Index 491

Preface

Both novice users and those familiar with the SunOS operating system can use online man pages to obtain information about the system and its features. A man page is intended to answer concisely the question “What does it do?” The man pages in general comprise a reference manual. They are not intended to be a tutorial.

Overview

The following contains a brief description of each man page section and the information it references:

- Section 1 describes, in alphabetical order, the `asadmin` and `hadbm` utility commands.
- Section 1M describes all the other Application Server utility commands.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. For example, if there are no bugs to report, there is no BUGS section.

NAME This section gives the names of the commands or functions documented, followed by a brief description of what they do.

SYNOPSIS This section shows the syntax of commands or functions.

The following special characters are used in this section:

	[]	Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.
		Separator. Only one of the arguments separated by this character can be specified at a time.
DESCRIPTION		This section defines the functionality and behavior of the service. Thus it describes concisely what the command does. It does not discuss OPTIONS or cite EXAMPLES. Interactive commands, subcommands, requests, macros, and functions are described under USAGE.
OPTIONS		This section lists the command options with a concise summary of what each option does. The options are listed literally and in the order they appear in the SYNOPSIS section. Possible arguments to options are discussed under the option, and where appropriate, default values are supplied.
OPERANDS		This section lists the command operands and describes how they affect the actions of the command.
EXAMPLES		This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command-line entry and machine response is shown. Whenever an example is given, the prompt is shown as <code>example%</code> , or if the user must be superuser, <code>example#</code> . Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS, and USAGE sections.
EXIT STATUS		This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion, and values other than zero for various error conditions.
SEE ALSO		This section lists references to other man pages, in-house documentation, and outside publications.
NOTES		This section lists additional information that does not belong anywhere else on the page. It takes the form of an aside to the user, covering points of special interest. Critical information is never covered here.

BUGS

This section describes known bugs and, wherever possible, suggests workarounds.

User Commands

add-resources(1)

NAME	add-resources – creates the resources specified in an XML file														
SYNOPSIS	add-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>xml_file_path</i>														
DESCRIPTION	The add-resources command creates the resources named in the specified XML file. The <i>xml_file_path</i> is the path to the XML file containing the resources to be created. The DOCTYPE should be specified as <i>install_dir/lib/dtds/sun-resources_1_0.dtd</i> in the <i>resources.xml</i> file. This command is supported in remote mode only.														
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

OPERANDS	<pre> -e --echo -I --interactive -h --help --target xml_file_path </pre>	<p>Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>If set to true (default), only the required password options are prompted.</p> <p>Displays the help text for the command.</p> <p>In Enterprise Edition, specifies the target for which you are creating the resources. Valid values are</p> <ul style="list-style-type: none"> ■ <i>server</i>, which creates the resources for the default server instance <i>server</i> and is the default value ■ <i>domain</i>, which creates the resources for the domain ■ <i>cluster_name</i>, which creates the resources for every server instance in the cluster ■ <i>instance_name</i>, which creates the resources for a particular server instance <p>The path to the XML file containing the resource(s) to be created.</p> <p>An example XML file follows. Replace <code><install_dir></code> with the location of your Application Server installation.</p> <pre> <?xml version="1.0" encoding="UTF-8"?> <!DOCTYPE resources PUBLIC "-//Sun Microsystems Inc.//DTD Application Server 8.0 Domain//EN "*<install_dir>/lib/dtds/sun-resources_1_0.dtd*"> <resources> <jdbc-connection-pool name="SPECjPool" steady-pool-size="100" max-pool-size="150" max-wait-time-in-millis="60000" pool-resize-quantity="2" idle-timeout-in-seconds="300" is-isolation-level-guaranteed="true" is-connection-validation-required="false" connection-validation-method="auto-commit" fail-all-connections="false" datasource-classname="oracle.jdbc.pool.OracleDataSource"> <property name="URL" value="jdbc:oracle:thin:@iasperfsol12:1521:specdb"/> <property name="User" value="spec"/> <property name="Password" value="spec"/> <property name="MaxStatements" value="200"/> <property name="ImplicitCachingEnabled" value="true"/> </jdbc-connection-pool> <jdbc-resource enabled="true" pool-name="SPECjPool" jndi-name="jdbc/SPECjDB"/> </resources> </pre>
----------	--	---

add-resources(1)

EXAMPLES

EXAMPLE 1 Using the add-resources command

The following command creates resources using the contents of the XML file resource.xml:

```
asadmin> add-resources --user admin --passwordfile passwords.txt  
--host localhost --port 4848 resource.xml  
Command add-resources executed successfully.
```

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	appclient – launches the Application Client Container and invokes the client application packaged in the application JAR file
SYNOPSIS	<pre> appclient --client <i>client_application_jar</i> [--mainclass <i>client_application_main_classname</i> -- name <i>display_name</i>] [--xml <i>sun-acc.xml file</i>] [--textauth] [--user <i>username</i>] [--password <i>password</i>] </pre>
DESCRIPTION	<p>Use the <code>appclient</code> command to launch the application client container and invoke a client application that is packaged in an application JAR file. The application client jar file is specified and created during deployment either by the <code>deploytool</code> or by using the <code>asadmin deploy</code> command.</p> <p>The application client container is a set of java classes, libraries and other files that are required to execute a first-tier application client program on a Java Virtual Machine (JVM). The application client container communicates with the Application Server using RMI-IIOP.</p> <p>The <code>client.jar</code> that is retrieved after deploying an application, should be passed with the <code>-client</code> option while running the <code>appclient</code> utility. The <code>-mainclass</code> and <code>-name</code> options are optional for a single client application. For multiple client applications use either the <code>-classname</code> option or the <code>-name</code> option.</p>
OPTIONS	<pre> --client required; the name and location for the client application jar file. The application client JAR file is specified and created during deployment, either by the <code>deploytool</code> or by the <code>asadmin deploy</code> command. --mainclass optional; the full classname of the main client application <code>main()</code> method that will be invoked by the Application Client Container. Used for a single client application. By default, uses the class specified in the <code>client.jar</code>. The class name must be the full name. For example, <code>com.sun.test.AppClient</code> --name optional; the display name for the client application. Used for multiple client applications. By default, the display name is specified in the <code>client.jar application-client.xml</code> file which is identified by the <code>display-name</code> attribute. --xml optional if using the default domain and instance, otherwise it is required; identifies the name and location of the client configuration XML file. If not specified, defaults to the value of <code>\$AS_ACC_CONFIG</code> identified in <code>asenv.conf</code> file. --textauth optional; used to specify using text format authentication when authentication is needed. </pre>
EXAMPLES	<p>EXAMPLE 1 Using the <code>appclient</code> command</p> <pre> appclient -client <code>appserv/bin/myclientapp.jar</code> -mainclass <code>com.sun.test.TestAppClient</code> -xml <code>sun-acc.xml</code> <code>scott sample</code> </pre>

appclient(1)

EXAMPLE 1 Using the `appclient` command (Continued)

Where: `appserv/bin/myclientapp.jar` is the full path for the client application `.jar` file, `com.sun.text.TestAppClient` is the full Java package name of the main client application, `scott` and `sample` are arguments to pass to the application, and `sun-acc.xml` is the name of the client configuration XML file. If `sun-acc.xml` is not in the current directory, you must give the absolute path location; otherwise the relative path is used. The relative path is relative to the directory where the command is being executed.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Unstable

SEE ALSO [package-appclient\(1M\)](#), [asadmin\(1M\)](#)

NAME	asadmin – utility for performing administrative tasks for the Sun Java System Application Server														
SYNOPSIS	asadmin <i>subcommand</i> [- short_option [<i>short_option_argument</i>]] * [--long_option [<i>long_option_argument</i>]] * [<i>operand</i>] *														
DESCRIPTION	<p>Use the asadmin utility to perform any administrative task for the Sun Java System Application Server. You can use this utility in place of using the Administration Console interface.</p> <p>The <i>subcommand</i> identifies the operation or task you wish to perform. Subcommands are case-sensitive. Short option arguments have a single dash (-); while long option arguments have two dashes (--). Options modify how the utility performs a subcommand. Options are also case-sensitive. Most options require argument values except boolean options which toggle to switch a feature ON or OFF. Operands appear after the argument values, and are set off by a space, a tab, or double dashes (—). The asadmin utility treats anything that comes after the options and their values as an operand.</p> <p>Local subcommands can be executed without the presence of an administration server. However, it is required that the user be logged into the machine hosting the domain in order to execute the subcommand and have access (permissions) for the installation and domain directories.</p> <p>Remote subcommands are always executed by connecting to an administration server and executing the subcommand there. A running administration server is required. All remote subcommands require the following options:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;">-u --user</td> <td>authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 20px;">-w --password</td> <td>password to administer the domain application server.</td> </tr> <tr> <td></td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 20px;">--passwordfile</td> <td>The file containing the domain application server password in the following form: AS_ADMIN_PASSWORD=<i>password</i>. Where <i>password</i> is the actual administrator password.</td> </tr> <tr> <td style="padding-right: 20px;">-H --host</td> <td>machine name where the domain application server is running.</td> </tr> <tr> <td style="padding-right: 20px;">-p --port</td> <td>port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.</td> </tr> <tr> <td style="padding-right: 20px;">-s --secure</td> <td>if true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	authorized domain application server administrative username.	-w --password	password to administer the domain application server.		The --password option is deprecated. Use --passwordfile instead.	--passwordfile	The file containing the domain application server password in the following form: AS_ADMIN_PASSWORD= <i>password</i> . Where <i>password</i> is the actual administrator password.	-H --host	machine name where the domain application server is running.	-p --port	port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.	-s --secure	if true, uses SSL/TLS to communicate with the domain application server.
-u --user	authorized domain application server administrative username.														
-w --password	password to administer the domain application server.														
	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	The file containing the domain application server password in the following form: AS_ADMIN_PASSWORD= <i>password</i> . Where <i>password</i> is the actual administrator password.														
-H --host	machine name where the domain application server is running.														
-p --port	port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.														
-s --secure	if true, uses SSL/TLS to communicate with the domain application server.														

asadmin(1M)

<code>-t --terse</code>	indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	if set to true (default), only the required password options are prompted.
<code>-h --help</code>	displays the help text for the command.

For security purposes, you can set the password for a subcommand from a file instead of entering the password at the command line. The `--passwordfile` option takes the file containing the passwords. The valid contents for the file are:

```
AS_ADMIN_PASSWORD=value
AS_ADMIN_ADMINPASSWORD=value
AS_ADMIN_USERPASSWORD=value
AS_ADMIN_MASTERPASSWORD=value
```

If `AS_ADMIN_PASSWORD` has been exported to the global environment, specifying the `--passwordfile` option will produce a warning using about the `--password` option. Unset `AS_ADMIN_PASSWORD` to prevent this from happening.

The master password is not propagated on the command line or an environment variable, but can be specified in the `passwordfile`.

To use the `--secure` option, you must use the `set` command to enable the `security-enabled` flag in the `admin http-listener` in the `domain.xml`.

When you use the `asadmin` subcommands to create and/or delete, you must restart the server for the newly created command to take affect. Use the `start-domain` command to restart the server.

To access the manpages for the Application Server command-line interface subcommands on the Solaris platform, add `$AS_INSTALL/man` to your `MANPATH` environment variable.

You can obtain overall usage information for any of the `asadmin` utility subcommands by invoking the `--help` option. If you specify a subcommand, the usage information for that subcommand is displayed. Using the `help` option without a subcommand displays a listing of all the available subcommands.

asant(1M)

NAME	asant – launches the Jakarta Ant tool																						
SYNOPSIS	asant <i>target_list</i>																						
DESCRIPTION	<p>Use the <code>asant</code> command to automate repetitive development and deployment tasks. <code>asant</code> is a shell script that invokes the underlying Ant infrastructure after initializing the environment to pick up the application server installed targets.</p> <p>To use Ant as part of the Sun Java System Application Server, verify that your PATH includes the provided <code>asant</code> (UNIX) or <code>ant.bat</code> (Windows) script.</p> <p>The bundled sample applications use <code>asant</code> extensively; however, <code>asant</code> can be used in any development or operational environments.</p> <p>The build targets are represented in the <code>build.xml</code> files that accompany the sample applications.</p> <p>To use the Ant tool to compile and reassemble the sample applications, verify that the <code>\$AS_INSTALL/bin</code> directory is on your environment's path. On UNIX, add the <code>\$AS_INSTALL/bin</code> directory to your PATH environment variable. On Windows, after installing the Sun ONE Application Server, set the system path by adding <code>\$AS_INSTALL\bin</code> to the user PATH. You can access the PATH system variable from: Start menu, Settings, Control Panel, System, Advanced, Environment Variables, User Variables for Administrator, PATH.</p> <p>The <i>target_list</i> is one or more space separated tasks as described below.</p>																						
TARGETS	<table><tr><td><code>compile</code></td><td>compiles all Java source code.</td></tr><tr><td><code>jar</code></td><td>assembles the EJB JAR module.</td></tr><tr><td><code>war</code></td><td>assembles the WAR file in <i>sample_dir/assemble/war</i></td></tr><tr><td><code>ear</code></td><td>assembles the EAR file in <i>sample_dir/assemble/ear</i></td></tr><tr><td><code>core</code></td><td>(default) compiles all sources, builds stubs and skeletons; and assembles EJB JAR, WAR and EAR files. This is the default target for all <code>build.xml</code> files shipped in the Sun ONE Application Server.</td></tr><tr><td><code>javadocs</code></td><td>creates Java docs in <i>sample_dir/javadocs</i></td></tr><tr><td><code>all</code></td><td>builds core and javadocs, verifies and deploys the application, and adds the resources..</td></tr><tr><td><code>deploy</code></td><td>deploys the application and automatically expands the EJB JAR; does not install Javadocs.</td></tr><tr><td><code>undeploy</code></td><td>removes the deployed sample from the Sun Java System Application Server.</td></tr><tr><td><code>clean</code></td><td>removes <i>appname/build/</i> and <i>appname/assemble/</i> and <i>appname/javadocs</i> directories.</td></tr><tr><td><code>verify</code></td><td>verifies the deployment descriptors in the sample.</td></tr></table>	<code>compile</code>	compiles all Java source code.	<code>jar</code>	assembles the EJB JAR module.	<code>war</code>	assembles the WAR file in <i>sample_dir/assemble/war</i>	<code>ear</code>	assembles the EAR file in <i>sample_dir/assemble/ear</i>	<code>core</code>	(default) compiles all sources, builds stubs and skeletons; and assembles EJB JAR, WAR and EAR files. This is the default target for all <code>build.xml</code> files shipped in the Sun ONE Application Server.	<code>javadocs</code>	creates Java docs in <i>sample_dir/javadocs</i>	<code>all</code>	builds core and javadocs, verifies and deploys the application, and adds the resources..	<code>deploy</code>	deploys the application and automatically expands the EJB JAR; does not install Javadocs.	<code>undeploy</code>	removes the deployed sample from the Sun Java System Application Server.	<code>clean</code>	removes <i>appname/build/</i> and <i>appname/assemble/</i> and <i>appname/javadocs</i> directories.	<code>verify</code>	verifies the deployment descriptors in the sample.
<code>compile</code>	compiles all Java source code.																						
<code>jar</code>	assembles the EJB JAR module.																						
<code>war</code>	assembles the WAR file in <i>sample_dir/assemble/war</i>																						
<code>ear</code>	assembles the EAR file in <i>sample_dir/assemble/ear</i>																						
<code>core</code>	(default) compiles all sources, builds stubs and skeletons; and assembles EJB JAR, WAR and EAR files. This is the default target for all <code>build.xml</code> files shipped in the Sun ONE Application Server.																						
<code>javadocs</code>	creates Java docs in <i>sample_dir/javadocs</i>																						
<code>all</code>	builds core and javadocs, verifies and deploys the application, and adds the resources..																						
<code>deploy</code>	deploys the application and automatically expands the EJB JAR; does not install Javadocs.																						
<code>undeploy</code>	removes the deployed sample from the Sun Java System Application Server.																						
<code>clean</code>	removes <i>appname/build/</i> and <i>appname/assemble/</i> and <i>appname/javadocs</i> directories.																						
<code>verify</code>	verifies the deployment descriptors in the sample.																						

EXAMPLES | **EXAMPLE 1** Compiling and Assembling a Sample Application

Using the simple stateless EJB sample as an example, execute several of the build targets as follows:

```
cd install_root/samples/ejb/stateless/simple/src
```

Execute the `compile` target to compile the Java sources as follows:

```
asant compile
```

Execute the `war`, `ear`, and `ejbjar` target to assemble the J2EE module files and the EAR file as follows by:

```
asant jar
asant war
asant ear
```

Alternatively, all the above tasks can be accomplished by:

```
asant core
```

Since the default build target is `core` you can execute `asant` without any arguments to rebuild the entire application.

EXAMPLE 2 Building Web-based Applications

You can build everything, including installing Javadocs, and deploying the application by:

```
asant all
```

Additionally, you can build everything, except the Javadocs, but deploy the application by:

```
asant core
or just,
asant
then,
asant deploy
```

To rebuild the `ear` after you have modified the deployment descriptors without recompiling:

```
asant ear
asant deploy
```

JBoss Application Server 3.0, 3.2													
Tomcat Web Server 4.1.12													
OPTIONS		<table border="0"> <tr> <td style="padding-right: 20px;">-h --help</td> <td>displays the arguments for launching the MigrationTool.</td> </tr> <tr> <td style="padding-right: 20px;">-v --version</td> <td>displays the version of the MigrationTool.</td> </tr> <tr> <td style="padding-right: 20px;">-u --ui</td> <td>invokes the tool in user interface mode.</td> </tr> </table>	-h --help	displays the arguments for launching the MigrationTool.	-v --version	displays the version of the MigrationTool.	-u --ui	invokes the tool in user interface mode.					
-h --help	displays the arguments for launching the MigrationTool.												
-v --version	displays the version of the MigrationTool.												
-u --ui	invokes the tool in user interface mode.												

asmigrate(1m)

<code>-c --commandline</code>	invokes the tool in command-line mode.
<code>-q --quiet</code>	launches the tool in quiet mode.
<code>-d --debug</code>	launches the tool in debug mode.
<code>-s --sourcedirectory</code>	identifies the directory where the source code to migrate or scan is present.
<code>-S --sourceserver</code>	identifies the source application server of the applications to be migrated. Possible servers include the following: <ul style="list-style-type: none">■ wl51: WebLogic Application Server 5.1■ wl60: WebLogic Application Server 6.0■ wl61: WebLogic Application Server 6.1■ wl81: WebLogic Application Server 8.1■ as65: Sun ONE Application Server 6.5■ as70: Sun ONE Application Server 7.0■ ws40: WebSphere Application Server 4.0■ ws50: WebSphere Application Server 5.x■ ri13: JavaTM™ 2 Platform Enterprise Edition 1.3■ ri14: JavaTM™ 2 Platform Enterprise Edition 1.3■ s1ws: Sun ONE Web Server■ jb30: JBoss Application Server 3.0■ tc41: Tomcat Application Server 4.1
<code>-t --targetdirectory</code>	target or output directory where the migrated application should be placed.
<code>-T --targetserver</code>	target application server to which the application is to be migrated. Use sjs80PE as the target server for Sun Java System Application Server 8.1 2005Q1.
<code>-n --scan-native-apis-only</code>	scans the source code only for the presence of application server specific proprietary APIs.
<code>-p --scan-packages</code>	comma-separated list of Java packages to scan.
<code>-j --java2db</code>	bypasses the creation of the <code>sun-cmp-mapping.xml</code> file. Instead, introduces the option argument into the <code>sun-ejb-jar.xml</code> file. Option arguments are: <ul style="list-style-type: none">■ create-tables: if set to true (default), creates tables at deploy. If set to false tables are not created.

-m --migrate-cmp	<ul style="list-style-type: none"> ■ drop-tables: if set to true (default), tables are dropped at undeploy. If set to false tables are not dropped. ■ db-vendor-name: name of the database vendor for the application to be migrated. Supported vendor names include: Oracle, Sybase, DB2, Generic SQL92, PointBase, MSSQL. <p>migrates 1.1 compliant CMPs, if any, to 2.0. Option arguments are:</p> <ul style="list-style-type: none"> ■ overwrite-conflicting-accessors: if set to true (default), conflicting accessors are overwritten. If set to false, conflicting accessors are not overwritten. ■ comment-pk-modifiers: if set to true (default), setters of primary key are commented. If set to false, setters of primary key are not commented.
-f --file-filter	<p>selects the type of files to migrate. Option arguments are:</p> <ul style="list-style-type: none"> ■ all-files: if specified and set to true (default), migrates all types of files. ■ html-files: if specified and set to true (default), migrates HTML files. ■ java-files: if specified and set to true (default), migrates Java files. ■ jsp-files: if specified and set to true (default), migrates JSP type files. ■ xml-files: if specified and set to true (default), migrates all XML type files. ■ archive-files: if specified and set to true (default), migrates jar/ear/war/rar file types.
-a --append-logs	<p>if specified, appends the logging to the existing or previous logs without overwriting them. If not specified, previous logs are overwritten.</p>
operands	<p>identifies the archive file (jar/ear/war/rar) to be migrated.</p>

asmigrate(1m)

EXAMPLES

EXAMPLE 1 Using asmigrate

This example shows how to migrate the source code for a Websphere 4.0 application to Sun Java System Application Server 8.1 Platform Edition 2005Q1 using the command line options. The output directory for the migrated code is /tmp/ws_out. The location of the source code is in directory, /d1/asmt/examples/websphere_4_0/PeopleDB/src.

```
asmigrate -c -T sjs80PE -S ws40 -t /tmp/ws_out -s  
/d1/asmt/examples/websphere_4_0/PeopleDB/src
```

This example shows how to migrate a Websphere 4.0 application archive to Sun Java System Application Server 8.1 Platform Edition 2005Q1.

```
asmigrate -c -T sjs80PE -S ws40 -t /tmp/ws_out  
/d1/asmt/examples/websphere_4_0/PeopleDB/WA  
SDeployed/PeopleDBEnEar.ear
```

This example shows how to migrate source code from Weblogic 6.1 application to Sun Java System Application Server 8 Platform Edition 2004Q4. Only Java files are designated to be migrated. CMP 1.1 beans will be migrated to CMP 2.0 beans and conflicting CMP related accessors will be overwritten.

```
asmigrate -c -T sjs80PE -S wl61 -t /tmp/ws_out -s  
/d1/asmt_headstrong/asmt/examples/weblogic_6_x/  
iBank -f java-files=true -m overwrite-conflicting-accessors=true
```

This example shows how to start the migration tool UI.

```
asmigrate -u
```

[asupgrade\(1M\)](#)

NAME	asupgrade – migrates the configuration of a previously installed Sun Java System Application Server
SYNOPSIS	<pre> asupgrade [--console] [--version] [--help] [--source <i>applicationserver_7.x/8.x_installation</i>] [--target <i>applicationserver_8.1_installation</i>] --adminuser <i>admin_user</i> [--adminpassword <i>admin_password</i>] [--masterpassword <i>changeit</i>] [--passwordfile <i>path_to_password_file</i>] [--domain <i>domain_name</i>] [--nsspwdfile <i>NSS_password_filepath</i>] [--targetnsspwdfile <i>target_NSS_password_filepath</i>] [--jkspwdfile <i>JKS_password_filepath</i>] [--capwdfile <i>CA_password_filepath</i>] [--clinstancefile <i>file1</i> [, <i>file2</i>, <i>file3</i>, ... <i>filen</i>]] </pre>
DESCRIPTION	<p>Use the <code>asupgrade</code> utility to migrate the server configuration and its persisted state, J2EE services, and deployed J2EE applications. The configuration of an installed Sun Java System Application Server 7 is migrated to the Sun Java System Application Server 8.1 installation. If the domain contains information about a deployed application and the installed application components do not agree with the configuration information, the configuration is migrated as is without any attempt to reconfigure the incorrect configurations.</p> <p><code>asupgrade</code> migrates the configuration and deployed applications of a previous version of the Application Server; however, the runtime binaries of the server are not updated. Database migrations or conversions are also beyond the scope of the <code>asupgrade</code> command.</p> <p>Only those instances that do not use Sun Java System Web Server-specific features will be upgraded seamlessly. Configuration files related to HTTP path, CGI bin, SHTML, and NSAPI plugins will not be upgraded.</p> <p>The upgrade process can also be initiated automatically at installation time using the Upgrade checkbox in the Application Server installer. After completion of the upgrade, use the uninstaller to remove the previous version of the application server.</p> <p>Application archives (EAR files) and component archives (JAR, WAR, and RAR files) that are deployed in the Application Server 7.x/8.0 environment do not require any modification to run on Application Server 8.1. Applications and components that are deployed in the source server are deployed on the target server during the upgrade. Applications that do not deploy successfully on the target server must be migrated using the Migration Tool or <code>asmigrate</code> command, then redeployed manually.</p> <p>Specify the source and target directories for the upgrade.</p> <p>If the upgrade includes certificates, provide the passwords for the source PKCS12 file and the target JKS keyfile for each domain that contains certificates to be migrated. Since Application Server 7 uses a different certificate store format (NSS) than Application Server 8 PE (JSSE), the migration keys and certificates are converted to the</p>

asupgrade(1)

new format. Only one certificate database password per domain is supported. If multiple certificate database passwords are used in a single domain, all of the passwords must be made the same before starting the upgrade. The passwords can be reset after the upgrade has been completed.

If the upgrade includes clusters, specify one or more cluster files. Upon successful upgrade, an upgrade report is generated listing successfully migrated items along with a list of the items that could not be migrated.

If you issue the `asupgrade` command with no options, the Upgrade Tool GUI will be displayed. If the `asupgrade` command is used in command-line mode and all of the required information is not supplied, an interviewer will request information for any required options that were omitted.

OPTIONS		
<code>-c --console</code>		Launches the upgrade command line utility.
<code>-V --version</code>		The version of the Upgrade Tool.
<code>-h --help</code>		Displays the arguments for launching the UpgradeTool.
<code>-s --source</code>		The installation directory for Sun Java System Application Server 7.x/8.x installation that will be upgraded.
<code>-t --target</code>		The installation directory for Sun Java System Application Server 8.1.
<code>-a --adminuser</code>		The username of the administrator.
<code>-w --adminpassword</code>		The password for the adminuser. Although this option can be used, the recommended way to transmit passwords is by using the <code>--passwordfile</code> option.
<code>-m --masterpassword</code>		The master password that is created during installation. The default value is <code>changeit</code> . Although this option can be used, the recommended way to transmit passwords is by using the <code>--passwordfile</code> option.
<code>-f --passwordfile</code>		The path to the file that contains the adminpassword and masterpassword. Content of this file should be in the following format: <code>AS_ADMIN_ADMINPASSWORD=adminpassword</code> <code>AS_ADMIN_MASTERPASSWORD=masterpassword</code>
<code>-d --domain</code>		The domain name for the migrated certificates.
<code>-n --nsspwdfile</code>		The path to the NSS password file.
<code>-e --targetnsspwdfile</code>		The path to the target NSS password file.
<code>-j --jkspwdfile</code>		The path to the JKS password file.
<code>-p --capwdfile</code>		The path to the CA certificate password file.

`-i --clinstancefile` The path to the cluster file. The default filename is `$AS_INSTALL/conf/clinstance.conf`.

EXAMPLES**EXAMPLE 1** Upgrading an Application Server 7 Installation to Application Server 8.1 with Prompts for Certificate Migration

This example shows how to upgrade a Sun Java System Application Server 7 installation to Sun Java System Application Server 8.1. You will be prompted to migrate certificates. If you reply no, then no certificates will be migrated.

```
example% asupgrade --adminuser admin --passwordfile password.txt
--source /home/sunas7 --target /home/sjsas8.1
```

EXAMPLE 2 Upgrading an Application Server 7.1 EE Installation with Clusters and NSS Certificates to Application Server 8.1 EE

This example shows how to upgrade a Sun Java System Application Server 7.1 EE installation with a cluster to Sun Java System Application Server 8.1 EE. NSS certificates will be migrated, as will the `clinstance.conf` cluster file.

```
example% asupgrade --adminuser admin
--passwordfile password.txt
--source /home/sjsas7.1 --target /home/sjsas8.1
--domain domain1 --nsspwdfile /home/sjsas7.1/nsspword.txt
--targetnsspwdfile /home/sjsas8.1/nsspword.txt
--clinstancefile /home/sjsas7.1/config/clinstance.conf
```

After the upgrade, node agents for all remote instances must be created and started on their respective host systems.

EXAMPLE 3 Upgrading an Application Server 7.0 PE Installation with NSS Certificates to Application Server 8.1 PE

This example shows how to upgrade a Sun Java System Application Server 7.0 PE installation to Sun Java System Application Server 8.1 PE. The NSS certificates from the 7.0 PE source server will be converted to JKS and CA certificates in the 8.1 PE target server.

```
example% asupgrade --adminuser admin
--passwordfile password.txt
--source /home/sjsas7.0 --target /home/sjsas8.1
--domain domain1 --nsspwdfile /home/sjsas7.0/nsspword.txt
--jkspwdfile /home/sjsas7.0/jkspword.txt
--capwdfile /home/sjsas7.0/capword.txt
```

EXAMPLE 4 Upgrading an Application Server 8.0 PE Installation with JKS and CA Certificates to Application Server 8.1 PE

This example shows how to upgrade a Sun Java System Application Server 8.0 PE installation to Sun Java System Application Server 8.1 PE. JKS and CA certificates will be migrated.

asupgrade(1)

EXAMPLE 4 Upgrading an Application Server 8.0 PE Installation with JKS and CA Certificates to Application Server 8.1 PE *(Continued)*

```
example% asupgrade --adminuser admin
--passwordfile password.txt
--source /home/sjsas8.0 --target /home/sjsas8.1
--domain domain1 --jkspwdfilename /home/sjsas8.0/jkspassword.txt
--capwdfilename /home/sjsas8.1/capassword.txt
```

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	backup-domain – performs a backup on the domain
SYNOPSIS	backup-domain [--domaindir <i>domain_directory</i>] [--descriptioin <i>description</i>] [--domaindir <i>domain_directory</i>] [<i>domain_name</i>]
DESCRIPTION	The backup-domain command backs up files under the named domain. This command is supported in local mode only.
OPTIONS	--domaindir This option specifies the parent directory of the domain upon which the command will operate. The default is <code>install_dir/domains</code> .
OPERANDS	<i>domain_name</i> This is the name of the root directory of the domain to be backed up. The default is all domains under <code>domaindir</code> .
EXAMPLES	EXAMPLE 1 Using backup-domain <pre>asadmin>backup-domain --domaindir directory1 domain1</pre> The command executed successfully. Where: domain1 is the domain name.
EXIT STATUS	0 command executed successfully 1 error in executing the command

capture-schema(1m)

NAME	capture-schema – stores the database metadata (schema) in a file for use in mapping and execution
SYNOPSIS	capture-schema -username <i>name</i> -password <i>password</i> -dburl <i>url</i> -driver <i>jdbc_driver_classname</i> [-schemaname <i>schemaname</i>] [-table <i>tablename</i>] -out <i>filename</i>
DESCRIPTION	<p>Stores the database metadata (schema) in a file.</p> <p>Run capture-schema as the same database user that owns the table(s), and use that same username with the -username option (and -schemaname, if required).</p> <p>When running capture-schema against an Oracle database, you should grant the database user running the capture-schema command the ANALYZE ANY TABLE privilege.</p> <p>You can also use the Sun Java System Studio IDE to capture the database schema.</p>
OPTIONS	<p>-username user name for authenticating access to a database.</p> <p>-password password for accessing the selected database.</p> <p>-dburl JDBC URL required by the driver for accessing a database.</p> <p>-driver JDBC driver classname in your CLASSPATH.</p> <p>-schemaname name of the user schema being captured. If not specified, the default will capture metadata for all tables from all the schemas accessible to this user.</p> <p><i>Specifying this parameter is highly recommended.</i> Without this option, if more than one schema is accessible to this user, more than one table with the same name may be captured, which will cause problems when mapping CMP fields to tables.</p> <p>The specified schema name must be uppercase.</p> <p>-table name of a table; multiple table names can be specified. If no table is specified, all the tables in the database or named schema are captured.</p> <p>The specified table name or names are case sensitive. Be sure to match the case of the previously created table names.</p> <p>-out name of the output file. This option is required. If the specified output file does not contain the .dbschema suffix, it will be appended to the filename.</p>
EXAMPLES	<p>EXAMPLE 1 Using capture-schema</p> <pre>capture-schema -username cantiflas -password enigma -dburl jdbc:oracle:thin:@sadbtrue:1521:ora817 -driver oracle.jdbc.driver.OracleDriver -schemaname CANTIFLAS -out cantiflas.dbschema</pre>

change-master-password(1)

NAME	change-master-password – changes the master password
SYNOPSIS	change-master-password [<i>--domaindir domain_path</i> <i>--agentdir node-agent_path</i>] [<i>--savemasterpassword=false</i>] [<i>domain_name</i> <i>node_agent_name</i>]
DESCRIPTION	This local command is used to modify the master password. Change-master-password is interactive in that the user is prompted for the old master password, as well as the new master password. This command will not work unless the server is stopped. In a distributed Enterprise Edition environment, this command must run on each machine in the domain, with the Node Agent stopped.
OPTIONS	<i>--domaindir</i> This option specifies the directory used for this operation. By default, the domaindir is \$AS_DEF_DOMAINS_PATH, which is an environment variable defined in asenv.bat/conf. Both the domaindir and the agentdir options should not be passed together; use one or the other. <i>--agentdir</i> Like a DAS, each Node Agent resides in a top level directory named <agentdir>/<nodeagent_name>. If the agentdir is not specified, then \$AS_DEF_DOMAINS_PATH/./nodeagents is used. Both the domaindir and the agentdir options should not be passed together; use one or the other. This option is supported in Enterprise Edition only. <i>--savemasterpassword</i> This option indicates whether the master password should be written to the file system. This is necessary so that start-domain can start the server without having to prompt the user. WARNING: saving the master password on disk is extremely dangerous and should be avoided. NOTE: if savemasterpassword is not set, the master password file, if it exists, will be deleted.
OPERANDS	<i>domain_name</i> This is the domain name whose password is to be changed. If there is only a single domain, this is optional. This option can be used on either the Platform Edition or the Enterprise Edition. <i>node-agent_name</i> This is the name of the node agent whose password is to be changed. If there is only a single domain, this is optional. This option can be used on Enterprise Edition only.

EXAMPLES **EXAMPLE 1** Using change-master-password

```
asadmin> change-master-password domain44ps
```

Master password has been changed

EXIT STATUS

clear-ha-store(1)

NAME	clear-ha-store – deletes tables in HADB												
SYNOPSIS	clear-ha-store --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--haagentport <i>port_number</i>] <i>databaseName</i>												
DESCRIPTION	<p>This command deletes tables in HADB. You must have created an entry in the HA database before you execute this command, using <code>configure-ha-cluster</code> or <code>create-ha-store</code>. Use fully qualified hostnames when specifying the hostlist interfaces explicitly for hosts with multiple network interfaces. <code>clear-ha-store</code> was named <code>delete-session-store</code> in the Sun Java System Application Server 7.1. <code>delete-session-store</code> has been deprecated.</p> <p>This command is supported in remote mode only.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

clear-ha-store(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--haagentport</code>	The name of the HA agent port. If not specified, the default port number is 1862.
OPERANDS	<i>databaseName</i>	The name of the HA database.
EXAMPLES	EXAMPLE 1 Using clear-ha-store	
	<code>asadmin> clear-ha-store hadatabase1</code>	
		The clear-ha-store command executed successfully
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-ha-store(1)	

configure-ha-cluster(1)

NAME	configure-ha-cluster – configures an existing cluster to be High Availability														
SYNOPSIS	configure-ha-cluster --host <i>localhost</i> [--port <i>4848</i>] [--user <i>user</i>] [--passwordfile <i>passwordfile_name</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--secure= <i>false</i>] [--devicesize <i>devicesize</i>] [--haagentport <i>port_number</i>] [--haadminpassword <i>password</i>] [--haadminpasswordfile <i>file_name</i>] [--hosts <i>hadb-host-list</i>] [--property (<i>name=value</i>): <i>name-value</i>]*] { <i>clusterName</i> }														
DESCRIPTION	<p>The <code>configure-ha-cluster</code> command performs the following tasks:</p> <ul style="list-style-type: none">■ Verifies that the cluster exists.■ Verifies that the cluster is standalone (an example of this is, that the cluster doesn't share its configuration with any other cluster).■ Checks if a database with the same name as the cluster already exists. If so, an error is logged and the command performs the next task.■ Creates an HA database with the same name as the cluster.■ Creates the correct tables in the database.■ Creates and/or modifies the appropriate resources in <code>domain.xml</code>. <p>This command is supported in remote mode only.</p>														
OPTIONS	<table><tr><td>-H --host</td><td>This option specifies the machine where the domain application server is located. The default is <code>localhost</code>.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.</td></tr><tr><td>-u --user</td><td>This option specifies the user name associated with the administrative instance.</td></tr><tr><td>-w --password</td><td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td></tr><tr><td>-W --passwordfile</td><td>The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=<i>password</i></code>. Where <i>password</i> is the actual administrator password for the domain.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code>.</td></tr><tr><td>-e --echo</td><td>Setting to <code>true</code> will echo the command line statement on to the standard output. Default is <code>false</code>.</td></tr></table>	-H --host	This option specifies the machine where the domain application server is located. The default is <code>localhost</code> .	-p --port	The port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.	-u --user	This option specifies the user name associated with the administrative instance.	-w --password	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	-W --passwordfile	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=<i>password</i></code> . Where <i>password</i> is the actual administrator password for the domain.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code> .	-e --echo	Setting to <code>true</code> will echo the command line statement on to the standard output. Default is <code>false</code> .
-H --host	This option specifies the machine where the domain application server is located. The default is <code>localhost</code> .														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.														
-u --user	This option specifies the user name associated with the administrative instance.														
-w --password	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.														
-W --passwordfile	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=<i>password</i></code> . Where <i>password</i> is the actual administrator password for the domain.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code> .														
-e --echo	Setting to <code>true</code> will echo the command line statement on to the standard output. Default is <code>false</code> .														

configure-ha-cluster(1)

-I --interactive	If set to true (default), only the required options are prompted.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
--devicesize	This is the device size in MegaBytes (MB). The valid range is between 208MB and 8+ gigabytes (GB).
--haagentport	This is the number of the HA agent port. The default is 1862.
--haadminpassword	This is the HA administrator's password.
--haadminpasswordfile	The file containing the high-availability password associated with the administrative instance. The password is defined in the following form: HADBM_ADMINPASSWORD= <i>password</i> , HADBM_DBPASSWORD= <i>password</i> , HADBM_SYSEMPASSWORD= <i>password</i> . Where <i>password</i> is the actual HA administrator password for the domain.
--hosts	This is a list of comma separated host names where the HADB instance is configured. The number of hosts must be greater than 1 and must be an even number. The same host names can be repeated. Use fully qualified hostnames when specifying the hostlist interfaces explicitly for hosts with multiple network interfaces.
--property	This is a list of property name/value pairs, which are separated by a colon.
OPERANDS	<i>clusterName</i> This is the name of the cluster that will be changed to high availability.
EXAMPLES	EXAMPLE 1 Using the configure-ha-cluster command This is a basic example of how the command is used. <code>asadmin>configure-ha-cluster --user admin --passwordfile passwordfile --hosts hostha1 cluster1</code> The command configuration-ha-cluster has executed successfully. Where: the hosts name is hostha1 and the cluster name is cluster1.
EXIT STATUS	0 command executed successfully 1 error in executing the command
SEE ALSO	remove-ha-cluster(1)

configure-ha-persistence(1)

NAME	asadmin configure-ha-persistence, configure-ha-persistence – enables configuration of parameters related to session persistence
SYNOPSIS	<pre>configure-ha-persistence --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--type <i>persistencetype</i>] [--frequency <i>frequency</i>] [--scope <i>scope</i>] [--store <i>jdbc_resource_jndi_name</i>] [--property (<i>name=value</i>) [:<i>name=value</i>] *] [--haagentport <i>portnumber</i>] [--hosts <i>hadb_hosts_list</i>] <i>clustername</i></pre>
DESCRIPTION	<p>Configure the global session persistence settings to balance your needs for performance, reliability, and high availability. You can override these settings for specific applications by changing the properties of the <code>manager-properties</code>, <code>store-properties</code>, and <code>session-properties</code> subelements of the <code>session-manager</code> element in the <code>sun-web.xml</code> file.</p> <p>The <code>configure-ha-persistence</code> command is available only in the Enterprise Edition of the Sun Java System Application Server.</p>
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is <code>localhost</code>.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

configure-ha-persistence(1)

<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--type</code>	Set the persistence type to specify where session data is stored. The persistence types available are: <ul style="list-style-type: none">■ <code>memory</code> If session persistence for the application server instance is disabled, this is the default persistence type. The memory persistence type provides no session persistence in a clustered environment. The memory persistence type is intended for development environments and should not be used for production.■ <code>file</code> This type provides no session persistence in a clustered environment. Use file persistence type to store session data in a file. If the instance becomes unavailable and restarts, it can recover the session information that was last written to the file. The file persistence type is meant for development environments and should not be used for production.■ <code>ha</code> If session persistence for the application server instance is enabled, this is the default persistence type. This type allows you to store session data in the HADB. The ha persistence type enables failover of session information between application server instances in a cluster. The session information for each application server instance in a cluster is stored in the HADB. The session information is available to all other instances in the cluster. If an instance in a cluster becomes unavailable, another instance in the cluster can continue to serve the sessions that the now unavailable instance was serving.

configure-ha-persistence(1)

--frequency

Set the persistence frequency to define the frequency at which the session state is stored in the HADB. The persistence frequencies available are:

- `web-method` The session is stored after every web request just before a response is sent back to the client. Use this frequency when you need very high availability of updated session states.
- `time-based` The session is stored at the time interval defined in the `reapIntervalSeconds` property. A better throughput is achieved because the session is stored after a configurable time interval instead of after every web request.

--scope

Set the persistence scope to determine how much of the session is stored. The persistence scopes available are:

- `modified-session` The entire session is stored only if it has been modified since the last time it was stored.
- `session` The entire session is stored every time session information is saved to the HADB.
- `modified-attribute` Only the modified attributes of the session are stored. Using this mode can improve the throughput and response time significantly for applications in which only a small portion of the session state is modified for any given request.

If you use the modified-attribute persistence scope, your application should follow these guidelines:

- Call `setAttribute()` every time you modify the session state.
- Make sure there are no cross-references between attributes. The object graph under each distinct attribute key is serialized and stored separately. If there are any object cross references between the objects under each separate key, they are not serialized and deserialized correctly.
- Ideally, the session state should be stored in multiple attributes, or at least in a read-only attribute and a modifiable attribute.

--store

Specify the JNDI name of the JDBC resource for the HADB. The default is `jdbc/hastore`.

--property

You can configure other session persistence properties to fine tune the session persistence configuration. The following properties are available:

configure-ha-persistence(1)

Property	Definition
reapIntervalSeconds	<p>Specifies the number of seconds between checks for modified or timed-out sessions. This is also the frequency at which passivation of sessions occurs. If the persistence type is file or ha, sessions are passivated if maxSessions has been exceeded. If the persistence frequency is time-based, active sessions are stored at this interval. The default is 60.</p>
maxSessions	<p>Specifies the maximum number of sessions that can be in the cache, or -1 for no limit. The default is -1.</p> <p>After this limit is reached:</p> <ul style="list-style-type: none"> ■ If the persistence type is memory, an attempt to create a new session causes an <code>IllegalStateException</code> to be thrown. ■ If the persistence type is file or ha, the sessions are passivated to the persistent store.
sessionFilename	<p>Specifies the absolute or relative path to the file in which the session state is preserved between application restarts, if preserving the state is possible. A relative path is relative to the temporary work directory for this application. Applicable only if the persistence type is memory. By default, the session state is not preserved across server restarts.</p>

configure-ha-persistence(1)

Property	Definition
directory	Specifies the absolute or relative path to the directory into which individual session files are written. A relative path is relative to the temporary work directory for this application. Applicable only if the persistence type is file. The default is <i>instance_dir/generated/jsp/j2ee-apps/appname/appname_war</i> .
timeoutSeconds	Specifies the default maximum inactive interval (in seconds) for sessions. If set to 0 or less, sessions never expire. If a <i>session-timeout</i> element is specified in the <i>web.xml</i> file, the <i>session-timeout</i> value overrides any <i>timeoutSeconds</i> value. If <i>timeoutSeconds</i> is specified in both <i>sun-web.xml</i> and <i>domain.xml</i> , the value in <i>sun-web.xml</i> takes precedence. If neither <i>session-timeout</i> nor <i>timeoutSeconds</i> is specified, the <i>timeoutSeconds</i> default is used. Note that the <i>session-timeout</i> element in <i>web.xml</i> is specified in minutes, not seconds. The default is 600.

OPERANDS

- `--haagentport` Specify the port number for the HADB node agent. The default is 1862.
- `--hosts` Specify a comma-separated list of HADB host names.
- clustername* Specify the name of the cluster for which you are configuring session persistence.

configure-ha-persistence(1)

EXAMPLES **EXAMPLE 1** Using configure-ha-persistence

```
asadmin> configure-ha-persistence --user admin --passwordfile secret.txt
--type ha --frequency web-method --scope modified-session --store jdbc/hastore
--property maxSessions=1000:reapIntervalSeconds=60 cluster1
```

EXIT STATUS 0
 command executed successfully

 1
 error in executing the command

copy-config(1)

NAME	copy-config – copies an existing configuration to create a new configuration												
SYNOPSIS	<pre>copy-config --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--systemproperties (<i>name=value</i>)[:<i>name=value</i>]*] <i>source_configuration_name</i> <i>destination_configuration_name</i></pre>												
DESCRIPTION	<p>Use the copy-config command to create a new configuration in the domain.xml file by copying an existing configuration. The new configuration is identical to the copied configuration, except for any properties you specify in the --systemproperties option.</p> <p>The configuration default-config is the configuration that is copied when a standalone sever instance or standalone cluster is created.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

copy-config(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--systemproperties</code>	Optional attribute name/value pairs for configuring the resource. The following properties are available:

System Property	Definition
HTTP_LISTENER_PORT	This property specifies the port number for http-listener-1. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
HTTP_SSL_LISTENER_PORT	This property specifies the port number for http-listener-2. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
IIOP_LISTENER_PORT	This property specifies which ORB listener port for IIOP connections orb-listener-1 listens on.
IIOP_SSL_LISTENER_PORT	This property specifies which ORB listener port for IIOP connections the IIOP listener called SSL listens on.
IIOP_SSL_MUTUALAUTH_PORT	This property specifies which ORB listener port for IIOP connections the IIOP listener called SSL_MUTUALAUTH listens on.
JMX_SYSTEM_CONNECTOR_PORT	This property specifies the port number on which the JMX connector listens. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.

OPERANDS	<code>source_configuration_name</code>	The name of the configuration you are copying.
	<code>destination_configuration_name</code>	The name of the new configuration you are creating by copying the source configuration. This name should be unique within a domain.xml. It should not be the same as the cluster name, serverinstance name, another config name, or node agent name.

EXAMPLES

EXAMPLE 1 Using the copy-config command

```
asadmin> copy-config --user admin --passwordfile passwords.txt
--systemproperties HTTP_LISTENER_PORT=2000:HTTP_SSL_LISTENER_PORT=3000
default-config new-config

NAME	create-acl – adds a new access control list file for the named instance
SYNOPSIS	<pre> create-acl --user <i>admin_user</i> [--password <i>admin_password</i>] [--host <i>localhost</i>] [--port 4848] [--passwordfile <i>filename</i>] [--secure -s] [--instance <i>instance_name</i>] --aclfile <i>filename</i> <i>acl_ID</i> </pre>
DESCRIPTION	Gets the access control lists associated with the named server instance.
OPTIONS	<pre> --user administrative user associated for the instance. --password administrative password corresponding to the administrative user. --host host name of the machine hosting the administrative instance. --port administrative port number associated with the administrative host. --secure indicates communication with the administrative instance in secured mode. --passwordfile file containing passwords appropriate for the command (e.g., administrative instance). --instance name of the instance. --aclfile name of the default acl file. </pre>
OPERANDS	<i>acl_ID</i> internal name for the ACL file listing. This ID is used in a virtual server element to define the ACL file used by the virtual server.
EXAMPLES	<p>EXAMPLE 1 Using create-acl</p> <pre> asadmin> create-acl --user admin --password adminadmin --host fuyako --port 7070 --instance server Created ACL with id=sampleACL </pre> <p>Where: <code>sampleACL</code> is the name of the ACL created.</p>
EXIT STATUS	<pre> 0 command executed successfully 1 error in executing the command </pre>
INTERFACE EQUIVALENT	Access Control List page
SEE ALSO	<code>delete-acl(1)</code> , <code>list-acl(1)</code>

create-admin-object(1)

NAME	create-admin-object – adds the administered object with the specified JNDI name																
SYNOPSIS	<pre>create-admin-object --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] --restype <i>admin_object_type</i> --rancode <i>resource_adapter_name</i> [--description <i>text</i>] [--property <i>name=value[:name=value]*</i>] <i>jndi-name</i></pre>																
DESCRIPTION	This command creates the administered object that has a specified jndi name.																
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on the standard output. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

create-admin-object(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	This is the name of the target upon which the command is operating. The valid targets for this command are instance, cluster, 'domain,' and 'server.' Server is the default option. This command is used by the Enterprise Edition only.
	<code>--restype</code>	This option is used to administer the object resource types, as defined by the resource adapter in the ra.xml file.
	<code>--raname</code>	This is the name of the resource adapter associated with this object.
	<code>--description</code>	This option is the text description of the administered object.
	<code>--property</code>	This option describes the "name/values" pairs for configuring the resource.
OPERANDS	<i>jndi_name</i>	This is the JNDI name of the administered object to be created.
EXAMPLES	EXAMPLE 1 Using create-admin-object	
		The <code>javax.jms.Queue</code> resource type is obtained from the <code>ra.xml</code> file. The <code>jmsrar.rar</code> must be deployed prior to executing this command.
		<pre>asadmin> create-admin-object --user admin1 --password adminadmin1 --restype javax.jms.Queue --raname jmsra --description "sample administered object" --property Name=sample_jmsqueue --target instance1 jms/samplequeue Command create-admin-object executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-admin-object(1) , list-admin-objects(1)	

create-application-ref(1)

NAME	create-application-ref – creates a reference to an application
SYNOPSIS	create-application-ref --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] [--enabled= <i>true</i>] [--virtualservers <i>virtual_servers</i>] <i>reference_name</i>
DESCRIPTION	<p>The create-application-ref command creates a reference from a cluster or an unclustered server instance to a previously deployed application element (for example, a J2EE application, a Web module, or an enterprise bean module). This effectively results in the application element being deployed and made available on the targeted instance or cluster.</p> <p>The target instance or instances making up the cluster need not be running or available for this command to succeed. If one or more instances are not available, they will receive the new application element the next time they start.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	Specifies the target for which you are creating the application reference. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, which creates the application reference for the default server instance <i>server</i> and is the default value ■ <i>cluster_name</i>, which creates the application reference for every server instance in the cluster ■ <i>instance_name</i>, which creates the application reference for the named unclustered server instance
--enabled	Indicates whether the application should be enabled (that is, loaded). This value will take effect only if the application is enabled at the global level. The default is true.
--virtualservers	Comma-separated list of virtual server IDs on which to deploy. This option applies only to Web modules (either standalone or in a J2EE application). If this option is not specified, the application is deployed to all virtual servers except the administrative server, <i>__asadmin</i> .
OPERANDS	<i>reference_name</i> The name of the application or module, which can be a J2EE application, Web module, EJB module, connector module, application client module, or lifecycle module.
EXAMPLES	EXAMPLE 1 Using the create-application-ref command The following command creates a reference to the Web module <i>MyWebApp</i> on the unclustered server instance <i>NewServer</i> . <pre>asadmin> create-application-ref --user admin2 --passwordfile passwords.txt --target NewServer MyWebApp</pre> Command <code>create-application-ref</code> executed successfully.

NAME	create-audit-module – adds an audit-module
SYNOPSIS	create-audit-module --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] [--classname <i>realm_class</i>] [--property (name=value) [:name=value]*] [<i>audit_module_name</i>]
DESCRIPTION	Adds the named audit module for the plugin module that implements the audit capabilities. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

create-audit-module(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are creating the audit module. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
	<code>--classname</code>	Java class which implements this realm.
	<code>--property</code>	optional attributes name/value pairs of provider implementation specific attributes.
OPERANDS	<code>audit_module_name</code>	name of this audit module.
EXAMPLES	EXAMPLE 1 Using create-audit-module	
		<pre>asadmin> create-audit-module --user admin1 --passwordfile password.txt --host pigeon --port 5001 --classname com.sun.appserv.auditmodule --property defaultuser=admin:Password=admin sampleAuditModule Command create-audit-module executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-audit-module(1) , list-audit-modules(1)	

NAME	create-auth-realm – adds the new authenticated realm																
SYNOPSIS	<pre>create-auth-realm --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target_name</i>] [--classname <i>realm_class</i>] [--isdefault=true] [--property (name=value) [:name=value]*] <i>auth_realm_name</i></pre>																
DESCRIPTION	Adds the named authorized realm. This command is supported in remote mode only.																
OPTIONS	<table border="0"> <tr> <td style="padding-right: 10px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 10px;">-w --password</td> <td>The --password option is deprecated. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="padding-right: 10px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="padding-right: 10px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="padding-right: 10px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="padding-right: 10px;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> <tr> <td style="padding-right: 10px;">-e --echo</td> <td>Setting to true will echo the command line statement on the standard output. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

create-auth-realm(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are creating the realm. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
	<code>--classname</code>	Java class which implements this realm.
	<code>--property</code>	optional attributes name/value pairs of provider implementation specific attributes.
OPERANDS	<code>auth_realm_name</code>	name of this realm.
EXAMPLES	EXAMPLE 1	Using <code>create-auth-realm</code> <pre>asadmin> create-auth-realm --user admin1 --passwordfile password.txt --host pigeon --port 5001 --classname com.iplanet.ias.security.auth.realm.DB.Database --property defaultuser=admin:Password=admin db Command create-auth-realm executed successfully</pre> Where <code>db</code> is the auth realm created.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>delete-auth-realm(1)</code> , <code>list-auth-realms(1)</code>	

NAME	create-cluster – creates a cluster						
SYNOPSIS	<pre> create-cluster --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--config <i>config_name</i>] [--systemproperties (<i>name=value</i>) [:<i>name=value</i>]*] <i>cluster_name</i> </pre>						
DESCRIPTION	<p>The <code>create-cluster</code> command creates a new cluster. When created, a cluster must reference a configuration (or, as with an unclustered server instance, a configuration can be implicitly created). Initially the cluster has no server instances, applications, or resources.</p> <p>If you do not use the <code>--config</code> option, the command creates a standalone cluster with a configuration named <code>cluster_name-config</code>.</p> <p>To add new instances to the cluster, use the <code>create-instance</code> command with the <code>--cluster</code> option. Use the <code>stop-instance</code> and <code>delete-instance</code> commands to delete server instances from the cluster at any time.</p> <p>To associate new applications and resources with the cluster regardless of the number of instances in the cluster, perform any of the following operations:</p> <ul style="list-style-type: none"> ■ Use the <code>deploy</code> command with the option <code>--target cluster_name</code>. ■ Use resource-creation commands (for example, <code>create-jdbc-resource</code>) with the option <code>--target cluster_name</code>. ■ Use reference management commands (for example, <code>create-application-ref</code> or <code>create-resource-ref</code>) if the application is already deployed or the resource is already created. <p>This command is supported in remote mode only.</p>						
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;"><code>-u --user</code></td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;"><code>-w --password</code></td> <td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td> </tr> <tr> <td style="vertical-align: top;"><code>--passwordfile</code></td> <td>This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>,</td> </tr> </table>	<code>-u --user</code>	The authorized domain application server administrative username.	<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> ,
<code>-u --user</code>	The authorized domain application server administrative username.						
<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.						
<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> ,						

create-cluster(1)

	AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.
-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--config	Creates a shared cluster. The specified configuration name must exist and must not be <code>default-config</code> (the standalone cluster configuration template) or a standalone configuration (including <code>server-config</code>). If this option is omitted, a standalone cluster is created.
--systemproperties	Defines system properties for the configuration created for by the cluster. These properties override the property values in the <code>default-config</code> configuration. The following properties are available:

Property	Definition
HTTP_LISTENER_PORT	This property specifies the port number for <code>http-listener-1</code> . Valid values are 1–65535. On UNIX, creating sockets that listen on ports 1–1024 requires superuser privileges.

Property	Definition
HTTP_SSL_LISTENER_PORT	This property specifies the port number for http-listener-2. Valid values are 1–65535. On UNIX, creating sockets that listen on ports 1–1024 requires superuser privileges.
IIOP_LISTENER_PORT	This property specifies which ORB listener port for IIOp connections orb-listener-1 listens on.
IIOP_SSL_LISTENER_PORT	This property specifies which ORB listener port for IIOp connections the IIOp listener called SSL listens on.
IIOP_SSL_MUTUALAUTH_PORT	This property specifies which ORB listener port for IIOp connections the IIOp listener called SSL_MUTUALAUTH listens on.
JMX_SYSTEM_CONNECTOR_PORT	This property specifies the port number on which the JMX connector listens. Valid values are 1–65535. On UNIX, creating sockets that listen on ports 1–1024 requires superuser privileges.

OPERANDS *cluster_name* A unique identifier for the cluster to be created.

EXAMPLES **EXAMPLE 1** Using the create-cluster command

The following command creates a cluster named MyCluster, overriding the default configuration's SSL port value. Because the --config option is not specified, the command makes a copy of the default-config and names it MyCluster-config.

```
asadmin> create-cluster --user admin1
--passwordfile passwords.txt --systemproperties
IIOP_SSL_LISTENER_PORT=1169 MyCluster
Command create-cluster executed successfully.
```

EXIT STATUS 0
command executed successfully

create-cluster(1)

create-connection-group(1)

NAME	create-connection—group – creates a new connection group with the named group ID
SYNOPSIS	<pre>create-connection-group --user <i>user_name</i> --password <i>password</i> --host <i>hostname</i> --port <i>admin_port_number</i> --instance <i>instance_name</i> --httplistener <i>http_listener_ID</i> --address <i>address</i> --defaultvs <i>virtual_server</i> --servername <i>server_name</i> <i>connection_group_ID</i></pre>
DESCRIPTION	Creates a new connection group with the named group ID.
OPTIONS	<p>--user identifies the user name associated with the named instance.</p> <p>--password identifies the password associated with the user name.</p> <p>--host identifies the host name for the machine.</p> <p>--port identifies the administrator port number associated with the hostname.</p> <p>--instance identifies the name of the instance associated with the JVM option to be created.</p> <p>--httplistener a unique identifier for the HTTP listener.</p> <p>--address the IP address of the listen socket. Can be in dotted-pair or IPv6 notation.</p> <p>--defaultvs the ID attribute of the default virtual server for this particular connection group.</p> <p>--servername identifies, in the hostname section, the URLs the server sends to the client. This name should be the alias name if your server uses an alias. If you append a colon (:) and port number, that port will be used in the URLs the server sends to the client.</p> <p><i>connection_group_ID</i> a unique identifier for the connection group.</p>
EXAMPLES	<pre>asadmin% create-connection-group</pre>
SEE ALSO	delete-connection-group(1) , list-connection-groups(1)

create-connector-connection-pool(1)

NAME	create-connector-connection-pool – adds a connector pool with the specified connection pool name												
SYNOPSIS	<pre> create-connector-connection-pool --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--steadypoolsize 8] [--maxpoolsize 32] [--maxwait 60000] [--poolresize 2] [--idletimeout 300] [--failconnection=<i>false</i>] --rancode <i>resource_adapter_name</i> --connectiondefinition <i>connection_definition_name</i> [--transactionsupport <i>transaction_support</i>] [--description <i>text</i>] [--property (<i>name=value</i>)[:<i>name=value</i>]*] <i>connector_connection_pool_name</i> </pre>												
DESCRIPTION	Adds a new connector connection pool with the specified connection pool name. This command is supported in remote mode only.												
OPTIONS	<table border="0"> <tr> <td style="padding-right: 10px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 10px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 10px;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="padding-right: 10px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="padding-right: 10px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="padding-right: 10px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-connector-connection-pool(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	The target option is deprecated.
<code>--raname</code>	The name of the resource adapter.
<code>--connectiondefinition</code>	The name of the connection definition.
<code>--steadypoolsize</code>	The minimum and initial number of connections maintained in the pool. The default value is 8.
<code>--maxpoolsize</code>	The maximum number of connections that can be created to satisfy client requests. The default value is 32.
<code>--maxwaittime</code>	The amount of time, in milliseconds, that a caller must wait before a connection is created, if a connection is not available. If set to 0, the caller is blocked indefinitely until a resource is available or until an error occurs. The default value is 60000.
<code>--poolresize</code>	The number of connections to be destroyed if the existing number of connections is above the steady-pool-size (subject to the limit specified in the maxpoolsize option). Possible values are from 0 to MAX_INTEGER. The default value is 2.
<code>--idletimeout</code>	The maximum time that a connection can remain idle in the pool. After this amount of time, the pool can close this connection. The default value is 300.
<code>--failconnection</code>	If set to true, all connections in the pool are closed if a single validation check fails. This parameter is mandatory if the is-connection-validation-required is set to true. Legal values are on, off, yes, no, 1, 0, true or false. The default value is false.
<code>--transactionsupport</code>	Indicates the level of transaction support that this pool will have. Possible values are XATransaction, LocalTransaction and NoTransaction. This attribute can support the resource adapter's transaction

create-connector-connection-pool(1)

	support attribute when the resource adapter's transaction support attribute is lower than or equal to but not higher than. The default value is true.
	<code>--description</code> Text providing descriptive details about the connector connection pool.
	<code>--property</code> optional attribute name/value pairs for configuring the resource.
OPERANDS	<i>connector_connection_pool_name</i> the name of the connection pool name to be created.
EXAMPLES	EXAMPLE 1 Using the create-connector-connection-pool command <pre>asadmin> create-connector-connection-pool --passwordfile passwordfile --steadypoolsize 20 --maxpoolsize 100 --poolresize 2 --maxwait 60000 --raname jmsra --connectiondefinition javax.jms.QueueConnectionFactory jms/qConnPool Command create-connector-connection-pool executed successfully</pre> Where <code>jms/qConnPool</code> is the name of the new connector connection pool.
EXIT STATUS	0 command executed successfully 1 error in executing the command
SEE ALSO	delete-connector-connection-pool(1) , list-connector-connection-pools(1)

create-connector-resource(1)

NAME	create-connector-resource – registers the connector resource with the specified JNDI name
SYNOPSIS	create-connector-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [---target <i>target</i>] --poolname <i>connectorConnectionPoolName</i> [--enabled= <i>true</i>] [--description <i>text</i>] <i>jndi_name</i>
DESCRIPTION	This command registers the connector resource with the JNDI name, which is specified by the <i>jndi_name</i> operand.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

create-connector-resource(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only, specifies the ending location of the connector resources. Valid values are "server," "domain," cluster, instance. The default is server.
	<code>--poolname</code>	The name of the connection pool. When two or more resource elements point to the same connection pool element, they use the same pool connections at runtime.
	<code>--enabled</code>	This option determines whether the resource is enabled at runtime. The default value is true.
	<code>--description</code>	Text providing descriptive details about the connector resource.
OPERANDS	<i>jndi_name</i>	the JNDI name of this connector resource.
EXAMPLES	EXAMPLE 1 Using the create-connector-resource command	
	<pre>asadmin> create-connector-resource --target server --poolname jms/qConnPool --description "creating sample connector resource" jms/qConnFactory Command create-connector-resource executed successfully</pre>	
		Where jms/qConnFactory is the sample connector resource that is created.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>delete-connector-resource(1)</code> , <code>list-connector-resources(1)</code>	

create-connector-security-map(1)

NAME	create-connector-security-map – creates or modifies a security map for the specified connector connection pool						
SYNOPSIS	<pre>create-connector-security-map --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] --poolname <i>connector_connection_pool_name</i> [--principals <i>principal_name1</i> [, <i>principal_name2</i>] * --usergroups <i>user_group1</i> [, <i>user_g</i>] --mappedusername <i>username</i> <i>security_map_name</i></pre>						
DESCRIPTION	<p>Use this command to create or modify a security map for the specified connector connection pool. If the security map is not present, one is created. Also, use this command to map the caller identity of the application (principal or user group) to a suitable EIS principal in container-managed transaction-based scenarios. One or more named security maps may be associated with a connector connection pool. The connector security map configuration supports the use of the wild card asterisk (*) to indicate all users or all user groups.</p> <p>For this command to succeed, you must have first created a connector connection pool using the <code>create-connector-connection-pool</code> command.</p> <p>The enterprise information system (EIS) is any system that holds the information. It can be a mainframe, a messaging system, a database system, or an application.</p> <p>This command is supported in remote mode only.</p>						
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <table border="0" style="width: 100%;"> <tr> <td style="padding-right: 20px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 20px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 20px;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD,</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD,
-u --user	The authorized domain application server administrative username.						
-w --password	The --password option is deprecated. Use --passwordfile instead.						
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD,						

create-connector-security-map(1)

	AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASSPASSWORD, and so on.
-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	The <code>-target</code> option is deprecated in this release.
--poolname	This property specifies the name of the connector connection pool to which the security map that is to be updated or created belongs.
--principals	This property specifies a comma-separated list of application-specific principals. Use either the <code>-principals</code> or <code>-usergroups</code> options, but not both.
--usergroups	This property specifies a comma-separated list of application-specific user groups. Use either the <code>-principals</code> or <code>-usergroups</code> options, but not both.
--mappedusername	This property specifies the EIS username.
--mappedpassword	The <code>--mappedpassword</code> option is deprecated. Use <code>--passwordfile</code> pointing to a file that contains an entry in the following format: AS_ADMIN_MAPPEDPASSWORD= <i>mapped-password</i> . If not specified using the <code>passwordfile</code> option, the user will be prompted for this password by the <code>asadmin</code> command-line tool.
OPERANDS	
<i>security_map_name</i>	name of the security map to be created.

create-connector-security-map(1)

EXAMPLES	<p>EXAMPLE 1 Using <code>create-connector-security-map</code></p> <p>It is assumed that the connector pool has already been created using the <code>create-connector-pool</code> command.</p> <pre>asadmin> create-connector-security-map --user admin --passwordfile pwd_file --poolname connector-pool1 --principals principal1, principal2 --mappedusername backend-username securityMap1 Command create-connector-security-map executed successfully</pre>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	<p>delete-connector-security-map(1), list-connector-security-maps(1), update-connector-security-map(1)</p>

create-custom-resource(1)

NAME	create-custom-resource – creates a custom resource
SYNOPSIS	create-custom-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] --restype <i>type</i> --factoryclassname <i>classname</i> [--enabled= <i>true</i>] --description <i>text</i> [--property (<i>name=value</i>) [: <i>name=value</i>] *] <i>jndi_name</i>
DESCRIPTION	The create-custom-resource command creates a custom resource. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	in Enterprise Edition, specifies the target to which you are deploying. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, which deploys the component to the default server instance <i>server</i> and is the default value ■ <i>domain</i>, which deploys the component to the domain. ■ <i>cluster_name</i>, which deploys the component to every server instance in the cluster. ■ <i>instance_name</i>, which deploys the component to a particular sever instance.
--resourcetype	The --resourcetype option is deprecated. Use --restype instead.
--restype	The type of custom resource to be created.
--factoryclass	The class that creates the custom resource.
--enabled	Determines whether the custom resource is enable at runtime. The default value is true.
--description	Text providing descriptive details about the custom resource.
--property	optional attribute name/value pairs for configuring the resource.
OPERANDS	<i>jndi_name</i> the JNDI name of this resource.
EXAMPLES	<p>EXAMPLE 1 Using the create-custom-resource command</p> <pre>asadmin> create-custom-resource [--target plum] [--restype javax.sql.datasource] admin-gui/admin/src Command create-custom-resource executed correctly.</pre> <p>Where asadmin is the command prompt and <i>jndi_name</i> is the name of the custom resource to be created.</p>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	delete-custom-resource(1) , list-custom-resources(1)

create-domain(1)

NAME	create-domain – creates a domain with the given name														
SYNOPSIS	<pre>create-domain [--domaindir <i>domain_directory</i>/domains] --adminport <i>port_number</i> --admin.jmxport <i>port_number</i> --adminuser <i>admin_user</i> [--passwordfile <i>passwordfile</i>] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--instanceport <i>port_number</i>] [--domainproperties (<i>name=value</i>) [:<i>name=value</i>]*] [--savemasterpassword=<i>false</i>] <i>domain_name</i></pre>														
DESCRIPTION	<p>Use the <code>create-domain</code> command to create a domain containing an instance that can administer itself. By creating a domain, an administration server is created in a directory named as the domain name. If you create a domain in a non-default directory, the domain will not be automatically shutdown during uninstallation. The <code>--adminpassword</code> option has been deprecated, use the <code>--passwordfile</code> option instead. To maintain high security, omit the <code>--passwordfile</code> from the command line and allow the system to prompt you for these options.</p> <p>This command is supported in local mode only.</p>														
OPTIONS	<table><tr><td><code>--domaindir</code></td><td>The directory where the domain is to be created. If specified, the path must be accessible in the filesystem. If not specified, the domain is created in the default domain directory.</td></tr><tr><td><code>--adminport</code></td><td>The administrative instance port number.</td></tr><tr><td><code>--admin.jmxport</code></td><td>Specifies the port on which the jmx connector is initialized. The valid values are 1-65535.</td></tr><tr><td><code>--adminuser</code></td><td>The username associated with the administrative instance.</td></tr><tr><td><code>-W --passwordfile</code></td><td>The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=<i>password</i></code>. Where <i>password</i> is the actual administrator password for the domain. This file can also contain the <code>AS_ADMIN_ADMINPASSWORD</code> and the <code>AS_MASTERPASSWORD</code>. The syntax for each is the same as the syntax for <code>AS_ADMIN_PASSWORD</code>. Using this option on the command line can be insecure, since the password is stored in clear text. This file, however, can be protected by file system permissions.</td></tr><tr><td><code>-t --terse</code></td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td><code>-e --echo</code></td><td>Setting to true will echo the command line statement on to the standard output. Default is false.</td></tr></table>	<code>--domaindir</code>	The directory where the domain is to be created. If specified, the path must be accessible in the filesystem. If not specified, the domain is created in the default domain directory.	<code>--adminport</code>	The administrative instance port number.	<code>--admin.jmxport</code>	Specifies the port on which the jmx connector is initialized. The valid values are 1-65535.	<code>--adminuser</code>	The username associated with the administrative instance.	<code>-W --passwordfile</code>	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=<i>password</i></code> . Where <i>password</i> is the actual administrator password for the domain. This file can also contain the <code>AS_ADMIN_ADMINPASSWORD</code> and the <code>AS_MASTERPASSWORD</code> . The syntax for each is the same as the syntax for <code>AS_ADMIN_PASSWORD</code> . Using this option on the command line can be insecure, since the password is stored in clear text. This file, however, can be protected by file system permissions.	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	<code>-e --echo</code>	Setting to true will echo the command line statement on to the standard output. Default is false.
<code>--domaindir</code>	The directory where the domain is to be created. If specified, the path must be accessible in the filesystem. If not specified, the domain is created in the default domain directory.														
<code>--adminport</code>	The administrative instance port number.														
<code>--admin.jmxport</code>	Specifies the port on which the jmx connector is initialized. The valid values are 1-65535.														
<code>--adminuser</code>	The username associated with the administrative instance.														
<code>-W --passwordfile</code>	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=<i>password</i></code> . Where <i>password</i> is the actual administrator password for the domain. This file can also contain the <code>AS_ADMIN_ADMINPASSWORD</code> and the <code>AS_MASTERPASSWORD</code> . The syntax for each is the same as the syntax for <code>AS_ADMIN_PASSWORD</code> . Using this option on the command line can be insecure, since the password is stored in clear text. This file, however, can be protected by file system permissions.														
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														
<code>-e --echo</code>	Setting to true will echo the command line statement on to the standard output. Default is false.														

create-domain(1)

-I --interactive
 --instanceport
 --domainproperties

If set to true (default), only the required options are prompted.
 The port number listening to the HTTP request. The port number cannot be currently in use. If not specified, the default value is 8080.
 Setting the optional name/value pairs overrides the default values for the properties of the domain to be created. The list must be separated by the ":" character. The following properties are available:

Property	Definition
jms.port	This property specifies the port number for JMS. Valid value are 7676
orb.listener.port	This property specifies which ORB listener port for IIOP connections orb-listener-1 listens on.
http.ssl.port	This property specifies the port number for http-listener-2. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
orb.ssl.port	This property specifies which ORB listener port for IIOP connections the IIOP listener called SSL listens on.
orb.mutualauth.port	This property specifies which ORB listener port for IIOP connections the IIOP listener called SSL_MUTUALAUTH listens on.

--savemasterpassword

Setting this option to true allows the masterpassword to be written to the file system. It is best to create a masterpassword when creating a domain, because masterpassword is used by the start-domain command. For security purposes, the default setting should be false, because saving the masterpassword on the disk is an insecure practice,

create-domain(1)

unless file system permissions are properly set. If masterpassword is saved, then `start-domain` will not prompt for it. Masterpassword gives an extra level of security to the environment.

OPERANDS *domain_name* The name of the domain to be created.

EXAMPLES **EXAMPLE 1** Using the `create-domain` command

```
asadmin> create-domain --domaindir /export/domains
--adminport 7070 --adminuser admin --instanceport 7071 sampleDomain
created domain sampleDomain successfully
```

Where: the `sampleDomain` domain is created in the `/export/domains` directory.

EXIT STATUS 0
command executed successfully

1
error in executing the command

SEE ALSO [delete-domain\(1\)](#), [start-domain\(1\)](#), [stop-domain\(1\)](#), [list-domains\(1\)](#)

NAME	create-file-user – creates a new file user
SYNOPSIS	create-file-user --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] [--authrealmname <i>auth_realm_name</i>] [--groups <i>user_groups[:user_groups]*</i>] <i>user_name</i>
DESCRIPTION	Creates an entry in the keyfile with the specified username, userpassword, and groups. Multiple groups can be created by separating them with a colon ":". If the <i>auth_realm_name</i> is not specified, an entry is created in the default keyfile. If <i>auth_realm_name</i> is specified, an entry is created in the keyfile using the auth-realm name. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

create-file-user(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	This is used for Enterprise Edition only. This is the name of the target on which the command operates. The valid targets are config, instance, cluster, or "server." By default, the target is the "Server."
<code>--groups</code>	This is the group associated with this file user.
<code>--authrealmname</code>	This is the file where the file users are stored.

OPERANDS `user_name` This is the name of file user to be created.

EXAMPLES

EXAMPLE 1 Using the create-file-user command

It is assumed that an authority realm has already been created using the create-auth-realm command.

```
asadmin> create-file-user --user admin1 --password adminadmin1
--host pigeon --port 5001 --userpassword sample --groups staff:manager
--authrealmname auth-realm1 sample_user
Command create-file-user executed successfully
```

Where: the sample_user is the file user created.

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	create-ha-store – creates tables in the HADB that are used by HA the cluster
SYNOPSIS	create-ha-store --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--haagentport <i>port_number</i>] <i>databaseName</i>
DESCRIPTION	This command creates tables in the HADB used by the HA cluster. You only need to use this command if you have previously used <code>clear-ha-store</code> . The <code>configure-ha-store</code> command also creates tables in the HADB. Use fully qualified hostnames when specifying the hostlist interfaces explicitly for hosts with multiple network interfaces. <code>create-ha-store</code> was named <code>create-session-store</code> in the Sun Java System Application Server 7.1. <code>create-session-store</code> has been deprecated. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p>--passwordfile This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is <code>localhost</code>.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

create-ha-store(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--haagentport</code>	The name of the HA agent port. If not specified, the default port number is 1862.
OPERANDS	<i>databaseName</i>	The name of the HA database.
EXAMPLES	EXAMPLE 1 Using create-ha-store <code>asadmin> create-ha-store hadatabase1</code> The create-ha-store command executed successfully	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	clear-ha-store(1) , configure-ha-cluster(1)	

NAME	create-http-health-checker – creates a health-checker for a specified load balancer configuration														
SYNOPSIS	<pre> create-http-health-checker --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--url <i>"/"</i>] [--interval 30] [--timeout 10] --config <i>config_name target</i> </pre>														
DESCRIPTION	This command creates a health checker for a specified load balancer configuration. It only works with the native load balancer provided with the Sun Java System Application Server. It does not work with other load balancers.														
OPTIONS	<table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 10px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

create-http-health-checker(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--url</code>	The URL to ping to determine whether the instance is healthy.
	<code>--interval</code>	The interval in seconds the health checker waits between checks of an unhealthy instance to see whether it has become healthy. The default value is 30 seconds. A value of 0 disables the health checker.
	<code>--timeout</code>	The interval in seconds the health checker waits to receive a response from an instance. If the health checker has not received a response in this interval, the instance is considered unhealthy.
	<code>--config</code>	The load balancer configuration for which you create the health-checker.
OPERANDS	<i>target</i>	<p>Specifies the target to which the health checker applies.</p> <p>Valid values are:</p> <ul style="list-style-type: none">■ <i>cluster_name</i>, which specifies the health checker will monitor all instances in the cluster.■ <i>instance_name</i>, which specifies that the health checker will monitor this standalone instance.
EXAMPLES	EXAMPLE 1 Using the create-http-health-checker command	<pre>asadmin> create-http-health-checker --user admin --passwordfile password.txt --config mycluster-http-lb-config mycluster Command create-http-health-checker executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-http-health-checker(1)	

NAME	create-http-lb-config – creates a configuration for the load balancer
SYNOPSIS	<pre>create-http-lb-config --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--responsetimeout 60] [--httpsrouting=false] [--reloadinterval 60] [--monitor=false] [--routecookie=true] [--target <i>target</i>] [<i>config_name</i>]</pre>
DESCRIPTION	<p>Use the create-http-lb-config command to create a load balancer configuration. This configuration applies to load balancing in the HTTP path.</p> <p>You must specify either a target or a configuration name, or both. If you don't specify a target, the configuration is created but not assigned to a target. If you don't specify a configuration name, a name is created based on the target name. If you specify both, the configuration is created with the specified name, referencing the specified target.</p>
OPTIONS	<pre>-u --user The authorized domain application server administrative username. -w --password The --password option is deprecated. Use --passwordfile instead. --passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on. -H --host The machine name where the domain application server is running. The default value is localhost. -p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849. -s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</pre>

create-http-lb-config(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code> .
<code>-e --echo</code>	Setting to <code>true</code> will echo the command line statement on the standard output. Default is <code>false</code> .
<code>-I --interactive</code>	If set to <code>true</code> (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--responsetimeout</code>	The time in seconds within which a server instance must return a response. If no response is received within the time period, the server is considered unhealthy. If set to a positive number, and the request is idempotent, the request is retried. If the request is not idempotent, an error page is returned. If set to 0 no timeout is used. The default is 60.
<code>--httpsrouting</code>	If set to <code>true</code> , HTTPS requests to the load balancer result in HTTPS requests to the server instance. If set to <code>false</code> , HTTPS requests to the load balancer result in HTTP requests to the server instance. The default is <code>false</code> .
<code>--reloadinterval</code>	The interval between checks for changes to the load balancer configuration file <code>loadbalancer.xml</code> . When the check detects changes, the configuration file is reloaded. A value of 0 disables reloading.
<code>--monitor</code>	Specifies whether monitoring is enabled. The default is <code>false</code> .
<code>--routecookie</code>	Specifies whether a route cookie is enabled.
<code>---target</code>	Specifies the target to which the load balancer configuration applies. If you don't specify a target, the load balancer configuration is created without a target. You can specify targets later using the command <code>create-http-lb-ref</code> .

Valid values are:

- *cluster_name*, which specifies that requests for this cluster will be handled by the load balancer.
- *instance_name*, which specifies that requests for this standalone instance will be handled by the load balancer.

create-http-lb-config(1)

OPERANDS	<i>config_name</i>	The name of the new load balancer configuration. This name must not conflict with any other load balancer groups, agents, configurations, clusters, or sever instances in the domain. If you don't specify a name, the load balancer configuration name is based on the target name, <i>target_name</i> -http-lb-config.
EXAMPLES	EXAMPLE 1	Using the create-http-lb-config command <pre>asadmin> create-http-lb-config --user admin --passwordfile file --target mycluster mylbconfigname</pre> Command create-http-lb-config executed successfully.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-http-lb-config(1) , list-http-lb-configs(1)	

create-http-lb-ref(1)

NAME	create-http-lb-ref – adds an existing cluster or server instance to an existing load balancer configuration														
SYNOPSIS	create-http-lb-ref --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] --config <i>config_name</i> <i>target</i>														
DESCRIPTION	Use the create-http-lb-ref command to add an existing cluster or server instance to an existing load balancer configuration. The load balancer forwards the requests to the clustered and standalone instances it references.														
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
	--config	Specifies which load balancer configuration to add clusters and server instances to.
OPERANDS	<i>target</i>	Specifies which cluster or instance to add to the load balancer. Valid values are: <ul style="list-style-type: none"> ■ <i>cluster_name</i>, which specifies that requests for this cluster will be handled by the load balancer. ■ <i>instance_name</i>, which specifies that requests for this standalone instance will be handled by the load balancer.
EXAMPLES	EXAMPLE 1 Using the create-http-lb-ref command	
	<pre>asadmin> create-http-lb-ref --user admin --passwordfile file --config mycluster-http-lb-config cluster2</pre> <p>Command create-http-lb-ref executed successfully.</p>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-http-lb-ref(1) , list-http-lb-configs(1)	

create-http-listener(1)

NAME	create-http-listener – adds a new HTTP listener socket												
SYNOPSIS	<pre> create-http-listener --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>server</i>] --listeneraddress <i>address</i> --listenerport <i>listener_port</i> --defaultvs <i>virtual_server</i> --servername <i>server_name</i> [--acceptorthreads <i>1</i>] [--securityenabled=<i>false</i>] [--redirectport <i>redirect_port</i>] [--xpowered=<i>true</i>] [--enabled=<i>true</i>] <i>listener_id</i> </pre>												
DESCRIPTION	The create-http-listener command creates an HTTP listener. This command is supported in remote mode only.												
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-http-listener(1)

-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	In Enterprise Edition, specifies the target for which you are creating the HTTP listener. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, which creates the listener for the default server instance <i>server</i> and is the default value ■ <i>configuration_name</i>, which creates the listener for the named configuration ■ <i>cluster_name</i>, which creates the listener for every server instance in the cluster ■ <i>instance_name</i>, which creates the listener for a particular server instance
--listeneraddress	The IP address of the listener address (resolvable by DNS).
--listenerport	The port number to create the listen socket on. Legal values are 1–65535. On UNIX, creating sockets that listen on ports 1–1024 requires superuser privileges. Configuring an SSL listen socket to listen on port 443 is recommended.
--defaultvts	The ID attribute of the default virtual server for this listener.
--servername	Tells the server what to put in the host name section of any URLs it sends to the client. This affects URLs the server automatically generates; it doesn't affect the URLs for directories and files stored in the server. This name should be the alias name if your server uses an alias. If a colon and port number are appended, that port will be used in URLs that the server sends to the client.
--acceptorthreads	The number of acceptor threads for the listen socket. The recommended value is the number of processors in the machine. The default value is 1.

create-http-listener(1)

	<code>--securityenabled</code>	If set to true, the HTTP listener runs SSL. You can turn SSL2 or SSL3 ON or OFF and set ciphers using an SSL element. The security setting globally enables or disables SSL by making certificates available to the server instance. The default value is false.
	<code>--redirectport</code>	Port number for redirects. If the HTTP listener is supporting non-SSL requests, and a request is received for which a matching security-constraint requires SSL transport, the Application Server will automatically redirect the request to this port number. This option is valid for Enterprise Edition only.
	<code>--xpowered</code>	If set to true, adds the X-Powered-By: Servlet/2.4 and X-Powered-By: JSP/2.0 headers to the appropriate responses. The Servlet 2.4 specification defines the X-Powered-By: Servlet/2.4 header, which containers may add to servlet-generated responses. Similarly, the JSP 2.0 specification defines the X-Powered-By: JSP/2.0 header, which containers may add to responses that use JSP technology. The goal of these headers is to aid in gathering statistical data about the use of Servlet and JSP technology.
	<code>--enabled</code>	If set to true, the listener is enabled at runtime.
OPERANDS	<i>listener_id</i>	The listener ID of the HTTP listener.
EXAMPLES	EXAMPLE 1 Using the create-http-listener command	
		The following command creates an HTTP listener named <code>sampleListener</code> that uses a nondefault number of acceptor threads and is not enabled at runtime:
		<pre>asadmin> create-http-listener --user admin1 --passwordfile passwords.txt --host pigeon --port 5001 --listeneraddress 0.0.0.0 --listenerport 7272 --defaultvs server --servername pigeon.red.planet.com --acceptorthreads 100 --securityenabled=false --enabled=false sampleListener Command create-http-listener executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-http-listener(1) , list-http-listeners(1) , create-virtual-server(1) , create-ssl(1)	

NAME	create-iiop-listener – adds an IIOP listener														
SYNOPSIS	<pre>create-iiop-listener --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>server</i>] --listeneraddress <i>address</i> [--iiopport 1072] [--securityenabled=<i>false</i>] [--enabled=<i>true</i>] [--property (<i>name=value</i>) [:<i>name=value</i>] *] <i>listener_id</i></pre>														
DESCRIPTION	The create-iiop-listener command creates an IIOP listener. This command is supported in remote mode only.														
OPTIONS	<table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 10px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

create-iiop-listener(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target for which you are creating the IIOP listener. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
	<code>--listeneraddress</code>	Either the IP address or the hostname (resolvable by DNS).
	<code>--iiopport</code>	The IIOP port number. The default value is 1072.
	<code>--securityenabled</code>	If set to true, the IIOP listener runs SSL. You can turn SSL2 or SSL3 ON or OFF and set ciphers using an SSL element. The security setting globally enables or disables SSL by making certificates available to the server instance. The default value is false.
	<code>--enabled</code>	If set to true, the IIOP listener is enabled at runtime.
	<code>--property</code>	Optional attribute name/value pairs for configuring the IIOP listener.
OPERANDS	<code>listener_id</code>	A unique identifier for the IIOP listener to be created.
EXAMPLES	EXAMPLE 1 Using the create-iiop-listener command	
		The following command creates an IIOP listener named <code>sample_iiop_listener</code> :
		<pre>asadmin> create-iiop-listener --user admin --passwordfile passwords.txt --host fuyako --port 7070 --listeneraddress 192.168.1.100 --iiopport 8080 sample_iiop_listener Command create-iiop-listener executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-iiop-listener(1) , list-iiop-listeners(1) , create-ssl(1)	

NAME	create-instance – creates an instance				
SYNOPSIS	<pre>create-instance --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--config <i>config_name</i> --cluster <i>cluster_name</i>] --nodeagent <i>nodeagent_name</i> [--systemproperties (<i>name=value</i>) [:<i>name=value</i>]*] <i>instance_name</i></pre>				
DESCRIPTION	<p>Use the create-instance command to create a new server instance residing on a local or remote machine. For a server instance to be functional it must have:</p> <ul style="list-style-type: none"> ■ A reference to a node agent which defines the machine where the server instance resides. ■ A reference to a configuration which defines the configuration of the instance. A server instance that is joining a cluster receives its configuration from its parent cluster. <p>The node agent does not need to be created or started to create the instance; however, if the node agent is running, a remote server instance is created in a stopped state. If the node agent is not running, domain.xml is updated with the instance information and a new server instance is created the next time the node agent is started.</p> <p>There are three types of server instances that can be created. Each server instance can only be of one type:</p> <ol style="list-style-type: none"> 1. Standalone server instance: the configuration for this instance is not shared by any other server instances or clusters. When a standalone server instance is created, a standalone configuration is also created based on the <code>default-config</code> configuration. If no configuration or cluster is identified, a standalone server instance is created by default. 2. Shared server instance: the configuration for this instance is shared with other server instances or clusters. A server instance is considered shared if its configuration is shared by any other server instances. 3. Clustered server instance: the configuration for this instance is shared with other instances in the cluster. A server instance that is a member of the cluster inherits its configuration from that cluster. Any server instance that is not part of a cluster is considered an unclustered server instance. <p>When creating server instances Application Server attempts to resolve possible port conflicts. It also assigns random ports, currently not in use and not already assigned to other instances on the same node agent. Use the <code>--systemproperties</code> option to create additional instances on the same node agent and specify system properties to resolve the port conflicts. System properties can be manipulated after instance creation using the system property commands.</p>				
OPTIONS	<table border="0" style="width: 100%;"> <tr> <td style="padding-right: 20px;"><code>-u --user</code></td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td><code>-w --password</code></td> <td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td> </tr> </table>	<code>-u --user</code>	The authorized domain application server administrative username.	<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.
<code>-u --user</code>	The authorized domain application server administrative username.				
<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.				

create-instance(1)

<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASPASSWORD</code> , and so on.
<code>-H --host</code>	The machine name where the domain application server is running. The default value is localhost.
<code>-p --port</code>	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--config</code>	Creates a shared server instance. The configuration name must exist and must not be named <code>default-config</code> or <code>server-config</code> . If the configuration name provided is a standalone configuration, an error is displayed.
<code>--cluster</code>	Creates a clustered server instance that inherits its configuration from the named cluster.

create-instance(1)

--nodeagent

The name of the node agent defining the machine where the server will be created. The node agent does not need to be running or even created. If the node agent does not exist, a placeholder will automatically be created in domain.xml.

--systemproperties

Defines system properties for the server instance. These properties override property definitions in the server instance's configuration. Currently, these properties allow a way for a server instance to override port settings defined in its configuration. This is necessary if for example two clustered instances (sharing the same configuration) reside on the same machine. The following properties are available:

Property	Definition
http-listener-1-port	This port is used to listen for HTTP requests. This property specifies the port number for http-listener-1. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
http-listener-2-port	This port is used to listen for HTTPS requests. This property specifies the port number for http-listener-2. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
orb-listener-1-port	This property specifies which ORB listener port for IIOP connections orb-listener-1 listens on.
IIOPIIOP_SSL_LISTENER_PORT	This port is used for secure IIOP connections.
IIOPIIOP_SSL_MUTUALAUTH_PORT	This property specifies which ORB listener port for IIOP connections the IIOP listener called SSL_MUTUALAUTH listens on.

create-instance(1)

Property	Definition
JMS_SYSTEM_CONNECTOR_PORT	Property specifies the port number on which the JMX connector listens. Valid values are 1–65535. On UNIX, creating sockets that listen on ports 1–1024 requires superuser privileges.

OPERANDS *instance_name*

The unique name of the instance being created. Each instance in the domain must have a unique name across all node agents, server instances, cluster names, and configuration names.

EXAMPLES **EXAMPLE 1** Using the create-instance command

```
asadmin> create-instance --user admin --passwordfile password.txt
--host myhost --port 4849 --nodeagent agent1 instance1
Command create-instance executed successfully
```

Where: instance1 is created on a machine where node agent, agent1 resides.

EXAMPLE 2 Using the create-instance command with systemproperties

```
asadmin> create-instance --user admin --passwordfile password.txt
--host myhost --port 4849 --nodeagent apple_agent --systemproperties HTTP_LISTENER_PORT=58294:
HTTP_SSL_LISTENER_PORT=58297:IIOP_LISTENER_PORT=58300:IIOP_SSL_LISTENER_PORT=58303:
IIOP_SSL_MUTUALAUTH_PORT=58306:JMX_SYSTEM_CONNECTOR_PORT=58309 instance2
Command create-instance executed successfully
```

Where: instance2 is created on a remote machine apple where node agent, apple_agent resides.

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	create-javamail-resource – creates a JavaMail session resource
SYNOPSIS	<pre>create-javamail-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] --mailhost <i>hostname</i> --mailuser <i>username</i> --fromaddress <i>address</i> [--storeprotocol <i>imap</i>] [--storeprotocolclass <i>com.sun.mail.imapIMAPStore</i>] [--transprotocol <i>smtp</i>] [--transprotocolclass <i>com.sun.mail.smtp.SMTPTransport</i>] [--debug=<i>false</i>] [--enabled=<i>true</i>] [--description <i>text</i>] [--property (<i>name=ovalue</i>) [:<i>name=value</i>] *] <i>jndi_name</i></pre>
DESCRIPTION	The create-javamail-resource command creates a JavaMail session resource. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

create-javamail-resource(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	<p>In Enterprise Edition, specifies the target for which you are creating the JavaMail session resource. Valid values are</p> <ul style="list-style-type: none">■ <code>server</code>, which creates the resource for the default server instance <code>server</code> and is the default value■ <code>domain</code>, which creates the resource for the domain■ <code>cluster_name</code>, which creates the resource for every server instance in the cluster■ <code>instance_name</code>, which creates the resource for a particular server instance
<code>--mailhost</code>	The DNS name of the default mail server. The connect methods of the Store and Transport objects use this value if a protocol-specific host property is not supplied. The name must be resolvable to an actual host name.
<code>--mailuser</code>	The mail account user name to provide when connecting to a mail server. The connect methods of the Store and Transport objects use this value if a protocol-specific username property is not supplied.
<code>--fromaddress</code>	The email address of the default user, in the form <code>username@host.domain</code> .
<code>--storeprotocol</code>	The mail server store protocol. The default is <code>imap</code> . Change this value only if you have reconfigured the Application Server's mail provider to use a nondefault store protocol.
<code>--storeprotocolclass</code>	The mail server store protocol class name. The default is <code>com.sun.mail.imap.IMAPStore</code> . Change this value only if you have reconfigured the Application Server's mail provider to use a nondefault store protocol.

create-javamail-resource(1)

--transprotocol	The mail server transport protocol. The default is smtp. Change this value only if you have reconfigured the Application Server's mail provider to use a nondefault transport protocol.
--transprotocolclass	The mail server transport protocol class name. The default is com.sun.mail.smtp.SMTPTransport. Change this value only if you have reconfigured the Application Server's mail provider to use a nondefault transport protocol.
--debug	If set to true, server starts up in debug mode for this resource. If the JavaMail log level is set to FINE or finer, the debugging output will be generated and will be included in the server log file. The default value is false.
--enabled	If set to true, the resource is enabled at runtime. The default value is true.
--description	A text description of the JavaMail resource.
--property	Optional attribute name/value pairs for configuring the JavaMail resource. The JavaMail API documentation lists the properties you might want to set.
OPERANDS	<i>jndi_name</i> The JNDI name of the JavaMail resource to be created. It is a recommended practice to use the naming subcontext prefix mail/ for JavaMail resources.
EXAMPLES	<p>EXAMPLE 1 Using the create-javamail-resource command</p> <p>The following command creates a JavaMail resource named mail/MyMailSession. The escape character (\) is used in the --fromaddress option to distinguish the dot (.) and at sign (@). The JNDI name for a JavaMail session resource customarily includes the mail/ naming subcontext.</p> <pre>asadmin> create-javamail-resource --user admin --passwordfile passwords.txt --host fuyako --port 7070 --mailhost localhost --mailuser sample --fromaddress sample\sun\.com mail/MyMailSession Command create-javamail-resource executed successfully.</pre>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	delete-javamail-resource(1) , list-javamail-resources(1)

create-jdbc-connection-pool(1)

NAME	create-jdbc-connection-pool – registers the JDBC connection pool
SYNOPSIS	<pre>create-jdbc-connection-pool --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--datasourceclassname <i>classname</i>] [--restype <i>res_type</i>] [--steadypoolsize <i>poolsize</i>] [--maxpoolsize <i>poolsize</i>] [--maxwait <i>time</i>] [--poolresize <i>limit</i>] [--idletimeout <i>time</i>] [--isolationlevel <i>isolation_level</i>] [--isolationguaranteed <i>true</i>] [--isconnectvalidatereq <i>false</i>] [--validationmethod <i>auto-commit</i>] [--validationtable <i>tablename</i>] [--failconnection <i>false</i>] [--description <i>text</i>] [--property (<i>name=value</i>) [:<i>name=value</i>]*] <i>connectionpoolid</i></pre>
DESCRIPTION	<p>Registers a new JDBC connection pool with the specified JDBC connection pool name.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p>--passwordfile This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

create-jdbc-connection-pool(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	The target option is deprecated.
<code>--datasourceclassname</code>	The name of the vendor supplied JDBC datasource resource manager.
<code>--restype</code>	The interface that the datasource class implements. Must be one of <code>javax.sql.DataSource</code> , <code>javax.sql.ConnectionPoolDataSource</code> or <code>javax.sql.XADataSource</code> . An error is produced when this option has a legal value and the indicated interface is not implemented by the datasource class. This option has no default value.
<code>--steadypoolsize</code>	The minimum and initial number of connections maintained in the pool. The default value is 8.
<code>--maxpoolsize</code>	The maximum number of connections that can be created. The default value is 32.
<code>--maxwait</code>	The amount of time a caller will wait before a connection timeout is sent. The default is 60 seconds. A value of 0 forces the caller to wait indefinitely.
<code>--poolresize</code>	The number of connections to be removed when <code>idletimeout</code> timer expires. Connections that have idled for longer than the timeout are candidates for removal. When the pool size reaches <code>steadypoolsize</code> , the connection removal stops. The default value is 2.
<code>--idletimeout</code>	The maximum time in seconds that a connection can remain idle in the pool. After this time, the implementation can close this connection. It is recommended that this timeout is kept shorter than the server side timeout to prevent the accumulation of unusable connections in the application. The default value is 300.

create-jdbc-connection-pool(1)

<code>--isolationlevel</code>	<p>This specifies the transaction-isolation-level on the pooled database connections. This option does not have a default value. If not specified, the pool operates with the default isolation level that the JDBC driver provides.</p> <p>You can set a desired isolation level using one of the standard transaction isolation levels: <code>read-uncommitted</code>, <code>read-committed</code>, <code>repeatable-read</code>, <code>serializable</code>. Applications that change the isolation level on a pooled connection programmatically risk polluting the pool. This could lead to program errors.</p>
<code>--isolationguaranteed</code>	<p>This is applicable only when a particular isolation level is specified for <code>transaction-isolation-level</code>. The default value is true.</p> <p>This option assures that every time a connection is obtained from the pool, <code>isolationlevel</code> is set to the desired value. This could have some performance impact on some JDBC drivers. Administrators can set this to false when the application does not change <code>--isolationlevel</code> before returning the connection.</p>
<code>--isconnectvalidatereq</code>	<p>If set to true, connections are validated or checked to see if they are usable before giving out the application. The default value is false.</p>
<code>--validationmethod</code>	<p>The name of the validation table used to perform a query to validate a connection. Valid settings are: <code>auto-commit</code>, <code>meta-data</code>, or <code>table</code>. The default value is <code>auto-commit</code>.</p>
<code>--validationtable</code>	<p>The name of the validation table used to perform a query to validate a connection.</p>
<code>--failconnection</code>	<p>If set to true, all connections in the pool must be closed when a single validation check fails. The default value is false. One attempt is made to re-establish failed connections.</p>
<code>--description</code>	<p>Text providing descriptive details about the specified JDBC connection pool.</p>
<code>--property</code>	<p>Optional attribute name/value pairs for configuring the connection pool.</p>
OPERANDS	
<code>connection_pool_id</code>	<p>The name of the JDBC connection pool to be created.</p>

create-jdbc-connection-pool(1)

EXAMPLES

EXAMPLE 1 Using create-jdbc-connection-pool command

```
asadmin> create-jdbc-connection-pool --user admin --passwordfile adminadminfile
--host fuyako --port 7070 --datasourceclassname com.pointbase.jdbc.jdbcUniversalDriver
--restype jax.sql.XADataSource --isolationlevel serializable --isconnectvalidatereq=true
--validationmethod auto-commit --description "XA Connection"
--property DatabaseName="jdbc\:pointbase\:server\:\\/localhost:9093\/sample"
:User=public:Password=public XA_connection_pool
Command create-jdbc-connection-pool executed successfully
```

Where: the XA_connection_pool is created. The escape character “\” is used in the --property option to distinguish the colons (:) and the backslash (/).

EXIT STATUS

0
command executed successfully

1
error in executing the command

create-jdbc-resource(1)

NAME	create-jdbc-resource – creates a JDBC resource with the specified JNDI name														
SYNOPSIS	<pre>create-jdbc-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target<i>target</i>] connectionpoolid <i>pool_name</i> [--enabled=<i>true</i>] [--description <i>text</i>] [--property (<i>name=value</i>) [:<i>name=value</i>]*] <i>jndi_name</i></pre>														
DESCRIPTION	The create-jdbc-resource command creates a new JDBC resource. This command is supported in remote mode only.														
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

create-jdbc-resource(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only, specifies the target to which you are deploying. Valid values are 'server,' 'domain,' cluster, and instance. The default is server.
	<code>--connectionpoolid</code>	The name of the JDBC connection pool. If two or more JDBC resource elements point to the same connection pool element, they use the same pool connections at runtime.
	<code>--enabled</code>	Determines whether the JDBC resource is enable at runtime. The default value is true.
	<code>--description</code>	Text providing descriptive details about the JDBC resource.
	<code>--property</code>	optional attribute name/value pairs for configuring the resource.
OPERANDS	<i>jndi_name</i>	the JNDI name of this JDBC resource.
EXAMPLES	EXAMPLE 1 Using the create-jdbc-resource command	
	<code>asadmin> create-jdbc-resource --connectionpoolid connPool02 test_jdbc_resource</code>	Command create-jdbc-resource executed successfully.
		Where test_jdbc_resource is the name of the new JDBC resource.
EXIT STATUS	0	command executed successfully
	1	error in executing the command

create-jmsdest(1)

NAME	create-jmsdest – creates a physical destination														
SYNOPSIS	create-jmsdest --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] --desttype <i>dest_type</i> [--property (<i>name=value</i>) [: <i>name=value</i>]*] <i>dest_name</i>														
DESCRIPTION	The create-jmsdest command creates a JMS physical destination. Along with the physical destination, you use the create-jms-resource command to create a JMS destination resource that has a Name property that specifies the physical destination. This command is supported in remote mode only.														
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target for which you are creating the physical destination. Although the <code>create-jmsdest</code> command is related to resources, a physical destination is created using the JMS Service, which is part of the configuration. Valid values are <ul style="list-style-type: none"> ■ <code>server</code>, which creates the physical destination for the default server instance <code>server</code> and is the default value ■ <code>configuration_name</code>, which creates the physical destination for the named configuration ■ <code>cluster_name</code>, which creates the physical destination for every server instance in the cluster ■ <code>instance_name</code>, which creates the physical destination for a particular server instance
<code>-T --desttype</code>	The type of the JMS destination. Valid values are <code>topic</code> and <code>queue</code> .
<code>--property</code>	Optional attribute name/value pairs for configuring the physical destination. You can specify the following property for a physical destination:

Property	Definition
<code>maxNumActiveConsumers</code>	The maximum number of consumers that can be active in load-balanced delivery from a queue destination. A value of -1 means an unlimited number. The default is 1. (Platform Edition limits this value to 2.)

To modify the value of this property or to specify other physical destination properties, use the `install_dir/imq/bin/imqcmd` command. See the *Sun Java System Message Queue 3 2005Q1 Administration Guide* for more information.

create-jmsdest(1)

OPERANDS *dest_name* A unique identifier for the the JMS destination to be created.

EXAMPLES **EXAMPLE 1** Using the create-jmsdest command

The following command creates a JMS physical queue named `PhysicalQueue`.

```
asadmin> create-jmsdest --user admin
--passwordfile passwords.txt --host localhost --port 4848 --desttype queue
--property User=public:Password=public PhysicalQueue
Command create-jmsdest executed successfully.
```

EXIT STATUS 0
command executed successfully

1
error in executing the command

SEE ALSO [create-jms-resource\(1\)](#), [delete-jmsdest\(1\)](#), [list-jmsdest\(1\)](#)

NAME	create-jms-host – creates a JMS host
SYNOPSIS	create-jms-host --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] [--mqhost <i>localhost</i>] [--mqport 7676] [--mquser <i>admin</i>] [--mqpassword <i>admin</i>] <i>jms_host_name</i>
DESCRIPTION	Creates a JMS host within the JMS service. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

create-jms-host(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target for which you are creating the JMS host. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the JMS host for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the JMS host for the named configuration■ <code>cluster_name</code>, which creates the JMS host for every server instance in the cluster■ <code>instance_name</code>, which creates the JMS host for a particular server instance
	<code>--mqhost</code>	The host name for the JMS service. The default value is <code>localhost</code> .
	<code>--mqport</code>	The port number used by the JMS service. The default value is <code>7676</code> .
	<code>--mquser</code>	The user name for the JMS service. The default value is <code>admin</code> .
	<code>--mqpassword</code>	The password for the JMS service. The default value is <code>admin</code> .
OPERANDS	<code>jms_host_name</code>	A unique identifier for the JMS host to be created.
EXAMPLES	EXAMPLE 1 Using the <code>create-jms-host</code> command	
		The following command creates a JMS host named <code>MyNewHost</code> :
		<pre>asadmin> create-jms-host --user admin --passwordfile passwords.txt --mqhost pigeon --mqport 7677 MyNewHost Command create-jms-host executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	list-jms-hosts(1) , delete-jms-host(1)	

NAME	create-jms-resource – creates a JMS resource
SYNOPSIS	create-jms-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] --restype <i>type</i> [--enabled=true] [--description <i>text</i>] [--property (<i>name=value</i>) [: <i>name=value</i>]*] <i>jndi_name</i>
DESCRIPTION	The <code>create-jms-resource</code> command creates a Java Message Service (JMS) connection factory resource or a JMS destination resource. This command is supported in remote mode only.
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

create-jms-resource(1)

<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target for which you are creating the JMS resource. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the resource for the default server instance <code>server</code> and is the default value■ <code>domain</code>, which creates the resource for the domain■ <code>cluster_name</code>, which creates the resource for every server instance in the cluster■ <code>instance_name</code>, which creates the resource for a particular server instance
<code>--restype</code>	The JMS resource type, which can be either <code>javax.jms.Topic</code> , <code>javax.jms.Queue</code> , <code>javax.jms.ConnectionFactory</code> , <code>javax.jms.TopicConnectionFactory</code> , or <code>javax.jms.QueueConnectionFactory</code> .
<code>--enabled</code>	If set to true, the resource is enabled at runtime.
<code>--description</code>	A text description of the JMS resource.
<code>--property</code>	Optional attribute name/value pairs for configuring the JMS resource.

You can specify the following properties for a connection factory resource:

Property	Definition
ClientId	Specifies a client ID for a connection factory that will be used by a durable subscriber.

create-jms-resource(1)

Property	Definition
AddressList	Specifies the names (and, optionally, port numbers) of a message broker instance or instances with which your application will communicate. Each address in the list specifies the host name (and, optionally, host port and connection service) for the connection. For example, the value could be <code>earth</code> or <code>earth:7677</code> . Specify the port number if the message broker is running on a port other than the default (7676). If you specify multiple hosts and ports in a clustered environment, the first available host on the list is used. Default: The local host and default port number (7676). The client will attempt a connection to a broker on port 7676 of the local host.
MessageServiceAddressList	Same as <code>AddressList</code> . This property name is deprecated. Use <code>AddressList</code> instead.
UserName	The user name for the connection factory. Default: <code>guest</code> .
Password	The password for the connection factory. Default: <code>guest</code> .
ReconnectEnabled	If enabled (value = <code>true</code>), specifies that the client runtime attempts to reconnect to a message server (or the list of addresses in the <code>AddressList</code>) when a connection is lost. Default: <code>false</code> .

create-jms-resource(1)

Property	Definition
ReconnectAttempts	Specifies the number of attempts to connect (or reconnect) for each address in the AddressList before the client runtime tries the next address in the list. A value of -1 indicates that the number of reconnect attempts is unlimited (the client runtime attempts to connect to the first address until it succeeds). Default: 6.
ReconnectInterval	Specifies the interval in milliseconds between reconnect attempts. This applies for attempts on each address in the AddressList and for successive addresses in the list. If the interval is too short, the broker does not have time to recover. If it is too long, the reconnect might represent an unacceptable delay. Default: 30,000 milliseconds.
AddressListBehavior	Specifies whether connection attempts are in the order of addresses in the AddressList attribute (PRIORITY) or in a random order (RANDOM). PRIORITY means that the reconnect will always try to connect to the first server address in the AddressList and will use another one only if the first broker is not available. If you have many clients attempting a connection using the same connection factory, specify RANDOM to prevent them from all being connected to the same address. Default: PRIORITY.

create-jms-resource(1)

Property	Definition
AddressListIterations	Specifies the number of times the client runtime iterates through the AddressList in an effort to establish (or re-establish) a connection). A value of -1 indicates that the number of attempts is unlimited. Default: -1.

You can specify the following properties for a destination resource:

Property	Definition
Name	(Required) This property specifies the name of the physical destination to which the resource will refer. You create a physical destination with the <code>create-jmsdest</code> command.
Description	This property provides a description of the physical destination.

OPERANDS *jndi_name*

The JNDI name of the JMS resource to be created.

EXAMPLES **EXAMPLE 1** Creating a JMS connection factory resource for durable subscriptions

The following command creates a connection factory resource of type `javax.jms.TopicConnectionFactory` whose JNDI name is `jms/DurableTopicConnectionFactory`. The `ClientId` property sets a client ID on the connection factory so that it can be used for durable subscriptions. The JNDI name for a JMS resource customarily includes the `jms/` naming subcontext.

```
asadmin> create-jms-resource --user admin1
--passwordfile passwords.txt --host pigeon --port 5001
--restype javax.jms.TopicConnectionFactory --description
"example of creating a JMS connection factory"
--property ClientId=MyID jms/DurableTopicConnectionFactory
Command create-jms-resource executed successfully.
```

create-jms-resource(1)

EXAMPLE 2 Creating a JMS destination resource

The following command creates a destination resource whose JNDI name is `jms/Queue`. The `Name` property specifies the physical destination to which the resource refers.

```
asadmin> create-jms-resource --user admin1
--passwordfile passwords.txt --host pigeon --port 5001
--restype javax.jms.Queue --property Name=PhysicalQueue jms/MyQueue
Command create-jms-resource executed successfully.
```

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	create-jndi-resource – registers a JNDI resource														
SYNOPSIS	<pre> create-jndi-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] --jndilookupname <i>lookup_name</i> --restype <i>type</i> --factoryclass <i>class_name</i> [--enabled=<i>true</i>] [--description <i>text</i>] [--property (<i>name=value</i>) [:<i>name=value</i>]*] <i>jndi_name</i> </pre>														
DESCRIPTION	The create-jndi-resource command registers a JNDI resource. This command is supported in remote mode only.														
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

create-jndi-resource(1)

<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	valid in Enterprise Edition only, specifies the target to which you are deploying. Valid values are 'server,' 'domain,' cluster, or instance. The default is server.
<code>--jndilookupname</code>	The lookup name that the external container uses.
<code>--resourcetype</code>	The <code>-resourcetype</code> option is deprecated. Use <code>-restype</code> instead.
<code>--restype</code>	The JNDI resource type. It can be topic or queue.
<code>--factoryclass</code>	The class that creates the JNDI resource.
<code>--enabled</code>	Determines whether the resource is enabled at runtime.
<code>--description</code>	The text that provides details about the JNDI resource.
<code>--property</code>	optional attribute name/value pairs for configuring the resource. The following properties are available:

Property	Definition
http-listener-1-port	This property specifies the port number for http-listener-1. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
http-listener-2-port	This property specifies the port number for http-listener-2. Valid values are 1-65535. On UNIX, creating sockets that listen on ports 1-1024 requires superuser privileges.
orb-listener-1-port	This property specifies which ORB listener port for IIOP connections orb-listener-1 listens on.

create-jndi-resource(1)

Property	Definition
IOP_SSL_LISTENER_PORT	This property specifies which ORB listener port for IOP connections the IOP listener called SSL listens on.
IOP_SSL_MUTUALAUTH_PORTS	This property specifies which ORB listener port for IOP connections the IOP listener called SSL_MUTUALAUTH listens on.
JMX_SYSTEM_Connector-port	This property specifies the port number on which the JMX connector listens. Valid values are 1–65535. On UNIX, creating sockets that listen on ports 1–1024 requires superuser privileges.

OPERANDS *jndi_name* The name of the JNDI resource to be created. This name must be unique.

EXAMPLES **EXAMPLE 1** Using the create-jndi-resource command

```
asadmin> create-jndi-resource --user admin --passwordfile filename
--host pigeon --port 4001 --jndilookupname sample_jndi --restype queue
--factoryclass sampleClass --description "this is a sample jndi"
resource: sample_jndi_resource
Command create-jndi-resource executed successfully
```

Where sample_jndi_resource is the new JNDI resource created.

EXIT STATUS 0
command executed successfully

1
error in executing the command

create-jvm-options(1)

NAME	create-jvm-options – creates JVM options in the Java configuration or profiler elements of the domain.xml file.												
SYNOPSIS	<pre>create-jvm-options --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] [--profiler=<i>false</i>] (<i>jvm_option_name=jvm_option_value</i>) [:<i>jvm_option_name=jvm_option_name</i>] *</pre>												
DESCRIPTION	<p>Creates JVM options in the Java configuration or profiler elements of the domain.xml file. JVM options are used to record the settings needed to get a particular profiler going.</p> <p>This command is supported in remote mode only.</p> <p>You must restart the server for newly created JVM options to take affect. Use the start/stop-domain command to restart the domain administration server.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
	--target	specifies the target to which you are deploying. Valid values are config, instance, cluster, or 'server.' The default is server.
	--profiler	indicates whether the JVM options are for the profiler. The profiler must exist for this option to be true.
OPERANDS	<i>jvm_option_name</i>	the left side of the equal sign (=) is the JVM option name. The right side of the equal sign (=) is the JVM option value. A colon (:) is a delimiter for multiple options.
EXAMPLES	EXAMPLE 1 Using the create-jvm-options command	
		JVM options must start with a dash (-), . Use the backslash (\) to escape the dash delimiter.
		<pre> asadmin> create-jvm-options --user admin --passwordfile adminfile --host localhost --port 4849 --target server "\-Dtmp=sun"-e \-Doption1=value1 create-jvm-options --interactive=true --secure=true --passwordfile /password --terse=false --user admin --target server --host localhost --echo=true --port 4849 \-Doption1=value1 Command create-jvm-options executed successfully </pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-jvm-options(1)	

create-lifecycle-module(1)

NAME	create-lifecycle-module – adds a lifecycle module												
SYNOPSIS	<pre>create-lifecycle-module --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--enabled=<i>true</i>] [--target <i>target</i>] --classname <i>classname</i> [--classpath <i>classpath</i>] [--loadorder <i>loadorder</i>] [--failurefatal=<i>false</i>] [--description <i>description</i>] [--property (<i>name=value</i>)[:<i>name=value</i>]*] <i>module_name</i></pre>												
DESCRIPTION	Creates the lifecycle module. The lifecycle modules provide a means of running short or long duration Java-based tasks within the application server environment. This command is supported in remote mode only.												
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-lifecycle-module(1)

-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	This option is the name of the resulting location. The valid targets for this command are configuration, instace, cluster, or server. This is used by EE only.
--classname	This is the fully qualified name of the startup class.
--classpath	This option indicates where this module is actually located if it is not under applications-root.
--loadorder	This option represents an integer value that can be used to force the order in which deployed lifecycle modules are loaded at server startup. Smaller numbered modules get loaded sooner. Order is unspecified if two or more lifecycle modules have the same load-order value.
--failurefatal	This options tells the system what to do if the lifecycle module does not load correctly. If this option is set to true, then the system aborts the server startup if this module does not load properly.
--enabled	This option determines whether the resource is enabled at runtime.
--description	This is the text description of the resource associated with this module.
--property	This is an optional attribute containing name/value pairs used to configure the resource.
OPERANDS	<i>module_name</i> This operand is a unique identifier or the deployed server lifecycle event listener module.
EXAMPLES	EXAMPLE 1 using create-lifecycle-module <pre> asadmin> create-lifecycle-module --user admin --passwordfile adminpassword.txt --host fuyako --port 7070 --classname "com.acme.CustomSetup" --classpath "/export/customSetup" --loadorder 1 --failurefatal=true --description "this is a sample customSetup" --property rmi=Server="acme1\7070":timeout=30 customSetup Command create-lifecycle-module executed successfully </pre>

create-lifecycle-module(1)

EXAMPLE 1 using create-lifecycle-module *(Continued)*

Where: `customSetup` is the lifecycle module created. The escape character `\` is used in the property option to distinguish the colons (`:`).

EXIT STATUS

0

command executed successfully

1

error in executing the command

create-message-security-provider(1)

NAME	create-message-security-provider – enables administrators to create the message-security-config and provider-config sub-elements for the security service in domain.xml						
SYNOPSIS	<pre> create-message-security-provider --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] --classname <i>provider_class</i> [--layer <i>message_layer</i>] [--providertype <i>provider_type</i>] [--requestauthsource <i>request_auth_source</i>] [--requestauthrecipient <i>request_auth_recipient</i>] [--responseauthsource <i>response_auth_source</i>] [--responseauthrecipient <i>response_auth_recipient</i>] [--isdefaultprovider] [--property (<i>name=value</i>) [:<i>name=value</i>]*] <i>provider_name</i> </pre>						
DESCRIPTION	<p>Enables the administrator to create the message-security-config and provider-config sub-elements for the security service in domain.xml (the file that specifies parameters and properties to the Application Server). The options specified in the list below apply to attributes within the message-security-config and provider-config sub-elements of the domain.xml file.</p> <p>If the message-layer (message-security-config) does not exist, it is created, and then the provider-config is created under it.</p> <p>This command is supported in remote mode only.</p>						
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <table border="0" style="width: 100%;"> <tr> <td style="padding-right: 20px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 20px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 20px;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD,</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD,
-u --user	The authorized domain application server administrative username.						
-w --password	The --password option is deprecated. Use --passwordfile instead.						
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD,						

create-message-security-provider(1)

	AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.
-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	In Enterprise Edition, specifies the target to which you are deploying. Valid values are <ul style="list-style-type: none">■ <i>server</i>, which deploys the component to the default server instance <i>server</i> and is the default value■ <i>domain</i>, which deploys the component to the domain.■ <i>cluster_name</i>, which deploys the component to every server instance in the cluster.■ <i>instance_name</i>, which deploys the component to a particular sever instance. The following optional attribute name/value pairs are available:

create-message-security-provider(1)

Property	Definition
classname	<p>Defines the Java implementation class of the provider. Client authentication providers must implement the <code>com.sun.enterprise.security.jauth.ClientAuthModule</code> interface. Server-side providers must implement the <code>com.sun.enterprise.security.jauth.ServerAuthModule</code> interface. A provider may implement both interfaces, but it must implement the interface corresponding to its provider type.</p>
layer	<p>The message-layer entity used to define the value of the <code>auth-layer</code> attribute of <code>message-security-config</code> elements. The default is <code>SOAP</code>.</p>
providertype	<p>Establishes whether the provider is to be used as client authentication provider, server authentication provider, or both. Valid options for this property include <code>client</code>, <code>server</code>, or <code>client-server</code>. The default value is <code>client-server</code>.</p>
requestauthsource	<p>The <code>auth-source</code> attribute defines a requirement for message-layer sender authentication (e.g. username password) or content authentication (e.g. digital signature) to be applied to request messages. Possible values are <code>sender</code> or <code>content</code>. When this argument is not specified, source authentication of the request is not required.</p>

create-message-security-provider(1)

Property	Definition
requestauthrecipient	The auth-recipient attribute defines a requirement for message-layer authentication of the receiver of a message to its sender (e.g. by XML encryption). Possible values are before-content or after-content. The default value is after-content.
responseauthsource	The auth-source attribute defines a requirement for message-layer sender authentication (e.g. username password) or content authentication (e.g. digital signature) to be applied to response messages. Possible values are sender or content. When this option is not specified, source authentication of the response is not required.
responseauthrecipient	The auth-recipient attribute defines a requirement for message-layer authentication of the receiver of the response message to its sender (e.g. by XML encryption). Possible values are before-content or after-content. The default value is after-content.
isdefaultprovider	The default-provider attribute is used to designate the provider as the default provider (at the layer) of the type or types identified by the providertype argument. There is no default associated with this option.

create-message-security-provider(1)

Property	Definition
property	Use this property to pass provider-specific property values to the provider when it is initialized. Properties passed in this way might include key aliases to be used by the provider to get keys from keystores, signing, canonicalization, encryption algorithms, etc.

OPERANDS *provider_name* The name of the provider used to reference the `provider-config` element.

EXAMPLES **EXAMPLE 1** Using `create-message-security-provider`

The following example shows how to create a message security provider for a client.

```
asadmin> create-message-security-provider --user admin
--passwordfile pwd_file
--classname com.sun.enterprise.security.jauth.ClientAuthModule
--providertype client mySecurityProvider
```

EXIT STATUS

0
command executed successfully

1
error in executing the command

SEE ALSO [delete-message-security-provider\(1\)](#),
[list-message-security-providers\(1\)](#)

create-node-agent(1)

NAME	create-node-agent – creates a node agent
SYNOPSIS	<pre>create-node-agent --host <i>DAS_host</i> --port <i>DAS_port</i> [--user <i>DAS_user</i>] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--agentdir <i>nodeagent_path</i>] [--agentport <i>port_number</i>] [--agentproperties (<i>name=value</i>) [:<i>name=value</i>]*] --passwordfile <i>password</i> [--savemasterpassword=<i>false</i>] [<i>nodeagent_name</i>]</pre>
DESCRIPTION	<p>The node agent facilitates remote server instance management. It is the responsibility of the node agent to create, start, stop, and delete a server instance. Every node agent must have a unique name and every new server instance must be created with a reference to a node agent name defining the machine on which the instance will reside. A node agent must be present on every machine that hosts server instances, including the machine hosting the Domain Administration Server (DAS).</p> <p>The domain administration server connection options identify the agent's initial target domain. The DAS does not need to be running when the node agent is being created.</p>
OPTIONS	<pre>--host Specifies the connection attributes to the DAS. The agent attempts to contact the DAS and join the domain when it is started. --port Specifies the connection attributes to the DAS. The agent attempts to contact the DAS and join the domain when it is started. --user The username associated with the administrative instance. Specifies the connection attributes to the DAS. The agent attempts to contact the DAS and join the domain when it is started. --adminpassword The domain application server password associated with the administrative instance. -t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false. -e --echo Setting to true will echo the command line statement on to the standard output. Default is false. -I --interactive If set to true (default), only the required options are prompted. --agentdir Like a DAS, each node agent resides in a top level directory named /. If the agentdir is not specified, then the default install_dir/nodeagents is used. --agentport The port on which the node agent's JMX connector will listen and accept requests. If not specified, then a random unused port is chosen.</pre>

create-node-agent(1)

`--agentproperties`

The following agentproperties are available:

Property	Definition
listenaddress	The address used by the JMX connector to listen for requests or notifications. The default is 0.0.0.0.
remoteclientaddress	The address used by DAS to connect to the Node Agent. The default is the hostname of the server.
loglevel	The initial log level at which messages are logged. The default is INFO.

`-W --passwordfile`

The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: `AS_ADMIN_PASSWORD=password`. Where *password* is the actual administrator password for the domain.

`--savemasterpassword`

Setting this option to true allows the `masterpassword` to be written to the file system. This is necessary so that the `start-domain` command can start the server without having to prompt the user. However, for security purposes, the default setting is false because saving the master password on the disk is an insecure practice.

OPERANDS

nodeagent_name

The name of the node agent must be unique in the domain. If not specified, the `nodeagent_name` defaults to the machine's host name.

EXAMPLES

EXAMPLE 1 Using `create-node-agent`

```
asadmin>create-node-agent --host dance --port 4848 --user admin1 --passwordfile pass2 nodeagent1
Node Agent nodeagent1 created.
```

Where: `nodeagent1` was created in the default `install_dir/nodeagents` directory.

EXIT STATUS

0
command executed successfully

1
error in executing the command

create-node-agent-config(1)

NAME	create-node-agent-config – adds a new unbound node agent to a domain
SYNOPSIS	create-node-agent-config --user <i>admin_name</i> --passwordfile <i>filename</i> [--host <i>localhost</i>] [--port <i>port_number</i>] [--secure= <i>false</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] <i>nodeagent_name</i>
DESCRIPTION	This command allows an agent placeholder to be created before the node agent's directory structure is created, using the create-node-agent command. This supports the offline configuration scenario where administrators define server instances in advance of creating the node agents on remote machines.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile The name of the file containing the domain application server password. The passwordfile should contain either of the following entries: AS_ADMIN_PASSWORD=<i>password</i> or AS_ADMIN_MAPPEDPASSWORD=<i>password</i>. If this option is not called directly, you will be prompted for it before the requested action is completed.</p> <p>-H --host The machine name where the the domain application server is running.</p> <p>-p --port The port number of the domain application server listening for administration requests.</p> <p>-s --secure If set to true, this command uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. The default is false.</p> <p>-e --echo Setting this option to true will echo the command line statement on the standard output. The default is false.</p> <p>-I --interactive If this option is set to true (default), only the required password options are prompted.</p>
OPERANDS	<i>nodeagent_name</i> The name of the node must be unique on the machine. Typically, the nodeagent_name is the host name of the machine where the node agent will reside.
EXAMPLES	EXAMPLE 1 Using create-node-agent-config <pre>asadmin> create-node-agent-config --user admin1 --passwordfile filename nodeagent1</pre> Command create-node-agent-config executed successfully.

create-node-agent-config(1)

EXIT STATUS 0
command executed successfully
1
error in executing the command

SEE ALSO [delete-node-agent-config\(1\)](#)

create-password-alias(1)

NAME	create-password-alias – creates a password alias												
SYNOPSIS	create-password-alias --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--aliaspassword <i>alias_password</i>] <i>aliasname</i>												
DESCRIPTION	<p>This command creates an alias for a password and stores it in domain.xml. An alias is a token of the form \${ALIAS=password-alias-password}. The password corresponding to the alias name is stored in encrypted form. The password-alias commands take both a secure interactive form (in which the user is prompted for all information) and a more script-friendly form, in which the password is propagated on the command line.</p> <p>This command is supported in remote mode only.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-password-alias(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--aliaspassword</code>	This is a separate and distinct password corresponding to the original password. WARNING: Passing this password on the command line is not secure. The password is optional and when omitted, the user is prompted.
OPERANDS	<code>aliasname</code>	This is the name of the substitute password as it appears in domain.xml.
EXAMPLES	EXAMPLE 1 Using create-password-alias <code>asadmin> create-password-alias --aliasname alias1</code> Command create-password-alias executed successfully	
EXIT STATUS	0 1	command executed successfully error in executing the command
SEE ALSO	<code>delete-password-alias(1)</code> , <code>list-password-aliases(1)</code> , <code>update-password-alias(1)</code>	

create-persistence-resource(1)

NAME	create-persistence-resource – registers a persistence resource												
SYNOPSIS	<pre> create-persistence-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--enabled=<i>true</i>] [--target <i>target</i>] [--jdbcjndiname <i>jndi_name</i> --connectionpoolid <i>id</i>] [--factoryclass <i>classname</i>] [--description <i>text</i>] [--property (<i>name=value</i>)[:<i>name=value</i>]*] <i>jndi_name</i> </pre>												
DESCRIPTION	<p>Registers a persistence resource. This command is supported in remote mode only.</p> <p>The --jdbcjndiname option and the --connectionpoolid option are mutually exclusive; only one should be used.</p>												
OPTIONS	<table border="0"> <tr> <td style="padding-right: 10px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 10px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 10px;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="padding-right: 10px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="padding-right: 10px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="padding-right: 10px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-persistence-resource(1)

-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--enabled	Determines whether the resource is enabled at runtime.
---target	Specifies the target for which you are creating a persistence resource. This option is available only in the Sun Java System Application Server Enterprise Edition. Valid values are <ul style="list-style-type: none"> ■ <code>server</code>, which deploys the component to the default server instance <code>server</code> and is the default value ■ <code>domain</code>, which deploys the component to the domain. ■ <code>cluster_name</code>, which deploys the component to every server instance in the cluster. ■ <code>instance_name</code>, which deploys the component to a particular sever instance.
--jdbcjndiname	Specifies the JDBC resource with which database connections are obtained. It must be the name of a pre-created JDBC resource.
--connectionpoolid	Specifies the name of the JDBC connection pool. If two or more JDBC resource elements point to the same connection pool element, they use the same pool connections at runtime.
--factoryclass	Deprecated, and not needed for the default CMP implementation. Specifies the class that creates the persistence manager instance.
--description	Specifies a text description of the persistence resource.
--property	Specifies optional name/value pairs for configuring the persistence resource.
OPERANDS <i>jndi_name</i>	Specifies the JNDI name of the persistence resource.

create-persistence-resource(1)

EXAMPLES

EXAMPLE 1 Using create-persistence-resource

```
asadmin> create-persistence-resource --user admin --passwordfile secret.txt
--jdbcjndiname sample_jndi_resource sample_persistence_resource
Command create-persistence-resource executed successfully
```

EXIT STATUS

0

command executed successfully

1

error in executing the command

-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

create-profiler(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are listing the realms. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
	<code>--classpath</code>	Java classpath string that specifies the classes needed by the profiler.
	<code>--nativelibpath</code>	automatically constructed to be a concatenation of the Application Server installation relative path for its native shared libraries, standard JRE native library path, the shell environment setting (<code>LD_LIBRARY_PATH</code> on UNIX) and any path that may be specified in the profile element.
	<code>--enabled</code>	profiler is enabled by default.
	<code>--property</code>	name/value pairs of provider specific attributes.
OPERANDS	<code>profiler_name</code>	name of the profiler.
EXAMPLES	EXAMPLE 1 Using create-profiler	
		<pre>asadmin> create-profiler --user admin --passwordfile password.txt --host localhost --port 4848 --classpath /home/appserver/ --nativelibpath /u/home/lib --enabled=false --property defaultuser=admin:password=adminadmin sample_profiler Created Profiler with id = sample_profiler</pre>
		Where: <code>sample_profiler</code> is the profiler created.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-profiler(1)	

create-resource-adapter-config(1)

NAME	create-resource-adapter-config – creates the configuration information in domain.xml for the connector module
SYNOPSIS	<pre> create-resource-adapter-config --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--threadpoolid <i>threadpool</i>] [--property (<i>property name=value</i>) [:<i>name=value</i>]*] <i>raname</i> </pre>
DESCRIPTION	<p>Creates configuration information for the connector module. This command can be executed prior to deploying a resource adapter, so that the configuration information is available at the time of deployment, or after deployment. If the resource adapter is created after deployment, the resource adapter is started. You must first create a threadpool, using the <code>create-threadpool</code> command, and then identify that threadpool value as the ID in the <code>--threadpoolid</code> option.</p>
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p>

create-resource-adapter-config(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	This option has been deprecated.
	<code>--threadpoolid</code>	The threadpool ID from which the work manager gets the thread.
	<code>--property</code>	This option specifies the configuration properties of the resource adapter java bean.
OPERANDS	<i>raname</i>	This operand is the value kept in the <code>resource-adapter-name</code> in the <code>domain.xml</code> file.
EXAMPLES	EXAMPLE 1 Using <code>create-resource-adapter-config</code> <code>asadmin> create-resource-adapter-config u--user ul --passwordfile pfile1 ral</code> Command <code>create-resource-adapter-config</code> executed successfully	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	<code>create-threadpool(1)</code> , <code>delete-resource-adapter-config(1)</code>	

NAME	create-resource-ref – creates a reference to a resource
SYNOPSIS	create-resource-ref --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] [--enabled=true] <i>reference_name</i>
DESCRIPTION	<p>The <code>create-resource-ref</code> command creates a reference from a cluster or an unclustered server instance to a previously created resource (for example, a JDBC resource created using the <code>create-jdbc-resource</code> command). This effectively results in the resource being made available in the JNDI tree of the targeted instance or cluster.</p> <p>The target instance or instances making up the cluster need not be running or available for this command to succeed. If one or more instances are not available, they will receive the new resource the next time they start.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

create-resource-ref(1)

	<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	Specifies the target for which you are creating the resource reference. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the resource reference for the default server instance <code>server</code> and is the default value■ <code>cluster_name</code>, which creates the resource reference for every server instance in the cluster■ <code>instance_name</code>, which creates the resource reference for the named unclustered server instance
	<code>--enabled</code>	Indicates whether the resource should be enabled. This value will take effect only if the resource is enabled at the global level. The default is <code>true</code> .
OPERANDS	<code>reference_name</code>	The name or JNDI name of the resource.
EXAMPLES	EXAMPLE 1 Using the create-resource-ref command	
		The following command creates a reference to the JMS destination resource <code>jms/Topic</code> on the cluster <code>Cluster1</code> .
		<pre>asadmin> create-resource-ref --user admin --passwordfile passwords.txt --target Cluster1 jms/Topic Command create-resource-ref executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-resource-ref(1) , list-resource-refs(1)	

NAME	create-ssl – creates and configures the SSL element in the selected HTTP listener, IIOF listener, or IIOF service
SYNOPSIS	<pre> create-ssl --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] --type <i>listener_or_service_type</i> --certname <i>cert_name</i> [--ssl2enabled=<i>false</i>] [--ssl2ciphers <i>ssl2ciphers</i>] [--ssl3enabled=<i>true</i>] [--tlseenabled=<i>true</i>] [--ssl3tlsciphers <i>ssl3tlsciphers</i>] [--tlscrollbackenabled=<i>true</i>] [--clientauthenabled=<i>false</i>] [<i>listener_id</i>] </pre>
DESCRIPTION	<p>Creates and configures the SSL element in the selected HTTP listener, IIOF listener, or IIOF service in order to enable secure communication on that listener/service.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

create-ssl(1)

<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target to which you are deploying. Valid values are <ul style="list-style-type: none">■ <i>server</i>, the server in which the <i>iiop-service</i> or listener is to be configured for SSL.■ <i>config</i>, the configuration that contains the listener or <i>iiop-service</i> for which SSL is to be configured.■ <i>cluster</i>, the cluster in which the listener or <i>iiop-service</i> is to be configured for SSL. All the server instances in the cluster will get the SSL configuration for the respective listener or <i>iiop-service</i>.■ <i>instance</i>, the instance in which the listener or <i>iiop-service</i> is to be configured for SSL. The following optional attribute name/value pairs are available:

Property	Definition
type	The type of service or listener for which the SSL is created. The type can be <i>http-listener</i> , <i>iiop-listener</i> , or <i>iiop-service</i> .
certname	The nickname of the server certificate in the certificate database or the PKCS#11 token. The format of the name in the certificate is <i>tokenname:nickname</i> . For this property, the <i>tokenname</i> is optional.

Property	Definition
ssl2enabled	Set this property to <i>true</i> to enable SSL2. The default value is <i>false</i> . If both SSL2 and SSL3 are enabled for a virtual server, the server tries SSL3 encryption first. In the event SSL3 encryption fails, the server then tries SSL2 encryption.
ssl2ciphers	A comma-separated list of the SSL2 ciphers to be used. Use the prefix + to enable or – to disable a particular cipher. Allowed values are: <i>rc4</i> , <i>rc4export</i> , <i>rc2</i> , <i>rc2export</i> , <i>idea</i> , <i>des</i> , and <i>desede3</i> . If no value is specified, all supported ciphers are assumed to be enabled.
ssl3enabled	Set this property to <i>false</i> to disable SSL3. The default value is <i>true</i> . If both SSL2 and SSL3 are enabled for a virtual server, the server tries SSL3 encryption first. In the event SSL3 encryption fails, the server then tries SSL2 encryption.
tlseabled	Set this property to <i>false</i> to disable TLS. The default value is <i>true</i> . It is good practice to enable TLS, which is a more secure version of SSL.

create-ssl(1)

Property	Definition
ssl3tlsciphers	A comma-separated list of the SSL3 and/or TLS ciphers to be used. Use the prefix + to enable or – to disable a particular cipher. Allowed SSL3 values are <i>rsa_rc4_128_md5</i> , <i>rsa3des_sha</i> , <i>rsa_des_sha</i> , <i>rsa_rc4_40_md5</i> , <i>rsa_rc2_40_md5</i> , and <i>rsa_null_md5</i> . Allowed TLS values are <i>rsa_des_56_sha</i> and <i>rsa_rc4_56_sha</i> . If no value is specified, all supported ciphers are assumed to be enabled.
tlscrollbackenabled	Set to <i>true</i> (default) to enable TLS rollback. TLS rollback should be enabled for Microsoft Internet Explorer 5.0 and 5.5. This option is only valid in the Enterprise Edition. This option is only valid when <i>tlsenabled=true</i> .
clientauthenabled	Set to <i>true</i> if you want SSL3 client authentication performed on every request independent of ACL-based access control. Default value is <i>false</i> .

OPERANDS *listener_id*

The ID of the listener for which the SSL element is to be created. The *listener_id* is not required if the `--type` is *iiop-service*.

EXAMPLES **EXAMPLE 1** Using create-ssl

The following example shows how to create an SSL element for an HTTP listener named *http-listener-1*.

```
asadmin> create-ssl --user admin --host fuyako --port 7070
--passwordfile adminpassword.txt --type http-listener --certname sampleCert http-listener-1
Created SSL in HTTP Listener
```

create-system-properties(1)

NAME	create-system-properties – adds or updates one or more system properties of the domain, configuration, cluster, or server instance												
SYNOPSIS	create-system-properties --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] [<i>name=value</i>] [: <i>name=value</i>]*												
DESCRIPTION	Shared or clustered server instances will often need to override attributes defined in their referenced configuration. Any configuration attribute in a server instance can be overridden through a system property of the corresponding name. This command adds or updates the system properties of a domain, configuration, cluster, or server instance.												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-system-properties(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are creating the system properties. The valid targets for this command are instance, cluster, configuration, 'domain,' and 'server.' Server is the default option.
OPERANDS	<code>name=value</code>	The name value pairs (separated by the ":" character) of the system properties to add to the specified target. If any of the system properties were previously defined, it will be updated with the newly specified value.
EXAMPLES	EXAMPLE 1 Using create-system-properties	
	<pre>asadmin> create-system-properties --user admin --passwordfile password.txt --host localhost --port 4849 --target mycluster http-listener-port=1088</pre>	Command create-system-properties executed successfully.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-system-property(1) , list-system-properties(1)	

create-threadpool(1)

NAME	create-threadpool – adds a threadpool												
SYNOPSIS	<pre>create-threadpool --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target_name</i>] [--maxthreadpoolsize <i>max_thread_pool_size</i>] [--minthreadpoolsize <i>min_thread_pool_size</i>] [--idletimeout <i>idle_thread_timeout_in_seconds</i>] [--workqueues <i>number_work_queues</i>] {<i>threadpool_id</i>}</pre>												
DESCRIPTION	<p>Creates a thread-pool with the specified name. You can specify maximum and minimum number of threads in the pool, the number of work queues, and the idle timeout of a thread. The created thread pool can be used for servicing IOP requests and for resource adapters to service work management requests. Please note that a created thread pool can be used in multiple resource adapters. This command is supported in remote mode only.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

create-threadpool(1)

-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	In Enterprise Edition, specifies the target on which you are creating the threadpool. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, which creates the listener for the default server instance <i>server</i> and is the default value ■ <i>configuration_name</i>, which creates the listener for the named configuration ■ <i>cluster_name</i>, which creates the listener for every server instance in the cluster ■ <i>instance_name</i>, which creates the listener for a particular server instance
--maxthreadpoolsize	maximum number of threads in the threadpool servicing requests in this queue. This is the upper bound on the number of threads that exist in the threadpool.
--minthreadpoolsize	minimum number of threads in the threadpool servicing requests in this queue. These are created up front when the threadpool is instantiated.
--idletimeout	idle threads are removed from the pool after this time.
--workqueues	identifies the total number of work queues serviced by this threadpool.
OPERANDS	<i>threadpool_id</i> an ID for the work queue; for example, thread-pool-1, thread-pool-2, etc.
EXAMPLES	<p>EXAMPLE 1 Using create-threadpool</p> <pre>asadmin> create-threadpool --user admin1 --passwordfile password.txt --maxthreadpoolsize 100 --minthreadpoolsize 20 --idletimeout 2 --workqueues 100 threadpool-1 Command create-threadpool executed successfully</pre>
EXIT STATUS	0 command executed successfully

create-threadpool(1)

1

error in executing the command

SEE ALSO [delete-threadpool\(1\)](#), [list-threadpools\(1\)](#)

NAME	create-virtual-server – creates the named virtual server
SYNOPSIS	<pre>create-virtual-server --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>server</i>] --hosts <i>hosts</i> [--httplisteners <i>http_listeners</i>] [--defaultwebmodule <i>default_web_module</i>] [--state <i>on</i>] [--logfile <i>log_file</i>] [--property (<i>name=value</i>) [:<i>name=value</i>]*] <i>virtual_server_id</i></pre>
DESCRIPTION	<p>The <code>create-virtual-server</code> command creates the named virtual server. Virtualization in the Application Server allows multiple URL domains to be served by a single HTTP server process that is listening on multiple host addresses. If the application is available at two virtual servers, they still share the same physical resource pools.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is <code>localhost</code>.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p>

create-virtual-server(1)

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target for which you are creating the virtual server. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the virtual server for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the virtual server for the named configuration■ <code>cluster_name</code>, which creates the virtual server for every server instance in the cluster■ <code>instance_name</code>, which creates the virtual server for a particular server instance
<code>--hosts</code>	A comma-separated (,) list of values allowed in the host request header to select the current virtual server. Each virtual server that is configured to the same connection group must have a unique hosts value for that group.
<code>--httplisteners</code>	A comma-separated (,) list of HTTP listener IDs. Required only for a virtual server that is not the default virtual server.
<code>--defaultwebmodule</code>	The standalone web module associated with this virtual server by default.
<code>--state</code>	Determines whether a virtual server is active (on) or inactive (off or disabled). Default is active (on). When inactive, the virtual server does not service requests.
<code>--logfile</code>	Name of the file where log entries for this virtual server are to be written. By default, this is the server log.
<code>--property</code>	Optional attribute name/value pairs for configuring the virtual server. The following properties are available:

create-virtual-server(1)

Property	Definition
docroot	Absolute path to root document directory for server.
accesslog	Absolute path to server access logs.
sso-enabled	If false, single sign-on is disabled for this virtual server, and users must authenticate separately to every application on the virtual server. Single sign-on across applications on the Application Server is supported by servlets and JSP pages. This feature allows multiple applications that require the same user sign-on information to share this information, rather than have the user sign on separately for each application. Default is true.
sso-max-inactive-seconds	Specifies the number of seconds after which a user's single sign-on record becomes eligible for purging if no client activity is received. Since single sign-on applies across several applications on the same virtual server, access to any of the applications keeps the single sign-on record active. Default is 300 seconds (5 minutes). Higher values provide longer single sign-on persistence for users at the expense of more memory use on the server.
sso-reap-interval-seconds	Specifies the number of seconds between purges of expired single sign-on records. Default is 60.

OPERANDS

virtual_server_id

Identifies the unique ID for the virtual server to be created. This ID cannot begin with a number.

create-virtual-server(1)

EXAMPLES **EXAMPLE 1** Using the create-virtual-server command

The following command creates a virtual server named sampleServer:

```
asadmin> create-virtual-server --user admin1
--passwordfile passwords.txt --hosts pigeon,localhost sampleServer
Command create-virtual-server executed successfully.
```

EXIT STATUS 0
 command executed successfully

1
 error in executing the command

NAME	delete-acl – removes the access control list file
SYNOPSIS	<pre>delete-acl --user admin_user [--password admin_password] [--host localhost] [--port 4848] [--passwordfile filename] [--secure -s] [--instance instance_name] acl_ID</pre>
DESCRIPTION	Gets the access control lists associated with the named server instance..
OPTIONS	<pre>--user administrative user associated for the instance. --password administrative password corresponding to the administrative user. --host host name of the machine hosting the administrative instance. --port administrative port number associated with the administrative host. --secure indicates communication with the administrative instance in secured mode. --passwordfile file containing passwords appropriate for the command (e.g., administrative instance). --instance name of the instance.</pre>
OPERANDS	<i>acl_ID</i> internal name for the ACL file listing. This ID is used in a virtual server element to define the ACL file used by the virtual server.
EXAMPLES	<p>EXAMPLE 1 Using delete-acl</p> <pre>asadmin> delete-acl --user admin --password adminadmin --host fuyako --port 7070 --instance server Deleted ACL with id = sampleACL</pre> <p>Where: <i>sampleACL</i> is the ACL that is deleted.</p>
EXIT STATUS	<pre>0 command executed successfully 1 error in executing the command</pre>
INTERFACE EQUIVALENT	Access Control List page
SEE ALSO	create-acl(1) , list-acl(1)

delete-admin-object-1(1)

NAME	delete-admin-object – removes the administered object with the specified JNDI name																
SYNOPSIS	delete-admin-object --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>jndi_name</i>																
DESCRIPTION	This command removes the administered object with the specified JNDI name.																
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on the standard output. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

delete-admin-object-1(1)

`-I --interactive` If set to true (default), only the required password options are prompted.

`-h --help` Displays the help text for the command.

`--target` This is the name of the target upon which the command is operating. The valid targets for this command are instance, cluster, 'domain,' and 'server.' Server is the default option. This command is used by the Enterprise Edition only.

OPERANDS *jndi_name* JNDI name of the administered object to be deleted.

EXAMPLES **EXAMPLE 1** Using delete-admin-object

The example listed in the `add-admin-object` command should be executed before attempting to execute this example:

```
asadmin> delete-admin-object --user admin --password admin123
--target instance1 jms/samplequeue
Command delete-admin-object executed successfully
```

EXIT STATUS 0
command executed successfully

1
error in executing the command

SEE ALSO [create-admin-object\(1\)](#), [list-admin-objects\(1\)](#)

delete-application-ref(1)

NAME	delete-application-ref – removes a reference to an application
SYNOPSIS	delete-application-ref --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] [--cascade= <i>false</i>] <i>reference_name</i>
DESCRIPTION	<p>The delete-application-ref command removes a reference from a cluster or an unclustered server instance to an application. This effectively results in the application element being undeployed and no longer available on the targeted instance or cluster.</p> <p>The target instance or instances making up the cluster need not be running or available for this command to succeed. If one or more instances are not available, they will no longer load the application the next time they start.</p> <p>Removal of the reference does not result in removal of the application from the domain. The bits are removed only by the undeploy command.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

	<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	Specifies the target from which you are removing the application reference. Valid values are <ul style="list-style-type: none"> ■ <code>server</code>, which removes the application reference from the default server instance <code>server</code> and is the default value ■ <code>cluster_name</code>, which removes the application reference from every server instance in the cluster ■ <code>instance_name</code>, which removes the application reference from the named unclustered server instance
	<code>--cascade</code>	This option, when set to true, will ensure the removal of the connector from remote instances. The default is false.
OPERANDS	<code>reference_name</code>	The name of the application or module, which can be a J2EE application module, Web module, EJB module, connector module, application client module, or lifecycle module.
EXAMPLES	<p>EXAMPLE 1 Using the delete-application-ref command</p> <p>The following command removes a reference to the Web module <code>MyWebApp</code> from the unclustered server instance <code>NewServer</code>.</p> <pre>asadmin> delete-application-ref --user admin2 --passwordfile passwords.txt --target NewServer MyWebApp Command delete-application-ref executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-application-ref(1) , list-application-refs(1) , undeploy(1)	

delete-audit-module(1)

NAME	create-audit-module – removes the named audit-module																				
SYNOPSIS	delete-audit-module --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] [<i>audit_module_name</i>]																				
DESCRIPTION	Removes the named audit module. This command is supported in remote mode only.																				
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on the standard output. Default is false.</td></tr><tr><td>-I --interactive</td><td>If set to true (default), only the required password options are prompted.</td></tr><tr><td>-h --help</td><td>Displays the help text for the command.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.	-I --interactive	If set to true (default), only the required password options are prompted.	-h --help	Displays the help text for the command.
-u --user	The authorized domain application server administrative username.																				
-w --password	The --password option is deprecated. Use --passwordfile instead.																				
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																				
-H --host	The machine name where the domain application server is running. The default value is localhost.																				
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																				
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																				
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																				
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																				
-I --interactive	If set to true (default), only the required password options are prompted.																				
-h --help	Displays the help text for the command.																				

delete-audit-module(1)

	<code>--target</code>	In Enterprise Edition, specifies the target on which you are deleting the audit module. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
OPERANDS	<code>audit_module_name</code>	name of the audit module to be deleted.
EXAMPLES	EXAMPLE 1 Using delete-audit-module	
		<pre>asadmin> delete-audit-module --user admin1 --passwordfile password.txt --host pigeon --port 5001 sampleAuditModule Command delete-audit-module executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-audit-module(1)</code> , <code>list-audit-modules(1)</code>	

delete-auth-realm(1)

NAME	delete-auth-realm – removes the named authentication realm																		
SYNOPSIS	delete-auth-realm --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] { <i>auth_realm-name</i> }																		
DESCRIPTION	Removes the named authorized realm. This command is supported in remote mode only.																		
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on the standard output. Default is false.</td></tr><tr><td>-I --interactive</td><td>If set to true (default), only the required password options are prompted.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.	-I --interactive	If set to true (default), only the required password options are prompted.
-u --user	The authorized domain application server administrative username.																		
-w --password	The --password option is deprecated. Use --passwordfile instead.																		
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																		
-H --host	The machine name where the domain application server is running. The default value is localhost.																		
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																		
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																		
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																		
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																		
-I --interactive	If set to true (default), only the required password options are prompted.																		

delete-auth-realm(1)

	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are deleting the authentication realm. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
OPERANDS	<code>auth_realm_name</code>	name of this realm.
EXAMPLES	EXAMPLE 1 Using delete-auth-realm	
	<pre>asadmin> delete-auth-realm --user admin1 --passwordfile password.txt --host pigeon --port 5001 db Command delete-auth-realm executed successfully</pre>	
		Where db is the authentication realm deleted.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-auth-realm(1) , list-auth-realms(1)	

delete-cluster(1)

NAME	delete-cluster – deletes a cluster
SYNOPSIS	delete-cluster --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>cluster_name</i>
DESCRIPTION	<p>The delete-cluster command deletes a cluster. A cluster can be deleted only if it contains no server instances. Stop and delete all server instances in the cluster before deleting the cluster.</p> <p>If a standalone cluster is deleted (that is, the cluster's configuration name is <i>cluster_name-config</i> and no other clusters or unclustered instances refer to this configuration), then its standalone configuration is automatically deleted.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

delete-cluster(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>cluster_name</i>	The name of the cluster to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-cluster command	
	The following command deletes the cluster named <code>MyCluster</code> . The same command also automatically deletes the configuration named <code>MyCluster-config</code> .	
	<pre>asadmin> delete-cluster --user admin1 --passwordfile passwords.txt MyCluster Command delete-cluster executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-cluster(1) , list-clusters(1) , start-cluster(1) , stop-cluster(1) , stop-instance(1)	

delete-connector-connection-pool(1)

NAME	delete-connector-connection-pool – removes the specified connector connection pool																
SYNOPSIS	delete-connector-connection-pool --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--cascade= <i>false</i>] <i>connector_connection_pool_name</i>																
DESCRIPTION	Removes the specified connector connection pool. This command is supported in remote mode only.																
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on the standard output. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

delete-connector-connection-pool(1)

<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--cascade</code>	When set to true, it deletes all connector resources associated with the pool that is named as operand, apart from the pool itself. When set to false, the deletion of pool fails if any resources are associated with the pool. The resource must be deleted explicitly or the option must be set to true. The default setting is false.

OPERANDS `connector_connection_pool_name` The name of the connection pool to be removed.

EXAMPLES **EXAMPLE 1** Using the delete-connector-connection-pool command

```
asadmin> delete-connector-connection-pool --cascade=false jms/qConnPool
Command delete-connector-connection-pool executed successfully
```

Where `.jms/qConnPool` is the connector connection pool that is removed.

EXIT STATUS 0
command executed successfully

1
error in executing the command

[list-connector-connection-pools\(1\)](#)

delete-connector-resource(1)

NAME	delete-connector-resource – removes the connector resource with the specified JNDI name
SYNOPSIS	delete-connector-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>jndi_name</i>
DESCRIPTION	This delete-connector-resource command removes the connector resource with the JNDI name, which is specified by the <i>jndi_name</i> operand.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-connector-resource(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only, specifies the target to which you are deploying. Valid values are 'server,' 'domain,' cluster, instance.
	<code>--poolname</code>	The name of the connection pool. When two or more resource elements point to the same connection pool element, they use the same pool connections at runtime.
	<code>--enabled</code>	This option determines whether the resource is enabled at runtime. The default value is true.
	<code>--description</code>	Text providing descriptive details about the connector resource.
OPERANDS	<i>jndi_name</i>	the JNDI name of this connector resource.
EXAMPLES	EXAMPLE 1 Using the delete-connector-resource command <pre>asadmin> delete-connector-resource --target server jms/qConnFactory --passwordfile file1 Command delete-connector-resource executed successfully</pre> <p>Where jms/qConnFactory is the connector resource that is removed.</p>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-connector-resource(1) , list-connector-resources(1)	

delete-connector-security-map(1)

NAME	delete-connector-security-map – deletes a security map for the specified connector connection pool
SYNOPSIS	delete-connector-security-map --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] --poolname <i>connector_connection_pool_name</i> <i>security_map_name</i>
DESCRIPTION	<p>Use this command to delete a security map for the specified connector connection pool.</p> <p>For this command to succeed, you must have first created a connector connection pool using the <code>create-connector-connection-pool</code> command.</p> <p>The enterprise information system (EIS) is any system that holds the information. It can be a mainframe, a messaging system, a database system, or an application.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p>

delete-connector-security-map(1)

<code>-p --port</code>	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	This option is deprecated in this release.
<code>--poolname</code>	This property specifies the name of the connector connection pool to which the security map that is to be deleted belongs.

OPERANDS `security_map_name` name of the security map to be deleted.

EXAMPLES **EXAMPLE 1** Using `delete-connector-security-map`

It is assumed that the connector pool has already been created using the `create-connector-pool` command.

```
asadmin> delete-connector-security-map --user admin
--passwordfile pwd_file.txt --poolname connector-pool1 securityMap1
Command delete-connector-security-map executed successfully
```

EXIT STATUS 0
command executed successfully

1
error in executing the command

SEE ALSO [create-connector-security-map\(1\)](#), [list-connector-security-maps\(1\)](#), [update-connector-security-map\(1\)](#)

delete-custom-resource(1)

NAME	delete-custom-resource – removes a custom resource
SYNOPSIS	delete-custom-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>jndi_name</i>
DESCRIPTION	The delete-custom-resource command removes a custom resource. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-custom-resource(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only, this command, specifies the location of the custom resources that you are deleting. Valid values are 'server,' ,domain,' cluster, and instance. The default is server.
OPERANDS	<i>jndi_name</i>	the JNDI name of this resource.
EXAMPLES	EXAMPLE 1 Using the delete-custom-resource command asadmin> <code>delete-custom-resource --target plm jndi_name_test --passwordfile file1</code> Command delete-custom-resource executed correctly.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-custom-resource(1) , list-custom-resources(1)	

delete-domain(1)

NAME	delete-domain – deletes the given domain
SYNOPSIS	delete-domain [--domaindir <i>install_dir</i> /domains] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] <i>domain_name</i>
DESCRIPTION	Use the delete-domain command to delete the named domain. The domain must already exist and must be stopped. This command is supported in local mode only.
OPTIONS	--domaindir The directory where the domain to be deleted is located. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir</i> /domains directory is deleted. -t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false. -e --echo Setting to true will echo the command line statement on to the standard output. Default is false. -I --interactive If set to true (default), only the required options are prompted.
OPERANDS	<i>domain_name</i> The unique name of the domain you wish to delete.
EXAMPLES	EXAMPLE 1 Using the delete-domain command <pre>asadmin> delete-domain --domaindir /export/domains sampleDomain deleted domain sampleDomain successfully</pre> Where: the sampleDomain domain is deleted from the /export/domains directory.
EXIT STATUS	0 command executed successfully 1 error in executing the command
SEE ALSO	create-domain(1) , start-domain(1) , stop-domain(1) , list-domains(1)

NAME	delete-file-user – removes the named file user
SYNOPSIS	delete-file-user --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>username</i>
DESCRIPTION	Deletes the entry in the keyfile with the specified username.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-file-user(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	This is used for Enterprise Edition only. This is the name of the target on which the command operates. The valid targets are config, instance, cluster, or "server." By default, the target is the "Server."
OPERANDS	<i>username</i>	This is the name of file user to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-file-user command	
		It is assumed that an authority realm has already been created using the create-auth-realm command.
		<pre>asadmin> delete-file-user --user admin1 --password adminadmin1 --host pigeon --port 5001 --username admin1 Command delete-file-user executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-file-user(1)</code> , <code>list-file-users(1)</code> , <code>update-file-user(1)</code> , <code>list-file-groups(1)</code>	

delete-http-health-checker(1)

NAME	delete-http-health-checker – deletes the health-checker for a specified load balancer configuration
SYNOPSIS	delete-http-health-checker --user <i>admin_user</i> [<i>--passwordfile filename</i>] [<i>--host host_name</i>] [<i>--port port_number</i>] [<i>--secure -s</i>] [<i>--terse=false</i>] [<i>--echo=false</i>] [<i>--interactive=true</i>] [<i>--help</i>] --config <i>config_name target</i>
DESCRIPTION	This command deletes the health checker from a load balancer configuration.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-http-health-checker(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--config</code>	The load balancer configuration from which you delete the health-checker.
OPERANDS	<i>target</i>	Specifies the target from which you are deleting the health checker. Valid values are: <ul style="list-style-type: none">■ <i>cluster_name</i>, which deletes the health checker that was monitoring all instances in the cluster.■ <i>instance_name</i>, which deletes the health checker that was monitoring this standalone instance.
EXAMPLES	EXAMPLE 1 Using the delete-http-health-checker command <pre>asadmin> delete-http-health-checker --user admin --passwordfile password.txt --config mycluster-http-lb-config mycluster</pre> Command delete-http-health-checker executed successfully.	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	create--http-health-checker(1)	

NAME	delete-http-lb-config – deletes a load balancer configuration
SYNOPSIS	delete-http-lb-config --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>config_name</i>
DESCRIPTION	Use the delete-http-lb-config command to delete a load balancer configuration. The load balancer must not reference any clusters or server instances.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p>

delete-http-lb-config(1)

	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<code>config_name</code>	The name of the new load balancer configuration to delete. The configuration must not reference any clusters or server instances.
EXAMPLES	EXAMPLE 1	Using the <code>delete-http-lb-config</code> command <pre>asadmin> delete-http-lb-config --user admin --passwordfile file mylbconfig</pre> Command <code>delete-http-lb-config</code> executed successfully.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-http-lb-config(1) , list-http-lb-configs(1)	

NAME	delete-http-lb-ref – deletes the cluster or server instance from a load balancer configuration
SYNOPSIS	delete-http-lb-ref --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] --config <i>config_name</i> <i>target</i>
DESCRIPTION	Use the delete-http-lb-ref command to remove a reference to a cluster or server instance from a load balancer configuration. So that you do not interrupt user requests, make sure the standalone server instance or all server instances in the cluster are disabled before you remove them from the load balancer configuration.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

delete-http-lb-ref(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--config</code>	Specifies which load balancer configuration to delete cluster and server instance references from.
OPERANDS	<i>target</i>	Specifies which cluster or instance to remove from the load balancer. Valid values are: <ul style="list-style-type: none">■ <i>cluster_name</i>, which specifies that requests for this cluster will no longer be handled by the load balancer.■ <i>instance_name</i>, which specifies that requests for this standalone instance will no longer be handled by the load balancer.
EXAMPLES	EXAMPLE 1 Using the delete-http-lb-ref command	
	<pre>asadmin> delete-http-lb-ref --user admin --passwordfile file --config mycluster-http-lb-config cluster2 Command delete-http-lb-ref executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-http-lb-ref(1) disable-http-lb-server(1)	

NAME	delete-http-listener – removes an HTTP listener
SYNOPSIS	delete-http-listener --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>server</i>] <i>listener_id</i>
DESCRIPTION	The delete-http-listener command removes the specified HTTP listener. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-http-listener(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the HTTP listener. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the listener from the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which deletes the listener from the named configuration■ <code>cluster_name</code>, which deletes the listener from every server instance in the cluster■ <code>instance_name</code>, which deletes the listener from a particular server instance
OPERANDS	<code>listener_id</code>	The unique identifier for the HTTP listener to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-http-listener command	
		The following command deletes the HTTP listener named <code>sampleListener</code> :
		<pre>asadmin> delete-http-listener --user admin1 --passwordfile passwords.txt --host pigeon --port 5001 sampleListener Command delete-http-listener executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-http-listener(1)</code> , <code>list-http-listeners(1)</code>	

NAME	delete-iiop-listener – removes an IIOP listener
SYNOPSIS	delete-iiop-listener --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>server</i>] <i>listener_id</i>
DESCRIPTION	The delete-iiop-listener command removes the specified IIOP listener. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-iiop-listener(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the IIOP listener. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the listener from the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which deletes the listener from the named configuration■ <code>cluster_name</code>, which deletes the listener from every server instance in the cluster■ <code>instance_name</code>, which deletes the listener from a particular server instance
OPERANDS	<code>listener_id</code>	The unique identifier for the IIOP listener to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-iiop-listener command	
		The following command deletes the IIOP listener named <code>sample_iiop_listener</code> :
		<pre>asadmin> delete-iiop-listener --user admin --passwordfile passwords.txt --host fuyako --port 7070 sample_iiop_listener Command delete-iiop-listener executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-iiop-listener(1)</code> , <code>list-iiop-listeners(1)</code>	

NAME	delete-instance – deletes the instance that is not running	
SYNOPSIS	delete-instance --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>instance_name</i>	
DESCRIPTION	Use the delete-instance command to delete the instance that you specify. The delete-instance command can be run both locally and remotely. The user authenticates using the password identified for the administration server. Additionally, the instance must already exist within the domain served by the administration server. Use this command with discretion since it is destructive and there is no undo.	
OPTIONS	-u --user	The authorized domain application server administrative username.
	-w --password	The --password option is deprecated. Use --passwordfile instead.
	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.
	-H --host	The machine name where the domain application server is running. The default value is localhost.
	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.

delete-instance(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<code>instance_name</code>	name of the instance to be deleted.
EXAMPLES	EXAMPLE 1 Using delete-instance in local mode	
	<pre>asadmin> delete-instance --user admin1 --passwordfile passwords.txt instance1</pre>	Command delete-instance executed successfully
	Where: instance1 is deleted on the local machine.	
	EXAMPLE 2 Using delete-instance in remote mode	
	<pre>asadmin> delete-instance --user admin --passwordfile passwords.txt --host pigeon --port 4849 instance2</pre>	Deleted Instance server1 successfully
	Where: instance2 is deleted on the remote machine.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-instance(1) , start-instance(1) , stop-instance(1)	

NAME	delete-javamail-resource – removes a JavaMail session resource
SYNOPSIS	delete-javamail-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] <i>jndi_name</i>
DESCRIPTION	The delete-javamail-resource command removes the specified JavaMail session resource. For Enterprise Edition, make sure to remove all references to this resource before executing this command. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

delete-javamail-resource(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the JavaMail session resource. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the resource from the default server instance <code>server</code> and is the default value■ <code>domain</code>, which deletes the resource from the domain■ <code>cluster_name</code>, which deletes the resource from every server instance in the cluster■ <code>instance_name</code>, which deletes the resource from a particular server instance
OPERANDS	<i>jndi_name</i>	The JNDI name of the JavaMail session resource to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-javamail-resource command	
		The following command deletes the JavaMail session resource named <code>mail/MyMailSession</code> :
		<pre>asadmin> delete-javamail-resource --user admin --passwordfile passwords.txt --host fuyako --port 7070 mail/MyMailSession Command delete-javamail-resource executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-javamail-resource(1) , list-javamail-resources(1)	

delete-jdbc-connection-pool(1)

NAME	delete-jdbc-connection-pool – removes the specified JDBC connection pool
SYNOPSIS	delete-jdbc-connection-pool --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--cascade= <i>false</i>] <i>connectionpoolid</i>
DESCRIPTION	Removes a specified JDBC connection pool that was previously created with the creat-jdbc-connection command. The operand identifies the JDBC connection pool to be deleted. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-jdbc-connection-pool(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--cascade</code>	If the option is set to true, all the connector resources associated with the pool (mentioned as operand) apart from the pool itself are deleted. When set to false, the deletion of pool fails if any resources are associated with the pool. Resources must be deleted explicitly or the option must be set to true. By default, the option is false.
OPERANDS	<i>connectionpoolid</i>	the name of the JDBC resource to be removed.
EXAMPLES	EXAMPLE 1 Using the delete-jdbc-connection-pool command <pre>asadmin> delete-jdbc-connection-pool --passwordfile file1 --user ul --cascade=false connection_pool</pre> Command delete-jdbc-connection-pool executed correctly. Where: asadmin is the command prompt and connection_pool_01 is the connection pool to be removed.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jdbc-connection-pool(1) , list-jdbc-connection-pools(1)	

delete-jdbc-resource(1)

NAME	delete-jdbc-resource – removes a JDBC resource with the specified JNDI name
SYNOPSIS	delete-jdbc-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] <i>jndi_name</i>
DESCRIPTION	The delete-jdbc-resource command removes a JDBC resource. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-jdbc-resource(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only, specifies the target to which you are deploying. Valid values are 'server,' 'domain,' cluster, or instance. The default is server.
OPERANDS	<i>jndi_name</i>	the JNDI name of this JDBC resource to be removed.
EXAMPLES	EXAMPLE 1 Using the delete-jdbc-resource command	
	<code>asadmin> delete-jdbc-resource --passwordfile pass1 --user ul --target plum test_jdbc_resource</code>	Command delete-jdbc-resource executed successfully.
		Where asadmin is the command prompt and test_jdbc_resource is the name of the JDBC resource that is removed.
EXIT STATUS	0	command executed successfully
	1	error in executing the command

NAME	delete-jmsdest – removes a physical destination
SYNOPSIS	delete-jmsdest --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] --desttype <i>type</i> <i>dest_name</i>
DESCRIPTION	The delete-jmsdest command removes the specified physical destination. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-jmsdest(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the physical destination. Although the <code>delete-jmsdest</code> command is related to resources, a physical destination is created and deleted using the JMS Service, which is part of the configuration. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the physical destination from the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which deletes the physical destination from the named configuration■ <code>cluster_name</code>, which deletes the physical destination from every server instance in the cluster■ <code>instance_name</code>, which deletes the physical destination from a particular server instance
	<code>-T --desttype</code>	The type of the JMS destination. Valid values are <code>topic</code> and <code>queue</code> .
OPERANDS	<code>dest_name</code>	The unique identifier of the the JMS destination to be deleted.
EXAMPLES	EXAMPLE 1 Using the <code>delete-jmsdest</code> command	The following command deletes the queue named <code>PhysicalQueue</code> : <pre>asadmin> delete-jmsdest --user admin --passwordfile passwords.txt --host localhost --port 4848 --desttype queue PhysicalQueue Command delete-jmsdest executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command

NAME	delete-jms-host – removes a JMS host														
SYNOPSIS	delete-jms-host --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] <i>jms_host_name</i>														
DESCRIPTION	The command removes the specified JMS host. This command is supported in remote mode only. Deleting the default JMS host, named <code>default_JMS_host</code> , is not recommended.														
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

delete-jms-host(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the JMS host. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the JMS host from the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which deletes the JMS host from the named configuration■ <code>cluster_name</code>, which deletes the JMS host from every server instance in the cluster■ <code>instance_name</code>, which deletes the JMS host from a particular server instance
OPERANDS	<code>jms_host_name</code>	The name of the host to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-jms-host command	
		The following command deletes the JMS host named <code>MyNewHost</code> .
		<pre>asadmin> delete-jms-host --user admin1 --passwordfile passwords.txt MyNewHost Command delete-jms-host executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-jms-host(1)</code> , <code>list-jms-hosts(1)</code>	

NAME	delete-jms-resource – removes a JMS resource
SYNOPSIS	delete-jms-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>jndi_name</i>
DESCRIPTION	The <code>delete-jms-resource</code> command removes the specified JMS resource. For Enterprise Edition, make sure to remove all references to this resource before executing this command. This command is supported in remote mode only.
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p><code>-e --echo</code> Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-jms-resource(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the JMS resource. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the resource from the default server instance <code>server</code> and is the default value■ <code>domain</code>, which deletes the resource from the domain■ <code>cluster_name</code>, which deletes the resource from every server instance in the cluster■ <code>instance_name</code>, which deletes the resource from a particular server instance
OPERANDS	<code>jndi_name</code>	The JNDI name of the JMS resource to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-jms-resource command	
		The following command deletes the JMS resource named <code>jms/Queue</code> :
		<pre>asadmin> delete-jms-resource --user admin1 --passwordfile passwords.txt --host pigeon --port 5001 jms/Queue Command delete-jms-resource executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-jms-resource(1)</code> , <code>list-jms-resources(1)</code>	

NAME	delete-jdbc-resource – removes the JNDI resource with the specified JNDI name
SYNOPSIS	delete-jndi-resource --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target</i>] <i>jndi_name</i>
DESCRIPTION	The delete-jndi-resource command removes the specified JNDI resource. This command is supported in remote mode only. In Enterprise Edition, you must remove all associations to the JNDI resource before you execute this command.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

delete-jndi-resource(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only. Valid values are 'server,' 'domain,' cluster, or instance. The default is 'server.'
OPERANDS	<i>jndi_name</i>	the name of the JNDI resource to be removed.
EXAMPLES	EXAMPLE 1 Using the delete-jndi-resource command	
	In Enterprise Edition, you must remove all associations to this resource before you execute this command.	
	<pre>asadmin> delete-jndi-resource --passwordfile p1 --user u2 --target plum sample_jndi_resource Command delete-jndi-resource executed successfully.</pre>	
	Where asadmin is the command prompt and sample_jndi_resource is the resource to be removed.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command

NAME	delete-jvm-options – removes JVM options from the Java configuration or profiler elements of the domain.xml file												
SYNOPSIS	<pre> delete-jvm-options --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] [--profiler =<i>false</i>] [(<i>jvm_option_name=jvm_option_value</i>)] [:<i>jvm_option_name=jvm_option_name</i>] [*] </pre>												
DESCRIPTION	Removes JVM options from the Java configuration or profiler elements of the domain.xml file. NOTE: In the syntax, there can be more than one jvm_option, separated by a colon.												
OPTIONS	<table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 10px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

delete-jvm-options(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	valid in Enterprise Edition only, specifies the target to which you are deploying. Valid values are 'server,' 'domain,' cluster, or instance. The default is server.
	<code>--profiler</code>	indicates whether the JVM options are for the profiler. The profiler must exist for this option to be true.
OPERANDS	<code>jvm_option_name=jvm_option_value</code>	The left side of the equal sign (=) is the JVM option name. The right side of the equal sign (=) is the JVM option value. A colon (:) is a delimiter for multiple options.
EXAMPLES	EXAMPLE 1 Using the delete-jvm-options command	
		To remove more than one JVM option, use a colon (:) to separate the options. If the JVM option itself contains a colon (:), use the backslash (\) to offset the colon (:) delimiter.
		<pre>asadmin> delete-jvm-options -e \-Dtmp=sun --interactive=true --secure=true --passwordfile /password --terse=false --user admin --target server --host localhost --echo=true --port 4849 \-Dtmp=sun Command delete-jvm-options executed successfully</pre>
		Where the JVM options are deleted.
		<pre>asadmin> delete-jvm-options -e \-Doption1=value1 --interactive=true --secure=true --passwordfile /password --terse=false --user admin --target server --host localhost --echo=true --port 4849 \-Doption1=value1 Command delete-jvm-options executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jvm-option(1)	

NAME	delete-lifecycle-module – removes the lifecycle module
SYNOPSIS	delete-lifecycle-module --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>module_name</i>
DESCRIPTION	Removes the lifecycle module. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-lifecycle-module(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	This is the name of the resulting location. The valid targets for this command are configuration, instance, cluster, or server. This is used by EE only.
OPERANDS	<i>module_name</i>	This operand is a unique identifier or the deployed server lifecycle event listener module.
EXAMPLES	EXAMPLE 1 Using delete-lifecycle-module <pre>asadmin> delete-lifecycle-module --user admin --passwordfile adminpassword.txt --host fuyako --port 7070 customSetup Deleted the Lifecycle module with module name = customSetup</pre> <p>Where: customSetup is the lifecycle module deleted.</p>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-lifecycle-module(1) , list-lifecycle-modules(1)	

delete-message-security-provider(1)

NAME	delete-message-security-provider – enables administrators to delete a provider-config sub-element for the given message layer (message-security-config element of domain.xml)								
SYNOPSIS	<pre> delete-message-security-provider --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--target <i>target</i>] --layer <i>message_layer</i> provider_name </pre>								
DESCRIPTION	<p>Enables administrators to delete a provider-config sub-element for the given message layer (message-security-config element of domain.xml, the file that specifies parameters and properties to the Application Server). The options specified in the list below apply to attributes within the message-security-config and provider-config sub-elements of the domain.xml file.</p> <p>If the message-layer (message-security-config attribute) does not exist, it is created, and then the provider-config is created under it.</p> <p>This command is supported in remote mode only.</p>								
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 20px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">--passwordfile</td> <td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.
-u --user	The authorized domain application server administrative username.								
-w --password	The --password option is deprecated. Use --passwordfile instead.								
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.								
-H --host	The machine name where the domain application server is running. The default value is localhost.								

delete-message-security-provider(1)

	<code>-p --port</code>	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
	<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target to which you are deploying. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deploys the component to the default server instance <code>server</code> and is the default value■ <code>domain</code>, which deploys the component to the domain.■ <code>cluster_name</code>, which deploys the component to every server instance in the cluster.■ <code>instance_name</code>, which deploys the component to a particular sever instance.
	<code>--layer</code>	The message-layer from which the provider has to be deleted. The default value is SOAP.
OPERANDS	<code>provider_name</code>	The name of the provider used to reference the <code>provider-config</code> element.
EXAMPLES	EXAMPLE 1 Using <code>delete-message-security-provider</code>	The following example shows how to delete a message security provider for a client. <pre>asadmin> delete-message-security-provider --user admin --layer SOAP mySecurityProvider</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-message-security-provider(1) , list-message-security-providers(1)	

NAME	delete-node-agent – deletes the node agent and its associated directory structure
SYNOPSIS	delete-node-agent [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--agentdir <i>nodeagent_path</i>] <i>nodeagent_name</i>
DESCRIPTION	Use the delete-node-agent command to delete the named node agent and its directory structure. The node agent must be stopped and have no associated server instances. After successful execution of the command, delete-node-agent-config must be executed to remove the named node agent from domain-xml.
OPTIONS	<p>-t--terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e--echo Setting to true will echo the command line statement on to the standard output. Default is false.</p> <p>-I--Interactive If set to true (default), only the required options are prompted.</p> <p>--agentdir Like a Domain Administration Server (DAS), each node agent resides in a top level directory named <agentdir>/<nodeagent_name>. If specified, the path must be accessible in the filesystem. If not specified, the node agent is deleted from the default install_dir/nodeagents directory.</p>
OPERANDS	<i>nodeagent_name</i> This is the name of the node agent to be deleted.
EXAMPLES	<p>EXAMPLE 1 Using delete-node-agent</p> <p>This is a basic example of how to use this command.</p> <pre>% asadmin>delete-node-agent nodeagent1 Node Agent nodeagent1 deleted.</pre> <p>Where: % is the command prompt, and nodeagent1, residing in the default install_dir/nodeagents directory, is deleted together with its directory structure. Please note that at this point nodeagent1 references still exist in domain.xml. Use the following command to complete the removal process:</p> <pre>% asadmin>delete-node-agent-config --user admin1 --passwordfile filename nodeagent1</pre>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	create-node-agent(1) , list-node-agents(1) , start-node-agent(1) , stop-node-agent(1)

delete-node-agent-config(1)

NAME	delete-node-agent-config – removes a node agent from a domain																		
SYNOPSIS	delete-node-agent-config --user <i>admin_name</i> --passwordfile <i>filename</i> [--host <i>localhost</i>] [--port <i>port_number</i>] [--secure= <i>false</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] <i>nodeagent_name</i>																		
DESCRIPTION	This command removes the specified node agent from the domain, at which point the node agent directory structure can also be removed (using the delete-node-agent command). Important: The specified node agent must have no server instances running, This means all the agent's instances must be deleted (using delete-instance) before executing this command.																		
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">-- passwordfile</td> <td>The name of the file containing the domain application server password. The passwordfile should contain either of the following entries: AS_ADMIN_PASSWORD=<i>password</i> or AS_ADMIN_MAPPEDPASSWORD=<i>password</i>. If this option is not called directly, you will be prompted for it before the requested action is completed.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, this command uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. The default is false.</td> </tr> <tr> <td style="vertical-align: top;">-e --echo</td> <td>Setting this option to true will echo the command line statement on the standard output. The default is false.</td> </tr> <tr> <td style="vertical-align: top;">-I --interactive</td> <td>If this option is set to true (default), only the required password options are prompted.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	-- passwordfile	The name of the file containing the domain application server password. The passwordfile should contain either of the following entries: AS_ADMIN_PASSWORD= <i>password</i> or AS_ADMIN_MAPPEDPASSWORD= <i>password</i> . If this option is not called directly, you will be prompted for it before the requested action is completed.	-H --host	The machine name where the domain application server is running.	-p --port	The port number of the domain application server listening for administration requests.	-s --secure	If set to true, this command uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. The default is false.	-e --echo	Setting this option to true will echo the command line statement on the standard output. The default is false.	-I --interactive	If this option is set to true (default), only the required password options are prompted.
-u --user	The authorized domain application server administrative username.																		
-w --password	The --password option is deprecated. Use --passwordfile instead.																		
-- passwordfile	The name of the file containing the domain application server password. The passwordfile should contain either of the following entries: AS_ADMIN_PASSWORD= <i>password</i> or AS_ADMIN_MAPPEDPASSWORD= <i>password</i> . If this option is not called directly, you will be prompted for it before the requested action is completed.																		
-H --host	The machine name where the domain application server is running.																		
-p --port	The port number of the domain application server listening for administration requests.																		
-s --secure	If set to true, this command uses SSL/TLS to communicate with the domain application server.																		
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. The default is false.																		
-e --echo	Setting this option to true will echo the command line statement on the standard output. The default is false.																		
-I --interactive	If this option is set to true (default), only the required password options are prompted.																		
OPERANDS	<i>nodeagent_name</i> The name of the node must be unique on the machine. Typically, the nodeagent_name is the host name of the machine where the node agent will reside.																		

EXAMPLES **EXAMPLE 1** Using delete-node-agent-config

This is a basic example of how the command is used.

```
asadmin> delete-node-agent-config --user admin1 --passwordfile filename nodeagent1  
Command delete-node-agent-config executed successfully.
```

EXIT STATUS

0
command executed successfully

1
error in executing the command

-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

delete-persistence-resource(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>---target</code>	Specifies the target from which you are deleting a persistence resource. This option is available only in the Sun Java System Application Server Enterprise Edition. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deploys the component to the default server instance <code>server</code> and is the default value■ <code>domain</code>, which deploys the component to the domain.■ <code>cluster_name</code>, which deploys the component to every server instance in the cluster.■ <code>instance_name</code>, which deploys the component to a particular sever instance.
OPERANDS	<code>jndi_name</code>	Specifies the JNDI name of the persistence resource.
EXAMPLES	EXAMPLE 1 Using delete-persistence-resource <pre>asadmin> delete-persistence-resource --user admin --passwordfile secret.txt --host pigeon --port 5001 sample_persistence_resource Command delete-persistence-resource executed successfully</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-persistence-resource(1) , list-persistence-resources(1)	

delete-profiler(1)

NAME	delete-profiler – deletes the profiler element																
SYNOPSIS	delete-profiler --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target_name</i>]																
DESCRIPTION	<p>Deletes the profiler element. A server instance is tied to a particular profiler by the profiler element in the Java configuration. Changing a profiler requires you to restart the server.</p> <p>This command is supported in remote mode only.</p>																
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on the standard output. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

delete-profiler(1)

<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target profiler element which you are deleting. Valid values are <ul style="list-style-type: none">■ <code>server</code>, deletes the profiler element for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, deletes the profiler element for the named configuration■ <code>cluster_name</code>, deletes the profiler element for every server instance in the cluster■ <code>instance_name</code>, deletes the profiler element for a particular server instance

EXAMPLES

EXAMPLE 1 Using delete-profiler

```
asadmin> delete-profiler --user admin --passwordfile password.txt
--host localhost --port 4848
Deleted Profiler
```

Where: `profiler` is the deleted profile element.

EXIT STATUS

0	command executed successfully
1	error in executing the command

-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

delete-resource-adapter-config(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	This option is deprecated.
OPERANDS	<i>raname</i>	This value is kept in the <code>resource-adapter-name</code> in the <code>domain.xml</code> file.
EXAMPLES	EXAMPLE 1 Using <code>delete-resource-adapter-config</code>	
	<pre>asadmin> delete-resource-adapter-config --user admin1 --passwordfile pfile1 ra1 Command delete-resource-adapter-config executed successfully</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-resource-adapter-config(1) , list-resource-adapter-configs(1)	

delete-resource-ref(1)

NAME	delete-resource-ref – removes a reference to a resource								
SYNOPSIS	delete-resource-ref --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] <i>reference_name</i>								
DESCRIPTION	<p>The <code>delete-resource-ref</code> command removes a reference from a cluster or an unclustered server instance to a resource (for example, a JDBC resource). This effectively results in the removal of the resource from the JNDI tree of the targeted instance or cluster.</p> <p>The target instance or instances making up the cluster need not be running or available for this command to succeed. If one or more instances are not available, they will no longer load the resource in the JNDI tree the next time they start.</p> <p>Removal of the reference does not result in removal of the resource from the domain. The resource is removed only by the <code>delete</code> command for that resource (for example, <code>delete-jdbc-resource</code>).</p> <p>This command is supported in remote mode only.</p>								
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.
-u --user	The authorized domain application server administrative username.								
-w --password	The --password option is deprecated. Use --passwordfile instead.								
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.								
-H --host	The machine name where the domain application server is running. The default value is localhost.								

	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
	--target	Specifies the target from which you are removing the resource reference. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, which removes the resource reference from the default server instance <i>server</i> and is the default value ■ <i>cluster_name</i>, which removes the resource reference from every server instance in the cluster ■ <i>instance_name</i>, which removes the resource reference from the named unclustered server instance
OPERANDS	<i>reference_name</i>	The name or JNDI name of the resource.
EXAMPLES	<p>EXAMPLE 1 Using the delete-resource-ref command</p> <p>The following command removes a reference to the JMS destination resource <code>jms/Topic</code> on the unclustered server instance <code>NewServer</code>.</p> <pre>asadmin> delete-resource-ref --user admin2 --passwordfile passwords.txt --target NewServer jms/Topic Command delete-resource-ref executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command

delete-ssl(1)

NAME	delete-ssl – deletes the SSL element in the selected HTTP listener, IIOP listener, or IIOP service
SYNOPSIS	delete-ssl --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>] --type <i>listener_or_service_type</i> <i>listener_id</i>
DESCRIPTION	Deletes the SSL element in the selected HTTP listener, IIOP listener, or IIOP service. The <i>listener_id</i> is not required if the --type is <i>iiop-service</i> . This command is supported in remote mode only.
OPTIONS	If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes. -u --user The authorized domain application server administrative username. -w --password The --password option is deprecated. Use --passwordfile instead. --passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on. -H --host The machine name where the domain application server is running. The default value is localhost. -p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849. -s --secure If set to true, uses SSL/TLS to communicate with the domain application server.

	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
	--target	In Enterprise Edition, specifies the target to which you are deploying. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, the server in which the <i>iiop-service</i> or <i>listener</i> is to be unconfigured for SSL. ■ <i>config</i>, the configuration that contains the <i>listener</i> or <i>iiop-service</i> for which SSL is to be unconfigured. ■ <i>cluster</i>, the cluster in which the <i>listener</i> or <i>iiop-service</i> is to be unconfigured for SSL. All the server instances in the cluster will get SSL unconfigured for the respective <i>listener</i> or <i>iiop-service</i>. ■ <i>instance</i>, the instance in which the <i>listener</i> or <i>iiop-service</i> is to be unconfigured for SSL.
	--type	The type of service or listener for which the SSL is created. The type can be <i>http-listener</i> , <i>iiop-listener</i> , or <i>iiop-service</i> .
OPERANDS	<i>listener_id</i>	The ID of the listener from which the SSL element is to be deleted. The <i>listener_id</i> operand is not required if the <code>--type</code> is <i>iiop-service</i> .
EXAMPLES	EXAMPLE 1 Using delete-ssl	The following example shows how to delete an SSL element from an HTTP listener named <i>http-listener-1</i> . <pre>asadmin> delete-ssl --user admin --secure --host fuyako --port 7070 --passwordfile adminpassword.txt --type http-listener http-listener-1 Deleted SSL in HTTP Listener</pre>
EXIT STATUS	0	command executed successfully

delete-ssl(1)

1

error in executing the command

SEE ALSO [create-ssl\(1\)](#)

delete-system-property(1)

NAME	delete-system-property – removes one system property of the domain, configuration, cluster, or server instance, at a time
SYNOPSIS	delete-system-property --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] [<i>property_name</i>]
DESCRIPTION	Shared or clustered server instances will often need to override attributes defined in their referenced configuration. Any configuration attribute in a server instance can be overridden through a system property of the corresponding name. This command deletes system properties of a domain, configuration, cluster, or server instance.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

delete-system-property(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are deleting the system properties. The valid targets for this command are instance, cluster, configuration, 'domain,' and 'server.' Server is the default option.
OPERANDS	<i>property_name</i>	The name of the system property to remove.
EXAMPLES	EXAMPLE 1 Using delete-system-properties <pre>asadmin> delete-system-property --user admin --passwordfile password.txt --host localhost --port 4849 --target mycluster http-listener-port Command delete-system-property executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-system-properties(1) , list-system-properties(1)	

NAME	delete-threadpool – removes the named threadpool
SYNOPSIS	<pre>delete-threadpool --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target_name</i>] [--maxthreadpoolsizes <i>max_thread_pool_size</i>] [--minthreadpoolsizes <i>min_thread_pool_size</i>] [--idletimeout <i>idle_thread_timeout_in_seconds</i>] [--workqueues <i>number_work_queues</i>] {<i>threadpool_id</i>}</pre>
DESCRIPTION	Removes the threadpool with the named ID. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

delete-threadpool(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target on which you are creating the threadpool. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
	<code>--maxthreadpoolsize</code>	maximum number of threads in the threadpool servicing requests in this queue. This is the upper bound on the number of threads that exist in the threadpool.
	<code>--minthreadpoolsize</code>	minimum number of threads in the threadpool servicing requests in this queue. These are created up front when the threadpool is instantiated.
	<code>--idletimeout</code>	idle threads are removed from the pool after this time.
	<code>--workqueues</code>	identifies the total number of work queues serviced by this threadpool.
OPERANDS	<code>threadpool_id</code>	an ID for the work queue; for example, <code>thread-pool-1</code> , <code>thread-pool-2</code> , etc.
EXAMPLES	EXAMPLE 1 Using <code>delete-threadpool</code>	<pre>asadmin> delete-threadpool --user admin1 --passwordfile password.txt threadpool-1 Command delete-threadpool executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-threadpool(1) , list-threadpools(1)	

NAME	delete-virtual-server – removes a virtual server
SYNOPSIS	delete-virtual-server --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>server</i>] <i>virtual_server_id</i>
DESCRIPTION	The delete-virtual-server command removes the virtual server with the specified virtual server ID. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

delete-virtual-server(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	In Enterprise Edition, specifies the target from which you are deleting the virtual server. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deletes the virtual server from the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which deletes the virtual server from the named configuration■ <code>cluster_name</code>, which deletes the virtual server from every server instance in the cluster■ <code>instance_name</code>, which deletes the virtual server from a particular server instance
OPERANDS	<code>virtual_server_id</code>	The unique identifier for the virtual server to be deleted.
EXAMPLES	EXAMPLE 1 Using the delete-virtual-server command	
		The following command deletes the virtual server named <code>sample_vs1</code> :
		<pre>asadmin> delete-virtual-server --user admin1 --passwordfile passwords.txt --host pigeon --port 5001 sample_vs1 Command delete-virtual-server executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-virtual-server(1)</code> , <code>list-virtual-servers(1)</code>	

NAME	deploy – deploys the specified component						
SYNOPSIS	<pre> deploy --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--virtualservers <i>virtual_servers</i>] [--contextroot <i>context_root</i>] [--force=<i>true</i>] [--precompilejsp=<i>false</i>] [--verify=<i>false</i>] [--name <i>component_name</i>] [--upload=<i>true</i>] [--retrieve <i>local_dirpath</i>] [--dbvendorname <i>dbvendorname</i>] [--createtables=<i>true false</i> --dropandcreatetables=<i>true false</i>] [--uniquetablenames=<i>true false</i>] [--enabled=<i>true</i>] [--deploymentplan <i>deployment_plan</i>] [--availabilityenabled=<i>false</i>] [--generatermistubs=<i>false</i>] [--target <i>target</i>] <i>filepath</i> </pre>						
DESCRIPTION	<p>Deploys an EJB, web, connector, or application. If the component is already deployed or already exists, it is forcefully redeployed if the <code>--force</code> option is set to <code>true</code>.</p> <p>The <code>--createtables</code> and <code>--dropandcreatetables</code> options are booleans and therefore can take the values of <i>true</i> or <i>false</i>. These options are only used during deployment of CMP beans that have not been mapped to a database (i.e., no <code>sun-cmp-mappings.xml</code> descriptor is provided in the module's <code>META-INF</code> directory). They are ignored otherwise.</p> <p>The <code>--createtables</code> and <code>--dropandcreatetables</code> options are mutually exclusive; only one should be used. If drop and/or create tables fails, the deployment does not fail; a warning message is provided in the log file.</p> <p>This command is supported in remote mode only.</p>						
OPTIONS	<table border="0"> <tr> <td style="padding-right: 10px;"><code>-u --user</code></td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 10px;"><code>-w --password</code></td> <td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td> </tr> <tr> <td style="padding-right: 10px;"><code>--passwordfile</code></td> <td>This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be</td> </tr> </table>	<code>-u --user</code>	The authorized domain application server administrative username.	<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be
<code>-u --user</code>	The authorized domain application server administrative username.						
<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.						
<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be						

deploy(1)

	specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.
-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--virtualservers	Comma separated list of virtual server names.
--contextroot	Valid only if the archive is a web module. It is ignored for other archive types; defaults to filename without extension.
--force	Makes sure the component is redeployed even if the specified component has already been deployed or already exists. Use this option when redeploying an existing application, otherwise you see an error.
--precompilejsp	By default this option is set to false, which does not allow the JSP to pre-compile during deployment. Instead JSPs are compiled during runtime.
--verify	If set to true, the syntax and semantics of the deployment descriptor is verified.

deploy(1)

--name	Name of the deployable component.
--upload	When set to true, uploads the deployable file to the administration server. If the filepath of the deployable file is mounted to the server machine, or if the administration server is running locally, set the upload option to false.
--retrieve	Retrieves the client stub JAR file from the server machine to the local directory.
--dbvendorname	Name of database vendor being used. Default is the database-entry-name entry in the cmp-resource() element of the sun-ejb-jar.xml file. If not specified the default is SQL92, and the DDL files to create and drop tables are generated in SQL92 format.
--createtables	Creates tables at deployment of an application with unmapped CMP beans. Default is the create-tables-at-deploy entry in the cmp-resource element of the sun-ejb-jar.xml file.
--dropandcreatetables	Drops tables at redeployment of an already deployed application with unmapped CMP beans. If not specified, the tables are dropped if the drop-tables-at-undeploy entry in the cmp-resource element of the sun-ejb-jar.xml file is set to true. The new tables are created if the create-tables-at-deploy entry in the cmp-resource element of the sun-ejb-jar.xml file is set to true. On redeployment the tables created by the previous deploy are dropped before creating the new tables.
--uniquetablenames	Guarantees unique table names for all the beans and results in a hashcode added to the table names. This is useful if you have an application with case-sensitive bean names.

deploy(1)

<code>--enabled</code>	<p>If set to true (default), allows users to access the application. If set to false, users will not be able to access the application.</p> <p>For Enterprise Edition, this option enables the application on the specified target instance or cluster. If you deploy to the target <code>domain</code>, this option is ignored, since deploying to the domain doesn't deploy to a specific instance or cluster.</p>
<code>--deploymentplan</code>	<p>Takes the deployment plan, which is a JAR containing Sun-specific descriptors, and deploys it. This should be passed along when deploying a pure EAR file. A pure EAR file is an EAR without Sun-specific descriptors.</p>
<code>--generatermistubs</code>	<p>If set to true, static RMI-IIOP stubs are generated and put into the <code>client.jar</code>. If set to false (default) the stubs are not generated.</p>
<code>--availabilityenabled</code>	<p>This option is available only in the Sun Java System Application Server Enterprise Edition. If set to true, high-availability is enabled for SFSB checkpointing (and potentially passivation). If set to false (default) all SFSB checkpointing is disabled for the application or EJB module. Set this option to true only high availability is configured and enabled.</p>
<code>--target</code>	<p>This option is available only in the Sun Java System Application Server Enterprise Edition. Specifies the target to which you are deploying. Valid values are:</p> <ul style="list-style-type: none">■ <code>server</code>, which deploys the component to the default server instance <code>server</code> and is the default value.■ <code>domain</code>, which deploys the component to the domain. If <code>domain</code> is the target for an initial deployment, the application is deployed to the domain, but no server instances or clusters reference the application. If <code>domain</code> is the target for a redeployment (the <code>--force</code> option is set to true), and

deploy(1)

dynamic reconfiguration is enabled for the clusters or server instances that reference the application, the referencing clusters or server instances automatically get the new version of the application. If redeploying, and dynamic configuration is disabled, the referencing clusters or server instances do not get the new version of the application until the clustered or standalone server instances are restarted.

- *cluster_name*, which deploys the component to every server instance in the cluster.
- *instance_name*, which deploys the component to a particular sever instance.

OPERANDS *filepath*

Path to the deployable file on the local machine if the `upload` option is set to `true`; otherwise the absolute path to the file on the server machine.

EXAMPLES **EXAMPLE 1** Deploying a J2EE application

Deploy (install) the J2EE application packaged in the `Cart.ear` file.

This syntax deploys the application to the default server instance `server`. For Sun Java System Application Server, Enterprise Edition, use the `--target` option to deploy to a different server instance or to a cluster.

```
asadmin> deploy --user admin --passwordfile filename Cart.ear
Command deploy executed successfully
```

EXAMPLE 2 Deploying a Web application with the default context root

Deploy the Web application in the `hello.war` file at the `hello` context root.

This syntax deploys the application to the default server instance `server`. For Sun Java System Application Server, Enterprise Edition, use the `--target` option to deploy to a different server instance or to a cluster.

```
asadmin> deploy --user admin --passwordfile myfile hello.war
Command deploy executed successfully
```

EXAMPLE 3 Deploying an enterprise bean (EJB component)

Deploy an enterprise bean with container-managed persistence (CMP) and create the database tables used by the bean.

deploy(1)

EXAMPLE 3 Deploying an enterprise bean (EJB component) *(Continued)*

This example uses the `--target` option, available with Sun Java System Application Server Enterprise Edition only. To use this example for Standard Edition, omit that option. The target in this example is an existing cluster, `cluster1`.

```
asadmin> deploy --user admin --passwordfile filename --createtables=true
--target cluster1 EmployeeEJB.jar
Command deploy executed successfully
```

EXAMPLE 4 Deploying a connector module (resource adapter)

Deploy a connector module packaged in a RAR file.

This example uses the `--target` option, available with Sun Java System Application Server Enterprise Edition only. To use this example for Standard Edition, omit that option. The target in this example is an existing standalone server instance that does not belong to a cluster.

```
asadmin> deploy --user admin --passwordfile filename --target myinstance jdbcra.rar
Command deploy executed successfully
```

EXIT STATUS

```
0
  command executed successfully
1
  error in executing the command
```

NAME	deploydir – deploys an exploded format of application archive						
SYNOPSIS	<pre> deploydir --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--virtualservers <i>virtual_servers</i>] [--contextroot <i>context_root</i>] [--force=<i>true</i>] [--verify=<i>false</i>] [--precompilejsp=<i>false</i>] [--name <i>component_name</i>] [--uniquetablenames=<i>true false</i>] [--dbvendorname <i>dbvendorname</i>] [--createtables=<i>false</i> --dropandcreatetables=<i>false</i>] [--generateterminstubs=<i>false</i>] [--availabilityenabled=<i>false</i>] [--target <i>target</i>] <i>dirpath</i> </pre>						
DESCRIPTION	<p>Deploys the exploded format of the application archives present under the directory provided as the command operand.</p> <p>Directory deployment is for advanced developers only. Do not use it in production environments. In production environments, use the <code>deploy</code> command. Directory deployment is not supported for clusters and remote server instances.</p> <p>The deployed EAR or WAR applications reside on the Domain Administration Server and have a directory structure that can be used for deployment. The <code>--force</code> option makes sure the component is forcefully (re)deployed even if the specified component has already been deployed or already exists. Set <code>--force</code> to <code>false</code> for a first deployment. If the application with that name is running and <code>force</code> is set to <code>false</code>, the command fails.</p> <p>If the <code>--uniquetablenames</code>, <code>--createtables</code>, and <code>--dropandcreatetables</code> options are not specified, the entries in the deployment descriptors are used.</p> <p>This command is supported in remote mode only.</p>						
OPTIONS	<table border="0"> <tr> <td style="padding-right: 20px;"><code>-u --user</code></td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 20px;"><code>-w --password</code></td> <td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td> </tr> <tr> <td style="padding-right: 20px;"><code>--passwordfile</code></td> <td>This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where</td> </tr> </table>	<code>-u --user</code>	The authorized domain application server administrative username.	<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where
<code>-u --user</code>	The authorized domain application server administrative username.						
<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.						
<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where						

deploydir(1)

	<p><i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p>
-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
---virtualservers	Comma separated list of virtual server IDs.
---contextroot	Valid only if the archive is a web module. It is ignored for other archive types; defaults to filename without extension.
---force	Makes sure the component is forcefully (re)deployed even if the specified component has already been deployed or already exists.
---verify	If set to true, the syntax and semantics of the deployment descriptor is verified.
---precompilejsp	By default, this option is set to false, which does not allow the JSP to pre-compile during deployment. Instead, JSPs are compiled during runtime.

deploydir(1)

<code>---name</code>	Name of the deployable component.
<code>---uniquetablenames</code>	Guarantees unique table names for all the beans and results in a hashcode added to the table names. This is useful if you have an application with case-sensitive bean names.
<code>---dbvendorname</code>	Name of the database vendor being used. Default is the corresponding entry in the <code>cmp-resource ()</code> element of the <code>sun-ejb-jar.xml</code> file. If not specified, the default is SQL92, and the DDL files to create and drop tables are generated in SQL92 format.
<code>---createtables</code>	Creates tables during deployment for applications using unmapped CMP beans. Default is the corresponding entry in the <code>cmp-resource</code> element of the <code>sun-ejb-jar.xml</code> file. If not specified, defaults to the entries in the deployment descriptors.
<code>---dropandcreatetables</code>	Drops existing tables and creates tables during deployment for application using unmapped CMP beans. If not specified, the tables are dropped if the <code>drop-tables-at-undeploy</code> entry in the <code>cmp-resource</code> element of the <code>sun-ejb-jar.xml</code> file is set to true. The new tables are created if the <code>create-tables-at-deploy</code> entry in the <code>cmp-resource</code> element of the <code>sun-ejb-jar.xml</code> is set to true. When the component is redeployed, the tables created by the previous deployment are dropped before creating the new tables.
<code>---generateterminstubs</code>	if set to true, static RMI-IIOP stubs are generated and put into the <code>client.jar</code> . If set to false (default) the stubs are not generated.
<code>---availabilityenabled</code>	If set to true, high-availability is enabled for SFSB checkpointing (and potentially passivation). .If set to false (default) all SFSB checkpointing is disabled for the application or EJB module.

deploydir(1)

	<code>--target</code>	In Enterprise Edition, specifies the target to which you are deploying. Valid values are: <ul style="list-style-type: none">■ <code>server</code>, which deploys the component to the default server instance <code>server</code> and is the default value.■ <code>domain</code>, which deploys the component to the domain.
OPERANDS	<i>dirpath</i>	path to the directory containing the exploded format of the deployable archive.
EXAMPLES	EXAMPLE 1 Using <code>deploydir</code> <pre>asadmin> deploydir --user admin --passwordfile passwords.txt --host localhost --port 4848 --force=true --precompilejsp=true /home/temp/sampleApp</pre> Command <code>deploydir</code> executed successfully Where the exploded application to be deployed is in the <code>/home/temp/sampleApp</code> directory.	
EXIT STATUS	0 command executed successfully 1 error in executing the command

NAME	deploytool – launches the deploytool utility to deploy, package, and edit your J2EE applications
SYNOPSIS	deploytool [--help] [--userdir <i>user_directory</i>] [--configdir <i>configuration_directory</i> --verbose]
DESCRIPTION	<p>Use the <code>deploytool</code> utility to deploy and package your J2EE applications and components, create and edit J2EE deployment descriptors, and create and edit Sun Java System Application Server specific deployment descriptors. If the application is not J2EE compliant, an error message is displayed.</p> <p>Only one session of the <code>deploytool</code> utility can run with a specific user directory. A lock file is created to ensure that only one utility session is running. A message is displayed if a lock file is detected.</p>
OPTIONS	<p>--help displays the arguments for launching the deploytool.</p> <p>--userdir identifies the user directory. The default user directory is <code>.deploytool</code> under your home directory. Only one <code>deploytool</code> session can be running per user directory. A lock file is created under the user directory to ensure that only one session of the <code>deploytool</code> is running. The <code>deploytool</code> utility uses this directory to store configuration information.</p> <ul style="list-style-type: none"> ■ On Solaris, the default directory is at <code>~/ .deploytool</code> <p>--configdir identifies the configuration directory. The configuration directory is where the <code>asenv.conf</code> file is located.</p> <p>On Solaris, the <code>asenv.conf</code> can be found at:</p> <ul style="list-style-type: none"> ■ Bundled installation: <code>/etc/appserver</code> ■ Unbundled installation: default is <code>/etc/opt/SUNWappserver</code> or user specified ■ Evaluation installation: <code>cd /etc</code>. Where <code>AS_SERVER_INSTALL</code> is the directory where you have installed the Sun Java System Application Server 8. <p>--verbose displays the <code>deploytool</code> log messages on the terminal window in Solaris and command window on windows.</p>
EXAMPLES	<p>EXAMPLE 1 Using <code>deploytool</code></p> <pre>example% deploytool --userdir /myapplication --config_dir /myconfigdir</pre> <p>Where <code>--userdir</code> specifies the destination directory, and <code>-config_dir</code> identifies the configuration directory.</p>

disable(1)

NAME	disable – disables the component
SYNOPSIS	disable --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] [<i>component_name</i>]
DESCRIPTION	disable immediately disables the named component. The component must have been deployed. If the component has not been deployed, an error message is returned.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p>

`-h --help` Displays the help text for the command.

`--target` In Enterprise Edition, specifies the target on which you are disabling the component. Valid values are

- `server`, which creates the listener for the default server instance `server` and is the default value
- `cluster_name`, which creates the listener for every server instance in the cluster
- `instance_name`, which creates the listener for a particular server instance

OPERANDS `component_name` name of the component to be disabled.

EXAMPLES **EXAMPLE 1** Using `disable`

```
asadmin> disable --user admin1 --passwordfile password.txt sampleApp
Command disable executed successfully
```

EXIT STATUS 0
command executed successfully

1
error in executing the command

disable-http-lb-application(1)

NAME	disable-http-lb-application – disables an application managed by a load balancer												
SYNOPSIS	disable-http-lb-application --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--timeout 30] --name <i>application_name target</i>												
DESCRIPTION	<p>This command disables an application managed by a load balancer. The disabled application goes offline with minimal impact to users. Disabling an application gives a finer granularity of control than disabling a server instance and is most useful when a cluster is hosting multiple independent applications.</p> <p>If an application is deployed across multiple clusters, use this command to disable it in one cluster while leaving it enabled in others.</p> <p>If an application is deployed to a single server instance, use this command to disable it in that instance while leaving the instance itself enabled.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

-I --interactive If set to true (default), only the required password options are prompted.

-h --help Displays the help text for the command.

EXAMPLES**EXAMPLE 1** Using display-license in local mode

```
asadmin> display-license
*****
Eval                    Sun ONE Application Server 7 Evaluation License
Expiration date        Tues 11 Sept 11:58:47 PDT 2002
Number of instances per admin server   Unlimited
Allow remote administration   YES
*****
```

EXAMPLE 2 Using display-license in remote mode

```
asadmin> display-license --user admin --password adminadmin --host fuyako --port 7070
*****
Eval                    Sun ONE Application Server 7 Evaluation License
Expiration date        Tues 11 Sept 11:58:47 PDT 2002
Number of instances per admin server   Unlimited

enable(1)

NAME	enable – enables the component
SYNOPSIS	enable --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--target <i>target_name</i>] [<i>component_name</i>]
DESCRIPTION	enable command enables the specified component. If the component is already enabled, then it is re-enabled. The component must have been deployed in order to be enabled. If it has not been deployed, then an error message is returned. This command is supported in remote mode only.
OPTIONS	<ul style="list-style-type: none"> -u --user The authorized domain application server administrative username. -w --password The --password option is deprecated. Use --passwordfile instead. --passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on. -H --host The machine name where the domain application server is running. The default value is localhost. -p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849. -s --secure If set to true, uses SSL/TLS to communicate with the domain application server. -t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false. -e --echo Setting to true will echo the command line statement on the standard output. Default is false.

-I --interactive If set to true (default), only the required password options are prompted.

-h --help Displays the help text for the command.

--target In Enterprise Edition, specifies the target on which you are enabling the component. Valid values are

- *server*, which creates the listener for the default server instance *server* and is the default value
- *cluster_name*, which creates the listener for every server instance in the cluster
- *instance_name*, which creates the listener for a particular server instance

OPERANDS *component_name* name of the component to be enabled.

EXAMPLES **EXAMPLE 1** Using enable

```
asadmin> enable --user admin1 --passwordfile password.txt sampleApp
Command enable executed successfully
```

enable-http-lb-application(1)

NAME	enable-http-lb-application – enables a previously-disabled application managed by a load balancer
SYNOPSIS	enable-http-lb-application --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] --name <i>application_name</i> <i>target</i>
DESCRIPTION	This command enables a previously disabled application managed by a load balancer. You can enable the application on all instances in a cluster, or on a single standalone server instance.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

enable-http-lb-application(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--name</code>	The name of the application to be enabled.
OPERANDS	<i>target</i>	This operand specifies on which server instance or cluster to enable the application. Valid values are: <ul style="list-style-type: none">■ <i>cluster_name</i>, which enables the application on all server instances in the cluster.■ <i>instance_name</i>, which enables the application in the standalone server instance.
EXAMPLES	EXAMPLE 1 Using the enable-http-lb-server command <code>asadmin> enable-http-lb-application --user admin</code> <code>--passwordfile password.txt --name webapps-simple mycluster</code> Command enable-http-lb-application executed successfully.	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	disable-http-lb-application(1)	

enable-http-lb-server(1)

NAME	enable-http-lb-server – enables a previously disabled sever or cluster managed by a load balancer
SYNOPSIS	enable-http-lb-server --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>target</i>
DESCRIPTION	This command enables a server or cluster of servers that was previously disabled. When a server is enabled, its applications are enabled too.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

enable-http-lb-server(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	This operand specifies which server instances and clusters to enable. Valid values are: <ul style="list-style-type: none">■ <i>cluster_name</i>, which enables all the server instances in the cluster.■ <i>instance_name</i>, which enables a standalone or clustered server instance.
EXAMPLES	EXAMPLE 1 Using the enable-http-lb-server command	
	<code>asadmin> enable-http-lb-server --user admin --passwordfile filename myserver</code>	Command enable-http-lb-server executed successfully.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-http-lb-ref(1) , disable-http-lb-server(1)	

export(1)

NAME	export – marks a variable name for automatic export to the environment of subsequent commands in multimode
SYNOPSIS	export [<i>name=value</i> [<i>name=value</i>] *]
DESCRIPTION	Marks a variable name for automatic export to the environment of subsequent commands. All subsequent commands use the variable name values as specified; unless you unset them or exit multimode. If only the variable name is specified, the current value of that variable name is displayed. If the export command is used without any arguments, a list of all the exported variables and their values is displayed. Exported shell environment variables set prior to invoking the <code>asadmin</code> utility are imported automatically and set as exported variables within <code>asadmin</code> . Unexported environment variables cannot be read by the <code>asadmin</code> utility.
OPERANDS	<i>name=value</i> variable name and value for automatic export to the environment to be used by subsequent commands.
EXAMPLES	<p>EXAMPLE 1 Using export to set an environment variable</p> <pre>asadmin> export AS_ADMIN_HOST=bluestar</pre> <p>In this case, the AS_ADMIN_HOST environment variables has been set to <i>bluestar</i>.</p> <p>EXAMPLE 2 Using export to set multiple environment variables</p> <pre>asadmin> export AS_ADMIN_HOST=bluestar AS_ADMIN_PORT=8000 AS_ADMIN_USER=admin AS_ADMIN_PREFIX=server1.jms-service</pre> <p>In this case, the environment variables have been set to: the host is <i>bluestar</i>, the port is <i>8000</i>, the administrator user is <i>admin</i>, and the prefix is <i>server1.jms-service</i>.</p> <p>EXAMPLE 3 Using export to list environment variables</p> <pre>asadmin> export AS_ADMIN_HOST=bluestar AS_ADMIN_PORT=8000 AS_ADMIN_USER=admin AS_ADMIN_PREFIX=server1.jms-service</pre> <p>The export with no input lists the set environment variables.</p>
EXIT STATUS	0 command executed successfully 1 error in executing the command
SEE ALSO	<code>unset(1)</code> , <code>multimode(1)</code>

NAME	export-http-lb-config – exports the load balancer configuration to a file that can be used by the load balancer
SYNOPSIS	export-htp-lb-config --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] --config <i>config_name</i> [<i>file_name</i>]
DESCRIPTION	Use the export-http-lb-config command to export a load balancer configuration into a file that the load balancer plug-in can use. The default file name is <code>loadbalancer.xml</code> , but you can specify a different name. Once exported, you manually copy the exported file to the load balancer plug-in location before configuration changes are applied.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

export-http-lb-config(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--config</code>	Specifies which load balancer configuration to export.
OPERANDS	<i>file_name</i>	Specifies the file name and location of the exported configuration. If you specify a directory (relative or absolute), the file named <code>loadbalancer.xml.load_balancer_config_name</code> is created in that directory. On Microsoft Windows systems the path must be in quotes. If you specify a file name in a relative or absolute path, then the file is created with the name you specify. If you do not specify this operand, the default value is a file named <code>loadbalancer.xml.load_balancer_config_name</code> created in the <code>app_sever_install/domains/domain_name/generated</code> directory.
EXAMPLES	EXAMPLE 1 Using the <code>export-http-lb-config</code> command on UNIX	
		The following example exports the load balancing configuration <code>mycluster-http-lb-config</code> to a file named <code>loadbalancer.xml</code> in the <code>/Sun/AppServer</code> directory .
		<pre>asadmin> export-http-lb-config --user admin --passwordfile file --config mycluster-http-lb-config Sun/AppServer/loadbalancer.xml Command export-http-lb-config executed successfully.</pre>
	EXAMPLE 2 Using the <code>export-http-lb-config</code> command on the Microsoft Windows platform	
		The following example exports the load balancing configuration <code>mycluster-http-lb-config</code> to a file named <code>loadbalancer.xml</code> in the <code>C:\Sun\AppServer</code> directory on a Microsoft Windows system.
		<pre>asadmin> export-http-lb-config --user admin --passwordfile file --config mycluster-http-lb-config "C:\Sun\AppServer\loadbalancer.xml" Command export-http-lb-config executed successfully.</pre>

EXIT STATUS 0
command executed successfully

get(1)

NAME	get – gets the values of the monitorable or configurable attributes
SYNOPSIS	get --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--monitor= <i>true false</i>] [<i>dotted_attribute_name</i>]
DESCRIPTION	Gets the values of attributes. If the --monitor option is set to true, the monitorable attributes are returned. If the --monitor option is set to false, the configurable attribute values are returned. On Solaris, quotes are needed when executing commands with * as the option value or operand.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

`-I --interactive` If set to true (default), only the required password options are prompted.

`-h --help` Displays the help text for the command.

`--monitor` defaults to false; if set to false, the configurable attribute values are returned. If set to true, the monitorable attribute values are returned.

OPERANDS *attributename* attribute name in the dotted notation.

EXAMPLES **EXAMPLE 1** Using `get`

```
asadmin> get --user admin --passwordfile password.txt --host localhost --port 4848
"server.resources.jdbc-resource.jdbc/PointBase.*"
server.resources.jdbc-resource.jdbc/PointBase.description=<null>
server.resources.jdbc-resource.jdbc/PointBase.enabled=true
server.resources.jdbc-resource.jdbc/PointBase.jndi-name=jdbc/PointBase
server.resources.jdbc-resource.jdbc/PointBase.object-type=user
server.resources.jdbc-resource.jdbc/PointBase.pool-name=PointBasePool
```

Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
	--target	In Enterprise Edition, specifies the target on which you are retrieving the client stubs. Valid values are <ul style="list-style-type: none"> ■ <i>server</i>, which creates the listener for the default server instance <i>server</i> and is the default value ■ <i>configuration_name</i>, which creates the listener for the named configuration ■ <i>cluster_name</i>, which creates the listener for every server instance in the cluster ■ <i>instance_name</i>, which creates the listener for a particular server instance
	--appname	name of the application.
OPERANDS	<i>local_directory_path</i>	path to the local directory where the client stub should be stored.
EXAMPLES	EXAMPLE 1 Using get-client-stubs	
	<pre>asadmin> get-client-stubs --user admin --passwordfile password.txt --host fuyako --port 7070 --appname myapplication.ear /sample/example</pre>	
EXIT STATUS	0	command executed successfully

hadbm(1m)

NAME	hadbm – utility for managing the High Availability Database (HADB)																																
SYNOPSIS	hadbm <i>command</i> [- <i>short-option</i> <i>option_argument</i> - <i>short-option</i> = <i>option_argument</i> -- <i>long-option</i> = <i>option_argument</i> - [<i>operand</i>] * hadbm <i>command_name</i> --help hadbm help																																
DESCRIPTION	<p>The hadbm command identifies the operation or task to perform. Commands are case-sensitive. One or more command options can be specified in one of the following formats:</p> <p><i>--option=value</i> <i>--option value</i> <i>-short-option value</i></p> <p>Options, like commands, are case-sensitive. Options require argument values except boolean options which toggle to switch a feature ON or OFF. Operands appear after the argument values and are set off by a space or an equal sign (=). Optional options and operands are identified in enclosed square brackets []. For commands that take a database name operand, if a database is not specified, the default database is used. The default database is hadb.</p>																																
COMMANDS	<table><tr><td>addnodes</td><td>adds nodes to the named database</td></tr><tr><td>clear</td><td>reinitializes all the data space on all nodes and starts the database</td></tr><tr><td>clearhistory</td><td>clears the history files on the database</td></tr><tr><td>create</td><td>creates a database instance</td></tr><tr><td>createdomain</td><td>creates a management domain of the listed HADB hosts</td></tr><tr><td>delete</td><td>removes the database</td></tr><tr><td>deletedomain</td><td>deletes the HADB management domain</td></tr><tr><td>deviceinfo</td><td>displays information about disk storage devices on each active data node</td></tr><tr><td>disablehost</td><td>selectively disables a host in the management domain</td></tr><tr><td>extenddomain</td><td>extends the current HADB management domain</td></tr><tr><td>get</td><td>gets the value of the specified configuration parameter</td></tr><tr><td>help</td><td>displays all the subcommands for the hadbm utility</td></tr><tr><td>list</td><td>lists all the existing databases</td></tr><tr><td>listdomain</td><td>lists all hosts defined in the management domain</td></tr><tr><td>listpackages</td><td>lists the packages registered in the management domain</td></tr><tr><td>reducedomain</td><td>removes hosts from the HADB management domain</td></tr></table>	addnodes	adds nodes to the named database	clear	reinitializes all the data space on all nodes and starts the database	clearhistory	clears the history files on the database	create	creates a database instance	createdomain	creates a management domain of the listed HADB hosts	delete	removes the database	deletedomain	deletes the HADB management domain	deviceinfo	displays information about disk storage devices on each active data node	disablehost	selectively disables a host in the management domain	extenddomain	extends the current HADB management domain	get	gets the value of the specified configuration parameter	help	displays all the subcommands for the hadbm utility	list	lists all the existing databases	listdomain	lists all hosts defined in the management domain	listpackages	lists the packages registered in the management domain	reducedomain	removes hosts from the HADB management domain
addnodes	adds nodes to the named database																																
clear	reinitializes all the data space on all nodes and starts the database																																
clearhistory	clears the history files on the database																																
create	creates a database instance																																
createdomain	creates a management domain of the listed HADB hosts																																
delete	removes the database																																
deletedomain	deletes the HADB management domain																																
deviceinfo	displays information about disk storage devices on each active data node																																
disablehost	selectively disables a host in the management domain																																
extenddomain	extends the current HADB management domain																																
get	gets the value of the specified configuration parameter																																
help	displays all the subcommands for the hadbm utility																																
list	lists all the existing databases																																
listdomain	lists all hosts defined in the management domain																																
listpackages	lists the packages registered in the management domain																																
reducedomain	removes hosts from the HADB management domain																																

	refragment	refragments the schema
	registerpackage	registers the HADB packages in the management domain
	resourceinfo	displays database resource information
	restart	restarts the database
	restartnode	restarts the specified node
	set	sets the value of the specified configuration attributes to the identified values
	start	starts the database
	startnode	starts the specified node
	status	shows the state of the database
	stop	gracefully stops the database
	stopnode	gracefully stops the specified node
	unregisterpackage	removes registered HADB packages from the management domain
	version	displays the hadbm version information
COMMON OPTIONS	-q --quiet	Performs the operation silently without any descriptive messages.
	-? --help	Displays a brief description of the hadbm utility and all the supported commands.
	-v --version	Displays the version details of the hadbm utility.
	-y --yes	Launches the command in non-interactive mode.
	-f --force	Launches the command in non-interactive mode, and does not return error if the post condition is already achieved.
	-e --echo	Displays the commands with all the options and their user-defined values or the default values; then launches the command.

hadbm-addnodes(1)

NAME	hadbm addnodes – adds new nodes to the named database, initializes devices for the new nodes, and refragments the schema														
SYNOPSIS	<pre>hadbm addnodes [--no-refragment] [--spares=<i>spare_count</i>] [--historypath=<i>path</i>] [--devicepath=<i>path</i>] [--set=<i>attribute_name_value_list</i>] [--dbpassword=<i>password</i> --dbpasswordfile=<i>filename</i>] [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] --hosts=<i>host_list</i> [<i>dbname</i>]</pre>														
DESCRIPTION	<p>Use the hadbm addnodes command to add new nodes to the named database, initialize the devices for the new nodes, and refragment the schema. The number of spares identified is the number of spares to be allotted from the host list as specified in the --hosts option. Hosts must be specified in pairs. All the active nodes in the database should be running when executing the hadbm addnodes command (this means the database has at least FaultTolerant or HAFaultTolerant state). If the database is not specified, the default database is used. The database is restarted without loss of service after adding the nodes.</p> <p>Refragmentation, though time consuming, is needed to store the data on the newly created nodes. You can elect to perform refragmentation during node creation (default). However, if you have chosen --no-refragment, you can refragment later by using the hadbm refragment command. The database is available during refragmentation.</p> <p>Data devices must have 50% free space to accommodate the old and new copies of the user data during refragmentation.</p>														
OPTIONS	<table><tr><td>-w --adminpassword</td><td>The actual HADB administration password.</td></tr><tr><td>-W --adminpasswordfile</td><td>The file from which the passwords are read.</td></tr><tr><td>-m --agent</td><td>Identifies the URL to the Management Agent(s) (hostlist:port).</td></tr><tr><td>-r --no-fragment</td><td>If this option is specified or set to true, refragmentation is not performed on the database after adding the nodes. If the option is not specified, or set to false (default), the database is refragmented after adding the nodes. All tables are refragmented over all nodes; including the new nodes.</td></tr><tr><td>-s --spares</td><td>Identifies the number of hosts to be used as spares out of the new nodes that are added.</td></tr><tr><td>-t --historypath</td><td>The path for the database history files.</td></tr><tr><td>-d --devicepath</td><td>The path for the data and log devices. The path to the device must already exist. To set the path differently for each node or device, use the --set option. There are three types of devices:</td></tr></table>	-w --adminpassword	The actual HADB administration password.	-W --adminpasswordfile	The file from which the passwords are read.	-m --agent	Identifies the URL to the Management Agent(s) (hostlist:port).	-r --no-fragment	If this option is specified or set to true, refragmentation is not performed on the database after adding the nodes. If the option is not specified, or set to false (default), the database is refragmented after adding the nodes. All tables are refragmented over all nodes; including the new nodes.	-s --spares	Identifies the number of hosts to be used as spares out of the new nodes that are added.	-t --historypath	The path for the database history files.	-d --devicepath	The path for the data and log devices. The path to the device must already exist. To set the path differently for each node or device, use the --set option. There are three types of devices:
-w --adminpassword	The actual HADB administration password.														
-W --adminpasswordfile	The file from which the passwords are read.														
-m --agent	Identifies the URL to the Management Agent(s) (hostlist:port).														
-r --no-fragment	If this option is specified or set to true, refragmentation is not performed on the database after adding the nodes. If the option is not specified, or set to false (default), the database is refragmented after adding the nodes. All tables are refragmented over all nodes; including the new nodes.														
-s --spares	Identifies the number of hosts to be used as spares out of the new nodes that are added.														
-t --historypath	The path for the database history files.														
-d --devicepath	The path for the data and log devices. The path to the device must already exist. To set the path differently for each node or device, use the --set option. There are three types of devices:														

	<ul style="list-style-type: none"> ■ DataDevice ■ NiLogDevice (node internal log device) ■ RelalgDevice (relational algebra query device)
-p --dbpassword	The password string for the system user of the database. The minimum length of the password must be 8 characters. You can identify either the database password, or for higher security, the password file where the password is defined.
-P --dbpasswordfile	Identifies the file containing the password to be used for the system user of the database.
-S --set	Identifies the configuration parameters that will be set to the database. Must be specified as a comma-separated list of database configuration attributes in name=value format. See <code>hadbm set</code> command for a list of writable configuration attributes.
-H --hosts	<p>A comma-separated list of new host names for the new nodes in the database. Duplicates are allowed; this creates multiple nodes on the same machine with different port numbers. Keep the mirror nodes on separate DRUs for deployment. One node is created for each comma-separated item in the list. The number of nodes must be even.</p> <p>If the database is already created with double network configuration, the nodes being added should also support that same configuration. They should have two NIC cards and the <code>--hosts</code> option should define the IP addresses for them. See the <code>hadbm create</code> command for more details.</p>
OPERANDS	<p><i>dbname</i></p> <p>The name of the database. The default database is <code>hadb</code>.</p>

EXAMPLES

EXAMPLE 1 Using addnodes

```
hadbm addnodes --dbpasswordfile=/home/hadb/dbpfile
--hosts host8,host9 mydatabase
Nodes successfully added to the database
```

EXAMPLE 2 Using addnodes with spares identified

```
hadbm addnodes --dbpasswordfile=/home/hadb/dbpfile
--spares=2 --hosts=host8,host9 mydatabase
Nodes successfully added to the database
```

hadbm-addnodes(1)

EXAMPLE 3 Using addnodes without a password

```
hadbm addnodes --hosts=host7,host8  
Please enter password for system user:  
Nodes successfully added to the database
```

EXIT STATUS

0
command executed successfully

1
error in executing the command

ERROR CODES

22002 specified database does not exist

22024 host unreachable

22025 hosts not added in pairs

22041 invalid database state

22042 database could not be refragmented (if the option `--no-fragment` is not set)

22043 specified number of spares could not be allocated

22044 path on host does not exist

22045 path on host needs write permissions

22046 database state deteriorated

22047 refragmentation cannot be done

22201 database not refragmented (warning issued when the option `--no-fragment` is set)

NAME	hadbm clear – reinitializes all the dataspace on all nodes and starts the database
SYNOPSIS	<pre>hadbm clear [--fast] [--spares=<i>number_of_spares</i>] [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--dbpassword=<i>password</i> --dbpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [<i>dbname</i>]</pre>
DESCRIPTION	<p>Use the hadbm clear command to reinitialize all the data devices and start the database. The hadbm clear command can also be used in the following situations:</p> <ul style="list-style-type: none"> ■ Restarting the database after a disaster. A disaster refers to double failures, where one or more mirror node pairs are down simultaneously. For example, due to a power failure, machine reboot, or some other unforeseen disaster. The hadbm status command will indicate a database that is hit by a disaster as “non-functional”. ■ The password provided at the time the database was created is lost during clear and the new password given in the --dbpassword=<i>password</i> option will be used when accessing the database in the future. The cleared database will be in an HA Fault Tolerant or Fault Tolerant state. <p>In interactive mode, the hadbm clear command prompts for a confirmation before clearing the database.</p>
OPTIONS	<pre>-F --fast Use this option to skip device initialization to save time. Do not use if the disk storage device is corrupted. The data devices must be initialized for the first time after the database is created. -s --spares If specified, identifies the number of spares. The number must be such that there are at least two active nodes. This number of spares must be even and must be less than or equal to the number of active nodes in the database. If not specified, the original number of spare nodes found in the database instance earlier will be preserved. Spare nodes are option, but having two or more ensures high availability. -p The password used for the system user of the database. This --dbpassword password must be valid and is expected to be passed in other commands that require data access. -P Identifies the file containing the password to be used for the --dbpasswordfile system user of the database. -w The actual HADBM administration password. --adminpassword -W The file from which the passwords are read. --adminpasswordfile -m --agent Identifies the URL to the Management Agent(s) (hostlist:port).</pre>
OPERANDS	<pre><i>dbname</i> The name of the database. The default database is hadb.</pre>

hadbm-clear(1)

EXAMPLES

EXAMPLE 1 Using clear with the default database

```
hadbm clear
Type "yes" or "y" to confirm this operation, anything else to cancel: y
Database successfully cleared
```

EXAMPLE 2 Using clear with a database identified

```
hadbm clear mydatabase
This command will clear the database.
Type "yes" or "y" to confirm this operation, anything else to cancel: y
Database successfully cleared
```

EXIT STATUS

```
0
  command executed successfully

1
  error in executing the command
```

ERROR CODES

```
22002  specified database does not exist
22061  database could not be cleared
```

NAME	hadbm clearhistory – clears the history files on the database
SYNOPSIS	<pre>hadbm clearhistory [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--saveto=<i>path</i>] [--agent=<i>ma_url</i>] [<i>dbname</i>]</pre>
DESCRIPTION	<p>Use the hadbm clearhistory command to clear the history files on the database. The directory to which the history files are to be saved must exist and must be writeable. The history file of the named database will be truncated. You can verify by checking the size of the history file. The database state remains unchanged. If a database is identified, it should already exist. If a database is not named, the default database history files are cleared. The default database is hadb.</p> <p>In interactive mode, the hadbm clearhistory command prompts for a confirmation before clearing the history.</p>
OPTIONS	<pre>-o --saveto The path to where the old history files are to be saved. -w --adminpassword The actual HADB administration password. -W --adminpasswordfile The file from which the passwords are read. -m --agent Identifies the URL to the Management Agent. The default is localhost:1862.</pre>
OPERANDS	<pre><i>dbname</i> The name of the database. The default database is hadb.</pre>
EXAMPLES	<p>EXAMPLE 1 Using clearhistory with a database identified</p> <pre>hadbm clearhistory mydatabase This command will clear the history file of the database. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database history file successfully cleared</pre> <p>EXAMPLE 2 Using clearhistory with the saveto option</p> <pre>hadbm clearhistory --saveto=/var/tmp mydatabase This command will clear the history file of the database. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database history file successfully cleared</pre>
EXIT STATUS	<pre>0 command executed successfully 1 error in executing the command</pre>
ERROR CODES	<pre>22002 specified database does not exist 22111 directory does not exist</pre>

hadbm-clearhistory(1)

22112 specified location is not a directory

22113 directory is not writeable

NAME	hadbm create – creates a database instance
SYNOPSIS	<pre> hadbm create [--package=<i>package_name</i>] [--packagepath=<i>path</i>] [--historypath=<i>path</i>] [--devicepath=<i>path</i>] [--datadevices=<i>number_of_devices_per_node</i>] [--portbase=<i>base_number</i>] [--spares=<i>number_of_spare</i>s] [--set=<i>attribute_name_value_list</i>] [--agent=<i>ma_url</i>] [--no-cleanup] [--no-clear] [--devicesize=<i>size</i>] [--dbpassword=<i>password</i> --dbpasswordfile=<i>filename</i>] [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i> --no-adminauthentication] --hosts=<i>host_list</i> [<i>dbname</i>] </pre>
DESCRIPTION	<p>The hadbm create command creates the specified database in the HADB management domain. The create command implicitly maps the hostlist to node numbers in the given order (i.e., the first host in the host list maps to physical node 0). You can specify where to store data devices, log devices, and history files. An HADB instance must have at least two active nodes. The hostlist defines which interfaces (IP addresses) the HADB nodes communicates on. If the hostlist consists of DNS names, an IP address will be resolved using a resolve mechanism in the management agent.</p> <p>The database system user will be assigned the password that is supplied in the --dbpassword option or the --dbpasswordfile option. This password is expected to be passed in other commands that require data access.</p> <p>All the paths used for the database should exist and should be writeable on the hosts.</p> <p>If necessary, the create command will create or extend the HADB management domain, using the hosts in the hostlist. It also registers the HADB software package on all the hosts in the hostlist given for the create command. If a package has been registered on only some of the hosts in the domain, the create command will register the package on the remaining hosts with its current packagepath.</p> <p>Apart from the domain management issues, the create command is atomic, and if it fails, all database resources will be cleaned up. To avoid the cleanup, use the --no-cleanup option.</p>
OPTIONS	<pre> -k --package <i>package_name</i> The name identifying the software package. If the package is not found, a default package is registered. -L --packagepath <i>path</i> Path to the HADB software package. Only used if the package is not registered in the domain. This option is deprecated. Use the hadbm registerpackage command to register a package in the domain. -t --historypath <i>path</i> The full path to the history files. If the historypath option is not specified, the default path is set up by the management agent(s). The management agent uses the entries in the configuration file (ma.server.dbhistorypath). </pre>

hadbm-create(1)

- `-d` The path for the data and log devices. The path to the device must already exist. To set the path differently for each node or device, use the `--set` option. There are four types of devices:
- DataDevice
 - NiLogDevice (node internal log device)
 - RelalgDevice (relational algebra query device)
 - NoManDevice (node manager device)
- If the `devicepath` option is not specified, the default path is set up by the management agent(s). The management agent uses the entries in the configuration file (`ma.server.dbdevicepath`).
- `-a` The number of data devices. The number must be between 1 and 8, on each node.
- `--datadevices`
- `-b --portbase` The port base number used for node 0. The other nodes are then assigned port number bases in steps of 10 from the number specified here.
- `-s --spares` The number of spares. The number must be less than the length of the host list and at least two active nodes should be there.
- `-S --set` Identifies the configuration parameters that will be set to the database. Must be specified as a comma-separated list of database configuration attributes in `name=value` format.

Use this option to set a different `--devicepath` for each node or each device. The syntax for each `name=value` pair is:

`Node-nodenum ber . device - devicenumber . DevicePath=path`

Where: *-devicenumber* is only required if the device is a DataDevice.

For example: `Node-0 . DataDevice-0 . DevicePath=/disk0`.

Any device path that is not set for a particular node or device defaults to the `--devicepath` value.

The following table identifies the configuration attributes available.

TABLE 1 Configuration Attributes

Variable	Range	Default
ConnectionTrace	true/false	false
CoreFile	true/false	false
DataBufferPoolSize	16–2047	200 MB
DataDeviceSize	32–262144	1024 MB

TABLE 1 Configuration Attributes *(Continued)*

Variable	Range	Default
DevicePath	n/a	n/a
EagerSessionThreshold	0–100	50 (% of NumberOfSessions)
EagerSessionTimeout	0–2147483647	120 seconds
EventBufferSize	0–2097152	0 MB
HistoryPath	n/a	n/a
InternalLogBufferSize	4–128	12 MB
LogBufferSize	4–2047	48 MB
MaxTables	100–1100	1100
NumberOfDatadevices	1–8	1
NumberOfLocks	20000–1073741824	50000
NumberOfSessions	1–10000	100
Portbase	10000–63000	15000
RelalgDeviceSize	32–262144	128 MB
SQLTraceMode	none/short/full	none
SessionTimeout	0–214743647	1800 seconds
StartRepairDelay	0–100000	20 seconds
StatInterval	0–600	600
SyslogFacility	<facility>	local0
SyslogLevel	<level>	warning
SyslogPrefix	<string>	hadb-<db_name>
TakeoverTime	500–16000	10000 MS

Valid values for SyslogFacility are:

local0/local1/local2/local3/local4/local5/local7/kern/mail/none

Valid values for SyslogLevel are:

info/warning/error/alert/severe/none

Heterogenous attributes:

- Node-<nodeno>.HistoryPath=<path_to_history_files>
- Node-<nodeno>.DevicePath=<default_path_for_devices_on_node>
- Node-<nodeno>.<device>.DevicePath=<path_for_device_on_node>

hadbm-create(1)

Where <device> is one of:

- DataDevice-<datadevicenumber>
- RelalgDevice
- NiLogDevice
- NoManDevice

<datadevicenumber> is a number in range of 0 to number of data devices specified in the `--datadevices` option.

<code>-m --agent</code>	Identifies the URL to the Management Agent(s) (hostlist:port).
<code>--no-cleanup</code>	Use this option to prevent the deletion of files that are normally deleted (such as the history files, devices, and configuration files) if the <code>create</code> command fails.
<code>--no-clear</code>	By default the database is initialized and started. However, if this option is set, the database processes will not be started, the devices will not be initialized, and you must use the <code>clear</code> command to start the database for the first time.
<code>-z --devicesize</code>	The size of the data devices (specified in MB). This size is applicable on all devices.
<code>-p --dbpassword</code>	The password string for the system user of the database. The minimum length of the password must be 8 characters. You can identify either the database password, or for higher security, the password file where the password is defined.
<code>-P --dbpasswordfile</code>	Identifies the file containing the password to be used for the system user of the database.
<code>-w --adminpassword</code>	The actual HADB administration password.
<code>-W --adminpasswordfile</code>	The file from which the passwords are read.
<code>-U --no-adminauthentication</code>	Using this option eliminates the need of password identification.
<code>-H --hosts</code>	A comma-separated list of all the host names or IP addresses used for all the nodes in the database. An HADB Management Agent must be running on each host. Using the IP address is recommended because there is no dependence on DNS lookups. Hostnames must be absolute. Do not use <code>localhost</code> or <code>127.0.0.1</code> as a hostname.

hadbm-create(1)

Configuring an HADB instance with double networks: To make HADB tolerate single network failures, the HADB server machines can be equipped with two NIC cards. The HADB instance must be configured to exploit these cards by specifying both IP addresses of the NIC cards for each node. The first IP address the HADB considers as “net-0,” the second is set to “net-a.” The syntax for a two-node configuration is:

```
--hosts=h0a+h0b,h1a+h1b.
```

- h0a is host-0's IP address on net-0
- h0b is host-0's IP address on net-1
- h1a is host-1's IP address on net-0
- h1b is host-1's IP address on net-1

All nodes in a database instance must be connected to both networks. It is not allowed to have some nodes connected to both networks while others are connected to only one network. The IP address of each NIC card must be on separate IP subnets.

OPERANDS *dbname* The name of the database. The default database is hadb.

EXAMPLES **EXAMPLE 1** Using create with two nodes on a single device

The following example creates a database with the default database name hadb with two active nodes, and a single data device. The system prompts you for the password twice. All paths are default paths and must be created before initiating this command.

```
hadbm create --devicesize=256 --hosts=host1,host2
Database successfully created and started
```

EXAMPLE 2 Using create with two nodes on multiple devices

The following example creates a database named mydb with two active nodes, two spare nodes, two devices per node, and a specific port base number for some specific path.

```
hadbm create -H host1,host2 --packagepath=/home/hadb/install
--historypath=/export/home/hadb/history --devicepath =/export/home/hadb/device
--configpath /home/hadb/config --datadevices=2 --portbase=1500
--dbpasswordfile=/home/hadb/dbpfile --spares=2 --devicesize=512
--set "Node-0.DataDevice-0.DevicePath=/disk0 Node-0.DataDevice-0.DevicePath=/disk1" mydb
Database successfully created and started
```

hadbm-create(1)

EXAMPLE 2 Using create with two nodes on multiple devices (Continued)

Node 0 gets two data devices: `/disk0/mydb.data.0` and `/disk1/mydb.data1.1`. Since Node 1 is not specified with any specific device path in the `--set` option, and since the `--datadevices` option was set to 2, Node 1 gets both devices on the path given in the `--devicepath` option. The devices for Node 1 are then `/export/home/hadb/device/mydb.data.1` and `/export/home/hadb/device/mydb.data1.1`.

EXIT STATUS

NAME	hadbm createdomain – creates a management domain of the listed HADB hosts	
SYNOPSIS	hadbm createdomain [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i> --no-adminauthentication --agent= <i>ma_url</i>] <i>host_list</i>	
DESCRIPTION	<p>Use the <code>hadbm createdomain</code> command to create the HADB management domains. All the hosts that will be part of the desired domain must be included in the <code>hostlist</code>; including the hosts retrieved through the <code>hadbm listdomain</code> command.</p> <p>To form a domain, the <code>hostlist</code> must consist of valid network addresses. After the management domain is successfully completed, all the hosts in the domain are enabled and the management agents are ready to manage databases.</p> <p>The following prerequisites must be met before using the <code>hadbm createdomain</code> command:</p> <ul style="list-style-type: none"> ■ HADB management agents are running on the hosts. ■ The management agents are not members of an existing domain. ■ All the management agents are configured to use the same port. ■ All the management agents can reach each other over UDP, TCP, and with IP multicast. 	
OPTIONS	<p><code>-w --adminpassword</code></p> <p><code>-W --adminpasswordfile</code></p> <p><code>-U --no-adminauthentication</code></p> <p><code>-m --agent</code></p>	<p>The actual HADBM administration password. Using this option with the <code>hadbm createdomain</code> or <code>hadbm create</code> command requires that the password is entered each time any <code>hadbm</code> command is used.</p> <p>The <code>adminpassword</code> is different from the <code>hadbm dbpassword</code> command. You must use both passwords when using the following commands: <code>hadbm create</code>, <code>hadbm addnodes</code>, <code>hadbm refragment</code>.</p> <p>The file from which the passwords are read.</p> <p>Using this option eliminates the need of password identification.</p> <p>Identifies the URL to the Management Agent. The default is <code>localhost:1862</code>.</p>
OPERANDS	<i>host_list</i>	A comma-separated list of all the hosts that are part of the Management Agent.
EXAMPLES	<p>EXAMPLE 1 Creating an HADB management domain</p> <pre>hadbm createdomain host1,host2,host3 Domain host1,host2,host3 created</pre>

NAME	hadbm delete – removes the database						
SYNOPSIS	<pre>hadbm delete [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [<i>dbname</i>]</pre>						
DESCRIPTION	<p>Use the hadbm delete command to remove the database, configuration files, device files, history and log files. If a database is identified, it should already exist and should be in a stopped state. If a database is not named, the default database is used. The default database is hadb.</p> <p>In interactive mode, the hadbm delete command prompts for a confirmation before removing the database.</p>						
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-w --adminpassword</td> <td>The actual HADB administration password.</td> </tr> <tr> <td style="vertical-align: top;">-W --adminpasswordfile</td> <td>The file from which the passwords are read.</td> </tr> <tr> <td style="vertical-align: top;">-m --agent</td> <td>Identifies the URL to the Management Agent. The default is localhost:1862.</td> </tr> </table>	-w --adminpassword	The actual HADB administration password.	-W --adminpasswordfile	The file from which the passwords are read.	-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.
-w --adminpassword	The actual HADB administration password.						
-W --adminpasswordfile	The file from which the passwords are read.						
-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.						
OPERANDS	<i>dbname</i> The name of the database. The default database is hadb.						
EXAMPLES	<p>EXAMPLE 1 Using delete</p> <pre>hadbm delete This command will remove the database and all configuration, history and log files. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database successfully deleted</pre> <p>EXAMPLE 2 Using delete with a database identified</p> <pre>hadbm delete mydatabase This command will remove the database and all configuration, history and log files. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database successfully deleted</pre>

NAME hadbm deviceinfo – displays information about disk storage devices on each active data node

SYNOPSIS **hadbm deviceinfo** [--details]
 [--adminpassword=*password* | --adminpasswordfile= *filename*]
 [--agent=*ma_url*] [*dbname*]

DESCRIPTION If a database is specified, the database should be existing as shown by the hadbm-list command. If the database name is not specified, the default database should exist as shown by the hadbm-list command.

The information displayed for each node of the database is:

- total device size allocated in MB
- free size in MB
- usage in percentage

The status of the database and the nodes are not changed.

OPTIONS

- d --details This option displays detailed information about the named database.
- w --adminpassword The actual HADB administration password.
- W --adminpasswordfile The file from which the passwords are read.
- m --agent Identifies the URL to the Management Agent. The default is localhost:1862.

OPERANDS *dbname* The name of the database. The default database is hadb.

EXAMPLES **EXAMPLE 1** Using deviceinfo without any options

```
hadbm deviceinfo
NodeNo    TotalSize    Freesize    Usage
3         1048         869        17%
4         1048         869        17%
5         1048         869        17%
6         1048         869        17%
```

EXAMPLE 2 Using deviceinfo with a database specified and quiet option

```
hadbm deviceinfo -q mydatabase
3         1048         869        17%
4         1048         869        17%
5         1048         869        17%
6         1048         869        17%
```

EXAMPLE 3 Using deviceinfo with details option

```
hadbm deviceinfo --details
NodeNo    TotalSize    FreeSize    Usage    NReads    Nwrites    DeviceName
3         1048         869        17%     0         42578     /export/home2/tmp//hadb.data-0.3
```

hadbm-deviceinfo(1)

EXAMPLE 3 Using deviceinfo with details option *(Continued)*

4	1048	869	17%	0	42554	/export/home2/tmp/hadb.data-0.4
5	1048	869	17%	0	42544	/export/home2/tmp/hadb.data-0.5
6	1048	869	17%	0	9828	/export/home2/tmp/hadb.data-0.6

EXIT STATUS

NAME	hadbm disablehost – selectively disables a host in the management domain
SYNOPSIS	<pre>hadbm disablehost [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] <i>hostname</i></pre>
DESCRIPTION	<p>Use the <code>disablehost</code> command to remove an unresponsive host from the management domain. Since the majority of management agents in a management domain must be enabled and running to execute HADB management commands, unresponsive hosts reduce the number of active agents and therefore prevent operation of <code>hadbm</code> commands.</p> <p>A disabled host is automatically re-enabled when its management agent is restarted.</p> <p>Before using the <code>disablehost</code> command, ensure the host to be disabled is:</p> <ul style="list-style-type: none"> ■ registered in the management domain ■ enabled ■ the management agent for the host is not running ■ all database nodes configured to run on the host are stopped
OPTIONS	<pre>-w --adminpassword The actual HADBM administration password. -W --adminpasswordfile The file from which the passwords are read. -m --agent Identifies the URL to the Management Agent. The default is localhost:1862.</pre>
OPERANDS	<i>hostname</i> The hostname for the host to be disabled.
EXAMPLES	<p>EXAMPLE 1 Disabling a host named <code>host1</code></p> <pre>hadbm disablehost host1 Host successfully disabled</pre>
EXIT STATUS	<pre>0 command executed successfully 1 error in executing the command</pre>
ERROR CODES	<pre>22176 the host is not registered in the HADB management domain 22180 the host is already disabled 22181 database nodes are running on the host. Use hadbm stopnode to stop the nodes before using disablehost 22182 the management agent is running on the specified host. Stop the management agent before disabling the host</pre>
SEE ALSO	<code>hadbm(1)</code> , <code>hadbm-create(1)</code> , <code>hadbm-listpackages(1)</code> , <code>hadbm-unregisterpackage(1)</code>

hadbm-extenddomain(1)

NAME	hadbm extenddomain – extends the current HADB management domain by adding the specified hosts
SYNOPSIS	hadbm extenddomain [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] <i>host_list</i>
DESCRIPTION	Use the hadbm extenddomain command to add hosts to an existing management domain. All the hosts that will be part of the desired domain must be included in the hostlist. The following prerequisites must be met before using the hadbm extenddomain command: <ul style="list-style-type: none"> ■ An HADB management domain must already exist. ■ HADB management agents are running on the hosts. ■ The management agents on the hosts to be added are not members of an existing domain. ■ All the management agents are configured to use the same port. ■ All the management agents can reach each other over UDP, TCP, and with IP multicast.
OPTIONS	-w --adminpassword The actual HADBM administration password. -W --adminpasswordfile The file from which the passwords are read. -m --agent Identifies the URL to the Management Agent. The default is localhost:1862.
OPERANDS	<i>host_list</i> A comma-separated list of all the hosts that are part of the management domain.
EXAMPLES	EXAMPLE 1 Adding hosts to an HADB management domain <pre>hadbm extenddomain host4,host5, Hosts added, domain is now host1,host2,host3,host4,host5</pre>
EXIT STATUS	0 command executed successfully 1 error in executing the command
ERROR CODES	22015 the hostlist contains duplicate host names 22016 the host 3 and host 4 are registered in different management domains. Domains cannot be merged. Use hadbm reducedomain to remove one of the hosts from a domain and then restart the agent 22191 the specified hosts are already part of the management domain 22192 the management domain does not exist 22196 the URL used to connect to management agents spans hosts which are not in the management domain

hadbm-extenddomain(1)

SEE ALSO hadbm(1), hadbm-create(1), hadbm-createdomain(1), hadbm-deletedomain(1),
hadbm-listdomain(1), hadbm-reducedomain(1)

hadbm-get(1)

NAME	hadbm-get – gets the value of the specified configuration attribute
SYNOPSIS	hadbm get --all <i>attribute_name_list</i> [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] [<i>dbname</i>]
DESCRIPTION	Use the get command to get the value of the named configuration attribute. If the command is run without any attributes, and with the --all option, all the supported variables and their values are retrieved. If an attribute is unrecognized, an exception is thrown on the unrecognized attribute name, and the variables and values of the recognized attributes are returned.

The readable configuration attributes are as follows:

Variable	Range	Default
ConnectionTrace	true/false	false
CoreFile	true/false	false
DatabaseName		hadb
DataBufferPoolSize	16–2047	200 MB
DataDeviceSize	32–262144	1024 MB
DevicePath	n/a	n/a
EagerSessionThreshold	0–100	50 (% of NumberOfSessions)
Eager SessionTimeout	0–2147483647	120 seconds
EventBufferSize	0–2097152	0 MB
HistoryPath	n/a	n/a
InternalLogBufferSize	4–128	12 MB
JdbcUrl	n/a	n/a
LogBufferSize	4–2047	48 MB
MaxTables	100–1100	1100
NumberOfDataDevices	1–8	1
NumberOfLocks	20000–1073741824	50000
NumberOfSessions	1–10000	100
PackageName	n/a	V4.x.x.x
PortBase	10000–63000	15000
RelalgDeviceSize	32–262144	128 MB

Variable	Range	Default
SQLTraceMode	none/short/full	none
SessionTimeout	0-2147483647	1800 seconds
StartRepairDelay	0-100000	20 seconds
StatInterval	0-600	600 seconds
SyslogFacility	<facility>	local0
SyslogLevel	<level>	warning
SyslogPrefix	<string>	hadb-<db_name>
TakeoverTime	500-16000	10000 MS

Heterogenous attributes:

- Node-<nodeno>.HistoryPath=<path_to_history_files>
- Node-<nodeno>.DevicePath=<default_path_for_devices_on_node>
- Node-<nodeno>.<device>.DevicePath=<path_for_device_on_node>

Where <device> is one of:

- DataDevice-<datadevicenumber>
- RelalgDevice
- NiLogDevice
- NoManDevice

OPTIONS

<code>--all</code>		If specified, gets all the supported variables and their values.
<code>-w --adminpassword</code>		The actual HADBM administration password.
<code>-W --adminpasswordfile</code>		The file from which the passwords are read.
<code>-m --agent</code>		Identifies the URL to the Management Agent. The default is localhost:1862.

OPERANDS

<i>attribute_name_list</i>	A comma or space separated list of variables whose values have been retrieved.	
<i>dbname</i>	The name of the database. The default database is hadb.	

EXAMPLES

EXAMPLE 1 Using get

```
hadbm get "takeoverTime numberOfLocks jdbcURL" mydatabase
Attribute      Value
takeoverTime   10000
numberOfLocks  10000
jdbcUrl        com:sun:hadb:royal:15000,polo:15020
```

hadbm-help(1)

	<code>unregisterpackage</code>	removes registered HADB packages from the management domain
	<code>version</code>	displays the hadbm version information
COMMON OPTIONS	<code>-q --quiet</code>	Performs the operation silently without any descriptive messages.
	<code>-? --help</code>	Displays a brief description of the hadbm utility and all the supported commands.
	<code>-v --version</code>	Displays the version details of the hadbm utility.
	<code>-y --yes</code>	Launches the command in non-interactive mode.
	<code>-f --force</code>	Launches the command in non-interactive mode, and does not return an error if the post condition is already achieved.
	<code>-e --echo</code>	Displays the commands with all the options and their user-defined values or the default values; then launches the command.
EXAMPLES	EXAMPLE 1 Executing an hadbm command	
	<code>hadbm clear</code>	
	This command will clear the database	
	Type "yes" or "y" to confirm this operation, anything else to cancel: y	
	Database successfully cleared	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	hadbm(1m)	

NAME	hadbm list – lists all the existing databases								
SYNOPSIS	hadbm list [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>]								
DESCRIPTION	Use the hadbm list command to get a listing of all the existing database instances known to the management client running this command. If the list could not display the database instance, see the hadbm command if you are sure you have created it earlier.								
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-w --adminpassword</td> <td>The actual HADBМ administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.</td> </tr> <tr> <td style="vertical-align: top;">-W --adminpasswordfile</td> <td>The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.</td> </tr> <tr> <td style="vertical-align: top;">-m --agent</td> <td>The file from which the passwords are read..</td> </tr> <tr> <td></td> <td>Identifies the URL to the Management Agent. The default is localhost:1862.</td> </tr> </table>	-w --adminpassword	The actual HADBМ administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.	-W --adminpasswordfile	The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.	-m --agent	The file from which the passwords are read..		Identifies the URL to the Management Agent. The default is localhost:1862.
-w --adminpassword	The actual HADBМ administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.								
-W --adminpasswordfile	The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.								
-m --agent	The file from which the passwords are read..								
	Identifies the URL to the Management Agent. The default is localhost:1862.								
EXAMPLES	<p>EXAMPLE 1 Using list</p> <pre>hadbm list Database hadb mydatabase</pre>								
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>

hadbm-listdomain(1)

NAME	hadbm listdomain – lists all hosts defined in the management domain								
SYNOPSIS	hadbm listdomain [<i>--adminpassword=password</i> <i>--adminpasswordfile=filename</i>] [<i>--agent=ma_url</i>]								
DESCRIPTION	Use the hadbm listdomain command to list all hosts defined in the management domain and the status of the management agents.								
OPTIONS	<table><tr><td>-w <i>--adminpassword</i></td><td>The actual HADB administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.</td></tr><tr><td></td><td>The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.</td></tr><tr><td>-W <i>--adminpasswordfile</i></td><td>The file from which the passwords are read.</td></tr><tr><td>-m <i>--agent</i></td><td>Identifies the URL to the Management Agent. The default is localhost:1862.</td></tr></table>	-w <i>--adminpassword</i>	The actual HADB administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.		The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.	-W <i>--adminpasswordfile</i>	The file from which the passwords are read.	-m <i>--agent</i>	Identifies the URL to the Management Agent. The default is localhost:1862.
-w <i>--adminpassword</i>	The actual HADB administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.								
	The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.								
-W <i>--adminpasswordfile</i>	The file from which the passwords are read.								
-m <i>--agent</i>	Identifies the URL to the Management Agent. The default is localhost:1862.								
EXAMPLES	<p>EXAMPLE 1 Using the hadbm-listdomain</p> <p>The following command lists all participating members of a previously created domain.</p> <pre>hadbm listdomain Hostname Enabled? Interfaces HostA Yes 10.0.5.70 HostB Yes 10.0.5.72 HostC Yes 10.0.5.73 HostD Yes 10.0.5.74</pre>								
EXIT STATUS	<table><tr><td>0</td><td>command executed successfully</td></tr><tr><td>1</td><td>error in executing the command</td></tr></table>	0	command executed successfully	1	error in executing the command				
0	command executed successfully								
1	error in executing the command

NAME hadbm listpackages – lists the packages registered in the management domain

SYNOPSIS **hadbm listpackages**
 [--adminpassword=*password* | --adminpasswordfile=*filename*]
 [--agent=*ma_url*]

DESCRIPTION Use the listpackages command to display a list of the packages registered in the management domain and the hosts to which they are registered.

OPTIONS

-w --adminpassword	The actual HADBM administration password. Using this option with the hadbm createdomain or hadbm create command requires that the password is entered each time any hadbm command is used.
-W --adminpasswordfile	The adminpassword is different from the hadbm dbpassword command. You must use both passwords when using the following commands: hadbm create, hadbm addnodes, hadbm refragment.
-m --agent	The file from which the passwords are read.
	Identifies the URL to the Management Agent. The default is localhost:1862.

EXAMPLES **EXAMPLE 1** Using the hadbm-listpackages

```
hadbm listpackages
Package      Hosts
V4.4         HostA,HostB,HostC,HostD
```

EXIT STATUS

0	command executed successfully
1	error in executing the command

SEE ALSO hadbm(1m), hadbm-create(1), hadbm-registerpackage(1), hadbm-unregisterpackage(1)

hadbm-ma(1)

NAME	<code>ma</code> – configures and starts the HADB Management Agent				
SYNOPSIS	<pre>ma <i>HADB_install_path</i>/bin/ma [--define=<i>assignment</i>] [--javahome=<i>JAVA_HOME</i>] [--systemroot=<i>root_path</i>] [--version] [--help] [--install] [--remove] [--service] [--name=<i>name_of_service</i>] [<i>AGENT_CONFIG_path</i>]</pre>				
DESCRIPTION	<p>Use the <code>ma</code> command to configure and start the HADB Management Agent on a host that will belong to an HADB management domain. The configuration is defined in the <code>AGENT_CONFIG</code> file. In addition you can register the Management Agent as a Windows service by using the service options <code>--install</code>, <code>--service</code>, and <code>--name</code>. The Management Agent ensures the availability of the HADB nodes on the host it runs by restarting them if there is a failure during startup, or during normal operation. To ensure the availability of the Management Agent you should register it as a Windows service so it is restarted automatically if it fails or when the computer reboots.</p> <p>An HADB management domain consists of a set of hosts that are capable of running HADB database nodes. A Management Agent runs on each host belonging to a management domain. <code>hadbm</code> management clients communicate with Management Agents to perform the <code>hadbm</code> management commands like <code>create</code>, <code>start</code>, <code>stop</code>, and so on.</p> <p>The Management Agent must be configured and started on all hosts before a database instance can be created. All hosts in a domain run a Management Agent at the same port number. All agents are aware of each other and their participation in the management domain. Agents communicate with each other, and may forward requests to other agents when they perform management commands specific to a host. For example, when an agent is requested to stop a node, it checks whether the mirror host is up and running. To get that information, it communicates with the agent running on the mirror host.</p> <p>The Management Agent maintains a repository where the database configuration is stored. A majority of agents in the management domain must be available to make changes in the repository.</p> <p>The <code>AGENT_CONFIG</code> file contains the configuration information for the Management Agent. A sample file named <code>mgt.cfg</code> is located in the <code>HADB_install_path/lib</code> directory. Use this sample file to assist you in defining your configuration files. In addition to the configuration variables, the <code>AGENT_CONFIG</code> file also contains the default path information for the history files, and the data device files for the HADB instances managed by this agent. If you have NOT specified the history and device path information using the <code>create</code> command, the default values located in the <code>AGENT_CONFIG</code> file will be used.</p>				
OPTIONS	<p>The following options identify common setup information for the Management Agent:</p> <table><tr><td><code>-D --define</code></td><td>The agent property assignment in the format of <i>property=value</i></td></tr><tr><td><code>-j --javahome</code></td><td>The full path to the Java runtime installation. The default value is the value of the <code>JAVA_HOME</code> variable.</td></tr></table>	<code>-D --define</code>	The agent property assignment in the format of <i>property=value</i>	<code>-j --javahome</code>	The full path to the Java runtime installation. The default value is the value of the <code>JAVA_HOME</code> variable.
<code>-D --define</code>	The agent property assignment in the format of <i>property=value</i>				
<code>-j --javahome</code>	The full path to the Java runtime installation. The default value is the value of the <code>JAVA_HOME</code> variable.				

-y --systemroot An alternate specification of the Windows system root path.

-V --version Displays the version information and exits.

-? --help Displays this help page and exits.

The following options identify service configuration information for the Management Agent:

-i --install Registers a service for the agent and starts the service.

-r --remove Stops and unregisters the agent service.

-s --service This option is for internal use by the service control program.

-n --name Identifies the name to use when registering and operating the service. The default name is HADBMgmtAgent.

OPERANDS *AGENT_CONFIG_path* The full path to the AGENT_CONFIG file.

EXAMPLES **EXAMPLE 1** Sample AGENT_CONFIG file

The following sample file can be edited for your particular installation:

```
ma.server.jmxml.port=31108 #this can be any port not currently being used#
ma.server.dbconfigpath=/etc/opt/SUNWhadb/MA
repository.dr.path=/var/opt/SUNWhadb/REP
```

hadbm-reducedomain(1)

NAME	hadbm reducedomain – removes hosts from the HADB management domain										
SYNOPSIS	<pre>hadbm reducedomain [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] <i>host_list</i></pre>										
DESCRIPTION	<p>The following prerequisites must be met before using the <code>hadbm reducedomain</code> command:</p> <ul style="list-style-type: none"> ■ An HADB management domain must already exist. ■ The hosts to be removed are registered in the domain. No database nodes are configured to be used on the hosts to be removed. ■ The HADB management repository is writable. ■ Software packages that are in use are not registered on the hosts which are to be removed. ■ The hostlist must not contain all agents in the domain. To remove all agents, use the <code>hadbm deletedomain</code> command. <p>After successfully executing the <code>hadbm reducedomain</code> command, the management agents of the removed hosts are stopped and the repository of the deleted hosts is cleaned up.</p>										
OPTIONS	<table border="0"> <tr> <td style="padding-right: 20px;"><code>-w --adminpassword</code></td> <td>The actual HADBM administration password.</td> </tr> <tr> <td><code>-W --adminpasswordfile</code></td> <td>The file from which the passwords are read.</td> </tr> <tr> <td><code>-m --agent</code></td> <td>Identifies the URL to the Management Agent. The default is localhost:1862.</td> </tr> </table>	<code>-w --adminpassword</code>	The actual HADBM administration password.	<code>-W --adminpasswordfile</code>	The file from which the passwords are read.	<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is localhost:1862.				
<code>-w --adminpassword</code>	The actual HADBM administration password.										
<code>-W --adminpasswordfile</code>	The file from which the passwords are read.										
<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is localhost:1862.										
OPERANDS	<table border="0"> <tr> <td style="padding-right: 20px;"><i>host_list</i></td> <td>A comma-separated list of all the hosts that are part of the management domain.</td> </tr> </table>	<i>host_list</i>	A comma-separated list of all the hosts that are part of the management domain.								
<i>host_list</i>	A comma-separated list of all the hosts that are part of the management domain.										
EXAMPLES	<p>EXAMPLE 1 Removing hosts from a management domain</p> <pre>hadbm reducedomain host4,host5 Hosts removed, domain is now host1,host2,host3</pre>										
EXIT STATUS	<table border="0"> <tr> <td style="padding-right: 20px;">0</td> <td>command executed successfully</td> </tr> <tr> <td>1</td> <td>error in executing the command</td> </tr> </table>	0	command executed successfully	1	error in executing the command						
0	command executed successfully										
1	error in executing the command										
ERROR CODES	<table border="0"> <tr> <td style="padding-right: 20px;">22015</td> <td>the hostlist contains duplicate host names</td> </tr> <tr> <td>22192</td> <td>the management domain does not exist</td> </tr> <tr> <td>22193</td> <td>the specified hosts are not part of the domain and cannot be removed</td> </tr> <tr> <td>22194</td> <td>hosts cannot be removed because they contain databases</td> </tr> <tr> <td>22195</td> <td>cannot remove all hosts from the domain</td> </tr> </table>	22015	the hostlist contains duplicate host names	22192	the management domain does not exist	22193	the specified hosts are not part of the domain and cannot be removed	22194	hosts cannot be removed because they contain databases	22195	cannot remove all hosts from the domain

hadbm-refragment(1)

NAME	hadbm refragment – refragments the database schema										
SYNOPSIS	<pre> hadbm refragment [--dbpassword=<i>password</i> --passwordfile=<i>passwordfilename</i>] [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [<i>dbname</i>] </pre>										
DESCRIPTION	<p>Refragmentation is needed to store the data on a newly created node. Run the <code>hadbm refragment</code> command after adding a node using the <code>hadbm addnodes</code> command with the <code>--no-refragment</code> option specified. If the <code>hadbm refragment</code> command fails, it can be retried. If it continues to fail, the database must be cleared, and the product-specific schemas must be reloaded. All the user tables are refragmented.</p> <p>If a database is specified, the database must already exist and must be in an HA Fault Tolerant or Fault Tolerant state. If the database is not named, the default database is refragmented. The default database is <code>hadb</code>.</p> <p>In interactive mode, the <code>hadbm refragment</code> command prompts for a confirmation before refragmenting the data.</p>										
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;"><code>-p --dbpassword</code></td> <td>The password string for the system user of the database. The minimum length of the password must be 8 characters. You can identify either the database password, or for higher security, the password file where the password is defined.</td> </tr> <tr> <td style="vertical-align: top;"><code>-P --dbpasswordfile</code></td> <td>Identifies the file containing the password to be used for the system user of the database.</td> </tr> <tr> <td style="vertical-align: top;"><code>-w --adminpassword</code></td> <td>The actual HADB administration password.</td> </tr> <tr> <td style="vertical-align: top;"><code>-W --adminpasswordfile</code></td> <td>The file from which the passwords are read.</td> </tr> <tr> <td style="vertical-align: top;"><code>-m --agent</code></td> <td>Identifies the URL to the Management Agent. The default is <code>localhost:1862</code>.</td> </tr> </table>	<code>-p --dbpassword</code>	The password string for the system user of the database. The minimum length of the password must be 8 characters. You can identify either the database password, or for higher security, the password file where the password is defined.	<code>-P --dbpasswordfile</code>	Identifies the file containing the password to be used for the system user of the database.	<code>-w --adminpassword</code>	The actual HADB administration password.	<code>-W --adminpasswordfile</code>	The file from which the passwords are read.	<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is <code>localhost:1862</code> .
<code>-p --dbpassword</code>	The password string for the system user of the database. The minimum length of the password must be 8 characters. You can identify either the database password, or for higher security, the password file where the password is defined.										
<code>-P --dbpasswordfile</code>	Identifies the file containing the password to be used for the system user of the database.										
<code>-w --adminpassword</code>	The actual HADB administration password.										
<code>-W --adminpasswordfile</code>	The file from which the passwords are read.										
<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is <code>localhost:1862</code> .										
OPERANDS	<table border="0"> <tr> <td style="vertical-align: top;"><code><i>dbname</i></code></td> <td>The name of the database. The default database is <code>hadb</code>.</td> </tr> </table>	<code><i>dbname</i></code>	The name of the database. The default database is <code>hadb</code> .								
<code><i>dbname</i></code>	The name of the database. The default database is <code>hadb</code> .										
EXAMPLES	<p>EXAMPLE 1 Using refragment</p> <pre> hadbm refragment --dbpasswordfile=/home/hadb/dbpfile mydatabase This command will refragment the data on all active nodes. Type "yes" or "y" to confirm this operation, anything else to cancel:y Database successfully refragmented </pre>										
EXIT STATUS	<table border="0"> <tr> <td style="vertical-align: top;">0</td> <td>command executed successfully</td> </tr> <tr> <td style="vertical-align: top;">1</td> <td>error in executing the command</td> </tr> </table>	0	command executed successfully	1	error in executing the command						
0	command executed successfully

hadbm-registerpackage(1)

NAME	hadbm registerpackage – registers HADB packages in the management domain
SYNOPSIS	hadbm registerpackage --packagepath= <i>path</i> [--hosts= <i>host_list</i>] [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] [<i>package_name</i>]
DESCRIPTION	<p>Use the hadbm registerpackage command to register the HADB packages that are installed on the hosts in the management domain. Registering packages can also be done when creating a database with the hadbm create command. The default package name is a string starting with V and containing the version number of the hadbm program. If the --hosts option is omitted, the package is registered on all enabled hosts in the domain.</p> <p>Before using the hadbm registerpackage command, ensure that all management agents are configured and running on all the hosts in the hostlist, the repository of the management agent is available for updates, and no software package is already registered with the same package name.</p>
OPTIONS	<p>-L The full path to the HADB software package. --packagepath</p> <p>-H --hosts A comma-separated or double quote enclosed list of hosts to register the package on.</p> <p>-w The actual HADB administration password. --adminpassword</p> <p>-W The file from which the passwords are read. --adminpasswordfile</p> <p>-m --agent Identifies the URL to the Management Agent. The default is localhost:1862.</p>
OPERANDS	<i>package_name</i> The name of the package you are registering. If a package name is not specified, the default name of the software package is used. For example, if you are using the software release V4-4-02, the default package name is V4.4.
EXAMPLES	<p>EXAMPLE 1 Registering a software package named v4</p> <pre>hadbm registerpackage --packagepath=hadb_install_dir/SUNWhadb/4.4/v4 Package successfully registered</pre> <p>EXAMPLE 2 Registering a software package name v4 on a specific host in the domain</p> <pre>hadbm registerpackage --packagepath=hadb_install_dir/SUNWhadb/4.4 --hosts=host1,host2,host3 v4 Package successfully registered</pre>
EXIT STATUS	0 command executed successfully

1
error in executing the command

ERROR CODES 22170 the software package could not be found at the specified path on the host
22171 the software package already exists or is registered with the same name

hadbm-resourceinfo(1)

NAME	hadbm resourceinfo – gives information about the database resources
SYNOPSIS	hadbm resourceinfo [--databuf] [--locks] [--logbuf] [--nilogbuf] [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] [<i>dbname</i>]
DESCRIPTION	Use the hadbm resourceinfo command to get information about the various database resources. If a database is named, it must already exist. If a database is not named, the default database is used. The default database is hadb.
OPTIONS	<p>-d --databuf This option displays the data buffer pool information.</p> <p>-l --locks This option displays the locks information.</p> <p>-b --logbuf This option displays the log buffer information.</p> <p>-n --nilogbuf This option displays the node internal log buffer information.</p> <p>-w --adminpassword The actual HADBM administration password.</p> <p>-W --adminpasswordfile The file from which the passwords are read.</p> <p>-m --agent Identifies the URL to the Management Agent. The default is localhost:1862.</p>
OPERANDS	<i>dbname</i> The name of the database. The default database is hadb.
EXAMPLES	<p>EXAMPLE 1 Using resourceinfo</p> <pre> hadbm resourceinfo Databuffer pool: NodeNo Avail Free Access Misses Copy-on-write 3 198 198 201 0 0 4 198 198 217 0 0 5 198 198 194 0 0 6 198 198 43 0 0 Locks: NodeNo Avail Free Waits 3 50000 50000 na 4 50000 50000 na 5 50000 50000 na 6 50000 50000 na Log buffer: NodeNo Avail Free 3 44 11 4 44 11 5 44 11 6 44 22 Node internal log buffer: NodeNo Avail Free 3 11 11 4 11 11 5 11 11 </pre>

hadbm-restart(1)

NAME	hadbm restart – restarts the database
SYNOPSIS	<pre>hadbm restart [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [--no-rolling] [<i>dbname</i>]</pre>
DESCRIPTION	<p>Use the <code>hadbm restart</code> command to restart the database. Once the database is restarted, it returns to the previous state or better. If the database name is specified, the database must exist. If the database name is not specified, the default database is restarted. The default database is <code>hadb</code>.</p> <p>In interactive mode, the <code>hadbm restart</code> command prompts for a confirmation before restarting the database.</p>
OPTIONS	<pre>-w --adminpassword The actual HADB administration password. -W --adminpasswordfile The file from which the passwords are read. -m --agent Identifies the URL to the Management Agent. The default is localhost:1862. -g --no-rolling This option restarts all nodes in the HADB at once with possible loss of service. If this option is not specified, the hadbm restarts the nodes one by one and maintains the availability of the HADB. If the option is specified, it stops all nodes in parallel and starts them in parallel. During this period, the HADB is not available.</pre>
OPERANDS	<pre><i>dbname</i> The name of the database. The default database is hadb.</pre>
EXAMPLES	<p>EXAMPLE 1 Using restart with a database identified</p> <pre>hadbm restart mydatabase This command will restart the named database. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database successfully restarted</pre> <p>EXAMPLE 2 Using restart with no rolling</p> <pre>hadbm restartnode --no-rolling mydatabase This command will restart the named database. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database successfully restarted</pre>

hadbm-restartnode(1)

NAME	hadbm restartnode – restarts the specified node								
SYNOPSIS	<pre>hadbm restartnode [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [--startlevel=<i>level</i>] <i>node_number</i> [<i>dbname</i>]</pre>								
DESCRIPTION	<p>Use the hadbm restartnode command to restart the node. The node is restarted by running the startup procedure on the node. The mirror node of the node to be restarted must be up. The node is restarted in the specified start level. The start level indicates the environmental conditions the node should take into consideration while starting. The valid start levels are:</p> <table border="1" data-bbox="444 680 1414 999"> <thead> <tr> <th>Start Level</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>normal (default)</td> <td>This start level is used when the node has been stopped earlier in a controlled way (default).</td> </tr> <tr> <td>repair</td> <td>This start level forces an active node to repair data from its mirror node.</td> </tr> <tr> <td>clear</td> <td>This start level reinitializes the devices for the node, and forces a repair of data from its mirror node.</td> </tr> </tbody> </table>	Start Level	Description	normal (default)	This start level is used when the node has been stopped earlier in a controlled way (default).	repair	This start level forces an active node to repair data from its mirror node.	clear	This start level reinitializes the devices for the node, and forces a repair of data from its mirror node.
Start Level	Description								
normal (default)	This start level is used when the node has been stopped earlier in a controlled way (default).								
repair	This start level forces an active node to repair data from its mirror node.								
clear	This start level reinitializes the devices for the node, and forces a repair of data from its mirror node.								
OPTIONS	<p>In interactive mode, the hadbm restartnode command prompts for a confirmation before restarting the node.</p> <table border="0"> <tr> <td style="vertical-align: top;">-w --adminpassword</td> <td>The actual HADBM administration password.</td> </tr> <tr> <td style="vertical-align: top;">-W --adminpasswordfile</td> <td>The file from which the passwords are read.</td> </tr> <tr> <td style="vertical-align: top;">-m --agent</td> <td>Identifies the URL to the Management Agent. The default is localhost:1862.</td> </tr> <tr> <td style="vertical-align: top;">-l --startlevel</td> <td>Identifies the start level to be used to restart the named node. The default start level is normal.</td> </tr> </table>	-w --adminpassword	The actual HADBM administration password.	-W --adminpasswordfile	The file from which the passwords are read.	-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.	-l --startlevel	Identifies the start level to be used to restart the named node. The default start level is normal.
-w --adminpassword	The actual HADBM administration password.								
-W --adminpasswordfile	The file from which the passwords are read.								
-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.								
-l --startlevel	Identifies the start level to be used to restart the named node. The default start level is normal.								
OPERANDS	<table border="0"> <tr> <td style="vertical-align: top;"><i>node_number</i></td> <td>A positive integer. The node number must be an existing node that is in a running state in the database.</td> </tr> <tr> <td style="vertical-align: top;"><i>dbname</i></td> <td>The name of the database. The default database is hadb.</td> </tr> </table>	<i>node_number</i>	A positive integer. The node number must be an existing node that is in a running state in the database.	<i>dbname</i>	The name of the database. The default database is hadb.				
<i>node_number</i>	A positive integer. The node number must be an existing node that is in a running state in the database.								
<i>dbname</i>	The name of the database. The default database is hadb.								
EXAMPLES	<p>EXAMPLE 1 Using restartnode on the default database</p> <pre>hadbm restartnode 2 This command will restart the node. Type "yes" or "y" to confirm this operation, anything else to cancel: y Node successfully restarted</pre>								

EXAMPLE 2 Using restartnode with a database identified

```
hadbm restartnode 2 mydatabase
This command will restart the node.
Type "yes" or "y" to confirm this operation, anything else to cancel: y
Node successfully restarted
```

hadbm-set(1)

NAME hadbm set – sets the value of the specified configuration attributes to the identified values

SYNOPSIS `hadbm set [--adminpassword=password | --adminpasswordfile=filename] [--agent=ma_url] {attribute_name_value_list} [dbname]`

DESCRIPTION The hadbm set command is used to reconfigure the database. Multiple configuration attributes can be modified in one single set operation. You can use a comma or space separated list of name=value pairs. If using a space separated list, use quotation marks to preserve the spaces. The writeable configuration attributes are as follows:

Variable	Range	Default
ConnectionTrace	true/false	false
CoreFile	true/false	false
DataBufferPoolSize	16–2047	200 MB
DataDeviceSize	32–262144	1024 MB
DevicePath	n/a	n/a
EagerSessionThreshold	0–100	50 (% of NumberOfSessions)
Eager SessionTimeout	0–2147483647	120 seconds
EventBufferSize	0–2097152	0 MB
HistoryPath	n/a	n/a
InternalLogBufferSize	4–128	12 MB
LogBufferSize	4–2047	48 MB
MaxTables	100–1100	1100
NumberOfDataDevices	1–8	1
NumberOfLocks	20000–1073741824	50000
NumberOfSessions	1–10000	100
PackageName	n/a	V4.x.x.x
RelalgDeviceSize	32–262144	128 MB
SQLTraceMode	none/short/full	none
SessionTimeout	0–2147483647	1800 seconds
StartRepairDelay	0–100000	20 seconds
StatInterval	0–600	600 seconds
SyslogFacility	<facility>	local0

Variable	Range	Default
SyslogLevel	<level>	warning
SyslogPrefix	<string>	hadb-<db_name>
TakeoverTime	500-16000	10000 MS

The values of the configuration attributes will be set into the database configuration. Use the `hadbm get` command to get the new value of an attribute. When the value part of an attribute is missing, the attribute is set to the default value.

Setting the database attribute may require the system to do a rolling restart of the hadb nodes. The database must be in Fault Tolerant or HA Fault Tolerant state before using the `hadbm set` command.

The `JdbcUrl` cannot be set with either the `hadbm set` or `hadbm create` commands. However, the `hadbm create` or `hadbm addnodes` commands derive the `JdbcUrl` value from values given for `--hosts` and `--portbase` options. So, there is no need to set this variable.

The `set` command can be used to do an online upgrade of the database. A pre-condition for online upgrade is that the new version of the HADB software has been installed on all the hosts, and is registered in the domain.

To do an online upgrade, modify the `packagename` attribute and set it to the name of the new package.

OPTIONS	<code>-w --adminpassword</code>	The actual HADBM administration password.
	<code>-W --adminpasswordfile</code>	The file from which the passwords are read.
	<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is localhost:1862.

OPERANDS	<code>attribute_name_value_list</code>	A list of variables with values to be set. All the attribute names must be supported attributes.
	<code>dbname</code>	The name of the database. The default database is hadb.

EXAMPLES

EXAMPLE 1 Using set

```
hadbm set "connectiontrace=true numberOfLocks=110000"
Database attributes successfully set.
```

EXIT STATUS	0	command executed successfully
	1	error in executing the command

ERROR CODES

NAME	hadbm start – starts the database										
SYNOPSIS	<pre>hadbm start [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [<i>dbname</i>]</pre>										
DESCRIPTION	<p>Use the hadbm start command to start the database. Only the nodes that were running before the database was stopped will be started. If the database name is specified, it should be an existing database. If the database name is not specified, the default database is used. If one or more mirror node pairs have stopped simultaneously due to a power outage, machine reboot or some other disaster (i.e., the hadb instance is in a non-functional state), then the database instance cannot be started. In such a case, use the hadbm clear command to start the database and recreate the schema.</p>										
OPTIONS	<table border="0"> <tr> <td style="padding-right: 20px;">-w --adminpassword</td> <td>The actual HADBM administration password.</td> </tr> <tr> <td style="padding-right: 20px;">-W --adminpasswordfile</td> <td>The file from which the passwords are read.</td> </tr> <tr> <td style="padding-right: 20px;">-m --agent</td> <td>Identifies the URL to the Management Agent. The default is localhost:1862.</td> </tr> </table>	-w --adminpassword	The actual HADBM administration password.	-W --adminpasswordfile	The file from which the passwords are read.	-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.				
-w --adminpassword	The actual HADBM administration password.										
-W --adminpasswordfile	The file from which the passwords are read.										
-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.										
OPERANDS	<table border="0"> <tr> <td style="padding-right: 20px;"><i>dbname</i></td> <td>The name of the database. The default database is hadb.</td> </tr> </table>	<i>dbname</i>	The name of the database. The default database is hadb.

hadbm-startnode(1)

NAME	hadbm startnode – starts the specified node								
SYNOPSIS	<pre>hadbm startnode [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [--startlevel=<i>level</i>] <i>node_number</i> [<i>dbname</i>]</pre>								
DESCRIPTION	<p>The hadbm startnode command starts the node by running the startup procedure on the node. The node is started in the specified start level. The start level indicates the environmental conditions the node should take into consideration while starting. The valid start levels are as follows:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Start Level</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">normal</td> <td>This start level is used when the node was earlier stopped in a controlled way (default).</td> </tr> <tr> <td style="text-align: center;">repair</td> <td>This start level forces an active node to repair data from its mirror node.</td> </tr> <tr> <td style="text-align: center;">clear</td> <td>This start level reinitializes the devices for the node, and force a repair of data from its mirror node.</td> </tr> </tbody> </table>	Start Level	Description	normal	This start level is used when the node was earlier stopped in a controlled way (default).	repair	This start level forces an active node to repair data from its mirror node.	clear	This start level reinitializes the devices for the node, and force a repair of data from its mirror node.
Start Level	Description								
normal	This start level is used when the node was earlier stopped in a controlled way (default).								
repair	This start level forces an active node to repair data from its mirror node.								
clear	This start level reinitializes the devices for the node, and force a repair of data from its mirror node.								
OPTIONS	<pre>-w --adminpassword The actual HADB administration password. -W --adminpasswordfile The file from which the passwords are read. -m --agent Identifies the URL to the Management Agent. The default is localhost:1862. -l --startlevel Indicates the start level to be used to start the specified node(s). The default start level is normal.</pre>								
OPERANDS	<pre><i>node_number</i> A positive integer. The node number specified must be an existing node that is in a running state in the database. <i>dbname</i> The name of the database. The default database is hadb.</pre>								
EXAMPLES	<p>EXAMPLE 1 Using startnode on the default database</p> <pre>hadbm startnode 1 Node successfully started</pre> <p>EXAMPLE 2 Using startnode with the startlevel and database identified</p> <pre>hadbm startnode --startlevel=normal 1 mydatabase Node successfully started</pre>

hadbm-status(1)

NAME	hadbm status – shows the state of the database												
SYNOPSIS	hadbm status [--nodes] [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] [<i>dbname</i>]												
DESCRIPTION	<p>Use the hadbm status command to get the current state of the database. The state can be one of the following:</p> <table><tr><td>HA Fault Tolerant (HAFT)</td><td>The database has at least one spare node on each DRU.</td></tr><tr><td>Fault Tolerant (FT)</td><td>All mirrored node pairs are up and running.</td></tr><tr><td>Operational (O)</td><td>One node in each mirrored node pair is up and running.</td></tr><tr><td>Non-operational (NO)</td><td>One or more mirrored node pair is missing both nodes. An arbitrary SQL transaction may not succeed.</td></tr><tr><td>Stopped (S)</td><td>No nodes are running.</td></tr><tr><td>Unknown (U)</td><td>Unable to determine the state of the database.</td></tr></table> <p>If a database is named, it must already exist. If a database is not named, the default database is used. The default database is hadb.</p>	HA Fault Tolerant (HAFT)	The database has at least one spare node on each DRU.	Fault Tolerant (FT)	All mirrored node pairs are up and running.	Operational (O)	One node in each mirrored node pair is up and running.	Non-operational (NO)	One or more mirrored node pair is missing both nodes. An arbitrary SQL transaction may not succeed.	Stopped (S)	No nodes are running.	Unknown (U)	Unable to determine the state of the database.
HA Fault Tolerant (HAFT)	The database has at least one spare node on each DRU.												
Fault Tolerant (FT)	All mirrored node pairs are up and running.												
Operational (O)	One node in each mirrored node pair is up and running.												
Non-operational (NO)	One or more mirrored node pair is missing both nodes. An arbitrary SQL transaction may not succeed.												
Stopped (S)	No nodes are running.												
Unknown (U)	Unable to determine the state of the database.												
OPTIONS	<table><tr><td>-n --nodes</td><td>If specified, displays the node status information. The following information is displayed for each node in the database:<ul style="list-style-type: none">■ Node number■ Name of the machine where the node is running■ Port number of the node■ Role of the node■ State of the node■ Number of the corresponding mirror node</td></tr><tr><td>-w --adminpassword</td><td>The actual HADB administration password.</td></tr><tr><td>-W --adminpasswordfile</td><td>The file from which the passwords are read.</td></tr><tr><td>-m --agent</td><td>Identifies the URL to the Management Agent. The default is localhost:1862.</td></tr></table>	-n --nodes	If specified, displays the node status information. The following information is displayed for each node in the database: <ul style="list-style-type: none">■ Node number■ Name of the machine where the node is running■ Port number of the node■ Role of the node■ State of the node■ Number of the corresponding mirror node	-w --adminpassword	The actual HADB administration password.	-W --adminpasswordfile	The file from which the passwords are read.	-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.				
-n --nodes	If specified, displays the node status information. The following information is displayed for each node in the database: <ul style="list-style-type: none">■ Node number■ Name of the machine where the node is running■ Port number of the node■ Role of the node■ State of the node■ Number of the corresponding mirror node												
-w --adminpassword	The actual HADB administration password.												
-W --adminpasswordfile	The file from which the passwords are read.												
-m --agent	Identifies the URL to the Management Agent. The default is localhost:1862.												
OPERANDS	<table><tr><td><i>dbname</i></td><td>The name of the database. The default database is hadb.</td></tr></table>	<i>dbname</i>	The name of the database. The default database is hadb.										
<i>dbname</i>	The name of the database. The default database is hadb.												
EXAMPLES	<p>EXAMPLE 1 Using status</p> <pre>hadbm status Database Status hadb HAFaultTolerant</pre>

hadbm-stop(1)

NAME	hadbm stop – gracefully stops the database								
SYNOPSIS	hadbm stop [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] [<i>dbname</i>]								
DESCRIPTION	<p>Use the <code>hadbm stop</code> command to stop the database gracefully. It is a good practice to stop the database if some maintenance activity is planned that affects the mirror nodes simultaneously. The data is intact in a database that is stopped gracefully, in contrast to the one that has not been stopped gracefully. Once you stop the database using the <code>hadbm stop</code> command, use the <code>hadbm start</code> command to start the database. If the database name is specified, the named database must exist. If the database name is not identified, the default database is used. The default database is <code>hadb</code>.</p> <p>In interactive mode, the <code>hadbm stop</code> command prompts for a confirmation before stopping the node.</p>								
OPTIONS	<table><tr><td><code>-w --adminpassword</code></td><td>The actual HADB administration password.</td></tr><tr><td><code>-W --adminpasswordfile</code></td><td>The file from which the passwords are read.</td></tr><tr><td><code>-m --agent</code></td><td>Identifies the URL to the Management Agent. The default is <code>localhost:1862</code>.</td></tr></table>	<code>-w --adminpassword</code>	The actual HADB administration password.	<code>-W --adminpasswordfile</code>	The file from which the passwords are read.	<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is <code>localhost:1862</code> .		
<code>-w --adminpassword</code>	The actual HADB administration password.								
<code>-W --adminpasswordfile</code>	The file from which the passwords are read.								
<code>-m --agent</code>	Identifies the URL to the Management Agent. The default is <code>localhost:1862</code> .								
OPERANDS	<table><tr><td><i>dbname</i></td><td>The name of the database. The default database is <code>hadb</code>.</td></tr></table>	<i>dbname</i>	The name of the database. The default database is <code>hadb</code> .						
<i>dbname</i>	The name of the database. The default database is <code>hadb</code> .								
EXAMPLES	<p>EXAMPLE 1 Using stop with a database identified</p> <pre>hadbm stop mydatabase This command will stop the named database. Type "yes" or "y" to confirm this operation, anything else to cancel: y Database successfully stopped</pre>								
EXIT STATUS	<table><tr><td>0</td><td>command executed successfully</td></tr><tr><td>1</td><td>error in executing the command</td></tr></table>	0	command executed successfully	1	error in executing the command				
0	command executed successfully								
1	error in executing the command

NAME	hadbm stopnode – gracefully stops the specified node
SYNOPSIS	<pre>hadbm stopnode [--adminpassword=<i>password</i> --adminpasswordfile=<i>filename</i>] [--agent=<i>ma_url</i>] [--no-repair] <i>node_number</i> [<i>dbname</i>]</pre>
DESCRIPTION	<p>The <code>hadbm stopnode</code> command stops the node gracefully. The mirror node of the node that is to be stopped must be running. If a node's mirror node is not up, the node will not be stopped and an error message is displayed. By default, a spare node can replace the stopped node by copying the data from the stopped node's mirror. If there is no spare available, an error message is displayed.</p> <p>In interactive mode, the <code>hadbm stopnode</code> command prompts for a confirmation before stopping the node.</p>
OPTIONS	<pre>-w --adminpassword The actual HADB administration password. -W --adminpasswordfile The file from which the passwords are read. -m --agent Identifies the URL to the Management Agent. The default is localhost:1862. -R --no-repair If specified, a spare will not replace the stopping node.</pre>
OPERANDS	<pre><i>node_number</i> A positive integer. The node number of the node to be stopped. <i>dbname</i> The name of the database. The default database is hadb.</pre>
EXAMPLES	<p>EXAMPLE 1 Using stopnode</p> <pre>hadbm stopnode 1 This command will stop the node. Type "yes" or "y" to confirm this operation, anything else to cancel: y Node successfully stopped</pre> <p>EXAMPLE 2 Using stopnode with no-repair option</p> <pre>hadbm stopnode --no-repair 1 mydatabase This command will stop the node. Type "yes" or "y" to confirm this operation, anything else to cancel: y hadbm:Info 22202 Repair was not initiated while stopping the node {0}.</pre>
EXIT STATUS	<pre>0 command executed successfully 1 error in executing the command</pre>
ERROR CODES	<pre>22002 specified database does not exist 22085 no spare to pickup (if --no-repair is specified) 22086 node could not be stopped 22087 no mirror node</pre>

hadbm-stopnode(1)

22088 node is not running

22202 repair not initiated

NAME	hadbm unregisterpackage – removes registered HADB packages from the management domain
SYNOPSIS	hadbm unregisterpackage [--hosts= <i>hostlist</i>] [--adminpassword= <i>password</i> --adminpasswordfile= <i>filename</i>] [--agent= <i>ma_url</i>] [<i>package_name</i>]
DESCRIPTION	<p>Use the hadbm unregisterpackage command to remove the HADB packages that are registered with the management domain. The default package name is a string starting with V and containing the version number of the hadbm program. If the --hosts option is omitted, the hostlist defaults to the enabled hosts where the package is registered.</p> <p>Before using the hadbm unregisterpackage command, ensure that all management agents are configured and running on all the hosts in the hostlist, the management agent's repository is available for updates, the package is registered in the management domain, and no existing databases are configured to run on the package about to be unregistered.</p>
OPTIONS	<p>-H--hosts A comma-separated or double quote enclosed space separated list of hosts to register the package on.</p> <p>-w --adminpassword The actual HADBM administration password.</p> <p>-W --adminpasswordfile The file from which the passwords are read.</p> <p>-m --agent Identifies the URL to the Management Agent. The default is localhost:1862.</p>
OPERANDS	<i>package_name</i> The name of the package you wish to remove from the domain.
EXAMPLES	<p>EXAMPLE 1 Unregistering a software package named v4</p> <pre>hadbm unregisterpackage v4</pre> <p>Package successfully unregistered</p> <p>EXAMPLE 2 Unregistering a software package named v4 from specific hosts in the domain</p> <pre>hadbm unregisterpackage --hosts=host1,host2,host3 v4</pre> <p>Package successfully unregistered</p>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
ERROR CODES	<p>22172 the software package is not registered in the domain</p> <p>22173 the software package is in use by a database instance and cannot be removed</p>

NAME	help – displays the asadmin utility commands																																						
SYNOPSIS	help [<i>or</i> --help -h -?]																																						
DESCRIPTION	<p>The help command displays a list of all the asadmin utility commands. Specify the command to display the usage information for that command. To display the manpage of each command, use the syntax: asadmin <i>command_name</i> —help -h -? or asadmin help <i>command_name</i></p> <p>The following is a list of all the asadmin utility commands:</p> <table border="0"> <tr> <td>add-resources</td> <td>registers the resource in the XML file specified</td> </tr> <tr> <td>backup-domain</td> <td>performs a backup on the domain</td> </tr> <tr> <td>change-master-password</td> <td>changes the master password</td> </tr> <tr> <td>clear-ha-store</td> <td>deletes tables in the HA database</td> </tr> <tr> <td>configure-ha-cluster</td> <td>configures an existing cluster to be High Availability</td> </tr> <tr> <td>configure-ha-persistence</td> <td>enables configuration of parameters related to session persistence</td> </tr> <tr> <td>copy-config</td> <td>copies an existing configuration to create a new configuration</td> </tr> <tr> <td>create-admin-object</td> <td>adds the administered object with the specified JNDI name</td> </tr> <tr> <td>create-application-ref</td> <td>creates a reference to an application</td> </tr> <tr> <td>create-audit-module</td> <td>creates an audit module for the optional plugin module</td> </tr> <tr> <td>create-auth-realm</td> <td>adds the new authorized realm</td> </tr> <tr> <td>create-cluster</td> <td>creates a cluster</td> </tr> <tr> <td>create-connector-connection-pool</td> <td>adds a connection pool with the specified connection pool name</td> </tr> <tr> <td>create-connector-resource</td> <td>registers the resource with the specified JNDI name</td> </tr> <tr> <td>create-connector-security-map</td> <td>creates or modifies a security map for the namedconnector connection pool</td> </tr> <tr> <td>create-custom-resource</td> <td>registers the custom resource</td> </tr> <tr> <td>create-domain</td> <td>creates a domain with the given name</td> </tr> <tr> <td>create-file-user</td> <td>creates a new file user</td> </tr> <tr> <td>create-ha-store</td> <td>creates tables in HA database that are used by HA cluster</td> </tr> </table>	add-resources	registers the resource in the XML file specified	backup-domain	performs a backup on the domain	change-master-password	changes the master password	clear-ha-store	deletes tables in the HA database	configure-ha-cluster	configures an existing cluster to be High Availability	configure-ha-persistence	enables configuration of parameters related to session persistence	copy-config	copies an existing configuration to create a new configuration	create-admin-object	adds the administered object with the specified JNDI name	create-application-ref	creates a reference to an application	create-audit-module	creates an audit module for the optional plugin module	create-auth-realm	adds the new authorized realm	create-cluster	creates a cluster	create-connector-connection-pool	adds a connection pool with the specified connection pool name	create-connector-resource	registers the resource with the specified JNDI name	create-connector-security-map	creates or modifies a security map for the namedconnector connection pool	create-custom-resource	registers the custom resource	create-domain	creates a domain with the given name	create-file-user	creates a new file user	create-ha-store	creates tables in HA database that are used by HA cluster
add-resources	registers the resource in the XML file specified																																						
backup-domain	performs a backup on the domain																																						
change-master-password	changes the master password																																						
clear-ha-store	deletes tables in the HA database																																						
configure-ha-cluster	configures an existing cluster to be High Availability																																						
configure-ha-persistence	enables configuration of parameters related to session persistence																																						
copy-config	copies an existing configuration to create a new configuration																																						
create-admin-object	adds the administered object with the specified JNDI name																																						
create-application-ref	creates a reference to an application																																						
create-audit-module	creates an audit module for the optional plugin module																																						
create-auth-realm	adds the new authorized realm																																						
create-cluster	creates a cluster																																						
create-connector-connection-pool	adds a connection pool with the specified connection pool name																																						
create-connector-resource	registers the resource with the specified JNDI name																																						
create-connector-security-map	creates or modifies a security map for the namedconnector connection pool																																						
create-custom-resource	registers the custom resource																																						
create-domain	creates a domain with the given name																																						
create-file-user	creates a new file user																																						
create-ha-store	creates tables in HA database that are used by HA cluster																																						

help(1)

create-http-health-checker	creates a health-checker for a specified load balancer configuration
create-http-lb-config	creates a configuration for the load balancer
create-http-lb-ref	add an existing cluster or server instance to an existing load balancer configuration
create-http-listener	adds a new HTTP listener socket
create-iiop-listener	adds the IIOP listener
create-instance	creates an instance with the given name
create-javamail-resource	registers the Javamail resource
create-jdbc-connection-pool	registers the JDBC connection pool
create-jdbc-resource	registers the JDBC resource
create-jms-host	creates a JMS host
create-jms-resource	registers the JMS resource
create-jmsdest	adds the named destination
create-jndi-resource	registers the JNDI resource
create-jvm-options	creates the JVM options from the Java configuration or profiler elements
create-lifecycle-module	adds a lifecycle module
create-message-security-provider	enables administrators to create the <code>message-security-config</code> and <code>provider-config</code> sub-elements for the security service in <code>domain.xml</code>
create-node-agent	creates a node agent and its associated directory structure
create-node-agent-config	adds a new unbound node agent to a domain
create-password-alias	creates a password alias
create-persistence-resource	registers the persistence resource
create-profiler	creates the profiler element
create-resource-adapter-config	creates the resource adapter Java bean
create-resource-ref	creates a reference to a resource
create-ssl	creates the SSL element in the HTTP listener or IIOP listener

create-system-properties	adds or updates one or more system properties of the domain, configuration, cluster, or server instance
create-threadpool	creates the thread pool
create-virtual-server	adds the named virtual server
delete-admin-object	removes the administered object with the specified JNDI name
delete-application-ref	removes a reference to an application
delete-audit-module	deletes the audit-module for the optional plugin module
delete-auth-realm	removes the named authorized realm
delete-cluster	deletes a cluster
delete-config	deletes an existing configuration
delete-connector-connection-pool	removes the specified connection pool
delete-connector-resource	removes the named resource connector
delete-connector-security-map	deletes the named security map
delete-custom-resource	removes the custom resource
delete-domain	deletes the given domain
delete-file-user	removes the named file user
delete-http-health-checker	deletes a health-checker for a specified load balancer configuration
delete-http-lb-config	deletes a load balancer configuration
delete-http-lb-ref	deletes the cluster or server instance from a load balancer configuration
delete-iiop-listener	removes the IIOP listener
delete-instance	deletes the instance that is not running
delete-javamail-resource	removes the Javamail resource
delete-jdbc-connection-pool	removes the JDBC connection pool
delete-jdbc-resource	removes the JDBC resource
delete-jms-host	removes a JMS host
delete-jms-resource	removes the JMS resource
delete-jmsdest	destroys the named destination
delete-jndi-resource	removes the JNDI resource

help(1)

delete-jvm-options	deletes the JVM options from the Java configuration or profiler elements
delete-lifecycle-module	removes the lifecycle module
delete-message-security-provider	enables administrators to delete a <code>provider-config</code> sub-element for the given message layer (<code>message-security-config</code> element of <code>domain.xml</code>)
delete-node-agent	deletes the node agent and its associated directory structure
delete-node-agent-config	removes a node agent from a domain
delete-password-alias	deletes a password alias
delete-persistence-resource	removes the persistence resource
delete-profiler	deletes the profiler element
delete-resource-adapter-config	deletes the resource adapter Java bean
delete-resource-ref	removes a reference to a resource
delete-ssl	deletes the <code>ssl</code> element from the HTTP listener or IIOP listener
delete-system-property	removes one or more system properties of the domain, configuration, cluster, or server instance
delete-threadpool	deletes the thread pool
delete-virtual-server	deletes the virtual server with the named virtual server ID
deploy	deploys the specified component
deploydir	deploys the component that is in the directory located on domain application server
disable	stops the component
disable-http-lb-application	disables an application managed by a load balancer
disable-http-lb-server	disables a sever or cluster managed by a load balancer
enable	runs the component
enable-http-lb-application	enables a previously-disabled application managed by a load balancer
enable-http-lb-server	enables a previously disabled sever or cluster managed by a load balancer

export	marks a variable name for automatic export to the environment of subsequent commands in multimode
export-http-lb-config	exports the load balancer configuration to a file that can be used by the load balancer
freeze-transaction-service	immobilizes the named transaction service
get	gets the values of the monitorable or configurable attributes
get-client-stubs	gets the stubs of the client
help	displays a list of all the commands available in the Command-line interface
jms-ping	checks to see if the JMS provider is up and running
list	lists the configurable elements
list-admin-objects	gets all the administered objects
list-application-refs	lists all application references in a cluster or unclustered server instance
list-audit-modules	lists the audit modules
list-auth-realms	lists the authorized realms
list-backups	lists all backups and restores
list-clusters	lists the existing clusters
list-configs	lists all existing configurations
list-connector-connection-pools	gets all the connection pools
list-connector-resources	gets all the connector resources
list-connector-security-maps	lists the security maps for the connector connection pool
list-custom-resources	gets all the custom resources
list-domains	lists the domains in the given domains directory
list-file-groups	lists the file groups
list-file-users	lists the file users
list-http-lb-configs	lists load balancer configurations
list-http-listeners	gets the HTTP listeners
list-iiop-listeners	gets the IIOP listeners
list-instances	lists all the instances in the server

help(1)

list-javamail-resources	gets all the Javamail resources
list-jdbc-connection-pools	registers the JDBC connection pool
list-jdbc-resources	gets all the JDBC resources
list-jms-hosts	lists the existing JMS hosts
list-jms-resources	gets all the JMS resources
list-jmsdest	gets all the named destinations
list-jndi-entries	gets all the named destinations browses and queries the JNDI tree
list-jndi-resources	gets all the JNDI resources
list-lifecycle-modules	gets the lifecycle modules
list-message-security-providers	enables administrators to list all security message providers (<code>provider-config</code> sub-elements) for the given message layer (<code>message-security-config</code> element of <code>domain.xml</code>)
list-node-agents	lists the node agents along with their status
list-password-aliases	lists all password aliases
list-persistence-resources	gets all the persistence resources
list-resource-adapter-configs	lists the resource adapters configured in an instance
list-resource-refs	lists the existing resource references
list-sub-components	lists EJBs or Servlets in a deployed module or in a module of a deployed application
list-system-properties	lists the system properties of the domain, configuration, cluster, or server instance
list-threadpools	lists the thread pools
list-timers	lists all of the timers owned by server instance(s)
list-virtual-servers	gets the virtual servers
migrate-timers	moves a timer when a server instance stops
multimode	allows you to execute multiple commands while returning environment settings and remaining in the <code>asadmin</code> utility
ping-connection-pool	tests if a connection pool is usable
recover-transactions	manually recovers pending transactions

rollback-transaction	rollback the named transaction
remove-ha-cluster	returns an HA cluster to non-HA status
restore-domain	restores files from backup
set	sets the values of attributes
show-component-status	displays the status of the deployed component
start-cluster	starts a cluster
start-domain	starts the given domain
start-instance	starts a server instance
start-node-agent	starts a node agent
stop-cluster	stops a cluster
stop-domain	stops the given domain
stop-instance	stops a server instance
stop-node-agent	stops a node agent
undeploy	removes a component in the domain application server
unfreeze-transaction-service	mobilizes the named transaction service
unset	removes one or more variables from the multimode environment
update-file-user	updates a current file user as specified
update-password-alias	updates a password alias
update-connector-security-map	updates the security map for the specified connector connection pool
verify-domain-xml	verifies the content of the domain.xml
version	displays the version information

The following commands are deprecated:

1. display-license
2. install-license
3. restart-instance
4. shutdown
5. create-acl
6. delete-acl
7. list-acls
8. start-appserv
9. stop-appserv

help(1)

EXAMPLES

EXAMPLE 1 Using help

```
asadmin> help
asadmin> create-domain --help
```

Where: **create-domain** is the command you wish to view the usage for.

NAME	install-license – installs the license file
SYNOPSIS	install-license
DESCRIPTION	install-license prevents unauthorized use of the Sun ONE Application Server. Allows you to install the license file. This command can be run locally only.
EXAMPLES	EXAMPLE 1 Using install-license asadmin> install-license LICENSE agreement will be displayed. Do you agree with the terms of this license [YES NO] YES Enter license key> ***** Installed the license
EXIT STATUS	0 command executed successfully 1 error in executing the command
SEE ALSO	display-license(1) , version(1)

jms-ping(1)

NAME	jms-ping – checks to see if the JMS service is up and running												
SYNOPSIS	jms-ping --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [<i>target</i>]												
DESCRIPTION	<p>The <code>jms-ping</code> command checks to see if the JMS service (also known as the JMS provider) is up and running. When you start the Application Server, the JMS service starts by default.</p> <p>The <code>jms-ping</code> command pings only the default JMS host within the JMS service. It throws an exception when it is unable to ping a built-in JMS service.</p> <p>This command is supported in remote mode only.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASEXPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASEXPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASEXPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

OPERANDS	<p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p><code>-e --echo</code> Setting to true will echo the command line statement on the standard output. Default is false.</p> <p><code>-I --interactive</code> If set to true (default), only the required password options are prompted.</p> <p><code>-h --help</code> Displays the help text for the command.</p> <p><i>target</i> In Enterprise Edition, this operand specifies the target for which the operation is to be performed. Valid values are:</p> <ul style="list-style-type: none"> ■ <i>server</i>, which pings the JMS service for the default server instance <i>server</i> and is the default value ■ <i>configuration_name</i>, which pings the JMS service for all clusters using the specified configuration ■ <i>cluster_name</i>, which pings the JMS service for the specified cluster ■ <i>instance_name</i>, which pings the JMS service for a particular server instance
EXAMPLES	<p>EXAMPLE 1 Using the jms-ping command</p> <p>The following command checks to see if the JMS service is running on the server instance <code>server1</code>:</p> <pre>asadmin> jms-ping --user admin --passwordfile passwords.txt --host bluestar --port 4848 server1 JMS Ping Status=RUNNING Command jms-ping executed successfully.</pre>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>

jspc(1M)

NAME	jspc – precompiles JSP source files into servlets	
SYNOPSIS	jspc [<i>options</i>] <i>jsp_files</i> or jspc [<i>options</i>] -webapp <i>dir</i>	
DESCRIPTION	Use the <code>jspc</code> command to compile your JSP 2.0 compliant source files into servlets. To allow the Application Server to pick up the precompiled JSP pages from a JAR file, specify the <code>-compile</code> and <code>-webinc</code> or <code>-webxml</code> options, which cause the JSP pages to be mapped to their corresponding servlet class files. This means that the JSP compiler will be bypassed when those JSPs are accessed.	
OPTIONS	<i>jsp_files</i>	one or more JSP files to be compiled.
	<code>-webapp</code> <i>dir</i>	a directory containing a web application. All JSPs in the directory and its subdirectories are compiled. You cannot specify a WAR, JAR, or ZIP file; you must first deploy it to an open directory structure using <code>asadmin deploy</code> .
	<code>-d</code> <i>dir</i>	the output directory for the compiled JSPs. Package directories are automatically generated based on the directories containing the uncompiled JSPs. The default directory is the directory specified by the <code>java.io.tmpdir</code> property, or the current directory.
	<code>-p</code> <i>name</i>	the name of the target package for all specified JSPs, which is prepended to the package component derived from the directory in which the JSP pages are located. The default is <code>org.apache.jsp</code> .
	<code>-c</code> <i>name</i>	the target class name of the first JSP compiled. Subsequent JSPs are unaffected.
	<code>-l</code>	outputs the name of the JSP page upon failure.
	<code>-s</code>	outputs the name of the JSP page upon success.
	<code>-uribase</code> <i>dir</i>	the URI directory to which compilations are relative. Applies only to JSP files listed in the command, and not to JSP files specified with <code>-webapp</code> option. This is the location of each JSP file relative to the <code>uriroot</code> . If this cannot be determined, the default is <code>/</code> .
	<code>-uriroot</code> <i>dir</i>	the root directory against which URI files are resolved. Applies only to JSP files listed in the command, and not to JSP files specified with <code>-webapp</code> option. If this option is not specified, all parent directories of the first JSP page are searched for a <code>WEB-INF</code> subdirectory. The closest directory to the JSP page that has one is used. If none of the JSP's parent directories have a <code>WEB-INF</code> subdirectory, the directory from which <code>jspc</code> is invoked is used.
	<code>-compile</code>	Compile the generated servlets.
	<code>-v</code>	enables verbose mode.

-mapped	generates separate <code>write()</code> calls for each HTML line and comments that describe the location of each line in the JSP file. By default, all adjacent <code>write()</code> calls are combined and no location comments are generated.
-die [<i>code</i>]	causes the JVM to exit and generates an error return code if a fatal error occurs. If the code is absent or unparsable it defaults to 1.
-webinc <i>file</i>	creates partial servlet mappings for the <code>-webapp</code> option, which can be pasted into a <code>web.xml</code> file.
-webxml <i>file</i>	creates an entire <code>web.xml</code> file for the <code>-webapp</code> option.
-classpath <i>path</i>	Override the system classpath with the specified classpath.
-ieplugin <i>class_id</i>	specifies the Java plugin COM class ID for Internet Explorer. Used by the <code>jsp:plugin</code> tags.
-xpoweredBy	Adds an X-Powered-By HTTP response header.
-trimSpaces	Trim spaces in template text between actions and directives.
-help	Print a summary of the syntax and options for this command.

EXAMPLES

EXAMPLE 1 Using `jspc` to compile the JSP pages in a Web application

The following command compiles a set of JSP files into Java source files under `/home/user/Hellodir`:

```
jspc welcome.jsp shop.jsp checkout.jsp -d /home/user/Hellodir
```

The following command compiles all the JSP files in the specified webapp into class files under `/home/user/Hellodir`:

```
jspc -webapp /path_to_source_directory -compile -d /home/user/Hellodir
```

The following command compiles a set of JSP files into Java class files in `/home/user/Hellodir` with the package name `com.test.jsp` prepended to the package hierarchy found in `/path_to_source_directory`. It creates `web.xml` in the output directory.

```
jspc -webapp /path_to_source_directory -compile -webxml /home/user/Hellodir/web.xml -d /home/user/Hellodir -p com.test.jsp
```

To use these precompiled JSP pages in your web application, package the servlet class files generated under `/home/user/Hellodir` into a JAR file, place the JAR file under `WEB-INF/lib`, and copy the generated `/home/user/Hellodir/web.xml` to `WEB-INF/web.xml`.

[jspc\(1M\)](#)

SEE ALSO [asadmin\(1M\)](#)

NAME	list – lists the configurable elements
SYNOPSIS	<pre>list --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--monitor=<i>[true false]</i>] [<i>dotted_parent_attribute_name</i>]</pre>
DESCRIPTION	<p>Lists the configurable element. On Solaris, quotes are needed when executing commands with * as the option value or operand.</p> <p>The dotted notation follows these guidelines:</p> <ul style="list-style-type: none"> ■ Any list command that has a dotted name that is not followed by a wildcard (*) will get, as its result, the current node's immediate children. For example, list --monitor server lists all immediate children belonging to the server node. ■ Any list command that has a dotted name followed by a wildcard(*) will get, as its result, a hierarchical tree of children nodes from the current node. For example, list --monitor server.applications.* will list all children of applications and their subsequent child nodes and so on. ■ Any list command that has a dotted name preceded or followed by a wildcard (*) of the form <i>*dotted name</i> or <i>dotted * name</i> or <i>dotted name*</i> will get, as its result, all nodes and their children matching the regular expression created by the provided matching pattern.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p>

list(1)

-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--monitor	defaults to false; if set to false, the configurable attribute values are returned. If set to true, the monitorable attribute values are returned.

OPERANDS *dotted_parent_element_name* configurable or monitorable element name.

EXAMPLES **EXAMPLE 1** Using list to view all dotted-name prefixes

```
asadmin> list --user admin --passwordfile password.txt
--port 5001 "*"
server
server.admin-service
server.admin-service.das-config
server.application-ref.MEjbApp
server.application-ref.__ejb_container_timer_app

list-acls(1)

NAME	list-acls – gets the access control lists
SYNOPSIS	list-acls --user <i>admin_user</i> [--password <i>admin_password</i>] [--host <i>localhost</i>] [--port 4848] [--passwordfile <i>filename</i>] [--secure -s] <i>instance_name</i>
DESCRIPTION	Gets the access control lists associated with the named server instance.
OPTIONS	--user administrative user associated for the instance. --password administrative password corresponding to the administrative user. --host host name of the machine hosting the administrative instance. --port administrative port number associated with the administrative host. --secure indicates communication with the administrative instance in secured mode. --passwordfile file containing passwords appropriate for the command (e.g., administrative instance).
OPERANDS	<i>instance_name</i> name of the instance.
EXAMPLES	EXAMPLE 1 Using list-acls <pre>asadmin> list-acls --user admin --password adminadmin --host fuyako --port 7070 server1 acl1 sampleACL</pre> <p>Where: <code>acl1</code> and <code>sampleACL</code> are the names of the ACLs listed.</p>
EXIT STATUS	0 command executed successfully 1 error in executing the command
INTERFACE EQUIVALENT	Access Control List page
SEE ALSO	<code>create-acl(1)</code> , <code>delete-acl(1)</code>

NAME	list-admin-objects – gets all the administered objects
SYNOPSIS	<code>--user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [<code>--port <i>port_number</i></code>] [<code>--secure -s</code>] [<code>--terse=false</code>] [<code>--echo=false</code>] [<code>--interactive=true</code>] [<code>--help</code>] [<i>target</i>]</code>
DESCRIPTION	This command lists all the administered objects. This command is supported in remote mode only.
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p><code>-e --echo</code> Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-admin-objects(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	This is the name of the target upon which the command is operating. The valid targets for this command are instance, cluster, 'domain,' and 'server.' Server is the default option. This command is used by the Enterprise Edition only.
EXAMPLES	EXAMPLE 1 Using list-admin-objects <pre>asadmin> list-admin-objects --user admin --password admin123 instance1</pre> Command list-admin-objects executed successfully	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	create-admin-object(1) , delete-admin-object(1)	

NAME	list-application-refs – lists the existing application references
SYNOPSIS	list-application-refs --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	<p>The <code>list-application-refs</code> command lists all application references in a cluster or an unclustered server instance. This effectively lists all the modules deployed on the specified target (for example, J2EE applications, Web modules, and enterprise bean modules).</p> <p>The target instance or instances making up the cluster need not be running or available for this command to succeed.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p>--passwordfile This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

list-application-refs(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	The target for which you are listing the application references. Valid values are <ul style="list-style-type: none">■ <i>server</i>, which lists the application references for the default server instance <i>server</i> and is the default value■ <i>cluster_name</i>, which lists the application references for every server instance in the cluster■ <i>instance_name</i>, which lists the application references for the named unclustered server instance
EXAMPLES	EXAMPLE 1 Using the list-application-refs command	
		The following command lists the application references for the unclustered server instance <i>NewServer</i> .
		<pre>asadmin> list-application-refs --user admin2 --passwordfile passwords.txt NewServer ClientSessionMDBApp MEjbApp __ejb_container_timer_app Command list-application-refs executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-application-ref(1) , delete-application-ref(1)	

NAME	list-audit-modules – gets all audit modules and displays them
SYNOPSIS	list-audit-modules --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	Lists all the audit modules. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-audit-modules(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, specifies the target on which you are listing the audit modules. Valid values are <ul style="list-style-type: none">■ <i>server</i>, which creates the listener for the default server instance <i>server</i> and is the default value■ <i>configuration_name</i>, which creates the listener for the named configuration■ <i>cluster_name</i>, which creates the listener for every server instance in the cluster■ <i>instance_name</i>, which creates the listener for a particular server instance
EXAMPLES	EXAMPLE 1 Using list-audit-modules	
	<pre>asadmin> list-audit-modules --user admin1 --password adminadmin1 --host pigeon --port 5001 sampleAUditModule1 sampleAuditModule2 Command list-audit-modules executed successfully</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-audit-module(1) , delete-audit-module(1)	

NAME	list-auth-realms – lists the authentication realms
SYNOPSIS	list-auth-realms --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target_name</i>]
DESCRIPTION	Lists the authentication realms. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p> <p>-h --help Displays the help text for the command.</p>

list-auth-realms(1)

OPERANDS	<p><i>target_name</i> name of the target on which you want to list the authentication realms.</p> <ul style="list-style-type: none">■ <i>server</i>, which creates the listener for the default server instance <i>server</i> and is the default value■ <i>configuration_name</i>, which creates the listener for the named configuration■ <i>cluster_name</i>, which creates the listener for every server instance in the cluster■ <i>instance_name</i>, which creates the listener for a particular server instance
EXAMPLES	<p>EXAMPLE 1 Using list-auth-realms</p> <pre>asadmin> list-auth-realms --user admin --passwordfile password.txt --host localhost --port 4848 file ldap certificate db Command list-auth-realms executed successfully</pre> <p>Where file, ldap, certificate, and db are the listed authentication realms.</p>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	<p>create-auth-realm(1), delete-auth-realm(1)</p>

NAME	list-backups – lists all backups and restores
SYNOPSIS	list-backups [--domaindir <i>domain_directory</i>] [--description <i>description</i>] [--terse= <i>false</i>] [--verbose= <i>false</i>] <i>domain_name</i>
DESCRIPTION	This command displays the status information about all backups and restores in the backup repository. The <code>list-backups</code> command is supported in local mode only.
OPTIONS	<p>--domaindir This option specifies the parent directory of the domain upon which the command will operate. The default is <code>install_dir/domains</code>.</p> <p>--description A description can contain any string to help identify the particular backup. The description is displayed as part of the information for any backup.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-t --verbose Indicates that output data is displayed with detailed information. Default is false.</p>
OPERANDS	<i>domain_name</i> This is the name of directory from which the command extracts the list of files and restores. There must be a subdirectory of <code>domaindir</code> with this name.
EXAMPLES	<p>EXAMPLE 1 Using list-backups</p> <pre>asadmin>list-backups --domaindir directory1 sample-backup The command list-backups executed successfully.</pre>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	<code>backup-domain(1)</code> , <code>restore-domain(1)</code>

list-clusters(1)

NAME	list-clusters – lists the existing clusters
SYNOPSIS	list-clusters --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The <code>list-clusters</code> command lists the existing clusters. This command is supported in remote mode only.
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p><code>-e --echo</code> Setting to true will echo the command line statement on the standard output. Default is false.</p>

	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
OPERANDS	<i>target</i>	<p>Specifies the target for which the clusters are to be listed. Valid values are:</p> <ul style="list-style-type: none"> ■ <i>domain</i>, which lists all clusters in the domain and is the default value ■ <i>cluster_name</i>, which lists the named cluster ■ <i>instance_name</i>, which lists the cluster associated with the clustered server instance. Unlike many of the other uses of <i>instance_name</i>, this is one situation where an unclustered instance cannot be specified. ■ <i>node_agent_name</i>, which lists all clusters associated with the named node agent. For example, if agent1 manages server1 and server2, which are part of cluster1 and cluster2, then cluster1 and cluster2 will be listed.
EXAMPLES	<p>EXAMPLE 1 Using the list-clusters command</p> <p>The following command lists all clusters in the current domain.</p> <pre>asadmin> list-clusters --user admin1 --passwordfile passwords.txt MyCluster not running Command list-clusters executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-cluster(1) , delete-cluster(1) , start-cluster(1) , stop-cluster(1)	

list-components(1)

NAME	list-components – lists deployed components														
SYNOPSIS	list-components --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--type <i>application ejb web connector</i>] [<i>target</i>]														
DESCRIPTION	The command <code>list-components</code> lists all deployed J2EE components. If the <code>--type</code> option is not specified, all components are listed. The available type values are: <code>application</code> (default), <code>ejb</code> , <code>web</code> , and <code>connector</code> . This command is supported in remote mode only.														
OPTIONS	<table><tr><td><code>-u --user</code></td><td>The authorized domain application server administrative username.</td></tr><tr><td><code>-w --password</code></td><td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td></tr><tr><td><code>--passwordfile</code></td><td>This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</td></tr><tr><td><code>-H --host</code></td><td>The machine name where the domain application server is running. The default value is <code>localhost</code>.</td></tr><tr><td><code>-p --port</code></td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td><code>-s --secure</code></td><td>If set to <code>true</code>, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td><code>-t --terse</code></td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code>.</td></tr></table>	<code>-u --user</code>	The authorized domain application server administrative username.	<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASPASSWORD</code> , and so on.	<code>-H --host</code>	The machine name where the domain application server is running. The default value is <code>localhost</code> .	<code>-p --port</code>	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	<code>-s --secure</code>	If set to <code>true</code> , uses SSL/TLS to communicate with the domain application server.	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code> .
<code>-u --user</code>	The authorized domain application server administrative username.														
<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.														
<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASPASSWORD</code> , and so on.														
<code>-H --host</code>	The machine name where the domain application server is running. The default value is <code>localhost</code> .														
<code>-p --port</code>	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
<code>-s --secure</code>	If set to <code>true</code> , uses SSL/TLS to communicate with the domain application server.														
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code> .														

list-components(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>-I --type</code>	This is the type of component to be listed. The options are application, ejb, web, and connector. If nothing is specified, then all of the components are listed.
OPERANDS	<code>target</code>	This is the name of the target upon which the command operates. The valid options are instance, cluster, 'domain,' and 'server.' This option is used in Enterprise Edition only.
EXAMPLES	EXAMPLE 1 Using <code>list-components</code>	
	<pre>asadmin> list-components --type application sampleApp J2EE-application Command list-components executed successfully</pre>	
	Where: the applications that were deployed are listed.	
EXIT STATUS	0	command executed successfully

list-connection-groups(1)

NAME	list-connection—groups – gets the connection groups
SYNOPSIS	list-connection-groups --user <i>user_name</i> --password <i>password</i> --host <i>hostname</i> --port <i>admin_port_number</i> --instance <i>instance_name</i> <i>http_listener_ID</i>
DESCRIPTION	Gets the profiler element associated with the named server instance..
OPTIONS	--user identifies the user name associated with the named instance. --password identifies the password associated with the user name. --host identifies the host name for the machine. --port identifies the administrator port number associated with the hostname. --instance identifies the name of the instance associated with the JVM option to be created. <i>http_listener_ID</i> a unique identifier for the HTTP listener.
EXAMPLES	asadmin% list-connection-groups
INTERFACE EQUIVALENT	unknown
SEE ALSO	create-connection-group(1) delete-connection-group(1)

list-connector-connection-pools(1)

NAME	list-connector-connection-pools – gets connector connection pools that have been created																
SYNOPSIS	<pre>list-connector-connection-pools --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help]</pre>																
DESCRIPTION	Use this command to list connector connection pools that have been created.																
OPTIONS	<table border="0"> <tr> <td style="padding-right: 20px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 20px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 20px;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="padding-right: 20px;">-H --host</td> <td>The machine name where the domain application server is running. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

list-connector-connection-pools(1)

`-I --interactive` If set to true (default), only the required password options are prompted.

`-h --help` Displays the help text for the command.

EXAMPLES

EXAMPLE 1 Using the list-connector-connection-pools command

```
asadmin> list-connector-connection-pools --user admin -passwordfile filename
jms/qConnPool
Command list-connector-connection-pools executed successfully
```

Where jms/qConnPool is the connector connection pool that is listed.

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	list-connector-resources – gets all connector resources
SYNOPSIS	list-connector-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target</i>]
DESCRIPTION	This command lists all connector resources.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-connector-resources(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition only, this operand specifies which configurations you can list. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the connector resources in the current domain and is the default.■ <i>domain</i>, which lists the connector resources in the current domain.■ <i>cluster_name</i>, which lists the connector resources in a cluster.■ <i>instance_name</i>, which lists the connector resources for a particular instance.
EXAMPLES	EXAMPLE 1	Using the list-connector-resources command <pre>asadmin> list-connector-resources --user admin --passwordfile --password --host instance1 --port 5001 target server resource10 resource20 resource35 Command list-connector-resources executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-connector-resource(1) , delete-connector-resource(1)	

list-connector-security-maps(1)

NAME	list-connector-security-map – lists the security maps belonging to the specified connector connection pool
SYNOPSIS	<pre>list-connector-security-maps --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--verbose=<i>false</i>] [--securitymap <i>security_map_name</i>] <i>connector_connection_pool_name</i></pre>
DESCRIPTION	<p>Use this command to list the security maps belonging to the specified connector connection pool.</p> <p>For this command to succeed, you must have first created a connector connection pool using the <code>create-connector-connection-pool</code> command.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

list-connector-security-maps(1)

	<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	This option is deprecated in this release.
	<code>--verbose</code>	This property returns a list including the identity, principals, and security name.
	<code>--securitymap</code>	This property specifies the name of the security map contained within the connector connection pool from which the identity and principals should be listed. With this option, <code>-verbose</code> is redundant.
OPERANDS	<code>connector_connection_pool_name</code>	name of the connector connection pool for which you want to list security maps.
EXAMPLES	EXAMPLE 1	Using <code>list-connector-security-maps</code> with the security map option
		It is assumed that the connector pool has already been created using the <code>create-connector-pool</code> command.
		<pre>asadmin> list-connector-security-maps --user admin --passwordfile pwd_file.txt --securitymap mysecuremap securityPool1 Command list-connector-security-maps executed successfully.</pre>
		One security map (mysecuremap) is listed for the <code>securityPool1</code> pool.
	EXAMPLE 2	Using <code>list-connector-security-maps</code> without the security map option
		It is assumed that the connector pool has already been created using the <code>create-connector-pool</code> command.
		<pre>asadmin> list-connector-security-maps --user admin --passwordfile pwd_file.txt securityPool1 Command list-connector-security-maps executed successfully.</pre>
		All security maps contained within <code>securityPool1</code> are listed.
EXIT STATUS	0	command executed successfully

list-custom-resources(1)

NAME	list-custom-resources – gets all custom resources
SYNOPSIS	list-custom-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	Use this command to list custom resources. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-custom-resources(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition only, this operand specifies the location of the custom resources. Valid values are "domain," cluster, or instance. The default is domain.
EXAMPLES	EXAMPLE 1 Using the list-custom-resources command <pre>asadmin> list-custom-resources --user admin --passwordfile filename --host plum --port 4848 target6 custom_resource01 custom_resource02 Command list-custom-resources executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-custom-resource(1) , delete-custom-resource(1)	

list-domains(1)

NAME	list-domains – lists the domains in the specified domain directory
SYNOPSIS	list-domains [--domaindir <i>install_dir/domains</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>]
DESCRIPTION	Use the <code>list-domains</code> command to list the domain. If the domain directory is not specified, the domain in the default <code>install_dir/domains</code> directory is listed. If there is more than one domain, the <code>domain_name</code> operand must be identified. This command is supported in local mode only.
OPTIONS	--domaindir The directory where the domains are located. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory are listed. -t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false. -e --echo Setting to true will echo the command line statement on to the standard output. Default is false.
EXAMPLES	EXAMPLE 1 Using the list-domains command <pre>asadmin> list-domains List of domains: domain1 running samples not running</pre> Where: the <code>domain1</code> and <code>samples</code> are the domains located in the default <code>install_dir/domains</code> directory.
EXIT STATUS	0 command executed successfully 1 error in executing the command
ERROR CODES	0 error message 1 error message
SEE ALSO	<code>create-domain(1)</code> , <code>delete-domain(1)</code> , <code>start-domain(1)</code> , <code>stop-domain(1)</code> ,

NAME	list-file-groups – lists file groups														
SYNOPSIS	list-file-groups --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--name <i>username</i>] [<i>target</i>]														
DESCRIPTION	Use this command to administer user support by the file realm authentication. This command lists available groups in the file user. If the --name option is not specified, all groups are listed. This command is supported in remote mode only.														
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

list-file-groups(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--name</code>	identifies the name of file user to be created.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies which configurations you can list. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the file groups in the current server and is the default.■ <i>domain</i>, which lists the file groups in the current domain.■ <i>cluster_name</i>, which lists the file groups in a cluster.■ <i>instance_name</i>, which lists the file groups for a particular instance.
EXAMPLES	EXAMPLE 1	Using the list-file-groups command <pre>asadmin> list-file-groups --user admin1 --password adminadmin1 --host pigeon --port 5001 --name sample_user Command list-file-groups executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-file-user(1) , update-file-user(1) , delete-file-user(1) , list-file-users(1)	

NAME	list-file-users – creates a list of file users
SYNOPSIS	list-file-users --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The list-file-users command creates a list of file users supported by file realm authentication.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-file-users(1)

<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>---target</code>	in Enterprise Edition, specifies the target to which you are deploying. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which deploys the component to the default server instance <code>server</code> and is the default value■ <code>domain</code>, which deploys the component to the domain.■ <code>cluster_name</code>, which deploys the component to every server instance in the cluster.■ <code>instance_name</code>, which deploys the component to a particular sever instance.

EXAMPLES

EXAMPLE 1 Using the list-file-users command

Create file users with the `create-file-user` command before you use this command..

```
asadmin> list-file-users plum
sample_user05
sample_user08
sample_user12
```

EXIT STATUS

0	command executed successfully
1	error in executing the command

NAME	list-http-lb-configs - lists load balancer configurations
SYNOPSIS	list-http-lb-configs --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	Use the list-http-lb-configs command to list the load balancer configurations. List them all or list them by the cluster or server instance they reference.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p>

list-http-lb-configs(1)

	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	Lists the load balancers by target. Valid values are: <ul style="list-style-type: none">■ <i>cluster_name</i>, which lists the load balancer configurations for this cluster.■ <i>instance_name</i>, which lists the load balancer configurations for this instance.
EXAMPLES	EXAMPLE 1	Using the <code>list-http-lb-config</code> command <pre>asadmin> list-http-lb-configs --user admin --passwordfile file mycluster-http-lb-config serverinstlb Command list-http-lb-configs executed successfully.</pre> EXAMPLE 2 Using the <code>list-http-lb-config</code> command with the <code>target</code> operand. <pre>asadmin> list-http-lb-configs --user admin --passwordfile file mycluster mycluster-http-lb-config Command list-http-lb-configs executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command

NAME	list-http-listeners – lists the existing HTTP listeners
SYNOPSIS	list-http-listeners --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The list-http-listeners command lists the existing HTTP listeners. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-http-listeners(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies the target for which the HTTP listeners are to be listed. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the listeners for the default server instance <i>server</i> and is the default value■ <i>configuration_name</i>, which lists the listeners for the specified configuration■ <i>cluster_name</i>, which lists the listeners for the specified cluster■ <i>instance_name</i>, which lists the listeners for a particular server instance
EXAMPLES	EXAMPLE 1 Using the list-http-listeners command	
		The following command lists all the HTTP listeners for the server instance:
		<pre>asadmin> list-http-listeners --user admin1 --passwordfile passwords.txt --host pigeon --port 5001 http-listener-1 http-listener-2 admin-listener Command list-http-listeners executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>create-http-listener(1)</code> , <code>delete-http-listener(1)</code>	

NAME	list-iop-listeners – lists the existing IOP listeners
SYNOPSIS	list-iop-listeners --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The list-iop-listeners command lists the existing IOP listeners. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-iiop-listeners(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies the target for which the IIOP listeners are to be listed. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the listeners in the default server instance <i>server</i> and is the default value■ <i>configuration_name</i>, which lists the listeners in the specified configuration■ <i>cluster_name</i>, which lists the listeners in the specified cluster■ <i>instance_name</i>, which lists the listeners in a particular server instance
EXAMPLES	EXAMPLE 1 Using the list-iiop-listeners command	
		The following command lists all the IIOP listeners for the server instance:
		<pre>asadmin> list-iiop-listeners --user admin --passwordfile passwords.txt --host fuyako --port 7070 orb-listener-1 SSL SSL_MUTUALAUTH sample_iiop_listener Command list-iiop-listeners executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-iiop-listener(1) , delete-iiop-listener(1)	

NAME	list-instances – lists all the instances along with their status
SYNOPSIS	list-instances --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	Use the <code>list-instances</code> to list all the instance in the server. The <code>list-instances</code> command can be run both locally and remotely. To list remote instances, the named administration server must be running on the hostname and port number specified. The user authenticates using the password identified for the administration server.
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

list-instances(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	This is the name of the target domain the instances you want listed are associated with.
EXAMPLES	EXAMPLE 1 Using list-instances in local mode	
	<pre>asadmin> list-instances --user admin --passwordfile passwords.txt instance1 Command list-instances executed successfully</pre>	
	Where: instance1 is listed.	
	EXAMPLE 2 Using list-instances in remote mode	
	<pre>asadmin> list-instances --user admin --passwordfile passwords.txt --host pigeon --port 4849 remote_instance1 running Command list-instances executed successfully</pre>	
	Where: remote-instance1 associates with user, passwordfile, host, and port of the remote machine.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-instance(1)	

NAME	list-javamail-resources – lists the existing JavaMail session resources
SYNOPSIS	list-javamail-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The command lists the existing JavaMail session resources. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-javamail-resources(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies the target for which the JavaMail session resources are to be listed. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the resources for the default server instance <i>server</i> and is the default value■ <i>domain</i>, which lists the resources for the domain■ <i>cluster_name</i>, which lists the resources for the specified cluster■ <i>instance_name</i>, which lists the resources for a particular server instance
EXAMPLES	EXAMPLE 1 Using the list-javamail-resources command	
		The following command lists the JavaMail session resources for the server instance:
		<pre>asadmin> list-javamail-resources --user admin1 --passwordfile passwords.txt --host pigeon --port 5001 mail/MyMailSession Command list-javamail-resources executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-javamail-resource(1) , delete-javamail-resource(1)	

NAME	list-jdbc-connection-pools – lists all JDBC connection pools																
SYNOPSIS	<pre>list-jdbc-connection-pools --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help]</pre>																
DESCRIPTION	Use this command to get the JDBC connection pools that have been created. This command is supported in remoted mode only.																
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> <tr> <td style="vertical-align: top;">-e --echo</td> <td>Setting to true will echo the command line statement on the standard output. Default is false.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-u --user	The authorized domain application server administrative username.																
-w --password	The --password option is deprecated. Use --passwordfile instead.																
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.																
-H --host	The machine name where the domain application server is running. The default value is localhost.																
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.																
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.																
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.																

list-jdbc-connection-pools(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	The target operand is deprecated.
EXAMPLES	EXAMPLE 1 Using the list-jdbc-connection-pools command	
	<pre>asadmin> list-jdbc-connection-pools --user admin --password adminadmin --host plum --port 7070 my_connection_pool</pre>	
	Where: <i>my_connection_pool</i> is the JDBC connection pool listed.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jdbc-connection-pool(1) , delete-jdbc-connection-pool(1)	

NAME	list-jdbc-resources – gets all JDBC resources
SYNOPSIS	list-jdbc-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>target</i>
DESCRIPTION	The <code>list-jdbc-resource</code> command produces a list of JDBC resources that have been created. This command is supported in remote mode only.
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p><code>-e --echo</code> Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-jdbc-resources(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies which jdbc resources you can list. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the jdbc resources in the current server and is the default.■ <i>domain</i>, which lists the jdbc resources in the current domain.■ <i>cluster_name</i>, which lists the jdbc resources in a cluster.■ <i>instance_name</i>, which lists the jdbc resources for a particular instance.
EXAMPLES	EXAMPLE 1 Using the list-jdbc-resources command	
	<pre>asadmin> list-jdbc-resources instance1 sample_jdbc_resource02 sample_jdbc_resource05 Command executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jdbc-resource(1) , delete-jdbc-resource(1)	

NAME	list-jmsdest – lists the existing JMS physical destinations
SYNOPSIS	list-jmsdest --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [desttype <i>type</i>] [<i>target</i>]
DESCRIPTION	The list-jmsdest command lists the JMS physical destinations. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-jmsdest(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>-T --desttype</code>	The type of JMS destinations to be listed. Valid values are <code>topic</code> and <code>queue</code> .
OPERANDS	<i>target</i>	<p>In Enterprise Edition, this operand specifies the target for which the physical destinations are to be listed. Although the <code>list-jmsdest</code> command is related to resources, a physical destination is created and deleted using the JMS Service, which is part of the configuration. Valid values are:</p> <ul style="list-style-type: none">■ <code>server</code>, which lists the physical destinations for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which lists the physical destinations for the specified configuration■ <code>cluster_name</code>, which lists the physical destinations for the specified cluster■ <code>instance_name</code>, which lists the physical destinations for a particular server instance
EXAMPLES	EXAMPLE 1 Using the <code>list-jmsdest</code> command	<p>The following command lists all the physical destinations for the default server instance:</p> <pre>asadmin> list-jmsdest --user admin --passwordfile passwords.txt --host bluestar --port 4848 PhysicalQueue queue {} PhysicalTopic topic {} Command list-jmsdest executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jmsdest(1) , delete-jmsdest(1)	

NAME	list-jms-hosts – lists the existing JMS hosts
SYNOPSIS	list-jms-hosts --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The list-jms-hosts command lists the existing JMS hosts for the JMS service. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-jms-hosts(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies the target for which the JMS hosts are to be listed. Valid values are: <ul style="list-style-type: none">■ <i>server</i>, which lists the JMS hosts for the default server instance <i>server</i> and is the default value■ <i>configuration_name</i>, which lists the JMS hosts for the specified configuration■ <i>cluster_name</i>, which lists the JMS hosts for the specified cluster■ <i>instance_name</i>, which lists the JMS hosts for a particular server instance
EXAMPLES	EXAMPLE 1 Using the list-jms-hosts command	
	The following command lists the JMS hosts for the server configuration.	
	<pre>asadmin> list-jms-hosts --user admin --passwordfile passwords.txt server-config default_JMS_host MyNewHost Command list-jms-hosts executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jms-host(1) , delete-jms-host(1)	

NAME	list-jms-resources – lists the JMS resources
SYNOPSIS	list-jms-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--restype <i>type</i>] [<i>target</i>]
DESCRIPTION	The <code>list-jms-resources</code> command lists the existing JMS resources (destination and connection factory resources). This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-jms-resources(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--restype</code>	The JMS resource type, which can be either <code>javax.jms.Topic</code> , <code>javax.jms.Queue</code> , <code>javax.jms.ConnectionFactory</code> , <code>javax.jms.TopicConnectionFactory</code> , or <code>javax.jms.QueueConnectionFactory</code> .
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies the target for which the JMS resources are to be listed. Valid values are: <ul style="list-style-type: none">■ <code>server</code>, which lists the resources for the default server instance <code>server</code> and is the default value■ <code>domain</code>, which lists the resources for the domain■ <code>cluster_name</code>, which lists the resources for the specified cluster■ <code>instance_name</code>, which lists the resources for a particular server instance
EXAMPLES	EXAMPLE 1 Using the <code>list-jms-resources</code> command to list all JMS resources	The following command lists all JMS resources: <pre>asadmin> list-jms-resources --user admin1 --passwordfile passwords.txt jms/Queue jms/Topic jms/QueueConnectionFactory jms/DurableTopicConnectionFactory Command list-jms-resources executed successfully.</pre>
	EXAMPLE 2 Using the <code>list-jms-resources</code> command to list JMS resources of a specified type	The following command lists all topic connection factories: <pre>asadmin> list-jms-resources --user admin1 --passwordfile passwords.txt --restype javax.jms.TopicConnectionFactory jms/DurableTopicConnectionFactory jms/TopicConnectionFactory Command list-jms-resources executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command

NAME	list-jndi-entries – browses and queries the JNDI tree
SYNOPSIS	list-jndi-entries --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--context <i>context_name</i>] [--target]
DESCRIPTION	Use this command to browse and query the JNDI tree. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-jndi-entries(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--context</code>	The name of the JNDI context or subcontext. If context is not specified, all entries in the naming service are returned. If context (such as <i>ejb</i>) is specified, all those entries are returned.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies which configurations you can list. Valid values are "server," "domain," cluster, or instance.
EXAMPLES	EXAMPLE 1 Using the list-jndi-entries command	
	<pre>asadmin> list-jndi-entries --user admin1 --passwordfile adminadmin1 --host localhost --port 5001 --context ejb Command list-jndi-resources executed successfully</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jndi-resource(1) , delete-jndi-resource(1)	

NAME	list-jndi-resources – lists all existing JNDI resources
SYNOPSIS	list-jndi-resources --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	Use the list-jndi-resources command to identify all existing JNDI resources. This command is supported in remote mode only. The target operand is only valid for Enterprise Edition.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

list-jndi-resources(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, this operand specifies which jndi resources you can list. Valid values 'server,' 'domain,' cluster, instance. The default is server.
EXAMPLES	EXAMPLE 1 Using the list-jndi-resources command	
		<pre>asadmin> list-jndi-resources --user admin --passwordfile passwords.txt --host plum --port 4849 --ta jndi_resource1 jndi_resource2 jndi_resource3 Command list-jndi-resources executed successfully</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-jndi-resource(1) , delete-jndi-resource(1)	

NAME	list-lifecycle-modules – lists the lifecycle modules
SYNOPSIS	list-lifecycle-modules --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	Lists the lifecycle modules. The lifecycle modules provide a means of running short or long duration Java-based tasks within the application server environment. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-lifecycle-modules(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<code>target</code>	This is the name of the resulting location. The valid targets for this command are configuration, instance, cluster, or server. This is used by EE only.
EXAMPLES	EXAMPLE 1 Using list-lifecycle-modules <pre>asadmin> list-lifecycle-modules --user admin --passwordfile adminpassword.txt --host fuyako --port 7070 customSetup Server1</pre>	
		Where: customSetup is the lifecycle module listed and targetserver is the default target.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-lifecycle-module(1) , delete-lifecycle-module(1)	

list-message-security-providers(1)

NAME	list-message-security-providers – enables administrators to list all security message providers (provider-config sub-elements) for the given message layer (message-security-config element of domain.xml)
SYNOPSIS	list-message-security-providers --user <i>admin_user</i> [<i>--passwordfile filename</i>] [<i>--host host_name</i>] [<i>--port port_number</i>] [<i>--secure -s</i>] [<i>--terse=false</i>] [<i>--echo=false</i>] [<i>--interactive=true</i>] [<i>--help</i>] --layer <i>message_layer</i> [<i>target</i>]
DESCRIPTION	Enables administrators to list all security message providers (provider-config sub-elements) for the given message layer (message-security-config element of domain.xml). This command is supported in remote mode only.
OPTIONS	If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.
-u --user	The authorized domain application server administrative username.
-w --password	The --password option is deprecated. Use --passwordfile instead.
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.
-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.

list-message-security-providers(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--layer</code>	The message-layer for which the provider has to be listed. The default value is SOAP.
OPERANDS	<i>target</i>	Lists all the objects of the specified type in the named configuration referenced by the named server instance or cluster. In Enterprise Edition, valid values include: <ul style="list-style-type: none">■ <i>server</i>, which deploys the component to the default server instance <i>server</i> and is the default value■ <i>config</i>, which deploys the component to the domain.■ <i>cluster</i>, which deploys the component to every server instance in the cluster.■ <i>instance</i>, which deploys the component to a particular server instance.
EXAMPLES	EXAMPLE 1 Using list-message-security-providers	The following example shows how to list message security providers for a message layer. <pre>asadmin> list-message-security-providers --user admin --layer SOAP Listing of all message security providers</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-message-security-provider(1) , delete-message-security-provider(1)	

NAME	list-node-agents – lists the node agents along with their status
SYNOPSIS	list-node-agents --user <i>user</i> --passwordfile <i>filename</i> [--host <i>localhost</i>] [--port <i>port_number</i>] [--secure= <i>false</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [<i>target</i>]
DESCRIPTION	The list-node-agents command displays the node agents along with their status (as an example, running or stopped). If the target is omitted, all node agents are listed.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>--password The --password option is deprecated. Use --passwordfile instead.</p> <p>-W --passwordfile The name of the file containing the domain application server password. The syntax for passwordfile is as follows: AS_ADMIN_PASSWORD=password. If this option is not called directly, the user will be prompted for it before the requested action is completed.</p> <p>-H --host The machine name where the domain application server is running.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Platform Edition is 4848. The default port number for Enterprise Edition is 4949.</p> <p>-s --secure If set to true, this command uses SSL/TLS to communicate with the domain application server. The default is false.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. The default is false.</p> <p>-e --echo Setting this option to true will echo the command line statement on the standard output. The default is false.</p> <p>-I --interactive If this option is set to true (default), the user will be prompted for the required password options.</p>
OPERANDS	<p><i>target</i></p> <p>This operand specifies which node agents are to be listed. The options are:</p> <ul style="list-style-type: none"> ■ “domain” This is the default. Domain lists all of the node agents in the domain. ■ <cluster-name> This lists all of the node agents associated with the named cluster. ■ <instance-name> This lists all of the node agents associated with the named server instance.

list-node-agents(1)

- `<agent-name>` This lists the named node agent.

EXAMPLES

EXAMPLE 1 Using list-node-agents

This is a basic example of how the command is used.

```
%asadmin>list-node-agents --user admin1 --passwordfile filename
agent1 not running
Command list-node-agents executed successfully.
```

Where: % is the command prompt and agent1 is the only node agent in the domain.

EXIT STATUS

0
command executed successfully

1
error in executing the command

NAME	list-password-aliases – lists all password aliases
SYNOPSIS	list-password-aliases --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help]
DESCRIPTION	This command lists all of the password aliases.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p>

list-password-aliases(1)

`-h --help` Displays the help text for the command.

EXAMPLES **EXAMPLE 1** Using list-password-aliases

```
asadmin> list-password-aliases
```

Command list-password-aliases executed successfully

EXIT STATUS

0

command executed successfully

1

error in executing the command

NAME	list-persistence-resources – gets all the persistence resources
SYNOPSIS	list-persistence-resources --user <i>admin_user</i> [<i>--passwordfile filename</i>] [<i>--host host_name</i>] [<i>--port port_number</i>] [<i>--secure -s</i>] [<i>--terse=false</i>] [<i>--echo=false</i>] [<i>--interactive=true</i>] [<i>--help</i>] <i>target</i>
DESCRIPTION	Gets all the persistence resources. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p>--passwordfile This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-persistence-resources(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	Specifies the target for which you are listing all persistence resources. This option is available only in the Sun Java System Application Server Enterprise Edition. Valid values are <ul style="list-style-type: none">■ <i>server</i>, which deploys the component to the default server instance <i>server</i> and is the default value■ <i>domain</i>, which deploys the component to the domain.■ <i>cluster_name</i>, which deploys the component to every server instance in the cluster.■ <i>instance_name</i>, which deploys the component to a particular sever instance.
EXAMPLES	EXAMPLE 1 Using list-persistence-resources	
	<pre>asadmin> list-persistence-resources --user admin --passwordfile secret.txt --host pigeon --port 5001 Command list-persistence-resources executed successfully</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-persistence-resource(1) , delete-persistence-resource(1)	

list-resource-adapter-configs(1)

NAME	list-resource-adapter-configs – lists the configuration information created in domain.xml for the connector module												
SYNOPSIS	<pre>list-resource-adapter-configs --user admin_user [--passwordfile filename] [--host host_name] [--port port_number] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--verbose=false] [--raname connectorModuleName] [target]</pre>												
DESCRIPTION	<p>This command lists the configuration information in the domain.xml for the connector module. It lists an entry called resource-adapter-config in the domain.xml.</p> <p>This command is supported in remote mode only.</p>												
OPTIONS	<table border="0"> <tr> <td style="padding-right: 20px;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="padding-right: 20px;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="padding-right: 20px;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The default value is localhost.</td> </tr> <tr> <td style="padding-right: 20px;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="padding-right: 20px;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=password, where password is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=password, where password is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

list-resource-adapter-configs(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--verbose</code>	Setting this property lists the properties that are configured.
	<code>--raname</code>	This is the connector module name.
OPERANDS	<code>target</code>	This is the name of the target upon which the command is operating. The valid targets for this command are instance, cluster, "domain," and "server." Server is the default option. This operand is used in EE only.
EXAMPLES	EXAMPLE 1 Using <code>list-resource-adapter-configs</code> <code>asadmin> list-resource-adapter-configs --user admin1</code> <code>--passwordfile pfile1</code> Command <code>list-resource-adapter-configs</code> executed successfully	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	<code>create-resource-adapter-config(1)</code> , <code>delete-resource-adapter-config(1)</code>	

NAME	list-resource-refs – lists the existing resource references
SYNOPSIS	list-resource-refs --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	<p>The <code>list-resource-refs</code> command lists all resource references in a cluster or an unclustered server instance. This effectively lists all the resources (for example, JDBC resources) available in the JNDI tree of the specified target.</p> <p>The target instance or instances making up the cluster need not be running or available for this command to succeed.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p>--passwordfile This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

list-resource-refs(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	The target for which you are listing the resource references. Valid values are <ul style="list-style-type: none">■ <i>server</i>, which lists the resource references for the default server instance <i>server</i> and is the default value■ <i>cluster_name</i>, which lists the resource references for every server instance in the cluster■ <i>instance_name</i>, which lists the resource references for the named unclustered server instance
EXAMPLES	EXAMPLE 1 Using the list-resource-refs command	
		The following command lists the resource references for the cluster <i>MyCluster</i> .
		<pre>asadmin> list-resource-refs --user admin --passwordfile passwords.txt MyCluster jms/Topic Command list-resource-refs executed successfully.</pre>
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-resource-ref(1) , delete-resource-ref(1)	

NAME	list-sub-components – lists EJBs or Servlets in deployed module or module of deployed application
SYNOPSIS	list-sub-components --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--type <i>ejbs</i> <i>servlets</i>] [--appname <i>appname</i>] <i>modulename</i>
DESCRIPTION	This command lists EJBs or Servlets in a deployed module or in a module of the deployed application. If a module is not identified, all modules are listed. The --appname option functions only when the given module is standalone. To display a specific module in an application, you must specify the module name and the --appname option. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p>

list-sub-components(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--type</code>	This is the type of component to be listed. The options are ejbs and servlets. If nothing is specified, then all of the components are listed.
	<code>--appname</code>	To display the sub components of a module in the deployed application, you must specify the modulename and use the <code>-appname</code> option. However, this option is required only when the desired output is the sub component of an embedded module of a deployed application.
OPERANDS	<code>modulename</code>	This is the name of the module containing the sub-component.
EXAMPLES	EXAMPLE 1 Using <code>list-sub-components</code> <pre>asadmin> list-sub-components --appname sampleApp --modulename --appname appname1 modulename</pre> Command <code>list-sub-components</code> executed successfully.	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	<code>deploy(1)</code> , <code>deploydir(1)</code> , <code>undeploy(1)</code> , <code>enable(1)</code> , <code>disable(1)</code> , <code>list-components(1)</code>	

NAME	list-system-properties – lists the system properties of the domain, configuration, cluster, or server instance
SYNOPSIS	lists-system-properties --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [target <i>target_name</i>]
DESCRIPTION	Shared or clustered server instances will often need to override attributes defined in their referenced configuration. Any configuration attribute in a server instance can be overridden through a system property of the corresponding name. This command lists the system properties of a domain, configuration, cluster, or server instance.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

list-system-properties(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	In Enterprise Edition, specifies the target on which you are listing the system properties. Valid values are <ul style="list-style-type: none">■ <i>domain</i>, which lists the system properties defined for the domain■ <i>configuration_name</i>, lists the system properties for the named configuration as well as those the cluster inherits from the domain.■ <i>cluster_name</i>, which lists the system properties defined for the named cluster as well as those the cluster inherits from its configuration and the domain.■ <i>instance_name</i>, which lists the system properties defined for the named server instance as well as those the server inherits from its cluster (if the instance is clustered), its configuration, and the domain.
EXAMPLES	EXAMPLE 1 Using list-system-properties	
	<pre>asadmin> list-system-properties --user admin --passwordfile password.txt --host localhost --port 4849 http-listener-port=1088 mycluster http-listener-port=1088 Command list-system-properties executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-system-properties(1) , delete-system-property(1)	

NAME	list-threadpools – lists all the threadpools
SYNOPSIS	list-threadpools --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>]
DESCRIPTION	Lists all the thread pools. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-threadpools(1)

<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target for which you are listing the threadpools. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance

EXAMPLES

EXAMPLE 1 Using list-threadpools

```
asadmin> list-threadpools --user admin --passwordfile password.txt
Command list-threadpools executed successfully
```

EXIT STATUS

0	command executed successfully
1	error in executing the command

[create-threadpool\(1\)](#), [delete-threadpool\(1\)](#)

NAME	list-timers – lists all of the timers owned by server instance(s)
SYNOPSIS	list-timers --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>target</i>
DESCRIPTION	This command lists the timers owned by a specific server instance or a cluster of server instances. Administrators can use this information to decide whether to do a timer migration or to verify that a migration has been completed successfully. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-timers(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	The target is either a stand-alone server instance or a cluster. If the target is the stand-alone instance, then the number of timers owned by the instance is listed. If the target is a cluster, then the number of timers owned by each instance in the cluster is listed.
EXAMPLES	EXAMPLE 1 Using list-timers	
		This is an example of how the command is used.
		<code>asadmin>list-timers --user admin --passwordfile filename target dancer</code> The list-timers command was executed successfully.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	migrate-timers(1)	

NAME	list-transaction-id – lists the transactions IDs
SYNOPSIS	list-transaction-id --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	This command lists the transaction IDs in the named target. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-transaction-id(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	This is used in Enterprise Edition only. This is the name of the target upon which the command operates.
EXAMPLES	EXAMPLE 1 Using list-transaction-id	
	<code>asadmin> list-transaction-id --user admin --passwordfile password.txt --target server</code>	The list-transaction-id command executed successfully
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>freeze-transaction-service(1)</code> , <code>unfreeze-transaction-service(1)</code> , <code>rollback-transaction(1)</code>	

NAME	list-virtual-servers – lists the existing virtual servers
SYNOPSIS	list-virtual-servers --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>target</i>]
DESCRIPTION	The list-virtual-servers command lists the existing virtual servers. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

list-virtual-servers(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>target</i>	<p>In Enterprise Edition, this operand specifies the target for which the virtual servers are to be listed. Valid values are:</p> <ul style="list-style-type: none">■ <i>server</i>, which lists the virtual servers in the default server instance <i>server</i> and is the default value■ <i>configuration_name</i>, which lists the virtual servers in the specified configuration■ <i>cluster_name</i>, which lists the virtual servers in the specified cluster■ <i>instance_name</i>, which lists the virtual servers in a particular server instance
EXAMPLES	<p>EXAMPLE 1 Using the list-virtual-servers command</p> <p>The following command lists all the virtual servers for the server instance:</p> <pre>asadmin> list-virtual-servers --user admin --passwordfile passwords.txt --host localhost --port 4848 server __asadmin Command list-virtual-servers executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	create-virtual-server(1) , delete-virtual-server(1)	

NAME	migrate-timers – moves a timer when a server instance stops
SYNOPSIS	migrate-timers --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--destination <i>destination_server_name</i>] <i>server_name</i>
DESCRIPTION	The function of the migrate-timer command is to move the timer to a specified server, when the server instance stops or fails abnormally. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

migrate-timers(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--destination</code>	This is the destination server instance. If this option is not specified, then DAS will find a server instance or multiple server instances. A migration notification will be sent to the selected server instances.
OPERANDS	<i>server_name</i>	This is the current location of the server instance. The server instance should not be active during this process.
EXAMPLES	EXAMPLE 1 Using migrate-timers	
		This is a simple example of how to use the command.
		<code>asadmin>migrate-timers myserver</code> This command was successfully executed.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>list-timers(1)</code>	

NAME	multimode – allows you to execute multiple commands while preserving environment settings and remaining in the asadmin utility
SYNOPSIS	multimode [--file <i>filename</i>] [--printprompt=true] [--encoding <i>encode</i>] [--terse=false] [--echo=false]
DESCRIPTION	<p>Use <code>multimode</code> to process the <code>asadmin</code> commands. The command-line interface will prompt you for a command, execute that command, display the results of the command, and then prompt you for the next command. Additionally, all the <code>asadmin</code> option names set in this mode are used for all the subsequent commands. You can set your environment and run commands until you exit <code>multimode</code> by typing “<code>exit</code>” or “<code>quit</code>.” You can also provide commands by passing a previously prepared list of commands from a file or standard input (pipe). You can invoke <code>multimode</code> from within a <i>multimode</i> session; once you exit the second <i>multimode</i> environment, you return to your original <i>multimode</i> environment.</p> <p>This command is supported in local mode only.</p>
OPTIONS	<p>--file reads the commands as defined in the file.</p> <p>--printprompt allows the printing of <code>asadmin</code> prompt after each command is executed. Set this option to <code>false</code> when the commands are piped or redirected from the standard input or file. By default the option is set to <code>true</code>.</p> <p>--encoding specifies the locale for the file to be decoded.</p> <p>--terse indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is <code>false</code>.</p> <p>--echo setting to <code>true</code> will echo the command line statement on to the standard output. Default is <code>false</code>.</p>
EXAMPLES	<p>EXAMPLE 1 Using <code>multimode</code> to execute multiple commands</p> <pre>% asadmin multimode --file commands_file.txt</pre> <p>Where: % is the system prompt. The administrative commands are executed from the <code>commands_file.txt</code> file.</p>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
SEE ALSO	export(1) , unset(1)

package-appclient(1M)

NAME package-appclient – packs the application client container libraries and jar files

SYNOPSIS `package-appclient`

DESCRIPTION Use the `package-appclient` command to pack the application client container libraries and jar files into an `appclient.jar` file. The created file is located at `appserver_install_dir/lib/appclient/appclient.jar`. The `appclient.jar` file provides an application client container package targeted at remote hosts that do not contain a server installation.

The `appclient.jar` archive contains native code and can be used on a target machine that is of similar architecture as the machine where it was produced. So, for example, an `appclient.jar` produced on a Solaris SPARC platform cannot be used on a Windows client machine.

After copying the `appclient.jar` file to a remote location, `unjar` it to get a set of libraries and jar files in the `appclient` directory

After unjarring on the client machine, modify `appclient_install_dir/config/asenv.conf` (`asenv.bat` for Windows) as follows:

- set `AS_WEBSERVICES_LIB` to `appclient_install_dir/lib`
- set `AS_NSS` to `appclient_install_dir/lib` (`appclient_install_dir\bin` for Windows)
- set `AS_IMQ_LIB` to `appclient_install_dir/imq/lib`
- set `AS_INSTALL` to `appclient_install_dir`
- set `AS_JAVA` to your JDK 1.4 home directory
- set `AS_ACC_CONFIG` to `appclient_install_dir/config/sun-acc.xml`

Modify `appclient_install_dir/config/sun-acc.xml` as follows:

- Ensure the `DOCTYPE` file references `appclient_install_dir/lib/dtds`
- Ensure that `target-server` address attribute references the server machine.
- Ensure that `target-server` port attribute references the ORB port on the remote machine.
- Ensure that `log-service` references a log file; if the user wants to put log messages to a log file.

Modify `appclient_install_dir/bin/appclient` (`appclient.bat` for Windows) as follows:

- change token `%CONFIG_HOME%` to `appclient_install_dir/config`

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Unstable

NAME	ping-connection-pools – tests that a connection pool is usable
SYNOPSIS	ping-connection-pools --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>pool_name</i>
DESCRIPTION	<p>This command tests that a connection pool is usable for both JDBC connection pools and connector connection pools. For example, if you create a new JDBC connection pool for use with an application that is expected to be deployed, before deploying the application, the previously created pool is tested with this command.</p> <p>Either a JDBC or connector connectionpool with authentication can be created. You can either use a <code>-property</code> option to specify user, password, or other connection information using the command line, or specify the connection information in the xml descriptor file.</p> <p>Before pinging a connection pool, you must create the connection pool with authentication and ensure that the enterprise server or database is started.</p>
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p>

ping-connection-pools(1)

	<code>-s --secure</code>	If set to true, uses SSL/TLS to communicate with the domain application server.
	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>pool_name</i>	This is the name of the pool to test.
EXAMPLES	EXAMPLE 1 Using the ping-connection-pool command <pre>asadmin> ping-connection-pool --user admin1 --passwordfile pwordfile</pre> Command ping-connection-pool executed successfully Where: asadmin is the command prompt and sampleConnectionPool is the name of the connection pool to ping.	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	create-connector-connection-pool(1) , create-jdbc-connection-pool(1)	

NAME	recover transactions – manually recovers pending transactions
SYNOPSIS	recover-transactions --user <i>user</i> --passwordfile <i>filename</i> [<i>--host localhost</i>] [<i>--port port_number</i>] [<i>--secure=false</i>] [<i>--terse=false</i>] [<i>--echo=false</i>] [<i>--interactive=true</i>] [<i>--delegatedrecovery=false</i>] [<i>--transactionlogdir tx_log_dir</i>] [<i>--recoveryserverid recovery_server_id</i>] <i>recovery_server_name</i>
DESCRIPTION	The function of this command is to manually recover pending transactions. This is used in remote mode only.
OPTIONS	<ul style="list-style-type: none"> -u --user The authorized domain application server administrative username. -w --password The --password option is deprecated. Use --passwordfile instead. --passwordfile The name of the file containing the domain application server password. The passwordfile should contain either of the following entries: AS_ADMIN_PASSWORD=<i>password</i> or AS_ADMIN_MAPPEDPASSWORD=<i>password</i>. If this option is not called directly, you will be prompted for it before the requested action is completed. -H.--host The machine name where the the domain application server is running. -p.--port The port number of the domain application server listening for administration requests. -s.--secure If set to true, this command uses SSL/TLS to communicate with the domain application server. -t.--terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. The default is false. -e.--echo Setting this option to true will echo the command line statement on the standard output. The default is false. -I.--interactive If this option is set to true (default), only the required password options are prompted. --delegatedrecovery When the delegated-recovery is set to false (the default), transaction recovery is done at the running server. When the delegated-recovery is set to true, another server performs the recovery for the failed server. If the command is set to true and there is no server-related data, the DAS does the delegated recovery.

recover-transactions(1)

	<code>--transactionlogdir</code>	When a server fails it writes the location in its transaction log. This option is required if the <code>--delegatedrecovery</code> option is set to true. If the failed server's transaction logs are copied to some other location to make it available to the surrogate recovery server, this option should be used. If the failed server's transaction-service, <code>tx-log-dir</code> is modified to reflect a new location, then this option is not required.
	<code>--recoveryserverid</code>	This option is the server identification id or token for the failed server. This option is required if the <code>--delegaterecovery</code> option is set to true. This option is not necessary if the <code>recovery_server_name</code> operand can give a hint of the <code>recovery_server_id</code> . The <code>recoveryserverid</code> option is not only used in recovery but it is also used in the creation of the XID and later used to recognize the XIDs that belong to this server.
OPERANDS	<i>recovery_server_name</i>	This is the name of the server that failed. It is this server that is losing the transaction that will be recovered.
EXAMPLES	EXAMPLE 1 Using recover-transactions asadmin> <code>recover-transactions serverid1</code> Transaction recovered.	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	none	

NAME	remove-ha-cluster – returns an HA cluster to non-HA status
SYNOPSIS	<pre>--user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] [--haagentport <i>port_number</i>] <i>clusterName</i></pre>
DESCRIPTION	<p>This command returns an HA cluster to non-HA status. Use fully qualified hostnames when specifying the hostlist interfaces explicitly for hosts with multiple network interfaces. This command is supported in remote mode only.</p> <p>The command performs the following tasks:</p> <ul style="list-style-type: none"> ■ The HA database is stopped. ■ The HA database is deleted. ■ The command deletes and/or modifies the appropriate resources in domain.xml.
OPTIONS	<pre>-u --user The authorized domain application server administrative username. -w --password The --password option is deprecated. Use --passwordfile instead. --passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on. -H --host The machine name where the domain application server is running. The default value is localhost. -p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849. -s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</pre>

remove-ha-cluster(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--haagentport</code>	This is the HA agent port containing the cluster to be changed. The default value is 1862.
OPERANDS	<i>clustername</i>	This is the name of the cluster to be altered.
EXAMPLES	EXAMPLE 1 Using remove-ha-cluster <code>asadmin> remove-ha-cluster --haagentport 1860 cluster1</code> Command remove-ha-cluster executed successfully	
EXIT STATUS	0 command executed successfully 1 error in executing the command	
SEE ALSO	configure-ha-cluster(1)	

NAME	restore-domain – restores files from backup	
SYNOPSIS	restore-domain [--domaindir <i>domain_directory</i>] [--filename <i>backup_filename</i>] [<i>domain_name</i>]	
DESCRIPTION	This command restores files under the domain from a backup directory. The restore-domain command is supported in local mode only.	
OPTIONS	--domaindir	This option specifies the parent directory of the domain upon which the command will operate. The default is <code>install_dir/domains</code> .
	--filename	This option reads the files for this restore from either the directory or from a zip file, depending upon the nature of the file. If this option is set, then the backup is read directly from the given location. This option is required if the backup directory is not set. There is no default.
OPERANDS	<i>domain_name</i>	This is the name of the root directory of the domain to restore. The default is all domains under <code>backupdir</code> .
EXAMPLES	EXAMPLE 1 Using restore-domain <code>asadmin>restore-domain --domaindir directory1 --filename file11</code> The command restore-domain executed successfully.	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	<code>backup-domain(1)</code> , <code>list-backups(1)</code>	

rollback-transaction(1)

NAME	rollback-transaction – rolls back the named transaction
SYNOPSIS	rollback-transaction --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--target <i>target_name</i>] [<i>transaction_id</i>]
DESCRIPTION	Rolls back the named transaction. This command is supported in remote mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

rollback-transaction(1)

<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--target</code>	In Enterprise Edition, specifies the target on which you are rolling back the transactions. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance

OPERANDS `transaction_id` identifier for the transaction to be rolled back..

EXAMPLES **EXAMPLE 1** Using rollback-transaction

```
asadmin> rollback-transaction --user admin --passwordfile password.txt --target server 0000000000
```

EXIT STATUS 0
command executed successfully

1
error in executing the command

SEE ALSO [freeze-transaction-service\(1\)](#), [unfreeze-transaction-service\(1\)](#)

set(1)

NAME	set – sets the values of attributes																		
SYNOPSIS	set --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [<i>attributename=value</i>]																		
DESCRIPTION	Sets the values of one or more configurable attribute. This command is supported in remote mode only. On Solaris, quotes are needed when executing commands with * as the option value or operand.																		
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. shutdown(1)

NAME	shutdown – brings down the administration server
SYNOPSIS	shutdown [--user <i>admin_user</i>] [--password <i>admin_password</i>] [--host <i>localhost</i>] [--port 4848] [--passwordfile <i>filename</i>] [--secure -s]
DESCRIPTION	shutdown gracefully brings down the administration server and all the running instances. You must manually start the administration server to bring it up again.
OPTIONS	--user administrative user associated for the instance. --password administrative password corresponding to the administrative user. --host host name of the machine hosting the administrative instance. --port administrative port number associated with the administrative host. --passwordfile file containing passwords appropriate for the command (e.g., administrative instance). --secure if true, uses SSL/TLS to communicate with the administrative instance.
EXAMPLES	EXAMPLE 1 Using the shutdown command asadmin> shutdown --user admin --password adminadmin --host bluestar --port 4848 Waiting for admin server to shutdown... Admin server has been shutdown
EXIT STATUS	0 command executed successfully 1 error in executing the command
INTERFACE EQUIVALENT	Administration Server page
SEE ALSO	start-instance(1) , stop-instance(1) , restart-instance(1) , start-domain(1) , stop-domain(1)

NAME	start-appserv – starts the domains in the default domains directory						
SYNOPSIS	start-appserv [--domaindir <i>install_dir</i> /domains] [--terse= <i>false</i>] [--echo= <i>false</i>]						
DESCRIPTION	Use the <code>start-appserv</code> command to start the domains in the default <i>install_dir</i> /domains directory. The <code>start-appserv</code> command requires that the user has set up an <code>AS_ADMIN_USER</code> environment and that all domains have the same admin user. The user will be prompted for the admin password for each domain (unless there is an <code>AS_ADMIN_PASSWORD</code> variable). The user will be prompted for the master password for each domain (unless <code>--password</code> was specified at domain creation time. This command is supported in local mode only.						
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;"><code>--domaindir</code></td> <td>The directory where the domains are to be started. If specified, the path must be to the default <i>install_dir</i>/domains directory.</td> </tr> <tr> <td style="vertical-align: top;"><code>-t --terse</code></td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> <tr> <td style="vertical-align: top;"><code>-e --echo</code></td> <td>Setting to true will echo the command line statement on to the standard output. Default is false.</td> </tr> </table>	<code>--domaindir</code>	The directory where the domains are to be started. If specified, the path must be to the default <i>install_dir</i> /domains directory.	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	<code>-e --echo</code>	Setting to true will echo the command line statement on to the standard output. Default is false.
<code>--domaindir</code>	The directory where the domains are to be started. If specified, the path must be to the default <i>install_dir</i> /domains directory.						
<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.						
<code>-e --echo</code>	Setting to true will echo the command line statement on to the standard output. Default is false.						
EXAMPLES	<p>EXAMPLE 1 Using the <code>start—appserv</code> command</p> <pre>asadmin> start-appserv Starting Domain sampleDomain, please wait Domain sampleDomain started Command start-appserv executed successfully</pre> <p>Where: the <code>sampleDomain</code> domain in the default domains directory is started.</p>

start-cluster(1)

NAME	start-cluster – starts a cluster
SYNOPSIS	start-cluster --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>cluster_name</i>
DESCRIPTION	<p>The <code>start-cluster</code> command attempts to start all non-running instances in the cluster that are reachable through their Node Agent. In other words, some instances may not be started if their Node Agent is not running.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p><code>-u --user</code> The authorized domain application server administrative username.</p> <p><code>-w --password</code> The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</p> <p><code>--passwordfile</code> This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASPASSWORD</code>, and so on.</p> <p><code>-H --host</code> The machine name where the domain application server is running. The default value is localhost.</p> <p><code>-p --port</code> The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p><code>-s --secure</code> If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p><code>-t --terse</code> Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
OPERANDS	<i>cluster_name</i>	The name of the cluster to be started.
EXAMPLES	EXAMPLE 1 Using the start-cluster command	
	The following command starts the cluster named MyCluster.	
	<pre>asadmin> start-cluster --user admin1 --passwordfile passwords.txt MyCluster Command start-cluster executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	stop-cluster(1), create-cluster(1), list-clusters(1), delete-cluster(1)	

start-domain(1)

NAME	start-domain – starts a domain																				
SYNOPSIS	start-domain [--domaindir <i>install_dir/domains</i>] [--user <i>admin_user</i>] [--passwordfile <i>file_name</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--verbose= <i>false</i>] [--debug= <i>false</i>] [<i>domain_name</i>]																				
DESCRIPTION	<p>Use the <code>start-domain</code> command to start a domain. If the domain directory is not specified, the domain in the default <code>install_dir/domains</code> directory is started. If there is more than one domain, the <code>domain_name</code> operand must be identified.</p> <p>This command is supported in local mode only.</p>																				
OPTIONS	<table><tr><td>--domaindir</td><td>The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory is started.</td></tr><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>-W --passwordfile</td><td>The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=password</code>. Where <code>password</code> is the actual administrator password for the domain.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on to the standard output. Default is false.</td></tr><tr><td>-I --interactive</td><td>If set to true (default), only the required password options are prompted.</td></tr><tr><td>--verbose</td><td>By default this flag is set to false. If set to true, detailed server startup output is displayed. Press CTRL-C to kill the server. Press CTRL-\ to print a thread dump.</td></tr><tr><td>--debug</td><td>By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.</td></tr><tr><td>--domaindir</td><td>The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory is started.</td></tr></table>	--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory is started.	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	-W --passwordfile	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=password</code> . Where <code>password</code> is the actual administrator password for the domain.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.	-I --interactive	If set to true (default), only the required password options are prompted.	--verbose	By default this flag is set to false. If set to true, detailed server startup output is displayed. Press CTRL-C to kill the server. Press CTRL-\ to print a thread dump.	--debug	By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.	--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory is started.
--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory is started.																				
-u --user	The authorized domain application server administrative username.																				
-w --password	The --password option is deprecated. Use --passwordfile instead.																				
-W --passwordfile	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: <code>AS_ADMIN_PASSWORD=password</code> . Where <code>password</code> is the actual administrator password for the domain.																				
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																				
-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.																				
-I --interactive	If set to true (default), only the required password options are prompted.																				
--verbose	By default this flag is set to false. If set to true, detailed server startup output is displayed. Press CTRL-C to kill the server. Press CTRL-\ to print a thread dump.																				
--debug	By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.																				
--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <code>install_dir/domains</code> directory is started.																				

start-domain(1)

-u --user	The authorized domain application server administrative username.
-w --password	The --password option is deprecated. Use --passwordfile instead.
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include MAPPEDPASSWORD, USERPASSWORD, SAVEDMASTERPASSWORD, MQPASSWORD, ALIASPASSWORD, and so on.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
--verbose	By default this flag is set to false. If set to true, detailed server startup output is displayed. On UNIX, press CTRL-C to kill the server. On Windows, press Ctrl-Break to kill the server. Press CTRL-\\ to print a thread dump.
--debug	By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.

OPERANDS *domain_name* The unique name of the domain you wish to start.

EXAMPLES **EXAMPLE 1** Using the start-domain command

```
asadmin> start-domain --domaindir /export/domains --user admin --passwordfile pass sampleDomain
Where: the sampleDomain domain in the /export/domains directory is started using admin password st
```

EXIT STATUS 0
command executed successfully

NAME	start-instance – starts a server instance
SYNOPSIS	start-instance --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>instance_name</i>
DESCRIPTION	This command starts an instance with the instance name you specify.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

start-instance(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>instance_name</i>	This is the name of the server instance to start.
EXAMPLES	EXAMPLE 1 Using start-instance asadmin> <code>start-instance -- instance_name instance1</code> Instance instance1 started	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
INTERFACE EQUIVALENT	Server Instance page	
SEE ALSO	<code>delete-instance(1)</code> , <code>create-instance(1)</code> , <code>stop-instance(1)</code> , <code>restart-instance(1)</code> , <code>start-appserv(1)</code> , <code>stop-appserv(1)</code> , <code>start-domain(1)</code> , <code>stop-domain(1)</code>	

NAME	start-node-agent – starts a node agent
SYNOPSIS	start-node-agent [--user <i>user</i>] [--passwordfile <i>passwordfile</i>] [--secure= <i>true</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--agentdir <i>nodeagent_path</i>] [--startinstances= <i>true</i>] [<i>nodeagent_name</i>]
DESCRIPTION	Use the start-node-agent command start a node agent. The comand will return control to the user before instances are actually started. The list-instances command can be executed to see if they have actually started. This command may take a while to execute since the node agent may need to create and start a number of server instances. This command is supported in local mode only.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p>

start-node-agent(1)

	<code>--agentdir</code>	Like a Domain Application Server (DAS), each node agent resides in a top level directory named <i>agentdir/nodeagent_name</i> . If specified, the path must be accessible in the filesystem. If not specified, the node agent is created in the default <i>install_dir/nodeagents</i> directory.
	<code>--startinstances</code>	If set to true, all server instances that are not currently running are started. If set to false, instances are not started. If the option is omitted, it defaults to the value of the node agent's <i>start-servers-in-startup</i> attribute, located in the <i>domain.xml</i> .
OPERANDS	<i>nodeagent_name</i>	The name of the node agent to be started.
EXAMPLES	EXAMPLE 1 Using the start-node-agent	This is a basic example of how the command is used. <pre>asadmin>start-node-agent --user admin --passwordfile passwordfile nodeagent1 Nodeagent1 started.</pre> Where: <i>nodeagent1</i> is started in the default <i>install_dir/nodeagents</i> directory.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	stop-node-agent(1) , delete-node-agent(1) , list-node-agents(1) , create-node-agent(1)	

NAME	stop-appserv – stops the domains in the specified domains directory
SYNOPSIS	stop-appserv [--domaindir <i>install_dir</i> /domains] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>]
DESCRIPTION	This command is deprecated use the <code>stop-domain</code> command instead. Use the <code>stop-appserv</code> command to stop the domains in specified domain directory. If the domain directory is not specified the domains in the default <i>install_dir</i> /domains directory are stopped. This command is supported in local mode only.
OPTIONS	<p>--domaindir The directory where the domains are to be stopped. If specified, path must be accessible in the filesystem. If not specified, the domains are stopped in the default <i>install_dir</i>/domains directory.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on to the standard output. Default is false.</p> <p>-I --interactive If set to true (default), only the required password options are prompted.</p>
EXAMPLES	<p>EXAMPLE 1 Using the stop—appserv command</p> <pre>asadmin> stop-appserv Stopping Domain sampleDomain, please wait Domain sampleDomain stopped Command stop-appserv executed successfully</pre> <p>Where: the sampleDomain domain in the default domains directory is stopped.</p>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>
ERROR CODES	<p>0 error message</p> <p>1 error message</p>

stop-cluster(1)

NAME	stop-cluster – stops a cluster														
SYNOPSIS	stop-cluster --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] <i>cluster_name</i>														
DESCRIPTION	<p>The <code>stop-cluster</code> command attempts to stop all running instances in the cluster that are reachable through their Node Agent. In other words, some instances may not be stopped if their Node Agent is not running.</p> <p>This command is supported in remote mode only.</p>														
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-u --user	The authorized domain application server administrative username.														
-w --password	The --password option is deprecated. Use --passwordfile instead.														
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.														
-H --host	The machine name where the domain application server is running. The default value is localhost.														
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.														
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.														
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.														

stop-cluster(1)

	-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
	-I --interactive	If set to true (default), only the required password options are prompted.
	-h --help	Displays the help text for the command.
OPERANDS	<i>cluster_name</i>	The name of the cluster to be started.
EXAMPLES	EXAMPLE 1 Using the stop-cluster command	
	The following command stops the cluster named MyCluster.	
	<pre>asadmin> stop-cluster --user admin1 --passwordfile passwords.txt MyCluster Command stop-cluster executed successfully.</pre>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	start-cluster(1) , create-cluster(1) , list-clusters(1) , delete-cluster(1)	

stop-domain(1)

NAME	stop-domain – stops the domain																				
SYNOPSIS	stop-domain [--domaindir <i>install_dir/domains</i>] [--user <i>admin_user</i>] [--passwordfile <i>file_name</i>] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--verbose= <i>false</i>] [--debug= <i>false</i>] [<i>domain_name</i>]																				
DESCRIPTION	Use the stop-domain command to stop a domain. If the domain directory is not specified, the domain in the default <i>install_dir/domains</i> directory is stopped. If there is more than one domain, the <i>domain_name</i> operand must be identified.																				
OPTIONS	<table><tr><td>--domaindir</td><td>The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir/domains</i> directory is started.</td></tr><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The --password option is deprecated. Use --passwordfile instead.</td></tr><tr><td>-W --passwordfile</td><td>The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: AS_ADMIN_PASSWORD=<i>password</i>. Where <i>password</i> is the actual administrator password for the domain.</td></tr><tr><td>-t --terse</td><td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td></tr><tr><td>-e --echo</td><td>Setting to true will echo the command line statement on to the standard output. Default is false.</td></tr><tr><td>-I --interactive</td><td>If set to true (default), only the required password options are prompted.</td></tr><tr><td>--verbose</td><td>By default this flag is set to false. If set to true, detailed server startup output is displayed. Press CTRL-C to kill the server. Press CTRL-\ to print a thread dump.</td></tr><tr><td>--debug</td><td>By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.</td></tr><tr><td>--domaindir</td><td>The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir/domains</i> directory is started.</td></tr></table>	--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir/domains</i> directory is started.	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	-W --passwordfile	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: AS_ADMIN_PASSWORD= <i>password</i> . Where <i>password</i> is the actual administrator password for the domain.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.	-I --interactive	If set to true (default), only the required password options are prompted.	--verbose	By default this flag is set to false. If set to true, detailed server startup output is displayed. Press CTRL-C to kill the server. Press CTRL-\ to print a thread dump.	--debug	By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.	--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir/domains</i> directory is started.
--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir/domains</i> directory is started.																				
-u --user	The authorized domain application server administrative username.																				
-w --password	The --password option is deprecated. Use --passwordfile instead.																				
-W --passwordfile	The file containing the domain application server password associated with the administrative instance. The password is defined in the following form: AS_ADMIN_PASSWORD= <i>password</i> . Where <i>password</i> is the actual administrator password for the domain.																				
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.																				
-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.																				
-I --interactive	If set to true (default), only the required password options are prompted.																				
--verbose	By default this flag is set to false. If set to true, detailed server startup output is displayed. Press CTRL-C to kill the server. Press CTRL-\ to print a thread dump.																				
--debug	By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.																				
--domaindir	The directory where the domain is to be started. If specified, the path must be accessible in the filesystem. If not specified, the domain in the default <i>install_dir/domains</i> directory is started.																				

stop-domain(1)

-u --user	The authorized domain application server administrative username.
-w --password	The --password option is deprecated. Use --passwordfile instead.
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD= <i>password</i> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include MAPPEDPASSWORD, USERPASSWORD, SAVEDMASTERPASSWORD, MQPASSWORD, ALIASPASSWORD, and so on.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
--verbose	By default this flag is set to false. If set to true, detailed server startup output is displayed. On UNIX, press CTRL-C to kill the server. On Windows, press Ctrl-Break to kill the server. Press CTRL-\\ to print a thread dump.
--debug	By default this flag is set to false. If set to true, the server is started in debug mode and prints the JPDA port on the console.

OPERANDS *domain_name* The unique name of the domain you wish to start.

EXAMPLES **EXAMPLE 1** Using start-domain

```
asadmin> stop-domain --domaindir /export/domains --user admin --passwordfile pass sampleDomain
Where: the sampleDomain domain in the /export/domains directory is stopped using admin password st
```

EXIT STATUS 0
command executed successfully

stop-domain(1)

SEE ALSO [start-domain\(1\)](#), [create-domain\(1\)](#), [delete-domain\(1\)](#)

NAME	stop-instance – stops a server instance
SYNOPSIS	<pre>--user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] <i>instance_name</i></pre>
DESCRIPTION	Use the stop-instance to stop the instance with the instance name specified. The stop-instance can be run both locally and remotely. The named instance must already exist within the given domain; and the instance must be running.
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p>

stop-instance(1)

	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
OPERANDS	<i>instance_name</i>	This is the name of the server instance to stop.
EXAMPLES	EXAMPLE 1 Using <code>stop-instance</code> in local mode	
	<pre>asadmin> stop-instance --local --domain domain1 server1 Instance server1 stopped</pre>	
		Where: the <code>server1</code> instance associated with the <code>domain1</code> domain is stopped locally.
	EXAMPLE 2 Using <code>stop-instance</code> in remote mode	
	<pre>asadmin> stop-instance --user admin --password bluestar --host localhost --port 4848 server1 Instance server1 stopped</pre>	
		Where: the <code>server1</code> instance associated with the named user, password, host and port is deleted from the remote machine.
EXIT STATUS	0	command executed successfully
	1	error in executing the command
INTERFACE EQUIVALENT	Server Instance page

NAME	stop-node-agent – stops a node agent								
SYNOPSIS	stop-node-agent [--agentdir <i>nodeagent_path</i> [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>]] [<i>nodeagent_name</i>]								
DESCRIPTION	<p>The local stop-node-agent command is used to stop a node agent. If the agent directory is not specified, the node agent in the default <i>install_dir/nodeagents</i> directory is stopped. If there is more than one domain, the <i>domain_name</i> operand must be identified. The stop-node-agent command stops all managed server instances of the node agent.</p> <p>This command is supported in local mode only.</p>								
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">--agentdir</td> <td>Like a Domain Administration Server (DAS), each node agent resides in a top level directory named <i>agentdir/nodeagent_name</i>. If specified, the path must be accessible in the filesystem. If not specified, the node agent is created in the default <i>install_dir/nodeagents</i> directory.</td> </tr> <tr> <td style="vertical-align: top;">-t --terse</td> <td>Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</td> </tr> <tr> <td style="vertical-align: top;">-e --echo</td> <td>Setting to true will echo the command line statement on to the standard output. Default is false.</td> </tr> <tr> <td style="vertical-align: top;">-I --Interactive</td> <td>If set to true (default), only the required options are prompted.</td> </tr> </table>	--agentdir	Like a Domain Administration Server (DAS), each node agent resides in a top level directory named <i>agentdir/nodeagent_name</i> . If specified, the path must be accessible in the filesystem. If not specified, the node agent is created in the default <i>install_dir/nodeagents</i> directory.	-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.	-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.	-I --Interactive	If set to true (default), only the required options are prompted.
--agentdir	Like a Domain Administration Server (DAS), each node agent resides in a top level directory named <i>agentdir/nodeagent_name</i> . If specified, the path must be accessible in the filesystem. If not specified, the node agent is created in the default <i>install_dir/nodeagents</i> directory.								
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.								
-e --echo	Setting to true will echo the command line statement on to the standard output. Default is false.								
-I --Interactive	If set to true (default), only the required options are prompted.								
OPERANDS	<i>nodeagent_name</i> This is the name of the node agent to stop.								
EXAMPLES	<p>EXAMPLE 1 Using stop-node-agent</p> <p>This is a basic example of how to use the command.</p> <pre>%asadmin>stop-node-agent nodeagent1</pre> <p>Where: % is the command line prompt. Node agent, nodeagent1, located in default <i>install_dir/nodeagents</i> is stopped.</p>								
EXIT STATUS	<table border="0"> <tr> <td style="vertical-align: top;">0</td> <td>command executed successfully</td> </tr> <tr> <td style="vertical-align: top;">1</td> <td>error in executing the command</td> </tr> </table>	0	command executed successfully	1	error in executing the command

undeploy(1)

NAME	undeploy – removes a component from the domain application server
SYNOPSIS	undeploy --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--droptables <i>true false</i>] [--cascade=false] [--target <i>target</i>] <i>component_name</i>
DESCRIPTION	<p>undeploy removes the specified component in the domain application server.</p> <p>The --droptables option is only used to undeploy CMP beans for which the tables had been created by the deployment. If not specified, the entries in the deployment descriptors are used.</p> <p>This command is supported in remote mode only.</p>
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--droptables</code>	If set to true, tables created by application using CMP beans during deployment are dropped. Default is the corresponding entry in the <code>cmp-resource</code> element of the <code>sun-ejb-jar.xml</code> file. If not specified, it defaults to the entries specified in the deployment descriptors.
<code>--cascade</code>	If set to true, it deletes all the connection pools and connector resources associated with the resource adapter being undeployed. If set to false, the undeploy fails if any pools and resources are still associated with the resource adapter. Then, either those pools and resources have to be deleted explicitly, or the option has to be set to true. If the option is set to false, and if there are no pools and resources still associated with the resource adapter, the resource adapter is undeployed. This option is applicable to connectors (resource adapters) and applications.
<code>--target</code>	This option is available only in the Sun Java System Application Server Enterprise Edition. Specifies the target from which you are undeploying. Valid values are: <ul style="list-style-type: none"> ■ <code>server</code>, which undeploys the component from the default server instance <code>server</code> and is the default value ■ <code>domain</code>, which undeploys the component from the domain. ■ <code>cluster_name</code>, which undeploys the component from every server instance in the cluster. ■ <code>instance_name</code>, which undeploys the component from a particular sever instance.

OPERANDS `component_name` name of the deployed component.

EXAMPLES **EXAMPLE 1** Simple undeployment

Undeploy (uninstall) an application named `Cart`

```
asadmin> undeploy --user admin Cart
```

EXAMPLE 2 Undeploying an enterprise bean with container-managed persistence (CMP)

Undeploy a CMP bean named `myejb` and drop the corresponding database tables. In a production environment, database tables contain valuable information, so use the `--droptables` option with care.

undeploy(1)

EXAMPLE 2 Undeploying an enterprise bean with container-managed persistence (CMP)
(*Continued*)

```
asadmin> undeploy --user admin --droptables=true myejb
```

EXAMPLE 3 Undeploy a connector (resource adapter)

Undeploy the connector module named jdbcra and perform a cascading delete to remove the associated resources and connection pools.

```
asadmin> undeploy --user admin --cascade=true jdbcra
```

NAME	unfreeze-transaction-service – resumes all suspended transactions
SYNOPSIS	unfreeze-transaction-service --user <i>admin_user</i> [<i>--passwordfile filename</i>] [<i>--host host_name</i>] [<i>--port port_number</i>] [<i>--secure -s</i>] [<i>--terse=false</i>] [<i>--echo=false</i>] [<i>--interactive=true</i>] [<i>--help</i>] [<i>--target target_name</i>]
DESCRIPTION	Resumes all the suspended inflight transactions. Invoke this command on an already frozen transaction. This command is supported in remote mode only.
OPTIONS	<ul style="list-style-type: none"> -u --user The authorized domain application server administrative username. -w --password The --password option is deprecated. Use --passwordfile instead. --passwordfile This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on. -H --host The machine name where the domain application server is running. The default value is localhost. -p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849. -s --secure If set to true, uses SSL/TLS to communicate with the domain application server. -t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false. -e --echo Setting to true will echo the command line statement on the standard output. Default is false. -I --interactive If set to true (default), only the required password options are prompted.

unfreeze-transaction-service(1)

	<code>-h --help</code>	Displays the help text for the command.
	<code>--target</code>	Supported in Enterprise edition only. This option specifies the target on which you are unfreezing the Transaction Service. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance
OPERANDS	<code>--target</code>	Supported in Enterprise edition only. This option specifies the target on which you are unfreezing the Transaction Service. Valid values are <ul style="list-style-type: none">■ <code>server</code>, which creates the listener for the default server instance <code>server</code> and is the default value■ <code>configuration_name</code>, which creates the listener for the named configuration■ <code>cluster_name</code>, which creates the listener for every server instance in the cluster■ <code>instance_name</code>, which creates the listener for a particular server instance

unset(1)

NAME	unset – removes one or more variables from the multimode environment
SYNOPSIS	unset [<i>env_var</i> *]
DESCRIPTION	Removes one or more variables you set for the multimode environment. The variables and their associated values will no longer exist in the environment.
OPERANDS	<i>env_var</i> environment variable to be removed.
EXAMPLES	<p>EXAMPLE 1 Using unset to remove environment variables</p> <pre>asadmin> export AS_ADMIN_HOST=bluestar AS_ADMIN_PORT=8000 AS_ADMIN_USER=admin asadmin> export AS_ADMIN_PREFIX=server1.jms-service asadmin> export AS_ADMIN_HOST=bluestar AS_ADMIN_PORT=8000 AS_ADMIN_USER=admin AS_ADMIN_PREFIX=server1.jms-service asadmin> unset AS_ADMIN_PREFIX asadmin> export AS_ADMIN_HOST=bluestar AS_ADMIN_PORT=8000 AS_ADMIN_USER=admin</pre> <p>Using the export command without the argument lists the environment variables that are set. Notice the AS_ADMIN_PREFIX is not in the environment after running the unset command.</p>
EXIT STATUS	0 command executed successfully
	1 error in executing the command
SEE ALSO	export(1) , multimode(1)

update-connector-security-map(1)

NAME	update-connector-security-map – creates or modifies a security map for the specified connector connection pool						
SYNOPSIS	<pre>update-connector-security-map --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=<i>false</i>] [--echo=<i>false</i>] [--interactive=<i>true</i>] [--help] --poolname <i>connector_connection_pool_name</i> [--addprincipals <i>principal_name1</i> [, <i>principal_name1</i>] * --addusergroups <i>user_group1</i> [, --removeprincipals <i>principal_name1</i> [, <i>principal_name2</i>] *] [--removeusergroups <i>user_group1</i> [, <i>user_group2</i>] *] [--mappedusername <i>username</i>] <i>security_map_name</i></pre>						
DESCRIPTION	<p>Use this command to create or modify a security map for the specified connector connection pool. If the security map is not present, one is created. If a specific security map is specified, the components of the security map (user name, groups, and principals) are provided.</p> <p>For this command to succeed, you must have first created a connector connection pool using the <code>create-connector-connection-pool</code> command.</p> <p>The enterprise information system (EIS) is any system that holds the information. It can be a mainframe, a messaging system, a database system, or an application.</p> <p>This command is supported in remote mode only.</p>						
OPTIONS	<p>If an option has a short option name, then the short option precedes the long option name. Short options have one dash whereas long options have two dashes.</p> <table><tr><td><code>-u --user</code></td><td>The authorized domain application server administrative username.</td></tr><tr><td><code>-w --password</code></td><td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td></tr><tr><td><code>--passwordfile</code></td><td>This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASSPASSWORD</code>, and so on.</td></tr></table>	<code>-u --user</code>	The authorized domain application server administrative username.	<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASSPASSWORD</code> , and so on.
<code>-u --user</code>	The authorized domain application server administrative username.						
<code>-w --password</code>	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.						
<code>--passwordfile</code>	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=<i>password</i></code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASSPASSWORD</code> , and so on.						

update-connector-security-map(1)

-H --host	The machine name where the domain application server is running. The default value is localhost.
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-t --terse	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
-e --echo	Setting to true will echo the command line statement on the standard output. Default is false.
-I --interactive	If set to true (default), only the required password options are prompted.
-h --help	Displays the help text for the command.
--target	This option is deprecated in this release.
--poolname	This property specifies the name of the connector connection pool to which the security map that is to be updated or created belongs.
--addprincipals	This property specifies a comma-separated list of EIS-specific principals to be added. Use either the <code>-addprincipals</code> or <code>-addusergroups</code> options, but not both.
--addusergroups	This property specifies a comma-separated list of EIS user groups to be added. Use either the <code>-addprincipals</code> or <code>-addusergroups</code> options, but not both at the same time.
--removeprincipals	This property specifies a comma-separated list of EIS-specific principals to be removed.
--removeusergroups	This property specifies a comma-separated list of EIS user groups to be removed.
--mappedusername	This property specifies the EIS username.
--mappedpassword	The <code>--mappedpassword</code> option is deprecated. Use <code>--passwordfile</code> pointing to a file that contains an entry in the following format: <code>AS_ADMIN_MAPPEDPASSWORD=<i>mapped-password</i></code> . If not specified using the <code>passwordfile</code> option, the user will be prompted for this password by the <code>asadmin</code> command-line tool.

update-connector-security-map(1)

OPERANDS *security_map_name* name of the security map to be created or updated.

EXAMPLES **EXAMPLE 1** Using update-connector-security-map

It is assumed that the connector pool has already been created using the create-connector-pool command.

```
asadmin> update-connector-security-map --user admin
--poolname connector-pool1 --addprincipals principal1, principal2
securityMap1
```

Command update-connector-security-map executed successfully

EXIT STATUS 0
command executed successfully

1
error in executing the command

NAME	update-file-user – updates a current file user as specified
SYNOPSIS	update-file-user --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse=false] [--echo=false] [--interactive=true] [--help] [--userpassword <i>user_passsword</i>] [--groups <i>user_groups[:user_groups]*</i>] <i>username</i>
DESCRIPTION	This command updates an existing entry in keyfile using the specified <i>user_name</i> , <i>user_password</i> and groups. Multiple groups can be entered by separating them, with a colon ":"
OPTIONS	<p>-u --user The authorized domain application server administrative username.</p> <p>-w --password The --password option is deprecated. Use --passwordfile instead.</p> <p>--passwordfile This option replaces the -- password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: AS_ADMIN_PASSWORD=<i>password</i>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</p> <p>-H --host The machine name where the domain application server is running. The default value is localhost.</p> <p>-p --port The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</p> <p>-s --secure If set to true, uses SSL/TLS to communicate with the domain application server.</p> <p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p>

update-file-user(1)

	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--userpassword</code>	This is the password of the file user.
	<code>--groups</code>	This is the name of the group to which the file user belongs.
OPERANDS	<i>username</i>	This is the name of file user to be deleted.
EXAMPLES	EXAMPLE 1 Using the update-file-user command <pre>asadmin> update-file-user --user admin1 --password adminadmin1 --host pigeon --port 5001 --userpassword sample_password --groups staff:manager:engineer --username dance Command update-file-user executed successfully</pre> <p>Where: the <code>sample_user</code> is the file user updated with the updated user password, groups, and user name.</p>	
EXIT STATUS	0	command executed successfully
	1	error in executing the command
SEE ALSO	delete-file-user(1) , list-file-users(1) , create-file-user(1) , list-file-groups(1)	

NAME	update-password-alias – updates a password alias												
SYNOPSIS	updates-password-alias --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--aliaspassword <i>alias_password</i>] <i>aliasname</i>												
DESCRIPTION	This command updates the transaction IDs in the named target. An alias is a token of the form <code>#{ALIAS=password-alias-password}</code> . The password corresponding to the alias name is stored in encrypted form. The password-alias commands take both a secure interactive form (in which the user is prompted for all information) and a more script-friendly form, in which the password is propagated on the command line. This command is supported in remote mode only.												
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-u --user</td> <td>The authorized domain application server administrative username.</td> </tr> <tr> <td style="vertical-align: top;">-w --password</td> <td>The --password option is deprecated. Use --passwordfile instead.</td> </tr> <tr> <td style="vertical-align: top;">--passwordfile</td> <td>This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.</td> </tr> <tr> <td style="vertical-align: top;">-H --host</td> <td>The machine name where the domain application server is running. The default value is localhost.</td> </tr> <tr> <td style="vertical-align: top;">-p --port</td> <td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td> </tr> <tr> <td style="vertical-align: top;">-s --secure</td> <td>If set to true, uses SSL/TLS to communicate with the domain application server.</td> </tr> </table>	-u --user	The authorized domain application server administrative username.	-w --password	The --password option is deprecated. Use --passwordfile instead.	--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The --password option is deprecated. Use --passwordfile instead.												
--passwordfile	This option replaces the --password option. Using the --password option on the command line or through the environment is deprecated. The --passwordfile option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the AS_ADMIN_ prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include AS_ADMIN_MAPPEDPASSWORD, AS_ADMIN_USERPASSWORD, AS_ADMIN_SAVEDMASTERPASSWORD, AS_ADMIN_MQPASSWORD, AS_ADMIN_ALIASPASSWORD, and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

update-password-alias(1)

	<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
	<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
	<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
	<code>-h --help</code>	Displays the help text for the command.
	<code>--aliaspassword</code>	This is a separate and distinct password corresponding to the original password. WARNING: Passing this password on the command line is not secure. The password is optional and when omitted, the user is prompted.
OPERANDS	<code>aliasname</code>	This is the name of the password as it appears in <code>domain.xml</code> .
EXAMPLES	EXAMPLE 1 Using <code>update-password-alias</code> <code>asadmin> update-password-alias --aliasname alias1</code> Command <code>update-password-alias</code> executed successfully	
EXIT STATUS	0 1	command executed successfully error in executing the command
SEE ALSO	delete-password-alias(1) , list-password-aliases(1) , create-password-alias(1)	

NAME	verifier – validates the J2EE Deployment Descriptors against application server DTDs																		
SYNOPSIS	verifier [<i>optional_parameters</i>] <i>jar_filename</i>																		
DESCRIPTION	<p>Use the <code>verifier</code> utility to validate the J2EE deployment descriptors and the Sun Java System Application Server specific deployment descriptors. If the application is not J2EE compliant, an error message is printed.</p> <p>When you run the <code>verifier</code> utility, two results files are created in XML and TXT format. The location where the files are created can be configured using the <code>-d</code> option. The directory specified as the destination directory for result files should exist. If no directory is specified, the result files are created in the current directory. Result files are named as <i>jar_filename.xml</i> and <i>jar_filename.txt</i></p> <p>The XML file has various sections that are dynamically generated depending on what kind of application or module is being verified. The root tag is <code>static-verification</code> which may contain the tags <code>application</code>, <code>ejb</code>, <code>web</code>, <code>appclient</code>, <code>connector</code>, <code>other</code>, <code>error</code> and <code>failure-count</code>. The tags are self explanatory and are present depending on the type of module being verified. For example, an EAR file containing a web and EJB module will contain the tags <code>application</code>, <code>ejb</code>, <code>web</code>, <code>other</code>, and <code>failure-count</code>.</p> <p>If the verifier ran successfully, a result code of 0 is returned. A non-zero error code is returned if the verifier failed to run.</p>																		
OPTIONS	<p>The optional parameters must be specified as follows:</p> <table border="0"> <tr> <td style="vertical-align: top;"><code>-d --destdir</code></td> <td>Identifies the destination directory. The verifier results are located in this specified directory. The directory must already exist.</td> </tr> <tr> <td style="vertical-align: top;"><code>-h --help-?</code></td> <td>Displays the verifier help.</td> </tr> <tr> <td style="vertical-align: top;"><code>-u --gui</code></td> <td>Enables the Verifier graphical user interface.</td> </tr> <tr> <td style="vertical-align: top;"><code>-v --verbose</code></td> <td>Turns verbose debugging ON. Default mode is verbose turned off. In verbose mode, the status of each run of each test is displayed on the verifier console.</td> </tr> <tr> <td style="vertical-align: top;"><code>-V --version</code></td> <td>Displays the Verifier tool version.</td> </tr> <tr> <td style="vertical-align: top;"><code>-r --reportlevellevel</code></td> <td>Identifies the result reporting level. The default report level is to display all results. The available reporting levels include: <table border="0" style="margin-left: 2em;"> <tr> <td style="vertical-align: top;"><code>a all</code></td> <td>Set output reporting level to display all results (default).</td> </tr> <tr> <td style="vertical-align: top;"><code>f failures</code></td> <td>Set output reporting level to display only failure results.</td> </tr> <tr> <td style="vertical-align: top;"><code>w warnings</code></td> <td>Set output reporting level to display only warning and failure results.</td> </tr> </table> </td> </tr> </table>	<code>-d --destdir</code>	Identifies the destination directory. The verifier results are located in this specified directory. The directory must already exist.	<code>-h --help-?</code>	Displays the verifier help.	<code>-u --gui</code>	Enables the Verifier graphical user interface.	<code>-v --verbose</code>	Turns verbose debugging ON. Default mode is verbose turned off. In verbose mode, the status of each run of each test is displayed on the verifier console.	<code>-V --version</code>	Displays the Verifier tool version.	<code>-r --reportlevellevel</code>	Identifies the result reporting level. The default report level is to display all results. The available reporting levels include: <table border="0" style="margin-left: 2em;"> <tr> <td style="vertical-align: top;"><code>a all</code></td> <td>Set output reporting level to display all results (default).</td> </tr> <tr> <td style="vertical-align: top;"><code>f failures</code></td> <td>Set output reporting level to display only failure results.</td> </tr> <tr> <td style="vertical-align: top;"><code>w warnings</code></td> <td>Set output reporting level to display only warning and failure results.</td> </tr> </table>	<code>a all</code>	Set output reporting level to display all results (default).	<code>f failures</code>	Set output reporting level to display only failure results.	<code>w warnings</code>	Set output reporting level to display only warning and failure results.
<code>-d --destdir</code>	Identifies the destination directory. The verifier results are located in this specified directory. The directory must already exist.																		
<code>-h --help-?</code>	Displays the verifier help.																		
<code>-u --gui</code>	Enables the Verifier graphical user interface.																		
<code>-v --verbose</code>	Turns verbose debugging ON. Default mode is verbose turned off. In verbose mode, the status of each run of each test is displayed on the verifier console.																		
<code>-V --version</code>	Displays the Verifier tool version.																		
<code>-r --reportlevellevel</code>	Identifies the result reporting level. The default report level is to display all results. The available reporting levels include: <table border="0" style="margin-left: 2em;"> <tr> <td style="vertical-align: top;"><code>a all</code></td> <td>Set output reporting level to display all results (default).</td> </tr> <tr> <td style="vertical-align: top;"><code>f failures</code></td> <td>Set output reporting level to display only failure results.</td> </tr> <tr> <td style="vertical-align: top;"><code>w warnings</code></td> <td>Set output reporting level to display only warning and failure results.</td> </tr> </table>	<code>a all</code>	Set output reporting level to display all results (default).	<code>f failures</code>	Set output reporting level to display only failure results.	<code>w warnings</code>	Set output reporting level to display only warning and failure results.												
<code>a all</code>	Set output reporting level to display all results (default).																		
<code>f failures</code>	Set output reporting level to display only failure results.																		
<code>w warnings</code>	Set output reporting level to display only warning and failure results.																		

verifier(1M)

OPERANDS	<i>jar_filename</i>	name of the ear/war/jar/rar file to perform static verification on. The results of verification are placed in two files <i>jar_filename.xml</i> and <i>jar_filename.txt</i> in the destination directory.
	-a --app	Runs only the application tests.
	--p --appclient	Runs only the application client tests.
	-c --connector	Runs only the connector tests.
	-e --ejb	Runs only the EJB tests.
	-w --web	Runs only the web tests.
	-s --webservices	Runs only the web services tests.
	-l --webservicesclient	Runs only the web services client tests.

EXAMPLES **EXAMPLE 1** Using verifier in the Verbose Mode

The following example runs the verifier in verbose mode and writes all the results of static verification of the `sample.ear` file to the destination directory named `/verifier-results`.

```
example% verifier -v -rf -d /verifier-results sample.ear
```

Where `-v` runs the verifier in verbose mode, `-d` specifies the destination directory, and `-rf` displays only the failures. The results are stored in `/verifier-results/sample.ear.xml` and `/verifier-results/sample.ear.txt`.

EXAMPLE 2 Using verifier to run Application and EJB tests

```
example% verifier --app --ejb sample.ear
```

SEE ALSO [asadmin\(1M\)](#)

NAME	verify-domain-xml – verifies the content of the domain.xml file
SYNOPSIS	verify-domain-xml [--terse= <i>false</i>] [--echo= <i>false</i>] [--help] [--verbose= <i>false</i>] [--domaindir <i>install_dir/domains</i>] [<i>domain_name</i>]
DESCRIPTION	Verifies the content of the domain.xml file.
OPTIONS	<p>-t --terse Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.</p> <p>-e --echo Setting to true will echo the command line statement on the standard output. Default is false.</p> <p>-h --help Displays the help text for the command.</p> <p>--verbose Turns on verbose debugging mode if true. The default is false.</p> <p>--domaindir Specifies the directory where the domains are located. The path must be accessible in the file system. The default is the value of the \$AS_DEF_DOMAINS_PATH environment variable. This variable is defined in asenv.bat/conf. The default value of this variable is <i>install_dir/domains</i>.</p>
OPERANDS	<i>domain_name</i> Specifies the name of the domain. The default is domain1.
EXAMPLES	<p>EXAMPLE 1 Using verify-domain-xml</p> <pre>asadmin> verify-domain-xml --verbose=true domain1 Element: applications Error: J2eeApplication Module does not contains application name 'MEjbApp' J2eeApplication Module does not contains application name '__ejb_container_timer_app'</pre>
EXIT STATUS	<p>0 command executed successfully</p> <p>1 error in executing the command</p>

version(1)

NAME	version – displays the version information												
SYNOPSIS	version --user <i>admin_user</i> [--passwordfile <i>filename</i>] [--host <i>host_name</i>] [--port <i>port_number</i>] [--secure -s] [--terse= <i>false</i>] [--echo= <i>false</i>] [--interactive= <i>true</i>] [--help] [--verbose= <i>false</i>]												
DESCRIPTION	<p>Use the <code>version</code> command to displays the version information. If the command-line cannot communicate with the administration server with the given user/password and host/port, then the command-line will retrieve the Version locally and display a warning message. If the <code>--user</code> option is not entered, the command-line will retrieve the version locally and display a warning message. The warning message will not be displayed if the <code>--terse</code> option is entered on the command line.</p> <p>This command is supported in remote mode only.</p>												
OPTIONS	<table><tr><td>-u --user</td><td>The authorized domain application server administrative username.</td></tr><tr><td>-w --password</td><td>The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.</td></tr><tr><td>--passwordfile</td><td>This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code>, where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code>, <code>AS_ADMIN_USERPASSWORD</code>, <code>AS_ADMIN_SAVEDMASTERPASSWORD</code>, <code>AS_ADMIN_MQPASSWORD</code>, <code>AS_ADMIN_ALIASEPASSWORD</code>, and so on.</td></tr><tr><td>-H --host</td><td>The machine name where the domain application server is running. The default value is localhost.</td></tr><tr><td>-p --port</td><td>The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.</td></tr><tr><td>-s --secure</td><td>If set to true, uses SSL/TLS to communicate with the domain application server.</td></tr></table>	-u --user	The authorized domain application server administrative username.	-w --password	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.	--passwordfile	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASEPASSWORD</code> , and so on.	-H --host	The machine name where the domain application server is running. The default value is localhost.	-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.	-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.
-u --user	The authorized domain application server administrative username.												
-w --password	The <code>--password</code> option is deprecated. Use <code>--passwordfile</code> instead.												
--passwordfile	This option replaces the <code>--password</code> option. Using the <code>--password</code> option on the command line or through the environment is deprecated. The <code>--passwordfile</code> option specifies the name of a file containing the password entries in a specified format. The entry for the password must have the <code>AS_ADMIN_</code> prefix followed by the password name in capital letters. For example, to specify the domain application server password, use an entry with the following format: <code>AS_ADMIN_PASSWORD=password</code> , where <i>password</i> is the actual administrator password. Other passwords that can be specified include <code>AS_ADMIN_MAPPEDPASSWORD</code> , <code>AS_ADMIN_USERPASSWORD</code> , <code>AS_ADMIN_SAVEDMASTERPASSWORD</code> , <code>AS_ADMIN_MQPASSWORD</code> , <code>AS_ADMIN_ALIASEPASSWORD</code> , and so on.												
-H --host	The machine name where the domain application server is running. The default value is localhost.												
-p --port	The port number of the domain application server listening for administration requests. The default port number for Enterprise Edition is 4849.												
-s --secure	If set to true, uses SSL/TLS to communicate with the domain application server.												

<code>-t --terse</code>	Indicates that any output data must be very concise, typically avoiding human-friendly sentences and favoring well-formatted data for consumption by a script. Default is false.
<code>-e --echo</code>	Setting to true will echo the command line statement on the standard output. Default is false.
<code>-I --interactive</code>	If set to true (default), only the required password options are prompted.
<code>-h --help</code>	Displays the help text for the command.
<code>--verbose</code>	By default this flag is set to false. If set to true, the version information is displayed in detail.

EXAMPLES**EXAMPLE 1** Using remote mode to display version

```
asadmin> version
Java 2 Platform Enterprise Edition 1.4 Application Server
```

EXAMPLE 2 Using remote mode to display version in detail

```
asadmin> version --user admin --passwordfile mysecret
--host bluestar --port 4848 --verbose
Java 2 Platform Enterprise Edition 1.4 Application Server (build A021930-126949)
```

EXIT STATUS

0	command executed successfully
1	error in executing the command

wscompile(1M)

NAME	wscompile – generates stubs, ties, serializers, and WSDL files used in JAX-RPC clients and services																										
SYNOPSIS	wscompile [<i>options</i>] <i>configuration_file</i>																										
DESCRIPTION	<p>Generates the client stubs and server-side ties for the service definition interface that represents the web service interface. Additionally, it generates the WSDL description of the web service interface which is then used to generate the implementation artifacts.</p> <p>In addition to supporting the generation of stubs, ties, server configuration, and WSDL documents from a set of RMI interfaces, <i>wscompile</i> also supports generating stubs, ties and remote interfaces from a WSDL document.</p> <p>You must specify one of the <i>-gen</i> options in order to use <i>wscompile</i> as a stand alone generator. You must use either <i>-import</i> (for WSDL) or <i>-define</i> (for an RMI interface) along with the <i>-model</i> option in order to use <i>wscompile</i> in conjunction with <i>wsdeploy</i>.</p> <p>Invoking the <i>wscompile</i> command without specifying any arguments outputs the usage information.</p>																										
OPTIONS	<table><tr><td><i>-cp path</i></td><td>location of the input class files.</td></tr><tr><td><i>-classpath path</i></td><td>same as <i>-cp path</i> option.</td></tr><tr><td><i>-d directory</i></td><td>where to place the generated output files.</td></tr><tr><td><i>-define</i></td><td>read the service's RMI interface, define a service. Use this option with the <i>-model</i> option in order to create a model file for use with the <i>wsdeploy</i> command.</td></tr><tr><td><i>-f:features</i></td><td>enables the given features. Features are specified as a comma separated list of features. See the list of supported features below.</td></tr><tr><td><i>-features:features</i></td><td>same as <i>-f:features</i> option.</td></tr><tr><td><i>-g</i></td><td>generates the debugging information.</td></tr><tr><td><i>-gen</i></td><td>generates the client-side artifacts.</td></tr><tr><td><i>-gen:client</i></td><td>same as <i>-gen</i> option.</td></tr><tr><td><i>-gen:server</i></td><td>generates the server-side artifacts and the WSDL file. If you are using <i>wsdeploy</i>, you do not specify this option.</td></tr><tr><td><i>-httpproxy:host:port</i></td><td>specifies an HTTP proxy server; defaults to port 8080.</td></tr><tr><td><i>-import</i></td><td>reads a WSDL file, generates the service RMI interface and a template of the class that implements the interface. Use this option with the <i>-model</i> option in order to create a model file for use with the <i>wsdeploy</i> command.</td></tr><tr><td><i>-mapping file</i></td><td>writes the mapping file to the specified file.</td></tr></table>	<i>-cp path</i>	location of the input class files.	<i>-classpath path</i>	same as <i>-cp path</i> option.	<i>-d directory</i>	where to place the generated output files.	<i>-define</i>	read the service's RMI interface, define a service. Use this option with the <i>-model</i> option in order to create a model file for use with the <i>wsdeploy</i> command.	<i>-f:features</i>	enables the given features. Features are specified as a comma separated list of features. See the list of supported features below.	<i>-features:features</i>	same as <i>-f:features</i> option.	<i>-g</i>	generates the debugging information.	<i>-gen</i>	generates the client-side artifacts.	<i>-gen:client</i>	same as <i>-gen</i> option.	<i>-gen:server</i>	generates the server-side artifacts and the WSDL file. If you are using <i>wsdeploy</i> , you do not specify this option.	<i>-httpproxy:host:port</i>	specifies an HTTP proxy server; defaults to port 8080.	<i>-import</i>	reads a WSDL file, generates the service RMI interface and a template of the class that implements the interface. Use this option with the <i>-model</i> option in order to create a model file for use with the <i>wsdeploy</i> command.	<i>-mapping file</i>	writes the mapping file to the specified file.
<i>-cp path</i>	location of the input class files.																										
<i>-classpath path</i>	same as <i>-cp path</i> option.																										
<i>-d directory</i>	where to place the generated output files.																										
<i>-define</i>	read the service's RMI interface, define a service. Use this option with the <i>-model</i> option in order to create a model file for use with the <i>wsdeploy</i> command.																										
<i>-f:features</i>	enables the given features. Features are specified as a comma separated list of features. See the list of supported features below.																										
<i>-features:features</i>	same as <i>-f:features</i> option.																										
<i>-g</i>	generates the debugging information.																										
<i>-gen</i>	generates the client-side artifacts.																										
<i>-gen:client</i>	same as <i>-gen</i> option.																										
<i>-gen:server</i>	generates the server-side artifacts and the WSDL file. If you are using <i>wsdeploy</i> , you do not specify this option.																										
<i>-httpproxy:host:port</i>	specifies an HTTP proxy server; defaults to port 8080.																										
<i>-import</i>	reads a WSDL file, generates the service RMI interface and a template of the class that implements the interface. Use this option with the <i>-model</i> option in order to create a model file for use with the <i>wsdeploy</i> command.																										
<i>-mapping file</i>	writes the mapping file to the specified file.																										

-model	write the internal model for the given file name. Use this option with the <code>-import</code> option in order to create a model file for use with the <code>wsdeploy</code> command.
-keep	keeps the generated files.
-nd <i>directory</i>	directory for the non-class generated files are stored.
-O	optimizes the generated code.
-s <i>directory</i>	directory for the generated source files.
-source <i>version</i>	generate code for the specified JAX-RPC version. Supported versions are 1.0.1, 1.0.3, 1.1, 1.1.1, and 1.1.2 (the default).
-verbose	output messages about what the compiler is doing.
-version	prints version information.

Exactly one of the `-input`, `-define`, `-gen` options must be specified.

SUPPORTED FEATURES

The `--f` option requires a comma-separated list of features. The following are the supported features.

datahandleronly	always map attachments to data handler type
documentliteral	use document literal encoding
donotoverride	do not regenerate classes that already exist in the classpath.
donotunwrap	disable unwrapping of document/literal wrapper elements in WSI mode (default).
explicitcontext	turn on explicit service context mapping.
infix: <i>name</i>	specify an <code>infix</code> to use for generated serializers (Solaris).
infix= <i>name</i>	specify an <code>infix</code> to use for generated serializers (Windows).
jaxbenumtype	map anonymous enumeration to its base type.
nodatabinding	turn off data binding for literal encoding.
noencodedtypes	turn off encoding type information.
nomultirefs	turn off support for multiple references.
norpcstructures	do not generate RPC structures (<code>-import</code> only).
novalidation	turn off validation for the imported WSDL file.
resolveidref	resolve <code>xsd:IDREF</code> .
rpclieteral	use the RPC literal encoding.
searchschema	search schema aggressively for subtypes.
serializeinterfaces	turn on direct serialization of interface types.

wscompile(1M)

strict	generate code strictly compliant with JAX-RPC 1.1 specification.
unwrap	enable unwrapping of document/literal wrapper elements in WSI mode.
useonewayoperations	allow generation of one-way operations.
wsi	enable WS-I Basic Profile features, to be used for document/literal, and RPC/literal.
donotoverride	do not regenerate the classes
donotunwrap	disables unwrapping of document/literal wrapper elements in WS-I mode. This is on by default.

Note: the `-gen` options are not compatible with `wsdeploy`.

CONFIGURATION FILE

The `wscompile` command reads the configuration file `config.xml` which contains information that describes the web service. The structure of the file is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<configuration
xmlns="http://java.sun.com/xml/ns/jax-rpc/ri/config">
<service> or <wsdl> or <modelfile>
</configuration>
```

The configuration element may contain exactly one `<service>`, `<wsdl>` or `<modelfile>`.

SERVICE ELEMENT

If the `<service>` element is specified, `wscompile` reads the RMI interface that describes the service and generates a WSDL file. In the `<interface>` subelement, the `name` attribute specifies the service's RMI interface, and the `servantName` attribute specifies the class that implements the interface. For example:

```
<service name="CollectionIF_Service"
targetNamespace="http://echoservice.org/wsdl"
typeNameSpace="http://echoservice.org/types"
packageName="stub_tie_generator_test">
<interface name="stub_tie_generator_test.CollectionIF"
servantName="stub_tie_generator_test.CollectionImpl"/>
</service>
```

WSDL ELEMENT	<p>If the <code><wsdl></code> element is specified, <code>wscompile</code> reads the WSDL file and generates the service's RMI interface. The <code>location</code> attribute specifies the URL of the WSDL file, and the <code>packageName</code> attribute specifies the package of the classes to be generated. For example:</p> <pre><wsdl location="http://tempuri.org/sample.wsdl" packageName="org.tempuri.sample"/></pre>
MODELFILE ELEMENT	<p>This element is for advanced users.</p> <p>If <code>config.xml</code> contains a <code><service></code> or <code><wsdl></code> element, <code>wscompile</code> can generate a model file that contains the internal data structures that describe the service. If a model file is already generated, it can be reused next time while using <code>wscompile</code>. For example:</p> <pre><modelfile location="mymodel.xml.gz"/></pre>
EXAMPLES	<p>EXAMPLE 1 Using <code>wscompile</code> to generate client-side artifacts</p> <pre>wscompile -gen:client -d outputdir -classpath classpathdir config.xml</pre> <p>Where a client side artifact is generated in the <code>outputdir</code> for running the service as defined in the <code>config.xml</code> file.</p> <p>EXAMPLE 2 Using <code>wscompile</code> to generate server-side artifacts</p> <pre>wscompile -gen:server -d outputdir -classpath classpathdir -model modelfile.Z config.xml</pre> <p>Where a server side artifact is generated in the <code>outputdir</code> and the <code>modelfile</code> in <code>modelfile.Z</code> for services defined in the <code>config.xml</code> file.</p>
SEE ALSO	<p>wsdeploy(1M)</p>

wsdeploy(1M)

NAME	<code>wsdeploy</code> – reads a WAR file and the <code>jaxrpc-ri.xml</code> file and generates another WAR file that is ready for deployment
SYNOPSIS	<code>wsdeploy -o input_WAR_file options</code>
DESCRIPTION	<p>Use the <code>wsdeploy</code> command to take a WAR file which does not have implementation specific server side tie classes to generate a deployable WAR file that can be deployed on the application server. <code>wsdeploy</code> internally runs <code>wscompile</code> with the <code>-gen:server</code> option. The <code>wscompile</code> command generates classes and a WSDL file which <code>wsdeploy</code> includes in the generated WAR file.</p> <p>Generally, you don't have to run <code>wsdeploy</code> because the functions it performs are done automatically when you deploy a WAR with <code>deploytool</code> or <code>asadmin</code>.</p>
OPTIONS	<ul style="list-style-type: none"><code>-classpath path</code> location of the input class files.<code>-keep</code> keep temporary files.<code>-tmpdir directory</code> use the specified directory as a temporary directory<code>-o output WAR file</code> required; location of the generated WAR file. This option is required.<code>-source version</code> generates code for the specified JAX-RPC SI version. Supported version are: 1.0.1, 1.0.3, 1.1, 1.1.1, and 1.1.2 (the default).<code>-verbose</code> outputs messages about what the compiler is doing.<code>-version</code> prints version information.
INPUT WAR FILE	<p>The input WAR file for <code>wsdeploy</code> will typically have the following structure:</p> <pre>META-INF/MANIFEST.MF WEB-INF/classes/hello/HelloIF.class WEB-INF/classes/hello/HelloImpl.class WEB-INF/jaxrpc-ri.xml WEB-INF/web.xml</pre> <p>Where: <code>HelloIF</code> is the service endpoint interface, and <code>HelloImpl</code> is the class that implements the interface. The <code>web.xml</code> file is the deployment descriptor of a web component.</p>
jaxrpc-ri.xml FILE	<p>The following is a simple HelloWorld service.</p> <pre><xml version="1.0" encoding="UTF-8"?> <webServices> xmlns="http://java.sun.com/xml/ns/jax-rpc/ri/dd" version="1.0" targetNamespaceBase="http://com.test/wsdl" typeNamespaceBase="http://com.test/types" urlPatternBase="/ws"></pre>

```

<endpoint
  name="MyHello"
  displayName="HelloWorld Service"
  description="A simple web service"
  wsdl="/WEB-INF/<wsdlname>"
  interface="hello.HelloIF"
  implementation="hello.HelloImpl"/>
<endpointMapping
  endpointName="MyHello"
  urlPattern="/hello"/>
</webServices>

```

The `webServices()` element must contain one or more `endpoint()` elements. The `interface` and `implementation` attributes of `endpoint()` specify the service's interface and implementation class. The `endpointMapping()` element associates the service port with the part of the endpoint URL path that follows the `urlPatternBase()`.

NAMESPACE MAPPINGS

Here is a schema type name example:

```

schemaType="ns1:SampleType"
xmlns:ns1="http://echoservice.org/types"

```

When generating a Java type from a schema type, `wscompile` gets the classname from the local part of the schema type name. To specify the package name of the generated Java classes, you define a mapping between the schema type namespace and the package name. You define this mapping by adding a `<namespaceMappingRegistry>` element to the `config.xml` file. For example:

```

<service>
  ...
  <namespaceMappingRegistry>
    <namespaceMapping
      namespace="http://echoservice.org/types"
      packageName="echoservice.org.types"/>
    </namespaceMappingRegistry>
  ....
</service>

```

You can also map namespaces in the opposite direction, from schema types to Java types. In this case, the generated schema types are taken from the package that the type comes from.

HANDLERS

A handler accesses a SOAP message that represents an RPC request or response. A handler class must implement the `javax.xml.rpc.handler` interface. Because it accesses a SOAP message, a handler can manipulate the message with the APIs of the `javax.xml.soap.package()`.

wsdeploy(1M)

A handler chain is a list of handlers. You may specify one handler chain for the client and one for the server. On the client, you include the `handlerChains()` element in the `jaxrpc-ri.xml` file. On the server, you include this element in the `config.xml` file. Here is an example of the `handlerChains()` element in the `config.xml`:

```
<handlerChains>
  <chain runAt="server"
    roles=
      "http://acme.org/auditing
      "http://acme.org/morphing"
    xmlns:ns1="http://foo/fo-1">
    <handler className="acme.MyHandler"
      headers="ns1:foo ns1:bar"/>
      <property
        name="property" value="xyz"/>
      </handler>
    </chain>
</handlerChains>
```

For more information on handlers, see the SOAP message Handlers chapter of the JAX-PRC specifications.

Index

Numbers and Symbols

— list-resource-adapter-configs, 413

b

brings down the administration server and associated instances — shutdown, 446

d

displays the license information — display-license, 256
displays the status of the deployed component — show-component-status, 444

g

generates stubs, ties, serializers, and WSDL files used in JAX-RPC clients and services — wscompile, 484

i

installs the license file — install-license, 341

r

reads a WAR file and the `jaxrpc-ri.xml` file and generates another WAR file that is ready for deployment — wsdeploy, 488
enables the component — enable, 258

s

sets the values of attributes — set, 442
disables the component — disable, 250

A

add an existing cluster or server instance to an existing load balancer configuration — create-http-lb-ref, 90
add-resources — creates the resources specified in an XML file specified, 16
adds a connecton pool with the specified connection pool name — create-connector-connection-pool, 68
adds a lifecycle module — create-lifecycle-module, 126
adds a new access control list file for the named instance — create-acl, 53
adds a new HTTP listener socket — create-http-listener, 92
adds a new unbound node agent to a domain — create-node-agent-config, 136
adds an audit-module — create-audit-module, 59

- adds new nodes to the named database, initializes devices for the new nodes, and refragments the schema — hadbm addnodes, 276
- adds the administered object with the specified JNDI name — create-admin-object, 54
- adds an IIOP listener — create-iiop-listener, 95
- creates a physical destination — create-jmsdest, 110
- creates the named virtual server — create-virtual-server, 159
- adds the new authenticated realm — create-auth-realm, 61
- allows you to execute multiple commands while preserving environment settings and remaining in the asadmin utility — multimode, 431
- appliant — launches the Application Client Container and invokes the client application packaged in the application JAR file, 19
- asadmin — utility for performing administrative tasks for the Sun Java System Application Server, 21
- asadmin create-persistence-resource, create-persistence-resource — registers a persistence resource, 140
- asmigrate — automates migration of J2EE applications from other J2EE platforms to Sun Java System Application Server, 27
- automates migration of J2EE applications from other J2EE platforms to Sun Java System Application Server — asmigrate, 27

B

- backup-domain — performs a backup on the domain, 35

C

- capture-schema — stores the database metadata (schema) in a file for use in mapping and execution, 36
- change-master-password — changes the master password, 38

- changes the master password — change-master-password, 38
- checks to see if the JMS service is up and running — jms-ping, 342
- clear-ha-store — deletes tables in HADB, 40
- clears the history files on the database — hadbm clearhistory, 281
- configure-ha-cluster — configures an existing cluster to be High Availability, 42
- configures an existing cluster to be High Availability — configure-ha-cluster, 42
- configures and starts the HADB Management Agent — ma, 306
- copies an existing configuration to create a new configuration — copy-configuration, 50
- copy-config — copies an existing configuration to create a new configuration, 50
- create-acl — adds a new access control list file for the named instance, 53
- create-admin-object — adds the administered object with the specified JNDI name, 54
- create-audit-module — adds an audit-module, 59
- create-auth-realm — adds the new authenticated realm, 61
- create-connector-connection-pool — adds a connecton pool with the specified connection pool name, 68
- create-domain — creates a domain with the given name, 78
- create-file-user — creates a new file user, 81
- create-ha-store — creates tables in the HADB that are used by HA the cluster, 83
- create-http-health-checker — creates a health-checker for a specified load balancer configuration, 85
- create-http-lb-ref — add an existing cluster or server instance to an existing load balancer configuration, 90
- create-http-listener — adds a new HTTP listener socket, 92
- create-iiop-listener — adds an IIOP listener, 95
- create-instance — creates an instance, 97
- create-javamail-resource — creates a JavaMail session resource, 101
- create-jdbc-resource — creates a JDBC resource with the specified JNDI name, 108

create-jms-resource —creates a JMS resource, 115
 create-jmsdest — creates a physical destination, 110
 create-lifecycle-module — adds a lifecycle module, 126
 create-message-security-provider — Enables administrators to create the message-security-config and provider-config sub-elements for the security service in domain.xml., 129
 create-node-agent — creates a node agent, 134
 create-node-agent-config — adds a new unbound node agent to a domain, 136
 create-password-alias — creates a password alias, 138
 create-profiler — creates the profiler element, 143
 create-resource-adapter-config — creates the configuration information in domain.xml for the connector module, 145
 create-ssl — creates and configures the SSL element in the selected HTTP listener, IIOP listener, or IIOP service, 149
 create-system-properties — adds or updates one or more system properties of the domain, configuration, cluster, or server instance, 154
 list-system-properties — lists the system properties of the domain, configuration, cluster, or server instance, 419
 create-virtual-server — creates the named virtual server, 159
 create-http-lb-config — creates a configuration for the load balancer, 87
 creates a configuration for the load balancer — create-http-lb-config, 87
 creates a database instance — hadbm create, 283
 creates a domain with the given name — create-domain, 78
 creates a health-checker for a specified load balancer configuration — create-http-health-checker, 85
 creates a JDBC resource with the specified JNDI name — create-jdbc-resource, 108
 creates a management domain of the listed HADB hosts — hadbm createdomain, 289
 creates a new file user — create-file-user, 81

creates a node agent — create-node-agent, 134
 creates a password alias — create-password-alias, 138
 creates an instance — create-instance, 97
 creates and configures the SSL element in the selected HTTP listener, IIOP listener, or IIOP service — create-ssl, 149
 creates or modifies a security map for the specified connector connection pool — create-connector-security-map, 73
 creates or modifies a security map for the specified connector connection pool — update-connector-security-map, 472
 creates tables in the HADB that are used by HA the cluster — create-ha-store, 83
 creates the configuration information in domain.xml for the connector module — create-resource-adapter-config, 145
 creates the profiler element — create-profiler, 143

D

delete-acl — removes the access control list file for the named instance, 163
 delete-auth-realm — removes the named authentication realm, 170
 delete-connector-connection-pool — removes the specified connector connection pool, 174
 delete-connector-security-map — deletes a security map for the specified connector connection pool, 178
 delete-domain — deletes the given domain, 182
 delete-file-user — removes the named file user, 183
 delete-http-health-checker — deletes a health-checker for a specified load balancer configuration, 185
 delete-http-lb-ref — deletes the cluster or server instance from a load balancer configuration, 189
 delete-http-listener — removes an HTTP listener, 191
 delete-iiop-listener — removes an IIOP listener, 193

`delete-instance` — deletes the instance that is not running., 195
`delete-javamail-resource` — removes a JavaMail session resource, 197
`delete-jms-resource` — removes a JMS resource, 207
`delete-jmsdest` — removes a physical destination, 203
`delete-jvm-options` — removes JVM options from the Java configuration or profiler elements of the `domain.xml` file, 211
`delete-lifecycle-module` — removes the lifecycle module, 213
`delete-message-security-provider` — enables administrators to delete a `provider-config` sub-element for the given message layer (`message-security-config` element of `domain.xml`), 215
`delete-node-agent` — deletes the node agent and its associated directory structure, 217
`delete-node-agent-config` — removes a node agent from a domain, 218
`delete-password-alias` — deletes a password alias, 220
`delete-profiler` — deletes the profiler element, 224
`delete-resource-adapter-config` — deletes the configuration information created in `domain.xml` for the connector module, 226
`delete-ssl` — deletes the SSL element in the selected HTTP listener, IIOP listener, or IIOP service, 230
`delete-system-property` — removes one system property of the domain, configuration, cluster, or server instance, at a time, 233
`delete-virtual-server` — removes a virtual server, 237
`delete-admin-object` — removes the administered object with the specified JNDI name, 164
`delete-http-lb-config` — deletes a load balancer configuration, 187
deletes a health-checker for a specified load balancer configuration — `delete-http-health-checker`, 185
deletes a load balancer configuration — `delete-http-lb-config`, 187
deletes a password alias — `delete-password-alias`, 220
deletes a security map for the specified connector connection pool — `delete-connector-security-map`, 178
deletes tables in HADB — `clear-ha-store`, 40
deletes the cluster or server instance from a load balancer configuration — `delete-http-lb-ref`, 189
deletes the configuration information created in `domain.xml` for the connector module — `delete-resource-adapter-config`, 226
deletes the given domain — `delete-domain`, 182
deletes the instance that is not running. — `delete-instance`, 195
deletes the node agent and its associated directory structure — `delete-node-agent`, 217
deletes the profiler element — `delete-profiler`, 224
deletes the SSL element in the selected HTTP listener, IIOP listener, or IIOP service — `delete-ssl`, 230
removes a virtual server — `delete-virtual-server`, 237
`deploy` — deploys the specified component, 239
`deploydir` — deploys an exploded format of application archive, 245
deploys an exploded format of application archive — `deploydir`, 245
deploys the specified component — `deploy`, 239
removes a physical destination — `delete-jmsdest`, 203
`disable` — disables the component, 250
`disable-http-lb-application` — disables an application managed by a load balancer, 252
`disable-http-lb-server` — disables a sever or cluster managed by a load balancer, 254
disables a sever or cluster managed by a load balancer — `disable-http-lb-server`, 254
disables an application managed by a load balancer — `disable-http-lb-application`, 252
`display-license` — displays the license information, 256
displays a list of all the subcommands to administer HADB — `hadbm help`, 301

displays information about disk storage devices on each active data node — `hadbm deviceinfo`, 293
displays the `hadbm` version information — `hadbm version`, 332
displays the version information — `version`, 482

E

`enable` — enables the component, 258
`enable-http-lb-application` — enables a previously-disabled application managed by a load balancer, 260
`enable-http-lb-server` — enables a previously disabled sever or cluster managed by a load balancer, 262
enables a previously-disabled application managed by a load balancer — `enable-http-lb-application`, 260
enables a previously disabled sever or cluster managed by a load balancer — `enable-http-lb-server`, 262
Enables administrators to create the `message-security-config` and `provider-config` sub-elements for the security service in `domain.xml`. — `create-message-security-provider`, 129
enables administrators to delete a `provider-config` sub-element for the given message layer (`message-security-config` element of `domain.xml`) — `delete-message-security-provider`, 215
`export` — marks a variable name for automatic export to the environment of subsequent commands in multimode, 264
`export-http-lb-config` — exports the load balancer configuration to a file that can be used by the load balancer, 265
exports the load balancer configuration to a file that can be used by the load balancer — `export-http-lb-config`, 265
extends the current HADB management domain by adding the specified hosts — `hadbm extenddomain`, 296

G

`get` — gets the values of the monitorable or configurable attributes, 270
`get-client-stubs` — gets the stubs of the client, 272
gets all audit modules and displays them — `list-audit-modules`, 355
gets all custom resources — `list-custom-resources`, 372
gets all JDBC resources — `list-jdbc-resources`, 391
gets all the administered objects — `list-admin-objects`, 351
lists the existing JavaMail session resources — `list-javamail-resources`, 387
lists the JMS resources — `list-jms-resources`, 397
lists the existing JMS physical destinations — `list-jmsdest`, 393
gets connector connection pools that have been created — `list-connector-connection-pools`, 365
gets the access control lists for the named instance — `list-acls`, 350
lists the existing HTTP listeners — `list-http-listeners`, 381
lists the existing IIOP listeners — `list-iiop-listeners`, 383
gets the stubs of the client — `get-client-stubs`, 272
gets the value of the specified configuration attribute — `hadbm-get`, 298
gets the values of the monitorable or configurable attributes — `get`, 270
lists the existing virtual servers — `list-virtual-servers`, 427
`gracefully` stops the specified node — `hadbm stopnode`, 329

H

`hadbm` — utility for managing the High Availability Database (HADB), 274
`hadbm addnodes` — adds new nodes to the named database, initializes devices for the new nodes, and refragments the schema, 276

hadbm clear — reinitializes all the dataspace on all nodes and starts the database, 279
hadbm clearhistory — clears the history files on the database, 281
hadbm create — creates a database instance, 283
hadbm createdomain — creates a management domain of the listed HADB hosts, 289
hadbm delete — removes the database, 291
hadbm deletedomain — removes the HADB management domain, 292
hadbm deviceinfo — displays information about disk storage devices on each active data node, 293
hadbm disablehost — selectively disables a host in the management domain, 295
hadbm extenddomain — extends the current HADB management domain by adding the specified hosts, 296
hadbm-get — gets the value of the specified configuration attribute, 298
hadbm help — displays a list of all the subcommands to administer HADB, 301
hadbm list — lists all the existing databases, 303
hadbm listdomain — lists all hosts defined in the management domain, 304
hadbm listpackages — lists the packages registered in the management domain, 305
hadbm reducedomain — removes hosts from the HADB management domain, 308
hadbm refragment — refragments the database schema, 310
hadbm registerpackage — registers HADB packages in the management domain, 312
hadbm restart — restarts the database, 316
hadbm set — sets the value of the specified configuration attributes to the identified values, 320
hadbm start — starts the database, 323
hadbm startnode — starts the specified node, 324
hadbm status — shows the state of the database, 326
hadbm stopnode — gracefully stops the specified node, 329
hadbm version — displays the hadbm version information, 332

I
install-license — installs the license file, 341

J
jms-ping — checks to see if the JMS service is up and running, 342
jspc — precompiles JSP source files into servlets, 344

L
launches the Application Client Container and invokes the client application packaged in the application JAR file. — **applclient**, 19
list — lists the configurable elements, 347
list-acls — gets the access control lists for the named instance, 350
list-audit-modules — gets all audit modules and displays them, 355
list-auth-realms — lists the authentication realms, 357
list-backups — lists all backups and restores, 359
list-components — lists deployed components, 362
list-connector-connection-pools — gets connector connection pools that have been created, 365
list-connector-security-maps — lists the security maps belonging to the specified connector connection pool, 369
list-custom-resources — gets all custom resources, 372
list-domains — lists the domains in the specified domain directory, 374
list-file-groups — lists the file groups, 375
list-http-listeners — lists the existing HTTP listeners, 381
list-iiop-listeners — lists the existing IIOP listeners, 383
list-instances — lists all the instances along with their status, 385
list-javamail-resources — lists the existing JavaMail session resources, 387

- list-jdbc-connection-pools — lists all JDBC connection pools, 389
- list-jdbc-resources — gets all JDBC resources, 391
- list-jms-resources — lists the JMS resources, 397
- list-jmsdest — lists the existing JMS physical destinations, 393
- list-lifecycle-modules — lists the lifecycle modules, 403
- list-node-agents — lists the node agents along with their status, 407
- list-password-aliases — lists all password aliases, 409
- list-resource-adapter-configs —, 413
- list-sub-components — lists EJBs or Servlets in deployed module or module of deployed application, 417
- list-timers — lists all of the timers owned by server instance(s), 423
- list-transaction-id — lists the transactions IDs, 425
- list-virtual-servers — lists the existing virtual servers, 427
- list-admin-objects — gets all the administered objects, 351
- list—http—lb—configs — lists load balancer configurations, 379
- lists all backups and restores —
 - list-backups, 359
- lists all hosts defined in the management domain — hadbm listdomain, 304
- lists all JDBC connection pools —
 - list-jdbc-connection-pools, 389
- lists all of the timers owned by server instance(s) — list-timers, 423
- lists all password aliases —
 - list-password-aliases, 409
- lists all the existing databases — hadbm list, 303
- lists all the instances along with their status —
 - list-instances, 385
- lists deployed components —
 - list-components, 362
- lists EJBs or Servlets in deployed module or module of deployed application —
 - list-sub-components, 417

- lists load balancer configurations —
 - list—http—lb—configs, 379
- lists the authentication realms —
 - list-auth-realms, 357
- lists the configurable elements — list, 347
- lists the domains in the specified domain directory — list-domains, 374
- lists the file groups — list-file-groups, 375
- lists the lifecycle modules —
 - list-lifecycle-modules, 403
- lists the node agents along with their status —
 - list-node-agents, 407
- lists the packages registered in the management domain — hadbm listpackages, 305
- lists the security maps belonging to the specified connector connection pool —
 - list-connector-security-maps, 369
- lists the transactions IDs —
 - list-transaction-id, 425

M

- ma — configures and starts the HADB Management Agent, 306
- manually recovers pending transactions —
 - recover transactions, 435
- marks a variable name for automatic export to the environment of subsequent commands in multimode —
 - export, 264
- migrate-timers — moves a timer when a server instance stops, 429
- moves a timer when a server instance stops —
 - migrate-timers, 429
- multimode — allows you to execute multiple commands while preserving environment settings and remaining in the asadmin utility, 431

P

- package-appclient — packs the application client container libraries and jar files, 432
- packs the application client container libraries and jar files — package-appclient, 432
- performs a backup on the domain —
 - backup-domain, 35

ping-connection-pools — tests that a connection pool is usable, 433
precompiles JSP source files into servlets — jspc, 344

R

recover transactions — manually recovers pending transactions, 435
refragments the database schema — hadbm refragment, 310
registers a persistence resource — asadmin create-persistence-resource, create-persistence-resource, 140
registers HADB packages in the management domain — hadbm registerpackage, 312
creates a JavaMail session resource — create-javamail-resource, 101
creates a JMS resource — create-jms-resource, 115
registers the resource in the XML file specified — add-resources, 16
reinitializes all the dataspace on all nodes and starts the database — hadbm clear, 279
remove-ha-cluster — returns an HA cluster to non-HA status, 437
removes a component from the domain application server — undeploy, 466
removes a node agent from a domain — delete-node-agent-config, 218
removes hosts from the HADB management domain — hadbm reducedomain, 308
removes JVM options from the Java configuration or profiler elements of the domain.xml file — delete-jvm-options, 211
removes one or more variables from the multimode environment — unset, 471
removes one system property of the domain, configuration, cluster, or server instance, at a time — delete-system-property, 233
removes the access control list file for the named instance — delete-acl, 163
removes the administered object with the specified JNDI name — delete-admin-object, 164
removes the database — hadbm delete, 291

removes the HADB management domain — hadbm deletedomain, 292
removes an HTTP listener — delete-http-listener, 191
removes an IIOP listener — delete-iiop-listener, 193
removes a JavaMail session resource — delete-javamail-resource, 197
removes a JMS resource — delete-jms-resource, 207
removes the lifecycle module — delete-lifecycle-module, 213
removes the named authentication realm — delete-auth-realm, 170
removes the named file user — delete-file-user, 183
removes the specified connector connection pool — delete-connector-connection-pool, 174
restarts the database — hadbm restart, 316
restore-domain — restores files from backup, 439
restores files from backup — restore-domain, 439
returns an HA cluster to non-HA status — remove-ha-cluster, 437

S

selectively disables a host in the management domain — hadbm disablehost, 295
set — sets the values of attributes, 442
sets the value of the specified configuration attributes to the identified values — hadbm set, 320
show-component-status — displays the status of the deployed component, 444
shows the state of the database — hadbm status, 326
shutdown — brings down the administration server and associated instances, 446
start-appserv — starts the domains in the default domains directory, 447
start-cluster — starts a cluster, 448
start-domain — starts a domain, 450
start-instance — starts a server instance, 453
start-node-agent — starts a node agent, 455

- starts a cluster — start-cluster, 448
- starts a domain — start-domain, 450
- starts a node agent — start-node-agent, 455
- starts a server instance — start-instance, 453
- starts the database — hadbm start, 323
- starts the domains in the default domains directory — start-appserv, 447
- starts the specified node — hadbm startnode, 324
- stop-appserv — stops the domains in the specified domains directory, 457
- stop-cluster — stops a cluster, 458
- stop-instance — stops a server instance, 463
- stop-node-agent — stops a node agent, 465
- stops a cluster — stop-cluster, 458
- stops a node agent — stop-node-agent, 465
- stops a server instance — stop-instance, 463
- stops the domains in the specified domains directory — stop-appserv, 457
- stores the database metadata (schema) in a file for use in mapping and execution — capture-schema, 36

T

- create—cluster — creates a cluster, 63
- create-jms-host — creates a JMS host, 113
- create-application-ref — creates a reference to an application, 56
- create-connector-resource — registers the connector resource with the specified JNDI name, 71
- create-connector-security-map, 73
- create-jdbc-connection-pool — registers the JDBC connection pool, 104
- create-jndi-resource — registers a JNDI resource, 121
- create-jvm-options — creates the JVM options from the Java configuration or profiler elements, 124
- create-resource-ref — creates a reference to a resource, 147
- delete—cluster — deletes a cluster, 172
- delete-application-ref — removes a reference to an application, 166

- delete-connector-resource — removes the connector resource with the specified JNDI name, 176
- delete-custom-resource—removes a custom resource, 180
- delete-jdbc-connection-pool — removes the specified JDBC connection pool, 199
- delete-jdbc-resource — removes a JDBC resource, 201
- delete-jms-host — removes a JMS host, 205
- delete-jndi-resource — removes a JNDI resource, 209
- delete-resource-ref — removes a reference to a resource, 228
- list—clusters — lists the existing clusters, 360
- list-application-refs — lists the existing application references, 353
- list-connector-resources — gets all connector resources, 367
- list-file-users — creates a list of file users, 377
- list-jms-hosts — lists the existing JMS hosts, 395
- list-jndi-entries — browses and queries the JNDI tree, 399
- list-jndi-resources — lists all existing JNDI resources, 401
- list-resource-refs — lists the existing references to an application, 415
- template — template for documenting manpages for the Sun Java System Application Server, 24, 31, 44, 76, 222, 411, 481
- browses and queries the JNDI tree — list-jndi-entries, 399
- creates a cluster— create-cluster, 63
- creates a JMS host — create-jms-host, 113
- creates a list of file users — list-file-users, 377
- creates a reference to a resource— create-resource-ref, 147
- creates a reference to an application— create-application-ref, 56
- creates the JVM options from the Java configuration or profiler elements — create-jvm-options, 124
- deletes a cluster— delete-cluster, 172
- gets all connector resources — templatelists-connector-resources, 367

- lists all existing JNDI resources—
 - list-jndi-resources, 401
- lists the existing application references—
 - list-application-refs, 353
- lists the existing clusters— list-clusters, 360
- lists the existing JMS hosts —
 - list-jms-hosts, 395
- lists the existing references to a resource—
 - list-application-refs, 415
- registers a JNDI resource—
 - create-jndi-resource, 121
- registers the connector resource with the specified JNDI name —
 - create-connector—resource, 71
- registers the JDBC connection pool —
 - create-jdbc-connection-pool, 104
- removes a custom resource —
 - delete-custom-resource, 180
- removes a JCBC resource—
 - delete-jdbc-resource, 201
- removes a JMS host— delete-jms-host, 205
- removes a JNDI resource—
 - delete-jndi-resource, 209
- removes a reference to a resource—
 - delete-resource-ref, 228
- removes a reference to an application—
 - delete-application-ref, 166
- removes the connector resource with the specified JNDI name —
 - delete-connector—resource, 176
- removes the specified JDBC connection pool
 - delete-jdbc-connection-pool, 199
- template for documenting manpages for the Sun Java System Application Server —
 - template, 24, 31, 44, 76, 222, 411, 481
- tests that a connection pool is usable —
 - ping-connection-pools, 433

U

- undeploy — removes a component from the domain application server, 466
- unset — removes one or more variables from the multimode environment, 471
- update-connector-security-map — creates or modifies a security map for the specified connector connection pool, 472

- update-file-user — updates a current file user as specified, 475
- update-password-alias — updates a password alias, 477
- updates a current file user as specified —
 - update-file-user, 475
- updates a password alias —
 - update-password-alias, 477
- utility for managing the High Availability Database (HADB) — hadbm, 274
- utility for performing administrative tasks for the Sun Java System Application Server — asadmin, 21

V

- validates the J2EE Deployment Descriptors against application server DTDs —
 - verifier, 479
- verifier — validates the J2EE Deployment Descriptors against application server DTDs, 479
- version — displays the version information, 482

W

- wscmpile — generates stubs, ties, serializers, and WSDL files used in JAX-RPC clients and services, 484
- wsdeploy — reads a WAR file and the `jaxrpc-ri.xml` file and generates another WAR file that is ready for deployment, 488
