Overview of HL7 and the Message Library for HL7

The Message Library for HL7 provides HL7 files formatted in Java™ syntax for use with Java CAPS applications. A Message Library, also known as an Object Type Definition (OTD) Library, is a compilation of pre-built message structures for industry-standard formats. The HL7 Message Library is designed to work in conjunction with the Sun Adapter for TCP/IP HL7 to help you establish and maintain an efficient and reliable HL7 messaging system.

The HL7 Message Library supports the following versions of HL7:

- [HL7 Version 2.1](#)
- [HL7 Version 2.2](#)
- [HL7 Version 2.3](#)
- [HL7 Version 2.3.1](#)
- [HL7 Version 2.4](#)
- [HL7 Version 2.5](#)
- [HL7 Version 2.5.1](#)
- [HL7 Version 2.6](#)
- [HL7 Version 3](#)

The HL7 Message Library files can be copied and modified using the Message Library Editor. The editor also allows you to test libraries and verify that all data elements are available and data formats are correct before runtime. The editor executes a trace of parsing during the unmarshal process to assist with troubleshooting.

About HL7

HL7 is a standard for electronic data exchange in healthcare environments. It standardizes the format and protocol for the exchange of certain key data sets among healthcare computer application systems. HL7 is designed to be flexible, allowing the various systems that send or receive patient information to share and apply data as needed. Because of this diversity in systems (data models, operating systems, communication environments, and so on), HL7 cannot be a plug and play interface standard.

HL7, or Health Level Seven, is also the name of an organization consisting of technical committees and special interest groups whose goal is to provide standards for the exchange,

management, and integration of data that support clinical patient care and the management, transfer, and assessment of healthcare services. More specifically, the goal is to create flexible, cost effective approaches, standards, guidelines, methodologies, and related services for interoperability between healthcare information systems.

The HL7 Standard

The HL7 standard addresses the interfaces among various systems that send or receive healthcare focused information, such as patient admissions, registration, discharge or transfer (ADT) data, queries, resource and patient scheduling, orders, results, clinical observations, billing, master file update information, medical records, patient referral, and patient care. It does not try to assume a particular architecture with respect to the placement of data within applications but is designed to support a central patient care system as well as a more distributed environment where data resides in departmental systems. Instead, HL7 serves as a way for dissimilar applications and data architectures operating in a heterogeneous system environment to communicate with each other.

Components of the HL7 Message

An HL7 transaction or message is comprised of a number of components in a defined sequence. This section defines the components of the HL7 transaction. The HL7 message is a unit of data transferred between systems. It consists of a group of segments in a defined sequence. Each message has a message type that defines its purpose. For example an ADT Message type is used to transmit portions of a patient's Patient Administration (ADT) data from one system to another. A three-character code contained within each message identifies its type. A trigger event, a real-world event such as a patient being admitted, initiates the exchange of messages.

Segments

A segment is a logical grouping of data fields. Segments may occur only once or repeat in a message and may be required or optional. Each segment is given a name. For example, the ADT message may include the following segments: Message Header (MSH), Event Type (EVN), Patient ID (PID), and Patient Visit (PV1). Segments are identified by unique three-character codes known as the Segment IDs.

Fields

A field is a string of characters. HL7 is not concerned with how a system actually stores data within an application. When fields are transmitted, they are sent as character strings. Except where noted, HL7 data fields may take on the null value. Sending the null value, which is transmitted as two double quote marks (""), is different from omitting an optional data field. The difference appears when the contents of a message is used to update a record in a database rather than create a new one. If no value is sent, (that is, it is omitted) the old value should remain unchanged. If the null value is sent, the old value should be changed to null.

Data field characteristics are as follows:

- **Position:** The ordinal position or sequence of the data field within the segment.
- **Maximum Length:** Maximum number of characters that one occurrence of the data field may occupy.
- **Type of Data:** Restrictions on the contents of the data field. There are a number of data types defined by HL7, for example TX (text data), SN (structured numeric), PT (processing time), DT (date), and so on.
- **Optionality:** Whether the field is required, optional, or conditional in a segment.
- **Repetition:** Whether the field may or may not repeat, or the number of times the field may repeat.
- **Table:** The manner in which HL7 defines the valid values for tables varies depending on institution, data type, reference, and so forth.
- **ID Number:** Small integer that uniquely identifies the data field throughout the Standard.
- **Name :** Descriptive name for the field.

Message Delimiters

Message delimiters are the specific predefined characters that are used to define the beginning and end of a message component. They are the segment terminator, the field separator, the component separator, subcomponent separator, repetition separator, and escape character.

Escape Sequences in Text

Fields Escape sequences vary depending on the type of field.

HL7 Message Sets

HL7 messages are grouped by type or purpose into transaction sets. For example, a Patient Administration (ADT) message is used to transmit patient admittance, transfer, demographic and discharge information. The Patient Administration transaction set includes messages that transmit portions, instances, or updates of this data necessary to the participating healthcare system.

Control

Control defines the general rules that apply to all messages, including the form used to describe messages, encoding rules for converting abstract messages to string characters, programming procedures for exchanging messages, relationship with lower level protocols, common message segments, and the acknowledgment message that can be used as-is in multiple applications.

Patient Administration

The Patient Administration transaction set (HL7 Standard, chapter 3), one of the most commonly used, provides demographic and visit information about patients. The event is transmitted as an unsolicited update or as a response to a record-oriented query.

Order Entry

The Order Entry transaction set provides for the transmission of orders for materials or services, and information regarding orders, for specific patients or departments. Order Entry messages include components that specify quantity, timing, billing, start and end date, priority, and so on.

Query

The Query transaction set provides requests for specific information with either an immediate or deferred response, depending on the type of query. Newer versions of HL7 include many of the most common queries that are likely to occur in a hospital.

Financial Management

The Financial Management transaction set provides for the entry and manipulation of information pertaining to billing accounts, adjustments, payments, charges, insurance, and other related patient billing and A/R information.

Observation Reporting

The Observation Reporting message set provides for the transmission of structured patient-oriented clinical information. This includes clinical observations such as clinical laboratory results, the results of imaging studies (excluding images), EKG pulmonary function studies, vital signs, intake and output, measures of patient status and condition, severity and/or frequency of symptoms, drug allergies, diagnostic lists, physician and nursing history, physicals, progress notes, operative notes and so on. Message information is reported in text, numeric or categorical values.

Master File

A master file is a common reference file containing more or less permanent descriptive information about a principal subject. In the healthcare environment, some common master files are doctor, location, system user, patient status, patient type, lab test definition, exam code definition, and charge master files. The Master Files Notification messages support the distribution of changes to various master files between systems, by either providing changes to the files or making data available for review and possible inclusion.

Medical Records/Information Management

The Medical Document Management (MDM) transaction set provides for the transmission of new or updated documents. MDM messages may contain a description of the status of a document (for example, the document has been dictated and is awaiting transcription) or both the status description and the document itself. A medical document or record is a legal document that serves as an accurate and comprehensive account of healthcare services provided to a patient.

Scheduling

The Scheduling transaction set supports the communication of various events in relation to schedules, appointments, services and resources. A schedule controls the dates and times available for the performance of a service or the use of a resource. The scheduling set contains three basic types of messages:

- The Request transaction, used to request an appointment for services or the use of resources.
- The Query transaction, which actively solicits scheduling information between systems.
- The Unsolicited transaction, which passively gathers and provides scheduling information between systems.

Scheduling messages may also contain other supporting information, including the reason for the appointment, patient information, person initiating the appointment, and location.

Patient Referral

The Patient Referral transaction set provides for patient referral communications between separate healthcare related entities. This includes primary healthcare providers, hospitals, labs, specialists, government agencies, and other healthcare entities. The receiving entity may require billing information, test results, provider information, patient demographics and so forth, calling for multiple inquiries and responses. For this reason, the referral set includes the referral, requests for information, and returned patient information.

Patient Care

The Patient Care transaction set supports the communication of problem-oriented records which include clinical problems, goals, and clinical pathway information. The problem in this case may be a diagnosis or other professional description of healthcare issues affecting a specific patient. Goals are objectives to be attained as the result of healthcare intervention applied to an individual. A pathway refers to a standardized plan of care by which progress toward an expected outcome is measured.

Laboratory Automation

The Laboratory Automation transaction set supports the communication of equipment information, including status, inventory, logs and service, test code settings, response, notification, and comment, as well as specimen status.

Application Management

The Application Management transaction set supports the transmission of application management information and application control-level requests.

Personnel Management

The Personnel Management transaction set supports the transmission of details regarding education, language, practitioner, and professional affiliations, as well as information on practitioner organization unit, and staff identification.

Working With HL7 Message Libraries

The Message Library Editor displays the structure of a selected Message Library and allows you to verify its operation with a built-in tester. You can also use the editor to create and modify Message Libraries.

The following topics provide information specific to using Message Libraries with the Message Library Editor. These Message Libraries are templates that correspond to message types used by industry-specific data exchange systems and open-source standards. The templates are predefined and can be used as-is.

- “[Viewing a Message Library Using the Message Library Editor](#)” on page 11
- “[Copying a Message Library to a Project](#)” on page 12
- “[Modifying a Message Library Using the Message Library Editor](#)” on page 13
- “[Using the Message Library Tester](#)” on page 30

Note – Only the base and generic 2.6 libraries are installed by default. You need to install the Message Libraries for the versions of HL7 you are using separately. For more information, see “[Installing Additional Repository-Based Java CAPS Components](#)” in *Installing Additional Components for Java CAPS 6*.

Viewing a Message Library Using the Message Library Editor

The Message Library Editor displays the structure of a selected Message Library and allows you to verify its operation with a built-in tester. You can also use the editor to create and modify User-Defined Message Libraries.

▼ To View a Message Library

- 1 In the NetBeans IDE, make sure you are connected to the CAPS Repository.
- 2 In the Projects window, expand CAPS Components Library > Message Library > HL7.
- 3 Under HL7, expand the appropriate HL7 Library version.

Note – The Message Libraries available under Message Library in the Projects window are protected (read-only).

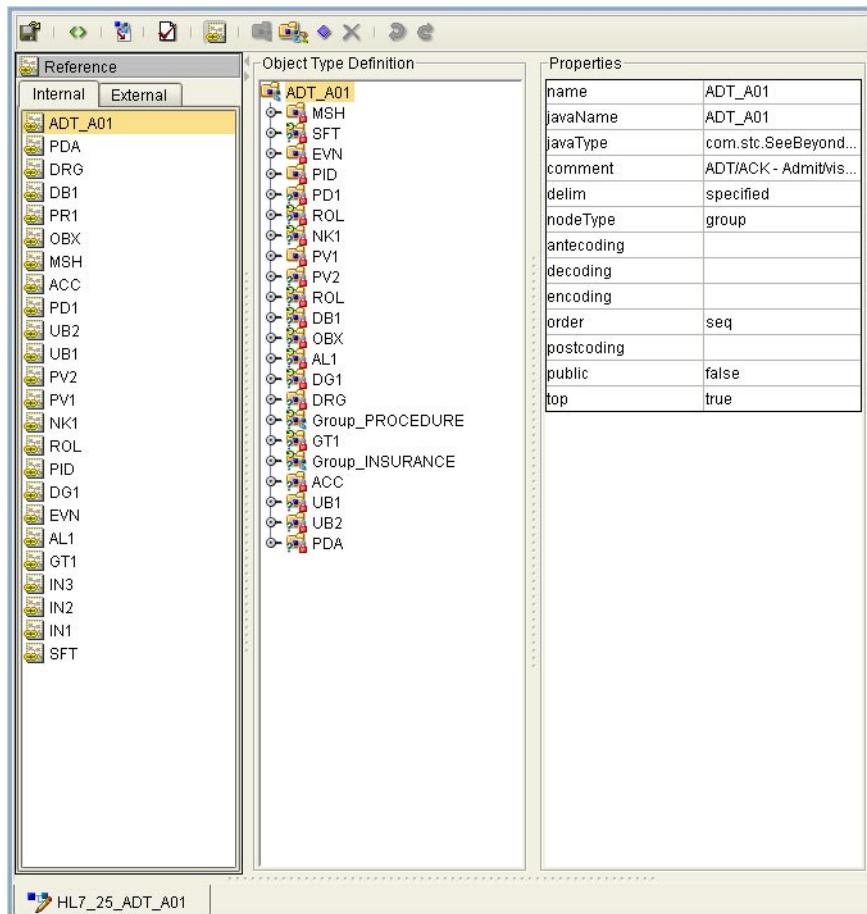

- 4 Double-click the Message Library in the Projects window to view the Message Library in read-only mode.

Copying a Message Library to a Project

You can copy and paste a Message Library to your Project to view the Message Library in an editable mode.

▼ To Copy a Message Library to the Project

- 1 In the NetBeans IDE, make sure you are connected to the CAPS Repository.
 - 2 In the Projects window, expand CAPS Components Library > Message Library > HL7.
 - 3 Under HL7, expand the appropriate HL7 Library version.
 - 4 Select the Message Library you want to copy, and then select Edit > Copy from the NetBeans toolbar.
 - 5 Right-click the Project to which you want to paste the Message Library, and then select Paste. The Message Library is added to your Project on the Projects window.
 - 6 Double-click the copied Message Library to view it in the Message Library Editor.
- The editable Message Library appears in the Message Library Editor. Notice that for the Message Libraries, the Message Library segments are still write protected. The Message Libraries properties can only be modified from the Root node at this point.

- 7 Select any of the Message Library's nodes or sub-nodes in the Object Type Definition pane to see the nodes properties displayed in the editor's Properties pane.

Modifying a Message Library Using the Message Library Editor

- “Message Library Check Out and Check In” on page 14
- “Adding and Replacing Message Library Segments” on page 14
- “Managing Message Library Nodes, Elements, and Fields” on page 18
- “Message Library Properties” on page 18
- “Specifying the Node Type” on page 23
- “Editing the Message Library Delimiters” on page 24
- “Changing HL7 Standard Encoding Characters” on page 26

- “[Specifying Delimiters](#)” on page 26

Message Library Check Out and Check In

The Message Libraries installed for the Message Library for HL7 are located in the Project window in the CAPS Components Library > Message Library > HL7 tree. These Message Libraries are protected and cannot be checked out or modified. This assures that the original Message Libraries are always available in their original form.

If you copy and paste an HL7 Message Library to a Project, version control is available for that Message Library. To check in or check out a Message Library, right-click the Message Library from the Project Explorer tree, and select Version Control > Check Out or Check In from the shortcut menu. When a Message Library has been checked in, the Message Library file icon appears in the Projects window as locked (the icon includes a red padlock).

Adding and Replacing Message Library Segments

HL7 Message Libraries are made up of various segment Message Libraries that correspond to the HL7 message segments. The main HL7 Message Libraries contain references to the segment Message Libraries, which are located in the same HL7 directory.

▼ To Replace a Message Library Segment

The following example uses the HL7_25_ADT_A02 Message Library segment to illustrate removing a segment Message Library and replacing it with a different segment. For example, if you are working with a V2.6 library and want to use the V2.5 version for one or more segments, you can replace those segments in your Message Library. It is important to retain the original Message Library structure. If you will be doing any cutting, pasting, or deleting of segments, make a note of the Message Library segment order in the Editor’s Object Type Definition pane.

The following steps illustrate deleting a Message Library segment from this list, so it is important to make a note of the original segment location so that you can relocate the edited segment to its original position in the Message Library structure as illustrated in the figure.

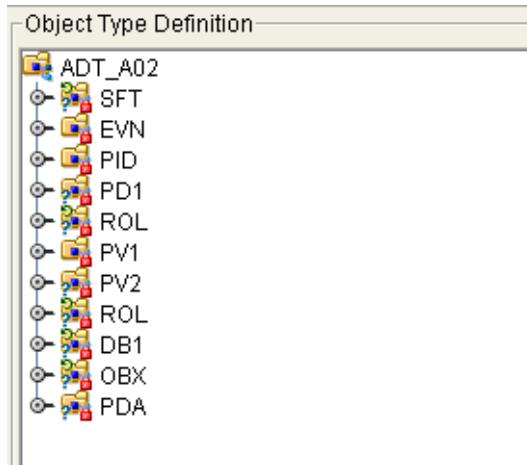

- 1 On the Projects window, copy the Message Library you want to use for your Project from CAPS Components Library > Message Library > HL7 and paste it into the Project.

Tip – To copy the Message Library segment, use the copy command from the Tools menu.

- 2 Repeat the above step for any Message Libraries that contain segments you want to use in the above Message Library.
- 3 Double-click the pasted Message Library from step 1 above to display it in the Message Library Editor.

4 Make note of the Message Library segment order so you can maintain the structure.

The figure below shows the structure of the HL7_26_ADT_A02 segment.

- 5 Click the Internal tab in the Reference pane, right-click the segment you want to replace, and then click Delete.
- 6 In the Internal tab, select the top-level node to display all segments in the Object Type Definition pane.
- 7 In the Object Type Definition pane, right-click the same segment you deleted above, and click Delete again.
- 8 In the Reference pane, click External, right-click any of the references to the segment you just removed, and then click Delete.

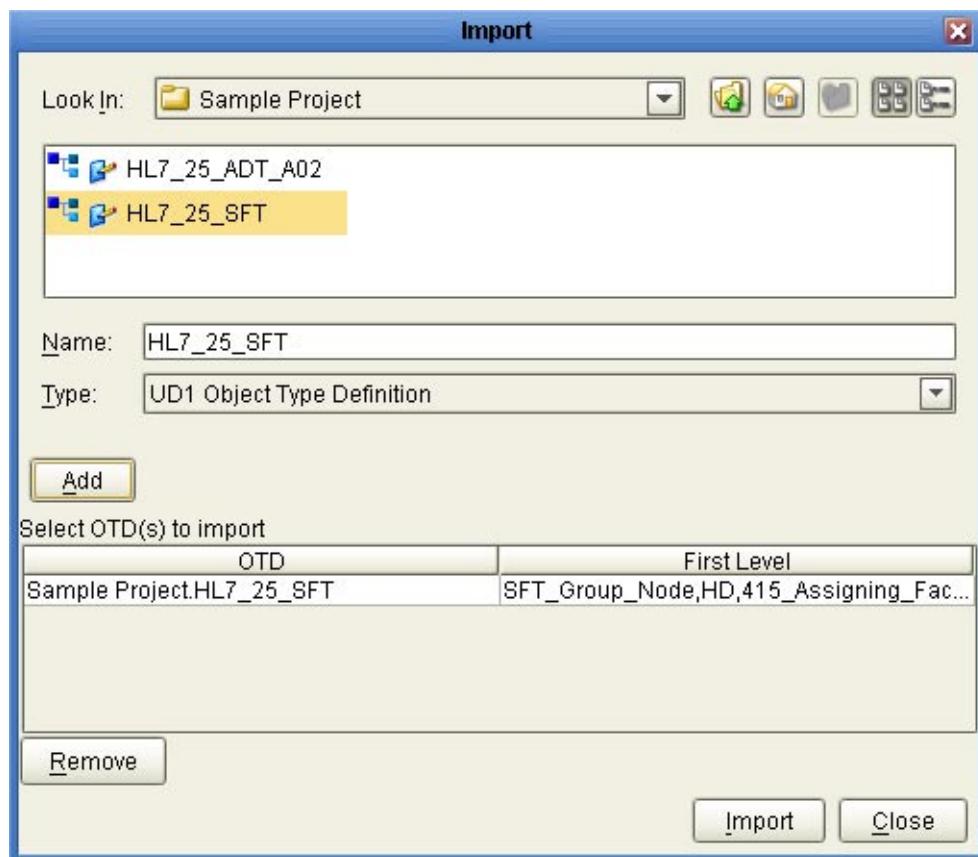

This removes all other references to the segment Message Library.
- 9 On the Message Library Editor toolbar, click Import OTD From External Template.

The Import dialog box appears.
- 10 In the Look In field, navigate to the location of the Message Library that contains the segment that will replace the one you just deleted.

This is one of the Message Libraries you pasted into a Project in step 2 above.
- 11 Locate and select the Message Library you want to import to your Project file.

12 Click Add to add the Message Library to the Select OTD(s) to Import section. Click Import.

The Message Library is added to the External tab of the Reference pane.

13 Drag the imported segment reference from the External tab and drop it onto the root node of the Object Type Definition pane.

The segment is added to the Object Type Definition tree.

14 Right-click the segment and click Level Up to move the segment up the tree from the Object Type Definition tree.

Repeat this step until the new segment is in the same position as that of the segment being replaced.

15 Repeat this procedure for any additional segments you want to replace.

16 Save the changes to the Repository.

You can now open the segment Message Library and edit the properties.

▼ **To Add a Segment Message Library to a Message Library**

You can also modify a Message Library by adding additional segment Message Libraries to your Message Library's external template.

- 1 On the Projects window, copy the Message Library you want to use for your Project from CAPS Components Library > Message Library > HL7 and paste it into the Project.**

Tip – To copy the Message Library segment, use the copy command from the Tools menu.

- 2 Repeat the above step to copy any segment Message Libraries you want to import to your Project.**

This opens the Message Library in the Message Library Editor.

- 3 Double-click the Message Library to which you want to add the segment.**

The Message Library Editor appears.

- 4 On the Message Library Editor toolbar, click Import OTD From External Template.**

The Import dialog box appears.

- 5 In the Look In field, navigate to the location of the Message Library that contains the segment that will replace the one you just deleted.**

This is one of the Message Libraries you pasted into a Project in step 2 above.

- 6 Locate and select the Message Library you want to import to your Project file.**

- 7 Click Add button to add the Message Library to the Select OTD(s) to Import section.**

- 8 Click Import.**

The Message Library is added to the External tab of the Reference pane.

- 9 Drag the imported segment reference from the External tab and drop it onto the root node of the Object Type Definition pane.**

The segment is added to the Object Type Definition tree.

- 10 Right-click the segment and click Level Up to move the segment up the tree from the Object Type Definition tree.**

Repeat this step until the new segment is in the location you want it.

11 Save the changes to the Repository.

Managing Message Library Nodes, Elements, and Fields

The HL7 Message Library copied to your Project can only be edited from the root node. Each of the Message Library's segments are write protected. The Message Library segments are visible from the Reference pane of the Message Library Editor. This Reference pane contains internal and external templates for the Message Library file. To edit specific segments of a Message Library, see “[Editing the Message Library Delimiters](#)” on page 24. For more information regarding Message Library properties, see “[Message Library Properties](#)” on page 18.

The Message Library Editor allows you to add and delete nodes, elements, and fields in a Message Library. You can also prune nodes, which deletes only the children associated with the node while the node itself is preserved. Pruning can only be performed on nodes. When you delete a node, all associated children are deleted. When you delete an element, all associated fields are deleted.

▼ To Manage Message Library Nodes, Elements, and Fields

- 1 To add a node, element, or field to the Message Library structure, right-click the
 - a. Right-click the node to which you want to add the node, element, or field.
 - b. Click Add, and then select the type of object to add.
 - c. In the Properties pane, customize the properties for your data requirements.
See “[Message Library Properties](#)” on page 18 for more information about properties.
- 2 To remove a node, element, or field, right-click the object to remove and then click Delete.
- 3 To prune a node, right-click the node and then click Prune.

Message Library Properties

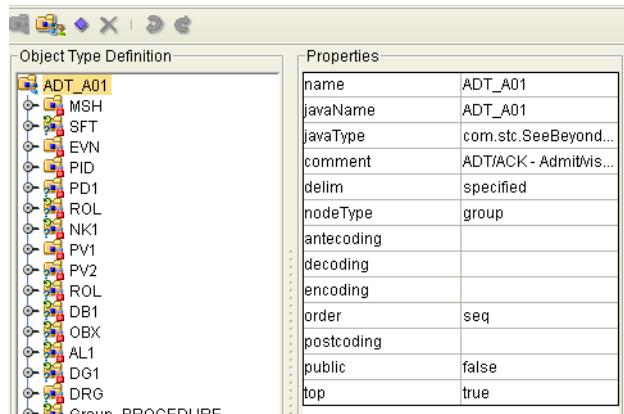

The Object Type Definition pane of the Message Library Editor displays the nodes, elements, and fields of the Message Library. When any of these are selected, the item's properties are displayed in the Properties pane.

The following topics list and describe each property:

- “[Node Properties](#)” on page 19
- “[Element Properties](#)” on page 20
- “[Field Properties](#)” on page 22

Node Properties

When an HL7 Message Library is opened in the Message Library Editor, the properties of the root node are displayed in the Properties pane. The configurable node properties are shown in the following figure and described in the table below.

Property	Description
name	The node display name. This can be any string.
javaName	The property accessor basename. This is normally derived from the display name, modified to suit the restrictions on Java identifiers, and supplied automatically by the Sun Enterprise Service Bus. Do not modify this property.
javaType	The Java type. This is automatically assigned, and not is editable.
comment	Free-form text (no runtime effect).
delim	The specified delimiter. See “ Specifying Delimiters ” on page 26.
nodeType	Governs the marshal/unmarshal format. See “ Specifying the Node Type ” on page 23.
antecoding	The input data coding. See “ Changing HL7 Standard Encoding Characters ” on page 26. If this property is not specified, the value specified for the decoding property will be used for the input data. This property is displayed only when the top property is set to true .

Property	Description
decoding	The unmarshal coding. See “ Changing HL7 Standard Encoding Characters ” on page 26 . It is recommended to use UTF-8 for DBCS data, since the hex value of some ASCII delimiter may coincide with a hex value contained within a double-byte character. This property is displayed only when the top property is set to true .
encoding	The marshal coding. This property is displayed only when the top property is set to true .
order	Specifies the ordering of the root node’s children: <ul style="list-style-type: none">■ seq: Specifies that the child nodes must appear in sequence.■ any: Specifies that the child nodes can appear in any order.■ mix:
postcoding	Specifies the output data coding (see Specifying Data Encoding on page 219). If this property is not specified, the value specified for the encoding property will be used for the output data. This property is displayed only when the top property is set to true .
public	Reserved for future development
rootClassName	The Java class name corresponding to the root node.
top	An indicator of whether the root node supports marshal/unmarshal (T/F).

Element Properties

The set of properties associated with the element level is shown in the following figure and is described in the table below.

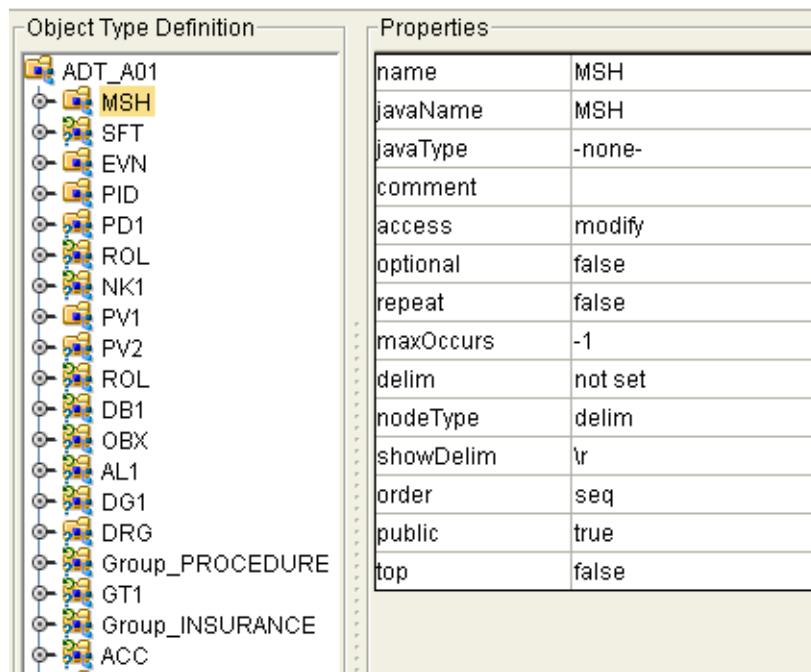

FIGURE 1 Message Library Editor - Message Library Element Properties

Property	Descriptions
name	The element display name.
javaName	Property accessor basename. Do not modify this property; it is assigned by the Sun Enterprise Service Bus.
javaType	The Java type. This is automatically assigned, and is not editable.
comment	Free-form text (no runtime effect).
access	The access specification.
optional	An indicator of whether the element is required or optional. Specify true if the element is optional; otherwise specify false . This is not applicable to the root or to a child of a choice node.
repeat	An indicator of whether the element can have multiple instances. Specify true if the element can appear multiple times; otherwise specify false . This is not applicable to the root or to a child of a choice node.
maxOccurs	The maximum number of occurrences of the node if the node is repeating. This property has no effect if node is non-repeating, but might show an error during validation if set to a value greater than 1.

Property	Descriptions
delim	The delimiter specification (see “Specifying Delimiters” on page 26).
nodeType	Governs the marshal/unmarshal format. See “Specifying the Node Type” on page 23.
showDelim	If the nodeType property is delimited, the delimiter appears here. This field is not editable.
public	For future use, not currently active.
top	An indicator or whether marshal/unmarshal is supported. Specify true if it is supported; otherwise specify false .

Field Properties

The set of properties associated with the field level is shown in the following figure and is described in the table below.

The screenshot shows the Sun HL7 Message Library Editor interface. On the left, the "Object Type Definition" pane displays a tree structure of message segments. The "MSH" segment is expanded, showing its 21 fields: MSH_segment_ID, MSH-1-field_separator, MSH-2-encoding_characters, MSH-3-sending_application, MSH-4-sending_facility, MSH-5-receiving_application, MSH-6-receiving_facility, MSH-7-date/time_of_message, MSH-8-security, MSH-9-message_type, MSH-10-message_control_id, MSH-11-processing_id, MSH-12-version_id, MSH-13-sequence_number, MSH-14-continuation_pointer, MSH-15-accept_acknowledgment_type, MSH-16-application_acknowledgment_type, MSH-17-country_code, MSH-18-character_set, MSH-19-principal_language_of_message, MSH-20-alternate_character_set_handling_, and MSH-21-message_profile_identifier. Below the MSH segment are collapsed sections for "SFT" and "SEG". On the right, the "Properties" pane lists the following properties for the MSH segment:

name	MSH_segment_ID
javaName	MSH_segment_ID
javaType	java.lang.String
comment	
access	modify
optional	false
repeat	false
maxOccurs	-1
delim	not set
initial	MSH
match	MSH
nodeType	fixed
align	blind
decoding	
encoding	
length	3

FIGURE 2 Message Library Editor - Message Library Field Properties

Property	Descriptions
name	The field display name.
javaName	The property accessor basename. Do not modify this property; it is assigned by the Sun Enterprise Service Bus.
javaType	The Java type. This can be either java.lang.String or byte array (byte[]).
comment	Free-form text (no runtime effect).
access	The access specification.
optional	An indicator of whether the field can be absent from an instance. Clicking the Value field toggles between true and false. Not applicable if the field is the child of a choice element node.
repeat	Specifies whether or not the node can appear multiple times. Specify true if the node is options; specify false if it is required. Click in the field to toggle between true and false. This is not applicable if the field is the child of a choice element node.
maxOccurs	The maximum number of occurrences of the node if the node is repeating. This property has no effect if the node is non-repeating, but it might show an error during validation if set to a value greater than 1.
delim	The delimiter specification (see “ Specifying Delimiters ” on page 26).
initial	The initial field value, which is set when the parent node is created or reset. When provided, it is assigned to the node before the node is populated with any data.
match	If nodeType is delimited, performs an exact match to the data.
nodeType	Governs the marshal/unmarshal format. See “ Specifying the Node Type ” on page 23.
align	Specifies the byte alignment criteria for the match property.
decoding	The unmarshal coding. This is displayed only if the nodeType property is set to fixed. It is recommended to use UTF-8 for DBCS data, since the hex value of some ASCII delimiter may coincide with a hex value contained within a doublebyte character.
encoding	The marshal coding. This property is displayed only if the nodeType property is set to fixed.
length	The length of the field. This property is displayed only if the nodeType property is set to fixed.

Specifying the Node Type

Note – If you move a Message Library node, you must reset the nodeType for that node.

▼ To Specify a Node Type

- 1 In the Message Library Editor, expand the Message Library until the field you want to edit appears in the Object Type Definition pane.
- 2 Select the field to edit.
- 3 Click in the **nodeType** field, and then click the arrow to display the options.
- 4 Select the option you want, and then save the Message Library.

The following table describes the **nodeType** options.

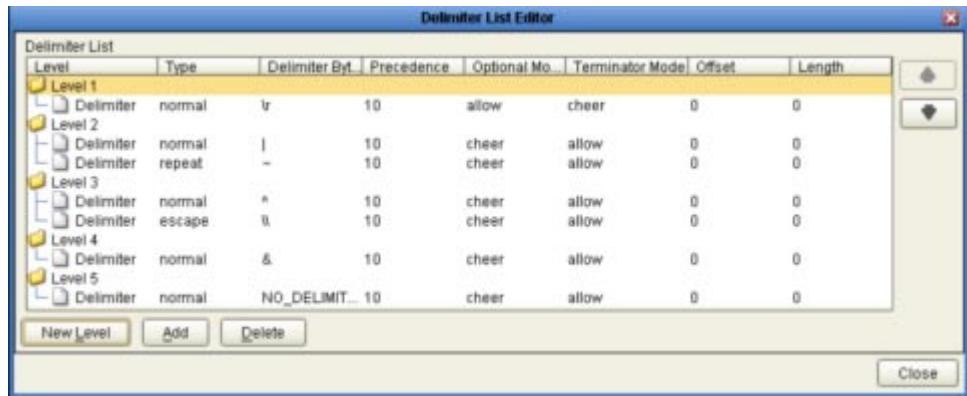

Option	Description	Element	Field	Internal
array	Array is a delimited structure. If repeated, occurrences are separated by the repeat delimiter. The last occurrence may be terminated by a normal delimiter.	Yes	Yes	simple or group
delim	Delim (delimited) structure. If repeated, occurrences are separated by a normal delimiter.	Yes	Yes	simple or group
fixed	Fixed indicates a fixed length, which is specified by non-negative integer (or zero to indicate end of parent node data).	Yes	Yes	simple or group
group	Group provides organizational grouping for purposes such as repetition. Applies only to elements.	Yes	No	group
trans	Trans (transient) appears only in an internal tree as a scratch pad field. It does not appear in external data representation, and can only have trans nodeTypes as children.	Yes	Yes	choice, simple, or group

Editing the Message Library Delimiters

Delimiters for all node levels are set and modified from the root node. Be aware that the default level 1 delimiter character is a non-ASCII character. Once it has been changed it cannot be typed back in as a character, but it can be pasted. For information about editing a specific segment of the Message Library, see “[Managing Message Library Nodes, Elements, and Fields](#)” on page 18.

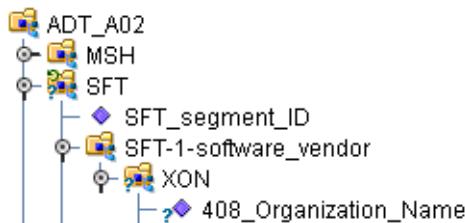

▼ To Edit the Delimiters From the Root Node

- 1 Select the root node in the Object Type Definition pane of the Message Library Editor.
- 2 Double-click the `delim` properties field in the Properties pane.
An ellipsis (...) button appears in the field.
- 3 Click the ellipsis button.
The Delimiter List Editor appears.

- 4 Double-click any field in the Delimiter List Editor on any level to make the field editable or to display a list of options.
- 5 For Level 3, do the following:
 - a. Double-click the Delimiter Bytes field for level 3.
 - b. Change the current delimiter character to a pound sign (#), Tab to the next field, and then click OK.

The delimiter for all level 3 nodes in the Message Library is now a pound sign (#), unless it is specified differently for a specific segment. The figure displays an example of various levels in the Object Type Definition tree, from the Root node.

Changing HL7 Standard Encoding Characters

All HL7 Message Libraries have a predefined list of delimiters, per the definition in the HL7 Standard. If you elect to change the delimiter encoding characters in your HL7 messages, you must change the delimiter in the Message Library from the root node using the Message Library Editor to match the delimiters used in the HL7 message.

The delimiter encoding character field is a fixed-length field of four encoding characters plus the field separator. The fifth (extra) character is necessary for the segment field separator.

If you wish to validate against the encoding characters, modify the prebuilt Collaboration rules as follows:

```

// first unmarshal the HL7 OTD payload

// then get the encoding character field:

String encodingChars = otdHL7_GENERIC_EVT_1.getMSH().getMsh2EncodingCharacters();

if (!encodingChars.equals("<customer_encoding_characters>")) {

    validated = false;

    ErrorMessage = "Validation Failure: Receiving Facility";

    log( LOG_LEVEL_ERROR, "Validate HL7 Message failed: Encoding character field" );

}
  
```

Specifying Delimiters

A node defines a set of delimiters to be used in the external data representation for itself and its descendants in the hierarchical data structure. If a node defines a delimiter list, this negates any effect of any ancestor's delimiter list on itself and its descendants. The delimiter list is typically specified on the Root node.

For example, if you want to parse the following data:

a^b|c^d|e

you might define a Message Library as follows:

- demo-otd
 - element1
 - field1
 - field2
 - element2
 - field3
 - field4
 - field5

The delimiter list for this Message Library will be specified on the demo-otd element, so that it applies to the entire Message Library, and will have two levels:

Level 1

- Delimiter |

Level 2

- Delimiter ^

The Level 1 delimiter applies to the two elements and field 5, and the Level 2 delimiter applies to fields 1 through 4.

Delimiter lists can be much more complex than this very simple example. For instance, you can create multiple delimiters of different types at any given level, and you can specify a delimiter list on any node within the Message Library—not only the Root node as shown in the example. See “[Modifying a Message Library Using the Message Library Editor](#)” on page 13 for a description of the procedure for creating a Delimiter List.

Delimiter Properties

Delimiters are defined using the Delimiter List Editor. The Delimiter properties and values are displayed in the following.

TABLE 1 Delimiter Properties

Delimiter Properties and Value Options		
Property	Option	Description
Level		Child level beneath defining node.
Type	escape	Escape sequence.
	repeat	Array delimiter/separator.

TABLE 1 Delimiter Properties *(Continued)*

Delimiter Properties and Value Options		
Property	Option	Description
	normal	Terminator.
Delimiter Bytes		Delimiter (single or multiple characters).
Precedence		See Precedence.
Optional Mode	never	Do not allow on input, do not emit on output (empty field between delimiters implies zero length data field).
	allow	Skip empty field if present; if absent, do not delimit on output.
	cheer	Skip empty field if present; if absent, do delimit on output.
	force	Require empty, delimited field on input; always delimit on output.
Terminator Mode	never	Do not allow on input, do not emit on output (pure separator).
	allow	Allow on input, do not emit on output.
	cheer	Allow on input, always emit on output.
	force	Require on input, always emit on output (pure terminator).

Type Property - Escape Option

An escape delimiter is simply a sequence that will be recognized and ignored during parsing. Its purpose is to allow the use of escape sequences to embed byte sequences in data that would otherwise be seen as delimiter occurrences.

For example, if there is a normal delimiter “+” at a given level, and we define an escape delimiter “\+”, then **aaa+b\+c+ddd** will parse as three fields: **aaa**, **b\+c**, and **ddd**. If the escape delimiter were not defined, the sequence would then parse as four fields: **aaa**, **b**, **c**, and **ddd**.

If there is only an escape delimiter on a given level, however, it presents a no delimiter defined situation for **delim** and **array** nodes.

Delimiter Bytes

There is essentially no limitation on what characters you can use as delimiters; however, you obviously want to avoid characters that can be confused with data or interfere with escape sequences. The backslash (\) is normally used as an escape character. The HL7 protocol uses a double backslash as part of an escape sequence that provides special text formatting instructions.

Note – You should avoid using a colon (:) as a delimiter character, since it is used as a literal in system-generated time strings. This can interfere with recovery procedures, for example following a Domain shutdown.

Terminator Mode Property

Consider the tree structure shown in the previous example, where the node **a** has a pipe (|) as its delimiter, the sub-node **b** has a tilde (~) as its delimiter, and sub-node **c** has an asterisk (*) as its delimiter.

Option	Input	Output
never	c	c
allow	c or c*	c
cheer	c or c*	c*
force	c*	c*

Optional Mode Property

Consider the tree structures shown in the figures, where the node **a** has a pipe (|) as its delimiter, and the sub-nodes **b**, **c**, and **d** all have asterisks (*) as their delimiters.

- **Example 1:** Sub-node **c** is optional. Sub-node **c** and sub-node **d** must have different values for the match parameter.

Option	Input	Output
never	b*d	b*d
allow	b**d	b*d
cheer	b**d	b**d
force	b**d	b**d

- **Example 2:** Both sub-node **c** and sub-node **d** are optional.

Option	Input	Output
never	b	b
allow	b , b* , or b**	b

Option	Input	Output
cheer	b , b*, or b**	b**
force	b**	b**

Precedence

Precedence indicates the priority of a certain delimiter, relative to the other delimiters. By default, all delimiters are at precedence 10, which means they are all considered the same; fixed fields are hard-coded at precedence 10. Delimiters on parent nodes are not considered when parsing the child fields; only the child's delimiter (or if it is a fixed field, its length).

Changing the precedence of a delimiter will cause them to be applied to the input data-stream in different ways. For example:

- Root node
 - element (type delim, delimiter = “^”, repeat)
 - field1 (type fixed, length = 5)
 - field2 (type fixed, length = 8, optional)

Although this will parse ”**abcde12345678^zyxvuABCDEFGH**”, it will not parse the text ”**abcde^zyxvuABCDEFGH**” even though the second fixed field is optional. The reason is that the element’s delimiter is ignored within the fixed field because they have the same precedence. If you want the element’s delimiter to be examined within the fixed field data, you must change its precedence, for example:

- Root node
 - element (type delim, delimiter = “^”, repeat, precedence = 11)
 - field1 (type fixed, length = 5)
 - field2 (type fixed, length = 8, optional)

This will successfully parse the text ”**abcde^zyxvuABCDEFGH**”.

Using the Message Library Tester

The Message Library Tester allows you to simulate the operation of a Collaboration containing a specific Message Library, thereby checking the correctness of the library during the design phase. You can enter input data values, perform the unmarshal and marshal operations, and also manipulate the tree structure as a Collaboration might do by using the Add Instance and Delete Instance functions. By using these latter features, you can prepare an output data file that can then be used as an input data file for testing purposes.

Note – For selected Message Libraries, the Verbose option provides a trace of parsing actions during the unmarshal process to aid in debugging the library structure. Selecting the Verbose check box causes parsing information to appear on the Verbose panel. The format and content of the data display are library-specific.

▼ To use the Message Library Tester

1 Open a Message Library in the editor.

2 From the Message Library Editor toolbar, click Run Test.

This saves the currently displayed Message Library to the Repository and displays the Message Library Tester at the bottom of the Message Library Editor. The data display panel offers four different data display modes. The Input mode is selected by default.

3 You can provide the input test data either by clicking the Open File icon and selecting a data file, or by copying and pasting the data to the Message Library Tester data panel.

4 Perform any of the following test:

- [“To Test Unmarshal Functionality” on page 31.](#)
- [“To Test Data Marshal Functionality” on page 32.](#)

▼ To Test Unmarshal Functionality

1 Click the desired unmarshal command to unmarshal the data from the Input panel to the OTD tree.

The unmarshal options are:

- Unmarshal
- Unmarshal from Bytes
- Unmarshal from String

2 To verify the unmarshal process, check the values of each element for correctness.

3 Save your input test data to a file for reuse by selecting the Input panel and clicking the Save icon.

4 If there are errors in your input data, the Status panel appears, displaying the appropriate error messages. Confirmation of correct operation is also reported.

▼ To Test Data Marshal Functionality

- 1 From the Message Library Tester, enter or change data values for each node in the Value column of the node table.

Use the Add/Delete Instance (+/-) buttons to add or remove instances where needed.

- 2 In the Input View Encoding field, select the output character encoding.

- 3 Click the desired marshal button to marshal (serialize) the data.

The output is displayed in the Output panel

The marshal options are:

- Marshal
- Marshal to Bytes
- Marshal to String

HL7 Message Library Methods

The HL7 Message Library provides an API that is available for you to use with your HL7 applications. The `HL7UtilityFunctions` class contains a number of Java methods that have been exposed to extend the functionality of the libraries. The utility functions are documented in the complete Javadocs for the HL7 Message Library. You can access the Javadocs in both HTML format and a downloadable ZIP file from <http://developers.sun.com/docs/javacaps/api/javadoc/index.jsp>.

HL7 Version 2.6 Message Library Structure

The following table describes the HL7 Version 2.6 Message Library.

HL7 2.6 Segment	HL7 Description
HL7_26_ADT_A03	ADT/ACK - Discharge/end visit
HL7_26_SIU_S13	SIU/ACK - Notification of appointment rescheduling
HL7_26_QBP_Z81	Dispense History
HL7_26_OMN_O07	OMN - Non-stock requisition order
HL7_26_RRE_O26	RRE - Pharmacy/Treatment Refill Authorization Acknowledgement
HL7_26_ADT_A01	ADT/ACK - Admit/visit notification

HL7 2.6 Segment	HL7 Description
HL7_26_QSX_J02	QSX/ACK - Cancel subscription/acknowledge message
HL7_26_SRM_S05	SRM/SRR - Request appointment discontinuation
HL7_26_EHC_E21	Cancel Authorization Request
HL7_26_RSP_K25	RSP - Personnel Information by Segment Response
HL7_26_DFT_P03	DFT/ACK - Post detail financial transaction
HL7_26_PEX_P07	PEX - Unsolicited initial individual product experience report
HL7_26_MDM_T03	MDM/ACK - Document status change notification
HL7_26_RQA_I09	RQA/RPA - Request for modification to an authorization
HL7_26_SRR_S08	SRM/SRR - Request modification of service/resource on appointment
HL7_26_ADT_A37	ADT/ACK - Unlink patient information
HL7_26_ADT_A52	ADT/ACK - Cancel leave of absence for a patient
HL7_26_ADT_A22	ADT/ACK - Patient returns from a "leave of absence"
HL7_26_SIU_S24	SIU/ACK - Notification of opened ("unblocked") schedule time slot(s)
HL7_26_MFK_M14	MFN/MFK - Master file notification - site defined
HL7_26_ADT_A12	ADT/ACK - Cancel transfer
HL7_26_RRD_O14	RRD - Pharmacy/treatment dispense acknowledgment
HL7_26_PMU_B02	PMU/ACK - Update personnel record
HL7_26_RSP_E03	HealthCare Services Invoice Status
HL7_26_QBP_E03	HealthCare Services Invoice Status
HL7_26_MFK_M05	MFN/MFK - Patient location master file
HL7_26_ADT_A42	ADT/ACK - Merge visit - visit number
HL7_26_RSP_Z82	Dispense History (Response)
HL7_26_RCL_I06	RQC/RCL - Request/receipt of clinical data listing
HL7_26_PEX_P08	PEX - Unsolicited update individual product experience report
HL7_26_ADT_A39	ADT/ACK - Merge person - patient ID (for backward compatibility only)
HL7_26_ADT_A55	ADT/ACK - Cancel change attending doctor
HL7_26_ADT_A38	ADT/ACK - Cancel pre-admit

HL7 2.6 Segment	HL7 Description
HL7_26_OPU_R25	OPU - Unsolicited Population/Location-Based Laboratory Observation Message
HL7_26_SRM_S06	SRM/SRR - Request appointment deletion
HL7_26_ADT_A54	ADT/ACK - Change attending doctor
HL7_26_EAN_U09	EAN/ACK - Automated equipment notification
HL7_26_ADT_A06	ADT/ACK - Change an outpatient to an inpatient
HL7_26_SIU_S17	SIU/ACK - Notification of appointment deletion
HL7_26_ADT_A35	ADT/ACK - Merge patient information - account number only (for backward compatibility)
HL7_26_ACK	Version 2.6 HL7 Acknowledgment
HL7_26_PMU_B08	PMU/ACK - Revoke Certificate/Permission
HL7_26_MFN_M11	MFN/MFK - Test/calculated observations master file
HL7_26_RDY_Z80	Dispense Information (Response)
HL7_26_QBP_Q15	QBP - Query by parameter requesting an RDY display response
HL7_26_SRR_S03	SRM/SRR - Request appointment modification
HL7_26_QRY_Q26	ROR - Pharmacy/treatment order response
HL7_26_QBP_Q24	QBP - Allocate identifiers
HL7_26_MFK_M10	MFN/MFK - Test /observation batteries master file
HL7_26_ADT_A46	ADT/ACK - Change patient ID (for backward compatibility only)
HL7_26_ADT_A45	ADT/ACK - Move visit information - visit number
HL7_26_OUL_R23	OUL - Unsolicited Specimen Container Oriented Observation Message
HL7_26_SRR_S10	SRM/SRR - Request discontinuation of service/resource on appointment
HL7_26_MFN_M01	MFN/MFK - Master file not otherwise specified (for backward compatibility only)
HL7_26_RQA_I10	RQA/RPA - Request for re-submission of an authorization
HL7_26_SCN_S37	SCN/ACK - Notification of anti-microbial device cycle data
HL7_26_QBP_E22	Authorization Request Status
HL7_26_MFK_M07	MFN/MFK - Clinical study without phases but with schedules master file
HL7_26_RTB_Z94	Tabular Dispense History (Response)

HL7 2.6 Segment	HL7 Description
HL7_26_ADT_A48	ADT/ACK - Change alternate patient ID (for backward compatibility only)
HL7_26_MDM_T06	MDM/ACK - Document addendum notification and content
HL7_26_MDM_T10	MDM/ACK - Document replacement notification and content
HL7_26_NMQ_N01	NMQ/NMR - Application management query message
HL7_26_INR_U06	INR/ACK - Automated equipment inventory request
HL7_26_RSP_K22	RSP - Find candidates response
HL7_26_MDM_T09	MDM/ACK - Document replacement notification
HL7_26_RSP_K24	RSP - Allocate identifiers response
HL7_26_SRM_S04	SRM/SRR - Request appointment cancellation
HL7_26_PMU_B03	PMU/ACK - Delete personnel record
HL7_26_ADT_A23	ADT/ACK - Delete a patient record
HL7_26_MFN_M05	MFN/MFK - Patient location master file
HL7_26_RTB_Z92	Who Am I (Response)
HL7_26_ADT_A30	ADT/ACK - Merge person information (for backward compatibility only)
HL7_26_CSU_C11	CSU - Patient completes a phase of the clinical trial
HL7_26_TCR_U11	TCR/ACK - Automated equipment test code settings request
HL7_26_ADT_A04	ADT/ACK - Register a patient
HL7_26_ADT_A26	ADT/ACK - Cancel pending transfer
HL7_26_ACK_var	null
HL7_26_ORU_R01	ORU/ACK - Unsolicited transmission of an observation message
HL7_26_OMI_O23	OMI - Imaging order
HL7_26_MFK_M17	DRG Master File Message
HL7_26_OML_O33	OML - Laboratory order for multiple orders related to a single specimen
HL7_26_PMU_B04	PMU/ACK - Active practicing person
HL7_26_CRM_C02	CRM - Cancel a patient registration on clinical trial (for clerical mistakes only)
HL7_26_RGR_RGR	Pharmacy/Treatment Dose Information
HL7_26_OMB_O27	OMB - Blood product order

HL7 2.6 Segment	HL7 Description
HL7_26_RQP_I04	RQD/RPI - Request for patient demographic data
HL7_26_ADT_A15	ADT/ACK - Pending transfer
HL7_26_BAR_P01	BAR/ACK - Add patient accounts
HL7_26_CRM_C03	CRM - Correct/update registration information
HL7_26_ORL_O34	ORL - Laboratory order response message to a multiple order related to single specification
HL7_26_DFT_P11	DFT/ACK - Post Detail Financial Transactions - New
HL7_26_INU_U05	INU/ACK - Automated equipment inventory update
HL7_26_QBP_Z93	Tabular Dispense History
HL7_26_PPT_PCL	PPT - PC/ pathway (goal-oriented) query response
HL7_26_RSP_K31	RSP - Dispense History Response
HL7_26_RPL_I02	RQI/RPL - Request/receipt of patient selection display list
HL7_26_RSP_E22	Authorization Request Status
HL7_26_MFN_M02	MFN/MFK - Master file - staff practitioner
HL7_26_VXR_V03	VXR - Vaccination record response
HL7_26_RSP_Z86	Pharmacy Information Comprehensive (Response)
HL7_26_RTC_Z76	Tabular Patient List (Response)
HL7_26_RPA_I09	RQA/RPA - Request for modification to an authorization
HL7_26_ADT_A05	ADT/ACK - Pre-admit a patient
HL7_26_ADT_A53	ADT/ACK - Cancel patient returns from a leave of absence
HL7_26_SIU_S22	SIU/ACK - Notification of deletion of service/resource on appointment
HL7_26_RSP_Z88	Dispense Information (Response)
HL7_26_RTC_K13	RTB - Tabular response in response to QBP^Q13
HL7_26_MDM_T08	MDM/ACK - Document edit notification and content
HL7_26_BPS_O29	BPS - Blood product dispense status
HL7_26_MFK_M12	MFN/MFK - Master file notification message
HL7_26_ROR_ROR	ROR - Pharmacy prescription order query response
HL7_26_RDS_O13	RDS - Pharmacy/treatment dispense

HL7 2.6 Segment	HL7 Description
HL7_26_EHC_E20	Submit Authorization Request
HL7_26_PIN_I07	PIN/ACK - Unsolicited insurance information
HL7_26_SIU_S18	SIU/ACK - Notification of addition of service/resource on appointment
HL7_26_ADT_A43	ADT/ACK - Move patient information - patient identifier list
HL7_26_ADT_A41	ADT/ACK - Merge account - patient account number
HL7_26_QBP_Q21	QBP - Get person demographics
HL7_26_ADT_A60	ADT/ACK - Update allergy information
HL7_26_MFK_M15	MFN/MFK - Inventory item master file notification
HL7_26_RAR_RAR	Pharmacy/Treatment Administration Information
HL7_26_OUL_R24	OUL - Unsolicited Order Oriented Observation Message
HL7_26_RPI_I04	RQD/RPI - Request for patient demographic data
HL7_26_ADT_A08	ADT/ACK - Update patient information
HL7_26_RSP_K21	RSP - Get person demographics response
HL7_26_MDM_T04	MDM/ACK - Document status change notification and content
HL7_26_EHC_E15	Payment/Remittance Advice
HL7_26_CRM_C05	CRM - Patient enters phase of clinical trial
HL7_26_EHC_E13	Additional Information Response
HL7_26_SRR_S07	SRM/SRR - Request addition of service/resource on appointment
HL7_26_RDE_O11	RDE - Pharmacy/treatment encoded order
HL7_26_MFK_M13	MFN/MFK - Master file notification - general
HL7_26_ORN_O08	ORN - Non-stock requisition acknowledgment
HL7_26_SSR_U04	SSR/ACK - specimen status request
HL7_26_ADT_A16	ADT/ACK - Pending discharge
HL7_26_OML_O21	OML - Laboratory order
HL7_26_MFN_M14	MFN/MFK - Master file notification - site defined
HL7_26_QBP_Q13	QBP - Query by parameter requesting an RTB - tabular response
HL7_26_OPR_O38	OPR - Population/Location-Based Laboratory Order Acknowledgment Message

HL7 2.6 Segment	HL7 Description
HL7_26_MFN_M06	MFN/MFK - Clinical study with phases and schedules master file
HL7_26_ORI_O24	ORI - Imaging order response message to any OMI
HL7_26_ORU_R32	ORU - Unsolicited Pre-Ordered Point-Of-Care Observation
HL7_26_ADT_A34	ADT/ACK - Merge patient information - patient ID only (for backward compatibility)
HL7_26_VXU_V04	VXU - Unsolicited vaccination record update
HL7_26_RRA_O18	RRA - Pharmacy/treatment administration acknowledgment
HL7_26_BAR_P10	BAR/ACK - Transmit Ambulatory Payment Classification (APC)
HL7_26_EAC_U07	EAC/ACK - Automated equipment command
HL7_26_RRE_O12	RRE - Pharmacy/treatment encoded order acknowledgment
HL7_26_BRT_O32	BRT - Blood product transfusion/disposition acknowledgment
HL7_26_PMU_B07	PMU/ACK - Grant Certificate/Permission
HL7_26_SRR_S05	SRM/SRR - Request appointment discontinuation
HL7_26_RQA_I11	RQA/RPA - Request for cancellation of an authorization
HL7_26_QRY_Q29	RER - Pharmacy/treatment encoded order information
HL7_26_PRR_PC5	PRR - PC/ problem response
HL7_26_ADT_A50	ADT/ACK - Change visit number
HL7_26_RPR_I03	RQI/RPR - Request/receipt of patient selection list
HL7_26_EAR_U08	EAR/ACK - Automated equipment response
HL7_26_PPR_PC2	PPR - PC/ problem update
HL7_26_PMU_B05	PMU/ACK - Deactivate practicing person
HL7_26_RGV_O15	RGV - Pharmacy/treatment given
HL7_26_CSU_C12	CSU - Update/correction of patient order/result information
HL7_26_ORL_O36	ORL - Laboratory order response message to a single container of a specimen OML
HL7_26_CRM_C08	CRM - Patient has gone off phase of clinical trial
HL7_26_MFN_M13	MFN/MFK - Master file notification - general
