Preface ...................................................................................................................................................13

1 Installation Issues ..................................................................................................................................17
   General Information .................................................................................................................................17
   New Minimum Memory Requirement .....................................................................................................17
   Changes in Upgrade Support for Solaris Releases .................................................................................17
   SPARC: Supported Memory Configuration for Newboot ........................................................................18
   Support for Products Not Part of the Solaris OS .....................................................................................18
   Before You Begin ....................................................................................................................................18
      Solaris Live Upgrade and Solaris Zones ...............................................................................................18
      Solaris Live Upgrade Restrictions .......................................................................................................19
      Upgrading a Solaris Trusted Extensions System That is Configured with Labeled Zones .................19
      Patching Minisroot on x86 Machines ....................................................................................................21
      Solaris Data Encryption Supplement on Solaris 10 Updates ...............................................................21
      Additional Procedures Required When Installing Patches for Solaris 10 5/08 Release ....................21
      x86: Systems With e1x or pcelx NICs Fail Network Configuration ....................................................21
      Default Size of /var File System Inadequate ......................................................................................22
      x86: Do Not Upgrade Hewlett-Packard (HP) Vectra XU Series Systems With BIOS Version GG.06.13 .................................................................................................................................23
      SPARC: Older Firmware Might Need Boot Flash PROM Update .........................................................23
      Additional Patches Are Needed to Run Solaris Live Upgrade ............................................................24
      Solaris Management Console 2.1 Software Is Not Compatible With Solaris Management Console 1.0, 1.0.1, or 1.0.2 Software ...............................................................................................................................24
      x86: Failure of BIOS Device Utility Prevents Installation or Upgrade From Being Completed (6362108) .................................................................................................................................26
      Cannot Create a Solaris Flash Archive When Solaris Zones Are Installed (6246943) ......................27
      x86: Sun Java Workstations 2100Z Might Panic When Booting From Solaris 10 Operating System DVD (6214356) .............................................................................................................................28
      x86: Serial Consoles of Some Sun Fire Systems Do Not Work (6208412) ......................................30
Solaris Installation GUI Program Might Fail on Systems With Existing x86 fdisk Boot Partitions (6186606) .................................................................................................................... 30

Installation Bugs ........................................................................................................................ 31

Some Asian Locales Cannot Be Used for Custom JumpStart (6681454) ..................................... 31

SPARC: Solaris 8 Migration Assistant Patch Requirements (6673751) ..................................... 31

PRODRM Has Problems Deleting prodreg Entry For Solaris Trusted Extensions (6616592) ................................................................. 32

Reboot Now Button Is Unresponsive (6270371) ...................................................................... 32

Sun Upgrade Detailed Patch Analysis Panel Not Scrollable (6597686) ..................................... 32

SPARC: $luupgrade Fails When Using a CD to Upgrade (6573154) ....................................... 33

Panic in PCIe as dev_info Node Has No Parent Data (6517798) ........................................... 33

The Linux Partition Does Not Display on the GRUB Menu After Installing the Solaris OS (6508647) ........................................................................................................................................ 34

x86: Install Hangs on Systems With 512 Mbyte of Memory (6423854) ..................................... 35

x86: Invalid /sbin/dhcpinfo Error During Installation (6332044) ....................................... 35

x86: Installation From CD Media Appears to Hang After Reboot Selection (6270371) .......... 36

x86: System Fails to Boot After Custom JumpStart Installation (6205478) ............................ 37

x86: GUI Interactive Installation From DVD Fails if boot_devce Variable Is Not Set (5065465) ........................................................................................................................................ 37

x86: USB Keyboards Might Freeze During Install on Some Dell Precision Workstations (4888849) ........................................................................................................................................ 38

Warnings Might Occur When a File System Is Created (4189127) ....................................... 38

Upgrade Issues and Bugs ............................................................................................................. 38

$lucreate and $lumake Commands Fail on Non-Global Zones (6659451) ............................. 39

SPARC: Upgrading with Solaris Live Upgrade From Solaris 8 and Solaris 9 Releases Fails (6638175) ........................................................................................................................................ 39

Incorrect Permissions on /tmp in Non-Global Zones After Solaris Live Upgrade (6619278) ........................................................................................................................................ 40

Issues With DSR Upgrade With Zones (6616788) ..................................................................... 40

Solaris Trusted Extensions Upgrade Issues (6616585) ............................................................ 41

System Cannot Communicate With ypbind After Upgrade (6488549) ................................... 41

Upgrade Fails on System With Zones That Have Been Installed But Not Booted .......... 41

Upgrading a Solaris 10 System with Non-Global Zones to the Solaris 10 5/08 Release Might Cause the Local File System Service to Fail (6428258) .............................................. 43

Device ID Discrepancies After Upgrading From Solaris 9 9/04 OS ........................................... 43

x86: Adding Driver Updates Might Cause Failure of Network Configuration (6353146) .... 44

x86: Cannot Delete the Solaris Live Upgrade Boot Environment That Contains the GRand
Unified Bootloader Menu (6341350) ................................................................. 44
Solaris Live Upgrade luupgrade Command Missing the Progress Bar (6239850) .... 45
SPARC: Upgrading From Solaris 9 Releases With Recommended Patch Cluster Partially Succeeds (6202868) ......................................................................................... 46
Obsolete Uninstallers Not Removed When You Use Solaris Live Upgrade to Upgrade From Previous Solaris Releases (6198380) ........................................................................... 46
Configuration File pam.conf Not Automatically Updated After an Upgrade (5060721) ... 48
Installer Text Display Problem When Using Solaris Live Upgrade (4736488) ............. 48
SPARC: Removal of SUNWjxcft Package Records Error During Upgrade (4525236) ...... 49
Upgrading to Solaris 10 Release Might Disable Existing Secure Shell Daemon (sshd) (4626093) ...................................................................................................................................... 49
Upgrade Fails if /export Directory Is Near Capacity (4409601) ..................................... 50
Upgrading Diskless Client Servers and Clients (4363078) ............................................ 50
Additional Installation Issues ........................................................................................ 51
smoservice add Command Does Not Install Designated ARCH=all Packages (4871256) ...................................................................................................................................... 51
StarOffice and StarSuite Software Cannot Coexist in the Same System ......................................................... 51
Additional Related Locales Might Be Installed ........................................................................ 52

2 Solaris Runtime Issues ......................................................................................... 53
Common Desktop Environment .................................................................................. 53
Remote Multilevel Login From the Login Screen Is Not Supported in Solaris Trusted Extensions (6616030) ...................................................................................................................................... 53
Trusted Stripe Disappears From the Screen After Resolution Change (6460624) ............ 54
x86: kmcconfig Command Does Not Create System Identification Configuration File for Xorg X Server (6217442) ...................................................................................................................................... 54
CDE Removable Media Auto Run Capability Removed (4634260) ............................... 55
Solaris PDASync Cannot Delete Last Entry From the Desktop (4260435) ....................... 55
File Systems ............................................................................................................... 55
x86: raidctl Fails to Create VDs on Dell SAS6i/R (6669169) ........................................... 55
x86: ata Timeouts During Boot (6586621) ....................................................................... 56
zoneadm install Fails With a ZFS Legacy Mount (6449301) ......................................... 57
ZFS and UNIX/POSIX Compliance Issues ........................................................................ 58
fdisk -E Can Sweep Disk Used by ZFS Without Warning (6412771) .......................... 58
ZFS and Third-Party Backup Product Issues ...................................................................... 58
ZFS GUI Should Check For /usr/lib/embedded_su at the Beginning of Each Wizard (6326334) ...................................................................................................................................... 59
Fails to Sync File System on Panic (6250422) ................................................................. 60
Upgrading From Some Solaris Express or Solaris 10 Releases Requires Remounting of File
Systems ........................................................................................................................................ 60
NFSv4 Access Control List Functions Might Work Incorrectly ............................................ 60
Access Problems Between Solaris NFSv4 Clients and NFSv4 Servers ......................... 61
Using mksfs Command to Create File System Might Fail on Very Large Disks (6352813) .. 61
System Crash Dump Fails on Devices Greater Than 1 TByte (6214480) ..................... 62
Using smosservice Command to Add OS Services Results in Insufficient Disk Space
Message (5073840) ................................................................................................................. 62
Hardware–Related Issues and Bugs ....................................................................................... 62
SPARC: SCSI Second Disk Fails to Attach After Solaris Live Upgrade (6684776) ............ 62
x86: Cannot Enable MPxIO (6664694) ................................................................................. 63
64-bit SPARC: DR Operations Involving Lowest CPU ID Fail (6663570) ....................... 63
SPARC: 19.55% Performance Regression for the NCP Device Driver (6660074) .......... 63
64-bit SPARC: Some DR Commands Fail (6614737) .................................................... 64
The (ZFS) ARC Allocates Memory Inside The Kernel Cage Preventing DR (6522017) .... 64
mpathadm Does Not Display Load-Balance Setting Specific to Device ....................... 65
Registration Tool Prevents Power Management on Some Framebuffers (6321362) ...... 65
SPARC: Sun Crypto Accelerator 4000 Board Versions 1.0 and 1.1 Not Supported in Solaris
10 OS ........................................................................................................................................ 65
Certain USB 2.0 Controllers Are Disabled ........................................................................ 65
Supported USB Devices and Corresponding Hub Configurations .................................. 66
x86: Limitations Exist With Certain Device Drivers in Solaris 10 OS ............................ 66
DVD-ROM/CD-ROM Drives on Headless Systems ......................................................... 66
x86: Manual Configuration Required to Specify Non-US English Keyboards ............... 67
SPARC: jfca Driver for Certain Host Bus Adapters That Are Connected to Tape Devices
Might Cause Errors (6210240) ............................................................................................ 68
Contention Exists Between Certain Devices That Share the Same Bus (6196994) ...... 69
hat_getkpfnum() DDI Function Is Obsolete (5046984) ................................................. 69
Some DVD and CD-ROM Drives Fail to Boot Solaris (4397457) ................................. 70
iPlanet Directory Server 5.1 Issues .................................................................................... 70
Installing Directory Server 5.1 ............................................................................................ 70
Migrating to the Sun Java System Directory Server 5 2005Q1 ....................................... 71
Issues While Running Debugger ....................................................................................... 72
x86: Unexpected SIGTRAP Signal Causes dbx Debugger to Hang (6546562) ............. 72
SPARC: Problems With dbx Debugger While Processing 64-bit Objects (6347707) .... 73
System Might Loop When Master CPU Is Changed (4405263) .................................... 73
Localization Issues .......................................................................................................................... 74
  Multiple Input Method Switcher Applications Appear in Trusted Java DS ............................. 74
  Wnn8 Japanese Input Method .............................................................................................................. 75
  Input Method Cannot Be Enabled With Primary Administrator Rights (6475081) .............. 75
  New ChuYin Input Method Not Supported in Upgrade to IIIMF rev.12 (6492129) .......... 75
  AltGr Does Not Work As Mode Switcher in Some Russian Locales (6487712) .............. 76
  Arabic Text Not Appearing in ar Locales ................................................................................... 76
  Solaris PDASync Does Not Support Data Exchange With the Multibyte Internationalized
    PDA Device (4263814) .............................................................................................................. 76
  Several Arabic Fonts Do Not Work in GNOME (6384024) .................................................... 76
  Unable to Switch Input Language on Session-Saved Applications (6360759) ................. 77
  Keyboard Shortcuts in Mozilla in ES Locale Are Unusual and Ambiguous (6288620) .... 77
  Migration Note to UTF-8 locales ............................................................................................ 78
  Hardware for Some Keyboards Layouts Type 6 and 7 Not Available ..................................... 80
  Sort Capability in the European UTF-8 Locales Does Not Function Correctly (4307314) .. 81

Networking Issues ............................................................................................................................... 81
  nxge Driver Panics in nxge_fflp_stat_update (6644276) .................................................... 82
  SPARC: NFS/RDMA Connection Errors (6229077) ............................................................. 82
  Login Fails on iSCSI Target With Two Portals and One Bad Portal (6476060) ................. 82
  System Domain of Interpretation Is Not Configurable (6314248) ...................................... 82
  IP Forwarding Disabled by Default in Solaris 10 OS ............................................................. 83
  Zone Not Booting When IP Address Belongs to a Failed IP Network Multipathing Group
    (6184000) .......................................................................................................................... 83
  Intermittent Errors Might Occur With the Use of DataDigests (5108515) ......................... 84
  Configuring Multiple Tunnels Between Two IP Nodes With Filtering Enabled Might Result
    in Packet Loss (4152864) ............................................................................................... 84

Security Issues ..................................................................................................................................... 84
  KDC Daemons Fail to Start (6623803) ...................................................................................... 84
  Nonpassword Logins Fail With pam_idap Enabled (6365896) ............................................. 85
  Incorrect Parameters Might Cause Panic in Sun StorEdge T3 (4319812) ......................... 85

Service Management Facility ........................................................................................................... 85
  Login Prompts Sometimes Appear Before File Systems Are Mounted (5082164) ............. 85

Smart Card ......................................................................................................................................... 86
  System Does Not Respond to Smart Card (4415094) .......................................................... 86

Solaris Commands and Standards ................................................................................................. 86

Preface

This document describes the Solaris 10 5/08 operating system. For information about the Solaris 10 3/05, Solaris 10 3/05 HW1, Solaris 10 3/05 HW2, Solaris 10 1/06, Solaris 10 6/06, Solaris 10 11/06, and Solaris 10 8/07, see the “Solaris 10 Release Notes”, Sun part number 820–1259.

The Solaris 10 5/08 Release Notes contain installation and runtime problem details. Also included are end-of-software support statements for the Solaris 10 Operating System.

Note – This Solaris release supports systems that use the SPARC and x86 families of processor architectures: UltraSPARC, SPARC64, AMD64, Pentium, and Xeon EM64T. The supported systems appear in the Solaris 10 Hardware Compatibility List at http://www.sun.com/bigadmin/hcl. This document cites any implementation differences between the platform types.

In this document the term “x86” refers to 64-bit and 32-bit systems manufactured using processors compatible with the AMD64 or Intel Xeon/Pentium product families. For supported systems, see the Solaris 10 Hardware Compatibility List.

Who Should Use This Book

These notes are for users and system administrators who install and use the Solaris 10 software.

Related Books

You might need to refer to the following documentation when you install Solaris software:

- Java Desktop System Release 3 Solaris 10 Collection
- Solaris 10 Start Here card
- Solaris 10 5/08 Installation Guide: Basic Installations
For information on current CERT advisories, see the official CERT web site at http://www.cert.org.

For some hardware configurations, you might need supplemental hardware-specific instructions for installing the Solaris software. If your system requires hardware-specific actions at certain points, the manufacturer of your hardware has provided supplemental Solaris installation documentation. Refer to those materials, such as Solaris Sun Hardware Platform Guide, for hardware-specific installation instructions.

Third-Party Web Site References

Third-party URLs are referenced in this document and provide additional, related information.

**Note** – Sun is not responsible for the availability of third-party web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other material on or available from such sites or resources. Sun will not be responsible or liable for any damage or loss caused or alleged to be caused by or in connection with use of or reliance on any such content, goods, or services that are available on or through any such sites or resources.

Documentation, Support, and Training

See the following web sites for additional resources:

- [Documentation](http://www.oracle.com/technetwork/indexes/documentation/index.html)
- [Support](http://www.oracle.com/us/support/systems/index.html)
- [Training](http://www.oracle.com/global/us/education/sun_select_country.html) – Choose the country for which you want Training information for former Sun products.
Oracle Software Resources

Oracle Technology Network (http://www.oracle.com/technetwork/index.html) offers a range of resources related to Oracle software:

- Discuss technical problems and solutions on the Discussion Forums (http://forums.oracle.com).

Typographic Conventions

The following table describes the typographic conventions that are used in this book.

<table>
<thead>
<tr>

Chapter 1

Installation Issues

This chapter describes problems that relate to the installation of the Solaris 10 Operating System.

Note – Some of the issues and bugs in this chapter have been fixed in subsequent Solaris 10 releases. If you have upgraded your Solaris software, certain issues and bugs in this chapter might no longer apply. To see which bugs and issues no longer apply to your specific Solaris 10 software, refer to Appendix A, “Table of Integrated Bug Fixes in the Solaris 10 Operating System.”

General Information

This section provides general information such as behavior changes in Solaris 10 OS.

New Minimum Memory Requirement

Starting with the Solaris 10 8/07 release, all x86 based systems must now have at least 384 Mbytes of RAM to run the Solaris software.

Changes in Upgrade Support for Solaris Releases

Starting with the Solaris 10 8/07 release, for SPARC systems, you can upgrade the Solaris OS only from the following releases:

- Solaris 8 OS
- Solaris 9 OS
- Solaris 10 OS

For x86 systems, you can upgrade the Solaris OS only from the following releases:
Solaris 9 OS
Solaris 10 OS

To upgrade releases previous to the Solaris 8 software to the Solaris 10 5/08 software, upgrade to any of the releases in the preceding list first. Then upgrade to the Solaris 10 8/07 release.

**SPARC: Supported Memory Configuration for Newboot**

Solaris releases that support the SPARC Newboot feature might require SPARC systems with at least 512 Mbytes of memory.

**Support for Products Not Part of the Solaris OS**

Although the Solaris 10 software has been tested for compatibility with previous releases, some third-party applications might not be fully ABI compliant. Contact the supplier of these applications directly for information about compatibility.

Your system might run both a Solaris OS and other products that are not part of the Solaris software. These products might be supplied by either Sun or another company. If you upgrade this system to the Solaris 10 release, make sure that these other products are also supported on the Solaris 10 OS. Depending on the status of each of these products, you can perform one of the following options:

- Verify that the existing version of the product is supported on the Solaris 10 software.
- Install a new version of the product that is supported on the Solaris 10 release. You might need to remove the previous version of the product prior to upgrading to the Solaris software. See the product documentation for more details.
- Remove the product prior to upgrading to the Solaris 10 software.

**Before You Begin**

This section contains critical installation issues that you need to be aware of before installing or upgrading to Solaris 10 OS. These issues might have an impact that would prevent installation or upgrades from completing successfully. If bugs in this section apply to your system, you might need to perform the recommended workarounds before you install or upgrade.

**Solaris Live Upgrade and Solaris Zones**

Starting with the Solaris 10 8/07 release, Using Solaris Live Upgrade with Solaris zones is supported. For more information about this, search for InfoDoc 72099 on the SunSolve web site.
Solaris Live Upgrade Restrictions

The Solaris 10 5/08 release has the following Solaris Live Upgrade restrictions:

■ Solaris Live Upgrade from the Solaris 8 release to the Solaris 10 5/08 release is not supported. Instead, use the standard upgrade procedure or perform a Solaris Live Upgrade from the Solaris 8 OS to the Solaris 9 OS or to the Solaris 10 OS. Then you can perform a Solaris Live Upgrade from the Solaris 9 release or the Solaris 10 release to the 10 5/08.

■ To upgrade your current Solaris 9 OS to the Solaris 10 5/08 release using Solaris Live Upgrade, apply the following patches:
  ■ For SPARC systems – 137477-01 or later
  ■ For x86 systems – 137478-01 or later

■ To upgrade your current Solaris 10 OS to the 10 5/08 release by using Solaris Live Upgrade, apply the following patches:
  ■ For SPARC systems – 137321-01 or later
  ■ For x86 systems – 137322-01 or later

These patches include the new p7zip functionality. Unzip the compressed installation images by using this new p7zip utility.

Note – The ’minimum required patch information for Solaris Live Upgrade in Infodoc 72099 is now in Infodoc 206844.

Upgrading a Solaris Trusted Extensions System That is Configured with Labeled Zones

Solaris systems that are configured with Solaris Trusted Extensions use non-global zones. Upgrading these systems is the same as upgrading a Solaris system that uses zones, and has the same issues.

■ ZFS Zones – Solaris systems with ZFS zones cannot currently be upgraded. For Solaris Trusted Extensions systems with ZFS zones, the alternative is to recreate the zones. To recreate the zones, perform these steps:
  1. First, back up all the data using the \texttt{tar -T} command.
  2. Then delete the zones.
  3. Upgrade the system and reconfigure all the zones.
  4. After all the zones are configured, restore all the data.

■ NFSv4 domain – After upgrade, when you bring up each labeled zone, you will be prompted for the NFSv4 domain. To avoid this prompt, before upgrade add the correct \texttt{NFSMAPID\_DOMAIN} value in the \texttt{/etc/default/nfs} file in each labeled zone. For more information, see CR 5110062.
Live Upgrade – Two bugs affect Live Upgrade of Solaris systems with zones:

- “lucreate and lumake Commands Fail on Non-Global Zones (6659451)” on page 39
- “Incorrect Permissions on /tmp in Non-Global Zones After Solaris Live Upgrade (6619278)” on page 40

These bugs will also affect the Live Upgrade of systems that are configured with Solaris Trusted Extensions. The workarounds are also the same.

Name Service – If your system was configured at install time to use a nameservice that is different from the name service being used during upgrade, then the global zone may use the correct name service after boot.

For example, if you specified NIS as the name service to use during system install, but the system was later converted to be an LDAP client, the luactivate boot can revert to using NIS as the name service for the global zone. This is due to CR 6569407.

The workaround is to adjust the name_service.xml symbolic link in the /var/svc/profile directory to point to the correct xml file corresponding to the name service currently in use. For example, if NIS was specified as the name service during install, then name_service.xml will be a symbolic link to ns_nis.xml. If the system was subsequently converted to being an LDAP client, and LDAP was the name service in use during Live Upgrade, then run the following command:

```
# ln -fs ns_ldap.xml name_service.xml
```

This should be done before starting Live Upgrade or before running the luactivate command. However, if you did not run this command before lucreate, then perform the following steps after running the luactivate command:

1. lumount the new boot environment:

   ```
   # lumount <BE_name>
   ```

2. Change to the /var/svc/profile directory of the boot environment:

   ```
   # cd ./.alt.<BE_name>/var/svc/profile
   ```

3. Link the name_service.xml link as appropriate. For example:

   ```
   # ln -fs ns_ldap.xml name_service.xml
   ```

4. lumount the boot environment:

   ```
   # luumount <BE_name>
   ```

Note – If the system is booted without performing the steps mentioned above, you will need to manually start the appropriate name service-related SMF client services.
Patching Miniroot on x86 Machines

The procedures for using patchadd with the -C destination specifier to patch a miniroot on an x86 machine have changed. You must now unpack the miniroot, apply patches, then repack the miniroot.

See the following for the detailed steps:

- Chapter 5, "Installing From the Network With DVD Media (Tasks)," in Solaris 10 5/08 Installation Guide: Network-Based Installations
- Chapter 6, "Installing From the Network With CD Media (Tasks)," in Solaris 10 5/08 Installation Guide: Network-Based Installations

Solaris Data Encryption Supplement on Solaris 10 Updates

Starting with the Solaris 10 8/07 release, the Solaris Data Encryption Supplement packages are included by default with the Solaris 10 OS software. You no longer need to install and download these packages.

Additional Procedures Required When Installing Patches for Solaris 10 5/08 Release

The following patches are applied to resolve problems that were reported in CR 6277164 and CR 6214222:

- Patch ID 119366-05 for SPARC based systems
- Patch ID 119367-05 for x86 based systems

The sections that follow provide further steps that you must perform to completely resolve the reported problems.

x86: Systems With elx or pcelx NICs Fail Network Configuration

Systems with an elx or a pcelx network interface card (NIC) fail to install. During the configuration of the NIC, the following error message might be displayed:

WARNING: elx: transmit or jabber underrun: d0<UNDER, INTR, CPLT>

See the elx(7D) or pcelx(7D) man page for more information.
**Workaround:** Install and run on systems that do not have elx or pcelx NICs.

**Default Size of /var File System Inadequate**

The default size of the /var file system might be insufficient if the /var file system is located on a separate slice.

You must manually specify a larger slice size for the /var file system.

**Note** – If the /var file system is not on a separate slice or partition, this problem does not occur.

**Workaround:** Choose one of the following workarounds.

- If you are using the Solaris installation program GUI, follow these steps.
  1. Begin the installation.
  2. From Select Type of Install, select Custom Install.
     The Solaris installation program displays several screens that enable you to customize the software localizations, products, and disk layout that you want to install.
     The disk layout screen is displayed.
  4. Type /var in the File System column for a specific slice, then click Apply.
     The installation program suggests a default size for the /var file system.
  5. Edit the Size column entry for the /var file system to twice the disk space size.
     For example, if the installation program assigns 40 Mbytes of space, change the Size value to 80.
  6. Complete the installation.

- If you are using the Solaris installation program's text installer, follow these steps.
  1. Begin the installation.
  2. From Select Type of Install, select Custom Install.
     The Solaris installation program displays several screens that enable you to customize the software localizations, products, and disk layout that you want to install.
     The disk layout screen is displayed.
  4. Type /var in the File System column for a specific slice.
     The installation program suggests a default size for the /var file system.
  5. Press F4_Customize to customize the size of the /var file system.
6. Edit the Size column entry for the /var file system to twice the disk space size.

For example, if the installation program assigns 40 Mbytes of space, change the Size value to 80.

7. Complete the installation.

- If you are using the custom JumpStart program, use the filesys profile keyword to set the size of the /var file system. The following example sets the size of the /var file system on slice 5 to 256 Mbytes.

```
filesys c0t0d0s5 256 /var
```

### x86: Do Not Upgrade Hewlett-Packard (HP) Vectra XU Series Systems With BIOS Version GG.06.13

The Solaris 10 software includes a feature that enables you to install large partitions. The system BIOS must support logical block addressing (LBA). BIOS Version GG.06.13 does not support LBA access. The Solaris boot programs cannot manage this conflict. This issue can also affect other HP Vectra systems.

If you perform this upgrade, your HP system can no longer boot. Only a blank black screen with a flashing underscore cursor is displayed.

**Workaround:** Do not upgrade HP Vectra XU Series systems with the latest BIOS Version GG.06.13 to the Solaris 10 release. This version no longer supports these systems.

You can still boot your system by using the boot diskette or boot CD because the boot paths do not use the hard disk code. Then select the hard disk as your bootable device instead of the network or CD-ROM drive.

### SPARC: Older Firmware Might Need Boot Flash PROM Update

On SPARC based systems, Solaris 10 OS runs in 64–bit mode only. Some Sun4U systems might need to be updated to a higher level of OpenBoot firmware in the flash PROM to run the OS in 64-bit mode. The following systems might require a flash PROM update:

- Ultra 2
- Ultra 450 and Sun Enterprise 450
- Sun Enterprise 3000, 4000, 5000, and 6000 systems

The following table lists the UltraSPARC systems and the minimum firmware versions that are required to run the 64–bit Solaris 10 OS. *System type* is the equivalent of the output of the `uname -i` command. You can determine which firmware version you are running by using the `prtconf -V` command.
TABLE 1–1  Minimum Firmware Versions Required to Run 64–Bit Solaris Software on UltraSPARC Systems

<table>
<thead>
<tr>
<th>System Type From <code>uname -i</code></th>
<th>Minimum Firmware Version From <code>prtconf -V</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>SUNW,Ultra-2</td>
<td>3.11.2</td>
</tr>
<tr>
<td>SUNW,Ultra-4</td>
<td>3.7.107</td>
</tr>
<tr>
<td>SUNW,Ultra-Enterprise</td>
<td>3.2.16</td>
</tr>
</tbody>
</table>

**Note** – If a system is not listed in the previous table, the system does not need a flash PROM update.

**Additional Patches Are Needed to Run Solaris Live Upgrade**

For Solaris Live Upgrade to operate correctly, a limited set of patch revisions must be installed for a given OS version. Make sure you have the most recently updated patch list by consulting [http://sunsolve.sun.com](http://sunsolve.sun.com). For additional information, search for InfoDoc 206844 on the SunSolve web site.

**Solaris Management Console 2.1 Software Is Not Compatible With Solaris Management Console 1.0, 1.0.1, or 1.0.2 Software**

Solaris Management Console 2.1 software is not compatible with Solaris Management Console 1.0, 1.0.1, or 1.0.2 software. If you are upgrading to the Solaris 10 release, and you have Solaris Management Console 1.0, 1.0.1, or 1.0.2 software installed, you must first uninstall the Solaris Management Console software before you upgrade. Solaris Management Console software might exist on your system if you installed the SEAS 2.0 overbox, the SEAS 3.0 overbox, or the Solaris 8 Admin Pack.

**Workaround:** Choose one of the following workarounds:

- Before you upgrade, use the `/usr/bin/prodreg` command to perform a full uninstall of Solaris Management Console software.
If you did not uninstall Solaris Management Console 1.0, 1.0.1, or 1.0.2 software before you upgraded to the Solaris 10 release, you must first remove all Solaris Management Console 1.0, 1.0.1, or 1.0.2 packages. Use the `pkgrm` command for package removal instead of the `prodreg` command. Carefully follow the order of package removal. Complete the following steps:

1. Become superuser.
2. Type the following command:
   
   ```
   # pkginfo | grep "Solaris Management Console"
   ```
   
   If the description does not start with "Solaris Management Console 2.1," the package names in the output identify a Solaris Management Console 1.0 package.
3. Use the `pkgrm` command to remove all instances of Solaris Management Console 1.0 packages in the following order:

   ```
   Note – Do not remove any package that has "Solaris Management Console 2.1" in its description. For example, SUNWmc.2 might indicate Solaris Management Console 2.1 software.
   ```
   
   If the `pkginfo` output displays multiple versions of Solaris Management Console 1.0 packages, use the `pkgrm` command to remove both packages. Remove the original package. Then, remove the package that has been appended with a number. For example, if the SUNWmcman and SUNWmcman.2 packages appear in the `pkginfo` output, first remove the SUNWmcman package and then remove the SUNWmcman.2 package. Do not use the `prodreg` command.

   ```
   # pkgrm SUNWmcman
   # pkgrm SUNWmcapp
   # pkgrm SUNWmcsvr
   # pkgrm SUNWmsrv
   # pkgrm SUNWmc
   # pkgrm SUNWmcc
   # pkgrm SUNWmcsws
   ```

4. In a terminal window, type the following command:

   ```
   # rm -rf /var/sadm/pkg/SUNWmcapp
   ```

The Solaris Management Console 2.1 software should now function properly. For future maintenance, or if the Solaris Management Console 2.1 software does not function properly, remove the Solaris Management Console 2.1 software. Reinstall the software by completing the following steps:

1. Use the `pkgrm` command to remove all Solaris Management Console 2.1 packages and dependent packages in the following order:
Note – If your installation has multiple instances of Solaris Management Console 2.1 packages, such as SUNWmc and SUNWmc.2, first remove SUNWmc, and then SUNWmc.2. Do not use the prodreg command.

# pkgrm SUNWpmgr
# pkgrm SUNWrmui
# pkgrm SUNWlvmg
# pkgrm SUNWlvma
# pkgrm SUNWlvmr
# pkgrm SUNWdclnt
# pkgrm SUNWmg
# pkgrm SUNWmgapp
# pkgrm SUNWmcdev
# pkgrm SUNWmcex
# pkgrm SUNWwbmc
# pkgrm SUNWmc
# pkgrm SUNWmcc
# pkgrm SUNWmccom

2. Insert the Solaris 10 Software - 4 CD into your CD-ROM drive. Type the following in a terminal window:

# cd /cdrom/cdrom0/Solaris_10/Product
# pkgadd -d . SUNWmc SUNWmcc SUNWmc SUNWwbmc SUNWmcex SUNWmcdev \ SUNWmgapp SUNWmg SUNWdclnt SUNWlvmr SUNWlvma SUNWlvmg SUNWpmgr \ SUNWrmui

All previous Solaris Management Console versions are removed. The Solaris Management Console 2.1 software is now functional.

x86: Failure of BIOS Device Utility Prevents Installation or Upgrade From Being Completed (6362108)

On certain occasions, the utility for BIOS devices (/sbin/biosdev) might fail and prevent a successful installation or upgrade. The failure can occur under either of the following circumstances:

- Patch ID 117435-02 was applied, but the system was not rebooted.
- The system contains two or more identical disks that have identical fdisk partitions.

The following error message is displayed:

biosdev: Could not match any!!

Workaround: Make sure that you reboot the system after applying Patch ID 117435-02. Ensure that identical disks to be used in the installation or upgrade are configured with different fdisk-partition layouts.
The following example is based on a system that has two disks with identical fdisk-partition layouts. To change the layouts, perform the following steps.

1. Become superuser.
2. Start the disk maintenance utility.
   
   # format
   
   A list of available disks in the system is displayed.
3. To select the disk whose fdisk partition you want to change, type the disk's number.
4. From the list of Format options, select fdisk.
   
   The disk's partition information and a list of fdisk options are displayed.
5. To change the disk's layout, choose one of the following:
   
   ■ To specify a different active partition, press 2.
   ■ To add another disk partition, press 1.
   ■ To delete an unused partition, press 3.
6. To save your changes and exit the fdisk menu, press 5.
7. To exit the disk maintenance utility, select Quit from the Format options.
8. Reboot the system.
9. After the system reboots, verify that the error message no longer appears. As superuser, type the following command:
   
   # /sbin/biosdev
   
   If the error message is still generated, repeat the procedure but select a different option in Step 5.
10. If the system contains other identical disks with identical fdisk-partition layouts, repeat Steps 1-9 on these disks. Otherwise, you can proceed with your Solaris installation or upgrade.

**Cannot Create a Solaris Flash Archive When Solaris Zones Are Installed (6246943)**

Starting with the current Solaris release, a Solaris Flash archive cannot be properly created when a non-global zone is installed. The Solaris Flash feature is not currently compatible with the Solaris containers (zones) feature.

Do not use the `flar create` command to create a Solaris Flash archive in these instances:

■ In any non-global zone
■ In the global zone if there are any non-global zones installed
If you create a Solaris Flash archive in such an instance, the resulting archive might not install properly when the archive is deployed.

**Workaround:** None.

---

**x86: Sun Java Workstations 2100Z Might Panic When Booting From Solaris 10 Operating System DVD (6214356)**

The DVD combo-drive firmware in a Sun Java Workstation 2100Z might cause a system panic. The panic occurs when you boot the workstation from the Solaris 10 Operating System DVD. After the kernel banner is displayed, the following message is very quickly flashed:

```plaintext
panic[cpu0]/thread=fec1be20: mod_hold_stub:
Couldn't load stub module sched/TS_DTBL
```

Then the system automatically resets.

**Workaround:** Choose one of the following options:

**Workaround 1:** Modify some BIOS configuration settings. This temporary workaround enables a Solaris 10 installation to be completed. However, this method might cause poor read-DVD performance. Follow these steps:

1. During system boot, press F2 at the prompt to enter the setup.

   The screen displays attachment-type options similar to the following example:

   ```plaintext
   Primary Master [ ]
   Primary Slave [ ]
   Secondary Master [CD-ROM]
   Secondary Slave [ ]
   ```

   2. Choose the DVD drive's attachment type by selecting the attachment type for CD-ROM.
Note – The screen might display more than one attachment type for CD-ROM, for example, if your system has multiple optical drives. In such cases, you might need to open the system case to determine the DVD drive’s point of attachment. Make sure that you select the correct attachment type that applies to the DVD drive.

3. After selecting the correct CD-ROM attachment type, press Enter. The next screen appears with Type: [Auto] automatically selected.
4. Press the spacebar twice to change the selection to Type: [CD-ROM].
5. Use the arrow keys to select Transfer Mode.
6. Press Enter to display a list of other Transfer Mode options.
7. Use the arrow keys to select Standard, then press Enter to accept your selection.
8. Press F10 to save the configuration changes and exit BIOS setup.

The system restarts.

Workaround 2: Update the DVD combo drive’s firmware to v1.12. This option requires your DVD combo drive to be attached to a system that is running Microsoft Windows. Follow these steps.

1. Remove your DVD combo drive from the Sun Java Workstation 2100z. See the workstation’s user’s guide for steps to remove the drive properly.
2. Connect the drive to a system that is running Microsoft Windows. Make sure to change the drive’s master and slave jumper settings, if needed.
4. Search for your DVD drive’s firmware by using the following information:
   ■ Product: Combo drives
   ■ Model: COM5232/AAH
   ■ Categories: Firmware
5. Download and install the firmware version R1.12.
6. Reinstall the drive on the workstation. If needed, restore the original master and slave jumper settings.

Note – Newer versions of the firmware might already be available at the site. Sun’s tests confirm that the v1.12 release resolves the panic issue. Sun cannot confirm whether newer firmware revisions after v1.12 similarly resolve the problem.
x86: Serial Consoles of Some Sun Fire Systems Do Not Work (6208412)

The serial console (ttya) on the following Sun Fire systems does not work by default:

- Sun Fire V20z
- Sun Fire V40z
- Sun Fire V60x
- Sun Fire V65x

To use the serial console, you must manually configure the system’s BIOS.

**Workaround:** This workaround requires your system to have a Sun keyboard and a display monitor. Follow these steps:

1. Boot the machine.
2. During system boot, press F2 at the prompt to access the Phoenix BIOS.
3. Under Peripherals, change the comm port from disabled to enabled.
4. Save the configuration and boot the system.
5. Use the `eeprom` command to change input-device and output-device to ttya.

**Note** – Pressing the Stop and N keys at system boot to reset the low-level firmware to default settings does not work on these systems.

Solaris Installation GUI Program Might Fail on Systems With Existing x86 fdisk Boot Partitions (6186606)

The Solaris installation GUI program might fail on a system with an existing x86 boot partition. The failure occurs if the existing x86 boot partition was created with the Solaris text-based installer. The following error message is displayed.

```
Default layout will not work on this system.
Error:
Error: ERROR: Could not create explicit fdisk partition on c0t0d0, requested cylinders 14581 - 14597 in use by fdisk partition 1
Error:
Error: ERROR: System installation failed
Pfinstall failed. Exit status java.lang.UNIXProcess@a89ce3 2
artition on c0t0d0, requested cylinders 14581 - 14597 in use by fdisk
partition 1   ERROR: System installation failed
```

**Workaround:** Choose one of the following workarounds.

**Workaround 1:** When the installation program prompts you to select an installation type, select 3 Solaris Interactive Text (Desktop Session).

**Workaround 2:** If you use the Solaris installation GUI program, follow these steps.
1. Begin the installation.
2. At the prompt to select an installation type, select Custom Install.
   The custom installation panels prompt you for information about the locales, software, and disks that you want to install.
3. Answer the questions on the screens as appropriate for your system.
4. On the Fdisk Selection screen, check the disk that contains the x86boot partition.
5. Remove the x86boot partition by changing it to UNUSED in the pull-down menu.
6. Add the x86boot partition back by changing UNUSED back to x86boot.
7. Continue the installation.

### Installation Bugs

The following bugs might occur during or after the installation of Solaris 10 OS.

#### Some Asian Locales Cannot Be Used for Custom JumpStart (6681454)

Some Asian locales like, th_TH.ISO8859-11, th_TH.TIS620, ko_KR.EUC, ko_KR.UTF-8, zh_TW.UTF-8, zh_TW.EUC, zh_CN.UTF-8, zh_CN.GBK, and zh_CN.UTF-8 cannot be used while installing with Custom JumpStart. While setting locales in the `sysidcfg` file using the `system_locale` keyword, the following error message is displayed:

```
xz.xx.xxxxx is not a valid system locale
```

The JumpStart installation is stopped and Interactive installation starts.

**Workaround:** Use shorter locale names such as th_TH, ko, UTF-8, zh_TW, zh, zh.GBK, and zh.UTF-8, instead of longer locale names,

#### SPARC: Solaris 8 Migration Assistant Patch Requirements (6673751)

Upgrading to the Solaris 10 5/08 release when running the co-packaged Solaris 8 Migration Assistant software fails. No error message is displayed. The system panics when a Solaris 8 branded zone is booted.

**Workaround:** Install the Solaris 8 Migration Assistant patch #128548-02 or later. This patch is recommended for all kernels. The patch #128548-02 or later should also be installed before
installing Solaris 10 8/07 release Kernel patch 127111-05 or later. Revision #128548-04 or later is required for UltraSparc IV based systems running Solaris 8 Migration Assistant. The most recent revision of patch #128548 is recommended in all cases.

- Commands
- Solaris 10 8/07 release Kernel patch 127111-05 or later

PRODRM Has Problems Deleting prodreg Entry For Solaris Trusted Extensions (6616592)

While upgrading Solaris Trusted Extensions from the Solaris 10 11/06 or Solaris 10 8/07 release to the current Solaris 10 5/08 release, the prodreg entry for Solaris Trusted extensions is not removed. No error message is displayed.

Workaround: After upgrading Solaris Trusted Extensions to the current release, remove the prodreg entry manually as follows:

```
# prodreg unregister -f -r -u "Solaris Trusted Extensions" -i 1
```

Reboot Now Button Is Unresponsive (6270371)

After you install the Solaris OS, the Reboot Now button does not work.

Workaround: Perform the following steps:

1. Open a terminal window.
2. Type the following commands:

   ```
   # touch /tmp/.instsuccess
   # pkill -9 java
   ```

   The system now reboots and does not require CDs.

Sun Upgrade Detailed Patch Analysis Panel Not Scrollable (6597686)

During a Solaris upgrade, if you select Detailed Analysis to see the patches that will be removed, the panel that displays the patches is not scrollable. The complete list of patches to be removed cannot be viewed.

Workaround: Run the analyze_patches scripts manually:

```
# cd <cdrom>/Solaris_10/Misc
# ./analyze_patches -R rootdir -N netdir -D databasedir
```
The command options are as follows:

- **-R rootdir**  
  *rootdir* is the root of the installed system. The default root directory is `/`.  

- **-N netdir**  
  *netdir* is the path to the root of the OS image to be installed.  
  /cdrom/cdrom0 is the default path.  
  *netdir* is the path to the directory that contains the Solaris_10_606 directory. You must use this option if you are running the patch_analyzer from an NFS mount point.

- **-D databasedir**  
  If the script is called from a directory other than the /Misc directory in the OS image, the program cannot find the database it uses for patch analysis. Use the -D option to supply the path to the database. Without this database, which is located in the Solaris_10_606/Misc/database directory on the OS image, the script will not run correctly.

**SPARC: luupgrade Fails When Using a CD to Upgrade (6573154)**

On a SPARC system, when using a CD (CD1) to upgrade your system by using Live Upgrade, the luupgrade command fails. The following error message is displayed.

```
# luupgrade -u -n s10u4_ABE -s /cdrom/cdrom0/s0 -j /var/tmp/profile
179536 blocks
miniroot filesystem is <lofs>
Mounting miniroot at </cdrom/cdrom0/s0/Solaris_10/Tools/Boot>
mount: /tmp/miniroot.3694: Device busy
ERROR: Cannot mount miniroot at </cdrom/cdrom0/s0/Solaris_10/Tools/Boot>.
```

**Workaround:** Choose one of the following workarounds.

- **Workaround 1:** Use the DVD physical media to do luupgrade.

- **Workaround 2:** If the system does not have a DVD drive, then use setup_install_server from CD1 to create an image locally for the upgrade to use. Run the following commands:

  ```
  # cd /cdrom/cdrom0/s0/Solaris_10/Tools
  # ./setup_install_server <local_location>
  # luupgrade -u -n s10u4_ABE -s <local_location>
  ```

**Panic in PCIe as dev_info Node Has No Parent Data (6517798)**

The Solaris OS might panic with a null pointer dereference if the driver.conf file has been modified using the parent attribute. The following error message is displayed:
System panic: BAD TRAP: type=31 rp=2a101d31200 addr=8 mmu_fsr=0 occurred in module "pcie" due to a NULL pointer dereference

**Workaround:** Before you install the Solaris 10 8/07 or Solaris 10 5/08 OS on a PCI Express (PCIe) based SPARC system, check if you have modified the driver.conf files as described below:

1. Change to the `/kernel/drv` directory.
2. Check if the `parent` attribute is set in the driver.conf file. If the `parent` attribute has been set and the last node in the parent has the word `pci` in it, comment out that line. Ensure that you comment out the entire property. For example:

   ```
   # name="ACME,simple" parent="/pci@7c0/pci@0/pci@9"
   # unit-address="3,1" debug-mode=12;
   name="ACME,example" parent="pseudo" instance=1;
   name="ACME,scsi" parent="/pci@7c0/pci@0/pci@9/scsi"
   unit-address="3,1" debug-mode=12;
   ```
3. Repeat step 2 for the driver.conf files in the following directories:
   - `/usr/kernel/drv`
   - `/platform/uname -i' drv`
   - `/platform/uname -m' drv`
4. Install the Solaris 10 8/07 or Solaris 10 5/08 OS.
5. Install patch 127774-01.
6. Change to the directories listed in steps 1 and 3. Uncomment all the lines that were commented out in step 2 in the driver.conf files.

---

**The Linux Partition Does Not Display on the GRUB Menu After Installing the Solaris OS (6508647)**

If Linux is installed on your disk and you installed the Solaris OS on a separate partition, the Linux partition does not display on the GRUB menu. No error message is displayed.

**Workaround:** Edit the GRUB menu's `menu.lst` file to add Linux to the GRUB menu. Perform the following steps:

1. Boot the Solaris OS.
2. Edit the `menu.lst` file at `/boot/grub/menu.lst`. For more information, see the System Administration Guide: Basic Administration.
**x86: Install Hangs on Systems With 512 Mbyte of Memory (6423854)**

Installations can run out of memory and hang on 512-Mbyte systems under the following conditions:

- You install using a network installation image of the OS.
- The Solaris installation program is in a windowing environment:
  - The graphical user interface (GUI).
  - The -text option or "3. Solaris Interactive Text (Desktop session)" in the menu below.

When the system exhausts available memory, the GUI installation process slows and eventually fails. The text does not display in a windowing environment.

**Workaround:**

To avoid this problem, select a non-windowing environment during the initial installation startup. During startup from the installation media the following menu is displayed:

```
1. Solaris Interactive (default)
2. Custom JumpStart
3. Solaris Interactive Text (Desktop session)
4. Solaris Interactive Text (Console session)
5. Apply driver updates
6. Single user shell
   Enter the number of your choice.
```

At this point, choose "4. Solaris Interactive Text (Console session)". This non-windowing environment will initiate a text-only installation, without using memory-intense processes.

**x86: Invalid /sbin/dhcpinfo Error During Installation (6332044)**

If you install the Solaris 10 8/07 or Solaris 10 5/08 OS on an x86 based system, the following error message is displayed.

```
/sbin/dhcpinfo: primary interface requested but no primary interface is set
```

The error does not affect the installation, and the installation succeeds.

**Workaround:** Ignore the error message.
x86: Installation From CD Media Appears to Hang After Reboot Selection (6270371)

A problem might occur when you are using the Solaris installation program and are using CD media. After the installation of the Solaris software from the Solaris 10 5/08 Software CD - 4, the following prompt is displayed:

Press Reboot now to continue.

If you press Reboot, the system might not respond. The installation is successful. However, the error prevents the installation program from exiting normally. Consequently, the typical postinstallation cleanup and system reboot cannot occur.

An error message similar to the following example is logged in /tmp/disk0_install.log file:

```java
Exception in thread "Thread-70" java.lang.IndexOutOfBoundsException:
  Index: 6, Size: 5
  at java.util.ArrayList.add(ArrayList.java:369)
  at com.sun.wizards.core.WizardTreeManager.actualExitButtonPressed(WizardTreeManager.java:1499)
  at com.sun.wizards.core.WizardTreeManager.exitButtonPressed(WizardTreeManager.java:1486)
  at com.sun.wizards.core.AutonextController.run(AutonextController.java:736)
  at java.lang.Thread.run(Thread.java:595)
```

**Workaround:** Choose one of the following workarounds.

- **Workaround 1:** Follow these steps.
  1. Shut down the system, then turn on the power again.
  2. After the system starts up, insert the appropriate CD at the prompt. Although the CD is inserted, no additional software is installed on the system. In a moment, the system reboots normally.

- **Workaround 2:** Follow these steps.
  1. Open a terminal window.
  2. Log in as superuser.
  3. Create or modify access to the .instsuccess file.

        # touch /tmp/.instsuccess

  4. Stop the Java process.

        # pkill -9 java
The system reboots without prompting for the CD media.

**x86: System Fails to Boot After Custom JumpStart Installation (6205478)**

If you use the Custom JumpStart installation method to install on an x86 based system, and explicitly configure slice 2 as the overlap slice in the profile, an error occurs. The system does not reboot successfully after the installation is completed. The following error message is displayed:

```
Cannot find Solaris partition
```

This failure occurs because the overlap slice 2 (c0t0d0s2, for example) is set to begin at cylinder 1 rather than cylinder 0.

**Workaround:** In the Custom JumpStart profile, remove the filesys keyword entry that configures slice 2 as the overlap slice. For example, you would remove a keyword entry that is similar to the following entry.

```
filesys c0t0d0s2 all overlap
```

After you remove the entry, perform the Custom JumpStart installation.

**x86: GUI Interactive Installation From DVD Fails if boot-device Variable Is Not Set (5065465)**

If you install Solaris from the Solaris 10 Operating System DVD, the interactive GUI installation might fail. This failure occurs if the boot-device configuration variable is not set on the system.

To determine if the boot-device configuration variable is set, type the following command.

```
# prtconf -pv | grep boot-device
```

If the output of this command is `boot-device: with no associated device`, you cannot use the interactive GUI installation program to install from the Solaris 10 Operating System DVD.

**Workaround:** Use the interactive text installer to install Solaris 10 software. When the installation program asks you to select a type of installation, select option 3, Solaris Interactive Text (Desktop Session).

For more information about installing from the Solaris 10 Operating System DVD, see *Solaris 10 5/08 Installation Guide: Basic Installations*. 
x86: USB Keyboards Might Freeze During Install on Some Dell Precision Workstations (4888849)

During installation, USB keyboards on some Dell Precision Workstations might freeze or become partially inoperative, thereby preventing installation.

Workaround: Perform one of the following workarounds:

- Switch the USB emulation mode in the firmware.
- Switch to a PS/2 keyboard.
- Reboot and try again.

Alternatively, update the system's BIOS to resolve the problem.

Warnings Might Occur When a File System Is Created (4189127)

When a file system is created during installation, one of the following warning messages might be displayed:

Warning: inode blocks/cyl group (87) >= data blocks (63) in last cylinder group. This implies 1008 sector(s) cannot be allocated.

Or:

Warning: 1 sector(s) in last cylinder unallocated

The warning occurs when the size of the file system that you created does not equal the space on the disk that is being used. This discrepancy can result in unused space on the disk that is not incorporated into the indicated file system. This unused space is not available for use by other file systems.

Workaround: Ignore the warning message.

Upgrade Issues and Bugs

Note – For the latest information about upgrade support beginning with the Solaris 10 5/08 release, see “Changes in Upgrade Support for Solaris Releases” on page 17.
This section describes upgrade bugs. Some might occur while you are upgrading to Solaris 10 OS. Others might occur after you have completed upgrading.

**lucreate and lumake Commands Fail on Non-Global Zones (6659451)**

When the `lucreate` and `lumake` commands are used on non-global zones which are not in the running state, the commands might not execute successfully. The contents of the original non-global zone and the copy might differ. Users might be unable to log in to the zone’s console using the `zlogin` command. The following error message is displayed while using the `zlogin` command:

```
zlogin: makeutx failed
```

The diagnostic output of the `lucreate` and `lumake` commands do not display any errors.

**Workaround:** Ensure that all non-global zones are in the running state before using the `lucreate` and `lumake` commands.

**SPARC: Upgrading with Solaris Live Upgrade From Solaris 8 and Solaris 9 Releases Fails (6638175)**

Upgrading to the Solaris 10 5/08 release using Solaris Live Upgrade, from the previous Solaris 8 and Solaris 9 releases fails. The install images compression file is now unzipped by using the `7za` utility. The SUNWp7zip package is not included in the Solaris 8 and 9 releases. As a result, Solaris Live Upgrade fails.

**Workaround:** Choose one of the following workarounds:

- **Workaround 1:** To upgrade your current Solaris 9 OS to the Solaris 10 5/08 release using Solaris Live Upgrade, apply the following patches:
  - For SPARC systems – 137477-01 or later
  - For x86 systems – 137478-01 or later

- **Workaround 2:** To upgrade your current Solaris 10 OS to the Solaris 10 5/08 release by using Solaris Live Upgrade, apply the following patches:
  - For SPARC systems – 137321-01 or later
  - For x86 systems – 137322-01 or later
Note – Solaris Live Upgrade from the Solaris 8 release to the Solaris 10 5/08 release is not supported. Instead, use the standard upgrade procedure or perform a Solaris Live Upgrade from the Solaris 8 OS to the Solaris 9 or Solaris 10 OS. Then you can perform a Solaris Live Upgrade from the Solaris 9 or Solaris 10 release to the Solaris 10 5/08 release.

Incorrect Permissions on /tmp in Non-Global Zones After Solaris Live Upgrade (6619278)

Various processes running in non-global zones using /tmp might crash after the zone has been upgraded using Solaris Live Upgrade. The upgrade process changes permissions on the /tmp directory which leads to applications failures. Users will see drwxr-xr-x permissions instead of the correct drwxrwxrwx permissions.

Workaround: Choose one of the following workarounds:

- **Workaround 1:** Before activating the new boot environment, perform the following steps:
  1. Mount the disk:
     ```bash
     # mount /dev/dsk/c1t1d0s6 /mnt
     ```
  2. Fix the permissions:
     ```bash
     # chmod 1777 /mnt/zone/*root/tmp
     ```
  3. Then unmount the disk:
     ```bash
     # umount /mnt
     ```

     This workaround fixes all zones at once.

- **Workaround 2:** If you have already booted the new boot environment, log in to the system as the root user. Halt the zone and manually set correct permissions on the /tmp directory. Type the following command:
  ```bash
  # chmod 1777 /path/root/tmp
  ```

  where path is the zone’s zonepath.

Issues With DSR Upgrade With Zones (6616788)

Disk space reallocation (DSR) upgrade with zones fails if zones are installed in the /opt directory. Upgrade might fail during the restoration of the DSR archive. In some cases, the upgrade might be successful, but the system cannot be rebooted.

Workaround: Ensure that the root file system is not 100% full before upgrade. Remove some files before upgrade so that the root slice is less than 90% full.
Solaris Trusted Extensions Upgrade Issues (6616585)

When you upgrade Solaris Trusted Extensions from the Solaris 10 11/06 or Solaris 10 8/07 release to the current Solaris 10 5/08 release, unwanted localized Solaris Trusted Extensions packages are installed on your system. This bug occurs because the Solaris Trusted Extensions installer in the Solaris 10 11/06 or Solaris 10 8/07 releases installs localized packages by default. No error message is displayed.

**Workaround:** Before upgrading Solaris Trusted Extensions to the current release, remove the following localized Solaris Trusted Extensions packages:

<table>
<thead>
<tr>
<th>Package</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUNWjdtts</td>
</tr>
<tr>
<td>SUNWjmgts</td>
</tr>
<tr>
<td>SUNWjtsman</td>
</tr>
<tr>
<td>SUNWjtsu</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-doc-ja</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-ui-it</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-ui-sv</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-doc-ko</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-ui-ja</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-ui-zhCN</td>
</tr>
<tr>
<td>SUNWtgnome-l10n-ui-de</td>
</tr>
</tbody>
</table>

System Cannot Communicate With ypbind After Upgrade (6488549)

This bug occurs during an upgrade from Solaris 10 Hardware 2 release to the current Solaris 10 5/08 release.

In the Solaris 10 Hardware 2 release, the `name_service.xml` file for any name service, such as NIS, NIS+, FILES, or LDAP is as follows:

```
# ls -l name_service.xml
lrwxrwxrwx 1 root root 10 Apr 10 16:26 name_service.xml -> ns_files.xml
```

If the name service is NIS, the `name_service.xml` file links to `ns_files.xml`. However, the contents of the `ns_files.xml` are the same as `ns_nis.xml`. 

Chapter 1 • Installation Issues
In the above output, the `ns_nis.xml` and `ns_files.xml` files are the same. This means that the `name_service.xml` file symbolically links to the wrong nameservice file. The `name_service.xml` file should link to the `ns_nis.xml`.

Note – The fix for CR6411084, the SUNWcsr install or postinstall script, creates the correct link only if `name_service.xml` is not a link file. If `name_service.xml` is already a symbolic link file, as in the Solaris 10 Hardware 2 release, the fix for CR 6411084 will not work.

After an upgrade from Solaris 10 Hardware 2 to the current Solaris 10 5/08 release, the following message is displayed on the console or logged in the messages file:

Oct 23 12:18:45 vt2000a automount[301]: [ID 366266 daemon.error] can't read nis map auto_master: can't communicate with ypbind - retrying

Also, the `/network/nis/client:default` service is offline.

Workaround: Choose one of the following workarounds:

- **Workaround 1**: Before an upgrade, remove the `/var/svc/profile/name_service.xml` file.
- **Workaround 2**: After an upgrade, change the `/var/svc/profile/name_service.xml` link to the correct `ns_<xxx>.xml` file, based on the name service.

### Upgrade Fails on System With Zones That Have Been Installed But Not Booted

A non-global zone that has been installed but never booted or made ready prevents a system from being upgraded correctly. No error message is displayed.

Workaround:

If such a zone is found, the zone should be made ready and then halted prior to starting the upgrade. For example:
Upgrading a Solaris 10 System with Non-Global Zones to the Solaris 10 5/08 Release Might Cause the Local File System Service to Fail (6428258)

Upgrading a Solaris 10 3/05 system or a Solaris 10 1/06 system to the Solaris 10 6/06, Solaris 10 8/07, or the Solaris 10 5/08 release with non-global zones might cause the SMF service that mounts local file systems to fail in the non-global zones. As a result, other services in the non-global zones might fail to start.

After upgrading a Solaris 10 system with non-global zones to the Solaris 10 6/06, Solaris 10 8/07, or the Solaris 10 5/08 release, services might be in the maintenance state. For example:

```
# zlogin myzone svcs -x
   svc:/system/filesystem/local:default (local file system mounts)
   Reason: Start method exited with $SMF_EXIT_ERR_FATAL.
   See: http://sun.com/msg/SMF-8000-KS
   See: /var/svc/log/system-filesystem-local:default.log
   Impact: 18 dependent services are not running. (Use -v for list.)
```

Workaround:

Reboot the non-global zone from the global zone. For example:

```
global# zoneadm -z myzone reboot
```

Device ID Discrepancies After Upgrading From Solaris 9 9/04 OS

In this Solaris 10 release, Solaris Volume Manager displays device ID output in a new format. Solaris 9 9/04 OS, which introduced device ID support in disk sets, does not recognize the new format. When you upgrade to Solaris 10 OS from the Solaris 9 9/04 release, device IDs that are associated with existing disk sets are not updated in the Solaris Volume Manager configuration. If you need to revert to Solaris 9 9/04 OS, configuration changes made to disk sets after the upgrade might not be available to Solaris 9 9/04 OS. For more information, see Chapter 25, "Troubleshooting Solaris Volume Manager (Tasks)," in Solaris Volume Manager Administration Guide.
x86: Adding Driver Updates Might Cause Failure of Network Configuration (6353146)

Installation of the Solaris 10 OS might fail while you are adding Driver Updates (DU), which are also known as Install Time Updates (ITU). This error occurs if you are using the GUI to install the Solaris 10 software. The following message is displayed:

Unable to run cmd: /usr/sbin/sysidput

Workaround: Use either of the following workarounds.
- **Workaround 1**: Configure the installation to use DHCP to gather network configuration information.
- **Workaround 2**: Use a text-based installation method.
  - If you are performing the text-based installation in a desktop session, follow these steps.
    1. After you have finished adding ITUs, type Ctrl-c instead of typing `e`.
    2. Choose option 3.
  - If you specify a serial console to use during the installation, follow these steps.
    1. After you have finished adding ITUs, type Ctrl-c instead of typing `e`.
    2. Choose option 4.

x86: Cannot Delete the Solaris Live Upgrade Boot Environment That Contains the GRand Unified Bootloader Menu (6341350)

When you use Solaris Live Upgrade to create boot environments, one of the boot environments in the system hosts the GRand Unified Bootloader (GRUB) menu. This boot environment cannot be removed with the `ludelete` command.

If you attempt to remove the boot environment, the following error message is displayed:

ERROR: The boot environment `name-of-boot-environment` contains the GRUB menu.
ERROR: You are not allowed to delete this BE.
Unable to delete boot environment.

Workaround: Use either the `lumake` command or the `luupgrade` command to reuse this boot environment. Make the boot environment that contains the GRUB menu the last boot environment to be deleted.
Note – Solaris Live Upgrade does not allow the last boot environment to be deleted. Nor can the boot environment that contains the GRUB menu be deleted. Therefore, if the last boot environment also contains the GRUB menu, then you can delete all other boot environments if needed.

Solaris Live Upgrade `luupgrade` Command Missing the Progress Bar (6239850)

The upgrade progress bar does not appear when you use the Solaris Live Upgrade software in the following manner:

- You use the Solaris 10 5/08 CD media to upgrade the OS.
- You upgrade a boot environment by using the `luupgrade` command with the following options:
  - `-i` to install from the CD media
  - `-O "-nodisplay -noconsole"` to run the installer on the second CD in text mode and without user interaction
- You are upgrading to the Solaris 10 5/08 software from the following releases:
  - Solaris 9 release
  - Solaris 10 release

For example, if you run the following command, the progress bar should be displayed after you see the following output:

```
# luupgrade -i -n s10u1 -s /net/installsrv/export/s10u1
-O "-nodisplay -noconsole"
```

Validating the contents of the media `/net/installsrv/export/s10u1`.
The media is a standard Solaris media.
The media contains a standard Solaris installer.
The media contains Solaris 3 version 10.
Mounting BE s10u1.
Running installer on BE s10u1.

No error message is displayed.

Workaround: Use the `prstat` command. This command enables you to watch the progress while packages are being added during the installation.
SPARC: Upgrading From Solaris 9 Releases With Recommended Patch Cluster Partially Succeeds (6202868)

For a system that is running a Solaris 9 release with the recommended patch cluster installed, upgrading to Solaris 10 OS only partially succeeds. This problem affects systems that are running the following releases with the Solaris 9 recommended patch cluster installed.

- Solaris 9 release
- Solaris 9 9/02 release
- Solaris 9 12/02 release
- Solaris 9 4/03 release
- Solaris 9 8/03 release
- Solaris 9 12/03 release
- Solaris 9 4/04 release

When you upgrade to the Solaris 10 release, the SUNWcti2x package is not successfully removed from the system.

Workaround: Choose one of the following workarounds.

- To avoid this problem, apply patch ID 117426-03, or a later version, to the system before you upgrade to the Solaris 10 OS.
  To download this patch, go to http://sunsolve.sun.com.

- If you encounter this problem during the upgrade, follow these steps.
  1. In a text editor, comment out the following line in the
     /var/sadm/pkg/SUNWcti2x/install/preremove file.

```
rem_drv -b ${BASEDIR} sc_nct || EXIT=1
```

  2. Remove the SUNWcti2x package.

```
# pkg rm SUNWcti2x
```

Obsolete Uninstallers Not Removed When You Use Solaris Live Upgrade to Upgrade From Previous Solaris Releases (6198380)

If you use Solaris Live Upgrade to upgrade from the Solaris 8 or Solaris 9 releases to Solaris 10 OS, obsolete uninstaller programs are not removed. These uninstaller programs from the previous OS remain in the system's /var/sadm/prod directory.

The following obsolete uninstallers are not removed.
uninstall A lterna t e Pathi ng 2 3 1 .c l ass
uninstall CDRW 1 1.c l ass o uninstall CDRW 1 0 .c l ass
uninstall B oneus L ocal i zat i on - Catalan CDE Desktop.c l ass

uninstall_web_start_wizards_sdk_3_0_1.class
uninstall_web_start_wizards_sdk.class
uninstall_xml_libraries_2_4_12.class

Workaround: After you upgrade the system, manually remove the obsolete uninstallers in the /var/sadm/prod directory.

Configuration File *pam.conf* Not Automatically Updated After an Upgrade (5060721)

This Solaris 10 release introduces changes in *pam_ldap* functionality. When you upgrade to the current release, *pam_ldap* configurations in your existing *pam.conf* configuration file are not updated to reflect these changes. If *pam_ldap* configuration is detected, the CLEANUP file that is generated at the end of the upgrade contains the following notification:

```
/etc/pam.conf please examine/update the pam LDAP configuration because its functionality has changed, refer to pam_ldap(5) documentation for more information
```

Workaround: After the upgrade, examine /etc/pam.conf. If necessary, modify this file manually to be compatible with the new functionalities of *pam_ldap*. The modifications involve password prompting such as the use of *first_pass* and *try_first_pass* options as well as password updates. For more information about updating *pam.conf*, refer to the *pam_ldap(5)* man page and documentation.

Installer Text Display Problem When Using Solaris Live Upgrade (4736488)

When using the Solaris Live Upgrade *luupgrade(1M)* command with the -i option to complete an upgrade of an inactive boot environment, the text that the installers display might be unreadable in some languages. The text is corrupted when the installers request fonts that do not exist on the older release that is on the current boot environment.

Workaround: Choose one of the following workarounds:

- Use a combined network installation image to do the installation.
- Enable the C locale by setting the environment variable on your system.
  - If you are using the Bourne shell or Korn shell, follow these steps:
    1. Set the C locale.
       ```
       # LANG=C; export LANG
       ```
    2. Begin the installation.
- If you are using the C shell, follow these steps:
1. Type the following:
   # csh
2. Set the C locale.
   # setenv LANG C
3. Begin the installation.

---

**SPARC: Removal of SUNWjxcft Package Records Error During Upgrade (4525236)**

When you upgrade from the Solaris 8 software to the Solaris 10 release, a problem is encountered when the SUNWjxcft package is removed. The following error message is recorded in the upgrade_log file:

Removing package SUNWjxcft:
Can’t open /a/usr/openwin/lib/locale/ja/X11/fonts/TTbitmaps/fonts.upr
Can’t open /a/usr/openwin/lib/locale/ja/X11/fonts/TTbitmaps/fonts.scale
Can’t open /a/usr/openwin/lib/locale/ja/X11/fonts/TTbitmaps/fonts.alias
Can’t open /a/usr/openwin/lib/locale/ja/X11/fonts/TT/fonts.upr
Can’t open /a/usr/openwin/lib/locale/ja/X11/fonts/TT/fonts.scale
Can’t open /a/usr/openwin/lib/locale/ja/X11/fonts/TT/fonts.alias
Removal of <SUNWjxcft> was successful

**Workaround:** Ignore the error message.

---

**Upgrading to Solaris 10 Release Might Disable Existing Secure Shell Daemon (sshd) (4626093)**

If you upgrade to the Solaris 10 release on a system that is running a third-party Secure Shell, such as OpenSSH from the /etc/init.d/sshd daemon, the upgrade disables the existing Secure Shell daemon. During an upgrade, Solaris 10 software overwrites the contents of /etc/init.d/sshd.

**Workaround:** Choose one of the following workarounds:

- If you do not want the Secure Shell protocol server program on your system, do not install the SUNWsshdr and SUNWsshd packages during the upgrade.
- If you do not want the Secure Shell protocol server or client programs on your system, do not install the Secure Shell Cluster (SUNWssh) during the upgrade.
Upgrade Fails if /export Directory Is Near Capacity (4409601)

If the /export directory is near full capacity when you upgrade to the Solaris 10 release, space requirements for /export are miscalculated. The upgrade then fails. This problem commonly occurs if a diskless client is installed. Another instance of the problem occurs when third-party software is installed in the /export directory. The following message is displayed:

WARNING: Insufficient space for the upgrade.

Workaround: Before you upgrade, choose one of the following workarounds:

- Rename the /export directory temporarily, until the upgrade is completed.
- Temporarily comment out the /export line in the /etc/vfstab file until the upgrade is completed.
- If /export is a separate file system, then unmount /export before you perform the upgrade.

Upgrading Diskless Client Servers and Clients (4363078)

If your system currently supports diskless clients that were installed with the Solstice AdminSuite 2.3 Diskless Client tool, you must perform the following two steps:

1. Delete all existing diskless clients that are the same Solaris version and architecture as the server.
2. Install or upgrade to the Solaris 10 release.

For specific instructions, see the System Administration Guide: Basic Administration.

If you attempt to install the Solaris 10 software over existing diskless clients, the following error message might be displayed:

The Solaris Version (Solaris version-number) on slice <xxxxxxxx> cannot be upgraded.
There is an unknown problem with the software configuration installed on this disk.

In this error message, version-number refers to the Solaris version that is currently running on your system. <xxxxxxxx> refers to the slice that is running this version of the Solaris software.
Additional Installation Issues

This section describes issues that are related to the installation of the Solaris OS.

smosservice add Command Does Not Install Designated ARCH=all Packages (4871256)

The smosservice add command does not install any packages that are designated ARCH=all in the root (/) or /usr file systems. There is no error message indicating these packages were skipped. This problem exists in all Solaris OS versions, and applies to both SPARC based and x86 based clients.

Note that the list of missing packages varies, depending on the Solaris release that you are running.

Workaround: Locate and install the missing ARCH=all packages.

For step-by-step instructions on locating and installing missing packages, see "How to Locate and Install Missing ARCH=all Packages" in System Administration Guide: Basic Administration.

StarOffice and StarSuite Software Cannot Coexist in the Same System

When you install Solaris 10 OS, either the StarOffice or the StarSuite software is also automatically installed, depending on which language you select. The languages and the corresponding software that these languages support are listed as follows:

<table>
<thead>
<tr>
<th>Selected Language</th>
<th>Supported Software</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chinese, Japanese, Korean</td>
<td>StarSuite</td>
</tr>
<tr>
<td>Other languages</td>
<td>StarOffice</td>
</tr>
</tbody>
</table>

StarOffice and StarSuite cannot coexist in the same system. If you want to replace a software that you accidentally installed, follow these steps.

1. Insert the Solaris 10 Software - 4 CD or Solaris 10 Operating System DVD in the drive.
2. Become superuser.
3. Change to the Product directory, for example, /cdrom/cdrom0/Solaris_10/Product.
4. Replace the software.
To replace StarOffice with StarSuite, use the following commands:

```
# pkgrm ‘pkginfo | grep staroffice- | awk '{print $2}’’
# pkgadd -d .SUNWstarsuite-*
```

To replace StarSuite with StarOffice, use the following commands:

```
# pkgrm ‘pkginfo | grep starsuite- | awk '{print $2}’’
# pkgadd -d . SUNWstaroffice-*
```

If you use Solaris CDs, the localization packages are included in either Language 1 or 2 CD. The package names are as follows:

- SUNWstaroffice-lang* where lang = es, fr, de, sv, or it
- SUNWstarsuite-lang* where lang = ja, ko, zh-CN, or zh-TW

### Additional Related Locales Might Be Installed

When you select a locale for your installation, additional related locales might also be installed. This change in behavior occurs in the Solaris 10 release because all full locales, with message translations, and the Asian and Japanese partial locales, locale enabler, have been repackaged based on language support for locales. Other partial locales are still packaged and installed based on geographic region, such as Central Europe.
This chapter describes runtime issues that are known to be problems.

Note – Some of the issues and bugs in this chapter have been fixed in subsequent Solaris 10 releases. If you have upgraded your Solaris software, certain issues and bugs in this chapter might no longer apply. To see which bugs and issues no longer apply to your specific Solaris 10 software, refer to Appendix A, “Table of Integrated Bug Fixes in the Solaris 10 Operating System.”

Common Desktop Environment

The following bugs in Solaris 10 OS apply to the Common Desktop Environment (CDE).

Remote Multilevel Login From the Login Screen Is Not Supported in Solaris Trusted Extensions (6616030)

The Remote Login item on the Options menu on the login screen cannot be used to remotely log in to a multilevel Trusted Extensions system. When the label of your system is the same as the label that has been assigned to an unlabeled system, you can log in remotely to that unlabeled system.

Workaround: To log in remotely, see the instructions in Chapter 8, “Remote Administration in Trusted Extensions (Tasks),” in Oracle Solaris Trusted Extensions Administrator’s Procedures.
Trusted Stripe Disappears From the Screen After Resolution Change (6460624)

When you type the /usr/X11/bin/xrander -s command to set a smaller screen resolution, trusted stripe is no longer displayed. This affects the Trusted CDE Desktop but not the Trusted Java DS Desktop. No error message is displayed.

**Workaround:** After the resolution change, restart the Workspace Manager. Select **windows -> Restart Workspace Manager** from the CDE workspace menu and click OK.

x86: kdmconfig Command Does Not Create System Identification Configuration File for Xorg X Server (6217442)

If you use the JumpStart installation method, the process might use a system identification configuration (sysidcfg) file. This file is used to generate a specific Xsun configuration file for a system. The Xsun configuration portion of a sysidcfg file is created by the command kdmconfig -d *filename*. However, on systems that use the default Xorg server, the command does not create a file with any Xorg configuration information. Consequently, you cannot use the JumpStart method on these systems without some additional preparatory steps.

**Workaround:** Before using the JumpStart installation method on a system that uses the Xorg server, perform the following steps.

1. Prepare a specific *xorg.conf* file to be used on the system. Store this file in the JumpStart directory of the JumpStart server.
   Create an *xorg.conf* file with one of these commands:
   - `/usr/X11/bin/Xorg -configure`
   - `/usr/X11/bin/xorgconfig`
   - `/usr/X11/bin/xorgcfg`

2. Create a finish script that copies the *xorg.conf* file to the */etc/X11* directory in the system that you want to install. For example, the script might include the following line:
   ```
cp ${SI_CONFIG_DIR}/xorg.conf /etc/X11/Xorg.conf
   ```

3. In the custom JumpStart rules file, include the finish script in the rules entry for systems of the type that you want to install.

4. Perform the custom JumpStart installation.

For instructions about how to perform a custom JumpStart installation, see the *Solaris 10 5/08 Installation Guide: Custom JumpStart and Advanced Installations*. Chapter 4 includes information about the JumpStart rules file, while Chapter 5 contains a section about finish scripts.
CDE Removable Media Auto Run Capability Removed
(4634260)

The Removable Media auto run capability in the CDE desktop environment has been
temporarily removed from the Solaris 10 software.

Workaround: To use the auto run function for a CD-ROM or another removable media
volume, you must do one of the following:

- Run the `volstart` program from the top level of the removable media file system.
- Follow the instructions that are included with the CD for access from outside of CDE.

Solaris PDASync Cannot Delete Last Entry From the
Desktop (4260435)

After you delete the last item from the desktop, the item is restored from the handheld device to
the desktop when you synchronize your handheld device. Examples of items that you might
delete, and then have restored, are the last appointment in your Calendar or the last address in
the Address Manager.

Workaround: Manually delete the last entry from the handheld device prior to
synchronization.

File Systems

The following file system bugs apply to the Solaris 10 release.

x86: raidctl Fails to Create VDs on Dell SAS6i/R
(6669169)

Dell SAS 6 HBA (LSI 1068) firmware versions starting with 0.20.46.00-IR introduce an
incompatibility which might prevent `lsiutil` and `raidctl(1M)` commands from successfully
configuring virtual drives. After the failure, the physical drives will enter an offline state and not
be accessible. The `raidctl(1M)` which is included with the Solaris 10 5/08 release is affected as
well as `lsiutil` from version 5.07.04 of the ITImpt package.

The following error message is displayed:

```
# /usr/sbin/raidctl -C "0.3.0 0.4.0" -s 64k 0
Creating RAID volume will destroy all data on spare space of member
disks, proceed (yes/no)?
```

Operation failed
Workaround: Configure virtual drives using the SAS configuration utility. To access the SAS configuration utility, enter Control-C when prompted during the BIOS boot sequence.

x86: ata Timeouts During Boot (6586621)

ata driver timeouts might occur during system boot on Intel multiprocessor systems. These timeouts occur when the root device is on a drive with the HBA controller bound to the legacy ata driver. These timeouts lead to a momentary hang, hard hang, or a panic during system boot with console messages similar to the following:

```
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: reset bus, target=0 lun=0
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: early timeout, target=0 lun=0
gda: [ID 107833 kern.warning] WARNING: /pci0,0/pci-ide@1f,2/ide00/cmdk@0,0 (Disk0):
  Error for command 'read sector' Error Level: Informational
  Sense Key: aborted command
  Vendor 'Gen-ATA ' error code: 0x3
  Error for command 'read sector' Error Level: Informational
  Sense Key: aborted command
  Vendor 'Gen-ATA ' error code: 0x3
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: abort request, target=0 lun=0
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: abort device, target=0 lun=0
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: reset target, target=0 lun=0
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: reset bus, target=0 lun=0
scsi: [ID 107833 kern.warning] WARNING: /pci@0,0/pci-ide@1f,2/ide@0 (ata0):
  timeout: early timeout, target=0 lun=0
gda: [ID 107833 kern.warning] WARNING: /pci0,0/pci-ide@1f,2/ide00/cmdk@0,0 (Disk0):
  Error for command 'read sector' Error Level: Informational
  Sense Key: aborted command
  Vendor 'Gen-ATA ' error code: 0x3
```

Workaround: Choose one of the following workarounds:

- **Note** – To avoid performance degradation, workaround 3 or workaround 4 should only be used temporarily until workaround 5 can be used.

- **Workaround 1:** Enable AHCI in BIOS if available on the system. Enabling this setting requires a reinstall of the Solaris OS.
- **Workaround 2:** Install Solaris on a disk on a controller which does not use the ata driver.
- **Workaround 3:** Disable MP in the BIOS setup so that a single processor is active.
- **Workaround 4:** Disable MP in Solaris so that a single processor is active. Perform the following steps from the Grand Unified Bootloader (GRUB) menu:
1. Type `e` to edit your selected Solaris entry.
2. Navigate to the line that begins with `kernel`. 
3. Type `e` to switch to the GRUB edit mode.
4. Append `-kd` to the line.
5. Press Enter to accept the change.
6. Type `b` to boot the selected Solaris entry.
7. At the `kcmd` prompt, type the following command:
   ```
   use_mp/W 0 :c
   ```
8. If you are performing a system boot, proceed to Step 10, otherwise install the Solaris 10 5/08 software.
9. At the end of the installation, reboot the system. Repeat steps 1 through 7.
10. To make this change permanent so that the above steps do not need to be repeated for subsequent boots, do the following:
   Become the super user, when the system boot is completed.
11. Open the `/etc/system` file.
12. Add the following line:
   ```
   set use_mp = 0
   ```

**Workaround 5:** Disable microcode update. Type the following command:
```
# mv /platform/i86pc/ucode /platform/i86pc/ucode.disabled
```
Microcode update can be invoked manually after the system is up:
```
# ucodeadm -u /platform/i86pc/ucode.disabled/intel-ucode.txt
```

---

**zoneadm install Fails With a ZFS Legacy Mount (6449301)**

If a non-global zone is initially configured with a ZFS file system to be mounted with the `add fs` subcommand and specifies `mountpoint=legacy`, the subsequent zone installation fails. The following error message is displayed.

ERROR: No such file or directory: cannot mount </zones/path/root/usr/local> in non-global zone to install: the source block device or directory </path/local> cannot be accessed

**Workaround:** Add access to a ZFS file system after installing the non-global zone.
ZFS and UNIX/POSIX Compliance Issues

ZFS is designed to be a POSIX compliant file system and in most situations, ZFS is POSIX compliant. However, two edge case conditions exist when ZFS does not meet the POSIX compliance tests:

1. Updating ZFS files system capacity statistics.
2. Modifying existing data with a 100 percent full file system.

Related CRs:
- 6362314
- 6362156
- 6361650
- 6343113
- 6343039

fdisk -E Can Sweep Disk Used by ZFS Without Warning (6412771)

If you use the fdisk -E command to modify a disk that is used by a ZFS storage pool, the pool becomes unusable and might cause an I/O failure or system panic.

Workaround:

Do not use the fdisk command to modify a disk that is used by a ZFS storage pool. If you need to access a disk that is used by a ZFS storage pool, use the format utility. In general, disks that are in use by file systems should not be modified.

ZFS and Third-Party Backup Product Issues

The following are the issues with the Veritas NetBackup and Brightstor ARCserve Backup products.

Veritas NetBackup Does Not Back Up and Preserve Files With ZFS/NFSv4 ACLs (6352899)

The Veritas NetBackup product can be used to back up ZFS files, and this configuration is supported. However, this product does not currently support backing up or restoring NFSv4-style ACL information from ZFS files. Traditional permission bits and other file attributes are correctly backed up and restored.

If a user tries to back up or restore ZFS files, the NFSv4-style ACL information from ZFS files is silently dropped. There is no error message indicating that the ACL information from ZFS files has been dropped.
Support for ZFS/NFSv4 ACLs is under development and is expected to be available in the next Veritas NetBackup release.

**Workaround 1:**

As of the Solaris 10 8/07 release, both the `tar` and `cpio` commands correctly handle ZFS files with NFSv4-style ACLs.

Use the `tar` command with the `-p` option or the `cpio` command with the `-P` option to write the ZFS files to a file. Then, use the Veritas NetBackup to back up the `tar` or `cpio` archive.

**Workaround 2:**

As an alternative to using Veritas NetBackup, use the ZFS `send` and `receive` commands to back up ZFS files. These commands correctly handle all attributes of ZFS files.

**BrightStor ARCserve Backup Client Agent for UNIX (Solaris) and ZFS Support**

The BrightStor ARCserve Backup (BAB) Client Agent for UNIX (Solaris) can be used to backup and restore ZFS files.

However, ZFS NFSv4-style ACLs are not preserved during backup. Traditional UNIX file permissions and attributes are preserved.

**Workaround:** If you want to preserve ZFS files with NFSv4-style ACLs, use the `tar` command with the `-p` option or the `cpio` command with the `-P` option to write the ZFS files to a file. Then, use BAB to backup the `tar` or `cpio` archive.

**ZFS GUI Should Check For /usr/lib/embedded_su at the Beginning of Each Wizard (6326334)**

If you add the SUNWzfs package from a Solaris 10 8/07 or Solaris 10 5/08 release to a system that runs a pre-Solaris 10 6/06 release, which does not have the `embedded_su` patch, the ZFS Administration application wizards are not fully functional.

If you attempt to run the ZFS Administration application on a system without the `embedded_su` patch, you will only be able to browse your ZFS configuration. The following error message is displayed:

```
/usr/lib/embedded_su: not found
```

**Workaround:**

Add the `embedded_su` patch (119574-02) to the system that runs a pre-Solaris 10 6/06 release.
Fails to Sync File System on Panic (6250422)

If a host panics with file system I/O occurring to a target, which is connected by using the Solaris iSCSI software initiator, the I/O might not be able to flush or sync to the target device. This inability to flush or sync might cause file system corruption. No error message is displayed.

Workaround:

Use the journaling file system like UFS. Starting with Solaris 10, UFS logging is enabled by default. For more information about UFS, see “What's New in File Systems?” in System Administration Guide: Devices and File Systems.

Upgrading From Some Solaris Express or Solaris 10 Releases Requires Remounting of File Systems

After you upgrade an NFSv4 server from Solaris Express 6/05 to Solaris Express 7/05 or later (including all Solaris 10 updates), your programs might encounter EACCESS errors. Furthermore, directories might erroneously appear to be empty.

To prevent these errors, unmount and then remount the client file systems. In case unmounting fails, you might need to forcibly unmount the file system by using umount -f. Alternatively, you can also reboot the client.

NFSv4 Access Control List Functions Might Work Incorrectly

NFSv4 Access Control List (ACL) functions might work improperly if clients and servers in the network are installed with different previous Solaris 10 releases. The affected ACL functions and command-line utilities that use these functions are the following:

- acl()
- facl()
- getfacl
- setfacl

For more information about these functions and utilities, see their respective man pages.

For example, errors might be observed in a network that includes the following configuration:

- A client that is running Solaris 10 Beta software
- A server that is running Solaris 10 software

The following table illustrates the results of the ACL functions in client-server configurations with different Solaris 10 releases.
<table>
<thead>
<tr>
<th>Operation</th>
<th>Client S10 OS</th>
<th>Server S10 OS</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>get ACL</td>
<td>S10 Beta</td>
<td>S10 OS</td>
<td>fabricated ACL *</td>
</tr>
<tr>
<td>get ACL</td>
<td>S10 OS</td>
<td>S10 Beta</td>
<td>works ok</td>
</tr>
<tr>
<td>set ACL</td>
<td>S10 Beta</td>
<td>S10 OS</td>
<td>works ok</td>
</tr>
<tr>
<td>set ACL</td>
<td>S10 OS</td>
<td>S10 Beta</td>
<td>Error: EOPNOTSUP</td>
</tr>
</tbody>
</table>

**Workaround:** For the NFSv4 ACL functionality to work properly, perform a full installation of the Solaris 10 OS on both the server and the client.

### Access Problems Between Solaris NFSv4 Clients and NFSv4 Servers

In the current Solaris 10 version, Solaris implementation of NFSv4 Access Control Lists (ACL) is now compliant with RFC 3530 specifications. However, errors occur for NFSv4 clients that use the Solaris 10 Beta 2 or Beta 1 versions. These clients cannot create files in the NFSv4 servers that are using the current Solaris 10 release. The following error message is displayed:

```
NFS getacl failed for server_name: error 9 (RPC: Program/version mismatch)
```

**Workaround:** None.

### Using `mkfs` Command to Create File System Might Fail on Very Large Disks (6352813)

The `mkfs` command might be unable to create a file system on disks with a certain disk geometry and whose sizes are greater than 8 Gbytes. The derived cylinder group size is too large for the 1-Kbyte fragment. The large size of the cylinder group means that the excess metadata cannot be accommodated in a block.

The following error message is displayed:

```
With 15625 sectors per cylinder, minimum cylinders per group is 16. This requires the fragment size to be changed from 1024 to 4096. Please re-run mkfs with corrected parameters.
```

**Workaround:** Use the `newfs` command instead. Or, assign a larger fragment size, such as 4096, when you use the `mkfs` command.
System Crash Dump Fails on Devices Greater Than 1 TByte (6214480)

The system cannot generate a dump on a partition that is equal to or greater than 1 Tbyte in size. If such a device is on a system, the following might occur after the system boots subsequent to a system panic:

- The system does not save the dump.
- The following message is displayed:

  0% done: 0 pages dumped, compression ratio 0.00, dump failed: error 6

Workaround: Configure the size of your system’s dump device to less than 1 Tbyte.

Using smosservice Command to Add OS Services Results in Insufficient Disk Space Message (5073840)

If you use the smosservice command to add OS services to a UFS file system, a message that there is insufficient disk space available is displayed. This error is specific to UFS file systems on EFI-labeled disks.

Workaround: Complete the following workaround.

1. Apply the SMI VTOC disk label.
2. Re-create the file system.
3. Rerun the smosservice command.

Hardware–Related Issues and Bugs

The following hardware–related issue and bugs apply to the Solaris 10 release.

SPARC: SCSI Second Disk Fails to Attach After Solaris Live Upgrade (6684776)

Some desktop systems might lose access to disks, other than their root disks, while using Solaris Live Upgrade to upgrade from the Solaris 10 8/07 release to the Solaris 10 5/08 release. This occurs due to a bug in the power management system.

The following error message is displayed:

System can’t access disk.
Workaround: Disable power management on the system. Perform the following steps:

1. Edit the /etc/power.conf configuration file and change the autopm entry from default to disable.
2. Update the power settings with the pmconfig -r command.
3. Reboot the system.

x86: Cannot Enable MPxIO (6664694)

x64 systems using the LSI SAS PCI-E host bus adapters (HBAs) such as SG-XPCIE8SAS-E-Z, SG-XPCIE4SAS-Z, SG-XPCIE4SAS3-Z, and SG-PCIE8SAS-Z, cannot enable MPxIO if more than 4 Gbytes of RAM is installed.

To confirm whether your system is affected, type the command prtpicl -v. Search the output of this command for devices using either pci1000,56 or pci1000,58 compatible properties, and where a pcie-capid-reg property exists and the revision-id property is less than or equal to 2. For example:

pci1000,56 AND pcie-capid-reg exists AND revision-id <= 2
or
pci1000,58 AND pcie-capid-reg exists AND revision-id <= 2

64-bit SPARC: DR Operations Involving Lowest CPU ID Fail (6663570)

Dynamic reconfiguration (DR) operations involving the lowest CPU ID might cause the domain to panic. The following error message is displayed:

panic[cpu40]/thread=2a1008ebca0: BAD TRAP: type=10 rp=xxxxxxx addr=xxxxxxx mmu_fsr=0

Workaround: Do not use DR to identify the system board hosting the CPU with the lowest CPU ID. Use the prtdiag command to identify the CPU with the lowest CPU ID.

SPARC: 19.55% Performance Regression for the NCP Device Driver (6660074)

Performance regression occurs for the Niagara Crypto Provider (NCP) device driver on Sun SPARC Enterprise T5220 machines with the Solaris 10 5/08 release. No error message is displayed.
Workaround: Add the following line to the `/platform/sun4v/kernel/drv/ncp.conf` configuration file:

```
ncp-threads-per-core=6;
```

**64-bit SPARC: Some DR Commands Fail (6614737)**

The DR commands, `deleteboard(8)` and `moveboard(8)`, might hang if any of the following conditions exist:

- A dual in-line memory module (DIMM) has been degraded.
- The domain contains system boards with different memory sizes.

No error message is displayed.

Workaround: If a DR command hangs, reboot the domain to recover.

Avoid performing DR operations if any of the listed conditions exist.

To identify if the system contains degraded memory, use the XSCF `showstatus` command. To identify if the domain contains system boards with different memory sizes, use the XSCF `showdevices` command. You can also use the `prtdiag` command on the domain to display the list of memory sizes of the system boards.

**The (ZFS) ARC Allocates Memory Inside The Kernel Cage Preventing DR (6522017)**

ZFS can potentially allocate kernel memory across all system boards on systems with very large memory configurations. One free system board is required for dynamic memory reconfiguration so that the memory from the board to be dynamically reconfigured can be copied to the free board. The dynamic memory reconfiguration means that you cannot dynamically reconfigure memory on systems with very large memory configurations that have ZFS running. High-end SunFire servers can relocate kernel pages so that this issue is avoided. These servers must have kernel page relocation (KPR) enabled for domains with more than 32 cores. No error message is displayed.

Workaround: Reduce the amount of kernel memory that ZFS can allocate by setting the `zfs_arc_max` parameter in the `/etc/system` file. The following example sets the maximum size to 512 Mbytes.

```
set zfs_arc_max = 0x20000000
```
mpathadm Does Not Display Load-Balance Setting Specific to Device

The mpathadm show logical-unit subcommand lists the load balancing global configuration value for the Current Load Balance property. However, entries in the csi_vhci.conf that change the load-balance type for a specific product are not reflected in the mpathadm output even when the setting is active.

Registration Tool Prevents Power Management on Some Framebuffers (6321362)

If the background processes for the registration tool are left running, the Elite3D and Creator3D framebuffers stop power management. This failure reduces the power savings when the system is in a power-managed state. Under certain conditions, sys-suspend might also hang. No error message is displayed. The system might hang during a system suspend or resume operation.

Workaround:

Run the following command approximately 60 seconds after each login:

```
# pkill -f basicreg.jar
# pkill -f swupna.jar
```

SPARC: Sun Crypto Accelerator 4000 Board Versions 1.0 and 1.1 Not Supported in Solaris 10 OS

A new cryptographic framework is provided in Solaris 10 OS. However, versions 1.0 and 1.1 of the Sun Crypto Accelerator 4000 board’s software and firmware do not utilize this framework. Consequently, these versions are not supported in the Solaris 10 OS.

The 2.0 release uses the new framework. This release is available as a free upgrade to current Sun Crypto Accelerator 4000 users who plan to use Solaris 10 OS. Because the Sun Crypto Accelerator 4000 is an export-controlled product, you must contact Sun Enterprise Services or your local sales channel to obtain the free upgrade. Additional information is available on the Sun Crypto Accelerator 4000 web page at Sun’s products site.

Certain USB 2.0 Controllers Are Disabled

Support for certain USB 2.0 controllers has been disabled because of incompatibilities between these devices and the EHCI driver. The following message is displayed:
Due to recently discovered incompatibilities with this USB controller, USB2.x transfer support has been disabled. This device will continue to function as a USB1.x controller. If you are interested in enabling USB2.x support please refer to the ehci(7D) man page. Please refer to www.sun.com/io for Solaris Ready products and to www.sun.com/bigadmin/hcl for additional compatible USB products.

For the latest information about USB devices, see http://www.sun.com/io_technologies/USB-Faq.html.

**Supported USB Devices and Corresponding Hub Configurations**

This Solaris release supports both USB 1.1 and USB 2.0 devices. The following table is a summary of USB devices that work in specific configurations. Connection types can either be direct to the computer or through a USB hub. Note that USB 1.1 devices and hubs are low speed or full speed. USB 2.0 devices and hubs are high speed. For details about ports and speeds of operation, see the *System Administration Guide: Devices and File Systems*.

<table>
<thead>
<tr>
<th>USB Devices</th>
<th>Connection Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>USB 2.0 storage devices</td>
<td>Direct, USB 1.1 hub, USB 2.0 hub</td>
</tr>
<tr>
<td>USB 1.1 devices except audio</td>
<td>Direct, USB 1.1 hub, USB 2.0 hub</td>
</tr>
<tr>
<td>USB 1.1 audio devices</td>
<td>Direct, USB 1.1 hub</td>
</tr>
<tr>
<td>USB 2.0 audio devices</td>
<td>Not supported</td>
</tr>
</tbody>
</table>

**x86: Limitations Exist With Certain Device Drivers in Solaris 10 OS**

The following list describes limitations with certain drivers and interfaces in this release of Solaris 10 for x86 platforms:

**Checkpoint Resume**

This functionality is turned off for all device types. In the DDI_SUSPEND code in your detach() function, you should return DDI_FAILURE.

**Power Management**

This functionality is unavailable to USB devices. Do not create power management components. Write your driver so that pm_raise_power() and pm_lower_power() are called only when power management components are created.
DVD-ROM/CD-ROM Drives on Headless Systems

Power management of interactive devices such as removable media is linked with power management of your monitor and the graphics card that drives your monitor. If your screen is active, devices such as the CD-ROM drive and diskette remain at full-power mode. These devices might switch to low-power mode on a system without a monitor. To restore power to the CD or diskette, type `volcheck` to obtain the latest status from each removable device.

Alternatively, you can disable power management on your system by using the Dtpower GUI. By disabling power management, these devices are constantly at full power.

x86: Manual Configuration Required to Specify Non-US English Keyboards

By default, the `kdmconfig` program specifies Generic US-English (104-Key) as the keyboard type that is connected to the system. If the system’s keyboard is not a US-English keyboard, you must manually specify the keyboard type during installation. Otherwise, installation continues by using the default keyboard specification that is inconsistent with the system’s actual keyboard type.

**Workaround 1:** If the system’s keyboard is not a US-English keyboard, perform the following steps during installation:

1. When the Proposed Window System Configuration For Installation is displayed, press Esc.

   **Note** – The information on the Proposed Window System Configuration For Installation, which includes the keyboard type, is displayed only for 30 seconds. If you want to change configuration settings, you must press Esc before the 30 seconds lapse. Otherwise, the installation continues by using the displayed settings.

2. Change the keyboard type to the type that corresponds to your system’s keyboard.
3. Press Enter to accept the changes and continue with the installation.

**Workaround 2:** If you want to change the keyboard type in a system that is already running Solaris 10 OS, use the `kdmconfig` program. Choose the option that applies to the type of X server your system is running.

- If your system is running the Xsun server, follow these steps:
  1. Run `kdmconfig`.
  2. Use the Change Keyboard option to change the keyboard type.
  3. Save the configuration.
If your system is running the default Xorg server, follow these steps:
1. Run `kdmconfig`.
2. Select the Xsun server.
3. Use the Change Keyboard option to change the keyboard type.
4. Save the configuration.
5. Run `kdmconfig` again to switch to the Xorg server.

**SPARC: jfca Driver for Certain Host Bus Adapters That Are Connected to Tape Devices Might Cause Errors (6210240)**

The jfca driver for the following host bus adapters (HBAs) might cause system panics or I/O failures when these HBAs are connected to tape devices:
- SG-PCI1FC-JF2
- SG-PCI2FC-JF2

The jfca driver for these HBAs is prone to race conditions when certain operations are being run, and thus causes the errors. The operations are the following:
- Link reset
- Loop reset
- Switch reset
- Repeated link failures

Error messages similar to the following examples might be displayed:

- I/O failure messages
  
  jfca: [ID 277337 kern.info] jfca4: Sequencer-detected error. Recover immediately.
  last message repeated 18376 times
  scsi: [ID 107833 kern.warning] WARNING: /pci@1e,600000/SUNW,jfca@3,1/fp@0,0/st@w210001086108 628.1 (st3): SCSI transport failed: reason ‘timeout’: giving up

- System panic message
  
  panic[cpu1]/thread=2a100497cc0: BAD TRAP: type=31 rp=2a1004978d0 addr=a8 mmu_fsr=0 occurred in module "jfca" due to a NULL pointer dereference

**Workaround:** Do not connect tape devices to either the SG-PCI1FC-JF2 or SG-PCI2FC-JF2 HBA.
Contention Exists Between Certain Devices That Share the Same Bus (6196994)

A bus contention occurs if Quad Fast-Ethernet (QFE) cards share the same bus with any of the following adapters:

- Sun GigaSwift adapter
- Sun Dual Gigabit Ethernet and Dual SCSI/P adapter
- Sun Quad Gigaswift Ethernet adapter

The infinite-burst parameter of the ce driver that is used by these adapters is enabled by default. Consequently, little or no bus time is available for the QFE ports that share the same bus.

Workaround: Do not place QFE cards on the same bus as the network adapters in the list.

hat_getkpfnum() DDI Function Is Obsolete (5046984)

The hat_getkpfnum() DDI function is obsolete. Developers should update their device drivers to not use the hat_getkpfnum() DDI interface. If drivers are using hat_getkpfnum(), warnings similar to the following example are displayed:

```bash
WARNING: Module mydrv is using the obsolete hat_getkpfnum(9F) interface in a way that will not be supported in a future release of Solaris. Please contact the vendor that supplied the module for assistance, or consult the Writing Device Drivers guide, available from http://www.sun.com for migration advice.
```

Callstack of bad caller:

```bash
hat_getkpfnum_badcall+93
hat_getkpfnum+6e
mydrv_setup_tx_ring+2d
mydrv_do_attach+84
mydrv_attach+242
devi_attach+6f
attach_node+62
i_ddi_config_node+82
i_ddi_attachchild+4a
devi_attach_node+4b
devi_attach_children+57
config_immediate_children+6e
devi_config_common+77
mt_config_thread+8b
```

To determine if a driver is using hat_getkpfnum(), consult the driver source code, or examine the driver’s symbols by using `nm()`. Using the driver `mydrv` as an example, type the following syntax:
% nm /usr/kernel/drv/mydrv | grep hat_getkpfnun

For guidance about migrating drivers away from hat_getkpfnun(), refer to Appendix B, “Summary of Solaris DDI/DKI Services,” in Writing Device Drivers.

**Some DVD and CD-ROM Drives Fail to Boot Solaris (4397457)**

The default timeout value for the SCSI portion of the SunSwift PCI Ethernet/SCSI host adapter (X1032A) card does not meet the timeout requirements of Sun’s SCSI DVD-ROM drive (X6168A). With marginal media, the DVD-ROM occasionally experiences timeout errors. The only exceptions are Sun Fire 6800, 4810, 4800, and 3800 systems. These systems overwrite the SCSI timeout value by means of OpenBoot PROM.

**Workaround:** For other platforms, use the on-board SCSI interfaces or DVD-ROM compatible SCSI adapters, such as the following examples:

- X1018A (SBus: F501-2739-xx)
- X6540A (PCI: F375-0005-xx)

**iPlanet Directory Server 5.1 Issues**

This section provides important information for users of iPlanet Directory Server 5.1 who are upgrading to the new Solaris 10 release.

**Installing Directory Server 5.1**

Sun Java System Directory Server 5 2005Q1 replaces iPlanet Directory Server 5.1 that was integrated in the Solaris 9 Operating System. In Solaris 10 OS, this new Directory Server can be installed as part of the Sun Java Enterprise System.

**Note** – For information about the Sun Java System Directory Server 5 2005Q1, refer to the documentation for the Sun Java System at [http://docs.sun.com](http://docs.sun.com).

Solaris 10 OS continues to support Directory Server 5.1. You might need to install Directory Server 5.1 under the following circumstances:

- You need to recover Directory Server 5.1 data.
- You want to migrate your data to Directory Server 5 2005Q1.
In Solaris 10 release, you install the Directory Server 5.1 manually. Follow these steps:

1. Insert the Solaris 10 Software - 5 CD into your CD-ROM drive.
2. Become superuser.
3. In a terminal window, install the Directory Server.

```
# cd /cdrom/cdrom0/Solaris_10/Product/
# pkgadd -d . IPLTnls IPLTnspri IPLTjss IPLTpldap
  IPLTdsr IPLTdsu IPLTadmin IPLTcons IPLTadcon IPLTdscon
  IPLTadman IPLTdsman
```

To install Simplified Chinese localization packages, issue the following additional command:

```
# pkgadd -d . IPLTcdsu IPLTcadmin IPLTcadcon
  IPLTcdscon IPLTcadman IPLTcdsman
```

To install Japanese localization packages, issue the following additional command:

```
# pkgadd -d . IPLTjdsu IPLTjadman IPLTjadcon
  IPLTjdscon IPLTjadman IPLTjdsman
```

**Migrating to the Sun Java System Directory Server 5 2005Q1**

**Caution** – The database formats of the two Directory Server versions are incompatible. Thus, if you are a Directory Server 5.1 user, Sun recommends that you migrate your database to a database that is formatted for the Sun Java System Directory Server 5 2005Q1.

To perform a migration, both versions of the Directory Server must exist in the system that has been upgraded to the Solaris 10 OS. If you are a DS 5.1 user, but are using the compressed archive (.tar.gz) delivery format, you can skip immediately to the migration instructions in Step 2.

1. On a terminal window, check whether iPlanet Directory Server 5.1 packages are present in your system.

```
$ pkginfo | grep IPLT
```

If the following packages appear as output, then you can go to Step 2 to proceed with the migration. The output indicates that the iPlanet Directory Server 5.1 packages are in the system.
If the packages do not exist, then install the iPlanet Directory Server 5.1 packages first. Refer to the 4-step procedure in the preceding section “Installing Directory Server 5.1” on page 70. After installation is complete, go to Step 2 to proceed with the migration.

After migrating your data, make sure you continue to back up directory data in the same way as you backed up directory data before migration. Future disaster recovery might require the migrated database.

### Issues While Running Debugger

The following issues involve the kernel debugger.

**x86: Unexpected SIGTRAP Signal Causes dbx Debugger to Hang (6546562)**

When the dbx debugger is being used on the Solaris 10 OS on x86 platforms to debug a program that raises or delivers signals that have signal handlers, dbx might receive an unexpected SIGTRAP signal from the kernel that causes the debugger to hang. This situation can occur when dbx is single stepping, running to a breakpoint, collecting runtime checking (RTC) data, or performing any other activity that depends on signal trapping.

In some cases, dbx displays a warning of an unexpected SIGTRAP signal when it hangs. For example:

```
  dbx: internal warning: unexpected SIGTRAP!
```

In other cases, dbx indicates receipt of a SEGV signal. For example:
signal SEGV (no mapping at the fault address) in main at line 29 in file “test.c”

In this case, when the user types the cont -sig SEGV command to continue execution with the SEGV signal, dbx displays the warning of the unexpected SIGTRAP.

This bug is introduced into the Solaris 10 OS on x86 platforms when kernel patch 127112 is installed.

Workaround: Do not install kernel patch 127112. Uninstall the kernel patch if it has already been installed. For more information about this bug, see the Sun Studio Support News page at http://developers.sun.com/sunstudio/support/troubleshooting/index.jsp.

SPARC: Problems With dbx Debugger While Processing 64-bit Objects (6347707)

The dbx debugger terminates with a memory access failure while processing certain 64-bit executable files and libraries. However, the problem does not affect the normal use of these 64-bit objects. An error message similar to the following example is displayed:

dbx: internal error: signal SIGBUS (invalid address alignment)

Workaround: Use either the mdb debugger or the Solaris Dynamic Tracing facility instead. These alternatives can diagnose processes that use the 64-bit objects.

System Might Loop When Master CPU Is Changed (4405263)

A system that is running the Solaris kernel debugger to debug a live system might loop with incomplete error messages. This loop occurs when the OpenBoot PROM’s master CPU is changed. A system reset restores the system to operation. However, the traces of the original failure are lost. Consequently, you cannot perform a diagnosis of the fatal reset.

Workaround: When the system is at the PROM level, the OpenBoot’s ok prompt is displayed. In a system with multiple CPUs, the ok prompt is preceded by a number that is enclosed in curly braces. This number indicates the active CPU in the system. To run your debug session while at the PROM level, use the following steps.

1. Raise pil to f by typing the following command:

   {0} ok h# 0f pil!

2. Use the switch -cpu command to selectively switch from the currently active CPU to different CPUs. For example, to switch from CPU #0 to CPU #1, type the following command:
Localization Issues

This section describes localization issues that apply to Solaris 10 OS.

Multiple Input Method Switcher Applications Appear in Trusted Java DS

When you log in to the Trusted Java DS with UTF-8 or Asian locales, the Input Method Switcher application, iiim-panel, appears per label by default. Thus in multiple label environment, multiple iiim-panel appears, which could be confusing to the user.

No error message is displayed.

Workaround: Stop using the iiim-panel. Perform the following steps:

- Right-click on iiim-panel and select Preference. The Input Method Preference Editor, iiim-properties, is displayed.
- Select None or Attach to Each Application from the Input Method Status and Switcher Placement list in the General tab.
- Press Apply or Click the OK button.

To switch the input language, you can also use Hotkey. To enable Hotkey, perform the following steps:

- Go to Misc tab in the iiim-properties.
- Select the Enable Language/Script choice window using Hotkey option.
- Press Apply or Click the OK button.
Note – When Attach to each application is selected, the language switcher list will not be displayed for GTK applications. You can switch input language by using Hotkey.

### Wnn8 Japanese Input Method

Wnn8 Japanese Input method cannot be used if the Wnn8 servers are not enabled.

**Workaround:** Enable the Wnn8 servers:

```
# svcadm enable wnn8/server
```

In addition, select Wnn8 as the Japanese Language engine by running the `iiim-properties` command.

### Input Method Cannot Be Enabled With Primary Administrator Rights (6475081)

A user who has the Primary Administrator right can not use the input method for specific locales which prevents that user from entering characters normally. The input method status is not displayed in the workspace. No error message is displayed.

**Workaround:** Add the following lines to the `/etc/security/exec_attr` file:

```
Primary Administrator:solaris:cmd:::/usr/bin/csh:uid=0;gid=0
Primary Administrator:solaris:cmd:::/usr/bin/ksh:uid=0;gid=0
Primary Administrator:solaris:cmd:::/usr/bin/sh:uid=0;gid=0
```

For information about the file format, see the `exec_attr(4)` man page.

### New ChuYin Input Method Not Supported in Upgrade to IIIMF rev.12 (6492129)

When you upgrade the OS to the Solaris 10 6/06 or Solaris 10 11/06 release, the input method framework and individual input methods get upgraded from rev.10 to rev.12. However, ChuYin is not in the list of supported input methods. Also, you cannot use the function keys F2 and F3 to switch methods.

**Workaround:** Use PinYin to type traditional Chinese characters with Hanyu PinYin. Use Ctrl+Shift to switch input methods.
**AltGr Does Not Work As Mode Switcher in Some Russian Locales (6487712)**

The AltGr key does not work as a mode switcher for the Russian Xsun layout in ru_RU.KOI8-R and ru_RU.ANSI1251 locales.

**Workaround 1:** Switch to the ru_RU.UTF-8 or the ru_RU.ISO8859-5 locale.

**Workaround 2:** Use IIIMF instead of the Russian keyboard layout.

**Arabic Text Not Appearing in ar Locales**

If your x86 system is using Xorg as the default Xserver, the Arabic font (iso7759-6) does not appear in the ar locale. This error does not occur if you are using XSun instead of XOrg.

**Workaround:** Follow these steps.

1. As superuser, edit /usr/dt/config/Xservers.
   - Uncomment or add the following line:
     ```
     :0 Local local_uid@console root /usr/openwin/bin/Xsun :0
     -nobanner -defdepth 24
     ```
   - Comment out the following line:
     ```
     :0 Local local_uid@console root /usr/X11/bin/Xorg :0
     ```
2. Reboot the system.

Alternatively, you can log in to ar_EG.UTF-8 or other UTF-8 locales.

**Solaris PDASync Does Not Support Data Exchange With the Multibyte Internationalized PDA Device (4263814)**

If you exchange multibyte data between a PDA device and Solaris CDE, the data might be corrupted in both environments.

**Workaround:** Back up your data on your personal computer with the PDA backup utility before you run the Solaris PDASync application. If you accidentally exchange multibyte data and corrupt that data, restore your data from the backup.
Several Arabic Fonts Do Not Work in GNOME (6384024)

In GNOME when you select certain Arabic fonts, the characters do not display. This problem appears when you select fonts for applications, the desktop, or the window title using the GNOME font properties menu. The affected fonts include:

- Akhbar MT (Regular, Bold)
- Shayyal MT (Regular, Bold)
- Naskh MT (Regular, Bold)

No error message is displayed.

Workaround:

Use any of the newly delivered Kacst family of fonts to display Arabic characters in GNOME applications.

Unable to Switch Input Language on Session-Saved Applications (6360759)

Multiple language input is supported in UTF-8 locales, but the language switch is not working with session-saved applications where mouse button 1 is clicked first after login. This problem occurs with the Java Desktop System (Java DS). No error message is displayed.

Workaround:

Click mouse button 1 on the background workspace or Launch Menu before clicking any application.

Keyboard Shortcuts in Mozilla in ES Locale Are Unusual and Ambiguous (6288620)

The keyboard shortcuts in Mozilla 1.7 are unusual, especially in Spanish locale. For example, Ctrl-S is being used for copying as well as for saving. No error message is displayed.

Workaround:

Identify the shortcut keys assigned to user actions from menu in the product.
Migration Note to UTF-8 locales

When migrating to UTF-8 locales, the files affect the method that you use to import or export data.

Microsoft Office Files

Microsoft Office files are encoded in Unicode. StarOffice applications can read and write the Unicode encoded files.

HTML Files

HTML files authored using HTML editors such as Mozilla Composer, or HTML files saved by a web browser, usually contain a charset encoding tag. After exporting or importing, you can browse such HTML files with the Mozilla Navigator web browser, or edit the files with Mozilla Composer, according to the encoding tag in the HTML file.

Fixing Broken HTML File

Some HTML files might be displayed in garbage characters. This problem is typically due to the following reasons:

- The charset encoding tag is incorrect.
- The charset encoding tag is missing.

To find the charset encoding tag in the HTML file, perform the following actions:

1. Open the file with Mozilla.
2. Press Ctrl-i, or click View to open the View menu.
3. Click Page Info.

The charset information is in the bottom of the General tab, for example:

```
Content-Type text/html; charset=us-ascii
```

If the string charset=us-ascii does not match the actual encoding of the file, the file might appear broken. To edit the encodings of the HTML file, perform the following actions:

1. Open the file with Mozilla Composer.
2. Open the File menu.
3. Select Save as Charset.
4. Choose the correct encoding. Mozilla Composer automatically converts the encoding and the charset tag as appropriate.
Emails Saved As Portable Format

Modern mails are tagged with the MIME charset tag. The Email and Calendar application accepts MIME charset tags. You do not need to perform any encoding conversion.

Plain Text Files

Plain text files do not have a charset tag. If the files are not in UTF-8 encoding, encoding conversion is needed. For example, to convert a plain text file encoded in Traditional Chinese big5 to UTF-8, execute the following command:

```bash
iconv -f big5 -t UTF-8 inputfilename
```

You can also use the File System Examiner for the encoding conversion.

You can use the Text Editor to read and write character encoding text automatically or by specifying an encoding explicitly when opening or saving a file.

To start Text Editor, click Launch, then choose Applications->Accessories->Text Editor.

File Names and Directory Names

If file names and directory names using multibyte characters are not in UTF-8 encoding, encoding conversion is needed. You can use File System Examiner to convert file and directory names and the contents of plain text files from legacy character encodings to UTF-8 encoding. Refer to the online Help for File System Examiner for more information.

To start File Systems Examiner, click Launch, then choose Applications->Utilities->File System Examiner.

When you access non-UTF-8 file or directory names on Microsoft Windows via SMB using File Manager, you can access the non-UTF-8 file or directory names without encoding conversion.

Launching Legacy Locale Applications

For applications that are not ready to migrate to Unicode UTF-8, you can create a launcher on a front panel to start the application in legacy locales. You can also launch the applications directly from the command line. Perform the following steps to create a launcher for an application.

1. Right-click on the panel where you want to place the launcher.
2. Choose Add to Panel->Launcher.
3. Use the following format to type the entry in the Command field in the Create Launcher dialog:

```env LANG=locale LC_ALL=locale application name```

For example, if you want to launch an application called motif-app from /usr/dt/bin in the Chinese Big5 locale, enter the following text in the Command field of the Create Launcher:

`env LANG=zh_TW.BIG5 LC_ALL=zh_TW.BIG5 /usr/dt/bin/motif-app`

4. Click OK to create the launcher on the panel.

When you need to run CLI (command line interface) applications which are specific to a legacy locale, open a Terminal window in the legacy locale first and then run the CLI applications in the same Terminal window. To open a Terminal window in a legacy locale, enter the following command:

```env LANG=locale LC_ALL=locale GNOME-TERMINAL --disable-factory```

Instead of opening a new Terminal window in a legacy locale, you can switch the locale setting from UTF-8 to a legacy locale in the current Terminal window by changing the encoding the Set Character Encoding menu in the Terminal window. Then you must also set the LANG and LC_ALL environment variables to the current shell.

### Hardware for Some Keyboards Layouts Type 6 and 7 Not Available

Software support for some keyboard layouts has been added to the Solaris OS. This software gives users greater flexibility for keyboard input by modifying standard U.S. keyboard layouts to their own language needs.

Currently, no hardware is available for the following keyboard layout types:

<table>
<thead>
<tr>
<th>Albania</th>
<th>Belarus</th>
</tr>
</thead>
<tbody>
<tr>
<td>Belarus</td>
<td>French Canadian</td>
</tr>
<tr>
<td>Croatia</td>
<td>Czech</td>
</tr>
<tr>
<td>Denmark</td>
<td>Estonia</td>
</tr>
<tr>
<td>Hungary</td>
<td>Iceland</td>
</tr>
<tr>
<td>Latvia</td>
<td>Lithuania</td>
</tr>
<tr>
<td>Malta UK</td>
<td>Malta US</td>
</tr>
</tbody>
</table>
Workaround: Choose one of the following workarounds:

- **Workaround 1:** To take advantage of this keyboard software, set up keyboard input using the `kbd -s` command line utility. For desktop sessions with the UTF-8 locale environment, use Input Method Preference Editor. If the required keyboard layout is not included in the `kbd -s` utility, use Workaround 2.

- **Workaround 2:** Modify the `/usr/openwin/share/etc/keytables/keytable.map` file. For example, for the Canadian Type 6 keyboard, make the following changes:

  1. Change the US6.kt entry to Canada6.kt in the
     `/usr/openwin/share/etc/keytables/keytable.map` file. The modified entry should read as follows:

     ```
     6 0 Canada6.kt
     ```

  2. Reboot the system for the changes to take effect.

**Sort Capability in the European UTF-8 Locales Does Not Function Correctly (4307314)**

The sort capability in the European UTF-8 locales does not work properly.

**Workaround:** Before you attempt to sort in a FIGGS UTF-8 locale, set the `LC_COLLATE` variable to the ISO–1 equivalent.

```bash
# echo $LC_COLLATE
> es_ES.UTF-8
# LC_COLLATE=es_ES.ISO8859-1
# export LC_COLLATE
```

Then start sorting.

**Networking Issues**

The following networking bugs apply to the Solaris 10 release.
**nxge Driver Panics in nxge_fflp_stat_update (6644276)**

Running kstat on the nxge driver might cause a system panic. However, this condition is rarely encountered.

**Workaround:** Do not run kstat on the nxge driver.

**SPARC: NFS/RDMA Connection Errors (6229077)**

Connection errors might occur between an NFS server and client that are using Remote Direct Memory Access (RDMA). Because of these errors, the buffer pool resources are exhausted and the system panics. The following error message is displayed:

```
rpcib: WARNING: rib_rbuf_alloc: No free buffers!
```

**Workaround:** Choose one of the following workarounds:

- Configure the NFS server to enable TCP. In the `/etc/default/nfs` file, change `(NFSD_PROTOCOL=tcp)`.
- Mount the NFS file system from the client side with the `proto=tcp` mount option.

For more information, see the `mount_nfs(1M)` and `nfs(4)` man pages.

**Login Fails on iSCSI Target With Two Portals and One Bad Portal (6476060)**

If an iSCSI target or an array returns more than one IP address as part of its send target response, the initiator takes into account only the last address in the list and not the first one, as it used to prior to this release. As a result, if the last IP address is bad or invalid, the connection to this target fails.

**Workaround:** Return the different target portal group tags (TPGT) for each entry in its send target response. The initiator tries to establish a connection to all the IP addresses so that the connection succeeds.

**System Domain of Interpretation Is Not Configurable (6314248)**

The system Domain of Interpretation (DOI) is not configurable. When the Solaris Management Console is used to create a new trusted network template, the Solaris Management Console sets the DOI to 0 and Solaris Trusted Extensions does not function correctly. Various error messages are displayed.
Workaround: Set the DOI to 1 using the Solaris Management Console.

IP Forwarding Disabled by Default in Solaris 10 OS

In this Solaris release, IP forwarding is disabled by default. This setting applies to both IPv4 and IPv6 regardless of other system configurations. Systems with multiple IP interfaces that formerly forwarded IP packets by default no longer have this automatic feature. To enable IP forwarding in multihomed systems, administrators must manually perform additional configuration steps.

Workaround: The command `routeadm` enables IP forwarding. The configuration changes that are the result of `routeadm` usage persist across system reboots.

- To enable IPv4 forwarding, type `routeadm -e ipv4-forwarding`.
- To enable IPv6 forwarding, type `routeadm -e ipv6-forwarding`.
- To apply the enabled IP-forwarding configuration to the currently running system, type `routeadm -u`.

For more information about IP forwarding, see the `routeadm(1M)` man page.

Zone Not Booting When IP Address Belongs to a Failed IP Network Multipathing Group (6184000)

A zone can be configured so that the zone’s IP address becomes part of an IP Network Multipathing (IPMP) group. The configuration process is documented in “How to Extend IP Network Multipathing Functionality to Shared-IP Non-Global Zones” in *System Administration Guide: Oracle Solaris Containers-Resource Management and Oracle Solaris Zones*.

If all the network interfaces in the IPMP group fail, a zone does not boot if it has an IP address that is part of the IPMP group.

The following example illustrates the result if you attempt to boot the zone.

```
# zoneadm -z my-zone boot
zoneadm: zone 'my-zone': bge0:1:
  could not set default interface for multicast: Invalid argument
zoneadm: zone 'my-zone': call to zoneadmd failed
```

Workaround: Repair at least one network interface in the group.
Intermittent Errors Might Occur With the Use of DataDigests (5108515)

Internet SCSI (iSCSI) targets might report cyclic redundancy check (CRC) errors if DataDigests are enabled. User applications that update input/output buffers after transmitting to the iSCSI initiator might cause a miscalculation of the CRC. When the target responds with a CRC error, the iSCSI Initiator retransmits the data with the correct DataDigest CRC. Data integrity is maintained. However, data transfer performance is affected. No error message is displayed.

**Workaround:** Do not use the DataDigest option.

Configuring Multiple Tunnels Between Two IP Nodes With Filtering Enabled Might Result in Packet Loss (4152864)

If you configure multiple IP tunnels between two IP nodes, and enable ip_strict_dst_multihoming or other IP filters, packet loss might result.

**Workaround:** Choose one of the following:
- First, configure a single tunnel between the two IP nodes. Add addresses to the tunnel by using the `ifconfig` command with the `addif` option.
- Do not enable `ip_strict_dst_multihoming` on tunnels between two IP nodes.

Security Issues

The following security issues applies to the Solaris 10 release.

KDC Daemons Fail to Start (6623803)

If Kerberos is configured to use the LDAP backend for the Kerberos database, krb5kdc/kadm1nd will fail to start when run through SMF. krb5kdc/kadm1nd will be in the maintenance state.

**Workaround:** Type the following command:

```
echo “something” > /var/krb5/principal
```
Note – Do not use this workaround unless the Kerberos LDAP database backend is being used. If the default db2 backend is being used, this workaround will destroy the Kerberos database.

Nonpassword Logins Fail With pam_ldap Enabled (6365896)

After the account management PAM module for LDAP (pam_ldap) is enabled, users must have passwords to log in to the system. Consequently, nonpassword-based logins fail, including those logins that use the following tools:

- Remote shell (rsh)
- Remote login (rlogin)
- Secure shell (ssh)

Workaround: None.

Incorrect Parameters Might Cause Panic in Sun StorEdge T3 (4319812)

A Sun StorEdge T3 system might panic if an application uses the HTTP interface to send tokens with out-of-range parameters.

Service Management Facility

This section describes issues that involve the Service Management Facility of Solaris 10 OS.

Login Prompts Sometimes Appear Before File Systems Are Mounted (5082164)

During system startups, sometimes the login services such as console or ssh logins start before remote file systems and naming services become available. Consequently, the user name might not be recognized or the user’s home directory might not be available.

Workaround: If the error occurs, wait for a few seconds and then log in again. Alternatively, log in from a local account to view the system state.
The following Smart Card bugs apply to Solaris 10 OS.

**System Does Not Respond to Smart Card (4415094)**

If `ocfserv` terminates and the display is locked, the system remains locked even when a smart card is inserted or removed.

**Workaround:** Perform the following steps to unlock your system:

1. Perform a remote login to the machine on which the `ocfserv` process was terminated.
2. Become superuser.
3. Kill the `dtsession` process by typing the following in a terminal window.
   
   ```
   # pkill dtsession
   ```

   `ocfserv` restarts and smart card login and capability are restored.

**Solaris Commands and Standards**

The following section describes behavior changes in certain commands and standards in Solaris 10 OS.

**Changed Man Pages for Solaris Trusted Extensions Are in Reference Manual Only**

The following Solaris Trusted Extensions man pages are revised for this release:

- `add_allocatable(1M)`
- `remove_allocatable(1M)`
- `label_to_str(3TSOL)`
- `tsol_getrtype(3TSOL)`
- `tnzonecfg(4)`

The revised man pages cannot be viewed using the `man` command. To view the revised man pages, see the *Solaris Trusted Extensions Reference Manual.*
Bash 2.0.5b No Longer Sets Some Environment Variables

Solaris 10 OS includes Bash 2.0.5b. This shell no longer automatically exports the following variables to the environment:

- HOSTNAME
- HOSTTYPE
- MACHTYPE
- OSTYPE

This new behavior applies even if the shell assigns default values to these variables.

**Workaround:** Export these variables manually.

New `ln` Utility Requires `-f` Option

The behavior of `/usr/bin/ln` has changed to adhere to all of the standards from SVID3 through XCU6. If you use the `ln` command without the `-f` option to link to an existing target file, the link is not established. Instead, a diagnostic message is written to standard error, and the command proceeds to link any remaining source files. Finally, the `ln` command exits with an error value.

For example, if file b exists, the syntax `ln a b` generates the following message:

```
ln: b: File exists
```

This behavior change affects existing shell scripts or programs that include the `ln` command without the `-f` option. Scripts that used to work might now fail in Solaris 10 OS.

**Workaround:** Use the `-f` option with the `ln` command. If you have existing scripts that execute the link utility, make sure to modify these scripts to comply with the command’s new behavior.

New `tcsh` Rejects `setenv` Variable Names That Use a Dash or an Equals Sign

In Solaris 10 OS, `tcsh` has been upgraded to version 6.12. This version no longer accepts environment variables whose names use a dash or an equals sign. Scripts that contain `setenv` lines and that work in earlier Solaris versions might generate errors in the current Solaris 10 release. The following error message is displayed:

```
setenv: Syntax error
```

For more information, refer to the `tcsh` man page for the Solaris 10 OS.
Workaround: Do not use the dash or equals sign in names for environment variables.

**STDOUT getc Family EOF Condition Behavior Change**

Applications that were built in strict standard C conformance mode are affected by the behavior changes of certain library functions. An example is applications that were compiled by using the `cc -Xc` or `c89` compilation mode. The behavior has changed for the following library functions:

- `fgetc()`
- `fgets()`
- `fgetwc()`
- `fgetws()`
- `getc()`
- `getchar()`
- `gets()`
- `getwc()`
- `getwchar()`
- `getws()`

A formal interpretation of the 1990 C Standard requires that after an end-of-file condition is set, no more data is returned from the file on subsequent input operations. The exception is if the file pointer is repositioned or the error and end-of-file flags are explicitly cleared by the application.

The behavior for all other compilation modes remains unchanged. Specifically, the interfaces can read additional newly written data from the stream after the end-of-file indicator has been set.

Workaround: Call `fseek()` or `clearerr()` on the stream to read additional data after the EOF condition has been reported on the stream.

**Output Columns of the ps Command Have Been Widened**

Due to larger UIDs, processor ids, and cumulative execution time, the columns of the `ps` command output have been widened. Customer scripts should not assume fixed output columns.

Workaround: Scripts should use the `-o` option of the `ps` command.

For more information, see the `ps(1)` man page.
Command `ping -v` Does Not Work on IPv6 Addresses (4984993)

The command `ping -v` fails when the command is applied to addresses that use Internet Protocol version 6 (IPv6). The following error message is displayed:

```
ping: setsockopt IPV6_RECVRTHDRDSTOPTS Invalid argument
```

**Workaround:** None. To obtain the same ICMP packet information that `ping -v` provides, use the `snoop` command.

Solaris Volume Manager

The following Solaris Volume Manager bugs apply to the Solaris 10 release.

**Solaris Volume Manager `metattach` Command Might Fail**

If you have a Solaris Volume Manager mirrored root (/) file system in which the file system does not start on cylinder 0, all submirrors you attach must also not start on cylinder 0.

If you attempt to attach a submirror starting on cylinder 0 to a mirror in which the original submirror does not start on cylinder 0, the following error message is displayed:

```
can't attach labeled submirror to an unlabeled mirror
```

**Workaround:** Choose one of the following workarounds:

- Ensure that both the root file system and the volume for the other submirror start on cylinder 0.
- Ensure that both the root file system and the volume for the other submirror do not start on cylinder 0.

**Note** – By default, the JumpStart installation process starts swap at cylinder 0 and the root (/) file system somewhere else on the disk. Common system administration practice is to start slice 0 at cylinder 0. Mirroring a default JumpStart installation with root on slice 0, but not cylinder 0, to a typical secondary disk with slice 0 that starts at cylinder 0, can cause problems. This mirroring results in an error message when you attempt to attach the second submirror. For more information about the default behavior of Solaris installation programs, see the Solaris 10 Installation Guides.
Solaris Volume Manager `metassist` Command Fails in Non-English Locales (5067097)

In non-English locales, the Solaris Volume Manager `metassist` command might fail to create volumes. For example, if `LANG` is set to `ja` (Japanese), the following error message is displayed:

```
xmEncodeEntitiesReentrant : input not UTF-8
Syntax of value for attribute read on mirror is not valid
Value "XXXXXX"(unknown word) for attribute read on mirror
is not among the enumerated set
Syntax of value for attribute write on mirror is not valid
Value "XXXXXX"(Parallel in Japanese) for attribute write on mirror
is not among the enumerated set
metassist: XXXXXX(invalid in Japanese) volume-config
```

**Workaround:** As superuser, set the `LANG` variable to `LANG=C`.

For the Bourne, Korn, and Bash shells, use the following command:

```
# LANG=C; export LANG
```

For the C shell, use the following command:

```
# setenv LANG C
```

Volume Creation Fails in Systems With Unformatted Disks (5064066)

Creating Solaris Volume Manager volume configurations with the `metassist` command might fail if an unformatted disk is in the system. The following error message is displayed:

```
metassist: failed to repartition disk
```

**Workaround:** Manually format any unformatted disks before you issue the `metassist` command.

Hot Spares Do Not Work Correctly When Solaris Volume Manager RAID-1 (Mirror) or RAID-5 Volumes Are Created in Disk Sets Built on Soft Partitions (4981358)

If you create a Solaris Volume Manager RAID-1 (mirror) or RAID-5 volume in a disk set that is built on top of a soft partition, hot spare devices do not work correctly.

Problems that you might encounter include, but are not limited to, the following:
- A hot spare device might not activate.
- A hot spare device status might change, indicating the device is broken.
- A hot spare device is used, but resynced from the wrong drive.
- A hot spare device in use encounters a failure, but the broken status is not reported.

**Workaround:** Do not use this configuration to create a Solaris Volume Manager RAID-1 or RAID-5 volume in disk sets.

**Solaris Volume Manager metadevadm Command Fails if Logical Device Name No Longer Exists (4645721)**

You cannot replace a failed drive with a drive that has been configured with the Solaris Volume Manager software. The replacement drive must be new to Solaris Volume Manager software. If you physically move a disk from one slot to another slot on a Sun StorEdge A5x00, the metadevadm command fails. This failure occurs when the logical device name for the slice no longer exists. However, the device ID for the disk remains present in the metadevice replica. The following message is displayed:

Unnamed device detected. Please run 'devfsadm && metadevadm -r to resolve.

**Note** - You can access the disk at the new location during this time. However, you might need to use the old logical device name to access the slice.

**Workaround:** Physically move the drive back to its original slot.

**Solaris Volume Manager metarecover Command Fails to Update metadb Namespace (4645776)**

If you remove and replace a physical disk from the system, and then use the metarecover -p -d command to write the appropriate soft partition specific information to the disk, an open failure results. The command does not update the metadevice database namespace to reflect the change in disk device identification. The condition causes an open failure for each such soft partition that is built on top of the disk. The following message is displayed:

Open Error

**Workaround:** Create a soft partition on the new disk instead of using the metarecover command to recover the soft partition.
Note – If the soft partition is part of a mirror or RAID 5, use the `metareplace` command without the `-e` option to replace the old soft partition with the new soft partition.

```
# metareplace dx mirror or RAID 5
old_soft_partition new_soft_partition
```

**Sun Java Desktop System**

This section describes issues that apply to the Sun Java Desktop System (Java DS) in the Solaris 10 OS.

**Email and Calendar**

This section describes issues related to Email and Calendars.

**Problems With Using Multiple Attachments (6260583)**

If you drag and drop email messages to a new email message body, the content of the new email message is corrupted.

**Workaround:** To send multiple attachments, perform the following steps:

1. Select the messages you want to attach.
2. On the Menu bar, choose Action => Forward => Attached.
   Alternatively, you can press Ctrl-J to send the messages.

**Problem With Changing Authentication Type (6246543)**

After you change the authentication type for the incoming mail server, Email and Calendar might not work correctly.

**Workaround:** Restart Email and Calendar.

**Incomplete List of Contacts in Contact Folder (5088514)**

After you import an LDAP Data Interchange Format file containing several contacts, only some of the contacts are displayed in your contact folder. This is a display problem only. Email and Calendar has imported all the contacts.

**Workaround:** Restart Email and Calendar.

**Login Issues**

This section describes login issues.
Login Error Message

You might encounter the following error message when you log in to a Java Desktop System session:

Could not look up internet address for hostname.
This will prevent GNOME from operating correctly.
It may be possible to correct the problem by adding hostname to the file /etc/hosts

Workaround: Ensure that your hostname is set up correctly in the /etc/hosts file. Perform the following steps:

1. Set the hostname in the /etc/hosts file as follows:

   127.0.0.1 localhost loghost hostname
   localhost.localdomain

   hostname is the name of your system.

2. Ensure that your hostname is listed in the /etc/nodename file. This file must also contain the following line:

   127.0.0.1 localhost loghost hostname
   localhost.localdomain

Help System

Wrong Help Window Opened For Volume Control (6253210)

If you use the Yelp browser to open the online help for Volume Control, the help file for the Keyboard Accessibility panel application is opened instead.

Workaround: None.

Online Help Freezes (5090731)

If you open an application’s online help and no help files exist for that application, an error dialog box is displayed. Unless you click OK, the online Help system freezes and you cannot open the online help of other applications that you start subsequently.

Workaround: You must click the OK button in the error dialog box.
Mozilla Browser

Cannot Print Certain Documents From the Mozilla Browser
You cannot print documents from the Mozilla browser if the documents contain Unicode characters that are not in the Basic Multilingual Plane (BMP).

Workaround: None.

System-Level Issues

User Preferences Not Fully Compatible
User preferences in your home account for an earlier version of the GNOME Desktop might be partly incompatible with the version on the Java DS Release 3.

Workaround: Reset your preferences. Perform the following steps:
1. Log out of the Java Desktop System.
2. Click Session and choose Failsafe terminal.
3. Log in.
4. In the failsafe terminal window, enter the following commands:
   % gnome-cleanup exit
5. Log in again.
   Your GNOME preferences are now reset.

Problems With Online Registration of StarOffice 7 Software (6208829)
You might be unable to complete the online registration of the StarOffice 7 software if the software cannot find Mozilla on the system. The software must be able to locate the Email and Calendar application to successfully send documents.

Workaround: Add /usr/sfw/bin to your PATH. Perform the following steps.
1. Open a terminal window.
2. Issue the following command:
   % export PATH=/usr/sfw/bin:$PATH
3. To start the StarOffice software, issue the following command:
   % soffice
4. Complete the StarOffice registration procedure.
Problems With Sound Recorder

The slide bar and the side counter do not work when the Sound Recorder is recording a new.wav file.

Workaround: None.

Nautilus ACL MASK is Not in Sync With Group Permissions (6464485)

The Group permissions in the Permissions tab should be the same as the Mask permissions in the Access Tab, but on some occasions they appear out of sync.

Workaround: Click the Close button, and then click Reload. View the file properties again. The Group permissions and the Mask permissions will now be in sync again. The permissions are set to what you changed the Mask to in the previous step.

strftime(3c) Should Support GNU Extension in %-m And %-d (6448815)

The Java DS menu bar and some applications, like Evolution, incorrectly display Chinese date. The incorrect date is displayed in the %-m %%-d D format where M and D are the month and date in Chinese respectively.

Workaround: Perform the following steps:
3. Edit the file gnome-panel.gnome-2-16.zh-CN.po and replace all occurrences of %-m with %Om, and %%-d with %e.

```bash
msgfmt -v -o gnome-panel.gnome-2-16.zh_CN.mo /tmp/gnome-panel.gnome-2-16.zh_CN.po
```

Copy the file back to the /usr/share/locale/LC_MESSAGES/ directory.
5. Log out of the system and re-login.
**x86: Cannot Configure Full-Screen Magnification on Systems With One Video Card**

If your Solaris 10 system has a single physical video card, you cannot configure the system for full-screen magnification. For such a configuration, you must use a separate configuration file in which you define settings for a dummy driver. First, make sure that the Xserver is not running. Then perform the following steps:

1. Log in to a command-line session.
   - If you are using the GNOME Display Manager, follow these steps:
     a. Log in to a session as superuser.
     b. At the prompt, type `svcadm disable application/gdm2-login`.
     c. Log in again as superuser.
   - If you are using dtlogin, follow these steps:
     a. In the dtlogin window, click Options and select Command Line Login.
     b. Log in as superuser.

2. Create a new `xorg.conf` file.
   
   ```
   # /usr/X11/bin/Xorg -configure
   
   The command creates the file `xorg.conf.new` in the root (/) directory.
   ```

3. Copy the new configuration file to the `/etc/X11` directory and rename the file `xorg.conf`.
   
   ```
   # cp /xorg.conf.new /etc/X11/xorg.conf
   ```

4. Modify the configurations in the file by using the following sample configurations:
   - Add a new monitor section.
     ```
     Section "Monitor"
     Identifier "monitor_dummy"
     ModelName "dummy"
     HorizSync 10-200
     VertRefresh 20-90
     EndSection
     ```
   - Add a new device section.
     ```
     Section "Device"
     BoardName "dummy"
     Driver "dummy"
     Identifier "device_dummy"
     VendorName "dummy"
     videoram 10000
     EndSection
     ```
Note – You might need to adjust the video ram value, depending on the screen width, height, and color depth of your particular graphics card. The value in Kbytes must be large enough for the intended screen. For example, you can compute the value by using the formula width * height * bpp/8.

- Add a new screen section.

Section "Screen"
 DefaultDepth 24
 SubSection "Display"
   Depth 24
   Modes "1280x1024"
 EndSubSection
 Device "device_dummy"
 Identifier "screen_dummy"
 Monitor "monitor_dummy"
 EndSection

Note – You might need to adjust the resolution value for your particular system setup.

5. Look for the following line under the ServerLayout section:

   Screen 0 "screen0" 0 0

6. Insert the following line below the line in the previous step:

   Screen 1 "screen_dummy" RightOf "Screen0"

   This new line defines Screen1, a second dummy screen that is notionally to the right of Screen0, the physical and primary screen.

7. Save the changes.

8. Reboot the system from the appropriate command-line session:
   - If you are using GDM, perform the following:
     a. Type svcadm enable application/gdm2-login.
     b. Reboot the system.
   - If you are using dtlogin, reboot the system and log in.

10. Change the Startup Mode to Magnifier.

11. Click Preferences, then select Magnifier.

12. Click Add/Modify.

13. Assign the following values for Magnifier preferences:
   - For Source: 0.1
   - For Zoomer Placement:
14. Click Apply.
   
   Because of the overlaying full-screen magnification zoomer, the Gnopernicus windows become invisible. However, full-screen magnification is now available.

**x86: Problems Configuring USB Mouse Device as Extension Device for Use With GNOME On-Screen Keyboard**

You cannot set up a USB mouse device as an extension device with the GNOME On-Screen Keyboard (GOK). The configuration fails when you are setting up the USB mouse device while using a PS2 mouse device as the core pointer. To properly set up the USB mouse, follow these steps:

1. Log in as superuser.
2. While the USB mouse device is unplugged, type the following in a terminal window:
   
   ```
   # ls -l /dev/usb/hid*
   ```
3. Connect the USB mouse and type the previous command again.
4. Record the path of the USB mouse that is displayed on the screen.
5. Log into a command-line session.
   
   - If you are using the GNOME Display Manager, follow these steps:
     a. Log in to a session as superuser.
     b. At the prompt, type `svcadm disable application/gdm2-login`.
     c. Log in again as superuser.
   
   - If you are using dtlogin, follow these steps:
     a. In the dtlogin window, click Options and select Command Line Login.
     b. Log in as superuser.
   
   ```
   # /usr/X11/bin/Xorg -configure
   ```
   
   The command creates the file `xorg.conf.new` in the root (/) directory.
7. Copy the new configuration file to the `/etc/x11` directory and rename the file `xorg.conf`.
   
   ```
   # cp /xorg.conf.new /etc/X11/xorg.conf
   ```
8. Modify the configurations in the file:
   
   - In the ServerLayout section, add an input device for Mouse1 after the line `InputDevice "Mouse0" "CorePointer"`. See the following example:
In the InputDevice section that contains the line Identifier "Mouse0", apply the following changes:

- Change Option "Device" "/dev/mouse" to Option "Device" "/dev/kdmouse".
- Change Option "Protocol" "auto" to Option "Protocol" "VUID".
- Add the following new Option:
  
  ```
  Option "StreamsModule" "vuid3ps2"
  ```

After you have applied the changes, the section should appear similar to the following example:

```
Section "InputDevice"
  Identifier "Mouse0"
  Driver "mouse"
  Option "Device" ""/dev/kdmouse"
  Option "Protocol" "VUID"
  Option "StreamsModule" "vuid3ps2"
EndSection
```

Create a new InputDevice section after the preceding InputDevice section:

```
Section "InputDevice"
  Identifier "Mouse1"
  Driver "mouse"
  Option "Device" "/dev/usb/hid1"
EndSection
```

Note – 
/dev/usb/hid1 is an example path for the USB mouse. Use the path in Step 4 to replace /dev/usb/hid1.

9. Save the file and exit.
10. Reboot the system from the appropriate command-line session:

- If you are using GDM, perform the following:
  a. Type `svcadm enable application/gdm2-login`.
  b. Reboot the system.
- If you are using dtlogin, reboot the system.

11. Log in to the accessible UI user’s account.
13. Log out of the system then log in to the accessible UI user’s account again.
14. Open a terminal window and type the following command:

   ```
   % /usr/sfw/bin/gok --select-action=switch1
   ```

15. In the GOK window, click GOK and select Preferences.
16. If necessary, set up GOK to the accessible UI user’s needs. Otherwise, to accept the current setup, click Apply then click OK in the GOK Preferences window.

17. Exit GOK and then restart it by clicking Launch Menu => Applications => Accessibility => On-Screen Keyboard. The following warning message might be displayed:

   The device you are using to control GOK is also controlling the system pointer.

18. Click OK.

19. Exit GOK and then repeat steps 14-17.

   The warning message is no longer displayed.

Certain View Options Might Cause File Manager to Fail (6233643)

The File Manager might fail if you use the following View options:

- View as Catalog
- View as Image Collection

Depending on the View options that you use, the following error messages might be displayed:

- Error:
  
  The application nautilus has quit unexpectedly

- Error:
  
  The Catalog view encountered an error while starting up

- Error:
  
  The Image Collection view encountered an error while starting up

**Workaround:** None. Every time these problems occur, restart File Manager or click the Restart Application button on the crash dialog box.

Problems Creating Certain Types of Archives (5082008)

You cannot use Archive Manager to create the following types of archives:

- .arj
- .lha
- .bzip
- .lzop
- .zoo
Workaround: None.

System Administration

This section describes system administration bugs in Solaris 10 OS.

SPARC: Solaris Volume Manager GUI Fails to Start (6671736)

The Solaris Volume Manager GUI fails to start successfully. However, no system panic is detected.

Workaround: Remove the following lines from the /var/sadm/smc/toolboxes/smc/smc.tbx file.

```xml
<ToolBoxURL>
  <URL>file:/var/sadm/smc/toolboxes/tsol_files/tsol_files.tbx</URL>
</ToolBoxURL>
<ToolBoxURL>
  <URL>file:/var/sadm/smc/toolboxed/tsol_ldap/tsol_ldap.tbx</URL>
</ToolBoxURL>
```

Cannot Log In to Solaris Management Console After Enabling Solaris Trusted Extensions (6639493)

The Solaris Management Console hangs and does not allow root login to the Solaris Management Console after enabling Solaris Trusted Extensions. The following error message might be displayed the Solaris Management Console hangs:

Configuring the Management Server...

Workaround: Perform the following steps:

1. Configure Solaris Trusted Extensions and start the Solaris Management Console.
2. Choose Open ToolBox from the Console menu.
3. Select localhost if it is listed.
4. If localhost is not listed, then type localhost.
5. Choose the Policy=TSOL toolbox.
6. Log in again to the Solaris Management Console as root.
7. (Optional) If the second login to the Solaris Management Console fails, repeat steps 1 through 5 by typing 127.0.0.1 instead of localhost in step 3.
zoneadm attach Command Might Fail (6550154)

When you attach a zone, if the original host and the new host have packages at the same patch level but at different intermediate patch histories, the zone attach might fail. Various error messages are displayed. The error message depends on the patch histories of the two hosts.

Workaround: Ensure that the original host and the new host machines have had the same sequence of patch versions applied for each patch.

Solaris is Unable to Handle Mode Switches Between Legacy and AHCI Modes for the SATA Controller (6520224)

In systems which have an AHCI compliant SATA controller, the BIOS setup typically enables the controller to be set in either AHCI, legacy, or RAID modes. Solaris supports AHCI and legacy modes.

The SATA mode setting in BIOS must not be changed after an initial Solaris installation. The SATA mode setting must also not be changed before or after a Solaris upgrade. If the SATA mode BIOS setting is modified after installing Solaris, the system will reset and fail to boot without indicating what led to the failure.

Workaround: If boot failure is encountered as a result of changing the BIOS setting, revert back to the original setting in order to boot Solaris.

Deferred Activation Patching (6486471)

Starting with patch 119254-42 and 119255-42, the patch installation utilities, `patchadd` and `patchrm`, have been modified to change the way that certain patches delivering new features or existing files that are incompatible with the running system are handled. This utilities modification affects the installation of these patches on any Solaris 10 release. These “deferred-activation” patches handle the large scope of change delivered in Kernel patches better.

In deferred Activation patching, a loopback file system, \( \text{lofs} \), is used to create a copy of the root file system. The original files being patched are copied to a safe location and the \( \text{lofs} \) copy of the root file system is patched. Then the original file is \( \text{lofs} \) mounted back over the new file as it is patched. This means the running system remains consistent over the duration of patching, new features are not active and any incompatible change is hidden until the user reboots.

Users must reboot as soon as possible after applying a Deferred Activation Patch, but they do not have to reboot immediately, they can still add further patches then reboot.
The patch README provides instructions on which patches require a reboot.

**Note** – Sun strongly recommends that patch operations are carried out in a single-user mode, especially when this is recommended by the patch README.

If you are running non-global zones or have lofs disabled, consider the following points when installing or removing deferred-activation patches:

- All non-global zones must be in a halted state for this patch operation. You must halt the non-global zone before applying the patch.
- Deferred-activation patching requires the loopback file system, lofs in order to complete successfully. Systems running Sun Cluster 3.1 or Sun Cluster 3.2 are likely to have lofs turned off because of restrictions on HA-NFS functionality when lofs is enabled. Therefore, before a deferred-activation patch is installed, you must re-enable the loopback file system by performing the following steps.
  1. Remove or comment out the following line in the /etc/system file:
     
     ```
     exclude:lofs
     ```
  2. Reboot your system.
  3. Install the patch.
  4. After you have completed the patch installation operation, restore or uncomment the same line from the /etc/system file.
  5. Reboot the system to resume normal operations.

No error message is displayed.

**Workaround:** Sun recommends Solaris Live Upgrade to manage patching. Solaris Live Upgrade prevents the problems of patching a running system. Solaris Live Upgrade reduces the amount of downtime involved in patching and reduces risk by providing fallback capability if problems occur. For more information, see *Solaris 10 5/08 Installation Guide: Solaris Live Upgrade and Upgrade Planning*.

**Possible Error With 32-bit Applications Getting File System State on Large File Systems (6468905)**

When run on large file systems, for example ZFS, applications using `statvfs(2)` or `statfs(2)` to get information about the state of the file system exhibit an error. The following error message is displayed:

```
Value too large for defined data type
```

**Workaround:** Applications should use `statvfs64()` instead.
Using patchadd With the -R Option To Specify an Alternative Root Path From Systems That Are Not Zones Aware Should Be Restricted (6464969)

On systems running a Solaris release that is not zones aware, using patchadd -R, or any command that accepts the -R option to specify an alternate root path for a global zone that has non-global zones installed, will not work.

In contrast with the error message that is displayed by using the luupgrade [-t, -T, -p, -P] command, no error message regarding the use of appropriate command-level restrictions is displayed in this instance.

There is no indication that the -R option did not work. As a result of the failure of the command, Solaris 10 packages or patches are not installed on any of the installed non-global zones.

This problem occurs while installing and uninstalling packages or patches.

Note – The -R option works if the alternate boot environment has configured non-global zones, but no installed non-global zones. However, to avoid a potential problem, or if you are not sure whether there are any installed non-global zones used as the alternate root path, restrict the use of the -R option in all instances.

For more information, see the following man pages:

- patchadd(1M)
- patchrm(1M)
- pkgadd(1M)
- pkgrm(1M)

Workaround 1: Upgrade the OS to at least the Solaris 10 1/06 release.

If you are running the Solaris 10 3/05 release, install the following patches to enable the use of commands that accept the -R option to create an alternate root path:

- Patch ID 119254-19 for SPARC based systems
- Patch ID 119255-19 for x86 based systems

Workaround 2: Restrict the use of the patchadd -R command or any command that accepts the -R option to create an alternate root path.

Instead, boot the alternate root, for example, the Solaris 10 release, as the active OS. Then install and uninstall the Solaris 10 packages and patches without using the -R option.
Sun Patch Manager Tool 2.0 Not Compatible With Previous Versions

A system that runs the Sun Patch Manager Tool 2.0 can manage remote systems that run Patch Manager Tool, including Sun Patch Manager Tool 1.0.

However, a system with an earlier version of Patch Manager Tool cannot manage remote systems that run Patch Manager Tool 2.0. Earlier versions include the following:

- Sun Patch Manager Base Software 1.x
- Sun Patch Manager Tool 1.0

Note – Common Information Model/Web Based Enterprise Management (CIM/WBEM) support for Patch Manager Tool does not exist in the Solaris 8 OS. Consequently, remote management with Patch Manager does not apply to Solaris 8 systems.

Cannot Delete Existing Diskless Clients From the System (6205746)

If you use the `smdiskless` command to delete a diskless client, the command fails. The diskless client is not removed from the system databases. The following error message is displayed:

Failing with error EXM_BMS.

Workaround: Unshare the `/export` partition before adding the client.

SPARC: `smosservice delete` Command Does Not Successfully Remove All Directories (6192105)

If you use the `smosservice delete` command to remove a diskless client service, the command does not successfully remove all the service directories.

Workaround: Follow these steps.

1. Make sure that no clients exist that use the service.

   ```bash
   # unshare /export/exec/Solaris_10_sparc.all
   # rm -rf /export/exec/Solaris_10_sparc.all
   # rm -rf /export/exec/.copyofSolaris_10_sparc.all
   # rm -rf /export/.copyofSolaris_10
   # rm -rf /export/Solaris_10
   # rm -rf /export/share
   # rm -rf /export/root/templates/Solaris_10
   # rm -rf /export/root/clone/Solaris_10
   # rm -rf /tftpboot/inetboot.sun4u.Solaris_10
   ```
2. Remove the following entry from the /etc/bootparams file.
   
   ```
   fs1-24 boottype= os
   ```

   **Note** – Remove this entry only if this file server does not provide functions or resources for any other services.

3. Remove the following entry from the /etc/dfs/dfstab file.
   
   ```
   share -F nfs -o ro /export/exec/Solaris_8_sparc.all/usr
   ```

4. Modify the /var/sadm/system/admin/services/Solaris_10 file.
   - If the file server is not Solaris_10, delete the file.
   - If the file server is Solaris_10, remove all entries after the first three lines. The deleted lines indicate the service USR_PATH and SPOOLED_ROOT packages in /export/root/templates/Solaris_10 and the supported platforms.

---

**kill -HUP Does Not Always Cause the Agent to Reread the snmpd.conf Configuration File (4988483)**

After modifying the contents of `snmpd.conf`, you can issue the command `kill -HUP snmp Process ID`. This command stops the snmp process. The command then sends a signal to the System Management Agent’s master agent (`snmpd`) to reread `snmpd.conf` and implement the modifications that you introduced. The command might not always cause the master agent to reread the configuration file. Consequently, using the command might not always activate modifications in the configuration file.

Instead of using `kill -HUP`, restart the System Management Agent after adding modifications to `snmpd.conf`. Perform the following steps:

1. Become superuser.
2. Type the following command:
   ```
   # /etc/init.d/init.sma restart
   ```

---

**x86: Pressing the F4 Key During BIOS Bootup Fails to Boot the Service Partition (4782757, 5051157)**

You are booting a Sun LX50 which has a Service partition and Solaris 10 OS on x86 is installed. Pressing the F4 function key to boot the Service partition, when given the option, causes the screen to go blank. The system then fails to boot the Service partition.
**Workaround:** Do not press the F4 key when the BIOS Bootup Screen is displayed. After a time-out period, the Current Disk Partition Information screen is displayed. Select the number in the Part# column that corresponds to type=DIAGNOSTIC. Press the Return key. The system boots the Service partition.

**Some com.sun Application Programming Interface Method Invocations Fail Under XML/HTTP Transport Protocol (4497393, 4497399, 4497406, 4497411)**

If you choose to use the com.sun application programming interface rather than the javax application programming interface to develop your WBEM software, only Common Information Model (CIM) remote method invocation (RMI) is fully supported. Other protocols, such as XML/HTTP, are not guaranteed to work completely with the com.sun application programming interface.

The following table lists examples of invocations that execute successfully under RMI but fail under XML/HTTP:

<table>
<thead>
<tr>
<th>Method Invocation</th>
<th>Error Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIMClient.close()</td>
<td>NullPointerException</td>
</tr>
<tr>
<td>CIMClient.execQuery()</td>
<td>CIM_ERR_QUERY_LANGUAGE_NOT_SUPPORTED</td>
</tr>
<tr>
<td>CIMClient.getInstance()</td>
<td>CIM_ERR_FAILED</td>
</tr>
<tr>
<td>CIMClient.invokeMethod()</td>
<td>XMLERROR: ClassCastException</td>
</tr>
</tbody>
</table>
This chapter describes issues specific to Sun midrange and high-end servers. Current Sun servers are part of the Sun Fire system family. Older servers are part of the Sun Enterprise system family.

**Note** – The Sun Validation Test Suite release notes are now a separate document and can be found at [http://www.oracle.com/us/sun](http://www.oracle.com/us/sun).

**Note** – Some of the issues and bugs in this chapter have been fixed in subsequent Solaris 10 releases. If you have upgraded your Solaris software, certain issues and bugs in this chapter might no longer apply. To see which bugs and issues no longer apply to your specific Solaris 10 software, refer to Appendix A, “Table of Integrated Bug Fixes in the Solaris 10 Operating System.”

### Dynamic Reconfiguration on Sun Fire High-End Systems

This section describes major domain-side DR bugs on the following Sun Fire high-end systems that run the Solaris 10 software:

- Sun Fire 25K
- Sun Fire 20K
- Sun Fire 15K
- Sun Fire 12K

For information about DR bugs on Sun Management Services, see the SMS Release Notes for the SMS version that is running on your system.
Note – This information applies only to DR as it runs on the servers listed in this section. For information about DR on other servers, see the Release Notes or Product Notes documents or sections that describe those servers.

**Known Software and Hardware Bugs**

The following software and hardware bugs apply to Sun Fire high-end systems.

**Deleteboard Shows Leakage Error (4730142)**

Warnings might be displayed when a DR command is executing on a system that is configured with the SunSwift PCI card, Option 1032. These warnings appear on domains that are running either the Solaris 8, Solaris 9, or Solaris 10 software. The following warning is an example:

Aug 12 12:27:41 machine genunix: WARNING:
vmem_destroy('pcisch2_dvma'): leaked

These warnings are benign. The Direct Virtual Memory Access (DVMA) space is properly refreshed during the DR operation. No true kernel memory leak occurs.

**Workaround:** To prevent the warning from being displayed, add the following line to /etc/system:

```
set pcisch:pci_preserve_iommu_tsb=0
```

**GigaSwift Ethernet MMF Link Fails With CISCO 4003 Switch After DR Attach**

The link fails between a system with a Sun GigaSwift Ethernet MMF Option X1151A and certain CISCO switches. The failure occurs when you attempt to run a DR operation on such a system that is attached to one of the following switches:

- CISCO WS-c5500 switch (f/w: WS-C5500 Software, Version McpSW: 4.2(1) and NmpSW: 4.2(1))

This problem is not seen on a CISCO 6509 switch.

**Workaround:** Use another switch. Alternatively, you can consult Cisco for a patch for the listed switches.
Dynamic Reconfiguration on Sun Fire Midrange Systems

This section describes major issues that are related to DR on the following Sun Fire midrange systems:

- Sun Fire E6900
- Sun Fire E4900
- Sun Fire E6800
- Sun Fire E4810
- Sun Fire E4800
- Sun Fire E3800

Note – This information applies only to DR as it runs on the servers listed in this section. For information about DR on other servers, see the Release Notes or Product Notes documents or sections that describe those servers.

Minimum System Controller Firmware

Table 3–1 shows acceptable combinations of Solaris software and System Controller (SC) firmware for each Sun Fire midrange system to run DR.

Note – To best utilize the latest firmware features and bug fixes, run the most recent SC firmware on your Sun Fire midrange system. For the latest patch information, see http://sunsolve.sun.com.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Solaris Release</th>
<th>Minimum SC Firmware</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sun Fire E6900/E4900 with UltraSPARC IV+</td>
<td>Solaris 10 3/05 HW1 (a limited release) or Solaris 10 1/06</td>
<td>5.19.0</td>
</tr>
<tr>
<td>E6900/E4900 without UltraSPARC IV+</td>
<td>Solaris 9 4/04</td>
<td>5.16.0</td>
</tr>
<tr>
<td>Sun Fire 6800/4810/4800/3800</td>
<td>Solaris 9 4/04</td>
<td>5.16.0</td>
</tr>
<tr>
<td>Sun Fire 6800/4810/4800/3800</td>
<td>Solaris 9</td>
<td>5.13.0</td>
</tr>
</tbody>
</table>

You can upgrade the system firmware for your Sun Fire midrange system by connecting to an FTP or HTTP server where the firmware images are stored. For more information, refer to the README and Install_info files. These files are included in the firmware releases that are running on your domains. You can download Sun patches from http://sunsolve.sun.com.
Known DR Software Bugs

This section lists important DR bugs.

Network Device Removal Fails When a Program Is Holding the Device Open (5054195)

If a process is holding open a network device, any DR operation that would involve that device fails. Daemons and processes that hold reference counts stop DR operations from completing.

Workaround: As superuser, perform the following steps:

1. Remove or rename the /rpl/boot directory.
2. Shut down NFS services.
   
   # sh /etc/init.d/nfs.server stop
3. Shut down Boot Server services.
   
   # sh /etc/init.d/boot.server stop
4. Perform the DR detach operation.
5. Restart NFS services.
   
   # sh /etc/init.d/nfs.server start
6. Restart Boot Server services.
   
   # sh /etc/init.d/boot.server start

Cannot Unconfigure cPCI Board With a Disabled Port 0 (4798990)

On Sun Fire midrange systems, a CompactPCI (cPCI) I/O board cannot be unconfigured when Port 0 (P0) on that board is disabled. This problem exists in Solaris 10 and Solaris 9 software. It also exists in Solaris 8 software that has one or more of the following patches installed:

- Patch ID 108528–11 through 108528–29
- Patch ID 111372–02 through 111372–04

The error also occurs only during DR operations that involve cPCI boards. An error message similar to the following example is displayed:

```
# cfgadm -c unconfigure NO.IB7
cfgadm: Hardware specific failure: unconfigure NO.IB7: Device busy:/ssm@0,0/pci@1b,700000/pci@1
```

NO.IB7 is a CompactPCI I/O Board with P0 disabled.

Workaround: Disable the slots instead of Port 0.
This section describes issues that involve the following features on the Sun Enterprise 10000 server:

- System Service Processor requirement
- Dynamic reconfiguration (DR)
- InterDomain Networks (IDNs)
- Solaris Operating System on Sun Enterprise 10000 domains

**Note** – The Solaris 10 software can be run on individual domains within a Sun Enterprise 10000 system. However, the Sun Enterprise 10000 System Service Processor is not supported by this release.

### System Service Processor Requirement

The SSP 3.5 software is required on your System Service Processor (SSP) to support the Solaris 10 software. Install the SSP 3.5 on your SSP first. Then you can install or upgrade to the Solaris 10 OS on a Sun Enterprise 10000 domain.

The SSP 3.5 software is also required so that the domain can be properly configured for DR Model 3.0.

### Dynamic Reconfiguration Issues

This section describes different issues that involve dynamic reconfiguration on Sun Enterprise 10000 domains.

#### DR Model 3.0

You must use DR 3.0 on Sun Enterprise 10000 domains that run the Solaris OS beginning with the Solaris 9 12/03 release. DR model 3.0 refers to the functionality that uses the following commands on the SSP to perform domain DR operations:

- addboard
- moveboard
- deleteboard
- showdevices
- rcfadm

You can run the `cfadm` command on domains to obtain board status information. DR model 3.0 also interfaces with the Reconfiguration Coordination Manager (RCM) to coordinate the DR operations with other applications that are running on a domain.
For details about DR model 3.0, refer to the Sun Enterprise 10000 Dynamic Reconfiguration User Guide.

**DR and Bound User Processes**

For this Solaris release, DR no longer automatically unbinds user processes from CPUs that are being detached. You must perform this operation before initiating a detach sequence. The drain operation fails if CPUs are found with bound processes.

**Network Device Removal Fails When a Program Is Holding the Device Open (5054195)**

If a process is holding open a network device, any DR operation that would involve that device fails. Daemons and processes that hold reference counts stop DR operations from completing.

**Workaround:** As superuser, perform the following steps:

1. Remove or rename the /rp1boot directory.
2. Shut down NFS services.
   ```
   # sh /etc/init.d/nfs.server stop
   ```
3. Shut down Boot Server services.
   ```
   # sh /etc/init.d/boot.server stop
   ```
4. Perform the DR detach operation.
5. Restart NFS services.
   ```
   # sh /etc/init.d/nfs.server start
   ```
6. Restart Boot Server services.
   ```
   # sh /etc/init.d/boot.server start
   ```

**InterDomain Networks**

For a domain to become part of an InterDomain Network, all boards with active memory in that domain must have at least one active CPU.

**OpenBoot PROM Variables**

Before you issue the boot net command from the OpenBoot PROM prompt (OK), verify that the local-mac-address? variable is set to false. This setting is the factory default setting. If the variable is set to true, you must ensure that this value is an appropriate local configuration.
Caution – A local-mac-address? that is set to true might prevent the domain from successfully booting over the network.

In a netcon window, you can use the following command at the OpenBoot PROM prompt to display the values of the OpenBoot PROM variables:

```
OK printenv
```

To reset the local-mac-address? variable to the default setting, use the setenv command:

```
OK setenv local-mac-address? false
```

Dynamic Reconfiguration on Sun Enterprise Midrange Systems

This section contains the latest information about dynamic reconfiguration (DR) functionality for the following midrange servers that are running the Solaris 10 software:

- Sun Enterprise 6x00
- Sun Enterprise 5x00
- Sun Enterprise 4x00
- Sun Enterprise 3x00

For more information about Sun Enterprise Server Dynamic Reconfiguration, refer to the Dynamic Reconfiguration User’s Guide for Sun Enterprise 3x00/4x00/5x00/6x00 Systems. The Solaris 10 release includes support for all CPU/memory boards and most I/O boards in the systems that are mentioned in the preceding list.

Supported Hardware

Before proceeding, make sure that the system supports dynamic reconfiguration. If your system is of an older design, the following message appears on your console or in your console logs. Such a system is not suitable for dynamic reconfiguration.

```
Hot Plug not supported in this system
```

The following I/O boards are not currently supported:

- Type 2 (graphics)
- Type 3 (PCI)
- Type 5 (graphics and SOC+)
Software Notes

This section provides general software information about DR.

Enabling Dynamic Reconfiguration

To enable dynamic reconfiguration, you must set two variables in the /etc/system file. You must also set an additional variable to enable the removal of CPU/memory boards. Perform the following steps:

1. Log in as superuser.
2. Edit the /etc/system file by adding the following lines:

   ```
   set pln:pln_enable_detach_suspend=1
   set soc:soc_enable_detach_suspend=1
   ```

3. To enable the removal of a CPU/memory board, add this line to the file:

   ```
   set kernel_cage_enable=1
   ```

   Setting this variable enables the memory unconfiguration operation.

4. Reboot the system to apply the changes.

Quiesce Test

You start the quiesce test with the following command:

```
# cfgadm -x quiesce-test sysctrl0:slot number
```

On a large system, the quiesce test might run for up to a minute. During this time no messages are displayed if `cfgadm` does not find incompatible drivers.

Disabled Board List

Attempting to connect a board that is on the disabled board list might produce an error message:

```
# cfgadm -c connect sysctrl0:slot number
```

`cfgadm`: Hardware specific failure: connect failed:
board is disabled: must override with [-f][-o enable-at-boot]

To override the disabled condition, two options are available:

- Using the force flag (`-f`)
Using the enable option (-o enable-at-boot)

```
cfgadm -o enable-at-boot -c connect sysctrl0:slot number
```

To remove all boards from the disabled board list, choose one of two options depending on the prompt from which you issue the command:

- From the superuser prompt, type:
  ```
  eeprom disabled-board-list=
  ```
- From the OpenBoot PROM prompt, type:
  ```
  OK set-default disabled-board-list
  ```

For further information about the `disabled-board-list` setting, refer to the "Specific NVRAM Variables" section in the Platform Notes: Sun Enterprise 3x00, 4x00, 5x00, and 6x00 Systems manual. This manual is part of the documentation set in this release.

### Disabled Memory List

Information about the OpenBoot PROM `disabled-memory-list` setting is published in this release. See "Specific NVRAM Variables" in the Platform Notes: Sun Enterprise 3x00, 4x00, 5x00, and 6x00 Systems in the Solaris on Sun Hardware documentation.

### Unloading Detach-Unsafe Drivers

If you need to unload detach-unsafe drivers, use the `modinfo` line command to find the module IDs of the drivers. You can then use the module IDs in the `modunload` command to unload detach-unsafe drivers.

### Self-Test Failure During a Connect Sequence

Remove the board from the system as soon as possible if the following error message is displayed during a DR connect sequence:

```
cfgadm: Hardware specific failure: connect failed: firmware operation error
```

The board has failed self-test, and removing the board avoids possible reconfiguration errors that can occur during the next reboot.

The failed self-test status does not allow further operations. Therefore, if you want to retry the failed operation immediately, you must first remove and then reinsert the board.

### Known Bugs

The following list is subject to change at any time.
Network Device Removal Fails When a Program Is Holding the Device Open (5054195)

If a process is holding open a network device, any DR operation that would involve that device fails. Daemons and processes that hold reference counts stop DR operations from completing.

Workaround: As superuser, perform the following steps:

1. Remove or rename the /rpl/boot directory.
2. Shut down NFS services.
   
   # sh /etc/init.d/nfs.server stop
3. Shut down Boot Server services.
   
   # sh /etc/init.d/boot.server stop
4. Perform the DR detach operation.
5. Restart NFS services.
   
   # sh /etc/init.d/nfs.server start
6. Restart Boot Server services.
   
   # sh /etc/init.d/boot.server start

cfgadm Disconnect Fails When Running Concurrent cfgadm Commands (4220105)

If a cfgadm process is running on one board, an attempt to simultaneously disconnect a second board fails. The following error message is displayed:

cfgadm: Hardware specific failure:
disconnect failed: nexus error during detach:address

Workaround: Run only one cfgadm operation at a time. Allow a cfgadm operation that is running on one board to finish before you start a cfgadm disconnect operation on a second board.
This chapter lists end-of-software support statements.

Note – The Solaris 10 OS media kit contains not only the Solaris 10 OS software, but also an extensive set of bonus software. The information provided on http://www.oracle.com/us/support/systems/operating-systems/index.html lists the components of the Solaris 10 OS media kit. It also shows the support provided for these components under the SunSpectrum program and Sun Software Support contracts.

Features That Might Be Removed in a Future Release

The following features might not be supported in a future release of the Solaris software.

**genlayouttbl Utility**

The `genlayouttbl(1)` utility which provides complex text layout data to the CDE/Motif GUI toolkit might not be available in a future release.

**Mobile IP**

The Mobile IPv4 feature described in the `mipagent(1M)` man page, might not be available in a future Solaris release.

**Gnopernicus**

Gnopernicus, the Java DS Screen Reader might not be available in a future Solaris release. Users should use the Orca Screen Reader instead.
**Xsun Server**

The Xsun server for the X Window System might not be available in a future Solaris release. Users should migrate to the Xorg server.

Features such as Display Postscript (DPS) and X Image Extension (XIE) that are available in Xsun but not in Xorg might no longer be included.

**Common Desktop Environment**

The Common Desktop Environment (CDE) might not be available in a future Solaris release. Users should migrate to the Java Desktop System.

**CDE Image Viewer**

CDE's Image Viewer sftimage might not be available in a future Solaris release. Users should migrate to GNOME Open gnome-open, to open image files.

**Sun Java System Calendar Server Client Applet**

The Sun Java System Calendar Server client applet, Now applet, might not be available in a future Solaris release.

**DARPA Trivial Name Server**

The DARPA trivial name server, in.named(1M), might not be available in a future Solaris release. The Internet domain name server named(1M) provides similar functionality.

**I2O Intelligent I/O**

The I2O intelligent I/O driver framework and all corresponding drivers might not be supported in a future Solaris release. This includes the i2o_bs(7D), and i2o_scsi(7D) drivers and all I2O related functionality.

**GNOME Viewer for PDF and PostScript Files**

The GNOME viewer for PDF and PostScript files, might not be available in a future Solaris release. A replacement application is expected to enable viewing of PDF and PostScript files.
The Graphical Smartcard Admin Interface

The graphical Smartcard admin interface sdt_smartcardadmin(1M) may not be available in future Solaris releases. The same functionality is available in the smartcard(1M) command.

iButton Smartcard

The Dallas Semiconductor iButton Java Card Smartcard and OpenCard Framework (OCF) terminal driver, as described in ocf_ibutton(7d) might not be supported in future Solaris releases. Users should migrate to other Smartcard devices that are supported by libpcscllite(3lib).

Cyberflex Smartcard

The Cyberflex Smartcard might not be supported by the pam_smartcard(5) and smartcard(1m) commands in future Solaris releases. Users should migrate to other Smartcard devices and cards that are supported by libpcscllite(3lib).

PAM Smartcard

The PAM Smartcard module pam_smartcard(5) might not be available in future Solaris releases.

OCF/SCF Smartcard Framework

The OCF/SCF Smartcard framework may not be available in a future Solaris releases. The functionality of ocf_serv(1M) will be provided by pcscl(1M). The card provisioning functionality of smartcard(1M) will be provided by muscletool(1M). The driver configuration functionality provided by smartcard(1M) is generally not necessary with pcscl(1M), however, when required system administrators can edit the reader.conf(4) file.

SCF Smartcard APIs

The SmartCard Framework (SCF) interfaces exported by libsmartcard and smartcard.jar may not be available in future Solaris releases. These interfaces are now obsolete. New C applications should be written to use the PS/SC interfaces exported from libpcscllite(3lib). There is no planned replacement for the SCF Java interfaces at this time.
Remote Program Load Server Functionality

The Remote Program Load (RPL) server functionality available through `rpld(1M)` and `rpld.conf(4)` may not be available in a future release of Solaris.

Transition From ipge to e1000g NIC Driver as the Default Ethernet Driver for Sun4V Systems

The `ipge` driver and all its SUNWipge packages for Sun4V systems might not be available in a future release of Solaris. Starting with the Solaris 10 8/07 release, Ontario and other SPARC based platforms transition from `ipge` to `e1000g` drivers. The `e1000g` driver will be the default Ethernet driver for all Sun platforms that use Intel 1G chipsets.

Solstice Enterprise Agents Support

The following Solstice Enterprise Agents (SEA) agents, libraries, and packages might not be supported in a future Solaris release:

- SEA-based SNMP master agent and sub agents
- libssagent and libssasnmp libraries
- SUNWsocom, SUNWssnm, SUNWmibii packages

The System Management Agent (SMA) provides similar functionality for the aforementioned sources.

Mozilla 1.X Support

The Mozilla 1.X software might not be supported in a future Solaris release. Equivalent software is expected to be available in a future release.

32-bit x86: Extended Memory File System Support

The extended memory file system (`xmemfs`) might not be supported in a future Solaris release.

For more information, see the `xmemfs(7FS)` man page.
Standard Type Services Framework Support

Standard Type Service Framwork (STSF) might not be available in a future Solaris release.

This includes the following:

- libST and libXst libraries
- xstls command
- stfsloader service
- XST extension to Xsun and Xorg servers

You can find this functionality in one of the following alternative sources:

- libX11
- libXft2

SPARC: jfca Driver Support

The JNI Fibre Channel Adapter (jfca) driver might not be available in a future Solaris release.

For more information, see the jfca(7D) man page.

zic -s Option Support

The -s option in the zic command might not be available in a future Solaris release.

For more information, see the zic(1M) man page.

Removable Volume Management Support

The volume management daemon (vold), volume management file system (volfs), and the associated volume management commands might not be included in a future Solaris release.

Automatic mounting and unmounting of removable media will continue to be supported.

For more information, see the vold(1M) and volfs(7FS) man pages.

32-bit x86: Controller Devices and Drivers

The following devices might not be supported in a future Solaris release:

- IBM PC ServeRAID SCSI
- IBM ServeRAID II Ultra SCSI
Features That Might Be Removed in a Future Release

- IBM ServeRAID-3 Ultra2 SCSI

In addition, device drivers written for these controllers might not be supported.

64-bit SPARC: Dual Basic Rate ISDN Interface and Multimedia Codec Chips

T5900FC Dual Basic Rate ISDN Interface (DBRI) and associated multimedia codec chips might not be supported in a future Solaris release. In addition, device drivers written for these devices might not be supported.

SPARC: Certain Drivers Might Not be Supported in a Future Solaris Release

The following drivers might not be supported in a future Solaris release:
- SUNWrtvc: Device driver for the SunVideo real-time video capture and compression card
- SUNWdial: Streams module for the Dials and Buttons devices
- SUNWdialh: Header files for the Dials and Buttons devices

Automated Security Enhancement Tool Support

The checksum functionality provided by Automated Security Enhancement Tool (ASET) in the /usr/aset directory might not be available in a future Solaris release.

You can find this functionality in one of the following alternative sources:
- The basic audit reporting tool, bart, in Solaris 10 OS
- The Solaris Fingerprint Database found at http://sunsolve.sun.com/pub-cgi/show.pl?target=content/content7

Asian Short dtlogin Names

The following Asian short locale names might not be listed in the dtlogin language list in a future release:
- zh
- ko
- zh_TW
Beginning with Solaris 8 release, new ISO-standard locale names have been provided, including the following locale names:

- zh_CN.EUC
- zh_CN.GBK
- zh_CN.UTF-8
- ko_KR.EUC
- ko_KR.UTF-8
- zh_TW.EUC

**Audit Daemon Interfaces**

The following interfaces that are used by the Solaris audit daemon might not be supported in a future release:

- auditsvc(2)
- audit_data(4)

**Cfront Runtime Support Library**

The library /libC.so.3 is the runtime support library for programs that are compiled by the Cfront C++ compiler C++ 3.0. Neither the compiler nor programs that are created by the compiler run on Solaris 10 OS. The library might not be supported in a future release of Solaris.

**Configuration Assistant's fp Plug-in Hardware Options**

The following options of the configuration administration's (cfgadm) fp plug-in might not be supported in a future Solaris release:

- show_FCP_dev
- unusable_FCP_dev

**Device Allocation Interfaces For the Basic Security Module**

The following components of the device allocation mechanism of the Basic Security Module might not be included in a future release of the Solaris software:

- mkdevalloc(1M)
- mkdevmaps(1M)
- /etc/security/dev
## Obsolete Device Driver Interfaces

Some device driver interfaces (DDI) might not be supported in a future release.

The following table lists the DDI interfaces that might not be supported, along with the preferred DDI interface alternatives.

<table>
<thead>
<tr>
<th>Obsolete Interface</th>
<th>Preferred Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>mmap</td>
<td>devmap</td>

<td>ddi_rep_put(8,16,32)</td>
</tr>
</tbody>
</table>
Device Management Entries in `power.conf`

The Device Management entries in the `power.conf` file might not be supported in a future release. Similar capability is provided by the Automatic Device Power Management entries in the Solaris 10 software.

For more information, see the `power.conf(4)` man page.

Device Support and Driver Software

The following table lists devices and driver software that might not be supported in a future release.

<table>
<thead>
<tr>
<th>Name of Physical Device</th>
<th>Name of Driver</th>
<th>Type of Card</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMI MegaRAID host bus adapter, first generation</td>
<td>mega</td>
<td>SCSI RAID</td>
</tr>
<tr>
<td>Compaq 53C8x5 PCI SCSI, and Compaq 53C876 PCI SCSI</td>
<td>cpqncr</td>
<td>SCSI HBA</td>
</tr>
<tr>
<td>Compaq SMART-2/P Array Controller and Compaq SMART-2SL Array Controller</td>
<td>smartii</td>
<td>SCSI RAID controller</td>
</tr>
</tbody>
</table>

Form and Menu Language Interpreter

The Form and Menu Language Interpreter (FMLI) commands are obsolete and might not be supported in a future Solaris release. The obsolete commands include the following:

- `/usr/bin/fmli`
- `/usr/bin/vsig`

Host Files in `/etc/net/ti*`

The host files in `/etc/net/ti*` are no longer consulted in the Solaris Operating System, though these files remain in the Solaris software. In a future Solaris release, these host files might be entirely removed.

Java 2 Platform, Standard Edition 1.4

Java 2 Platform, Standard Edition (J2SE Platform) 1.4 might not be included in a future Solaris release. J2SE 5.0 software, the default Java version in the Solaris 10 OS, is a compatible replacement for J2SE 1.4 technology.
Kerberos Ticket Lifetime Parameters in \texttt{krb5.conf}

The Kerberos Ticket Lifetime parameters, \texttt{max\_life} and \texttt{max\_renewable\_life}, might no longer be supported in a future release of the Solaris OS. These parameters are in the \texttt{appdefaults} section of the \texttt{/etc/krb5/krb5.conf} file. Instead of these parameters, use \texttt{max\_lifetime} and \texttt{renew\_lifetime} in the \texttt{libdefaults} section of \texttt{/etc/krb5/krb5.conf}.

Korean CID Fonts

Korean CID fonts will not be supported in a future release. You can use the Korean TrueType fonts that are included in the Solaris software as a replacement for Korean CID fonts.

Legacy or Traditional Non-UTF-8 Locales

Sun is adopting Unicode for character encoding. Therefore, except for \texttt{zh\_CN.GB18030} and \texttt{C} locales, non-UTF-8 locales might be removed as the Java Desktop System login locale in a future Solaris release.

Functions in the CPU Performance Counters Library (\texttt{libcpc})

Hardware performance counters enable the measurement of many different hardware events that are related to CPU behavior. The following functions in the CPU Performance Counters library (\texttt{libcpc}) might not be supported in a future Solaris OS release:

<table>
<thead>
<tr>
<th>Function</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{cpc_access}</td>
<td>\texttt{cpc_bind_event}</td>
</tr>
<tr>
<td>\texttt{cpc_count_sys_events}</td>
<td>\texttt{cpc_count_usr_events}</td>
</tr>
<tr>
<td>\texttt{cpc_event_accum}</td>
<td>\texttt{cpc_event_diff}</td>
</tr>
<tr>
<td>\texttt{cpc_eventtostr}</td>
<td>\texttt{cpc_getcciname}</td>
</tr>
<tr>
<td>\texttt{cpc_getcpuref}</td>
<td>\texttt{cpc_getcpuver}</td>
</tr>
<tr>
<td>\texttt{cpc_getnpic}</td>
<td>\texttt{cpc_getusage}</td>
</tr>
<tr>
<td>\texttt{cpc_pctx_bind_event}</td>
<td>\texttt{cpc_pctx_invalidate}</td>
</tr>
<tr>
<td>\texttt{cpc_pctx_rele}</td>
<td>\texttt{cpc_pctx_take_sample}</td>
</tr>
<tr>
<td>\texttt{cpc_rele}</td>
<td>\texttt{cpc_seterrfn}</td>
</tr>
<tr>
<td>\texttt{cpc_shared_bind_event}</td>
<td>\texttt{cpc_shared_close}</td>
</tr>
</tbody>
</table>
New functions have been added to the library in Solaris 10 OS. Developers who have code that utilizes the interfaces in the preceding list should instead use the following corresponding new functions:

<table>
<thead>
<tr>
<th>Old Function</th>
<th>New Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpc_shared_open</td>
<td>cpc_shared_release</td>
</tr>
<tr>
<td>cpc_shared_take_sample</td>
<td>cpc_strerror</td>
</tr>
<tr>
<td>cpc_take_sample</td>
<td>cpc_version</td>
</tr>
<tr>
<td>cpc_walk_names</td>
<td></td>
</tr>
</tbody>
</table>

See the cpc(3CPC) man page for details.

**libXinput Library**

The `libXinput.so.0` library might not be provided in a future release of the Solaris software. The `libXinput.so.0` library was provided for backward compatibility with X11R4 applications.
that were built by using the draft standard X Input API of Solaris 2.1 and Solaris 2.2. The X11 standard X Input Extension library, libXi, was integrated in Solaris 2.3.

All applications that rely on the libXi API should be built by using the libXi shared library for future compatibility and standards conformance.

**Network Information Service Plus (NIS+) Name Service Type**

NIS+ might not be supported in a future release. Tools to aid in the migration from NIS+ to LDAP are available in the Solaris 9 software. For more information, visit http://www.sun.com/directory/nisplus/transition.html.

**ntstest Test Program**

The nstest is an interactive DNS test program to construct and send DNS queries. This program might no longer be supported in a future Solaris OS release. The same functionality that is provided by this test program is available by using the dig and nslookup commands.

**Perl Version 5.6.1**

Perl version 5.6.1 might not be supported in a future Solaris OS release. Perl version 5.8.4, the default version in the Solaris 10 OS, is not binary compatible with Perl version 5.6.1. However, the earlier version is still retained in this Solaris release. Customized modules that are installed by the customer must be rebuilt and reinstalled to use Perl version 5.8.4. Modify any scripts that require the use of version 5.6.1 to specifically use version 5.6.1 of the interpreter instead of version 5.8.4. The interpreters of the respective Perl versions are located in the following directories:

- Perl 5.6.1 /usr/perl5/5.6.1/bin/perl
- Perl 5.8.4 /bin/perl, /usr/bin/perl, or /usr/perl5/bin/perl

**Solaris Management Console Patch Tool (Patch Manager)**

The Solaris Management Console patch tool, Patch Manager, might not be available in a future release.
Features That Might Be Removed in a Future Release

Solstice Enterprise Agents
Solstice Enterprise Agents might not be supported in a future release.

Standalone Router Discovery
The /usr/sbin/in.rdisc implementation of the IPv4 ICMP Router Discovery protocol might not be supported in a future release of the Solaris software. A near-equivalent version of this protocol, which is implemented as a component of /usr/sbin/in.routed, supports an enhanced administrative interface. The /usr/sbin/in.routed component supports the implementation of Routing Information Protocol (RIP) version 2. The /usr/sbin/in.routed component also has the ability to distinguish Mobile IP advertisements from Router Discovery messages.

Sun Fire Link Interfaces
The Sun Fire Link Interfaces might no longer be supported in a future Solaris release.

Sun Java Desktop System Applications
The following applications in the Java DS, Release 3, might be removed from a future release.

■ Sun Java Calendar Preview
■ GNOME Keyboard Layout Switcher
■ Java DS Diagram Editor
■ Java DS Java Text Editor
■ Java DS Java Dictionary
■ Java DS Disk Analyzer
■ Java DS Mr. Project

Token Ring and Fiber Distributed Data Interface Device Types
Support for token ring (DL_TPR) and Fiber Distributed Data Interface (FDDI) device types in generic LAN driver (GLD) might be removed in a future Solaris release. After the removal is implemented, drivers for token ring or FDDI that rely on this support in GLD cease to function. However, other drivers or applications that do not use this support are not affected. To test whether a driver relies on GLD, run the following script:
#!/bin/sh
#
# Test a driver binary for use of GLD
#
for file do
  /usr/ccs/bin/nm $file | /bin/awk ' /
|gld_register$/ { isgld=1; }
END {
  if (isgld)
    print file, "uses GLD";
  else
    print file, "does not use GLD";
} file=$file
done

For more information about generic LAN driver, see the gld(7D) man page as well as "Writing Device Drivers".

**WBEM-based Dynamic Reconfiguration**

The feature known as WDR - Web-Based Enterprise Management Dynamic Reconfiguration - might not be supported in a future release of the Solaris Operating System. WDR is currently supported on Sun Fire midrange and high-end systems.

**XIL Interface**

The XIL interface might not be supported in a future release. An application that uses XIL causes the following warning message to be displayed:

```
WARNING: XIL OBSOLESCENCE
This application uses the Solaris XIL interface
which has been declared obsolete and may not be
present in version of Solaris beyond Solaris 9.
Please notify your application supplier.
The message can be suppressed by setting the environment variable
"_XIL_SUPPRESS_OBSOLETE_MSG."
```

**xetops Utility**

The xetops utility might not be supported in a future release. The xetops utility converts an Asian text file to a PostScript file. This conversion enables Asian characters to be printed on PostScript printers that do not have resident Asian fonts.

Similar capability is provided in the mp command, which has been enhanced to support all of the native Asian encodings with more options and functionality.
x86: Xsun DDX Modules, Library, and Related Files

Certain DDX modules for Xsun might be removed from a future Solaris release. These modules are used when you configure the Xsun X server on the kdmconfig screen, Video Device Selection, by selecting an entry that is not prefixed with “XF86.” The files affected by this notice include the following:

- Files in the `/usr/openwin/server/modules` directory whose names do not have the `ddxSUNWxf86` prefix
- The `/usr/openwin/server/lib/libaccel.so.1` library
- Files with the `.xga` suffix under the `/usr/openwin/share/etc/devdata/SUNWaccel/boards` directory

Sun recommends that for your preferred X server, use the Xorg X server whose DDX modules provide comparable functionality to the Xsun X server. However, if you use the Xsun X server, you can still use the XFree86 DDX modules. These are modules with the prefix `ddxSUNWxf86` and whose entries in the kdmconfig screen, Video Device Selection, begin with “XF86.” These modules provide comparable functionality to the Xsun DDX modules that might be removed.
Documentation Issues

This chapter describes known issues that are related to documentation.

Solaris ZFS Administration Guide

The description of the compression property in Table ZFS Native Property Descriptions under Managing ZFS File Systems is incorrect:

Controls the compression algorithm used for this dataset. Currently, you can select lzjb, gzip, or gzip-N. Enabling compression on a file system with existing data only compresses new data. Existing data remains uncompressed. This property can also be referred to by its shortened column name, compress.

The description should now read as follows:

Enables or disables compression for this dataset. The values are on, off, and lzjb. Currently, setting this property to the lzjb algorithm has the same effect as setting this property to on. The default value is off. Enabling compression on a file system with existing data only compresses new data. Existing data remains uncompressed. This property can also be referred to by its shortened column name, compress.

System Administration Guide: IP Services

The title of the procedure to ensure unique MAC addresses is SPARC: How to Ensure That the MAC Address of an Interface Is Unique, in Solaris 10 3/05 ONLY. This procedure applies to all Solaris 10 Update releases and so the title should read as SPARC: How to Ensure That the MAC Address of an Interface Is Unique.
System Administration Guide: Naming and Directory Services (NIS+)

Starting with the Solaris 10 8/07 release, the Solaris OS does not have two separate hosts files. The `/etc/inet/hosts` file is now a single hosts file that contains both IPv4 and IPv6 entries. You need not maintain IPv4 entries in two hosts files that always require synchronization. For backward compatibility, the `/etc/inet/ipnodes` file is replaced with a symbolic link of the same name to the `/etc/inet/hosts` file. For more information, see the `hosts(4)` man page. NIS clients and servers can communicate using either IPv4 or IPv6 RPC transports.

Discontinuation of Swedish Documentation

Starting with the Solaris 10 8/07 release, documents will not be translated into Swedish. For all the latest information, see the English documents on [http://www.oracle.com/technetwork/indexes/documentation/index.html](http://www.oracle.com/technetwork/indexes/documentation/index.html).

Application Server Documentation Refers to Derby Database Instead of Java DB

Application Server documentation refers to the Java DB database as “Derby.” Replace all references to “Derby” with Java DB. The database is installed to `/usr/appserver/javadb`.

Documents on the Software Supplement CD

Beginning with Solaris 10 Operating System, the Supplement CD no longer exists. The documents that were formerly supplied on the Supplement CD can now be found at [http://www.oracle.com/technetwork/indexes/documentation/index.html](http://www.oracle.com/technetwork/indexes/documentation/index.html). The rest of the CD's contents reside elsewhere in the Solaris kit or on Sun Microsystems' web site.

System Administration Guide: Basic Administration

This section describes corrections to specific chapters in the System Administration Guide: Basic Administration.
Managing Diskless Clients (Tasks)

In Step 4 of “How to Add a Diskless Client,” the command to verify whether a diskless client has been added should read as follows:

4. Verify that the diskless clients were installed.

# /usr/sadm/bin/smdiskless list -H host-name:898 --

Solaris 10 Start Here and Solaris 10 Installation Guides

The Solaris 10 Start Here and Solaris 10 Installation Guides incorrectly indicate that Sun Java Enterprise System is installed by default in the Solaris 10 release. To install Sun Java Enterprise System with the Solaris 10 OS, you must perform a custom installation.

The following documents incorrectly state that Sun Java Enterprise System is installed by default during a Solaris 10 installation.

Solaris 10 Installation Guide: Basic Installations

- Planning for a Solaris Installation From CD or DVD Media (Tasks) — Checklist for Installation
- Installing With the Solaris Installation Program (Tasks)
  - Step 9 of SPARC: To Install or Upgrade With the Solaris Installation Program
  - Step 17 of x86: To Install or Upgrade With the Solaris Installation Program

Solaris 10 Installation Guide: Network-Based Installations

- Solaris Installation and Upgrade (Roadmap) — Task Map: Installing or Upgrading the Solaris Software
- Gathering Information Before Installation or Upgrade (Planning)
Checklist for Installation
Checklist for Upgrading

Solaris 10 Installation Guide: Solaris Live Upgrade and Upgrade Planning
- Solaris Installation and Upgrade (Roadmap) — Task Map: Installing or Upgrading the Solaris Software
- Gathering Information Before Installation or Upgrade (Planning) — Checklist for Upgrading

Solaris 10 Installation Guide: Custom JumpStart and Advanced Installations
See Solaris Installation and Upgrade (Roadmap) — Task Map: Installing or Upgrading the Solaris Software.

Solaris 10 Start Here
See Install the Solaris 10 OS.

Solaris 10 Documentation and Man Pages
The company S2io has changed its name to Neterion. All references to S2io in the Solaris 10 documentation and man pages should read Neterion.
This section describes new features and enhancements in the Solaris 10 5/08 release.

**x86: PowerNow! Support for AMD Family 10h Processors**

This device management enhancement is new in the Solaris 10 5/08 release.

This feature introduces support for AMD's PowerNow! technology into Solaris for AMD Family 10h Processors. This support will enable Solaris administrators to manage the power consumption of their AMD processors by lowering the processor frequency during idle periods.

For more information on how to enable Solaris CPU power management, see `power.conf(4)`.
Table of Integrated Bug Fixes in the Solaris 10 Operating System

The tables in this appendix list bugs in these Release Notes that have been fixed in the Solaris 10 OS. For bugs that no longer apply to your Solaris 10 OS, refer to the table that corresponds to the specific release that you are using.

**Note** – The tables are only partial lists. Other fixed bugs in the operating system that were not previously documented in the Release Notes are excluded from these tables. For a complete list, refer to the Solaris 10 Operating System Patch List. The Patch List identifies bugs that have been fixed by specific patches that were applied to the current release. The list includes bugs that have not been documented in the Release Notes.

</table>
In this appendix, the Solaris 10 5/08 patch list provides a list of patches pre-applied to the Solaris 10 5/08 release. Patches released after the Solaris 10 5/08 release can be found on the My Oracle Support.

The patches that are listed in this appendix have been applied to the Solaris 10 Operating System in one of the following ways:

- **SolStart**
  These patches are located in the `/var/sadm/patch` directory on an installed system.

- **Freshbits technology**
  These patches were applied when the Solaris 10 OS was created. Therefore, these patches are not located in the `/var/sadm/patch` directory.

The `showrev -p` command provides a list of all patches that were applied to the installed system, regardless of how they were applied. The Solaris 10 software includes a known and tested level of patches. However, patches cannot be backed out of the Solaris 10 release.

**SPARC Patch List**

- 124337-01 – SunOS 5.10: FUJITSU PCI Fibre Channel Driver 3.0 miniroot patch
- 117465-02 – SunOS 5.10: fwtmp Patch
- 118367-04 – SunOS 5.10: csh Patch
- 118566-01 – SunOS 5.10: patch usr/sbin/ping
- 118666-15 – JavaSE 5.0: update 14 patch (equivalent to JDK 5.0u14)
- 118667-15 – JavaSE 5.0: update 14 patch (equivalent to JDK 5.0u14), 64bit
- 118676-03 – SunOS 5.10: patch for Solaris make and sccs utilities
- 118683-02 – SunOS 5.10: Patch for assembler
118705-01 – SunOS 5.10: XVR-1000 GFB Graphics Patch
118706-01 – SunOS 5.10: Creator and Creator3D: FFB Graphics Patch
118707-05 – SunOS 5.10: Expert3D IFB Graphics Patch
118708-17 – SunOS 5.10: Sun XVR-1200 and Sun XVR-600 Graphics Accelerator Patch
118711-03 – SunOS 5.10: M64 Graphics Patch
118712-20 – SunOS 5.10: Sun XVR-100 Graphics Accelerator Patch
118717-02 – SunOS 5.10: Sun Video Timing Information Patch
118718-01 – SunOS 5.10: Generic Framebuffer configuration Graphics Patch
118735-01 – SunOS 5.10: patch usr/sbin/rpc.nisd_resolv
118777-12 – SunOS 5.10: Sun GigaSwift Ethernet 1.0 driver patch
118814-01 – SunOS 5.10: patch platform/sun4u/kernel/tod/sparcv9/todsg
118824-01 – SunOS 5.10: patch usr/bin/sparcv9/sort
118818-24 – SunOS 5.10: Solaris Crypto Framework patch
120900-04 – SunOS 5.10: libzonecfg Patch
121133-02 – SunOS 5.10: zones library and zones utility patch
119254-53 – SunOS 5.10: Install and Patch Utilities Patch
119042-10 – SunOS 5.10: svccfg & svcprop patch
119578-30 – SunOS 5.10: FMA Patch
118833-36 – SunOS 5.10: kernel patch
118842-01 – SunOS 5.10: dada patch
118884-01 – SunOS 5.10: atomic.h patch
118945-01 – SunOS 5.10: Sun Gigabit Ethernet 3.0 driver patch
118959-03 – SunOS 5.10: patch usr/bin/lastcomm and usr/bin/acctcom
118981-03 – SunOS 5.10: Sun Quad FastEthernet qfe driver
119059-40 – X11 6.6.2: Xsun patch
119063-01 – SunOS 5.10: libXpm patch
119065-01 – SunOS 5.10: fc-cache patch
119070-04 – SunOS 5.10: Netra-CP2300 Patch
119081-25 – SunOS 5.10: CD-ROM Install Boot Image Patch
119090-25 – SunOS 5.10: Sun iSCSI Device Driver and Utilities
119115-33 – Mozilla 1.7 patch
119117-42 – Evolution 1.4.6 patch
119130-33 – SunOS 5.10: Sun Fibre Channel Device Drivers

• 119246-32 – SunOS 5.10: Manual Page updates for Solaris 10
• 124628-05 – SunOS 5.10: CD-ROM Install Boot Image Patch
• 119252-22 – SunOS 5.10: System Administration Applications Patch
• 126538-01 – SunOS 5.10: i.manifest and r.manifest patch
• 124393-06 – CDE 1.6: Dtlogin smf patch
• 123611-03 – X11 6.6.2: Trusted Extensions patch
• 119280-17 – CDE 1.6: Runtime library patch for Solaris 10
• 119278-20 – CDE 1.6: dtlogin patch
• 121734-07 – SunOS 5.10: patch to support addition of new UTF-8 locales
• 119252-22 – SunOS 5.10: System Administration Applications Patch
• 119262-07 – SunOS 5.10: Patch for Central European Region locale issues
• 119276-09 – SunOS 5.10: Patch for Northern Europe Region locale issues
• 119282-01 – CDE1.6:: GNOME/CDE Menu for Solaris 10
• 119284-01 – CDE 1.6: sdtwsmfinfo patch
• 119286-02 – CDE 1.6: dtterm libDtTerm patch
• 119309-03 – SunOS 5.10: PGX32 Graphics
• 124188-02 – SunOS 5.10: Trusted Solaris Attributes Patch
• 121308-12 – SunOS 5.10: Solaris Management Console Patch
• 119313-19 – SunOS 5.10: WBEM Patch
• 119315-12 – SunOS 5.10: Solaris Management Applications Patch
• 119317-01 – SunOS 5.10: SVr4 Packaging Commands (usr) Patch
• 120460-13 – GNOME 2.6.0:: GNOME libs Patch
• 119368-05 – GNOME 2.6.0: Printing Technology Patch
• 119372-02 – GNOME 2.6.0:: GNOME common development tools and libraries Patch
• 119397-07 – SunOS 5.10: Patch for North America Region locale issues
• 119399-07 – SunOS 5.10: Patch for Central American Region locale issues
• 119401-09 – SunOS 5.10: Patch for Western Europe Region locale issues
• 119404-07 – SunOS 5.10: Patch for South American Region locale issues
• 119407-08 – SunOS 5.10: Patch for Eastern Europe Region locale issues
• 122212-25 – GNOME 2.6.0:: GNOME Desktop Patch
• 119410-05 – GNOME 2.6.0:: GNOME Applets Patch
• 119414-14 – GNOME 2.6.0:: GNOME Accessibility Libraries Patch
• 119416-01 – GNOME 2.6.0:: GNOME Text-To-Speech Engine Patch
• 119418-04 – GNOME 2.6.0:: GNOME On-screen Keyboard Patch
• 119420-01 – SunOS 5.10: Thai locale patch
• 119470-13 – SunOS 5.10: Sun Enterprise Network Array firmware and utilities
• 120199-11 – SunOS 5.10: sysidtool patch
• 119534-13 – SunOS 5.10: Flash Archive Patch
• 119538-14 – GNOME 2.6.0: Window Manager Patch
• 119540-07 – GNOME 2.6.0:: GNOME Dlogin configuration Patch
• 119544-03 – GNOME 2.6.0:: GNOME streaming media framework Patch
• 120099-08 – APOC 1.2: Sun Java(tm) Desktop System Configuration Shared Libraries
• 119546-08 – APOC 1.2: APOC Configuration Agent Patch
• 119548-12 – GNOME 2.6.0:: GNOME Multi-protocol instant messaging client Patch
• 119555-04 – SunOS 5.10: Software to support QLogic Ultra3 SCSI host bus adapters
• 119570-01 – SunOS 5.10: lwp8 Patch
• 119574-02 – SunOS 5.10: su patch
• 119583-01 – SunOS 5.10: memory classification header file patch
• 119598-08 – GNOME 2.6.0:: GNOME Screen Reader and Magnifier Patch
• 119601-12 – SunOS 5.10: Patch for European Region JDS messages
• 119603-08 – SunOS 5.10: Patch for Asian Region JDS messages
• 119605-08 – SunOS 5.10: Patch for Japanese JDS messages
• 119648-03 – SunOS 5.10: vlan driver patch
• 119703-11 – S10: localeadm patch
• 119721-02 – SunOS 5.10: usr/lib/ecode/sparcv9/interpreter patch
• 119876-05 – SunOS 5.10: FJSV, GPUU platform links patch
• 119728-03 – SunOS 5.10: FJSV, GPUU platform fmd.conf patch
• 120272-17 – SunOS 5.10: SMA patch
• 122640-05 – SunOS 5.10: zfs genesis patch
• 126897-02 – SunOS 5.10: Fault Manager Patch
• 127755-01 – SunOS 5.10: Fault Manager patch
• 125503-02 – SunOS 5.10: package-move-of-IP-objects patch
• 125547-02 – SunOS 5.10: zoneadm indirect dependency patch
• 126419-01 – SunOS 5.10: umountall patch
- 120011-14 – SunOS 5.10: kernel patch
- 119757-11 – SunOS 5.10: Samba patch
- 119764-06 – SunOS 5.10: ipmitool patch
- 119766-02 – SunOS 5.10: SunFreeware man pages patch
- 119771-02 – SunOS 5.10: Asian CCK locales patch
- 119783-05 – SunOS 5.10: bind patch
- 119797-17 – SunOS 5.10: CDE Localization message patch
- 119810-05 – SunOS 5.10: International Components for Unicode Patch
- 119812-05 – X11 6.6.2: Freetype patch
- 119814-19 – SunOS 5.10: OS Japanese manpages patch
- 119844-07 – SunOS 5.10: Patch for Southern Europe Region locale issues
- 119845-05 – SunOS 5.10: Patch for Australasia Region locale issues
- 119890-03 – GNOME 2.6.0: search tool Patch

- 137321-01 – SunOS 5.10: p7zip patch

Note – The Oracle Solaris 10 5/08 software contains script/special patches which do not deliver bug fixes or new features, but deliver changes that are required as a result of issues with the creation of the update image. As a result, the following script/special patches are not made available for customers to download from My Oracle Support, because they are not required outside of creating the Update release.

- 119079-13 – SunOS 5.10: Script Patch
- 119088-11 – SunOS 5.10: SPECIAL PATCH: SUNWqlc package install updates patch
- 119092-10 – SunOS 5.10: SPECIAL PATCH: iSCSI Script Patch to replace package scripts
- 120224-07 – SunOS 5.10: SPECIAL PATCH: Emulex-Sun Fibre Channel Adapter driver
- 120274-01 – SunOS 5.10: SPECIAL PATCH: For postinstall File
- 120344-01 – SunOS 5.10: SPECIAL PATCH: Common Fibre Channel HBA API Library Script Patch
- 120416-06 – SunOS 5.10: SPECIAL PATCH: class action scripts patch
- 120452-01 – SunOS 5.10: SPECIAL PATCH: For editable files only
- 120690-01 – SunOS 5.10: SPECIAL PATCH : For depend File
- 120746-01 – SunOS 5.10_sparc, SUNWswmt patch
- 120825-01 – SunOS 5.10: SPECIAL PATCH: FJSVpiclu depend file
- 120837-01 – SunOS 5.10: SPECIAL PATCH: For DEPEND Files
- 120932-01 – Solaris 10 U1: Live Upgrade to S10U1 fails due to checkinstall script
- 120934-01 – Solaris 10 U1: Live Upgrade to S10U1 fails due to SUNWccccrr postinatall

121571-04 – S10_x86: Patch for Australasia Region locale issues
121572-06 – S10_x86: Patch for South Europe Region locale issues
121604-02 – SunOS 5.10_x86: libcfgadm.so.1, scsi.so.1 patch
121607-02 – GNOME 2.6.0_x86: Python patch
121621-03 – SunOS 5.10_x86: Patch for mediaLib in Solaris
121668-02 – SunOS 5.10_x86: pilot-link header patch
121670-01 – SunOS 5.10_x86: SunFreeware pilot-link man pages patch
125288-02 – SunOS 5.10_x86: Japanese X locale update
121676-11 – SunOS 5.10_x86: Japanese Input System ATOK patch
121678-05 – SunOS 5.10_x86: Japanese Input System Wnn patch
121805-03 – SunOS 5.10_x86: GRUB patch
121871-01 – X11 6.6.2_x86: xterm patch
x86 Patch List

- 121924-01 – GNOME 2.6.0_x86:: GNOME CD Burner patch
- 121954-02 – SunOS 5.10_x86: Localization patch for new EMEA FIGGS locales
- 121978-03 – CDE 1.6_x86: dtlogin resources patch
- 122006-01 – SunOS 5.10_x86: SunFreeware growisofs man page
- 122010-01 – SunOS 5.10_x86: SunFreeware cdrtools patch
- 122012-01 – SunOS 5.10_x86: SunFreeware cdrtools man pages patch
- 122078-03 – SunOS 5.10_x86: NIS yp utilities patch
- 122084-02 – SunOS 5.10_x86: fsck mirrored patch
- 122086-01 – SunOS 5.10_x86: nispasswd patch
- 122120-05 – SunOS 5.10_x86: Patch for Arabic Fonts
- 122131-03 – S10_x86: Patch to update SUNWlocaledefs src files
- 122175-03 – SunOS 5.10_x86: dumpadm patch
- 122205-02 – GNOME 2.6.0_x86: configuration framework patch
- 122209-01 – GNOME 2.6.0_x86: Removable Media Patch
- 122211-01 – GNOME 2.6.0_x86:: GNOME Media Player Patch
- 122240-01 – SunOS 5.10_x86: Apache 2 mod_perl Perl cgi patch
- 122248-01 – SunOS 5.10_x86: patch clmb
- 122260-01 – SunOS 5.10_x86: SunFreeware gnu esp ghostscript patch
- 122262-01 – SunOS 5.10_x86: SunFreeware ghostscript man pages patch
- 122365-01 – SunOS 5.10_x86: bscbus, bscv driver patch
- 122409-01 – SunOS 5.10_x86: libmtmalloc patch
- 122419-01 – SunOS 5.10_x86: Fix Garbled Message Issues for Ru
- 122423-03 – SunOS 5.10_x86: add missing locale files for Mozilla
- 122425-01 – SunOS 5.10_x86: Mozilla default bookmarks patch
- 122471-02 – GNOME 2.6.0_x86:: GNOME Java Help Patch
- 122488-05 – SunOS 5.10_x86: Patch for Middle Eastern Region locale issue
- 122522-01 – SunOS 5.10_x86: locator patch
- 122655-05 – SunOS 5.10_x86: jumpstart and live upgrade compliance patch
- 122670-01 – Evolution 1.4.6_x86: Cryptographic Library patch
- 122676-01 – SunOS 5.10_x86: SunFreeware samba man pages patch
- 122736-01 – CDE 1.6_x86: backdrops patch
- 122748-01 – SunOS 5.10_x86: gda patch
- 122755-01 – SunOS 5.10_x86: libexacct.so.1 fma patch
12276-01 – SunOS 5.10_x86: Sun Update Connection Bootstrapper
122829-02 – SunOS 5.10_x86: lsimega driver patch
122861-05 – SunOS 5.10_x86: SCN Update Manager localization patch
122912-10 – SunOS 5.10_x86: Apache 1.3 Patch
122959-04 – GNOME 2.6.0_x86: RealPlayer media application
123004-03 – SunOS 5.10_x86: SAM module patch
124187-07 – SunOS 5.10_x86: SCN Base cacao module patch
123631-03 – SunOS 5.10_x86: HTTP proxy settings patch
123006-07 – SunOS 5.10_x86: Basic Registration Update
123012-01 – SunOS 5.10_x86: BR desktop icon patch
123016-01 – SunOS 5.10_x86: ps patch
123122-02 – SunOS 5.10_x86: usr/lib/libwsreg.so.1 Patch
123133-01 – SunOS 5.10_x86: more patch
123163-02 – GNOME 2.6.0_x86:: GNOME Java Run Time Patch
123195-01 – SunOS 5.10_x86: cron patch
123323-01 – SunOS 5.10_x86: pwconv patch
123327-01 – SunOS 5.10_x86: tail patch
123329-01 – SunOS 5.10_x86: expr patch
123333-01 – SunOS 5.10_x86: tftp and in.tftpd patch
123407-02 – SunOS 5.10_x86: svc-zones patch
123495-04 – X11 6.6.2_x86: fontconfig patch
123521-01 – SunOS 5.10_x86: dirname & basename patch
123527-01 – SunOS 5.10_x86: libcurses patch
123591-08 – SunOS 5.10_x86: Postgresql patch
123614-01 – X11 6.6.2_x86: OpenGL patch
123648-02 – SunOS 5.10_x86: gcc patch
123662-04 – SunOS 5.10_x86: Basic Registration Localization
123896-04 – SunOS 5.9_x86 5.10_x86: Common Agent Container (cacao) runtime 2.1 upgrade patch 04
123913-01 – SunOS 5.10_x86: ppriv patch
123939-01 – GNOME 2.6.0_x86: GNU Transport Layer Security Library Patch
124154-02 – SunOS 5.10_x86: Solaris Management Applications Localization patch
124180-01 – SunOS 5.10_x86: Sun Update Connection Bootstrapper Localization
124238-01 – SunOS 5.10_x86: ftp patch
- 124326-01 – SunOS 5.10_x86: rcm modules patch
- 124364-01 – SunOS 5.10_x86: /usr/bin/stardict patch
- 124396-01 – CDE 1.6_x86: dtaction patch
- 124398-02 – CDE 1.6_x86: libDtWidget patch
- 124400-01 – CDE 1.6_x86: dtfile patch
- 124402-01 – CDE 1.6_x86: dtpad patch
- 124404-01 – CDE 1.6_x86: dtstyle patch
- 124406-01 – CDE 1.6_x86: sdftprop patch
- 124445-01 – SunOS 5.10_x86: mountd patch
- 124458-01 – X11 6.6.2_x86: xdm patch
- 124631-16 – SunOS 5.10_x86: System Administration Applications, Network, and Core Libraries Patch
- 124925-01 – SunOS 5.10_x86: vold patch
- 124939-03 – SunOS 5.10.5.10_x86: JDMK 5.1 patch
- 124944-01 – SunOS 5.10_x86: SunFreeware gzip man pages patch
- 124998-01 – SunOS 5.10_x86: /usr/bin/tip patch
- 125023-01 – SunOS 5.10_x86: /usr/sbin/sar patch
- 125076-01 – SunOS 5.10_x86: svc-volfs patch
- 125165-10 – SunOS 5.10_x86: Qlogic ISP Fibre Channel Device Driver
- 125168-01 – SunOS 5.10_x86: gssd patch
- 125173-01 – SunOS 5.10_x86: llc2 patch
- 125175-02 – SunOS 5.10_x86: tl driver patch
- 125185-05 – SunOS 5.10_x86: Sun Fibre Channel Device Drivers
- 125212-01 – SunOS 5.10_x86: SunFreeware zlib patch
- 125214-02 – SunOS 5.10_x86: SunFreeware zlib man pages patch
- 125216-02 – SunOS 5.10_x86: SunFreeware wget patch
- 125218-01 – SunOS 5.10_x86: SunFreeware wget man pages patch
- 125280-05 – CDE1.6_x86: dtsession patch
- 125282-02 – CDE 1.6_x86: sdimage patch
- 125286-03 – SunOS 5.10_x86: Japanese font patch
- 125294-03 – SunOS 5.10_x86: Japanese iconv patch
- 125333-02 – JDS 3_x86: Macromedia Flash Player Plugin Patch
- 125365-02 – SunOS 5.10_x86: adpu320 driver patch
x86 Patch List

- 125389-01 – SunOS 5.10_x86: SNIA Multipath Management API and Multipathing Utilities
- 125475-01 – X11 6.8.0_x86: Xorg client libraries patch
- 125500-01 – SunOS 5.10_x86: chmod chown Patch
- 125532-02 – GNOME 2.6.0_x86: File System Examiner Patch
- 125534-06 – GNOME 2.6.0_x86: Trusted Extension Runtime Patch
- 125538-01 – GNOME 2.6.0_x86:: GNOME post script viewer

- 125542-02 – Mozilla 1.7_x86: Mozilla Thunderbird email client
- 125544-02 – GNOME 2.6.0_x86:: GNOME panel applets
- 125546-01 – GNOME 2.6.0_x86:: GNOME Performance Meter
- 125550-01 – SunOS 5.10_x86: logins patch
- 125552-01 – SunOS 5.10_x86: librestart patch
- 125720-20 – X11 6.8.0_x86: Xorg server patch
- 125726-02 – X11 6.6.2_x86: xinerama patch
- 125732-02 – SunOS 5.10_x86: XML and XSLT libraries patch
- 125895-01 – SunOS 5.10_x86: cut patch
- 125901-01 – SunOS 5.10_x86: audiohd patch
- 125906-01 – SunOS 5.10_x86: keytables patch
- 125907-01 – SunOS 5.10_x86: pcn driver patch
- 125953-04 – Sun Java Web Console 3.0.2_x86: Support for Application Server 8.2 EE
- 126118-02 – CDE 1.6_x86: Dtpower patch
- 126120-01 – CDE 1.6_x86: sys-suspend patch
- 126134-02 – SunOS 5.10_x86: sshd Patch
- 126207-04 – SunOS 5.10_x86: zebra ripd quagga patch
- 126261-01 – SunOS 5.10_x86: logadvm patch
- 126263-01 – SunOS 5.10_x86: prctl patch
- 127128-11 – SunOS 5.10_x86: kernel patch
- 126269-01 – SunOS 5.10_x86: This patch corrects deletes in SUNWtsg and SUNWtsu in 127128-05
- 126364-04 – SunOS 5.10_x86: X Window System changes - Solaris Trusted Extensions
- 126366-06 – SunOS 5.10_x86:: CDE Desktop changes - Solaris Trusted Extensions
- 126426-01 – SunOS 5.10_x86: fsckall patch
- 126431-01 – SunOS 5.10_x86: libcurses patch
x86 Patch List

- 126441-01 – SunOS 5.10_x86: rm patch
- 126443-01 – SunOS 5.10_x86: ac97.h and audioxp.h patch
- 126529-01 – SunOS 5.10_x86: SNIA Multipath Management API Libraries and scsi_vhci driver
- 126541-02 – SunOS 5.10_x86: libumem library patch
- 126543-02 – SunOS 5.10_x86: snmpdx and mibiisa patch
- 126545-01 – SunOS 5.10_x86: snmpdx manifest patch
- 126547-01 – SunOS 5.10_x86: Bash patch
- 126586-02 – SunOS 5.10_x86: auto_ef patch
- 126631-02 – SunOS 5.10_x86: tcsh patch
- 126650-01 – SunOS 5.10_x86: sulogin patch
- 126654-01 – SunOS 5.10_x86: md patch
- 126656-01 – SunOS 5.10_x86: poll driver patch
- 126658-01 – SunOS 5.10_x86: timex patch
- 126739-02 – S10_x86: Patch for European Region TJDS messages
- 126741-02 – SunOS 5.10_x86: Patch for Asian Region TJDS messages
- 126743-01 – S10_x86: Patch for Japanese TJDS messages
- 126869-02 – SunOS 5.10_x86: SunFreeware bzip2 patch
- 127542-01 – X11 6.8.0_x86: xman patch
- 127639-01 – CDE 1.4_x86: dterm patch
- 127725-01 – SunOS 5.10_x86: xntpd patch
- 127727-01 – SunOS 5.10_x86: getent patch
- 127738-01 – SunOS 5.10_x86: fifofs patch
- 127754-01 – SunOS 5.10_x86: pcicfg Patch
- 127760-01 – SunOS 5.10_x86: sar patch
- 127764-01 – SunOS 5.10_x86: libtsol patch
- 127785-01 – SunOS 5.10_x86: SunFreeware bzip2 man pages patch
- 127854-01 – SunOS 5.10_x86: sad driver patch
- 127867-02 – SunOS 5.10_x86: ufs patch
- 127869-01 – SunOS 5.10_x86: mv patch
- 127873-01 – SunOS 5.10_x86: mailx patch
- 127879-01 – SunOS 5.10_x86: usr/bin/du patch
- 127883-02 – SunOS 5.10_x86: sendmail and mail(1) patch
- 127885-01 – SunOS 5.10_x86: awk patch
- 127889-06 – SunOS 5.10_x86: ipf patch
- 127891-02 – SunOS 5.10_x86: nge patch
- 127915-01 – SunOS 5.10_x86: lofiadm patch
- 127923-03 – SunOS 5.10_x86: cpio patch
- 127960-01 – SunOS 5.10_x86: rpcsec patch
- 127965-04 – SunOS 5.10_x86: UFS utilities patch
- 127971-01 – SunOS 5.10_x86: find patch
- 127975-01 – SunOS 5.10_x86: in.routed patch
- 127977-04 – SunOS 5.10_x86: in.mpathd Patch
- 127981-01 – SunOS 5.10_x86: KMF Patch
- 127995-01 – SunOS 5.10_x86: xargs patch
- 127999-01 – SunOS 5.10_x86: kssladm patch
- 128001-01 – SunOS 5.10_x86: in.ftpd patch
- 128005-01 – SunOS 5.10_x86: dlpi header patch
- 128007-04 – SunOS 5.10_x86: usbsksp patch
- 128009-01 – SunOS 5.10_x86: libaio.so.1 patch
- 128293-01 – SunOS 5.10_x86: rsm patch
- 128295-02 – SunOS 5.10_x86: rpcmod patch
- 128297-01 – SunOS 5.10_x86: pcfs patch
- 128301-03 – SunOS 5.10_x86: zoneinfo timezones patch
- 128303-02 – SunOS 5.10_x86: libpicdevtree patch
- 128305-03 – SunOS 5.10_x86: ehci and scsa2usb patch
- 128307-03 – SunOS 5.10_x86: devfs patch
- 128309-02 – SunOS 5.10_x86: Broadcom NetXtreme II 5708S driver patch

137281-01 – SunOS 5.10_x86: dld patch
137283-01 – SunOS 5.10_x86: intpexec patch
137322-01 – SunOS 5.10_x86: p7zip patch

Note – The Oracle Solaris 10 5/08 software contains script/special patches which do not deliver bug fixes or new features, but deliver changes that are required as a result of issues with the creation of the update image. As a result, the following script/special patches are not made available for customers to download from My Oracle Support, because they are not required outside of creating the Update release.

119080-12 – SunOS 5.10_x86: SPECIAL PATCH: For Script Files
119089-11 – SunOS 5.10_x86: SPECIAL PATCH: SUNWqlc package install updates patch
