP DHCP IP address to a static IP address using the serial connection (system management port):

1. Connect a terminal (or a PC running terminal emulation software) to the server serial port.

2. Ensure that the server hardware is installed and cables are inserted.

3. Verify that your terminal, laptop, PC, or terminal server is operational.

4. Configure the terminal device or the terminal emulation software running on a laptop or PC to the following settings:
   - 8,N,1: eight data bits, no parity, one stop bit
   - 9600 baud
   - Disable hardware flow control (CTS/RTS)
   - Disable software flow control (XON/XOFF)

5. Connect a null serial modem cable from the server’s back panel RJ45 serial port to a terminal device (if not connected already).
   See FIGURE 1-4 for the serial port position.

6. Press Enter on the terminal device to establish a connection between the terminal device and the LOM service processor (SP). The following prompt appears.

   ->

7. Type the default user name root, and then type the default password: changeme to log in to the LOM SP.
   The LOM displays a default command prompt, indicating that you have successfully logged in:

   ->

8. Type the following command to determine the SP IP address:

   show /SP/network

9. After the status has been determined, view the output of show /SP/network.
   - ELOM: IPSource = dhcp
   - ILOM: ipdiscovery = dhcp
10. To assign a static IP ADDRESS, type the following commands in exact order:

**ELOM:**

```
set /SP/network IPSource=static
set /SP/network IPAddress=xxx.xxx.xxx.xxx
set /SP/network Netmask=xxx.xxx.xxx.xxx
set /SP/network Gateway=xxx.xxx.xxx.xxx
```

Where `xxx` = IP address numbers

**ILOM:**

```
set /SP/network/ pendingipdiscovery=static
set /SP/network/ pendingipaddress=xxx.xxx.xxx.xxx
set /SP/network/ pendingipnetmask=xxx.xxx.xxx.xxx
set /SP/networks/ pendingipgateway=xxx.xxx.xxx.xxx
set /SP/networks/ commitpending=true
```

Where `xxx` = IP address numbers

---

**Example 2**

To change the service processor (SP) static IP address to a DHCP IP address using the serial connection (system management port), perform the following steps:

1. Connect a terminal (or a PC running terminal emulation software) to the server serial port.

2. Ensure that the server hardware is installed and cables are inserted.

3. Verify that your terminal, laptop, PC, or terminal server is operational.

4. Configure the terminal device or the terminal emulation software running on a laptop or PC to the following settings:
   - 8,N,1: eight data bits, no parity, one stop bit
   - 9600 baud
   - Disable hardware flow control (CTS/RTS)
   - Disable software flow control (XON/XOFF)

5. Connect a null serial modem cable from the server’s back panel serial management to a terminal device (If not connected already).

   See **FIGURE 1-4** for the serial port position.

6. Press Enter on the terminal device to establish a connection between the terminal device and the LOM SP. The prompt appears.

   `->`
7. Type the following command to change a static address to a DHCP address:
   ELOM:
   \texttt{set /SP/network IPSource=dhcp}
   ILOM:
   \texttt{set /SP/network pendingipdiscovery=dhcp}
   \texttt{set /SP/network commitpending=true}

8. Type \texttt{show /SP/network} to view the newly assigned DHCP address.
   DHCP enabled is shown as \texttt{ipdiscovery =DHCP}

Method 3: Using the Service Processor (SP) LOM Web Browser Interface

\textbf{Note} – The SP Web Browser Interface can be accessed \textit{only} if you know the service processor IP address. See “Determining the LOM Service Processor IP Address” on page 34.

To change a static IP address, using the service processor (SP) Embedded LOM or Integrated LOM Web Browser Interface:

1. Open a Sun Microsystems supported Web browser, such as Internet Explorer, Mozilla, or Firefox.
2. Type the IP address of the SP in the browser address bar.
   For example: \texttt{http://xxx.xxx.xxx.xxx}
   Where \texttt{xxx.xxx.xxx.xxx} is the IP address of the SP.
3. Accept the certificate when prompted.
4. Enter your username (\texttt{root}) and password (\texttt{changme}).
5. Select the Configuration tab and then the Network tab.
6. Set configurations, such as IP configuration and DNS, as required.
7. Do one of the following:
   - If DHCP is required, select the Enable DHCP check box.
   - If STATIC is required, clear the Enable DHCP check box, and manually set all IP information.
8. If you manually change the IP address, you must manually change the subnet mask, because the subnet mask changes according to the IP address class.
9. Record your settings.

10. Log out.

11. If the IP address changes, you must reconnect using the newly assigned IP address, because the current session will become unresponsive.

Refer to the following documentation for detailed information on using the LOM interface.

ELOM: Embedded Lights Out Manager (ELOM) Administration Guide
ILOM: Sun Integrated Lights Out Manager Users Guide

---

**Applying Power for the First Time**

To turn on the server for the first time:

1. **Verify that the power cord has been connected and that standby power is on.**

   In standby power mode, the Power/OK LED on the front panel flashes. See **FIGURE 3-2**.

2. **Verify that you are connected to the server through the serial management port, perform the following sub-steps:**

   a. Connect a terminal (or a PC running terminal emulation software) to the server serial port.

   b. Ensure that the server hardware is installed and cables are inserted.

   c. Verify that your terminal, laptop, PC, or terminal server is operational.

   d. Configure the terminal device or the terminal emulation software running on a laptop or PC to the following settings:

      ■ 8,N,1: eight data bits, no parity, one stop bit

      ■ 9600 baud

      ■ Disable hardware flow control (CTS/RTS)

      ■ Disable software flow control (XON/XOFF)

   e. Connect a null serial modem cable from the server’s back panel serial management port to a terminal device (if not connected already).

      See **FIGURE 1-4** for the serial port position.
f. Press Enter on the terminal device to establish a connection between the terminal device and the LOM service processor (SP).

   The following prompt appears.

   ->

3. Use a pencil, or other pointed object, to press and release the recessed Power button on the server front panel.

   When main power is applied to the server, the Power/OK LED next to the Power button lights and remains lit.

4. To display a screen for configuring the preinstalled Solaris OS from the system management port, do one of the following

   ELOM:
   a. Type: cd /SP/AgentInfo
   b. Type: start Console

   ILOM:
   Type: start/SP/Console

5. Install and configure the software, as required.

---

**Note** – Do one of the following from the serial console:

**ELOM**: To switch back to the Embedded LOM command-line interface from the serial console, press **Esc + Shift + 9**, or press **Esc (**, depending on your keyboard location.

**ILOM**: To switch back to the ILOM command-line interface from the serial console, press **Esc (**, depending on your keyboard location.
Installing the Intel PROSET Teaming Utility

The Intel PROSET teaming utility is optional for Windows systems.

To install the Intel PROSET Teaming Utility:

1. **Install the Ethernet drivers from the Tools & Drivers CD Version 1.1 or later, using your preferred method.**
   - Autorun - Insert the Tool & Drivers CD. From the Autorun menu, choose Install/Update drivers and optional packages.
   - Manually - Access the Ethernet properties and update the driver manually through Device Manager.

2. **When the Ethernet cards have been installed and IP addresses assigned, run the PROSET installer.**
   Locate the installer on the Tools & Drivers CD Version 1.1 or later, in the following location: `drivers\windows\IntelNic\2003\PROSET\2003_xx` where `xx` is 32 or 64 bit. Use `PROSETDX.msi` installer.

3. **Follow the instructions on your screen and choose the Advanced Network Features from the displayed list of options.**

4. **To access the PROSET Teaming options, access the Ethernet Card through Device Manager and choose Properties.**

   The new tabs installed are **Teaming and VLAN**.
This chapter describes how to configure the Solaris™ 10 operating system (OS) that might be preinstalled on your Sun Fire X4150 server. Solaris 10 11/06 is the minimum supported version.

This chapter assumes that your server has a hard drive installed, with the Solaris operating system preinstalled. Your system might be different, depending on your hard drive configuration.

This chapter includes the following topics:

- “Solaris Preinstall Overview” on page 45
- “Configuring Sun Fire X4150 Server RAID Drives” on page 51
- “Mirroring the Preinstalled Solaris OS with LSI RAID” on page 53
- “Solaris 10 Operating System User Information” on page 55

Solaris Preinstall Overview

Read this section before you set up Solaris.

Delivery Methods

To deliver preinstalled Solaris, you can select a delivery option in the GRUB menu that allows you to choose a delivery method:

- Deliver Solaris preinstall through the serial management port (default method)
  or
■ Deliver the preinstalled Solaris 10 image using a directly connected monitor and keyboard.

About the GRUB Menu

Solaris uses a GRUB boot loader with a GRUB menu. When you start the Solaris OS, a GRUB menu appears. The GRUB menu allows you to select to direct output to either the serial port or video port.

If you take no action within 30 seconds at the boot menu, default redirection (serial management port–ttya) of the Solaris OS occurs. Serial redirection requires a connection to the serial management port. See “Determining the LOM Service Processor IP Address” on page 34 and “Method 2: Using the Serial Connection” on page 38.

Before You Begin

Before you configure the preinstalled Solaris OS, you must do the following:

1. Perform initial configuration of the service processor, and determine the server’s network settings. See “Setting Up the Sun Fire X4150 Server” on page 27.

2. Gather the information that you will need to configure the server. See “Installation Worksheet” on page 47.

3. After these steps are complete, you can configure the preinstalled Solaris OS. See “Configuring the Solaris OS” on page 49.
## Installation Worksheet

Fill in **TABLE 4-1** with information you need to configure the preinstalled Solaris 10 OS for the server. Collect only the information that applies to your system.

<table>
<thead>
<tr>
<th>Installation Information</th>
<th>Description</th>
<th>Enter System Configuration: Asterisk (*) indicates default.</th>

</tbody>
</table>
Configuring the Solaris OS

To configure the preinstalled Solaris OS:

1. **Log in to the service processor as an administrator. For example:**
   - Login: `root`
   - Password: `changeme`

2. **Start the LOM console.**
   - **ELOM:**
     - a. Type: `cd /SP/AgentInfo`
     - b. Type: `start Console`
   - **ILOM:**
     - Type: `start/SP/Console`

Refer to the *Embedded Lights Out Manager (ELOM) Administration Guide* for detailed information.
Refer to the *Sun Integrated Lights Out Manager Users Guide* for detailed information.

3. **Follow the Solaris 10 preinstallation onscreen instructions.**

4. **Type the system and network information when prompted. See TABLE 4-1 for collected information.**
   
The displayed screens can vary, depending on how you chose to assign network information to the server (DHCP or static IP address).

5. **After the system configuration information has been entered, the OS installation continues. On completion, the system reboots and displays the Solaris OS login.**

### Redirect the Console Output to the Video Port (Optional)

You must complete the procedure “Configuring the Solaris OS” on page 49 and be logged in to the service processor (SP) before you can redirect the console output to the video port. This procedure is optional.

**Note** – The Solaris GRUB menu allows you to manually select graphics adapter redirection during the boot process. If not chosen within 30 seconds after the GRUB menu is displayed, the system defaults to serial redirection (ttya).

1. **Reboot the system.**

2. **To enable video output, choose Solaris Build - Graphics Adapter from the GRUB menu Changing Default Console Output.**

### Using the GRUB Menu

The preinstalled Solaris 10 OS image directs console output to the serial port by default. After the initial configuration of the preinstalled Solaris OS is complete, you can modify the Solaris 10 GRUB menu to direct output to the video port by default.

**Caution** – This procedure is intended only for advanced users of the Solaris OS. You can seriously disrupt server operation or make the server unbootable if you introduce a problem in the *menu.lst* file.

To set the video port as the default output, do the following procedure:
1. Open the `/boot/grub/menu.lst` file in a text editor.

2. Modify the following line in the file to change the default so that the console output goes to the video port:
   
   ```
   default 1
   ```

3. Run the following command to add the Xserver startup scripts:
   
   ```
   /usr/dt/bin/dtconfig -e
   ```

4. Reboot the server.
   
   After the system reboots, the console output goes to the video port by default.

---

**Configuring Sun Fire X4150 Server RAID Drives**

After you configure the Solaris OS, you might need to configure the RAID drives.

**RAID Drive Overview**

The Sun Fire X4150 Server has two optional RAID HBA (HBA) cards. You can access RAID configuration through the HBA card BIOS. To access the LSI card BIOS, press Ctrl-C. To access the Sun StorageTek card BIOS, press Ctrl-A:

<table>
<thead>
<tr>
<th>RAID HBA cards</th>
<th>Press for BIOS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sun StorageTek</td>
<td>Ctrl-A</td>
</tr>
<tr>
<td>LSI 3081E</td>
<td>Ctrl-C</td>
</tr>
</tbody>
</table>

The system will have the preinstalled OS on HD0. When the Solaris OS installation has been completed, the option to upgrade your single-disk OS to a mirrored RAID solution is available.

The configuration procedure is different for each supported controller card. For example, a Sun StorageTek HBA card has many more options for RAID configuration than an LSI HBA card. Configure the RAID depending on your needs as shown in **TABLE 4-3**.
## RAID Drive Options

**TABLE 4-3** shows the RAID drive options:

<table>
<thead>
<tr>
<th>SAS Card</th>
<th>Drives Supported</th>
<th>RAID Configuration Supported</th>
<th>Drive Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sun StorageTek</td>
<td>Seagate 7 3GB SAS</td>
<td>Volume – 1 disk</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Fujitsu 73 GB SAS</td>
<td>RAID 0 – stripe – 2 disk</td>
<td>No redundancy</td>
</tr>
<tr>
<td></td>
<td></td>
<td>minimum</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Hitachi 146 GB SAS</td>
<td>RAID 1 – mirror – 2 disk</td>
<td>50%</td>
</tr>
<tr>
<td></td>
<td></td>
<td>minimum</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>RAID 1E – 3 drive minimum</td>
<td>50%</td>

</tr>
<tr>
<td></td>
<td>Fujitsu 73GB SAS</td>
<td>IME – Integrated Mirror Enhanced array. 3 to 8 disks including up to 2 hot spares.</td>
<td>All data will be deleted during creation.</td>
</tr>
<tr>
<td></td>
<td>Hitachi 146 GB SAS</td>
<td>IS – Integrated Striping array. 2 to 8 disks.</td>
<td>All data will be deleted during creation.</td>
</tr>
</tbody>
</table>
Mirroring the Preinstalled Solaris OS with LSI RAID

The Solaris OS supports hardware RAID and cannot be installed on an existing array if one has been created. Refer to the Sun Fire X4150 OS Installation Guide or an HBA card product guide.

If you choose the preinstalled Solaris OS and want to make the OS part of a RAID set, and if you are using LSI RAID only, perform the following procedure to update the preinstalled Solaris OS to a mirrored RAID set. As stated in TABLE 4-3, only IM (Integrated Mirror) allows data on the primary hard disk drive (HDD) to be preserved or merged into an array of disks.

This example allows the creation of a mirror before or after the Solaris installation. The server has 2 disks: HDD0 (with the OS) and HDD1 (which is blank).

To create a mirror image of the Solaris OS on HDD1:

1. **Power on your server system for the first time.**
2. **Press CTRL-C to access the LSI RAID configuration Utility.**
3. **Select the SAS card - SAS1068E. Press Enter.**
4. **Choose RAID Properties.**
5. **Create an IM (Integrated Mirror) for the required disk configuration.**
6. **Select the hard disks to be used. Use the right arrow to move the cursor to the RAID column, and press the Space bar to include into RAID.**
7. **Because HDD0 contains data, select merge or delete:**
   - Choose M to merge data and start a sync operation.
   - Choose D to erase the Solaris PreInstall.
8. **Press C to create the RAID and start the sync operation.**
9. **Click Exit to save the configuration and close the menu.**
10. **Press Esc to exit the configuration utility and reboot.**
Creating a RAID Set to Incorporate a Preinstalled OS Using the Sun StorageTek Card

The Sun StorageTek card allows you to choose from many RAID configurations. How you configure your system depends on your system requirements and the available hard disk drives in the system. The following example shows how to mirror the preinstalled Solaris OS. This is the better option, and all remaining disks (should there be more than 2) are incorporated into a data RAID set using the available options as shown in TABLE 4-3.

You will need the Sun Fire X4150 Tools & Drivers CD.

Follow these steps to mirror your configured Solaris OS:

1. **Using your Solaris Server, log in and start Xserver.**
   This graphical user interface is required for StorageTek Software Management.

2. **From the supplied Sun Fire X4150 Tools & Drivers CD, copy the StorMan.ds application, located in the /drivers/sx86/StorageTek/MGMT directory, to a new directory you choose on your Solaris server, for example, mkdir /StorMan.**

3. **Change the permissions of the new directory and StorMan application.**
   chmod 777 StorMan.ds

4. **Run the following command to install the application:**
   pkgadd -d StorMan.ds

5. **Choose to install all components when prompted.**

6. **To run the application, type the following:**
   sh /usr/StorMan/StorMan.sh
   A split screen appears.

7. **Click the screen to activate the Managed Systems List.**

8. **Double-click the local machine (it is displayed by IP Address of the Primary ENET connection.**
   A prompt appears.

9. **At the prompt, log in as root, using the OS password that was assigned during installation.**

10. **Click the SUN STK RAID Controller.**
   All attached hard disk drives on Enclosure 0 and 1 appear.
Tip – HDD0 (OS) should be Enclosure 0 Logical Volume 1.

11. To mirror the OS, right-click Logical Device 1 and choose Expand or Change Logical Device.

12. Choose the appropriate RAID option (in this example, RAID 1 for Mirror).

13. Choose a disk to mirror the OS with, from the physical disk list.
   Select the hard disk drive that best fits your needs.

14. After you select the HDD, click Next, and then view the configuration summary.

15. Click Apply to start the mirroring process.
   You can also click Schedule to perform the mirroring process at a later time.

16. One more confirmation screen will be displayed, and once confirmed, the OS will begin to mirror.
   Mirroring may take several hours, depending on the amount of data and the HDD size.

Solaris 10 Operating System User Information

This section provides pointers to information about the Solaris 10 operating system.

Accessing Solaris 10 User Documentation

You can access the various collections of the Solaris 10 OS user documentation at:
http://docs.sun.com/app/docs/prod/solaris.10

Specifically, you can access the Solaris 10 OS Release and Installation collection at:
http://docs.sun.com/app/docs/coll/1236.1
Downloading Solaris 10 OS Software

If you need to install the Solaris 10 11/06 OS or reinstall the OS after removing it, you can download the CD or DVD image at:

http://www.sun.com/software/solaris/get.jsp

Solaris 10 6/06 is the minimum supported version for the Sun Fire X4150 server.

See the Sun Fire X4150 Server Operating System Installation Guide for specific instructions on Solaris 10 installation.

Solaris 10 OS Training

Sun provides flexible training options that accommodate your personal schedule and learning style. The training options include instructor-led, web-based online, CD-ROM, and Live Virtual Classes. For Solaris 10 OS training and certification options at a glance, go to:

http://www.sun.com/training/catalog/solaris10.html
Configuring the Preinstalled Windows Server 2003 R2 Operating System

This chapter describes how to configure the Preinstalled Windows Server 2003 R2 Operating System (OS) that might be preinstalled on your Sun Fire X4150 server. This chapter assumes that your server has a hard drive installed, with the Preinstalled Windows Server 2003 R2 OS preinstalled. Your system might be different, depending on your hard drive configuration and ordering options.

This chapter includes the following topics:

- “Windows Server 2003 R2 Preinstall Overview” on page 57
- “Configuring the Windows Server 2003 R2 Operating System” on page 58
- “Configuring Sun Fire X4150 Server RAID Drives” on page 60

Windows Server 2003 R2 Preinstall Overview

Read this section before you set up Windows Server 2003 R2.

Servers shipped with the factory-installed Windows Server 2003 R2 OS include a Getting Started Guide. Read this guide before performing the initial setup of the Windows Server 2003 R2 OS. For initial setup procedure, also refer to the Sun x64 Servers Windows 2003 R2 Preinstall Product Notes.
Delivery Methods

By default, video output for the Windows preinstall is directed to the VGA monitor. If no VGA monitor is attached, use a Remote Console session to configure the OS.

How to start a RKVM Session

For detailed information on starting a Remote Console session:

**ELOM:** See "Starting the Remote Console Application" in the *Embedded Lights out Manager Guide for the Sun Fire X4150 and X4450 Servers.*

**ILOM:** See the *Sun Integrated Lights Out Manager Users Guide* for detailed information.

---

**Note –** If a VGA monitor is attached, skip this section

---

1. **Determine the Service Processor IP address.**
   
   **ELOM:** See *Determining the Embedded LOM Service Processor IP Address.*
   
   Refer to the *Embedded Lights Out Manager (ELOM) Administration Guide* for detailed information.
   
   **ILOM:** Refer to the *Sun Integrated Lights Out Manager Users Guide* for detailed information.

2. **Open a browser window.**

3. **Type the IP address of Service Processor into a browser window, and then login to the Remote Console**

4. **Click on the Remote Control tab, and then select Redirection.**

5. **Click Launch.**
   
   The console appears.

---

Configuring the Windows Server 2003 R2 Operating System

To configure the preinstalled Windows Server 2003 R2 Operating System:

1. **Boot the pre-installation image for the first time.**
2. The EMS Connection Detected dialog box appears. Click OK to continue using this local connection.

An EMS (emergency management console) connection might be detected if Serial Console Redirection is enabled in the BIOS, and an EMS Connection Detected popup message might appear, as shown here.

![EMS Connection Detected](image)

**Note** – In Sun servers, Serial Console Redirection is enabled by default.

3. The Welcome to Windows Setup Wizard screen appears. Click Next.

4. The License Agreement screen appears.

5. Read the terms and conditions of the license agreement, and if you agree, accept the terms and conditions. Click Next.

6. The Regional and Language Options screen appears.

7. Select your preferred region and language. Click Next.

8. The Personalize Your Software screen appears.

9. Type your name and organization. Click Next.

10. The Licensing Modes screen appears.

11. Select the desired licensing mode. Click Next.

12. The Computer Name and Administrator Password screen appears.

   a. Enter an administrator password and confirm the password.

   b. Keep or change the suggested Computer name.

   c. Click Next.

The Date and Time Settings screen appears.
13. Set the Date, Time, and Time Zone settings for your locale. Click Next.
   The network software installs and configures the operating system.
   The Network Settings page appears.
   The Workgroup or Computer Domain page appears.

14. Configure the computer to be part of a Domain or Workgroup, and then click Next.
   The Performing Final Tasks page appears and the server restarts automatically when completed.

Configuring Sun Fire X4150 Server RAID Drives

After you configure the Windows Server 2003 R2 OS, you might need to configure the RAID drives.

RAID Drive Overview

The Sun Fire X4150 server has two optional RAID Host Bus Adapter (HBA) cards. You can access RAID configuration through the HBA card BIOS. To access the LSI card BIOS, press Ctrl-C. To access the Sun StorageTek card BIOS, press Ctrl-A:

<table>
<thead>
<tr>
<th>RAiD HBA cards</th>
<th>Press for BIOS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sun StorageTek</td>
<td>Ctrl-A</td>
</tr>
<tr>
<td>LSI 3081E</td>
<td>Ctrl-C</td>
</tr>
</tbody>
</table>

The system will have the preinstalled OS on HD0. When the Windows Server 2003 R2 OS installation has been completed, the option to upgrade your single-disk OS to a mirrored RAID solution is available.

The configuration procedure is different for each supported controller card. For example, a Sun StorageTek HBA card has many more options for RAID configuration than an LSI HBA card. Configure the RAID depending on your needs as shown in TABLE 5-2.
**Note** – Configuring the Sun Fire X4150 server RAID is optional, by default, the preinstalled Windows Server 2003 R2 image is configured in a non-RAID configuration. If anything other than a basic Mirror RAID is required, it is recommended to perform a fresh install of the Windows Server 2003 R2 OS in the desired RAID configuration.

## RAID Drive Options

TABLE 5-2 shows the RAID drive options:

<table>
<thead>
<tr>
<th>SAS Card</th>
<th>Drives Supported</th>
<th>RAID Configuration Supported</th>
<th>Drive Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sun StorageTek</td>
<td>Seagate 73 GB SAS</td>

</tr>
</tbody>
</table>
Mirroring the Preinstalled Windows Server 2003 R2 OS with LSI RAID

The Windows Server 2003 R2 OS supports hardware RAID and cannot be installed on an existing array if one has been created. Refer to the Sun Fire X4150 Server Operating System Installation Guide or an HBA card product guide.

If you choose the preinstalled Windows Server 2003 R2 OS and want to make the OS part of a RAID set, and if you are using LSI RAID only, perform the following procedure to update the preinstalled Windows Server 2003 R2 OS to a mirrored RAID set. As stated in TABLE 5-2, only IM (Integrated Mirror) allows data on the primary hard disk drive (HDD) to be preserved or merged into an array of disks.

This example allows the creation of a mirror before or after the Windows Server 2003 R2 installation. The server has 2 disks: HDD0 (with the OS) and HDD1 (which is blank).

To create a mirror image of the Windows Server 2003 R2 OS on HDD1:

1. **Power on your server system for the first time.**
2. **Press Ctrl-C to access the LSI RAID configuration utility.**
3. **Select the SAS card - SAS1068E. Press Enter.**
4. **Choose RAID Properties.**
5. **Create an IM (Integrated Mirror) for the required disk configuration.**
6. **Select the hard disks to be used. Use the right arrow to move the cursor to the RAID column, and press the Space bar to include into RAID.**
7. **Because HDD0 contains data, select merge or delete:**
   - Choose M to merge data and start a sync operation.
   - Choose D to erase the Windows Server 2003 R2 PreInstall.
8. **Press C to create the RAID and start the sync operation.**
9. **Click Exit to save the configuration and close the menu.**
10. **Press Esc to exit the configuration utility and reboot.**
Creating a RAID Set to Incorporate a Preinstalled OS Using the Sun StorageTek Card

The Sun StorageTek card allows you to choose from many RAID configurations. How you configure your system depends on your system requirements and the available hard disk drives in the system. The following example shows how to mirror the preinstalled Windows Server 2003 R2 OS. This is the better option, and all remaining disks (should there be more than 2) are incorporated into a data RAID set using the available options as shown in TABLE 5-2.

You will need the Sun Fire X4150 Server Tools and Drivers CD.

Follow these steps to mirror your configured Windows Server 2003 R2 OS:

1. Select Start and then Sun Link - Online Information.
2. Select Install Supplemental Software.
3. Check Sun StorageTek Manager.
4. Click Next to install the Sun StorageTek Manager program.
5. Select Start and then Sun StorageTek RAID Manager.
6. Double-click the local machine that displays by the IP Address of the Primary ENET connection.
   A prompt appears.
7. At the prompt, log in as root, using the OS password that was assigned during installation.
8. Click the SUN STK RAID Controller.
   All attached hard disk drives on Enclosure 0 and 1 appear.
9. To mirror the OS, right-click Logical Device 1 and then choose Expand or Change Logical Device.
10. Choose the appropriate RAID option.
    In this example, select RAID 1 for Mirror.
11. Choose a disk to mirror the OS with, from the physical disk list.
    Select the hard disk drive that best fits your needs.
12. After you select the hard disk drive, click Next, and then view the configuration summary.
13. Click Apply to start the mirroring process.
    You can also click Schedule to perform the mirroring process at a later time.
14. **One more confirmation screen appears. Confirm the mirroring.**

The OS begins to mirror. Mirroring may take several hours, depending on the amount of data and the hard disk drive size.
If You Need Help

This chapter describes troubleshooting information and how to apply and remove AC power to the Sun Fire X4150 server. Support contacts are also included.

This chapter includes the following topics:

- “Powering On and Off the Server” on page 65
- “Setup Troubleshooting” on page 67
- “Contacting Support” on page 68

---

Powering On and Off the Server

Use the following procedures to power on and power off the Sun Fire X4150 server.

Power On the Main Power

To apply main power for all server components:

1. **Verify that the power cord has been connected and that standby power is on.**
   In standby power mode, the Power/OK LED on the front panel flashes.

2. **Use a stylus, pen, or other non-conducting pointed object, to press and release the recessed Power button on the server front panel.**
   When the main power is applied to the server, the Power/OK LED next to the Power button lights and remains lit, as shown in FIGURE 6-1.
FIGURE 6-1  Front Panel Power/OK LED

Note – The first time the server powers on, the power on self-test (POST) can take up to a minute.

Power Off from Main Power Mode

To remove main power from the server, use one of the following two methods:

TABLE 6-1  Shutdown

<table>
<thead>
<tr>
<th>Shutdown</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Graceful shutdown</td>
<td>Use a pen, or other pointed object, to press and release the Power button on the front panel. This causes Advanced Configuration and Power Interface (ACPI)–enabled operating systems to perform an orderly shutdown. Servers not running ACPI-enabled operating systems will shut down to standby power mode immediately.</td>
</tr>
<tr>
<td>Emergency shutdown</td>
<td>Press and hold the Power button for at least four seconds until the main power is off and the server enters standby power mode. When the main power is off, the Power/OK LED on the front panel flashes, indicating that the server is in standby power mode.</td>
</tr>
</tbody>
</table>

Caution – To completely power off the server, you must disconnect the AC power cords from the back panel of the server.
Setup Troubleshooting

This section contains information to help you troubleshoot minor server problems.

If you experience problems while setting up your server, refer to the troubleshooting information in **TABLE 6-2**.

**TABLE 6-2  Troubleshooting Procedures**

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible solution</th>
</tr>
</thead>
</table>
| Server powers on, but the monitor does not. | • Is the Power button for the monitor turned on?  
• Is the monitor power cord connected to a wall outlet?  
• Is the monitor power cord connected to the monitor?  
• Does the wall outlet have power? Test by plugging in another device. |
| CD or DVD does not eject from the media tray when you press the Eject button. | • Move the mouse or press any key on the keyboard. The drive might be in low power mode.  
• Use the utility software installed on your server to eject the CD.  
• Make sure that the media in the device is not in use and is not mounted by the operating system. |
| No video is displayed on the monitor screen. | • Is the monitor cable attached to the video connector?  
• Does the monitor work when connected to another system?  
• If you have another monitor, does it work when connected to the original system?  
• If, after POST and BIOS are complete, you no longer see video output on your monitor and see only a flashing cursor, check the configuration of the operating system to determine if it is configured to redirect its output exclusively over the serial line. |
| Server does not power on when the front panel Power button is pressed. | Keep notes on the following situations in case you need to call service:  
• Is the Power LED illuminated on the front of the system? (Ensure that the power cord is connected to the system and to a grounded power receptacle.)  
• Does the wall outlet have power? Test by plugging in another device.  
• Does the monitor sync within five minutes after power on? (The green LED on the monitor stops flashing and remains illuminated.) |
| Keyboard or mouse does not respond to actions. | • Verify that the mouse and keyboard cables are connected to the on-board USB 2.0 connectors on the server.  
• Verify that the server is powered on and the front Power LED is illuminated. |
Note – For additional troubleshooting information, see the Sun Fire X4150 Server Service Manual.

### Contacting Support

If the troubleshooting procedures in this chapter fail to solve your problem, use **TABLE 6-3** to collect information that you might need to communicate to the support personnel. **TABLE 6-4** lists the Sun web sites and telephone numbers for additional technical support.
