# *Preface*

---

## *OVERVIEW*

A man page is provided for both the naive user, and sophisticated user who is familiar with the SunOS operating system and is in need of on-line information. A man page is intended to answer concisely the question “What does it do?” The man pages in general comprise a reference manual. They are not intended to be a tutorial.

The following contains a brief description of each section in the man pages and the information it references:

- Section 1 describes, in alphabetical order, commands available with the operating system.
- Section 1M describes, in alphabetical order, commands that are used chiefly for system maintenance and administration purposes.
- Section 2 describes all of the system calls. Most of these calls have one or more error returns. An error condition is indicated by an otherwise impossible returned value.
- Section 3 describes functions found in various libraries, other than those functions that directly invoke UNIX system primitives, which are described in Section 2 of this volume.

- 
- Section 4 outlines the formats of various files. The C structure declarations for the file formats are given where applicable.
  - Section 5 contains miscellaneous documentation such as character set tables, etc.
  - Section 6 contains available games and demos.
  - Section 7 describes various special files that refer to specific hardware peripherals, and device drivers. STREAMS software drivers, modules and the STREAMS-generic set of system calls are also described.
  - Section 9 provides reference information needed to write device drivers in the kernel operating systems environment. It describes two device driver interface specifications: the Device Driver Interface (DDI) and the Driver–Kernel Interface (DKI).
  - Section 9E describes the DDI/DKI, DDI-only, and DKI-only entry-point routines a developer may include in a device driver.
  - Section 9F describes the kernel functions available for use by device drivers.
  - Section 9S describes the data structures used by drivers to share information between the driver and the kernel.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. For example, if there are no bugs to report, there is no BUGS section. See the intro pages for more information and detail about each section, and **man(1)** for more information about man pages in general.

## *NAME*

This section gives the names of the commands or functions documented, followed by a brief description of what they do.

## *SYNOPSIS*

This section shows the syntax of commands or functions. When a command or file does not exist in the standard path, its full pathname is shown. Literal characters (commands and options) are in **bold** font and variables (arguments, parameters and substitution characters) are in *italic* font. Options and

---

arguments are alphabetized, with single letter arguments first, and options with arguments next, unless a different argument order is required.

The following special characters are used in this section:

- [ ] The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument *must* be specified.
- ... Ellipses. Several values may be provided for the previous argument, or the previous argument can be specified multiple times, for example, '*filename ...*'.
- | Separator. Only one of the arguments separated by this character can be specified at time.
- { } Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.

## *PROTOCOL*

This section occurs only in subsection 3R to indicate the protocol description file. The protocol specification pathname is always listed in **bold** font.

## *DESCRIPTION*

This section defines the functionality and behavior of the service. Thus it describes concisely what the command does. It does not discuss **OPTIONS** or cite **EXAMPLES**. Interactive commands, subcommands, requests, macros, functions and such, are described under **USAGE**.

## *IOCTL*

This section appears on pages in Section 7 only. Only the device class which supplies appropriate parameters to the **ioctl(2)** system call is called **ioctl** and generates its own heading. **ioctl** calls for a specific device are listed alphabetically (on the man page for that specific device). **ioctl** calls are used for a particular class of devices all of which have an **io** ending, such as **mtio(7)**.

---

## *OPTIONS*

This lists the command options with a concise summary of what each option does. The options are listed literally and in the order they appear in the SYNOPSIS section. Possible arguments to options are discussed under the option, and where appropriate, default values are supplied.

## *OPERANDS*

This section lists the command operands and describes how they affect the actions of the command.

## *OUTPUT*

This section describes the output - standard output, standard error, or output files - generated by the command.

## *RETURN VALUES*

If the man page documents functions that return values, this section lists these values and describes the conditions under which they are returned. If a function can return only constant values, such as 0 or -1, these values are listed in tagged paragraphs. Otherwise, a single paragraph describes the return values of each function. Functions declared as **void** do not return values, so they are not discussed in RETURN VALUES.

## *ERRORS*

On failure, most functions place an error code in the global variable **errno** indicating why they failed. This section lists alphabetically all error codes a function can generate and describes the conditions that cause each error. When more than one condition can cause the same error, each condition is described in a separate paragraph under the error code.

---

## *USAGE*

This section is provided as a *guidance* on use. This section lists special rules, features and commands that require in-depth explanations. The subsections listed below are used to explain built-in functionality:

- Commands**
- Modifiers**
- Variables**
- Expressions**
- Input Grammar**

## *EXAMPLES*

This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command line entry and machine response is shown. Whenever an example is given, the prompt is shown as

**example%**

or if the user must be super-user,

**example#**

Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS and USAGE sections.

## *ENVIRONMENT*

This section lists any environment variables that the command or function affects, followed by a brief description of the effect.

## *EXIT STATUS*

This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion and values other than zero for various error conditions.

## *FILES*

---

This section lists all filenames referred to by the man page, files of interest, and files created or required by commands. Each is followed by a descriptive summary or explanation.

## *ATTRIBUTES*

This section lists characteristics of commands, utilities, and device drivers by defining the attribute type and its corresponding value. (See **attributes(5)** for more information.)

## *SEE ALSO*

This section lists references to other man pages, in-house documentation and outside publications.

## *DIAGNOSTICS*

This section lists diagnostic messages with a brief explanation of the condition causing the error. Messages appear in **bold** font with the exception of variables, which are in *italic* font.

## *WARNINGS*

This section lists warnings about special conditions which could seriously affect your working conditions — this is not a list of diagnostics.

## *NOTES*

This section lists additional information that does not belong anywhere else on the page. It takes the form of an *aside* to the user, covering points of special interest. Critical information is never covered here.

## *BUGS*

This section describes known bugs and wherever possible suggests workarounds.

**NAME** Intro, intro – introduction to kernel data structures

**DESCRIPTION** Section 9S describes the data structures used by drivers to share information between the driver and the kernel.

In this section, reference pages contain the following headings:

- **NAME** summarizes the structure's purpose.
- **SYNOPSIS** lists the include file that defines the structure.
- **INTERFACE LEVEL** describes any architecture dependencies.
- **DESCRIPTION** provides general information about the structure.
- **STRUCTURE MEMBERS** lists all accessible structure members.
- **SEE ALSO** gives sources for further information.

Every driver **MUST** include `<sys/ddi.h>` and `<sys/sunddi.h>`, in that order, and last.

The following table summarizes the STREAMS structures described in this section.

Structure	Type
<code>copyreq</code>	DDI/DKI
<code>copyresp</code>	DDI/DKI
<code>datab</code>	DDI/DKI
<code>fmodsw</code>	Solaris DDI
<code>free_rtn</code>	DDI/DKI
<code>iocblk</code>	DDI/DKI
<code>linkblk</code>	DDI/DKI
<code>module_info</code>	DDI/DKI
<code>msgb</code>	DDI/DKI
<code>qband</code>	DDI/DKI
<code>qinit</code>	DDI/DKI
<code>queclass</code>	Solaris DDI
<code>queue</code>	DDI/DKI
<code>streamtab</code>	DDI/DKI
<code>stroptions</code>	DDI/DKI

The following table summarizes structures that are not specific to STREAMS I/O.

Structure	Type
<code>aio_req</code>	Solaris DDI
<code>buf</code>	DDI/DKI
<code>cb_ops</code>	Solaris DDI
<code>ddi_device_acc_attr</code>	Solaris DDI
<code>ddi_dma_attr</code>	Solaris DDI
<code>ddi_dma_cookie</code>	Solaris DDI
<code>ddi_dma_lim_sparc</code>	Solaris SPARC DDI
<code>ddi_dma_lim_x86</code>	Solaris x86 DDI
<code>ddi_dma_req</code>	Solaris DDI

<b>ddi_dmae_req</b>	Solaris x86 DDI
<b>ddi_idevice_cookie</b>	Solaris DDI
<b>ddi_mapdev_ctl</b>	Solaris DDI
<b>devmap_callback_ctl</b>	Solaris DDI
<b>dev_ops</b>	Solaris DDI
<b>iovec</b>	DDI/DKI
<b>kstat</b>	Solaris DDI
<b>kstat_intr</b>	Solaris DDI
<b>kstat_io</b>	Solaris DDI
<b>kstat_named</b>	Solaris DDI
<b>map</b>	DDI/DKI
<b>modldrv</b>	Solaris DDI
<b>modlinkage</b>	Solaris DDI
<b>modlstrmod</b>	Solaris DDI
<b>scsi_address</b>	Solaris DDI
<b>scsi_arq_status</b>	Solaris DDI
<b>scsi_device</b>	Solaris DDI
<b>scsi_extended_sense</b>	Solaris DDI
<b>scsi_hba_tran</b>	Solaris DDI
<b>scsi_inquiry</b>	Solaris DDI
<b>scsi_pkt</b>	Solaris DDI
<b>scsi_status</b>	Solaris DDI
<b>uio</b>	DDI/DKI

**NOTES**

Do not declare arrays of structures as the size of the structures may change between releases. Rely only on the structure members listed in this chapter and not on unlisted members or the position of a member in a structure.

<b>Name</b>	<b>Description</b>
<b>aio_req(9S)</b>	asynchronous I/O request structure
<b>buf(9S)</b>	block I/O data transfer structure
<b>cb_ops(9S)</b>	character/block entry points structure
<b>copyreq(9S)</b>	STREAMS data structure for the M_COPYIN and the M_COPYOUT message types
<b>copyresp(9S)</b>	STREAMS data structure for the M_IOCTLDATA message type
<b>datab(9S)</b>	STREAMS message data structure
<b>ddi_device_acc_attr(9S)</b>	data access attributes structure
<b>ddi_dma_attr(9S)</b>	DMA attributes structure
<b>ddi_dma_cookie(9S)</b>	DMA address cookie
<b>ddi_dmae_req(9S)</b>	DMA engine request structure

<b>ddi_dma_lim</b> (9S)	See <b>ddi_dma_lim_sparc</b> (9S)
<b>ddi_dma_lim_sparc</b> (9S)	SPARC DMA limits structure
<b>ddi_dma_lim_x86</b> (9S)	x86 DMA limits structure
<b>ddi_dma_req</b> (9S)	DMA Request structure
<b>ddi_idevice_cookie</b> (9S)	device interrupt cookie
<b>ddi_mapdev_ctl</b> (9S)	device mapping-control structure
<b>devmap_callback_ctl</b> (9S)	device mapping-control structure
<b>dev_ops</b> (9S)	device operations structure
<b>fmodsw</b> (9S)	STREAMS module declaration structure
<b>free_rtn</b> (9S)	structure that specifies a driver's message freeing routine
<b>iocblk</b> (9S)	STREAMS data structure for the M_IOCTL message type
<b>iovec</b> (9S)	data storage structure for I/O using uio
<b>kstat</b> (9S)	kernel statistics structure
<b>kstat_intr</b> (9S)	structure for interrupt kstats
<b>kstat_io</b> (9S)	structure for I/O kstats
<b>kstat_named</b> (9S)	structure for named kstats
<b>linkblk</b> (9S)	STREAMS data structure sent to multiplexor drivers to indicate a link
<b>modldrv</b> (9S)	linkage structure for loadable drivers
<b>modlinkage</b> (9S)	module linkage structure
<b>modlstrmod</b> (9S)	linkage structure for loadable STREAMS modules
<b>module_info</b> (9S)	STREAMS driver identification and limit value structure
<b>msgb</b> (9S)	STREAMS message block structure
<b>qband</b> (9S)	STREAMS queue flow control information structure
<b>qinit</b> (9S)	STREAMS queue processing procedures structure
<b>queclass</b> (9S)	a STREAMS macro that returns the queue message class definitions for a given message block
<b>queue</b> (9S)	STREAMS queue structure
<b>scsi_address</b> (9S)	SCSI address structure
<b>scsi_arq_status</b> (9S)	SCSI auto request sense structure
<b>scsi_device</b> (9S)	SCSI device structure
<b>scsi_extended_sense</b> (9S)	SCSI extended sense structure
<b>scsi_hba_tran</b> (9S)	SCSI Host Bus Adapter (HBA) driver transport vector structure
<b>scsi_inquiry</b> (9S)	SCSI inquiry structure
<b>scsi_pkt</b> (9S)	SCSI packet structure

<b>scsi_status</b> (9S)	SCSI status structure
<b>streamtab</b> (9S)	STREAMS entity declaration structure
<b>stroptions</b> (9S)	options structure for M_SETOPTS message
<b>tuple</b> (9S)	Card Information Structure (CIS) access structure
<b>uio</b> (9S)	scatter/gather I/O request structure

<b>NAME</b>	aio_req – asynchronous I/O request structure
<b>SYNOPSIS</b>	<pre>#include &lt;sys/uio.h&gt; #include &lt;sys/aio_req.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI)
<b>DESCRIPTION</b>	An <b>aio_req</b> structure describes an asynchronous I/O request.
<b>STRUCTURE MEMBERS</b>	<pre>struct uio  *aio_uio; /* uio structure describing the I/O request */</pre> The <b>aio_uio</b> member is a pointer to a <b>uio(9S)</b> structure, describing the I/O transfer request.
<b>SEE ALSO</b>	<b>aread(9E)</b> , <b>awrite(9E)</b> , <b>aphysio(9F)</b> , <b>uio(9S)</b>

<b>NAME</b>	buf – block I/O data transfer structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/ddi.h> <b>#include</b> <sys/sunddi.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI).  The <b>buf</b> structure is the basic data structure for block I/O transfers. Each block I/O transfer has an associated buffer header. The header contains all the buffer control and status information. For drivers, the buffer header pointer is the sole argument to a block driver <b>strategy</b> (9E) routine. Do not depend on the size of the <b>buf</b> structure when writing a driver.  It is important to note that a buffer header may be linked in multiple lists simultaneously. Because of this, most of the members in the buffer header cannot be changed by the driver, even when the buffer header is in one of the driver's work lists.  Buffer headers are also used by the system for unbuffered or physical I/O for block drivers. In this case, the buffer describes a portion of user data space that is locked into memory.  Block drivers often chain block requests so that overall throughput for the device is maximized. The <b>av_forw</b> and the <b>av_back</b> members of the <b>buf</b> structure can serve as link pointers for chaining block requests.
<b>STRUCTURE MEMBERS</b>	<pre> int          b_flags;          /* Buffer status */ struct buf   *av_forw;        /* Driver work list link */ struct buf   *av_back;        /* Driver work list link */ size_t       b_bcount;        /* # of bytes to transfer */ union {   caddr_t     b_addr;          /* Buffer's virtual address */ } b_un; daddr_t      b_blkno;          /* Block number on device */ diskaddr_t   b_lblkno;         /* Expanded block number on device */ size_t       b_resid;          /* # of bytes not transferred */ size_t       b_bufsize;        /* size of allocated buffer */ int          (*b_iodone)(struct buf *); /* function called */  /* by biodone */ int          b_error;          /* expanded error field */ void         *b_private;        /* "opaque" driver private area */ dev_t        b_edev;           /* expanded dev field */ </pre> <p>The members of the buffer header available to test or set by a driver are as follows: <b>b_flags</b> stores the buffer status and tells the driver whether to read or write to the device. The driver must never clear the <b>b_flags</b> member. If this is done, unpredictable results can occur including loss of disk sanity and the possible failure of other kernel processes.</p>

Valid flags are as follows:

<b>B_BUSY</b>	indicates the buffer is in use. The driver may not change this flag unless it allocated the buffer with <b>getrbuf(9F)</b> , and no I/O operation is in progress.
<b>B_DONE</b>	indicates the data transfer has completed. This flag is read-only.
<b>B_ERROR</b>	indicates an I/O transfer error. It is set in conjunction with the <b>b_error</b> field. <b>bioerror(9F)</b> should be used in preference to setting the <b>B_ERROR</b> bit.
<b>B_PAGEIO</b>	indicates the buffer is being used in a paged I/O request. See the description of the <b>b_un.b_addr</b> field for more information. This flag is read-only.
<b>B_PHYS</b>	indicates the buffer header is being used for physical (direct) I/O to a user data area. See the description of the <b>b_un.b_addr</b> field for more information. This flag is read-only.
<b>B_READ</b>	indicates data is to be read from the peripheral device into main memory.
<b>B_WRITE</b>	indicates the data is to be transferred from main memory to the peripheral device. <b>B_WRITE</b> is a pseudo flag and cannot be directly tested; it is only detected as the NOT form of <b>B_READ</b> .

**av\_forw** and **av\_back** can be used by the driver to link the buffer into driver work lists.

**b\_bcount** specifies the number of bytes to be transferred in both a paged and a non-paged I/O request.

**b\_un.b\_addr** is the virtual address of the I/O request, unless **B\_PAGEIO** is set. The address is a kernel virtual address, unless **B\_PHYS** is set, in which case it is a user virtual address. If **B\_PAGEIO** is set, **b\_un.b\_addr** contains kernel private data. Note that either one of **B\_PHYS** and **B\_PAGEIO**, or neither, may be set, but not both.

**b\_blkno** identifies which logical block on the device (the device is defined by the device number) is to be accessed. The driver may have to convert this logical block number to a physical location such as a cylinder, track, and sector of a disk. This is a 32-bit value. The driver should use **b\_blkno** or **b\_lblkno**, but not both.

**b\_lblkno** identifies which logical block on the device (the device is defined by the device number) is to be accessed. The driver may have to convert this logical block number to a physical location such as a cylinder, track, and sector of a disk. This is a 64-bit value. The driver should use **b\_lblkno** or **b\_blkno**, but not both.

**b\_resid** should be set to the number of bytes not transferred because of an error.

**b\_bufsize** contains the size of the allocated buffer.

**b\_iodone** identifies a specific **biodone** routine to be called by the driver when the I/O is complete.

**b\_error** may hold an error code that should be passed as a return code from the driver.

**b\_error** is set in conjunction with the **B\_ERROR** bit set in the **b\_flags** member.

**bioerror(9F)** should be used in preference to setting the **b\_error** field.

**b\_private** is for the private use of the device driver.

**b\_edev** contains the major and minor device numbers of the device accessed.

**SEE ALSO**

**strategy(9E)**, **aphysio(9F)**, **bioclone(9F)**, **biodone(9F)**, **bioerror(9F)**, **bioinit(9F)**, **clrbuf(9F)**, **getrbuf(9F)**, **physio(9F)**, **iovec(9S)**, **uio(9S)**

*Writing Device Drivers*

**WARNINGS**

Buffers are a shared resource within the kernel. Drivers should read or write only the members listed in this section. Drivers that attempt to use undocumented members of the **buf** structure risk corrupting data in the kernel or on the device.

<b>NAME</b>	cb_ops – character/block entry points structure																																																
<b>SYNOPSIS</b>	<pre>#include &lt;sys/conf.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>																																																
<b>INTERFACE LEVEL DESCRIPTION</b>	<p>Solaris DDI specific (Solaris DDI).</p> <p><b>cb_ops</b> contains all entry points for drivers that support both character and block entry points. All leaf device drivers supporting direct user process access to a device should declare a <b>cb_ops</b> structure.</p> <p>All drivers which safely allow multiple threads of execution in the driver at the same time must set the <b>D_MP</b> flag in the <b>cb_flag</b> field.</p> <p>If the driver properly handles 64-bit offsets, it should also set the <b>D_64BIT</b> flag in the <b>cb_flag</b> field. This specifies that the driver will use the <b>uio_loffset</b> field of the <b>uio(9S)</b> structure.</p> <p><b>mt-streams(9F)</b> describes other flags that may be set in the <b>cb_flag</b> field.</p> <p><b>cb_rev</b> is the <b>cb_ops</b> structure revision number. This field must be set to <b>CB_REV</b>.</p> <p>Non-STREAMS drivers should set <b>cb_str</b> to <b>NULL</b>.</p> <p>The following DDI/DKI or DKI-only or DDI-only functions are provided in the character/block driver operations structure.</p> <table border="0" style="width: 100%;"> <thead> <tr> <th style="text-align: left;">block/char</th> <th style="text-align: left;">Function</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr><td>b/c</td><td>XXopen</td><td>DDI/DKI</td></tr> <tr><td>b/c</td><td>XXclose</td><td>DDI/DKI</td></tr> <tr><td>b</td><td>XXstrategy</td><td>DDI/DKI</td></tr> <tr><td>b</td><td>XXprint</td><td>DDI/DKI</td></tr> <tr><td>b</td><td>XXdump</td><td>DDI(Sun)</td></tr> <tr><td>c</td><td>XXread</td><td>DDI/DKI</td></tr> <tr><td>c</td><td>XXwrite</td><td>DDI/DKI</td></tr> <tr><td>c</td><td>XXioctl</td><td>DDI/DKI</td></tr> <tr><td>c</td><td>XXdevmap</td><td>DDI(Sun)</td></tr> <tr><td>c</td><td>XXmmap</td><td>DKI</td></tr> <tr><td>c</td><td>XXsegmap</td><td>DKI</td></tr> <tr><td>c</td><td>XXchpoll</td><td>DDI/DKI</td></tr> <tr><td>c</td><td>XXprop_op</td><td>DDI(Sun)</td></tr> <tr><td>c</td><td>XXaread</td><td>DDI(Sun)</td></tr> <tr><td>c</td><td>XXawrite</td><td>DDI(Sun)</td></tr> </tbody> </table>	block/char	Function	Description	b/c	XXopen	DDI/DKI	b/c	XXclose	DDI/DKI	b	XXstrategy	DDI/DKI	b	XXprint	DDI/DKI	b	XXdump	DDI(Sun)	c	XXread	DDI/DKI	c	XXwrite	DDI/DKI	c	XXioctl	DDI/DKI	c	XXdevmap	DDI(Sun)	c	XXmmap	DKI	c	XXsegmap	DKI	c	XXchpoll	DDI/DKI	c	XXprop_op	DDI(Sun)	c	XXaread	DDI(Sun)	c	XXawrite	DDI(Sun)

<b>NAME</b>	datab – STREAMS message data structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI). The <b>datab</b> structure describes the data of a STREAMS message. The actual data contained in a STREAMS message is stored in a data buffer pointed to by this structure. A <b>msgb</b> (message block) structure includes a field that points to a <b>datab</b> structure. A data block can have more than one message block pointing to it at one time, so the <b>db_ref</b> member keeps track of a data block's references, preventing it from being deallocated until all message blocks are finished with it.
<b>STRUCTURE MEMBERS</b>	<b>unsigned char</b> *db_base; /* first byte of buffer */ <b>unsigned char</b> *db_lim; /* last byte (+1) of buffer */ <b>unsigned char</b> db_ref; /* # of message pointers to this data */ <b>unsigned char</b> db_type; /* message type */ A <b>datab</b> structure is defined as type <b>dblk_t</b> .
<b>SEE ALSO</b>	<b>free_rtn(9S)</b> , <b>msgb(9S)</b> <i>Writing Device Drivers</i> <i>STREAMS Programming Guide</i>

<b>NAME</b>	ddi_device_acc_attr – data access attributes structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/ddi.h> <b>#include</b> <sys/sunddi.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI). The <b>ddi_device_acc_attr</b> structure describes the data access characteristics and requirements of the device.
<b>STRUCTURE MEMBERS</b>	<pre> <b>ushort_t</b>  devacc_attr_version; <b>uchar_t</b>   devacc_attr_endian_flags; <b>uchar_t</b>   devacc_attr_dataorder; </pre> <p>The <b>devacc_attr_version</b> member identifies the version number of this structure. The current version number is <b>DDI_DEVICE_ATTR_V0</b>.</p> <p>The <b>devacc_attr_endian_flags</b> member describes the endian characteristics of the device. Specify one of the following values.</p> <p style="padding-left: 40px;"><b>DDI_NEVERSWAP_ACC</b> data access with no byte swapping.</p> <p style="padding-left: 40px;"><b>DDI_STRUCTURE_BE_ACC</b> structural data access in big endian format.</p> <p style="padding-left: 40px;"><b>DDI_STRUCTURE_LE_ACC</b> structural data access in little endian format.</p> <p><b>DDI_STRUCTURE_BE_ACC</b> and <b>DDI_STRUCTURE_LE_ACC</b> describes the endian characteristics of the device as big endian or little endian, respectively. Even though most of the devices will have the same endian characteristics as their buses, there are examples of devices with I/O an processor that has opposite endian characteristics of the buses. When <b>DDI_STRUCTURE_BE_ACC</b> or <b>DDI_STRUCTURE_LE_ACC</b> is set, byte swapping will automatically be performed by the system if the host machine and the device data formats have opposite endian characteristics. The implementation may take advantage of hardware platform byte swapping capabilities.</p> <p>When <b>DDI_NEVERSWAP_ACC</b> is specified, byte swapping will not be invoked in the data access functions.</p> <p>The <b>devacc_attr_dataorder</b> member describes order in which the CPU will reference data. Specify one of the following values.</p> <p style="padding-left: 40px;"><b>DDI_STRICTORDER_ACC</b> The data references must be issued by a CPU in program order. Strict ordering is the default behavior.</p> <p style="padding-left: 40px;"><b>DDI_UNORDERED_OK_ACC</b> The CPU may re-order the data references. This includes all kinds of re-ordering. (i.e. a load followed by a store may be replaced by a store followed by a load).</p>

**DDI\_MERGING\_OK\_ACC**

The CPU may merge individual stores to consecutive locations. For example, the CPU may turn two consecutive byte stores into one halfword store. It may also batch individual loads. For example, the CPU may turn two consecutive byte loads into one halfword load.

**DDI\_MERGING\_OK\_ACC** also implies re-ordering.

**DDI\_LOADCACHING\_OK\_ACC**

The CPU may cache the data it fetches and reuse it until another store occurs. The default behavior is to fetch new data on every load.

**DDI\_LOADCACHING\_OK\_ACC** also implies merging and re-ordering.

**DDI\_STORECACHING\_OK\_ACC**

The CPU may keep the data in the cache and push it to the device (perhaps with other data) at a later time. The default behavior is to push the data right away. **DDI\_STORECACHING\_OK\_ACC** also implies load caching, merging, and re-ordering.

These values are advisory, not mandatory. For example, data can be ordered without being merged or cached, even though a driver requests unordered, merged and cached together.

**EXAMPLES**

The following examples illustrate the use of device register address mapping setup functions and different data access functions.

**Example 1**

This example demonstrates the use of the **ddi\_device\_acc\_attr** structure in **ddi\_regs\_map\_setup**(9F). It also shows the use of **ddi\_getw**(9F) and **ddi\_putw**(9F) functions in accessing the register contents.

```

dev_info_t *dip;
uint_t rnumber;
ushort_t *dev_addr;
offset_t offset;
offset_t len;
ushort_t dev_command;
ddi_device_acc_attr_t dev_attr;
ddi_acc_handle_t handle;

...

/*
 * setup the device attribute structure for little endian,
 * strict ordering and 16-bit word access.
 */
dev_attr.devacc_attr_version = DDI_DEVICE_ATTR_V0;
dev_attr.devacc_attr_endian_flags = DDI_STRUCTURE_LE_ACC;
dev_attr.devacc_attr_dataorder = DDI_STRICTORDER_ACC;

```

```

/*
 * set up the device registers address mapping
 */
ddi_regs_map_setup(dip, rnumber, (caddr_t *)&dev_addr, offset, len,
                  &dev_attr, &handle);

/* read a 16-bit word command register from the device*/
dev_command = ddi_getw(handle, dev_addr);

dev_command |= DEV_INTR_ENABLE;
/* store a new value back to the device command register*/
ddi_putw(handle, dev_addr, dev_command);

```

**Example 2**

The following example illustrates the steps used to access a device with different apertures. We assume that several apertures are grouped under one single "reg" entry. For example, the sample device has four different apertures each 32K in size. The apertures represent YUV little-endian, YUV big-endian, RGB little-endian, and RGB big-endian. This sample device uses entry 1 of the "reg" property list for this purpose. The size of the address space is 128K with each 32K range as a separate aperture. In the register mapping setup function, the sample driver uses the *offset* and *len* parameters to specify one of the apertures.

```

ulong_t *dev_addr;
ddi_device_acc_attr_t dev_attr;
ddi_acc_handle_t handle;
uchar_t buf[256];

...

/*
 * setup the device attribute structure for never swap,
 * unordered and 32-bit word access.
 */
dev_attr.devacc_attr_version = DDI_DEVICE_ATTR_V0;
dev_attr.devacc_attr_endian_flags = DDI_NEVERSWAP_ACC;
dev_attr.devacc_attr_dataorder = DDI_UNORDERED_OK_ACC;

/*
 * map in the RGB big-endian aperture
 * while running in a big endian machine
 * - offset 96K and len 32K
 */
ddi_regs_map_setup(dip, 1, (caddr_t *)&dev_addr, 96*1024, 32*1024,
                  &dev_attr, &handle);

/*

```

**Example 3**

```

* Write to the screen buffer
* first 1K bytes words, each size 4 bytes
*/
ddi_rep_putl(handle, buf, dev_addr, 256, DDI_DEV_AUTOINCR);

```

The following example illustrates the use of the functions that explicitly call out the data word size to override the data size in the device attribute structure.

```

struct device_blk {
    ushort  d_command;    /* command register */
    ushort  d_status;     /* status register */
    ulong   d_data;       /* data register */
} *dev_blkp;

dev_info_t *dip;
caddr_t dev_addr;
ddi_device_acc_attr_t dev_attr;
ddi_acc_handle_t handle;
uchar_t buf[256];

...

/*
 * setup the device attribute structure for never swap,
 * strict ordering and 32-bit word access.
 */
dev_attr.devacc_attr_version = DDI_DEVICE_ATTR_V0;
dev_attr.devacc_attr_endian_flags = DDI_NEVERSWAP_ACC;
dev_attr.devacc_attr_dataorder = DDI_STRICTORDER_ACC;

ddi_regs_map_setup(dip, 1, (caddr_t *)&dev_blkp, 0, 0,
    &dev_attr, &handle);

/* write command to the 16-bit command register */
ddi_putw(handle, &dev_blkp->d_command, START_XFER);

/* Read the 16-bit status register */
status = ddi_getw(handle, &dev_blkp->d_status);

if (status & DATA_READY)
    /* Read 1K bytes off the 32-bit data register */
    ddi_rep_getl(handle, buf, &dev_blkp->d_data,
        256, DDI_DEV_NO_AUTOINCR);

```

*Writing Device Drivers*

<b>NAME</b>	ddi_dma_attr – DMA attributes structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/ddidmareq.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI). A <b>ddi_dma_attr_t</b> structure describes device and DMA engine specific attributes necessary to allocate DMA resources for a device. The driver may have to extend the attributes with bus specific information depending on the bus to which the device is connected.
<b>STRUCTURE MEMBERS</b>	<pre> <b>uint_t</b>          <b>dma_attr_version;</b>          /* version number */ <b>uint64_t</b>        <b>dma_attr_addr_lo;</b>          /* low DMA address range */ <b>uint64_t</b>        <b>dma_attr_addr_hi;</b>          /* high DMA address range */ <b>uint64_t</b>        <b>dma_attr_count_max;</b>        /* DMA counter register */ <b>uint64_t</b>        <b>dma_attr_align;</b>           /* DMA address alignment */ <b>uint_t</b>          <b>dma_attr_burstsizes;</b>      /* DMA burstsizes */ <b>uint32_t</b>        <b>dma_attr_minxfer;</b>         /* min effective DMA size */ <b>uint64_t</b>        <b>dma_attr_maxxfer;</b>         /* max DMA xfer size */ <b>uint64_t</b>        <b>dma_attr_seg;</b>            /* segment boundary */ <b>int</b>             <b>dma_attr_sgllen;</b>         /* s/g list length */ <b>uint32_t</b>        <b>dma_attr_granular;</b>        /* granularity of device */ <b>uint_t</b>          <b>dma_attr_flags;</b>          /* DMA transfer flags */ </pre> <p><b>dma_attr_version</b> stores the version number of this DMA attribute structure. It should be set to <b>DMA_ATTR_V0</b>.</p> <p>The <b>dma_attr_addr_lo</b> and <b>dma_attr_addr_hi</b> fields specify the address range the device's DMA engine can access. The <b>dma_attr_addr_lo</b> field describes the inclusive lower 64 bit boundary. The <b>dma_attr_addr_hi</b> describes the inclusive upper 64 bit boundary. The system will ensure that allocated DMA resources are within the range specified (see <b>ddi_dma_cookie(9S)</b>).</p> <p>The <b>dma_attr_count_max</b> describes an inclusive upper bound for the device's DMA counter register. For example, 0xFFFFF would describe a DMA engine with a 24 bit counter register. DMA resource allocation functions have to break up a DMA object into multiple DMA cookies if the size of the object exceeds the size of the DMA counter register.</p> <p>The <b>dma_attr_align</b> specifies alignment requirements for allocated DMA resources. This field can be used to force more restrictive alignment than imposed by <b>dma_attr_burstsizes</b> or <b>dma_attr_minxfer</b>, such as alignment at a page boundary. Most drivers will set this to 1 indicating byte alignment.</p> <p>The <b>dma_attr_burstsizes</b> field describes the possible burst sizes the device's DMA engine can accept. The format of the data sizes is binary encoded in terms of powers of two. When DMA resources are allocated, the system may modify the burstsizes value to reflect the system limits. The driver must use the allowable burstsizes to program the DMA engine (see <b>ddi_dma_burstsizes(9F)</b>).</p>

The **dma\_attr\_minxfer** field describes the minimum effective DMA access size in units of bytes. DMA resources may be modified depending on the presence and use of I/O caches and write buffers between the DMA engine and the memory object. This field is used to determine alignment and padding requirements for **ddi\_dma\_mem\_alloc(9F)**.

The **dma\_attr\_maxxfer** field describes the maximum effective DMA access size in units of bytes.

The **dma\_attr\_seg** field specifies segment boundary restrictions for allocated DMA resources. The system will allocate DMA resources for the device such that the object does not span the segment boundary specified by **dma\_attr\_seg**. For example a value of 0xFFFF means DMA resources must not cross a 64K boundary. DMA resource allocation functions may have to break up a DMA object into multiple DMA cookies to enforce segment boundary restrictions. In this case, the transfer must be performed using scatter-gather I/O or multiple DMA windows.

The **dma\_attr\_sgllen** field describes the length of the device's DMA scatter/gather list. Possible values are as follows:

- < 0 Device DMA engine is not constrained by the size – for example, DMA chaining.
- = 0 Reserved.
- = 1 Device DMA engine does not support scatter/gather such as third party DMA, etc.
- > 1 Device DMA engine uses scatter/gather. **dma\_attr\_sgllen** is the maximum number of entries in the list.

The **dma\_attr\_granular** field describes the granularity of the device transfer size, in units of bytes. When the system allocates DMA resources, a single segment's size will be a multiple of the device granularity. Or if **dma\_attr\_sgllen** is larger than 1 within a window, the sum of the sizes for a subgroup of segments will be a multiple of the device granularity.

The **dma\_attr\_flags** field can be set to:

#### **DDI\_DMA\_FORCE\_PHYSICAL**

Some platforms [such as *SPARC* systems] support what is called *DVMA* (Direct *Virtual* Memory Access). On these platforms the device is provided with a virtual address by the system in order to perform the transfer. In this case, the underlying platform provides an *IOMMU* which translates accesses to these virtual addresses into the proper physical addresses. Some of these platforms support in addition DMA.

**DDI\_DMA\_FORCE\_PHYSICAL** indicates that the system should return physical rather than virtual I/O addresses if the system supports both. If the system does not support physical DMA, the return value from **ddi\_dma\_alloc\_handle(9F)** will be **DDI\_DMA\_BADATTR**. In this case, the driver has to clear **DDI\_DMA\_FORCE\_PHYSICAL** and retry the operation.

**EXAMPLES**

For example, assume a device has the following DMA characteristics:

- Full 32-bit range addressable
- 24-bit DMA counter register
- byte alignment
- 4 and 8-byte burst sizes support
- Minimum effective transfer size of 1 bytes
- 64M maximum transfer size limit
- Maximum segment size of 32K
- 17 scatter/gather list elements
- 512 byte device transfer size granularity

The corresponding `ddi_dma_attr_t` structure would be initialized as follows:

```
static ddi_dma_attr_t dma_attrs = {
    DMA_ATTR_V0,           /* version number */
    (uint64_t)0x0,        /* low address */
    (uint64_t)0xffffffff, /* high address */
    (uint64_t)0xffff,     /* DMA counter max */
    (uint64_t)0x1,        /* alignment */
    0x0c,                 /* burst sizes */
    0x1,                  /* minimum transfer size */
    (uint64_t)0x3ffffff,  /* maximum transfer size */
    (uint64_t)0x7fff,     /* maximum segment size */
    17,                   /* scatter/gather list lgth */
    512,                  /* granularity */
    0                      /* DMA flags */
};
```

*Writing Device Drivers*

<b>NAME</b>	ddi_dma_cookie – DMA address cookie
<b>SYNOPSIS</b>	<b>#include</b> <sys/sunddi.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI). The <b>ddi_dma_cookie_t</b> structure contains DMA address information required to program a DMA engine. It is filled in by a call to <b>ddi_dma_getwin(9F)</b> , <b>ddi_dma_addr_bind_handle(9F)</b> , or <b>ddi_dma_buf_bind_handle(9F)</b> to get device specific DMA transfer information for a DMA request or a DMA window.
<b>STRUCTURE MEMBERS</b>	<pre> <b>uint64_t</b>    <b>dmac_laddress;</b>    /* 64 bit address */ <b>uint32_t</b>    <b>dmac_address;</b>    /* 32 bit address */ <b>size_t</b>     <b>dmac_size;</b>       /* transfer size */ <b>uint_t</b>     <b>dmac_type;</b>       /* bus specific type bits */ </pre> <p><b>dmac_laddress</b> specifies a 64 bit I/O address appropriate for programming the device's DMA engine. If a device has a 64-bit DMA address register a driver should use this field to program the DMA engine. <b>dmac_address</b> specifies a 32 bit I/O address. It should be used for devices which have a 32-bit DMA address register. The I/O address range that the device can address and other DMA attributes have to be specified in a <b>ddi_dma_attr(9S)</b> structure.</p> <p><b>dmac_size</b> describes the length of the transfer in bytes.</p> <p><b>dmac_type</b> contains bus specific type bits (if appropriate). For example, a device on a VME bus will have VME address modifier bits placed here.</p>

<b>NAME</b>	ddi_dma_lim_sparc, ddi_dma_lim – SPARC DMA limits structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/ddidmareq.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris SPARC DDI specific (Solaris SPARC DDI). A <b>ddi_dma_lim</b> structure describes in a generic fashion the possible limitations of a device's DMA engine. This information is used by the system when it attempts to set up DMA resources for a device.
<b>STRUCTURE MEMBERS</b>	<pre> <b>u_int</b>    <b>dlim_addr_lo;</b>        /* low range of 32 bit addressing capability */ <b>u_int</b>    <b>dlim_addr_hi;</b>        /* inclusive upper bound of addressing */   /* capability */ <b>u_int</b>    <b>dlim_cntr_max;</b>       /* inclusive upper bound of dma engine's */   /* address limit */ <b>u_int</b>    <b>dlim_burstsizes;</b>    /* binary encoded dma burst sizes */ <b>u_int</b>    <b>dlim_minxfer;</b>       /* minimum effective dma transfer size */ <b>u_int</b>    <b>dlim_dmaspeed;</b>     /* average dma data rate (kb/s) */ </pre> <p>The <b>dlim_addr_lo</b> and <b>dlim_addr_hi</b> fields specify the address range the device's DMA engine can access. The <b>dlim_addr_lo</b> field describes the lower 32 bit boundary of the device's DMA engine, the <b>dlim_addr_hi</b> describes the inclusive upper 32 bit boundary. The system will allocate DMA resources in a way that the address for programming the device's DMA engine (see <b>ddi_dma_cookie</b>(9S) or <b>ddi_dma_htoc</b>(9F)) will be within this range. For example, if your device can access the whole 32 bit address range, you may use <b>[0,0xFFFFFFFF]</b>. If your device has just a 16 bit address register but will access the top of the 32 bit address range, then <b>[0xFFFF0000,0xFFFFFFFF]</b> would be the right limit.</p> <p>The <b>dlim_cntr_max</b> field describes an inclusive upper bound for the device's DMA engine address register. This handles a fairly common case where a portion of the address register is simply a latch rather than a full register. For example, the upper 8 bits of a 32 bit address register may be a latch. This splits the address register into a portion which acts as a true address register (24 bits) for a 16 megabyte segment and a latch (8 bits) to hold a segment number. To describe these limits, you would specify <b>0xFFFF</b> in the <b>dlim_cntr_max</b> structure.</p> <p>The <b>dlim_burstsizes</b> field describes the possible burst sizes the device's DMA engine can accept. At the time of a DMA resource request, this element defines the possible DMA burst cycle sizes that the requester's DMA engine can handle. The format of the data is binary encoding of burst sizes assumed to be powers of two. That is, if a DMA engine is capable of doing 1, 2, 4 and 16 byte transfers, the encoding would be 0x17. If the device is an SBus device and can take advantage of a 64 bit SBus, the lower 16 bits are used to specify the burst size for 32 bit transfers and the upper 16 bits are used to specify the burst size for 64 bit transfers. As the resource request is handled by the system, the burst-sizes value may be modified. Prior to enabling DMA for the specific device, the driver that owns the DMA engine should check (using <b>ddi_dma_burstsizes</b>(9F)) what the allowed burstsizes have become and program the DMA engine appropriately.</p>

The **dlim\_minxfer** field describes the minimum effective DMA transfer size (in units of bytes). It must be a power of two. This value specifies the minimum effective granularity of the DMA engine. It is distinct from **dlim\_burstsizes** in that it describes the minimum amount of access a DMA transfer will effect. **dlim\_burstsizes** describes in what electrical fashion the DMA engine might perform its accesses, while **dlim\_minxfer** describes the minimum amount of memory that can be touched by the DMA transfer. As a resource request is handled by the system, the **dlim\_minxfer** value may be modified contingent upon the presence (and use) of I/O caches and DMA write buffers in between the DMA engine and the object that DMA is being performed on. After DMA resources have been allocated, the resultant minimum transfer value can be gotten using **ddi\_dma\_devalign(9F)**.

The field **dlim\_dmaspeed** is the expected average data rate for the DMA engine (in units of kilobytes per second). Note that this should not be the maximum, or peak, burst data rate, but a reasonable guess as to the average throughput. This field is entirely optional, and may be left as zero. Its intended use is to provide some hints about how much DMA resources this device may need.

<b>NAME</b>	ddi_dma_lim_x86 – x86 DMA limits structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/ddidmareq.h>
<b>INTERFACE LEVEL</b>	Solaris x86 DDI specific (Solaris x86 DDI)
<b>DESCRIPTION</b>	<p>A <b>ddi_dma_lim</b> structure describes in a generic fashion the possible limitations of a device or its DMA engine. This information is used by the system when it attempts to set up DMA resources for a device. When the system is requested to perform a DMA transfer to or from an object, the request will be broken up, if necessary, into multiple sub-requests, each of which conforms to the limitations expressed in the <b>ddi_dma_lim</b> structure.</p> <p>This structure should be filled in by calling the routine <b>ddi_dmae_getlim(9F)</b>, which sets the values of the structure members appropriately based on the characteristics of the DMA engine on the driver's parent bus. If the driver has additional limitations, it may <i>further restrict</i> some of the values in the structure members. A driver should take care to not <i>relax</i> any restrictions imposed by <b>ddi_dmae_getlim()</b>.</p>
<b>STRUCTURE MEMBERS</b>	<pre> u_int  dlim_addr_lo;      /* low range of 32 bit addressing capability */ u_int  dlim_addr_hi;     /* inclusive upper bound of addressing capability */ u_int  dlim_minxfer;     /* minimum effective dma transfer size */ u_int  dlim_version;     /* version number of this structure */ u_int  dlim_adreg_max;   /* inclusive upper bound of incrementing addr reg */ u_int  dlim_ctreg_max;  /* maximum transfer count minus one */ u_int  dlim_granular;   /* granularity (and min size) of transfer count */ short  dlim_sgllen;     /* length of DMA scatter/gather list */ u_int  dlim_reqsize;    /* maximum transfer size in bytes of a single I/O */ </pre> <p>The <b>dlim_addr_lo</b> and <b>dlim_addr_hi</b> fields specify the address range the device's DMA engine can access. The <b>dlim_addr_lo</b> field describes the lower 32 bit boundary of the device's DMA engine; <b>dlim_addr_hi</b> describes the inclusive upper 32 bit boundary. The system will allocate DMA resources in a way that the address for programming the device's DMA engine (see <b>ddi_dma_cookie(9S)</b> or <b>ddi_dma_segtocookie(9F)</b>) will be within this range. For example, if your device can access the whole 32 bit address range, you may use <b>[0,0xFFFFFFFF]</b>.</p> <p>The <b>dlim_minxfer</b> field describes the minimum effective DMA transfer size (in units of bytes). It must be a power of two. This value specifies the minimum effective granularity of the DMA engine. It describes the minimum amount of memory that can be touched by the DMA transfer. As a resource request is handled by the system, the <b>dlim_minxfer</b> value may be modified contingent upon the presence (and use) of I/O caches and DMA write buffers in between the DMA engine and the object that DMA is being performed on. After DMA resources have been allocated, the resultant minimum transfer value can be retrieved using <b>ddi_dma_devalign(9F)</b>.</p>

The **dlim\_version** field specifies the version number of this structure. This field should be set to **DMALIM\_VER0**.

The **dlim\_adreg\_max** field describes an inclusive upper bound for the device's DMA engine address register. This handles a fairly common case where a portion of the address register is simply a latch rather than a full register. For example, the upper 16 bits of a 32 bit address register may be a latch. This splits the address register into a portion which acts as a true address register (lower 16 bits) for a 64 kilobyte segment and a latch (upper 16 bits) to hold a segment number. To describe these limits, you would specify **0xFFFF** in the **dlim\_adreg\_max** structure member.

The **dlim\_ctreg\_max** field specifies the maximum transfer count that the DMA engine can handle in one segment or cookie. The limit is expressed as the maximum count minus one. This transfer count limitation is a per-segment limitation. It is used as a bit mask, so it must be one less than a power of two.

The **dlim\_granular** field describes the granularity of the device's DMA transfer ability, in units of bytes. This value is used to specify, for example, the sector size of a mass storage device. DMA requests will be broken into multiples of this value. If there is no scatter/gather capability, then the size of each DMA transfer will be a multiple of this value. If there is scatter/gather capability, then a single segment will not be smaller than the minimum transfer value, but may be less than the granularity; however the total transfer length of the scatter/gather list will be a multiple of the granularity value.

The **dlim\_sgllen** field specifies the maximum number of entries in the scatter/gather list. It is the number of segments or cookies that the DMA engine can consume in one I/O request to the device. If the DMA engine has no scatter/gather list, this field should be set to one.

The **dlim\_reqsize** field describes the maximum number of bytes that the DMA engine can transmit or receive in one I/O command. This limitation is only significant if it is less than  $(\text{dlim\_ctreg\_max} + 1) * \text{dlim\_sgllen}$ . If the DMA engine has no particular limitation, this field should be set to **0xFFFFFFFF**.

NAME	ddi_dma_req – DMA Request structure
SYNOPSIS	<b>#include</b> <sys/ddidmareq.h>
INTERFACE LEVEL DESCRIPTION	Solaris DDI specific (Solaris DDI).  A <b>ddi_dma_req</b> structure describes a request for DMA resources. A driver may use it to describe forms of and ways to allocate DMA resources for a DMA request.
STRUCTURE MEMBERS	<pre> <b>ddi_dma_lim_t</b>  *dmar_limits;      /* Caller's dma engine's */                                      /* constraints */ <b>u_int</b>         dmar_flags;        /* Contains information for */                                      /* mapping routines */ <b>int</b>          (*dmar_fp)(caddr_t); /* Callback function */ <b>caddr_t</b>      dmar_arg;          /* Callback function's argument */ <b>ddi_dma_obj_t</b> dmar_object;      /* Description of the object */                                      /* to be mapped */ </pre> <p>For the definition of the DMA limits structure, which <b>dmar_limits</b> points to, see <b>ddi_dma_lim_sparc(9S)</b> or <b>ddi_dma_lim_x86(9S)</b>.</p> <p>Valid values for <b>dmar_flags</b> are:</p> <pre> <b>DDI_DMA_WRITE</b>      /* Direction memory --&gt; IO */ <b>DDI_DMA_READ</b>      /* Direction IO --&gt; memory */ <b>DDI_DMA_RDWR</b>      /* Both read and write */ <b>DDI_DMA_REDZONE</b>   /* Establish an MMU redzone at end of mapping */ <b>DDI_DMA_PARTIAL</b>   /* Partial mapping is allowed */ <b>DDI_DMA_CONSISTENT</b> /* Byte consistent access wanted */ <b>DDI_DMA_SBUS_64BIT</b> /* Use 64 bit capability on SBus */ </pre> <p><b>DDI_DMA_WRITE</b>, <b>DDI_DMA_READ</b> and <b>DDI_DMA_RDWR</b> describe the intended direction of the DMA transfer. Some implementations may explicitly disallow <b>DDI_DMA_RDWR</b>.</p> <p><b>DDI_DMA_REDZONE</b> asks the system to establish a protected <i>red zone</i> after the object. The DMA resource allocation functions do not guarantee the success of this request as some implementations may not have the hardware ability to support it.</p> <p><b>DDI_DMA_PARTIAL</b> tells the system that the caller can accept a partial mapping. That is, if the size of the object exceeds the resources available, only allocate a portion of the object and return status indicating so. At a later point, the caller can use <b>ddi_dma_curwin(9F)</b> and <b>ddi_dma_movwin(9F)</b> to change the valid portion of the object that has resources allocated.</p> <p><b>DDI_DMA_CONSISTENT</b> gives a hint to the system that the object should be mapped for <i>byte consistent</i> access. Normal data transfers usually use a <i>streaming</i> mode of operation. They start at a specific point, transfer a fairly large amount of data sequentially, and then stop usually on a aligned boundary. Control mode data transfers for memory resident device control blocks (for example ethernet message descriptors) do not access memory</p>

in such a sequential fashion. Instead, they tend to modify a few words or bytes, move around and maybe modify a few more. There are many machine implementations that make this difficult to control in a generic and seamless fashion. Therefore, explicit synchronization steps using `ddi_dma_sync(9F)` or `ddi_dma_free(9F)` are required in order to make the view of a memory object shared between a CPU and a DMA device consistent. However, proper use of the `DDI_DMA_CONSISTENT` flag gives a *hint* to the system so that it will attempt to pick resources such that these synchronization steps are as efficient as possible.

`DDI_DMA_SBUS_64BIT` tells the system that the device can do 64 bit transfers on a 64 bit SBus. If the SBus does not support 64 bit data transfers, data will be transferred in 32 mode.

The callback function specified by the member `dmар_fp` indicates how a caller to one of the DMA resource allocation functions (see `ddi_dma_setup(9F)`) wants to deal with the possibility of resources not being available. If `dmар_fp` is set to `DDI_DMA_DONTWAIT`, then the caller does not care if the allocation fails, and can deal with an allocation failure appropriately. If `dmар_fp` is set to `DDI_DMA_SLEEP`, then the caller wishes to have the allocation routines wait for resources to become available. If any other value is set, and a DMA resource allocation fails, this value is assumed to be a function to call at a later time when resources may become available. When the specified function is called, it is passed the value set in the structure member `dmар_arg`. The specified callback function *must* return either 0 (indicating that it attempted to allocate a DMA resources but failed to do so, again), in which case the callback function will be put back on a list to be called again later, or the callback function must return 1 indicating either success at allocating DMA resources or that it no longer wishes to retry.

The callback function will be called in interrupt context. Therefore, only system functions and contexts that are accessible from interrupt context will be available. The callback function must take whatever steps necessary to protect its critical resources, data structures, queues, so forth.

Note that it is possible that a call to `ddi_dma_free(9F)`, which frees DMA resources, may cause a callback function to be called, and unless some care is taken an undesired recursion may occur. Unless care is taken, this may cause an undesired recursive `mutex_enter(9F)`, which will cause a system panic.

#### dmар\_object Structure

The `dmар_object` member of the `ddi_dma_req` structure is itself a complex and extensible structure:

```
u_int          dmao_size;    /* size, in bytes, of the object */
ddi_dma_atyp_t dmao_type;    /* type of object */
ddi_dma_aobj_t dmao_obj;     /* the object described */
```

The `dmao_size` element is the size, in bytes, of the object resources are allocated for DMA.

The `dmao_type` element selects the *kind* of object described by `dmao_obj`. It may be set to `DMA_OTYP_VADDR` indicating virtual addresses.

The last element, **dmao\_obj**, consists of the virtual address type:

**struct v\_address virt\_obj;**

It is specified as:

```
struct v_address {  
    caddr_t v_addr; /* base virtual address */  
    struct as *v_as; /* pointer to address space */  
};
```

*Writing Device Drivers*

<b>NAME</b>	ddi_dmae_req – DMA engine request structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/dma_engine.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris x86 DDI specific (Solaris x86 DDI).  A <b>ddi_dmae_req</b> structure is used by a device driver to describe the parameters for a DMA channel. This structure contains all the information necessary to set up the channel, except for the DMA memory address and transfer count. The defaults as specified below support most standard devices. Other modes may be desirable for some devices, or to increase performance. The DMA engine request structure is passed to <b>ddi_dmae_prog(9F)</b> .
<b>STRUCTURE MEMBERS</b>	The <b>ddi_dmae_req</b> structure contains several members, each of which controls some aspect of DMA engine operation. The structure members associated with supported DMA engine options are described here.  <pre> <b>uchar_t</b>          <b>der_command;</b>      /* Read / Write */ <b>uchar_t</b>          <b>der_bufprocess;</b>   /* Standard / Chain */ <b>uchar_t</b>          <b>der_path;</b>         /* 8 / 16 / 32 */ <b>u_short</b>         <b>der_ioadr;</b>        /* MicroChannel I/O address */ <b>uchar_t</b>          <b>der_cycles;</b>       /* Compat / Type A / Type B / Burst */ <b>uchar_t</b>          <b>der_trans;</b>        /* Single / Demand / Block */ <b>ddi_dma_cookie_t</b> <b>*(<i>proc</i>)();</b>        /* address of nextcookie routine */ <b>void</b>             <b>*<i>procparms</i>;</b>      /* parameter for nextcookie call */ </pre> <p><b>der_command</b> specifies what DMA operation is to be performed. The value <b>DMAE_CMD_WRITE</b> signifies that data is to be transferred from memory to the I/O device. The value <b>DMAE_CMD_READ</b> signifies that data is to be transferred from the I/O device to memory. This field must be set by the driver before calling <b>ddi_dmae_prog()</b>.</p> <p><b>der_bufprocess</b> On some bus types, a driver may set <b>der_bufprocess</b> to the value <b>DMAE_BUF_CHAIN</b> to specify that multiple DMA cookies will be given to the DMA engine for a single I/O transfer, thus effecting a scatter/gather operation. In this mode of operation, the driver calls <b>ddi_dmae_prog()</b> to give the DMA engine the DMA engine request structure and a pointer to the first cookie. The <b>proc</b> structure member must be set to the address of a driver <b>nextcookie</b> routine that takes one argument, specified by the <b>procparms</b> structure member, and returns a pointer to a structure of type <b>ddi_dma_cookie_t</b> that specifies the next cookie for the I/O transfer. When the DMA engine is ready to receive an additional cookie, the bus nexus driver controlling that DMA engine calls the routine specified by the <b>proc</b> structure member to obtain the next cookie from the driver. The driver's <b>nextcookie</b> routine must then return the address of the next cookie (in static storage) to the bus nexus routine that called it. If there are no more segments in the current DMA</p>

window, then `(*proc)()` must return the NULL pointer.

A driver may only specify the `DMAE_BUF_CHAIN` flag if the particular bus architecture supports the use of multiple DMA cookies in a single I/O transfer. A bus DMA engine may support this feature either with a fixed-length scatter/gather list, or via an interrupt chaining feature such as the one implemented in the EISA architecture. A driver must ascertain whether its parent bus nexus supports this feature by examining the scatter/gather list size returned in the `dlim_sgllen` member of the DMA limit structure (see `ddi_dma_lim_x86(9S)`) returned by the driver's call to `ddi_dmae_getlim()`. If the size of the scatter/gather list is 1, then no chaining is available, the driver *must not* specify the `DMAE_BUF_CHAIN` flag in the `ddi_dmae_req` structure it passes to `ddi_dmae_prog()`, and the driver need not provide a `nextcookie` routine.

If the size of the scatter/gather list is greater than 1, then DMA chaining is available, and the driver has two options. Under the first option, the driver chooses not to use the chaining feature, in which case (a) the driver must *set* the size of the scatter/gather list to 1 *before* passing it to the DMA setup routine, and (b) the driver must *not* set the `DMAE_BUF_CHAIN` flag.

Under the second option, the driver chooses to use the chaining feature, in which case (a) it should leave the size of the scatter/gather list alone, and (b) it *must* set the `DMAE_BUF_CHAIN` flag in the `ddi_dmae_req` structure. Before calling `ddi_dmae_prog()` the driver must *prefetch* cookies by repeatedly calling `ddi_dma_nextseg(9F)` and `ddi_dma_segtocookie(9F)` until either (1) the end of the DMA window is reached (`ddi_dma_nextseg(9F)` returns NULL), or (2) the size of the scatter/gather list is reached, whichever occurs first. These cookies must be saved by the driver until they are requested by the nexus driver calling the driver's `nextcookie` routine. The driver's `nextcookie` routine must return the prefetched cookies, in order, one cookie for each call to the `nextcookie` routine, until the list of prefetched cookies is exhausted. After the end of the list of cookies is reached, the `nextcookie` routine must return the NULL pointer.

The size of the scatter/gather list determines how many discontinuous segments of physical memory may participate in a single DMA transfer. ISA and MCA bus DMA engines have no scatter/gather capability, so their scatter/gather list sizes are 1. EISA bus DMA engines have a DMA chaining interrupt facility that allows very large scatter/gather operations. Other finite scatter/gather list sizes would also be possible. For performance reasons, it is recommended that drivers use the chaining capability if it is available on their parent bus.

As described above, a driver making use of DMA chaining must prefetch DMA cookies before calling `ddi_dmae_prog()`. There are two

reasons why the driver must do this. First, the driver must have some way to know the total I/O count with which to program the I/O device. This I/O count must match the total size of all the DMA segments that will be chained together into one DMA operation. Depending on the size of the scatter/gather list and the memory position and alignment of the DMA object, all or just part of the current DMA window may be able to participate in a single I/O operation. The driver must compute the I/O count by adding up the sizes of the prefetched DMA cookies. The number of cookies whose sizes are to be summed is the lesser of (a) the size of the scatter/gather list, or (b) the number of segments remaining in the window. Second, on some bus architectures, the driver's nextcookie routine may be called from a high-level interrupt routine. If the cookies were not prefetched, the nextcookie routine would have to call `ddi_dma_nextseg()` and `ddi_dma_segtocookie()` from a high-level interrupt routine, which is not recommended.

When breaking a DMA window into segments, the system arranges that the end of every segment whose number is an integral multiple of the scatter/gather list size will fall on a device-granularity boundary (as specified in the `dlim_granular` field in the `ddi_dma_lim_x86(9S)` structure).

If the scatter/gather list size is 1 (either because no chaining is available or because the driver does not wish to use the chaining feature), then the total I/O count for a single DMA operation is simply the size of DMA segment denoted by the single DMA cookie that is passed in the call to `ddi_dmae_prog()`. In this case, the system arranges that each DMA segment is a multiple of the device-granularity size.

<b>der_path</b>	specifies the DMA transfer size. The default of zero ( <code>DMAE_PATH_DEF</code> ) specifies ISA compatibility mode. In that mode, channels 0, 1, 2, and 3 are programmed in 8-bit mode ( <code>DMAE_PATH_8</code> ), and channels 5, 6, and 7 are programmed in 16-bit, count-by-word mode ( <code>DMAE_PATH_16</code> ). On the EISA bus, other sizes may be specified: <code>DMAE_PATH_32</code> specifies 32-bit mode, and <code>DMAE_PATH_16B</code> specifies a 16-bit, count-by-byte mode. MCA channel 4 must be explicitly programmed with <code>DMAE_PATH_8</code> or <code>DMAE_PATH_16</code> .
<b>der_ioadr</b>	only applicable to devices using MicroChannel DMA services, and if non-zero, specifies the MicroChannel DMA I/O address register value. This register causes the MicroChannel DMA controller to present the I/O address on the bus during DMA cycles; thus a DMA slave device can be made to respond to the I/O request by decoding the address and control buses rather than the bus arbitration level. Set <code>der_ioadr</code> to the I/O address of the device being accessed through DMA if the device operates in this way.
<b>der_cycles</b>	specifies the timing mode to be used during DMA data transfers. The default of zero ( <code>DMAE_CYCLES_1</code> ) specifies ISA compatible timing.

Drivers using this mode must also specify **DMAE\_TRANS\_SINGL** in the **der\_trans** structure member. On EISA buses, these other timing modes are available:

**DMAE\_CYCLES\_2** specifies type “A” timing;

**DMAE\_CYCLES\_3** specifies type “B” timing;

**DMAE\_CYCLES\_4** specifies “Burst” timing.

**der\_trans** specifies the bus transfer mode that the DMA engine should expect from the device. The default value of zero (**DMAE\_TRANS\_SINGL**) specifies that the device will perform one transfer for each bus arbitration cycle. Devices that use ISA compatible timing (specified by a value of zero, which is the default, in the **der\_cycles** structure member) should use the **DMAE\_TRANS\_SINGL** mode.

On EISA buses, a **der\_trans** value of **DMAE\_TRANS\_BLK** specifies that the device will perform a block of transfers for each arbitration cycle. A value of **DMAE\_TRANS\_DMND** specifies that the device will perform the Demand Transfer Mode protocol.

<b>NAME</b>	dev_ops – device operations structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/conf.h> <b>#include</b> <sys/devops.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI).  <b>dev_ops</b> contains driver common fields and pointers to the <b>bus_ops</b> and/or <b>cb_ops</b> (9S). Following are the device functions provided in the device operations structure. All fields must be set at compile time.  <b>devo_rev</b> Driver build version. Set this to <b>DEVO_REV</b> . <b>devo_refcnt</b> Driver reference count. Set this to <b>0</b> . <b>devo_getinfo</b> Get device driver information (see <b>getinfo</b> (9E)). <b>devo_identify</b> Determine if a driver is associated with a device (see <b>identify</b> (9E)). <b>devo_probe</b> Probe device (see <b>probe</b> (9E)). <b>devo_attach</b> Attach driver to <b>dev_info</b> (see <b>attach</b> (9E)). <b>devo_detach</b> Detach/prepare driver to unload (see <b>detach</b> (9E)). <b>devo_reset</b> Reset device. (Not supported in this release.) Set this to <b>nodev</b> . <b>devo_cb_ops</b> Pointer to <b>cb_ops</b> (9S) structure for leaf drivers. <b>devo_bus_ops</b> Pointer to bus operations structure for nexus drivers. Set this to <b>NULL</b> if this is for a leaf driver.

<b>NAME</b>	devmap_callback_ctl – device mapping-control structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/ddidevmap.h>
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI).
<b>DESCRIPTION</b>	<p>A <b>devmap_callback_ctl</b> structure describes a set of callback routines that are called by the system to notify a device driver to manage events on the device mappings created by <b>devmap_setup(9F)</b> or <b>ddi_devmap_segmap(9F)</b>.</p> <p>Device drivers pass the initialized <b>devmap_callback_ctl</b> structure to either <b>devmap_devmem_setup(9F)</b> or <b>devmap_umem_setup(9F)</b> in the <b>devmap(9E)</b> entry point during the mapping setup. The system will make a private copy of the structure for later use. Device drivers may specify different <b>devmap_callback_ctl</b> for different mappings.</p> <p>A device driver should allocate the device mapping control structure and initialize the following fields if the driver wants the entry points to be called by the system:</p> <p><b>devmap_rev</b>           Version number. Set this to <b>DEVMAP_OPS_REV</b>.</p> <p><b>devmap_map</b>           Set to the address of the <b>devmap_map(9E)</b> entry point or to <b>NULL</b> if the driver does not support this callback. If set, the system will call the <b>devmap_map(9E)</b> entry point during the <b>mmap(2)</b> system call. The drivers typically allocate driver private data structure in this function and return the pointer to the private data structure to the system for later use.</p> <p><b>devmap_access</b>       Set to the address of the <b>devmap_access(9E)</b> entry point or to <b>NULL</b> if the driver does not support this callback. If set, the system will call the driver's <b>devmap_access(9E)</b> entry point during memory access. The system expects <b>devmap_access(9E)</b> to call either <b>devmap_do_ctxmgt(9F)</b> or <b>devmap_default_access(9F)</b> to load the memory address translations before it returns to the system.</p> <p><b>devmap_dup</b>           Set to the address of the <b>devmap_dup(9E)</b> entry point or to <b>NULL</b> if the driver does not support this call. If set, the system will call the <b>devmap_dup(9E)</b> entry point during the <b>fork(2)</b> system call.</p> <p><b>devmap_unmap</b>       Set to the address of the <b>devmap_unmap(9E)</b> entry point or to <b>NULL</b> if the driver does not support this call. If set, the system will call the <b>devmap_unmap(9E)</b> entry point during the <b>munmap(2)</b> or <b>exit(2)</b> system calls.</p>
<b>STRUCTURE MEMBERS</b>	<pre>int    devmap_rev; int    (*devmap_map)(devmap_cookie_t dhp, dev_t dev, u_int flags,                     offset_t off, size_t len, void **pvtp); int    (*devmap_access)(devmap_cookie_t dhp, void *pvtp, offset_t off,                     size_t len, u_int type, u_int rw);</pre>

```
int      (*devmap_dup)(devmap_cookie_t dhp, void *pvtp,  
                    devmap_cookie_t new_dhp, void **new_pvtp);  
void     (*devmap_unmap)(devmap_cookie_t dhp, void *pvtp, offset_t off,  
                    size_t len, devmap_cookie_t new_dhp1, void **new_pvtp1,  
                    devmap_cookie_t new_dhp2, void **new_pvtp2);

<b>NAME</b>	fmodsw – STREAMS module declaration structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h> <b>#include</b> <sys/conf.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI)  The <b>fmodsw</b> structure contains information for STREAMS modules. All STREAMS modules must define a <b>fmodsw</b> structure.  <b>f_name</b> must match <b>mi_idname</b> in the <b>module_info</b> structure (see <b>module_info(9S)</b> ). All modules must set the <b>f_flag</b> to <b>D_MP</b> to indicate that they safely allow multiple threads of execution. See <b>mt-streams(9F)</b> for additional flags.
<b>STRUCTURE MEMBERS</b>	<b>char</b> <b>f_name</b> [FMNAMESZ + 1];        /* <b>module name</b> */ <b>struct streamtab</b> * <b>f_str</b> ;                    /* <b>streams information</b> */ <b>int</b> <b>f_flag</b> ;                        /* <b>flags</b> */
<b>SEE ALSO</b>	<b>mt-streams(9F)</b> , <b>modlstrmod(9S)</b> , <b>module_info(9S)</b> <i>STREAMS Programming Guide</i>

<b>NAME</b>	free_rtn – structure that specifies a driver’s message freeing routine
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL</b>	Architecture independent level 1 (DDI/DKI).
<b>DESCRIPTION</b>	The <b>free_rtn</b> structure is referenced by the <b>datab</b> structure. When <b>freeb</b> (9F) is called to free the message, the driver’s message freeing routine (referenced through the <b>free_rtn</b> structure) is called, with arguments, to free the data buffer.
<b>STRUCTURE MEMBERS</b>	<pre>void (*free_func)() /* user’s freeing routine */ char *free_arg /* arguments to free_func() */</pre> The <b>free_rtn</b> structure is defined as type <b>frtn_t</b> .

<b>NAME</b>	iocblk – STREAMS data structure for the M_IOCTL message type
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL</b>	Architecture independent level 1 (DDI/DKI).
<b>DESCRIPTION</b>	The iocblk data structure is used for passing M_IOCTL messages.
<b>STRUCTURE MEMBERS</b>	<pre>int    ioc_cmd;      /* ioctl command type */ cred_t *ioc_cr;     /* full credentials */ uint   ioc_id;      /* ioctl id */ uint   ioc_flag;    /* ioctl flags */ uint   ioc_count;   /* count of bytes in data field */ int    ioc_rval;    /* return value */ int    ioc_error;   /* error code */</pre>
<b>SEE ALSO</b>	<i>STREAMS Programming Guide</i>

<b>NAME</b>	iovec – data storage structure for I/O using uio
<b>SYNOPSIS</b>	<b>#include</b> <sys/uio.h>
<b>INTERFACE LEVEL</b>	Architecture independent level 1 (DDI/DKI).
<b>DESCRIPTION</b>	An <b>iovec</b> structure describes a data storage area for transfer in a <b>uio</b> (9S) structure. Conceptually, it may be thought of as a base address and length specification.
<b>STRUCTURE MEMBERS</b>	<b>caddr_t iov_base;</b> /* base address of the data storage area */ /* represented by the iovec structure */ <b>int iov_len;</b> /* size of the data storage area in bytes */
<b>SEE ALSO</b>	<b>uio</b> (9S) <i>Writing Device Drivers</i>

<b>NAME</b>	kstat – kernel statistics structure
<b>SYNOPSIS</b>	<pre>#include &lt;sys/types.h&gt; #include &lt;sys/kstat.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>
<b>INTERFACE LEVEL DESCRIPTION</b>	<p>Solaris DDI specific (Solaris DDI)</p> <p>Each kernel statistic (kstat) exported by device drivers consists of a header section and a data section. The <b>kstat</b> structure is the header portion of the statistic.</p> <p>A driver receives a pointer to a <b>kstat</b> structure from a successful call to <b>kstat_create</b>(9F). Drivers should never allocate a <b>kstat</b> structure in any other manner.</p> <p>After allocation, the driver should perform any further initialization needed before calling <b>kstat_install</b>(9F) to actually export the kstat.</p>
<b>STRUCTURE MEMBERS</b>	<pre>void      *ks_data;                /* kstat type-specific data */ ulong_t   ks_ndata;               /* # of type-specific data records */ ulong_t   ks_data_size;          /* total size of kstat data section */ int       (*ks_update)(struct kstat *, int); void      *ks_private;           /* arbitrary provider-private data */ void      *ks_lock;              /* protects this kstat's data */</pre> <p>The members of the <b>kstat</b> structure available to examine or set by a driver are as follows:</p> <p><b>ks_data</b> points to the data portion of the kstat. Either allocated by <b>kstat_create</b>(9F) for the drivers use, or by the driver if it is using virtual kstats.</p> <p><b>ks_ndata</b> is the number of data records in this kstat. Set by the <b>ks_update</b>(9E) routine.</p> <p><b>ks_data_size</b> is the amount of data pointed to by <b>ks_data</b>. Set by the <b>ks_update</b>(9E) routine.</p> <p><b>ks_update</b> is a pointer to a routine which dynamically updates kstats. This is useful for drivers where the underlying device keeps cheap hardware stats, but extraction is expensive. Instead of constantly keeping the kstat data section up to date, the driver can supply a <b>ks_update</b>(9E) function which updates the kstat's data section on demand. To take advantage of this feature, set the <b>ks_update</b> field before calling <b>kstat_install</b>(9F).</p> <p><b>ks_private</b> is a private field for the driver's use. Often used in <b>ks_update</b>(9E).</p> <p><b>ks_lock</b> is a pointer to a mutex that protects this kstat. kstat data sections are optionally protected by the per-kstat <b>ks_lock</b>. If <b>ks_lock</b> is non-NULL, kstat clients (such as <b>/dev/kstat</b>) will acquire this lock for all of their operations on that kstat. It is up to the kstat provider to decide whether guaranteeing consistent data to kstat clients is sufficiently important to</p>

justify the locking cost. Note, however, that most statistic updates already occur under one of the provider's mutexes, so if the provider sets **ks\_lock** to point to that mutex, then kstat data locking is free. **ks\_lock** is really of type (**kmutex\_t \***); it is declared as (**void \***) in the kstat header so that users don't have to be exposed to all of the kernel's lock-related data structures.

**SEE ALSO****kstat\_create(9F)***Writing Device Drivers*

<b>NAME</b>	kstat_intr – structure for interrupt kstats										
<b>SYNOPSIS</b>	<pre>#include &lt;sys/types.h&gt; #include &lt;sys/kstat.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>										
<b>INTERFACE LEVEL DESCRIPTION</b>	<p>Solaris DDI specific (Solaris DDI)</p> <p>Interrupt statistics are kept in the <b>kstat_intr</b> structure. When <b>kstat_create</b>(9F) creates an interrupt kstat, the <b>ks_data</b> field is a pointer to one of these structures. The macro <b>KSTAT_INTR_PTR()</b> is provided to retrieve this field. It looks like this:</p> <pre>#define KSTAT_INTR_PTR(kptr)      ((kstat_intr_t *) (kptr)-&gt;ks_data)</pre> <p>An interrupt is a hard interrupt (sourced from the hardware device itself), a soft interrupt (induced by the system via the use of some system interrupt source), a watchdog interrupt (induced by a periodic timer call), spurious (an interrupt entry point was entered but there was no interrupt to service), or multiple service (an interrupt was detected and serviced just prior to returning from any of the other types).</p> <p>Drivers generally only report claimed hard interrupts and soft interrupts from their handlers, but measurement of the spurious class of interrupts is useful for autovectorred devices in order to pinpoint any interrupt latency problems in a particular system configuration.</p> <p>Devices that have more than one interrupt of the same type should use multiple structures.</p>										
<b>STRUCTURE MEMBERS</b>	<pre>ulong_t  intrs[KSTAT_NUM_INTRS]; /* interrupt counters */</pre> <p>The only member exposed to drivers is the <b>intrs</b> member. This field is an array of counters; the driver must use the appropriate counter in the array based on the type of interrupt condition. The following indexes are supported:</p> <table border="0"> <tr> <td><b>KSTAT_INTR_HARD</b></td> <td>hard interrupt</td> </tr> <tr> <td><b>KSTAT_INTR_SOFT</b></td> <td>soft interrupt</td> </tr> <tr> <td><b>KSTAT_INTR_WATCHDOG</b></td> <td>watchdog interrupt</td> </tr> <tr> <td><b>KSTAT_INTR_SPURIOUS</b></td> <td>spurious interrupt</td> </tr> <tr> <td><b>KSTAT_INTR_MULTSVC</b></td> <td>multiple service interrupt</td> </tr> </table>	<b>KSTAT_INTR_HARD</b>	hard interrupt	<b>KSTAT_INTR_SOFT</b>	soft interrupt	<b>KSTAT_INTR_WATCHDOG</b>	watchdog interrupt	<b>KSTAT_INTR_SPURIOUS</b>	spurious interrupt	<b>KSTAT_INTR_MULTSVC</b>	multiple service interrupt
<b>KSTAT_INTR_HARD</b>	hard interrupt										
<b>KSTAT_INTR_SOFT</b>	soft interrupt										
<b>KSTAT_INTR_WATCHDOG</b>	watchdog interrupt										
<b>KSTAT_INTR_SPURIOUS</b>	spurious interrupt

<b>NAME</b>	kstat_io – structure for I/O kstats
<b>SYNOPSIS</b>	<pre>#include &lt;sys/types.h&gt; #include &lt;sys/kstat.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>
<b>INTERFACE LEVEL DESCRIPTION</b>	<p>Solaris DDI specific (Solaris DDI)</p> <p>I/O kstat statistics are kept in a <b>kstat_io</b> structure. When <b>kstat_create(9F)</b> creates an I/O kstat, the <b>ks_data</b> field is a pointer to one of these structures. The macro <b>KSTAT_IO_PTR()</b> is provided to retrieve this field. It looks like this:</p> <pre>#define KSTAT_IO_PTR(kptr) ((kstat_io_t *) (kptr)-&gt;ks_data)</pre>
<b>STRUCTURE MEMBERS</b>	<pre>u_longlong_t  nread;    /* number of bytes read */ u_longlong_t  nwritten; /* number of bytes written */ ulong_t       reads;    /* number of read operations */ ulong_t       writes;   /* number of write operations */</pre> <p>The <b>nread</b> field should be updated by the driver with the number of bytes successfully read upon completion.</p> <p>The <b>nwritten</b> field should be updated by the driver with the number of bytes successfully written upon completion.</p> <p>The <b>reads</b> field should be updated by the driver after each successful read operation.</p> <p>The <b>writes</b> field should be updated by the driver after each successful write operation</p> <p>Other I/O statistics are updated through the use of the <b>kstat_queue(9F)</b> functions.</p>
<b>SEE ALSO</b>	<p><b>kstat_create(9F)</b>, <b>kstat_named_init(9F)</b>, <b>kstat_queue(9F)</b>,  <b>kstat_runq_back_to_waitq(9F)</b>, <b>kstat_runq_enter(9F)</b>, <b>kstat_runq_exit(9F)</b>,  <b>kstat_waitq_enter(9F)</b>, <b>kstat_waitq_exit(9F)</b>, <b>kstat_waitq_to_runq(9F)</b></p> <p><i>Writing Device Drivers</i></p>

<b>NAME</b>	kstat_named – structure for named kstats
<b>SYNOPSIS</b>	<pre>#include &lt;sys/types.h&gt; #include &lt;sys/kstat.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>
<b>INTERFACE LEVEL DESCRIPTION</b>	<p>Solaris DDI specific (Solaris DDI)</p> <p>Named kstats are an array of name-value pairs. These pairs are kept in the <b>kstat_named</b> structure. When a kstat is created by <b>kstat_create(9F)</b>, the driver specifies how many of these structures will be allocated. They are returned as an array pointed to by the <b>ks_data</b> field.</p>
<b>STRUCTURE MEMBERS</b>	<pre>union {     char          c[16];     long          l;     ulong_t       ul;     longlong_t    ll;     u_longlong_t  ull; } value; /* value of counter */</pre> <p>The only member exposed to drivers is the <b>value</b> member. This field is a union of several data types. The driver must specify which type it will use in the call to <b>kstat_named_init()</b>.</p>
<b>SEE ALSO</b>	<p><b>kstat_create(9F)</b>, <b>kstat_named_init(9F)</b></p> <p><i>Writing Device Drivers</i></p>

<b>NAME</b>	linkblk – STREAMS data structure sent to multiplexor drivers to indicate a link
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI). The <b>linkblk</b> structure is used to connect a lower Stream to an upper STREAMS multiplexor driver. This structure is used in conjunction with the <b>I_LINK</b> , <b>I_UNLINK</b> , <b>P_LINK</b> , and <b>P_UNLINK</b> ioctl commands (see <b>streamio(7I)</b> ). The <b>M_DATA</b> portion of the <b>M_IOCTL</b> message contains the <b>linkblk</b> structure. Note that the <b>linkblk</b> structure is allocated and initialized by the Stream head as a result of one of the above ioctl commands.
<b>STRUCTURE MEMBERS</b>	<pre> <b>queue_t</b>  *l_qtop;      /* lowest level write queue of upper stream */                           /* (set to NULL for persistent links) */ <b>queue_t</b>  *l_qbot;     /* highest level write queue of lower stream */ <b>int</b>      l_index;     /* index for lower stream. */ </pre>
<b>SEE ALSO</b>	<b>ioctl(2)</b> , <b>streamio(7I)</b> <i>STREAMS Programming Guide</i>

<b>NAME</b>	modldrv – linkage structure for loadable drivers
<b>SYNOPSIS</b>	<b>#include</b> <sys/modctl.h>
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI)
<b>DESCRIPTION</b>	The <b>modldrv</b> structure is used by device drivers to export driver specific information to the kernel.
<b>STRUCTURE MEMBERS</b>	<pre> <b>struct mod_ops</b>    *<b>drv_modops</b>; <b>char</b>              *<b>drv_linkinfo</b>; <b>struct dev_ops</b>   *<b>drv_dev_ops</b>; </pre> <p><b>drv_modops</b>        Must always be initialized to the address of <b>mod_driverops</b>. This identifies the module as a loadable driver.</p> <p><b>drv_linkinfo</b>      Can be any string up to <b>MODMAXNAMELEN</b>, and is used to describe the module. This is usually the name of the driver, but can contain other information (such as a version number).</p> <p><b>drv_dev_ops</b>        Pointer to the driver's <b>dev_ops(9S)</b> structure.</p>
<b>SEE ALSO</b>	<b>add_drv(1M)</b> , <b>dev_ops(9S)</b> , <b>modlinkage(9S)</b> <i>Writing Device Drivers</i>

<b>NAME</b>	modlinkage – module linkage structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/modctl.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI) The <b>modlinkage</b> structure is provided by the module writer to the routines which install, remove, and retrieve information from a module. See <b>_init(9E)</b> , <b>_fini(9E)</b> , and <b>_info(9E)</b> .
<b>STRUCTURE MEMBERS</b>	<pre>int    ml_rev void   *ml_linkage[4];</pre> <p><b>ml_rev</b>           Is the revision of the loadable modules system. This must have the value <b>MODREV_1</b>.</p> <p><b>ml_linkage</b>       Is a null terminated array of pointers to linkage structures. For driver modules there is only one linkage structure.</p>
<b>SEE ALSO</b>	<b>add_drv(1M)</b> , <b>_fini(9E)</b> , <b>_info(9E)</b> , <b>_init(9E)</b> , <b>modldrv(9S)</b> , <b>modlstrmod(9S)</b> <i>Writing Device Drivers</i>

<b>NAME</b>	modlstrmod – linkage structure for loadable STREAMS modules
<b>SYNOPSIS</b>	<b>#include</b> <sys/modctl.h>
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI)
<b>DESCRIPTION</b>	The <b>modlstrmod</b> structure is used by STREAMS modules to export module specific information to the kernel.
<b>STRUCTURE MEMBERS</b>	<pre> <b>struct mod_ops</b>    *<b>strmod_modops</b>; <b>char</b>             *<b>strmod_linkinfo</b>; <b>struct fmodsw</b>    *<b>strmod_fmmodsw</b>; </pre> <p><b>strmod_modops</b>     Must always be initialized to the address of <b>mod_strmodops</b>. This identifies the module as a loadable STREAMS module.</p> <p><b>strmod_linkinfo</b>   Can be any string up to <b>MODMAXNAMELEN</b>, and is used to describe the module. This is usually the name of the module, but can contain other information (such as a version number).</p> <p><b>strmod_fmmodsw</b>    Is a pointer to a template of a class entry within the module that is copied to the kernel's class table when the module is loaded.</p>
<b>SEE ALSO</b>	<b>modload(1M)</b> <i>Writing Device Drivers</i>

<b>NAME</b>	module_info – STREAMS driver identification and limit value structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI).  When a module or driver is declared, several identification and limit values can be set. These values are stored in the <b>module_info</b> structure.  The <b>module_info</b> structure is intended to be read-only. However, the flow control limits ( <b>mi_hiwat</b> and <b>mi_lowat</b> ) and the packet size limits ( <b>mi_minpsz</b> and <b>mi_maxpsz</b> ) are copied to the <b>QUEUE</b> structure, where they may be modified.
<b>STRUCTURE MEMBERS</b>	<pre> <b>ushort</b>  <b>mi_idnum;</b>    /* module ID number */ <b>char</b>    <b>*mi_idname;</b> /* module name */ <b>ssize_t</b> <b>mi_minpsz;</b> /* minimum packet size */ <b>ssize_t</b> <b>mi_maxpsz;</b> /* maximum packet size */ <b>size_t</b>  <b>mi_hiwat;</b>  /* high water mark */ <b>size_t</b>  <b>mi_lowat;</b>  /* low water mark */ </pre> <p>The constant <b>FMNAMESZ</b>, limiting the length of a module's name, is set to eight in this release.</p>
<b>SEE ALSO</b>	<b>queue(9S)</b> <i>STREAMS Programming Guide</i>

<b>NAME</b>	msgb – STREAMS message block structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI). A STREAMS message is made up of one or more message blocks, referenced by a pointer to a <b>msgb</b> structure. The <b>b_next</b> and <b>b_prev</b> pointers are used to link messages together on a <b>QUEUE</b> . The <b>b_cont</b> pointer links message blocks together when a message is composed of more than one block. Each <b>msgb</b> structure also includes a pointer to a <b>datab(9S)</b> structure, the data block (which contains pointers to the actual data of the message), and the type of the message.
<b>STRUCTURE MEMBERS</b>	<pre> struct msgb    *b_next;    /* next message on queue */ struct msgb    *b_prev;    /* previous message on queue */ struct msgb    *b_cont;    /* next message block */ unsigned char  *b_rptr;    /* 1st unread data byte of buffer */ unsigned char  *b_wptr;    /* 1st unwritten data byte of buffer */ struct datab   *b_datap;   /* pointer to data block */ unsigned char  b_band;     /* message priority */ unsigned short b_flag;     /* used by stream head */ </pre> <p>Valid flags are as follows:</p> <pre> MSGMARK    last byte of message is "marked". MSGDELIM   message is delimited. </pre> <p>The <b>msgb</b> structure is defined as type <b>mblk_t</b>.</p>
<b>SEE ALSO</b>	<b>datab(9S)</b> <i>Writing Device Drivers</i> <i>STREAMS Programming Guide</i>

<b>NAME</b>	qband – STREAMS queue flow control information structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI). The <b>qband</b> structure contains flow control information for each priority band in a queue. The <b>qband</b> structure is defined as type <b>qband_t</b> .
<b>STRUCTURE MEMBERS</b>	<pre> <b>struct qband</b>  <b>*qb_next;</b>  /* next band's info */ <b>size_t</b>       <b>qb_count</b>   /* number of bytes in band */ <b>struct msgb</b>  <b>*qb_first;</b> /* start of band's data */ <b>struct msgb</b>  <b>*qb_last;</b>  /* end of band's data */ <b>size_t</b>       <b>qb_hiwat;</b>  /* band's high water mark */ <b>size_t</b>       <b>qb_lowat;</b>  /* band's low water mark */ <b>uint</b>        <b>qb_flag;</b>   /* see below */ </pre> <p>Valid flags are as follows:</p> <pre> <b>QB_FULL</b>      Band is considered full. <b>QB_WANTW</b>    Someone wants to write to band. </pre>
<b>SEE ALSO</b>	<b>strqget(9F)</b> , <b>strqset(9F)</b> , <b>msgb(9S)</b> , <b>queue(9S)</b> <i>STREAMS Programming Guide</i>
<b>NOTES</b>	All access to this structure should be through <b>strqget(9F)</b> and <b>strqset(9F)</b> . It is logically part of the <b>queue(9S)</b> and its layout and partitioning with respect to that structure may change in future releases. If portability is a concern, do not declare or store instances of or references to this structure.

<b>NAME</b>	qinit – STREAMS queue processing procedures structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI). The <b>qinit</b> structure contains pointers to processing procedures for a <b>QUEUE</b> . The <b>streamtab</b> structure for the module or driver contains pointers to one <b>queue(9S)</b> structure for both upstream and downstream processing.
<b>STRUCTURE MEMBERS</b>	<pre> <b>int</b>          (<b>*qi_putp</b>)();    /* <b>put procedure</b> */ <b>int</b>          (<b>*qi_srvp</b>)();    /* <b>service procedure</b> */ <b>int</b>          (<b>*qi_qopen</b>)();   /* <b>open procedure</b> */ <b>int</b>          (<b>*qi_qclose</b>)();  /* <b>close procedure</b> */ <b>int</b>          (<b>*qi_qadmin</b>)();  /* <b>unused</b> */ <b>struct module_info</b> <b>*qi_minfo</b>; /* <b>module parameters</b> */ <b>struct module_stat</b> <b>*qi_mstat</b>; /* <b>module statistics</b> */ </pre>
<b>SEE ALSO</b>	<b>queue(9S)</b> , <b>streamtab(9S)</b> <i>Writing Device Drivers</i> <i>STREAMS Programming Guide</i>
<b>NOTES</b>	This release includes no support for module statistics.

<b>NAME</b>	queclass – a STREAMS macro that returns the queue message class definitions for a given message block
<b>SYNOPSIS</b>	<pre>#include &lt;sys/stream.h&gt; queclass( mblk_t *bp);</pre>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI). <b>queclass</b> returns the queue message class definition for a given data block pointed to by the message block <i>bp</i> passed in. The message may either be <b>QNORM</b> , a normal priority, or <b>QPCTL</b> , a high priority, message.
<b>SEE ALSO</b>	<i>STREAMS Programming Guide</i>

<b>NAME</b>	queue – STREAMS queue structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI).  A STREAMS driver or module consists of two <b>queue</b> structures, one for upstream processing (read) and one for downstream processing (write). This structure is the major building block of a stream. It contains pointers to the processing procedures, pointers to the next and previous queues in the stream, flow control parameters, and a pointer defining the position of its messages on the STREAMS scheduler list.  The <b>queue</b> structure is defined as type <b>queue_t</b> .
<b>STRUCTURE MEMBERS</b>	<pre> struct qinit    *q_qinfo;    /* module or driver entry points */ struct msgb    *q_first;    /* first message in queue */ struct msgb    *q_last;    /* last message in queue */ struct queue   *q_next;    /* next queue in stream */ struct queue   *q_link;    /* to next queue for scheduling*/ void           *q_ptr;     /* pointer to private data structure */ size_t         q_count;    /* approximate size of message queue */ uint          *q_flag;    /* status of queue */ ssize_t       *q_minpsz;  /* smallest packet accepted by QUEUE */ ssize_t       *q_maxpsz;  /* largest packet accepted by QUEUE */ size_t        *q_hiwat;   /* high water mark */ size_t        *q_lowat;   /* low water mark */ </pre> <p>Valid flags are as follows:</p> <pre> QENAB        Queue is already enabled to run. QWANTR       Someone wants to read queue. QWANTW       Someone wants to write to queue. QFULL        Queue is considered full. QREADR       This is the reader (first) queue. QUSE         This queue in use (allocation). QNOENB       Do not enable queue via putq. </pre>
<b>SEE ALSO</b>	<b>strqget(9F)</b> , <b>strqset(9F)</b> , <b>module_info(9S)</b> , <b>msgb(9S)</b> , <b>qinit(9S)</b> , <b>streamtab(9S)</b> <i>Writing Device Drivers</i> <i>STREAMS Programming Guide</i>

<b>NAME</b>	scsi_address – SCSI address structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/scsi/scsi.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris architecture specific (Solaris DDI).  A <b>scsi_address</b> structure defines the addressing components for SCSI target device. The address of the target device is separated into two components: target number and logical unit number. The two addressing components are used to uniquely identify any type of SCSI device; however, most devices can be addressed with the target component of the address. In the case where only the target component is used to address the device, the logical unit should be set to <b>0</b> . If the SCSI target device supports logical units, then the HBA must interpret the logical units field of the data structure.  The <b>pkt_address</b> member of a <b>scsi_pkt(9S)</b> is initialized by <b>scsi_init_pkt(9F)</b> .
<b>STRUCTURE MEMBERS</b>	<pre> <b>scsi_hba_tran_t</b>  *<b>a_hba_tran</b>;    /* Transport vectors for the SCSI bus */ <b>u_short</b>          <b>a_target</b>;      /* SCSI target id */ <b>u_char</b>          <b>a_lun</b>;         /* SCSI logical unit */ </pre> <p><b>a_hba_tran</b> is a pointer to the controlling HBA's transport vector structure. The SCSI interface uses this field to pass any transport requests from the SCSI target device drivers to the HBA driver.</p> <p><b>a_target</b> is the target component of the SCSI address.</p> <p><b>a_lun</b> is the logical unit component of the SCSI address. The logical unit is used to further distinguish a SCSI target device that supports multiple logical units. The <b>makecom(9F)</b> family of functions use the <b>a_lun</b> field to set the logical unit field in the SCSI CDB, for compatibility with SCSI-1.</p>

<b>NAME</b>	scsi_arq_status – SCSI auto request sense structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/scsi/scsi.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI)  When auto request sense has been enabled using <b>scsi_ifsetcap</b> (9F) and the "auto-rqsense" capability, the target driver must allocate a status area in the SCSI packet structure (see <b>scsi_pkt</b> (9S)) for the auto request sense structure. In the event of a <i>check condition</i> the transport layer will automatically execute a request sense command. This ensures that the request sense information does not get lost. The auto request sense structure supplies the SCSI status of the original command, the transport information pertaining to the request sense command, and the request sense data.
<b>STRUCTURE MEMBERS</b>	<pre> <b>struct scsi_status</b>          <b>sts_status;</b>          /* SCSI status */ <b>struct scsi_status</b>          <b>sts_rqpkt_status;</b>      /* SCSI status of   request sense cmd */ <b>u_char</b>                     <b>sts_rqpkt_reason;</b>    /* reason completion */ <b>u_char</b>                     <b>sts_rqpkt_resid;</b>      /* residue */ <b>u_int</b>                      <b>sts_rqpkt_state;</b>       /* state of command */ <b>u_int</b>                      <b>sts_rqpkt_statistics;</b>    /* statistics */ <b>struct scsi_extended_sense</b> <b>sts_sensedata;</b>        /* actual sense data */ </pre> <p><b>sts_status</b> is the SCSI status of the original command. If the status indicates a <i>check condition</i> then the transport layer may have performed an auto request sense command.</p> <p><b>sts_rqpkt_status</b> is the SCSI status of the request sense command.</p> <p><b>sts_rqpkt_reason</b> is the completion reason of the request sense command. If the reason is not <b>CMD_CMPLT</b>, then the request sense command did not complete normally.</p> <p><b>sts_rqpkt_resid</b> is the residual count of the data transfer and indicates the number of data bytes that have not been transferred. The auto request sense command requests <b>SENSE_LENGTH</b> bytes.</p> <p><b>sts_rqpkt_state</b> has bit positions representing the five most important status that a SCSI command can go through.</p> <p><b>sts_rqpkt_statistics</b> maintains transport-related statistics of the request sense command.</p> <p><b>sts_sensedata</b> contains the actual sense data if the request sense command completed normally.</p>

<b>NAME</b>	scsi_device – SCSI device structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/scsi/scsi.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris DDI specific (Solaris DDI).  The <b>scsi_device</b> structure stores common information about each SCSI logical unit, including pointers to areas that contain both generic and device specific information. There is one <b>scsi_device</b> structure for each logical unit attached to the system. The host adapter driver initializes part of this structure prior to <b>probe(9E)</b> and destroys this structure after a probe failure or successful <b>detach(9E)</b> .
<b>STRUCTURE MEMBERS</b>	<pre> <b>struct scsi_address</b>      <b>sd_address;</b>    /* Routing information */ <b>dev_info_t</b>             <b>*sd_dev;</b>        /* Cross-reference to our dev_info_t */ <b>kmutex_t</b>               <b>sd_mutex;</b>      /* Mutex for this device */ <b>struct scsi_inquiry</b>     <b>*sd_inq;</b>       /* scsi_inquiry data structure */ <b>struct scsi_extended_sense</b> <b>*sd_sense;</b> /* Optional request sense buffer ptr */ <b>caddr_t</b>                 <b>sd_private;</b>    /* Target drivers private data */ </pre> <p><b>sd_address</b> contains the routing information that the target driver normally copies into a <b>scsi_pkt(9S)</b> structure using the collection of <b>makecom(9F)</b> functions. The SCSI library routines use this information to determine which host adapter, SCSI bus, and target/lun a command is intended for. This structure is initialized by the host adapter driver.</p> <p><b>sd_dev</b> is a pointer to the corresponding <b>dev_info</b> structure. This pointer is initialized by the host adapter driver.</p> <p><b>sd_mutex</b> is a mutual exclusion lock for this device. It is used to serialize access to a device. The host adapter driver initializes this mutex. See <b>mutex(9F)</b>.</p> <p><b>sd_inq</b> is initially NULL (zero). After executing <b>scsi_probe(9F)</b> this field contains the inquiry data associated with the particular device.</p> <p><b>sd_sense</b> is initially NULL (zero). If the target driver wants to use this field for storing REQUEST SENSE data, it should allocate an <b>scsi_extended_sense(9S)</b> buffer and set this field to the address of this buffer.</p> <p><b>sd_private</b> is reserved for the use of target drivers and should generally be used to point to target specific data structures.</p>
<b>SEE ALSO</b>	<b>detach(9E)</b> , <b>probe(9E)</b> , <b>makecom(9F)</b> , <b>mutex(9F)</b> , <b>scsi_probe(9F)</b> , <b>scsi_extended_sense(9S)</b> , <b>scsi_pkt(9S)</b>  <i>Writing Device Drivers</i>

<b>NAME</b>	scsi_extended_sense – SCSI extended sense structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/scsi/scsi.h>
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI).
<b>DESCRIPTION</b>	The <b>scsi_extended_sense</b> structure for error codes <b>0x70</b> (current errors) and <b>0x71</b> (deferred errors) is returned on a successful REQUEST SENSE command. SCSI-2 compliant targets are required to return at least the first 18 bytes of this structure. This structure is part of <b>scsi_device(9S)</b> structure.
<b>STRUCTURE MEMBERS</b>	<pre> u_char  es_valid          :1;  /* sense data is valid */ u_char  es_class         :3;  /* Error Class- fixed at 0x7 */ u_char  es_code          :4;  /* Vendor Unique error code */ u_char  es_segnum;       /* segment number: for COPY cmd only */ u_char  es_filmk        :1;  /* File Mark Detected */ u_char  es_eom          :1;  /* End of Media */ u_char  es_ili          :1;  /* Incorrect Length Indicator */ u_char  es_key          :4;  /* Sense key */ u_char  es_info_1;      /* information byte 1 */ u_char  es_info_2;      /* information byte 2 */ u_char  es_info_3;      /* information byte 3 */ u_char  es_info_4;      /* information byte 4 */ u_char  es_add_len;     /* number of additional bytes */ u_char  es_cmd_info[4]; /* command specific information */ u_char  es_add_code;    /* Additional Sense Code */ u_char  es_qual_code;   /* Additional Sense Code Qualifier */ u_char  es_fru_code;    /* Field Replaceable Unit Code */ u_char  es_skey_specific[3]; /* Sense Key Specific information */ </pre> <p><b>es_valid</b>, if set, indicates that the information field contains valid information.</p> <p><b>es_class</b> should be <b>0x7</b>.</p> <p><b>es_code</b> is either <b>0x0</b> or <b>0x1</b>.</p> <p><b>es_segnum</b> contains the number of the current segment descriptor if the REQUEST SENSE command is in response to a <b>COPY</b>, <b>COMPARE</b>, and <b>COPY AND VERIFY</b> command.</p> <p><b>es_filmk</b>, if set, indicates that the current command had read a filemark or setmark (sequential access devices only).</p> <p><b>es_eom</b>, if set, indicates that an end-of-medium condition exists (sequential access and printer devices only).</p> <p><b>es_ili</b>, if set, indicates that the requested logical block length did not match the logical block length of the data on the medium.</p>

**es\_key** indicates generic information describing an error or exception condition. The following sense keys are defined:

<b>KEY_NO_SENSE</b>	Indicates that there is no specific sense key information to be reported.
<b>KEY_RECOVERABLE_ERROR</b>	Indicates that the last command completed successfully with some recovery action performed by the target.
<b>KEY_NOT_READY</b>	Indicates that the logical unit addressed cannot be accessed.
<b>KEY_MEDIUM_ERROR</b>	Indicates that the command terminated with a non-recovered error condition that was probably caused by a flaw on the medium or an error in the recorded data.
<b>KEY_HARDWARE_ERROR</b>	Indicates that the target detected a non-recoverable hardware failure while performing the command or during a self test.
<b>KEY_ILLEGAL_REQUEST</b>	Indicates that there was an illegal parameter in the CDB or in the additional parameters supplied as data for some commands.
<b>KEY_UNIT_ATTENTION</b>	Indicates that the removable medium may have been changed or the target has been reset.
<b>KEY_WRITE_PROTECT/KEY_DATA_PROTECT</b>	Indicates that a command that reads or writes the medium was attempted on a block that is protected from this operation.
<b>KEY_BLANK_CHECK</b>	Indicates that a write-once device or a sequential access device encountered blank medium or format-defined end-of-data indication while reading or a write-once device encountered a non-blank medium while writing.
<b>KEY_VENDOR_UNIQUE</b>	This sense key is available for reporting vendor-specific conditions.
<b>KEY_COPY_ABORTED</b>	Indicates a <b>COPY</b> , <b>COMPARE</b> , and <b>COPY AND VERIFY</b> command was aborted.
<b>KEY_ABORTED_COMMAND</b>	Indicates that the target aborted the command.
<b>KEY_EQUAL</b>	Indicates a <b>SEARCH DATA</b> command has satisfied an equal comparison.

**KEY\_VOLUME\_OVERFLOW**

Indicates that a buffered peripheral device has reached the end-of-partition and data may remain in the buffer that has not been written to the medium.

**KEY\_MISCOMPARE**

Indicates that the source data did not match the data read from the medium.

**KEY\_RESERVE**

Indicates that the target is currently reserved by a different initiator.

**es\_info\_{1,2,3,4}** is device type or command specific.

**es\_add\_len** indicates the number of additional sense bytes to follow.

**es\_cmd\_info** contains information that depends on the command which was executed.

**es\_add\_code** (ASC) indicates further information related to the error or exception condition reported in the sense key field.

**es\_qual\_code** (ASCQ) indicates detailed information related to the additional sense code.

**es\_fru\_code** (FRU) indicates a device-specific mechanism to unit that has failed.

**es\_key\_specific** is defined when the value of the sense-key specific valid bit (bit 7) is 1. This field is reserved for sense keys not defined above.

<b>NAME</b>	scsi_hba_tran – SCSI Host Bus Adapter (HBA) driver transport vector structure	
<b>SYNOPSIS</b>	#include <sys/scsi/scsi.h>	
<b>INTERFACE LEVEL DESCRIPTION</b>	Solaris architecture specific (Solaris DDI). A <b>scsi_hba_tran_t</b> structure defines vectors that an HBA driver exports to SCSI interfaces so that HBA specific functions can be executed.	
<b>STRUCTURE MEMBERS</b>	<pre> dev_info_t      *tran_hba_dip;           /* HBAs dev_info pointer */ void            *tran_hba_private;      /* HBA softstate */ void            *tran_tgt_private;      /* HBA target private pointer */ struct scsi_device *tran_sd;           /* scsi_device */ int             (*tran_tgt_init)();      /* transport target */ int             (*tran_tgt_probe)();     /* initialization */ int             (*tran_tgt_free)();      /* transport target probe */ void            (*tran_start)();        /* transport target free */ int             (*tran_reset)();        /* transport start */ int             (*tran_abort)();        /* transport reset */ int             (*tran_getcap)();       /* transport abort */ int             (*tran_setcap)();       /* capability retrieval */ struct scsi_pkt (*tran_init_pkt)();     /* capability establishment */ void            (*tran_destroy_pkt)();  /* packet and dma allocation */ void            (*tran_dmafree)();      /* packet and dma */ void            (*tran_sync_pkt)();     /* deallocation */ void            (*tran_reset_notify)(); /* dma deallocation */ </pre>	<pre> /* HBA softstate */ /* HBA target private pointer */ /* scsi_device */ /* transport target */ /* initialization */ /* transport target probe */ /* transport target free */ /* transport start */ /* transport reset */ /* transport abort */ /* capability retrieval */ /* capability establishment */ /* packet and dma allocation */ /* packet and dma */ /* deallocation */ /* dma deallocation */ /* sync DMA */ /* bus reset notification */ </pre>
<b>tran_hba_dip</b>	dev_info pointer to the HBA supplying the <b>scsi_hba_tran</b> structure.	
<b>tran_hba_private</b>	Private pointer which the HBA driver can use to refer to the device's soft state structure.	
<b>tran_tgt_private</b>	Private pointer which the HBA can use to refer to per-target specific data. This field may only be used when the <b>SCSI_HBA_TRAN_CLONE</b> flag is specified in <b>scsi_hba_attach(9F)</b> . In this case, the HBA driver must initialize this field in its <b>tran_tgt_init(9E)</b> entry point.	
<b>tran_sd</b>	pointer to <b>scsi_device(9S)</b> structure if cloning; otherwise NULL.	
<b>tran_tgt_init</b>	is the function entry allowing per-target HBA initialization, if necessary.	
<b>tran_tgt_probe</b>	is the function entry allowing per-target <b>scsi_probe(9F)</b> customization, if necessary.	
<b>tran_tgt_free</b>	is the function entry allowing per-target HBA deallocation, if	

	necessary.
<b>tran_start</b>	is the function entry that starts a SCSI command execution on the HBA hardware.
<b>tran_reset</b>	is the function entry that resets a SCSI bus or target device.
<b>tran_abort</b>	is the function entry that aborts one SCSI command, or all pending SCSI commands.
<b>tran_getcap</b>	is the function entry that retrieves a SCSI capability.
<b>tran_setcap</b>	is the function entry that sets a SCSI capability.
<b>tran_init_pkt</b>	is the function entry that allocates a <b>scsi_pkt</b> structure.
<b>tran_destroy_pkt</b>	is the function entry that frees a <b>scsi_pkt</b> structure allocated by <b>tran_init_pkt</b> .
<b>tran_dmafree</b>	is the function entry that frees DMA resources which were previously allocated by <b>tran_init_pkt</b> .
<b>tran_sync_pkt</b>	synchronize data in <i>pkt</i> after a data transfer has been completed.
<b>tran_reset_notify</b>	is the function entry allowing a target to register a bus reset notification request with the HBA driver.

<b>NAME</b>	scsi_inquiry – SCSI inquiry structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/scsi/scsi.h>
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI).
<b>DESCRIPTION</b>	The <b>scsi_inquiry</b> structure contains 36 required bytes, followed by a variable number of vendor-specific parameters. Bytes 59 through 95, if returned, are reserved for future standardization. This structure is part of <b>scsi_device</b> (9S) structure and typically filled in by <b>scsi_probe</b> (9F).
<b>STRUCTURE MEMBERS</b>	<pre> u_char  inq_dtype;           /* peripheral qualifier, device type */ u_char  inq_rmb              : 1; /* removable media */ u_char  inq_qual            : 7; /* device type qualifier */ u_char  inq_iso             : 2; /* ISO version */ u_char  inq_ecma            : 3; /* ECMA version */ u_char  inq_ansi           : 3; /* ANSI version */ u_char  inq_aenc            : 1; /* async event notification cap. */ u_char  inq_trmiop         : 1; /* supports TERMINATE I/O PROC msg */ u_char  inq_rdf             : 4; /* response data format */ u_char  inq_len;           /* additional length */ u_char  inq_reladdr        : 1; /* supports relative addressing */ u_char  inq_wbus32         : 1; /* supports 32 bit wide data xfers */ u_char  inq_wbus16        : 1; /* supports 16 bit wide data xfers */ u_char  inq_sync           : 1; /* supports synchronous data xfers */ u_char  inq_linked        : 1; /* supports linked commands */ u_char  inq_cmdque         : 1; /* supports command queueing */ u_char  inq_sftre          : 1; /* supports Soft Reset option */ char    inq_vid[8];        /* vendor ID */ char    inq_pid[16];       /* product ID */ char    inq_revision[4];   /* revision level */ </pre> <p><b>inq_dtype</b> identifies the type of device. Bits 0 - 4 represent the Peripheral Device Type and bits 5 - 7 represent the Peripheral Qualifier. The following values are appropriate for Peripheral Device Type field:</p> <pre> DTYPE_ARRAY_CTRL   Array controller device (for example, RAID). DTYPE_DIRECT       Direct-access device (for example, magnetic disk). DTYPE_ESI          Enclosure services device. DTYPE_SEQUENTIAL   Sequential-access device (for example, magnetic tape). DTYPE_PRINTER      Printer device. DTYPE_PROCESSOR    Processor device. DTYPE_WORM         Write-once device (for example, some optical disks). </pre>

<b>DTYPE_RODIRECT</b>	CD-ROM device.
<b>DTYPE_SCANNER</b>	Scanner device.
<b>DTYPE_OPTICAL</b>	Optical memory device (for example, some optical disks).
<b>DTYPE_CHANGER</b>	Medium Changer device (for example, jukeboxes).
<b>DTYPE_COMM</b>	Communications device.
<b>DTYPE_UNKNOWN</b>	Unknown or no device type.
<b>DTYPE_MASK</b>	Mask to isolate Peripheral Device Type field.

The following values are appropriate for the Peripheral Qualifier field:

<b>DPQ_POSSIBLE</b>	The specified peripheral device type is currently connected to this logical unit. If the target cannot determine whether or not a physical device is currently connected, it shall also use this peripheral qualifier when returning the INQUIRY data. This peripheral qualifier does not imply that the device is ready for access by the initiator.
<b>DPQ_SUPPORTED</b>	The target is capable of supporting the specified peripheral device type on this logical unit. However, the physical device is not currently connected to this logical unit.
<b>DPQ_NEVER</b>	The target is not capable of supporting a physical device on this logical unit. For this peripheral qualifier, the peripheral device type shall be set to <b>DTYPE_UNKNOWN</b> to provide compatibility with previous versions of SCSI. For all other peripheral device type values, this peripheral qualifier is reserved.
<b>DPQ_VUNIQ</b>	This is a vendor-unique qualifier.

**DTYPE\_NOTPRESENT** is the peripheral qualifier **DPQ\_NEVER** and the peripheral device type **DTYPE\_UNKNOWN** combined.

**inq\_rmb**, if set, indicates that the medium is removable.

**inq\_qual** is a device type qualifier.

**inq\_iso** indicates ISO version.

**inq\_ecma** indicates ECMA version.

**inq\_ansi** indicates ANSI version.

**inq\_aenc**, if set, indicates that the device supports asynchronous event notification capability as defined in SCSI-2 specification.

**inq\_trmiop**, if set, indicates that the device supports the TERMINATE I/O PROCESS message.

**inq\_rdf**, if reset, indicates the INQUIRY data format is as specified in SCSI-1.

**inq\_inq\_len** is the additional length field which specifies the length in bytes of the parameters.

**inq\_reladdr**, if set, indicates that the device supports the relative addressing mode of this logical unit.

**inq\_wbus32**, if set, indicates that the device supports 32-bit wide data transfers.

**inq\_wbus16**, if set, indicates that the device supports 16-bit wide data transfers.

**inq\_sync**, if set, indicates that the device supports synchronous data transfers.

**inq\_linked**, if set, indicates that the device supports linked commands for this logical unit.

**inq\_cmdque**, if set, indicates that the device supports tagged command queueing.

**inq\_sftre**, if reset, indicates that the device responds to the RESET condition with the hard RESET alternative. If this bit is set, this indicates that the device responds with the soft RESET alternative.

**inq\_vid** contains eight bytes of ASCII data identifying the vendor of the product.

**inq\_pid** contains sixteen bytes of ASCII data as defined by the vendor.

**inq\_revision** contains four bytes of ASCII data as defined by the vendor.

<b>NAME</b>	scsi_pkt – SCSI packet structure	
<b>SYNOPSIS</b>	#include <sys/scsi/scsi.h>	
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI).	
<b>DESCRIPTION</b>	A <b>scsi_pkt</b> structure defines the packet which is allocated by <b>scsi_init_pkt(9F)</b> . The target driver fills in some information, and passes it to <b>scsi_transport(9F)</b> for execution on the target. The HBA fills in some other information as the command is processed. When the command completes (or can be taken no further) the completion function specified in the packet is called with a pointer to the packet as its argument. From fields within the packet, the target driver can determine the success or failure of the command.	
<b>STRUCTURE MEMBERS</b>	<pre>opaque_t      pkt_ha_private;           /* private data for host adapter */ struct scsi_address pkt_address;       /* destination packet is for */ opaque_t      pkt_private;            /* private data for target driver */ void          (*pkt_comp)(struct scsi_pkt *); /* callback */ u_int         pkt_flags;              /* flags */ int           pkt_time;               /* time allotted to complete */  /* command */ u_char        *pkt_scbp;              /* pointer to status block */ u_char        *pkt_cdbp;              /* pointer to command block */ ssize_t       pkt_resid;              /* number of bytes not transferred */ u_int         pkt_state;              /* state of command */ u_int         pkt_statistics;         /* statistics */ u_char        pkt_reason;             /* reason completion called */</pre>	<p><b>pkt_ha_private</b> is an opaque pointer which the Host Bus Adapter uses to reference a private data structure used to transfer scsi_pkt requests.</p> <p><b>pkt_address</b> is initialized by <b>scsi_init_pkt(9F)</b> and serves to record the intended route and recipient of a request.</p> <p><b>pkt_private</b> is reserved for the use of the target driver and is not changed by the HBA driver.</p> <p><b>pkt_comp</b> specifies the command completion callback routine. When the host adapter driver has gone as far as it can in transporting a command to a SCSI target, and the command has either run to completion, or can go no further for some other reason, the host adapter driver will call the function pointed to by this field and pass a pointer to the packet as argument.</p> <p>The callback routine itself is called from interrupt context and must not sleep nor call any function which may sleep.</p> <p><b>pkt_flags</b> provides additional information about how the target driver wants the command to be executed. See <b>pkt_flag Definitions</b>.</p>

<b>pkt_time</b>	will be set by the target driver to represent the maximum length of time in seconds that this command is allowed take to complete. <b>pkt_time</b> may be <b>0</b> if no timeout is required.
<b>pkt_scbp</b>	points to the SCSI status completion block.
<b>pkt_cdbp</b>	points to a kernel addressable buffer whose length was specified by a call to the proper resource allocation routine, <b>scsi_init_pkt(9F)</b> .
<b>pkt_resid</b>	contains a residual count, either the number of data bytes that have not been transferred ( <b>scsi_transport(9F)</b> ) or the number of data bytes for which DMA resources could not be allocated <b>scsi_init_pkt(9F)</b> . In the latter case, partial DMA resources may only be allocated if <b>scsi_init_pkt(9F)</b> is called with the <b>PKT_DMA_PARTIAL</b> flag.
<b>pkt_state</b>	has bit positions representing the five most important states that a SCSI command can go through (see <b>pkt_state Definitions</b> ).
<b>pkt_statistics</b>	maintains some transport-related statistics. (see <b>pkt_statistics Definitions</b> ).
<b>pkt_reason</b>	contains a completion code that indicates why the <b>pkt_comp</b> function was called.

The host adapter driver will update the **pkt\_resid**, **pkt\_reason**, **pkt\_state**, and **pkt\_statistics** fields.

#### **pkt\_flags Definitions:**

The definitions that are appropriate for the structure member **pkt\_flags** are:

<b>FLAG_NOINTR</b>	Run command with no command completion callback; command is complete upon return from <b>scsi_transport(9F)</b> .
<b>FLAG_NODISCON</b>	Run command without disconnects.
<b>FLAG_NOPARITY</b>	Run command without parity checking.
<b>FLAG_HTAG</b>	Run command as the head of queue tagged command.
<b>FLAG_OTAG</b>	Run command as an ordered queue tagged command.
<b>FLAG_STAG</b>	Run command as a simple queue tagged command.
<b>FLAG_SENSING</b>	This command is a request sense command.
<b>FLAG_HEAD</b>	This command should be put at the head of the queue.

#### **pkt\_reason Definitions:**

The definitions that are appropriate for the structure member **pkt\_reason** are:

<b>CMD_CMPLT</b>	No transport errors—normal completion.
<b>CMD_INCOMPLETE</b>	Transport stopped with abnormal state.
<b>CMD_DMA_DERR</b>	DMA direction error.
<b>CMD_TRAN_ERR</b>	Unspecified transport error.
<b>CMD_RESET</b>	SCSI bus reset destroyed command.

<b>CMD_ABORTED</b>	Command transport aborted on request.
<b>CMD_TIMEOUT</b>	Command timed out.
<b>CMD_DATA_OVR</b>	Data Overrun.
<b>CMD_CMD_OVR</b>	Command Overrun.
<b>CMD_STS_OVR</b>	Status Overrun.
<b>CMD_BADMSG</b>	Message not Command Complete.
<b>CMD_NOMSGOUT</b>	Target refused to go to Message Out phase.
<b>CMD_XID_FAIL</b>	Extended Identify message rejected.
<b>CMD_IDE_FAIL</b>	Initiator Detected Error message rejected.
<b>CMD_ABORT_FAIL</b>	Abort message rejected.
<b>CMD_REJECT_FAIL</b>	Reject message rejected.
<b>CMD_NOP_FAIL</b>	No Operation message rejected.
<b>CMD_PER_FAIL</b>	Message Parity Error message rejected.
<b>CMD_BDR_FAIL</b>	Bus Device Reset message rejected.
<b>CMD_ID_FAIL</b>	Identify message rejected.
<b>CMD_UNX_BUS_FREE</b>	Unexpected Bus Free Phase.
<b>CMD_TAG_REJECT</b>	Target rejected the tag message.

**pkt\_state Definitions:**

The definitions that are appropriate for the structure member **pkt\_state** are:

<b>STATE_GOT_BUS</b>	Bus arbitration succeeded.
<b>STATE_GOT_TARGET</b>	Target successfully selected.
<b>STATE_SENT_CMD</b>	Command successfully sent.
<b>STATE_XFERRED_DATA</b>	Data transfer took place.
<b>STATE_GOT_STATUS</b>	Status received.
<b>STATE_ARQ_DONE</b>	The command resulted in a check condition and the host adapter driver executed an automatic request sense cmd.

**pkt\_statistics Definitions:**

The definitions that are appropriate for the structure member **pkt\_statistics** are:

<b>STAT_DISCON</b>	Device disconnect.
<b>STAT_SYNC</b>	Command did a synchronous data transfer.
<b>STAT_PERR</b>	SCSI parity error.
<b>STAT_BUS_RESET</b>	Bus reset.
<b>STAT_DEV_RESET</b>	Device reset.
<b>STAT_ABORTED</b>	Command was aborted.
<b>STAT_TIMEOUT</b>	Command timed out.

*Writing Device Drivers*

<b>NAME</b>	scsi_status – SCSI status structure												
<b>SYNOPSIS</b>	<b>#include</b> <sys/scsi/scsi.h>												
<b>INTERFACE LEVEL</b>	Solaris DDI specific (Solaris DDI)												
<b>DESCRIPTION</b>	The SCSI-2 standard defines a status byte which is normally sent by the target to the initiator during the status phase at the completion of each command.												
<b>STRUCTURE MEMBERS</b>	<pre> <b>uchar</b>  <b>sts_scsi2</b>  : <b>1</b>;  /* SCSI-2 modifier bit */ <b>uchar</b>  <b>sts_is</b>     : <b>1</b>;  /* intermediate status sent */ <b>uchar</b>  <b>sts_busy</b>   : <b>1</b>;  /* device busy or reserved */ <b>uchar</b>  <b>sts_cm</b>     : <b>1</b>;  /* condition met */ <b>uchar</b>  <b>sts_chk</b>    : <b>1</b>;  /* check condition */ </pre> <p><b>sts_chk</b> indicates that a contingent allegiance condition has occurred.</p> <p><b>sts_cm</b> is returned whenever the requested operation is satisfied</p> <p><b>sts_busy</b> indicates that the target is busy. This status is returned whenever a target is unable to accept a command from an otherwise acceptable initiator (that is, no reservation conflicts). The recommended initiator recovery action is to issue the command again at a later time.</p> <p><b>sts_is</b> is returned for every successfully completed command in a series of linked commands (except the last command), unless the command is terminated with a check condition status, reservation conflict, or command terminated status. Note that host bus adapter drivers may not support linked commands (see <b>scsi_ifsetcap(9F)</b>). If <b>sts_is</b> and <b>sts_busy</b> are both set, then a reservation conflict has occurred.</p> <p><b>sts_scsi2</b> is the SCSI-2 modifier bit. If <b>sts_scsi2</b> and <b>sts_chk</b> are both set, this indicates a command terminated status. If <b>sts_scsi2</b> and <b>sts_busy</b> are both set, this indicates that the command queue in the target is full.</p> <p>For accessing the status as a byte, the following values are appropriate:</p> <table border="0"> <tr> <td style="padding-left: 2em;"><b>STATUS_GOOD</b></td> <td>This status indicates that the target has successfully completed the command.</td> </tr> <tr> <td style="padding-left: 2em;"><b>STATUS_CHECK</b></td> <td>This status indicates that a contingent allegiance condition has occurred.</td> </tr> <tr> <td style="padding-left: 2em;"><b>STATUS_MET</b></td> <td>This status is returned when the requested operations are satisfied.</td> </tr> <tr> <td style="padding-left: 2em;"><b>STATUS_BUSY</b></td> <td>This status indicates that the target is busy.</td> </tr> <tr> <td style="padding-left: 2em;"><b>STATUS_INTERMEDIATE</b></td> <td>This status is returned for every successfully completed command in a series of linked commands.</td> </tr> <tr> <td style="padding-left: 2em;"><b>STATUS_SCSI2</b></td> <td>This is the SCSI-2 modifier bit.</td> </tr> </table>	<b>STATUS_GOOD</b>	This status indicates that the target has successfully completed the command.	<b>STATUS_CHECK</b>	This status indicates that a contingent allegiance condition has occurred.	<b>STATUS_MET</b>	This status is returned when the requested operations are satisfied.	<b>STATUS_BUSY</b>	This status indicates that the target is busy.	<b>STATUS_INTERMEDIATE</b>	This status is returned for every successfully completed command in a series of linked commands.	<b>STATUS_SCSI2</b>	This is the SCSI-2 modifier bit.
<b>STATUS_GOOD</b>	This status indicates that the target has successfully completed the command.												
<b>STATUS_CHECK</b>	This status indicates that a contingent allegiance condition has occurred.												
<b>STATUS_MET</b>	This status is returned when the requested operations are satisfied.												
<b>STATUS_BUSY</b>	This status indicates that the target is busy.												
<b>STATUS_INTERMEDIATE</b>	This status is returned for every successfully completed command in a series of linked commands.												
<b>STATUS_SCSI2</b>	This is the SCSI-2 modifier bit.												

**STATUS\_INTERMEDIATE\_MET**

This status is a combination of **STATUS\_MET** and **STATUS\_INTERMEDIATE**.

**STATUS\_RESERVATION\_CONFLICT**

This status is a combination of **STATUS\_INTERMEDIATE** and **STATUS\_BUSY**, and is returned whenever an initiator attempts to access a logical unit or an extent within a logical unit is reserved.

**STATUS\_TERMINATED**

This status is a combination of **STATUS\_SCSI2** and **STATUS\_CHECK**, and is returned whenever the target terminates the current I/O process after receiving a terminate I/O process message.

**STATUS\_QFULL**

This status is a combination of **STATUS\_SCSI2** and **STATUS\_BUSY**, and is returned when the command queue in the target is full.

*Writing Device Drivers*

<b>NAME</b>	streamtab – STREAMS entity declaration structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/stream.h>
<b>INTERFACE LEVEL DESCRIPTION</b>	Architecture independent level 1 (DDI/DKI). Each STREAMS driver or module must have a <b>streamtab</b> structure. <b>streamtab</b> is made up of <b>qinit</b> structures for both the read and write queue portions of each module or driver. (Multiplexing drivers require both upper and lower <b>qinit</b> structures.) The <b>qinit</b> structure contains the entry points through which the module or driver routines are called. Normally, the read <b>QUEUE</b> contains the <b>open</b> and <b>close</b> routines. Both the read and write queue can contain <b>put</b> and service procedures.
<b>STRUCTURE MEMBERS</b>	<b>struct qinit</b> *st_rdinit; /* read QUEUE */ <b>struct qinit</b> *st_wrinit; /* write QUEUE */ <b>struct qinit</b> *st_muxrinit; /* lower read QUEUE*/ <b>struct qinit</b> *st_muxwinit; /* lower write QUEUE*/
<b>SEE ALSO</b>	<b>qinit(9S)</b> <i>STREAMS Programming Guide</i>

<b>NAME</b>	stroptions – options structure for M_SETOPTS message
<b>SYNOPSIS</b>	<pre>#include &lt;sys/stream.h&gt; #include &lt;sys/stropts.h&gt; #include &lt;sys/ddi.h&gt; #include &lt;sys/sunddi.h&gt;</pre>
<b>INTERFACE LEVEL DESCRIPTION</b>	<p>Architecture independent level 1 (DDI/DKI).</p> <p>The M_SETOPTS message contains a <b>stroptions</b> structure and is used to control options in the stream head.</p>
<b>STRUCTURE MEMBERS</b>	<pre>uint          so_flags;          /* options to set */ short         so_readopt;       /* read option */ ushort        so_wroff;         /* write offset */ ssize_t       so_minpsz;        /* minimum read packet size */ ssize_t       so_maxpsz;        /* maximum read packet size */ size_t        so_hiwat;         /* read queue high water mark */ size_t        so_lowat;         /* read queue low water mark */ unsigned char so_band;          /* band for water marks */ ushort        so_errop;         /* error option */</pre> <p>The following are the flags that can be set in the <b>so_flags</b> bit mask in the <b>stroptions</b> structure. Note that multiple flags can be set.</p> <pre>SO_READOPT    set read option SO_WROFF      set write offset SO_MINPSZ     set min packet size SO_MAXPSZ     set max packet size SO_HIWAT      set high water mark SO_LOWAT      set low water mark SO_MREADON    set read notification ON SO_MREADOFF   set read notification OFF SO_NDELOON    old TTY semantics for NDELAY reads/writes SO_NDELOFF    STREAMS semantics for NDELAY reads/writes SO_ISTTY      the stream is acting as a terminal SO_ISNTTY     the stream is not acting as a terminal SO_TOSTOP     stop on background writes to this stream SO_TONSTOP    do not stop on background writes to stream SO_BAND       water marks affect band SO_ERROPT     set error option</pre>

When **SO\_READOPT** is set, the **so\_readopt** field of the **stroptions** structure can take one of the following values (see **read(2)**):

<b>RNORM</b>	read msg norm
<b>RMSGD</b>	read msg discard
<b>RMSGN</b>	read msg no discard

When **SO\_BAND** is set, **so\_band** determines to which band **so\_hiwat** and **so\_lowat** apply.

When **SO\_ERROPT** is set, the **so\_errop** field of the **stroptions** structure can take a value that is either none or one of:

<b>RERRNORM</b>	persistent read errors; default
<b>RERRNONPERSIST</b>	non-persistent read errors

OR'ed with either none or one of:

<b>WERRNORM</b>	persistent write errors; default
<b>WERRNONPERSIST</b>	non-persistent write errors

*STREAMS Programming Guide*

<b>NAME</b>	tuple – Card Information Structure (CIS) access structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/pccard.h>
<b>INTERFACE LEVEL</b>	Solaris DDI Specific (Solaris DDI)
<b>DESCRIPTION</b>	<p>The <b>tuple_t</b> structure is the basic data structure provided by Card Services to manage PC Card information. A PC Card provides identification and configuration information through its Card Information Structure (CIS). A PC Card driver accesses a PC Card's CIS through various Card Services functions.</p> <p>The CIS information allows PC Cards to be self-identifying, meaning that the CIS provides information to the system so that it can identify the proper PC Card driver for the PC Card, and configuration information so that the driver can allocate appropriate resources to configure the PC Card for proper operation in the system.</p> <p>The CIS information is contained on the PC Card in a linked list of tuple data structures called a CIS chain. Each tuple has a one-byte type and a one-byte link, an offset to the next tuple in the list. A PC Card can have one or more CIS chains.</p> <p>A multi-function PC Card that complies with the PC Card 95 MultiFunction Metaformat specification will have one or more global CIS chains that collectively are referred to as the global CIS. These PC Cards will also have one or more per-function CIS chains. Each per-function collection of CIS chains is referred to as a function-specific CIS.</p> <p>To examine a PC Card's CIS, first a PC Card driver must locate the desired tuple by calling <b>csx_GetFirstTuple</b>(9F). Once the first tuple is located, subsequent tuples may be located by calling <b>csx_GetNextTuple</b>(9F) (see <b>csx_GetFirstTuple</b>(9F)). The linked list of tuples may be inspected one by one, or the driver may narrow the search by requesting only tuples of a particular type.</p> <p>Once a tuple has been located, the PC Card driver may inspect the tuple data. The most convenient way to do this for standard tuples is by calling one of the number of tuple-parsing utility functions; for custom tuples, the driver may get access to the raw tuple data by calling <b>csx_GetTupleData</b>(9F).</p> <p>Solaris PC Card drivers do not need to be concerned with which CIS chain a tuple appears in. On a multi-function PC Card, the client will get the tuples from the global CIS followed by the tuples in the function-specific CIS. The caller will not get any tuples from a function-specific CIS that does not belong to the caller's function.</p>
<b>STRUCTURE MEMBERS</b>	<p>The structure members of <b>tuple_t</b> are:</p> <pre> <b>uint32_t</b>   <b>Socket;</b>           /* socket number */ <b>uint32_t</b>   <b>Attributes;</b>       /* tuple attributes */ <b>cisdata_t</b>  <b>DesiredTuple;</b>    /* tuple to search for */ </pre>

```

cisdata_t TupleOffset;    /* tuple data offset */
cisdata_t TupleDataMax;  /* max tuple data size */
cisdata_t TupleDataLen;  /* actual tuple data length */
cisdata_t TupleData[CIS_MAX_TUPLE_DATA_LEN]; /* body tuple data */
cisdata_t TupleCode;     /* tuple type code */
cisdata_t TupleLink;     /* tuple link */

```

The fields are defined as follows:

<b>Socket</b>	Not used in Solaris, but for portability with other Card Services implementations, it should be set to the logical socket number.
<b>Attributes</b>	This field is bit-mapped. The following bits are defined: <ul style="list-style-type: none"> <li><b>TUPLE_RETURN_LINK</b> Return link tuples if set.</li> <li><b>TUPLE_RETURN_IGNORED_TUPLES</b> Return ignored tuples if set. Ignored tuples are those tuples in a multi-function PC Card's global CIS chain that are duplicates of the same tuples in a function-specific CIS chain.</li> <li><b>TUPLE_RETURN_NAME</b> Return tuple name string via the <b>csx_ParseTuple(9F)</b> function if set.</li> </ul>
<b>DesiredTuple</b>	This field is the requested tuple type code to be returned, when calling <b>csx_GetFirstTuple(9F)</b> or <b>csx_GetNextTuple(9F)</b> . <b>RETURN_FIRST_TUPLE</b> is used to return the first tuple regardless of tuple type, if it exists. <b>RETURN_NEXT_TUPLE</b> is used to return the next tuple regardless of tuple type.
<b>TupleOffset</b>	This field allows partial tuple information to be retrieved, starting at the specified offset within the tuple. This field must only be set before calling <b>csx_GetTupleData(9F)</b> .
<b>TupleDataMax</b>	This field is the size of the tuple data buffer that Card Services uses to return raw tuple data from <b>csx_GetTupleData(9F)</b> . It can be larger than the number of bytes in the tuple data body. Card Services ignores any value placed here by the client.
<b>TupleDataLen</b>	This field is the actual size of the tuple data body. It represents the number of tuple data body bytes returned by <b>csx_GetTupleData(9F)</b> .
<b>TupleData</b>	This field is an array of bytes containing the raw tuple data body contents returned by <b>csx_GetTupleData(9F)</b> .
<b>TupleCode</b>	This field is the tuple type code and is returned by <b>csx_GetFirstTuple(9F)</b> or <b>csx_GetNextTuple(9F)</b> when a tuple matching the <b>DesiredTuple</b> field is returned.
<b>TupleLink</b>	This field is the tuple link, the offset to the next tuple, and is returned by <b>csx_GetFirstTuple(9F)</b> or <b>csx_GetNextTuple(9F)</b> when a tuple

matching the **DesiredTuple** field is returned.

<b>NAME</b>	uio – scatter/gather I/O request structure
<b>SYNOPSIS</b>	<b>#include</b> <sys/uio.h>
<b>INTERFACE LEVEL</b>	Architecture independent level 1 (DDI/DKI).
<b>DESCRIPTION</b>	<p>A <b>uio</b> structure describes an I/O request that can be broken up into different data storage areas (scatter/gather I/O). A request is a list of <b>iovec</b> structures (base/length pairs) indicating where in user space or kernel space the I/O data is to be read/written.</p> <p>The contents of <b>uio</b> structures passed to the driver through the entry points should not be written by the driver. The <b>uio_move(9F)</b> function takes care of all overhead related to maintaining the state of the <b>uio</b> structure.</p> <p><b>uio</b> structures allocated by the driver should be initialized to zero before use (by <b>bzero(9F)</b>, <b>kmem_zalloc(9F)</b>, or an equivalent).</p>
<b>STRUCTURE MEMBERS</b>	<pre> iovec_t    *uio_iov;    /* pointer to the start of the iovec */                 /* list for the uio structure */ int        uio_iovcnt; /* the number of iovecs in the list */ off_t      uio_offset; /* 32-bit offset into file where data is */                 /* transferred from or to. See NOTES. */ offset_t   uio_loffset; /* 64-bit offset into file where data is */                 /* transferred from or to. See NOTES. */ uio_seg_t  uio_segflg; /* identifies the type of I/O transfer: */                 /* UIO_SYSSPACE: kernel &lt;-&gt; kernel */                 /* UIO_USERSPACE: kernel &lt;-&gt; user */ short      uio_fmode;  /* file mode flags (not driver settable) */ daddr_t    uio_limit;  /* 32-bit ulimit for file (maximum block */                 /* offset). not driver settable. See NOTES. */ diskaddr_t uio_llimit; /* 64-bit ulimit for file (maximum block */                 /* offset). not driver settable. See NOTES. */ int        uio_resid;  /* residual count */ </pre> <p>The <b>uio_iov</b> member is a pointer to the beginning of the <b>iovec(9S)</b> list for the <b>uio</b>. When the <b>uio</b> structure is passed to the driver through an entry point, the driver should not set <b>uio_iov</b>. When the <b>uio</b> structure is created by the driver, <b>uio_iov</b> should be initialized by the driver and not written to afterward.</p>
<b>SEE ALSO</b>	<b>aread(9E)</b> , <b>awrite(9E)</b> , <b>read(9E)</b> , <b>write(9E)</b> , <b>bzero(9F)</b> , <b>kmem_zalloc(9F)</b> , <b>uio_move(9F)</b> , <b>cb_ops(9S)</b> , <b>iovec(9S)</b> <i>Writing Device Drivers</i>
<b>NOTES</b>	Only one of <b>uio_offset</b> or <b>uio_loffset</b> should be interpreted by the driver. Which field the driver interprets is dependent upon the settings in the <b>cb_ops(9S)</b> structure.

Only one of **uio\_limit** or **uio\_llimit** should be interpreted by the driver. Which field the driver interprets is dependent upon the settings in the **cb\_ops(9S)** structure.

When performing I/O on a seekable device, the driver should not modify either the **uio\_offset** or the **uio\_loffset** field of the **uio** structure. I/O to such a device is constrained by the maximum offset value. When performing I/O on a device on which the concept of position has no relevance, the driver may preserve the **uio\_offset** or **uio\_loffset**, perform the I/O operation, then restore the **uio\_offset** or **uio\_loffset** to the field's initial value. I/O performed to a device in this manner is not constrained.

`fmodsw` — STREAMS module declaration structure,  
9S-43

## I

I/O data storage structure using `uio`  
— `iovec`, 9S-46  
I/O request structure, scatter/gather  
— `uio`, 9S-85  
I/O, block, data transfer structure  
— `buf`, 9S-10  
`iocblk` — STREAMS data structure for the  
`M_IOCTL` message type, 9S-45

## K

kernel statistics structure — `kstat`, 9S-47  
`kstat` — kernel statistics structure, 9S-47  
`kstat_intr` — structure for interrupt kstats, 9S-49  
`kstat_io` — structure for I/O kstats, 9S-50  
`kstat_named` — structure for named kstats, 9S-51

## L

`linkblk` — STREAMS data structure sent to multi-  
plexor drivers to indicate a link, 9S-52

## M

`modlinkage` — module linkage structure, 9S-54

## O

options structure for `M_SETOPTS` message —  
`stroptions`, 9S-80

## Q

`queclass` — a STREAMS macro that returns the  
queue message class definitions for a given  
message block, 9S-60

## S

SCSI address structure — `scsi_address`, 9S-62  
SCSI auto request sense structure —  
`scsi_arq_status`, 9S-63  
SCSI device structure — `scsi_device`, 9S-64,  
9S-70  
SCSI extended sense structure —  
`scsi_extended_sense`, 9S-65  
SCSI Host Bus Adapter (HBA) driver transport vec-  
tor structure — `scsi_hba_tran`, 9S-68  
SCSI packet structure — `scsi_pkt`, 9S-73  
SCSI status structure — `scsi_status`, 9S-77  
`scsi_address` — SCSI address structure , 9S-62  
`scsi_arq_status` — SCSI auto request sense  
structure, 9S-63  
`scsi_device` — SCSI device structure, 9S-64  
`scsi_extended_sense` — SCSI extended sense  
structure, 9S-65  
`scsi_hba_tran` — SCSI Host Bus Adapter (HBA)  
driver transport vector structure, 9S-68  
`scsi_inquiry` — SCSI device structure, 9S-70  
`scsi_pkt` — SCSI packet structure , 9S-73  
`pkt_flags` Definitions, 9S-74  
`pkt_reason` Definitions, 9S-74  
`pkt_state` Definitions, 9S-75  
`pkt_statistics` Definitions, 9S-75  
`scsi_status` — SCSI status structure, 9S-77  
STREAMS data structure for the `M_COPYIN` and  
the `M_COPYOUT` message types — `copyreq`,  
9S-15

---

STREAMS data structure for the M\_IOCTLDATA message type — `copyresp`, 9S-16

STREAMS data structure for the M\_IOCTL message type — `iocblk`, 9S-45

STREAMS data structure sent to multiplexor drivers to indicate a link — `linkblk`, 9S-52

STREAMS driver identification and limit value structure

- `module_info`, 9S-56

STREAMS entity declaration structure

- `streamtab`, 9S-79

STREAMS macro that returns the queue message class definitions for a given message block — `queclass`, 9S-60

STREAMS message block structure

- `msgb`, 9S-57

STREAMS message data structure

- `datab`, 9S-17

STREAMS module declaration structure — `fmodsw`, 9S-43

STREAMS modules, loadable, linkage structure

- `modlstrmod`, 9S-55

STREAMS queue flow control information structure

- `qband`, 9S-58

STREAMS queue processing procedures structure

- `qinit`, 9S-59

STREAMS queue structure

- `queue`, 9S-61

`stroptions` — options structure for M\_SETOPTS message, 9S-80

structure for I/O kstats — `kstat_io`, 9S-50

structure for interrupt kstats — `kstat_intr`, 9S-49

structure for named kstats — `kstat_named`, 9S-51

## T

`tuple` — Card Information Structure (CIS) access structure, 9S-82

## U

`uio` — scatter/gather I/O request structure, 9S-85
