Preface

The *Solaris 7 11/99 Sun Hardware Platform Guide* contains important information about the Sun[™] hardware supported by the Solaris[™] 7 11/99 operating environment.

This manual:

- Provides platform-specific installation instructions for the Solaris 7 11/99 software
- Describes software provided on the Sun Computer Systems Supplement CD and explains how to install product software
- Describes flash PROM update procedures necessary for some systems to run in 64-bit mode
- Describes installation issues affecting the Sun Enterprise 10000 system
- Identifies installation issues affecting the SPARCstorage[™] Array
- Describes hardware and software requirements affecting Power Management[™] software

Note – For general Solaris 7 11/99 operating environment installation instructions, refer to Chapter 1 “Installing Software From the Solaris CD”. For information about how to install software contained on the Sun Computer Systems Supplement CD and information about supported hardware, refer to Chapter 3, “Installing Software from the Sun Computer Systems Supplement CD”.

Where to Find Installation Information

The Solaris 7 11/99 software is delivered on two CDs:

- Solaris 7 11/99 SPARC Platform Edition CD (called the Solaris CD throughout this manual)
- Supplement for Solaris 7 11/99 Operating Environment for Sun Computer Systems CD (called the Supplement CD throughout this manual).

Before installing the Solaris 7 11/99 software, check TABLE P-1 for listings of manuals with information that may apply to your situation and TABLE P-2 for specific installation information.

Note – All Solaris and SPARC documentation can be found on the Documentation CD. All Sun hardware-specific documentation can be found on the Supplement CD. Some co-packaged products contain documentation on their respective CDs.

| Install an AnswerBook from the Supplement CD | Chapter 3 in this manual |

How This Book Is Organized

This book is organized as follows:

Chapter 1 supports the *Solaris 7 11/99 Start Here* card by providing additional installation instructions on how to install or upgrade to the Solaris 7 11/99 software on specific Sun platforms and hardware options.

Chapter 2 lists supported Sun hardware.

Chapter 3 describes how to install the software for Sun platforms and hardware options and describes value-added software provided to users of Sun hardware.

Chapter 4 describes the procedure for updating the flash PROMs for 64-bit operation on Ultra 1, Ultra 2, Ultra 450, and Sun Enterprise 450 systems.

Chapter 5 describes the procedure for updating the flash PROMs for 64-bit operation on Sun Enterprise 3x00, 4x00, 5x00, and 6x00 systems.

Chapter 6 describes how to install the Solaris 7 11/99 software either as a new installation or as an upgrade on systems where the SPARCstorage Array™ may be used as the boot device.

Chapter 7 describes the hardware and software requirements for running the Power Management software on Sun hardware.

Chapter 8 describes installing Alternate Pathing 2.2 on Sun Enterprise 6x00, 5x00, 4x00, and 3x00 servers.

Chapter 9 describes installing Alternate Pathing 2.2 on Sun Enterprise 10000 servers.

Chapter 10 describes how to install Solaris 7 11/99 software on a Sun Enterprise 10000 Domain. It also describes how to upgrade the Solaris software on a host domain.

Typographic Conventions

TABLE P-3 Typographic Conventions

| Typeface or Symbol | Meaning | Example |
|--------------------|--|---|
| AaBbCc123 | The names of commands, files, and directories; on-screen computer output | Edit your <code>.login</code> file. Use <code>ls -a</code> to list all files. <code>machine_name%</code> You have mail. |
| AaBbCc123 | What you type, contrasted with on-screen computer output | <div>machine_name% su Password:</div> |
| <i>AaBbCc123</i> | Command-line placeholder: replace with a real name or value | To delete a file, type <code>rm filename</code> . |
| <i>AaBbCc123</i> | Book titles, new words or terms, or words to be emphasized | Read Chapter 6 in <i>User's Guide</i> . These are called <i>class</i> options. You <i>must</i> be root to do this. |

Sun Documentation on the Web

The `docs.sun.com` web site enables you to access Sun technical documentation on the Web. You can browse the `docs.sun.com` archive or search for a specific book title or subject at:

`http://docs.sun.com`

Sun Welcomes Your Comments

We are interested in improving our documentation and welcome your comments and suggestions. You can email your comments to us at:

`docfeedback@sun.com`

Please include the part number of your document in the subject line of your email.

Installing Software From the Solaris CD

Automatic Installation of Solaris Software

For the Sun™ hardware listed in TABLE 1-1, the Solaris™ 7 11/99 release requires no special installation or upgrade instructions. If you plan to perform an automatic installation of the Solaris 7 11/99 operating environment on your Sun hardware, refer to the *Solaris 7 11/99 (SPARC Platform Edition) Installation Library* or the *Solaris Advanced Installation Guide* for all your installation needs.

Manual Installation of Solaris Software

If you are installing the Solaris 7 11/99 operating environment using the manual (or interactive) method, you may need to add some software packages and clusters. This section identifies platform-specific installation needs and lists the required software packages and clusters. The manual installation method is described in the “Planning Your Installation” module of the *Solaris 7 11/99 (SPARC Platform Edition) Installation Library*.

Platform Names and Groups

You need to know your system architecture (platform group), if you are performing one of the following tasks:

- Setting up a boot server on a subnet
- Adding clients for network installation (standalone, servers, dataless, diskless)

If you are writing a custom JumpStart™ installation rules file, you need to know the platform name.

TABLE 1-1 shows the platform names and platform groups of various Sun hardware systems.

TABLE 1-1 Platform Names for Sun Systems

| System | Platform Name | Platform Group |
|------------------------------|-------------------------|----------------|
| SPARCstation SLC | SUNW,Sun_4_20 | sun4c |
| SPARCstation ELC | SUNW,Sun_4_25 | sun4c |
| SPARCstation IPC | SUNW,Sun_4_40 | sun4c |
| SPARCstation IPX | SUNW,Sun_4_50 | sun4c |
| SPARCstation 1 | SUNW,Sun_4_60 | sun4c |
| SPARCstation 1+ | SUNW,Sun_4_65 | sun4c |
| SPARCstation 2 | SUNW,Sun_4_75 | sun4c |
| SPARCclassic | SUNW,SPARCclassic | sun4m |
| SPARCstation LX | SUNW,SPARCstation-LX | sun4m |
| SPARCstation LX+ | SUNW,SPARCstation-LX+ | sun4m |
| SPARCstation 4 | SUNW,SPARCstation-4 | sun4m |
| SPARCstation 5 | SUNW,SPARCstation-5 | sun4m |
| SPARCstation 5Model 170 | SUNW,SPARCstation-5 | sun4m |
| SPARCstation 10 | SUNW,SPARCstation-10 | sun4m |
| SPARCstation 10SX | SUNW,SPARCstation-10,SX | sun4m |
| SPARCstation 20 | SUNW,SPARCstation-20 | sun4m |
| SPARCstation Voyager | SUNW,S240 | sun4m |
| Ultra 1 Model 140 | SUNW,Ultra-1 | sun4u |
| Ultra 1 Model 170 | SUNW,Ultra-1 | sun4u |
| Ultra 1 Creator Model 140E | SUNW,Ultra-1 | sun4u |

| Ultra 450 | SUNW,Ultra-4 | sun4u |
| Sun Enterprise 2 Model 1170 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 2 Model 2170 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 2 Model 1200 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 2 Model 2200 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 2 Model 1300 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 2 Model 2300 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 150 | SUNW,Ultra-1 | sun4u |

TABLE 1-1 Platform Names for Sun Systems *(Continued)*

| System | Platform Name | Platform Group |
|----------------------|-----------------------|----------------|
| Sun Enterprise 250 | SUNW,Ultra-250 | sun4u |
| Sun Enterprise 450 | SUNW,Ultra-4 | sun4u |
| Sun Enterprise 3000 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 4000 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 5000 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 6000 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 3500 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 4500 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 5500 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 6500 | SUNW,Ultra-Enterprise | sun4u |
| Sun Enterprise 10000 | SUNW,Ultra-Enterprise | sun4u |
| SPARCserver 1000 | SUNW,SPARCserver-1000 | sun4d |
| SPARCcenter 2000 | SUNW,SPARCcenter-2000 | sun4d |

Refer to the *Solaris 7 11/99 SPARC (SPARC Platform Edition) Installation Instructions* manual for further information on platform groups for all other systems.

Setting Up Diskless Clients Using Solstice AdminSuite

If you are setting up a diskless client on a platform other than a sun4c, sun4d, or sun4m, select Entire Distribution Plus OEM as the client OS service.

Caution – If you do not select this metacluster, you will not be able to boot your sun4u system as a diskless client.

Interactive Installation of Solaris Software

When you install the Solaris 7 11/99 operating environment from the Solaris CD, all of the required software clusters and packages for your Sun hardware are automatically loaded. If you choose to customize your Solaris 7 11/99 software configuration using the interactive installation method, refer to TABLE 1-2 and TABLE 1-3 to identify which software packages and clusters are needed.

TABLE 1-2 Required Software Clusters and Packages for Sun Hardware

Custom JumpStart Profiles

For information on the availability of the custom JumpStart™ method at your site, consult your system administrator. TABLE 1-4 lists platforms and hardware and software options that may require additional entries in custom profiles. These clusters might not be installed with the core distribution software group. Refer to the *Solaris 7 11/99 SPARC Installation Instructions* manual for more information.

When writing Custom JumpStart profiles, be sure to allow sufficient space in the root partition for software from the Supplement CD, such as software for SunVTS diagnostics.

Note – For more information about automating Solaris installations, refer to *Automating Solaris Installations: A Custom JumpStart Guide* (Kasper/McClellan), a SunSoft Press/Prentice Hall publication.

32-bit Kernel the Default on 200MHz or Lower UltraSPARC Systems

On UltraSPARC systems with 200MHz or lower processors, it is possible for a user to run a 64-bit program designed to exploit a problem that could cause a processor to stall. Since 64-bit programs cannot run on the Solaris 32-bit kernel, the Solaris 32-bit kernel is booted by default on these systems.

The code sequence that exploits the problem is very unusual, and is not likely to be generated by a compiler. Assembler code had to be specifically written to demonstrate the problem. It is highly unlikely that a legitimate handwritten assembler routine would use this code sequence.

Users willing to assume the risk that a user might accidentally or deliberately run a program that was designed to cause a processor to stall may choose to run the Solaris 64-bit kernel on these systems.

You can determine the speed of your processor(s) by typing:

```
# /usr/sbin/psrinfo -v
```

You can change the default kernel from 32-bit on a system by modifying the `boot` policy file. Edit the `/platform/platform-name/boot.conf` file so that it contains an uncommented line with the variable named

`ALLOW_64BIT_KERNEL_ON_UltraSPARC_1_CPU` set to the value `true` as shown in the example that follows:

```
ALLOW_64BIT_KERNEL_ON_UltraSPARC_1_CPU=true
```

See `boot(1M)` for more information about changing the default kernel.

You may also purchase an upgrade to your system, contact your Sun representative for details.

Supported Sun Hardware

Supported Platforms

Note – Not all platforms and peripheral devices listed in this chapter are compatible. Contact your authorized Sun support provider for support information.

- SPARCclassic™
- SPARCstation SLC™
- SPARCstation ELC™
- SPARCstation LX
- SPARCstation IPC™
- SPARCstation IPX™
- SPARCstation 1
- SPARCstation 1+
- SPARCstation 2
- SPARCstation 4
- SPARCstation 5
- SPARCstation 5 Model 170
- SPARCstation 10
- SPARCstation 10SX
- SPARCstation 20
- SPARCstation 20 Model HS11, HS12, HS14, HS21, HS22, 151, and 152
- SPARCstation Voyager™
- Ultra™ 1 Model 140, 170
- Ultra 1 Creator Model 140E, 170E, 200E
- Ultra 1 Creator3D Model 140E, 170E, 200E
- Sun Enterprise™ 1 Model 140, 170, 170E
- Ultra 2 Creator Model 1170, 2170, 1200, 2200, 1300, 2300
- Ultra 2 Creator3D Model 1170, 2170, 1200, 2200

- Ultra 5
- Ultra 10
- Ultra 30
- Ultra 60
- Ultra 80
- Ultra 450
- Sun Enterprise 2 Model 1170, 2170, 1200, 2200, 1300, 2300
- Sun Enterprise 150
- Sun Enterprise 250
- Sun Enterprise 450
- Sun Enterprise 3000
- Sun Enterprise 4000
- Sun Enterprise 5000
- Sun Enterprise 6000
- Sun Enterprise 3500
- Sun Enterprise 4500
- Sun Enterprise 5500
- Sun Enterprise 6500
- Sun Enterprise 10000
- SPARCserver™ 1000 and 1000E
- SPARCcenter 2000 and 2000E

Supported Storage Peripherals

The following peripherals are supported:

- SPARCstorage™ Array
- Sun StorEdge™ A5000
- Sun StorEdge D1000/A1000

SCSI Disks

Sun StorEdge UniPack

- 1.05-Gbyte
- 1.05-Gbyte Fast/Wide
- 2.1-Gbyte
- 2.1-Gbyte Fast/Wide
- 4.2-Gbyte Fast/Wide
- 9-Gbyte Ultra
- 18-Gbyte Ultra

Sun StorEdge MultiPack

- 2.1-Gbyte (2 x 1.05-Gbyte)
- 4.2-Gbyte (2 x 2.1-Gbyte Fast SCSI-2)
- 4.2-Gbyte (4 x 1.05-Gbyte)
- 4.2-Gbyte (2 x 2.1-Gbyte 7200 rpm)
- 8.4-Gbyte (4 x 2.1-Gbyte Fast SCSI-2)
- 8.4-Gbyte (2 x 4.2-Gbyte 5400 rpm)
- 8.4-Gbyte (4 x 2.1-Gbyte 7200 rpm)
- 8.4-Gbyte (2 x 4.2-Gbyte)
- 9-Gbyte (2 x 9-Gbyte 7200 rpm Ultra)
- 9-Gbyte (4 x 9-Gbyte 7200 rpm Ultra)
- 9-Gbyte (6 x 9-Gbyte Ultra)
- 16.8-Gbyte (4 x 4.2-Gbyte)
- 16.8-Gbyte (4 x 4.2-Gbyte 5400 rpm)
- 18-Gbyte (2 x 9-Gbyte)
- 36-Gbyte (2 x 18-Gbyte)
- 36-Gbyte (4 x 9-Gbyte)
- 54-Gbyte (6 x 9-Gbyte)
- 72-Gbyte (4 x 18-Gbyte)
- 108-Gbyte (6 x 18-Gbyte)

Desktop Storage Pack (3.5-inch)

- 104-Mbyte
- 207-Mbyte
- 207-Mbyte Low profile (LP)
- 424-Mbyte
- 535-Mbyte (LP)
- 1.05-Gbyte
- 1.05-Gbyte (LP)
- 2.1-Gbyte
- 4.2-Gbyte

External Storage Module/External Expansion Module (5.25-inch)

- 327-Mbyte
- 669-Mbyte

Multi-Disk Pack (3.5-inch)

- 4.2-Gbyte (4 x 1.05-Gbyte)
- 4.2-Gbyte (2 x 2.1-Gbyte)

- 8.4-Gbyte (4 x 2.1-Gbyte)
- 8.4-Gbyte (2 x 4.2-Gbyte)
- 16.8-Gbyte (4 x 4.2-Gbyte)

Desktop Storage Module

- 16.8-Gbyte (4 x 4.2-Gbyte 5.25-inch)
- 1.3-Gbyte (5.25-inch)

Differential SCSI Disk Tray (5.25-inch)

- 2.1-Gbyte
- 2.9-Gbyte
- 9.0-Gbyte

Differential SCSI Expansion Pedestal (5.25-inch)

- 2.1-Gbyte

SCSI Disk Cards (3.5-inch)

- 2.1-Gbyte (4 x 535-Mbyte, narrow)
- 4.2-Gbyte (4 x 1.05-Gbyte, wide)
- 8.4-Gbyte (4 x 2.1-Gbyte, wide)

Enterprise Disk Cards

- 4.2-Gbyte (2 x 2.1-Gbyte)
- 8.4-Gbyte (2 x 4.2-Gbyte)

CD Drives

- SunCD™ drive
- SunCD Plus™ drive
- SunCD 2Plus™ drive
- SunCD 4 drive
- Sun StorEdge CD12 drive
- SunCD 16 drive
- SunCD 24 drive
- SunCD 32 drive

SCSI Tape Drives

- 60-Mbyte 1/4 inch QIC Sun3 Mass Storage subsystem
- 150-Mbyte 1/4 inch QIC Desktop Backup Pack and External Storage Module
- 2.5-Gbyte 1/4-inch QIC Sun StorEdge UniPack
- 1/2-inch Front Load (800/1600/6250 bpi) Tape
- 5-Gbyte 4mm Tape Desktop Backup Pack and Sun StorEdge UniPack
- 20-Gbyte 4mm Tape Auto-Loader Desktop Backup Module
- 2.3-Gbyte 8mm Desktop Backup Pack and External Storage Module
- 5.0-Gbyte 8mm Desktop Backup Pack
- 10-Gbyte 8mm Desktop Backup Pack
- 14-Gbyte 8mm Desktop Backup Pack and Sun StorEdge UniPack
- Multi-Tape Tray and Dragon Media Tray
- 20-Gbyte 4mm tape autoloader
- 5.0-Gbyte 8mm
- 10-Gbyte 8mm
- 14-Gbyte 8mm
- Internal
- 4-Gbyte 4mm DDS2 tape drive
- 4-Gbyte 4mm DDS2CR tape drive
- 4-Gbyte DDS3 tape drive
- 7-Gbyte 8mm 8505XL tape drive
- 7-Gbyte 8mm 8705DX tape drive
- SPARCstorage Library (up to two 14-Gbyte tape drives with 10 magazine cartridges and a robotic mechanism to select cartridges) (SCSI)

Diskette Drives

- 3.5-inch dual-density diskette drive
- 3.5-inch tri-density diskette drive
- 3.5-inch tri-density manual eject diskette drive

Expansion Subsystems

- SBus Expansion Subsystem/Chassis (SES/C)
- SBus Expansion Subsystem/Board (SES/B)

Controllers

Sun StorEdge SCSI Host Adapters

- Sun SCSI Host Adapter (SSHA)
- SBus SCSI Buffered Ethernet (SBE/S)
- SBus Fast SCSI Buffered Ethernet (FSBE/S)
- SBus Single-Ended Fast/Wide Intelligent SCSI-2 (SWIS/S)
- SBus Single-Ended Fast/Wide SCSI-2 (SunSwift)
- SBus Differential Fast/Wide Intelligent SCSI-2 (DWIS/S)
- SBus Differential SCSI Buffered Ethernet (DSBE/S)

PCI Host Adapters

- PCI Single-ended Fast/Wide SCSI-2 (SunSwift/PCI)
- Dual Differential UltraSCSI (UD2S)
- Dual Single-ended UltraSCSI (US2S)

Fibre Channel Host Adapters

- FC/S
- FC-OM (FC/S only)
- FC100/S
- GBIC (FC100/S only)

Graphics Accelerators

The following frame buffers are supported:

Frame Buffer Support Matrix

TABLE 2-1 Supported Frame Buffers

| Product Name | Common Name | Device Driver X | Bus Architecture |
|--------------------|-------------|----------------------|--|
| n/a | CG3 | /dev/fbs/cgthreeX | SBus |
| GX | CG6 | /dev/fbs/cgsixX | SBus |
| GXplus | CG6 | /dev/fbs/cgsixX | SBus |
| TGX | TurboGX | /dev/fbs/cgsixX | SBus |
| TGX4 | TurboGX+ | /dev/fbs/cgsixX | SBus |
| SX | CG14 | /dev/fbs/cgfourteenX | embedded SPARCstation 10SX SPARCstation 20 |
| S24 | tcx | /dev/fbs/tcxX | AFX Bus |
| FSV | tcx | /dev/fbs/tcxX | AFX Bus (embedded) |
| SunVideo | rtvc | /dev/rtvcX | SBus |
| Creator | ffb | /dev/fbs/ffbX | UPA Bus |
| Creator3D | ffb | /dev/fbs/ffbX | UPA Bus |
| Creator Series 2 | ffb2 | /dev/fbs/ffbX | UPA Bus |
| Creator3D Series 2 | ffb2 | /dev/fbs/ffbX | UPA Bus |
| Elite3D | afb | /dev/fbs/afbX | UPA Bus |
| PGX | M64 | /dev/fbs/m64X | PCI Bus |

Note – x denotes the device number for the device driver and FSV (tcx) is integrated on the SPARCstation 4 system motherboard.

PCMCIA

The PCMCIA interfaces are provided with the following products:

- SPARCstation Voyager (uses STP4020 PCMCIA controller chip)
- PCMCIA Interface/SBus (uses STP4020 PCMCIA controller chip)

The supported PC cards are:

- Serial RS-232 communication cards
- Data and fax modem cards
- SRAM, DRAM, MROM memory cards

TTY Graphics Input Devices

- SunDials™
- SunButtons™

Note – The SunDials and SunButtons products are not supported on all hardware. Contact your authorized Sun Support provider for more information.

Networking and Communications

The following network and communications devices are supported:

- SBus Second Ethernet
- SBus SCSI/Buffered Ethernet Card (SBE/S)
- SBus Fast SCSI Buffered Ethernet Card (FSBE/S)
- SBus Differential SCSI Buffered Ethernet Card (DSBE/S)
- SBus Quad Ethernet Controller (SQEC)
- SunSwift SBus Adapter
- SunFastEthernet-2 SBus Adapter
- SunSwift PCI Adapter

Unbundled Options

- SBus Fiber Distributed Data Interface (FDDI/S)
- SBus High-Speed Interface (HSI/S)
- SBus Token Ring Interface (TRI/S)
- SBus Prestoserve™
- SBus SunATM™ 155
- SBus SunATM 622
- SBus Fibre Channel Card (FC/S)
- NVSIMM
- Integrated Services Digital Network (ISDN)
- Serial Parallel Controller/SBus (SPC/S)
- SunPC™ Accelerator
- SunFDDI Single-Attach PCI Adapter
- SunFDDI Dual-Attach PCI Adapter
- SUNTRI Token Ring Interface PCI Adapter
- SUNHSI High-Speed Serial Interface PCI Adapter
- Sun Serial Asynchronous Interface PCI Adapter

Keyboard and Mouse Options

The following keyboard and mouse options are supported:

Keyboard Options

- Type 3 keyboard
- Type 4 keyboard
- Type 5 keyboard
- Compact 1 keyboard

Mouse Options

- M3 mouse
- M4 mouse
- Type 5 mouse
- Compact 1 mouse

Installing Software from the Sun Computer Systems Supplement CD

This chapter describes the contents and the installation of the Sun Computer Systems Supplement CD, which contains software for these Sun products:

- SunVTS™ 3.4
- OpenGL 1.2 software
- PC launcher/PC file viewer 1.0.1/1.0.1 software
- ShowMe TV™ 1.3 Software
- Sun Hardware Manual Pages
- Solaris 7 11/99 AnswerBook™ Set
- SunFDDI™ 6.0 drivers
- SunHSI (PCI: 2.0) and SunHSI (SBus: 3.0) drivers
- Sun GigabitEthernet 2.0 driver
- SunATM 4.0 Update 1
- SunForum™ 2.0 software
- Remote System Control (RSC) 1.0 for Sun Enterprise Servers
- Alternate Pathing 2.2 software
- Java 3D 1.1.1
- Sun Enterprise 10000 SSP 3.2

Installing Sun Computer Systems Supplement CD Software

There are at least four ways to install software from the supplement CD:

- Solaris Web Start 1.0
- Solaris Web Start 2.0
- AdminTool/SWMtool
- pkgadd

Before Installing Supplement CD Software

If you have installed any of the Supplement CD software from a previous release, you should remove the packages associated with that software before installing the new software.

Installing Supplement CD Software Using Solaris Web Start 1.0

You can use the Solaris Web Start 1.0 method to install some of the software from the Supplement CD at the same time you are installing from the Solaris CD. For more information on the Solaris Web Start 1.0 method of installation, see the “*Using Solaris Web Start*” module in the Information Library.

See TABLE 3-1 for a list of which software on the Supplement CD is installed by default or not installed by Solaris Web Start 1.0. software

Installing Supplement CD Software Using Solaris Web Start 2.0

You can use Solaris Web Start 2.0 to install Supplement CD software after you have installed the Solaris operating environment.

▼ To Install Supplement CD Software Using Solaris Web Start 2.0

1. **Insert the Supplement CD into your CDROM drive.**
2. **In a shell, type:**

```
# cd /cdrom/cdrom0
# ./installer
```

3. **When the Solaris Web Start GUI is displayed, select Next.**
4. **See TABLE 3-1. In the Solaris Web Start 2.0 column, software is labeled “Installed by default” or “Optional”.**
 - a. **If you want to install all of the default installed software, click Default Install, then click Next.**

b. If you only want to install some of the software products, click Custom Install, then click Next. Select the software you want to install, then click Next.

TABLE 3-1 Supplement Software Installation

| Software | Solaris Web Start 1.0 (Desktop) | Solaris Web Start 1.0 (Server) | Solaris Web Start 2.0 |
|--|--|---------------------------------------|------------------------------|
| SunVTS | Optional | Installed by default | Installed by default |
| OpenGL software | Installed by default | Installed by default | Installed by default |
| PC launcher and PC file viewer | Installed by default | Installed by default | Installed by default |
| ShowMe TV 1.3 software | Installed by default | Installed by default | Installed by default |
| Solaris on Sun Hardware AnswerBook Set | Optional | Installed by default | Installed by default |
| SunFDDI drivers | Cannot be installed | Cannot be installed | Optional |
| SunHSI drivers | Cannot be installed | Cannot be installed | Optional |
| Sun GigabitEthernet driver | Cannot be installed | Cannot be installed | Optional |
| SunATM driver | Cannot be installed | Cannot be installed | Optional |
| SunForum software | Installed by default | Optional | Installed by default |
| Remote System Control (RSC) for Sun Enterprise Servers | Cannot be installed | Cannot be installed | Optional |
| Alternate Pathing 2.2 software | Cannot be installed | Optional | Optional |
| Sun Enterprise 10000 SSP | Cannot be installed | Cannot be installed | Optional |
| Java 3D 1.1.1 | Cannot be installed | Cannot be installed | Installed by default |

Installing Supplement CD Software Using `swmtool`

With `swmtool`, you can install packages for more than one software product during the same installation session.

▼ To Install Clusters and Packages Using `swmtool`

1. Insert the Supplement CD into your CD-ROM drive.
2. In a shell, become superuser using the `su` command and the superuser password.
3. Start `swmtool`:

```
# swmtool
```

4. Select Add from the `swmtool` Edit Menu.
5. Enter the path to the Supplement CD:

```
/cdrom/cdrom0
```

or:

```
/cdrom/cdrom0/Product
```

From `/cdrom/cdrom0` you can add clusters; from `/cdrom/cdrom0/Product` you can customize and add individual packages.

6. In the `swmtool` GUI, select the clusters or packages you want to install.
7. Select Add.

Some products may require a customized installation. For example, packages may need to be installed in a directory other than the default directory, `/opt`. Specific directions for any customized installations are included in the individual software product sections in this chapter.

Installing Supplement CD Software on a Standalone System Using pkgadd

- ▼ To install packages for supported products from the Supplement CD using `pkgadd`
1. Insert the Supplement CD into your CD-ROM drive.
The File Manager window is displayed.
 2. In a shell, become superuser using the `su` command and the superuser password.
 3. Type:

```
# /usr/sbin/pkgadd -d /cdrom/cdrom0/Product package_names
```

or:

```
# cd /cdrom/cdrom0/Product
# pkgadd -d . package_names
```

The argument to the `-d` option must be a full path name to a device or directory. If you do not specify the device on which the package resides, `pkgadd` checks the default spool directory (`/var/spool/pkg`). If the package is not there, installation fails.

To install a particular product, choose the appropriate packages:

TABLE 3-2 Software, Clusters, and Packages

| Software | Version | Cluster | Packages |
|--|---------|-----------|--|
| Alternate Pathing Core Software | 2.2 | SUNWCap | SUNWapdoc SUNWapdv SUNWapr SUNWapu |
| Validation Test Suite Software (SunVTS) | 3.4 | SUNWCvts | SUNWsycfd SUNWvts SUNWvtsmn SUNWeswsa |

| SunForum | 2.0 | SUNWCdat | SUNWdat SUNWdatr SUNWdatu |
| SunFDDI PCI Driver Software | 2.0 | SUNWCfdip | SUNWpfd SUNWpfh SUNWpfm SUNWpfu |
| SunFDDI SBus Driver Software | 6.0 | SUNWCfdis | SUNWnfd SUNWnfh SUNWnfm SUNWnfu |
| Sun GigabitEthernet Software | 2.0 | SUNWCgem | SUNWged SUNWgedm SUNWgedu |

TABLE 3-2 Software, Clusters, and Packages *(Continued)*

| Software | Version | Cluster | Packages |
|-----------------------------------|---------|-----------|--|
| SunHSI PCI Driver Software | 2.0 | SUNWChsip | SUNWhsip SUNWhsipm SUNWhsipu |
| SunHSI SBbus Driver Software | 3.0 | SUNWChsis | SUNWhsis SUNWhsism SUNWhsisu |
| Sun Hardware AnswerBook 2 Cluster | 1.0 | SUNWCabk | SUNWabhdw |
| Java 3D | 1.1.1 | SUNWCj3d | SUNWj3doc SUNWj3dem SUNWj3drt SUNWj3dut |
| SunATM 4.0 Update 1 | 4.0 | SUNWCatm | SUNWatm SUNWatma SUNWatmu |

Note – For information on installing Sun Enterprise 10000 SSP, see the document, *Sun Enterprise 10000 SSP Installation and Release Notes*, a printed copy of which is included in your server media kit.

Note – Some packages have been localized. For a list of localized package names, see Appendix A.

If a problem occurs during package installation, information about the problem is displayed, followed by this prompt:

```
Do you want to continue with this installation?
```

Respond with either `yes`, `no`, or `quit`.

Validation Test Suite Software (SunVTS Software)

The SunVTS validation test suite is a diagnostic tool designed to test Sun hardware. By running multiple diagnostic hardware tests, the SunVTS software verifies the connectivity and functionality of most hardware controllers and devices in a 32-bit or 64-bit environment.

Within this environment, you can run individual tests designed to validate most currently supported hardware that Sun sells. The SunVTS environment also allows programmers to develop their own tests and run them on SunVTS interfaces.

You can find the software for the SunVTS application on the Supplement CD. To use the SunVTS software, refer to the *SunVTS 3.4 User's Guide*, *SunVTS 3.4 Test Reference Manual*, and the *SunVTS Quick Reference Card*.

TABLE 3-3 describes the main features of the SunVTS environment.

TABLE 3-3 SunVTS Diagnostic Tools

| Features | Description |
|---|---|
| SunVTS kernel (<code>vtstk</code>) | The SunVTS kernel controls all aspects of the testing. It is a daemon designed to stay in the background, and to be used when needed. Upon starting, the SunVTS kernel probes the hardware configuration of the system under test and waits for instructions from a user interface. During testing, the SunVTS kernel coordinates the running of individual tests, and manages all the messages (informational and error messages) sent by these tests. |
| SunVTS CDE user interface (<code>vtsui</code>) | This interface is designed to run on top of the Common Desktop Environment (CDE). It will also run on top of OpenWindows if the CDE package <code>SUNWdtbas</code> is installed. This interface provides a user-friendly GUI for accessing SunVTS test session configuration, execution, and log files. |
| SunVTS OPEN LOOK user interface (<code>vtsui.ol</code>) | This interface is designed to be run on top of OpenWindows. The SunVTS OPEN LOOK User Interface may not support the latest SunVTS features. For full feature support, use the SunVTS CDE or TTY interface. The SunVTS OPEN LOOK User Interface will be sustained but not enhanced, as long as OPEN LOOK is supported in the Solaris environment. |

TABLE 3-3 SunVTS Diagnostic Tools *(Continued)*

| Features | Description |
|---|--|
| SunVTS TTY user interface (<code>vtstty</code>) | Because not every system has a monitor, SunVTS has a TTY interface. This ASCII menu-based interface accepts various key sequences to control the test options and the test sessions. It can be used from a terminal, a shelltool, or a modem. |
| Running an individual test from the command line | Besides being run from a SunVTS user interface, each individual hardware test can be run from a UNIX® command line. Running a test alone can be helpful to validate only one piece of hardware. |
| Custom test support | A SunVTS user can run third-party executable test binaries under the SunVTS environment in the way that the test, rather than the SunVTS kernel, fully controls its input argument list and output log files. A user can simply modify the <code>.customtest</code> file provided by SunVTS to make it loosely coupled to the environment. |

SunVTS Clusters and Packages

TABLE 3-4 provides a list of SunVTS clusters and packages needed to run the SunVTS diagnostic tool.

TABLE 3-4 SunVTS Clusters and Packages on the Supplement CD

| Cluster | Includes Packages | Name | Description |
|-----------|----------------------|--|--|
| SUNWCvts | SUNWvts | Validation Test Suite | SunVTS kernel, User Interface (UI), tests and tools |
| | SUNWvtsmn | Validation Test Suite Manual Pages | Manual pages for SunVTS utilities/binaries |
| | SUNWsyncfd | | Standalone configuration reader for Enterprise server platforms |
| | SUNWeswsa | | Standalone configuration reader for desktop platforms |
| SUNWCvtsx | SUNWvtsx SUNWCvts | Validation Test Suite | 64-Bit Validation Test Suite software |
| SUNWCondg | SUNWodu | Online Validation Test Suite Diagnostics | Online diagnostics tool software Note: <code>SUNWodu</code> is not installed via Web Start. You must install it using <code>pkgadd</code> . |

Installing SunVTS

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Using SunVTS Software

To use SunVTS software, refer to the *SunVTS 3.4 User's Guide* in the Solaris 7 11/99 on Sun Hardware AnswerBook set. For SunVTS test and quick reference information, refer to the *SunVTS 3.4 Test Reference Manual* and *SunVTS Quick Reference Card*.

OpenGL Software

The Sun OpenGL software for Solaris is Sun's native implementation of the OpenGL application programming interface (API). The OpenGL API is an industry-standard, vendor-neutral graphics library. It provides a small set of low-level geometric primitives and many basic and advanced 3D rendering features, such as modeling transformations, shading, lighting, anti-aliasing, texture mapping, fog, and alpha blending.

Supported Platforms

The Sun OpenGL 1.2 software for Solaris supports the following devices:

- Creator Graphics, Creator3D Graphics, and Elite3D Graphics—OpenGL functionality is accelerated in hardware.
- SX, GX, GX+, TGX, TGX+, S24—OpenGL functionality is performed in software.
- All Sun SPARC™ systems equipped with the following frame buffers are supported on the OpenGL 1.2 software: the TCX, SX, GX, Creator, and Elite3D families of frame buffers. This includes Ultra desktop, Sun Enterprise and all the legacy SPARCstation family.

Removing Old Packages

If you have older versions of the Sun OpenGL software for Solaris packages, you must use the `pkgrm` command to remove them.

▼ To Remove Old Packages

1. Check to see whether any older versions of the OpenGL packages are installed using the `pkginfo` command.

The `pkginfo | egrep -i "OpenGL"` command lists any existing OpenGL packages that you have installed.

```
% pkginfo | egrep -i "OpenGL"
application SUNWffbg1      Creator Graphics (FFB) OpenGL Support
application SUNWglrt      OpenGL Runtime Libraries
application SUNWglrtu     OpenGL Platform Specific Runtime Libraries
application SUNWglwrt     OpenGL Widget Library
application SUNWafbg1     Loadable pipeline for UPA Bus Elite3D graphics
application SUNWgldoc     Solaris OpenGL Documentation and Man Pages
application SUNWglh       Solaris OpenGL Header Files
application SUNWglut       Solaris OpenGL Utilities and Example Programs
application SUNWglwh       Solaris OpenGL Widget Header Files
```

2. To remove the packages, become superuser:

```
% su
Password: superuser password
```

3. Run `pkgrm` to remove all existing Sun OpenGL software for Solaris packages.

```
# pkgrm SUNWglrt SUNWglh...
```

OpenGL Clusters and Packages

TABLE 3-5 lists the clusters and packages that are provided with the Sun OpenGL software for Solaris.

TABLE 3-5 OpenGL Clusters and Packages

| Cluster Name | Package Name | Description | Default Install Location |
|-----------------------|-----------------------|--|------------------------------------|
| SUNWCogl | SUNWglrt | OpenGL client-side runtime libraries | /usr/openwin/lib |
| | SUNWglrtu | UltraSPARC-specific OpenGL libraries | /usr/openwin/platform/sun4u/lib/GL |
| | SUNWffbg1 | Device pipeline for Creator and Creator3D Graphics frame buffers | /usr/openwin/lib/GL/devhandlers |
| | SUNWafbg1 | Loadable pipeline for UPA Bus Elite3D graphics | /usr/openwin |
| SUNWCogl _x | SUNWglrt _x | Sun OpenGL 64-bit Runtime Libraries | /usr/openwin |
| | SUNWafbg _x | Sun OpenGL 64-bit loadable pipeline for the UPA Bus Elite3D graphics accelerator | /usr/openwin |
| | SUNWffbg _x | Sun OpenGL 64-bit loadable pipeline for the UPA Bus Creator graphics accelerator | /usr/openwin |
| | SUNWCogl | Core OpenGL software, see SUNWCogl in the left column, above. | |

Installing OpenGL

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

After Installing the Packages

After installing the packages, do the following:

▼ To Verify Package Installation

1. Exit the window system and restart it so that the window system loads the newly installed GLX server extension.
2. To verify that the OpenGL libraries are installed correctly, run `ogl_install_check`.

The `ogl_install_check` test program prints the version of the OpenGL library and renderer used, and renders a rotating wheel. The program returns the following output when it is run on an UltraSPARC Creator3D:

```
OpenGL Vendor:           Sun Microsystems, Inc.  
OpenGL Version:         1.2 Sun OpenGL 1.2 for Solaris
```

For diagnostic purposes, the following values should be noted if Solaris OpenGL software problems are seen:

```
OpenGL Renderer:         Creator 3D, VIS  
OpenGL Extension Support: GL_EXT_texture3D  
                        GL_SGI_color_table  
                        GL_SUN_geometry_compression  
                        GL_EXT_abgr  
                        GL_EXT_rescale_normal  
OpenGL GLX Server:       Detail Status Report  
    GLX:      Context is direct.  
    GLX:      OpenGL Rendering in use  
    GLX:      Double Buffering in use  
    GLX:      Color Buffer (GLX_BUFFER_SIZE) = 24 bits  
    GLX:      Depth Buffer (GLX_DEPTH_SIZE) = 28 bits  
    GLX:      Stencil Buffer (GLX_STENCIL_SIZE) = 4 bits  
    GLX:      RGBA (True Color/Direct Color) Visual in use  
OpenGL Library:          Detail Status Report  
    Number of color bits (R/G/B/A): 8/8/8/0  
    Frame Buffer Depth (GL_DEPTH_BITS):28
```

Unexpected Slow Local Rendering

Whenever possible, Sun OpenGL software for Solaris renders directly to the frame buffer, bypassing the X server. This is enabled by Sun's DGA mechanism for locking portions of the screen. However, a Solaris security feature only allows the user who originally logged in to the window system to use DGA to lock portions of the screen. Only owners of the window system have access to DGA.

If you notice poor performance when rendering locally, the cause may be this Solaris security feature. For example, if you start the window system, and another user at the workstation changes to that user's own environment using `su`, the application will not run via DGA even though the second user is running the application locally.

If you notice slow local rendering, run the `ogl_install_check` diagnostic program (found in `/usr/openwin/demo/GL`) to determine whether the application is running via DGA. If the OpenGL GLX server status report from the `ogl_install_check` program says that the GLX context is indirect, edit the login permissions to enable DGA access for all users.

To give all local users access to DGA, follow these steps:

▼ To Give All Local Users Access to DGA

1. Become superuser:

```
% su
Password: superuser password
```

2. Edit permissions to allow world read/write access to the following devices:

```
% chmod 666 /dev/mouse /dev/kbd /dev/sound/* /dev/fbs/*
```

This will enable DGA access for all users for the duration of the current window system session (subject to X authorization, see `xhost(1)`).

3. Edit the `/etc/logindevperm` file and change the default permissions of all devices listed in the file to 0666 to allow world read/write access.

For example, in the following lines in `logindevperm`, change 0600 to 0666 so that the next time you log in and restart your window system, it will still be accessible by all users.

```
/dev/console      0600      /dev/mouse:/dev/kbd
/dev/console      0600      /dev/sound/*      # audio devices
/dev/console      0600      /dev/fbs/*        #frame buffers
```

Note that your system is no longer secure.

PC Launcher

Audience

PC launcher is designed for Solaris users who have access to Windows '95 or '98 based PC environments

What is PC Launcher?

PC launcher provides you with the capability to view and edit PC files and attachments by launching the associated Windows applications and files in the PC environment. PC launcher enables you to launch attachments and files created in the Windows environment.

PC Launcher Installation Requirements

- Software Supplement for the Solaris 7 11/99 Operating Environment for Sun Computer Systems CD

If you don't have the Supplement CD, contact your Sun service representative.

System Requirements

Sun Workstation

- Solaris 7 operating environment
- CDE 1.3
- 32 MB RAM

Network PC Environment with one of the following:

- SunPCi card
- Software Environment
- PC Hardware with Win 9x (PC -NFS/Solstice Network Client)

PC Launcher Installation

SunPCi Requirements

In order for PC launcher to work, SunPCi and its host workstation must be able to ping each other by 'name'. To do this, you must have:

- IP connectivity between the two.
- Name services (whatever you happen to be using) set up on each so that you can look up the other's name and get its IP address.

Because of the network architecture of SunPCi and the way it shares Ethernet access with its host, the SunPCi and host cannot see each other on the network.

To work around this, use an IP routing system (a "real" router, another Sun system, an NT system, etc.) on the same subnet to act as a proxy router.

Note – You must have account access to the IP router you have selected, since you must add two routes to it.

For example, based on following setup:

- SunPCi IP = 10.0.0.1
- Host workstation IP = 10.0.0.2
- Router IP = 10.0.0.3

you need to do the following:

1. On the host workstation:

```
route add 10.0.0.1 10.0.0.3 1
```

Note – You can add an `/etc/rc` script to make this happen at every reboot.

2. On the routing proxy:

```
route add 10.0.0.2 10.0.0.3 0
```

```
route add 10.0.0.1 10.0.0.3 0 (or the equivalent)
```

Caution – You must add routes to all three systems in this fashion in order for this to work. Do NOT assume that "standard network default routers" or anything else will provide similar functionality; they will not.

After doing this, verify that the SunPCi can ping its host by IP, and vice versa. Once that works, make sure that they can ping each other by name; add entries to the appropriate naming services if they cannot. On UNIX, examples of naming services are DNS or `/etc/hosts`. Windows can use DNS or the hosts file as well. Consult your System Administrator to add these entries, based on your setup. Once the systems can ping each other by name, PC launcher will install.

For further assistance with installation of SunPCi, refer to the following publications:

- *SunPCi Installation Guide*
- *SunPCi Release Notes*
- *SunPCi 1.1 Windows NT Installation Guide*

Installing PC Launcher Packages

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Configuring PC Launcher

You configure PC launcher by specifying your setup in the three steps on the PC launcher Configuration window.

Before configuring, you must have the following:

- A network host name and network connectivity between your Solaris and Windows environments.
- Your UNIX home directory mapped in your Windows environment.

▼ To Configure PC Launcher for PCi

1. From the CDE Toolbar, start the Application Manager.
2. Click **Configure PC launcher** under the Desktop controls. The **PC launcher Configuration window** is displayed. Answer the questions in the following three steps.
 - a. **On-Board PC Emulator and SunPCI (default)**
 - b. **Enter your Sun PCi's hostname (default)**
 - c. **Let PC Emulator handle the file**
3. Click **OK**.

Note – PC-type documents can be opened for viewing and editing through the Sun PCi card whenever you double-click a document. If you want to do “quick” viewing, select “Let Solaris handle the file” and PC file viewer is invoked. For editing, use the right-mouse button and select “Open In Emulator”.

4. **From SunPCi run** `h: \.dt\bin\win9x\intel\sdtpcactiond.exe` (**assuming h: is mapped to your UNIX home directory**).

▼ To Configure PC Launcher for the Software Environment

1. From the CDE Toolbar, start the Application Manager.
2. Click Configure PC launcher under the Desktop controls then select or enter the following:
 - a. On-Board PC Emulator and SoftWindows.
 - b. `<Hostname>`
 - c. Let Solaris handle the file

Note – PC-type documents can be opened for viewing and editing with a right-mouse double-click. If you selected “Let Solaris handle the file” when you configured PC launcher, then double-clicking on a file will launch PC file viewer.

3. Click OK.
4. From Software Environment run:

`h: \.dt\bin\win9x\intel\sdtpcactiond.exe`

(assuming h: is mapped to your UNIX home directory).

▼ To Configure PC Launcher for a Deskside PC

1. From the CDE Toolbar, start the Application Manager.
2. Click Configure PC launcher under the Desktop Applications then select or enter the following:

- a. Standalone PC
- b. <Hostname>
- c. Let the Standalone PC handle the file

Note – PC-type documents can be opened for viewing and editing with a right-mouse double-click. If you selected “Let Solaris handle the file” when you configured PC launcher, then double-clicking on a file will launch PC file viewer.

- 3. Click OK.
- 4. From Deskside PC run:

```
h: \.dt\bin\win9x\intel\sdtpcactiond.exe
```

(assuming h: is mapped to your UNIX home directory).

Using PC Launcher

The CDE front panel and CDE workspace can be populated with an icon representing the PC environment, such as SunPCi. To do this, drag and drop OpenInSunPCi from the Desktop Applications in Application Manager, onto the Front Panel.

If you did not configure PC launcher, then the first time you open PC launcher, the PC launcher Configuration window will display. This is where you will configure PC launcher. You only need to configure PC launcher once.

Working With Windows Files

Windows Files

Identification of many popular PC file formats in CDE allows you to select and launch them in your preferred PC environment, such as SunPCi. A right mouse click on these files gives you the three following choices in the menu:

- Open—the double-click action.
- OpenInEmulator—launches the file in your preferred hardware, such as SunPCi (or any software emulator).

- **OpenInRemotePC**—launches the file in a standalone networked PC.

You can drag and drop Windows shortcuts onto the Front Panel. You can also put shortcuts on the CDE workspace by creating a windows short cut in your UNIX home directory and using `dtfile` to drag and drop. Refer to Windows help on creating shortcuts, and CDE help to get more information on drag and drop.

▼ To Open an Application or Datafile

- **Double-click on the shortcut from the Solaris desktop.**

The associated applications must be available to you. This procedure makes the Solaris desktop act like a Windows desktop. You can keep all your relevant applications inside the Solaris CDE front panel and CDE workspace and run them by double-clicking on them.

▼ To Run Windows Binary Files

- **Double-click on the file (`exe`) and run inside the PC environment (for example, `SunPCi`).**

▼ To Copy and Paste Text

1. **Highlight the text you want to copy and select Copy from the Edit menu.**
2. **Click the place you want to paste the text, and select Paste from the Edit menu.**

▼ To View a File

- **Click on the file and select View.**

▼ To Search for a File

1. **Select Find/Change from the Edit menu.**
2. **Enter the filename into the Find field and click Find.**

▼ To Print Files

- **Select Print from the File menu**

The file will print out on the PC printer.

Other Features

▼ To Display the Windows Start Menu in CDE

Using manual steps, you can get to all of the Windows Start Menu choices in the CDE Application Manager.

1. **Start Windows Explorer.**
2. **Copy** C: \Window\StartMenu\ **to** H: \.dt\appmanager.
3. **Start Application Manager.**
4. **Go to the Desktop controls.**
5. **Click Reload Application.**

▼ To Log On to a Different Machine

- **Reconfigure PC launcher on the Configuration window.**

▼ To Reconfigure PC Launcher

- **Remove the PC's hostname in Step 2 on the PC launcher Configuration window.**

▼ Switch Between Targets

- **Change your selection in Step 1 on the PC launcher Configuration window.**

Getting Help for PC Launcher

Help for PC launcher is available through the Help menu at the bottom of the PC launcher Configuration window.

PC File Viewer

PC File Viewer

The PC file viewer software provides you with an application to view popular PC file formats such as Microsoft Word, PowerPoint, Excel, Lotus 1-2-3, and AutoCAD. The viewer allows you to choose a file and to copy and paste information from the viewer to another application, such as a text editor. CDE applications will be able to identify these filetypes and launch this application by double-clicking on the icon in your mail attachment or from File Manager (`dtfile`).

File Formats Supported

PC file viewer supports 17 different file types:

Word Processing Formats

- Microsoft Word for Windows versions through 7.0 and Word 97
- Microsoft Windows Works versions through 4.0
- Word Perfect for Windows versions through 7.0
- AMI/AMI Professional versions through 3.1

Spreadsheet Formats

- Microsoft Excel Windows versions 2.2 through 7.0 and Excel 97
- Microsoft Excel Chart versions 2.x through 7.0
- Microsoft Windows Works versions through 4.0
- Lotus 1-2-3 Windows versions through 6.x
- Lotus 1-2-3 Chart Windows versions through 5.0
- QuattroPro for Windows versions through 7.0

Presentation Formats

- Microsoft PowerPoint versions through 7.0 and PowerPoint 97
- Corel Presentation versions through 7.0
- Freelance versions 1.0 and 2.0

Graphics Formats

- BMP—Windows
- DXF—versions through 13
- GEM—Bitmap and vector
- PIC—Lotus

PC File Viewer Limitations

PC file viewer is limited to the following products and configurations for this Solaris release:

- SPARC architecture ONLY
- Printing is not supported

The following limitations are related to displaying items in a supported file:

- Charts are not supported in QuattroPro.
- Text that is designed to be shown vertically is shown horizontally in the viewer. This vertical text may overlap adjacent cells making reading what is in them difficult.
- Figures and footers are aligned with the anchors in the text. If font sizes on the viewing system are not identical to those on the authoring system, then anchored objects will not be at the appropriate place in the text.
- There is limited support for incremental shading in presentation file formats
- There is no support for drawing objects in Microsoft Word and Lotus.
- Borders in Word Perfect and AmiPro files are not supported
- Copy & Paste does not work for Japanese text in Microsoft Office applications.

Note – All of the above limitations also exist in the Microsoft Windows version of the product from Inso Corporation.

- There is no support for OLE objects.
- If a font that is used in a document is not on the system, the default system font will be used and the viewed text may look different than what was seen in the authoring application.
- If a special character is used in a document that is not in the available character set, it will be replaced by an asterisk in the document as shown by the file viewer.

PC File Viewer Packages

TABLE 3-6 lists the packages that are provided with PC file viewer.

TABLE 3-6 PC file viewer Packages

| Locale | Package Name | Description |
|---------------------|---------------------|--|
| English | SUNWdtpcv | US base package |
| | SUNWdtpcz | US base actions and messages |
| Japanese | SUNWjdpcv | Japanese EUC/PCK/UTF-8 common messages |
| | SUNWjepcv | Japanese EUC messages |
| | SUNWjppcv | Japanese PCK messages |
| | SUNWjupcv | Japanese UTF-8 messages |
| | SUNWjepcz | Japanese EUC action files |
| | SUNWjppcz | Japanese PCK action files |
| | SUNWjupcz | Japanese UTF-8 action files |
| Korean | SUNWkcpcv | Korean EUC/UTF-8 common messages |
| | SUNWkupcv | Korean UTF-8 messages |
| | SUNWkdpcv | Korean EUC messages |
| | SUNWkupcz | Korean UTF-8 action files |
| | SUNWkdpcz | Korean EUC action files |
| Traditional Chinese | SUNWhcpcv | Traditional Chinese EUC/BIG5 common files |
| | SUNW5pcv | Traditional Chinese BIG5 messages |
| | SUNWhdpcv | Traditional Chinese EUC messages |
| | SUNW5pcz | Traditional Chinese BIG5 action files |
| | SUNWhdpcz | Traditional Chinese EUC action files |
| Simplified Chinese | SUNWccpcv | Simplified Chinese EUC/GBK common messages |
| | SUNWcdpcv | Simplified Chinese EUC messages |
| | SUNWgpcv | Simplified Chinese GBK messages |
| | SUNWcdpcz | Simplified Chinese EUC action files |
| | SUNWgpcz | Simplified Chinese GBK action files |
| German | SUNWdepcv | German messages |
| | SUNWdepcz | German action files |

TABLE 3-6 PC file viewer Packages *(Continued)*

| Locale | Package Name | Description |
|---------------|---------------------|----------------------|
| French | SUNWfrpcv | French messages |
| | SUNWfrpcz | French action files |
| Spanish | SUNWespcv | Spanish messages |
| | SUNWespcz | Spanish action files |
| Italian | SUNWitpcv | Italian messages |
| | SUNWitpcz | Italian action files |
| Swedish | SUNWsvpcv | Swedish messages |
| | SUNWsvpcz | Swedish action files |

Installing PC File Viewer

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Adding PC File Viewer to the CDE Front Panel

To Add PC File Viewer to the CDE Front Panel

- 1. Open File Manager (dtfile).**
- 2. Go to the /opt/SUNWdtpcv/bin directory.**
You will see the PC file viewer icon there.
- 3. Open the CDE front panel where you want the icon.**
For example, the Application or File sub-folder.
- 4. Drag and drop the PC file viewer icon from File Manager to InstallIcon in the selected subfolder.**

Now the PC file viewer can be launched by just clicking on the icon in the CDE front panel. You can also promote the icon to appear on the front panel by default.

ShowMe TV 1.3 Software

ShowMe TV is a television system for local- and wide-area networks. You can use it to view and broadcast live or prerecorded video programs on your network. Here are some examples of how you can use ShowMe TV:

- Broadcast and view training courses
- Lectures
- Corporate messages
- Monitor important news events

ShowMe TV contains the following components:

- ShowMe TV Receiver
- ShowMe TV Transmitter
- ShowMe TV Address Book

ShowMe TV Packages

TABLE 3-7 lists the packages that are provided with ShowMe TV.

TABLE 3-7 ShowMe TV Packages

| Package Name | Description | Default Install Location | Disk Space (Kbytes) |
|--------------|---|--------------------------|---------------------|
| SUNWsmth | Online help binaries and documentation | /opt/SUNWsmth | 319 |
| SUNWsmtr | ShowMe TV receiver application and support files | /opt/SUNWsmtr | 12320 |
| SUNWsmtr | ShowMe TV transmitter application and support files | /opt/SUNWsmtr | 9329 |
| SUNWsmtr | Support utilities | /opt/SUNWsmtr | 842 |

Removing Old Packages

If you have ShowMe TV 1.1, 1.2, or 1.2.1 installed, you need to remove it before installing ShowMe TV 1.3.

- To remove ShowMe TV 1.1, type:

```
# pkgrm SUNWsmUt1 SUNWstv SUNWstvs
```

If you have an earlier release of ShowMe TV 1.2 installed, you need to remove it before installing any new software packages.

- To remove ShowMe TV 1.2 or 1.2.1, type:

```
# pkgrm SUNWsmstv SUNWsmstv SUNWsmstv SUNWsmtvh
```

Installing ShowMe TV

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Translated Documentation

The Supplement CD contains the *ShowMe TV User's Guide* in the following languages:

- French
- German
- Spanish
- Italian
- Swedish
- Japanese
- Korean
- Simplified Chinese
- Traditional Chinese

▼ Accessing the ShowMe TV User's Guide

The `/cdrom/cdrom0/Docs/ShowMeTV1.3/UserGuide` directory on the Supplement CD contains the following files:

TABLE 3-8 ShowMe TV Translated Documents

| File Name | Description |
|---------------|--------------------------------|
| UG_en.ps | English PostScript™ file |
| UG_de.ps | German PostScript file |
| UG_fr.ps | French PostScript file |
| UG_es.ps | Spanish PostScript file |
| UG_it.ps | Italian PostScript file |
| UG_sv.ps | Swedish PostScript file |
| UG_ja.ps | Japanese PostScript file |
| UG_ko_dir/ | Korean HTML files |
| UG_zh_dir/ | Simplified Chinese HTML files |
| UG_zh_TW_dir/ | Traditional Chinese HTML files |

- To view the desired PostScript manual, type the following at the command line:

```
# imagetool filename
```

- To print the manual, either use the File menu in Image Tool or type the following at the command line:

```
# lp filename
```

- To view the manuals in HTML format, use a Web browser and type the following in the address field:

```
file:/cdrom/cdrom0/Docs/ShowMeTV1.3/UserGuide/directory
```

If you have copied the HTML files to a different directory, type in the path to that directory. Open the table of contents to determine which file to open.

Solaris 7 11/99 AnswerBook Set

For customers using Sun hardware, a set of online manuals in AnswerBook format is provided on the Supplement CD. The *Solaris 7 11/99 on Sun Hardware Collection* is contained in the package named SUNWabhdw.

Refer to the *SPARC: Solaris 7 11/99 SPARC Installation Instructions* for information about installing the Solaris 7 11/99 on Sun Hardware AnswerBook set.

Refer to the “Accessing Online Documentation” module in the *Solaris 7 11/99 Installation Library* for information about how to install document collections on an AnswerBook2 server.

The AnswerBook set includes general manuals as well as Platform Notes, which are manuals that cover use of Solaris 7 11/99 software with specific Sun hardware products.

TABLE 3-9 lists the online manuals in this AnswerBook collection.

TABLE 3-9 Solaris 7 11/99 on Sun Hardware AnswerBook Manuals

| Title | Contents |
|--|--|
| <i>Solaris 7 11/99 on Sun Hardware Documentation Guide</i> | Information about other manuals in this set. Helps you determine which manuals are useful for the work you do with your hardware. |
| <i>Solaris on Sun Hardware Reference Manual Supplement</i> | Information to help you find a compilation of manual pages provided in packages on the Supplement CD. Includes man pages that cover SunVTS software. |
| <i>Solaris Handbook for Sun Peripherals</i> | Information about installing drives and other peripherals for use with the Solaris 7 11/99 software environment. Covers issues such as configuring SCSI addresses. |
| <i>Solaris Handbook for Sun Frame Buffers</i> | Information on how to use features of the TurboGXPlus, SX, PGX (m64) and Creator Graphics Accelerator frame buffers. Also explains how to configure multiple monitors on a system. (In some past Solaris releases, this manual was titled <i>Platform Notes: SMCC Frame Buffers</i> .) |
| <i>NFS Server Performance and Tuning Guide</i> | Information about the performance and tuning of an NFS server. |
| <i>SunVTS 3.3 User's Guide</i> | Basic instructions on using the SunVTS diagnostic software. |
| <i>SunVTS 3.3 Test Reference Manual</i> | Information about each test provided with the SunVTS diagnostic software. |
| <i>SunVTS Quick Reference Card</i> | A quick reference card for the SunVTS diagnostic software. |
| <i>PCI: SBus Comparison</i> | Feature differences between SBus and PCI. |

TABLE 3-9 Solaris 7 11/99 on Sun Hardware AnswerBook Manuals (*Continued*)

| Title | Contents |
|---|--|
| <i>Platform Notes: The hme FastEthernet Device Driver</i> | Information on how to configure the hme device driver for use with the Ultra Workstation series platform, Sun Enterprise servers, SunSwift SBus adapter, SunSwift PCI adapter, and PCI SunFastEthernet card. |
| <i>Platform Notes: SPARCstation 10SX and 20 System Configuration Guide</i> | Information about how to take advantage of graphics memory and acceleration features of these systems. |
| <i>Platform Notes: SPARCstation Voyager Software Guide</i> | Information about Supplement CD software used with the SPARCstation Voyager system. Also contains information for system administrators supporting users with these systems. |
| <i>Platform Notes: Sun Enterprise 6000, 5000, 4000, and 3000 Systems</i> | Sun Enterprise X000-specific OpenBoot commands, including those for board hot-plug operations. Also contains board hot-plug procedures, and miscellaneous related information. |
| <i>Platform Notes: Sun Enterprise 250 Server</i> | New OpenBoot commands, configuration variables, and disk drive hot-plug procedures. Also provides procedures for mapping between logical and physical device names for internal storage devices. |
| <i>Platform Notes: Sun Ultra 450 Workstation and Sun Enterprise 450 Server</i> | New OpenBoot commands, configuration variables, and disk drive hot-plug procedures. Also provides procedures for mapping between logical and physical device names for internal storage devices. |
| <i>Platform Notes: Using luxadm Software</i> | Instructions on using the luxadm administrative program with the Sun StorEdge A5000 and the SPARCstorage Array. |
| <i>Platform Notes: Sun FDDI Adapters</i> | Information about how to configure the SunFDDI driver software and use the SunFDDI network utilities. |
| <i>Platform Notes: Sun GigabitEthernet Device Driver</i> | Information on how to configure the Sun GigabitEthernet driver software. |
| <i>Platform Notes: The SunHSI/S Device Driver</i> | Describes how to configure the SunHSI SBus driver software. |
| <i>Platform Notes: The SunHSI/P Device Driver</i> | Describes how to configure the SunHSI PCI driver software. |
| <i>Platform Notes: The SunATM Driver Software</i> | Describes how to configure the SunATM driver software. |
| <i>Dynamic Reconfiguration User's Guide for Sun Enterprise 6x00, 5x00, 4x00, 3x00 Systems</i> | Information about how to use Dynamic Reconfiguration software features on these Sun Enterprise servers. |
| <i>Remote System Control (RSC) User's Guide</i> | Information about how to use Remote System Control for the Enterprise 250 Server. |
| <i>Remote System Control (RSC) Installation Guide</i> | Installation and configuration information for Remote System Control for the Enterprise 250 Server. |

TABLE 3-9 Solaris 7 11/99 on Sun Hardware AnswerBook Manuals (*Continued*)

| Title | Contents |
|--|--|
| <i>Sun Enterprise Server Alternate Pathing User's Guide</i> | Information about how to use Alternate Pathing software features on Sun Enterprise servers. |
| <i>Sun Enterprise Server Alternate Pathing Reference Manual</i> | Man pages for Sun Enterprise Server Alternate Pathing |
| <i>Sun Enterprise 10000 Dynamic Reconfiguration User's Guide</i> | Information about how to use Dynamic Reconfiguration software features on the Sun Enterprise 10000 server. |
| <i>Sun Enterprise 10000 Dynamic Reconfiguration Reference Manual</i> | Man pages for Sun Enterprise 10000 Dynamic Reconfiguration. |

Additional documentation can be found on the Supplement CD in the `/cdrom/cdrom0/Docs` directory.

Solaris 7 11/99 AnswerBook Clusters and Packages

The following table lists the clusters and packages that are provided for the Solaris 7 11/99 AnswerBook collection.

TABLE 3-10 Solaris 7 11/99 AnswerBook Clusters and Packages on the Supplement CD

| Cluster Name | Includes Package | Description |
|--------------|------------------|-------------------------|
| SUNWCabk | SUNWabhdw | Sun Hardware AnswerBook |

Installing Solaris 7 11/99 AnswerBook Set

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Using the Solaris 7 11/99 AnswerBook Set

To determine which of the manuals in this AnswerBook set are of interest to you, see the *Solaris 7 11/99 on Sun Hardware Documentation Guide* in this set.

To view any AnswerBook set, see the *Solaris User's Guide* in the Solaris 7 11/99 User AnswerBook on the Solaris CD.

Sun Computer Systems Manual Page Clusters and Packages

The SUNWCman cluster will install all the manual (man) pages for software on the Supplement CD. This provides a way to install the man pages on a system without installing the software they describe on that system.

TABLE 3-11 Sun Computer Systems Manual Page Clusters and Packages on the Supplement CD

| Cluster Name | Includes Package | Name | Description |
|--------------|------------------|---|--|
| SUNWCman | SUNWvtsmn | Online Validation Test Suite Manual Pages | Manual pages for SunVTS drivers/binaries |
| | SUNWnfm | SunFDDI SBus Manual Pages | Manual pages for SunFDDI SBus |
| | SUNWpfm | SunFDDI PCI Manual Pages | Manual pages for SunFDDI PCI |

Installing Sun Computer Systems Manual Pages

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Using Sun Computer Systems Manual Pages

To view the man pages you have installed, use the `man` command as you would for the man pages installed as part of the Solaris operating environment installation. These additional man pages are also available in the *Solaris on Sun Hardware Reference Manual Supplement* in the Solaris 7 11/99 on Sun Hardware AnswerBook set.

Sun Remote System Control for Sun Servers

Sun Remote System Control (RSC) is a secure server management tool that lets you monitor and control a Sun Enterprise 250 server over modem lines and over a network, using Solaris operating environment or Microsoft Windows clients. RSC can also notify you when server problems occur. RSC provides remote system administration for geographically distributed or physically inaccessible systems. All hardware functionality required to support RSC is already included with your Sun Enterprise 250 server.

The Sun Remote System Control for Sun Servers software is provided on the Supplement CD. For installation information, see “Installing Sun Computer Systems Supplement CD Software” on page 23. For configuration information for Remote System Control, see *Remote System Control (RSC) Installation Guide*.

SunForum

SunForum is a data conferencing product for Sun workstations. It is based on the T.120 standard, which enables your Sun system to conference over intranets and the Internet with other T.120 products, such as Microsoft NetMeeting and PictureTel LiveShare Plus, version 4.0.

SunForum includes the features

- View and control applications shared from other UNIX or PC machines that are based on the T.120 protocol.
- Share local Solaris applications, which can be viewed and controlled by any conference participant.
- Exchange ideas and data using the whiteboard, clipboard, chat, and file transfers.

Installing SunForum

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Online Help

You can read information about SunForum online. You can access help from the Help menu located on any SunForum menu bar.

Network Adapter Drivers Included on the Supplement CD

The following drivers are provided on the Supplement CD contained in your Solaris 7 11/99 Media Kit:

- Sun GigabitEthernet Driver software
- SunFDDI PCI Driver software
- SunFDDI SBus Driver software
- SunHSI PCI Driver software
- SunHSI SBus Driver software
- SunATM 4.0 Update 1

Note – SunFDDI supports booting from the 32-bit kernel or the 64-bit kernel. SunFDDI will attach to whichever you choose to boot from with no special user interaction.

Installing the Drivers

Note – Before installing driver software from the supplement CD make sure that you have already installed the adapter hardware. Refer to the appropriate Platform Notes for more information.

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Platform Notes for Network Adapter Drivers

Refer to the following platform notes for more information:

- *Platform Notes: Sun FDDI Adapters*
- *Platform Notes: The Sun GigabitEthernet Device Driver*

- *Platform Notes: The SunHSI/P Device Driver*
 - *Platform Notes: The SunHSI/S Device Driver*
 - *Platform Notes: SunATM Driver Software*
-

Java 3D 1.1.1 API

The Java 3D™ 1.1.1 API is a set of classes for writing three-dimensional graphics applications and 3D applets. It gives developers high level constructs for creating and manipulating 3D geometry and for constructing the structures used in rendering that geometry. Application developers can describe very large virtual worlds using these constructs, which provides Java 3D with enough information to render these worlds efficiently.

Installation Dependencies

- OpenGL 1.1 or later
- JDK 1.2 or later

Installing Java 3D 1.1.1 API

See “Installing Sun Computer Systems Supplement CD Software” on page 23.

Sun Enterprise 10000 SSP

For SSP installation and update procedures, as well as SSP release notes, see the document, *Sun Enterprise 10000 SSP Installation and Release Notes*, a printed copy of which is included in your server media kit.

Updating the Flash PROM on the Ultra 1, Ultra 2, Ultra 450, and Sun Enterprise 450 Systems

This chapter describes how to update the flash PROM on the Ultra™ 1, Ultra 2, Ultra 450, and the Sun™ Enterprise™ 450 systems.

Some systems require a higher level of OpenBoot™ firmware in the flash PROM to run the 64-bit mode of the Solaris™ 7 operating environment. The OpenBoot firmware is contained within a single flash PROM for the Ultra 1, Ultra 2, Ultra 450, and the Sun Enterprise 450 systems.

Note – Only those systems identified in this chapter and the following chapter need the flash PROM upgrade.

The flash PROM devices, which contain OpenBoot, are electrically erasable and writable devices. This means that the firmware can be updated without removing the flash PROM from the system board.

Related Material

You can also use the Flash PROM Update Multimedia Collection containing videos of how to upgrade the flash PROM in the Ultra 1, Ultra 2, Ultra 450, and Sun Enterprise 450 systems. This collection is located on the Flash PROM Update Multimedia AnswerBook CD. For more information, see “Flash PROM Update Multimedia Collection” on page 79.

Determining If the Flash PROM Needs Updating

Only sun4u systems that can run the 64-bit mode of the Solaris 7 operating environment might need the flash PROM update. Systems that can only run the 32-bit mode (such as those in the sun4c, sun4d, and sun4m platform groups) do not require updated firmware to run Solaris 7 software.

Note – If the Solaris 7 operating environment notified you that the flash PROM in your system needs updating, skip the steps in the procedure “To Determine If Your System Requires a Flash PROM Update” on page 60 and go directly to “Updating the Flash PROM” on page 61.

▼ To Determine If Your System Requires a Flash PROM Update

1. Determine the architecture type of your system.

```
% uname -m
```

TABLE 4-1 Determining the System Architecture

| If your system architecture type is . . . | Then . . . |
|---|--|
| • sun4u | Go to Step 2. |
| • sun4c, sun4d, sun4m | You do not need a flash PROM update. Do not proceed further. |

2. Determine the system type of your system.

```
% uname -i
```

TABLE 4-2 Determining the System Type

| If your system type is one of the following systems. . . | Then . . . |
|---|--|
| SUNW, Ultra-1 SUNW, Ultra-2 SUNW, Ultra-4 SUNW, Ultra-Enterprise | Go to Step 3 for each system type. |
| Not in the above list | You do not need a flash PROM update. Do not proceed further. |

3. Determine the version level of the firmware in your system. Type:

```
% prtconf -v
```

TABLE 4-3 Determining the Firmware Version Level

| If your system type is . . . | And you see a number lower than . . . | Then . . . | Otherwise . . . |
|------------------------------|---------------------------------------|--|--|
| SUNW, Ultra-1 | 3.11.1 | Proceed to “Updating the Flash PROM” on page 61. | You do not need a flash PROM update. Do not proceed further. |
| SUNW, Ultra-2 | 3.11.2 | Proceed to “Updating the Flash PROM” on page 61. | You do not need a flash PROM update. Do not proceed further. |
| SUNW, Ultra-4 | 3.7.107 | Proceed to “Updating the Flash PROM” on page 61. | You do not need a flash PROM update. Do not proceed further. |
| SUNW, Ultra-Enterprise | 3.2.16 | Proceed to “Updating the Flash PROM” on page 61. | You do not need a flash PROM update. Do not proceed further. |

Updating the Flash PROM

This section describes the following:

- Capturing configuration variable settings
- Installing the Solaris 7 operating environment
- Making the flash PROM write-enabled
- Steps to perform before updating the flash PROM
- Updating the flash PROM

Note – For step-by-step instructions, follow the procedures beginning with “To Capture the Configuration Variable Settings” on page 62.

After installing the Solaris 7 operating environment on your hardware, set the write-protect/enable flash PROM jumper to the write-enable position (Sun Ultra 1 and Ultra 2 systems) before you attempt to update the firmware in the flash PROM. To change the write protection state of the Sun Enterprise 450 system, turn the external front panel keyswitch.

Refer to the recovery procedure covered later in this chapter if there is a power interruption during the update process.

Return the write-protect/enable jumper (Sun Ultra 1 and Ultra 2 systems) to the write-protect position after updating the firmware in the flash PROM.

When your system has been updated to the proper firmware revision, you can run the Solaris 7 software in 64-bit mode.

Capturing Configuration Variable Settings

While the Solaris operating environment is still running, capture the NVRAM configuration variable settings *before* you install the Solaris 7 operating environment or begin the flash PROM update process. This will enable you to restore customized settings if there is a problem during the flash PROM upgrade.

▼ To Capture the Configuration Variable Settings

1. **Using the `eeeprom` utility, capture the system's configuration variable settings in a file. The *filename* is any file name you choose.**

```
% eeeprom > filename
```

Note – If you have custom values installed in `oem-logo` or `keymap`, those values cannot be displayed or printed properly by the `eeeprom` utility because the contents contain binary information. If it is necessary to restore these values after a power loss, you should determine the original method by which these values were placed into NVRAM and use that method to restore the values.

2. Print out the values captured by the `eeeprom` command. Type the following:

```
lp filename
```

You must have a printed copy of the configuration values before you install the Solaris 7 operating environment and begin to update the flash PROM.

▼ To Install the Solaris 7 Operating Environment

- **Install the Solaris 7 operating environment on your system.**

Refer to the *Installation Library* shipped in your Solaris 7 media kit. As the Solaris 7 operating environment is installed, you will be notified whether the flash PROM in your system needs updating. Installing this Solaris release will provide the software that can upgrade your system's flash PROM to the required level.

Making the Flash PROM Write-Enabled

Before you update the OpenBoot firmware contained in the flash PROM, you must set a jumper to the write-enable position (Sun Ultra 1 and Ultra 2 systems) or set the front panel keyswitch to the proper position (Sun Enterprise 450 system and the Sun Ultra 450 workstation).

The Sun Ultra 1 and Ultra 2 systems, which do not have a front panel keyswitch, are equipped with jumpers on their motherboards that allow the flash PROM to be either write-protected or write-enabled. The default position is for the flash PROM to be write-protected. To update the flash PROM, you must change the jumper to the write-enable position.

▼ Sun Ultra 1 and Ultra 2 Systems: To Change the Jumper to the Write-Enable Position

1. Shut down the system. Type the following:

```
% su
Type your superuser password
# init 0
System shutdown messages
```

2. Power off the system unit.

Refer to the installation guide or service manual for your system.

3. Remove the system access cover.

Refer to the installation guide or service manual for your system for this procedure.

4. Use proper grounding procedures such as wearing a wrist strap to avoid electrostatically damaging system components.

5. Locate the flash PROM J2003 write-protect/enable jumper on the motherboard in your system:

- See FIGURE 4-1 if you have a Sun Ultra 1 system.
- See FIGURE 4-2 if you have a Sun Ultra 2 system.

Note – You may have to remove a plug-in card if the card is covering the flash PROM jumper. Refer to the service manual for your system to remove the card.

FIGURE 4-1 Sun Ultra 1 Series Write-Protect/Enable Jumper Location on Motherboard

FIGURE 4-2 Sun Ultra 2 System Write-Protect/Enable Jumper Location on Motherboard

6. Set the J2003 write-protect/enable jumper to pins 2 and 3 (write enabled) using needlenose pliers (see FIGURE 4-3). Pin 1 is noted by an asterisk (*).

FIGURE 4-3 Setting the Write-Protect/Enable Jumper to the Write-Enable Position

TABLE 4-4 Jumper Setting

| Jumper | Pins 1 + 2 Jumpered | Pins 2 + 3 Jumpered | Default Jumper on Pins | Name |
|--------|---------------------|---------------------|------------------------|--------------------------|
| J2003 | Write-protect | Write-enable | 1 + 2 | Write-protect/ enable |

7. If you removed a plug-in card from the system before changing the jumper, replace the card now.

8. Remove your wrist strap and replace the system access cover.
9. Go to “Before Updating the Flash PROM” on page 67.

Sun Enterprise 450 System and the Sun Ultra 450 Workstation: Disabling Write Protection

For the Sun Enterprise 450 system and the Sun Ultra 450 workstation you do not have to change jumper pins. Instead, you move the keyswitch to allow the flash PROM to be write-enabled.

When the switch is set to the Locked position (FIGURE 4-4), the flash PROM is write-protected. When the switch is set to the On or Diagnostics position, the flash PROM is write-enabled.

▼ To Write Enable the Flash PROM on the Sun Enterprise 450 System and the Sun Ultra 450 Workstation

- Turn the keyswitch to the On or Diagnostics position (FIGURE 4-4) before updating the flash PROM.

Note – Disabling write-protection the Sun Enterprise 450 system or the Ultra 450 workstation assumes that the write-protect/enable jumper was set in the default position (enabled). If you previously changed the write-protect/enable jumper to be write protected, perform the steps to make the flash PROM write enabled in “Location of Flash PROM Jumpers in Sun Enterprise 450 System and the Ultra 450 Workstation” on page 77. You must change the jumper to be write enabled before continuing with the flash PROM update procedure.

FIGURE 4-4 Sun Enterprise 450 and Sun Ultra 450 Keyswitch Location

Before Updating the Flash PROM

Before you begin updating the flash PROM, please note the following.

Caution – Do not interrupt power during flash PROM updating. When you are using the update routine, do not remove or insert system boards.

Note – If power is interrupted during flash PROM updating, follow the power interruption recovery procedures covered later in this chapter.

▼ To Update the Flash PROM

1. If you shut down your system to set the write-enable jumper (Ultra 1, Ultra 2 systems), turn the system on so it can boot.

2. Bring the system down to single user mode. Type the following:

```
% su
Type your superuser password
# init s
```

3. Execute the flash PROM update script by typing the following:

```
/bin/sh /usr/platform/sun4u/lib/prom/`/usr/bin/uname -i`
```

When the flash update process begins, it displays the current, available OpenBoot firmware revisions.

4. Type yes to the question about updating the firmware in the system flash PROM.

Note – If the NVRAM configuration variable `use-nvramrc?` is set to true, the update script resets `use-nvramrc?` to false. You will *only* see the message about the `use-nvramrc?` variable if `use-nvramrc?` is set to true. This is rarely the case.

```
Current System Flash PROM Revision:
-----
OBP 3.5.2 1997/01/06 17:40

Available System Flash PROM Revision:
-----
OBP 3.11.1 1997/12/03 15:44

NOTE: The system will be rebooted (reset) after the firmware has
been updated.

Do you wish to update the firmware in the system Flash PROM? yes/
no :yes

The NVRAM variable 'use-nvramrc?' was 'true'. This program will
reset it to the default value 'false'. This is being done because
the contents of the NVRAM variable 'nvramrc' may or may not be
appropriate for use with the new firmware. Do not change the value
of 'use-nvramrc?' until you evaluate the contents of 'nvramrc'.
```

5. Next, the update script asks you if you want to continue. Type yes.

```
Are you sure that you wish to continue? yes/no :yes
```

```
**IMPORTANT** If the power fails during the firmware update that
is about to take place, it is possible that the customized values
in the NVRAM configuration variables will revert back to their
*default values* once the system power is restored. *If* this event
occurs then it could have a significant effect on the behavior of
the system after power is restored. Following is a list of the
system's NVRAM configuration variables which have default values
and have been customized. You may wish to write this information
down so that the values may be restored after recovery from a power
loss.
```

```
Name: sbus-probe-list
```

```
Default: 01
```

```
Current: 10
```

```
Name: nvramrc
```

```
Default: <null>
```

```
Current: ." This is a sample message which indicates that nvramrc
has been modified." cr
```

If any of the NVRAM configuration variables have been customized, the update displays both the default value and the current value.

Note – After the update, you may want to evaluate if the customized values displayed on the previous screen need to be modified.

The script automatically boots the machine and displays the following message:

```
Erasing the top half of the Flash PROM.
Programming OBP into the top half of the Flash PROM.
Verifying OBP in the top half of the Flash PROM.

Erasing the bottom half of the Flash PROM.
Programming OBP into the bottom half of Flash PROM.
Verifying OBP in the bottom half of the Flash PROM.

Erasing the top half of the Flash PROM.
Programming POST into the top half of Flash PROM.
Verifying POST in the top half of the Flash PROM.

The system's Flash PROM firmware has been updated.

Please wait while the system is rebooted . . .
The system's reboot messages are displayed.
.....
NOTICE: 64-bit OS installed, but the 32-bit OS is the default for
the processor on this system.

See boot(1M) for more information.
Booting the 32-bit OS/
```

- 6. Become root and change the default kernel from 32-bit to 64-bit by editing the /platform/platform-name/boot.conf file.**

```
# cd /platform/sun4u/
# ls
boot.conf  cprboot    cprbooter  kadb        kernel      ufsboot
# vi boot.conf
```

- 7. Uncomment the line `ALLOW_64BIT_KERNEL_ON_UltraSPARC_1_CPU=true`.**
- 8. If you have a Sun Ultra 1 or Ultra 2 system, change the jumper back to the write-protect position.**
- a. Allow the system to boot so you can become superuser.**
 - b. Halt the system by typing `init 0` at the superuser prompt.**

- c. Power off the system.
- d. Open the system unit (refer to the installation or service manual for your system).
- e. Attach a wrist strap properly (refer to the installation or service manual for your system).
- f. Reset the J2003 write-enable/protect jumper to the write-protect position. In the write-protect position pins 1 and 2 are jumpered (see FIGURE 4-1, FIGURE 4-2, FIGURE 4-5, and TABLE 4-4). You may need to remove a plug-in card from the system before resetting the jumper if the card is covering the jumper. Pin 1 is noted by an asterisk (*).

FIGURE 4-5 Moving the Write-Protect/Enable Jumper Back to the Write-Protect Position

- g. If you removed a plug-in card from the system before changing the jumper, replace the card now.
 - h. Remove your wrist strap and replace the system access cover.
 - i. Turn the power on to the system.
9. If you have a Sun Enterprise 450 system or a Sun Ultra 450 workstation, turn the keyswitch to the Standby position, wait a few seconds, and then power on again. This power-cycling flushes any old firmware code out of system memory.

Recovering From a Power Failure During the Flash PROM Update

If the power was lost during the flash PROM update, complete the power interruption recovery procedure for your system.

Sun Ultra 1 and Ultra 2 Systems, Sun Enterprise 450 System, Sun Ultra 450 Workstation

If power to your system was interrupted during updating of the flash PROM, complete the following steps:

1. **Turn the power switch to the Standby position to prevent power surge to the system when power is restored.**
2. **After power is restored to the system location, return the power switch to the On position.**

After power is restored, one of the following two recovery scenarios should happen on your system. Follow the instructions described for the appropriate scenario.

Scenario 1—System Recovers After Power Restoration

If your system attempts to autoboot after power is restored, you *must* complete the flash PROM updating process.

Scenario 2—System Does Not Recover After Power Restoration

If your system does not boot, run diagnostics, or return to the PROM monitor's `ok` prompt after power is restored, complete the following steps:

1. **If the update was being run via a serial port and the system also has a frame buffer and keyboard installed, or if the system has a keyboard and more than one frame buffer installed:**
 - a. **Connect a monitor to each frame buffer.**
 - b. **Confirm that output has been redirected to one of the frame buffers.**
 - The NVRAM configuration variables *might* have been modified because of the firmware update just before power was lost. If this happened, then the system output was possibly redirected to a device other than the one originally used to display it. This could only have happened if a keyboard was connected to the system.
 - If there is no keyboard connected to the system and the NVRAM configuration variables are set to their default values, then system input and output are directed to serial port A.

2. If output cannot be found on any of the installed frame buffers or serial port A, set the boot control jumper to boot from the half of the PROM that is not currently selected. See FIGURE 4-1, FIGURE 4-2, FIGURE 4-6, and FIGURE 4-7. An asterisk (*) on the main logic board notes the location of pin 1.
- If the jumper is set for high-half booting, move it to low-half booting (pins 2 and 3 jumpered). See FIGURE 4-6.
 - If the jumper is set for low-half booting, move it to high-half booting (pins 1 and 2 jumpered). See FIGURE 4-6.

TABLE 4-5 Boot Control Jumper

| System | Jumper | Pins 1 + 2 Jumpered | Pins 2 + 3 Jumpered | Default Jumper on Pins | Name |
|---|--------|---------------------|---------------------|------------------------|--------------|
| Ultra 1, 2 | J2204 | High-half booting | Low-half booting | 2 + 3 | Boot control |
| Sun Enterprise 450 or Sun Ultra 450 workstation | J5501 | High-half booting | Low-half booting | 2 + 3 | Boot control |

FIGURE 4-6 Setting the Boot Control Jumper to Low-Half Booting or High-Half Booting

3. **Power on the system unit.**
- If the system recovers, complete the programming process by rebooting.
 - If the system does not recover, repeat Step 1 and Step 2 a second time.
4. If the system *still* does not recover, contact your Sun service provider or local Sun service Authorized Service Provider.

Restoring NVRAM Configuration Variables

If for any reason, the flash PROM update process did not complete successfully, for example if you lost power, you may have to restore `diag-switch?` to its default value of false and restore any customized values to the other NVRAM configuration variables.

Note – Use the steps in this section only if for any reason your NVRAM configuration variables were not reset to their customized values or if `diag-switch?` was not set to its proper value.

1. Reboot the system by typing `reboot` at the prompt.

If `diag-switch?` was set to true and the system is power cycled, diagnostics will be run. Running diagnostics could take several minutes. Also, the system will attempt to boot from the network once the diagnostics have completed running.

Note – Other NVRAM variables may be reset to their default values, which could affect the system in other ways. For example, if you ran the flash PROM update through the serial port and the system still has its keyboard plugged in, you will no longer get any response from the serial port connection. The firmware will be waiting for input from the keyboard.

2. As the system boots, go to the `ok` prompt by one of the following methods.

- Press Stop-a from the keyboard.
- If you are running on a terminal and connected to serial port A of the system, press the Break key.
- If you are connected to serial port A via telnet connection send a Break sequence by pressing the Control and] keys simultaneously. This returns you to the telnet command line. Type `send brk` at the telnet command line.
- If you are connected to serial port A via a tip connection, send a Break sequence by typing the characters `~#` in quick succession.

3. **Reset the configuration variables default value to the current value (see the values you captured with the `eeeprom` command in “To Capture the Configuration Variable Settings” on page 62 and the values you wrote down earlier in this procedure in Step 1). At the `ok` prompt, type the following for *each* configuration variable:**

```
ok setenv variablename currentvalue
```

For example:

```
ok setenv auto-boot? false
```

The `setenv` command resets each configuration variable you entered to the current value.

4. **If the OpenBoot `diag-switch?` variable was set to `true` (`false` is the default) and the system is power cycled, diagnostics will run. Also, when you boot the system, the system will attempt to boot from the network. Unless you had `diag-switch?` set to `true` before the flash PROM update, set `diag-switch?` to `false`, the default value:**

```
ok setenv diag-switch? false
```

5. **If the `use-nvramrc?` configuration variable was set to `true` before the flash PROM update, as part of the update the `use-nvramrc?` variable was set to `false` because the contents of the NVRAM configuration variable `nvramrc` may or may not be appropriate for use with the new firmware. If you want to change the `use-nvramrc?` variable back to `true`, evaluate the contents of `nvramrc` first with `printenv nvramrc` then change the `use-nvramrc?` configuration variable back to `true` with the `setenv use-nvramrc? true` command.**
6. **Make sure that other configuration variables are set properly.**
 - a. Use the `printenv` OpenBoot command to display the NVRAM configuration variables and their settings.
 - b. At the PROM monitor's `ok` prompt, you can use OpenBoot commands to restore the values of the configuration variables. Refer to the *OpenBoot 3.x Command Reference Manual*. You can also use the `eeeprom` utility as superuser in the Solaris operating environment. See the `eeeprom` man page description for more information.

7. If you have a Sun Enterprise 450 or an Ultra 450, turn the keyswitch to the **Standby position**, wait a few seconds, and then power on again. If you have an **Ultra 1 or Ultra 2 system**, type `reset-all`.

If you set the `auto-boot?` NVRAM configuration variable to `true`, and the `boot-device` variable contains the device or device alias where the Solaris 7 operating environment was installed, then the system will boot the Solaris 7 operating environment.

Error Messages

Most of the error messages were documented within the flash PROM update procedure. This section contains error messages that were not part of the flash PROM update procedure.

Retained Page/mmap Failure

If you see an error message similar to the following, just after the flash update program logs on Flash Update 2.0: Program and system initialization in progress... `eeeprom:(attach)` No retained page found in device tree then the update will fail with the following message if the Flash PROM Update is attempted:

```
Do you wish to update the firmware in the system Flash PROM? yes/  
no : yes  
eeeprom:(mmap) on retained page failed: no retained page found  
Flash Update: MMAP call failed.  
: No such device or address
```

If this error occurs, issue a `reboot` command at the superuser prompt and allow the system to return to the Flash PROM Update inquiry **WITHOUT INTERRUPTION**. Attempt the flash PROM Update once again by completing the steps in the section “To Update the Flash PROM” on page 67. If the reboot was uninterrupted and the flash PROM Update fails a second time for the same reason, contact your Authorized Service Provider.

Location of Flash PROM Jumpers in Sun Enterprise 450 System and the Ultra 450 Workstation

The flash PROM update procedure for the Sun Enterprise 450 and the Ultra 450 systems assumes that the write-protect/enable jumper was set in the default position (enabled). In order to update the flash PROM, you must move the write-protect/enable jumper to the write-enable position.

Three jumpers on the main logic board affect flash PROM operation. FIGURE 4-7 shows the jumper locations, and TABLE 4-6 describes their functions.

FIGURE 4-7 Flash PROM Jumpers on the Sun Enterprise 450 System and the Sun Ultra 450 Workstation

TABLE 4-6 Sun Enterprise 450 and Ultra 450 Flash PROM Jumper Settings

| Jumper | Pins 1 + 2 Jumpered | Pins 2 + 3 Jumpered | Default on Pins | Signal Controlled |
|--------|---------------------|---------------------|-----------------|------------------------|
| J3102 | Flash PROM | Not to be used | 1 + 2 | FLASH PROM SEL |
| J3103 | Write-protect | Write-enable | 2 + 3 | FLASH PROM PROG ENABLE |
| J5501 | High-half booting | Low-half booting | 2 + 3 | XOR LOGIC SET |

Make sure that the write-protect/write-enable jumper is set to the write-enable position, pins 2 and 3 jumpered (see FIGURE 4-8). Pin 1 is noted by an asterisk (*).

FIGURE 4-8 Setting the J3103 Write Protect/Enable Jumper on the Sun Enterprise 450 or Ultra 450

Flash PROM Update Multimedia Collection

The video content of the AnswerBook2 collection is very large. You may want to view it directly from the CD rather than installing this software package on a system already running an AnswerBook2 server. You also can view the video clips directly without using AnswerBook software or a browser.

▼ Running the Video Clips from the CD

To run the video clips contained in this AnswerBook collection directly from the CD, perform the following steps:

1. **Insert the Flash PROM Update Multimedia AnswerBook CD into your CD-ROM drive.**
2. **Change directory to, or bring up file manager, and go to the top level of the CD-ROM volume. This should look similar to:**

```
% cd /cdrom/flash_answerbook
```

where *cdrom* is the mount-point for the CD-ROM device and *flash_answerbook* is the name of the CD-ROM volume.

3. To run the viewing script, type:

```
% ./watch-videos
```

4. Select the first video clip you want to see.
5. Before you view another video clip, dismiss the viewer that displayed the previous video clip.

▼ Running an AnswerBook2 Server from the CD

To run the AnswerBook2 server directly from the CD, perform the following steps:

1. Insert the Flash PROM Update Multimedia AnswerBook CD into your CD-ROM drive.
2. Open a command window and become superuser using the `su` command and superuser password.
3. Change directory to the top level of the CD-ROM volume.

This should look similar to:

```
# cd /cdrom/flash_answerbook
```

where *cdrom* is the mount-point for the CD-ROM device and *flash_answerbook* is the name of the CD-ROM volume.

Among other things, this directory contains the executable script `ab2cd`.

4. Run the following command:

```
# ./ab2cd
```

5. If you have existing AnswerBook2 documentation collections installed on your server machine and you want the CD-driven server software to recognize those collections, use the following command:

```
# ./ab2cd -s
```

This causes the CD-driver server software to scan for other collections installed on this system and add them to its database.

6. You can now access the document server using the following URL:

`http://server:8888/`

Where *server* is the name of the machine to which the CD is attached.

7. To view video clips that are contained in an AnswerBook document, edit your browser's preferences to specify an MPEG Video application.

For example, to make use of the ShowMe™ TV™ software provided on this CD in a Netscape Communicator browser, perform these steps:

a. In the top bar menu of the browser, select Edit --> Preferences.

b. In the Preferences window, select the category Navigator and the subcategory Applications.

c. In the list of Applications, specify that MPEG Video is handled by the following: `showmetv -nowrap %s`.

d. Click OK to apply this change to the Preferences.

8. In the document, click the video clip icon to launch the viewer.

9. Before you view another video clip, dismiss the viewer that displayed the previous video clip.

10. To stop running the AnswerBook server from the CD, run the following command:

```
# /cdrom/flash_answerbook/ab2cd stop
```

Notes on Running AnswerBook2 from a CD

The following paragraphs provide important information about running the AnswerBook2 server from the CD.

Default AnswerBook2 Port

The AnswerBook2 server run from the CD always runs on port 8888. If you already have an AnswerBook2 server running on your system using the default port (8888), the `ab2cd` script will display the following message:

```
A document server is already running on this system as server:8888.
```

Shut down the current server before running the `ab2cd` command. Use the following command to shut down the existing server:

```
# /usr/lib/ab2/bin/ab2admin -o stop
```

Stopping the AnswerBook2 Server Process

Always use `ab2cd stop` to stop the server running from the CD. Do not use `/etc/init.d/ab2mgr stop` to stop the CD-based server.

The `ab2cd stop` command stops the AnswerBook2 server process and cleans up all files in the `/tmp/.ab2/` and `/tmp/ab2cd_config/` directories. The `/etc/init.d/ab2mgr stop` command stops all server processes, but does not clean up the files in the `/tmp/.ab2/` and `/tmp/ab2cd_config/` directories.

Running Two AnswerBooks

To run two AnswerBook2 servers (one on your system, one from the CD), keep these rules in mind:

Startup

- The `/etc/init.d/ab2mgr start` command always starts the server on your system.
- The `ab2cd` command always starts the server from the CD.

Shutdown

- Always use the `ab2cd stop` command to stop the server running from the CD.
- To stop both servers, first use the `ab2cd stop` command to stop the server running from the CD, then use either `/etc/init.d/ab2mgr stop` or `/usr/lib/ab2/bin/ab2admin -o stop` to stop the server running on your system.

Updating the Flash PROM on the Sun Enterprise 3x00, 4x00, 5x00, and 6x00 Systems

The steps in this chapter describe how to update the flash PROMs in your Sun Enterprise 3x00, 4x00, 5x00, or 6x00 system.

Some systems require higher level of OpenBoot™ firmware in the flash PROM to run the 64-bit mode of the Solaris™ 7 operating environment. The OpenBoot firmware is contained in several PROMs that are located on several different boards.

The flash PROM devices, which contain OpenBoot, are electrically erasable and writable devices. This means that the firmware can be updated without removing the flash PROM from the system board. This Solaris 7 kit includes the routines and instructions you need to update the flash PROM in your system.

Determining If the Flash PROM Needs Updating

Note – If your system is an Ultra™ Enterprise™ 10000, you do not need to do this update because the Ultra Enterprise 10000 does not have a flash PROM.

Only sun4u systems that can run the 64-bit mode of the Solaris 7 operating environment might need the flash PROM update. Systems that can only run the 32-bit mode (such as those in the sun4c, sun4d, and sun4m platform groups) do not require updated firmware to run Solaris 7 software.

Note – If the Solaris 7 operating environment notified you that the flash PROM in your system needs updating, skip the steps in the procedure “To Determine If Your System Requires a Flash PROM Update” on page 84 and go directly to “Updating the Flash PROM” on page 85.

▼ **To Determine If Your System Requires a Flash PROM Update**

1. Determine the architecture type of your system.

```
% uname -m
```

TABLE 5-1 Determining the System Architecture

| If your system architecture type is . . . | Then . . . |
|---|--|
| • sun4u | Go to Step 2. |
| • sun4c, sun4d, sun4m | You do not need a flash PROM update. Do not proceed further. |

2. Determine the system type of your system.

```
% uname -i
```

TABLE 5-2 Determining the System Type

| If your system type is one of the following systems. . . | Then . . . |
|--|--|
| SUNW, Ultra-1 SUNW, Ultra-2 SUNW, Ultra-4 | Go to Chapter 4 |
| SUNW, Ultra-Enterprise | Go to Step 3. |
| Not in the above list | You do not need a flash PROM update. Do not proceed further. |

3. Determine the version level of the firmware in your system. Type `prtconf -V` (upper case V).

```
% prtconf -V
```

TABLE 5-3

| If your system type is . . . | And you see a number lower than . . . | Then . . . | Otherwise . . . |
|------------------------------|---------------------------------------|--|--|
| SUNW, Ultra-Enterprise | 3.2.16 | Proceed to “Updating the Flash PROM” on page 85. | You do not need a flash PROM update. Do not proceed further. |
| SUNW, Ultra-1 | 3.11.1 | Proceed to Chapter 4. | You do not need a flash PROM update. Do not proceed further. |
| SUNW, Ultra-2 | 3.11.2 | Proceed to Chapter 4. | You do not need a flash PROM update. Do not proceed further. |
| SUNW, Ultra-4 | 3.7.107 | Proceed to Chapter 4. | You do not need a flash PROM update. Do not proceed further. |

Updating the Flash PROM

This section describes the following:

- Flash PROM update process
- Capturing NVRAM configuration variable settings
- Making the flash PROM write-enabled
- Steps to perform before updating the flash PROM
- Updating the flash PROM

Flash PROM Update Process

Note – For step-by-step instructions, follow the procedures beginning with “Capturing Configuration Variable Settings” on page 86.

After installing the Solaris 7 operating environment, make sure that the external front panel keyswitch is set to the On or Diagnostics position.

Take note of screen messages, during the flash PROM update, that report configuration variables that may be reset to their default values. When the update is complete and after you either reset the system or power cycle the system, revise the configuration variables as needed to restore your preferences.

Refer to the recovery procedure covered later in this chapter if there is a power interruption during the update process.

When your system has been updated to the proper firmware revision, you can run Solaris 7 software in 64-bit mode.

Capturing Configuration Variable Settings

While the Solaris operating environment is still running, capture the NVRAM configuration variable settings *before* you install the Solaris 7 operating environment or begin the flash PROM update process.

As part of the flash PROM update, your NVRAM configuration variables might change to the default values. To ensure that you can change the default values back to the values you customized, you need to save the current state of the NVRAM configuration variables using the `eeeprom` command.

▼ To Capture the Configuration Variable Settings

1. Using the `eeeprom` utility, capture the system's configuration variable settings in a file. Type `eeeprom > filename`. The *filename* is any file name you choose.

```
% eeeprom > filename
```

Note – If you have custom values installed in `oem-logo` or `keymap`, those values cannot be displayed or printed properly by the `eeeprom` utility because the contents contain binary information. If it is necessary to restore these values after a power loss, you should determine the original method by which these values were placed into NVRAM and use that method to restore the values.

2. Print out the values captured by the `eeeprom` command. You must have a printed copy of the configuration values before you install the Solaris 7 operating environment and begin to update the flash PROM. Type the following:

```
lp filename
```

▼ To Install the Solaris 7 Operating Environment

- **Install the Solaris 7 operating environment on your system.**

Refer to the *Installation Library* which is in your Solaris 7 media kit. As the Solaris 7 operating environment is installed, you will be notified whether the flash PROM in your system needs updating. Installing this Solaris release will provide the software that can upgrade your system's flash PROM to the required level.

Making the Flash PROM Write-Enabled

Before you update the OpenBoot firmware, which is contained in the flash PROM, you must set the front panel keyswitch to the proper position to allow the flash PROM to be write-enabled.

When the switch is set to the Locked position (FIGURE 5-1), the flash PROM is write-protected. When the switch is set to the On position or to the Diagnostics position, the flash PROM is write-enabled.

FIGURE 5-1 shows the keyswitch positions on a 16-slot Sun Enterprise 6000 system. The server systems described in this section have the same keyswitch positions.

▼ To Write Enable the Flash PROM

- **Turn the keyswitch to the On or Diagnostics position (FIGURE 5-1) before updating the flash PROM.**

Note – Disabling write-protection on servers assumes that the system's write-protect/enable jumpers were set in the default position (enabled). If you previously removed the write-protect/enable jumper, perform the steps to make the flash PROM write enabled in "Location of Flash PROM Jumpers in Sun Enterprise Server Systems" on page 97.

FIGURE 5-1 Sun Enterprise 6x00, 5x00, 4x00, 3x00 Keyswitch Locations

Before Updating the Flash PROM

Before you begin updating the flash PROM, please note the following cautions.

Caution – Do not interrupt power during flash PROM updating. When you are using the update routine, do not remove or insert system boards.

Caution – The flash update may cause default NVRAM values to overwrite customized NVRAM variables. Be sure to record the custom and default values displayed so that you can restore them after you perform the flash PROM update.

Note – If power is interrupted during flash PROM updating, follow the power interruption recovery procedures covered later in this chapter.

Running the Flash PROM Update Script Manually

The flash PROM update script is typically run at bootup. You can also run the flash PROM update script manually by doing the following:

1. Bring the system down to single user mode. Type the following:

```
% su
Type your superuser password
# init s
```

2. Execute the flash PROM update script by typing the following:

```
/bin/sh /usr/platform/sun4u/lib/prom/`/usr/bin/uname -i`
```

Follow the step-by-step instructions when running the script in the section “To Update the Flash PROM” on page 89. Begin with Step 2 (do not execute the `reboot` command).

▼ To Update the Flash PROM

1. Reboot your system. Type `reboot` at the superuser prompt.

```
# reboot
```

2. If your flash PROM needs to be updated, the flash PROM update script displays the following message:

This system has older firmware. Although the current firmware is fully capable of running the 32-bit packages, you will not be able to run the 64-bit packages installed on this system until you update the system flash PROM.

This system ships with flash PROM write-protect jumpers in the "write enabled" position. Unless the jumpers on this system have been changed, there is no need to change them in order to run the system flash PROM update.

The front panel keyswitch on this system must NOT be in the "SECURE" position while the system flash PROM update is running. Please check the keyswitch position before answering the next question.

See the Hardware Platform Guide for more information.

Please answer the next question within 90 seconds, or press the ENTER key to disable the timer.

Would you like to run the system flash PROM update now?
(By default the system flash PROM update will not be run now.)
yes or no? [y,n] **y**
Extracting files
Loading flashprom driver

3. When the flash update process begins, it displays the current and available system board PROM revisions.

Current System Board PROM Revisions:

```
-----  
Board 0: CPU/Memory OBP 3.2.16 1998/06/08 16:58 POST 3.9.4 1998/06/09 16:25  
Board 2: CPU/Memory OBP 3.2.16 1998/06/08 16:58 POST 3.9.4 1998/06/09 16:25  
Board 4: CPU/Memory OBP 3.2.16 1998/06/08 16:58 POST 3.9.4 1998/06/09 16:25  
Board 6: CPU/Memory OBP 3.2.16 1998/06/08 16:58 POST 3.9.4 1998/06/09 16:25  
Board 1: I/O Type 2 FCODE 1.8.3 1997/11/14 12:41 iPOST 3.4.6 1998/04/16 14:22  
Board 3: I/O Type 5 FCODE 1.8.7 1997/12/08 15:39 iPOST 3.4.6 1998/04/16 14:22  
Board 7: I/O Type 5 FCODE 1.8.7 1997/12/08 15:39 iPOST 3.4.6 1998/04/16 14:22
```

Available 'Update' Revisions:

```
-----  
CPU/Memory OBP 3.2.16 1998/06/08 16:58 POST 3.9.4 1998/06/09 16:25  
I/O Type 1 FCODE 1.8.3 1997/11/14 12:41 iPOST 3.4.6 1998/04/16 14:22  
I/O Type 2 FCODE 1.8.3 1997/11/14 12:41 iPOST 3.4.6 1998/04/16 14:22

I/O Type 5 FCODE 1.8.7 1997/12/08 15:39 iPOST 3.4.6 1998/04/16 14:22
```

- 4. If any of the NVRAM configuration variables have been customized, the update displays both the default value and the customized (current) value.**

```
Verifying Checksums: Okay
```

```
Do you wish to flash update your firmware? y/[n] : y
```

```
**IMPORTANT** As a consequence of the firmware upgrade that is about to take place, it is very possible that the customized values in the configuration variables will revert to their *default values* upon the next system power-cycle or soft-reset. If this happens, it could have a significant effect on the behavior of the system after the power-cycle or soft-reset.
```

```
Following is a list of the system's NVRAM configuration variables which have been customized (i.e. they are different than the default values).
```

```
You may wish to write down the values of the indicated configuration variables so that they may be restored (if necessary) after the next power-cycle or soft-reset.
```

```
Name: auto-boot?
```

```
Default: true
```

```
Current: false
```

```
Name: boot-file
```

```
Default: <null>
```

```
Current: kadb -d
```

- 5. Take note of the variables and values for current settings.**

Either write down the current values or mark up the `eeeprom` output you captured in “To Capture the Configuration Variable Settings” on page 86 so that you know which NVRAM configuration variables will need to be changed from their default values after the flash PROM update.

If the keyswitch is set to the locked position, you will see the following error message..

```
FEPROM Write Protected: Check Write Enable Jumper or Front Panel Key Switch.
```

- 6. Make the flash PROM write-enabled by turning the keyswitch to the On or Diagnostics position then type `reboot` at the `#` prompt**

7. The update then prompts you if you want to continue. Make sure that you have turned the keyswitch to the On or Diagnostics position then type y. The flash PROMs are updated.

```
Are you sure that you wish to continue? y/[n] : y

Updating Board 0: Type 'cpu' (PromID=1a4)

Updating Board 6: Type 'dual-pci' (PromID=1a4)
1 Erasing ..... Done.
1 Verifying Erase ..... Done.
1 Programming ..... Done.
1 Verifying Program ..... Done.

Unloading flashprom driver

The new firmware will not take effect until the system is power-
cycled.
```

8. After the flash PROMs are updated, the system asks if you would like to halt the system. Type yes.

```
Do you wish to halt the system now? yes or no? yes

The system's shutdown messages are displayed.

Program terminated
ok
```

Note – If you answered no to the question on halting the system, the installation will continue but the updated firmware will not become effective until the next system reboot. The NVRAM configuration variables are changed to default values at the next system reboot. If you customized NVRAM configuration variables you must change the values back to their customized settings.

9. Turn the keyswitch to the Standby position.
10. Turn the power on to the system. As the system boots, diagnostics will be run at boot up because the OpenBoot `diag-switch?` was set to `true` in the flash PROM update procedure. Running diagnostics could take several minutes.

Note – Other NVRAM variables may be reset to their default values, which could affect the system in other ways. For example, if you ran the flash PROM update through the serial port and the system still has its keyboard plugged in, you will no longer get any response from the serial port connection. The firmware will be waiting for input from the keyboard. TABLE 5-4, which follows, describes the workarounds for NVRAM settings.

11. As the system boots, go to the `ok` prompt by one of the following methods.
 - a. Press Stop-a from the keyboard.
 - b. If you are running on a terminal and connected to serial port A of the system, press the Break key.
 - c. If you are connected to serial port A via telnet connection send a Break sequence by pressing the Control and J keys simultaneously. This returns you to the telnet command line. Type `send brk` at the telnet command line.
 - d. If you are connected to serial port A via a tip connection, send a Break sequence by typing the characters `~#` in quick succession.

12. **Reset the configuration variables default value to the current value** (see the values you captured with the `eeeprom` command in “To Capture the Configuration Variable Settings” on page 86 and the values you wrote down earlier in this procedure in Step 1). At the `ok` prompt, type the following for *each* configuration variable:

```
ok setenv variablename currentvalue
```

For example:

```
ok setenv auto-boot? false
```

The `setenv` command resets each configuration variable you entered to the current value.

13. **When you updated the flash PROM, the OpenBoot `diag-switch?` variable was also set to `true`. With `diag-switch?` set to `true`, diagnostics will run when you reboot the system. If you don't want diagnostics to be run at boot up, set `diag-switch?` to `false` with the `setenv diag-switch? false` command.**
14. **Make sure that other configuration variables are set properly.** TABLE 5-4 describes what might occur if you did not have the default NVRAM configuration variables set before the flash PROM update.
 - a. Use the `printenv` OpenBoot command to display the NVRAM configuration variables and their settings.
 - b. Use the `setenv` OpenBoot command to restore the NVRAM configuration variables to the customized values except for the `nvrामrc` configuration variable.

- c. For the `nvrामrc` configuration variable refer to TABLE 5-4 for how to restore the configuration variable to the customized settings. For additional information on the NVRAM configuration variables, refer to the *OpenBoot 3.x Command Reference Manual*.

TABLE 5-4 Restoring Customized Settings

| Variable Name | Default Value | Description |
|---------------|---------------|--|
| output-device | screen | If output-device is not set to the default value before the flash PROM update, then it is possible that the output device may be other than what you anticipate. |
| input-device | keyboard | If input-device is not set to the default value before the flash PROM update, then it is possible that the input device may be other than what you anticipate. |
| ttyb-mode | 9600,8,n,1,- | If you are running anything from the serial ports A or B with port settings other than what is default (baud rate, number of bits, parity, number of stop bits, handshake), then those communications lines may not function after the flash PROM update. |
| ttya-mode | 9600,8,n,1,- | If you are running anything from the serial ports A or B with port settings other than what is default (baud rate, number of bits, parity, number of stop bits, handshake), then those communications lines may not function after the flash PROM update. |
| boot-command | boot | If there are any custom flags to boot, then the system may not boot as anticipated after the flash PROM update. |
| auto-boot? | true | The system may attempt to autoboot after the first reset or power cycle following the flash PROM update. With auto-boot? set to false, the system will not autoboot. |
| diag-switch? | true | After you reboot or power cycle the system after the flash PROM update, the diag-switch? may be set to true. With diag-switch? set to true, diagnostics will be run at boot up. Also, the system may attempt to boot from a different device than was booted prior to the flash PROM update. |
| diag-device | disk | If you had diag-switch? set to true before the update then this is the device that would probably have been booted. This device might not be the boot device after the flash PROM update. |
| diag-file | Empty string | If you were booting a customized kernel file before the update, and diag-switch? was set to true after the flash PROM update, the customized kernel file might not be booted after the flash PROM update. |

TABLE 5-4 Restoring Customized Settings (*Continued*)

| Variable Name | Default Value | Description |
|---------------------------|-----------------------|--|
| <code>boot-file</code> | Empty string | If you were booting a customized kernel file before the flash PROM update, and <code>diag-switch?</code> was false (default), the customized kernel file might not be booted after the flash PROM update. |
| <code>boot-device</code> | <code>disk net</code> | If you had a different sequence of boot-devices specified, after the flash PROM update an incorrect device might be booted. |
| <code>use-nvramrc?</code> | false | If you had customized commands in the <code>nvramrc</code> , and <code>use-nvramrc?</code> was set to true, then those customized commands might not be used after the flash PROM update. |
| <code>nvramrc</code> | Empty | If you had customized commands in the <code>nvramrc</code> , then those customized commands might be lost after the flash PROM update. Do not use <code>setenv</code> to change the <code>nvramrc</code> variable. Instead use <code>nvedit</code> and <code>nvstore</code> . If you know that the <code>nvramrc</code> variable contains a firmware patch which is no longer compatible with the newly programmed firmware, do not change the <code>nvramrc</code> variable to its previously customized value. |
| <code>oem-logo?</code> | false | If <code>oem-logo?</code> was true before the flash PROM update, the <code>oem-logo</code> might be lost after the update, and <code>oem-logo?</code> might be set to false. |
| <code>oem-banner?</code> | false | If <code>oem-banner?</code> was true before the flash PROM update, the <code>oem-banner</code> might be lost after the flash PROM update, and <code>oem-banner?</code> might be set to false. |

15. Turn the keyswitch to the Standby position, wait a few seconds, and then power on again.

This power-cycling flushes any old firmware code out of system memory.

If you set the `auto-boot?` NVRAM configuration variable to true, and the `boot-device` variable contains the device or device alias where the Solaris 7 operating environment was installed, then the system will boot the Solaris 7 operating environment. This concludes the flash PROM update procedure.

Location of Flash PROM Jumpers in Sun Enterprise Server Systems

If you previously removed the write-protect/enable jumper, you must reinstall it in order to successfully perform the flash PROM update procedure.

Sun Enterprise 3x00, 4x00, 5x00, and 6x000 systems have a jumper on the clock board, P0601, which controls if the flash PROM can or cannot be updated.

- With the jumper P0601 *installed*, *all* the flash PROM *can* be updated.
- With the jumper P0601 *removed*, *all* the flash PROM *cannot* be updated.

If you previously removed jumper P0601, you must reinstall it before you can complete the flash PROM update procedure.

Installing the P0601 Jumper

To install the P0601 jumper, follow these steps:

1. **Halt the system then turn the keyswitch to the Standby position.**

Caution – The clock board is not hot-pluggable. Do not remove the clock board until the system has been halted and powered off.

2. **Remove the clock board from the system (see FIGURE 5-2).**

FIGURE 5-2 Rear View of the Sun Enterprise 6000 System

Note – FIGURE 5-2 shows a 16-slot system. Systems also come in 4-, 5-, and 8-slot configurations.

3. Locate the P0601 jumper location (FIGURE 5-3) on the clock board.

FIGURE 5-3 Clock Board and Jumper P0601 Jumper Location

- 4. Insert the P0601 jumper on the clock board.**
- 5. Replace the clock board in the system.**
Refer to Chapter 6 in your reference manual for the detailed procedure.
- 6. Turn the keyswitch to the On or Diagnostics position.**

Recovering From a Power Failure During the Flash PROM Update

If the power was lost during the flash PROM update, complete the power interruption recovery procedure for your system.

Sun Enterprise 3x00, 4x00, 5x00, and 6x00 Systems

There are three scenarios for the Sun Enterprise 3x00, 4x00, 5x00, and 6x00 systems:

- Completing the update of the flash PROM
- Recovering a one-board system after power interruption
- Recovering a multi-board system after power interruption

▼ To Complete the Update of the Flash PROM

If power was interrupted during the flash PROM update procedure, it is possible that one or more system boards were not updated successfully. You must become superuser and complete the flash PROM update.

- At the # prompt, type the following:

```
# /bin/sh /usr/platform/sun4u/lib/prom/`uname -i`
```

▼ To Recover a One-Board System After Power Interruption

- Call your Sun service provider or local Sun service Authorized Service Provider.

▼ To Recover a Multi-Board System After Power Interruption

Only one board is updated at any given time in the flash PROM updating process. If there is a power interruption to the system while the flash PROMs are being updated, only one board will have its flash PROMs in an inconsistent state.

Note – Power interruption during updating of the flash PROMs aborts the updating at the point of the power interruption. Turn the keyswitch to the Standby position (FIGURE 5-1) to prevent power surge to the system when power is restored.

The following recovery procedure requires another board of the same type with an uncorrupted PROM image (if you are updating an “I/O Type 1” board, you must use another “I/O Type 1” board). In the following code examples, the flash PROM on board 3 recovers by copying the flash PROM image from board 0.

1. Connect a null modem cable to port A and to either a terminal or a Sun™ Workstation™.

2. Set the serial port at 9600 bps, 8-bit word, no parity, and 1 stop bit.
3. Remove the board that was being programmed when the power went out.
4. Turn the keyswitch to the On position (FIGURE 5-1).

The system responds with the message:

```
Hardware Power ON
```

- Wait 15 seconds and type `s` on the keyboard terminal or the tip window connected to the serial port.

The system responds:

```
0,0>
*** Toggle Stop POST Flag = 1 ***
```

This message shows that POST (power-on self-test) has recorded your request to stop after testing is completed.

When POST stops, it will display the following options menu:

```
0,0>Extended POST Menu
0,0>Select one of the following functions
0,0>      '0'      Return
0,0>      '1'      Reset
0,0>      '2'      Peek/Poke device
0,0>      '3'      Environmental Status
0,0>      '4'      Test Menus
0,0>      '5'      State Dump
0,0>      '6'      Frequency Margining
0,0>      '7'      Display System Summary
0,0>      '8'      Display Fatal Reset Info
0,0>      '9'      Scan System Board Ring
0,0>      'a'      Set Memory Test Megs
0,0>      'b'      Print SIMM Info
0,0>      'c'      Focus CPU
0,0>      'd'      CPU State
0,0>      'f'      fcopy
0,0>      'g'      System Power Off
0,0>      'h'      Bounce Patterns
0,0>      'i'      Focus I/O Board
0,0>
```

1. Type f to select fcopy.

```
Command ==> f
0,0>Flash PROM Copy Menu
0,0>Select one of the following functions
0,0>      '0'      Return
0,0>      '1'      Copy
0,0>      '2'      Verify
0,0>      '3'      Display Version
0,0>      '4'      Activate System Board
0,0>

Command ==>
```

2. Without powering off the system, plug in the board with the corrupted flash PROM. Be sure its power LED is lit.

3. Type 4 to select Activate System Board.

The system prompts you to enter the board number in hexadecimal notation from 0 through 9 and “a” through “f”. In the example below, board 3 is entered as the board to be activated.

```
Command ==> 4
0,0>Input board number in hex ('0' thru '9' and 'a' thru 'f')
?3
0,0>
0,0>Flash PROM Copy Menu
0,0>      '0'      Return
0,0>      '1'      Copy
0,0>      '2'      Verify
0,0>      '3'      Display Version
0,0>      '4'      Activate System Board
0,0>

Command ==>
```

4. **Type 1 to select Copy. Respond to the prompts for source (where to copy from) and destination (where to copy to) board numbers in hexadecimal notation.**

In the example below, board 0 is entered as the source and board 3 is entered as the destination:

```
Command ==> 1
0,0>Input board number in hex ('0' thru '9' and 'a' thru 'f')
0,0>
from board? 0
to board? 3
0,0>    Mfg code 04, Dev code a4
0,0>Erasing prom at 000001cc.f8000000
0,0>Copy prom at 000001c0.f8000000 to prom at 000001cc.f8000000
0,0>.....
0
```

5. **Type 3 to select Display Version.**

The system responds by showing all PROM versions in the system.

```
Command ==> 3
0,0>Slot 0 CPU/Memory  OBP      3.2.1 1996/3/11 09:57 POST   3.0.1
1996/3/11 18:38
0,0>Slot 1 IO Type 1   FCODE   1.6.0 1996/1/23 13:44 iPOST  1.1.4
1996/3/05 04:06
```

6. **Turn the keyswitch to the Standby position (FIGURE 5-1). Wait 15 seconds.**
7. **Complete the procedure “To Update the Flash PROM” on page 89 to reattempt the flash PROM update process.**

Installing the Solaris Operating Environment With the SPARCstorage Array

This chapter describes how to install Solaris 7 11/99 software either as a new installation or as an upgrade on systems where the SPARCstorage Array may be used as the boot device.

Note – The installation instructions in this chapter are specific to systems configured with SPARCstorage Arrays.

Caution – The following installation instructions should be performed by an experienced system administrator. Failure to comply with this requirement may result in a loss of data stored on your disks.

Disk Management Software

Caution – If you are currently running disk management software on your system, refer to your disk management software documentation before proceeding with these instructions or you may lose the data on your disks.

SPARCstorage Array Firmware

In the installation and upgrade scenarios below, you will be instructed to check, and if necessary, upgrade the firmware for your SPARCstorage Array(s).

This Solaris 7 11/99 software contains SPARCstorage Array firmware revision level 3.12, which is the latest version of firmware for all SPARCstorage Array models (100 and 200 series).

If your SPARCstorage Array has a firmware revision level below 3.12, you must upgrade the firmware revision level to 3.12 as instructed.

If the firmware revision level on your SPARCstorage Array(s) is at a revision level of 3.12 or higher, you do not need to upgrade your firmware.

Installation and Upgrade Scenarios

This chapter is divided into several installation and upgrade scenarios. Refer to the tables below to select the installation or upgrade method that describes your current situation.

Note – Read through the entire scenario before performing any installation or upgrade. A thorough comprehension of the material is necessary to ensure a successful installation.

TABLE 6-1 New Installations

| New Installations | Go to |
|--|--|
| New installation of Solaris 7 11/99 on a SPARCstorage Array disk | “Scenario 1: New Installation of Solaris 7 11/99 Software on Systems Booting From the SPARCstorage Array Disk” on page 107 |
| New installation of Solaris 7 11/99 on a non SPARCstorage Array disk | “Scenario 2: New Installation of Solaris 7 11/99 Software on Systems Not Booting From the SPARCstorage Array Disk” on page 112 |

TABLE 6-2 Upgrades

| Upgrades: | Go to: |
|---|--|
| Upgrading to Solaris 7 11/99 from: <ul style="list-style-type: none"> • Solaris 2.3 operating environment • Solaris 2.4 Hardware 11/94 operating environment • Solaris 2.4 Hardware 3/95 operating environment • Solaris 2.5 operating environment • Solaris 2.5.1 operating environment • Solaris 2.6 Hardware: 3/98 operating environment • Solaris 2.6 Hardware: 5/98 operating environment | “Scenario 3: Upgrading to the Solaris 7 11/99 Operating Environment” on page 113 |

Scenario 1: New Installation of Solaris 7 11/99 Software on Systems Booting From the SPARCstorage Array Disk

Using the FC/S SBus Card

If the disk that you intend to use as your boot device is on a SPARCstorage Array that is connected to the system through an FC/S SBus card, note that the FC/S SBus card FCode revision level must be at 1.33 or higher to allow booting.

The following FC/S SBus cards are configured from the factory with an FCode revision level of 1.33 or higher:

- 501-2069-07 or higher
- 501-2553-03 or higher

To check the FCode revision level of your FC/S SBus card, refer to “To Check the FCode Level of Your FC/S SBus Card” on page 110.

Using the Onboard FC Ports

If the SPARCstorage Array is connected to the system through an onboard FC port, it is not necessary to check the FCode revision level; these systems come configured from the factory with the minimum FCode revision level to allow booting.

▼ To Install Solaris 7 11/99 Software on a SPARCstorage Array Disk

1. Install the Solaris operating environment with the no reboot option.

Refer to Chapter 1, “Installing Software From the Solaris CD” and the *SPARC: Installing Solaris Software* manual for more information.

Note – Keep track of which disk you select as your boot device as you will need this information to set your boot path.

Caution – Do not select the system to reboot at the end of the Solaris installation setup.

2. Determine which level of SPARCstorage Array firmware is in each SPARCstorage Array:

```
# ssaadm display controller
```

Where *controller* is the logical controller name of the SPARCstorage Array (for example, c1). Look for the line that gives the firmware revision information, similar to the following:

```
Firmware Rev: 3.12
```

3. If the firmware revision is lower than 3.12, download the new firmware:

```
# ssaadm download -f /usr/lib/firmware/ssa/ssafirmware controller
```

4. Set your boot device:

```
# ssaadm set_boot_dev <boot device pathname>
```

Where *<boot device pathname>* is the path to the device you selected as your boot device in Step 1. This command is interactive and requires user confirmation before setting the boot path. This command sets the OBP environmental variable *boot device* to the path of the device you selected as the boot device. You should create an OBP *devalias* to keep track of the boot path in case of accidental loss.

5. If you need to upgrade your FCode, use the `ssaadm` command:

```
# ssaadm fc_download
```

6. Halt the system:

```
# /usr/sbin/init 0
```

7. If you downloaded new firmware, press the `SYS OK` button on the back of the SPARCstorage Array(s) to reset.

Note – Before booting your system, wait for the SPARCstorage Array to complete POST.

8. Reset and boot your system:.

```
ok reset  
ok boot
```

Note – You have completed the new installation of Solaris 7 11/99 operating environment. If you would like to install disk management software, refer to your disk management software documentation.

Troubleshooting

If your system does not boot, check that:

- Your boot-device environmental variable is correctly set to your boot device.
- The FCode revision level is at 1.33 or higher if you are attempting to boot through an FC/S SBus Card. To check the FCode revision level, refer to “To Check the FCode Level of Your FC/S SBus Card” on page 110.

▼ To Check the FCode Level of Your FC/S SBus Card

1. Determine your FCode level:

```
ok setenv fcode-debug? true
ok reset
ok show-devs
```

You should see output similar to this:

```
.
.
.
/iommu@0,10000000/sbus@0,10001000/le@1,c00000
/iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0
/iommu@0,10000000/sbus@0,10001000/ledma@4,8400010
/iommu@0,10000000/sbus@0,10001000/SUNW,bpp@4,c800000
/iommu@0,10000000/sbus@0,10001000/espdma@4,8400000
/iommu@0,10000000/sbus@0,10001000/SUNW,DBRIe@2,10000/mmcodec
/iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0/SUNW,pln@a0000800,201cac11
/iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0/SUNW,pln@a0000800,201cac11/
SUNW,ssd
```

2. Look at the output from the `show-devs` command and find the lines for the FC/S card(s) that is attached to the SPARCstorage Array that you want to boot from.

The output for an FC/S card will be the lines containing `soc@x,x` similar to:

```
/iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0
/iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0/SUNW,pln@a0000800,201cac11
/iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0/SUNW,pln@a0000800,201cac11
SUNW,ssd
```

3. Determine which version of FCode is in the FC/S card:

```
ok cd short_path
ok sccsid type
1.33 95/04/19
ok device-end
```

Where *short_path* is the *shortest* line containing *soc@x,x* from the output. Using the previous output as an example, you would enter:

```
ok cd /iommu@0,10000000/sbus@0,10001000/SUNW,soc@0,0
ok sccsid type
1.33 95/04/19
ok device-end
```

If the FCode version is not at 1.33 or higher you *must* upgrade to the minimum FCode level.

Note – You can upgrade your FCode after installing the Solaris 7 11/99 software.

The following part numbers refer to the FC/S SBus Cards that contain the minimum FCode revision level to allow booting:

- 501-2069-07 or higher
- 501-2553-03 or higher

4. Reset the `fcode-debug?` OBP environment variable.

```
ok setenv fcode-debug? false
ok reset
```

Scenario 2: New Installation of Solaris 7 11/99 Software on Systems Not Booting From the SPARCstorage Array Disk

▼ To Install Solaris 7 11/99 Software on Systems Not Booting From the SPARCstorage Array Disk

1. Install the Solaris software environment with the no reboot option.

Refer to Chapter 1, “Installing Software From the Solaris CD” and the *SPARC: Installing Solaris Software* manual for more information.

Caution – Do not select the system to reboot at the end of the Solaris installation setup.

2. Determine which level of SPARCstorage Array firmware is in each SPARCstorage Array:

```
# ssaadm display controller
```

Where *controller* is the logical controller name of the SPARCstorage Array (for example, *c1*). Look for the line that gives the firmware revision information, similar to the following:

```
Firmware Rev: 3.12
```

3. If the firmware revision is lower than 3.12, download the new firmware:

```
# ssaadm download -f /usr/lib/firmware/ssa/ssafirmware controller
```

4. Halt the system:

```
# /usr/sbin/init 0
```

5. If you downloaded new firmware, press the **SYS OK** button on the back of the SPARCstorage Array(s) to reset.

Note – Before you proceed, wait for the SPARCstorage Array to complete POST.

6. Boot your system:

`ok boot`

Note – You have completed the new installation of the Solaris 7 11/99 operating environment. If you would like to install disk management software, refer to your disk management software documentation.

Scenario 3: Upgrading to the Solaris 7 11/99 Operating Environment

If you are currently using one of the Solaris releases below and would like to upgrade to the Solaris 7 11/99 operating environment, follow the instructions in this section.

- Solaris 2.3 operating environment
- Solaris 2.4 Hardware 11/94 operating environment
- Solaris 2.4 Hardware 3/95 operating environment
- Solaris 2.5 operating environment
- Solaris 2.5.1 operating environment
- Solaris 2.5.1 Hardware: 8/97 operating environment
- Solaris 2.5.1 Hardware 11/97 operating environment
- Solaris 2.6 operating environment
- Solaris 2.6 Hardware: 3/98 operating environment
- Solaris 2.6 Hardware: 5/98 operating environment

Caution – If you are currently running disk management software on your system, *do not* follow these instructions or you may lose the data on your disks. Refer to your disk management software documentation for instructions.

▼ To Upgrade to the Solaris 7 11/99 Operating Environment

1. Type `su` to become superuser.

2. Back up the data on your system.

Refer to the *System Administration Guide, Volume I* for information.

3. Stop all processes (database or other applications) that are accessing SPARCstorage Array disks except `/`, `swap`, `/usr`, and `/opt`.

4. Insert the Solaris 7 11/99 CD into the CD-ROM drive and upgrade your system to the Solaris 7 11/99 operating environment.

Refer to Chapter 1, "Installing Software from the Solaris CD" and the SPARC: Installing Solaris Software manual for more information.

Caution – Do not select the system to reboot at the end of the Solaris installation setup.

5. Determine which level of SPARCstorage Array firmware is in your SPARCstorage Array(s) by entering the following command at the prompt for each SPARCstorage Array:

```
# ssaadm display controller
```

Where *controller* is the logical controller name of the SPARCstorage Array (for example, `c1`). Look for the line that gives the firmware revision information, similar to the following:

```
Firmware Rev 3.12
```

6. If the firmware revision is below 3.12, download the new firmware for each SPARCstorage Array:

```
# ssaadm download -f /usr/lib/firmware/ssa/ssafirmware controller
```

7. Halt your system:

```
# /usr/sbin/init 0
```

8. If you downloaded new firmware, press the `SYS OK` button on the back of the SPARCstorage Array(s) to reset.

Note – Before booting your system, wait for the SPARCstorage Array to complete POST.

9. Boot your system:

`ok boot`

Power Management on Sun Hardware

The U.S. Environmental Protection Agency has launched the Energy Star Computers program to encourage the introduction and use of energy-efficient computer systems and to reduce air pollution associated with energy generation.

In response to this policy, Sun is providing Power Management™ software. In order to reduce the amount of power your Sun workstation uses, your Sun workstation is now capable of entering a lower power state when the display is inactive for a period of time.

This section supplements the *Using Power Management* manual in the Solaris 7 11/99 User Collection.

Supported Platforms

Power Management software supports the sun4m and sun4u platform groups. Software features and defaults may vary between the two platform groups. Refer to *Using Power Management* in the Solaris 7 11/99 User AnswerBook set for more information when you identify the platform group that applies to your system.

Note – Power Management does not support the sun4c and sun4d platform groups.

TABLE 7-1 Platform Names and Groups Supported by Power Management

| System Name | Platform Name | Platform Group |
|------------------------------|-------------------------|----------------|
| SPARCstation 4 | SUNW,SPARCstation-4 | sun4m |
| SPARCstation 5 | SUNW,SPARCstation-5 | sun4m |
| SPARCstation 10 | SUNW,SPARCstation-10 | sun4m |
| SPARCstation 10SX | SUNW,SPARCstation-10,SX | sun4m |
| SPARCstation 20 | SUNW,SPARCstation-20 | sun4m |
| SPARCstation LX | SUNW,SPARCstation-LX | sun4m |
| SPARCstation LX+ | SUNW,SPARCstation-LX+ | sun4m |
| SPARCclassic | SUNW,SPARCclassic | sun4m |
| SPARCclassic X | SUNW,SPARCclassic-X | sun4m |
| SPARCstation Voyager | SUNW,S240 | sun4m |
| Ultra 1 (all models) | SUNW,Ultra-1 | sun4u |
| Ultra 5 | SUNW,Ultra-5 | sun4u |
| Ultra 10 | SUNW,Ultra-10 | sun4u |
| Ultra 30 | SUNW,Ultra-30 | sun4u |
| Ultra 60 | SUNW,Ultra-60 | sun4u |
| Ultra 450 | SUNW,Ultra-4 | sun4u |
| Ultra 2 Creator (all models) | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 1 Model 140 | SUNW,Ultra-1 | sun4u |
| Sun Enterprise 1 Model 170 | SUNW,Ultra-1 | sun4u |
| Sun Enterprise 1 Model 170E | SUNW,Ultra-1 | sun4u |
| Sun Enterprise 2 Model 1300 | SUNW,Ultra-2 | sun4u |
| Sun Enterprise 2 Model 2300 | SUNW,Ultra-2 | sun4u |

Hardware and Software Requirements

Power Management software in the Solaris 7 11/99 software requires the following:

- Hardware options
 - Type 5 or Compact 1 keyboard
 - 17-inch, 20-inch, or 24-inch color monitor
- Software
 - Solaris 7 11/99 software environment (already installed)

Supported Peripherals

TABLE 7-2 shows the peripherals supported by Power Management software.

TABLE 7-2 Power Management Supported Peripherals

| Peripheral | Description |
|---------------|---|
| Frame Buffers | Black and white frame buffer driver |
| | 24-bit color frame buffer driver |
| | Accelerated 8-bit color frame buffer driver |
| | 8-bit color frame buffer driver |
| | SX graphic driver |
| | Creator and Creator3D graphics accelerators |
| | FFB2 graphics |
| | PGX graphics frame buffer |
| | ATI graphics (m64) |
| SBus | SBus driver |
| | SBus memory driver |
| | SBus DMA gate array driver |
| | Sysio SBus driver |
| SCSI | Emulex Intelligent SCSI Processor driver |
| | Emulex SCSI Processor host adapter driver |
| | SCSI disk driver |
| | SCSI tape driver |

TABLE 7-2 Power Management Supported Peripherals *(Continued)*

| Peripheral | Description |
|---------------|--|
| | Symbios SCSI host adapter |
| Miscellaneous | Intel 82072/82077 floppy disk driver |
| | LANCE (Am7990) Ethernet driver |
| | Zilog 8530 SCC Serial Communications driver |
| | Serial I/O driver for Multi-Interface Chip (MIC) |
| | Dual Basic Rate ISDN and audio interface driver |
| | CS 4231 Audio Chip driver |
| | AMD AM79C30A Audio Chip driver |
| | Bi-directional Parallel Port driver |
| | Profile driver |
| | SunSwift SBus Adapter drivers |
| | SunSwift PCI Adapter drivers |
| | SunFDDI Single-Attach PCI Adapter |
| | SunFDDI Dual-Attach PCI Adapter |
| | SUNTRI Token Ring Interface PCI Adapter |
| | Dual Single-ended UltraSCSI PCI Adapter |
| | Dual Differential UltraSCSI PCI Adapter |

SPARCstation 4 Issues

This section describes a workaround to a limitation of the SPARCstation 4 when used with Power Management.

The AC accessory outlet on the SPARCstation 4 system is an unswitched outlet. The AC power switch does not control power flowing through the accessory outlet. If you connect a monitor to the accessory outlet, you cannot turn it off using the system unit power switch. Similarly, if you use Power Management software, the software cannot turn off the monitor automatically. To conserve energy, consider using an Energy Star-compliant monitor. Sun offers a variety of Energy Star-compliant monitors in its standard SPARCstation 4 system configurations. This information does not apply to SPARCserver 4 configurations. The SPARCserver 4 includes a switched accessory outlet.

Alternate Pathing 2.2 on the Sun Enterprise 3x00, 4x00, 5x00, and 6x00 Servers

This chapter contains fresh install and upgrade instructions for Alternate Pathing (AP) 2.2. With the introduction of AP 2.2, both the fresh install instructions and the upgrade instructions now apply to the Sun Enterprise[™] 3x00, 4x00, 5x00, and 6x00 servers.

Performing a Fresh Install of AP

The fresh install instructions in this section are for environments where AP is not currently installed and configured. If any version of AP is currently installed and configured, you can use the instructions in “Performing an Upgrade of AP” on page 128. That procedure uses scripts that save your current AP configuration, and then restore that configuration after you install the AP 2.2 packages.

Caution – The installation instructions in this section assume that you have already installed the Solaris 7 11/99 operating environment. You must do so before you attempt to install AP 2.2.

The AP packages require approximately 2.7 megabytes of disk space on the server. The following table lists the total size of the AP software by file system.

TABLE 8-1 AP Software File System Sizes

| File System | Size |
|-------------|-------------|
| /usr | 317 Kbytes |
| / | 1.3 Mbytes |
| /etc | 13 Kbytes |
| /kernel | 1528 Kbytes |
| /sbin | 1481 Kbytes |

▼ To Install a Fresh Copy of AP 2.2

- 1. If you plan to install AP on top of a fresh copy of the Solaris 7 11/99 operating environment, install the operating environment (if necessary) and then return to this procedure.**

See “Upgrading a System” in *Solaris 7 (SPARC Platform Edition) Installation Library*. Note that you must choose the initial install option to perform a fresh install of the Solaris software.

- 2. Log in to the server as superuser.**
- 3. Insert the Supplement CD into the CD-ROM drive if it is not already in the drive.**
The volume manager takes a few seconds to mount the CD.

4. Install the AP 2.2 host packages on the server:

```
# pkgadd -d /cdrom/cdrom0/Product SUNWapdoc SUNWapu SUNWapr \
SUNWapdv
```

The software briefly displays copyright, trademark, and license information for each package, then messages about `pkgadd(1M)` actions taken to install the package, including a list of the files and directories being installed. Depending on your configuration, you may see the following message:

```
This package contains scripts which will be executed
with superuser permission during the process of installing this
package.

Do you want to continue with the installation of this
package [y,n,?]
```

If so, type `y` to continue.

When this portion of the installation is complete, the AP 2.2 packages have been installed and the superuser prompt is displayed.

5. Remove the Supplement CD from the CD-ROM drive:

```
# cd /
# eject cdrom
```

6. Configure AP.

For an example of the steps you need to follow, see “To Configure AP” on page 123. Also see the *Sun Enterprise Server Alternate Pathing User's Guide*.

▼ To Configure AP

1. Create three to five AP databases:

```
# apdb -c raw_disk_slice -f
```

2. Create the AP metadisks.

You must know the configuration of the host's hardware so that you know which two ports are connected to the same disk array. The following steps use `pln` ports. Your ports may vary, depending on the configuration of the host.

a. Display all of the ports and their disk device nodes.

```
# apinst
pln0
    /dev/dsk/clt0d0
    /dev/dsk/clt1d0
    /dev/dsk/clt2d0
    /dev/dsk/clt3d0
    /dev/dsk/clt4d0
    /dev/dsk/clt5d0
pln1
    /dev/dsk/c2t0d0
    /dev/dsk/c2t1d0
    /dev/dsk/c2t2d0
    /dev/dsk/c2t3d0
    /dev/dsk/c2t4d0
    /dev/dsk/c2t5d0
```

b. Create an uncommitted disk pathgroup.

```
# apdisk -c -p pln0 -a pln1
# apconfig -S -u
```

Where:

- c causes the pathgroup to be created
- p designates the primary path
- a designates the alternate path

You can verify the results by using `apconfig(1M)` as shown above.

c. Commit the database entries:

```
# apdb -C
```

You can verify the results of the above command by using `apconfig -S`.

d. Rebuild the devices directories:

```
# drvconfig -i ap_dmd
# ls -l /devices/pseudo/ap_dmd*
...
```

As shown above, you can verify the results of the `drvconfig(1M)` command by listing the contents of `/devices/pseudo/ap_dmd*`.

e. Create symbolic links from the devices directory `/devices/pseudo` to the special metadisk files in `/dev/ap/dsk` and `/dev/ap/rdisk`:

```
# apconfig -R
# ls -l /dev/ap/dsk
...
```

As shown above, you can verify the results of the `apconfig(1M)` command by listing the contents of `/dev/ap/dsk` to view the symbolic links.

f. If you are placing the boot disk under AP control, use `apboot(1M)` to define the new AP boot device:

```
# apboot metadisk_name
```

The `apboot(1M)` command modifies the `/etc/vfstab` file and the `/etc/system` file. The *metadisk_name* must be in the form: `mcxtxdx`.

g. Modify any references that use a physical device node (that is, a path that begins with `/dev/dsk` or `/dev/rdisk`) to use the corresponding metadisk device node (that is, a path that begins with `/dev/ap/dsk` or `/dev/ap/rdisk`).

If a partition is mounted under a physical path, unmount and remount it under the metadisk path.

Examine `/etc/vfstab` for any physical devices that should be changed to AP metadevices. If necessary, edit `/etc/vfstab` to make the necessary modifications.

Caution – You must be a knowledgeable system administrator to edit the `/etc/vfstab` file. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the server.

3. Create AP metanetworks (for non-primary networks).

Note – The following steps should be applied to all networks that you want to alternately path *except* the primary network.

a. Create the network pathgroup:

```
# apnet -c -p network_interface -a network_interface
# apconfig -N -u
...
```

As shown above, you can verify the results of the `apnet(1M)` command by using `apconfig(1M)`.

b. Commit the network pathgroup entries in the database:

```
# apdb -C
```

You can verify the results of the `apdb(1M)` command by using the `apconfig(1M)` command with the `-N` option.

c. Remove all direct usage of both members of the network pathgroups.

If the physical interface is currently plumbed, and it is not the interface that you will be using as you run commands to configure the metanetwork, you can unplumb the physical interface by using the `ifconfig(1M)` command.

d. Create an `/etc/hostname.mnetwork_interface_name` file for any metanetworks that you want to configure when the server is rebooted.

4. Create the AP metanetwork for the primary network.

a. View the contents of the `/etc/nodename` and `/etc/hostname.interface_name` files to verify that the interface name is the same.

b. Create the primary network pathgroup:

```
# apnet -c -p network_interface -a network_interface
```

Where:

- c creates the new primary network pathgroup
- p designates the primary network path
- a designates the alternate path

c. Commit the network pathgroup entry in the database:

```
# apdb -C
# apconfig -N
```

As shown above, you can verify the results of the `apdb(1M)` command by using `apconfig(1M)`.

d. Create the new `/etc/hostname.minterface_name` file to configure the network when you reboot the server.

For example, `/etc/hostname.minterface_name` might contain `hmb`.

e. Remove the configuration files that correspond to the metanetwork interface:

```
# rm -f /etc/hostname.primary_interface_name \
/etc/hostname.alternate_interface_name
```

5. If you plan to use a volume manager, such as Sun Enterprise Volume Manager™ (SEVM) or Solstice DiskSuite™ (SDS), configure the volume manager according to the vendor's instructions.

Caution – Make sure that your volume manager is supported in the Solaris 7 11/99 operating environment (which is required for AP 2.2).

■ **SEVM Issues**

If you want to build your SEVM volumes on top of AP, you should configure your volumes using AP metadisk paths rather than physical paths. SEVM recognizes and properly installs existing AP metadevices with no special action required.

SEVM can encapsulate both nonboot disks and boot disks that are configured as AP metadevices. SEVM can encapsulate AP databases without any impact on AP. Note, however, that the standard SEVM requirements for encapsulation apply:

- There must be an `s2` slice that represents the entire disk.
- There must be a "small amount" of free disk space at the beginning or end of the disk.
- There must be two free partitions.

The partition requirement may necessitate giving up an AP database, which is often placed in slice `s4`.

It is best to configure SEVM *after* you configure AP. It is beyond the scope of this document to describe how to integrate AP with an existing SEVM configuration.

■ **SDS Issues**

If you want to build your SDS volumes on top of AP, you should configure your volumes using AP metadisk paths rather than physical paths. SDS recognizes and properly installs existing AP metadevices with no special action required.

6. Reboot the server (if necessary).

If you just rebooted the server after configuring a volume manager, this step is unnecessary.

Performing an Upgrade of AP

This section provides upgrade instructions for AP 2.2 on the Sun Enterprise 3x00, 4x00, 5x00, and 6x00 Servers. AP 2.0 and AP 2.1 are not supported under the Solaris 7 11/99 operating environment. The upgrade process involves removing the earlier version of AP, installing a set of core AP packages, and restoring your AP configuration. Scripts are provided to simplify this process.

Installation of the packages on the enclosed CD-ROM requires approximately 2.7 megabytes of disk space. The following table lists the total size of the AP software by file system:

TABLE 8-2 AP Software File System Sizes

| File System | Size |
|-------------|-------------|
| /opt | 1.23-Mbytes |
| /usr | 158-Kbytes |
| / | 1.3-Mbytes |

Backing Up Your Server

Always back up an existing server before you upgrade any software. The safest backup to perform is a level 0 dump (`ufsdump(1M)`) of the file systems connected to the server being upgraded. If you do not have an established backup procedure, see the *System Administration Guide*.

You do not need to back out installed patches before you perform the upgrade.

Checking Other Software Documentation

Check the documentation of other software you are running, such as disk volume managers, before you use the `upgrade` option in the `suninstall` utility. There may be additional instructions you need to follow to preserve existing configurations. Also, be sure to check the release notes for AP and any volume managers you are using.

Upgrading AP and Solaris Software Simultaneously

The AP upgrade procedures in this section use two scripts, `ap_upgrade_begin` and `ap_upgrade_finish`. The first script saves your current AP configuration. The second script restores that exact configuration after you install the AP 2.2 packages. It is likely that you will upgrade to the Solaris 7 11/99 operating environment at the same time you upgrade to AP 2.2, since AP 2.2 requires the Solaris 7 11/99 operating environment. Because the AP configuration is restored exactly as it was before you upgraded to Solaris 7 11/99 software, you need to be aware of the issues described in the following sections.

Controller Renumbering

In general, avoid changing your hardware in ways that can result in controller renumbering.

If I/O controller renumbering occurs, the AP upgrade scripts will not work. I/O controller renumbering can occur if you alter your hardware configuration in certain ways, and then perform a reconfigure boot (`boot -R`) or otherwise cause a `drvconfig(1M)` command to be executed. For example, you might use Dynamic Reconfiguration (DR) to logically detach a system board. If that system board hosts I/O controllers, and other higher numbered system boards also host I/O controllers, the next reconfigure boot operation may cause the controllers to be renumbered. For example, `pln5` may become `pln3`.

The `suninstall` procedure requires a reconfigure boot operation. If this causes controllers to be renumbered, you cannot use `ap_upgrade_finish` to complete the AP upgrade. However, you may still choose to use `ap_upgrade_begin`. The reason for this is that `ap_upgrade_begin` saves information about your AP configuration in the files `/var/tmp/ap*`. If you have a deep understanding of the way device numbering works, you can recreate your AP configuration by referencing those files under `/var/tmp`, and manually remapping the old AP configuration after taking into consideration how the underlying physical controllers have been renumbered.

If you do not have a good understanding of device numbering, you should either perform a fresh install and recreate your AP configuration from scratch, or ask your service representative for assistance.

AP Database Partitions

The AP upgrade scripts attempt to recreate the AP databases in the same partitions that they occupied before the upgrade to the Solaris 7 11/99 operating environment. Note, however, that the Solaris 7 11/99 operating environment requires more disk space than earlier versions of the Solaris operating environment. Because of this, you can choose to modify the boot disk partitioning scheme during `suninstall`. If you place file systems in all partitions that were previously used for AP databases, `ap_upgrade_finish` is not able to recreate any databases and the upgrade process fails. Furthermore, if you place a file system in *any* partition that was previously used for an AP database, and if for some reason that file system is not mounted at the time you run `ap_upgrade_finish`, that file system is overwritten by a copy of the AP database.

Root Disk Partitions

The AP upgrade facility assumes that the partitioning of the `root` disk (the disk containing the `root` partition) is not modified during the upgrade. The Solaris 7 11/99 software requires more disk space than earlier versions.

One way to acquire the additional space is to repartition the original disk or to split the `root` disk into two disks using standard commands prior to the Solaris 7 11/99 upgrade. If you need to repartition the `root` disk, you should do so *before* performing the AP 2.2 upgrade procedure. If there is insufficient space when you run `suninstall`, you have the option to modify the disk partitioning layout to acquire more space. However, during `suninstall`, you must not relocate the `root` or `usr` partitions to another disk as this will cause the AP upgrade script to fail.

Uncommitted AP Database Entries

Before you run `ap_upgrade_begin`, commit any uncommitted entries in the AP database. Any metadevices that were created but not committed are not preserved during the upgrade. Similarly, any metadevices that were deleted but not committed will continue to exist after the upgrade.

▼ To Upgrade To AP 2.2

1. **If necessary, commit any uncommitted AP metadevices.**

- a. Log in to the server as superuser.
- b. Commit the entries in the AP database:

```
# apdb -C
```

2. Terminate any processes that directly or indirectly access AP metadevices.

The `ap_upgrade_begin` script, which you run later in this procedure, and the subsequent reboot cause the boot disk and primary network to use physical paths rather than AP metadevices.

3. Remove the current AP configuration.

- a. Log in as superuser.

- b. Insert the Supplement CD into the CD-ROM drive.

The volume manager takes a few seconds to mount the CD.

- c. Run the following script to deconfigure AP (and save the AP configuration so that it can be restored later):

```
# /cdrom/cdrom0/Tools/ap_upgrade_begin
...
ap_upgrade_begin has completed
```

This script saves the current AP configuration information in the files `/var/tmp/ap*`. This script also generates executable shell scripts that you can use to regenerate your AP configuration. You may examine the `/var/tmp/ap*` files if you wish, but do not modify or remove them. Doing so can compromise the upgrade procedure.

- d. If any file systems shown in `/etc/vfstab` are still configured as metadevices, edit `/etc/vfstab` and reconfigure those file systems as physical devices.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the server.

- e. Remove the packages `SUNWapdoc`, `SUNWapr`, `SUNWapu`, and `SUNWabap` by using the `pkgrm(1M)` command.

4. If you plan to upgrade to the Solaris 7 11/99 operating environment, perform that upgrade now.

See “Upgrading a System” in *Solaris 7 (SPARC Platform Edition) Installation Library*. Note that you must choose the upgrade option to perform an upgrade of the Solaris software.

Caution – Wait until the Solaris upgrade process is completely finished before continuing with this procedure.

Caution – Make sure you upgrade the correct slice. If you were previously using a volume manager to mirror the boot disk, and if you were also using AP to alternately path each boot disk mirror, then there are four physical paths that were previously potential paths to the boot disk (two alternate paths for each boot disk mirror). Now that both AP and the volume manager have been deconfigured, examine `/etc/vfstab` to determine the physical path that corresponds to the root (`/`) file system. When you run `suninstall`, specify that path as the disk to upgrade. Later, when you restore your volume manager, be sure to designate that disk as the primary mirror. See your volume manager documentation for information on determining which physical slice is used when booting.

5. Upgrade to AP 2.2.

a. Log in as superuser.

b. If necessary, re-insert the Supplement CD into the CD-ROM drive.

The volume manager takes a few seconds to mount the CD.

c. Install the required AP 2.2 packages:

```
# cd /cdrom/cdrom0/Product
# pkgadd -d . SUNWapdv SUNWapr SUNWapu SUNWapdoc
```

d. Run the following script to restore the original AP configuration.

Caution – Be sure to read “Upgrading AP and Solaris Software Simultaneously” on page 129 before performing the following command.

```
# /cdrom/cdrom0/Tools/ap_upgrade_finish
...
ap_upgrade_finish has completed
```

- e. If there are any file systems shown in `/etc/vfstab` that are still configured as physical devices, and if you wish to build those file systems on AP metadevices, edit `/etc/vfstab` and reconfigure those file systems as AP metadevices.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will loose data the next time you boot the server.

- f. **Reboot.**

Upgrading to AP 2.2 and Solstice DiskSuite 4.2 Simultaneously

If you are upgrading from the Solaris 2.5.1 or 2.6 operating environments to the Solaris 7 11/99 operating environment and have AP 2.0 or 2.1 and Solstice DiskSuite 4.0 or 4.1 (SDS) on your system, you must upgrade to AP 2.2 and SDS 4.2.

You should ensure that you have the following publications before you start the upgrade:

- *Solaris 7 11/99 Release Notes Supplement for Sun Hardware* (available in printed form in your Solaris 7 11/99 Media Kit)
- *Solaris 7 11/99 Sun Hardware Platform Guide*, (available in printed form in your Solaris 7 11/99 Media Kit or in AnswerBook2 format on the Sun Hardware Supplements CD)
- *Sun Enterprise Server Alternate Pathing User's Guide* (available in AnswerBook2 format on the Sun Hardware Supplements CD in your Solaris 7 11/99 Media Kit)
- *Solstice DiskSuite 4.2 User's Guide* (available in AnswerBook2 format from <http://docs.sun.com> or from your SDS Media Kit)
- *Solstice DiskSuite 4.2 Installation and Product Notes* (available in AnswerBook2 format from <http://docs.sun.com> or from your SDS Media Kit)

Caution – You must follow the sequence given here to successfully complete the upgrade.

The basic tasks are:

- Unconfigure SDS 4.0 or 4.1.
- Remove AP 2.0 or 2.1.
- Upgrade to the Solaris 7 11/99 operating environment.
- Install AP 2.2.
- Install and reconfigure SDS 4.2.

▼ To Upgrade To AP 2.2 and SDS 4.2

Caution – Before proceeding with this procedure, read the release notes for AP as well as the release notes for any volume managers you may be using. Also, read through this entire procedure before proceeding.

1. If necessary, commit any uncommitted AP metadevices.

- a. Log in to the server as superuser.
- b. Commit the entries in the AP database:

```
# apdb -C
```

2. Deconfigure Solstice DiskSuite (SDS) by following steps one through eight in “How to Convert to DiskSuite 4.2 on SPARC Systems Running DiskSuite 4.0 or 4.1” in the *Solstice DiskSuite 4.2 Installation and Product Notes (October 19, 1998)*.

3. Reboot.

This assures that the deconfigured disk volumes are no longer active.

4. Terminate any processes that directly or indirectly access AP metadevices.

You do not need to be concerned here about the fact that your boot disk or primary network may be using AP metadevices. The `ap_upgrade_begin` script, which you will run later in this procedure, and the subsequent reboot will cause the boot disk and primary network to use physical paths rather than AP metadevices.

5. Remove the current AP configuration.

- a. Log in as superuser.
- b. Insert the Supplement CD into the CD-ROM drive.

The volume manager takes a few seconds to mount the CD.

- c. Run the following script to deconfigure AP (and save the AP configuration so that it can be restored later):

```
# /cdrom/cdrom0/Tools/ap_upgrade_begin
...
ap_upgrade_begin has completed
```

This script saves the current AP configuration information in the files `/var/tmp/ap*`. This script also generates executable shell scripts that you can use to regenerate your AP configuration. You may examine the `/var/tmp/ap*` files if you wish, but do not modify or remove them. Doing so can compromise the upgrade procedure.

- d. If any file systems shown in `/etc/vfstab` are still configured as metadevices, edit `/etc/vfstab` and reconfigure those file systems as physical devices.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the server.

- e. Remove the packages `SUNWapdoc`, `SUNWapr`, `SUNWapu`, and `SUNWabap` by using the `pkgrm(1M)` command.

6. If you plan to upgrade to the Solaris 7 11/99 operating environment, perform that upgrade now.

See “Upgrading a System” in *Solaris 7 (SPARC Platform Edition) Installation Library*. Note that you must choose the upgrade option to perform an upgrade of the Solaris software.

Caution – Wait until the Solaris upgrade process is completely finished before continuing with this procedure.

Caution – Make sure you upgrade the correct slice. If you were previously using a volume manager to mirror the boot disk, and if you were also using AP to alternately path each boot disk mirror, then there are four physical paths that were previously potential paths to the boot disk (two alternate paths for each boot disk mirror). Now that both AP and the volume manager have been deconfigured, examine `/etc/vfstab` to determine the physical path that corresponds to the root (`/`) file system. When you run `suninstall`, specify that path as the disk to upgrade. Later, when you restore your volume manager, be sure to designate that disk as the primary mirror. See your volume manager documentation for information on determining which physical slice is used when booting.

7. Upgrade to AP 2.2.

a. Log in as superuser.

b. If necessary, re-insert the Supplement CD into the CD-ROM drive.

The volume manager takes a few seconds to mount the CD.

c. Install the required AP 2.2 packages:

```
# cd /cdrom/cdrom0/Product
# pkgadd -d . SUNWapdv SUNWapr SUNWapu SUNWapdoc
```

d. Run the following script to restore the original AP configuration:

Caution – Be sure to read “Upgrading AP and Solaris Software Simultaneously” on page 129 before performing the following command.

```
# /cdrom/cdrom0/Tools/ap_upgrade_finish
...
ap_upgrade_finish has completed
```

e. If there are any file systems shown in `/etc/vfstab` that are still configured as physical devices, and if you wish to build those file systems on AP metadevices, edit `/etc/vfstab` and reconfigure those file systems as AP metadevices.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the server.

f. Reboot.

8. Install and configure Solstice DiskSuite 4.2, by following steps 10 through 16 in the procedure “How to Convert to DiskSuite 4.2 on SPARC Systems Running DiskSuite 4.0 or 4.1” in the *Solstice DiskSuite 4.2 Installation and Product Notes* (October 19, 1998).

Caution – If your boot disk is mirrored, make sure you specify the upgraded disk as the primary mirror.

9. Optionally set the OBP `boot-device` variable to any available boot device path.

There may be as many as four boot device paths if you have a mirrored boot disk that is also alternately pathed. (Earlier in this procedure, when both AP and the volume manager were deconfigured, it was necessary for `boot-device` to point to the physical path to root (/) as specified in `/etc/vfstab`.)

Upgrading to AP 2.2 and a Volume Manager Other Than Solstice DiskSuite 4.2

If you are upgrading to AP 2.2 and you are also upgrading to a volume manager other than Solstice DiskSuite 4.2, follow the general guidelines in this section.

Caution – Make sure that your volume manager is supported in the Solaris 7 11/99 operating environment (which is required for AP 2.2).

Use the procedure “To Upgrade To AP 2.2 and SDS 4.2” on page 134 as an example. However, two of the steps are different:

- Instead of Step 2, “Deconfigure Solstice DiskSuite (SDS)”, use the following general guidelines:
 1. Most likely, you should follow the deconfiguration steps within a procedure that upgrades the volume manager to a newer version.
 2. After following the steps that deconfigure the volume manager devices, you may be in the middle of a volume manager upgrade procedure. Do not proceed beyond the point of deconfiguring the volume manager.
 3. Do not install new volume manager packages.
 4. Do not run `suninstall`.
 5. Continue with Step 3 of “To Upgrade To AP 2.2 and SDS 4.2” on page 134 immediately after deconfiguring the volume manager.
- Instead of Step 8, “Install and Configure Solstice DiskSuite 4.2”, follow your vendor’s instructions for restoring the volume manager configuration. Most likely, you should continue with the procedure you were following in the bullet point above.

Alternate Pathing 2.2 on the Sun Enterprise 10000 Server

This chapter contains fresh install and upgrade instructions for Alternate Pathing (AP) 2.2 on the Sun Enterprise[™] 10000 server.

Performing a Fresh Install of AP

The AP 2.2 release includes one package that must be installed on the SSP and a set of core packages that must be installed on the Sun Enterprise 10000 domain.

The fresh install instructions in this section are for environments where AP is not currently installed and configured. If any version of AP is currently installed and configured, you can use the instructions in “Performing an Upgrade of AP” on page 146. That procedure uses scripts that save your current AP configuration, and then restore that configuration after you install the AP 2.2 packages.

Caution – The installation instructions in this section assume that you have already installed the Solaris 7 11/99 operating environment. You must do so before you attempt to install AP 2.2.

The AP packages require approximately 2.7 megabytes of disk space on the domain and 37 kilobytes on the SSP. The following table lists the total size of the AP software by file system:

TABLE 9-1 AP Disk Space Requirements by File System

| File System | Size |
|-------------|-------------|
| Host: | |
| /usr | 317 Kbytes |
| / | 1.3 Mbytes |
| /etc | 13 Kbytes |
| /kernel | 1528 Kbytes |
| /sbin | 1481 Kbytes |
| SSP: | |
| /opt | 31 Kbytes |

▼ To Install a Fresh Copy of AP 2.2

1. **If you plan to install AP on top of a fresh copy of the Solaris 7 11/99 operating environment, install the operating environment (if necessary) and then return to this procedure.**

See “Performing a Fresh Install” in the chapter “Solaris 7 11/99 on the Sun Enterprise 10000 Server” in the *Solaris 7 11/99 Sun Hardware Platform Guide*.

2. **Mount the CD-ROM.**

- a. **Log in to the SSP as superuser.**

- b. **Insert the Sun Computer Systems Supplement CD into the CD-ROM drive.**

The CD-ROM drive is attached to the SSP. Wait for the volume manager to mount the CD-ROM.

- c. **Execute the following `share(1M)` command on the SSP to make the CD-ROM usable across the net.**

```
ssp# share -o ro,anon=0 -F nfs /cdrom/cdrom0
```

3. **Install the AP packages on the SSP (and spare SSP, if applicable)**

- a. Change to the AP 2.2 product directory and execute the `pkgadd(1M)` command to add the `SUNWapssp` package onto the SSP.

```
ssp# cd /cdrom/cdrom0/Product
ssp# pkgadd -d . SUNWapssp
```

- b. Start the `ap_ssp_daemon`.

```
ssp# init q
```

- c. If you have a spare SSP, perform the above steps on the spare SSP.

4. Install AP on the domain.

- a. Log in to the domain as superuser.
- b. Create and mount the `/cdrom` directory.

```
# mkdir /cdrom
# mount ssp_hostname:/cdrom/cdrom0 /cdrom
```

- c. Install the AP 2.2 host packages on the domain.

```
# pkgadd -d /cdrom/Product SUNWapdoc SUNWapu \
SUNWapr SUNWapdv
```

5. Unmount and remove the CD-ROM.

- a. Unmount the CD-ROM on the domain.

```
# cd /
# umount /cdrom
```

- b. If necessary, log in to the SSP as superuser.

- c. Remove the Sun Computer Systems Supplement CD from the CD-ROM drive:

```
ssp# cd /
ssp# unshare /cdrom/cdrom0
ssp# eject cdrom
```

6. Configure AP.

For an example of the steps you need to follow, see “To Configure AP” on page 142. Also see the *Sun Enterprise Server Alternate Pathing User’s Guide*.

▼ To Configure AP

1. Create three to five AP databases.

```
# apdb -c raw_disk_slice -f
```

2. Create AP metadisks.

You must know the configuration of the domain’s hardware so that you know which two ports are connected to the same disk array. The following examples use `pln` ports. Your ports may vary, depending on the configuration of the domain.

a. Display all of the ports and their disk device nodes.

```
# apinst
pln0
    /dev/dsk/clt0d0
    /dev/dsk/clt1d0
    /dev/dsk/clt2d0
    /dev/dsk/clt3d0
    /dev/dsk/clt4d0
    /dev/dsk/clt5d0
pln1
    /dev/dsk/c2t0d0
    /dev/dsk/c2t1d0
    /dev/dsk/c2t2d0
    /dev/dsk/c2t3d0
    /dev/dsk/c2t4d0
    /dev/dsk/c2t5d0
```

b. Create an uncommitted disk pathgroup.

```
# apdisk -c -p pln0 -a pln1
# apconfig -S -u
```

where:

- c causes the pathgroup to be created
- p designates the primary path
- a designates the alternate path.

You can verify the results by using `apconfig(1M)` as shown above.

c. Commit the database entries.

```
# apdb -C
```

You can verify the results of the above command by using `apconfig -S`.

d. Rebuild the devices directories.

```
# drvconfig -i ap_dmd
# ls -l /devices/pseudo/ap_dmd*
...
```

As shown above, you can verify the results of the `drvconfig(1M)` command by listing the contents of `/devices/pseudo/ap_dmd*`.

e. Create symbolic links from the devices directory `/devices/pseudo` to the special metadisk files in `/dev/ap/dsk` and `/dev/ap/rdisk`.

```
# apconfig -R
# ls -l /dev/ap/dsk
...
```

As shown above, you can verify the results of the `apconfig(1M)` command by listing the contents of `/dev/ap/dsk` to view the symbolic links.

- f. If you are placing the boot disk under AP control, use `apboot(1M)` to define the new AP boot device.

```
# apboot metadisk_name
```

The `apboot(1M)` command modifies the `/etc/vfstab` file and the `/etc/system` file. The `metadisk_name` must be in the form: `mcxtxdx`.

- g. **Modify any references that use a physical device node (that is, a path that begins with `/dev/dsk` or `/dev/rdisk`) to use the corresponding metadisk device node (that is, a path that begins with `/dev/ap/dsk` or `/dev/ap/rdisk`).**

If a partition is mounted under a physical path, unmount and remount it under the metadisk path.

Examine `/etc/vfstab` for any physical devices that should be changed to AP metadevices. If necessary, edit `/etc/vfstab` to make the necessary modifications.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the domain.

3. Create AP metanetworks (for non-primary networks).

Note – The following steps should be applied to all networks that you want to alternately path *except* the primary network.

a. Create the network pathgroup.

```
# apnet -c -p network_interface -a network_interface
# apconfig -N -u
...
```

As shown above, you can verify the results of the `apnet(1M)` command by using `apconfig(1M)`.

b. Commit the network pathgroup entries in the database.

```
# apdb -C
```

You can verify the results of the `apdb(1M)` command by using the `apconfig(1M)` command with the `-N` option.

c. Remove all direct usage of both members of the network pathgroups.

If the physical interface is currently plumbed, and it is not the interface that you will be using as you run commands to configure the metanetwork, you can unplumb the physical interface by using the `ifconfig(1M)` command.

d. Create an `/etc/hostname.mnetwork_interface_name` file for any metanetworks that you want to configure when the domain is rebooted.

4. Create the AP metanetwork for the primary network.

a. View the contents of the `/etc/nodename` and `/etc/hostname.interface_name` files to verify that the interface name is the same.

b. Create the primary network pathgroup.

```
# apnet -c -p network_interface -a network_interface
```

In this example, `-c` creates the new primary network pathgroup, `-p` designates the primary network path, and `-a` designates the alternate path.

c. Commit the network pathgroup entry in the database.

```
# apdb -C
# apconfig -N
```

As shown above, you can verify the results of the `apdb(1M)` command by using `apconfig(1M)`.

d. Create the new `/etc/hostname.minterface_name` file to configure the network when you reboot the domain.

For example, `/etc/hostname.minterface_name` might contain `hmb`.

e. Remove the configuration files that correspond to the metanetwork interface.

```
# rm -f /etc/hostname.primary_interface_name \
/etc/hostname.alternate_interface_name
```

5. If you plan to use a volume manager, such as Sun Enterprise Volume Manager™ (SEVM) or Solstice DiskSuite™ (SDS), configure the volume manager according to the vendor's instructions.

Caution – Make sure that your volume manager is supported in the Solaris 7 11/99 operating environment (which is required for AP 2.2).

■ SEVM Issues

If you want to build your SEVM volumes on top of AP, you should configure your volumes using AP metadisk paths rather than physical paths. SEVM recognizes and properly installs existing AP metadevices with no special action required.

SEVM can encapsulate both nonboot disks and boot disks that are configured as AP metadevices. SEVM can encapsulate AP databases without any impact on AP. Note, however, that the standard SEVM requirements for encapsulation apply:

- There must be an $s2$ slice that represents the entire disk.
- There must be a "small amount" of free disk space at the beginning or end of the disk.
- There must be two free partitions.

The partition requirement may necessitate giving up an AP database, which is often placed in slice $s4$.

It is best to configure SEVM *after* you configure AP. It is beyond the scope of this document to describe how to integrate AP with an existing SEVM configuration.

■ SDS Issues

If you want to build your SDS volumes on top of AP, you should configure your volumes using AP metadisk paths rather than physical paths. SDS recognizes and properly installs existing AP metadevices with no special action required.

6. Reboot the domain (if necessary).

If you just rebooted the domain after configuring a volume manager, this step is unnecessary.

Performing an Upgrade of AP

This section provides upgrade instructions for AP 2.2 on the SSP and on a domain. AP 2.0 and AP 2.1 are not supported under the Solaris 7 8/99 operating environment. The upgrade process involves removing the earlier version of AP on the SSP and on the host domain, installing one AP package on the SSP and a set of core AP packages on the domain, and restoring your AP configuration. Scripts are provided to simplify this process.

Caution – If you are installing AP 2.2 on a Sun Enterprise 10000 domain, the SSP must be running the SSP 3.1 software. SSP 3.0 does not support AP 2.2. Refer to your SSP Media Kit for instructions on how to install the SSP software.

Installation of the packages on the enclosed CD-ROM requires approximately 2.7 megabytes of disk space on the host domain and 37 kilobytes on the SSP. The following table lists the total size of the AP software by file system:

TABLE 9-2 AP Software File System Sizes

| File System | Size |
|-------------|-------------|
| Domain: | |
| /opt | 1.23-Mbytes |
| /usr | 158-Kbytes |
| / | 1.3-Mbytes |
| SSP: | |
| /opt | 37-Kbytes |

Backing Up Your Server

Always back up an existing server before you upgrade any software. The safest backup to perform is a level 0 dump (`ufsdump(1M)`) of the file systems connected to the server being upgraded. If you do not have an established backup procedure, see the *System Administration Guide*.

You do not need to back out installed patches before you perform the upgrade.

Checking Other Software Documentation

Check the documentation of other software you are running, such as disk volume managers, before you use the `upgrade` option in the `suninstall` utility. There may be additional instructions you need to follow to preserve existing configurations. Also, be sure to check the release notes for AP and any volume managers you are using.

Upgrading AP and Solaris Software Simultaneously

The AP upgrade procedures in this section use two scripts, `ap_upgrade_begin` and `ap_upgrade_finish`. The first script saves your current AP configuration. The second script restores that exact configuration after you install the AP 2.2 packages. It is likely that you will upgrade to the Solaris 7 11/99 operating environment at the same time you upgrade to AP 2.2, since AP 2.2 requires the Solaris 7 11/99 operating environment. Because the AP configuration is restored exactly as it was before you upgrade to the Solaris 7 11/99 operating environment, you need to be aware of the issues described in this section.

Controller Renumbering

If I/O controller renumbering occurs, the AP upgrade scripts will not work. I/O controller renumbering can occur if you alter your hardware configuration in certain ways, and then perform a reconfigure boot (`boot -R`) or otherwise cause a `drvconfig(1M)` command to be executed. For example, you might use Dynamic Reconfiguration (DR) to logically detach a system board from a domain. If that system board hosts I/O controllers, and other higher numbered system boards in the domain also host I/O controllers, the next reconfigure boot operation may cause the controllers to be renumbered. For example, `pln5` may become `pln3`.

The `suninstall` procedure requires a reconfigure boot operation. If this causes controllers to be renumbered, you cannot use `ap_upgrade_finish` to complete the AP upgrade. However, you may still choose to use `ap_upgrade_begin`. The reason for this is that `ap_upgrade_begin` saves information about your AP configuration in the files `/var/tmp/ap*`. If you have a deep understanding of the way device numbering works, you can recreate your AP configuration by referencing those files under `/var/tmp`, and manually remapping the old AP configuration after taking into consideration how the underlying physical controllers have been renumbered.

If you do not have a good understanding of device numbering, either perform a fresh install and recreate your AP configuration from scratch, or ask your service representative for assistance. In general, you should avoid changing your hardware in ways that can result in controller renumbering.

AP Database Partitions

The AP upgrade scripts attempt to recreate the AP databases in the same partitions that they occupied before the upgrade to Solaris 7 11/99 operating environment. Note, however, that the Solaris 7 11/99 operating environment requires more disk space than earlier Solaris versions. Because of this, you may choose to modify the boot disk partitioning scheme during `suninstall`. If you place file systems in all

partitions that were previously used for AP databases, `ap_upgrade_finish` is not able to recreate any databases and the upgrade process fails. Furthermore, if you place a file system in *any* partition that was previously used for an AP database, and if for some reason that file system is not mounted at the time you run `ap_upgrade_finish`, that file system is overwritten by a copy of the AP database.

Root Disk Partitions

The AP upgrade facility assumes that the partitioning of the `root` disk (the disk containing the `root` partition) is not modified during the upgrade. The Solaris 7 11/99 software requires more disk space than earlier versions. One way to acquire the additional space is to repartition the original disk or to split the `root` disk into two disks using standard commands prior to the Solaris 7 11/99 upgrade. If you need to repartition the `root` disk, you should do so *before* performing the AP 2.2 upgrade procedure. If there is insufficient space when you run `suninstall`, you have the option to modify the disk partitioning layout to acquire more space. However, during `suninstall`, you must not relocate the `root` or `usr` partitions to another disk as this will cause the AP upgrade script to fail.

Uncommitted AP Database Entries

Before you run `ap_upgrade_begin`, commit any uncommitted entries in the AP database. Any metadevices that were created but not committed are not preserved during the upgrade. Similarly, any metadevices that were deleted but not committed will continue to exist after the upgrade.

▼ To Upgrade To AP 2.2

1. **If necessary, commit any uncommitted AP metadevices.**
 - a. **Log in to the domain as superuser.**
 - b. **Commit the entries in the AP database.**

```
# apdb -C
```

2. **Terminate any processes that directly or indirectly access AP metadevices.**

You do not need to be concerned here about the fact that your boot disk or primary network may be using AP metadevices. The `ap_upgrade_begin` script, which you will run later in this procedure, and the subsequent reboot will cause the boot disk and primary network to use physical paths rather than AP metadevices.

3. Prepare the CD-ROM.

- a. Log in to the SSP as superuser.
- b. Insert the Sun Computer Systems Supplement CD into the CD-ROM drive of the SSP machine.

Wait for the volume manager to mount the CD.

- c. Share the CD-ROM so that it can be accessed over the network.

```
ssp# share -o ro,anon=0 -F nfs /cdrom/cdrom0
```

4. Upgrade AP on the SSP.

- a. Kill the `ap_ssp_daemon` process.
- b. Remove the package `SUNWapssp` on both the main SSP and the spare SSP (if you have one) by using the `pkgrm(1M)` command.
- c. Install the AP 2.2 `SUNWapssp` package on both the main SSP and the spare SSP (if you have one).

```
ssp# cd /cdrom/cdrom0/Product
ssp# pkgadd -d . SUNWapssp
```

- d. Start the `ap_ssp_daemon` (on the main SSP).

```
ssp# init q
```

5. Remove AP from the domain.

- a. Log in to the domain as superuser.
- b. Create and mount the `/cdrom` directory.

```
# mkdir /cdrom
# mount ssp_hostname:/cdrom/cdrom0 /cdrom
```

- c. Run the following script to deconfigure AP (and save the AP configuration so that it can be restored later):

```
# /cdrom/Tools/ap_upgrade_begin
...
ap_upgrade_begin has completed
```

This script saves the current AP configuration information in the files `/var/tmp/ap*`. This script also generates executable shell scripts that you can use to regenerate your AP configuration. You may examine the `/var/tmp/ap*` files if you wish, but do not modify or remove them. Doing so can compromise the upgrade procedure.

- d. If any file systems shown in `/etc/vfstab` are still configured as AP metadevices, edit `/etc/vfstab` and reconfigure those file systems as physical devices.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the domain.

- e. Remove the packages `SUNWapdoc`, `SUNWapdr`, `SUNWapu`, and `SUNWabap` by using the `pkgrm(1M)` command.

6. If you plan to upgrade to the Solaris 7 11/99 operating environment, perform that upgrade now.

See the section “Performing an Upgrade” in the chapter “Solaris 7 11/99 on the Sun Enterprise 10000 Server” in the *Solaris 7 11/99 Sun Hardware Platform Guide*.

Caution – Wait until the Solaris upgrade process is completely finished before continuing with this procedure.

Caution – Make sure you upgrade the correct slice. If you were previously using a volume manager to mirror the boot disk, and if you were also using AP to alternately path each boot disk mirror, then there are four physical paths that were previously potential paths to the boot disk (two alternate paths for each boot disk mirror). Now that both AP and the volume manager have been deconfigured, examine `/etc/vfstab` to determine the physical path that corresponds to the root (`/`) file system. Make sure the OBP boot-device variable is set to that path. When you run `suninstall`, specify that path as the disk to upgrade. Later, when you restore your

volume manager, be sure to designate that disk as the primary mirror. See your volume manager documentation for information on determining which physical slice is used when booting.

7. Prepare the CD-ROM (if necessary).

a. Log in to the SSP as superuser.

b. Re-insert the Sun Computer Systems Supplement CD into the CD-ROM drive of the SSP machine.

Wait for the volume manager to mount the CD.

c. Share the CD-ROM so that it can be accessed over the network.

```
ssp# share -o ro,anon=0 -F nfs /cdrom/cdrom0
```

8. Upgrade to AP 2.2 on the domain.

a. Log in to the domain as superuser.

b. If necessary, create and mount the /cdrom directory.

```
# mkdir /cdrom
# mount ssp_hostname:/cdrom/cdrom0 /cdrom
```

c. Install the required AP 2.2 packages.

```
# cd /cdrom/Product
# pkgadd -d . SUNWapdv SUNWapr SUNWapu SUNWapdoc
```

d. Run the following script to restore the original AP configuration.

Caution – Be sure to read “Upgrading AP and Solaris Software Simultaneously” on page 148 before performing the following command.

```
# /cdrom/Tools/ap_upgrade_finish
...
ap_upgrade_finish has completed
```

- e. If there are any file systems shown in `/etc/vfstab` that are still configured as physical devices, and if you wish to build those file systems on AP metadevices, edit `/etc/vfstab` and reconfigure those file systems as AP metadevices.

Caution – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the domain.

f. Reboot the domain.

9. On the SSP, unshare the CD-ROM drive, and remove the Sun Computer Systems Supplement CD.

```
ssp# cd /  
ssp# unshare /cdrom/cdrom0  
ssp# eject cdrom
```

Upgrading to AP 2.2 and Solstice DiskSuite 4.2 Simultaneously

If you are upgrading from the Solaris 2.5.1 or 2.6 operating environments to the Solaris 7 11/99 operating environment and have AP 2.0 or 2.1 and Solstice™ DiskSuite™ 4.0 or 4.1 (SDS) on your system, you must upgrade to AP 2.2 and SDS 4.2.

You should ensure that you have the following publications before you start the upgrade:

- *Solaris 7 11/99 Release Notes Supplement for Sun Hardware* (available in printed form in your Solaris 7 11/99 Media Kit)
- *Solaris 7 11/99 Sun Hardware Platform Guide*, (available in printed form in your Solaris 7 11/99 Media Kit or in AnswerBook2 format on the Sun Hardware Supplements CD)
- *Sun Enterprise Server Alternate Pathing User's Guide* (available in AnswerBook2 format on the Sun Hardware Supplements CD in your Solaris 7 11/99 Media Kit)
- *Solstice DiskSuite 4.2 User's Guide* (available in AnswerBook2 format from <http://docs.sun.com> or from your SDS Media Kit)
- *Solstice DiskSuite 4.2 Installation and Product Notes* (available in AnswerBook2 format from <http://docs.sun.com> or from your SDS Media Kit)

Caution – You must follow the sequence given here to successfully complete the upgrade.

The basic tasks are:

- Unconfigure SDS 4.0 or 4.1.
- Remove AP 2.0 or 2.1.
- Upgrade to the Solaris 7 11/99 operating environment.
- Install AP 2.2.
- Install and reconfigure SDS 4.2.

▼ To Upgrade To AP 2.2 and SDS 4.2

Caution – Before proceeding with this procedure, read the release notes for AP as well as the release notes for Solstice DiskSuite 4.2. Also, read through this entire procedure before proceeding.

1. If necessary, commit any uncommitted AP metadevices.

- a. Log in to the domain as superuser.
- b. Commit the entries in the AP database.

```
# apdb -C
```

2. Deconfigure Solstice DiskSuite™ (SDS) by following steps one through eight in “How to Convert to DiskSuite 4.2 on SPARC Systems Running DiskSuite 4.0 or 4.1” in the Solstice DiskSuite 4.2 Installation and Product Notes (October 19, 1998).

3. Reboot.

This assures that the deconfigured disk volumes are no longer active.

4. Terminate any processes that directly or indirectly access AP metadevices.

You do not need to be concerned here about the fact that your boot disk or primary network may be using AP metadevices. The `ap_upgrade_begin` script, which you will run later in this procedure, and the subsequent reboot will cause the boot disk and primary network to use physical paths rather than AP metadevices.

5. Prepare the CD-ROM.

- a. Log in to the SSP as superuser.

- Wait for the volume manager to mount the CD.

- ```
ssp# share -o ro,anon=0 -F nfs /cdrom/cdrom0
```

**a. Kill the `ap_ssp_daemon` process.**

- ```
ssp# cd /cdrom/cdrom0/Product
ssp# pkgadd -d . SUNWapssp
```

- ssp#
- init**
- q

a. Log in to the domain as superuser.

- ```
mkdir /cdrom
mount ssp_hostname:/cdrom/cdrom0 /cdrom
```

- c. Run the following script to deconfigure AP (and save the AP configuration so that it can be restored later):

```
/cdrom/Tools/ap_upgrade_begin
...
ap_upgrade_begin has completed
```

This script saves the current AP configuration information in the files `/var/tmp/ap*`. This script also generates executable shell scripts that you can use to regenerate your AP configuration. You may examine the `/var/tmp/ap*` files if you wish, but do not modify or remove them. Doing so can compromise the upgrade procedure.

- d. If any file systems shown in `/etc/vfstab` are still configured as AP metadevices, edit `/etc/vfstab` and reconfigure those file systems as physical devices.

---

**Caution** – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will lose data the next time you boot the domain.

---

- e. Remove the packages `SUNWapdoc`, `SUNWapr`, `SUNWapu`, and `SUNWabap` by using the `pkgrm(1M)` command.

8. If you plan to upgrade to the Solaris 7 11/99 operating environment, perform that upgrade now.

See the section “Performing an Upgrade” in the chapter “Solaris 7 11/99 on the Sun Enterprise 10000 Server” in the *Solaris 7 11/99 Sun Hardware Platform Guide*.

---

**Caution** – Wait until the Solaris upgrade process is completely finished before continuing with this procedure.

---

---

**Caution** – Make sure you upgrade the correct slice. If you were previously using a volume manager to mirror the boot disk, and if you were also using AP to alternately path each boot disk mirror, then there are four physical paths that were previously potential paths to the boot disk (two alternate paths for each boot disk mirror). Now that both AP and the volume manager have been deconfigured, examine `/etc/vfstab` to determine the physical path that corresponds to the root (`/`) file system. Make sure the OBP boot-device variable is set to that path. When you run `suninstall`, specify that path as the disk to upgrade. Later, when you restore your

volume manager, be sure to designate that disk as the primary mirror. See your volume manager documentation for information on determining which physical slice is used when booting.

---

**9. Prepare the CD-ROM (if necessary).**

**a. Log in to the SSP as superuser.**

**b. Re-insert the Sun Computer Systems Supplement CD into the CD-ROM drive of the SSP machine.**

Wait for the volume manager to mount the CD.

**c. Share the CD-ROM so that it can be accessed over the network.**

```
ssp# share -o ro,anon=0 -F nfs /cdrom/cdrom0
```

**10. Upgrade to AP 2.2 on the domain.**

**a. Log in to the domain as superuser.**

**b. If necessary, create and mount the /cdrom directory.**

```
mkdir /cdrom
mount ssp_hostname:/cdrom/cdrom0 /cdrom
```

**c. Install the required AP 2.2 packages.**

```
cd /cdrom/Product
pkgadd -d . SUNWapdv SUNWapr SUNWapu SUNWapdoc
```

**d. Run the following script to restore the original AP configuration.**

---

**Caution** – Be sure to read “Upgrading AP and Solaris Software Simultaneously” on page 148 before performing the following command.

---

```
/cdrom/Tools/ap_upgrade_finish
...
ap_upgrade_finish has completed
```

- e. If there are any file systems shown in `/etc/vfstab` that are still configured as physical devices, and if you wish to build those file systems on AP metadevices, edit `/etc/vfstab` and reconfigure those file systems as AP metadevices.

---

**Caution** – You must be a knowledgeable system administrator to edit `/etc/vfstab`. If you do not configure your file systems properly in `/etc/vfstab`, it is possible that you will loose data the next time you boot the domain.

---

- f. Reboot the domain.

11. On the SSP, unshare the CD-ROM drive, and remove the Sun Computer Systems Supplement CD.

```
ssp# cd /
ssp# unshare /cdrom/cdrom0
ssp# eject cdrom
```

12. Install and configure Solstice DiskSuite 4.2, by following steps 10 through 16 in the procedure “How to Convert to DiskSuite 4.2 on SPARC Systems Running DiskSuite 4.0 or 4.1” in the *Solstice DiskSuite 4.2 Installation and Product Notes* (October 19, 1998).

---

**Caution** – If your boot disk is mirrored, make sure you specify the upgraded disk as the primary mirror.

---

13. Optionally set the OBP `boot-device` variable to any available boot device path.

There may be as many as four boot device paths if you have a mirrored boot disk that is also alternately pathed. (Earlier in this procedure, when both AP and the volume manager were deconfigured, it was necessary for `boot-device` to point to the physical path to root (/) as specified in `/etc/vfstab`.)

## Upgrading to AP 2.2 and a Volume Manager Other Than Solstice DiskSuite 4.2

If you are upgrading to AP 2.2 and you are also upgrading to a volume manager other than Solstice DiskSuite 4.2, follow the general guidelines in this section.

---

**Caution** – Make sure that your volume manager is supported in the Solaris 7 11/99 operating environment (which is required for AP 2.2).

---

Use the procedure “To Upgrade To AP 2.2 and SDS 4.2” on page 154 as an example. However, two of the steps are different:

- Instead of Step 2, “Deconfigure Solstice DiskSuite™ (SDS)”, use the following general guidelines:
  1. Most likely, you should follow the deconfiguration steps within a procedure that upgrades the volume manager to a newer version.
  2. After following the steps that deconfigure the volume manager devices, you may be in the middle of a volume manager upgrade procedure. Do not proceed beyond the point of deconfiguring the volume manager.
  3. Do not install new volume manager packages.
  4. Do not run `suninstall`.
  5. Continue with Step 3 of “To Upgrade To AP 2.2 and SDS 4.2” on page 154 immediately after deconfiguring the volume manager.
- Instead of Step 12, “Install and Configure Solstice DiskSuite 4.2”, follow your vendor’s instructions for restoring the volume manager configuration. Most likely, you should continue with the procedure you were following in the bullet point above.

# The Solaris 7 11/99 Operating Environment on the Sun Enterprise 10000 Server

---

This chapter includes fresh install and upgrade instructions for the Solaris™ operating environment on the Sun Enterprise 10000 server.

---

**Caution** – If you are installing Solaris 7 11/99 on a Sun Enterprise 10000 domain, your system must have SSP 3.1, SSP 3.1.1, or SSP 3.2 running on the System Service Processor (SSP). SSP 3.0 does not support domains running Solaris 7 11/99. Please refer to your Solaris media kit for instructions on how to install the SSP software.

---

---

## Knowing Where to Start

This section contains a list of the most common installation scenarios for the Sun Enterprise 10000 server. Choose which scenario best suits your objective for the installation, and perform the procedures in the sections that are listed in the exact order in which they appear.

- Creating a new domain and installing Solaris 7 11/99 on a new boot disk
- Installing a fresh copy of Solaris 7 11/99 on an existing domain
- Upgrading the boot disk to Solaris 7 11/99

The procedures that are covered in this chapter can take a considerable amount of time to complete, depending entirely on the configuration of the server and the site in which it resides.

---

**Note** – This chapter does not cover recovery from crashed disks or installations over the network from a machine other than the SSP.

---

## What You Need to Start

You need to be very familiar with your site configuration and with the configuration of the server before you start a fresh install or an upgrade. Some of the information can be gotten from the server configuration files; however, site configuration information must be gotten from the site administrator. The following list contains references to information that you must have to complete the fresh installation or the upgrade:

- IP address for the new domain
- Logical name of the boot device in the form `cxtxdxx`

You can use the `/etc/vfstab` file to determine the logical name of the boot device. In the following example, the boot device is `c0t0d0s0`.

|                   |                     |       |      |      |         |         |
|-------------------|---------------------|-------|------|------|---------|---------|
| #device           | device              | mount | FS   | fsck | mount   | mount   |
| #to mount         | to fsck             | point | type | pass | at boot | options |
| #                 |                     |       |      |      |         |         |
| /dev/dsk/c0t0d0s0 | /dev/rdisk/c0t0d0s0 | /     | ufs  | 1    | no      |         |

---

**Caution** – Controller numbers can change. You must ensure that you are using the correct logical name with the correct controller number.

---

---

## Creating a Domain

This section contains instructions on how to create a new domain. The entire procedure includes the following tasks:

- Creating the `eeprom.image` file for the new domain
- Creating the new domain on the SSP
- Installing a fresh copy of the Solaris operating environment by performing the procedures in “Performing a Fresh Install” on page 165

You must have the system identification key and the host ID *before* you perform the following instructions. You can obtain the key and ID from your service provider. This key is used to generate an `eeeprom.image` file.

## ▼ To Create the `eeeprom.image` File

1. **Log in to the SSP as user `ssp`.**

The default password is `ssp`.

2. **When prompted for the `SUNW_HOSTNAME` variable, use either the platform name or the name of any existing domain.**

3. **Use the `sys_id(1M)` command to create the `eeeprom.image` file.**

```
ssp% sys_id -h hostid -k key \
-f $SSPVAR/.ssp_private/eeeprom_save/eeeprom.image.domain_name
```

Where *hostid* is the number provided with the key in the form of `0X80A66xxx`, *key* is the EEPROM key number, and *domain\_name* is the hostname of the new domain.

---

**Note** – All *key* and *hostid* numbers are case-sensitive and must be entered exactly as they are received.

---

**4. Execute the following `sys_id(1M)` command to check the results.**

```
ssp% sys_id -d -f \
$SSPVAR/.ssp_private/eeeprom_save/eeeprom.image.domain_name
```

In the following example, 49933C54C64C858CD4CF is the *key* and 0x80a66e05 is the *hostid*:

```
ssp% sys_id -h 0x80a66e05 -k 49933C54C64C858CD4CF \
-f $SSPVAR/.ssp_private/eeeprom_save/eeeprom.image.domain_name
ssp% sys_id -d -f $SSPVAR/.ssp_private/eeeprom_save/ \
eeeprom.image.domain_name

IDPROM in eeeprom.image.domain_name
Format = 0x01
Machine Type = 0x80
Ethernet Address = 0:0:be:a6:6e:5
Manufacturing Date = Wed Dec 31 16:00:00 1997
Serial number (machine ID) = 0xa66e05
Checksum = 0x3f
```

**5. Back up the SSP `eeeprom.image` files to tape or disk where they can be accessed in case of an SSP boot-disk failure.**

You are done creating the `eeeprom.image` file for the domain. You can now create the new domain on the SSP, as described in the following section.

## ▼ To Create a New Domain on the SSP

- 1. Log in to the SSP as user `ssp`.**
- 2. When prompted for the `SUNW_HOSTNAME` variable, specify the name of the domain that you wish to create.**

Ensure that the domain name corresponds with the hostname of the domain in which the operating system is to be installed. Domain names cannot be longer than 14 characters.

### 3. Use the `domain_create(1M)` command to create the domain.

```
ssp% domain_create -d domain_name -b board_numbers -o \
OS_version -p platform_name
```

Where *domain\_name* is the name of the domain specified in Step 2, *board\_numbers* is a list of the system boards, delimited by spaces, to be included in the domain, *OS\_version* is the version of the domain's operating system, and *platform\_name* is the name of the platform as defined during the SSP package configuration.

If you upgraded the SSP software to SSP 3.1.1 or SSP 3.2, the *OS\_version* should be 5.7. If you did not upgrade the SSP software, the *OS\_version* should be 2.7.

Refer to the *Sun Enterprise 10000 SSP User Guide* for additional information.

### 4. Check the power to the domain.

```
ssp% power
```

The output of the `power(1M)` command depends greatly on the configuration of the server. If you are unfamiliar with the output, refer to the `power(1M)` for an explanation, or contact your service provider for an explanation of the output.

### 5. If you have determined that elements of the domain are powered off, power on those elements.

```
ssp% power -on
```

You are done creating the domain. You can now install a fresh copy of the Solaris operating environment, as described in the following section.

---

## Performing a Fresh Install

This section contains instructions on how to perform a fresh installation of Solaris 7 11/99. The installation includes the following tasks:

- Configuring the domain network information
- Setting up the SSP
- Bringing up the domain
- Installing a fresh copy of the boot image
- Configuring the Solaris operating environment
- Configuring the OBP environment

- Bringing up the domain
- Installing the Computer Systems supplements packages
- Configuring the Network Time Protocol (NTP) packages
- Finishing the fresh install

## ▼ To Configure the Domain Network Information

1. **Log in to the SSP as superuser.**
2. **Manually edit the `/etc/hosts` file to include the IP address of the new domain.**

You need to get the IP address from your network administrator.

The correct entries would look similar to the following `/etc/hosts` sample. Note that the new entry is `tacos`:

```
129.153.49.185 tacos
127.0.0.1 localhost
129.153.49.179 snax-ssp vegetables loghost
129.153.49.181 snax-cb0
129.153.49.182 snax-cb1
129.153.49.180 pizza
129.153.49.183 chips
129.153.49.1 marvin-49
110.0.0.1 vegetables-priv
110.0.0.5 chips-priv
```

The `/etc/hosts` file is actually a link to `./inet/hosts`.

---

**Caution** – If the new domain entry follows any other host or SSP entry, the `add_install_client` command may not work in Step 4 in “To Set Up the SSP” on page 167.

---

**3. Manually edit the `/etc/ethers` file to include the Ethernet address of the new domain.**

The correct entries would look similar to the following `/etc/ethers` sample. Note that `tacos` represents the name of the new domain in this example:

```
8:0:20:87:58:a5 snax-ssp vegetables
8:0:20:87:58:a5 snax-ssp vegetables
0:0:be:01:00:1e snax-cb0
0:0:be:01:00:57 snax-cb1
0:0:be:a6:50:2f pizza
0:0:be:a6:6f:19 chips-priv
0:0:be:a6:6f:23 nachos
0:0:be:a6:6f:2a tacos
```

You are done configuring the domain network information. If you use NIS at your site, check with your network administrator about what configuration issues must be addressed before you continue the installation. NIS issues are out of the scope of this chapter. Otherwise, you can now set up the SSP as a boot server, as described in the next section.

## ▼ To Set Up the SSP

**1. Insert the Solaris CD into the CD-ROM drive on the SSP.**

After inserting the CD, wait about one minute for the volume manager to mount the CD-ROM.

**2. Log in to the SSP as superuser.**

**3. Change to the `Tools` directory on the CD.**

```
ssp# cd /cdrom/cdrom0/s0/Solaris_2.7/Tools
```

#### 4. Set up the host domain as an install client.

```
ssp# ./add_install_client domain_name sun4u
```

The `add_install_client` command should share the CD across the net. If an error occurs, you may receive the following message:

```
panic-boot: Could not mount filesystem
```

If you receive this message, use the following `share(1M)` command to correct the error.

```
ssp# share -F nfs -o ro,anon=0 /cdrom/cdrom0/s0
```

If the `/etc/nsswitch.conf` file contains a DNS entry in its host list, you may receive the following warning:

```
Error: domain_name does not exist in the NIS ethers map.
```

If you receive this message, you need to remove the DNS entry in the `/etc/nsswitch.conf` file, to add the `domain_name` to the ethers map if the name is not already in the map, and to re-run the `add_install_client(1M)` command.

#### 5. Check to see if Patch 105684 has been installed.

```
ssp# showrev -p | grep 105684
```

If you have not upgraded the SSP software to SSP 3.1.1 or SSP 3.2 and if Patch 105684 is not installed, you need to install Patch 105684-04, at a minimum. You can obtain this patch from <http://www.sunsolve.com>. Refer to the patch README file for directions on how to install the patch.

#### 6. Exit the superuser level.

#### 7. Use the `domain_status(1M)` command to ensure that the OS version is set to the proper value.

If you upgraded the SSP software to SSP 3.1.1 or SSP 3.2, the OS version should be 5.7. If you did not upgrade the SSP software, the OS version should be 2.7. If the OS version is set to the proper value, proceed to Step 8. If not, perform the following steps:

**a. Remove the existing domain.**

```
ssp% domain_remove -d domain_name
```

The `domain_remove(1M)` command prompts you to save the domain directories, as in the following example:

```
domain_remove: The following subdirectories contain domain specific
 information such as messages files, configuration files,
 and hpost dump files. You may choose to keep these
 directories if you still need this information. This
 domain may be created with or without this information
 being saved.

/var/opt/SUNWssp/adm/xf4-b3
/var/opt/SUNWssp/etc/allxf4/xf4-b3

Keep directories (y/n)? y
Domain : xf4-b3 is removed !
```

Be sure to answer yes, `y`, to the prompt so that the domain information is saved. If you answer no, you will have to supply the board numbers and the platform name for the new domain.

**b. Create the new domain with the new OS version number.**

```
ssp% domain_create -d domain_name -o 5.7
```

If you saved the domain information, you do not need to include the `-b` and `-p` arguments. The `domain_create(1M)` command uses the domain information that was saved and the information you provide with the command to create the new domain.

If you upgraded the SSP software to SSP 3.1.1 or SSP 3.2, the OS version should be 5.7. If you did not upgrade the SSP software, the OS version should be 2.7.

**8. Use the `domain_switch(1M)` command to ensure that `SUNW_HOSTNAME` is set to the proper domain name.**

```
ssp% domain_switch domain_name
```

---

**Note** – The `domain_switch(1M)` command must be executed from a C shell. By default, the SSP window is a C shell.

---

## 9. Check for blacklisted components.

If SBus boards have been added to a system board, confirm that the processors on those system boards are not blacklisted. Processors are blacklisted at the factory when a system board does not have SBus cards installed.

During the bring-up process, observe the list of blacklisted components. Alternatively, for instructions on how to retrieve the blacklist file, refer to the `blacklist(1M)` man page.

To remove a processor from the blacklist, edit the blacklist file and remove the number of the board from the `pc` line in the file. By default, the blacklist file resides at `$$SSPVAR/etc/platform_name/blacklist`; however, the location of the blacklist file can be reconfigured so that the location of the blacklist file on your server may be different from the default location.

You are done setting up the SSP as a boot server. You can now bring up the domain, as described in the next section.

# ▼ To Bring Up the Domain

## 1. Bring up the domain.

```
ssp% bringup -A off
```

If this is the first domain to be brought up, you will be prompted to configure the centerplane. Type `y` to continue if you are sure that no other domains are running. Responding `yes` resets the entire platform; therefore, you must ensure that no other domains are running.

```
This bringup will configure the Centerplane. Please confirm (y/n)? y
```

After a few minutes the SSP prompt is displayed. Review the output of the `bringup(1M)` command. If errors occurred, you must correct those errors before you proceed. If no errors occurred, continue to the next step.

**2. In the SSP window, open a `netcon(1M)` session.**

```
ssp% netcon -g
```

The `ok` prompt is displayed after a few minutes. The duration depends directly on the size of the domain.

You are done bringing up the domain. You can now set up the OpenBoot PROM, as described in the next section.

## ▼ To Set Up the OBP Environment

**1. Use the `devalias` command to check for duplicate `devalias` entries in OBP.**

The `suninstall` utility may not work properly if you have defined duplicate `devalias` in OBP. Use the `devalias` command to check the aliases. The output may resemble the following example:

```
ok devalias
net /sbus@41,0/qec@0,20000/qe@1,0
ttya /ssp-serial
ssa_b_example /sbus@40,0/SUNW,soc@0,0/SUNW,pln@b0000000,XXXXXX/SUNW,ssd@0,0:a
ssa_a_example /sbus@40,0/SUNW,soc@0,0/SUNW,pln@a0000000,XXXXXX/SUNW,ssd@0,0:a
isp_example /sbus@40,0/QLGC,isp@0,10000/sd@0,0
net_example /sbus@40,0/qec@0,20000/qe@0,0
net /sbus@41,0/qec@0,20000/qe@0,0
ok
```

---

**Note** – If any `devalias` are defined twice (`net` is defined twice in the above example), you should remove the extra `devalias` entries.

---

**2. If any duplicate entries exist in the `devalias` list, remove them.**

The following example removes the last-created `net` `devalias`. You may have to issue a second `nvunalias` command if the second `net` alias is the incorrect one. Then issue an `nvalias` command to create the correct `net` device alias.

```
ok nvunalias net
```

3. If a `net alias` does not exist for the network interface that is on the same subnet as the SSP, create one by typing a command similar to the following example:

```
ok nvalias net /sbus@41,0/SUNW,hme@0,8c00000
```

Where `/sbus@41,0` refers to system board 0 and SBus 1. The `/SUNW,hme@0` portion of the device name defines a 100BASE-T network interface installed in Slot 0. This information is site-specific; thus, your configuration may vary.

The following table contains the SBus numbers used in the `devalias` file.

**TABLE 10-1** SBus Numbers in the `devalias` File

| system board | sysio 0  | sysio 1  | system board | sysio 0  | sysio 1  |
|--------------|----------|----------|--------------|----------|----------|
| 0            | /sbus@40 | /sbus@41 | 8            | /sbus@60 | /sbus@61 |
| 1            | /sbus@44 | /sbus@45 | 9            | /sbus@64 | /sbus@65 |
| 2            | /sbus@48 | /sbus@49 | 10           | /sbus@68 | /sbus@69 |
| 3            | /sbus@4c | /sbus@4d | 11           | /sbus@6c | /sbus@6d |
| 4            | /sbus@50 | /sbus@51 | 12           | /sbus@70 | /sbus@71 |
| 5            | /sbus@54 | /sbus@55 | 13           | /sbus@74 | /sbus@75 |
| 6            | /sbus@58 | /sbus@59 | 14           | /sbus@78 | /sbus@79 |
| 7            | /sbus@5c | /sbus@5d | 15           | /sbus@7c | /sbus@7d |

The `watch-net-all` command (no spaces) displays the functioning network interfaces.

You are done setting up the OBP environment. You can now install the Solaris operating environment, as described in the following section.

## ▼ To Install the Solaris 7 11/99 Operating Environment

You can use these instructions to install the Solaris operating environment without saving any previous files.

During the installation, you will use the `suninstall` utility, which has its own instructions. The following instructions are specific to the Sun Enterprise 10000. For more information about the `suninstall` utility, refer to the Solaris installation instructions in your Solaris media kit.

---

**Caution** – The next step starts the `suninstall` utility. During the installation, you will be asked to specify the device name of the boot disk. Do not begin the installation until you know the device name.

---

- In the `netcon(1M)` window, boot the system from the network.

```
ok boot net
```

---

**Note** – You should have an alias (usually `net`) in OBP for the proper network interface. Use that alias with the `boot(1M)` command, as shown in the example above. Otherwise, you must type in the complete OBP device path. If you specify an alias (or path) that does not describe the proper network interface, the `boot(1M)` command will fail, and you will have to bring up the domain again.

---

If you install the operating system on a drive other than the one designated as the boot drive, the `suninstall` utility displays a warning message similar to the following:

```
Warning
You have an invalid disk configuration because of the condition(s)
displayed in the window below. Errors should be fixed to ensure a
successful installation. Warnings can be ignored without causing
the installation to fail.

> To go back and fix errors or warnings, select Cancel.
> To accept the error conditions or warnings and continue with the
installation, select Continue.

WARNING: The boot disk is not selected or does not have a "/" mount
point (c0t3d0)
```

You can safely ignore this warning and press F2 to continue.

The `boot net` command starts the `suninstall` utility. This utility prompts you to provide site and platform-specific information. Refer to the following table for the platform-specific information you may need to supply. If you have questions about the `suninstall` utility, refer to the *Installation Instructions for Solaris 7 11/99 (SPARC Platform Edition)* in your media kit.

**TABLE 10-2** Platform-Specific Information for the `suninstall` Utility

| If you are asked to                                                                             | Do this                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Please enter the hostname of the SSP for <code>domain_name</code> [ <code>default_name</code> ] | Enter the hostname for your SSP. Note that the default value is to append <code>-ssp</code> to the domain name.                                                                                                                                             |
| Set the network information                                                                     | Select the appropriate level of information you want to provide. If you select any option other than <code>None</code> , the <code>suninstall</code> utility displays a series of dialogs that request configuration information. Provide that information. |
| Solaris Interactive Installation                                                                | Select <code>Initial</code> for fresh install.                                                                                                                                                                                                              |

**TABLE 10-2** Platform-Specific Information for the `suninstall` Utility

| If you are asked to               | Do this                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select 64 bit                     | Click “Select To Include Solaris 64-bit Support” to install the 64-bit kernel. Refer to the Solaris 7 11/99 <i>Release Notes Supplement</i> for instructions on how to check the operating mode, to set the default mode, and to switch the operating mode.                                                                                                                                                                                                           |
| Select Software                   | Select Entire Distribution plus OEM Support.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Select Disk(s)                    | Select the disk(s) on which the software is to be installed. If you choose a drive other than the one designated as the boot drive, a warning message appears later in the installation process. At that point, you can choose whether to continue, or not.                                                                                                                                                                                                           |
| Automatically Layout File Systems | Select Manual Layout. The <code>suninstall</code> utility enables you to customize the root disk by specifying disk partitions. Refer to TABLE 10-3 on page 176 as a guide.                                                                                                                                                                                                                                                                                           |
| Mount Remote File System          | Press F4 if file systems are to be mounted from a remote file server. Press F2 if they are not.                                                                                                                                                                                                                                                                                                                                                                       |
| Reboot after installation         | Select <code>manual reboot</code> and press F2 to begin the installation. This step, which installs the software and the patches from the Solaris release CD, can take approximately 40 minutes to complete. When the install ends successfully, the superuser prompt is displayed in the domain’s <code>netcon(1M)</code> console window. You can now configure the Solaris operating environment, as described in “To Configure the Solaris Operating Environment”. |

When you perform a full install of the Solaris 7 11/99 operating environment on a domain, the `suninstall` utility allows you to manually enter the disk partition sizes for your file systems. Do not use disk partitions that are less than the minimum sizes in TABLE 10-3.

If two disks are used, root (/) and /usr must be on the device specified in the OBP boot alias.

TABLE 10-3 Minimum Partition Sizes

| Partition | Minimum Sizes | Notes                                                                                                                                                                               |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 /       | 256 Mbyte     | Bare minimum size                                                                                                                                                                   |
| 1 swap    | 1024 Mbyte    | Bare minimum size                                                                                                                                                                   |
| 2 overlap |               | Actual total disk size                                                                                                                                                              |
| 3 /var    | 512 Mbyte     |                                                                                                                                                                                     |
| 4         | 3 Mbyte       | This slice must be reserved for the Alternate Pathing and Solstice™ DiskSuite™ products. Otherwise, subsequent Alternate Pathing installations will overwrite the operating system. |
| 5 /opt    | 512 Mbyte     | This may be larger depending upon remaining space.                                                                                                                                  |
| 6 /usr    | 1 Gbyte       | Asian-language users may need more space here.                                                                                                                                      |

Use the Tab key to move the cursor, and use the keyboard to type the size for each partition. Press F2 when you are done.

Return to TABLE 10-2 on page 174 to continue the `suninstall` installation.

## ▼ To Configure the Solaris Operating Environment

1. After the operating system is loaded and the superuser prompt is displayed, list the `devices` entry for your boot disk.

```
domain_name# ls -l /dev/dsk/root_partition_device
```

where *root\_partition\_device* is in the form `cxtxdxsx`.

2. Copy the part of the string that begins with either `/sbus` or `/pci`.

Example:

```
/sbus@65,0/SUNW,fas@1,8800000/sd@3,0:a.
```

Record your device string here:

/

---

You will use this string in the next section.

3. Perform any site-specific configuration tasks on the newly installed environment by editing the configuration files in the `/a` directory.

The number and extent of any site-specific configuration task, such as configuring the default router, are highly dependent on the local configuration of the server and the network on which it resides. If you are unsure about what tasks you should perform, contact your service provider, or refer to the System Administration Guide.

4. Shut down the domain from the `netcon(1M)` window.

```
domain_name# init 0
```

You are done configuring the Solaris operating environment. You can now configure the OpenBoot PROM variables, as described in the following section.

## ▼ To Configure the OBP Variables

1. In the `netcon(1M)` window, assign the device string to an alias (refer to Step 2 in “To Configure the Solaris Operating Environment” for the *device\_string*).

```
ok nvalias bootdisk_alias device_string
```

---

As in this example, the `nvalias` command should be entered on a single line.

2. Use the `setenv` command to set the default boot-disk alias to the correct device.

```
ok setenv boot-device bootdisk_alias
```

Where *bootdisk\_alias* corresponds to the user-defined alias you established in Step 1. The device should correspond to the device that you want to use as the boot disk, which may be different than the device on which you just installed the Solaris operating environment.

You are done configuring the OBP variables. You can now bring up the domain, as described in the following section.

## ▼ To Bring Up the Domain

1. In an SSP window, use the `su(1M)` command to switch the user to superuser.
2. Change to the `Tools` directory.

```
ssp# cd /cdrom/cdrom0/s0/Solaris_2.7/Tools
```

3. Remove the host domain as an install client.

```
ssp# ./rm_install_client domain_name
```

4. Remove the Solaris CD from the CD-ROM drive.

```
ssp# cd /
ssp# unshare /cdrom/cdrom0/s0
ssp# eject cdrom
```

5. Exit the superuser shell to the SSP window as user `ssp`.

**6. From the SSP window, bring up the domain.**

```
ssp% bringup -A on
```

If you set the *bootdisk\_alias* to a device other than the device on which you just installed the Solaris operating environment, you need to supply the device alias for that device in this step.

If this is the first domain to be brought up, you will be prompted to configure the centerplane. Type *y* to confirm if you are sure that no other domains are running. Responding yes resets the entire platform; therefore, you must ensure that no other domains are running.

```
This bringup will configure the Centerplane. Please confirm (y/n)? y
```

**7. After the domain boots, type the superuser password then re-enter the password when prompted in the `netcon(1M)` window.**

```
Root password: password
Please re-enter your root password: password
```

Your entry will become the new superuser password for the domain.

You are done bringing up the domain. You can now install the Sun Computer Systems supplements packages, as described in the following section.

## ▼ To Install the Sun Computer Systems Supplements Packages

You should install the supplement packages as needed from the Sun Computer Systems Supplements CD.

- 1. Insert the Sun Computer Systems Supplements CD into the CD-ROM drive on the SSP.**
- 2. Log in as superuser on the SSP and share the CD-ROM.**

```
ssp# share -F nfs -o ro,anon=0 /cdrom/cdrom0
```

- 3. Log in as superuser in the `netcon(1M)` window.**

**4. Create and mount the `/cdrom` directory on the domain.**

```
domain_name# mkdir /cdrom
domain_name# mount ssp_name:/cdrom/cdrom0 /cdrom
```

**5. Add the `SUNWabhdw AnswerBook2` package.**

```
domain_name# cd /cdrom/Product
domain_name# pkgadd -d . SUNWabhdw
```

---

**Note** – Perform this step only for those domains in which you want to use the AnswerBook files.

---

The `pkgadd(1M)` command may display several messages and ask several installation questions for each package, some relating to space, others asking whether it is OK to continue. After answering these questions, and when asked whether to proceed, answer Yes.

**6. In the `netcon(1M)` window, unmount the CD.**

```
domain_name# cd /
domain_name# umount /cdrom
```

**7. Log in to the SSP as superuser and remove the Sun Computer Systems Supplement CD from the CD-ROM drive.**

```
ssp# cd /
ssp# unshare /cdrom/cdrom0
ssp# eject cdrom
```

**8. Install and configure any other purchased software packages.**

You are done installing the Sun Computer Systems supplements packages. You can now configure the Network Time Protocol (NTP) packages, as described in the following section.

## ▼ To Configure the NTP Packages

Perform the following steps to configure the `ntp.conf` file, which resides at `/etc/inet/ntp.conf`.

1. If needed, use the `netcon(1M)` window to log in to the domain as superuser.
2. Create the `ntp.conf` file in your text editor.
3. Edit the file so that it resembles the following example.

```
example Starfire domain /etc/inet/ntp.conf
configuration file ntp.conf
for Solaris 7 11/99
substitute actual ssp name for <ssp-name>

server <ssp-name> prefer
we can always fall back to the local clock.
server 127.127.1.0
fudge 127.127.1.0 stratum 9

Other ntp files.
driftfile /etc/inet/ntp.drift

Encryption:
disable auth
controlkey 1
requestkey 1
authdelay 0.000793

precision declaration
precision -18 # clock reading precision (1 usec)
```

Each domain should use the SSP as its source for time, and the SSP should use at least two other sources, besides its internal clock, to avoid a single point of failure in case the SSP's clock fails. For more information about NTP commands, refer to the `ntp(1M)` man page in the *man Pages(1M): System Administration Commands* section of the Solaris Administration AnswerBook2 Collection.

You are done configuring the NTP packages. You can now finish the fresh install, as described in the following section.

## ▼ To Finish the Fresh Install

### 1. Check the operating mode.

```
domain_name# isainfo -k
```

If you are running in 64-bit mode, you should get the following output.

```
sparcv9
```

### 2. Reboot the domain with the proper operating mode.

For the Solaris 7 11/99 operating environment, you can use either the 32-bit mode or the 64-bit mode. The 64-bit mode is the default for all sun4u platforms.

#### a. For 32-bit mode, type the following command.

```
domain_name# reboot boot_alias kernel/unix
```

#### b. For 64-bit mode, type one of the following commands.

Use the `ps(1)` command to ensure that the `edd(1M)` daemon is running before you attempt to reboot the domain.

If you are not already in 32-bit mode, use the following command.

```
domain_name# reboot boot_alias
```

If you are switching from the 32-bit mode, use the following command.

```
domain_name# reboot boot_alias kernel/sparcv9/unix
```

You are done with the fresh install unless you need to license your software, as described in the following section.

## Licensing Your Software

The Sun Enterprise 10000 domain feature requires different approaches to software licensing when compared to systems that cannot be logically partitioned.

## FLEXlm-Based Licensing

License management (the license server) is normally tied to a machine host ID. On a Sun Enterprise 10000 system, the license server is tied to the domain host ID. Each domain receives its own domain host ID.

Therefore, if licensing is installed on a Sun Enterprise 10000 system, it must be installed in a domain that will not be removed. Adding or removing processors from the domain will not affect licensing, as long as the domain always has at least one active processor.

If licensing ever needs to be moved from one domain to another, the licenses will need to be regenerated using the new domain host ID. This is identical to the situation when moving the license server from one machine to another. This process is called a *server move*; contact the Sun License Center to request a *server move*.

For more licensing information, use the following Sun License Center URL:

■ <http://www.sun.com/licensing>

To obtain the Sun Enterprise 10000 system domain host ID, type `hostid` in a shell window.

## Other Software Licensing

Other software vendors may have unique software licensing policies on the Sun Enterprise 10000 system. All major independent service providers have been notified and should have software policies in place. For additional information, contact your service provider.

---

# Performing an Upgrade to Solaris 7 11/99

These upgrade instructions are intended only for the Sun Enterprise 10000 server. You should read this entire section before you attempt to upgrade the domain.

---

**Caution** – If you are installing Solaris 7 11/99 on a Sun Enterprise 10000 domain, the SSP must be running SSP 3.1, SSP 3.1.1, or SSP 3.2. SSP 3.0 does not support Solaris 7 11/99. Please refer to your Solaris Media Kit for instructions on how to install the SSP software.

---

This section contains instructions on how to perform an upgrade from an earlier version of the Solaris operating environment to the Solaris 7 11/99 version. The upgrade includes the following tasks:

- Preparing the domain for the upgrade
- Checking the domain network information
- Setting up the SSP
- Bringing up the domain
- Upgrading the boot image
- Configuring the Solaris operating environment
- Configuring the OBP environment
- Bring up the domain after the upgrade to Solaris 7 11/99
- Upgrading the Computer Systems supplements packages
- Configuring the Network Time Protocol packages
- Finishing the upgrade

---

**Caution** – To upgrade a domain to Solaris 7 11/99, the `/usr` partition on your boot disk must be larger than 653-Mbytes. If the partition is smaller than 653-Mbytes, you must repartition the drive before you attempt to upgrade the domain. Sun Microsystems suggests that you use the disk-partition sizes in TABLE 10-6. With the introduction of the 64-bit kernel into the Solaris operating environment, the environment's size has grown significantly; thus, if you are still using a single 2.1-Gbyte disk as your boot disk, you should migrate to a 4.2-Gbyte, or larger, disk at some point in the near future.

---

Always back up an existing domain before you use the `upgrade` option in the `suninstall` utility. The safest backup to perform is a level 0 dump of the file systems connected to the domain being upgraded. If you do not have an established backup procedure, see the *System Administration Guide*.

---

**Caution** – In Solaris 2.5.1, the kernel resides in `/platform/sun4ul/kernel/unix`. If you override the boot file location by explicitly setting it to `kernel/unix`, you can successfully upgrade the Solaris software, but you will not be able to boot the domain.

---

The `upgrade` option in the `suninstall` utility determines how the Solaris software is copied to the disk. It merges the new version of the Solaris software with the existing files on the domain's disk, saving as many local modifications as possible.

---

**Note** – The `upgrade` option may require deleting software packages if the disk is full; this requires knowledge of packages and dependencies.

---

You do not need to back out installed patches before you perform the upgrade.

Check the documentation of other software you are running, such as any disk volume managers, before you use the `upgrade` option. There may be additional instructions you need to follow to preserve existing configurations, especially for Alternate Pathing, Solstice™ DiskSuite™, or Veritas Volume Manager.

During an upgrade, the `suninstall` utility attempts to preserve local modifications to the server whenever possible; however, local modifications might make an upgrade fail or perform differently than you would expect.

The following table includes tasks you should perform before you upgrade the domain.

**TABLE 10-4** Upgrading Tasks

| What to Do Before Upgrading                         | How to                                                                                                                                                                                                                                                                   | Why                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preserve symbolic links                             | <p>Replace symbolic links that use absolute paths with symbolic links that use relative paths.</p> <p>For example, if <code>/usr/openwin</code> is a symbolic link to <code>/export/openwin</code></p> <p>change the symbolic link to <code>../export/openwin</code></p> | <p>During an upgrade, the <code>suninstall</code> utility cannot reference symbolic links that use absolute paths because the Solaris installation program mounts the root (<code>/</code>) file system at <code>/a</code>. For example, a symbolic link to <code>/export/openwin</code> would fail because during an upgrade, <code>/export/openwin</code> is really <code>/a/export/openwin</code>.</p> <p>When the <code>suninstall</code> utility cannot reference a symbolic link, it will overwrite the symbolic link and install the software (the installation program does not know that the software exists). As a result, duplicate software will be installed, and the upgrade may fail because of insufficient disk space.</p> |
| Preserve symbolic links to automounted file systems | Remove packages (by using Software Manager or the <code>pkgrm(1M)</code> command) that will create files or directories currently automounted.                                                                                                                           | <p>The automounter is not active during an upgrade, so the <code>suninstall</code> utility installs any package's files or directories that are symbolic links to automounted file systems. If a symbolic link is overwritten, the upgrade may fail because of insufficient disk space.</p> <p>(If you cannot remove a package, you can replace the symbolic link after the upgrade is completed.)</p> <p><i>Note:</i> The <code>/var/mail</code> and <code>/var/news</code> directories, which usually reside on an automounted file system, are not affected by an upgrade.</p>                                                                                                                                                           |
| Prevent unneeded file systems from being mounted    | In the <code>/etc/vfstab</code> file, comment out file systems that you do not want mounted during the upgrade.                                                                                                                                                          | During an upgrade, the <code>suninstall</code> utility attempts to mount all of the file systems listed in the <code>/etc/vfstab</code> file on the root file system being upgraded. If the Solaris installation program cannot mount a file system, it reports the failure and exits.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## ▼ To Prepare the Domain for the Upgrade

1. **Log in to the domain as superuser and backup the domain if you have not already done so.**

Using `ufsdump(1M)`, backup all operating-system file systems.

2. **Comment out all of the file systems in the `/etc/vfstab` file except root (`/`), `/usr`, `/export`, `/var`, `/opt`, `/proc`, `/dev/fd`, `/tmp`, and `swap` if you have not already done so.**

3. **Comment out all swap partitions that are not on the same controller as the root disk.**

During an upgrade, the `suninstall` utility attempts to add all of the swap devices listed in the `/etc/vfstab` file. If the `suninstall` utility cannot access a swap device, it reports the failure and exits.

4. **If any metadevices exist (for example, disk, network, mirrored, striped, or concatenated) for Alternate Pathing, Solstice DiskSuite, Sun™ Enterprise™ Volume Manager, or Veritas, refer to the installation instructions for those products and perform the appropriate steps to remove the metadevices.**

This step is necessary because the `suninstall` utility cannot handle metadevices. For more information about these products, refer to their respective user's guides.

---

**Caution** – Make certain that all metadevices are removed. If any are not, the upgrade will fail.

---

5. **If you removed metadevices, reboot the domain to ensure that all of the active metadevices are removed.**

```
domain_name# init 6
```

6. **If you rebooted the domain in the prior step, and the reboot was successful, log in to the domain as superuser.**
7. **If you are upgrading from Solaris 2.5.1, remove the `SUNWxntp` packages by using the `pkgrm(1M)` command.**

```
domain_name# pkgrm SUNWxntp
```

## 8. Shut down the domain before you begin the upgrade.

```
domain_name# shutdown -i0 -g60 -y
```

You are done preparing the domain for the upgrade. You can now check the domain network information, as described in the following section.

## ▼ To Check the Domain Network Information

For existing machines, the SSP should already be configured with the domain network information; however, to ensure that the information is correct, perform the following steps.

1. **Log in to the SSP as superuser.**
2. **Ensure that the Sun Enterprise 10000 host name and host-name IP address are correct in the `/etc/hosts` file.**
3. **Ensure that the Sun Enterprise 10000 host name and Ethernet address are correct in the `/etc/ethers` file.**

You are done checking the domain network information. If you use NIS at your site, check with your network administrator about what configuration issues must be addressed before you continue the installation. NIS issues are out of the scope of this chapter. You can now set up the SSP as a boot server, as described in the following section.

## ▼ To Set Up the SSP

1. **Insert the Solaris CD disk into the CD-ROM drive on the SSP.**

Wait for the Volume Manager to mount the CD-ROM.

2. **In the SSP window, change to the `Tools` directory.**

```
ssp# cd /cdrom/cdrom0/s0/Solaris_2.7/Tools
```

### 3. Set up the host domain as an install client.

```
ssp# ./add_install_client domain_name sun4u
```

The `add_install_client` command should share the CD across the net. If an error occurs, you may receive the following warning:

```
prom_panic: Could not mount filesystem
```

If you receive this warning, use the following `share(1M)` command to correct the error.

```
ssp# share -F nfs -o ro,anon=0 /cdrom/cdrom0/s0
```

If the `/etc/nsswitch.conf` file contains DNS entry in its host list, you may receive the following warning:

```
Error: domain_name does not exist in the NIS ethers map.
```

If you receive this message, you will need to remove the DNS entry in the `/etc/nsswitch.conf` file, add the *domain\_name* to the ethers map, if the name is not already in the map, and re-run the `add_install_client(1M)` command.

### 4. Check to see if Patch 105684 has been installed.

```
ssp# showrev -p | grep 105684
```

If you did not upgrade the SSP software to SSP 3.1.1 or SSP 3.2 and if Patch 105684 is not installed, install Patch 105684-04, at a minimum. You can obtain this patch from <http://www.sunsolve.com>. Refer to the patch README file for directions on how to install the patch.

### 5. Exit the superuser level.

You are done setting up the SSP as a boot server. You can now bring up the domain, as described in the following section.

## ▼ To Bring Up the Domain

1. In an SSP window, ensure that the `SUNW_HOSTNAME` variable is set to the proper domain name.

```
ssp% domain_switch domain_name
```

---

**Note** – The `domain_switch(1M)` command must be executed from the C shell. By default, the SSP window is a C shell.

---

2. Use the `domain_status(1M)` command to ensure that the OS version is set to the proper value.

If you upgraded the SSP software to SSP 3.1.1 or SSP 3.2, the OS version should be 5.7. If you did not upgrade the SSP software, the OS version should be 2.7. If the OS version is set to the proper value, proceed to Step 3. If not, perform the following steps:

- a. Remove the existing domain.

```
ssp% domain_remove -d domain_name
```

The `domain_remove(1M)` command prompts you to save the domain directories, as in the following example:

```
domain_remove: The following subdirectories contain domain specific
 information such as messages files, configuration files,
 and hpost dump files. You may choose to keep these
 directories if you still need this information. This
 domain may be created with or without this information
 being saved.
```

```
/var/opt/SUNWssp/adm/xf4-b3
/var/opt/SUNWssp/etc/allxf4/xf4-b3
```

```
Keep directories (y/n)? y
Domain : xf4-b3 is removed !
```

Be sure to answer yes, `y`, to the prompt so that the domain information is saved. If you answer no, you will have to supply the board numbers and the platform name for the new domain.

**b. Create the new domain with the new OS version number.**

```
ssp% domain_create -d domain_name -o 5.7
```

If you saved the domain information, you do not need to include the `-b` and `-p` arguments. The `domain_create(1M)` command uses the domain information that was saved and the information you provide with the command to create the new domain.

If you upgraded the SSP software to SSP 3.1.1 or SSP 3.2, the OS version should be 5.7. If you did not upgrade the SSP software, the OS version should be 2.7.

**3. Bring up the domain.**

```
ssp% bringup -A off
```

If this is the first domain to be brought up, you will be prompted to configure the centerplane. Type `y` to confirm if you are sure that no other domains are running. Responding yes resets the entire platform; therefore, you must ensure that no other domains are running.

```
This bringup will configure the Centerplane. Please confirm (y/n)? y
```

After a few minutes the SSP prompt is displayed.

**4. At the `ssp` prompt, open a `netcon(1M)` session.**

```
ssp% netcon -g
```

After a few minutes the `ok` prompt is displayed.

You are done bringing up the domain. You can now upgrade the Solaris operating environment, as described in the following section.

## ▼ To Upgrade the Solaris 7 11/99 Operating Environment

The steps that follow modify the `suninstall` procedures. For more information, refer to the Solaris installation instructions in your Solaris Media Kit.

---

**Note** – You should have an alias (usually `net`) in OBP for the proper network interface. Use that alias with the `boot(1M)` command, as shown in the example above. Otherwise, you must type in the complete OBP device path. If you specify an alias (or path) that does not describe the proper network interface, the `boot(1M)` command will fail.

---

- In the `netcon(1M)` window, boot the system from the network.

```
ok boot net
```

The `boot net` command starts the `suninstall` utility. This utility prompts you to provide site and platform-specific information. Refer to the following table for the platform-specific information you may need to supply. If you have questions about the `suninstall` utility, please refer to the *Installation Instructions for Solaris 7 11/99 (SPARC Platform Edition)* in your media kit.

**TABLE 10-5** Platform-Specific Information for the `suninstall` Utility

| If you are asked to                                                        | Do this                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Please enter the hostname of the SSP for <i>domain_name</i> [default_name] | Enter the hostname for your SSP. Note that the default is to append <code>-ssp</code> to the <i>domain_name</i> .                                                                                                                                           |
| Set the network information                                                | Select the appropriate level of information you want to provide. If you select any option other than <code>None</code> , the <code>suninstall</code> utility displays a series of dialogs that request configuration information. Provide that information. |
| Solaris Interactive Installation                                           | Select <code>Upgrade</code> .                                                                                                                                                                                                                               |
| Select 64 bit                                                              | Click “Select To Include Solaris 64-bit Support” to install the 64-bit kernel. Refer to the <i>Solaris 7 Release Notes Supplement</i> for instructions on how to check the operating mode, to set the default mode, and to switch the operating mode.       |
| Select Software                                                            | Select <code>Entire Distribution plus OEM Support</code> .                                                                                                                                                                                                  |

**TABLE 10-5** Platform-Specific Information for the `suninstall` Utility *(Continued)*

| If you are asked to                             | Do this                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Disk(s)                                  | Select the disk(s) on which the software is to be upgraded. If you choose a drive other than the one designated as the bootdrive, a warning message appears later in the installation process. At that point, you can choose whether to continue, or not.<br><i>Note:</i> For Solaris 7 11/99, you may see a warning stating that the system needs more disk space. Refer to TABLE 10-6 for more information.                                                                                                                                                                                                          |
| Automatically Layout File Systems               | Press F4 if file systems are to be mounted from a remote file server. Press F2 if they are not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Select post installation option (manual reboot) | Select <code>manual reboot</code> and press F2 to begin the upgrade. This step, which installs the software and the patches on the Solaris release CD, takes many minutes to complete. When the upgrade is complete, the <code>suninstall</code> utility does not reboot the domain if you select <code>manual reboot</code> . The Sun Enterprise 10000 host displays the superuser prompt in the <code>netcon(1M)</code> window. You are done upgrading the Solaris operating environment. You can now bring up the domain, as described in “To Bring Up the Domain After the Upgrade to Solaris 7 11/99” on page 194 |

When you perform a complete upgrade (that is, all of the software) of the Solaris 7 11/99 operating environment on a domain, the `suninstall` utility allows you to manually enter the disk partition sizes for your file systems. Sun Microsystems suggests that you do not use disk partitions that are less than the minimum sizes in TABLE 10-6.

If two disks are used, root (/) and /usr must be on the device specified in the OBP boot alias.

TABLE 10-6 Minimum Partition Sizes

| Partition | Minimum Sizes | Notes                                                                                                                                                                             |
|-----------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 /       | 256 Mbyte     | Bare minimum size                                                                                                                                                                 |
| 1 swap    | 1024 Mbyte    | Bare minimum size                                                                                                                                                                 |
| 2 overlap |               | Actual total disk size                                                                                                                                                            |
| 3 /var    | 512 Mbyte     |                                                                                                                                                                                   |
| 4         | 3 Mbyte       | This slice must be reserved for the Alternate Pathing and Solstice DiskSuite products. Otherwise, subsequent Alternate Pathing installations will overwrite the operating system. |
| 5 /opt    | 512 Mbyte     | This may be larger depending upon remaining space.                                                                                                                                |
| 6 /usr    | 1 Gbyte       | Asian-language users may need more space here.                                                                                                                                    |

Use the Tab key to move the cursor, and use the keyboard to type the size for each partition. Press F2 when you are done.

During the upgrade, the `suninstall` utility may notify you that your disk partition sizes are not large enough for Solaris 7 11/99, as in the following example:

```
- More Space Needed -----
```

If you see this message during the upgrade, you should check the /usr partition. If this partition is smaller than 653 megabytes, you must repartition the boot disk by performing the following steps.

Press F2 to select Auto Layout.

**Caution** – Make sure that the partition sizes for the root (/), /swap, /usr, and /var file systems are not reduced below the minimum sizes shown in TABLE 10-6.

If the proposed modifications are acceptable, press F2 to continue.

Otherwise, press F4 to change the constraints that the `suninstall` utility uses to reconfigure the disk partitions. Your data will be temporarily backed up during the partition reconfiguration, and then it will be restored. For more information, refer to the *Solaris Advanced Installation Guide*.

---

**Note** – For systems with a large I/O configuration (for example, 100 disks or more), the size of the root (/) file system should be increased. Sun Microsystems suggests that you use sizes of approximately 256 megabytes to 512 megabytes to allow for additional space, which will be required for device name entries.

---

Return to TABLE 10-5 on page 191 to complete the upgrade of the Solaris operating environment.

## ▼ To Bring Up the Domain After the Upgrade to Solaris 7 11/99

1. Shut down the domain from the superuser prompt.

```
domain_name# init 0
```

2. From an SSP window, bring up the domain.

```
ssp% bringup -A on
```

---

**Note** – This step assumes that you are upgrading the boot disk that is defined in the OBP boot-device variable. If you are upgrading a different boot disk, you must supply the device's alias as an argument to the `bringup(1M)` command.

---

3. After the SSP prompt is displayed, check the output of the `bringup(1M)` command to ensure that no errors occurred during the bring-up.

If errors occurred, you need to correct those errors before you continue the upgrade. If none occurred, proceed to the next step.

4. Use the `su(1M)` command to switch the user to superuser.
5. Change to the `Tools` directory.

```
ssp# cd /cdrom/cdrom0/s0/Solaris_2.7/Tools
```

6. Remove the host domain as an install client.

```
ssp# ./rm_install_client domain_name
```

## 7. Remove the Solaris 7 11/99 CD.

```
ssp# cd /
ssp# unshare /cdrom/cdrom0/s0
ssp# eject cdrom
```

You are done bringing up the domain. You can now upgrade the Sun Computer Systems supplements packages, as described in the following section.

## ▼ To Install the Sun Computer Systems Supplements Packages

You should upgrade the supplement packages as needed from the Sun Computer Systems Supplements CD.

1. Insert the Sun Computer Systems Supplements CD into the CD-ROM drive on the SSP.
2. Log in as superuser on the SSP and share the CD-ROM.

```
ssp# share -F nfs -o ro,anon=0 /cdrom/cdrom0
```

3. Log in as superuser in the `netcon(1M)` window.
4. Create and mount the `/cdrom` directory on the domain.

```
domain_name# mkdir /cdrom
domain_name# mount ssp_name:/cdrom/cdrom0 /cdrom
```

5. Add the `SUNWabhdw AnswerBook2` package to the newly created domain.

```
domain_name# cd /cdrom/Product
domain_name# pkgadd -d . SUNWabhdw
```

---

**Note** – Perform this step only for those domains in which you want to use the AnswerBook files.

---

The `pkgadd(1M)` command may display several messages and ask several installation questions for each package, some relating to space, others asking whether it is OK to continue. After answering these questions, and when asked whether to proceed, answer Yes.

**6. In the `netcon(1M)` window, unmount the CD.**

```
domain_name# cd /
domain_name# umount /cdrom
```

**7. Log in to the SSP as superuser and remove the Sun Computer Systems Supplement CD from the CD-ROM drive.**

```
ssp# cd /
ssp# unshare /cdrom/cdrom0
ssp# eject cdrom
```

**8. Install and configure any other purchased software packages.**

You are done upgrading the Sun Computer Systems supplements packages. You can now configure the Network Time Protocol (NTP) packages, as described in the following section.

## ▼ To Configure the NTP Packages

Perform the following steps to configure the `ntp.conf` file, which resides at `/etc/inet/ntp.conf`.

**1. Log in to the domain as superuser.**

## 2. Open the `ntp.conf` file in your text editor.

If the file exists, ensure that it resembles the following example.

```
example Starfire domain /etc/inet/ntp.conf
configuration file ntp.conf
for Solaris 7 11/99
substitute actual ssp name for <ssp-name>

server <ssp-name> prefer
we can always fall back to the local clock.
server 127.127.1.0
fudge 127.127.1.0 stratum 9

Other ntp files.
driftfile /etc/inet/ntp.drift

Encryption:
disable auth
controlkey 1
requestkey 1
authdelay 0.000793

precision declaration
precision -18 # clock reading precision (1 usec)
```

If the `ntp.conf` file does not exist, create the file and edit it so that it resembles the above example.

Each domain should use the SSP as its source for time, and the SSP should use at least two other sources, besides its internal clock, to avoid a single point of failure in case the SSP's clock fails. For more information about NTP commands, refer to the `ntp(1M)` man page in the *man Pages(1M): System Administration Commands* section of the Solaris Administration AnswerBook2 Collection.

You are done configuring the NTP packages. You can now configure the OBP boot-disk alias, as described in the following section.

## ▼ To Configure the OBP Boot-Disk Alias

### 1. Log in to the domain as superuser in a `netcon(1M)` window.

2. Use the `eeeprom(1M)` command to set the boot-device alias.

```
domain_name# eeeprom boot-device=boot_device_alias
```

You are done configuring the OBP boot-device alias. You can now finish the upgrade, as described in the following section.

## ▼ To Finish the Upgrade

1. If you removed any metadevices (disks and networks) in “To Prepare the Domain for the Upgrade” on page 186, refer to the installation instructions for each product (for example, Alternate Pathing, Solstice DiskSuite, and Veritas Volume Manager) to recreate the metadevices.
2. Uncomment all swap partitions that are not on the same controller as the root disk.
3. Check the operating mode.

```
domain_name# isainfo -k
```

If you are running in 64-bit mode, you should get the following output:

```
sparcv9
```

4. If needed, reboot the domain with the proper operating mode.

For the Solaris 7 11/99 operating environment, you can use either the 32-bit mode or the 64-bit mode. The 64-bit mode is the default for all `sun4u` platforms.

- a. For 32-bit mode, type the following command.

```
domain_name# reboot boot_alias kernel/unix
```

**b. For 64-bit mode, type one of the following commands.**

If you are not already in 32-bit mode, use the following command.

```
domain_name# reboot boot_alias
```

If you are switching from the 32-bit mode, use the following command.

```
domain_name# reboot boot_alias kernel/sparcv9/unix
```

You are done with the upgrade.

# Localized Packages on the Supplement CD

## Japanese Localized Packages

TABLE A-1 Japanese Localized Packages

| Software Product      | Package Name | Description                                     |
|-----------------------|--------------|-------------------------------------------------|
| SunForum              | SUNWjadat    | Japanese (ja-EUC) SunForum                      |
|                       | SUNWjpdatt   | Japanese (ja-PCK) SunForum                      |
| Alternate Pathing     | SUNWjaap     | Japanese localization for Alternate Pathing     |
| Remote System Control | SUNWjarsc    | Japanese (EUC) Remote System Control            |
