Preface

The SPARCstation Voyager Service Manual describes how to remove and replace system parts. Chapter 11 lists the replacement parts. This manual also describes how to troubleshoot system problems by running diagnostic programs.

This book is written for Sun® field service representatives, original equipment manufacturers (OEMs), value-added resellers (VARs), and other customers with self-maintenance contracts.

What Typographic Changes Mean

The following table describes the typographic changes used in this book.

<table>
<thead>
<tr>
<th>Typeface or Symbol</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>AaBbCc123</td>

Notes, Cautions, and Warnings

**Caution** – This equipment contains lethal voltage. Accidental contact can result in serious injury or death.

**Caution** – Improper handling by unqualified personnel can cause serious damage to this equipment. Unqualified personnel who tamper with this equipment may be held liable for any resultant damage to the equipment.

Individuals who remove any outer panels or open covers to access this equipment must observe all safety precautions and ensure compliance with skill level requirements, certification, and all applicable local and national laws.

Procedures contained in this document must be performed by qualified service-trained maintenance providers.

**Note** – Before you begin, carefully read each of the procedures in this manual. If you have not performed similar operations on comparable equipment, do not attempt to perform these procedures.
Product Description

System Unit

The major system components are:

- CPU unit
- Display Panel
- Sun Compact 1 (or Type 5) Keyboard
- Mouse
- PCMCIA cards (optional)
- Memory cards (optional)
- Battery (optional)

The following figures illustrate the SPARCstation™ Voyager™ workstation:

- FIGURE 1-1 shows the front view of the unit
- FIGURE 1-2 shows the rear view
- FIGURE 1-3 shows the internal front view
- FIGURE 1-4 shows the internal rear view
- FIGURE 1-5 shows the back panel

CHAPTER 2

Diagnostic Overview

This chapter describes how to diagnose a problem with a SPARCstation Voyager workstation and run diagnostic tests. You should be familiar with troubleshooting hardware, running diagnostic tests, and replacing or upgrading hardware.

- “Diagnostic Overview” on page 7
- “Diagnostic Tools” on page 9

Default Boot Mode

To troubleshoot a problem, it is helpful to know what part of the system has control of system operations at any moment.

When you turn on the power, control of the system passes in this order:

- OpenBoot’ initialization (initializes serial-controller-chip and checks the keyboard)
- Power-On Self-Test (POST) program (if Stop-D keys are pressed or diag-switch? true or if keyboard is not attached)
- OpenBoot program
- Operating system

The flowchart in FIGURE 2-1 outlines the roles played by various diagnostics during the default boot mode.
This section describes how the various diagnostic tools work together in the different power-on modes.

**Note** – POST will run at power on if the Stop-D keys are pressed or the diag-switch? parameter is set to true, or the keyboard is disconnected.

While the POST code executes, the Caps Lock LED on the keyboard flashes to indicate that testing is in progress. If a failure occurs in POST, the failing replaceable unit is encoded on three LEDs located on the keyboard and failure messages are output to the serial port. See Chapter 3, “Power-On Self-Test (POST).”

If the POST passes, the system probes for SBus devices and interprets their drivers. Next, high-level tests are performed. You will see the words **Testing Memory** while the high-level tests are running. After **Testing Memory** is displayed, if you want to use the OpenBoot PROM commands (ok prompt), press the Stop-A keys simultaneously.
If the auto-boot? parameter is set to false (not the default), you will get the ok prompt. To change to the monitor prompt (>) see the manual OpenBoot Command Reference.

If the auto-boot? parameter is set to true (default), and the diag-switch? parameter is set to false (default), the operating system is booted using the device alias disk. If the auto-boot? parameter is set to true (default), and the diag-switch? parameter is set to true (not the default), the operating system is booted using the device alias net. See TABLE 2-1.

To run user-specified programs, you must be at the ok prompt.

TABLE 2-1 describes the auto-boot? and diag-switch? parameters.

TABLE 2-1 Definition of auto-boot? and diag-switch? Parameters

<table>
<thead>
<tr>

<td>False</td>
<td>Boot operating system (/kernel/unix) from disk automatically only if the boot-device is set to disk (default setting)</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>Boot operating system (/kernel/unix) from network automatically only if diag-device is set to net (default setting)</td>
</tr>
</tbody>
</table>

Diagnostic Tools

The main categories of diagnostic tests are:
- OpenBoot PROM diagnostics
- Power-On Self-Test (POST)
- On-Board diagnostics
- SunDiag™ System Exerciser
TABLE 2-2 provides a summary of the available diagnostic tools and lists when to use each diagnostic tool.

TABLE 2-2  Diagnostic Tools

<table>
<thead>
<tr>
<th>Diagnostic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power-On Self-Test</td>
<td>POST tells you if the CPU board or memory card fails. POST code, residing in the OpenBoot PROM, executes at power-on when you press and hold the Stop-D keys, or the diag-switch? parameter is set to true, or the keyboard is disconnected.</td>
</tr>
<tr>
<td>On-Board Diagnostics</td>
<td>Includes tests such as: Ethernet and the diskette drive controller tests. To run on-board diagnostics, you must be at the \texttt{ok} prompt. See Appendix C, “Selected On-Board Diagnostics.”</td>
</tr>
<tr>
<td>Forth Toolkit</td>
<td>Allows input to the system at the OpenBoot PROM level. Supports functions such as changing NVRAM parameters, resetting the system, running diagnostic tests, displaying system information, and redirecting input and output. See the manual \textit{OpenBoot Command Reference}.</td>
</tr>
<tr>
<td>SunDiag System Exerciser</td>
<td>Runs under the operating system and displays real-time use of the system resources and peripherals. See the \textit{SunDiag User’s Guide} for more information. If SunDiag fails, run the Power-On Self-Test.</td>
</tr>
</tbody>
</table>

OpenBoot PROM Diagnostics

The diagnostics stored in the OpenBoot PROM include:

- POST
- On-board diagnostics

See TABLE 2-2 and Chapter 3 for information on POST. If there is system trouble, you can run on-board diagnostics for thorough tests, including but not limited to:

- Ethernet test
- Memory test
- Diskette drive test
- SCSI disk test

You can run on-board diagnostics from the \texttt{ok} prompt. If there is a problem with the operating system, the operating system brings the system to the \texttt{ok} prompt. You can also get to the \texttt{ok} prompt by shutting down the operating system.
TABLE 2-3 describes selected on-board diagnostic tests and what you must do before you run each test. Some of the tests verify the proper operation of the network controller, the diskette drive system, memory, and the system clock.

**TABLE 2-3  Selected On-Board Diagnostic Tests**

<table>

</tbody>
</table>
Use the SunDiag system exerciser, which is shipped with and runs under the operating system, to test system resources and peripheral equipment.
If the SunDiag program has been selected during the operating system loading procedure, it can be run at any time. The SunDiag system exerciser is usually located in the directory /opt/SUNWdiag/bin. If the SunDiag system exerciser is not on the system hard disk or server, you can load it from CD-ROM. For more information, see the SunDiag User's Guide.

If the SunDiag tests pass, the system is operating properly. If the SunDiag tests fail, the error messages indicate the part of the system which has failed. If the error messages are not descriptive enough, you can run POST. See Chapter 3
The Power-On Self-Test (POST) diagnostics reside in the OpenBoot PROM located on the system board. There are two POST modes: Normal and Diagnostic.

Normal Mode

Under normal mode, when the system is turned on, control is sent to the OpenBoot PROM. Depending on the options set in the OpenBoot PROM, for example if `diag-switch` is disabled (set to false) and `auto-boot` is enabled (set to true), the operating system will load.

Low level diagnostic testing is not run, but memory will be tested based on the setting of the `selftest-#megs` parameter in the system’s NVRAM. The default for `selftest-#megs` is 1 (one megabyte). Change this parameter to increase the amount of memory tested at power on time.

Diagnostic Mode

You need to remove the PCMCIA card from the system to run a full diagnostic mode test by POST. If there is any PCMCIA card inserted in the system, POST will not run the following tests:
PCMCIA Status Chnge Intr Test
PCMCIA I/O Interrupt Test
PCMCIA Card Detect Intr Test
PCMCIA I/O St Chnge Intr Test

If an error or errors occur during the POST, all error messages are displayed on the TTY, tip window or display panel.

Setting Up a tip Connection to Another Workstation

You can use the serial port on the SPARCstation Voyager workstation to connect to another Sun workstation (either the same type of SPARC system or a different type of Sun workstation or server system). This connection lets you use a shell window on the Sun workstation as a terminal to the SPARCstation Voyager workstation being tested.

The tip method is recommended, because it lets you use SunOS windowing and operating system features to help you work with the boot PROM.

1. Connect the SPARCstation Voyager workstation serial port (TTYa) to another Sun workstation TTYa serial port using a serial connection cable. This connection is made with a 3-wire null modem cable. Connect wires 3-2, 2-3, and 7-7.

2. At the other Sun workstation, add the following lines to the file /etc/remote:

```
hardwire:\
    :dv=/dev/ttya:br#9600:el=^C^S^Q^U^D:ie=%$:oe=^D:
```

3. In a shelltool window on the Sun workstation, type `tip hardwire`. (Some commands will not work properly in a command tool window.) The system will reply `connected`.

4. When you are finished running POST and want to disconnect the tip window, type `kill -9` and the process ID number of the tip hardwire process.
How to Invoke POST at Power On

You can invoke POST at power on with or without a keyboard. The following flowchart shows the steps to POST and the options available.

![Flowchart](image)

**FIGURE 3-1  How to Invoke POST**

Tests POST Runs

Following is a sample listing from OpenBoot PROM version 2.15, or later versions of the diagnostic mode tests completed by POST in a SPARCstation Voyager workstation.
These messages are sent to the system’s serial port and can be viewed by attaching a terminal or `tip` window to the port.

Status Lights (LEDs) and Indicators

The power light emitting diode (LED) at the front of the chassis remains lit when the system is operating normally. FIGURE 3-2 shows the location of the power LED.

This section describes the keyboard LED sequences displayed at power on when POST fails. If a failure occurs in POST, the keyboard displays a specific LED pattern. See FIGURE 3-3 and TABLE 3-1. After POST is completed and during normal system operation, the LEDs should not be interpreted as diagnostic error indicators.

Following system initialization, the operating system boots automatically, unless the NVRAM configuration options specify not to do so.

**Note** – The Caps Lock key LED, located just below the left Shift key, is not used as a power-on test failure indicator, but flashes on and off while POST is running.
Power-On Self-Test

This section describes the keyboard LED patterns as a result of POST and their meaning. FIGURE 3-3 shows the location of the LED keys on the Sun Compact 1 keyboard. TABLE 3-1 lists the meaning of the LED keys.

![Keyboard Diagram]

FIGURE 3-3 Arrangements of the Sun Compact 1 Keyboard LEDs

<table>
<thead>

<td>Is not applicable</td>
</tr>
</tbody>
</table>

If the Caps Lock key fails to flash on and off after you have pressed and held the Stop-D keys when you power on the system, POST failed.

POST Error Messages

The following are the possible POST error messages that will be displayed after POST runs.
If the CPU failed:

STATUS : Power-On Selftest FAILED ... Replace Main Logic Board

If the upper memory card failed:

STATUS : Power-On Selftest FAILED ... Replace Upper Memory Card

If the lower memory card failed:

STATUS : Power-On Selftest FAILED ... Replace Lower Memory Card

The upper memory card is the one located farthest from the CPU board. The lower memory card is the one located closest to the CPU board.

FIGURE 3-4  Upper and Lower Memory Cards Location

After POST Ends

Use FIGURE 3-5 to determine what diagnostics tests to run after the POST ends.
FIGURE 3-5  Tests to Run After Running POST

- POST passed?
  - Yes: Run on-board diagnostics or SunDiag
  - No: Use error messages displayed on TTY, tip window or display panel
Troubleshooting Procedures

This chapter describes how to troubleshoot problems you might experience and the corrective actions you can take.

- “Troubleshooting Tips” on page 25
- “Power On Does Not Succeed” on page 26
- “Display Panel Problems” on page 28
- “Disk Drive or SCSI Errors” on page 29

Troubleshooting Tips

**Power On Does Not Succeed**

1. Check that the AC power cord is connected to the wall outlet and to the power supply.

2. Verify that AC power is being supplied from the wall outlet by using a VOM.

3. Remove the power supply from the system and connect it to the wall outlet. The LED on the power supply should light to indicate the power supply is working. If the LED does not light, the power supply is defective.

4. If the system runs on battery, connect the external DC cable to the DC input connector on the back panel and to the power supply. The battery may be dead or defective.

5. If power on fails using the keyboard power-on key, press the power switch at the rear of the system. If power on succeeds, the cable for the keyboard may be damaged or incorrectly connected. Or, the keyboard may be defective.

6. The CPU board may have failed. See Section “System Board Test” on page 4-27.

7. The DC/DC converter may have failed. See Section “DC/DC Converter Test” on page 4-27.
System Board Test

1. Connect a terminal to the system serial port, or use a tip connection to another workstation to view POST progress and failure information.
   See Section “Setting Up a tip Connection to Another Workstation” on page 3-16.

2. Press and hold the Stop–D keys. While holding the keys down, press the power-on key. Observe the keyboard LEDs.
   ■ The Caps Lock key should flash on and off, indicating the system is running the POST.
   ■ If the Caps Lock key fails to flash, POST failed to start or a test has failed. Remove optional parts of the system such as memory cards and PCMCIA cards, and try to run POST again.
   ■ If a test fails, POST uses other keyboard LEDs to indicate which part of the system has failed. See Section “Power-On Self-Test” on page 3-21.

3. Observe the POST progress messages on the system serial port. It provides additional diagnostic information.

DC/DC Converter Test

1. Remove the rear cover of the system to expose the DC/DC converter.
   See Section “Opening the Rear of the System” on page 7-43.

2. Press the power switch on. Use a VOM to measure the voltages at the DC/DC converter connector (location J0900 on the CPU board).
   See TABLE 4-2 below for the expected voltages.

   **Note** – The DC/DC converter should remain connected to the CPU board during this test.

<table>
<thead>
<tr>

</tr>
<tr>
<td>4</td>
<td>Red</td>
<td>+5V</td>
</tr>
<tr>
<td>5</td>
<td>Red</td>
<td>+5V</td>
</tr>
</tbody>
</table>
3. Replace the DC/DC converter if any of the expected DC voltage is not present.

4. Replace the CPU board if DC voltages are still not present after replacing the DC/DC converter. This may indicate a shorted component on the CPU board.

### Display Panel Problems

#### No Video Output on Display Panel

1. Check the following connections to make sure they are secured:
   - Connection between the display panel and the video board
   - Connection between the flex cable and the video board
   - Connection between the flex cable and the CPU board

2. If a monitor is available, connect it to the 13W3 video port at the rear of the system and power on the system. If data appears on the monitor, the video board is not defective. Replace the display panel.

3. If no monitor is available to test the video board, replace the video board first and retest the system. If video output is still not seen, replace the display panel. Replace the CPU and the flex cable if the previous steps fail to restore the video.

#### Lines or Blank Areas on the Display Panel

1. If a monitor is available, connect it to the 13W3 video port at the rear of the system and power on the system. If similar defects appear on the monitor, replace the video board.

---

<td>Yellow</td>
<td>+3.3V</td>
</tr>
<tr>
<td>10</td>
<td>Green</td>
<td>BATT_RTN</td>
</tr>
</tbody>
</table>
2. If solid lines appear, replace the display panel.
   Solid lines usually indicates display panel failures.

3. If lines persist after replacing the display panel, replace the video board and/or the flex cable.

## Disk Drive or SCSI Errors

TABLE 4-3 lists disk drive error conditions and corrective actions.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read, write, or parity error reported by the</td>
<td>Replace the disk drive indicated by the failure message. The operating system</td>
</tr>
<tr>
<td>operating system or applications.</td>
<td>identifies the internal disk as c0t3d0. If a different drive id is indicated, it is</td>
</tr>
<tr>
<td></td>
<td>probably an external disk.</td>
</tr>
</tbody>
</table>

Drive fails to boot or does not respond to commands. | SCSI controller or disk may be defective. See Section “Testing the System SCSI Controller” on page 4-29. |
| If the problem is with an external disk, the SCSI | terminator may be missing, defective, or incorrectly installed on the last device in the SCSI chain. |

## Testing the System SCSI Controller

To test the system’s SCSI controller, test the drive’s response to the `probe-scsi` command.
1. At the ok prompt, type `probe-scsi`.

   See the following example:

   ```
   ok probe-scsi
   Target 3
   Unit 0 Disk TOSHIBA MK2326FB A10S
   ```

   If the internal disk drive responds and a message similar to the example above is displayed, the system’s SCSI controller has successfully probed the device. This indicates that the CPU board is working properly.

   If the disk drive does not respond:

2. Verify that all SCSI devices on the SCSI chain have a different SCSI address. The internal disk drive is set to SCSI address 3. Do not assign SCSI address 7 to any device. This address is reserved for the system SCSI controller.

3. If external SCSI devices are connected to the system, verify that all SCSI cables and the SCSI terminator are connected securely. The SCSI terminator must be connected to the last physical SCSI device in the chain.

4. Check the SCSI cables to make sure there are no bent pins.

5. After checking the previous causes and the problem persists, replace the unresponsive SCSI device.

6. If the problem still occurs after replacing the SCSI device, replace the CPU board.

7. If replacing the SCSI device and the CPU board does not correct the problem, replace the I/O board.
Memory Errors

If the operating system, diagnostic program, or POST does not display a memory card location as part of a memory error message, and the only available information is a physical memory address, use TABLE 4-3 to locate the memory errors. See FIGURE 4-1 for memory cards locations.

### TABLE 4-4  Physical Memory Address and Memory Locations

<table>
<thead>
<tr>
<th>Physical Memory Address Range</th>
<th>Memory Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bank #0</td>
<td>CPU on-board memory 16 MBytes</td>
</tr>
<tr>
<td>0000000 - 0fffffff</td>
<td></td>
</tr>
<tr>
<td>1000000 - 1fffffff</td>
<td></td>
</tr>
<tr>
<td>Bank #1</td>
<td>Lower memory card 16 or 32 MBytes</td>
</tr>
<tr>
<td>2000000 - 2fffffff</td>
<td></td>
</tr>
<tr>
<td>3000000 - 3fffffff</td>
<td></td>
</tr>
<tr>
<td>Bank #3</td>
<td>Upper memory card 16 or 32 MBytes</td>
</tr>
<tr>
<td>6000000 - 6fffffff</td>
<td></td>
</tr>
<tr>
<td>7000000 - 7fffffff</td>
<td></td>
</tr>
<tr>
<td>Bank #5</td>
<td></td>
</tr>
<tr>
<td>a000000 - affffffff</td>
<td></td>
</tr>
<tr>
<td>b000000 - bfffffff</td>
<td></td>
</tr>
<tr>
<td>Bank #7</td>
<td></td>
</tr>
<tr>
<td>e000000 - efffffff</td>
<td></td>
</tr>
<tr>
<td>f000000 - ffffffff</td>
<td></td>
</tr>
</tbody>
</table>
For example, if physical memory address 125febc is indicated as the failing memory location, TABLE 4-3 shows that this address is within the CPU on-board memory range. The CPU board should be replaced to correct this failure.

If memory errors occur between the address ranges of 2000000 and 7ffffff, replace the lower memory card. If memory errors occur between the address ranges of a000000 and fffffff, replace the upper memory card.
Safety and Tools Requirements

Before beginning any procedure, read the instructions and cautions in this section. This information explains how to work safely when servicing a Sun Microsystems product.

Safety Requirements

For your protection, observe the following safety precautions when setting up your equipment:

- Follow all cautions, warnings, and instructions marked on the equipment.
- Ensure that the voltage and frequency rating of the power outlet you use matches the electrical rating label on the equipment.
- Never push objects of any kind through openings in the equipment as they may touch dangerous voltage points or short out components that could result in fire or electric shock.
- Refer servicing of equipment to qualified personnel.

Symbols

The following symbols mean:

**Caution** – Risk of personal injury and equipment damage. Follow the instructions.
Caution – Hazardous voltages are present. To reduce the risk of electric shock and danger to personal health, follow the instructions.

Caution – Hot surfaces. Avoid contact. Surfaces are hot and may cause personal injury if touched.

Safety Precautions

Modification to Equipment

Caution – Do not make mechanical or electrical modifications to the equipment. Sun Microsystems, Inc. is not responsible for regulatory compliance of a modified Sun product.

Placement of a Sun product

Caution – To ensure reliable operation of your Sun product and to protect it from overheating, openings in the equipment must not be blocked or covered. A Sun product should never be placed near a radiator or heat register.

Power Cord Connection

Caution – Not all power cords have the same current ratings. Household extension cords do not have overload protection. Do not use household extension cords with your Sun product.
Electrostatic Discharge

**Caution** – The boards and hard disk drive contain electronic components that are extremely sensitive to static electricity. Ordinary amounts of static from your clothes or work environment can destroy components.

Do not touch the components themselves or any metal parts. Wear a wrist strap when handling the drive assembly, board, or card.

Lithium Battery

**Caution** – On Sun CPU boards, there is a lithium battery molded into the real-time clock, SGS No. MK48T08. Batteries are not customer replaceable parts. They may explode if mistreated. Do not dispose of the battery in fire. Do not disassemble it or attempt to recharge it.

Rechargeable Battery

**Caution** – Handle damaged or leaking lithium-ion battery with extreme care. If the battery is damaged, electrolyte may leak from the cells and may cause personal injury.

Display Panel

**Caution** – High voltage is present in the backlight assembly interior. Do not disassemble the panel.

**Caution** – The florescent tubes in the backlight assembly contain mercury vapor. Breathing the mercury vapor can be harmful. If breakage occurs, move out of the vicinity until the vapor clears.
Caution – The liquid crystal material can be harmful if breakage occurs. Be sure to wash your hands to avoid accidentally ingesting the liquid crystal material.

Caution – The display panel’s front surface is plastic and easily damaged. Do not press on the front of the display panel. Discoloration and damage can occur. Clean it with a soft cloth dampened with water.

Tools Required

- Screwdriver, Phillips #1
- Hex nut driver, 3/16 inches
- Flat blade screwdriver
- Grounding wrist strap
- Volt-Ohmmeter (VOM) for checking voltages and continuity
- Antistatic surface

You will need an antistatic surface on which to place static-sensitive parts such as boards, cards, disk drive, and TOD/NVRAM. The following items can be used as an antistatic surface:

- Bag used to wrap a Sun replacement part
- Shipping container used to package a Sun replacement part
- Sun ESD mat, P/N 250-1088. You can purchase it through your Sun sales representative
CHAPTER 6

Power Off and On

This chapter tells you how to turn the power off before you service the system and how to turn the power back on after you have serviced the system.

Powering Off the System

**Note** – Do not suspend the system prior to removing or replacing any part. You must power off the system.

1. Become superuser by typing `su`.
2. Type your superuser password.
3. Type `init 0`.

```
machinename% su
password%
machinename# init 0
screen messages
ok
```

4. Turn off the power to all external units.

   External units can include external drives, printers, or other serial or parallel devices. See the document supplied with each device.

5. Press the Shift and power keys to turn off the system.

   See FIGURE 6-1. If your system does not have a keyboard, go to Step 1.
6. Disconnect the keyboard cable from the keyboard port labeled on the back panel of the system.
   Go to Step 1.

7. Press the power switch on the back panel.

8. Disconnect the power source.
   a. For the system that runs on the power supply:
      Disconnect the AC power cable from the wall outlet and the power supply.
FIGURE 6-3  System With the Power Supply

b. For the system that runs on the battery:
   There is no power cable to be disconnected.
c. For the system that contains a battery and runs on the power supply (slow charging the battery):

Disconnect the external DC cable from the DC input connector on the back panel, and disconnect the AC power cable from the wall outlet.
9. Disconnect cables to any external units.
See the document supplied with each device.

**FIGURE 6-5** System With the Battery and Power Supply Installed

---

**Powering On the System**

1. Connect the keyboard cable to the keyboard port labeled on the back panel of the system if your system has a keyboard.

2. Connect the power source.
   a. For the system that runs on the power supply:
      Connect the AC power cable to the power supply and to the wall outlet. See FIGURE 6-3.
   b. For the system that runs on the battery:
      There is no power cable to be connected. See FIGURE 6-4.
c. For the system that contains battery and runs on the power supply (slow charging the battery):
   Connect the external DC cable to the DC input connector on the backpanel, and connect the AC power cable to the wall outlet. See FIGURE 6-5.

3. Connect the cables to all external units.
   See the manual supplied with each device for instructions.

4. Turn on the power to all external units starting with the unit farthest electrically from the system unit.
   The external units can include external drives, printers, or other serial or parallel devices.

5. Press the power key on the system unit keyboard, or press the power switch on the back panel for a system without a keyboard.
   See FIGURE 6-1 or FIGURE 6-2. The system will reboot.
CHAPTER 7

Internal Access

Follow the procedure in Section "Powering Off the System" on page 6-37, before you begin.

Opening the Rear of the System

Removing the Power Supply

1. Slide the power supply door to the unlock position and remove it.

2. Pull the pull ring to remove the power supply out of the tunnel.

   See FIGURE 7-2.
Removing the Left Cap

1. Remove the rubber plug from the left cap.
   See FIGURE 7-3. Puncture the end of a paper clip into the center of the rubber plug, then pull it out.

2. Loosen the two screws on the left cap with a Phillips screwdriver.

3. Slide the left cap off the unit.
Removing the Right Cap

1. Remove both rubber plugs from the right cap.
   See FIGURE 7-4. If the lock block was installed, you need to remove the top rubber plug only.
2. Loosen the two screws holding the right cap of the unit with a Phillips screwdriver.

See FIGURE 7-4. If the lock block was installed, loosen the top screw only.

**Note** – If the system has a lock block installed, remove the lock block with a Phillips screwdriver.

3. Slide the right cap off the unit.

**Removing the Rear cover**

- Hold both ends of the rear cover, slide it back, and then lift it up away from the unit as shown.
Now you have access to the memory card slots, the CPU board, floppy cable, flex cable and the DC/DC converter.

**Caution** – Surfaces on the DC/DC converter and the heatsink on the microSPARC II processor may be hot. Avoid contact with these surfaces while they are hot.

**Caution** – You must attach your wrist strap now. Ordinary amounts of static from your clothes or work environment can destroy components.

For information on how to attach a wrist strap, see the next section, “Attaching the Wrist Strap” on page 47.

### Attaching the Wrist Strap

1. Unwrap the first two folds of the wrist strap. Wrap the adhesive side firmly around your wrist.
2. Peel the liner from the copper foil at the opposite end of the wrist strap and attach the end to the metal part of the system. See FIGURE 7-8.

---

Opening the Front of the System

Follow the procedure in Section “Opening the Rear of the System” on page 7-43 before you begin.

Removing the Filler Cover

This section applies to headless (no display panel) systems only. Otherwise, see Section “Removing the Display Panel” on page 7-49.

1. Loosen the two screws on the filler cover.
2. Remove the filler cover by lifting it up.

3. Proceed to Section “Removing the Front Cover” on page 7-50.

Removing the Display Panel

1. Loosen the two Phillips screws behind the display panel.
   See FIGURE 7-10.

2. Remove the display panel from the system by wiggling it upward.

   Caution – Place the display panel with its front facing down on a flat and clean surface. The front surface could be damaged otherwise.
Removing the Front Cover

- Hold both ends of the front cover, and lift it up away from the unit.
Now you have access to the video board, speaker, and floppy drive.

Removing the Bottom Front Cover

- Remove the bottom front cover by sliding it off the unit.
Now you have access to the hard disk drive, the SCSI cable and the IR board.

Removing the Bottom Rear Cover

**Caution** — You must remove the display panel before laying the unit on its front, to avoid possible damage to the panel.

1. Lay the system gently on its front.
   
   See FIGURE 7-13.

2. Loosen the Phillips screws attaching the bottom rear cover of the base as shown.
3. Place the system right side up.

4. Move the floppy drive out of the way.
   The floppy drive must be moved to allow removal of the bottom rear cover.
   
   a. **Disconnect the flex cable from the video board.**
      
      See Figure 7-14. Hold both ends of the connectors and wiggle them out of the sockets.

   b. **Loosen the screw on the floppy drive locking lever.**
c. Gently pull the locking lever toward the drive, slide the floppy drive to the right, and leave it hanging.

5. Hold and raise the bottom rear cover slightly, then pull the left side toward the right side of the unit.
Now you have access to the IR cable and the I/O board.

Closing the System

Replacing the Bottom Rear Cover

Replace the bottom rear cover if it has been removed.

1. Hold the bottom rear cover at both ends and place it on the unit.
2. Replace the floppy drive.
   
a. Position the floppy drive so that the four mounting feet are aligned with the four slots on the system.
   
   See FIGURE 7-19.

   b. Push the four mounting feet in the slots and slide the floppy drive toward the video board until you hear it click.
   
   See FIGURE 7-19.
c. Tighten the screw on the floppy drive locking lever.

d. Connect the flex cable to the video board.

See FIGURE 7-20.
e. Lay the system on its front.
   See FIGURE 7-13.

**Caution** – You must remove the display panel before laying the unit on its front, to avoid possible damage to the panel.

3. Tighten the two screws to secure the bottom rear cover to the base.
   See FIGURE 7-13. Do not overtighten the screws.

![FIGURE 7-21 Screws in the Bottom Rear Cover](image)

**Replacing the Bottom Front Cover**

Replace the bottom front cover, if it has been removed.

- Hold the bottom front cover at both ends and gently slide it onto the system.
Replacing the Front Cover

1. Hold both ends of the front cover and line it up with the system.
FIGURE 7-23  Replacing the Front Cover

2. Slide the front cover down so the connector comes through the cutout at the center, and the flange of the bottom front cover slides into the groove at the bottom of the front cover.

Replacing the Display Panel

1. Hold the display panel with both hands, position it as shown in FIGURE 7-24, and push it down until the connector sits in the socket.
2. Tighten the two captive screws on the display panel. Do not overtighten the screws.

Replacing the Rear Cover

1. Remove the wrist strap from the system and your wrist.
2. Hold both ends of the rear cover, line it up as shown, and then slide it in.
Replacing the Right Cap

1. Hold the front and rear covers together and slide the right cap onto the unit.  
   See FIGURE 7-26.

2. Tighten the two screws to secure the right cap on the unit.  
   Do not overtighten the screws. If a lock block was installed, tighten the top screw only.

3. Insert both rubber plugs into the right cap.  
   If a lock block was installed, insert the top rubber plug only.
Note – If the system has a lock block installed, insert the lock block into the lower right cap hole and tighten the screw.

Replacing the Left Cap

1. Hold the front and rear covers together and slide the left cap onto the unit. See FIGURE 7-28.
2. Tighten the two screws to secure the left cap on the unit.
   Do not overtighten the screws.

3. Insert the rubber plug in the left cap.

![FIGURE 7-28 Replacing the Left Cap]

Replacing the Power Supply

1. Insert the power supply into the tunnel, and slide it in.
2. Replace the power supply door by sliding it to the locked position.
Major Subassemblies

This chapter explains how to remove and replace the major subassemblies. See Section “List of Replacement Parts” on page 11-111 for the part numbers and description of replaceable parts. The following is the list of the major subassemblies:

■ “Display Panel” on page 68
■ “Power Supply” on page 69
■ “Speaker” on page 69
■ “DC/DC Converter” on page 70
■ “SCSI Cable” on page 72
■ “Floppy Cable” on page 73
■ “Flex Cable” on page 81

Refer to the following before you remove any part:

■ “Safety Requirements” on page 33
■ “Powering Off the System” on page 37
■ “Opening the Rear of the System” on page 43
■ “Attaching the Wrist Strap” on page 47
■ “Opening the Front of the System” on page 48
■ “Removing the Bottom Rear Cover” on page 52
■ “Removing the Bottom Front Cover” on page 51

Refer to the following after replacing any part:

■ “Closing the System” on page 55
■ “Powering On the System” on page 41
Display Panel

Removing the Display Panel

1. **Open the rear of the system.**
   See Section “Opening the Rear of the System” on page 7-43.

2. **Remove the display panel.**
   See Section “Removing the Display Panel” on page 7-49.

Replacing the Display Panel

1. **Install the new display panel.**
   See Section “Replacing the Display Panel” on page 7-60.

2. **Replace the rear cover.**
   See Section “Replacing the Rear Cover” on page 7-61.

3. **Replace the right cap.**
   See Section “Replacing the Right Cap” on page 7-62.

4. **Replace the left cap.**
   See Section “Replacing the Left Cap” on page 7-63.

5. **Replace the power supply.**
   See Section “Replacing the Power Supply” on page 7-64.

6. **Power on the system.**
   See Section “Powering On the System” on page 6-41.
Power Supply

Removing the Power Supply

To remove the power supply, follow the steps in Section “Removing the Power Supply” on page 7-43.

Replacing the Power Supply

1. Replace the power supply.
   See Section “Replacing the Power Supply” on page 7-64.

2. Power on the system.
   Section “Powering On the System” on page 6-41.

Speaker

Removing the Speaker

1. Remove the CPU board from the system.
   See Section “Removing the CPU Board” on page 10-96.

2. Gently press the speaker tabs and pull the speaker out of the system.
   See FIGURE 8-1.
Replacing the Speaker

1. Gently press the speaker tabs and insert the replacement speaker into its cavity. See FIGURE 8-1. Make sure that the speaker cable is routed to the rear side of the system.

2. Replace the CPU board on the system. See Section "Replacing the CPU Board" on page 10-99.

DC/DC Converter

Removing the DC/DC Converter

1. Disconnect the DC/DC converter connector from the CPU board.
2. Loosen the four threaded standoffs.
   Use a 3/16" hex nut driver. See FIGURE 8-3.

3. Remove the DC/DC converter.
Replacing the DC/DC Converter

1. Align the DC/DC converter on the four threaded studs.
   See FIGURE 8-3.

2. Install and tighten the four threaded standoffs on the studs.
   See FIGURE 8-3.

3. Connect the DC/DC converter connector to the CPU board connector.
   See FIGURE 8-1.

4. Close the system and power it on.

SCSI Cable

Removing the SCSI Cable

1. Remove the hard disk drive.
   See Section “Removing the Hard Disk Drive” on page 9-92.

2. Disconnect the SCSI cable from the I/O board.

   ![SCSI Cable Diagram](image.png)

   FIGURE 8-4  Disconnecting the SCSI Cable from the I/O Board
Replacing the SCSI Cable

1. **Connect the SCSI cable to the I/O board.**
   See FIGURE 8-4.

   **Note** – Check both ends of the SCSI connector to make sure it is lined up with the I/O board socket.

2. **Replace the disk drive.**
   See Section “Replacing the Hard Disk Drive” on page 9-94.

3. **Close the system and power it on.**

Floppy Cable

Removing the Floppy Cable

1. **Remove the CPU board.**
   See Section “Removing the CPU Board” on page 10-96.

2. **Remove the video board.**
   a. Place an antistatic surface on your work area.
   b. Press the speaker at both tabs lightly and pull it out of its cavity.
   See FIGURE 8-5.
c. Disconnect the flex cable from the video board.
   Hold both ends of the connectors and wiggle them out of the sockets.

d. Remove all three screws from the video board.
   See FIGURE 8-7.

   e. Gently pull down the video board, remove it from the chassis and put it aside on the antistatic surface.
3. **Disconnect the floppy cable from the floppy drive.**

   Use the tip of a flat blade screwdriver or similar tool to push both ends of the connector locking device away from the drive. Gently, pull the floppy cable from the drive.

4. **Remove the floppy cable from the system.**
Replacing the Floppy Cable

1. Place the replacement floppy cable in the system.
   See FIGURE 8-9.

2. Replace the CPU Board.
   a. Position the CPU board on the system so that the four slots on the CPU board line up with the four pins on the system.
      See FIGURE 8-9. The card edge should be seated in the I/O board socket.

   b. Connect the floppy cable to the CPU board.
      See FIGURE 8-10.

      i. Make sure the connector locking device is unlocked.
         Use the tip of a flat blade screwdriver or similar tool to push both ends of the connector locking device away from the board.

      ii. Insert the floppy cable into the connector.

      iii. Lock the connector locking device by pushing in both ends of the locking device toward the CPU board.
c. Connect the flex cable to the CPU board.

d. Snap in both bail locks to lock the flex connector on the CPU board.

e. Connect the speaker cable to the CPU board.

See FIGURE 8-11.

f. Push the CPU board down so the card edge is seated in the I/O board socket.

See FIGURE 8-12. Insert a screwdriver or similar tool through the openings at the top of the CPU board and the chassis. Use the tool as a lever to push the CPU board down into the socket on the I/O board.

g. Replace and tighten the two screws on the CPU board.

See FIGURE 8-12.
h. Connect the DC/DC converter connector to the CPU board.

i. Tuck the pull tab behind the memory card.

3. Connect the floppy cable to the floppy drive.
a. Unlock the connector locking device.
See FIGURE 8-14. Use the tip of a flat blade screwdriver or similar tool to push both ends of the locking device away from the drive.

![FIGURE 8-14 Unlocking the Floppy Connector](image)

b. Insert the floppy cable into the connector.
See FIGURE 8-15.

c. Push down both sides of the connector locking device to secure the floppy cable in the floppy connector.

![FIGURE 8-15 Connecting the Floppy Cable to the Floppy Drive](image)

4. Replace the video board.
a. Position the new video board on the system.
   See FIGURE 8-7. The connector of the video board should stick out through the slot on the system.

b. Insert and tighten the three mounting screws.

c. Connect the flex cable to the video board.
   See FIGURE 8-7.

5. Replace the speaker
   Gently press the speaker tabs and insert the speaker into its cavity.
   See FIGURE 8-17.
6. Close the system and power it on.

---

**Flex Cable**

**Removing the Flex Cable**

1. **Remove the hard disk drive.**  
   See Section “Removing the Hard Disk Drive” on page 9-92.

2. **Disconnect the flex cable from the video board.**

3. **Snap open the bail locks at both ends of the flex connector.**  
   See FIGURE 8-19.

4. **Disconnect the flex cable from the CPU board.**  
   See FIGURE 8-19.
5. Remove the flex cable from the system.

Replacing the Flex Cable

1. Connect the replacement flex cable to the CPU board.
   
   See FIGURE 8-19.

2. Snap in both bail locks to secure the flex connector to the CPU board.

3. Connect the flex cable to the video board.
   
   See FIGURE 8-18.

4. Replace the disk drive.
   
   See Section “Replacing the Hard Disk Drive” on page 9-94.

5. Close the system and power it on.
IR Cable

Removing the IR Cable

1. Remove the hard disk drive.
   See Section “Removing the Hard Disk Drive” on page 9-92.

2. Disconnect the SCSI cable from the I/O board.

3. Disconnect the IR cable from the IR board.
   See FIGURE 8-21.

FIGURE 8-20 Connecting/Disconnecting the SCSI Cable—the I/O board
4. **Remove the two screws from the IR board.**
   Use a Phillips screwdriver.

5. **Remove the IR board.**
   Place it on an antistatic surface.

6. **Disconnect the IR cable from the I/O board.**
7. Remove the IR cable.

Replacing the IR Cable

1. Connect the replacement IR cable to the I/O board.

   See FIGURE 8-23.

2. Replace the IR board in the system and connect the IR cable to the IR board.

   See FIGURE 8-21.

3. Insert and tighten the two Phillips screws on the IR board.

   See FIGURE 8-22.

4. Connect the SCSI cable to the I/O board.

   See FIGURE 8-20.

5. Replace the hard disk drive.

   See Section “Replacing the Hard Disk Drive” on page 9-94.

6. Close the system and power it on.
Storage Devices

This chapter describes how to remove and replace the storage device units:
- “Floppy Drive” on page 87
- “Hard Disk Drive” on page 92

Refer to the following before you remove any part:
- “Safety Requirements” on page 33
- “Powering Off the System” on page 37
- “Opening the Rear of the System” on page 43
- “Attaching the Wrist Strap” on page 47
- “Opening the Front of the System” on page 48
- “Removing the Bottom Front Cover” on page 51

Refer to the following after replacing any part:
- “Closing the System” on page 55
- “Powering On the System” on page 41

Floppy Drive

Removing the Floppy Drive

1. Place an antistatic surface on your work area.
2. Disconnect the flex cable from the video board.
   See FIGURE 9-1. Hold both ends of the connectors and wiggle them out of the sockets.
3. **Disconnect the floppy cable from the floppy drive.**

   See FIGURE 9-2. Use the tip of a flat blade screwdriver or similar tool to release the connector locking device. Pull the floppy cable out of the connector.

4. **Loosen the screw on the locking lever.**

   Use a Phillips screwdriver.
5. Gently pull the locking lever toward the drive, slide the floppy drive to the right, and pull it away from the unit.
Replacing the Floppy Drive

1. Unlock the connector locking device at both ends of the floppy drive connector. See FIGURE 9-5. Use the tip of a flat blade screwdriver or similar tool to push both ends of the locking device away from the connector.

![FIGURE 9-5 Unlocking the Floppy Connector](image1)

2. Insert the floppy cable into the floppy drive connector. See FIGURE 9-6.

![FIGURE 9-6 Connecting the Floppy Cable to the Floppy Drive](image2)

3. Push in both ends of the connector locking device to secure the floppy cable in the floppy connector.
4. Position the floppy drive so that the four mounting feet are aligned with the four slots on the system.

5. Push the four mounting feet in the slots and slide the floppy drive toward the video board until you hear the floppy locking lever click.
   See FIGURE 9-7.

6. Insert and tighten the screw on the locking lever.
7. Connect the flex cable to the video board.
   See FIGURE 9-8.

8. Close the system and power it on.

---

**Hard Disk Drive**

**Removing the Hard Disk Drive**

1. Place an antistatic surface on your work area.

2. Disconnect the SCSI cable from the drive by pulling on the pull tab.
   See FIGURE 9-9.
3. **Loosen the two screws on the drive mounting bracket.**
   See FIGURE 9-10.

4. **Slide the disk drive forward and up out of the unit.**
   Place it on an antistatic surface.

---

**Caution** – Handle the drive by its ends only. Do not press on the top of the drive.
Replacing the Hard Disk Drive

**Caution** – Handle the drive by its ends only. Do not press on the top of the drive.

1. Position the replacement drive so both screws line up with the mounting holes.  
   See FIGURE 9-11.

2. Tighten both screws to secure the drive into the unit.

3. Connect the SCSI cable to the drive.  
   See FIGURE 9-9. Align the cable to the connector carefully so that the cable is correctly inserted.

4. Close the system and power it on.
CHAPTER 10

System Boards and Component Replacement

This chapter provides information on removing and replacing the boards and the TOD/NVRAM on the CPU board:

■ “CPU Board” on page 96
■ “TOD/NVRAM” on page 100
■ “Video Board” on page 101
■ “Memory Card” on page 103
■ “IR Board” on page 105
■ “I/O Board” on page 108

Refer to the following before you remove any part:

■ “Safety Requirements” on page 33
■ “Powering Off the System” on page 37
■ “Opening the Rear of the System” on page 43
■ “Attaching the Wrist Strap” on page 47
■ “Opening the Front of the System” on page 48
■ “Removing the Bottom Rear Cover” on page 52
■ “Removing the Bottom Front Cover” on page 51

Refer to the following after replacing any part:

■ “Closing the System” on page 55
■ “Powering On the System” on page 41
CPU Board

Removing the CPU Board

1. Place an antistatic surface on your work area.

2. Loosen and remove the two Phillips screws from the CPU board.
   See FIGURE 10-1.

3. Disconnect the DC/DC converter cable from the CPU board.
   See FIGURE 10-2.

4. Disconnect the CPU board by pushing it up and away from the system unit.
   Insert a screwdriver or similar tool through the openings at the top of the CPU board
   and the top of the chassis. Use the tool as a lever to push the CPU board up. Do not
   remove the CPU board from the system yet.

5. Disconnect the floppy cable from the CPU board.
   See FIGURE 10-2. Use the tip of a flat blade screwdriver or similar tool to push both
   ends of the connector locking device away from the CPU board. Then, disconnect
   the floppy cable from the CPU board.
6. Snap open the bail lock ends from the flex connector and disconnect the connector from the CPU board.
See FIGURE 10-3.

7. Disconnect the speaker cable from the CPU board.
See FIGURE 10-4.
8. Remove the CPU board from the system.

9. Place the CPU board on an antistatic surface.

Replacing the TOD/NVRAM

Remove the TOD from your defective CPU board, and install it on the replacement CPU board.
1. Locate the TOD on the replacement CPU board.
   See FIGURE 10-6.

   ![FIGURE 10-6 Location of the TOD/NVRAM](image)

2. Hold the TOD carrier on both ends and pull it away from the board.
   See FIGURE 10-6. Gently wiggle the chip carrier as necessary.

3. Put the TOD with its carrier on an antistatic surface.
   You must send this TOD back with the defective CPU board to Sun.

4. Locate the TOD on the defective CPU board, hold the TOD carrier on both ends and lift it straight up.
   Gently wiggle the chip carrier as necessary.

5. Carefully align the pins and insert the TOD in the socket of the replacement CPU board.
   The carrier is keyed so the TOD can be installed only one way.

6. Push the TOD into the carrier until it sits tightly in the socket.

Replacing the CPU Board

1. Position the replacement CPU board so that the four slots on the CPU board line up with the four pins on the system unit.
   See FIGURE 10-5.

2. Connect the floppy cable to the CPU board.
   See FIGURE 10-2.

   a. Make sure the connector locking device is unlocked.
      Use the tip of a flat blade screwdriver or similar tool to push both ends of the connector locking device away from the board.
b. Insert the floppy cable into the connector.

c. Lock the connector locking device by pushing in both ends of the locking device toward the CPU board.

3. Connect the flex cable to the CPU board.
   See FIGURE 10-3.

4. Snap in both bail locks to lock the flex connector on the CPU board.
   See FIGURE 10-3.

5. Connect the speaker cable to the CPU board.
   See FIGURE 10-4.

6. Push the CPU board down so the connector is seated in the I/O board socket.
   See FIGURE 10-1. Insert a screwdriver or similar tool through the openings at the top of the CPU board and the chassis. Use the tool as a lever to push the board down into the socket on the I/O board.

7. Tighten the two screws on the CPU board.
   See FIGURE 10-1. If the CPU board is not installed correctly, the screw holes will not line up with the chassis.

8. Connect the DC/DC converter cable to the CPU board.
   See FIGURE 10-2.

9. Remove any memory cards from the defective CPU and install them in the replacement CPU.
   a. Remove the memory card(s) from the defective CPU.
      See Section “Removing the Memory Card” on page 10-103.
   b. Replace the memory card(s) in the replacement CPU.
      Section “Replacing the Memory Card” on page 10-104.

10. Close the system and power it on.

---

TOD/NVRAM

You need to remove the CPU board from the system and place it on an antistatic mat before removing the TOD from the CPU board.
Removing the TOD/NVRAM

1. **Remove the CPU Board**
   See Section “Removing the CPU Board” on page 10-96.

2. **Locate the TOD on the CPU board.**
   See FIGURE 10-6.

3. **Hold the TOD carrier on both ends and lift it straight up.**
   Gently wiggle the chip carrier as necessary.

4. **Place it on an antistatic surface.**

Replacing the TOD/NVRAM

1. **Position the replacement TOD on the CPU board.**
   See FIGURE 10-6.

2. **Carefully align the pins and insert the TOD into the socket.**
   The carrier is keyed so the TOD can be installed only one way.

3. **Push the TOD into the carrier until it sits tightly in the socket.**

4. **Replace the CPU Board**
   See Section “Replacing the CPU Board” on page 10-99.

5. **Close the system and power it on.**

---

Video Board

Removing the Video Board

1. **Place an antistatic surface on your work area.**

2. **Gently press the speaker tabs and pull the speaker out of its cavity.**
   See FIGURE 10-7. Leave the speaker cable connected to the CPU board.
3. Disconnect the flex cable from the video board.
   See FIGURE 10-8.

4. Remove the three screws from the video board.

5. Pull the video board down slightly and slide it out of the three pins.
Replacing the Video Board

1. Position the new video board on the three pins.
   See FIGURE 10-9. The video board connector should stick out of the slot on the system unit.

2. Insert and tighten the three screws.

3. Connect the flex cable to the video board.
   See FIGURE 10-8.

4. Gently press the speaker tabs and insert the speaker back into its cavity.
   See FIGURE 10-7.

5. Close the system and power it on.

Memory Card

Removing the Memory Card

1. Pull the pull tab out from behind the defective memory card.
2. Gently pull up the pull tab to remove the memory card.

![FIGURE 10-10 Removing the Memory Card](image)

**Replacing the Memory Card**

1. Push the replacement memory card all the way into the slot.
   
   See FIGURE 10-11. The Sun logo on the memory card should be facing out. The memory card is keyed so it fits one way only.
FIGURE 10-11 Replacing a Memory Card

2. Tuck the pull tab behind the memory card.
   The pull tab interferes with the rear cover installation if not tucked in.

3. Close the system and power it on.

IR Board

Removing the IR Board

1. Remove the hard disk drive.
   See Section “Removing the Hard Disk Drive” on page 9-92.

2. Disconnect the SCSI cable from the I/O board.
3. Disconnect the IR cable from the IR board. See FIGURE 10-13.

4. Remove the two screws from the IR board. Use a Phillips screwdriver.
5. **Remove the IR board.**
   Place it on an antistatic surface.

**Replacing the IR Board**

1. **Position the replacement IR board in the unit.**
   See FIGURE 10-14.

2. **Install both screws to secure the IR board to the unit.**

3. **Connect the IR cable to the IR board.**
   See FIGURE 10-13.

4. **Connect the SCSI cable to the I/O board.**
   See FIGURE 10-12.

5. **Replace the hard disk drive.**
   See Section “Replacing the Hard Disk Drive” on page 9-94.

6. **Close the system and power it on.**
I/O Board

Removing the I/O Board

1. Remove the hard disk drive.
   See Section “Removing the Hard Disk Drive” on page 9-92.

2. Disconnect the SCSI cable from the I/O board.

3. Remove the CPU board.
   Section “Removing the CPU Board” on page 10-96.

4. Disconnect the DC harness from the I/O board.
   See FIGURE 10-16.

5. Disconnect the IR cable from the I/O board.

6. Remove all screws from the back panel.
   See FIGURE 10-16.
7. Remove the screw from the I/O board.
   See FIGURE 10-17.

8. Grasp the I/O board at both ends and gently lift it up and out of the unit.
   See FIGURE 10-18. Place it on an antistatic surface.
Replacing the I/O Board

1. Replace the I/O board into the unit.
   See FIGURE 10-18.

2. Insert and tighten all screws on the back panel.
   See FIGURE 10-16.

3. Tighten the screw on the I/O board.
   See FIGURE 10-17.

4. Connect the DC power harness to the I/O board.
   See FIGURE 10-16.

5. Connect the IR cable to the I/O board.
   See FIGURE 10-16.

6. Connect the SCSI cable to the I/O board.
   See FIGURE 10-12.

7. Replace the CPU board.
   See Section “Replacing the CPU Board” on page 10-99.

8. Replace the hard disk drive.
   See Section “Replacing the Hard Disk Drive” on page 9-94.
Replacement Parts

This chapter provides the replacement parts list and figures to illustrate the SPARCstation Voyager workstation.

List of Replacement Parts

This section lists part numbers and describes replacement parts for the system. Although these part numbers are correct as of the publication date of this document, they are subject to change. Consult your authorized Sun sales representative or service provider to confirm part numbers before you order new or replacement parts.

Selected On-Board Diagnostics

This appendix describes the selected on-board diagnostics. These tests will help you in troubleshooting the system.

**Caution** – To run diagnostics at the `ok` prompt, you must shut down the system in an orderly manner. When the operating system or any other stand-alone program is booted, do not use the `Stop (L1) - A` keys to halt the system. Abruptly aborting the operating system may cause damage to data files.

- “test Device Alias, test Device Pathname” on page 143
- “test-all” on page 144
- “watch-clock” on page 144
- “watch-net, watch-tpe” on page 145
- “probe-scsi” on page 146
- “test-memory” on page 146
- “power-off” on page 147

---

**test Device Alias, test Device Pathname**

The `test` command, combined with a device alias or device pathname, executes that device selftest program. If a device has no selftest program, this message is displayed: *No selftest method for device name.*

To run the selftest program for a device, type the `test` command followed by the `device alias` or `device pathname`. 
For example:

```
  ok test floppy
Testing floppy disk system. A formatted disk should be in the drive.
Test succeeded.
```

**test-all**

The `test-all` command tests all devices in the system which have a selftest program. Disks, tapes, and CD-ROMs are not tested by `test-all`. Tests are executed in order using the device tree (viewed with the `show-devs` command) as reference. The `diag-switch?` parameter must be set true to run this test.

```
  ok test-all
```

**watch-clock**

Displays seconds from the NVRAM/TOD (Non-Volatile RAM/Time of Day). The counter counts from 0 to 59 repeatedly. For example:

```
  ok watch-clock
Watching the ‘seconds’ register of the real time clock chip.
It should be ‘ticking’ once a second.
Type any key to stop
41
```

To interrupt the test, press any key on the keyboard.
watch-net, watch-tpe

These tests monitor broadcast Ethernet packets on the Ethernet cable connected to the system. Good packets received by the system are displayed on the screen by a period (.). Errors are indicated with an X and the error description. For example:

```
ok watch-net
  Internal loopback test -- succeeded.
  External loopback test -- Auto-selecting Ethernet cable I/F
Trying TPE
Received packet on TPE
Select cable - TPE succeeded.
Looking for Ethernet packets.
.'.' is a good packet. "X" is a bad packet.
Type any key to stop.
..............................................................
..............................................................
...................Framing error CRC error X..............
```

The SPARCstation Voyager workstation has one on-board 10Base T Ethernet interface, (also called twisted-pair Ethernet or TPE).

You can also use watch-tpe to monitor the 10BaseT (TPE) connection. For example:

```
ok watch-tpe
  Internal loopback test -- succeeded.
  External loopback test -- succeeded.
Looking for Ethernet packets.
.'.' is a good packet. 'X' is a bad packet.
Type any key to stop.
..............................................................
```

..............................................................
**probe-scsi**

The `probe-scsi` test sends an inquiry command to internal and external SCSI devices connected to the SPARCstation Voyager workstation on-board SCSI interface. If a SCSI device is connected and powered up, the target address, unit number, device type, and manufacturer name should be displayed. For example:

```
ok probe-scsi
Target 3
  Unit 0 Disk SEAGATE ST1480 SUN04245828 Copyright (c) 1991 Seagate All rights reserved.
```

**test-memory**

Tests all of the system main memory if the system `diag-switch?` parameter is true. If the `diag-switch?` is set to false, it tests the memory according to the number specified in `selftest-#megs`. When the `test-memory` diagnostic is running, the number of Mbytes being tested is displayed and counted down to zero during the test.

If the `diag-switch?` parameter is false, this test uses the `selftest-#megs` parameter in NVRAM to determine how much memory to test. The default for the `selftest-#megs` parameter is 1, so only 1 Mbyte of memory is tested.

To change the amount of memory tested using the `selftest-#megs` parameter to 16 Mbytes, type this command:

```
ok setenv selftest-#megs 16
```

This sets the desired memory size to 16 Mbytes. Use any whole number as long as it does not exceed the actual size of memory (in Mbytes) installed in the system. When the `test-memory` diagnostic is running, the number of megabytes being tested is displayed and counted down to zero during the test.
**power-off**

This command turns the power off. You must have a Compact 1 or type 5 keyboard attached in order to use this command.
# Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AMLCD</strong></td>
<td>An acronym for Active Matrix Liquid Crystal Display. A specific style of flat panel display technology.</td>
</tr>
<tr>
<td><strong>ASIC</strong></td>
<td>An acronym for Application Specific Integrated Circuit. A silicon chip designed to implement functions that would otherwise require several chips or parts.</td>
</tr>
<tr>
<td><strong>boot</strong></td>
<td>To load the system software into memory and start it running.</td>
</tr>
<tr>
<td><strong>boot PROM</strong></td>
<td>In Sun workstations, contains the PROM monitor program, a command interpreter used for booting, resetting, low-level configuration, and simple test procedures.</td>
</tr>
<tr>
<td><strong>DBRI</strong></td>
<td>An acronym for Dual Basic Rate Interface. A Sun designed ASIC that implements the hardware end of an ISDN interface.</td>
</tr>
<tr>
<td><strong>default</strong></td>
<td>A preset value that is assumed to be correct unless changed by the user.</td>
</tr>
<tr>
<td><strong>Desktop Storage Module</strong></td>
<td>An external data storage that contains a disk drive or a tape drive. Abbreviated as DSM.</td>
</tr>
<tr>
<td><strong>Desktop Storage Pack</strong></td>
<td>An external data storage unit that contains a disk drive (Desktop Disk Pack), a tape drive (Desktop Backup Pack), or a CD-ROM drive (Desktop SunCD Pack), and that can be connected to a SPARCstation Voyager workstation. Abbreviated as DSP.</td>
</tr>
<tr>
<td><strong>Ethernet</strong></td>
<td>A type of network hardware that allows communication between systems connected directly together by transceiver taps, transceiver cables, and a coaxial cable. Implemented in the SPARCstation Voyager workstation using twisted-pair telecommunications wire and cable.</td>
</tr>
<tr>
<td><strong>External Storage Module</strong></td>
<td>An external unit that contains disk/tape drives and that can be connected to a SPARCstation Voyager workstation. Abbreviated as ESM.</td>
</tr>
<tr>
<td><strong>ISDN</strong></td>
<td>An acronym for Integrated Services Digital Network. A technical standard that provides for fully digital transmission and reception of data, and fully digital end-to-end connectivity of telecommunications devices across a public network.</td>
</tr>
<tr>
<td><strong>Memory Card</strong></td>
<td>A small board which usually contains several DRAMs. These cards are added to a system to increase the amount of memory available to the CPU.</td>
</tr>
<tr>
<td><strong>NVRAM</strong></td>
<td>An acronym for non-volatile random access memory. The NVRAM is used to store system variables used by the boot PROM. It also contains the system’s hostid number and Ethernet address.</td>
</tr>
<tr>
<td><strong>PCMCIA</strong></td>
<td>Personal Computer Memory Card International Association is an international organization that has defined interface standards for Personal Computer Cards. These PC Cards add memory, mass storage and I/O capabilities to mobile computing systems. You can use a Sun modem contained on a PCMCIA card on your SPARCstation Voyager workstation.</td>
</tr>
<tr>
<td><strong>point-to-point protocol (PPP)</strong></td>
<td>The successor to SLIP, PPP provides router-to-router and host-to-network connections over both synchronous and asynchronous circuits.</td>
</tr>
<tr>
<td><strong>power management</strong></td>
<td>The regulation of a computer’s power consumption.</td>
</tr>
<tr>
<td><strong>Resume</strong></td>
<td>Turning the power on after a suspend. The resume operation restores the system to the point at which it was suspended.</td>
</tr>
<tr>
<td><strong>SCSI</strong></td>
<td>Small Computer System Interface; pronounced “scuzzy.”</td>
</tr>
<tr>
<td><strong>SLAVIO</strong></td>
<td>This chip contains all of the control logic referred to as slave I/O devices. These devices are serial ports, floppy controller, EPROM, TOD chip and NVRAM.</td>
</tr>
<tr>
<td><strong>suspend</strong></td>
<td>A means of turning off the power in which the system state is saved to disk. See also resume.</td>
</tr>
<tr>
<td><strong>system</strong></td>
<td>Any computer that allows you to run programs or applications. In this book, it means the SPARCstation Voyager workstation unit together with the Sun operating system and peripheral hardware devices.</td>
</tr>
<tr>
<td><strong>system unit</strong></td>
<td>The enclosure containing the system memory, central processing unit, hard disk, floppy drive, and video board.</td>
</tr>
<tr>
<td><strong>TOD</strong></td>
<td>An acronym of Time of Day. This is a special timekeeping chip that keeps track of what day and time it is.</td>
</tr>
