This product or document is protected by copyright and distributed under licenses restricting its use, copying, distribution, and decompilation. No part of this product or document may be reproduced in any form by any means without prior written authorization of Sun and its licensors, if any. Third-party software, including font technology, is copyrighted and licensed from Sun suppliers.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, docs.sun.com, AnswerBook, AnswerBook2, DiskSuite, HotJava, Java, JavaSpaces, JDK, JumpStart, OpenWindows, Solstice AdminSuite, Solstice AutoClient, Solaris Management Console, SunOS, Sun StorEdge, Sun Enterprise, XView, and Solaris are trademarks, registered trademarks, or service marks of Sun Microsystems, Inc. in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc. PostScript is a trademark or registered trademark of Adobe Systems, Incorporated, which may be registered in certain jurisdictions. Netscape is a trademark or registered trademark of Netscape Communications Corporation. Netscape Communicator is a trademark or registered trademark of Netscape Communications Corporation.

The OPEN LOOK and Sun™ Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Federal Acquisitions: Commercial Software—Government Users Subject to Standard License Terms and Conditions.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Contents

Preface 9

1 Installation Issues 13

Issues You Need to Know About Before Installing Solaris 8 Software from DVD 14

Cannot Access Data on Solaris 8 2/02 DVD in Solaris 2.6 and Solaris 7 Operating Environment (4511090) 14

Solaris Web Start 3.0 Issues You Need to Know About Before Using the Solaris 8 Installation CD 15

Solaris Web Start 3.0 Installation Partition Issue 15

Solaris Web Start 3.0 Bugs You Need to Know About Before Using the Solaris 8 Installation CD 16

Initial Install Might Not Be Possible If Swap Slice Does Not Start At The First Usable Cylinder (4508297) 16

Default Install Might Be Disabled If Swap Slice Is Not on The Default Boot Disk (4527984) 17

Cannot Specify an Alternate Network Interface to Use During System Identification on Network Gateway Systems (4302896) 17

Issues You Need to Know About Before Installing Solaris 8 Software 18

Insufficient Space for Extra Languages During Upgrade (4414329) 18

Previous Versions of Solaris Management Console Software Are Not Compatible With Solaris Management Console 2.0 Software 19

Locale Installation Mechanism Change 21

Do Not Install a Large Partition on Systems That Already Have Installed symhisl, mega, or cpqncr Disk Controller Drivers 21

Update the DPT PM2144UW Controller BIOS to the Latest Revision Before Upgrading to the Solaris 8 Operating Environment 22

Do Not Upgrade Hewlett-Packard (HP) Vectra XU Series Systems With BIOS Version GG.06.13 22

Direct Memory Access (DMA) Is Disabled on PCI-IDE Systems	23
Installation Bugs That Occur During a Solaris Web Start 3.0 Installation	23
cpio Error Messages Occur When Booting From IA Boot Partition (4327051)	23
Installation Bugs That Occur During an Installation From Solaris 8 1 of 2 CD	24
Solaris 8 Software 2 of 2 Installation Program Does Not Automatically Start When Using Custom JumpStart or re-preinstall (4556860)	24
ddi : net : x86 Network Boot Only Works on First Network Interface of a Given Type (1146863)	25
Installation Progress Bar May Be Inaccurate (1266156)	25
Warnings May Occur When a File System Is Created (4189127)	26
Custom JumpStart Does Not Prompt for the Solaris 8 Software 2 of 2 CD (4304912)	26
Upgrade Issues	27
Cannot Use Solaris Installation CD to Upgrade Intel Systems to the Solaris 8 Operating Environment	27
Priority Paging Is Not Needed With the New Solaris 8 Caching Architecture	27
Installation Bugs That Occur During an Upgrade	28
Live Upgrade Might Not Determine Boot Device (4525464)	28
Upgrade Fails if /export Is Near Capacity (4409601)	29
Unable to Remove .save.SUNWcsr After Upgrading (4400054)	29
Upgrading Diskless Client Servers and Clients (4363078)	30
Upgrading the JavaSpaces Datastore to Prevent Web-Based Enterprise Management (WBEM) Data Loss (4365035)	30
Solstice DiskSuite May Cause Data Loss (4121281)	31
Relocated CDE From the Solaris 2.5.1 Operating Environment Orphaned by an Upgrade to the Solaris 8 Operating Environment (4260819)	31
Upgrading the Solaris 7 Operating Environment With WBEM 1.0 to the Solaris 8 Operating Environment Causes WBEM 2.0 to Fail (4274920)	32
SUNWweudt Partially Fails to Install During an Upgrade (4304305)	32
Localization Bugs That Occur During Installation	33
Solaris Web Start Installation Kiosk Menu Not Localized for European Locales (4510925)	33
Error Messages May Occur During European Upgrade (4230247, 4225787)	33
2 Solaris Runtime Issues	35
USB Issues	35
Audio Applications Might Stop Working After a USB Audio Device Is Hot-Unplugged (4424286)	35
USB Speakers Might Not Produce Sound	36

Smart Card Bugs	36
System Does Not Respond to Smart Card (4415094)	36
Edit Config File Menu Item in Smart Cards Management Console Does Not Work (4447632)	36
Common Desktop Environment (CDE) Issues	37
Compiling Motif Programs on the Solaris 8 Operating Environment	37
Common Desktop Environment Bugs	37
OpenWindows File Manager Fails to Mount Diskette (4329368)	37
PDASync Cannot Delete Last Entry From the Desktop (4260435)	39
PDASync Does Not Support Data Exchange With the Multibyte Internationalized PDA Device (4263814)	39
System Administration Bugs	39
Remote Display of Solaris Management Console Hangs (4488117)	39
Web-Based Enterprise Management (WBEM) HTTP Service Does Not Automatically Start (4486999)	40
WBEM Event Delivery Fails When Lowercase Is Used (4441369)	40
Incorrect Error Message When Using <code>flarcreate -e</code> and <code>-E</code> (4404811)	40
Obsolete Files Still Present in Help System (4339515)	41
CIM_ERR_LOW_ON_MEMORY Error Occurs When Trying to Add Data With WBEM (4312409)	41
Performance Issue	42
Direct Memory Access (DMA) Is Disabled On PCI-IDE Systems	42
AnswerBook2 Bugs	43
The <code>ab2admin</code> Command Intermittently Indicates <code>command failed</code> Even Though the Command Succeeded (4242577)	43
<code>ab2cd</code> Script Displays an Erroneous Error Message (4256516)	43
Localization Issues	44
Use Font Downloader to Print From Any Non-ISO8859-1 Locale	44
Runtime Localization Bugs	44
The Euro Currency Symbol Is Not Adequately Supported in the UTF-8 and Greek Locales (4363812, 4305075)	44
Warning Messages Might Appear When Launching Java Applications From Any UTF-8 Locale (4342801)	45
Some Greek Characters Are Not Available in CDE (4179411)	45
Cannot Print Extended Characters in Calendar Manager in All Partial Locales (4285729)	45
Cutting and Pasting Text Between Arabic and UTF-8 English Does Not Work (4287746)	45
The CDE Extras Drop-Down Menu Is Not Available for European Locales (4298547)	45

CTL Is Not Supported in Japanese and Asian UTF-8 Locales (4300239)	46
Cannot Add, Remove, or Modify Users in Solstice AdminTool in the Greek Locale (4302983)	46
Font Downloader Add and Cancel Buttons Are Incorrectly Labeled in the Italian Locale (4303549)	47
Missing Arabic Characters and Incompatibility Between the Sun Arabic Keyboard and the Microsoft Arabic Keyboard (4303879)	47
Sorting in the European UTF-8 Locales Does Not Function Correctly (4307314)	47
Applications Not Fully Localized (4304495, 4306619)	48

A Patch List 69

Patch List 69

Preface

The *Solaris™ 8 (Intel Platform Edition) 2/02 Release Notes* contains installation problem details and other information that were not available until immediately before the release of the Solaris 8 2/02 operating environment.

Note – In this document the term “IA” refers to the Intel 32-bit processor architecture, which includes the Pentium, Pentium Pro, Pentium II, Pentium II Xeon, Celeron, Pentium III, Pentium III Xeon, and Pentium 4 processors and compatible microprocessor chips made by AMD.

Who Should Use This Book

These notes are for users and system administrators who are installing and using the Solaris 8 2/02 operating environment.

The Solaris 8 2/02 release notes are available:

- In the Solaris 8 2/02 Release Documents Collection on the Solaris 8 2/02 Documentation CD
- In print with the product (installation issues and bugs only)
- On <http://docs.sun.com> (the most up-to-date information)

Related Books

You might need to refer to the following manuals when installing Solaris software:

- *Solaris 8 Start Here*
- *Solaris 8 2/02 What's New Supplement*
- *Solaris 8 Advanced Installation Guide*
- *Solaris 8 System Administration Supplement*
- *Solaris 8 (Intel Platform Edition) 2/02 Hardware Compatibility List*
- *Solaris 8 (Intel Platform Edition) Device Configuration Guide*

For information on current CERT advisories, see the official CERT web site at <http://www.cert.org>.

Solaris documentation is available on the Solaris 8 2/02 Documentation CD that is included with this product.

For some hardware configurations, you might need supplemental hardware-specific instructions for installing the Solaris operating environment. If your system requires hardware-specific actions at certain points, the manufacturer of your hardware has provided supplemental Solaris installation documentation. Refer to those materials for hardware-specific installation instructions.

Accessing Sun Documentation Online

The docs.sun.comSM Web site enables you to access Sun technical documentation online. You can browse the docs.sun.com archive or search for a specific book title or subject. The URL is <http://docs.sun.com>.

Typographic Conventions

The following table describes the typographic changes used in this book.

TABLE P-1 Typographic Conventions

Typeface or Symbol	Meaning	Example
AaBbCc123	The names of commands, files, and directories; on-screen computer output	Edit your <code>.login</code> file. Use <code>ls -a</code> to list all files. machine_name% you have mail.
AaBbCc123	What you type, contrasted with on-screen computer output	machine_name% su Password:
<i>AaBbCc123</i>	Command-line placeholder: replace with a real name or value	To delete a file, type rm <i>filename</i> .
<i>AaBbCc123</i>	Book titles, new words, or terms, or words to be emphasized.	Read Chapter 6 in <i>User's Guide</i> . These are called <i>class</i> options. You must be <i>root</i> to do this.

Shell Prompts in Command Examples

The following table shows the default system prompt and superuser prompt for the C shell, Bourne shell, and Korn shell.

TABLE P-2 Shell Prompts

Shell	Prompt
C shell prompt	machine_name%
C shell superuser prompt	machine_name#
Bourne shell and Korn shell prompt	\$
Bourne shell and Korn shell superuser prompt	#

Installation Issues

This chapter describes problems that relate to the installation of the Solaris 8 2/02 operating environment.

The following installation bug descriptions have been added to this chapter since this document was published on the Solaris 8 2/02 Documentation CD and in the Installation Kiosk on the Solaris 8 2/02 Installation CD.

- “Cannot Access Data on Solaris 8 2/02 DVD in Solaris 2.6 and Solaris 7 Operating Environment (4511090)” on page 14
- “Initial Install Might Not Be Possible If Swap Slice Does Not Start At The First Usable Cylinder (4508297)” on page 16
- “Default Install Might Be Disabled If Swap Slice Is Not on The Default Boot Disk (4527984)” on page 17
- “Solaris 8 Software 2 of 2 Installation Program Does Not Automatically Start When Using Custom JumpStart or re-preinstall (4556860)” on page 24
- “Solaris Web Start Installation Kiosk Menu Not Localized for European Locales (4510925)” on page 33

Note – The name of this product is Solaris 8 2/02 , but code and path or package path names might use Solaris 2.8 or SunOS™ 5.8. Always follow the code or path as it is written.

Issues You Need to Know About Before Installing Solaris 8 Software from DVD

Cannot Access Data on Solaris 8 2/02 DVD in Solaris 2.6 and Solaris 7 Operating Environment (4511090)

If your system is running the Solaris 2.6 or Solaris 7 operating environment, Volume Management incorrectly mounts the Solaris 8 2/02 DVD. The Solaris 8 2/02 DVD will mount, but the data is inaccessible. As a result, you cannot setup an install server, perform a Live Upgrade, or access any data on the media.

Workaround: Choose one of the following workarounds.

- Apply the patches appropriate for your system.

TABLE 1-1 DVD patches for the Solaris 2.6 and Solaris 7 Operating Environments

Release	Patch ID
Solaris 2.6 operating environment	107619-03
Solaris 2.7 operating environment	107260-03

- Manually mount the Solaris 8 2/02 DVD. Do not use Volume Management to mount the Solaris 8 2/02 DVD. Follow these steps.

1. Become superuser.
2. Stop Volume Management.

```
# /etc/init.d/volmgt stop
```
3. Manually mount the DVD.

```
# mkdir /mnt1  
# mount -F hsfs -o ro /dev/dsk/c0t6d0s0 /mnt1
```
4. Verify that the DVD is mounted and the data is accessible.

```
# cd /mnt1  
# ls
```

The system returns the following information if the DVD is correctly mounted.

```
Copyright Solaris_8
```

Solaris Web Start 3.0 Issues You Need to Know About Before Using the Solaris 8 Installation CD

Solaris Web Start 3.0 Installation Partition Issue

If Solaris™ Web Start 3.0 on the Solaris 8 Installation CD is unable to locate a Solaris `fdisk` partition on a system, you must create a Solaris `fdisk` partition on your `root` disk.

Caution – If you change the size of an existing `fdisk` partition, all data on that partition is automatically deleted. Back up your data before you create a Solaris `fdisk` partition.

Solaris Web Start 3.0 requires two `fdisk` partitions to perform an installation.

- Solaris `fdisk` partition
This is the typical Solaris `fdisk` partition.
- x86 Boot `fdisk` partition
This is a 10-Mbyte `fdisk` partition that enables Intel architecture to boot the miniroot that is placed on the newly created swap slice that is located on the Solaris `fdisk` partition.

Note – The Solaris Web Start 3.0 installation utility creates the x86 boot partition, removing 10 Mbytes from the Solaris `fdisk` partition. This utility prevents any existing `fdisk` partitions from being altered.

Do not create this partition manually.

This requirement also prevents you from using Web Start 3.0 to upgrade from the Solaris 2.6 or Solaris 7 releases to the Solaris 8 operating environment. For more information, refer to “Cannot Use Solaris Installation CD to Upgrade Intel Systems to the Solaris 8 Operating Environment” on page 27.

Solaris Web Start 3.0 Bugs You Need to Know About Before Using the Solaris 8 Installation CD

Initial Install Might Not Be Possible If Swap Slice Does Not Start At The First Usable Cylinder (4508297)

When you install from the Solaris 8 Installation CD, the Solaris Web Start installation program might prompt you to use an existing swap slice to hold the installation software. However, the installation program does not indicate whether the existing swap slice starts at the first usable cylinder or not. If you choose to use this slice and it does not begin at the first usable cylinder, installation might not be possible on some disk configurations.

Workaround: If you intend to perform an initial install, follow these steps.

Note – This will prevent any file system preservations on the disk.

1. During setup, answer **No** to all questions that prompt you to use an existing swap slice.
2. If prompted, select **None** from the list of alternatives, then answer **No** when you are prompted to re-select a slice to hold the Solaris installation software.
3. Select a disk to re-partition when you are prompted by the installer.
4. Choose a size when you are prompted to provide a size for the swap slice.
5. When the installer asks if the swap slice can start at the beginning of the disk, answer **Yes**.
6. Complete the installation.

For more information on re-partitioning disks or choosing a size for the swap slice, see the *Solaris 8 Advanced Installation Guide*.

Default Install Might Be Disabled If Swap Slice Is Not on The Default Boot Disk (4527984)

When you install from the Solaris 8 Installation CD and you choose a swap slice that is not on the default boot disk, the Default Install selection might be disabled. This problem can occur even when the swap slice starts at the first usable cylinder and the default boot disk contains sufficient space for a Default Install. The following error message is displayed.

```
Note:Default install is not possible.The file system requires manual layout.
```

Workaround: Choose one of the following workarounds.

- If you are performing an initial install, choose the default boot disk as the location for the swap slice.
- Perform a Custom Install if your swap slice is not located on the default boot disk.

Cannot Specify an Alternate Network Interface to Use During System Identification on Network Gateway Systems (4302896)

A network gateway is used to communicate with other networks. A gateway system contains multiple network interface adapters and each adapter connects with a different network.

If you use the Solaris 8 Installation CD to install the Solaris 8 2/02 operating environment on a gateway system, Solaris Web Start 3.0 uses the primary interface to gather system information. You cannot instruct Solaris Web Start 3.0 to use an alternate network interface to gather information for system identification.

Workaround: To specify another interface for gathering system information, choose one of the following workarounds.

- Create a `sysidcfg` file that specifies the network interface to use during system identification. See “Guidelines for Preconfiguring With the `sysidcfg` File” in *Solaris 8 Advanced Installation Guide* and the man page `sysidcfg(4)` for information on how to create and modify a `sysidcfg` file.
- Use the Solaris 8 Software 1 of 2 CD to launch an Interactive Installation of the Solaris 8 2/02 operating environment. Specify that the system is networked, and then select the alternate network interface to use for system identification from the list that is provided.

Issues You Need to Know About Before Installing Solaris 8 Software

Insufficient Space for Extra Languages During Upgrade (4414329)

When you upgrade from the Solaris 2.6 and Solaris 7 operating environments using a CD or CD images, extra European languages might be installed for locales that are not present on the system. If there is insufficient space in the file system, the upgrade will not complete. Languages for locales that are present on the system may not be installed.

Workaround: Choose one of the following workarounds.

- Manually select the languages you want installed during the upgrade process. Follow these steps.
 1. When the Language CD install panel is displayed, click the Back button.
 2. Deselect the extra languages and continue with the upgrade.
- Use a combined net install image to upgrade from the Solaris 2.6 and Solaris 7 operating environments. Do not use CDs or CD images to upgrade.
- After upgrading, follow these steps.
 1. Login to the system.
 2. Run `prodreg`.
 3. Uninstall any extra languages.
 4. Insert the Language CD into your CD-ROM drive and run the top level installer.
 5. Choose Custom Install.
 6. Select the languages you want installed.
 7. Complete the Language CD installation by clicking the Next and Install Now buttons.

Previous Versions of Solaris Management Console Software Are Not Compatible With Solaris Management Console 2.0 Software

If you upgrade to the Solaris 8 2/02 , or compatible, operating environment and you have Solaris Management Console™ 1.0, 1.0.1, or 1.0.2 software installed, you must uninstall the Solaris Management Console software before you upgrade. Solaris Management Console 2.0 software is not compatible with any previous version of the console. Solaris Management Console software might exist on your system if you installed the SEAS 2.0 overbox, the SEAS 3.0 overbox, or the Solaris 8 Admin Pack.

Workaround: Choose one of the following workarounds.

- Before you upgrade, run `/usr/bin/prodreg` and perform a full uninstall of the Solaris Management Console software.
- If you did not uninstall Solaris Management Console 1.0, 1.0.1, or 1.0.2 software before you upgraded, you must remove all Solaris Management Console 1.0, 1.0.1., or 1.0.2 software packages. You must use `pkgrm` for package removal instead of `prodreg` and you must carefully follow the order of package removal. Follow these steps.

1. Become superuser.
2. In a terminal window, type the following commands.

```
# pkginfo |grep "Solaris Management Console"  
# pkginfo |grep "Solaris Management Applications"  
# pkginfo |grep "Solaris Diskless Client Management Application"
```

The package names in the output identify a Solaris Management Console 1.0 software package if the description does not start with "Solaris Management Console 2.0."

3. Use `pkgrm` to remove all instances of Solaris Management Console 1.0 software packages in the following order.

Note – Do not remove any package that has "Solaris Management Console 2.0" in the description. For example, `SUNWmc.2` might indicate the Solaris Management Console 2.0 software.

Note – If the `pkginfo` output displays multiple versions of Solaris Management Console 1.0 software packages, use `pkgrm` to remove both packages. Remove the original package first and then the package that has been appended with a number. For example, if the `SUNWmcman` and `SUNWmcman.2` packages appear in the `pkginfo` output, first remove `SUNWmcman` and then `SUNWmcman.2`. Do not use `prodreg`.

```
# pkgrm SUNWmcman
# pkgrm SUNWmcapp
# pkgrm SUNWmcsvr
# pkgrm SUNWmcsvu
# pkgrm SUNWmc
# pkgrm SUNWmcc
# pkgrm SUNWmcsws
```

4. In a terminal window, type the following command.

```
# rm -rf /var/sadm/pkg/SUNWmcapp
```

The Solaris Management Console 2.0 software should now function. For future maintenance, or if the console does not function properly, remove the Solaris Management Console 2.0 software and reinstall it by following the next steps.

1. In a terminal window type the following commands.

```
# pkginfo |grep "Solaris Management Console"
# pkginfo |grep "Solaris Management Applications"
# pkginfo |grep "Solaris Diskless Client Management Application"
```

The package names in the output identify the remaining Solaris Management Console software packages that are installed on your system.

2. Use `pkgrm` to remove all Solaris Management Console 2.0 software packages in the following order.

Note – If your system has multiple instances of Solaris Management Console 2.0 software packages, such as `SUNWmc` and `SUNWmc.2`, first remove `SUNWmc`, and then `SUNWmc.2`. Do not use `prodreg`.

```
# pkgrm SUNWdclnt
# pkgrm SUNWmga
# pkgrm SUNWmgapp
# pkgrm SUNWmcdev
# pkgrm SUNWmcex
# pkgrm SUNWwbmc
# pkgrm SUNWmc
# pkgrm SUNWmcc
# pkgrm SUNWmccom
```

3. Insert the Solaris 8 Software (Intel Platform Edition) 1 of 2 CD into your CD-ROM drive and type the following in a terminal window.

```
# cd /cdrom/sol_8_202_ia/s0/Solaris_8/Product
# pkgadd -d . SUNWmccom SUNWmcc SUNWmc SUNWwbmc SUNWmcex SUNWmcdev \
SUNWmgapp SUNWmga SUNWdc1nt
```

All previous versions of the Solaris Management Console software are now removed and the Solaris Management Console 2.0 software is functional.

Locale Installation Mechanism Change

The locale support installation mechanism has changed in the Solaris 8 operating environment. In the Solaris 2.5.1, 2.6, and 7 operating environments, the level of locale support that was installed depended on the software cluster that was chosen. The Solaris 8 operating environment includes a new installation interface that prompts you to select specific geographic regions for which you require locale support. Therefore, you can customize the configuration of your system at installation of the Solaris 8 operating environment with more freedom than in the Solaris 2.5.1, 2.6, and 7 operating environments.

Notice especially the following behaviors:

- You must select the locales to be installed during the initial installation in the Geographic Selection screen. C (POSIX locale) and en_US.UTF-8 (Unicode support) are the only locales that are automatically installed.
- When you upgrade from previous releases, some of the locales are automatically selected, depending on the available locales on the system to be upgraded. Note that English, French, German, Italian, Spanish, and Swedish partial locales were always present on the system in the Solaris 2.5.1, 2.6, and 7 operating environments.
- Unicode locales (UTF-8) have a feature to enable multilingual text input. Because these locales use Asian input methods that are provided by each individual locale, install those Asian locales for which you need to type text.

Do Not Install a Large Partition on Systems That Already Have Installed symhisl, mega, or cpqncr Disk Controller Drivers

Do not attempt to install a large partition that extends beyond the 8-Gbyte boundary on a disk that uses any of the controllers that are listed next. If you do attempt to install such a partition, the installed system does not behave properly.

The Solaris operating environment installation program cannot detect that the driver does not support large partitions. The installation continues without displaying an error. However, when you reboot your system, the reboot might fail.

Even if you successfully reboot your system, it will fail later because of other changes that are related to boot devices or added packages. The disk controllers that are associated with these drivers are the following.

- Symbios 53C896-based controllers (`symhisl`)
- AMI MegaRAID controllers (`mega`)
- Compaq 53C8xx-based SCSI controllers (`cpqncr`)

Workaround: Do not install a large partition that extends beyond the first 8 Gbytes of a disk on systems that have disk controllers that are driven by the `symhisl`, `mega`, or `cpqncr` drivers.

Update the DPT PM2144UW Controller BIOS to the Latest Revision Before Upgrading to the Solaris 8 Operating Environment

The Solaris 8 operating environment includes a new feature that enables you to install large partitions. The DPT PM2144UW controller's BIOS must support logical block addressing (LBA). The latest revision of the BIOS fully supports LBA access. The problem can also affect other DPT controller models.

Workaround: Prior to upgrading your system to the Solaris 8 operating environment, ensure that the DPT PM2144UW controller's BIOS is the latest available version from DPT.

To determine if your system has a DPT controller, perform the following steps:

1. Run the `prtconf -D`.
2. If the name `dpt` is displayed, run the card's configuration utility to obtain information about the model and BIOS revision.
3. Upgrade DPT PM2144UW controllers by flashing the BIOS or by installing the latest BIOS EPROM that you have obtained from DPT. See <http://www.dpt.com> for the latest BIOS images for all DPT controllers.

You can now upgrade the system to the Solaris 8 operating environment.

Do Not Upgrade Hewlett-Packard (HP) Vectra XU Series Systems With BIOS Version GG.06.13

The Solaris 8 operating environment includes a new feature that enables you to install large partitions. The system BIOS must support logical block addressing (LBA). BIOS Version GG.06.13 does not support LBA access. The Solaris boot programs cannot manage this conflict. The problem can also affect other HP Vectra systems.

If you perform this upgrade, your HP system can no longer boot. Only a blank black screen with a flashing underscore cursor is displayed.

Workaround: Do not upgrade HP Vectra XU Series systems with the latest BIOS Version GG.06.13 to the Solaris 8 operating environment because it no longer supports these systems.

You can still boot your system by using the boot diskette or boot CD because the boot paths do not use the hard disk code. Then select the hard disk as your bootable device instead of the network or CD-ROM drive.

Direct Memory Access (DMA) Is Disabled on PCI-IDE Systems

By default, the Solaris ata device driver has the DMA feature disabled for ATA/ATAPI devices. Installing the Solaris 8 operating environment works properly with DMA disabled.

To enable the DMA feature for improved performance, see “Direct Memory Access (DMA) Is Disabled On PCI-IDE Systems” on page 42.

Installation Bugs That Occur During a Solaris Web Start 3.0 Installation

cpio Error Messages Occur When Booting From IA Boot Partition (4327051)

If you use the Solaris 8 2/02 Installation CD, the following error messages are recorded in the `/var/sadm/system/logs/cd0_install.log` file.

```
cpio: Cannot chown() "/tmp/x86_boot/solaris", errno 22, Invalid argument
cpio: Error during chown() of "/tmp/x86_boot/solaris/boot.bin", errno 22, Invalid argument
cpio: Cannot chown() "/tmp/x86_boot/solaris/boot.bin", errno 22, Invalid argument
```

These messages indicate that Web Start 3.0 on the Solaris 8 2/02 Installation CD cannot change the ownership of the files that are needed to boot from the IA boot partition. Because the IA boot partition is a PCFS file system and does not support the `chown` command, the `cpio` errors occur.

Workaround: Ignore the error messages.

Installation Bugs That Occur During an Installation From Solaris 8 1 of 2 CD

Solaris 8 Software 2 of 2 Installation Program Does Not Automatically Start When Using Custom JumpStart or `re-preinstall` (4556860)

If you install using the custom JumpStart™ program or the `re-preinstall` command, when the Solaris 8 Software 1 of 2 CD completes, the Solaris 8 Software 2 of 2 CD installation program does not automatically start. The system will reboot normally, but the installation is not complete.

Workaround: If you are performing a custom JumpStart installation, or you are using the `re-preinstall` command, choose one of the following workarounds.

- Use a combined network image of the Solaris 8 Software CDs to perform the installation.
- After the installation program on the Solaris 8 Software 1 of 2 CD completes, follow these steps.
 1. Login as superuser.
 2. Verify that the file `/var/sadm/system/data/packages_to_be_added` exists. Type the following command.

```
# ls /var/sadm/system/data/
```

 - If the file `packages_to_be_added` is listed in the output of the `ls` command, go to the next step.
 - If the output of the `ls` command does not list `packages_to_be_added`, your installation is complete. Do not continue with the workaround.
 3. Insert the Solaris 8 Software 2 of 2 CD into the CD-ROM drive and type the following commands to start the installation program.

```
# volcheck
# cd /cdrom/cdrom0/Solaris_8/Tools/Installers
# ./solaris2
```
 4. After the Solaris 8 Software 2 of 2 installation completes, type the following command to determine if `/var/sadm/system/data/packages_to_be_added` exists.

```
# ls /var/sadm/system/data
```

 - If the file `packages_to_be_added` is listed in the output of the `ls` command, go to the next step.

- If the output of the `ls` command does not list `packages_to_be_added`, your installation is complete. Do not continue with the workaround.
5. Insert the Solaris 8 Languages CD into the CD-ROM drive and type the following commands.

```
# volcheck
# cd /cdrom/cdrom0
# ./installer
```
 6. Choose the custom installation path in the Solaris 8 Languages CD installation program.
 7. Select the languages that you require for your system and complete the installation.

Note – If you have more than one CD-ROM drive, the path might be `/cdrom/cdrom#`, where `cdrom#` is the CD-ROM drive into which you inserted the Solaris 8 Software 2 of 2 CD, or the Solaris 8 Languages CD.

ddi: net: x86 Network Boot Only Works on First Network Interface of a Given Type (1146863)

Booting over the network must be done on the primary network interface of IA-based systems.

Identifying the primary network interface requires some experimentation, however the first or last network device that is listed on the Boot Solaris menu is likely to be the primary interface.

As soon as you have determined the primary interface, it remains the primary interface every time you boot unless you make a change to the hardware configuration. If you change the hardware configuration, the primary interface might or might not change, depending on the type of changes you have made.

If you boot from a non-primary network interface, the booting system hangs and a boot server is not contacted. This problem can also occur if the system is not registered as a client of the boot server.

Installation Progress Bar May Be Inaccurate (1266156)

The Installing Solaris Software - Progress bar sometimes indicates that an installation is complete when it is still in progress. The installation program might add packages for several minutes after the progress bar has indicated that the installation is complete.

Do not rely on the progress bar to indicate that the installation is complete. The installation displays the following message when the program has completed all installation operations.

```
Installation complete
```

Warnings May Occur When a File System Is Created (4189127)

One of the following warning messages might be displayed when a file system is created during installation.

```
Warning: inode blocks/cyl group (87) >= data blocks (63)
in last cylinder group. This implies 1008 sector(s) cannot be allocated.
```

Or

```
Warning: 1 sector(s) in last cylinder unallocated
```

The warning occurs when the size of the file system that is being created does not map exactly to the space on the disk that is being used. This discrepancy can result in unused space on the disk that is not incorporated into the indicated file system. This unused space is not available for use by other file systems.

Workaround: Ignore the warning message.

Custom JumpStart Does Not Prompt for the Solaris 8 Software 2 of 2 CD (4304912)

After you install the Solaris 8 Software 1 of 2 CD, a custom JumpStart installation does not prompt you to install the Solaris 8 Software 2 of 2 CD.

Workaround: Choose one of the following workarounds.

- If you are installing only the End User software group, you do not need to install the Solaris 8 Software 2 of 2 CD because the End User software and its basic locale support are on the Solaris 8 Software 1 of 2 CD.
- If you are installing the Entire Distribution plus OEM, Entire Distribution, or Developer software, and are using a custom JumpStart installation from a server, use a network install server that contains the Solaris 8 1 of 2, 2 of 2, and Languages CDs. See “Creating a Profile Server” in *Solaris 8 Advanced Installation Guide*.
- If you are installing the Entire Distribution plus OEM, Entire Distribution, or Developer software and are using a custom JumpStart installation from a diskette, follow these steps to install the Solaris 8 Software 2 of 2 and Languages CDs:
 1. After the custom JumpStart completes the installation of the Solaris 8 Software 1 of 2 CD, reboot the system.

2. Log in to the system.
3. Insert the Solaris 8 Software 2 of 2 CD.
4. Execute the `installer` script and follow the instructions on the screen to install the remaining software.
5. Insert the Solaris 8 Languages CD.
6. Execute the `installer` script and follow the instructions on the screen to install any languages.

Upgrade Issues

Cannot Use Solaris Installation CD to Upgrade Intel Systems to the Solaris 8 Operating Environment

You cannot use Solaris Web Start 3.0 on the Solaris 8 Installation CD to upgrade IA-based systems from the Solaris 2.6 or 7 operating environments to the Solaris 8 operating environment because of the x86 boot partition requirement. Use the Solaris Software 1 of 2 CD to upgrade to the Solaris 8 operating environment on IA-based systems.

Priority Paging Is Not Needed With the New Solaris 8 Caching Architecture

The Solaris 8 operating environment introduces a new architecture for file system caching, which subsumes the Solaris 7 Priority Paging functionality. Do not set the system variable `priority_paging` in the Solaris 8 operating environment. Remove the variable from the `/etc/system` file when systems are upgraded to the Solaris 8 operating environment.

The new caching architecture removes most of the pressure on the virtual memory system that resulted from file system activity. As a result, the new caching architecture changes the dynamics of the memory-paging statistics, which simplifies the observation of system memory characteristics. However, several of the statistics report significantly different values. Consider these differences when you analyze memory behavior or set performance monitoring thresholds. The most notable differences are the following.

- The number of page reclaims is higher, which you should consider normal operation during file system activity that is heavy.
- The amount of free memory is higher because the free memory count now includes a large component of the file system cache.
- Scan rates are almost zero unless there is a shortage of system-wide available memory. Scanning is no longer used to replace the free list during normal file system I/O.

Installation Bugs That Occur During an Upgrade

Caution – Ensure that you read bug description ID 4121281 before you start upgrading your IA (Intel architecture) based system to the Solaris 8 operating environment.

Live Upgrade Might Not Determine Boot Device (4525464)

If you boot from a Solstice DiskSuite™ or a Solaris™ Volume Manager mirrored root, or a Veritas encapsulated root, the `lucreate` command might be unable to determine the boot device. The following error message is displayed.

```
WARNING: Unable to determine root device by accessing boot device settings directly.
ERROR: Unable to determine root device for current BE.
ERROR: Unable to determine the physical boot device for the current BE <...>.
Use the <-C> command line option to specify the physical boot device for the current BE
<...>
```

If you use `lucreate -C` to specify the physical boot device the command fails.

Workaround: Manually edit `/usr/sbin/lucreate` to enable Live Upgrade to determine the boot device from a Solstice DiskSuite or a Solaris Volume Manager mirrored root, or a Veritas encapsulated root. Follow these steps.

1. Make a backup copy of `/usr/sbin/lucreate`.
2. Open `/usr/sbin/lucreate` in a text editor.
3. Locate the following line in `/usr/sbin/lucreate`.

```
elif [ "${dpbe_pbeBootDev}" -eq "-" ] ; then
```

4. Change the previous line to the following.

```
elif [ "${dpbe_pbeBootDev}" = '-' ] ; then
```

5. Locate the following line in `/usr/sbin/lucreate`.

```
if [ "${OPTARG}" -ne "-" ] ; then
```

6. Change the previous line to the following.

```
if [ "${OPTARG}" != '-' ] ; then
```

7. Save the changes to `/usr/sbin/lucreate`.

The `lucreate` command can now determine the boot device and the `-C` option will function correctly.

You can remove the backup copy of `/usr/sbin/lucreate` when the upgrade completes.

Upgrade Fails if /export Is Near Capacity (4409601)

If the `/export` directory is near full capacity and you upgrade to the Solaris 8 2/02 operating environment, the space requirements for `/export` are miscalculated and the upgrade fails. The problem commonly occurs if a diskless client is installed, or if third-party software is installed in `/export`. The following message is displayed.

```
WARNING: Insufficient space for the upgrade.
```

Workaround: Before you upgrade, choose one of the following workarounds.

- Temporarily rename the `/export` directory until the upgrade completes.
- Temporarily comment out the `/export` line in the `/etc/vfstab` file until the upgrade completes.
- If `/export` is a separate file system, then unmount `/export` before you perform the upgrade.

Unable to Remove .save.SUNWcsr After Upgrading (4400054)

After upgrading from the Solaris 2.5.1 8/97 or 11/97 operating environment to the Solaris 8 operating environment, you might see the following error in `/a/var/sadm/system/logs/upgrade_log`.

```
rm: Unable to remove directory /a/var/sadm/pkg/.save.SUNWcsr: File exists
```

Workaround: To prevent the error, before you upgrade to the Solaris 8 operating environment, perform `fsck` on the root file system.

To resolve the error after you upgrade, perform `fsck` on the root file system.

Upgrading Diskless Client Servers and Clients (4363078)

If your system currently supports diskless clients that were installed with the AdminSuite 2.3 Diskless Client tool, you must first delete all existing diskless clients prior to installing the Solaris 8 2/02 operating environment. For specific instructions, see "How to Set Up Your Diskless Client Environment" in *Solaris 8 System Administration Supplement*.

If you attempt to install the Solaris 8 2/02 operating environment over existing diskless clients, the following error message appears.

```
The Solaris Version (Solaris 7) on slice <xxxxxxx> cannot be upgraded.  
There is an unknown problem with the software configuration installed  
on this disk.
```

Upgrading the JavaSpaces Datastore to Prevent Web-Based Enterprise Management (WBEM) Data Loss (4365035)

If you are upgrading from the Solaris 8 (Solaris WBEM Services 2.0), Solaris 8 6/00 (WBEM Services 2.1), Solaris 8 10/00 (WBEM Services 2.2), or Solaris 8 1/01 (WBEM Services 2.3) operating environments to the Solaris 8 2/02 operating environment (Solaris WBEM Services 2.4), you must convert any proprietary custom Managed Object Format (MOF) data to the new Reliable Log repository format that is used with Solaris WBEM Services 2.4. Failure to convert the data results in data loss.

Workaround: To convert WBEM data, before upgrading you must save the JavaSpaces™ software. After upgrading, you must run the `wbemconfig convert` command.

Before upgrading to the Solaris 8 2/02 operating environment, follow these steps to save the JavaSpaces software.

1. **Become superuser.**

2. **Save the JavaSpaces software.**

```
cp /usr/sadm/lib/wbem/outrigger.jar /usr/sadm/lib/wbem/outrigger.jar.tmp
```

3. **Check and record the version of the JDK™ software that is installed on your machine. For example:**

```
# /usr/bin/java -version  
java version "1.2.1"  
Solaris VM (build Solaris_JDK_1.2.1_04c, native threads, sunwjit)
```

You must be running the same version of the JDK software that was running when the original JavaSpaces datastore was created.

Note – After upgrading to the Solaris 8 2/02 operating environment, you must convert the WBEM data. For specific instructions, see “Upgrading the CIM Object Manager Repository” in *Solaris WBEM Services Administrator’s Guide*.

Solstice DiskSuite May Cause Data Loss (4121281)

The Solstice DiskSuite `metadb` replicas contain driver names as part of the Solstice DiskSuite configuration data. In IA-based systems that run versions 2.4, 2.5, 2.5.1, and 2.6 of the Solaris operating environment, the SCSI driver name is `cmdk`. The `cmdk` driver has been replaced by the `sd` driver in the Solaris 7 and 8 operating environments for IA-based systems.

Workaround: To avoid potential data loss during upgrades to the Solaris 7 and 8 operating environments, you must save the system’s meta device configurations in text files and remove their `metadb` replicas before upgrading any IA-based system that is running Solstice DiskSuite software. After you finish upgrading your IA-based system, you must restore the meta device configurations by using the Solstice DiskSuite command line interface.

The *DiskSuite Version 4.2 Release Notes* describe a procedure for saving `metadb` configurations, removing `metadb` replicas, upgrading IA-based systems to the Solaris 7 and 8 operating environments, upgrading Solstice DiskSuite to version 4.2, and restoring metadvice configurations. Bourne shell scripts that automate the procedure are available for the Solaris 7 and 8 operating environments.

Relocated CDE From the Solaris 2.5.1 Operating Environment Orphaned by an Upgrade to the Solaris 8 Operating Environment (4260819)

This problem affects systems that run the Solaris 2.5.1 and the Solaris 2.5.1 unbundled CDE operating environments. However, these systems are only affected if the unbundled CDE has been relocated to a directory other than `/usr/dt`. The CDE relocation on these systems has been accomplished by creating a symbolic link in `/usr/dt` that points to the relocated CDE.

When you upgrade to the Solaris 8 operating environment, CDE is reinstalled in `/usr/dt`, and the link to the relocated version is removed. The relocated CDE is not removed and is therefore orphaned.

If the upgrade involves the reallocation of file systems, the upgrade might fail because the reallocation mechanism does not allow for the extra space that is needed in `/usr/dt` for the new version of CDE. This failure is not visible until the upgrade has been completed. If this failure occurs, the upgrade log includes several messages that indicate more space is needed for an upgrade.

Workaround: Uninstall the relocated CDE before you start upgrading to the Solaris 8 operating environment. You can uninstall by using the `install-cde` script from the Solaris 2.5.1 CDE CD. You should run this script with the `-uninstall` flag to remove CDE.

Upgrading the Solaris 7 Operating Environment With WBEM 1.0 to the Solaris 8 Operating Environment Causes WBEM 2.0 to Fail (4274920)

If you installed WBEM 1.0 from the Solaris Easy Access Server (SEAS) 3.0 CD on a system that runs the Solaris 7 operating environment, you must remove the WBEM 1.0 packages before upgrading to the Solaris 8 operating environment. The Solaris WBEM Services 2.0 do not start after you upgrade the Solaris 7 operating environment with WBEM 1.0 to the Solaris 8 operating environment. The Common Information Model (CIM) Object Manager fails to start. The following error message is displayed.

```
File not found: /opt/sadm/lib/wbem/cimom.jar
```

Workaround: Use the `pkgrm` command to remove the WBEM 1.0 packages before upgrading to the Solaris 8 operating environment.

1. Use the `pkginfo` command to check if the WBEM 1.0 packages are installed by typing the following.:

```
% pkginfo | grep WBEM
```

2. Become superuser.

3. Use the `pkgrm` command to remove all WBEM 1.0 packages by typing the following.

```
# pkgrm SUNWwbapi
# pkgrm SUNWwbcor
# pkgrm SUNWwbdev
# pkgrm SUNWwbdoc
# pkgrm SUNWwbn
```

SUNWweedt Partially Fails to Install During an Upgrade (4304305)

The upgrade log might state that the `SUNWweedt` package was only partially installed.

```
Doing pkgadd of SUNWeeudt to /.
ERROR: attribute verification of
</a/usr/dt/appconfig/types/ru_RU.KOI8-R/datatypes.dt>
failed pathname does not exist ...

Installation of <SUNWeeudt> partially failed.
pkgadd return code = 2
```

Workaround: Perform the following steps after the upgrade has been completed.

1. To remove the SUNWeeudt package, type the following.

```
# pkgrm SUNWeeudt
```

2. To add the SUNWeeudt package, type the following.

```
# pkgadd SUNWeeudt
```

Localization Bugs That Occur During Installation

Solaris Web Start Installation Kiosk Menu Not Localized for European Locales (4510925)

If you use the Solaris 8 2/02 Installation CD to install in a European locale, the Kiosk menu that appears at the end of the installation process displays in the C locale.

Error Messages May Occur During European Upgrade (4230247, 4225787)

After upgrading from the Solaris 7 3/99, 5/99, 8/99, or 11/99 operating environment to the Solaris 8 2/02 operating environment, the following errors might appear in the upgrade logs.

```
Doing pkgadd of SUNWplow to /.
pkgadd: ERROR: unable to create package object
</a/usr/openwin/share/locale/de.ISO8859-15>.
  file type <s> expected <d> actual
  unable to remove existing directory at
</a/usr/openwin/share/locale/de.ISO8859-15>
....
Installation of <SUNWplow> partially failed.
```

```
pkgadd return code = 2
```

```
Doing pkgadd of SUNWpldte to /.  
WARNING: /a/usr/dt/appconfig/types/de.ISO8859-15  
may not overwrite a populated directory.  
.....  
pkgadd: ERROR: /a/usr/dt/appconfig/types/de.ISO8859-15  
could not be installed.  
.....  
Installation of <SUNWpldte> partially failed.  
pkgadd return code = 2
```

This warning occurs because the patch switches the affected directories in the upgrade logs from symbolic links to directories. The upgrade process then attempts to install an updated version of the package that does not include the change. These errors do not affect the operating environment on your system.

Workaround: Ignore these error messages.

Solaris Runtime Issues

This chapter describes known runtime problems.

Note – The name of this product is Solaris 8 2/02 , but code and path or package path names might use Solaris 2.8 or SunOS 5.8. Always follow the code or path as it is written.

USB Issues

Audio Applications Might Stop Working After a USB Audio Device Is Hot-Unplugged (4424286)

If you hot-unplug a USB audio device the links to `/dev/audio` are broken. As a result, some audio applications might not recognize audio devices, including on-board audio. Rebooting the system or hot-plugging the USB audio device has no effect.

Workaround: Perform the following steps after a USB audio device is hot-unplugged.

1. Become superuser.
2. Correct the broken links by typing the following on a command line.

```
# rm /dev/audio*
# /usr/sbin/devfsadm -c audio
```

For more information see `devfsadm(1M)`.

USB Speakers Might Not Produce Sound

Third-party USB speakers might not produce sound after the USB driver is attached. Increasing the speaker volume or hot-plugging the device might not have any effect.

Workaround: Power cycle the USB speakers.

Smart Card Bugs

System Does Not Respond to Smart Card (4415094)

If `ocfserv` terminates and the display is locked, the system remains locked even when a smart card is inserted or removed.

Workaround: Perform the following steps to unlock your system.

1. Use `rlogin` to connect to the system on which the `ocfserv` process terminated.
2. Kill the `dtsession` process by typing the following in a terminal window.

```
% pkill dtsession
```

The `ocfserv` process restarts and smart card login and functionality will be restored.

Edit Config File Menu Item in Smart Cards Management Console Does Not Work (4447632)

The Edit Config File menu item in the Smart Cards Management Console does not edit smart card configuration files that are located in `/etc/smartcard/openCard.properties`. If the menu item is selected, a warning is displayed that indicates not to continue unless requested by technical support.

Workaround: Do not use the Edit Config File menu item in the Smart Cards Management Console. For information on smart card configuration, see *Solaris Smart Cards Administration Guide*.

Common Desktop Environment (CDE) Issues

Compiling Motif Programs on the Solaris 8 Operating Environment

A problem occurs when you compile a Motif program in the Solaris 8 operating environment under the following circumstances. When you link to a shared library that has been compiled in the Solaris 2.4, 2.5, 2.5.1 or 2.6 operating environments, the older library also uses the Motif Application Programming Interface (API).

The Motif program uses Motif version 2.1 and the old shared library uses Motif version 1.2. A core dump occurs. This is not a binary compatibility problem for applications that were compiled in the Solaris 2.4, 2.5, 2.5.1, 2.6 operating environments, which should run correctly in the Solaris 8 operating environment.

Workaround: If an older shared library links directly to the Motif library, and if you are compiling a program in the Solaris 8 operating environment that links to both Motif and that older shared library, use a line such as the following to compile:

```
cc foo.c -o program -DMOTIF12_HEADERS -I/usr/openwin/include \  
-I/usr/dt/include -lXm12 -lXt -lX11
```

In this line, *program* is the name of the program you are compiling.

Common Desktop Environment Bugs

OpenWindows File Manager Fails to Mount Diskette (4329368)

The OpenWindows™ File Manager fails to display a File Manager view that lists the contents of a floppy disk in certain circumstances. The problem occurs when you insert a floppy disk into the drive on a system that also has a SCSI removable media device. When you select Check for Floppy from the File menu in File Manager, File Manager mounts the floppy disk in the `/floppy` directory, but fails to display a File Manager view that lists the floppy disk contents.

Workaround: Choose one of the following workarounds.

- To view the contents of a floppy disk, follow these steps:
 1. Click on the / folder in the File Manager Iconic Path.
 2. Double-click on the floppy folder in the / display window.
 3. Double-click on the floppy0 folder in the /floppy display window.
- To format a floppy disk, follow these steps:
 1. Unmount the floppy disk..

```
% volrmmount -e floppy0
```

In this command, *floppy0* is the floppy disk's folder in the /floppy directory.
 2. Format the floppy disk.

```
% fdformat floppy0
```
- To create a new file system on a floppy disk, follow these steps:

Note – If you have already unmounted the floppy disk, go to step 2 of this workaround.

1. Unmount the floppy disk.

```
% volrmmount -e floppy0
```

In this command, *floppy0* is the floppy disk's folder in the /floppy directory.
2. Create the appropriate file system on the floppy disk.
 - To create a new UFS file system on the floppy disk, use the `newfs` command:

```
% newfs /vol/dev/aliases/floppy0
```
 - To create a PCFS file system on the floppy disk, use the `mkfs` command:

```
% mkfs -F pcfs /vol/dev/aliases/floppy0
```
3. Mount the floppy disk.

```
% volrmmount -i floppy0
```
- To eject the floppy disk, use the `eject` command.

```
% eject floppy0
```

To prevent this problem, apply patch 109464-01.

PDASync Cannot Delete Last Entry From the Desktop (4260435)

After you delete the last item from the desktop, the item is restored from the handheld device to the desktop when you synchronize your handheld device. Examples of items that you might delete and have restored are the last appointment in your Calendar or the last address in the Address Manager.

Workaround: Manually delete the last entry from the handheld device prior to synchronization.

PDASync Does Not Support Data Exchange With the Multibyte Internationalized PDA Device (4263814)

If you exchange multibyte data between a PDA device and Solaris CDE, the data might be corrupted in both environments.

Workaround: Back up your data on your personal computer with the PDA backup utility before you run the PDASync application. If you accidentally exchange multibyte data and corrupt that data, restore your data from the backup.

System Administration Bugs

Remote Display of Solaris Management Console Hangs (4488117)

When you remotely display the Solaris Management Console on the Solaris 8 7/01, or 2/02 operating environment, opening a dialog box in the console causes the console, including the open dialog box, to hang.

Workaround: Use the Solaris Management Console on your local system to connect to, and manage, a system running the Solaris 8 7/01, or 2/02 operating environment. Follow these steps.

1. Close the hung console window.
2. Start the Solaris Management Console on your local system.
3. Select Open Toolbox from the console menu.

4. Click the Server Toolbox tab and select, or enter, the name of the remote system you want to manage.
5. Click the Open button.

You can now use the console to manage the remote system.

Web-Based Enterprise Management (WBEM) HTTP Service Does Not Automatically Start (4486999)

The WBEM HTTP service in the Solaris 8 operating environment does not automatically start. If you want to use HTTP to connect to WBEM, you must manually start the WBEM HTTP service.

Workaround: To manually start the WBEM HTTP service, follow these steps.

1. Become superuser.
2. Stop the WBEM server if it is running.

```
# /etc/init.d/init.wbem stop
```
3. Set your classpath to include the following .jar files.

```
# CLASSPATH=/usr/sadm/lib/wbem/cimapi.jar:/usr/sadm/lib/xml.jar:\
  /usr/sadm/lib/wbem/cimom.jar
# export CLASSPATH
```
4. Start the HTTP service.

```
# java com.sun.wbem.client.HttpService &
```
5. Start the Common Information Model (CIM) Object Manager service.

```
# /usr/sadm/lib/wbem/wbemconfig &
```

WBEM Event Delivery Fails When Lowercase Is Used (4441369)

If a Solaris provider generates indications and the class name is set to lowercase, the event delivery fails.

Workaround: Use uppercase characters to define indication class names.

Incorrect Error Message When Using flarcreate -e and -E (4404811)

If you run the flarcreate command with both the -e and -E options an error is encountered. The following message is displayed.

```
ERROR: Options -D and -f are mutually exclusive
```

The message should read as follows.

```
ERROR: Options -E and -e are mutually exclusive
```

Workaround: Ignore the error message. Do not use the `-e` and `-E` options together.

Obsolete Files Still Present in Help System (4339515)

After selecting Help -> Information from the Front Panel, a list of obsolete files is returned. The correct file is `S8FCSreleasenotes`.

CIM_ERR_LOW_ON_MEMORY Error Occurs When Trying to Add Data With WBEM (4312409)

The following error message is displayed when memory is low:

```
CIM_ERR_LOW_ON_MEMORY
```

You cannot add more entries when the CIM Object Manager has run low on memory. You must reset the CIM Object Manager Repository.

Workaround: To reset the CIM Object Manager Repository, follow these steps.

1. Become superuser.
2. Stop the CIM Object Manager.

```
# /etc/init.d/init.wbem stop
```
3. Remove the JavaSpaces log directory.

```
# /bin/rm -rf /var/sadm/wbem/logr
```
4. Restart the CIM Object Manager.

```
# /etc/init.d/init.wbem start
```

Note – You lose any proprietary definitions in your datastore. You must recompile the MOF files that contain those definitions by using the `mofcomp` command. For example:

```
# /usr/sadm/bin/mofcomp -u root -p root_password your_mof_file
```

Performance Issue

Direct Memory Access (DMA) Is Disabled On PCI-IDE Systems

By default, the Solaris `ata` device driver has the DMA feature disabled for ATA/ATAPI devices.

This feature has been disabled to avoid problems on some systems that do not properly support DMA on ATA/ATAPI drives. Most of the problems are related to an outdated system BIOS.

To enable (or disable) DMA for the `ata` driver after an installation of the Solaris 8 operating environment, do the following.

1. Run the Solaris (Intel Platform Edition) Device Configuration Assistant from the boot diskette or the installation CD (if your system supports CD-ROM booting).

Note – When you boot from the boot diskette, the new `ata-dma-enabled` property value is preserved on the diskette. Therefore, the changed value is in effect when you reuse the boot diskette.

2. Press `F2_Continue` to scan for devices.
3. Press `F2_Continue` to display a list of boot devices.
4. Press `F4_Boot Tasks` and select `View/Edit Property Settings`.
5. Press `F2_Continue`.
6. Change the value of the `ata-dma-enabled` property to 1 to enable DMA (a value of 0 disables DMA):
 - a. Select the `ata-dma-enabled` property from the list and press `F3_Change`.
 - b. Type `1` and press `F2_Continue` to enable (type `0` and press `F2_Continue` to disable).
 - c. Press `F2_Back`, then `F3_Back` to return to the Boot Solaris menu.
 - d. Select the device from which you want to install (network adapter or CD-ROM drive) and press `F2_Continue`.

Note – If any problems occur after enabling DMA, disable DMA by setting the `ata-dma-enabled` property to 0 and using the previous procedure. Update your system with the latest BIOS from your hardware manufacturer, and then re-enable DMA.

AnswerBook2 Bugs

The `ab2admin` Command Intermittently Indicates command failed Even Though the Command Succeeded (4242577)

If the `ab2admin` command fails, the error message contains additional information besides `command failed`. For example, it might also include `path not found` or `invalid ID`.

Workaround: If the message `command failed` is displayed, ensure that the operation failed. For example, if the command you submitted should have deleted a collection from the AnswerBook2™ database, type the following command to verify that the collection is displayed in the database.

```
# ab2admin -o list
```

You can frequently ignore the message `command failed` when no additional information is provided.

`ab2cd` Script Displays an Erroneous Error Message (4256516)

During the startup of an AnswerBook2 server, the `ab2cd` script might display the following erroneous error message.

```
sort: can't read /tmp/ab1_sort.XXX: No such file or directory
```

This error message states that the `ab2cd` script has not located any of the AnswerBook (Display PostScript™) collections on the CD.

Workaround: Ignore the error message.

Localization Issues

Use Font Downloader to Print From Any Non-ISO8859-1 Locale

Perform the following steps to print from any non-ISO8859-1 locale by using the Font Downloader.

1. Log in to CDE.
2. Type `fdl` at the command line to start the Font Downloader.
3. Specify the printer by selecting Add from the Printer menu.
4. Select Font Bundle from the Download menu.

The font bundles are then downloaded to the specified printer, depending on what codeset is needed for printing.

Runtime Localization Bugs

The Euro Currency Symbol Is Not Adequately Supported in the UTF-8 and Greek Locales (4363812, 4305075)

The euro currency symbol is not generated when you press ALTGr+E in the UTF-8 locales.

Workaround: Choose one of the following workarounds.

- Perform the following steps to enter the euro currency symbol in the UTF-8 locales.
 1. Select Lookup in the UTF-8 Input Mode Selection window.
 2. Select Currency Symbols.
 3. Select the Euro symbol.
- Log in to any ISO8859-15 locale and use Alt+E to access the Euro.

Note – In the Greek locale type, `dumpcs` at the console prompt. Then copy and paste the euro currency symbol.

Warning Messages Might Appear When Launching Java Applications From Any UTF-8 Locale (4342801)

LucidaSansLat4 font aliases are not available, so related error messages might appear when you launch a Java application from any UTF-8 locale.

Workaround: Log in to the ISO-1 equivalent of the locale and launch the Java application from there.

Some Greek Characters Are Not Available in CDE (4179411)

Some dead-key combinations do not work correctly in CDE. Also, names of months do not function correctly in the Calendar Manager in the Greek locale.

Cannot Print Extended Characters in Calendar Manager in All Partial Locales (4285729)

If you attempt to print extended characters when you use Calendar Manager in a partial locale, the extended characters do not print correctly.

Cutting and Pasting Text Between Arabic and UTF-8 English Does Not Work (4287746)

You cannot cut or paste Arabic text between an application or window that is running under `en_US.UTF-8` in Arabic input mode and an application or window running under `ar_EY.ISO8859-6` in Arabic input mode.

The CDE Extras Drop-Down Menu Is Not Available for European Locales (4298547)

When you right-click in any CDE application for a European locale, the CDE Extras drop-down menu does not display any options.

CTL Is Not Supported in Japanese and Asian UTF-8 Locales (4300239)

Complex Text Language (CTL) support for entering Hebrew, Arabic, or Thai has been implemented in `en_US.UTF-8` and European UTF-8 locales, but is not supported in `ja_JP.UTF-8`, `ko.UTF-8`, also known as `ko_KR.UTF-8`, `zh.UTF-8`, which is also known as `zh_CN.UTF-8`, and `zh_TW.UTF-8` locales.

Workaround: Use the `en_US.UTF-8` locale if you need to enter Thai, Arabic, or Hebrew by using CTL. If you want to enter those languages in Asian and Japanese UTF-8 locales, do the following.

1. Create a symbolic link to common CTL modules. In the instance of `ja_JP.UTF-8`, use the following commands.:

```
# cd /usr/lib/locale/ja_JP.UTF-8
# mkdir LO_LTYPE ; cd LO_LTYPE
# ln -s ../../common/LO_LTYPE/umle.layout.so.1 \
ja_JP.UTF-8.layout.so.1
# mkdir sparcv9 ; cd sparcv9
# ln -s ../../common/LO_LTYPE/sparcv9/umle.layout.so.1 \
ja_JP.UTF-8.layout.so.1
```

2. Edit the `/usr/openwin/lib/locale/ja_JP.UTF-8/XLC_LOCALE` file by commenting out the `load_option delay_nocheck` line from Thai, Arabic, or Hebrew entries. For example, in the Thai language, use the following.

```
# fs14 class (Thai)
  fs14 {
    charset          TIS620.2533-0:GR
    font {
      # load_option delay_nocheck <--- comment out
      primary        TIS620.2533-0:GR
    }
  }
```

Cannot Add, Remove, or Modify Users in Solstice AdminTool in the Greek Locale (4302983)

The Add, Modify, and Remove User screens are blank in the Greek locale of the Solstice AdminTool software.

Workaround: In superuser mode, copy the following file.

```
# cp /usr/openwin/lib/locale/C/app-defaults/Admin \
/usr/openwin/lib/locale/el_GR.ISO8859-7/app-defaults/Admin
```

You can now add, remove, and modify user information in the Greek locale.

Font Downloader Add and Cancel Buttons Are Incorrectly Labeled in the Italian Locale (4303549)

When you are in the Italian locale and you are using the Font Downloader, both the Add and Cancel buttons in the Add Printer dialog box are incorrectly labeled. Both buttons are labeled A.

- The left button should be labeled Aggiungi (Add).
- The right button should be labeled Annulla (Cancel).

Missing Arabic Characters and Incompatibility Between the Sun Arabic Keyboard and the Microsoft Arabic Keyboard (4303879)

The following table describes the differences between the Sun Solaris Arabic keyboard and the Microsoft Arabic keyboard.

TABLE 2-1 Differences Between Sun and Microsoft Arabic Keyboards

Key	Sun Keyboard Layout	Microsoft Keyboard Layout
T	T	Arabic Lam_alef with Hamza below
U	U	Right single quotation mark
I	I	Arabic multiplication sign
O	O	Arabic division sign
A	;	Arabic Kasra
S	S	Arabic Kasratan
Z	Z	Tilde
X	X	Arabic Sukun
C	Arabic Kasratan	Left curly brace
V	Arabic Kasra	Right curly brace
M	Sukun	Single low quotation mark
<	<	Arabic comma

Sorting in the European UTF-8 Locales Does Not Function Correctly (4307314)

Sorting in the European UTF-8 locales produces unexpected results.

Workaround: Before you attempt to sort in a FIGGS UTF-8 locale, set the `LC_COLLATE` variable to the ISO-1 equivalent.

```
# echo $LC_COLLATE
> es_ES.UTF-8
# setenv LC_COLLATE es_ES.IS08859-1
Then start sorting.
```

Applications Not Fully Localized (4304495, 4306619)

The following applications are not fully localized. Some parts are not fully translated.

- Smart Card application (4304495)
- SEAM application messages (4306619)

Late-Breaking News

This chapter includes information on new features that arrived too late to be included in the Solaris 8 documentation set. For information on new features in the Solaris 8 2/02 operating environment, refer to the Solaris 8 2/02 Update AnswerBook Collection on <http://docs.sun.com>.

Update Feature Documentation

Some features in this Update release might not have documentation other than man pages. For additional reference, refer to the Solaris 9 operating environment documentation on <http://docs.sun.com>.

Prior to the release of the Solaris 9 operating environment, follow the links for documentation on the Solaris 9 operating environment Early Access Web site at <http://www.sun.com/solaris/programs/solaris9ea>.

When accessing Solaris 9 documentation during the beta period, you might be asked to accept a restricted usage license.

Diskless Client Support

The Solaris 8 2/02 operating environment includes diskless client support. Support in this release is limited to SPARC architecture diskless clients from either SPARC or Intel architecture (IA) servers.

PIM Kernel Support

The Solaris 8 operating environment includes kernel support for the PIM protocol that is described in RFC 2362. The Solaris 8 operating environment does not include the routing daemons. For users who are using the Solaris 8 operating environment to route their multicast network traffic, implementations of the PIM protocol Sparse mode and Dense mode are at <http://netweb.usc.edu/pim>.

Configuring Runtime Search Paths

You can now modify the runtime linker's search paths with the `-z nodefaultlib` option to the `ld` command and with runtime configuration files that are created by the new utility `crle(1)`.

End-of-Software Support Statements

This chapter lists end-of-support statements.

Current Release

This section describes end-of-software support statements that apply to the Solaris 8 2/02 operating environment.

HotJava Browser

The HotJava™ browser is no longer supported.

Solaris Java Development Kit: JNI 1.0 Interface

The 1.0 version of the Java Native Interface (JNI 1.0) is no longer supported by the Solaris Java Development Kit version 1.2 (JDK™ 1.2).

Support in the Solaris Java Development Kit (JDK) for the 1.0 version of the Java Native Interface (JNI 1.0) has been removed. JNI 1.0 is also known as the Native Method Interface (NMI).

Solstice AdminSuite 2.3/AutoClient 2.1

Solstice AdminSuite™ 2.3 software is no longer supported. Any attempt to run Solstice AdminSuite 2.3 to configure a Solstice AutoClient or diskless client results in a failure for which no patch is available or planned. Solaris 8 2/02 includes new commands for diskless client management. See `smosservice(1M)` and `smdiskless(1M)` for more information.

F3 Font Technology

F3 fonts and the TypeScaler rasterizer, the Sun proprietary scalable font technology, is no longer supported. Sun continues to support the industry standard font formats, Type1 and TrueType.

XGL

XGL is no longer supported.

Derived Type `paddr_t`

The `paddr_t` data type in `sys/types.h` is not supported in the 64-bit compilation environment. This data type is currently only available in the 32-bit compilation environment.

Changes to Application Programming Interfaces (APIs) for User Accounting Data

Two sets of application programming interfaces (API) enable user accounting data to be accessed by applications. The preferred set of programming interfaces for accessing and manipulating user accounting information is described on the `getutxent(3C)` man page. These interfaces are more capable and more portable than the older `getutent(3C)` routines.

Older applications can access the underlying accounting files directly. The files `/var/adm/utmp` and `/var/adm/wtmp` and the corresponding symbolic links `/etc/utmp` and `/etc/wtmp` are no longer supported. The format of the data that is contained in these files constrains the future evolution of the Solaris operating environment. Applications that use these files should be updated to use the documented and supported APIs.

Applications that are already using the `getutent(3C)` family of routines might be unaffected on small system configurations. However, in future releases these interfaces might return errors when you use them on very large system configurations. For this reason, use the `getutxent(3C)` routines for old code and new code instead of the `getutent(3C)` APIs.

`sysidnis(1M)` System Identification Program

`sysidnis(1M)` is no longer supported. `sysidnis(1M)` is the System Identification program responsible for configuring name services during installation and upgrade, and after unconfiguration that uses `sys-unconfig(1M)`.

`sysidnis(1M)` has been replaced by `sysidns(1M)`.

Console Subsystem

The console subsystem for the Solaris operating environment that runs on an IA based system has been replaced. The replacement is more compatible with the console subsystem for the Solaris operating environment that runs on a SPARC based system and provides for future extensibility. This replacement has invalidated undocumented and unsupported interfaces, as well as some documented interfaces.

Documented interfaces include the following.

- `pcmapkeys(1)`
- `loadfont(1)`
- `loadfont(4)`

Undocumented and unsupported interfaces include the following.

- `ioctl`s listed in `/usr/include/sys/kd.h`
- `ioctl`s listed in `/usr/include/sys/vt.h`
- VT support
- `/dev/vt*`
- The terminal type for the console is no longer `AT386`, but `sun-color`.

Video Cards

The Solaris operating environment might no longer support drivers for the following video cards:

- Boca Voyager 64
- Compaq QVision 1024
- Compaq QVision 2000

- FIC 864P
- Everex ViewPoint 64P
- Everex VBA Trio 64P
- Matrox Impression Plus
- Western Digital Paradise Bahamas

Future Releases

This section describes end-of-software support statements that apply to future releases of the Solaris operating environment.

Perl Version 5.005_03

The default version of Perl might be changed to a version that is not binary compatible with the current default (5.005_03) in a future release of the Solaris operating environment. Customer-installed modules need to be rebuilt and reinstalled against the new version. Modify any scripts that require the use of version 5.005_03 to explicitly use the 5.005_03 version of the interpreter (`/usr/perl5/5.005_03/bin/perl`) instead of the default version (`/bin/perl` or `/usr/perl5/bin/perl`).

Early Access (EA) Directory

The name of the EA directory might be changed in a future minor release of the Solaris operating environment media.

SUNWebnfs

The SUNWebnfs package might no longer be included on future releases of Solaris operating environment media.

The library and documentation are available for download from <http://www.sun.com/webnfs>.

aspppd(1M) Utility

The aspppd(1M) utility might no longer be supported in a future release. Use the pppd(1M) utility with Solaris PPP 4.0 that is included in the Solaris 8 operating environment.

JDK 1.2.2 and JRE 1.2.2

Version 1.2.2 of the JDK and version 1.2.2 of the JRE might no longer be supported in a future release. Near-equivalent functionality is supported by Java 2 Standard Edition, version 1.3 and compatible versions. All current and previous versions of the JDK and JRE are available for download from <http://java.sun.com>.

JDK 1.1.8 and JRE 1.1.8

Version 1.1.8 of the JDK and version 1.1.8 of the JRE may no longer be supported in a future release. Near-equivalent functionality is supported by Java 2 Standard Edition, version 1.3 and compatible versions. All current and previous versions of the JDK and JRE are available for download from <http://java.sun.com>.

GMT Zoneinfo Timezones

The `/usr/share/lib/zoneinfo/GMT[+-]*` time zones might no longer be supported in a future release. These files might be removed from `/usr/share/lib/zoneinfo`. Replace usage of the zoneinfo timezones with the equivalent `Etc/GMT[+-]*` file. See `zoneinfo(4)` and `environ(5)` for more information.

s5fs File System

The `s5fs` file system might no longer be supported in a future release. The `s5fs` file system supports the installation of Interactive UNIX applications. Support for the installation of Interactive UNIX applications is no longer required in the Solaris operating environment.

sendmail Utility Features

Some features of the `sendmail` utility might no longer be supported in a future release. The affected features are modifications that are specific to Sun and are nonstandard. These features include special syntax and semantics for V1/Sun configuration files, the remote mode feature, and the three `sun-reverse-alias` features.

More information about these features and migration issues is located at <http://www.sendmail.org/vendor/sun/solaris9.html>.

AnswerBook2 Server

The AnswerBook2 server may no longer be supported in a future release. Solaris documentation will continue to be available on the Solaris Documentation CD in online formats. All Solaris documentation is also available at <http://docs.sun.com>.

AdminTool

AdminTool (`admintool`), including `swmtool`, might no longer be supported in a future release. These tools performs user management, printer management, software package management, serial port management, group management, and host management.

The print management function is currently available in the Solaris 8 operating environment (see `/usr/sadm/admin/bin/printmgr`).

Solstice Enterprise Agents

Solstice Enterprise Agents might no longer be supported in a future release.

XIL

XIL might no longer be supported in a future release. An application that uses XIL causes the following warning message to be displayed.

```
WARNING: XIL OBSOLESCENCE
This application uses the Solaris XIL interface
which has been declared obsolete and may not be
present in versions of Solaris beyond Solaris 8.
Please notify your application supplier.
The message can be suppressed by setting the environment variable
"_XIL_SUPPRESS_OBSOLETE_MSG."
```

Lightweight Directory Access Protocol (LDAP) Client Library

LDAP client library, `libldap.so.3`, might no longer be included in a future release. The new version of this library, `libldap.so.4`, is compliant with the `draft-ietf-ldapext-ldap-c-api-04.txt` revision of the `ldap-c-api` draft from the Internet Engineering Task Force (IETF).

SUNWrdm

The SUNWrdm package, which formerly contained release notes and which was installed in `/usr/share/release_info`, might not be included on the Solaris Software CD in a future release.

For release notes, refer to the Release Notes on the Solaris Documentation CD, the printed Installation Release Notes, or the Release Notes on <http://docs.sun.com>.

crash(1M) Utility

The `crash(1M)` utility might no longer be supported in a future release. The `crash` command is a utility that examines system crash dump files, which is a capability that is superseded by the new `mdb(1)` utility. The `crash` command's interface has been structured around implementation details, such as slots, that have no relation to the Solaris operating system implementation.

"Transition From `crash`" in *Solaris Modular Debugger Guide* provides information for users who are making the transition from using `crash` to using `mdb`.

Kerberos Version 4 Client

The Kerberos version 4 client might be removed from a future release. This client includes the Kerberos version 4 support in the `kinit(1)`, `kdestroy(1)`, `klist(1)`, `ksrvtgt(1)`, `mount_nfs(1M)`, `share(1M)`, and `kerbd(1M)` commands. Support is also in the `kerberos(3KRB)` library, and in the ONC RPC programming API `kerberos_rpc(3KRB)`.

adb(1) Map Modifiers and Watchpoint Syntax

The `adb(1)` utility might be implemented as a link to the new `mdb(1)` utility in a future version of the Solaris 8 operating environment.

The `mdb(1)` man page describes the features of the new debugger, including its `adb(1)` compatibility mode. Even in this compatibility mode, differences between `adb(1)` and `mdb(1)` exist. These differences include the following.

- The text output format of some subcommands is different in `mdb(1)`. Macro files are formatted by using the same rules, but scripts that depend on the output of other subcommands might need to be modified.
- The watchpoint length specifier syntax in `mdb(1)` is different from the syntax that is described in `adb(1)`. The `adb(1)` watchpoint commands `:w`, `:a`, and `:p` enable an integer length (in bytes) to be inserted between the colon and the command character. In `mdb(1)`, the count should be specified following the initial address as a repeat count.

The `adb(1)` command `123:456w` is specified in `mdb(1)` as `123,456:w`.

- The `/m`, `/*m`, `?m`, and `?*m` format specifiers are not recognized or supported by `mdb(1)`.

OpenWindows Toolkits for Developers

OpenWindows XView™ and OLIT toolkits might no longer be supported in a future release. Therefore, consider migration to the Motif toolkit. To disable the warning message, use `#define OWTOOLKIT_WARNING_DISABLED` or `-D`.

OpenWindows Environment For Users

The OpenWindows environment might no longer be supported in a future release. Therefore, consider migration to the Common Desktop Environment (CDE).

Federated Naming Service (FNS)/XFN Libraries and Commands

The Federated Naming Service that is based on the X/Open XFN standard might no longer be supported in a future release.

Crash Dump Options for Solaris `ipcs(1)` Command

The capability of applying `ipcs(1)` command to system crash dumps by using the `-C` and `-N` command-line options might no longer be supported in a future release. Equivalent capability is now provided by the `mdb(1) :: ipcs` debugger command.

Deprecate `sendmail -AutoRebuildAliases` Option

The `-AutoRebuildAliases` option for the `sendmail(1M)` man page is deprecated and might no longer be supported in a future release.

`devconfig`

`devconfig` might no longer be supported in a future release.

Device Support and Driver Software

The following table lists devices and driver software that may no longer be supported in a future release.

TABLE 4-1 Device Support and Driver Software

Name of Physical Device	Name of Driver	Type of Card
Mylex/Buslogic FlashPoint Ultra PCI SCSI	flashpt	SCSI HBA
Qlogic	hxhn	SCSI HBA
AMI MegaRAID host bus adapter, first generation	mega	SCSI RAID
Madge Token Ring Smart 16/4, Madge Token Ring Smart 16/4 PCI BM Mk2, Madge Token Ring Smart 16/4 PCI BM Mk1, and Madge Token Ring PCI Presto	mtok	Network
Compaq 53C8x5 PCI SCSI, and Compaq 53C876 PCI SCSI	cpqncr	SCSI HBA
Compaq Integrated NetFlex-3 10/100 T PCI, Compaq NetFlex-3/P, Compaq NetFlex-3 DualPort 10/100 TX PCI, Compaq Netelligent 10 T PCI, and Compaq Netelligent 10/100 TX PCI	cnft	Network
Compaq SMART-2/P Array Controller and Compaq SMART-2SL Array Controller	smartii	SCSI RAID controller

Intel 486-Based Systems

The Solaris operating environment might no longer be supported on Intel 486-based systems in a future release.

Documentation Issues

This chapter describes known documentation problems.

The following documentation issues have been added to this chapter since this document was published on the Solaris 8 2/02 Documentation CD and in the Installation Kiosk on the Solaris 8 2/02 Installation CD.

- “Document Affected: “Backing Up a UFS Snapshot” in *Solaris 8 System Administration Supplement*” on page 61

Note – The name of this product is Solaris 8 2/02 , but code and path or package path names might use Solaris 2.8 or SunOS 5.8. Always follow the code or path as it is written.

Documentation Errata

Document Affected: “Backing Up a UFS Snapshot” in *Solaris 8 System Administration Supplement*

In the “Backing Up a UFS Snapshot” example, the following mount command is incorrect.

```
# mount -F UFS -o ro /dev/fssnap/1 /backups/home.bkup
```

The following is the correct mount command.

```
# mount -F ufs -o ro /dev/fssnap/1 /backups/home.bkup
```

Document Affected: “OCF Client Properties Overview” in *Solaris Smart Cards Administration Guide*

The following text from the “Valid and Default Card Types for Client Applications” section is incorrect and should be ignored:

For example, suppose you specify iButton, Cyberflex, and CardA as the validcards properties for Application B. Then you specify Cyberflex as the defaultcard property. If Application B accepts only its default card and the user tries to log in to Application B with CardA, then the system displays the message:

```
Waiting for Default Card
```

Login to Application B is blocked until the user inserts a Cyberflex card into the reader.

Document Affected: “Setting Up a Smart Card (Tasks)” in *Solaris Smart Cards Administration Guide*

The “Example--Creating User Information on a Smart Card (Command Line)” section has a property that is named `username`. The property name is incorrect. The property should read `user`.

Document Affected: “OCF Client Properties Overview” in *Solaris Smart Cards Administration Guide* and “Additional Client Configuration Tasks” in *Solaris Smart Cards Administration Guide*

The following note is missing from the “OCF Client Properties Overview” and “Additional Client Configuration Tasks” section.

Note – Do not set the Re-authentication timeout to zero.

Document Affected: “Setting Up a Smart Card (Overview)” in *Solaris Smart Cards Administration Guide*

The following note is missing from the “Setting Up a Smart Card (Overview)” chapter.

Note – Payflex cards do not support multiple profiles. Do not use Payflex cards in cases where a user needs to login to the desktop and one or more secure applications.

Document Affected: Localized New Features List (4389948)

The localized New Features List is not contained in the Installation Kiosk.

Workaround: For a localized list, see “What’s New at a Glance” in *Solaris 8 Desktop User Supplement*, *Solaris 8 System Administration Supplement*, *Solaris 8 Software Developer Supplement*, or *Solaris 8 Installation Supplement*.

Document Affected: *CDE User’s Guide* in AnswerBook2 (4356456)

Some graphics in the *CDE Users’s Guide* in the AnswerBook2 software are unreadable in the Spanish, Italian, and German locales.

Workaround: Refer to the *CDE User’s Guide* on <http://docs.sun.com> for readable graphics.

Documents Affected: AnswerBook2 Help Collection

The AnswerBook2 software has been upgraded to Version 1.4.3, but the documentation still refers to Version 1.4.2. Except for the number issue, the documentation is correct.

Documents Affected: “Adaptec AHA-2940AU, 2940U, 2940U Dual, 2940UW, 2940UW Dual, 2940U2, 2940U2B, 2940U2W, 2944UW, 2950U2B, 3940AU, 3940AUW, 3940AUWD, 3940U, 3940UW HBAs” in *Solaris 8 (Intel Platform Edition) Device Configuration Guide*, `adp(7D)` and `cadp(7D)` in the *Solaris 8 Reference Manual Collection*, and *What’s New in the Solaris 8 Operating Environment*

The current statement is incorrect.

The Adaptec Ultra devices are supported by the `cadp` driver and they support PCI hot-plugging.

This statement should read as follows.

The following Adaptec Ultra SCSI devices are now supported by the `adp` driver and not the `cadp` driver.

- AHA-2940AU
- AHA-2940U
- AHA-2940U Dual
- AHA-2940UW
- AHA-2940UW Dual
- AHA-2944UW
- AHA-3940AU
- AHA-3940AUW
- AHA-3940AUWD
- AHA-3940U
- AHA-3940UW

The current statement that indicates support of the `cadp` driver appears in the following documents.

- *Solaris 8 Reference Manual Collection* `adp(7D)` and `cadp(7D)`
- *What’s New in the Solaris 8 Operating Environment*
- *Solaris 8 (Intel Platform Edition) Device Configuration Guide*

PCI hot-plugging is not supported for these Ultra SCSI devices. However, the Ultra 2 SCSI devices that are supported by the `cadp` driver support PCI hot-plugging.

Document Affected: “IPv6 Header Format” in *System Administration Guide, Volume 3*

The 4-bit Priority field description reflects RFC 1883, which has been obsoleted by RFC 2460 (Solaris 8 implements RFC 2460). Consequently, the Priority field has been replaced by an 8-bit Traffic Class field. The IPv6 Header Format figure should identify the Traffic Class field instead of the Priority field. The Priority bulleted item on this page should also be replaced by the following Traffic Class description:

Traffic Class - 8 bit traffic class field.

This new value also reduces the number of bits that are allocated to the "Flow Label" field to 20 bits.

Document Affected: “Priority Values” in *System Administration Guide, Volume 3*

The 4-bit Priority field description reflects RFC 1883, which has been obsoleted by RFC 2460 (Solaris 8 implements RFC 2460). Consequently, the Priority field has been replaced by the 8-bit Traffic Class field. The Priority section should be replaced by the following Traffic Classes section.

Traffic Classes

Originating nodes and forwarding routers can use the 8-bit Traffic Class field in the IPv6 header to identify and distinguish between different classes or priorities of IPv6 packets.

The following general requirements apply to the Traffic Class field.

- The service interface to the IPv6 service within a node must provide a means for an upper-layer protocol to supply the value of the Traffic Class bits in packets that were originated by that upper-layer protocol. The default value must be zero for all 8 bits.
- Nodes that support a specific use of some or all of the Traffic Class bits can change the value of those bits in packets that they originate, forward, or receive, as required for that specific use. Nodes should ignore and leave unchanged any bits of the Traffic Class field for which they do not support a specific use.

Document Affected: “Implementing IPsec” in *System Administration Guide, Volume 3*

Step 10c in this procedure incorrectly omits the addition of the *up* parameter that is required in the line that is added to the `/etc/hostname.ip.tun0` file. Consequently, you must add the *up* parameter at the end of the line entry in this step.

Document Affected: “NFS Parameters for the nfs Module” in *System Administration Guide, Volume 3* (4299091)

Several corrections apply to this section.

- For the `nfs_32_time_ok` symbol, do the following.
 - Change the symbol name to `nfs_allow_preepoch_time`.
 - Change the description to, “This symbol controls whether the NFS client or server allows file timestamps that precede 1970.”
 - No change to the default description.
 - Delete the `nfs_acl_cache` symbol entry.
- Add an `nfs_disable_rddir_cache` symbol entry.
 - Description: Some servers do not properly update the attributes of the directory when changes are made. To allow interoperability with these broken servers, set this variable to disable the `readdir` cache.
 - Default: Set to `off(0)`.
- For the `nfs_lookup_neg_cache` and `nfs3_lookup_neg_cache` symbols, do the following.
 - Change the default to 1. Ignore the comment about the directory name caching.
- For the `nrnode` symbol, do the following.
 - Change the default description to *set to ncsize*. By setting the variable to 1, you are effectively disabling the cache, not because an explicit check reveals whether or not the variable 1 but because you are creating a very small cache.
- For the `nfs_write_error_interval` symbol, do the following.
 - Change the description to, “This symbol controls how often NFS ENOSPC and EDQUOT write error messages are logged. The symbols units are in seconds.”
 - No change to the default description.

Document Affected: “NFS Parameters for the nfs Module” in *System Administration Guide, Volume 3* (4299091)

Delete the `nfsreadmap` symbol entry.

Document Affected: “NFS Parameters for rpcsec Parameters” in *System Administration Guide, Volume 3* (4299091)

For the `authdes_cachesz` symbol, do the following.

- Change the default description to, “Defaults to 1024”.
- Delete the `authkerb_cachesz` symbol entry.
- Delete the `authkerb_win` symbol entry.

Patch List

The patches listed in this appendix have been applied to the Solaris 8 2/02 operating environment in one of the following ways:

- SolStart
The patches are located in the `/var/sadm/patch` directory on an installed system.
- Freshbits technology
These patches were applied when the Solaris 8 Software CD was created. Therefore, these patches are not located in the `/var/sadm/patch` directory.

The `showrev -p` command provides a list of all patches applied to the installed system regardless of how they were applied. The Solaris 8 Software CD includes a known and tested level of patches; however, patches cannot be backed out of the Solaris 8 2/02 release.

Note – The Solaris 8 2/02 operating environment contains special patches which perform tasks specific to the Solaris update release installation images. These patches are specific to each Solaris operating environment update release and do not apply to other systems or releases of the Solaris operating environment.

Do not attempt to download or install these patches on other systems or installations of the Solaris operating environment.
