Preface 11

1. Installation Issues 15

System Identification Bugs 16

   System Identification Tools Fail to Verify Name Server (4265363) 16

Solaris Web Start 3.0 Issues You Need to Know About Before Using the Solaris 8 Installation CD 16

   Solaris Web Start 3.0 Installation Partition Issue 16

Solaris Web Start 3.0 Bugs You Need to Know About Before Using the Solaris 8 Installation CD 17

   Cannot Specify an Alternate Network Interface to Use During System Identification on Network Gateway Systems (4302896) 17

Issues You Need to Know About Before Installing Solaris 8 Software 18

   Locale Installation Mechanism Change 18

   Do Not Install a Large Partition on Systems That Already Have symhisl, mega, or cpqncr Disk Controller Drivers Installed 19

   Update the DPT PM2144UW Controller BIOS to the Latest Revision Before Upgrading to the Solaris 8 Operating Environment 19

   Do Not Upgrade Hewlett-Packard (HP) Vectra XU Series Systems With BIOS Version GG.06.13 20

   Direct Memory Access (DMA) Is Disabled on PCI-IDE Systems 20

Installation Bugs That Occur During a Solaris Web Start 3.0 Installation 21
cpio Error Messages Occur When Booting From IA Boot Partition (4327051) 21

Installation Bugs That Occur During an Interactive Installation From Solaris 8 1 of 2 CD 21

ddi: net: x86 Network Boot Only Works on First Network Interface of a Given Type (1146863) 21

Installation Progress Bar May Be Inaccurate (1266156) 22

Warnings May Occur When a File System Is Created (4189127) 22

Custom JumpStart Does Not Prompt for the Solaris 8 Software 2 of 2 CD (4304912) 23

Upgrade Issues 23

Cannot Use Solaris Installation CD to Upgrade Intel Systems to the Solaris 8 Operating Environment 23

Priority Paging Is Not Needed With the New Solaris 8 Caching Architecture 24

Installation Bugs That Occur During an Upgrade 24

DiskSuite May Cause Data Loss (4121281) 24

Obsolete Files in SUNWpmi and SUNWxwpls Are Not Removed When Upgrading From the Solaris 7 11/99 Operating Environment to the Solaris 8 Operating Environment (4313654) 25

Upgrading the Solaris 7 Operating Environment With Web-Based Enterprise Management (WBEM) 1.0 to the Solaris 8 Operating Environment Causes WBEM 2.0 Not to Work (4274920) 25

SUNWseeudt Partially Fails to Install During an Upgrade (4304305) 26

Localization Bugs 27

Invalid Language Option K018-R (4342970) 27

Turkish Locale Does Not Install From Solaris 8 1 of 2 CD (4359095) 27

Error Messages May Occur During European Upgrade (4230247, 4225787) 27

Swedish Locale: Dialog Boxes Displayed During Installation Are Not Localized (4300655) 28

French and Italian Installation Wizards May Display [0] Instead of the CD Title (4302549) 28

Motif suninstall Fails in de_AT.ISO8859-15 and fr_BE.ISO8859-15 Locales (4305420)

German Locale: Add and Cancel Buttons in the Proxy Kiosk Screen Are Labeled as Undefined (4306260)

2. Solaris Runtime Issues 31

Security Update Issues 31

Netscape Communicator Vulnerability 31

Security Update Bugs 32

ypbind Buffer OverFlow Can Allow Root Privileges (4362647)

Common Desktop Environment (CDE) Issues 32

Compiling Motif Programs on the Solaris 8 Operating Environment 32

Common Desktop Environment Bugs 33

sdtwinlist (Window List) and sdtgwm (Windows Manager) Icons Are Missing from desktop_apps (4360521)

Volume Manager Might Fail To Mount CDROM (4355643)

OpenWindows File Manager Fails to Mount Diskette (4329368)

PDASync Cannot Delete Last Entry From the Desktop (4260435)

PDASync Does Not Support Data Exchange With the Multibyte Internationalized PDA Device (4263814)

System Administration Bugs 37

Obsolete Files Still Present in Help System (4339515)

CIM_ERR_LOW_ON_MEMORY Error Occurs When Trying to Add Data With WBEM (4312409)

mofcomp Fails Due to a WBEM JavaSpaces Problem (4336719)

WBEM Common Information Model Object Manager Crashes When Solaris_FileSystem Instances Are Requested (4301275)

Hardware Configuration Bugs 39

Systems With Small Memory Configurations Panic During Boot Time If They Have Several USB Devices (4359440)

Java Runtime Issues 40

Java Plug-in Support 40
Performance Issue 40

Direct Memory Access (DMA) Is Disabled On PCI-IDE Systems 40

AnswerBook2 Bugs 41

The ab2admin Command Intermittently Indicates command failed Even Though the Command Succeeded (4242577) 41

ab2cd Script Displays an Erroneous Error Message (4256516) 42

Localization Issues 42

Use Font Downloader to Print From Any Non-ISO8859-1 Locale 42

Localization Bugs 43

Warning Messages Might Appear When Launching Java Applications From Any UTF-8 Locale (4342801) 43

UTF-8 Version of sdtwinlst and sdtgwm Are Not Localized For European Languages (4352800, 4352861) 43

Some Greek Characters Are Not Available in CDE (4179411) 43

Cannot Print Extended Characters in Calendar Manager in All Partial Locales (4285729) 43

Cutting and Pasting Text Between Arabic and UTF-8 English Does Not Work (4287746) 44

The CDE Extras Drop-Down Menu Is Not Available for European Locales (4298547) 44

CTL Is Not Supported in Japanese and Asian UTF-8 Locales (4300239) 44

Several Screens in The Smart Card Application Have Not Been Localized (4304495) 45

Cannot Add, Remove, or Modify Users in Solstice AdminTool in the Greek Locale (4302983) 45

Font Downloader Add and Cancel Buttons Are Incorrectly Labeled in the Italian Locale (4303549) 45

Missing Arabic Characters and Incompatibility Between the Sun Arabic Keyboard and the Microsoft Arabic Keyboard (4303879) 46

SEAM Application Displays Messages That Are Not Localized (4306619) 46

A. Patch List 75

Patch List 75
The Solaris™ 8 (Intel Platform Edition) 10/00 Release Notes Update contains installation problem details and other information that were not available until immediately before the release of the Solaris 8 10/00 operating environment.

Note - In this document the term “IA” refers to the Intel 32-bit processor architecture, which includes the Pentium, Pentium Pro, Pentium II, Pentium II Xeon, Celeron, Pentium III, and Pentium III Xeon processors and compatible microprocessor chips made by AMD and Cyrix.

Who Should Use This Book

These notes are for users and system administrators who are installing and using the Solaris 8 10/00 operating environment.

Related Books

You may need to refer to the following manuals when installing Solaris software:

- Solaris 8 Start Here
- Solaris 8 (Intel Platform Edition) Installation Guide
- Solaris 8 Advanced Installation Guide
- Solaris 8 Installation Supplement
Solaris 8 (Intel Platform Edition) 10/00 Hardware Compatibility List

The Solaris 8 10/00 release notes are available:

- In the Solaris 8 10/00 Release Documents Collection on the Solaris 8 10/00 Documentation CD
- In print with the product (installation issues and bugs only)
- On http://docs.sun.com (the most up-to-date information)

Solaris 8 System Administration Supplement

Solaris documentation is available on the Solaris 8 10/00 Documentation CD included with this product.

For some hardware configurations, you may need supplemental hardware-specific instructions for installing the Solaris operating environment. If your system requires hardware-specific actions at certain points, the manufacturer of your hardware has provided supplemental Solaris installation documentation. Refer to those materials for hardware-specific installation instructions.

Ordering Sun Documents

Fatbrain.com, an Internet professional bookstore, stocks select product documentation from Sun Microsystems, Inc.

For a list of documents and how to order them, visit the Sun Documentation Center on Fatbrain.com at http://www1.fatbrain.com/documentation/sun.

Accessing Sun Documentation Online

The docs.sun.com Web site enables you to access Sun technical documentation online. You can browse the docs.sun.com archive or search for a specific book title or subject. The URL is http://docs.sun.com.
Information about the Solaris hardware certification program can be found on the Internet at http://soldc.sun.com/support/certify. Occasionally, an updated Hardware Compatibility List is produced between releases. If a newer version of this document exists, it will be available at the certification web site.
Installation Issues

This chapter describes problems relating to the installation of the Solaris 8 10/00 operating environment.

**Note** - The name of this product is Solaris 8 10/00, but code and path or package path names may use Solaris 2.8 or SunOS™ 5.8. Always follow the code or path as it is written.

**Note** - In the HTML version of the Solaris 8 Advanced Installation Guide on the Solaris 8 Documentation CD, pages were dropped. To read the complete Solaris 8 Advanced Installation Guide, refer to:
- The PDF version on the Solaris 8 Documentation CD
- The AnswerBook2 version on the Solaris 8 Documentation CD
- http://docs.sun.com
System Identification Bugs

System Identification Tools Fail to Verify Name Server (4265363)

If you are configuring the name service (NIS+, NIS or DNS) on a system and the name server(s) exist on another subnet and the router does not broadcast its route, then the system identification tools fail to verify the name server.

If you choose DNS as the name service, the installation program prompts you to accept the unverified data and continue. If you choose NIS+ or NIS as the name service, the system identification cannot continue without verification and the name service cannot be configured during installation.

Workaround: Choose one of the following workarounds.

1. If you are installing using a graphical interface, open a terminal window and type the following command to add a router:

```
# route add default <ip_address_of_router>
```

2. If you are installing using a command line interface, choose nameservice = none. After the installation is complete, create the /etc/defaultrouter file and run sys-unconfig.

Solaris Web Start 3.0 Issues You Need to Know About Before Using the Solaris 8 Installation CD

Solaris Web Start 3.0 Installation Partition Issue

If Solaris Web Start 3.0 on the Solaris 8 Installation CD is unable to locate a Solaris fdisk partition on a system, you must create a Solaris fdisk partition on your root disk.
Caution - If you change the size of an existing fdisk partition, all data on that partition is automatically deleted. Back up your data before you create a Solaris fdisk partition.

Solaris Web Start 3.0 requires two fdisk partitions to perform an installation.

- Solaris fdisk partition
  
  This is the typical Solaris fdisk partition.

- x86 Boot fdisk partition
  
  This is a 10–Mbyte fdisk partition that enables Intel architecture to boot the miniroot that is placed on the newly created swap slice located on the Solaris fdisk partition.

Note - The Solaris Web Start 3.0 installation utility creates the x86 boot partition, removing 10–Mbytes from the Solaris fdisk partition. This prevents any existing fdisk partitions from being altered.

This partition should not be created manually.

This requirement also prevents you from using Web Start 3.0 to upgrade from the Solaris 2.6 or Solaris 7 releases to the Solaris 8 operating environment. For more information, refer to “Upgrade Issues” on page 23.

Solaris Web Start 3.0 Bugs You Need to Know About Before Using the Solaris 8 Installation CD

Cannot Specify an Alternate Network Interface to Use During System Identification on Network Gateway Systems (4302896)

A network gateway is used to communicate with other networks. A gateway system contains multiple network interface adapters and each adapter connects with a different network.

If you use the Solaris 8 10/00 Installation CD to install the Solaris 8 10/00 operating environment on a gateway system, Solaris Web Start 3.0 uses the primary interface to
gather system information. You cannot instruct Solaris Web Start 3.0 to use an alternate network interface to gather information for system identification.

**Workaround:** To specify another interface for gathering system information, choose one of the following workarounds.

- Create a `sysidcfg` file that specifies the network interface to use during system identification. See “Guidelines for Preconfiguring With the sysidcfg File” in Solaris 8 Advanced Installation Guide and the man page `sysidcfg(4)` for information on how to create and modify a `sysidcfg` file.
- Use the Solaris 8 10/00 Software 1 of 2 CD to launch an Interactive Installation of the Solaris 8 10/00 operating environment. Specify that the system is networked, and then select the alternate network interface to use for system identification from the list provided.

---

**Issues You Need to Know About Before Installing Solaris 8 Software**

**Locale Installation Mechanism Change**

The locale support installation mechanism has changed in the Solaris 8 operating environment. In the Solaris 2.5.1, 2.6, and 7 operating environments, the level of locale support installed depended on the software cluster chosen. The Solaris 8 operating environment includes a new installation interface that prompts you to select specific geographic regions for which you require locale support. Therefore, you have more freedom to customize the configuration of your system when you install the Solaris 8 operating environment more than was possible in the Solaris 2.5.1, 2.6, and 7 operating environments.

Notice especially the following behaviors:

- You must select the locales to be installed during the initial installation in the Geographic Selection screen. `c` (POSIX locale) and `en_US.UTF-8` (Unicode support) are the only locales that are automatically installed.
- When you upgrade from previous releases, some of the locales are automatically selected depending on the available locales on the system to be upgraded. Note that English, French, German, Italian, Spanish, and Swedish partial locales were always present on the system in the Solaris 2.5.1, 2.6, and 7 operating environments.
- Unicode locales (UTF-8) have a feature to enable multilingual text input. Because these locales use Asian input methods that are provided by each individual locale, install those Asian locales for which you need to type text.
Do Not Install a Large Partition on Systems That Already Have symhisl, mega, or cpqncr Disk Controller Drivers Installed

If you attempt to install a large partition (one that extends beyond the 8–Gbyte boundary) on a disk that uses any of the controllers listed next, the installed system does not behave properly.

The Solaris operating environment installation program cannot detect that the driver does not support large partitions. The installation continues without displaying an error. However, when you reboot your system, the reboot may fail.

Even if you successfully reboot your system, it will fail later because of other changes related to boot devices or added packages. The disk controllers associated with these drivers are:

- Symbios 53C896–based controllers (symhisl)
- AMI MegaRAID controllers (mega)
- Compaq 53C8xx-based SCSI controllers (cpqncr)

Workaround: Do not install a large partition that extends beyond the first 8 Gbytes of a disk on systems that have disk controllers driven by the symhisl, mega, or cpqncr drivers.

Update the DPT PM2144UW Controller BIOS to the Latest Revision Before Upgrading to the Solaris 8 Operating Environment

The Solaris 8 operating environment includes a new feature that enables you to install large partitions. The DPT PM2144UW controller’s BIOS must support Logical Block Addressing (LBA). The latest revision of the BIOS fully supports LBA access. The problem can also affect other DPT controller models.

Workaround: Prior to upgrading your system to the Solaris 8 operating environment, ensure that the DPT PM2144UW controller’s BIOS is the latest available version from DPT.

To determine if your system has a DPT controller, perform the following steps:

1. Run the `prtconf -D`.
2. If the name `dpt` is displayed, run the card’s configuration utility to obtain information about the model and BIOS revision.
3. Upgrade DPT PM2144UW controllers by flashing the BIOS or by installing the latest BIOS EPROM obtained from DPT. See http://www.dpt.com for the latest BIOS images for all DPT controllers.

You can now upgrade the system to the Solaris 8 operating environment.

Do Not Upgrade Hewlett-Packard (HP) Vectra XU Series Systems With BIOS Version GG.06.13

The Solaris 8 operating environment includes a new feature that enables you to install large partitions. The system BIOS must support Logical Block Addressing (LBA). BIOS Version GG.06.13 does not support LBA access. The Solaris boot programs cannot manage this conflict. The problem can also affect other HP Vectra systems. If you perform this upgrade, your HP system will no longer boot. Only a blank black screen with a flashing underbar cursor is displayed.

Workaround: Do not upgrade HP Vectra XU Series systems with the latest BIOS Version GG.06.13 to the Solaris 8 operating environment because it no longer supports these systems.

You can still boot your system using the boot diskette or boot CD because the boot paths do not use the hard disk code. Then select the hard disk as your bootable device instead of the network or CD-ROM drive.

Direct Memory Access (DMA) Is Disabled on PCI-IDE Systems

By default, the Solaris ata device driver has the DMA feature disabled for ATA/ATAPI devices. Installing the Solaris 8 operating environment works properly with DMA disabled.

To enable the DMA feature for improved performance, see “Direct Memory Access (DMA) Is Disabled On PCI-IDE Systems” on page 40.
Installation Bugs That Occur During a Solaris Web Start 3.0 Installation

cpio Error Messages Occur When Booting From IA Boot Partition (4327051)

If you use the Solaris 8 10/00 Installation CD, the following error messages are recorded in the /var/sadm/system/logs/cd0_install.log file.

```
cpio: Cannot chown() "/tmp/x86_boot/solaris", errno 22, Invalid argument
cpio: Error during chown() of "/tmp/x86_boot/solaris/
    boot.bin", errno 22, Invalid argument
cpio: Cannot chown() "/tmp/x86_boot/solaris/
    boot.bin", errno 22, Invalid argument
```

These messages indicate that Web Start 3.0 on the Solaris 8 10/00 Installation CD cannot change the ownership of the files needed to boot from the IA boot partition. Because the IA boot partition is a PCFS file system and does not support the chown command, the cpio errors occur.

**Workaround:** Ignore the error messages.

Installation Bugs That Occur During an Interactive Installation From Solaris 8 1 of 2 CD

ddi: net: x86 Network Boot Only Works on First Network Interface of a Given Type (1146863)

Booting over the network must be done on the primary network interface of IA-based systems.

Identifying the primary network interface is a matter of trial and error, but the first or last network device listed on the Boot Solaris menu is likely to be the primary interface.
As soon as you have determined the primary interface, it remains the primary interface every time you boot unless you make a change to the hardware configuration. If you change the hardware configuration, the primary interface may or may not change, depending on the type of changes made.

If you boot from a non-primary network interface, the booting system hangs and a boot server is not contacted. (This problem can also occur if the system is not registered as a client of the boot server.)

Installation Progress Bar May Be Inaccurate (1266156)

The Installing Solaris Software - Progress bar sometimes indicates that an installation is complete when it is still in progress. The installation program may add packages for several minutes after the progress bar has indicated that the installation is complete.

Do not rely on the progress bar to indicate that the installation is complete. The installation displays the following message when the program has completed all installation operations.

```
Installation complete
```

Warnings May Occur When a File System Is Created (4189127)

One of the following warning messages may be displayed when a file system is created during installation.

```
Warning: inode blocks/cyl group (87) >= data blocks (63) in last cylinder group. This implies 1008 sector(s) cannot be allocated.
```

or

```
Warning: 1 sector(s) in last cylinder unallocated
```

The warning occurs when the size of the file system being created does not map exactly to the space on the disk being used. This discrepancy can result in unused space on the disk that is not incorporated into the indicated file system. This unused space is not available for use by other file systems.

**Workaround:** Ignore the warning message.
Custom JumpStart Does Not Prompt for the Solaris 8 Software 2 of 2 CD (4304912)

After installing the Solaris 8 Software 1 of 2 CD, a custom JumpStart™ installation does not prompt you to install the Solaris 8 Software 2 of 2 CD.

**Workaround:** Choose one of the following workarounds:

- If you are installing only the End User software group, you do not need to install the Solaris 8 Software 2 of 2 CD because the End User software and its basic locale support are on the Solaris 8 Software 1 of 2 CD.

- If you are installing the Entire Distribution plus OEM, Entire Distribution, or Developer software, and are using a custom JumpStart installation from a server, use a network install server that contains the Solaris 8 1 of 2, 2 of 2, and Languages CDs. See “Creating a Profile Server” in *Solaris 8 Advanced Installation Guide*.

- If you are installing the Entire Distribution plus OEM, Entire Distribution, or Developer software and are using a custom JumpStart installation from a diskette, follow these steps to install the Solaris 8 Software 2 of 2 and Languages CDs:
  1. After the custom JumpStart completes the installation of the Solaris 8 Software 1 of 2 CD, reboot the system.
  2. Log in to the system.
  3. Insert the Solaris 8 Software 2 of 2 CD.
  4. Execute the `installer` command and follow the instructions on the screen to install the remaining software.
  5. Insert the Solaris 8 Languages CD.
  6. Execute the `installer` command and follow the instructions on the screen to install any languages.

---

**Upgrade Issues**

**Cannot Use Solaris Installation CD to Upgrade Intel Systems to the Solaris 8 Operating Environment**

You cannot use Solaris Web Start 3.0 on the Solaris 8 Installation CD to upgrade IA-based systems from the Solaris 2.6 or 7 operating environments to the Solaris 8 operating environment because of the x86 boot partition requirement. Use the Solaris Software 1 of 2 CD to upgrade to the Solaris 8 operating environment on IA-based systems.
Priority Paging Is Not Needed With the New Solaris 8 Caching Architecture

The Solaris 8 operating environment introduces a new file system caching architecture, which subsumes the Solaris 7 Priority Paging functionality. You should not set the system variable `priority_paging` in the Solaris 8 operating environment, and you should remove the variable from the `/etc/system` file when systems are upgraded to the Solaris 8 operating environment.

The new caching architecture removes most of the pressure on the virtual memory system that resulted from file system activity. As a result, the new caching architecture changes the dynamics of the memory paging statistics, which makes observing system memory characteristics simpler. However, several of the statistics report significantly different values. You should consider these differences when analyzing memory behavior or setting performance monitoring thresholds. The most notable differences are:

- The number of page reclaims is higher, which you should consider normal operation during heavy file system activity.
- The amount of free memory is higher because the free memory count now includes a large component of the file system cache.
- Scan rates are almost zero unless there is a shortage of system-wide available memory. Scanning is no longer used to replace the free list during normal file system I/O.

Installation Bugs That Occur During an Upgrade

**Caution** - Be sure to read bug description ID 4121281 before you start upgrading your IA (Intel architecture) based system to the Solaris 8 operating environment.

DiskSuite May Cause Data Loss (4121281)

The DiskSuite™ `metadb` replicas contain driver names as part of the DiskSuite configuration data. In IA-based systems that run versions 2.4, 2.5, 2.5.1, and 2.6 of the Solaris operating environment, the SCSI driver name is `cmdk`. The `cmdk` driver has been replaced by the `sd` driver in the Solaris 7 and 8 operating environments for IA-based systems.
**Workaround:** To avoid potential data loss during upgrades to the Solaris 7 and 8 operating environments, you must save the system’s meta device configurations in text files and remove their `metadb` replicas before upgrading any IA-based system that is running DiskSuite software. After you finish upgrading your IA-based system, you must restore the meta device configurations by using the DiskSuite command line interface.

The *DiskSuite Version 4.2 Release Notes* describe a procedure for saving `metadb` configurations, removing `metadb` replicas, upgrading IA-based systems to the Solaris 7 and 8 operating environments, upgrading DiskSuite to version 4.2, and restoring meta device configurations. Bourne shell scripts that automate the procedure are available for the Solaris 7 and 8 operating environments.

**Obsolete Files in SUNWpmi and SUNWxwpls Are Not Removed When Upgrading From the Solaris 7 11/99 Operating Environment to the Solaris 8 Operating Environment (4313654)**

When upgrading to the Solaris 8 operating environment, obsolete files in SUNWpmi or SUNWxwpls may not be removed. In addition, the permissions for the `/usr/openwin/server/etc/OWconfig` file are different in the Solaris 8 operating environment than in past Solaris releases.

The presence of these obsolete files and the difference in file permissions for `OWconfig` do not cause problems on your upgraded system.

**Workaround:** Ignore the error messages that list obsolete SUNWpmi or SUNWxwpls files that were not removed during the upgrade. Ignore the error messages indicating that the file permissions of `/usr/openwin/server/etc/OWconfig` are different from what was expected.

**Upgrading the Solaris 7 Operating Environment With Web-Based Enterprise Management (WBEM) 1.0 to the Solaris 8 Operating Environment Causes WBEM 2.0 Not to Work (4274920)**

If you installed WBEM 1.0 from the Solaris Easy Access Server (SEAS) 3.0 CD on a system running the Solaris 7 operating environment, you must remove the WBEM 1.0 packages before upgrading to the Solaris 8 operating environment. The Solaris WBEM Services 2.0 do not start after upgrading the Solaris 7 operating environment.
with WBEM 1.0 to the Solaris 8 operating environment. The Common Information Model (CIM) Object Manager fails to start. The following error message is displayed.

File not found: /opt/sadm/lib/wbem/cimom.jar

**Workaround:** Use the `pkgrm` command to remove the WBEM 1.0 packages before upgrading to the Solaris 8 operating environment.

1. Use the `pkginfo` command to check if the WBEM 1.0 packages are installed by typing:

```
% pkginfo | grep WBEM
```

2. Become superuser.

3. Use the `pkgrm` command to remove all WBEM 1.0 packages by typing:

```
# pkgrm SUNWwbapi
# pkgrm SUNWwbcor
# pkgrm SUNWwbdev
# pkgrm SUNWwbdoc
# pkgrm SUNWwbm
```

**SUNWeeudt Partially Fails to Install During an Upgrade (4304305)**

The upgrade log may state that the `SUNWeeudt` package was only partially installed.

```
Doing pkgadd of SUNWeeudt to /.
ERROR: attribute verification of
   </a/usr/dt/appconfig/types/ru_RU.KOI8-R/datatypes.dt>
failed pathname does not exist ...

Installation of <SUNWeeudt> partially failed.
pkgadd return code = 2
```

**Workaround:** Perform the following steps after the upgrade has been completed.

1. Remove the `SUNWeeudt` package by typing:

```
# pkgrm SUNWeeudt
```
2. Add the SUNWeeudt package by typing:

```bash
# pkgadd SUNWeeudt
```

---

**Localization Bugs**

**Invalid Language Option K018-R (4342970)**

K018-R is an invalid language. It appears in the Language Selection Screen when installing from the Solaris 8 1 of 2 CD. If chosen, installation is not affected and will run in English.

**Turkish Locale Does Not Install From Solaris 8 1 of 2 CD (4359095)**

The Turkish locale does not install when using Solaris 8 1 of 2 CD. The following error message appears:

```bash
couldn’t set locale correctly
```

**Workaround:** Install through the C language and add Turkish Support.

**Error Messages May Occur During European Upgrade (4230247, 4225787)**

After upgrading from the Solaris 7 3/99, 5/99, 8/99 or 11/99 operating environments to the Solaris 8 10/00 operating environment, the following errors may appear in the upgrade logs.

```bash
Doing pkgadd of SUNWplow to /.
pkgadd: ERROR: unable to create package object
"/a/usr/openwin/share/locale/de.ISO8859-15".
  file type <s> expected <d> actual
  unable to remove existing directory at
 ="/a/usr/openwin/share/locale/de.ISO8859-15"
```

(continued)
Installation of `<SUNWplow>` partially failed.
pkgadd return code = 2

Doing pkgadd of `SUNWpldte` to `/`
WARNING: `/a/usr/dt/appconfig/types/de.ISO8859-15`
may not overwrite a populated directory.

pkgadd: ERROR: `/a/usr/dt/appconfig/types/de.ISO8859-15`
could not be installed.

Installation of `<SUNWpldte>` partially failed.
pkgadd return code = 2

This warning occurs because the patch switches the affected directories listed in the upgrade logs from symbolic links to directories. The upgrade process then attempts to install an updated version of the package that does not include the change. These errors do not affect the operating environment on your system.

Workaround: Ignore these error messages.

Swedish Locale: Dialog Boxes Displayed During Installation Are Not Localized (4300655)
The Solaris interactive installation dialog box has not been localized except for the title. The section that has not been localized begins with the following text.

```
You’ll be using the initial option ...
```

French and Italian Installation Wizards May Display `{0}` Instead of the CD Title (4302549)
{0} is occasionally displayed in French and Italian where a CD title normally appears.
Motif suninstall Fails in de_AT.ISO8859-15 and fr_BE.ISO8859-15 Locales (4305420)

Installing the operating environment by using the two languages specified causes parts of the installation process to be displayed in English. In addition, not all localization packages are installed. The following message is displayed.

```
XView warning: "de" kann nicht als Sprachumgebungs-Kategorie Ausgabesprache (gesetzt über UmgebungsvARIABLE(n)) verwendet werden, wenn Standardsprache auf "de_AT.ISO8859-15" gesetzt ist
(Server Package)
XView warning: Requested input method style not supported.
(Server package)
```

**Workaround:** Install the Solaris operating environment using the German or French ISO8859-1 locales.

German Locale: Add and Cancel Buttons in the Proxy Kiosk Screen Are Labeled as Undefined (4306260)

The German Web Start Kiosk proxy information dialog box has the OK and Cancel buttons labeled as *Undefined*. The button on the left should be OK and the button on the right should be Cancel.
Solaris Runtime Issues

This chapter describes known runtime problems.

The following runtime bug descriptions have been added to this chapter since this document was published on the Solaris 8 10/00 Documentation CD and in the Installation Kiosk on the Solaris 8 10/00 Installation CD.

- Netscape Communicator Vulnerability issue
- Bug ID 4362647
- Bug ID 4360521
- Bug ID 4355643
- Bug ID 4342801

Note - The name of this product is Solaris 8 10/00, but code and path or package path names may use Solaris 2.8 or SunOS 5.8. Always follow the code or path as it is written.

Security Update Issues

Netscape Communicator Vulnerability

An exploit referred to as "Brown Orifice" creates an HTTP server as a Java applet, which has the effect of turning the Netscape browser into a web server. This allows remote users to access local and networked files. These files include URLs located behind firewalls using "file://", "http://", "https://", "ftp://", and other types of connections. There are no symptoms that would show the problem has occurred.

This is not an architectural problem with the Java security model.
Netscape Communicator versions 4.04 through 4.74 are affected. For more information on this vulnerability see CERT advisory CA-2000-15 at: http://www.cert.org/advisories/CA-2000-15.html

To correct this issue download and install Netscape Communicator version 4.75 from: http://www.sun.com/software/solaris/netscape

---

Security Update Bugs

**ypbind Buffer OverFlow Can Allow Root Privileges (4362647)**

*ypbind* has a buffer overflow which can be exploited remotely to gain root access on the compromised system.

**Workaround:** To prevent this problem, apply patch 110323-01.

---

Common Desktop Environment (CDE) Issues

**Compiling Motif Programs on the Solaris 8 Operating Environment**

A problem occurs when compiling a Motif program in the Solaris 8 operating environment when you link to a shared library that has been compiled in the Solaris 2.4, 2.5, 2.5.1 or 2.6 operating environments and the older library also uses the Motif Application Programming Interface (API).

The Motif program uses Motif version 2.1 and the old shared library uses Motif version 1.2. A core dump occurs. This is not a binary compatibility problem for applications compiled in the Solaris 2.4, 2.5, 2.5.1, 2.6 operating environments, which should run correctly in the Solaris 8 operating environment.

**Workaround:** If you have an older shared library that links directly to the Motif library, and if you want to compile a program in the Solaris 8 operating environment that links to both Motif and that older shared library, use a line like this to compile:

```
c c foo.c -o program -DMOTIF12_HEADERS -I/usr/openwin/include -I/usr/dt/include
-lXm12 -lXt -lX11
```
where program is the name of the program you are compiling.

Common Desktop Environment Bugs

sdtwinlst (Window List) and sdtgwm (Windows Manager) Icons Are Missing from desktop_apps (4360521)

The sdtwinlst (Window List) and sdtgwm (Windows Manager) icons do not appear in Application Manager. A generic icon is displayed instead. The reason is that two action files, sdtgwm.dt and sdtwinlst.dt, are missing from the directory /usr/dt/appconfig/types/C.

Workaround: To add the missing icons:
1. Create a new file in /usr/dt/appconfig/type/C and name it sdtgwm.dt.
2. Edit this file and insert the following text:

```
ACTION SDtgwm
{
  LABEL GWM
  TYPE COMMAND
  EXEC_STRING sdtgwm
  ICON SDtgwm
  WINDOW_TYPE NO_STDIO
}
```

3. Create a new file in /usr/dt/appconfig/type/C and name it sdtwinlst.dt.
4. Edit this file and insert the following text:
5. To verify all actions have been reloaded, exit the CDE session and log in again.

Volume Manager Might Fail To Mount CDROM (4355643)

A CDROM with an unusual data layout might fail to mount automatically. The File Manager Window might not display the CDROM's contents after it is inserted into the drive.

**Workaround:** Mount the CDROM manually:
1. Become root.
2. Stop the volume manager:
   ```
   /etc/init.d/volmgt stop
   ```
3. Mount the CDROM:
   ```
   mount -F hsfs -r device_pathname /mnt
   ```
   Where *device_pathname* is the pathname to where in the system the CDROM drive is connected to. For example, `/dev/dsk/c0t6d0s0`.

   **Note** - CDROM drives are typically connected to `c0t6d0s0` or to `c0t2d0s0` at the factory, but you must use the correct pathname for this command to work.
4. Restart the volume manager:
   ```
   /etc/init.d/volmgt start
   ```
OpenWindows File Manager Fails to Mount Diskette (4329368)

If you insert a diskette into its drive on a system with SCSI removable media devices and then select Check for Floppy from the File menu in OpenWindows™ File Manager, File Manager mounts the diskette in the /floppy directory, but fails to display a File Manager view listing the disk contents. The Format Floppy and Eject Floppy options do not appear in the File menu of File Manager.

**Workaround:** Choose one of the following workarounds.

- **To view the contents of a diskette,** follow these steps:
  1. Click on the / folder in the File Manager Iconic Path.
  2. Double-click on the floppy folder in the / display window.
  3. Double-click on the floppy0 folder in the /floppy display window.

- **To format a diskette,** follow these steps:
  1. Unmount the diskette.

  ```
  % volrmmount -e floppy0
  ```

  where floppy0 is the floppy disk’s folder in the /floppy directory.

  2. Format the diskette.

  ```
  % fdformat floppy0
  ```

- **To create a new file system on a diskette,** follow these steps:

  **Note** - If you have already unmounted the diskette, go to step 2 of this workaround.

  1. Unmount the diskette.

  ```
  % volrmmount -e floppy0
  ```

  where floppy0 is the diskette’s folder in the /floppy directory.

  2. Create the appropriate file system on the diskette.

  - To create a new UFS file system on the diskette, use the `newfs` command:

    ```
    % newfs /vol/dev/aliases/floppy0
    ```

  - To create a PCFS file system on the diskette, use the `mkfs` command:

    ```
    % mkfs -F pcfs /vol/dev/aliases/floppy0
    ```
3. Mount the diskette.

```bash
% volrmmount -i floppy0
```

To eject the diskette, use the `eject` command.

```bash
% eject floppy0
```

To prevent this problem, apply patch 109464-01.

PDASync Cannot Delete Last Entry From the Desktop (4260435)

After deleting the last item from the desktop (for example, the last appointment in your Calendar or the last address in the Address Manager), it is restored from the handheld device to the desktop when you synchronize your handheld device.

**Workaround:** Manually delete the last entry from the handheld device prior to synchronization.

PDASync Does Not Support Data Exchange With the Multibyte Internationalized PDA Device (4263814)

If you exchange multibyte data between a PDA device and Solaris CDE, the data may be corrupted in both environments.

**Workaround:** Back up your data on your personal computer with the PDA backup utility before you run the PDASync application. If you accidentally exchange multibyte data and corrupt that data, restore your data from the backup.
System Administration Bugs

Obsolete Files Still Present in Help System (4339515)

After selecting Help -> Information from the Front Panel, a list of obsolete files is returned. The correct file is S8FCSreleasenotes.

CIM_ERR_LOW_ON_MEMORY Error Occurs When Trying to Add Data With WBEM (4312409)

The following error message is displayed when memory is low:

```
CIM_ERR_LOW_ON_MEMORY
```

You cannot add more entries when the Common Information Model (CIM) Object Manager has run low on memory. You must reset the CIM Object Manager Repository.

**Workaround:** To reset the CIM Object Manager Repository:

1. Become superuser.
2. Stop the CIM Object Manager.
   ```
   # /etc/init.d/init.wbem stop
   ```
3. Remove the JavaSpaces log directory.
   ```
   # /bin/rm -rf /var/sadm/wbem/log
   ```
4. Restart the CIM Object Manager.
   ```
   # /etc/init.d/init.wbem start
   ```

**Note** - You will lose any proprietary definitions in your datastore. You must recompile the MOF files that contain those definitions using the `mofcomp` command. For example:

```
# /usr/sadm/bin/mofcomp -u root -p root_password your_mof_file
```
mofcomp Fails Due to a WBEM JavaSpaces Problem (4336719)

When running either /usr/sadm/bin/mofcomp or /usr/sadm/bin/wbemadmin the following error message may appear:

```
NO_SUCH_QUALIFIER1: Qualifier association not found.
```

You must reset the CIM Object Manager Repository.

**Workaround:** To reset the CIM Object Manager Repository:

1. Become superuser.
2. Stop the CIM Object Manager.
   ```
   # /etc/init.d/init.wbem stop
   ```
3. Rename the JavaSpaces log directory.
   ```
   # mv /var/sadm/wbem/log /var/sadm/wbem/logprepatch
   ```
4. Restart the CIM Object Manager.
   ```
   # /etc/init.d/init.wbem start
   ```

**Note** - You will lose any proprietary definitions in your datastore. You must recompile the MOF files that contain those definitions using the mofcomp command. For example:

```
# /usr/sadm/bin/mofcomp -u root -p root_password your_mof_file
```

---

WBEM Common Information Model Object Manager Crashes When Solaris_FileSystem Instances Are Requested (4301275)

If you enumerate instances of the Solaris_FileSystem class by using CIM WorkShop or the WBEM APIs, then the CIMOM no longer runs and the following error message is displayed:

```
Attempted to complete RMI action 
enumInstances and received exception 
java.rmi.UnmarshalException: Error
```

(continued)
unmarshaling return header; nested exception is:
java.io.EOFException

Workaround: In superuser mode, restart the CIMOM by typing the following command:

```bash
#/etc/init.d/init.wbem start
```

Hardware Configuration Bugs

Systems With Small Memory Configurations Panic During Boot Time If They Have Several USB Devices (4359440)

USB capable systems with small memory configurations might panic when booting from either disk, CD or a network when several USB devices are connected. One of the following panic messages will appear in this event:

```bash
panic[cpu0]/thread=1040800: main: unable to fork init.
```

or

```bash
panic[cpu0]/thread=2a1000fd40: BAD TRAP: type=31
rp=2a1000fd0a0 addr=0 mmu_fsr=0 occurred in module "genunix" due to a NULL pointer dereference
```

Workaround: If you have more than 4 USB devices, boot the system with only the USB keyboard and mouse connected. After you see the Solaris login prompt, connect the remaining USB devices.
Java Runtime Issues

Java Plug-in Support

Java Plug-in 1.2 is the default plug-in that runs Java 2 applets but not all Java 1.1 applets. If you require the Java Plug-in 1.1, you can download it from http://www.sun.com/solaris/netscape.

If you choose to have both Java Plug-in 1.1 and Java Plug-in 1.2 on the same system, you must follow the instructions for how to install Java Plug-in 1.1 and then configure your environment accordingly.

Performance Issue

Direct Memory Access (DMA) Is Disabled On PCI-IDE Systems

By default, the Solaris ata device driver has the DMA feature disabled for ATA/ATAPI devices.

This feature has been disabled to avoid problems on some systems that do not properly support DMA on ATA/ATAPI drives. Most of the problems are related to an outdated system BIOS.

To enable (or disable) DMA for the ata driver after an installation of the Solaris 8 operating environment:

1. Run the Solaris (Intel Platform Edition) Device Configuration Assistant from the boot diskette or the installation CD (if your system supports CD-ROM booting).

   Note - When booting with the boot diskette, the new atadma-enabled property value will be preserved on the diskette. Therefore, the changed value is in effect when reusing the boot diskette.

2. Press F2_Continue to scan for devices.
3. Press F2_Continue to display a list of boot devices.
5. Change the value of the ata-dma-enabled property to 1 to enable DMA (a value of 0 disables DMA):
   a. Select the ata-dma-enabled property from the list and press F3_Change.
   b. Type 1 and press F2_Continue to enable (type 0 and press F2_Continue to disable).
   c. Press F2_Back, then F3_Back to return to the Boot Solaris menu.
   d. Select the device from which you want to install (network adapter or CD-ROM drive) and press F2_Continue.

**Note** - If any problems occur after enabling DMA, disable DMA (set the ata-dma-enabled property to 0 using the above procedure), update your system with the latest BIOS from your hardware manufacturer, and then re-enable DMA.

---

**AnswerBook2 Bugs**

**The ab2admin Command Intermittently Indicates command failed Even Though the Command Succeeded (4242577)**

If the ab2admin command fails, the error message contains additional information besides command failed. For example, it may also include path not found or invalid ID.

**Workaround:** If the message command failed is displayed, make sure that the operation failed. For example, if the command you submitted should have deleted a collection from the AnswerBook2 database, type the following command to verify that the collection is displayed in the database.

```
# ab2admin -o list
```

You can frequently ignore the message command failed when no additional information is provided.
ab2cd Script Displays an Erroneous Error Message (4256516)

During the startup of an AnswerBook2™ server, the ab2cd script may display the following erroneous error message.

```
sort: can't read /tmp/abl_sort.XXX: No such file or directory
```

This error message states that the ab2cd script has not located any of the AnswerBook (Display PostScript™) collections on the CD.

**Workaround:** Ignore the error message.

---

Localization Issues

Use Font Downloader to Print From Any Non-ISO8859-1 Locale

Perform the following steps to print from any non-ISO8859-1 locale using the Font Downloader.

1. Log in to CDE.
2. Type `fdl` at the command line to start the Font Downloader.
3. Specify the printer by selecting Add from the Printer menu.
4. Select Font Bundle from the Download menu.

The font bundles are then downloaded to the specified printer, depending on what codeset is needed for printing.
Localization Bugs

Warning Messages Might Appear When Launching Java Applications From Any UTF-8 Locale (4342801)

LucidaSansLat4 font aliases are not available so related error messages might appear when launching a Java application from any UTF-8 locale.

Workaround: Log into the ISO-1 equivalent of the locale and launch the Java application from there.

UTF-8 Version of sdtwinlst and sdtgwm Are Not Localized For European Languages (4352800, 4352861)

sdtwinlst (Windows List) and sdtgwm (Graphical Workspace Manager) are unlocalized in UTF-8 selected encodings for European languages.

Workaround: Login to an ISO8859-1 encoding, then run sdtwinlst and sdtgwm.

Some Greek Characters Are Not Available in CDE (4179411)

Some dead-key combinations do not work correctly in CDE. Also, names for months do not function correctly in the Calendar Manager in the Greek locale.

Cannot Print Extended Characters in Calendar Manager in All Partial Locales (4285729)

If you attempt to print extended characters when using Calendar Manager in a partial locale, the extended characters do not print correctly.
Cutting and Pasting Text Between Arabic and UTF-8 English Does Not Work (4287746)

You cannot cut or paste Arabic text between an application or window running under en_US.UTF-8 in Arabic input mode and one running under ar_EY.ISO8859-6 in Arabic input mode.

The CDE Extras Drop-Down Menu Is Not Available for European Locales (4298547)

When you right-click in any CDE application for a European locale, the CDE Extras drop-down menu does not display any options.

CTL Is Not Supported in Japanese and Asian UTF-8 Locales (4300239)

Complex Text Language (CTL) support for entering Hebrew, Arabic, or Thai has been implemented in en_US.UTF-8 and European UTF-8 locales, but is not supported in ja_JP.UTF-8, ko.UTF-8, also known as ko_KR.UTF-8, zh.UTF-8, which is also known as zh_CH.UTF-8, and zh_TW.UTF-8 locales.

Workaround: Use the en_US.UTF-8 locale if you need to enter Thai, Arabic, or Hebrew using CTL. If you want to enter those languages in Asian and Japanese UTF-8 locales:

1. Create a symbolic link to common CTL modules. In the case of ja_JP.UTF-8:

```
# cd /usr/lib/locale/ja_JP.UTF-8
# mkdir LO_LTYPE ; cd LO_LTYPE
# ln -s ../../common/LO_LTYPE/umle.layout.so.1 ja_JP.UTF-8.layout.so.1
# mkdir sparcv9 ; cd sparcv9
# ln -s ../../../common/LO_LTYPE/sparcv9/umle.layout.so.1 ja_JP.UTF-8.layout.so.1
```

2. Edit the /usr/openwin/lib/locale/ja_JP.UTF-8/XLC_LOCALE file by commenting out the load_option delay_nocheck line from Thai, Arabic, or Hebrew entries. For example, in the case of Thai:
Several Screens in The Smart Card Application Have Not Been Localized (4304495)
Several screens in the Smart Card application are not fully localized.

Cannot Add, Remove, or Modify Users in Solstice AdminTool in the Greek Locale (4302983)
The Add, Modify, and Remove User screens are blank in the Greek locale of the Solstice AdminTool software.

Workaround: In superuser mode, copy the following file:

```
cp /usr/openwin/lib/locale/C/app-defaults/Admin
/usr/openwin/lib/locale/el_GR.ISO8859-7/app-defaults/Admin
```

You can now add, remove, and modify user information in the Greek locale.

Font Downloader Add and Cancel Buttons Are Incorrectly Labeled in the Italian Locale (4303549)
When you are in the Italian locale using the Font Downloader, both the Add and Cancel buttons in the Add Printer dialog box are incorrectly labeled; they are both labeled A ....

- The left button should be labeled Aggiungi (Add).
- The right button should be labeled Annulla (Cancel).
Missing Arabic Characters and Incompatibility Between the Sun Arabic Keyboard and the Microsoft Arabic Keyboard (4303879)

The following table describes the differences between the Sun Solaris Arabic keyboard and the Microsoft Arabic keyboard.

<table>
<thead>
<tr>
<th>Key</th>
<th>Sun Keyboard Layout</th>
<th>Microsoft Keyboard Layout</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>T</td>
<td>Arabic Lam_alef with Hamza below</td>
</tr>

</table>

SEAM Application Displays Messages That Are Not Localized (4306619)

SEAM uses some of the resource files in the Solaris 8 operating environment, but only when the Kerberos settings are selected during an installation.
The Euro Currency Symbol Is Not Adequately Supported in the UTF-8 and Greek Locales (4306958, 4305075)

The Euro currency symbol is not generated when pressing AltGr+E in the UTF-8 locale.

**Workaround:** Perform the following steps to enter the Euro currency symbol in the UTF-8 locale:

1. Select Lookup in the UTF-8 Input Mode Selection window.
2. Select Currency Symbols.
3. Select the Euro symbol.

**Note -** In the Greek locale type `dumpcs` at the console prompt. Then copy and paste the Euro currency symbol.

---

Sorting in the European UTF-8 Locales Does Not Function Correctly (4307314)

Sorting in the European UTF-8 locales does not work properly.

**Workaround:** Before you attempt to sort in a FIGGS UTF-8 locale, set the `LC_COLLATE` variable to the ISO1 equivalent.

```
# echo $LC_COLLATE > es_ES.UTF-8
# setenv LC_COLLATE es_ES.ISO8859-1
```

Then start sorting.

---
Late-Breaking News

This chapter includes information on new features that arrived too late to be included in the Solaris 8 documentation set. For information on new features in the Solaris 8 10/00 operating environment, refer to the Solaris 8 10/00 Update AnswerBook Collection on http://docs.sun.com.

PIM Kernel Support

The Solaris 8 operating environment includes kernel support for the PIM protocol as described in RFC 2362. The Solaris 8 operating environment does not include the routing daemons, but for those users who want to use the Solaris 8 operating environment to route their multicast network traffic, implementations of the PIM protocol (both Sparse and Dense mode) may be found at http://netweb.usc.edu/pim.

Configuring Runtime Search Paths

You can now modify the runtime linkers search paths with the \texttt{-z nodefaultlib} option to the \texttt{ld} command and with runtime configuration files created by the new utility \texttt{crl(1)}.

49
End-of-Software Support Statements

This chapter lists end-of-support statements. No new end-of-software support statements have been added since this document was published on the Solaris 8 10/00Documentation CD and in the Installation Kiosk on the Solaris 8 10/00 Installation CD.

Current Release

HotJava Browser
The HotJava™ browser is no longer supported.

Solaris Java Development Kit: JNI 1.0 Interface
The 1.0 version of the Java Native Interface (JNI 1.0) is no longer supported by the Solaris Java Development Kit version 1.2 (JDK™ 1.2).
Support in the Solaris Java Development Kit (JDK) for the 1.0 version of the Java Native Interface (JNI 1.0) has been removed. JNI 1.0 is also known as the Native Method Interface (NMI).

Solstice AdminSuite 2.3/AutoClient 2.1
Solstice AdminSuite™ 2.3 software is no longer supported with the Solaris 8 operating environment. Any attempt to run Solstice AdminSuite 2.3 to configure a Solstice AutoClient or diskless client will result in a failure for which no patch is
available or planned. While it may be possible to manually edit configuration files to enable diskless clients, such an operation is not recommended or supported.

F3 Font Technology

F3 fonts and the TypeScaler rasterizer, Sun’s proprietary scalable font technology, is no longer supported. Sun will continue to support the industry standard font formats, Type1 and TrueType.

XGL

XGL is no longer supported.

Derived Type paddr_t

The paddr_t data type found in sys/types.h is not supported in the 64-bit compilation environment. It is currently only available in the 32-bit compilation environment.

Changes to Application Programming Interfaces (APIs) for User Accounting Data

Two sets of APIs allow user accounting data to be accessed by applications. The preferred set of programming interfaces for accessing and manipulating user accounting information is described on the getutxent(3C) man page. These interfaces are both more capable and more portable than the older getutent(3C) routines.

Older applications may access the underlying accounting files directly. The files /var/adm/utmp and /var/adm/wtmp and the corresponding symbolic links /etc/utmp and /etc/wtmp are no longer supported. The format of the data contained in these files constrains the future evolution of the Solaris operating environment. Applications using these files should be updated to use the documented and supported APIs.

Applications that are already using the getutent(3C) family of routines may be unaffected on small system configurations. However, in future releases these interfaces may return errors when used on very large system configurations. For this reason, use the getutxent(3C) routines for both old and new code in place of the getutent(3C) APIs.
The `sysidnis(1M)` System Identification Program

`sysidnis(1M)` is no longer supported. `sysidnis(1M)` is the System Identification program responsible for configuring name services during installation, upgrade, and after unconfiguration using `sys-unconfig(1M)`.

`sysidnis(1M)` has been replaced by `sysidns(1M)`.

Console Subsystem

The console subsystem for the Solaris operating environment running on an IA-based system has been replaced. The replacement is more compatible with the console subsystem for the Solaris operating environment running on a SPARC-based system and provides for future extensibility. This replacement has invalidated a large number of undocumented and unsupported interfaces, as well as some documented interfaces.

Documented interfaces:

- `pcmapkeys(1)`
- `loadfont(1)`
- `loadfont(4)`

Undocumented and unsupported interfaces:

- `ioctl`s listed in `/usr/include/sys/kd.h`
- `ioctl`s listed in `/usr/include/sys/vt.h`
- VT support
- `/dev/vt*`

- The terminal type for the console is no longer AT386; it is now sun-color.

Video Cards

The Solaris operating environment may no longer support drivers for the following video cards:

- Boca Voyager 64
- Compaq QVision 1024
- Compaq QVision 2000
- FIC 864P
Future Releases

GMT Zoneinfo Timezones

The zoneinfo timezones in the following left column may no longer be supported in a future release. These files may be removed from /usr/share/lib/zoneinfo. Replace usage of the zoneinfo timezones in the left column with the equivalent timezones in the right column.

**Note** - When setting the `TZ` environment variable to a zoneinfo GMT\([-\]+]* timezone, the timezone must be preceded with a colon (':') character. For example, replace the zoneinfo timezone setting `TZ=:GMT+1`, which is 1 hour east of the Prime Meridian, with the equivalent zoneinfo timezone setting `TZ=:Etc/GMT-1`.

The planned removal of the zoneinfo GMT\([-\]+]* timezones does not affect POSIX-style GMT\([-\]+]* timezone settings, for example `TZ=GMT+1` (without the colon character). An equivalent zoneinfo timezone, located under /usr/share/lib/zoneinfo/Etc and with the same name, may be used instead. The POSIX-style timezone only displays the string "GMT" in the abbreviated timezone name, while the zoneinfo timezone displays the offset from GMT. For example, replace the POSIX-style timezone setting, `TZ=GMT+1`, with the equivalent zoneinfo timezone setting `TZ=:Etc/GMT+1`.

See environ.5 and zoneinfo.4 for more information.

</table>
Solstice AdminTool

Solstice AdminTool (admintool) may no longer be supported in a future release. This tool performs user management, printer management, software package management, serial port management, group management, and host management.

The print management function is currently available in the Solaris 8 operating environment (see /usr/sadm/admin/bin/printmgr).

Solstice Enterprise Agents

Solstice Enterprise Agents may no longer be supported in a future release. This functionality has been replaced by the Solaris Web-Based Enterprise Management (WBEM) Services feature that is released as part of the Solaris 8 operating environment.

XIL

XIL may no longer be supported in a future release. An application using XIL causes the following warning message to be displayed.

```
WARNING: XIL OBSOLESCENCE
This application uses the Solaris XIL interface which has been declared obsolete and may not be present in version of Solaris beyond Solaris 8.
Please notify your application supplier.
The message can be suppressed by setting the environment variable _XIL_SUPPRESS_OBSOLETE_MSG.
```

Lightweight Directory Access Protocol (LDAP) Client Library

LDAP client library, libldap.so.3, may no longer be supported in a future release. The new version of this library, libldap.so.4, is compliant with the draft-ietf-ldapext-ldap-c-api-04.txt revision of the ldap-c-api draft from the Internet Engineering Task Force (IETF).
JDK 1.1.x and JRE 1.1.x

Version 1.1.x of the JDK and JRE may no longer be supported in a future release. Near-equivalent functionality is supported by Java 2 Standard Edition, versions 1.2 onwards.

SUNWrdm

The SUNWrdm package, formerly containing release notes and installed in /usr/share/release_info, may not be included on the Solaris Software CD in a future release.

**crash(1M) Utility**

The **crash(1M)** utility may no longer be supported in a future release. The **crash** command is a utility that examines system crash dump files, whose functionality is superseded by the new **mdb(1)** utility. The **crash** command’s interface has been structured around implementation details, such as slots, that have no relation to the Solaris operating system implementation.

“Transition From crash” in Solaris Modular Debugger Guide provides information for users who wish to transition from using **crash** to using **mdb**.

Kerberors Version 4 Client

The Kerberos version 4 client may be removed in a future release. This includes the Kerberos version 4 support in the **kinit(1)**, **kdestroy(1)**, **klist(1)**, **ksrvtgt(1)**, **mount_nfs(1M)**, **share(1M)**, and **kerbd(1M)** commands, in the **kerberos(3KRB)** library, and in the ONC RPC programming API **kerberos_rpc(3KRB)**.

**adb(1) Map Modifiers and Watchpoint Syntax**

The **adb(1)** utility may be implemented as a link to the new **mdb(1)** utility in a future version of the Solaris 8 operating environment.

The **mdb(1)** man page describes the features of the new debugger, including its **adb(1)** compatibility mode. Even in this compatibility mode, differences between **adb(1)** and **mdb(1)** exist. They are:
The text output format of some subcommands is different in `mdb(1)`. Macro files are formatted using the same rules, but scripts that depend on the output of other subcommands may need to be modified.

The watchpoint length specifier syntax in `mdb(1)` is different from the syntax described in `adb(1)`. The `adb(1)` watchpoint commands `:w`, `:a`, and `:p` allow an integer length (in bytes) to be inserted between the colon and the command character. In `mdb(1)`, the count should be specified following the initial address as a repeat count.

The `adb(1)` command `123:456w` is specified in `mdb(1)` as `123,456:w`.

The `/m`, `/*m`, `?m`, and `?*m` format specifiers are not recognized or supported by `mdb(1)`.

### OpenWindows Toolkits for Developers

OpenWindows™ XView™ and OLIT toolkits may no longer be supported in a future release. You may want to migrate to the Motif toolkit. To disable the warning message, use `#define OWTOOLKIT_WARNING_DISABLED` or `-D`.

### OpenWindows Environment For Users

The OpenWindows environment may no longer be supported in a future release. You may want to migrate to CDE, the Common Desktop Environment.

### Federated Naming Service (FNS)/XFN Libraries and Commands

The Federated Naming Service based on the X/Open XFN standard may no longer be supported in a future release.

### Solaris `ipcs(1)` Command

The ability to apply the `ipcs(1)` command to system crash dumps using the `-c` and `-N` command line options may no longer be supported in a future release. Equivalent functionality is now provided by the `mdb(1)::ipcs` debugger command.
Deprecate sendmail −AutoRebuildAliases Option

The −AutoRebuildAliases option for the sendmail(1m) man page is deprecated and may no longer be supported in a future release.

devconfig

devconfig may no longer be supported in a future release.

Device Support and Driver Software

The following table lists devices and driver software that may no longer be supported in a future release.

**TABLE 4-2** Device Support and Driver Software

<table>
<thead>

Intel 486–Based Systems

The Solaris operating environment may no longer be supported on Intel 486–based systems in a future release.
Documentation Issues

This chapter describes known documentation problems. The following documentation issues have been added to this chapter since this document was published on the Solaris 8 10/00 Documentation CD and in the Installation Kiosk on the Solaris 8 10/00 Installation CD.

- CDE User’s Guide in AnswerBook2

Note - The name of this product is Solaris 8 10/00, but code and path or package path names may use Solaris 2.8 or SunOS 5.8. Always follow the code or path as it is written.

Documentation Errata

Some graphics in the CDE User’s Guide in AnswerBook2 are unreadable in the Spanish, Italian and German locales.

Documents Affected: AnswerBook2 Help Collection

The AnswerBook2 software has been upgraded to Version 1.4.3, but the documentation still refers to Version 1.4.2. Aside from the number issue, the documentation is correct.

Document Affected: \texttt{usbprn(7D) man page (4347481)}

USB printing using the \texttt{usbprn(7D)} device driver is not supported in the \textit{Solaris 8 (Intel Platform Edition) 10/00 release}.

In the \texttt{usbprn(7D) man page}, the value of the Architecture attribute incorrectly states that support is limited to PCI-based systems. The value of the Architecture attribute in the \texttt{ATTRIBUTES} section should read:

Limited to PCI-based SPARC systems.

Current statement:

The Adaptec Ultra devices are supported by the \texttt{cadp} driver and they support PCI hot-plugging.

Should read as follows:

The Adaptec Ultra SCSI devices:

- AHA-2940AU
- AHA-2940U
- AHA-2940U Dual
- AHA-2940UW
- AHA-2940UW Dual
- AHA-2944UW
- AHA-3940AU
- AHA-3940AUW
- AHA-3940AUWD
- AHA-3940U
- AHA-3940UW

are now supported by the adp driver instead of the cadp driver as stated in the following documents:

- Solaris 8 Reference Manual Collection adp(7D) and cadp(7D)
- What’s New in the Solaris 8 Operating Environment

PCI hot-plugging is not supported for these Ultra SCSI devices. However, the Ultra 2 SCSI devices supported by the cadp driver support PCI hot-plugging.

The ninth and tenth bulleted items in the “Known Problems and Limitations” section of the “Adaptec AHA-2940AU, 2940U, 2940U Dual, 2940UW, 2940UW Dual, 2940U2, 2940U2B, 2940U2W, 2944UW, 2950U2B, 3940AU, 3940AUW, 3940AUWD, 3940U, 3940UW, 3944AUWD, 3950U2B HBAs” in the Solaris 8 (Intel Platform Edition) Device Configuration Guide should read as follows:

- When setting up a SCSI bus configuration, avoid connecting wide devices to a narrow bus. However, if you have such a configuration, add the following entry to the cadp.conf file:

  ```
  target<n>-scsi-options=0x1df8
  ```

  where <n> is the target ID of the wide device on the narrow bus. This entry disables wide negotiation for the specified target. Also ensure that the upper 8 bits of the bus are properly terminated at both ends of the SCSI chain.

- If you experience installation problems on systems with Intel 440BX/440GX motherboards, upgrade the motherboard BIOS with the latest revision.

The 4-bit Priority field description reflects RFC 1883, which has been obsoleted by RFC 2460 (Solaris 8 implements RFC 2460). Consequently, the Priority field has been replaced by an 8-bit Traffic Class field. The IPv6 Header Format figure should identify the Traffic Class field in place of the Priority field. The Priority bullet on this page should also be replaced by the following Traffic Class description:

Traffic Class - 8 bit traffic class field.

This new value also reduces the number of bits allocated to the "Flow Label" field to 20 bits.

Document Affected: “Priority Values” in *System Administration Guide, Volume 3*

The 4-bit Priority field description reflects RFC 1883, which has been obsoleted by RFC 2460 (Solaris 8 implements RFC 2460). Consequently, the Priority field has been replaced by the 8-bit Traffic Class field. The Priority section should be replaced by the following Traffic Classes section.

**Traffic Classes**

Originating nodes and forwarding routers can use the 8-bit Traffic Class field in the IPv6 header to identify and distinguish between different classes or priorities of IPv6 packets.

The following general requirements apply to the Traffic Class field.

- The service interface to the IPv6 service within a node must provide a means for an upper-layer protocol to supply the value of the Traffic Class bits in packets originated by that upper-layer protocol. The default value must be zero for all 8 bits.

- Nodes that support a specific use of some or all of the Traffic Class bits can change the value of those bits in packets that they originate, forward, or receive, as required for that specific use. Nodes should ignore and leave unchanged any bits of the Traffic Class field for which they do not support a specific use.

Step 10c in this procedure incorrectly omits the addition of the up parameter required in the line added to the /etc/hostname.ip.tun0 file. Consequently, the up parameter must be added at the end of the line entry in this step.

Several corrections apply to this section:

- For the nfs_32_time_ok symbol:
  - Change the symbol name to nfs_allow_preepoch_time.
  - Change the description to: This symbol controls whether the NFS client or server allows file time stamps that precede 1970.
  - No change to the default description.
  - Delete the nfs_acl_cache symbol entry.

- Add an nfs_disable_rddir_cache symbol entry.
  - Description: Some servers do not properly update the attributes of the directory when changes are made. To allow interoperability with these broken servers, set this variable to disable the readdir cache.
  - Default: Set to off(0).

- For the nfs_lookup_neg_cache and nfs3_lookup_neg_cache symbols:
  - Change the default to 1. Ignore the comment about the directory name caching.

- For the nrnode symbol:
  - Change the default description to: set to ncsiz e. By setting the variable to 1 you are effectively disabling the cache, not because there is an explicit check to see whether or not it is 1 but because you are creating a very small cache.

- For the nfs_write_error_interval symbol:
  - Change the description: This symbol controls how often NFS ENOSPC and EDQUOT write error messages are logged. Its units are in seconds.
  - No change to the default description.

- Delete the nfsreadmap symbol entry.

For the authdes_cachesz symbol:

- Change the default description: Defaults to 1024.
- Delete the authkerb_cachesz symbol entry.
- Delete the authkerb_win symbol entry.

Document Affected: “Mobile IP Mobility Agent Status” and “Displaying Mobility Agent Status” in Mobile IP Administration Guide

Current statement:

Use the mipagentstat(1M) command’s −b option to display the home agent’s binding table.

Should read as follows:

Use the mipagentstat(1M) command’s −h option to display the home agent’s binding table.
Document Affected: “Managing Mobile IP” and “Deploying Mobile IP” in Mobile IP Administration Guide

The Address Section in the Mobile IP configuration file has a parameter named Default-Node. This parameter name is incorrect. Node-Default is the correct parameter name.

Document Affected: sdtgwm(1) man page (4330198)

The -w option described in the man page sdtgwm(1) is not supported in the Solaris 8 10/00 operating environment.

Document Affected: “To Create a Boot Server on a Subnet” in “Creating an Install Server and a Boot Server” in Solaris 8 Advanced Installation Guide (4327931)

The instructions to create a boot server over a subnet incorrectly direct you to use the Solaris 8 Software 2 of 2 CD and the Solaris 8 Languages CD. If you follow these instructions, the following error message is displayed.

```
An existing install server cannot be found at /image_name.
This tool can only add packages to an install server that already exists.
```

When following the instructions “To Create a Boot Server on a Subnet” in the “Creating an Install Server and a Boot Server” in Solaris 8 Advanced Installation Guide, skip Steps 6 through 15.
CERT Advisories

This chapter lists all CERT Advisories as of 1/6/2000.

APPENDIX A

Patch List

The patches listed in this appendix have been applied to the Solaris 8 10/00 operating environment in one of the following ways:

- SolStart
  The patches are located in the /var/sadm/patch directory on an installed system.
- Freshbits technology
  These patches were applied when the Solaris 8 Software CD was created. Therefore, these patches are not located in the /var/sadm/patch directory.

The showrev -p command provides a list of all patches applied to the installed system regardless of how they were applied. The Solaris 8 Software CD includes a known and tested level of patches; however, patches cannot be backed out of the Solaris 8 10/00 release.
