| ■ For subcommand <code>modify</code> : |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -c <i>command</i>                      | (Optional) Specifies the command that you want to run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -h                                     | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -m <i>day_of_month</i>                 | (Optional) Specifies the day of the month you want to run the job. Valid values are 1–31. If you specify both <code>-t</code> and <code>-m</code> options, the job executes one day per month at the time specified by <code>-t</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| -M <i>month</i>                        | (Optional) Specifies the month that you want to run the job. Valid values are 1–12. If you specify both <code>-t</code> and <code>-M</code> options, the job executes during the specified month at the time specified by <code>-t</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| -n <i>name</i>                         | Specifies the current unique name of the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -N <i>new_name</i>                     | (Optional) Specifies the new unique name of the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| -o <i>owner</i>                        | (Optional) Specifies the user name that is the owner of the job. If you do not specify this option, the user name specified by the <code>-U</code> option is assumed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -O <i>new_owner</i>                    | (Optional) Specifies the new owner of the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -t <i>time_of_day</i>                  | (Optional) Specifies the time (in <i>hh:mm</i> ) that you want to execute the command. If no other time-related options are specified ( <code>-m</code> , <code>-M</code> , or <code>-w</code> ), then the job executes every day at the time specified by <code>-t</code> . If you specify both <code>-t</code> and <code>-w</code> options, the job executes one day per week at the time specified by <code>-t</code> . If you specify both <code>-t</code> and <code>-m</code> options, the job executes one day per month at the time specified by <code>-t</code> . If you specify both <code>-t</code> and <code>-M</code> , then the job executes each day during the specified month at the time specified by <code>-t</code> . |
| -w <i>day_of_week</i>                  | (Optional) Specifies the day of the week you want to execute the command. Valid values are as follows: <ul style="list-style-type: none"><li>■ 0=Sunday</li><li>■ 1=Monday</li><li>■ 2=Tuesday</li><li>■ 3=Wednesday</li><li>■ 4=Thursday</li><li>■ 5=Friday</li><li>■ 6=Saturday</li></ul> If you specify both <code>-t</code> and <code>-w</code> options, the job executes one day per week at the time specified by <code>-t</code> .                                                                                                                                                                                                                                                                                                |

**EXAMPLES****EXAMPLE 1 Adding a Job**

The following adds a new job, owned by root, that removes the old log files from /tmp daily at 1:30 AM.

```
./smcron add -H myhost -u root -p mypassword -- -n "Remove old logs" \
-t 1:30 -c "rm /tmp/*.log" -o root
```

**EXAMPLE 2 Deleting a Job**

The following deletes the job Remove old logs owned by root:

```
./smcron delete -H myhost -u root -p mypassword -- \
-n "Remove old logs" -o root
```

**EXAMPLE 3 Listing Jobs in Native Format**

The following lists all jobs in native, or crontab(1), format:

```
./smcron list -H myhost -u root -p mypassword -- -f n
MINUTE HOUR DATE MONTH DAY COMMAND
10 3 * * O,4 /etc/cron.d/logchecker
10 3 * * o /usr/lib/newsyslog
15 3 * * 0 /usr/lib/fs/nfs/nfsfind
1 2 * * * [-x /usr/sbin/rtc] && /usr/sbin/rtc -c > /dev/null 2>&1
```

**EXAMPLE 4 Listing Jobs in Standard Format**

The following lists all jobs owned by lp in standard format:

```
./smcron list -H myhost -u root -p mypassword -- -f s -o lp
NAME::OWNER::SCHEDULE::COMMAND
NoName_1765663371::lp::Weekly on Sundays at 3:13 AM::cd /var/lp/logs;
if [-f requests]; then if [-f requests.1]; then /bin/mv requests.1
requests.2; fi; /usr/bin/cp requests requests.1; > requests; fi
NoName_512822673::lp::Weekly on Sundays at 4:15 AM::cd /var/lp/logs;
if [-f lpsched]; then if [-f lpsched.1]; then /bin/mv lpsched.1
lpsched.2; fi; /usr/bin/cp lpsched lpsched.1; >lpsched; fi
```

**EXAMPLE 5 Listing jobs in verbose format**

The following lists all jobs in verbose format:

```
./smcron list -H myhost -u root -p mypassword -- -f v
NAME::OWNER::SCHEDULE::NEXT_RUN::STATUS::COMMAND
NoName_1075488942::root::Advanced:::Finished on Feb 10 3:10 with code 1
::/etc/cron.d/logchecker
databackup::root::Weekly on Sundays at 3:10 AM::3/19/00 3:10 AM
::Finished on Sep 19 3:10::/usr/lib/newsyslog
runlog::root::Daily at 2:01 AM::3/14/00 2:01 AM::Finished on Feb 11
```

## smcron(1M)

### EXAMPLE 5 Listing jobs in verbose format (Continued)

```
2:01 AM:./usr/sbin/rtc
```

### EXAMPLE 6 Changing a Job

The following modifies the job Remove old logs owned by root to execute daily at 2:00 AM:

```
./smcron modify -H myhost -u root -p mypassword -- -n "Remove old logs" \
-o root -t 2:00
```

### EXAMPLE 7 Specifying Multiple Time Arguments

smcron allows you to specify a range of times for all of its time-related subcommands, -m, -M, -t, and -w. For example, the following command:

```
smcron add -u root -p xxxx -- -n cronjob1 -w 1-4,5 \
-t 12:00,13:15,14:30 -c ls
```

...creates the following entry in crontab:

```
0,15,30 12,13,14 * * 1,2,3,4,6 ls #cronjob1
```

This job would run on Monday through Thursday and Saturday at the following times:

```
12:00 12:15 12:30
13:00 13:15 13:30
14:00 14:15 14:30
```

## ENVIRONMENT VARIABLES

See environ(5) for a description of the JAVA\_HOME environment variable, which affects the execution of the smcron command. If this environment variable is not specified, the /usr/java location is used. See smc(1M).

## EXIT STATUS

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

## ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| NAME        | smdiskless – manage diskless client support for a server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |
| SYNOPSIS    | <code>/usr/sadm/bin/smdiskless subcommand [ auth_args] - - [subcommand_args]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |
| DESCRIPTION | <p>The <code>smdiskless</code> command manages diskless client support for a server.</p> <p><code>smdiskless</code> subcommands are:</p> <table> <tr> <td>add</td><td>Adds a new diskless client to a server. There are two usages for this command. The user can either specify all the optional arguments directly on the command line, or provide a <code>sysidcfg(4)</code> formatted file as input. A future enhancement will allow specifying both a <code>sysidcfg(4)</code> formatted file and optional arguments, which will override the values in the <code>sysidcfg(4)</code> file.</td></tr> <tr> <td>delete</td><td>Deletes an existing diskless client from the system databases and removes any server support associated with the host, depending on the <code>os_server</code> type.</td></tr> <tr> <td>list</td><td>Lists existing diskless clients served by <code>os_server</code>.</td></tr> <tr> <td>modify</td><td>Modifies the specified attributes of the diskless client <code>os_server</code>.</td></tr> </table>                                                                                                                                                                                                                                                                                                | add | Adds a new diskless client to a server. There are two usages for this command. The user can either specify all the optional arguments directly on the command line, or provide a <code>sysidcfg(4)</code> formatted file as input. A future enhancement will allow specifying both a <code>sysidcfg(4)</code> formatted file and optional arguments, which will override the values in the <code>sysidcfg(4)</code> file. | delete | Deletes an existing diskless client from the system databases and removes any server support associated with the host, depending on the <code>os_server</code> type. | list | Lists existing diskless clients served by <code>os_server</code> . | modify | Modifies the specified attributes of the diskless client <code>os_server</code> . |
| add         | Adds a new diskless client to a server. There are two usages for this command. The user can either specify all the optional arguments directly on the command line, or provide a <code>sysidcfg(4)</code> formatted file as input. A future enhancement will allow specifying both a <code>sysidcfg(4)</code> formatted file and optional arguments, which will override the values in the <code>sysidcfg(4)</code> file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |
| delete      | Deletes an existing diskless client from the system databases and removes any server support associated with the host, depending on the <code>os_server</code> type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |
| list        | Lists existing diskless clients served by <code>os_server</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |

| OPTIONS     | <p>The <code>smdiskless</code> authentication arguments, <code>auth_args</code>, are derived from the <code>smc(1M)</code> arg set and are the same regardless of which subcommand you use. The <code>smdiskless</code> command requires the Solaris Management Console to be initialized for the command to succeed (see <code>smc(1M)</code>). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <code>subcommand_args</code>, must come after the <code>auth_args</code> and must be separated from them by the <code>- -</code> option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |
| auth_args   | <p>The valid <code>auth_args</code> are <code>-D</code>, <code>-H</code>, <code>-l</code>, <code>-p</code>, <code>-r</code>, and <code>-u</code>; they are all optional. If no <code>auth_args</code> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either <code>-D</code> or <code>--domain</code>.</p> <p><b>Note –</b> <code>smdiskless</code> supports the <code>--auth-data file</code> option, which enables you to specify a file the console can read to collect authentication data. See <code>smc(1M)</code> for a description of this option.</p> <p><code>-D   - --domain domain</code></p> <p>Specifies the default domain that you want to manage. The syntax of <code>domain</code> is <code>type:/host_name/domain_name</code>, where <code>type</code> is <code>nis</code>, <code>nis+</code>, <code>dns</code>, <code>ldap</code>, or <code>file</code>; <code>host_name</code> is the name of the machine that serves the domain; and <code>domain_name</code> is the name of the domain you want to manage. (Note: Do not use <code>nis+</code> for <code>nisplus</code>.)</p> |     |                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                                      |      |                                                                    |        |                                                                                   |

If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

**-H** | **-** **-hostname** *host\_name:port*

Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the `smc(1M)` **-B** option, or set your console preferences to load a "home toolbox" by default.

**-l** | **-** **-rolepassword** *role\_password*

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

**-p** | **-** **-password** *password*

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

**-r** | **-** **-rolename** *role\_name*

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

**-u** | **-** **-username** *user\_name*

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

**-** **-**

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the **-** **-** option.

*subcommand\_args*

*Note:* Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

■ For subcommand `add`:

- |                                |                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-h</b>                      | (Optional) Displays the command's usage statement.                                                                                                              |
| <b>-i</b> <i>IP_address</i>    | Specifies the IP address for the host in the form of 129.9.200.1.                                                                                               |
| <b>-e</b> <i>ethernet_addr</i> | Specifies the Ethernet address.                                                                                                                                 |
| <b>-n</b> <i>host</i>          | Specifies the client name.                                                                                                                                      |
| <b>-o</b> <i>os_server</i>     | (optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified |

## smdiskless(1M)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | <p>in the <code>smc(1M)</code> <code>-D</code> option. This option is useful in the event that the name service server and the OS server are not the same machine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>-x os=platform</code>   | <p>Specifies the operating system. The syntax for <i>platform</i> is as follows:</p> <p><i>instruction_set.implementation.Solaris_version</i></p> <p>where</p> <ul style="list-style-type: none"><li>■ <i>instruction_set</i> is one of <code>sparc</code> or <code>i386</code></li><li>■ <i>implementation</i> is the implementation architecture, that is, <code>i86pc</code>, <code>sun4c</code> (for Solaris 2.6 and 7 only), <code>sun4m</code>, and <code>sun4u</code>.</li><li>■ <i>version</i> is the Solaris version number. The supported <i>version</i> numbers are <code>2.6</code>, <code>2.7</code> (for Solaris 7), <code>8</code>, and <code>9</code>. Examples are:</li></ul> <p><code>sparc.sun4c.Solaris_2.7</code><br/><code>sparc.sun4u.Solaris_8</code></p> |
| <code>-x root=pathname</code> | <p>(Optional) Specifies the absolute path of the directory in which to create the root directory for diskless clients. The default (and recommended) <i>pathname</i> is <code>/export/root/client_name</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-x swap=pathname</code> | <p>(Optional) Specifies the absolute path of the directory in which to create the swap file for diskless clients. The default (and recommended) <i>pathname</i> is <code>/export/swap/client_name</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-x swapsize=size</code> | <p>(Optional) Specifies the size, in megabytes, of the swap file for diskless clients. The default swap size is 24M.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>-x dump=pathname</code> | <p>(Optional) Specifies the absolute path of the dump directory for diskless clients. The default (and recommended) <i>pathname</i> is <code>/export/dump/client_name</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>-x dumpsize=size</code> | <p>(Optional) Specifies the size, in megabytes, of the dump file for diskless clients. The default swap size is 24M.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>-x pw=Y</code>          | <p>(Optional) Prompts for the system's root password. The default is not to prompt. The following options are used to configure workstations on first boot by <code>sysidtool(1M)</code>. They can either be specified on the command line, or in a <code>sysidcfg(4)</code> formatted file. <i>Note:</i> Use the <code>sysidcfg(4)</code> file to:</p>                                                                                                                                                                                                                                                                                                                                                                                                                           |

- Add a DNS client.
- Specify use of the LDAP name service.
- Specify a security policy.

The keywords and functions supported by `sysidtool` and `sysidcfg` vary among Solaris releases. Consult the man pages for your operating system release (`uname -r`) to determine the level of support available.

- x *tz=timezone*  
(Optional) Specifies the path of a timezone file, relative to `/usr/share/lib/zoneinfo`. The default is the server's timezone.
- x *ns=NIS | NIS+ | NONE*  
(Optional) Specifies the client's nameservice. This is one of NIS, NIS+, or NONE. Use a `sysidcfg(4)` file to specify DNS or LDAP. The default *ns* value is NONE, which results in the use of the `files` source in `nsswitch.conf`. See `nsswitch.conf(4)` for a description of the `files` source.
- x *nameserver=hostname*  
(Optional) Specifies the nameserver's hostname. The default is the server's nameserver.
- x *domain=domain*  
(Optional) Specifies the client's domain. The default is the server's domain.
- x *nameserver\_ipaddress=ip\_address*  
(Optional) Specifies the nameserver's IP address.
- x *netmask=ip\_address*  
(Optional) Specifies the client's IP address netmask. The default is the server's netmask.
- x *locale=locale*  
(Optional) Specifies the client's system locale. The default is the C locale.
- x *terminal=term*  
(Optional) Specifies the workstation's terminal type, typically, `sun` or `xterms`.
- x *passwd=root\_password*  
(Optional) Specifies the system's root password. The default is no password.
- x *sysidcfg=path\_to\_sysidcfg\_file*  
(Optional) Specifies the file to be placed in the `/etc` directory of the diskless client. On first boot, `/etc/.UNCONFIGURED` exists and `sysidtool(1M)` will run. If a file called `/etc/sysidcfg` exists, `sysidtool(1M)` reads this file and uses the information for system configuration.
- For subcommand `delete`:
  - h (Optional) Displays the command's usage statement.
  - n *host* Specifies the hostname of the diskless client to delete. This host is deleted from relevant tables and OS Services for this client are deleted.

## smdiskless(1M)

-o *os\_server* (Optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified in the `smc(1M) -D` option. This option is useful in the event that the name service server and the OS server are not the same machine.

■ For subcommand `list`:

-h (Optional) Displays the command's usage statement.

-o *os\_server* (Optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified in the `smc(1M) -D` option. This option is useful in the event that the name service server and the OS server are not the same machine.

■ For subcommand `modify`:

-e *ethernet\_addr* Changes the specified diskless client's ethernet address to *ethernet\_addr*.

-h (Optional) Displays the command's usage statement.

-n *host* Specifies the host name of the diskless client to modify.

-o *os\_server* (Optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified in the `smc(1M) -D` option. This option is useful in the event that the name service server and the OS server are not the same machine.

-x *tz=timezone* (Optional) Changes the specified diskless client's timezone.

## EXAMPLES

### EXAMPLE 1 Creating a new diskless client

The following command adds a new diskless client named `client1` which will run Solaris 9 on a sun4u machine:

```
example% /usr/sadm/bin/smdiskless add -- -i 129.9.200.1 \
-e 8:0:11:12:13:14 -n client1 -x os=sparc.sun4u.Solaris_9 \
-x root=/export/root/client1 -x swap=/export/swap/client1 \
-x swapsize=32 -x tz=US/Eastern -x locale=en_US
```

### EXAMPLE 2 Deleting an existing diskless client

The following command deletes the diskless client named `client1` from the OS server named `osserver`, where the OS server is using NIS+ and the NIS+ server is `nisplusservice`:

```
example% /usr/sadm/bin/smdiskless delete \
-D nisplus:/nisplusserver/my.domain.com -- \
-o osserver -n client1
```

**EXAMPLE 3** Listing the diskless clients served by a host

The following command lists the diskless clients running on the OS server, `osserver`:

```
example% /usr/sadm/bin/smdiskless list -D file:/osserver/osserver -- \
-o oserver
```

**EXAMPLE 4** Modifying the attributes of the diskless client host

The following command modifies the ethernet address for the client named `client1` on the OS server, `osserver`, to be `8:0:11:12:13:15`:

```
example% /usr/sadm/bin/smdiskless modify -D file:/osserver/osserver -- \
-o oserver -n client1 -e 8:0:11:12:13:15
```

**ENVIRONMENT  
VARIABLES**

See `environ(5)` for a description of the `JAVA_HOME` environment variable, which affects the execution of the `smdiskless` command. If this environment variable is not specified, the `/usr/java1.2` location is used. See `smc(1M)`.

**EXIT STATUS**

The following exit values are returned:

- 0 Successful completion.
- 1 Invalid command syntax. A usage message displays.
- 2 An error occurred while executing the command. An error message displays.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWdclnt       |

**SEE ALSO**

| <b>OPTIONS</b>     | <p>The smexec authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smexec command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |                                                                                                                                                                         |        |                                                                                                                                                                                |        |                                                                                                                                                                             |
| <i>auth_args</i>   | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - -domain with the <i>domain</i> argument.</p> <p>-D   - -domain <i>domain</i></p> <p>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type:/host_name/domain_name</i>, where <i>type</i> is nis, nisplus, dns, ldap, or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (Note: Do not use nis+ for nisplus.)</p> <p>If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.</p> <p>-H   - -hostname <i>host_name:port</i></p> <p>Specifies the <i>host_name</i> and <i>port</i> to which you want to connect. If you do not specify a <i>port</i>, the system connects to the default port, 898. If you do not specify</p> |     |                                                                                                                                                                         |        |                                                                                                                                                                                |        |                                                                                                                                                                             |

*host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the `smc(1M) -B` option, or set your console preferences to load a “home toolbox” by default.

`-l | - -rolepassword role_password`

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

`-p | - -password password`

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

`-r | - -rolename role_name`

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

`-u | - -username user_name`

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

`- -`

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the `- -` option.

*subcommand\_args*

*Note:* Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

■ For subcommand `add`:

- `-c command_path` Specifies the full path to the command associated with the new `exec_attr` entry.
- `-g egid` (Optional) Specifies the effective group ID that executes with the command.
- `-G gid` (Optional) Specifies the real group ID that executes with the command.
- `-h` (Optional) Displays the command’s usage statement.
- `-n profile_name` Specifies the name of the profile associated with the new `exec_attr` entry.
- `-t type` Specifies the type for the command. Currently, the only acceptable value for *type* is `cmd`.
- `-u euid` (Optional) Specifies the effective user ID that executes with the command.

- U *uid* (Optional) Specifies the real user ID that executes with the command.
- For subcommand **delete**:
  - c *command\_path* Specifies the full path to the command associated with the `exec_attr` entry.
  - h (Optional) Displays the command's usage statement.
  - n *profile\_name* Specifies the name of the profile associated with the `exec_attr` entry.
  - t *type* Specifies the type `cmd` for command. Currently, the only acceptable value for *type* is `cmd`.
- For subcommand **modify**:
  - c *command\_path* Specifies the full path to the command associated with the `exec_attr` entry that you want to modify.
  - g *egid* (Optional) Specifies the new effective group ID that executes with the command.
  - G *gid* (Optional) Specifies the new real group ID that executes with the command.
  - h (Optional) Displays the command's usage statement.
  - n *profile\_name* Specifies the name of the profile associated with the `exec_attr` entry.
  - t *type* Specifies the type `cmd` for command. Currently, the only acceptable value for *type* is `cmd`.
  - u *euid* (Optional) Specifies the new effective user ID that executes with the command.
  - U *uid* (Optional) Specifies the new real user ID that executes with the command.

**EXAMPLES****EXAMPLE 1** Creating an `exec_attr` database entry

The following creates a new `exec_attr` entry for the User Manager profile on the local file system. The entry type is `cmd` for the command `/usr/bin/cp`. The command has an effective user ID of 0 and an effective group ID of 0.

```
./smexec add -H myhost -p mypasswd -u root -- -n "User Manager" \
-t cmd -c /usr/bin/cp -u 0 -g 0
```

**EXAMPLE 2** Deleting an `exec_attr` database entry

The following example deletes an `exec_attr` database entry for the User Manager profile from the local file system. The entry designated for the command `/usr/bin/cp` is deleted.

**EXAMPLE 2** Deleting an exec\_attr database entry      *(Continued)*

```
./smexec delete -H myhost -p mypasswd -u root -- -n "User Manager" \
-t cmd -c /usr/bin/cp
```

**EXAMPLE 3** Modifying an exec\_attr database Entry

The following modifies the attributes of the exec\_attr database entry for the User Manager profile on the local file system. The /usr/bin/cp entry is modified to execute with the real user ID of 0 and the real group ID of 0.

```
./smexec modify -H myhost -p mypasswd -u root -- -n "User Manager" \
-t cmd -c /usr/bin/cp -U 0 -G 0
```

**ENVIRONMENT  
VARIABLES**

See environ(5) for a description of the JAVA\_HOME environment variable, which affects the execution of the smexec command. If this environment variable is not specified, the /usr/java location is used. See smc(1M).

**EXIT STATUS**

The following exit values are returned:

- 0            Successful completion.
- 1            Invalid command syntax. A usage message displays.
- 2            An error occurred while executing the command. An error message displays.

**FILES**

The following file is used by the smexec command:

|                         |                                                |
|-------------------------|------------------------------------------------|
| /etc/security/exec_attr | Execution profiles database. See exec_attr(4). |
|-------------------------|------------------------------------------------|

**ATTRIBUTES**

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

| NAME                         | smgroup – manage group entries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| SYNOPSIS                     | <code>/usr/sadm/bin/smgroup subcommand [ auth_args ] - - [subcommand_args]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| DESCRIPTION                  | <p>The smgroup command manages one or more group definitions in the group database for the appropriate files in the local /etc files name service or a NIS or NIS+ name service.</p> <p>The following smgroup subcommands are supported</p> <table> <tr> <td>add</td><td>Adds a new group entry. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> <tr> <td>delete</td><td>Deletes a group entry. You can delete only one entry at a time. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete the system groups with IDs less than 100, or the groups 60001, 60002, or 65534.</td></tr> <tr> <td>list</td><td>Lists one or more group entries in the form of a three-column list, containing the group name, group ID, and group members, separated by colons (:). To list entries, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.</td></tr> <tr> <td>modify</td><td>Modifies a group entry. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> </table> | add                          | Adds a new group entry. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                      | delete | Deletes a group entry. You can delete only one entry at a time. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete the system groups with IDs less than 100, or the groups 60001, 60002, or 65534. | list | Lists one or more group entries in the form of a three-column list, containing the group name, group ID, and group members, separated by colons (:). To list entries, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization. | modify | Modifies a group entry. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. |
| add                          | Adds a new group entry. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| delete                       | Deletes a group entry. You can delete only one entry at a time. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete the system groups with IDs less than 100, or the groups 60001, 60002, or 65534.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| list                         | Lists one or more group entries in the form of a three-column list, containing the group name, group ID, and group members, separated by colons (:). To list entries, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| modify                       | Modifies a group entry. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| OPTIONS                      | <p>The smgroup authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smgroup command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| <i>auth_args</i>             | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - -domain.</p> <p>The following <i>auth_args</i> are supported:</p> <table> <tr> <td>-D   - -domain <i>domain</i></td><td>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type:/host_name/domain_name</i>, where <i>type</i> is nis, nisplus, dns, ldap or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (<i>Note:</i> Do not use nis+ for nisplus.)</td></tr> </table>                                                                                                                                                                                                                                                                                           | -D   - -domain <i>domain</i> | Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type:/host_name/domain_name</i> , where <i>type</i> is nis, nisplus, dns, ldap or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. ( <i>Note:</i> Do not use nis+ for nisplus.) |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |
| -D   - -domain <i>domain</i> | Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type:/host_name/domain_name</i> , where <i>type</i> is nis, nisplus, dns, ldap or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. ( <i>Note:</i> Do not use nis+ for nisplus.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                                                                                                                                                            |      |                                                                                                                                                                                                                                                              |        |                                                                                                                                     |

If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

**-H | -** *-hostname host\_name:port*

Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the smc(1M) **-B** option, or set your console preferences to load a "home toolbox" by default.

**-l | -** *-rolepassword role\_password*

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

**-p | -** *-password password*

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

**-r | -** *-rolename role\_name*

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

**-u | -** *-username user\_name*

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

**- -**

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the **- -** option.

*subcommand\_args*

Descriptions and other argument options that contain white spaces must be enclosed in double quotes.

The add subcommand supports the following *subcommand\_args*:

**-g** *gid*

(Optional) Specifies the group ID for the new group. The group ID must be a non-negative decimal integer with a maximum value of 2MB (2,147,483,647). Group IDs 0–99 are reserved for the system and should be used with care. If you do not specify a *gid*, the system automatically assigns the next available *gid*. To maximize interoperability and compatibility, administrators are recommended to assign groups using the range of GIDs below 60000 where possible.

**-h**

(Optional) Displays the command's usage statement.

## smgroup(1M)

`-m group_member1 -m group_member2 . . .`

(Optional) Specifies the new members to add to the group.

`-n group_name`

Specifies the name of the new group. The group name must be unique within a domain, contain 2–32 alphanumeric characters, begin with a letter, and contain at least one lowercase letter.

The `delete` subcommand supports the following *subcommand\_args*:

`-h` (Optional) Displays the command's usage statement.

`-n group_name` Specifies the name of the group you want to delete.

The `list` subcommand supports the following *subcommand\_args*:

`-h` (Optional) Displays the command's usage statement.

`-n group_name` (Optional) Specifies the name of the group you want to list. If you do not specify a group name, all groups are listed.

The `modify` subcommand supports the following *subcommand\_args*:

`-h`

(Optional) Displays the command's usage statement.

`-m group_member1 -m group_member2 . . .`

(Optional) Specifies the new members to add to the group. Note that *group\_member* overwrites the existing member list in the group file.

`-n group_name`

Specifies the name of the group you want to modify.

`-N new_group`

(Optional) Specifies the new group name. The group name must be unique within a domain, contain 2–32 alphanumeric characters, begin with a letter, and contain at least one lowercase letter.

### EXAMPLES

#### EXAMPLE 1 Creating a Test Group

The following creates the `test_group` group entry with a group ID of 123 and adds `test_member1` and `test_member2` to the group:

```
./smgroup add -H myhost -p mypasswd -u root -- -n test_group \
-m test_member1 -m test_member2 -g 123
```

#### EXAMPLE 2 Deleting a Group

The following deletes `test_group`:

```
./smgroup delete -H myhost -p mypasswd -u root -- -n test_group
```

#### EXAMPLE 3 Displaying All Groups

The following displays all groups in a three-column list showing the group name, group ID, and group members:

**EXAMPLE 3** Displaying All Groups      *(Continued)*

```
./smgroup list -H myhost -p mypasswd -u root --
```

**EXAMPLE 4** Displaying a Group

The following displays the `group_1` data in a three-column list showing the group name, group ID, and group members:

```
./smgroup list -H myhost -p mypasswd -u root -- -n group_1
```

**EXAMPLE 5** Renaming a Group

The following renames a group from `finance` to `accounting`:

```
./smgroup modify -H myhost -p mypasswd -u root -- \
-n finance -N accounting
```

**ENVIRONMENT  
VARIABLES**

See `environ(5)` for a description of the `JAVA_HOME` environment variable, which affects the execution of the `smgroup` command. If this environment variable is not specified, the `/usr/java` location is used. See `smc(1M)`.

**EXIT STATUS**

The following exit values are returned:

- 0            Successful completion.
- 1            Invalid command syntax. A usage message displays.
- 2            An error occurred while executing the command. An error message displays.

**FILES**

The following files are used by the `smgroup` command:

`/etc/group`      Group file. See `group(4)`.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

**SEE ALSO**

`smc(1M)`, `group(4)`, `attributes(5)`, `environ(5)`

| DESCRIPTION      | The <code>smlog</code> command manages WBEM log files and allows a user to view WBEM log file records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |
| Subcommands      | <p>The <code>smlog</code> command supports the following subcommands:</p> <table><tr><td>backup</td><td>Backs up the entries in the current WBEM log file. The backup command then creates a new log file and makes this log file the current log file.</td></tr><tr><td>delete</td><td>Deletes an existing (backed up) WBEM log file.</td></tr><tr><td>list</td><td>Lists the names of all the WBEM log files available for viewing.</td></tr><tr><td>view</td><td>Allows the user to view the contents of the specified WBEM log file.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | backup | Backs up the entries in the current WBEM log file. The backup command then creates a new log file and makes this log file the current log file. | delete | Deletes an existing (backed up) WBEM log file. | list | Lists the names of all the WBEM log files available for viewing. | view | Allows the user to view the contents of the specified WBEM log file. |
| backup           | Backs up the entries in the current WBEM log file. The backup command then creates a new log file and makes this log file the current log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |
| delete           | Deletes an existing (backed up) WBEM log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |
| list             | Lists the names of all the WBEM log files available for viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |
| view             | Allows the user to view the contents of the specified WBEM log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |
| OPTIONS          | <p>The <code>smlog</code> authentication arguments, <i>auth_args</i>, are derived from the <code>smc(1M)</code> <i>arg</i> set and are the same regardless of which subcommand you use. The <code>smlog</code> command requires the Solaris Management Console to be initialized for the command to succeed (see <code>smc(1M)</code>). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the <code>--</code> option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |
| <i>auth_args</i> | <p>The valid <i>auth_args</i> are <code>-D</code>, <code>-H</code>, <code>-l</code>, <code>-p</code>, <code>-r</code>, and <code>-u</code>; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either <code>-D</code> or <code>--domain</code> with the <i>domain</i> argument.</p> <p><code>-D   --domain domain</code><br/>Specifies the default domain that you want to manage. <code>smlog</code> accepts only <i>file</i> for this option. <i>file</i> is also the default value.</p> <p>The <i>file</i> default domain means that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.</p> <p><code>-H   --hostname host_name:port</code><br/>Specifies the <i>host_name</i> and <i>port</i> to which you want to connect. If you do not specify a <i>port</i>, the system connects to the default port, 898. If you do not specify <i>host_name:port</i>, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the <code>smc -B</code> option (see <code>smc(1M)</code>), or set your console preferences to load a “home toolbox” by default.</p> |        |                                                                                                                                                 |        |                                                |      |                                                                  |      |                                                                      |

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | <p><b>-l</b>   <b>-</b> <b>-rolepassword</b> <i>role_password</i><br/> Specifies the password for the <i>role_name</i>. If you specify a <i>role_name</i> but do not specify a <i>role_password</i>, the system prompts you to supply a <i>role_password</i>. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.</p> <p><b>-p</b>   <b>-</b> <b>-password</b> <i>password</i><br/> Specifies the password for the <i>user_name</i>. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.</p> <p><b>-r</b>   <b>-</b> <b>-rolename</b> <i>role_name</i><br/> Specifies a role name for authentication. If you do not specify this option, no role is assumed.</p> <p><b>-u</b>   <b>-</b> <b>-username</b> <i>user_name</i><br/> Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.</p> <p><b>-</b> <b>-</b><br/> This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the <b>- -</b> option.</p> |
| <b>subcommand_args</b> | <p>Descriptions and other <b>arg</b> options that contain white spaces must be enclosed in double quotes.</p> <p>The <b>backup</b> subcommand supports the following <i>subcommand_args</i>:</p> <p><b>-h</b>      Displays the command's usage statement.</p> <p>            This <i>subcommand_arg</i> is optional.</p> <p>The <b>delete</b> subcommand supports the following <i>subcommand_args</i>:</p> <p><b>-h</b>              Displays the command's usage statement.</p> <p>                    This <i>subcommand_arg</i> is optional.</p> <p><b>-n name</b>      Specifies the name of the log file you want to delete.</p> <p>The <b>list</b> subcommand supports the following <i>subcommand_args</i>:</p> <p><b>-h</b>      Displays the command's usage statement.</p> <p>            This <i>subcommand_arg</i> is optional.</p> <p>The <b>view</b> subcommand supports the following <i>subcommand_args</i>:</p> <p><b>-h</b>              Displays the command's usage statement.</p> <p>                    This <i>subcommand_arg</i> is optional.</p> <p><b>-n name</b>      Specifies the name of the log file you want to view.</p> <p><b>-v</b>              Displays the data in verbose format.</p>                                                      |

smlog(1M)

This *subcommand\_arg* is optional.

## EXAMPLES

### EXAMPLE 1 Listing WBEM Log Files

The following command lists all available WBEM log files:

```
./smlog list -H myhost -p mypasswd -u root --
```

```
Log.01/03/2001.14:38:29
Log.01/04/2001.16:34:59
Log.01/08/2001.14:13:33
Log.01/11/2001.18:39:53
Log.01/12/2001.10:31:31
Log.12/21/2000.17:41:11
```

### EXAMPLE 2 Displaying a WBEM Log File

The following command displays the contents of a log file:

```
./smlog view -H myhost -p mypasswd -u root -- -n Log.01/04/2001.16:34:59
```

| Date and Time     | Client    | User | Source            | Severity      | Category        |
|-------------------|-----------|------|-------------------|---------------|-----------------|
| 1/5/01 5:22:47 PM | hostname1 | root | Solaris_OsService | Informational | Application log |
| 1/5/01 5:21:46 PM | hostname1 | root | Solaris_OsService | Informational | Application log |

The smlog output wraps when it exceeds 80 characters.

## ENVIRONMENT VARIABLES

See environ(5) for a description of the JAVA\_HOME environment variable, which affects the execution of the smlog command. If this environment variable is not specified, the /usr/java1.2 location is used. See smc(1M).

## EXIT STATUS

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

## ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

| DESCRIPTION        | The smmaillist command manages one or more email alias entries for the appropriate files in the local /etc files name service or a NIS or NIS+ name service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |
| <i>subcommands</i> | <p>smmaillist <i>subcommands</i> are:</p> <table> <tr> <td>add</td><td>Creates a new email alias definition and adds it to the appropriate files. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> <tr> <td>delete</td><td>Deletes an email alias entry. You can delete only one entry at a time. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete Postmaster or Mailer-Daemon aliases.</td></tr> <tr> <td>list</td><td>Lists one or more email alias entries. To list an entry, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.</td></tr> <tr> <td>modify</td><td>Modifies an email alias entry. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> </table> | add | Creates a new email alias definition and adds it to the appropriate files. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. | delete | Deletes an email alias entry. You can delete only one entry at a time. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete Postmaster or Mailer-Daemon aliases. | list | Lists one or more email alias entries. To list an entry, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization. | modify | Modifies an email alias entry. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. |
| add                | Creates a new email alias definition and adds it to the appropriate files. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |
| delete             | Deletes an email alias entry. You can delete only one entry at a time. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete Postmaster or Mailer-Daemon aliases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |
| list               | Lists one or more email alias entries. To list an entry, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |
| modify             | Modifies an email alias entry. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |
| OPTIONS            | <p>The smmaillist authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smmaillist command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                   |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |
| <i>auth_args</i>   | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - -domain with the <i>domain</i> argument.</p> <p>-D   - -domain <i>domain</i></p> <p>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type</i>:/<i>host_name</i>/<i>domain_name</i>, where <i>type</i> is nis, nisplus, dns, ldap, or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (<i>Note:</i> Do not use nis+ for nisplus.)</p>                                      |     |                                                                                                                                                                                     |        |                                                                                                                                                                                                                                                        |      |                                                                                                                                                 |        |                                                                                                                                            |

## smmaillist(1M)

If you do not specify this option, the Solaris Management Console assumes the `file` default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

**-H | -** `-hostname host_name:port`

Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the `smc(1M) -B` option, or set your console preferences to load a "home toolbox" by default.

**-l | -** `-rolepassword role_password`

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

**-p | -** `-password password`

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

**-r | -** `-rolename role_name`

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

**-u | -** `-username user_name`

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

**- -**

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the `- -` option.

### *subcommand\_args*

*Note:* Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

#### ■ For subcommand `add`:

- `-a address1 -a address2 . . .` (Optional) Specifies the new email address. See `sendmail(1M)`.
- `-h` (Optional) Displays the command's usage statement.
- `-n alias_name` Specifies the name of the alias you want to add. See `sendmail(1M)`.

#### ■ For subcommand `delete`:

- `-h` (Optional) Displays the command's usage statement.
- `-n alias_name` Specifies the alias you want to delete.

#### ■ For subcommand `list`:

- h (Optional) Displays the command's usage statement.
- n *alias\_name* (Optional) Specifies the name of the alias you want to display. If you do not specify an alias, all aliases are listed.
- For subcommand modify:
  - a *address1* -a *address2* . . . (Optional) Specifies new email address(es) to replace the existing one(s). See `sendmail(1M)`.
  - h (Optional) Displays the command's usage statement.
  - n *alias\_name* (Optional) Specifies the name of the alias you want to modify.
  - N *new\_alias\_name* Specifies the new alias name. Use only when renaming an alias. See `sendmail(1M)`.

## EXAMPLES

### EXAMPLE 1 Creating an alias

The following creates the `coworkers` alias and adds the following member list: `bill@machine1`, `sue@machine2`, and `me@machine3` to the alias.

```
./smmailist add -H myhost -p mypasswd -u root -- -n coworkers \
-a bill@machine1 -a sue@machine2 -a me@machine3
```

### EXAMPLE 2 Deleting a mail alias

The following deletes the `my_alias` alias:

```
./smmailist delete -H myhost -p mypasswd -u root -- -n my_alias
```

### EXAMPLE 3 Displaying members of a mail alias

The following displays the list of members belonging to the `my_alias` alias:

```
./smmailist list -H myhost -p mypasswd -u root -- -n my_alias
```

### EXAMPLE 4 Displaying members of all mail aliases

The following displays the list of members belonging to all mail aliases:

```
./smmailist list -H myhost -p mypasswd -u root --
```

### EXAMPLE 5 Renaming a mail alias

The following renames the `current_name` mail alias to `new_name`:

```
./smmailist modify -H myhost -p mypasswd -u root -- \
-n current_name -N new_name
```

## smmaillist(1M)

### EXAMPLE 6 Redefining an address list

The following changes the recipients of the alias `my_alias` to `bill@machine1`. Any previous recipients are deleted from the alias.

```
./smmaillist modify -H myhost -p mypasswd -u root -- \
-n my_alias -a bill@machine1
```

### ENVIRONMENT VARIABLES

See `environ(5)` for a description of the `JAVA_HOME` environment variable, which affects the execution of the `smmaillist` command. If this environment variable is not specified, the `/usr/java` location is used. See `smc(1M)`.

### EXIT STATUS

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

### FILES

The following files are used by the `smmaillist` command:

|                                |                                                                       |
|--------------------------------|-----------------------------------------------------------------------|
| <code>/var/mail/aliases</code> | Aliases for <code>sendmail(1M)</code> . See <code>aliases(4)</code> . |
|--------------------------------|-----------------------------------------------------------------------|

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

| NAME        | smmultiuser – manage bulk operations on user accounts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |     |                                                                                                                                                               |        |                                                                                                                                                                          |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SYNOPSIS    | <code>/usr/sadm/bin/smmultiuser subcommand [ auth_args] - - [subcommand_args]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |     |                                                                                                                                                               |        |                                                                                                                                                                          |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DESCRIPTION | <p>The <code>smmultiuser</code> command allows bulk operations on user entries in the local <code>/etc</code> filesystem or a NIS or NIS+ name service, using either an input file or piped input. <i>Note:</i> Both input files and piped input contain a cleartext (non-encrypted) password for each new user entry.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |     |                                                                                                                                                               |        |                                                                                                                                                                          |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| subcommands | <p><code>smmultiuser</code> subcommands are:</p> <table> <tr> <td>add</td><td>Adds multiple user entries to the appropriate files. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> <tr> <td>delete</td><td>Deletes one or more user entries from the appropriate files. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> <tr> <td>modify</td><td> <p>Modifies existing user entries in the user account database. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. Here is the list of what can be modified using the <code>modify</code> subcommand:</p> <ol style="list-style-type: none"> <li>1. UserName (only under certain conditions; see Note 2 in NOTES).</li> <li>2. Password (only under certain conditions; see Note 3 in NOTES). | OPTIONS     | <p>The <code>smmultiuser</code> authentication arguments, <i>auth_args</i>, are derived from the <code>smc(1M)</code> arg set and are the same regardless of which subcommand you use. The <code>smmultiuser</code> command requires the Solaris Management Console to be initialized for the command to succeed (see <code>smc(1M)</code>). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the <code>- -</code> option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |     |                                                                                                                                                               |        |                                                                                                                                                                          |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| auth_args   | <p>The valid <i>auth_args</i> are <code>-D</code>, <code>-H</code>, <code>-l</code>, <code>-p</code>, <code>-r</code>, <code>- -trust</code>, and <code>-u</code>; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either <code>-D</code> or <code>- -domain</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |     |                                                                                                                                                               |        |                                                                                                                                                                          |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## smmultiuser(1M)

-D | - -domain *domain*

Specifies the default domain that you want to manage. The syntax of *domain* is *type:/host\_name/domain\_name*, where *type* is *nis*, *nisplus*, *dns*, *ldap*, or *file*; *host\_name* is the name of the machine that serves the domain; and *domain\_name* is the name of the domain you want to manage. (Note: Do not use *nis+* for *nisplus*.)

If you do not specify this option, the Solaris Management Console assumes the *file* default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

-H | - -hostname *host\_name:port*

Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the *smc(1M)* -B option, or set your console preferences to load a "home toolbox" by default.

-l | - -rolepassword *role\_password*

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

-p | - -password *password*

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

-r | - -rolename *role\_name*

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

- -trust

Trusts all downloaded code implicitly. Use this option when running the terminal console non-interactively and you cannot let the console wait for user input.

If using piped input into any of the *smmultiuser* subcommands, it will now be necessary to use the - -trust option with the -L *logfile* option. See EXAMPLES.

-u | - -username *user\_name*

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

- -

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the - - option.

*subcommand\_args*

Note: Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

- For subcommand **add**:
  - h (Optional) Displays the command's usage statement.
  - i *input\_file* Specifies the input file containing the user account information. After the command is executed, the input file is removed. The input file must follow the `/etc/passwd` file format. If you do not specify the -i *input\_file* option, you must include a *pipedReader* operand immediately before the command. See EXAMPLES.
  - L *logfile* (Optional) Specifies the full pathname to the text file that stores the command's success/failure data. *Note*: This text file is an ASCII—formatted log file; it is different from and unrelated to the output of the normal logging mechanism that also occurs within the Log Viewer tool. The -L *logfile* option is used to dump additional logging information to a text file.
- For subcommand **delete**:
  - h (Optional) Displays the command's usage statement.
  - i *input\_file* Specifies the input file containing the user account information. After the command is executed, the input file is removed. The input file must follow the `/etc/passwd` file format. If you do not specify the -i *input\_file* option, you must include a *pipedReader* operand immediately before the command. See EXAMPLES.
  - L *logfile* (Optional) Specifies the full pathname to the text file that stores the command's success/failure data.
- For subcommand **modify**:
  - h (Optional) Displays the command's usage statement.
  - i *input\_file* Specifies the input file containing the user account information. After the command is executed, the input file is removed. The input file must follow the `/etc/passwd` file format. If you do not specify the -i *input\_file* option, you must include a *pipedReader* operand immediately before the command. See EXAMPLES. *Note*: When modifying passwords, use the pipedReader input, since it is more secure than keeping passwords in a file. See Note 1 in NOTES.
  - L *logfile* (Optional) Specifies the full pathname to the text file that stores the command's success/failure data.

**OPERANDS** The following operands are supported:

- pipedReader* You must include *pipedReader* if you do not specify an *input\_file*. Include the pipedReader input immediately before the command. The pipedReader input must follow the `/etc/passwd` file format. See EXAMPLES. *Note*: Use the - `-trust` option when using pipedReader input with the -L *logfile* option to avoid the user prompt from the Security Alert Manager, which normally asks the user whether the log file should be created. Without the - `-trust` option, the

## smmultiuser(1M)

pipelined input is improperly taken as the answer to the prompt before the user can answer “Y” or “N”, and the logging operation will probably fail.

### EXAMPLES

#### EXAMPLE 1 Creating multiple user accounts

The following reads in user account data from the `/tmp/foo` file and creates new user accounts on the local file system. The input file is formatted in the `/etc/passwd` format.

```
./smmultiuser add -H myhost -p mypasswd -u root -- -i /tmp/foo
```

#### EXAMPLE 2 Deleting multiple user accounts

The following reads in user account data from the `/tmp/foo` file and deletes the named user accounts from the local file system:

```
./smmultiuser delete -H myhost -p mypasswd -u root -- -i /tmp/foo
```

#### EXAMPLE 3 Creating a log file with pipelined input

The following example shows the use of the `smc(1M)` - `-trust` option that is required when creating a log file. It is applicable to the `delete` and `modify` subcommands also.

```
cat /tmp/users.txt | smmultiuser add --trust -- -l /tmp/mylog.txt
```

### ENVIRONMENT VARIABLES

See `environ(5)` for a description of the `JAVA_HOME` environment variable, which affects the execution of the `smprofile` command. If this environment variable is not specified, the `/usr/java` location is used. See `smc(1M)`.

### EXIT STATUS

The following exit values are returned:

- 0 Successful completion.
- 1 Invalid command syntax. A usage message displays.
- 2 An error occurred while executing the command. An error message displays.

### FILES

The following files are used by the `smprofile` command:

`/etc/passwd` Contains the file format to use for the *input\_file* and *pipelined\_input*. See `passwd(4)`.

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

**SEE ALSO** `smc(1M)`, `passwd(4)`, `attributes(5)`, `environ(5)`

- NOTES**
1. The file format used by both the `add` and `modify` subcommands is the `/etc/passwd` format. But there is an allowance for a mutated version of this file format that contains an extra field at the end of each line to be used for the Full Name. If the extra field is appended to the end of each line, it will be used for the Full Name value, but if it is omitted, it will be assumed that no FullName modification is being done. The extra field is separated with a colon (:), just like all the other fields.  
  
Example of regulation `/etc/passwd` entry:  
  
`rick2:x:101:10:description1:/home/rick2:/bin/sh`Example of `/etc/passwd` variant entry:  
  
`rick2:x:101:10:description1:/home/rick2:/bin/sh:Ricks_fullname`
  2. The modifies are all done based on lookups of the user name in the user tables. If a user name can not be found in this lookup, a secondary check will be made to see if the uid *and* FullName can be found in the user tables. If they are both found, assume that a user rename has occurred. If neither can be found, assume that the user account does not exist and cannot be modified.
  3. If no password is supplied, assume that there is no change to the password information. If a password is being changed, it should be supplied in cleartext as piped input, although this is not required. The password can be supplied in the input file also. Once read in, the password will be changed accordingly.

| DESCRIPTION      | <p>The smoservice command manages OS services.</p> <p>smoservice <i>subcommands</i> are:</p> <table> <tr> <td>add</td><td>Adds the specified OS services.</td></tr> <tr> <td>delete</td><td>Deletes the specified OS services.</td></tr> <tr> <td>list</td><td>Either lists all the installed OS services for the server if you do not specify a hostname, or lists the OS services for the specified diskless client if you do specify a hostname.</td></tr> <tr> <td>patch</td><td>Manages patches on all existing diskless clients. For example, you can use this subcommand to initially establish a patch spool directory on an OS server. Then, you can apply the patch to the spool area, verifying the patch as needed. Once the patch exists in the spool area, you can apply the patch to the clone area. In addition, you can migrate the patched clone area to clients.</td></tr> </table>                                                                                                                                                                                                                                                              | add | Adds the specified OS services. | delete | Deletes the specified OS services. | list | Either lists all the installed OS services for the server if you do not specify a hostname, or lists the OS services for the specified diskless client if you do specify a hostname. | patch | Manages patches on all existing diskless clients. For example, you can use this subcommand to initially establish a patch spool directory on an OS server. Then, you can apply the patch to the spool area, verifying the patch as needed. Once the patch exists in the spool area, you can apply the patch to the clone area. In addition, you can migrate the patched clone area to clients. |
| add              | Adds the specified OS services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                 |        |                                    |      |                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                                                |
| delete           | Deletes the specified OS services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |     |                                 |        |                                    |      |                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                                                |
| list             | Either lists all the installed OS services for the server if you do not specify a hostname, or lists the OS services for the specified diskless client if you do specify a hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |     |                                 |        |                                    |      |                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                                                |
| patch            | Manages patches on all existing diskless clients. For example, you can use this subcommand to initially establish a patch spool directory on an OS server. Then, you can apply the patch to the spool area, verifying the patch as needed. Once the patch exists in the spool area, you can apply the patch to the clone area. In addition, you can migrate the patched clone area to clients.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |                                 |        |                                    |      |                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                                                |
| OPTIONS          | <p>The smoservice authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smoservice command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |     |                                 |        |                                    |      |                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>auth_args</i> | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - -domain.</p> <p>-D   - -domain <i>domain</i></p> <p>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type</i>:/<i>host_name</i>/<i>domain_name</i>, where <i>type</i> is nis, nis+, dns, ldap, or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (Note: Do not use nis+ for nisplus.)</p> <p>If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.</p> |     |                                 |        |                                    |      |                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                                                |

- H | - -hostname *host\_name:port*  
Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the smc(1M) -B option, or set your console preferences to load a "home toolbox" by default.
- l | - -rolepassword *role\_password*  
Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.
- p | - -password *password*  
Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.
- r | - -rolename *role\_name*  
Specifies a role name for authentication. If you do not specify this option, no role is assumed.
- u | - -username *user\_name*  
Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.
- -  
This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the - - option.

*subcommand\_args* Note: Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

■ For subcommand add:

- h (Optional) Displays the command's usage statement.
- o *os\_server* (Optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified in the smc(1M) -D option. This option is useful in the event that the name service server and the OS server are not the same machine.
- x mediapath=*path* Specifies the full path to the Solaris CD image.
- x platform=*platform* Specifies the OS service to add. The instruction architecture, machine class, OS, and version are given in the form:  
  
*instruction\_set.machine\_class.Solaris\_os\_version*for example, *sparc.sun4m.Solaris\_9*

## smoservice(1M)

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -x cluster= <i>cluster</i>                        | Specifies the Solaris cluster to install. For example, SUNWCa11.                                                                                                                                                                                                                                                                                                                                                                                                     |
| -x locale= <i>locale</i> [ <i>locale</i> , . . .] | (Optional) Specifies the locales to install from the specified cluster. A comma-delimited list of locales can be specified.                                                                                                                                                                                                                                                                                                                                          |
| ■ For subcommand delete:                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -h                                                | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -o <i>os_server</i>                               | (Optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified in the smc(1M) -D option. This option is useful in the event that the name service server and the OS server are not the same machine.                                                                                                                                                                |
| -x rmplatform= <i>platform</i>                    | Specifies the OS service to remove. The instruction architecture, machine class, OS, and version are given in the form:<br><br><i>instruction_set.machine_class.Solaris_os_version</i> for example, <i>sparc.all.Solaris_9</i> . Note: Only a machine class of <i>all</i> is supported.                                                                                                                                                                              |
| ■ For subcommand list:                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -h                                                | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -o <i>os_server</i>                               | (Optional) Specifies the name of the host where the OS service filesystems reside. If this option is not specified, the host will be the same as that specified in the smc(1M) -D option. This option is useful in the event that the name service server and the OS server are not the same machine.                                                                                                                                                                |
| ■ For subcommand patch:                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -a <i>patch_directory/patch_ID</i>                | Adds the specified patch, <i>patch_ID</i> , to the spool directory. <i>patch_directory</i> specifies the source path of the patch to be spooled which includes the patchid directory name. Patches are spooled to <i>/export/diskless/Patches/</i> . If the patch being added obsoletes an existing patch in the spool, the obsolete patch is moved to the archive area, <i>/export/diskless/Patches/Archive</i> (to be restored if this new patch is ever removed). |
| -h                                                | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -m                                                | (Optional) Synchronizes spooled patches with offline copies of each diskless client OS service on                                                                                                                                                                                                                                                                                                                                                                    |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | the server. Spooled patches and applied patches are compared so that newly spooled patches can be installed and patches recently removed from the spool can be backed out. This option does not apply to patches directly to diskless client OS services or diskless clients; the <code>-u</code> option must be used to update the services and clients with the changes. Clients are not required to be down at this time, as all patching is done off line. <i>Note:</i> The server is fully available during this operation. |
| <code>-P</code>         | Lists all currently spooled patches with an associated synopsis. The list is split up into sections detailing the patches for each OS and architecture in this format:<br><br><pre>Solaris os_rell architecture1: patchid Synopsis patchid Synopsis ..... Solaris os_rell architecture2: patchid Synopsis .....</pre>                                                                                                                                                                                                            |
| <code>-r patchid</code> | Removes the specified patchid from the spool if it is not a requirement for any of the other patches in the spool. All archived patches that were obsoleted by the removed patch are restored to the spool.                                                                                                                                                                                                                                                                                                                      |
| <code>-U</code>         | (Optional) Updates all diskless client OS services and diskless clients with any changes after synchronizing patches with the <code>-m</code> option. Clients must be brought down during this operation. Once execution has completed, each client should be booted again.                                                                                                                                                                                                                                                      |

## EXAMPLES **EXAMPLE 1** Creating a new OS service

The following command adds an OS service for Solaris 9 for the sun4u machine class where the OS server is *not* using a name service:

```
example% /usr/sadm/bin/smoservice add -- \
-x mediapath=/net/imageserver/5.8/sparc \
-x platform=sparc.sun4u.Solaris_9 \
-x cluster=SUNWCXall -x locale=en_US
```

The following command adds an OS service for Solaris 9 for the sun4u machine class where the OS server is using NIS, the NIS server is `nisserv`, the OS server is `osserver`, and the port to which you connect on `osserver` is 898:

## smoservice(1M)

```
example% /usr/sadm/bin/smoservice add -D nis:/nisserver/my.domain.com -- \
 -H osserver:898 -- \
 -x mediapath=/net/imageserver/5.8/sparc \
 -x platform=sparc.sun4u.Solaris_9 \
 -x cluster=SUNWCXall -x locale=en_US \
 -o osserver
```

In the preceding example, the OS service is placed in /export on osserver, while the hosts.byaddr, ethers, and bootparams maps are updated on the NIS server.

### EXAMPLE 2 Deleting an OS service

The following command deletes the OS service for Solaris 9 for the sun4u machine class where the OS server is using NIS, the NIS server is nisserver, and the OS server is osserver:

```
example% /usr/sadm/bin/smoservice delete\
 -D nis:/nisserver/my.domain.com -- \
 -x rmplatform=sparc.all.Solaris_9 \
 -o osserver
```

### EXAMPLE 3 Listing installed OS services

The following command lists the OS services installed on the machine, osserver:

```
example% /usr/sadm/bin/smoservice list \
 -D file:/osserver/osserver -- -o osserver
```

## ENVIRONMENT VARIABLES

See environ(5) for a description of the JAVA\_HOME environment variable, which affects the execution of the smoservice command. If this environment variable is not specified, the /usr/java1.2 location is used. See smc(1M).

## EXIT STATUS

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

## ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWdcInt       |

| <b>NAME</b>                     | smpatch – manage patches                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |            |                                                                                                                                                                                                                                                                                                                               |                |                                                                                                                                                                                                                                                                                                                                           |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                       |
| <b>SYNOPSIS</b>                 | <code>/usr/sadm/bin/smpatch subcommand [auth_args ] -- [subcommand_args]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |            |                                                                                                                                                                                                                                                                                                                               |                |                                                                                                                                                                                                                                                                                                                                           |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                       |
| <b>DESCRIPTION</b>              | <p>The <code>smpatch</code> command manages patch installation on single or multiple machines, analyzes patch requirements, and downloads required patches.</p> <p>To run this command on multiple machines, you must first create a role on each machine that contains the necessary rights to perform patch management. In addition, all of the machines on which you want to install patches must run the same version of the Solaris operating environment, have the same hardware architecture, and have the same patches installed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |            |                                                                                                                                                                                                                                                                                                                               |                |                                                                                                                                                                                                                                                                                                                                           |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                       |
| <b>Subcommands</b>              | <p>The following subcommands are supported:</p> <table> <tr> <td><b>add</b></td><td>Installs patches on single or multiple machines. You can either specify the patch IDs and the machine names directly on the command line, or you can specify a <i>patchlist_file</i> and a <i>machinelist_file</i> that contains the list of patches and the machines on which you want to install the patches, respectively.</td></tr> <tr> <td><b>analyze</b></td><td> <p>Analyzes and lists the patches required for a specified machine.</p> <p>You must first install the PatchPro application on the host machine before you run the analyze command. To install PatchPro, download the packages from the Sun Microsystems web site and follow the instructions to install the software on your machine.</p> </td></tr> <tr> <td><b>download</b></td><td> <p>Downloads patches from the SunSolve Online database to the patch directory. You can either specify the patches that you want to download, or you can specify a machine name to download the recommended patches for that machine.</p> <p>You must first install the PatchPro application on the host machine before you run the download command. To install PatchPro, download the packages from the Sun Microsystems web site and follow the instructions to install the software on your machine.</p> </td></tr> <tr> <td><b>remove</b></td><td>Removes a single patch from a system.</td></tr> </table> | <b>add</b> | Installs patches on single or multiple machines. You can either specify the patch IDs and the machine names directly on the command line, or you can specify a <i>patchlist_file</i> and a <i>machinelist_file</i> that contains the list of patches and the machines on which you want to install the patches, respectively. | <b>analyze</b> | <p>Analyzes and lists the patches required for a specified machine.</p> <p>You must first install the PatchPro application on the host machine before you run the analyze command. To install PatchPro, download the packages from the Sun Microsystems web site and follow the instructions to install the software on your machine.</p> | <b>download</b> | <p>Downloads patches from the SunSolve Online database to the patch directory. You can either specify the patches that you want to download, or you can specify a machine name to download the recommended patches for that machine.</p> <p>You must first install the PatchPro application on the host machine before you run the download command. | <b>OPTIONS</b>                  | There are two kinds of options: authentication arguments ( <i>auth_args</i> ) and subcommand arguments ( <i>subcommand_args</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |            |                                                                                                                                                                                                                                                                                                                               |                |                                                                                                                                                                                                                                                                                                                                           |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                       |
| <b>Authentication Arguments</b> | <p>The <code>smpatch</code> authentication arguments, <i>auth_args</i>, are derived from the <code>smc(1M)</code> argument set and are the same regardless of which subcommand you use.</p> <p>Valid <i>auth_args</i> are <code>-D</code>, <code>-H</code>, <code>-l</code>, <code>-p</code>, <code>-r</code>, and <code>-u</code>; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |            |                                                                                                                                                                                                                                                                                                                               |                |                                                                                                                                                                                                                                                                                                                                           |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                       |

## smpatch(1M)

The single letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either `-D` or `--domain`.

Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

The following authentication arguments (*auth\_args*) are supported:

`-D` | `--domain` *domain*

Specifies the default domain that you want to manage. `smpatch` only accepts files for this option.

If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

`-H` | `--hostname` *host\_name:port*

Specifies the host and port to which you want to connect. If you do not specify a port, the system connects to the default port, 898. If you do not specify a host (*host\_name:port*), the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the `smc -B` option, or set your console preferences to load a home toolbox by default.

`-l` | `--rolepassword` *role\_password*

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

`-p` | `--password` *password*

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Because passwords specified on the command line can be seen by any user on the system, this option is considered insecure.

`-r` | `--rolename` *role\_name*

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

`-u` | `--username` *user\_name*

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

`--`

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the `--` option.

### Subcommand Arguments

The subcommand-specific options, *subcommand\_args*, must come after the *auth\_args* and must be separated from them by the `--` option. Enclose descriptions and *arg* options that contain white space in double quotes.

add

The add subcommand requires one of the following subcommand arguments:

`-i patch_id1 -i patch_id2 . . .`

Specifies the patch or patches that you want to install. You can specify the `-x idlist=patch_id_file` operand instead of specifying this option.

`-x idlist=patchlist_file`

Specifies a file that contains the list of patches that you want to install. You can specify the `-i patch_id1` option instead of specifying this operand.

The following subcommand arguments are optional for the add subcommand:

`-d patchdir`

Specifies the directory where the patches are located. If you do not specify this option, the default patch spool directory (`/var/sadm/spool`), located on the host specified with the `-H` authentication argument, is assumed. The patch directory has the following syntax: `machine_name: /directory_path`, where `/directory_path` is a fully-qualified, shared directory. You can specify just the `/directory_path` if the directory is an NFS-mounted network directory or is located on the machine on which you want to install the patches.

`-h`

Displays the command's usage statement.

`-n machine_name1 -n machine_name2 . . .`

Specifies the machine(s) on which you want to install the patches. If you do not specify this option, the machine is assumed to be that specified with the `-H` authentication argument. You can specify the `-x mlist=machine_name_file` operand instead of specifying this option.

`-x mlist=machinelist_file`

Specifies a file that contains the list of machines to which you want to install patches. You can specify the `-n machine_name1` option instead of specifying this operand.

analyze

The following subcommand arguments are optional for the analyze subcommand:

`-h`

Displays the command's usage statement.

`-n machine_name`

Specifies the machine for which you want to display a list of patches recommended by SunSolve. If you do not specify this option, the machine is assumed to be that specified by the `-H` authentication argument.

|                 | <p><i>machinelist_file</i></p>                    | <p>Specifies the fully-qualified path and file name of the file containing the list of machine names on which you want to install the patches. The <i>machinelist_file</i> file contains one machine name per line.</p>                                                                                            |
|                 | <p><i>patchlist_file</i></p>                      | <p>Specifies the fully-qualified path and file name of the file containing the list of patches that you want to install. The <i>patchlist_file</i> contains one patch ID per line.</p>                                                                                                                             |

**EXAMPLES****EXAMPLE 1** Installing Patches on Multiple Machines

The following example installs patches 102893-01, 106895-09, and 106527-05 on the machines lab1 and lab2. The patches are located in the /files/patches/s9 shared directory on the machine fileserver:

```
/usr/sadm/bin/smpatch add -H myhost -p mypasswd -u root -- \
-i 102893-01 -i 106895-09 -i 106527-05 \
-d fileserver:/files/patches/s9 \
-n lab1 -n lab2
```

**EXAMPLE 2** Installing Patches Using a patch\_list File

The following example specifies the /tmp/patch/patch\_file to install patches on the machines lab1 and lab2. The patches are located in the NFS network-mounted directory /net/fileserver/export/patchspool/Solaris9:

```
/usr/sadm/bin/smpatch add -H myhost -p mypasswd -u root -- \
-x mlist=/tmp/patch/patch_file \
-d /net/fileserver/export/patchspool/Solaris9 \
-n lab1 -n lab2
```

**EXAMPLE 3** Installing Patches Using a patch\_list File and a machine\_list File

The following example installs the patches listed in /tmp/patch/patch\_file on the machines listed in /tmp/patch/machine\_file. The patches are located in the default /var/sadm/spool directory on the default machine myhost.

```
/usr/sadm/bin/smpatch add -H myhost -p mypasswd -u root -- \
-x mlist=/tmp/patch/patch_file \
-x mlist=/tmp/patch/machine_file
```

**EXAMPLE 4** Analyzing and Downloading Patches from SunSolve Online

The following example analyzes the lab1 machine and downloads the assessed patches from the SunSolve Online database to the default patch spool directory.

```
/usr/sadm/bin/smpatch download -p mypasswd -u root -- -n lab1
```

**EXAMPLE 5** Downloading Patches From the SunSolve Database

The following example downloads the 102893-01 and 106895-09 patches from the SunSolve Online database to the /files/patches/s8 directory located on the default machine.

```
/usr/sadm/bin/smpatch download -p mypasswd -u root -- \
-i 102893-01 -i 106895-09 -d /files/patches/s8
```

**EXAMPLE 6** Removing Patches

The following example removes patch 102893-01:

## smpatch(1M)

### **EXAMPLE 6** Removing Patches      *(Continued)*

```
/usr/sadm/bin/smpatch remove -p mypasswd -u root -- \
-i 10283-01
```

### **ENVIRONMENT VARIABLES**

See [environ\(5\)](#) for descriptions of the following environment variables that affect the execution of `smpatch`: `JAVA_HOME`. If this environment variable is not specified, the `/usr/java` location is used. See [smc\(1M\)](#).

### **EXIT STATUS**

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

### **ATTRIBUTES**

See [attributes\(5\)](#) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

### **SEE ALSO**

| NAME        | smprofile – manage profiles in the prof_attr and exec_attr databases                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| SYNOPSIS    | <code>/usr/sadm/bin/smprofile subcommand [ auth_args] - - [subcommand_args]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| DESCRIPTION | The smprofile command manages one or more profiles in the prof_attr(4) or exec_attr(4) databases in the local /etc files name service or a NIS or NIS+ name service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| subcommands | <p>smprofile subcommands are:</p> <table> <tr> <td>add</td><td>Adds a new profile (right) to the prof_attr(4) database. To add a profile, the administrator must have the solaris.profmgr.write authorization.</td></tr> <tr> <td>delete</td><td>Deletes a profile from the prof_attr(4) database, deletes all associated entries from the exec_attr(4) database, and deletes the assigned profile from the user_attr(4) database. To delete a profile, the administrator must have the solaris.profmgr.execattr.write and solaris.profmgr.write authorization.</td></tr> <tr> <td>list</td><td>Lists one or more profiles from the prof_attr(4) or exec_attr(4) databases. To list a profile, the administrator must have the solaris.profmgr.read authorization.</td></tr> <tr> <td>modify</td><td>Modifies a profile in the prof_attr(4) database. To modify a profile, the administrator must have the solaris.profmgr.write authorization.</td></tr> </table> | add | Adds a new profile (right) to the prof_attr(4) database. To add a profile, the administrator must have the solaris.profmgr.write authorization. | delete | Deletes a profile from the prof_attr(4) database, deletes all associated entries from the exec_attr(4) database, and deletes the assigned profile from the user_attr(4) database. To delete a profile, the administrator must have the solaris.profmgr.execattr.write and solaris.profmgr.write authorization. | list | Lists one or more profiles from the prof_attr(4) or exec_attr(4) databases. To list a profile, the administrator must have the solaris.profmgr.read authorization. | modify | Modifies a profile in the prof_attr(4) database. To modify a profile, the administrator must have the solaris.profmgr.write authorization. |
| add         | Adds a new profile (right) to the prof_attr(4) database. To add a profile, the administrator must have the solaris.profmgr.write authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| delete      | Deletes a profile from the prof_attr(4) database, deletes all associated entries from the exec_attr(4) database, and deletes the assigned profile from the user_attr(4) database. To delete a profile, the administrator must have the solaris.profmgr.execattr.write and solaris.profmgr.write authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| list        | Lists one or more profiles from the prof_attr(4) or exec_attr(4) databases. To list a profile, the administrator must have the solaris.profmgr.read authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| modify      | Modifies a profile in the prof_attr(4) database. To modify a profile, the administrator must have the solaris.profmgr.write authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| OPTIONS     | <p>The smprofile authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smprofile command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                                                    |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |
| auth_args   | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - -domain with the <i>domain</i> argument.</p> <p>-D   - -domain <i>domain</i></p> <p>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type:/host_name/domain_name</i>, where <i>type</i> is nis, nisplus, dns, ldap, or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (Note: Do not use nis+ for nisplus.)</p>                                                                                          |     |                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                    |        |                                                                                                                                            |

## smprofile(1M)

If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

-H | - -hostname *host\_name:port*

Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the smc(1M) -B option, or set your console preferences to load a "home toolbox" by default.

-l | - -rolepassword *role\_password*

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

-p | - -password *password*

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

-r | - -rolename *role\_name*

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

-u | - -username *user\_name*

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

- -

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the - - option.

### *subcommand\_args*

*Note:* Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

■ For subcommand add:

-a *addauth1* -a *addauth2* . . .

(Optional) Specifies the authorization name(s) to add to the new profile. The administrator must have the `solaris.profmgr.write` authorization and must have the corresponding "grant" authorization. A "grant" authorization is one in which the lowest component of the authorization name is replaced by the word grant. For example, to grant some profile the `solaris.role.write` authorization, the administrator needs that authorization and also the

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                          | solaris.role.grant authorization. For more information on granting authorizations, see <code>auth_attr(4)</code> .                                                                                                                                                                                                                                                                                                                                                                |
| <code>-d description</code>              | Specifies the description of the new profile.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-h</code>                          | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-m html_help</code>                | Specifies the HTML help file name for the new profile. The help file name must be put in the <code>/usr/lib/help/profiles/locale/C</code> directory.                                                                                                                                                                                                                                                                                                                              |
| <code>-n name</code>                     | Specifies the name of the new profile.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>-p addprof1 -p addprof2 ...</code> | (Optional) Specifies the supplementary profile name(s) to add to the new profile.                                                                                                                                                                                                                                                                                                                                                                                                 |
| ■ For subcommand <code>delete</code> :   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>-h</code>                          | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-n name</code>                     | Specifies the name of the profile you want to delete.                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <code>-h</code>                          | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-l</code>                          | (Optional) Displays the detailed output for each profile in a block of <i>key:value</i> pairs, followed by a blank line that delimits each profile block. Each <i>key:value</i> pair is displayed on a separate line. All the attributes associated with a profile from the <code>prof_attr</code> and <code>exec_attr</code> databases are displayed. If you do not specify this option, only the specified profile name(s) and associated profile description(s) are displayed. |
| <code>-n name1 -n name2 ...</code>       | (Optional) Specifies the profile(s) that you want to display. If you do not specify a profile name, all profiles are displayed.                                                                                                                                                                                                                                                                                                                                                   |
| ■ For subcommand <code>modify</code> :   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>-a addauth1 -a addauth2 ...</code> | (Optional) Specifies the authorization name(s) to add to the profile. The administrator must currently have been granted each of the specified authorizations and must have the ability to grant each of those authorizations to other users or roles. For more information on granting authorizations, see <code>auth_attr(4)</code> .                                                                                                                                           |
| <code>-d description</code>              | (Optional) Specifies the new description of the profile.                                                                                                                                                                                                                                                                                                                                                                                                                          |

## smprofile(1M)

|                                                          |                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-h</code>                                          | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                          |
| <code>-m <i>html_help</i></code>                         | (Optional) Specifies the new HTML help file name of the profile. If you change this name, you must accordingly rename the help file name entered in the <code>/usr/lib/help/profiles/locale/C</code> directory.                                                                                                                                             |
| <code>-n <i>name</i></code>                              | Specifies the name of the profile you want to modify.                                                                                                                                                                                                                                                                                                       |
| <code>-p <i>addprof1</i> -p <i>addprof2</i> . . .</code> | (Optional) Specifies the supplementary profile name(s) to add to the profile. The administrator must have the <code>solaris.profmgr.assign</code> authorization to add any profile and the <code>solaris.profmgr.delegate</code> authorization to add any profile that has been assigned to the authenticated user.                                         |
| <code>-q <i>delprof1</i> -q <i>delprof2</i> . . .</code> | (Optional) Specifies the supplementary profile name(s) to delete from the profile. The administrator must have the <code>solaris.profmgr.assign</code> authorization to delete any profile and the <code>solaris.profmgr.delegate</code> authorization to delete any profile that has been assigned to the authenticated user.                              |
| <code>-r <i>delauth1</i> -r <i>delauth2</i> . . .</code> | (Optional) Specifies the authorization name(s) to delete from the profile. The administrator must have the <code>solaris.profmgr.write</code> authorization and must have the corresponding "grant" authorization. For more information about "grant" authorizations, see the <code>-a</code> option description for the <code>add</code> subcommand above. |

### EXAMPLES

#### EXAMPLE 1 Creating a new profile

The following creates a new User Manager profile on the local file system. The new profile description is Manage users and groups, and the authorizations assigned are `solaris.admin.usermgr.write` and `solaris.admin.usermgr.read`. The supplementary profile assigned is Operator. The help file name is `RtUserMgmt.html`.

```
./smprofile add -H myhost -p mypasswd -u root -- -n "User Manager" \
-d "Manage users and groups" -a solaris.admin.usermgr.write \
-a solaris.admin.usermgr.read -p Operator -m RtUserMgmt.html
```

#### EXAMPLE 2 Deleting a profile

The following deletes the User Manager profile from the local file system:

```
./smprofile delete -H myhost -p mypasswd -u root -- -n "User Manager"
```

#### EXAMPLE 3 Listing all profiles

The following lists all profiles and their associated profile descriptions on the local file system.

```
./smprofile list -H myhost -p mypasswd -u root --
```

#### EXAMPLE 4 Modifying a profile

The following modifies the User Manager profile on the local file system. The new profile description is Manage world, the new authorization assignment is solaris.admin.usermgr.\* authorizations, and the new supplementary profile assignment is All. (The -a option argument must be enclosed in double quotes when the wildcard character (\*) is used.)

```
./smprofile modify -H myhost -p mypasswd -u root -- -n "User Manager" \
-d "Manage world" -a "solaris.admin.usermgr.*" -p All
```

#### ENVIRONMENT VARIABLES

See environ(5) for a description of the JAVA\_HOME environment variable, which affects the execution of the smprofile command. If this environment variable is not specified, the /usr/java location is used. See smc(1M).

#### EXIT STATUS

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

#### FILES

The following files are used by the smprofile command:

|                         |                                                     |
|-------------------------|-----------------------------------------------------|
| /etc/security/exec_attr | Execution profiles database. See exec_attr(4).      |
| /etc/security/prof_attr | Profile description database. See prof_attr(4).     |
| /etc/user_attr          | Extended user attribute database. See user_attr(4). |

#### ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

smprofile(1M)

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWmga         |

| NAME        | smrole – manage roles and users in role accounts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| SYNOPSIS    | <code>/usr/sadm/bin/smrole subcommand [ auth_args ] - - [subcommand_args]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| DESCRIPTION | The smrole command manages roles and adds or deletes users in role accounts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| subcommands | <p>smrole subcommands are:</p> <table> <tr> <td>add</td><td>Adds a new role entry. To add an entry, the administrator must have the <code>solaris.role.write</code> authorization.</td></tr> <tr> <td>delete</td><td>Deletes one or more roles. To delete an entry, the administrator must have the <code>solaris.role.write</code> authorization.</td></tr> <tr> <td>list</td><td>Lists one or more roles. If you do not specify a role name, all roles are listed. To list an entry, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.</td></tr> <tr> <td>modify</td><td>Adds or deletes users from a role account. To modify an entry, the administrator must have the <code>solaris.role.write</code> authorization.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | add | Adds a new role entry. To add an entry, the administrator must have the <code>solaris.role.write</code> authorization. | delete | Deletes one or more roles. To delete an entry, the administrator must have the <code>solaris.role.write</code> authorization. | list | Lists one or more roles. If you do not specify a role name, all roles are listed. To list an entry, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization. | modify | Adds or deletes users from a role account. To modify an entry, the administrator must have the <code>solaris.role.write</code> authorization. |
| add         | Adds a new role entry. To add an entry, the administrator must have the <code>solaris.role.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| delete      | Deletes one or more roles. To delete an entry, the administrator must have the <code>solaris.role.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| list        | Lists one or more roles. If you do not specify a role name, all roles are listed. To list an entry, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| modify      | Adds or deletes users from a role account. To modify an entry, the administrator must have the <code>solaris.role.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| OPTIONS     | <p>The smrole authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smrole command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |
| auth_args   | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - --domain with the <i>domain</i> argument.</p> <p>-D   - --domain <i>domain</i></p> <p>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type: /host_name /domain_name</i>, where <i>type</i> is nis, nisplus, dns, ldap, or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (Note: Do not use nis+ for nisplus.)</p> <p>If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.</p> <p>-H   - --hostname <i>host_name:port</i></p> <p>Specifies the <i>host_name</i> and <i>port</i> to which you want to connect. If you do not specify a <i>port</i>, the system connects to the default port, 898. If you do not specify</p> |     |                                                                                                                        |        |                                                                                                                               |      |                                                                                                                                                                                            |        |                                                                                                                                               |

## smrole(1M)

*host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the `smc(1M) -B` option, or set your console preferences to load a “home toolbox” by default.

`-l | - -rolepassword role_password`

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

`-p | - -password password`

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

`-r | - -rolename role_name`

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

`-u | - -username user_name`

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

`- -`

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the `- -` option.

### *subcommand\_args*

*Note:* Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

#### ■ For subcommand `add`:

- `-a adduser1 -a adduser2 . . .` (Optional) Specifies the user name(s) to add to the new role. The administrator must have the `solaris.role.assign` authorization.
- `-c comment` (Optional) Includes a short description of the role. Consists of a string of up to 256 printable characters, excluding the colon (:).
- `-d dir` (Optional) Specifies the home directory of the new role, limited to 1024 characters.
- `-F full_name` (Optional) Specifies the full, descriptive name of the role. The *full\_name* must be unique within a domain, and can contain alphanumeric characters and spaces. If you use spaces, you must enclose the *full\_name* in double quotes.
- `-G group1 -G group2 . . .` (Optional) Specifies the new role’s supplementary group membership in the system group database with the character string names of one or more

existing groups. *Note:* You cannot assign a primary group to a role. A role's primary group is always sysadmin (group 14).

- h (Optional) Displays the command's usage statement.
- n *rolename* Specifies the name of the role you want to create.
- p *addprof1* -p *addprof2* . . . (Optional) Specifies the profile(s) to add to the role. To assign a profile to a role, the administrator must have the `solaris.profmgr.assign` or `solaris.profmgr.delegate` authorization.
- P *password* (Optional) Specifies the role's password. The *password* can contain up to eight characters. If you do not specify a password, the system prompts you for one. To set the password, the administrator must have the `solaris.admin.usermgr.pswd` authorization. *Note:* When you specify a password using the -P option, you type the password in plain text. Specifying a password using this method introduces a security gap while the command is running. However, if you do not specify a password (and the system prompts you for one), the echo is turned off when you type in the password.
- s *shell* (Optional) Specifies the full pathname of the program used as the role's shell on login. Valid entries are `/bin/pfcsh` (C shell), `/bin/pfksh` (Korn shell), and `/bin/pfsh` (Bourne shell), the default.
- u *uid* (Optional) Specifies the ID of the role you want to add. If you do not specify this option, the system assigns the next available unique ID greater than 100.
- x *autohome=Y|N* (Optional) Sets the role's home directory. The home directory path in the password entry is set to `/home/login name`.
- x *perm=home\_perm* (Optional) Sets the permissions on the role's home directory. *perm* is interpreted as an octal number, and the default is 0775.
- x *serv=homedir\_server* (Optional) If -D is `nis`, `nisplus`, or `ldap`, use this option to specify the name of the server where the user's home directory resides. Users created in a local scope must have their home directory server

created on their local machines.

- For subcommand `delete`:
  - h (Optional) Displays the command's usage statement.
  - n *rolename1* -n *rolename2* ... Specifies the name of the role(s) you want to delete.
- For subcommand `list`:
  - h (Optional) Displays the command's usage statement.
  - l (Optional) Displays the output for each user in a block of *key:value* pairs (for example, `user name:root`), followed by a blank line that delimits each user block. Each *key:value* pair is displayed on a separate line. The keys are: `autohome`, `setup`, `comment`, `home directory`, `login shell`, `primary group`, `secondary groups`, `server`, `user ID (UID)`, and `user name`.
  - n *role1* -n *role2* ... (Optional) Specifies the role(s) that you want to list. If you do not specify a role name, all roles are listed.
- For subcommand `modify`:
  - a *adduser1* -a *adduser2* ... (Optional) Specifies the user name(s) to add to the new role. The administrator must have the `solaris.role.assign` authorization, or must have the `solaris.role.delegate` authorization and be a member of the role being modified.
  - c *comment* (Optional) Includes a short description of the role. Consists of a string of up to 256 printable characters, excluding the colon (:).
  - d *dir* (Optional) Specifies the home directory of the new role, limited to 1024 characters.
  - F *full\_name* (Optional) Specifies the full, descriptive name of the role. The *full\_name* must be unique within a domain, and can contain alphanumeric characters and spaces. If you use spaces, you must enclose the *full\_name* in double quotes.
  - G *group1* -G *group2* ... (Optional) Specifies the new role's secondary group membership in the system group database with the character string names of one or more existing groups. *Note:* You cannot assign a primary group to a role. A role's primary group is always `sysadmin` (group 14).
  - h (Optional) Displays the command's usage statement.

|                                            |                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-n rolename</code>                   | Specifies the name of the role you want to modify.                                                                                                                                                                                                                                                                                                                                           |
| <code>-N new_rolename</code>               | (Optional) Specifies the new name of the role.                                                                                                                                                                                                                                                                                                                                               |
| <code>-p addprof1 -p addprof2 . . .</code> | (Optional) Specifies the profile(s) to add to the role. To assign a profile to a role, the administrator must have the <code>solaris.profmgr.assign</code> or <code>solaris.profmgr.delegate</code> authorization.                                                                                                                                                                           |
| <code>-P password</code>                   | (Optional) Specifies the role's password. The <i>password</i> can contain up to eight characters. To set the password, the administrator must have the <code>solaris.admin.usermgr.pswd</code> authorization. <i>Note:</i> When you specify a password, you type the password in plain text. Specifying a password using this method introduces a security gap while the command is running. |
| <code>-q delprof1 -q delprof2 . . .</code> | (Optional) Specifies the profile(s) to delete from the role.                                                                                                                                                                                                                                                                                                                                 |
| <code>-r deluser1 -r deluser2 . . .</code> | (Optional) Specifies the user name(s) to delete from the role.                                                                                                                                                                                                                                                                                                                               |
| <code>-s shell</code>                      | (Optional) Specifies the full pathname of the program used as the role's shell on login. Valid entries are <code>/bin/pfcsh</code> (C shell), <code>/bin/pfksh</code> (Korn shell), and <code>/bin/pfsh</code> (Bourne shell), the default.                                                                                                                                                  |
| <code>-x autohome=Y N</code>               | (Optional) Sets the role's home directory. The home directory path in the password entry is set to <code>/home/login_name</code> .                                                                                                                                                                                                                                                           |
| <code>-x perm=home_perm</code>             | (Optional) Sets the permissions on the role's home directory. <i>perm</i> is interpreted as an octal number, and the default is 0775.                                                                                                                                                                                                                                                        |

## EXAMPLES **EXAMPLE 1** Creating a role account

The following creates the `role1` account with a full name of Engineering Admin and a password of `abc123` on the local file system, and assigns `user1` and `user2` to the role. This role has Name Service Security and Audit Review rights. The system assigns the next available unique UID greater than 100.

```
./smrole add -H myhost -p mypasswd -u root -- -n role1 \
-F "Engineering Admin" -P abc123 -a user1 -a user2 \
-p "Name Service Security" -p "Audit Review"
```

## smrole(1M)

### EXAMPLE 2 Deleting role accounts

The following deletes the `role1` and `role2` accounts from the local file system.

```
./smrole delete -H myhost -p mypasswd -u root -- -n role1 -n role2
```

### EXAMPLE 3 Listing role accounts

The following lists all role accounts on the local file system in summary form.

```
./smrole list -H myhost -p mypasswd -u root --
```

### EXAMPLE 4 Modifying a role account

The following modifies the `role1` account so the role defaults to the Korn shell, includes the `user3` account, and does not include the `user2` account.

```
./smrole modify -H myhost -p mypasswd -u root -- -n role1 \
-s /bin/pfksh -a user3 -r user2
```

## ENVIRONMENT VARIABLES

See `environ(5)` for a description of the `JAVA_HOME` environment variable, which affects the execution of the `smrole` command. If this environment variable is not specified, the `/usr/java` location is used. See `smc(1M)`.

## EXIT STATUS

The following exit values are returned:

- |   |                                                                           |
|---|---------------------------------------------------------------------------|
| 0 | Successful completion.                                                    |
| 1 | Invalid command syntax. A usage message displays.                         |
| 2 | An error occurred while executing the command. An error message displays. |

## FILES

The following files are used by the `smrole` command:

|                                        |                                                                           |

| SYNOPSIS       | <b>smrsh</b> -c <i>command</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |                  |
| DESCRIPTION    | <p>The <b>smrsh</b> program is intended as a replacement for the <b>sh</b> command in the program mailer in <b>sendmail(1M)</b> configuration files. The <b>smrsh</b> program sharply limits commands that can be run using the program syntax of <b>sendmail</b>. This improves overall system security. <b>smrsh</b> limits the set of programs that a programmer can execute, even if <b>sendmail</b> runs a program without going through an alias or forward file.</p> <p>Briefly, <b>smrsh</b> limits programs to be in the directory <code>/var/adm/sm.bin</code>, allowing system administrators to choose the set of acceptable commands. It also rejects any commands with the characters: <code>, , &lt; , &gt; ,   , ; , &amp; , \$ , \r</code> (RETURN), or <code>\n</code> (NEWLINE) on the command line to prevent end run attacks.</p> <p>Initial pathnames on programs are stripped, so forwarding to <code>/usr/ucb/vacation</code>, <code>/usr/bin/vacation</code>, <code>/home/server/mydir/bin/vacation</code>, and <code>vacation</code> all actually forward to <code>/var/adm/sm.bin/vacation</code>.</p> <p>System administrators should be conservative about populating <code>/var/adm/sm.bin</code>. Reasonable additions are utilities such as <b>vacation(1)</b> and <b>procmail</b>. Never include any shell or shell-like program (for example, <b>perl</b>) in the <code>sm.bin</code> directory. This does not restrict the use of <b>shell</b> or <b>perl</b> scripts in the <code>sm.bin</code> directory (using the <code>#!</code> syntax); it simply disallows the execution of arbitrary programs.</p> |                |                 |              |                  |
| OPTIONS        | <p>The following options are supported:</p> <p>-c <i>command</i>      Where <i>command</i> is a valid command, executes <i>command</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |                  |

| SYNOPSIS                 | <b>/usr/sadm/bin/smserialport</b> <i>subcommand</i> [ <i>auth_args</i> ] -- [ <i>subcommand_args</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| DESCRIPTION              | The smserialport command manages serial ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| Sub-commands             | <p>The following smserialport sub-commands (<i>subcommand</i>) are supported:</p> <table> <tr> <td>configure</td><td>Configures a serial port's basic settings for a device such as a terminal, modem or no connection.</td></tr> <tr> <td>delete</td><td>Deletes a given port. You can disable a port and prevent new services from being spawned for incoming connections, without interfering with existing services.</td></tr> <tr> <td>list</td><td>Lists all serial ports.</td></tr> <tr> <td>modify</td><td>Modifies a serial port's parameters.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | configure | Configures a serial port's basic settings for a device such as a terminal, modem or no connection. | delete | Deletes a given port. You can disable a port and prevent new services from being spawned for incoming connections, without interfering with existing services. | list | Lists all serial ports. | modify | Modifies a serial port's parameters. |
| configure                | Configures a serial port's basic settings for a device such as a terminal, modem or no connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| delete                   | Deletes a given port. You can disable a port and prevent new services from being spawned for incoming connections, without interfering with existing services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| list                     | Lists all serial ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| modify                   | Modifies a serial port's parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| OPTIONS                  | There are two kinds of options: authentication arguments ( <i>args</i> ) and sub-command arguments ( <i>subcommand_args</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |
| Authentication Arguments | <p>The smserialport authentication arguments, <i>args</i>, are derived from the smc(1M) argument set and are the same regardless of which sub-command you use.</p> <p>Valid <i>args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes.</p> <p>The single letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or --domain.</p> <p>Descriptions and other arg options that contain white spaces must be enclosed in double quotes.</p> <p>The following authentication arguments (<i>args</i>) are supported:</p> <p>-D   --domain <i>domain</i><br/> Specifies the default domain that you want to manage. smserialport accepts only the <i>file</i> value for this option. <i>file</i> is also the default value.</p> <p>The <i>file</i> default domain means that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the <i>domain</i> for all other tools.</p> <p>-H   --hostname <i>host_name:port</i><br/> Specifies the host and port to which you want to connect. If you do not specify a port, the system connects to the default port, 898. If you do not specify a host (<i>host_name:port</i>, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the smc -B option, or set your console preferences to load a home toolbox by default.</p> |           |                                                                                                    |        |                                                                                                                                                                |      |                         |        |                                      |

## smserialport(1M)

### Sub-command Arguments

- l | --rolepassword *role\_password*  
Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.
  - p | --password *password*  
Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Because passwords specified on the command line can be seen by any user on the system, this option is considered insecure.
  - r | --rolename *role\_name*  
Specifies a role name for authentication. If you do not specify this option, no role is assumed.
  - u | --username *user\_name*  
Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.
  - This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the -- option.
- The sub-command specific options, *subcommand\_args*, must come after the *args* and must be separated from them by the -- option. Enclose descriptions and *arg* options that contain white space in double quotes.
- configure      The configure sub-command requires the following sub-command argument:
- n *port\_name*      Specifies the name of the serial port to reconfigure.
- The following sub-command arguments are optional for the configure sub-command:
- b *baudrate*  
Specifies the port baud rate. The supported baud rate are 38400, 19200, 9600, 4800, 2400, 1200, 300 and auto. The default is 9600.
  - c *comment*  
Specifies a short comment description of the service. The default is a description of the requested device type.
  - h  
Displays the command's usage statement.
  - l *login\_prompt*  
Specifies the login prompt. The default is *tty`port\_name`login:.*

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <p><i>-t terminal_type</i><br/>Specifies the terminal type. The default is <code>tvi925</code>.</p> <p><i>-x device_name</i><br/>Specifies the device to be configured. Valid <code>device_names</code> are: <code>terminal</code>, <code>modemdialin</code>, <code>modemdialout</code>, <code>modemdialinout</code> or <code>initializeonly</code> for no connection. The default is <code>terminal</code>.</p> <p><i>-x service=y   n</i><br/>Specifies the status of service, that is <code>y</code> for enabled or <code>n</code> for disabled. The default is <code>y</code>.</p> |

## smserialport(1M)

- h  
Displays the command usage statement.
- l *login\_prompt*  
Specifies the login prompt.
- t *terminal\_type*  
Specifies the terminal type.
- x *bidirectional=y | n*  
Specifies the bi-directional port flag, *y* for set or *n* for not set.  
When this flag is set, the line can be used in both directions.
- x *connect\_on\_carrier=y | n*  
Specifies if to connect on carrier, that is *y* or *n*.
- x *initialize\_only=y | n*  
Specifies if the service invocation. If *y* the service is invoked only once. This can be used to configure a particular device without actually monitoring it, as with software carrier.
- x *service\_program=command*  
Specifies the full pathname of the service command to invoke when a connection request is received.
- x *service\_status=y | n*  
Specifies the status of service, that is *y* for enabled or *n* for disabled.
- x *software\_carrier=y | n*  
Specifies the carrier detection. *y* for software or *n* for hardware.
- x *timeout=timeout*  
Specifies the time to close a port if the open on the port succeeds, and no input data is received in *timeout* seconds. The supported *timeout* are never, 30, 60 and 90.

### EXAMPLES

#### EXAMPLE 1 Listing Serial Ports

The following example lists the serial ports:

```
example% ./smserialport list -H myhost -u root -p mypassword --
```

| Port | Service | Baud-Rate | Terminal-Type | Prompt      | Comment |
|------|---------|-----------|---------------|-------------|---------|
| a    | enabled | 9600      | xterm         | as          | welcome |
| b    | enabled | 9600      | tvi925        | ttyb login: |         |

#### EXAMPLE 2 Modifying Serial Ports

The following example contains two commands. The first command modifies serial port *b* for a baud rate of 4800, an *xterm* as terminal type, a *b:* for login prompt and a comment. The second command lists the ports.

```
example% ./smserialport modify -H myhost -u root -p mypassword -- \
-n b -b 4800 -t xterm -l b: -c "modified port b"
```

**EXAMPLE 2** Modifying Serial Ports (Continued)

```
example% ./smserialport list -H myhost -u root -p mypassword --
```

| Port | Service | Baud-Rate | Terminal-Type | Prompt | Comment         |
|------|---------|-----------|---------------|--------|-----------------|
| a    | enabled | 9600      | xterm         | as     | welcome         |
| b    | enabled | 4800      | xterm         | b:     | modified port b |

**EXAMPLE 3** Deleting a Serial Port

The following example contains two commands. The first command deletes serial port b. The second command lists the ports.

```
example% ./smserialport delete -H myhost -u root \
 -p mypassword -- -n b
```

```
example% ./smserialport list -H myhost -u root -p mypassword --
```

| Port | Service  | Baud-Rate | Terminal-Type | Prompt      | Comment |
|------|----------|-----------|---------------|-------------|---------|
| a    | enabled  | 9600      | xterm         | as          | welcome |
| b    | disabled | 9600      | tvi925        | ttyb login: |         |

**EXAMPLE 4** Configuring a Serial Port

The following example contains two commands. The first command configures serial port b for a bi-directional modem. The second command lists the ports.

```
example% ./smserialport configure -H myhost -u root \
 -p mypassword -- -n b -x device=modemdialinout
```

```
example% ./smserialport list -H myhost -u root -p mypassword --
```

| Port | Service | Baud-Rate | Terminal-Type | Prompt      | Comment                 |
|------|---------|-----------|---------------|-------------|-------------------------|
| a    | enabled | 9600      | xterm         | as          | welcome                 |
| b    | enabled | 9600      | tvi925        | ttyb login: | Modem - Dial In and Out |

|                       |                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENVIRONMENT VARIABLES | See environ(5) for descriptions of the following environment variables that affect the execution of smserialport: JAVA_HOME. If this environment variable is not specified, the /usr/java location is used. See smc(1M). |
| EXIT STATUS           | The following exit values are returned:<br><br>0 Successful completion.<br><br>1 Invalid command syntax. A usage message displays.<br><br>2 An error occurred while executing the command. An error message displays.    |
| ATTRIBUTES            | See attributes(5) for descriptions of the following attributes:                                                                                                                                                          |

| NAME        | smuser – manage user entries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| SYNOPSIS    | <b>/usr/sadm/bin/smuser</b> <i>subcommand</i> [ <i>auth_args</i> ] - - [ <i>subcommand_args</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| DESCRIPTION | The smuser command manages one or more user entries in the local /etc filesystem or a NIS or NIS+ target name service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| subcommands | <p>smuser <i>subcommands</i> are:</p> <table> <tr> <td>add</td><td>Adds a new user entry to the appropriate files. You can use a template and input file instead of supplying the additional command line options. If you use a template and command line options, the command line options take precedence and override any conflicting template values. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> <tr> <td>delete</td><td>Deletes one or more user entries from the appropriate files. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete the system accounts with IDs less than 100, or 60001, 60002, or 65534.</td></tr> <tr> <td>list</td><td>Lists one more user entries from the appropriate files. To list entries, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.</td></tr> <tr> <td>modify</td><td>Modifies a user entry in the appropriate files. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.</td></tr> </table> | add | Adds a new user entry to the appropriate files. You can use a template and input file instead of supplying the additional command line options. If you use a template and command line options, the command line options take precedence and override any conflicting template values. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. | delete | Deletes one or more user entries from the appropriate files. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete the system accounts with IDs less than 100, or 60001, 60002, or 65534. | list | Lists one more user entries from the appropriate files. To list entries, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization. | modify | Modifies a user entry in the appropriate files. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. |
| add         | Adds a new user entry to the appropriate files. You can use a template and input file instead of supplying the additional command line options. If you use a template and command line options, the command line options take precedence and override any conflicting template values. To add an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| delete      | Deletes one or more user entries from the appropriate files. To delete an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization. <i>Note:</i> You cannot delete the system accounts with IDs less than 100, or 60001, 60002, or 65534.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| list        | Lists one more user entries from the appropriate files. To list entries, the administrator must have the <code>solaris.admin.usermgr.read</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| modify      | Modifies a user entry in the appropriate files. To modify an entry, the administrator must have the <code>solaris.admin.usermgr.write</code> authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| OPTIONS     | <p>The smuser authentication arguments, <i>auth_args</i>, are derived from the smc(1M) arg set and are the same regardless of which subcommand you use. The smuser command requires the Solaris Management Console to be initialized for the command to succeed (see smc(1M)). After rebooting the Solaris Management Console server, the first Solaris Management Console connection might time out, so you might need to retry the command.</p> <p>The subcommand-specific options, <i>subcommand_args</i>, must come after the <i>auth_args</i> and must be separated from them by the - - option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |
| auth_args   | <p>The valid <i>auth_args</i> are -D, -H, -l, -p, -r, and -u; they are all optional. If no <i>auth_args</i> are specified, certain defaults will be assumed and the user may be prompted for additional information, such as a password for authentication purposes. These letter options can also be specified by their equivalent option words preceded by a double dash. For example, you can use either -D or - -domain with the <i>domain</i> argument.</p> <p>-D   - -domain <i>domain</i></p> <p>Specifies the default domain that you want to manage. The syntax of <i>domain</i> is <i>type:/host_name/domain_name</i>, where <i>type</i> is nis, nisplus, dns, ldap, or file; <i>host_name</i> is the name of the machine that serves the domain; and <i>domain_name</i> is the name of the domain you want to manage. (<i>Note:</i> Do <i>not</i> use nis+ for nisplus.)</p>                                                                                                                                                                                                                                                                                                              |     |                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                                                                                                                                                                |      |                                                                                                                                                                 |        |                                                                                                                                                             |

## smuser(1M)

If you do not specify this option, the Solaris Management Console assumes the file default domain on whatever server you choose to manage, meaning that changes are local to the server. Toolboxes can change the domain on a tool-by-tool basis; this option specifies the domain for all other tools.

-H | - -hostname *host\_name:port*

Specifies the *host\_name* and *port* to which you want to connect. If you do not specify a *port*, the system connects to the default port, 898. If you do not specify *host\_name:port*, the Solaris Management Console connects to the local host on port 898. You may still have to choose a toolbox to load into the console. To override this behavior, use the smc(1M) -B option, or set your console preferences to load a "home toolbox" by default.

-l | - -rolepassword *role\_password*

Specifies the password for the *role\_name*. If you specify a *role\_name* but do not specify a *role\_password*, the system prompts you to supply a *role\_password*. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

-p | - -password *password*

Specifies the password for the *user\_name*. If you do not specify a password, the system prompts you for one. Passwords specified on the command line can be seen by any user on the system, hence this option is considered insecure.

-r | - -rolename *role\_name*

Specifies a role name for authentication. If you do not specify this option, no role is assumed.

-u | - -username *user\_name*

Specifies the user name for authentication. If you do not specify this option, the user identity running the console process is assumed.

- -

This option is required and must always follow the preceding options. If you do not enter the preceding options, you must still enter the - - option.

### subcommand\_args

*Note:* Descriptions and other arg options that contain white spaces must be enclosed in double quotes.

#### ■ For subcommand add:

-c *comment*

(Optional) Includes a short description of the login, which is typically the user's name. Consists of a string of up to 256 printable characters, excluding the colon (:).

-d *dir*

(Optional) Specifies the home directory of the new user, limited to 1024 characters.

-e *ddmmyyyy*

(Optional) Specifies the expiration date for a login. After this date, no user can access this login. This option is useful for creating temporary logins. Specify a null value (" ") to indicate that the login is always

|                                        |                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                        | valid. The administrator must have the <code>solaris.admin.usermgr.pswd</code> authorization.                                                                                                                                                                                                                                                                                   |
| <code>-f inactive</code>               | (Optional) Specifies the maximum number of days allowed between uses of a login ID before that ID is declared invalid. Normal values are positive integers. Enter zero to indicate that the login account is always active.                                                                                                                                                     |
| <code>-F full_name</code>              | (Optional) Specifies the full, descriptive name of the user. The <i>full_name</i> must be unique within a domain and can contain alphanumeric characters and spaces. If you use spaces, you must enclose the <i>full_name</i> in double quotes.                                                                                                                                 |
| <code>-g group</code>                  | (Optional) Specifies the new user's primary group membership in the system group database with an existing group's integer ID.                                                                                                                                                                                                                                                  |
| <code>-G group1 -G group2 . . .</code> | (Optional) Specifies the new user's supplementary group membership in the system group database with the character string names of one or more existing groups. Duplicates of groups specified with the <code>-g</code> and <code>-G</code> options are ignored.                                                                                                                |
| <code>-h</code>                        | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                                                                                                              |
| <code>-n login</code>                  | Specifies the new user's login name. The login name must be unique within a domain, contain 2–32 alphanumeric characters, begin with a letter, and contain at least one lowercase letter.                                                                                                                                                                                       |
| <code>-P password</code>               | (Optional) Specifies up to an eight-character password assigned to the user account. <i>Note:</i> When you specify a password, you type the password in plain text. Specifying a password using this method introduces a security gap while the command is running. To set the password, the administrator must have the <code>solaris.admin.usermgr.pswd</code> authorization. |
| <code>-s shell</code>                  | (Optional) Specifies the full pathname (limited to 1024 characters) of the program used as the user's shell on login. Valid entries are a user-defined shell, <code>/bin/csh</code> (C shell), <code>bin/ksh</code> (Korn shell), and the default, <code>/bin/sh</code> (Bourne shell).                                                                                         |
| <code>-t template</code>               | (Optional) Specifies a template, created using the User Manager tool, that contains a set of pre-defined user attributes. You may have entered a name service server in the template. However, when a user is actually added with this template, if a name service is                                                                                                           |

## smuser(1M)

|                                        |                                                                                                                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                        | unavailable, the user's local server will be used for both the Home Directory Server and Mail Server.                                                                                                                                     |
| -u <i>uid</i>                          | (Optional) Specifies the user ID of the user you want to add. If you do not specify this option, the system assigns the next available unique user ID greater than 100.                                                                   |
| -x <i>autohome</i> =Y N                | (Optional) Sets the home directory to automount if set to Y. The user's home directory path in the password entry is set to <i>/home/login name</i> .                                                                                     |
| -x <i>mail</i> = <i>mail_server</i>    | (Optional) Specifies the host name of the user's mail server, and creates a mail file on the server. Users created in a local scope must have a mail server created on their local machines.                                              |
| -x <i>perm</i> = <i>home_perm</i>      | (Optional) Sets the permissions on the user's home directory. <i>perm</i> is interpreted as an octal number, and the default is 0775.                                                                                                     |
| -x <i>pwmax</i> = <i>days</i>          | (Optional) Specifies the maximum number of days that the user's password is valid. The administrator must have the <code>solaris.admin.usermgr.pswd</code> authorization.                                                                 |
| -x <i>pwmin</i> = <i>days</i>          | (Optional) Specifies the minimum number of days between user password changes. The administrator must have the <code>solaris.admin.usermgr.pswd</code> authorization.                                                                     |
| -x <i>pwwarn</i> = <i>days</i>         | (Optional) Specifies the number of days relative to <i>pwmax</i> that the user is warned about password expiration prior to the password expiring. The administrator must have the <code>solaris.admin.usermgr.pswd</code> authorization. |
| -x <i>serv</i> = <i>homedir_server</i> | (Optional) Specifies the name of the server where the user's home directory resides. Users created in a local scope must have their home directory server created on their local machines.                                                |
| ■ For subcommand <code>delete</code> : |                                                                                                                                                                                                                                           |
| -h                                     | (Optional) Displays the command's usage statement.                                                                                                                                                                                        |
| -n <i>login1</i>                       | Specifies the login name of the user you want to delete.                                                                                                                                                                                  |
| -n <i>login2</i> . . .                 | (Optional) Specifies the additional login name(s) of the user(s) you want to delete.                                                                                                                                                      |
| ■ For subcommand <code>list</code> :   |                                                                                                                                                                                                                                           |
| -h                                     | (Optional) Displays the command's usage statement.                                                                                                                                                                                        |

- l Displays the output for each user in a block of *key:value* pairs (for example, user name:root) followed by a blank line to delimit each user block. Each *key:value* pair is displayed on a separate line. The keys are: autohome setup, comment, days to warn, full name,home directory, home directory permissions, login shell, mail server, max days change, max days inactive, min days change, password expires, password type, primary group, rights, roles, secondary groups, server, user ID (UID), and user name.
- n *login1* Specifies the login name of the user you want to list.
- n *login2* ... (Optional) Specifies the additional login name(s) of the user(s) you want to list.
- For subcommand modify:
  - a *addrole1* -a *addrole2* ... (Optional) Specifies the role(s) to add to the user account. To assign a role to a user, the administrator must have the `solaris.role.assign` authorization or must have the `solaris.role.delegate` authorization and be a member of each of the roles specified.
  - c *comment* (Optional) Describes the changes you made to the user account. Consists of a string of up to 256 printable characters, excluding the colon (:).
  - d *description* (Optional) Specifies the user's home directory, limited to 1024 characters.
  - e *ddmmyyyy* (Optional) Specifies the expiration date for a login in a format appropriate to the locale. After this date, no user can access this login. This option is useful for creating temporary logins. Specify a null value (" ") to indicate that the login is always valid.
  - f *inactive* (Optional) Specifies the maximum number of days allowed between uses of a login ID before the ID is declared invalid. Normal values are positive integers. Specify zero to indicate that the login account is always active.
  - F *full\_name* (Optional) Specifies the full, descriptive name of the user. The *full\_name* must be unique within a domain and can contain alphanumeric characters and spaces. If you use spaces, you must enclose the *full\_name* in double quotes.
  - g *group* (Optional) Specifies the new user's primary group membership in the system group database with an existing group's integer ID.

## smuser(1M)

|                                            |                                                                                                                                                                                                                                                                                           |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-G group1 -G group2 . . .</code>     | (Optional) Specifies the new user's supplementary group membership in the system group database with the character string names of one or more existing groups. Duplicates of groups specified with the <code>-g</code> and <code>-G</code> options are ignored.                          |
| <code>-h</code>                            | (Optional) Displays the command's usage statement.                                                                                                                                                                                                                                        |
| <code>-n name</code>                       | Specifies the user's current login name.                                                                                                                                                                                                                                                  |
| <code>-N new_name</code>                   | (Optional) Specifies the user's new login name. The login name must be unique within a domain, contain 2–32 alphanumeric characters, begin with a letter, and contain at least one lowercase letter.                                                                                      |
| <code>-p addprof1 -p addprof2 . . .</code> | (Optional) Specifies the profile(s) to add to the user account. To assign a profile to a user, the administrator must have the <code>solaris.profmgr.assign</code> or <code>solaris.profmgr.delegate</code> authorization.                                                                |
| <code>-P password</code>                   | (Optional) Specifies up to an eight-character password assigned to the user account.<br><br>When you specify a password, you type the password in plain text. Specifying a password using this method introduces a security gap while the command is running.                             |
| <code>-q delprof1 -q delprof2 . . .</code> | (Optional) Specifies the profile(s) to delete from the user account.                                                                                                                                                                                                                      |
| <code>-r delrole1 -r delrole2 . . .</code> | (Optional) Specifies the role(s) to delete from the user account.                                                                                                                                                                                                                         |
| <code>-s shell</code>                      | (Optional) Specifies the full pathname (limited to 1024 characters) of the program used as the user's shell on login. Valid entries are a user-defined shell, <code>/bin/csh</code> (C shell), <code>bin/ksh</code> (Korn shell), and the default, <code>/bin/sh</code> (Bourne shell).l) |
| <code>-x autohome=Y N</code>               | (Optional) Sets up the home directory to automount if set to <code>Y</code> . The user's home directory path in the password entry is set to <code>/home/login name</code> .                                                                                                              |
| <code>-x pwmax=days</code>                 | (Optional) Specifies the maximum number of days that the user's password is valid.                                                                                                                                                                                                        |
| <code>-x pwmin=days</code>                 | (Optional) Specifies the minimum number of days between password changes.                                                                                                                                                                                                                 |
| <code>-x pwwarn=days</code>                | (Optional) Specifies the number of days relative to <code>pwmax</code> that the user is warned about password                                                                                                                                                                             |

expiration before the password expires.

**EXAMPLES****EXAMPLE 1** Creating a new user account

The following creates a new user account on the local file system. The account name is `user1`, and the full name is Joe Smith. The comment field verifies that the account is for Joe Smith. The system will assign the next available user ID greater than 100 to this account. There is no password set for this account, so when Joe Smith logs in for the first time, he will be prompted to enter a password.

```
./smuser add -H myhost -p mypasswd -u root -- -F "Joe Smith" \
-n user1 -c "Joe's account"
```

**EXAMPLE 2** Deleting a user account

The following deletes the `user1` account from the local file system:

```
./smuser delete -H myhost -p mypasswd -u root -- -n user1
```

**EXAMPLE 3** Listing all user accounts

The following lists all user accounts on the local file system in summary form:

```
./smuser list -H myhost -p mypasswd -u root --
```

**EXAMPLE 4** Modifying a user account

The following modifies the `user1` account to default to a Korn shell, and assigns the account to the `qa_group` secondary group.

```
./smuser modify -H myhost -p mypasswd -u root -- -n user1 \
-s /bin/ksh -G qa_group
```

**ENVIRONMENT  
VARIABLES**

See `environ(5)` for a description of the `JAVA_HOME` environment variable, which affects the execution of the `smuser` command. If this environment variable is not specified, the `/usr/java` location is used. See `smc(1M)`.

**EXIT STATUS**

The following exit values are returned:

- 0 Successful completion.
- 1 Invalid command syntax. A usage message displays.
- 2 An error occurred while executing the command. An error message displays.

**FILES**

The following files are used by the `smuser` command:

`/etc/aliases` Mail aliases. See `aliases(4)`.

smuser(1M)

|                           |                                                             |
|---------------------------|-------------------------------------------------------------|
| /etc/auto_home            | Automatic mount points. See automount(1M).                  |

| <b>DESCRIPTION</b>               | <p>The Master Agent, <code>snmpdx</code>, is the main component of Solstice Enterprise Agent technology. It runs as a daemon process and listens to User Datagram Protocol (UDP) port 161 for SNMP requests. The Master Agent also opens another port to receive SNMP trap notifications from various subagents. These traps are forwarded to various managers, as determined by the configuration file.</p> <p>Upon invocation, <code>snmpdx</code> reads its various configuration files and takes appropriate actions by activating subagents, determining the subtree Object Identifier (OID) for various subagents, populating its own Management Information Bases (MIBs), and so forth. The Master Agent invokes subagents, registers subagents, sends requests to subagents, receives responses from subagents, and traps notifications from subagents.</p> <p>The Master Agent is invoked from a start-up script at boot time only if contents of the resource configuration file <code>/var/snmp/conf/snmpdx.rsrc</code> are non-trivial.</p>                                                                                                                                                                                                                                                                                                                                                                      |                          |                                                                                                                                                        |                            |                                                                                                                                                |                             |                                                                                                                                                  |                 |                                     |                          |                                                                                                                                                                                                                                                                                     |                                  |                                                          |                    |                                                                                                                                                  |

|                    | <p>SPLIT      Each variable in the incoming request results in one send-request to each subagent.</p> <p>The default is GROUP.</p>                                                                                                                                                                                                                                              |
|                    | <p><b>-o <i>filename</i></b>      Specify the full path of the file containing the tuple (enterprise-name, OID). For example, (Sun Microsystems, 1.3.1.6.1.4.32). The Master Agent uses this file as a base for look-up in the trap-filtering and forwarding process. The default file is <code>/etc/snmp/conf/enterprises.oid</code>.</p>                                      |
|                    | <p><b>-p <i>port</i></b>      Specify the port number. The default port number is 161.</p>                                                                                                                                                                                                                                                                                      |
|                    | <p><b>-r <i>filename</i></b>      Specify the full path of the resource file to be used by the Master Agent. This file stores information about the subagents that the Master Agent invokes and manages. The default resource file is <code>/etc/snmp/conf/snmpdx.rsrc</code>.</p>                                                                                              |
|                    | <p><b>-y</b>      Set a recovery indicator to invoke the recovery module. The recovery process discovers which subagents in the previous session are still active; those subagents not active are re-spawned by the Master Agent.</p>                                                                                                                                           |

| <b>NAME</b>                         | snmpXdmid – Sun Solstice Enterprise SNMP-DMI mapper subagent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                |                                                                          |                                   |                                                                                      |                                |                                                              |                                     |                                                           |  |                                          |  |                                                                     |
| <b>SYNOPSIS</b>                     | <code>/usr/lib/dmi/snmpXdmid -s hostname [-h] [-c config-dir] [-d debug-level]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                |                                                                          |                                   |                                                                                      |                                |                                                              |                                     |                                                           |  |                                          |  |                                                                     |
| <b>DESCRIPTION</b>                  | <p>The <code>snmpXdmid</code> utility is a subagent in the Solstice Enterprise Agent Desktop Management Interface package. It maps the SNMP requests forwarded by the Master Agent (<code>snmpdx(1M)</code>) into one or more equivalent DMI requests. Further, it remaps the DMI response into SNMP response back to <code>snmpdx</code>. By default, <code>snmpXdmid</code> also forwards the DMI indications as SNMP traps to <code>snmpdx</code>. The feature is configurable and can be disabled by setting <code>TRAP_FORWARD_TO_MAGENT=0</code> in the <code>snmpXdmid</code> configuration file, <code>snmpXdmid.conf</code>.</p> <p>This subagent runs as a daemon in the system. The subagent uses a set of <code>.MAP</code> files located in <code>/var/dmi/map</code> to map the SNMP Object Identifier (OID) into a corresponding DMI component. The map files are generated using the MIF-to-MIB utility, <code>miftomib</code>. They are read by <code>snmpXdmid</code> when a corresponding MIF file gets registered with the DMI Service Provider (<code>dmispd(1M)</code>).</p> <p>The <code>snmpXdmid.conf</code> file is used for configuration information. Each entry in the file consists of a keyword followed by an equal sign (=), followed by a parameter string. The keyword must begin in the first position. A line beginning with a pound sign (#) is treated as a comment and the subsequent characters on that line are ignored. The keywords currently supported are:</p> <table> <tr> <td><code>WARNING_TIMESTAMP</code></td><td>Indication subscription expiration, warning time.</td></tr> <tr> <td><code>EXPIRATION_TIMESTAMP</code></td><td>Indication subscription expiration timestamp.</td></tr> <tr> <td><code>FAILURE_THRESHOLD</code></td><td>DMISP retries before dropping indication due to comm errors.</td></tr> <tr> <td><code>TRAP_FORWARD_TO_MAGENT</code></td><td></td></tr> <tr> <td></td><td>0 Drop indication at the subagent level.</td></tr> <tr> <td></td><td>non-zero Forward indications as SNMP traps to <code>snmpdx</code>.</td></tr> </table> <p>By default, the configuration file <code>snmpXdmid.conf</code> is located in the <code>/etc/dmi/conf</code> directory. You can specify an alternative directory with the <code>-c</code> option.</p> | <code>WARNING_TIMESTAMP</code> | Indication subscription expiration, warning time.                        | <code>EXPIRATION_TIMESTAMP</code> | Indication subscription expiration timestamp.                                        | <code>FAILURE_THRESHOLD</code> | DMISP retries before dropping indication due to comm errors. | <code>TRAP_FORWARD_TO_MAGENT</code> |                                                           |  | 0 Drop indication at the subagent level. |  | non-zero Forward indications as SNMP traps to <code>snmpdx</code> . |

| NAME        | snmpXwbemd – SNMP Adapter Subagent for WBEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SYNOPSIS    | <code>/usr/sadm/lib/wbem/snmpXwbemd [-d] [-h] [-p <i>port</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DESCRIPTION | <p>The <code>snmpXwbemd</code> daemon is a subagent in the Web-Based Enterprise Management (WBEM) services package.</p> <p>This daemon maps the Simple Network Management Protocol (SNMP) requests forwarded by the Solstice Enterprise Agents (SEA) Master Agent <code>snmpdx(1M)</code> into one or more equivalent WBEM Common Information Model (CIM) properties and instances. Further, it remaps the response from the CIM Object Manager into a SNMP response, which it passes back to <code>snmpdx(1M)</code>.</p> <p>A mapping file contains the corresponding Object Identifier (OID), class name, property name, and Abstract Syntax Notation 1 (ASN.1) type for each object. You can also create your own mapping file.</p>                                                                                                                                                                                                                                                                                                                                        |
| OPTIONS     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li><code>-d</code> Displays all debug information.</li><li><code>-h</code> Displays help by printing the correct command line usage.</li><li><code>-p</code> Specifies the port number to use.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPERANDS    | <p>The following operand is supported:</p> <ul style="list-style-type: none"><li><i>port</i> Specifies the port number you want to use.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXAMPLES    | <p><b>EXAMPLE 1</b> An Example of a <code>050SUNWwbcou.map</code> File</p> <p>This mapping file that Sun Microsystems provides contains definitions of objects, in this format:</p> <pre># #pragma ident      "@(#) 050SUNWwbcou.map    1.0    01/04/03 SMI" # # Copyright (c) 2001 by Sun Microsystems, Inc. # All rights reserved. # # *** Description of contents *** # # First non-commented non-blank line contains required Version label. # Remaining non-commented non-blank lines are considered map entries # used as described below: # # Column 1 - SNMP OID - Uniquely describes an SNMP variable # Column 2 - CIM Class Name - CIM class associated with this variable # Column 3 - CIM Property Name - CIM property that maps to SNMP OID variable # Column 4 - ASN.1 type - SNMP datatype that dictates how data is mapped #              to/from SNMP requests. Supported types are: SnmpString, SnmpOid, #              SnmpTimeticks, SnmpCounter, SnmpInt, SnmpGauge, SnmpIpAddress, #              SnmpOpaque) # Column 5 and greater are ignored #</pre> |

**EXAMPLE 1** An Example of a 050SUNWwbcou.map File (Continued)

```
Version 1.0
```

```
1.3.6.1.2.1.1.1.0 Solaris_ComputerSystem Description SnmpString
1.3.6.1.2.1.1.3.0 Solaris_OperatingSystem LastBootUpTime SnmpTimeticks
1.3.6.1.2.1.1.4.0 Solaris_ComputerSystem PrimaryOwnerContact SnmpString
1.3.6.1.2.1.1.5.0 Solaris_ComputerSystem Name SnmpString
```

```
1.3.6.1.2.1.25.1.5.0 Solaris_OperatingSystem NumberOfUsers SnmpGauge
1.3.6.1.2.1.25.1.6.0 Solaris_OperatingSystem NumberOfProcesses SnmpGauge
1.3.6.1.2.1.25.1.7.0 Solaris_OperatingSystem MaxNumberOfProcesses SnmpGauge
1.3.6.1.2.1.25.1.2.0 Solaris_OperatingSystem LocalDateTime SnmpString
```

Each definition of an object in this file contains an OID, its corresponding CIM class name, its corresponding CIM property name, and its corresponding ASN.1 type. Each of these elements is separated by a space character.

**FILES** /var/sadm/wbem/snmp/map/050SUNWwbcou.map  
The SNMP Adapter Subagent for WBEM MIB-2 mapping file that Sun Microsystems provides contains SNMP Management Information Base (MIB) definitions for the CIM instrumentation that SNMP manages.

**EXIT STATUS** The following exit values are returned:

```
0 Successful completion.
1 An error occurred.
```

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes.

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWwbcou       |
| CSI                 | Enabled         |
| Interface Stability | Evolving        |
| MT-Level            | Safe            |

| NAME        | snoop – capture and inspect network packets                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SYNOPSIS    | <b>snoop</b> [-aqrCDNPSvV] [-t [r   a   d]] [-c <i>maxcount</i> ] [-d <i>device</i> ]<br>[-i <i>filename</i> ] [-n <i>filename</i> ] [-o <i>filename</i> ] [-p <i>first</i> [, <i>last</i> ]] [-s <i>snaplen</i> ]<br>[-x <i>offset</i> [, <i>length</i> ]] [ <i>expression</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DESCRIPTION | <p>snoop captures packets from the network and displays their contents. snoop uses both the network packet filter and streams buffer modules to provide efficient capture of packets from the network. Captured packets can be displayed as they are received, or saved to a file (which is <i>RFC 1761</i>-compliant) for later inspection.</p> <p>snoop can display packets in a single-line summary form or in verbose multi-line forms. In summary form, only the data pertaining to the highest level protocol is displayed. For example, an NFS packet will have only NFS information displayed. The underlying RPC, UDP, IP, and ethernet frame information is suppressed but can be displayed if either of the verbose options are chosen.</p> <p>snoop requires an interactive interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTIONS     | <p>-C List the code generated from the filter expression for either the kernel packet filter, or snoop's own filter.</p> <p>-D Display number of packets dropped during capture on the summary line.</p> <p>-N Create an IP address-to-name file from a capture file. This must be set together with the -i option that names a capture file. The address-to-name file has the same name as the capture file with .names appended. This file records the IP address to hostname mapping at the capture site and increases the portability of the capture file. Generate a .names file if the capture file is to be analyzed elsewhere. Packets are not displayed when this flag is used.</p> <p>-P Capture packets in non-promiscuous mode. Only broadcast, multicast, or packets addressed to the host machine will be seen.</p> <p>-S Display size of the entire ethernet frame in bytes on the summary line.</p> <p>-V Verbose summary mode. This is halfway between summary mode and verbose mode in degree of verbosity. Instead of displaying just the summary line for the highest level protocol in a packet, it displays a summary line for each protocol layer in the packet. For instance, for an NFS packet it will display a line each for the ETHER, IP, UDP, RPC and NFS layers. Verbose summary mode output may be easily piped through grep to extract packets of interest. For example, to</p> |

## snoop(1M)

|                                          |                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                          | view only RPC summary lines, enter the following:<br>example# <b>snoop -i rpc.cap -V   grep RPC</b>                                                                                                                                                                                                                                                                    |
| <b>-a</b>                                | Listen to packets on /dev/audio (warning: can be noisy).                                                                                                                                                                                                                                                                                                               |
| <b>-c <i>maxcount</i></b>                | Quit after capturing <i>maxcount</i> packets. Otherwise keep capturing until there is no disk left or until interrupted with Control-C.                                                                                                                                                                                                                                |
| <b>-d <i>device</i></b>                  | Receive packets from the network using the interface specified by <i>device</i> , for example, <i>le0</i> or <i>hme0</i> . The program <i>netstat</i> (1M), when invoked with the <b>-i</b> flag, lists all the interfaces that a machine has. Normally, <i>snoop</i> will automatically choose the first non-loopback interface it finds.                             |
| <b>-i <i>filename</i></b>                | Display packets previously captured in <i>filename</i> . Without this option, <i>snoop</i> reads packets from the network interface. If a <i>filename.names</i> file is present, it is automatically loaded into the <i>snoop</i> IP address-to-name mapping table (See <b>-N</b> flag).                                                                               |
| <b>-n <i>filename</i></b>                | Use <i>filename</i> as an IP address-to-name mapping table. This file must have the same format as the <i>/etc/hosts</i> file (IP address followed by the hostname).                                                                                                                                                                                                   |
| <b>-o <i>filename</i></b>                | Save captured packets in <i>filename</i> as they are captured. (This <i>filename</i> is referred to as the "capture file".) The format of the capture file is RFC 1761-compliant. During packet capture, a count of the number of packets saved in the file is displayed. If you wish just to count packets without saving to a file, name the file <i>/dev/null</i> . |
| <b>-p <i>first</i> [ , <i>last</i> ]</b> | Select one or more packets to be displayed from a capture file. The <i>first</i> packet in the file is packet number 1.                                                                                                                                                                                                                                                |
| <b>-q</b>                                | When capturing network packets into a file, do not display the packet count. This can improve packet capturing performance.                                                                                                                                                                                                                                            |
| <b>-r</b>                                | Do not resolve the IP address to the symbolic name. This prevents <i>snoop</i> from generating network traffic while capturing and displaying packets. However, if the <b>-n</b> option is used, and an address is found in the mapping file, its corresponding name will be used.                                                                                     |
| <b>-s <i>snaplen</i></b>                 | Truncate each packet after <i>snaplen</i> bytes. Usually the whole packet is captured. This option is useful if only                                                                                                                                                                                                                                                   |

## snoop(1M)

|          |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                                      | <p>certain packet header information is required. The packet truncation is done within the kernel giving better utilization of the streams packet buffer. This means less chance of dropped packets due to buffer overflow during periods of high traffic. It also saves disk space when capturing large traces to a capture file. To capture only IP headers (no options) use a <i>snaplen</i> of 34. For UDP use 42, and for TCP use 54. You can capture RPC headers with a <i>snaplen</i> of 80 bytes. NFS headers can be captured in 120 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|          | -t [ r   a   d ]                     | <p>Time-stamp presentation. Time-stamps are accurate to within 4 microseconds. The default is for times to be presented in d (delta) format (the time since receiving the previous packet). Option a (absolute) gives wall-clock time. Option r (relative) gives time relative to the first packet displayed. This can be used with the -p option to display time relative to any selected packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|          | -v                                   | <p>Verbose mode. Print packet headers in lots of detail. This display consumes many lines per packet and should be used only on selected packets.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|          | -x <i>offset</i> [ , <i>length</i> ] | <p>Display packet data in hexadecimal and ASCII format. The <i>offset</i> and <i>length</i> values select a portion of the packet to be displayed. To display the whole packet, use an <i>offset</i> of 0. If a <i>length</i> value is not provided, the rest of the packet is displayed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OPERANDS | <i>expression</i>                    | <p>Select packets either from the network or from a capture file. Only packets for which the expression is true will be selected. If no expression is provided it is assumed to be true.</p> <p>Given a filter expression, snoop generates code for either the kernel packet filter or for its own internal filter. If capturing packets with the network interface, code for the kernel packet filter is generated. This filter is implemented as a streams module, upstream of the buffer module. The buffer module accumulates packets until it becomes full and passes the packets on to snoop. The kernel packet filter is very efficient, since it rejects unwanted packets in the kernel before they reach the packet buffer or snoop. The kernel packet filter has some limitations in its implementation; it is possible to construct filter expressions that it cannot handle. In this event, snoop tries to split the filter and do as much filtering in the kernel as possible. The remaining filtering is done by the packet filter for snoop. The -C flag can be used to view generated</p> |

code for either the packet filter for the kernel or the packet filter for snoop. If packets are read from a capture file using the `-i` option, only the packet filter for snoop is used.

A filter *expression* consists of a series of one or more boolean primitives that may be combined with boolean operators (AND, OR, and NOT). Normal precedence rules for boolean operators apply. Order of evaluation of these operators may be controlled with parentheses. Since parentheses and other filter expression characters are known to the shell, it is often necessary to enclose the filter expression in quotes. Refer to Example 2 for information about setting up more efficient filters.

The primitives are:

#### *host hostname*

True if the source or destination address is that of *hostname*. The *hostname* argument may be a literal address. The keyword *host* may be omitted if the name does not conflict with the name of another expression primitive. For example, "pinky" selects packets transmitted to or received from the host pinky, whereas "pinky and dinky" selects packets exchanged between hosts pinky AND dinky.

The type of address used depends on the primitive which precedes the *host* primitive. The possible qualifiers are "inet", "inet6", "ether", or none. These three primitives are discussed below. Having none of the primitives present is equivalent to "inet host hostname or inet6 host hostname". In other words, snoop tries to filter on all IP addresses associated with *hostname*.

#### *inet or inet6*

A qualifier that modifies the *host* primitive that follows. If it is *inet*, then snoop tries to filter on all IPv4 addresses returned from a name lookup. If it is *inet6*, snoop tries to filter on all IPv6 addresses returned from a name lookup.

#### *ipaddr, atalkaddr, or etheraddr*

Literal addresses, IP dotted, AppleTalk dotted, and ethernet colon are recognized. For example,

- "129.144.40.13" matches all packets with that IP ;
- "2::9255:a00:20ff:fe73:6e35" matches all packets with that IPv6 address as source or destination;
- "65281.13" matches all packets with that AppleTalk address;
- "8:0:20:f:b1:51" matches all packets with the ethernet address as source or destination.

## snoop(1M)

An ethernet address beginning with a letter is interpreted as a hostname. To avoid this, prepend a zero when specifying the address. For example, if the ethernet address is "aa:0:45:23:52:44", then specify it by add a leading zero to make it "0aa:0:45:23:52:44".

from or src

A qualifier that modifies the following *host*, *net*, *ipaddr*, *atalkaddr*, *etheraddr*, *port* or *rpc* primitive to match just the source address, port, or RPC reply.

to or dst

A qualifier that modifies the following *host*, *net*, *ipaddr*, *atalkaddr*, *etheraddr*, *port* or *rpc* primitive to match just the destination address, port, or RPC call.

ether

A qualifier that modifies the following *host* primitive to resolve a name to an ethernet address. Normally, IP address matching is performed.

ethertype *number*

True if the ethernet type field has value *number*. Equivalent to "ether[12:2] = *number*".

ip, ip6, arp, rarp, pppoe, pppoes

True if the packet is of the appropriate ethertype.

pppoe

True if the ethertype of the packet is either pppoe or pppoes.

broadcast

True if the packet is a broadcast packet. Equivalent to "ether[2:4] = 0xffffffff".

multicast

True if the packet is a multicast packet. Equivalent to "ether[0] & 1 = 1".

apple

True if the packet is an Apple Ethertalk packet. Equivalent to "ethertype 0x809b or ethertype 0x80f3".

decnet

True if the packet is a DECNET packet.

greater *length*

True if the packet is longer than *length*.

less *length*

True if the packet is shorter than *length*.

udp, tcp, icmp, icmp6, ah, esp

True if the IP or IPv6 protocol is of the appropriate type.

**net *net***

True if either the IP source or destination address has a network number of *net*. The *from* or *to* qualifier may be used to select packets for which the network number occurs only in the source or destination address.

**port *port***

True if either the source or destination port is *port*. The *port* may be either a port number or name from */etc/services*. The *tcp* or *udp* primitives may be used to select TCP or UDP ports only. The *from* or *to* qualifier may be used to select packets for which the *port* occurs only as the source or destination.

**rpc *prog* [ , *vers* [ , *proc* ] ]**

True if the packet is an RPC call or reply packet for the protocol identified by *prog*. The *prog* may be either the name of an RPC protocol from */etc/rpc* or a program number. The *vers* and *proc* may be used to further qualify the program *version* and *procedure* number, for example, "rpc nfs, 2, 0" selects all calls and replies for the NFS null procedure. The *to* or *from* qualifier may be used to select either call or reply packets only.

**ldap**

True if the packet is an LDAP packet on port 389.

**gateway *host***

True if the packet used *host* as a gateway, that is, the ethernet source or destination address was for *host* but not the IP address. Equivalent to "ether host *host* and not host *host*".

**nofrag**

True if the packet is unfragmented or is the first in a series of IP fragments. Equivalent to "ip[6:2] & 0x1fff = 0".

***expr relop expr***

True if the relation holds, where *relop* is one of >, <, >=, <=, =, !=, and *expr* is an arithmetic expression composed of numbers, packet field selectors, the *length* primitive, and arithmetic operators +, -, \*, &, |, ^, and %. The arithmetic operators within *expr* are evaluated before the relational operator and normal precedence rules apply between the arithmetic operators, such as multiplication before addition. Parentheses may be used to control the order of evaluation. To use the value of a field in the packet use the following syntax:

*base*[*expr* [: *size* ] ]

where *expr* evaluates the value of an offset into the packet from a *base* offset which may be *ether*, *ip*, *udp*, *tcp*, or *icmp*. The *size* value specifies the size of the field. If not given, 1 is assumed. Other legal values are 2 and 4. For example,

snoop(1M)

```
ether[0] & 1 = 1
```

is equivalent to multicast

```
ether[2:4] = 0xffffffff
```

is equivalent to broadcast.

```
ip[ip[0] & 0xf * 4 : 2] = 2049
```

is equivalent to `udp[0:2] = 2049`

```
ip[0] & 0xf > 5
```

selects IP packets with options.

```
ip[6:2] & 0x1fff = 0
```

eliminates IP fragments.

```
udp and ip[6:2]&0x1fff = 0 and udp[6:2] != 0
```

finds all packets with UDP checksums.

The length primitive may be used to obtain the length of the packet. For instance "length > 60" is equivalent to "greater 60", and "ether[length - 1]" obtains the value of the last byte in a packet.

and

Perform a logical AND operation between two boolean values. The AND operation is implied by the juxtaposition of two boolean expressions, for example "dinky pinky" is the same as "dinky AND pinky".

or or ,

Perform a logical OR operation between two boolean values. A comma may be used instead, for example, "dinky, pinky" is the same as "dinky OR pinky".

not or !

Perform a logical NOT operation on the following boolean value. This operator is evaluated before AND or OR.

slp

True if the packet is an SLP packet.

sctp

True if the packet is a SCTP packet.

## EXAMPLES

### EXAMPLE 1 Using the snoop Command

Capture all packets and display them as they are received:

```
example# snoop
```

**EXAMPLE 1** Using the snoop Command (Continued)

Capture packets with host funky as either the source or destination and display them as they are received:

```
example# snoop funky
```

Capture packets between funky and pinky and save them to a file. Then inspect the packets using times (in seconds) relative to the first captured packet:

```
example# snoop -o cap funky pinky
```

```
example# snoop -i cap -t r | more
```

To look at selected packets in another capture file:

```
example# snoop -i pkts -p 99,108
 99 0.0027 boutique -> sunroof NFS C GETATTR FH=8E6C
100 0.0046 sunroof -> boutique NFS R GETATTR OK
101 0.0080 boutique -> sunroof NFS C RENAME FH=8E6C MTra00192 to .nfs08
102 0.0102 marmot -> viper NFS C LOOKUP FH=561E screen.r.13.i386
103 0.0072 viper -> marmot NFS R LOOKUP No such file or directory
104 0.0085 bugbomb -> sunroof RLOGIN C PORT=1023 h
105 0.0005 kandinsky -> sparky RSTAT C Get Statistics
106 0.0004 beebilebrox -> sunroof NFS C GETATTR FH=0307
107 0.0021 sparky -> kandinsky RSTAT R
108 0.0073 office -> jeremiah NFS C READ FH=2584 at 40960 for 8192
```

To look at packet 101 in more detail:

```
example# snoop -i pkts -v -p101

NFS: File handle = 0000164300000000100080000305A1C47
NFS: 597A0000000800002046314AFC450000
NFS: File name = .nfs08
NFS:

```

To view just the NFS packets between sunroof and boutique:

```

example# snoop -i pkts rpc nfs and sunroof and boutique
1 0.0000 boutique -> sunroof NFS C GETATTR FH=8E6C
2 0.0046 sunroof -> boutique NFS R GETATTR OK
3 0.0080 boutique -> sunroof NFS C RENAME FH=8E6C MTra00192 to .nfs08

```

To save these packets to a new capture file:

```

example# snoop -i pkts -o pkts.nfs rpc nfs sunroof boutique

```

To view encapsulated packets, there will be an indicator of encapsulation:

```

example# snoop ip-in-ip
sunroof -> boutique ICMP Echo request (1 encap)

```

If -V is used on an encapsulated packet:

```

example# snoop -V ip-in-ip
sunroof -> boutique ETHER Type=0800 (IP), size = 118 bytes
sunroof -> boutique IP D=129.144.40.222 S=129.144.40.200 LEN=104, ID=27497
sunroof -> boutique IP D=10.1.1.2 S=10.1.1.1 LEN=84, ID=27497
sunroof -> boutique ICMP Echo request

```

**EXAMPLE 2** Setting Up A More Efficient Filter

To set up a more efficient filter, the following filters should be used toward the end of the expression, so that the first part of the expression can be set up in the kernel: greater, less, port, rpc, nofrag, and relop. The presence of OR makes it difficult to split the filtering when using these primitives that cannot be set in the kernel. Instead, use parentheses to enforce the primitives that should be OR'd.

To capture packets between funky and pinky of type tcp or udp on port 80:

```
example# snoop funky and pinky and port 80 and tcp or udp
```

Since the primitive port cannot be handled by the kernel filter, and there is also an OR in the expression, a more efficient way to filter is to move the OR to the end of the expression and to use parentheses to enforce the OR between tcp and udp:

```
example# snoop funky and pinky and (tcp or udp) and port 80
```

**EXIT STATUS**

|   |                        |
|---|------------------------|
| 0 | Successful completion. |
| 1 | An error occurred.     |

**FILES**

|               |                                                     |
|---------------|-----------------------------------------------------|
| /dev/audio    | Symbolic link to the system's primary audio device. |
| /dev/null     | The null file.                                      |
| /etc/hosts    | Host name database.                                 |
| /etc/rpc      | RPC program number data base.                       |
| /etc/services | Internet services and aliases.                      |

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWrcmdc       |

**WARNINGS** The processing overhead is much higher for realtime packet interpretation. Consequently, the packet drop count may be higher. For more reliable capture, output raw packets to a file using the -o option and analyze the packets off-line.

## snoop(1M)

Unfiltered packet capture imposes a heavy processing load on the host computer, particularly if the captured packets are interpreted realtime. This processing load further increases if verbose options are used. Since heavy use of `snoop` may deny computing resources to other processes, it should not be used on production servers. Heavy use of `snoop` should be restricted to a dedicated computer.

`snoop` does not reassemble IP fragments. Interpretation of higher level protocol halts at the end of the first IP fragment.

`snoop` may generate extra packets as a side-effect of its use. For example it may use a network name service (NIS or NIS+) to convert IP addresses to host names for display. Capturing into a file for later display can be used to postpone the address-to-name mapping until after the capture session is complete. Capturing into an NFS-mounted file may also generate extra packets.

Setting the `snaplen` (`-s` option) to small values may remove header information that is needed to interpret higher level protocols. The exact cutoff value depends on the network and protocols being used. For NFS Version 2 traffic using UDP on 10 Mb/s ethernet, do not set `snaplen` less than 150 bytes. For NFS Version 3 traffic using TCP on 100 Mb/s ethernet, `snaplen` should be 250 bytes or more.

`snoop` requires information from an RPC request to fully interpret an RPC reply. If an RPC reply in a capture file or packet range does not have a request preceding it, then only the RPC reply header will be displayed.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |

| <b>NAME</b>        | soconfig – configure transport providers for use by sockets                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <pre>/sbin/soconfig -f file</pre> <pre>/sbin/soconfig family type protocol [path]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | <p>The soconfig utility configures the transport provider driver for use with sockets. It specifies how the family, type, and protocol parameters in the <code>socket(3SOCKET)</code> call are mapped to the name of a transport provider such as <code>/dev/tcp</code>. This utility can be used to add an additional mapping or remove a previous mapping.</p> <p>The <code>init(1M)</code> utility uses soconfig with the <code>sock2path(4)</code> file during the booting sequence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-f file</code> Set up the soconfig configuration for each driver according to the information stored in <code>file</code>. A soconfig file consists of lines of at least the first three fields listed below, separated by spaces:</p> <pre>family type protocol path</pre> <p>These fields are described in the OPERANDS section below.</p> <p>An example of <code>file</code> can be found in the EXAMPLES section below.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <table> <tr> <td><i>family</i></td><td>The protocol family as listed in the <code>/usr/include/sys/socket.h</code> file, expressed as an integer.</td></tr> <tr> <td><i>type</i></td><td>The socket type as listed in the <code>/usr/include/sys/socket.h</code> file, expressed as an integer.</td></tr> <tr> <td><i>protocol</i></td><td>The protocol number as specified in the family-specific <code>include</code> file, expressed as an integer. For example, for <code>AF_INET</code> this number is specified in <code>/usr/include/netinet/in.h</code>. An unspecified protocol number is denoted with the value zero.</td></tr> <tr> <td><i>path</i></td><td>The string that specifies the path name of the device that corresponds to the transport provider. If this parameter is specified, the configuration will be added for the specified family, type, and protocol. If this parameter is not specified, the configuration will be removed.</td></tr> </table> | <i>family</i> | The protocol family as listed in the <code>/usr/include/sys/socket.h</code> file, expressed as an integer. | <i>type</i> | The socket type as listed in the <code>/usr/include/sys/socket.h</code> file, expressed as an integer. | <i>protocol</i> | The protocol number as specified in the family-specific <code>include</code> file, expressed as an integer. For example, for <code>AF_INET</code> this number is specified in <code>/usr/include/netinet/in.h</code> . An unspecified protocol number is denoted with the value zero. | <i>path</i> | The string that specifies the path name of the device that corresponds to the transport provider. If this parameter is specified, the configuration will be added for the specified family, type, and protocol. If this parameter is not specified, the configuration will be removed. |
| <i>family</i>      | The protocol family as listed in the <code>/usr/include/sys/socket.h</code> file, expressed as an integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <i>type</i>        | The socket type as listed in the <code>/usr/include/sys/socket.h</code> file, expressed as an integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <i>protocol</i>    | The protocol number as specified in the family-specific <code>include</code> file, expressed as an integer. For example, for <code>AF_INET</code> this number is specified in <code>/usr/include/netinet/in.h</code> . An unspecified protocol number is denoted with the value zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |
| <i>path</i>        | The string that specifies the path name of the device that corresponds to the transport provider. If this parameter is specified, the configuration will be added for the specified family, type, and protocol. If this parameter is not specified, the configuration will be removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                                                                                            |             |                                                                                                        |                 |                                                                                                                                                                                                                                                                                       |             |                                                                                                                                                                                                                                                                                        |

| <b>SYNOPSIS</b>      | <b>/usr/snadm/bin/soladdapp</b> [-r <i>registry</i> ] -n <i>name</i> -i <i>icon</i> -e <i>executable</i><br>[ <i>args</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |           |
| <b>DESCRIPTION</b>   | soladdapp adds an application to the Solstice application registry. After it is added, the application is displayed in the Solstice Launcher main window (see solstice(1M)).                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |           |
| <b>OPTIONS</b>       | <p>-r <i>registry</i>            Define the full path name of the Solstice registry file.</p> <p>-n <i>name</i>                Define the name of the tool to be registered.</p> <p>-i <i>icon</i>                Define the full path name of the tool icon.</p> <p>-e <i>executable</i>        Define the full path name of the tool.</p> <p><i>args</i>                  Specify any arguments to use with the tool.</p> <p>When executed without options, soladdapp uses<br/>/opt/SUNWadm/etc/.solstice_registry (the default registry path).</p> |                |                 |              |           |
| <b>RETURN VALUES</b> | <p>0                    on success</p> <p>1                    on failure</p> <p>2                    if the registry is locked</p> <p>3                    if the entry is a duplicate.</p>                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |           |
| <b>EXAMPLES</b>      | <p><b>EXAMPLE 1</b> A sample display of the soladdapp command.</p> <p>The following adds an application called Disk Manager to the Solstice application registry for display in the Solstice Launcher main window.</p> <pre># soladdapp -r /opt/SUNWadm/etc/.solstice_registry -n "Disk Manager" -i /opt/SUNWdsk/etc/diskmgr.xpm -e /opt/SUNWdsk/bin/diskmgr</pre>                                                                                                                                                                                    |                |                 |              |           |

| <b>DESCRIPTION</b> | <p>solstice used on a system presents the Solstice Launcher, a graphical user interface that provides access to the Solstice AdminSuite product family of system administration tools. The tools that appear in the launcher depend on what Solstice products you installed on your system.</p> <p>Help is available by using the Help button.</p>                                                                                                                                                                                                                                                                                    |                |                 |              |           |
| <b>USAGE</b>       | <p>The Solstice Launcher allows you to do the following tasks:</p> <p>Launch applications<br/>Use the Solstice Launcher to launch system administration tools.</p> <p>Register applications<br/>Use the Solstice Launcher to add and register applications locally with the launcher.</p> <p>Remove applications<br/>Use the Solstice Launcher to remove locally registered applications.</p> <p>Customize application properties<br/>Use the Solstice Launcher to show, hide, or remove applications in the launcher, reorder the icons, change the launcher window width, modify applications properties, and add applications.</p> |                |                 |              |           |
| <b>FILES</b>       | <p>/\$HOME/.solstice_registry<br/>Local registry information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |           |

| <b>NOTES</b>       | <p>The Solstice Launcher adds or removes local applications that are private to the user (not local to the system) only. The properties of globally registered applications that are used by local and remote users sharing the software from a particular /opt directory cannot be modified from the Solstice Launcher. To register global applications for use by local and remote users, use the soladdapp(1M) command. To remove globally registered applications, use the soldelapp(1M) command.</p>                                                                                                                             |                |                 |              |           |

| DESCRIPTION | <p>The sppptun utility is used to configure and query the Solaris PPP tunneling device driver, /dev/sppptun. Currently, only PPP over Ethernet (PPPoE) is supported, so the plumb and unplumb arguments are used to specify Ethernet interfaces that are to be used for PPPoE, and the query option lists the plumbed interfaces.</p> <p>The use of sppptun to add interfaces is similar to the use of ifconfig(1M) to add interfaces to IP. The plumbing is done once for each interface, preferably at system start-up time, and is not normally manipulated on a running system. If multiple instances of PPP are run over a single interface, they share the plumbing to that interface. Plumbing for each session is not required (and not possible for PPPoE).</p> <p>The proper way to plumb interfaces for PPPoE is to list the interfaces, one per line, in the /etc/ppp/pppoe.if file.</p>                                                                                                                                                                                                                                                                                |
| USAGE       | <p><b>sppptun plumb</b><br/>When specified with no additional arguments, the plumb argument lists the protocols that are supported by the utility. These are the strings that are used as the <i>protocol</i> argument below.</p> <p><b>sppptun plumb</b> <i>protocol device</i><br/>This plumbs a new interface into the driver. The <i>protocol</i> parameter is pppoe for the PPP-carrying "Session Stage" connection or pppoeD for the PPPoE "Discovery Stage" connection. Both connections must be present for each Ethernet interface that is to be used for PPPoE. The <i>device</i> parameter is the path name of the Ethernet interface to use (use ifconfig(1M) to list available devices). If the path begins with /dev/, then this portion may be omitted.</p> <p><b>sppptun unplumb</b> <i>interface</i><br/>This removes an existing interface from the driver and terminates any PPP sessions that were using the interface. The <i>interface</i> parameter is the name of the interface as reported when the interface was plumbed.</p> <p><b>sppptun query</b><br/>Displays the canonical names of all interfaces plumbed into the /dev/sppptun device driver.</p> |
| EXAMPLES    | <p><b>EXAMPLE 1</b> Setting up to Use PPPoE on hme0</p> <p>Plumb the hme0 interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**EXAMPLE 1** Setting up to Use PPPoE on hme0      (Continued)

```
sppptun plumb pppoe hme0
hme0:pppoe
sppptun plumb pppoe hme0
hme0:pppoe
```

Remove the hme0 interface.

```
sppptun unplumb hme0:pppoe
sppptun unplumb hme0:pppoe
```

**EXAMPLE 2** Script to Remove All Plumbed Interfaces

```
#!/bin/sh
for intf in `sppptun query`
do
 sppptun unplumb $intf
done
```

**EXIT STATUS**      The following exit values are returned:

- 0              Successful completion.
- 1              One or more errors occurred.

**FILES**            /etc/ppp/pppoe.if              list of Ethernet interfaces to be plumbed at boot time  
                  /usr/sbin/sppptun            executable command  
                  /dev/sppptun            Solaris PPP tunneling device driver

| <b>SYNOPSIS</b>    | <b>/usr/sbin/spray</b> [-c <i>count</i> ] [-d <i>delay</i> ] [-l <i>length</i> ] [-t <i>nettype</i> ] <i>host</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |           |
| <b>DESCRIPTION</b> | <p>spray sends a one-way stream of packets to <i>host</i> using RPC, and reports how many were received, as well as the transfer rate. The <i>host</i> argument can be either a name or an Internet address.</p> <p>spray is not useful as a networking benchmark, as it uses unreliable connectionless transports, UDP for example. spray can report a large number of packets dropped when the drops were caused by spray sending packets faster than they can be buffered locally, that is, before the packets get to the network medium.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                 |              |           |
| <b>OPTIONS</b>     | <p>-c <i>count</i> Specify how many packets to send. The default value of <i>count</i> is the number of packets required to make the total stream size 100000 bytes.</p> <p>-d <i>delay</i> Specify how many microseconds to pause between sending each packet. The default is 0.</p> <p>-l <i>length</i> The <i>length</i> parameter is the numbers of bytes in the Ethernet packet that holds the RPC call message. Since the data is encoded using XDR, and XDR only deals with 32 bit quantities, not all values of <i>length</i> are possible, and spray rounds up to the nearest possible value. When <i>length</i> is greater than 1514, then the RPC call can no longer be encapsulated in one Ethernet packet, so the <i>length</i> field no longer has a simple correspondence to Ethernet packet size. The default value of <i>length</i> is 86 bytes, the size of the RPC and UDP headers.</p> <p>-t <i>nettype</i> Specify class of transports. Defaults to netpath. See rpc(3NSL) for a description of supported classes.</p> |                |                 |              |           |

| NAME        | ssaadm – administration program for SPARCstorage Array and SPARCstorage RSM disk systems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SYNOPSIS    | <b>ssaadm</b> [-v] [-e] <i>subcommand</i> [ <i>subcommand_option...</i> ]   <i>pathname...</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DESCRIPTION | <p>The ssaadm program is an administrative command that manages the SPARCstorage Array and SPARCstorage RSM disk systems (henceforth called SPARCstorage systems). ssaadm performs a variety of control and query tasks depending on the command line arguments and options used. The luxadm(1M) utility replaces ssaadm and should be used instead.</p> <p>The command line must contain a <i>subcommand</i> (listed under USAGE) and at least one <i>pathname</i>. Commands specific to either a SPARCstorage Array or a SPARCstorage RSM state that fact. It may also contain options and other parameters depending on the subcommand. The subcommand is applied to each of the pathnames on the command line.</p> <p><i>pathname</i> specifies the SPARCstorage system controller or a disk in the SPARCstorage system. The controller name is specified by its physical name, for example,</p> <pre>/devices/. . . /. . . /SUNW,soc@3,0/SUNW,     pln@xxxxxxx,xxxxxxx:ctlr</pre> <p>or by a name of the form</p> <pre>cN</pre> <p>where <i>N</i> is the logical controller number. ssaadm uses the <i>cN</i> name to find an entry in the /dev/rdisk directory of a disk that is attached to the SPARCstorage system controller. The /dev/rdisk entry is then used to determine the physical name of the SPARCstorage system controller. A disk in the SPARCstorage system is specified by its logical or physical device name, for example,</p> <pre>/dev/rdisk/clt0d0s2</pre> <p>or</p> <pre>/devices/. . . /. . . /SUNW,soc@3,0/SUNW,     pln@xxxxxxx,xxxxxxx/ssd@0,0:c,raw</pre> <p>See disks(1M) for more information on logical names for disks and controllers.</p> |
| OPTIONS     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-e                      Expert mode. This is required for the expert mode subcommands listed below.</li> <li>-v                      Verbose mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Subcommands</b> | <p><code>display [-p] <i>pathname</i> . . .</code></p> <p>Display configuration information for the specified units or display performance information for the specified SPARCstorage Array controller. If <i>pathname</i> specifies the controller, the configuration information is displayed for all disks in the SPARCstorage Array. For each drive that has fast write enabled, (FW) are displayed after the drive identification.</p> <p><code>-p</code></p> <p>Display performance information for the specified SPARCstorage Array controller. The accumulation of the performance statistics must be enabled using the <code>perf_statistics</code> subcommand before displaying the performance information. If not enabled, all of the I/Os per second are displayed as zeros.</p> <p>The performance display reports the following information:</p> <p><b>BUSY</b></p> <p>How busy the controller in the SPARCstorage Array is, expressed as a percentage.</p> <p><b>IOPS</b></p> <p>The total I/Os per second for the SPARCstorage Array.</p> <p>entries for each disk</p> <p>The total number of I/Os per second.</p> <p><code>download -f <i>filename</i> <i>pathname</i></code></p> <p><code>download -w <i>wwn</i> <i>pathname</i></code></p> <p>Download an image to the SPARCstorage Array controller.</p> <p><code>-f</code></p> <p>Download the prom image specified by <i>filename</i> to the SPARCstorage Array controller FEPROMs. When the download is complete, the SPARCstorage Array must be reset in order to use the downloaded code. Note that the <code>download</code> subcommand modifies the FEPROM on the SPARCstorage Array and should be used <i>with caution</i>.</p> <p><code>-w</code></p> <p>Change the SPARCstorage Array controller's World Wide Name. <i>wwn</i> is a 12 digit hex number, leading zeros required. The new SPARCstorage Array controller's image have the least significant 6 bytes of the 8-byte World Wide Name modified to <i>wwn</i>.</p> <p><code>fast_write [-s] -c <i>pathname</i></code></p> <p><code>fast_write [-s] -d <i>pathname</i></code></p> <p><code>fast_write [-s] -e <i>pathname</i></code></p> |

Enable or disable the use of the NVRAM to enhance the performance of writes in the SPARCstorage Array. *pathname* may refer to the SPARCstorage Array controller or to an individual disk.

- c  
Enable fast writes for synchronous writes only.
- d  
Disable fast writes.
- e  
Enable fast writes.
- s  
Save the state that is currently being requested so it persists across power-cycles.

**fc\_s\_download** [-f *fcode-file*]

Download the fcode contained in the file *fcode-file* into *all* the FC/S Sbus Cards. This subcommand is interactive and expects user confirmation before downloading the fcode. When invoked without the [-f *fcode-file*] option, the current version of the fcode in each FC/S Sbus card is printed. Note that the **fc\_s\_download** subcommand should be used *only in single-user mode*; otherwise the FC/S card could be reset.

**insert\_device** *pathname*

Guide user through hot insertion of a disk device.

This subcommand only applies to the RSM. See NOTES for hot plugging limitations.

**perf\_statistics** -d *pathname*

**perf\_statistics** -e *pathname*

Enable or disable the accumulation of performance statistics for the specified SPARCstorage Array controller. The accumulation of performance statistics must be enabled before using the **display -p** subcommand. This subcommand can be issued only to the SPARCstorage Array controller.

- d  
Disable the accumulation of performance statistics.
- e  
Enable the accumulation of performance statistics.

**purge** *pathname*

Purge any fast write data from NVRAM for one disk, or all disks if the controller is specified. This option should be used with caution, usually only when a drive has failed.

**release** *pathname*

Release a reservation held on the specified controllers or disks. When HA (High\_Availability) Software is running on a system, do not use this subcommand to release a disk on an SSA. Doing so could cause problems for the HA software.

**remove\_device** *pathname*

Guide user through hot removal of a disk device.

This subcommand only applies to the RSM. See NOTES for hot plugging limitations.

`replace_device pathname`

Guide user through hot replacement of a disk device.

This subcommand only applies to the RSM. See NOTES for hot plugging limitations.

`reserve pathname`

Reserve the specified controllers or disks for exclusive use by the issuing host. When HA (High\_Availability) Software is running on a system, do not use this subcommand to reserve a disk on an SSA. Doing so could cause problems for the HA software.

`set_boot_dev [-y] pathname`

Set the boot-device variable in the PROM to the physical device name specified by *pathname* which can be a block special device or the pathname of the directory on which the boot file system is mounted. This subcommand normally runs interactively and requests confirmation for setting the default boot device in the PROM. The -y option can be used to run it in non-interactive mode, in which case no confirmation is requested or required.

`start [-t tray-number] pathname`

Spin up the specified disks. If *pathname* specifies the controller, this action applies to all disks in the SPARCstorage Array.

-t

Spin up all disks in the tray specified by *tray-number*. *pathname* must specify the controller.

`stop [-t tray-number] pathname`

Spin down the specified disks. If *pathname* specifies the controller, this action applies to all disks in the SPARCstorage Array.

-t

Spin down all disks in the tray specified by *tray-number*. *pathname* must specify the controller.

`sync_cache pathname`

Flush all outstanding writes for the specified disk from NVRAM to the media. If *pathname* specifies the controller, this action applies to all disks in the SPARCstorage Array.

#### SCSI Enclosure Services (SES) Subcommands

The SPARCstorage RSM tray is addressed by the using the logical or physical path of the SES device or specifying the controller followed by the tray number if that controller has multiple trays. The controller is addressed by *cN* or the physical path to the SPARCstorage Array's controller.

See `ses(7D)` for more information about environmental sensor cards and associated devices.

These subcommands also work with RSM trays directly attached to wide differential SCSI controllers.

`alarm pathname | controller tray-number`  
 Display the current state of the audible alarm.

`alarm_on pathname | controller tray-number`  
`alarm_off pathname | controller tray-number`  
 Enable or disable the audible alarm for this enclosure.

`alarm_set pathname | controller tray-number [seconds]`  
 Set the audible alarm setting to seconds.

`env_display pathname | controller tray-number`  
 Display the environmental information for the specified unit.

`led pathname`  
 Display the current state of the led for the specified disk.

`led_on pathname`  
`led_off pathname`  
 Turn on or off the led for this disk.

`power_off pathname | controller tray-number`  
 Power down this RSM. The RSM will need to be powered back on manually.

This subcommand does not work with RSMs directly attached to wide differential SCSI controllers.

#### Expert Mode Subcommands

See NOTES for limitations of these subcommands. Only users that are knowledgeable about the systems they are managing should use the expert mode subcommands.

For the following subcommands that work on a bus if a disk is specified then the bus that disk attached to is used.

|                                            |                                                            |
|--------------------------------------------|------------------------------------------------------------|
| <code>bus_getstate <i>pathname</i></code>  | Get and display the state of the specified bus.            |
| <code>bus_quiesce <i>pathname</i></code>   | Quiesce the specified bus.                                 |
| <code>bus_reset <i>pathname</i></code>     | Reset the specified bus.                                   |
| <code>bus_resetall <i>pathname</i></code>  | Reset the specified bus and all devices on that bus.       |
| <code>bus_unquiesce <i>pathname</i></code> | Unquiesce the specified bus.                               |
| <code>dev_getstate <i>pathname</i></code>  | Get the state (online or offline) of the specified device. |
| <code>dev_reset <i>pathname</i></code>     | Reset the specified device.                                |
| <code>offline <i>pathname</i></code>       | Turn the specified disk offline.                           |
| <code>online <i>pathname</i></code>        | Turn the specified disk online.                            |

## ssaadm(1M)

### EXAMPLES

**EXAMPLE 1** Using `ssaadm` to remove a disk on an SSA

An example of using the expert mode hot plugging subcommands to hot remove a disk on a SSA follows. See **NOTES** for hot plugging limitations.

The first step reserves the SCSI device so that it can't be accessed via its second SCSI bus:

```
example# ssaadm reserve /dev/dsk/clt8d0s2
```

The next two steps take the disk to be removed offline then quiesce the bus:

```
example# ssaadm -e offline /dev/dsk/clt8d0s2
example# ssaadm -e bus_quiesce /dev/dsk/clt8d0s2
```

The user then removes the disk and continues by unquiescing the bus, putting the disk back online, then releasing it:

```
example# ssaadm -e bus_unquiesce /dev/dsk/clt8d0s2
example# ssaadm -e online /dev/dsk/clt8d0s2
example# ssaadm release /dev/dsk/clt8d0s2
```

### EXIT STATUS

The following exit values are returned:

|          |                        |
|----------|------------------------|
| 0        | Successful completion. |
| non-zero | An error occurred.     |

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWssaop       |

### SEE ALSO

`disks(1M)`, `luxadm(1M)`, `attributes(5)`, `ses(7D)`

*SPARCstorage Array User's Guide*

### NOTES

Currently, only some device drivers support hot plugging. If hot plugging is attempted on a disk or bus where it is not supported, an error message of the form:

```
ssaadm: can't acquire "PATHNAME": No such file or directory
```

is displayed.

Do not quiesce any bus containing a disk with the `root`, `usr`, or `swap` partitions to avoid possible system deadlock.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>NAME</b>                   | sshd – secure shell daemon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>               | <b>sshd</b> [-diqQ46] [-b <i>bits</i> ] [-f <i>config_file</i> ] [-g <i>login_grace_time</i> ]<br>[-h <i>host_key_file</i> ] [-k <i>key_gen_time</i> ] [-p <i>port</i> ] [-u <i>len</i> ]<br>[-v <i>client_protocol_id</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b>            | <p>The <b>sshd</b> (Secure Shell daemon) is the daemon program for <b>ssh</b>(1). Together these programs replace <b>rlogin</b> and <b>rsh</b>, and provide secure encrypted communications between two untrusted hosts over an insecure network. The programs are intended to be as easy to install and use as possible.</p> <p><b>sshd</b> is the daemon that listens for connections from clients. It forks a new daemon for each incoming connection. The forked daemons handle key exchange, encryption, authentication, command execution, and data exchange.</p> <p>This implementation of <b>sshd</b> supports both SSH protocol versions 1 and 2 simultaneously. Because of security weaknesses in the v1 protocol, sites should run only v2, if possible. In the default configuration, only protocol v2 is enabled for the server. To enable v1 and v2 simultaneously, see the instructions in <b>sshd_config</b>(4).</p> <p>Support for v1 is provided to help sites with existing <b>ssh</b> v1 clients and servers to transition to v2. v1 might not be supported in a future release.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SSH Protocol Version 1</b> | <p>Each host has a host-specific RSA key (normally 1024 bits) used to identify the host. Additionally, when the daemon starts, it generates a server RSA key (normally 768 bits). This key is normally regenerated every hour if it has been used, and is never stored on disk.</p> <p>Whenever a client connects the daemon responds with its public host and server keys. The client compares the RSA host key against its own database to verify that it has not changed. The client then generates a 256-bit random number. It encrypts this random number using both the host key and the server key, and sends the encrypted number to the server. Both sides then use this random number as a session key which is used to encrypt all further communications in the session. The rest of the session is encrypted using a conventional cipher, currently Blowfish or 3DES, with 3DES being used by default. The client selects the encryption algorithm to use from those offered by the server.</p> <p>Next, the server and the client enter an authentication dialog. The client tries to authenticate itself using <b>.rhosts</b> authentication, <b>.rhosts</b> authentication combined with RSA host authentication, RSA challenge-response authentication, or password-based authentication.</p> <p><b>Rhosts</b> authentication is normally disabled because it is fundamentally insecure, but can be enabled in the server configuration file if desired. System security is not improved unless <b>rshd</b>(1M), <b>rlogind</b>(1M), <b>rexecd</b>(1M), and <b>rexed</b>(1M) are disabled (thus completely disabling <b>rlogin</b>(1) and <b>rsh</b>(1) into the machine).</p> |

## sshd(1M)

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SSH Protocol Version 2</b>                | <p>Version 2 works similarly to version 1: Each host has a host-specific DSA/RSA key. However, when the daemon starts, it does not generate a server key. Forward security is provided through a Diffie-Hellman key agreement. This key agreement results in a shared session key. The rest of the session is encrypted using a symmetric cipher, currently Blowfish, 3DES, or AES. The client selects the encryption algorithm to use from those offered by the server. Additionally, session integrity is provided through a cryptographic message authentication code (<code>hmac-sha1</code> or <code>hmac-md5</code>).</p> <p>Protocol version 2 provides a public key based user authentication method (<code>PubKeyAuthentication</code>) and conventional password authentication.</p>                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Command Execution and Data Forwarding</b> | <p>If the client successfully authenticates itself, a dialog for preparing the session is entered. At this time the client can request things like allocating a pseudo-tty, forwarding X11 connections, forwarding TCP/IP connections, or forwarding the authentication agent connection over the secure channel.</p> <p>Finally, the client either requests a shell or execution of a command. The sides then enter session mode. In this mode, either side may send data at any time, and such data is forwarded to/from the shell or command on the server side, and the user terminal on the client side.</p> <p>When the user program terminates and all forwarded X11 and other connections have been closed, the server sends command exit status to the client, and both sides exit.</p> <p><code>sshd</code> can be configured using command-line options or the configuration files <code>/etc/ssh/ssh_config</code> and <code>~/.ssh/config</code>, both described in <code>ssh_config(4)</code>. Command-line options override values specified in the configuration file.</p> <p><code>sshd</code> rereads its configuration file when it receives a hangup signal, <code>SIGHUP</code>.</p> |
| <b>Host Access Control</b>                   | <p>The <code>sshd</code> daemon uses TCP Wrappers to restrict access to hosts. It uses the service name of <code>sshd</code> for <code>hosts_access()</code>. For more information on TCP Wrappers see <code>tcpd(1M)</code> and <code>hosts_access(3)</code> man pages, which are part of the <code>SUNWsfman</code> package (they are not SunOS man pages). TCP wrappers binaries, including <code>libwrap</code>, are in <code>SUNWtcpd</code>, a required package for <code>SUNWsshd</code>, the package containing <code>sshd</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b>                               | <p>The options for <code>sshd</code> are as follows:</p> <ul style="list-style-type: none"><li><code>-b bits</code><br/>Specifies the number of bits in the server key (the default is 768).</li><li><code>-d</code><br/>Debug mode. The server sends verbose debug output to the system log, and does not put itself in the background. The server also will not fork and will only process one connection. This option is only intended for debugging for the server. Multiple <code>-d</code> options increase the debugging level. Maximum is 3.</li><li><code>-f configuration_file</code><br/>Specifies the name of the configuration file. The default is <code>/etc/ssh/sshd_config</code>. <code>sshd</code> refuses to start if there is no configuration file.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |

- g *login\_grace\_time*  
Gives the grace time for clients to authenticate themselves (the default is 300 seconds). If the client fails to authenticate the user within this number of seconds, the server disconnects and exits. A value of zero indicates no limit.
- h *host\_key\_file*  
Specifies the file from which the host key is read (the default is `/etc/ssh/ssh_host_key`). This option must be given if `sshd` is not run as root (as the normal host file is normally not readable by anyone but root).
- i  
Specifies that `sshd` is being run from `inetd`. `sshd` is normally not run from `inetd` because it needs to generate the server key before it can respond to the client, and this may take tens of seconds. Clients would have to wait too long if the key was regenerated every time. However, with small key sizes (for example, 512) using `sshd` from `inetd` may be reasonable.
- k *key\_gen\_time*  
Specifies how often the server key is regenerated (the default is 3600 seconds, or one hour). The motivation for regenerating the key fairly often is that the key is not stored anywhere, and after about an hour, it becomes impossible to recover the key for decrypting intercepted communications even if the machine is cracked into or physically seized. A value of zero indicates that the key will never be regenerated.
- p *port*  
Specifies the port on which the server listens for connections (the default is 22).
- q  
Quiet mode. Nothing is sent to the system log. Normally the beginning, authentication, and termination of each connection is logged.
- u *len*  
Used to specify the size of the field in the `utmp` structure that holds the remote host name. If the resolved host name is longer than *len*, the dotted decimal value will be used instead. This allows hosts with very long host names that overflow this field to still be uniquely identified. Specifying `-u0` indicates that only dotted decimal addresses should be put into the `utmp` file.
- 4  
Forces `sshd` to use IPv4 addresses only.
- 6  
Forces `sshd` to use IPv6 addresses only.

authorized\_keys  
File Format

The `$HOME/.ssh/authorized_keys` file lists the public keys that are permitted for RSA authentication. Each line of the file contains one key (empty lines and lines starting with a hash mark [#] are ignored as comments). Each line consists of the following fields, separated by spaces: options, bits, exponent, modulus, comment. The options field is optional; its presence is determined by whether the line starts with a number or not (the option field never starts with a number). The bits, exponent, modulus and comment fields give the RSA key; the comment field is not used for anything (but may be convenient for the user to identify the key).

Lines in this file are usually several hundred bytes long (because of the size of the RSA key modulus). You will find it very inconvenient to type them in; instead, copy the `identity.pub` file and edit it.

Permissions of this file must be set so that it is not world or group writable. See the `StrickModes` option of `sshd_config(4)`.

The options (if present) consist of comma-separated option specifications. No spaces are permitted, except within double quotes. The following option specifications are supported:

`from="pattern-list"`

Specifies that in addition to RSA authentication, the canonical name of the remote host must be present in the comma-separated list of patterns (`*` and `?` serve as wildcards). The list can also contain patterns negated by prefixing them with `!`; if the canonical host name matches a negated pattern, the key is not accepted. The purpose of this option is to optionally increase security: RSA authentication by itself does not trust the network or name servers or anything (but the key); however, if somebody somehow steals the key, the key permits an intruder to log in from anywhere in the world. This additional option makes using a stolen key more difficult (name servers and/or routers would have to be compromised in addition to just the key).

`command="command"`

Specifies that the *command* is executed whenever this key is used for authentication. The command supplied by the user (if any) is ignored. The command is run on a `pty` if the connection requests a `pty`; otherwise it is run without a `tty`. A quote can be included in the command by quoting it with a backslash. This option might be useful to restrict certain RSA keys to perform only a specific operation. An example might be a key that permits remote backups but nothing else. The client might specify TCP/IP and/or X11 forwarding unless they are explicitly prohibited.

`environment="NAME=value"`

Specifies that the string *NAME=value* is to be added to the environment when logging in using this key. Environment variables set this way override other default environment values. Multiple options of this type are permitted.

`no-port-forwarding`

Forbids TCP/IP forwarding when this key is used for authentication. Any port forward requests by the client will return an error. This might be used, for example, in connection with the `command` option.

`no-X11-forwarding`

Forbids X11 forwarding when this key is used for authentication. Any X11 forward requests by the client will return an error.

`no-agent-forwarding`

Forbids authentication agent forwarding when this key is used for authentication.

`no-pty`

Prevents `tty` allocation (a request to allocate a `pty` will fail).

## ssh\_known\_hosts File Format

The `/etc/ssh/ssh_known_hosts` and `$HOME/.ssh/known_hosts` files contain host public keys for all known hosts. The global file should be prepared by the administrator (optional), and the per-user file is maintained automatically: whenever the user connects from an unknown host its key is added to the per-user file.

Each line in these files contains the following fields: hostnames, bits, exponent, modulus, comment. The fields are separated by spaces.

Hostnames is a comma-separated list of patterns (\* and ? act as wildcards); each pattern in turn is matched against the canonical host name (when authenticating a client) or against the user-supplied name (when authenticating a server). A pattern can also be preceded by ! to indicate negation: if the host name matches a negated pattern, it is not accepted (by that line) even if it matched another pattern on the line.

Bits, exponent, and modulus are taken directly from the RSA host key; they can be obtained, for example, from `/etc/ssh/ssh_host_rsa_key.pub`. The optional comment field continues to the end of the line, and is not used.

Lines starting with a hash mark (#) and empty lines are ignored as comments.

When performing host authentication, authentication is accepted if any matching line has the proper key. It is thus permissible (but not recommended) to have several lines or different host keys for the same names. This will inevitably happen when short forms of host names from different domains are put in the file. It is possible that the files contain conflicting information; authentication is accepted if valid information can be found from either file.

The lines in these files are typically hundreds of characters long. You should definitely not type in the host keys by hand. Rather, generate them by a script or by taking `/etc/ssh/ssh_host_rsa_key.pub` and adding the host names at the front.

## EXAMPLES

### EXAMPLE 1 authorized\_key File Entries

The following are examples of `authorized_key` file entries.

```
1024 33 12121...312314325 ylo@foo.bar
```

```
from="*.niksula.hut.fi,!pc.niksula.hut.fi" 1024 35 23...2334 ylo@niksula
```

```
command="dump /home",no-pty,no-port-forwarding 1024 33 23...2323
backup.hut.fi
```

### EXAMPLE 2 ssh\_known\_hosts File Entries

The following are examples of `ssh_known_hosts` file entries.

```
closenet,closenet.hut.fi,...,130.233.208.41 1024 37 159...93
closenet.hut.fi
```

## EXIT STATUS

The following exit values are returned:

## sshd(1M)

|              |                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | 0                                                                              | Successful completion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|              | >0                                                                             | An error occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>FILES</b> | <code>/etc/ssh/sshd_config</code>                                              | Contains configuration data for <code>sshd</code> . This file should be writable by root only, but it is recommended (though not necessary) that it be world-readable.                                                                                                                                                                                                                                                                                                                                                     |
|              | <code>/etc/ssh/ssh_host_key</code>                                             | Contains the private part of the host key. This file should only be owned by root, readable only by root, and not accessible to others. <code>sshd</code> does not start if this file is group/world-accessible.                                                                                                                                                                                                                                                                                                           |
|              | <code>/etc/ssh/ssh_host_key.pub</code>                                         | Contains the public part of the host key. This file should be world-readable but writable only by root. Its contents should match the private part. This file is not used for encryption; it is provided only for the convenience of the user so its contents can be copied to known hosts files. These two files are created using <code>ssh-keygen(1)</code> .                                                                                                                                                           |
|              | <code>/var/run/sshd.pid</code>                                                 | Contains the process ID of the <code>sshd</code> listening for connections. If there are several daemons running concurrently for different ports, this contains the pid of the one started last. The content of this file is not sensitive; it can be world-readable.                                                                                                                                                                                                                                                     |
|              | <code>/etc/ssh/ssh_known_hosts</code> and <code>\$HOME/.ssh/known_hosts</code> | These files are consulted when using <code>rhosts</code> with RSA host authentication to check the public key of the host. The key must be listed in one of these files to be accepted. The client uses the same files to verify that the remote host is the one it intended to connect. These files should be writable only by root or the owner. <code>/etc/ssh/ssh_known_hosts</code> should be world-readable, and <code>\$HOME/.ssh/known_hosts</code> can but need not be world-readable.                            |
|              | <code>/etc/nologin</code>                                                      | If this file exists, <code>sshd</code> refuses to let anyone except root log in. The contents of the file are displayed to anyone trying to log in, and non-root connections are refused. The file should be world-readable.                                                                                                                                                                                                                                                                                               |
|              | <code>\$HOME/.rhosts</code>                                                    | This file contains host-username pairs, separated by a space, one per line. The given user on the corresponding host is permitted to log in without password. The same file is used by <code>rlogind</code> and <code>rshd</code> . The file must be writable only by the user; it is recommended that it not be accessible by others. It is also possible to use <code>netgroups</code> in the file. Either host or user name may be of the form <code>+%groupname</code> to specify all hosts or all users in the group. |
|              | <code>\$HOME/.shosts</code>                                                    | For <code>ssh</code> , this file is exactly the same as for <code>.rhosts</code> . However, this file is not used by <code>rlogin</code> and <code>rshd</code> , so using this permits access using SSH only.                                                                                                                                                                                                                                                                                                              |
|              | <code>/etc/hosts.equiv</code>                                                  | This file is used during <code>.rhosts</code> authentication. In its simplest form, this file contains host names, one per line. Users on these hosts are permitted to log in                                                                                                                                                                                                                                                                                                                                              |

without a password, provided they have the same user name on both machines. The host name can also be followed by a user name; such users are permitted to log in as any user on this machine (except root). Additionally, the syntax `+@group` can be used to specify netgroups. Negated entries start with a hyphen (-).

If the client host/user is successfully matched in this file, login is automatically permitted, provided the client and server user names are the same. Additionally, successful RSA host authentication is normally required. This file must be writable only by root; it is recommended that it be world-readable.

Warning: It is almost never a good idea to use user names in `hosts.equiv`. Beware that it really means that the named user(s) can log in as anybody, which includes `bin`, `daemon`, `adm`, and other accounts that own critical binaries and directories. For practical purposes, using a user name grants the user root access. Probably the only valid use for user names is in negative entries. This warning also applies to `rsh/rlogin`.

`/etc/ssh/shosts.equiv`

This file is processed exactly as `/etc/hosts.equiv`. However, this file might be useful in environments that want to run both `rsh/rlogin` and `ssh`.

`$HOME/.ssh/environment`

This file is read into the environment at login (if it exists). It can contain only empty lines, comment lines (that start with #), and assignment lines of the form `name=value`. The file should be writable only by the user; it need not be readable by anyone else.

`$HOME/.ssh/rc`

If this file exists, it is run with `/bin/sh` after reading the environment files but before starting the user's shell or command. If X11 spoofing is in use, this will receive the "proto cookie" pair in standard input (and `DISPLAY` in environment). This must call `xauth(1)` in that case.

The primary purpose of `$HOME/.ssh/rc` is to run any initialization routines that might be needed before the user's home directory becomes accessible; AFS is a particular example of such an environment.

This file will probably contain some initialization code followed by something similar to:

```
if read proto cookie;
then echo add $DISPLAY $proto $cookie | xauth -q -;
fi
```

If this file does not exist, `/etc/ssh/sshrd` is run, and if that does not exist, `xauth` is used to store the cookie. `$HOME/.ssh/rc` should be writable only by the user, and need not be readable by anyone else.

`/etc/ssh/sshrd`

Similar to `$HOME/.ssh/rc`. This can be used to specify machine-specific login-time initializations globally. This file should be writable only by root, and should be world-readable.

sshd(1M)

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWsshdu       |

**SEE ALSO** `scp(1)`, `ssh(1)`, `ssh-add(1)`, `ssh-agent(1)`, `ssh-keygen(1)`, `sftp-server(1M)`, `sshd(1M)`, `sshd_config(4)`, `attributes(5)`

To view license terms, attribution, and copyright for OpenSSH, the default path is `/var/sadm/pkg/SUNWsshdr/install/copyright`. If the Solaris operating environment has been installed anywhere other than the default, modify the given path to access the file at the installed location.

**AUTHORS** OpenSSH is a derivative of the original and free `ssh 1.2.12` release by Tatu Ylonen. Aaron Campbell, Bob Beck, Markus Friedl, Niels Provos, Theo de Raadt and Dug Song removed many bugs, added newer features and created Open SSH. Markus Friedl contributed the support for SSH protocol versions 1.4 and 2.0.

| <b>NAME</b>        | statd – network status monitor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |           |

| <b>SYNOPSIS</b>    | <code>/usr/lib/nfs/statd</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |           |
| <b>DESCRIPTION</b> | <p>statd is an intermediate version of the status monitor. It interacts with lockd(1M) to provide the crash and recovery functions for the locking services on NFS. statd keeps track of the clients with processes which hold locks on a server. When the server reboots after a crash, statd sends a message to the statd on each client indicating that the server has rebooted. The client statd processes then inform the lockd on the client that the server has rebooted. The client lockd then attempts to reclaim the lock(s) from the server.</p> <p>statd on the client host also informs the statd on the server(s) holding locks for the client when the client has rebooted. In this case, the statd on the server informs its lockd that all locks held by the rebooting client should be released, allowing other processes to lock those files.</p> |                |                 |              |           |
| <b>FILES</b>       | <p><code>/var/statmon/sm</code><br/>lists hosts and network addresses to be contacted after a reboot</p> <p><code>/var/statmon/sm.bak</code><br/>lists hosts and network addresses that could not be contacted after last reboot</p> <p><code>/var/statmon/state</code><br/>includes a number which changes during a reboot</p> <p><code>/usr/include/rpcsvc/sm_inter.x</code><br/>contains the rpcgen source code for the interface services provided by the statd daemon.</p>                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |           |

| <b>SYNOPSIS</b>    | <b>strace</b> [ <i>mid sid level...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DESCRIPTION</b> | <p>strace without arguments writes all STREAMS event trace messages from all drivers and modules to its standard output. These messages are obtained from the STREAMS log driver (see <code>log(7D)</code>). If arguments are provided, they must be in triplets of the form <i>mid, sid, level</i>, where <i>mid</i> is a STREAMS module ID number, <i>sid</i> is a sub-ID number, and <i>level</i> is a tracing priority level. Each triplet indicates that tracing messages are to be received from the given module/driver, sub-ID (usually indicating minor device), and priority level equal to, or less than the given level. The token <code>all</code> may be used for any member to indicate no restriction for that attribute.</p> <p>The format of each trace message output is:</p> <pre>&lt;seq&gt; &lt;time&gt; &lt;ticks&gt; &lt;level&gt; &lt;flags&gt; &lt;mid&gt; &lt;sid&gt; &lt;text&gt;</pre> <p>&lt;seq&gt;                    trace sequence number</p> <p>&lt;time&gt;                  time of message in <i>hh:mm:ss</i></p> <p>&lt;ticks&gt;                time of message in machine ticks since boot</p> <p>&lt;level&gt;                tracing priority level</p> <p>&lt;flags&gt;                E : message is also in the error log F : indicates a fatal error N :<br/>                         mail was sent to the system administrator (hardcoded as root)</p> <p>&lt;mid&gt;                   module ID number of source</p> <p>&lt;sid&gt;                   sub-ID number of source</p> <p>&lt;text&gt;                  formatted text of the trace message</p> <p>Once initiated, strace will continue to execute until terminated by the user.</p> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> A sample output of the strace command:</p> <p>The following example outputs all trace messages from the module or driver whose module ID is 41:</p> <pre>strace 41 all all</pre> <p>The following example outputs those trace messages from driver or module ID 41 with sub-IDs 0, 1, or 2:</p> <pre>strace 41 0 1 41 1 1 41 2 0</pre> <p>Messages from sub-IDs 0 and 1 must have a tracing level less than or equal to 1. Those from sub-ID 2 must have a tracing level of 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*STREAMS Programming Guide*

- NOTES**
- There is no restriction to the number of `strace` processes opening the STREAMS log driver at a time.
  - The log-driver records the list of the triplets specified in the command invocation, and compares each potential trace message against this list to decide if it should be formatted and sent up to the `strace` process. Hence, long lists of triplets will have a greater impact on overall STREAMS performance. Running `strace` will have the most impact on the timing of the modules and drivers generating the trace messages that are sent to the `strace` process. If trace messages are generated faster than the `strace` process can handle them, some of the messages will be lost. This last case can be determined by examining the sequence numbers on the trace messages output.

## strclean(1M)

| NAME           | strclean – STREAMS error logger cleanup program                                                                                                                                                                                                                                             |                |                 |              |         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| SYNOPSIS       | <b>strclean</b> [-a <i>age</i> ] [-d <i>logdir</i> ]                                                                                                                                                                                                                                        |                |                 |              |         |
| DESCRIPTION    | <i>strclean</i> is used to clean up the STREAMS error logger directory on a regular basis (for example, by using <i>cron</i> ). By default, all files with names matching <i>error.*</i> in <i>/var/adm/streams</i> that have not been modified in the last three days are removed.         |                |                 |              |         |
| OPTIONS        | <p>The following options are supported:</p> <p>-<i>age</i>                      The maximum age in days for a log file can be changed using the -a option.</p> <p>-<i>dlogdir</i>                  A directory other than <i>/var/adm/streams</i> can be specified using the -d option.</p> |                |                 |              |         |
| EXAMPLES       | <p><b>EXAMPLE 1</b> A sample of using the <i>strclean</i> command.</p> <p>This example has the same result as running <i>strclean</i> with no arguments:</p> <pre>example% strclean -d /var/adm/streams -a 3</pre>                                                                          |                |                 |              |         |
| FILES          | <i>/var/adm/streams/error.*</i>                                                                                                                                                                                                                                                             |                |                 |              |         |

| <b>DESCRIPTION</b> | <p>strerr receives error log messages from the STREAMS log driver (see log(7D)) and appends them to a log file. The resultant error log files reside in the directory <code>/var/adm/streams</code>, and are named <code>error.mm-dd</code>, where <i>mm</i> is the month and <i>dd</i> is the day of the messages contained in each log file.</p> <p>The format of an error log message is:</p> <pre>&lt;seq&gt; &lt;time&gt; &lt;ticks&gt; &lt;flags&gt; &lt;mid&gt; &lt;sid&gt; &lt;text&gt;</pre> <p>&lt;seq&gt;                    error sequence number</p> <p>&lt;time&gt;                   time of message in hh:mm:ss</p> <p>&lt;ticks&gt;                  time of message in machine ticks since boot priority level</p> <p>&lt;flags&gt;                  T : the message was also sent to a tracing process<br/>F : indicates a fatal error<br/>N : send mail to the system administrator (hardcoded as root)</p> <p>&lt;mid&gt;                    module ID number of source</p> <p>&lt;sid&gt;                    sub-ID number of source</p> <p>&lt;text&gt;                   formatted text of the error message</p> <p>Messages that appear in the error log are intended to report exceptional conditions that require the attention of the system administrator. Those messages which indicate the total failure of a STREAMS driver or module should have the F flag set. Those messages requiring the immediate attention of the administrator will have the N flag set, which causes the error logger to send the message to the system administrator using mail. The priority level usually has no meaning in the error log but will have meaning if the message is also sent to a tracer process.</p> <p>Once initiated, strerr continues to execute until terminated by the user. It is commonly executed asynchronously.</p> |                |                 |              |         |

strerr(1M)

**NOTES** | There is no restriction to the number of `strerr` processes opening the STREAMS log driver at a time.

If a module or driver is generating a large number of error messages, running the error logger will cause a degradation in STREAMS performance. If a large burst of messages are generated in a short time, the log driver may not be able to deliver some of the messages. This situation is indicated by gaps in the sequence numbering of the messages in the log files.

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| NAME        | sttydefs – maintain line settings and hunt sequences for TTY ports                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SYNOPSIS    | <pre> /usr/sbin/sttydefs -a ttylabel [-b] [-f final-flags] [-i initial-flags]                     [-n nextlabel]  /usr/sbin/sttydefs -l [ttylabel]  /usr/sbin/sttydefs -r ttylabel </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DESCRIPTION | <p>sttydefs is an administrative command that maintains the line settings and hunt sequences for the system's TTY ports by making entries in, and deleting entries from the <code>/etc/ttydefs</code> file.</p> <p>sttydefs with a <code>-a</code> or <code>-r</code> option may be invoked only by the super-user. sttydefs with <code>-l</code> may be invoked by any user on the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OPTIONS     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li><code>-a ttylabel</code>                      Add a record to the <code>tttydefs</code> file, using <i>tttylabel</i> as its label. The following describes the effect of the <code>-b</code>, <code>-n</code>, <code>-i</code>, or <code>-f</code> options when used in conjunction with the <code>-a</code> option:</li> <li><code>-b</code>                                      Enable autobaud. Autobaud allows the system to set the line speed of a given TTY port to the line speed of the device connected to the port without the user's intervention.</li> <li><code>-f final-flags</code>                      Specify the value to be used in the <i>final-flags</i> field in <code>/etc/ttydefs</code>. <i>final-flags</i> must be in a format recognized by the <code>stty</code> command. <i>final-flags</i> are the <code>termio(7I)</code> settings used by <code>ttymon</code> after receiving a successful connection request and immediately before invoking the service on the port. If this option is not specified, sttydefs will set <i>final-flags</i> equal to the <code>termio(7I)</code> flags <code>9600</code> and <code>sane</code>.</li> <li><code>-i initial-flags</code>                      Specify the value to be used in the <i>initial-flags</i> field in <code>/etc/ttydefs</code>. <i>initial-flags</i> must be in a format recognized by the <code>stty</code> command. These flags are used by <code>ttymon</code> when searching for the correct baud rate. They are set prior to writing the prompt. If this option is not specified, sttydefs will set <i>initial-flags</i> equal to the <code>termio(7I)</code> flag <code>9600</code>.</li> <li><code>-n nextlabel</code>                          Specify the value to be used in the <i>nextlabel</i> field in <code>/etc/ttydefs</code>. If this option is not specified, sttydefs will set <i>nextlabel</i> equal to <i>tttylabel</i>.</li> <li><code>-l[ttylabel]</code>                          If a <i>tttylabel</i> is specified, sttydefs displays the record from <code>/etc/ttydefs</code> whose TTY label matches the specified <i>tttylabel</i>. If no <i>tttylabel</i> is specified, sttydefs</li> </ul> |

## sttydefs(1M)

|                | <p>displays the entire contents of <code>/etc/ttydefs</code>.<br/><code>sttydefs</code> verifies that each entry it displays is correct and that the entry's <i>nextlabel</i> field references an existing</p> <p><code>-r <i>ttlabel</i></code> Remove any record in the <code>tttydefs</code> file that has <i>ttlabel</i> as its label.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |         |

| SYNOPSIS    | <b>su</b> [-] [ <i>username</i> [ <i>arg...</i> ]]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DESCRIPTION | <p>The su command allows one to become another user without logging off or to assume a role. The default user <i>name</i> is root (super user).</p> <p>To use su, the appropriate password must be supplied (unless the invoker is already root). If the password is correct, su creates a new shell process that has the real and effective user ID, group IDs, and supplementary group list set to those of the specified <i>username</i>. Additionally, the new shell's project ID is set to the default project ID of the specified user. See <code>getdefaultproj(3PROJECT)</code>, <code>setproject(3PROJECT)</code>. The new shell will be the shell specified in the shell field of <i>username</i>'s password file entry (see <code>passwd(4)</code>). If no shell is specified, <code>/usr/bin/sh</code> is used (see <code>sh(1)</code>). If superuser privilege is requested and the shell for the superuser cannot be invoked using <code>exec(2)</code>, <code>/sbin/sh</code> is used as a fallback. To return to normal user ID privileges, type an EOF character (CTRL-D) to exit the new shell.</p> <p>Any additional arguments given on the command line are passed to the new shell. When using programs such as sh, an <i>arg</i> of the form <code>-c string</code> executes <i>string</i> using the shell and an <i>arg</i> of <code>-r</code> gives the user a restricted shell.</p> <p>The following statements are true if the login shell is <code>/usr/bin/sh</code> or an empty string (which defaults to <code>/usr/bin/sh</code>) in the specific user's password file entry. If the first argument to su is a dash (-), the environment will be changed to what would be expected if the user actually logged in as the specified user. Otherwise, the environment is passed along, with the exception of <code>\$PATH</code>, which is controlled by <code>PATH</code> and <code>SUPATH</code> in <code>/etc/default/su</code>.</p> <p>All attempts to become another user using su are logged in the log file <code>/var/adm/sulog</code> (see <code>sulog(4)</code>).</p> |
| SECURITY    | <p>su uses <code>pam(3PAM)</code> for authentication, account management, and session management.</p> <p>The PAM configuration policy, listed through <code>/etc/pam.conf</code>, specifies the modules to be used for su. The following example shows a partial <code>pam.conf</code> file with entries for the su command using the authentication, account management, and session management module.</p> <pre> su    auth      requisite    pam_authtok_get.so.1 su    auth      required    pam_dhkeys.so.1 su    auth      required    pam_unix_auth.so.1  su    account   required    pam_unix_roles.so.1 su    account   required    pam_unix_projects.so.1 su    account   required    pam_unix_account.so.1  su    session   required    pam_unix_session.so.1 </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | If there are no entries for the <code>su</code> service, then the entries for the other service will be used. If multiple authentication modules are listed, then the user may be prompted for multiple passwords.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| ENVIRONMENT VARIABLES | Variables with <code>LD_</code> prefix are removed for security reasons. Thus, <code>su bin</code> will not retain previously exported variables with <code>LD_</code> prefix while becoming user <code>bin</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                       | If any of the <code>LC_*</code> variables ( <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , <code>LC_TIME</code> , <code>LC_COLLATE</code> , <code>LC_NUMERIC</code> , and <code>LC_MONETARY</code> ) (see <code>environ(5)</code> ) are not set in the environment, the operational behavior of <code>su</code> for each corresponding locale category is determined by the value of the <code>LANG</code> environment variable. If <code>LC_ALL</code> is set, its contents are used to override both the <code>LANG</code> and the other <code>LC_*</code> variables. If none of the above variables are set in the environment, the "C" (U.S. style) locale determines how <code>su</code> behaves. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                       | <code>LC_CTYPE</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Determines how <code>su</code> handles characters. When <code>LC_CTYPE</code> is set to a valid value, <code>su</code> can display and handle text and filenames containing valid characters for that locale. <code>su</code> can display and handle Extended Unix Code (EUC) characters where any individual character can be 1, 2, or 3 bytes wide. <code>su</code> can also handle EUC characters of 1, 2, or more column widths. In the "C" locale, only characters from ISO 8859-1 are valid. |
|                       | <code>LC_MESSAGES</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Determines how diagnostic and informative messages are presented. This includes the language and style of the messages, and the correct form of affirmative and negative responses. In the "C" locale, the messages are presented in the default form found in the program itself (in most cases, U.S. English).                                                                                                                                                                                   |
| FILES                 | <code>\$HOME/.profile</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | user's login commands for <code>sh</code> and <code>ksh</code>                                                                                                                                                                                                                                                                                                                                                                                                                                     |

sulogin(1M)

NAME | sulogin – access single-user mode

SYNOPSIS `sulogin`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DESCRIPTION</b> | <p>The <code>sulogin</code> utility is automatically invoked by <code>init</code> when the system is first started. It prompts the user to type the root password to enter system maintenance mode (single-user mode) or to type EOF (typically CTRL-D) for normal startup (multi-user mode). The user should never directly invoke <code>sulogin</code>.</p> <p>The <code>sulogin</code> utility can prompt the user to enter the root password on a variable number of serial console devices, in addition to the traditional console device. See <code>consadm(1M)</code> and <code>msglog(7D)</code> for a description of how to configure a serial device to display the single-user login prompt.</p> |

| DESCRIPTION    | <p>suninstall is a forms-based subsystem for installing the operating system.</p> <p>suninstall only exists on the Solaris CD-ROM and should only be invoked from there. Refer to the installation manual for more details.</p> <p>suninstall allows installation of the operating system onto any stand-alone system. suninstall loads the software available on the CD-ROM. Refer to the installation manual for disk space requirements.</p> <p>To abort the installation procedure, use the interrupt character (typically, CTRL-C).</p> |                |                 |              |                        |
| USAGE          | Refer to the installation manual for more information on the various menus and selections.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                 |              |                        |

| DESCRIPTION | <p>SUNWgfb_config is the Sun XVR-1000 Graphics Accelerator device dependent layer for fbconfig(1M). It configures the Sun XVR-1000 Graphics Accelerator and some of the X11 window system defaults. The device can drive two monitors, each with a unique video stream (called stream a and stream b).</p> <p>The first form of SUNWgfb_config shown in the synopsis above sets card options, which are options common to both stream a and stream b, and apply to the entire card.</p> <p>The second form is used to set stream options, which are options specific to either stream a or stream b. The second form usage requires the -stream option to define which stream is affected.</p> <p>Both the first form and the second form store the specified options in the OWconfig file. These options will be used to initialize the device the next time the window system is run on that device. Updating options in the OWconfig file provides persistence of these options across window system sessions and system reboots. For -res now, -try, -slave, -master, -port, and -g, the device will be immediately programmed.</p> <p>The third form, which invokes the -defaults option, sets all card options and all stream options to their default values.</p> <p>The fourth form, which invokes the -prconf, -propt, and -res \? options, queries the device for status that is card-specific.</p> <p>The fifth form, which invokes the -help, and -list options, provides instruction on using SUNWgfb_config and a list of available devices. Additionally for the fifth form, all other options are ignored.</p> |

You can specify options for only one device at a time. Specifying options for multiple devices requires multiple invocations of `SUNWgfb_config`.

Only Sun XVR-1000 Graphics Accelerator-specific options can be specified through `SUNWgfb_config`. The normal window system options for specifying default depth, default visual class, and so forth are still specified as device modifiers on the command line when the X server is started.

You can also specify the `OWconfig` file that is to be updated. By default, the machine-specific file in the `/etc/openwin` directory tree is updated. You can use the `-file` option to specify an alternate file. For example, the system-global `OWconfig` file in the `/usr/openwin` directory tree can be updated instead.

## GENERAL OPTIONS

`-dev device-filename`

Specifies the device's special file. The default is `/dev/fb`.

`-file machine | system`

Specifies which `OWconfig` file to update. If `machine`, the machine-specific `OWconfig` file in the `/etc/openwin` directory tree is used. If `system`, the global `OWconfig` file in the `/usr/openwin` directory tree is used. If the file does not exist, it is created.

`-res video-mode [ now | try [ noconfirm ] ]`

Specifies the video mode used to drive the monitor connected to the specified device. If `-res` is invoked without specifying `-stream`, then the last setting for `-active` will determine which *video-mode* value(s) are modified. If `-active` is set to both or auto, then both stream *video-mode* values will be modified.

The *video-mode* argument specifies resolution and timing information for the display (for example, `SUNW_STD_1280x1024x76`). The naming convention for the *video-mode* specifier is: `< origin >_< type >_< width >x< height >x< rate >`. The elements of the specifier are described as follows:

*origin*

This can be one of:

- SUNW, Sun derived resolution
- VESA, Video Electronics Standards Association-derived resolution
- other, other source

*type*

This can be one of:

- STD, normal resolution, usable by most display devices
- DIG, resolution tuned only for LCD flat panels
- INT, interlaced
- STEREO, stereo

*width*

screen width in pixels

*height*

screen height in pixels

## SUNWgfb\_config(1M)

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| rate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | vertical frequency of the screen refresh                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>Note that some video-modes supported by the device, might not be supported by the monitor. The list of video-modes supported by the device and the monitor can be obtained by running <code>SUNWgfb_config</code> with the <code>-res \?</code> option (the fourth form shown in the command synopsis above).</p> <p>The <code>-res</code> option also accepts additional, optional arguments, listed below, immediately following the video mode specification. Either <code>now</code> or <code>try</code> (<code>try</code> subsumes <code>now</code>) and <code>noconfirm</code> can be present.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| now                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>If present, not only is the video mode be updated in the <code>OWconfig</code> file, but the device is immediately programmed to display this video mode. This is useful for changing the video mode before starting the window system.</p> <p><b>Note</b> – It is recommended that you not use this suboption with <code>SUNWgfb_config</code> while the configured device is being used (for example, while running the window system). Unpredictable results can occur. To run <code>SUNWgfb_config</code> with the <code>now</code> suboption, first bring the window system down. If the <code>now</code> suboption is used within a window system session, the video mode is changed immediately, but the width and height of the affected screen do not change until the window system is exited and reentered. In addition, the system might not recognize changes in stereo mode.</p> |
| noconfirm                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Using the <code>-res</code> option, the user can put the system into an unusable state, with no video output. To reduce the chance of this, the default behavior of <code>SUNWgfb_config</code> is to display a warning message and to ask the user whether to continue. The <code>noconfirm</code> bypasses this confirmation. This option is useful when <code>SUNWgfb_config</code> is being run from a shell script.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| try                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>If present, the specified video mode will be programmed on a trial basis. The user is asked to confirm the video mode by typing <code>y</code> within 10 seconds. Alternatively, the user can terminate the trial before 10 seconds elapse by typing any character other than <code>y</code> or carriage return. Such input is considered a no and the previous video mode is restored. With a negative response, <code>SUNWgfb_config</code> does not change the video mode in the <code>OWconfig</code> file; other options specified still take effect. If a carriage return is typed, the user is asked (<code>y</code> or <code>n</code>) whether to keep the new video mode. The <code>try</code> suboption implies the <code>now</code> suboption. See the warning note in the description of the <code>now</code> suboption, above.</p>                                                |
| -defaults                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Resets all option values to their default values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**-propt**

Displays the current values of all options in the OWconfig file specified by the -file option for the device specified by the -dev option. Displays the values of options as they will be in the OWconfig file after the call to SUNWgfb\_config completes. The following is an example display:

```
--- OpenWindows Configuration for /dev/fbs/gfb0 ---
OWconfig: machine
Active Streams: both
Samples Per Pixel: 2
Multisample Allocation Model: static
Multisample Mode: auto
Doublewide: disable
Gamma Correction Value: 2.22

--- OpenWindows Configuration for Stream a ---
Video Mode: SUNW_STD_1280x1024x76

--- OpenWindows Configuration for Stream b ---
Video Mode: VESA_STD_640x480x60
```

**-prconf**

Displays the XVR-1000 hardware configuration. The following is an example display:

```
--- Hardware Configuration for /dev/fb (SUNWgfb0) ---
Type: Sun Graphics Accelerator
Part: 501-5865
Memory:
 MAJC: 32MB
 Texture: 256MB total
 3DRAM64: 5.0M pixels

Versions: FCode 1.14 MCode 0.19 MAJC 2.1 FBC3 3.0 XChip 2.0

Video Streams:
 Stream a
 Current resolution Setting: SUNW_STD_1280x1024x76
 Monitor/EDID data (13W3)
 Monitor Manufacturer: SUN
 Monitor Name: GDM-5410
 EDID: Version 1, Revision 2
 Stream b
 Current resolution Setting: VESA_STD_640x480x60
 Port: svideo
```

**-help**

Displays a list of the SUNWgfb\_config command line options, along with a brief explanation of each.

**-res \?**

Displays list of defined *video-mode* names.

**CARD OPTIONS****-active a | b | both | auto**

Specifies which streams are enabled. both select both streams. The default is auto, which means whichever stream is chosen by the console.

## SUNWgfb\_config(1M)

```
-multisample enable | disable | auto
[static | dynamic]
```

The suboptions for `-multisample` are described as follows:

`disable`  
No multisample is possible.

`enable`  
Multisample is possible but is selected on a per-application basis.

`auto`  
All Sun OpenGL applications are rendered using multisampling.

`static`  
Multisample allocation occurs at X startup/config load time. The config *samples\_per-pixel* or *max* parameter specifies the depth that is pre-allocated.

`dynamic`  
OpenGL tasks allocate buffers themselves.

```
-samples samples_per-pixel
```

Specifies the number of samples/pixel to pre-allocate in static mode. Provides a hint to OpenGL in dynamic mode. The allowable choices for *samples\_per-pixel* are 2, 3, 4, 5, 6, 8, 10, 16, and max. The default is max, which means to use the maximum number of samples that can be supported with the amount of memory available.

```
-doublewide enable | disable | reverse
```

This option makes it easy for you to combine both streams into one virtual display. If you specify `enable`, stream a is to the left of stream b. If `reverse` is specified, stream b is to the left of stream a. Both will be the same resolution defined with the `-res` option. If you specify `disable`, only one stream will be enabled.

```
-g gamma-correction value
```

This option changes the gamma correction value. By default the gamma correction value is 2.22. Any value less than zero is illegal. This option can be used while the window system is running. Changing the gamma correction value will affect all the windows being displayed using gamma-corrected visuals. The gamma correction value is also saved in the `OWconfig` file for the next time the window system starts.

```
-gfile gamma-correction file
```

This option loads the gamma correction table from the specified file. This file should be formatted to provide the gamma correction values for R, G and B channels on each line. Each of these values should be in hexadecimal format and separated from each other by at least one space. This file should provide 1024 such triplets. An example of this file is as follows:

```
0x000 0x000 0x000
0x001 0x001 0x001
0x002 0x002 0x002
...
...
0x3ff 0x3ff 0x3ff
```

**STREAM  
OPTIONS**

Using this option, the gamma correction table can be loaded while the window system is running. The new gamma correction will affect all the windows being displayed using gamma-corrected visuals. Note, when gamma correction is being done using a user-specified table, the gamma correction value is undefined. By default, the window system assumes a gamma correction value of 2.22 and loads the gamma table it creates corresponding to this value.

**-master a | b | input**

This option controls the setting frame pins on the stereo/sync connector on the device. It also controls which stream drives stereo glasses, which attach to the same connector.

If a or b is selected, the card is setup to be a sync master, and the frame sync signal from the corresponding stream will be sent out this connector.

If you select input, the card is setup to take its frame sync from another card through this connector. This sync can then be used to sync either or both streams by setting the stream-specific **-slave** option(s) to external.

If stereo glasses are used, the a or b options select which stream is used for the sync signal to the glasses.

**-buffer size [ width height ] | auto**

Explicitly allows you to specify size of managed area, which occupies all or a portion of the device's 3D RAM. The default is auto, that is, to automatically size the buffer based on the current stream resolutions. This should be sufficient for most users.

**-stream a | b**

Specifies for which stream options will be set. It is a required option for each of the other options in this section. It is optional for **-res**. Only one **-stream** option can be specified.

**-port hd15 | dvid | svideo | auto**

Directs stream b to the appropriate output connector: hd-15, dvid, or svideo. If auto, then the output connector for stream b is selected by the console. Stream a is always output through the 13W3 connector.

**-tile [ lr | ll | rl | rr ]**

**[ tt | tb | bb | bt ]**

**[ stra | strb | buff ]**

Stream-specific option aligns display of child stream (specified by **-stream**) relative to parent. Sub-options are as follows:

ll        Align child left edge with parent left edge.

lr        Align child left edge with parent right edge.

rr        Align child right edge with parent right edge.

rl        Align child right edge with parent left edge.

tt        Align child top edge with parent top edge.

## SUNWgfb\_config(1M)

|      |                                                  |
|------|--------------------------------------------------|
| tb   | Align child top edge with parent bottom edge.    |
| bb   | Align child bottom edge with parent bottom edge. |
| bt   | Align child bottom edge with parent top edge.    |
| stra | Parent is stream a; child must be stream b.      |
| strb | Parent is stream b; child must be stream a.      |
| buff | Parent is buffer.                                |

An error is returned if parent and child are one in the same (for example, `-stream a -tile ll tt stra`). The default values are the same as the settings for `-doublewide`; stream a is set to `ll tt buff`, and stream b is set to `lr tt stra`.

`-offset` *xoff-value* | *yoff-value*

Offsets display of child stream (specified by `-stream`) relative to parent and child alignment edges specified by `-tile`.

*xoff-value*      Number of pixels offset in horizontal direction. Positive direction is right; negative is left. Default is 0, which means the two edges touch.

*yoff-value*      Number of pixels offset in vertical direction. Positive direction is up; negative is down. Default is 0, which means the two edges touch.

`-slave` [ *enable* | *disable* ] [ *internal* | *external* ]

This option allows you to specify the sync source for the specified stream.

*internal* indicates that the sync source is the other stream of this device.

*external* indicates the sync is taken from a source outside the device. If you use *external*, you also need to use the card option `-master input`.

### DEFAULTS

For a given invocation of `SUNWgfb_config`, if an option does not appear on the command line, the corresponding `OWconfig` option is not updated. It retains its previous value.

When the window system is run, if an option has never been specified through `SUNWgfb_config`, a default value is used. The option defaults are as follows:

| Option                    | Default                        |
|---------------------------|--------------------------------|
| <code>-dev</code>         | <code>/dev/fb</code>           |
| <code>-file</code>        | <code>machine</code>           |
| <code>-res</code>         | <code>none</code>              |
| <code>-samples</code>     | <code>max</code>               |
| <code>-multisample</code> | <code>enable/dynamic</code>    |
| <code>-clearpixel</code>  | <code>255</code>               |
| <code>-slave</code>       | <code>disabled/external</code> |

|             |                                                        |
|-------------|--------------------------------------------------------|
| -doublewide | not set                                                |
| -g          | 2.22                                                   |
| -active     | auto                                                   |
| -port       | auto                                                   |
| -tile       | ll/tt/buff (for stream a)<br>lr/tt/stra (for stream b) |
| -offset     | 0/0                                                    |

The default for the `-res` option of `none` means that, when the window system is run, the screen resolution will be the video mode that is currently programmed in the device. This provides compatibility for users who are used to specifying the device resolution through the PROM.

**Note** – Some devices (for example, GX) do not support changing the video mode defaults through software. This means that the PROM ultimately determines the default video mode.

#### EXAMPLES **EXAMPLE 1** Switching Resolution of a Monitor

The following example switches to the resolution of 1280 by 1024 at 76 Hz:

```
example% fbconfig -stream a -res -SUNW_STD_1280x1024x76
```

**FILES** `/usr/lib/fbconfig/SUNWgfb_config`  
device special file

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWgfbcf       |

**SEE ALSO** `fbconfig(1M)`, `attributes(5)`

See the `dtlogin(1)` man page in the CDE man page collection. Also useful is the `Xsun(1)` man page in the OpenWindows man page collection.

## SUNWifb\_config(1M)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>DESCRIPTION</b> | <p>SUNWifb_config configures the Sun Expert3D Graphics Accelerator, Sun Expert3D-Lite, and Sun XVR-500 Graphics Accelerators, and some of the X11 window system defaults for the graphics accelerator.</p> <p>The first form of SUNWifb_config shown in the synopsis above stores the specified options in the OWconfig file. These options will be used to initialize the Sun Expert3D device the next time the window system is run on that device. Updating options in the OWconfig file provides persistence of these options across window system sessions and system reboots.</p> <p>The second and third forms of SUNWifb_config, which invoke only the -prconf, -propt, -help, and -res \? options, do not update the OWconfig file. Additionally, for the third form of the command, all other options are ignored.</p> <p>Options may be specified for only one Sun Expert3D device at a time. Specifying options for multiple Sun Expert3D devices requires multiple invocations of SUNWifb_config.</p> <p>Only options specific to the Sun Expert3D device can be specified through SUNWifb_config. The normal window system options for specifying default depth, default visual class and so forth are still specified as device modifiers on the openwin command line (see the Xsun(1) manual page in the OpenWindows Desktop Reference Manual).</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-dev <i>device-filename</i><br/>Specifies the Sun Expert3D special file. The default is /dev/fbs/ifb0.</li> <li>-file machine   system<br/>Specifies which OWconfig file to update. If machine, the machine-specific OWconfig file in the /etc/openwin directory tree is used. If system, the global OWconfig file in the /usr/openwin directory tree is used. If the file does not exist, it is created.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**-res *video-mode***

Specifies the video mode used to drive the monitor connected to the specified Sun Expert3D device.

The format of these built-in video modes is:

*widthxheightxrate*

where *width* is the screen width in pixels, *height* is the screen height in pixels, and *rate* is the vertical frequency of the screen refresh. The *s* suffix of 960x680x112*s* and 960x680x108*s* means that these are stereo video modes. The *i* suffix of 640x480x60*i* and 768x575x50*i* designates interlaced video timing. If absent, non-interlaced timing will be used. As a convenience, -res also accepts formats with @ (at sign) in front of the refresh rate instead of x. For example: 1280x1024@76. Note that some video-modes supported by the Sun Expert3D device might not be supported by the monitor. The list of video-modes supported by the Sun Expert3D device and the monitor can be obtained by running SUNWifb\_config with the -res \? option (shown in the command synopsis above). The following is a list of all possible video-modes supported on the Sun Expert3D device:

```
1024x768x60
1024x768x70
1024x768x75
1024x768x75
1024x768x77
1024x800x84
1152x900x66
1152x900x76
1280x800x76
1280x1024x60
1280x1024x67
1280x1024x76
1280x1024x85
1280x1024x112s (Stereo)
960x680x112s (Stereo)
960x680x108s (Stereo)
640x480x60
640x480x60i (Interlaced)
768x575x50i (Interlaced)
1440x900x76
1600x1000x66
1600x1000x76
```

## SUNWifb\_config(1M)

### Symbolic names

1600x1280x76  
1792x1344x75  
1920x1080x72  
1920x1200x70  
1920x1200x75

For convenience, some of the above video modes have symbolic names defined for them. Instead of the form *width x height x rate*, one of these names may be supplied as the argument to *-res*. The meaning of the symbolic name *none* is that when the window system is run the screen resolution will be the video mode that is currently programmed in the device.

| Name   | Corresponding Video Mode |
|--------|--------------------------|
| svga   | 1024x768x60              |
| 1152   | 1152x900x76              |
| 1280   | 1280x1024x76             |
| stereo | 960x680x112s             |
| ntsc   | 640x480x60i              |
| pal    | 768x575x50i              |
| none   | (see text above)         |

The *res* option also accepts additional, optional arguments immediately following the video mode specification. Any or all of the following might be present.

### now

If present, not only will the video mode be updated in the *OWconfig* file, but the Sun Expert3D device will be immediately programmed to display this video mode. (This is useful for changing the video mode before starting the window system).

Note that it is inadvisable to use this suboption with *SUNWifb\_config* while the configured device is being used (for example, while running the window system); unpredictable results might occur. To run *SUNWifb\_config* with the *now* suboption, first bring the window system down. If the *now* suboption is used within a window system session, the video mode will be changed immediately, but the width and height of the affected screen will not change until the window system is exited and reentered again. In addition, the system may not recognize changes in stereo mode. Consequently, this usage is strongly discouraged.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| noconfirm                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Using the <code>-res</code> option, the user could potentially put the system into an unusable state, a state where there is no video output. This can happen if there is ambiguity in the monitor sense codes for the particular code read. To reduce the chance of this, the default behavior of <code>SUNWifb_config</code> is to print a warning message to this effect and to prompt the user to find out if it is okay to continue. The <code>noconfirm</code> option instructs <code>SUNWifb_config</code> to bypass this confirmation and to program the requested video mode anyway. This option is useful when <code>SUNWifb_config</code> is being run from a shell script.                                                                                              |
| nocheck                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | If present, the normal error checking based on the monitor sense code (described above) will be suspended. The video mode specified by the user will be accepted regardless of whether it is appropriate for the currently attached monitor. (This option is useful if a different monitor is to be connected to the Sun Expert3D device). Use of this option implies <code>noconfirm</code> as well.                                                                                                                                                                                                                                                                                                                                                                               |
| try                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | If present, the specified video mode will be programmed on a trial basis. The user will be asked to confirm the video mode by typing <code>y</code> within 10 seconds. Or the user may terminate the trial before 10 seconds are up by typing any character. Any character other than <code>y</code> or carriage return is considered a "no" and the previous video mode will be restored and <code>SUNWifb_config</code> will not change the video mode in the <code>OWconfig</code> file (other options specified will still take effect). If a carriage return is typed, the user is prompted for a yes or no answer on whether to keep the new video mode. This option implies the <code>now</code> suboption (see the warning paragraph under the <code>now</code> suboption). |
| <code>-deflinear true   false</code><br>The Sun Expert3D device possesses two types of visuals: linear and nonlinear. Linear visuals are gamma corrected and nonlinear visuals are not. There are two visuals that have both linear and nonlinear versions: 24-bit TrueColor and 8-bit StaticGray. If <code>true</code> , the default visual is set to the linear visual that satisfies other specified default visual selection options (specifically, the <code>Xsun(1) -defdepth</code> and <code>-defclass</code> options described in the OpenWindows Desktop Reference Manual). If <code>false</code> , or if there is no linear visual that satisfies the other default visual selection options, the non-linear visual specified by these other options will be chosen to be the default. This option cannot be used when the <code>-defoverlay</code> option is present, because the Sun Expert3D does not possess a linear overlay visual. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## SUNWifb\_config(1M)

`-defoverlay true | false`

The Sun Expert3D device provides an 8-bit PseudoColor visual whose pixels are disjoint from the rest of the Sun Expert3D visuals. This is called the overlay visual. Windows created in this visual will not damage windows created in other visuals. The converse, however, is not true. Windows created in other visuals will damage overlay windows. If the value of this option is `true`, the overlay visual will be made the default visual. If `false`, the nonoverlay visual that satisfies the other default visual selection options, such as `-defdepth` and `-defclass`, will be chosen as the default visual. See the `Xsun(1)` manual page in the OpenWindows Desktop Reference Manual. Whenever `-defoverlay true` is used, the default depth and class chosen on the `openwin` command line must be 8-bit PseudoColor. If not, a warning message will be printed and the `-defoverlay` option will be treated as `false`. This option cannot be used when the `-deflinear` option is present, because the Sun Expert3D device does not possess a linear overlay visual.

`-linearorder first | last`

If `first`, linear visuals will come before their non-linear counterparts on the X11 screen visual list for the Sun Expert3D screen. If `last`, the nonlinear visuals will come before the linear ones.

`-overlayorder first | last`

If `-first`, the depth 8 PseudoColor Overlay visual will come before the non-overlay visual on the X11 screen visual list for the Sun Expert3D screen. If `last`, the non-overlay visual will come before the overlay one.

`-expvis enable | disable`

If enabled, OpenGL Visual Expansion will be activated. Multiple instances of selected visual groups (8-bit PseudoColor, 24-bit TrueColor, and so forth) can be found in the screen visual list.

`-slave enable | disable`

If enabled, the video for this frame buffer will be synced with the video of the display which is connected to it. For applications which support it buffers will also be swapped synchronously.

`-accum enable | disable`

If enabled, frame buffer memory is allocated for accelerated accumulation buffer for windows. If disabled, software accumulation buffering will be done for windows. Accelerated accumulation buffers for pBuffers are always available as memory allows.

`-g gamma-correction_value`

This option allows changing the gamma correction value. All linear visuals provide gamma correction. By default the gamma correction value is 2.22. Any value less than zero is illegal. The gamma correction value is applied to the linear visual, which then has an effective gamma value of 1.0, which is the value returned by `XSolarisGetVisualGamma()`. See `XSolarisGetVisualGamma(3)` for a description of that function. This option can be used while the window system is running. Changing the gamma correction value will affect all the windows being displayed using the linear visuals.

**-gfile *gamma-correction\_file***

This option loads gamma correction table from the specified file. This file should be formatted to provide the gamma correction values for R, G and B channels on each line. Each of these values should be in hexadecimal format and separated from each other by at least one space. Also, this file should provide 1024 such triplets. An example of this file is as follows.

```
0x00 0x00 0x000
0x01 0x01 0x001
0x02 0x02 0x002
...
...
0x3ff 0x3ff 0x3ff
```

Using this option, the gamma correction table can be loaded while the window system is running. The new gamma correction will affect all the windows being displayed using the linear visuals. Note that, when gamma correction is being done using a user-specified table, the gamma correction value is undefined. By default, the window system assumes a gamma correction value of 2.22 and loads the gamma table it creates corresponding to this value.

**-defaults**

Resets all option values to their default values.

**-propt**

Prints the current values of all Sun Expert3D options in the OWconfig file specified by the -file option for the device specified by the -dev option. Prints the values of options as they will be in the OWconfig file after the call to SUNWifb\_config completes. This is a typical display:

```
--- OpenWindows Configuration for /dev/fbs/ifb0 ---
OWconfig: machine
Video Mode: 1280x1024x76
Accum: Disabled (do not allocate an accumulation buffer)
Default Visual: Non-Linear Normal Visual
Visual Ordering: Linear Visuals are last
 Overlay Visuals are last
OpenGL Visual Expansion: enabled
Gamma Correction Value: 2.22
Gamma Correction Table: Available
```

**-prconf**

Prints the Sun Expert3D hardware configuration. This is a typical display:

```
--- Hardware Configuration for /dev/fbs/ifb0 ---
PROM Information: @(#)ifb.fth 1.25 99/10/12 SMI
EDID Data: Available - EDID version 1 revision 1
Monitor possible resolutions: 1024x768x60, 1024x768x70, 1024x768x75,
1152x900x66, 1152x900x76, 1280x1024x67, 1280x1024x76, 960x680x112s,
640x480x60
Current resolution setting: 1280x1024x76
```

## SUNWifb\_config(1M)

### -help

Prints a list of the `SUNWifb_config` command-line options, along with a brief explanation of each.

### -samples 1 | 2 | 4 | 8 | 16

Requested number of samples to compute per display pixel. The requested number of samples per pixel will be used if `-multisample` is not disabled and resources exist for the request.

Query the number of samples used with `-propt` (see above) or the `xglnfo` utility. The `xglnfo` utility can return the number of multisamples after you specify the option `-multisample enable`.

The default is 16.

### -multisample enable | disable | auto

If set to `disable`, no multisample is possible. If set to `enable`, multisample is possible but is selected on a per-window basis using a library interface. If set to `auto`, all Sun OpenGL windows are rendered using multisampling.

Query the number of samples used with `-propt` (see above) or the `xglnfo` utility. The `xglnfo` utility can return the number of multisamples if `-multisample` is set to `enable`.

The default is `disable`.

The `xglnfo` utility is shipped with the Sun OpenGL package, `SUNWglrt`. The man page for `xglnfo` is part of another Sun OpenGL package, `SUNWgldoc`.

## DEFAULTS

For a given invocation of `SUNWifb_config` command line if an option does not appear on the command line, the corresponding `OWconfig` option is not updated; it retains its previous value. When the window system is run, if an Sun Expert3D option has never been specified via `SUNWifb_config`, a default value is used. The option defaults are as follows:

| Option                     | Default                    |
|----------------------------|----------------------------|
| <code>-dev</code>          | <code>/dev/fbs/ifb0</code> |
| <code>-file</code>         | <code>machine</code>       |
| <code>-res</code>          | <code>none</code>          |
| <code>-deflinear</code>    | <code>false</code>         |
| <code>-defoverlay</code>   | <code>false</code>         |
| <code>-linearorder</code>  | <code>last</code>          |
| <code>-overlayorder</code> | <code>last</code>          |
| <code>-expvis</code>       | <code>enable</code>        |
| <code>-slave</code>        | <code>disable</code>       |
| <code>-accum</code>        | <code>enable</code>        |
| <code>-g</code>            | <code>2.22</code>          |
| <code>-samples</code>      | <code>16</code>            |
| <code>-multisample</code>  | <code>disable</code>       |

## SUNWifb\_config(1M)

The default for the `-res` option of none means that, when the window system is run, the screen resolution will be the video mode that is currently programmed in the device. This design choice provides compatibility for users who are used to specifying the device resolution through the PROM. On some devices (for example, GX), this is the only way of specifying the video mode. This means that the PROM ultimately determines the default Sun Expert3D video mode.

### EXAMPLES **EXAMPLE 1** Changing Monitor Resolution

The following example switches the monitor type to the resolution of 1280 x 1024 at 76 Hz:

```
example% /usr/lib/fbconfig/SUNWifb_config -res 1280x1024x76
```

**FILES** `/dev/fbs/ifb0` device special file

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWifbcf       |

| NAME        | swap – swap administrative interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SYNOPSIS    | <pre>/usr/sbin/swap -a swapname [swaplow] [swaplen] /usr/sbin/swap -d swapname [swaplow] /usr/sbin/swap -l /usr/sbin/swap -s</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DESCRIPTION | The swap utility provides a method of adding, deleting, and monitoring the system swap areas used by the memory manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OPTIONS     | <p>The following options are supported:</p> <p><i>-a swapname</i>      Add the specified swap area. This option can only be used by the super-user. <i>swapname</i> is the name of the swap file: for example, <i>/dev/dsk/c0t0d0s1</i> or a regular file. <i>swaplow</i> is the offset in 512-byte blocks into the file where the swap area should begin. <i>swaplen</i> is the desired length of the swap area in 512-byte blocks. The value of <i>swaplen</i> can not be less than 16. For example, if <i>n</i> blocks are specified, then (<i>n</i>-1) blocks would be the actual swap length. <i>swaplen</i> must be at least one page in length. The size of a page of memory can be determined by using the <i>pagesize</i> command. See <i>pagesize(1)</i>. Since the first page of a swap file is automatically skipped, and a swap file needs to be at least one page in length, the minimum size should be a multiple of 2 <i>pagesize</i> bytes. The size of a page of memory is machine dependent.</p> <p><i>swaplow + swaplen</i> must be less than or equal to the size of the swap file. If <i>swaplen</i> is not specified, an area will be added starting at <i>swaplow</i> and extending to the end of the designated file. If neither <i>swaplow</i> nor <i>swaplen</i> are specified, the whole file will be used except for the first page. Swap areas are normally added automatically during system startup by the <i>/sbin/swapadd</i> script. This script adds all swap areas which have been specified in the <i>/etc/vfstab</i> file; for the syntax of these specifications, see <i>vfstab(4)</i>.</p> <p>To use an NFS or local file-system <i>swapname</i>, you should first create a file using <i>mkfile(1M)</i>. A local file-system swap file can now be added to the running system by just running the <i>swap -a</i> command. For NFS mounted swap files, the server needs to export the file. Do this by performing the following steps:</p> <ol style="list-style-type: none"><li>1. Add the following line to <i>/etc/dfs/dfstab</i>:</li></ol> <pre>share -F nfs -o rw=clientname , root=clientname path-to-swap-file</pre> |

2. Run `shareall(1M)`.
3. Have the client add the following lines to `/etc/vfstab`:

```
server:path-to-swap-file - local-path-to-swap-file fs - - -
local-path-to-swap-file - - swap - - -
```

4. Have the client run `mount`:

```
mount local-path-to-swap-file
```

5. The client can then run `swap -a` to add the swap space:

```
swap -a local-path-to-swap-file
```

`-d swapname`

Delete the specified swap area. This option can only be used by the super-user. *swapname* is the name of the swap file: for example, `/dev/dsk/c0t0d0s1` or a regular file. *swaplow* is the offset in 512-byte blocks into the swap area to be deleted. If *swaplow* is not specified, the area will be deleted starting at the second page. When the command completes, swap blocks can no longer be allocated from this area and all swap blocks previously in use in this swap area have been moved to other swap areas.

`-l`

List the status of all the swap areas. The output has five columns:

|                     |                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------|
| <code>path</code>   | The path name for the swap area.                                                            |
| <code>dev</code>    | The major/minor device number in decimal if it is a block special device; zeroes otherwise. |
| <code>swaplo</code> | The <i>swaplow</i> value for the area in 512-byte blocks.                                   |
| <code>blocks</code> | The <i>swapplen</i> value for the area in 512-byte blocks.                                  |
| <code>free</code>   | The number of 512-byte blocks in this area that are not currently allocated.                |

The list does not include swap space in the form of physical memory because this space is not associated with a particular swap area.

If `swap -l` is run while *swapname* is in the process of being deleted (by `swap -d`), the string `INDEL` will appear in a sixth column of the swap stats.

`-s`

Print summary information about total swap space usage and availability:

|                        |                                                                                       |
|------------------------|---------------------------------------------------------------------------------------|
| <code>allocated</code> | The total amount of swap space in bytes currently allocated for use as backing store. |
|------------------------|---------------------------------------------------------------------------------------|

## swap(1M)

|                       | <div>reserved</div> <div>used</div> <div>available</div> <div>These numbers include swap space from all configured swap areas as listed by the -l option, as well swap space in the form of physical memory.</div>                                                  | <div>The total amount of swap space in bytes not currently allocated, but claimed by memory mappings for possible future use.</div> <div>The total amount of swap space in bytes that is either allocated or reserved.</div> <div>The total swap space in bytes that is currently available for future reservation and allocation.</div> |                |                 |              |         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| USAGE                 | Only the first 2 Gbyte of a block device larger than 2 Gbyte in size can be used for swap in swapfs on a 32-bit operating system. With a 64-bit operating system, a block device larger than 2 Gbyte can be fully utilized for swap up to 2 <sup>63</sup> −1 bytes. |                                                                                                                                                                                                                                                                                                                                          |                |                 |              |         |
| ENVIRONMENT VARIABLES | See environ(5) for descriptions of the following environment variables that affect the execution of swap: LC_CTYPE and LC_MESSAGE.                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                          |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>swmtool</b> [-d directory]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |              |           |
| <b>DESCRIPTION</b> | <p>The <b>swmtool</b> command invokes the <b>admintool(1M)</b> application, which is preselected to add or remove software. Using the <b>swmtool</b> command, you can add software from a product CD or hard disk to an installed system, or you can remove software from an installed system.</p> <p>Once logged in, you may run <b>swmtool</b> to examine the packages on your local system.</p> <p>Membership in the <b>sysadmin</b> group (gid 14) is used to restrict access to administrative tasks. Members of the <b>sysadmin</b> group can use <b>swmtool</b> to add or remove software packages. Non-members have read-only permissions (where applicable).</p> <p>Help is available by using the Help button.</p> |                |                 |              |           |
| <b>OPTIONS</b>     | <p><b>-d</b> <i>directory</i></p> <p>Specify the directory containing the software to be installed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |           |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> A sample display of using <b>swmtool</b> command.</p> <p>The following example starts the <b>admintool()</b> application and tells it to look for software packages in the local directory <b>/cdrom/cdrom0/s0</b> (the default directory for a CD when running Volume Manager).</p> <pre>example% /usr/sbin/swmtool -d /cdrom/cdrom0/s0</pre>                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |           |

| DESCRIPTION | <p>The <code>sxconfig</code> command configures contiguous memory parameters for exclusive use by the SX video system on the Desktop SPARCsystems with graphics option. <i>platform-name</i> can be found using the <code>-i</code> option of <code>uname(1)</code>.</p> <p>After configuring the physically contiguous memory, using the various options described below, the system must be rebooted for the changes to take effect. If this command is being used to configure physically contiguous memory for the first time after the system software has been installed, then the system must be rebooted using the reconfiguration option (<code>-r</code>) of <code>boot(1M)</code>.</p> <p>The amount of memory to be reserved depends upon the type of application. Applications that benefit from the availability of contiguous memory are those that are written to the XGL and XIL graphics and imaging foundation library APIs.</p> <p>The <i>Platform Notes: SPARCstation 10SX System Configuration Guide</i> provides more detailed information regarding how much memory to reserve for various types of graphics and imaging applications.</p> <p><code>sxconfig</code> is supported only on Desktop SPARCsystems with SX graphics option.</p> <p>The interface, output, and command location are uncommitted and subject to change in future releases.</p> |
| OPTIONS     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-c            Display the current configuration parameters in the driver configuration file. If the system was not rebooted after previously changing the configuration parameters, then the displayed values do not reflect the actual system setup.</li> <li>-d            Restore all configuration parameters to the default values. By default, 0 megabytes of physically contiguous memory are reserved, fragmentation is not allowed, and 32 megabytes of memory are reserved for system use.</li> <li>-f            Allow fragmentation. If no single chunk of memory of at least the requested size is found, allow the request to span multiple chunks. This flag also specifies that less than <i>size</i> megabytes of data may be reserved if there are not enough contiguous chunks available. If this flag is not specified, then the memory reserved must be exactly one chunk of the requested size for the request to succeed.</li> <li>-n            Specify that fragmentation is not allowed.</li> </ul>                                                                                                                                                                                                                                                                |

|                 |                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| -l <i>limit</i> | Specify that at least <i>limit</i> megabytes of total memory must remain for system use after the contiguous memory has been reserved. |
| -s <i>size</i>  | Reserve <i>size</i> megabytes of contiguous memory for exclusive use by the SX video subsystem.                                        |

## EXAMPLES

### EXAMPLE 1 Using sxconfig

The following example reserves 16 megabytes of contiguous memory without fragmentation and indicates 32 megabytes of memory should remain for system use after reserving the contiguous memory:

```

example# sxconfig -s 16 -l 32

```

### EXAMPLE 2 Using sxconfig with Fragmentation

The following example reserves 16 megabytes of contiguous memory with fragmentation allowed and indicates 32 megabytes of memory should remain for system use after reserving the contiguous memory:

```

example# sxconfig -s 16 -f -l 32

```

### EXAMPLE 3 Reporting Current Configuration Parameters

The following example reports current configuration parameters in the driver configuration file:

```

example# sxconfig -c

```

### EXAMPLE 4 Restoring Configuration Parameters to Default Values

The following example restores all configuration parameters to the default values:

```

example# sxconfig -d

```

### EXAMPLE 5 Disabling Fragmentation

The following example disables fragmentation:

```

example# sxconfig -n

```

## EXIT STATUS

sxconfig returns 0 on success, and a positive integer on failure.

- |   |                                                              |
|---|--------------------------------------------------------------|
| 1 | Permission denied. Only root can run this command.           |
| 2 | Configuration file <code>sx_cmem.conf</code> does not exist. |
| 3 | Illegal option.                                              |
| 4 | Illegal combination of options.                              |

## sxconfig(1M)

- 5 Illegal argument for -s option. Should be an integer.
- 6 Illegal argument for -l option. Should be an integer.

### FILES

/platform/*platform-name*/kernel/drv/sx\_cmem  
Contiguous memory device driver

/platform/*platform-name*/kernel/drv/sx\_cmem.conf  
Configuration file for contiguous memory driver

/etc/init.d/sxcmem  
Contiguous memory startup script

| <b>DESCRIPTION</b> | <i>sync</i> executes the <i>sync</i> system primitive. If the system is to be stopped, <i>sync</i> must be called to insure file system integrity. It will flush all previously unwritten system buffers out to disk, thus assuring that all file modifications up to that point will be saved. See <i>sync(2)</i> for details. |                |                 |              |         |

| SYNOPSIS    | <code>/usr/sbin/syncinit device [ [baud_rate]   [keyword=value,...]<br/>  [single-word option] ]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                    |       |        |      |     |                                                                                                                                                                                                                                                                                                                                                                                                          |    |                                                                                                                                  |      |     |                                                                                                                                                                                                                                                                                                                                                                                                                    |    |                         |      |     |                                                  |    |                                                 |     |     |                                                        |     |                                                        |
| DESCRIPTION | <p>The syncinit utility allows the user to modify some of the hardware operating modes common to synchronous serial lines. This can be useful in troubleshooting a link, or necessary to the operation of a communications package.</p> <p>If run without options, syncinit reports the options as presently set on the port. If options are specified, the new settings are reported after they have been made.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                    |       |        |      |     |                                                                                                                                                                                                                                                                                                                                                                                                          |    |                                                                                                                                  |      |     |                                                                                                                                                                                                                                                                                                                                                                                                                    |    |                         |      |     |                                                  |    |                                                 |     |     |                                                        |     |                                                        |
| OPTIONS     | <p>Options to syncinit normally take the form of a keyword, followed by an equal sign and a value. The exception is that a baud rate may be specified as a decimal integer by itself. Keywords must begin with the value shown in the options table, but may contain additional letters up to the equal sign. For example, loop= and loopback= are equivalent.</p> <p>The following options are supported:</p> <table><tr><th>Keyword</th><th>Value</th><th>Effect</th></tr><tr><td rowspan="2">loop</td><td>yes</td><td>Set the port to operate in internal loopback mode. The receiver is electrically disconnected from the DCE receive data input and tied to the outgoing transmit data line. Transmit data is available to the DCE. The Digital Phase-Locked Loop (DPLL) may not be used as a clock source in this mode. If no other clocking options have been specified, perform the equivalent of txc=baud and rxc=baud.</td></tr><tr><td>no</td><td>Disable internal loopback mode. If no other clocking options have been specified, perform the equivalent of txc=txc and rxc=rxc.</td></tr><tr><td rowspan="2">echo</td><td>yes</td><td>Set the port to operate in auto-echo mode. The transmit data output is electrically disconnected from the transmitter and tied to the receive data input. Incoming receive data is still visible. Use of this mode in combination with local loopback mode has no value, and should be rejected by the device driver. The auto-echo mode is useful to make a system become the endpoint of a remote loopback test.</td></tr><tr><td>no</td><td>Disable auto-echo mode.</td></tr><tr><td rowspan="2">nrzi</td><td>yes</td><td>Set the port to operate with NRZI data encoding.</td></tr><tr><td>no</td><td>Set the port to operate with NRZ data encoding.</td></tr><tr><td rowspan="2">txc</td><td>txc</td><td>Transmit clock source will be the TxC signal (pin 15).</td></tr><tr><td>rxc</td><td>Transmit clock source will be the RxC signal (pin 17).</td></tr></table> | Keyword                                                                                                                                                                                                                                                                                                                                                                                                            | Value | Effect | loop | yes | Set the port to operate in internal loopback mode. The receiver is electrically disconnected from the DCE receive data input and tied to the outgoing transmit data line. Transmit data is available to the DCE. The Digital Phase-Locked Loop (DPLL) may not be used as a clock source in this mode. If no other clocking options have been specified, perform the equivalent of txc=baud and rxc=baud. | no | Disable internal loopback mode. If no other clocking options have been specified, perform the equivalent of txc=txc and rxc=rxc. | echo | yes | Set the port to operate in auto-echo mode. The transmit data output is electrically disconnected from the transmitter and tied to the receive data input. Incoming receive data is still visible. Use of this mode in combination with local loopback mode has no value, and should be rejected by the device driver. The auto-echo mode is useful to make a system become the endpoint of a remote loopback test. | no | Disable auto-echo mode. | nrzi | yes | Set the port to operate with NRZI data encoding. | no | Set the port to operate with NRZ data encoding. | txc | txc | Transmit clock source will be the TxC signal (pin 15). | rxc | Transmit clock source will be the RxC signal (pin 17). |
| Keyword     | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Effect                                                                                                                                                                                                                                                                                                                                                                                                             |       |        |      |     |                                                                                                                                                                                                                                                                                                                                                                                                          |    |                                                                                                                                  |      |     |                                                                                                                                                                                                                                                                                                                                                                                                                    |    |                         |      |     |                                                  |    |                                                 |     |     |                                                        |     |                                                        |

The receiver is electrically disconnected from the DCE receive data input and tied to the outgoing transmit data line. Transmit data is available to the DCE. The Digital Phase-Locked Loop (DPLL) may not be used as a clock source in this mode. If no other clocking options have been specified, perform the equivalent of txc=baud and rxc=baud.           |       |        |      |     |                                                                                                                                                                                                                                                                                                                                                                                                          |    |                                                                                                                                  |      |     |                                                                                                                                                                                                                                                                                                                                                                                                                    |    |                         |      |     |                                                  |    |                                                 |     |     |                                                        |     |                                                        |

The transmit data output is electrically disconnected from the transmitter and tied to the receive data input. Incoming receive data is still visible. Use of this mode in combination with local loopback mode has no value, and should be rejected by the device driver. The auto-echo mode is useful to make a system become the endpoint of a remote loopback test. |       |        |      |     |                                                                                                                                                                                                                                                                                                                                                                                                          |    |                                                                                                                                  |      |     |                                                                                                                                                                                                                                                                                                                                                                                                                    |    |                         |      |     |                                                  |    |                                                 |     |     |                                                        |     |                                                        |

|       |                |                                                                 |
|-------|----------------|-----------------------------------------------------------------|
|       | baud           | Transmit clock source will be the internal baud rate generator. |
|       | pll            | Transmit clock source will be the output of the DPLL circuit.   |
| rx    | rx             | Receive clock source will be the RxC signal (pin 17).           |
|       | tx             | Receive clock source will be the TxC signal (pin 15).           |
|       | baud           | Receive clock source will be the internal baud rate generator.  |
|       | pll            | Receive clock source will be the output of the DPLL circuit.    |
| speed | <i>integer</i> | Set the baud rate to <i>integer</i> bits per second.            |

There are also several single-word options that set one or more parameters at a time:

| Keyword  | Equivalent to Options: |
|----------|------------------------|
| external | txc=txc rxc=rx         |
| sender   | txc=baud rxc=rx        |
| internal | txc=pll rxc=pll        |
| stop     | speed=0                |

## EXAMPLES

### EXAMPLE 1 Using syncinit

The following command sets the first CPU port to loop internally, using internal clocking and operating at 38400 baud:

```
example# syncinit zsh0 38400 loop=yes
device: /dev/zsh ppa: 0
speed=38400, loopback=yes, echo=no, nrzi=no, txc=baud, rxc=baud
```

The following command sets the same port's clocking, local loopback and baud rate settings to their default values:

```
example# syncinit zsh0 stop loop=no
device: /dev/zsh ppa: 0
speed=0, loopback=no, echo=no, nrzi=no, txc=txc, rxc=rx
```

## ATTRIBUTES

syncinit(1M)

**DIAGNOSTICS**

*device* missing minor device number

The name *device* does not end in a decimal number that can be used as a minor device number.

bad speed: *arg*

The string *arg* that accompanied the speed= option could not be interpreted as a decimal integer.

Bad arg: *arg*

The string *arg* did not make sense as an option.

ioctl failure code = *errno*

An ioctl(2) system call failed. The meaning of the value of *errno* may be found in intro(2).

**WARNINGS**

Do not use syncinit on an active serial link, unless needed to resolve an error condition. Do not use this command casually or without being aware of the consequences.

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| NAME        | syncloop – synchronous serial loopback test program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SYNOPSIS    | <b>/usr/sbin/syncloop</b> [-cdlstv] <i>device</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DESCRIPTION | <p>The <code>syncloop</code> command performs several loopback tests that are useful in exercising the various components of a serial communications link.</p> <p>Before running a test, <code>syncloop</code> opens the designated port and configures it according to command line options and the specified test type. It announces the names of the devices being used to control the hardware channel, the channel number (ppa) corresponding to the <i>device</i> argument, and the parameters it has set for that channel. It then runs the loopback test in three phases.</p> <p>The first phase is to listen on the port for any activity. If no activity is seen for at least four seconds, <code>syncloop</code> proceeds to the next phase. Otherwise, the user is informed that the line is active and that the test cannot proceed, and the program exits.</p> <p>In the second phase, called the "first-packet" phase, <code>syncloop</code> attempts to send and receive one packet. The program will wait for up to four seconds for the returned packet. If no packets are seen after five attempts, the test fails with an excoriating message. If a packet is returned, the result is compared with the original. If the length and content do not match exactly, the test fails.</p> <p>The final phase, known as the "multiple-packet" phase, attempts to send many packets through the loop. Because the program has verified the integrity of the link in the first-packet phase, the test will not fail after a particular number of timeouts. If a packet is not seen after four seconds, a message is displayed. Otherwise, a count of the number of packets received is updated on the display once per second. If it becomes obvious that the test is not receiving packets during this phase, the user may wish to stop the program manually. The number and size of the packets sent during this phase is determined by default values, or by command line options. Each returned packet is compared with its original for length and content. If a mismatch is detected, the test fails. The test completes when the required number of packets have been sent, regardless of errors.</p> <p>After the multiple-packet phase has completed, the program displays a summary of the hardware event statistics for the channel that was tested. The display takes the following form:</p> <pre> CRC errors   Aborts   Overruns   Underruns   In&lt;-Drops-&gt; Out           0           0           0           0   0           0 </pre> <p>This is followed by an estimated line speed, which is an approximation of the bit rate of the line, based on the number of bytes sent and the actual time that it took to send them.</p> |
| OPTIONS     | The options for <code>syncloop</code> are described in the following table:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## syncloop(1M)

| Option | Parameter            | Default       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -c     | <i>packet_count</i>  | 100           | Specifies the number of packets to be sent in the multiple-packet phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -d     | <i>hex_data_byte</i> | <i>random</i> | Specifies that each packet will be filled with bytes with the value of <i>hex_data_byte</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -l     | <i>packet_length</i> | 100           | Specifies the length of each packet in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -s     | <i>line_speed</i>    | 9600          | Bit rate in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -v     |                      |               | Sets verbose mode. If data errors occur, the expected and received data is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -t     | <i>test_type</i>     | <i>none</i>   | A number, from 1 to 4, that specifies which test to perform. The values for <i>test_type</i> are as follows: 1: Internal loopback test. Port loopback is on. Transmit and receive clock sources are internal (baud rate generator). 2: External loopback test. Port loopback is off. Transmit and receive clock sources are internal. Requires a loopback plug suitable to the port under test. 3: External loopback test. Port loopback is off. Transmit and receive clock sources are external (modem). Requires that one of the local modem, the remote modem, or the remote system be set in a loopback configuration. 4: Test using predefined parameters. User defines hardware configuration and may select port parameters using the <code>syncinit(1M)</code> command. |

All numeric options except -d are entered as decimal numbers (for example, -s 19200). If you do not provide the -t *test\_type* option, syncloop prompts for it.

### EXAMPLES

**EXAMPLE 1** A sample display of using the syncloop command.

In the following command syncloop uses a packet length of 512 bytes over the first CPU port:

```
example# syncloop -l 512 zsh0
```

In response to the above command, syncloop prompts you for the test option you want.

The following command performs an internal loopback test on the first CPU port, using 5000 packets and a bit rate of 56Kbps:

```
example# syncloop -t 1 -s 56000 -c 5000 zsh0
```

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

syncloop(1M)

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO**  
**DIAGNOSTICS**

syncinit(1M), syncstat(1M), attributes(5), zsh(7D)

*device* missing minor device number

The name *device* does not end in a decimal number that can be used as a minor device number.

invalid packet length: *nnn*

The packet length was specified to be less than zero or greater than 4096.

poll: nothing to read

poll: nothing to read or write.

The poll(2) system call indicates that there is no input pending and/or that output would be blocked if attempted.

len *xxx* should be *yyy*

The packet that was sent had a length of *yyy*, but was received with a length of *xxx*.

*nnn* packets lost in outbound queueing

*nnn* packets lost in inbound queueing

A discrepancy has been found between the number of packets sent by syncloop and the number of packets the driver counted as transmitted, or between the number counted as received and the number read by the program.

**WARNINGS**

To allow its tests to run properly, as well as prevent disturbance of normal operations, syncloop should only be run on a port that is not being used for any other purpose at that time.

# syncstat(1M)

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |

| NAME        | syncstat – report driver statistics from a synchronous serial link                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| SYNOPSIS    | <code>/usr/sbin/syncstat [-c] device [interval]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| DESCRIPTION | <p>The <code>syncstat</code> command reports the event statistics maintained by a synchronous serial device driver. The report may be a single snapshot of the accumulated totals, or a series of samples showing incremental changes. Prior to these it prints the device name being used to query a particular device driver, along with a number indicating the channel number (ppa) under control of that driver.</p> <p>Event statistics are maintained by a driver for each physical channel that it supports. They are initialized to zero at the time the driver module is loaded into the system, which may be either at boot time or when one of the driver's entry points is first called.</p> <p>The <i>device</i> argument is the name of the serial device as it appears in the <code>/dev</code> directory. For example, <code>zsh0</code> specifies the first on-board serial device.</p> <p>The following is a breakdown of <code>syncstat</code> output:</p> <table> <tr> <td>speed</td><td>The line speed the device has been set to operate at. It is the user's responsibility to make this value correspond to the modem clocking speed when clocking is provided by the modem.</td></tr> <tr> <td>ipkts</td><td>The total number of input packets.</td></tr> <tr> <td>opkts</td><td>The total number of output packets.</td></tr> <tr> <td>undrun</td><td>The number of transmitter underrun errors.</td></tr> <tr> <td>ovrrun</td><td>The number of receiver overrun errors.</td></tr> <tr> <td>abort</td><td>The number of aborted received frames.</td></tr> <tr> <td>crc</td><td>The number of received frames with CRC errors.</td></tr> <tr> <td>isize</td><td>The average size (in bytes) of input packets.</td></tr> <tr> <td>osize</td><td>The average size (in bytes) of output packets.</td></tr> </table> | speed | The line speed the device has been set to operate at. It is the user's responsibility to make this value correspond to the modem clocking speed when clocking is provided by the modem. | ipkts | The total number of input packets. | opkts | The total number of output packets. | undrun | The number of transmitter underrun errors. | ovrrun | The number of receiver overrun errors. | abort | The number of aborted received frames. | crc | The number of received frames with CRC errors. | isize | The average size (in bytes) of input packets. | osize | The average size (in bytes) of output packets. |
| speed       | The line speed the device has been set to operate at. It is the user's responsibility to make this value correspond to the modem clocking speed when clocking is provided by the modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| ipkts       | The total number of input packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| opkts       | The total number of output packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| undrun      | The number of transmitter underrun errors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| ovrrun      | The number of receiver overrun errors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |

| crc         | The number of received frames with CRC errors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| isize       | The average size (in bytes) of input packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| osize       | The average size (in bytes) of output packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |
| OPTIONS     | <p><code>-c</code> Clear the accumulated statistics for the device specified. This may be useful when it is not desirable to unload a particular driver, or when the driver is not capable of being unloaded.</p> <p><i>interval</i> <code>syncstat</code> samples the statistics every <i>interval</i> seconds and reports incremental changes. The output reports line utilization for input and output in place of average packet sizes. These are the relationships between bytes transferred and the baud rate, expressed as percentages. The loop repeats indefinitely, with a column heading printed every twenty lines for convenience.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |                                                                                                                                                                                         |       |                                    |       |                                     |        |                                            |        |                                        |       |                                        |     |                                                |       |                                               |       |                                                |

**EXAMPLES****EXAMPLE 1** Sample output from the syncstat command:

```
example# syncstat zsh0
speed ipkts opkts undrun ovrrun abort crc isize osize
9600 15716 17121 0 0 1 3 98 89

example# syncstat -c zsh0 speed ipkts opkts undrun ovrrun abort crc isize osize
9600 0 0 0 0 0 0 0 0
```

In the following sample output a new line of output is generated every five seconds:

```
example# syncstat zsh0 5 ipkts opkts undrun ovrrun abort crc iutil outil
12 10 0 0 0 0 5% 4%
22 60 0 0 0 0 3% 90%
36 14 0 0 0 1 51% 2%
```

**ATTRIBUTES**

**SEE ALSO**  
**DIAGNOSTICS**

syncinit(1M), syncloop(1M), attributes(5), zsh(7D)

bad interval: *arg*

The argument *arg* is expected to be an interval and could not be understood.

*device* missing minor device number

The name *device* does not end in a decimal number that can be used as a minor device number.

baud rate not set

The *interval* option is being used and the baud rate on the device is zero. This would cause a divide-by-zero error when computing the line utilization statistics.

**WARNINGS**

Underrun, overrun, frame-abort, and CRC errors have a variety of causes.

Communication protocols are typically able to handle such errors and initiate recovery of the transmission in which the error occurred. Small numbers of such errors are not a significant problem for most protocols. However, because the overhead involved in recovering from a link error can be much greater than that of normal operation, high error rates can greatly degrade overall link throughput. High error rates are often caused by problems in the link hardware, such as cables, connectors, interface electronics or telephone lines. They may also be related to excessive load on the link or the supporting system.

The percentages for input and output line utilization reported when using the *interval* option may occasionally be reported as slightly greater than 100% because of inexact sampling times and differences in the accuracy between the system clock and the modem clock. If the percentage of use greatly exceeds 100%, or never exceeds 50%, then the baud rate set for the device probably does not reflect the speed of the modem.

| <b>DESCRIPTION</b> | <p>The <b>sysdef</b> utility outputs the current system definition in tabular form. It lists all hardware devices, as well as pseudo devices, system devices, loadable modules, and the values of selected kernel tunable parameters.</p> <p>It generates the output by analyzing the named bootable operating system file (<i>namelist</i>) and extracting the configuration information from it.</p> <p>The default system <i>namelist</i> is <code>/dev/kmem</code>.</p>                                                                                                                                                                                                                       |
| <b>OPTIONS</b>     | <p><b>-n <i>namelist</i></b> Specifies a <i>namelist</i> other than the default (<code>/dev/kmem</code>). The <i>namelist</i> specified must be a valid bootable operating system.</p> <p><b>-h</b> Prints the identifier of the current host in hexadecimal. This numeric value is unique across all Sun hosts.</p> <p><b>-d</b> The output includes the configuration of system peripherals formatted as a device tree.</p> <p><b>-D</b> For each system peripheral in the device tree, display the name of the device driver used to manage the peripheral.</p>                                                                                                                                |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Sample output format</p> <p>The following example displays the format of the <code>sysdef -d</code> output:</p> <pre>example% <b>sysdef</b> -d Node 'Sun 4/60', unit #0 (no driver) Node 'options', unit #0 (no driver) Node 'zs', unit #0 Node 'zs', unit #1 Node 'fd', unit #0 Node 'audio', unit #0 Node 'sbus', unit #0 Node 'dma', unit #0 Node 'esp', unit #0 Node 'st', unit #1 (no driver) Node 'st', unit #0 Node 'sd', unit #2 Node 'sd', unit #1 Node 'sd', unit #0 Node 'le', unit #0 Node 'bwtwo', unit #0 Node 'auxiliary-io', unit #0 Node 'interrupt-enable', unit #0 Node 'memory-error', unit #0 Node 'counter-timer', unit #0 Node 'eeprom', unit #0</pre> |
| <b>FILES</b>       | <pre>/dev/kmem</pre> <p>default operating system image</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| DESCRIPTION                 | <p>The <b>syseventadm</b> command is an administrative front-end to add, remove and list sysevent event handlers. <b>syseventadm</b> can only be run by root.</p> <p>The <b>syseventadm</b> add command adds a handler for a sysevent event specified by at least one of vendor, publisher or class. If <i>class</i> is specified, it may be qualified with a <i>sub-class</i>. Only the values specified for <i>vendor</i>, <i>publisher</i>, <i>class</i> and <i>sub-class</i> when adding the handler are matched against sysevent events to determine if the specification matches the event and the handler should be run. <i>path</i> is the full pathname of the command to be run in response to matching events, with optional arguments (<i>args</i>). If <i>username</i> is specified, the command is invoked as user <i>username</i>, otherwise as root.</p> <p>The <b>syseventadm</b> remove command removes handlers for matching sysevent event specifications. Event specifications may be matched by specifying at least one of <i>vendor</i>, <i>publisher</i>, <i>class</i>, <i>username</i> or <i>path</i>. If <i>class</i> is specified, it may be qualified with a <i>sub-class</i>. Any of <i>vendor</i>, <i>publisher</i>, <i>class</i>, <i>sub-class</i>, <i>username</i>, <i>path</i> or <i>args</i> not specified match the corresponding fields of all events. Handlers for all matching specifications are removed.</p> <p>The <b>syseventadm</b> list command lists the handlers for matching sysevent event specifications using the same match criteria as the remove command but without the requirement that at least one of <i>vendor</i>, <i>publisher</i>, <i>class</i>, <i>username</i> or <i>path</i> be specified. With no match criteria, all specifications are listed. The list command output format is: [<i>vendor=vendor</i>] [<i>publisher=publisher</i>] [<i>class=class</i>] [<i>subclass=subclass</i>] [<i>username=username</i>] <i>path</i> [<i>args</i>] where each of <i>class</i>, <i>sub-class</i>, <i>vendor</i>, <i>publisher</i> and <i>username</i> is listed only if part of the match criteria for the listed specification.</p> <p>The <b>syseventadm</b> restart command informs the syseventd daemon to reread the sysevent registry after a change has been made by adding or removing one or more sysevent handler specifications.</p> |
| Argument Macro Substitution | <p>The sysevent handling facility provides extensive macro capability for constructing the command line arguments to be executed in response to an event. Macro expansion applies only to the command line <i>args</i> specified for an event handler, with macros expanded with data from the event itself. Pre-defined macros are provided for the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

event *class*, *subclass*, *publisher* and *vendor* information. Macros not matching one of the pre-defined macro names cause the attribute list attached to the event to be searched for an attribute of that name, with the value of the matching attribute substituted on the command line.

Macros are introduced by the `$` character, with the macro name being the following token separated by a SPACE or TAB character. If the macro name is embedded in text, it may be delineated by `{` and `}`. A `\` before the `$` causes macro expansion not to occur.

|                          |                                         |
|--------------------------|-----------------------------------------|
| <code>\$class</code>     | The class string defining the event     |
| <code>\$publisher</code> | The publisher string defining the event |
| <code>\$sequence</code>  | The sequence number of the event.       |
| <code>\$subclass</code>  | The subclass string defining the event  |
| <code>\$timestamp</code> | The timestamp of the event.             |
| <code>\$vendor</code>    | The vendor string defining the event    |

Macro names other than those pre-defined are compared against the attribute list provided with the event. An attribute with name matching the macro name causes the value of the attribute to be substituted as ASCII text on the generated command line.

Use of a macro for which no attribute with that name is defined, or for which multiple attributes with that name are provided, cause an error and the command is not invoked.

Attributes with signed data types (`DATA_TYPE_INT16`, `DATA_TYPE_INT32` and `DATA_TYPE_INT64`) are expanded as decimal digits.

Attributes with unsigned data types (`DATA_TYPE_BYTE`, `DATA_TYPE_UINT16`, `DATA_TYPE_UINT32`, `DATA_TYPE_UINT64` and `DATA_TYPE_HTTPTIME`) are expanded as hexadecimal digits with a `0x` prefix.

Attributes with string data type (`DATA_TYPE_STRING`) are expanded with the string data. The data is not quoted. If it is desired that the quoted strings be generated on the command line, put quotes around the macro call in the arguments.

Array types are expanded with each element expanded as defined for that scalar type, with a space separating each element substitution.

**OPTIONS** The following options are supported:

|                           |                                                                  |
|---------------------------|------------------------------------------------------------------|
| <code>-c class</code>     | The string specifying the event class.                           |
| <code>-p publisher</code> | The string specifying the event publisher.                       |
| <code>-R rootdir</code>   | Cause syseventadm to use an alternate root path <i>rootdir</i> . |
| <code>-s subclass</code>  | The string specifying the event subclass.                        |

| EXAMPLES | <p><b>EXAMPLE 1</b> Adding an Event Handler</p> <p>The following example adds an event handler for an event defined by vendor SUNW, class EC_ENV and sub-class ESC_ENV_TEMP. The command to be run is <code>/opt/SUNWenv/bin/ec_env_temp</code>, with arguments being the class name, sub-class name and pathname derived from the event attributes. The <code>\$</code> characters are preceded by a backslash to circumvent shell interpretation. There is no need to restart the service after the change since the registry is maintained on <code>\$ALTROOT</code>.</p> <pre># syseventadm add -R \ \$ALTROOT -v SUNW -c EC_ENV -s ESC_ENV_TEMP /opt/SUNWenv/bin/ec_env_temp \ \$class \ \$subclass \ \$pathname</pre> <p><b>EXAMPLE 2</b> Removing an Event Handler</p> <p>The following example removes the event handler added in Example 1.</p> <pre># syseventadm remove -R \ \$ALTROOT -v SUNW -c EC_ENV -s ESC_ENV_TEMP /opt/SUNWenv/bin/ec_env_temp \ \${class} \ \${subclass} \ \${pathname}</pre> <p><b>EXAMPLE 3</b> Listing Event Handlers</p> <p>The following example lists all event handlers for events of class EC_ENV, subclass ESC_ENV_TEMP, as defined by vendor SUNW:</p> <pre># syseventadm list -v SUNW -c EC_ENV -s ESC_ENV_TEMP vendor=SUNW class=EC_ENV subclass=ESC_ENV_TEMP /opt/SUNWenv/bin/ec_env_temp \ \${class} \ \${subclass} \ \${pathname}</pre> <p><b>EXAMPLE 4</b> Listing Event Handlers</p> <p>The following example lists all event handlers defined by vendor VRTS.</p> <pre># syseventadm list -v VRTS</pre> <p><b>EXAMPLE 5</b> Removing Event Handlers</p> <p>The following example removes all event handlers defined by vendor VRTS, and restarts service.</p> |

**EXAMPLE 5** Removing Event Handlers      *(Continued)*

```
syseventadm remove -v VRTS
syseventadm restart
```

**EXAMPLE 6** Listing All Event Handlers Specified to Run a Command

The following example lists all event handlers specified to run the command `/opt/SUNWenv/bin/ec_env_temp`:

```
syseventadm list /opt/SUNWenv/bin/ec_env_temp
```

**EXAMPLE 7** Removing Event Handlers and Restarting Service

The following example removes all event handlers specified to run the command `/opt/SUNWenv/bin/ec_env_temp`, and restarts service:

```
syseventadm remove /opt/SUNWenv/bin/ec_env_temp
syseventadm restart
```

**EXIT STATUS**

The following exit values are returned:

- |   |                                                                      |
|---|----------------------------------------------------------------------|
| 0 | Successful completion.                                               |
| 1 | No matching event specification found (remove or list commands only) |
| 2 | Incorrect command usage.                                             |
| 3 | Permission denied.                                                   |
| 4 | Command failed.                                                      |

**NOTES**

To avoid upgrade problems, packages delivering a sysevent event handler should install the event handler by running `syseventadm` from the package's postinstall script. The event handler can then be removed by running `syseventadm` from the package's preremove script using the same arguments as when added.

## syseventconfd(1M)

| <b>NAME</b>        | syseventconfd – kernel system event command invocation daemon                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |

| <b>SYNOPSIS</b>    | <code>/usr/lib/sysevent/syseventd [-d <i>debug_level</i>] [-r <i>rootdir</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>syseventd is a user-level daemon that accepts delivery of system event buffers from the kernel. Once an event buffer has been delivered to syseventd, it, in turn, attempts to propagate the event to all interested end event subscribers.</p> <p>Event subscribers take the form of a syseventd loadable module (SLM). syseventd passes the event buffer to each of its subscribers and in return expects a notification as to the successful or unsuccessful delivery attempt.</p> <p>Upon successful delivery of the event buffer to all interested event subscribers, syseventd frees the event buffer from the kernel event queue.</p>                                       |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-d <i>debug_level</i></code>      Enable debug mode. Messages are printed to the invoking user's terminal.</p> <p><code>-r <i>rootdir</i></code>          Cause syseventd to use an alternate root path when creating its door and lock files. Modules continue to be loaded from the standard module directories.</p>                                                                                                                                                                                                                                                                                                           |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0                      Successful completion.</p> <p>non-zero              An error occurred.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| NAME        | sysidconfig – execute system configuration applications, or define set of system configuration applications                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SYNOPSIS    | <b>sysidconfig</b> [-lv] [-a <i>application</i> ] [-b <i>basedir</i> ] [-r <i>application</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DESCRIPTION | <p>Invoked without any options, the <code>sysidconfig</code> program executes a list of applications. An application on this list is referred to as a "system configuration application." Every application on this list will be passed one command-line argument, <code>-c</code>. This flag will cause the system configuration application to perform its configuration function. Without options, <code>sysidconfig</code> should only be invoked by startup scripts, which occurs during the initial installation and during a reconfigure reboot.</p> <p>All applications on the list will be executed, if possible. All activity taken by the <code>sysidconfig</code> program is logged in the <code>sysidconfig</code> log file, <code>/var/log/sysidconfig.log</code>. If one or more of the applications on the list are either not present at execution time, are not executable, or execute but return a failure code upon completion, then that information will be logged as well. Successful completion of the program can be assumed if no error message is present in the log file. Programs are executed sequentially, with only one configuration application active at a time.</p> <p>Executed with the <code>-l</code>, <code>-a</code>, or <code>-r</code> options, the <code>sysidconfig</code> program allows the super-user to list the defined configuration applications, and to add items to or remove items from that list. Running <code>sysidconfig</code> with options is the only way to view or manipulate the list. Only the super-user can execute the <code>sysidconfig</code> program with options.</p> <p>The <code>-b</code> and <code>-v</code> options change the behavior of <code>sysidconfig</code>, and can be used with or without the list manipulation options discussed above. The <code>-b basedir</code> option is used to specify a reference root directory other than the default, <code>/</code>. The <code>-v</code> option duplicates the log file output on <code>stdout</code>.</p> <p>By default, no SPARC based applications exist on this list. However, the IA based systems are delivered with one application, <code>kdmconfig(1M)</code>, on the list. <code>kdmconfig</code> is not delivered on SPARC based systems.</p> <p>This application is an extension of the <code>sysidtool(1M)</code> suite of programs. It is executed during initial installation and during a reconfigure reboot, before the window system has been started. Graphical User Interface (GUI) applications will not execute successfully if they are added to the list of configuration applications via <code>sysidconfig -a</code>.</p> <p>This program is referenced, but not fully described, in the <code>sysidtool(1M)</code> manual page.</p> |
| OPTIONS     | <p>The valid options are:</p> <p><code>-a application</code>      Add the named application to the list of defined applications. When next invoked without arguments, <code>sysidconfig</code> will run</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## sysidconfig(1M)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | this newly added application after all previously defined applications. <i>application</i> must be a fully qualified path name that is not currently on the list of applications to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>-b</b> <i>basedir</i>     | Specify an alternate base directory (/ is defined as the default base directory if no other is specified). The specified directory is used as the root directory when adding, listing, removing, or executing configuration applications. The log file where information is recorded is in /var/log, relative to the specified <i>basedir</i> . In the log file, the <i>basedir</i> is not noted. This means, for example, that if the super-user on a diskless client's server executes:<br><br><pre>sysidconfig -b /export/root/client -a /sbin/someapp</pre> then the diskless client <i>client</i> would have /sbin/someapp executed upon reconfigure reboot. The diskless client's log file would note that /sbin/someapp was added, not /export/root/client/sbin/someapp. |
| <b>-l</b>                    | List defined configuration applications. Applications will be executed one at a time, in the order shown in the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>-r</b> <i>application</i> | Remove the named application from the list of defined applications. <i>application</i> must be a fully qualified path name and it must be on the existing list of applications to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>-v</b>                    | Verbose mode. This option echoes all information sent to the log file to stdout. Such information includes timestamp information about when the program was executed, the names of applications being executed, and results of those executions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**RETURN VALUES** The sysidconfig program will return 0 if it completes successfully.

When executed with the -r or -a options, error conditions or warnings will be reported on stderr. If the requested action completes successfully, an exit code of 0 will be returned.

|               |               |                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------|
| <b>ERRORS</b> | <b>EPERM</b>  | The program was executed by a user other than the super-user.                       |
|               | <b>EINVAL</b> | Option -l, -a, or -r was passed and the action could not be completed successfully. |

| <b>DIAGNOSTICS</b> | <p>When run without options, a log of the <code>sysidconfig</code> program's activity can be found in <code>/var/log/sysidconfig.log</code>. This file contains a timestamp log of each program executed, its resulting <code>stderr</code> output, and its exit code. If an application in the list was not found or is not executable, that will also be noted.</p> |

| DESCRIPTION                                          | <p>sysidtool is a suite of five programs that configure a new system, or one that has been unconfigured with sys-unconfig(1M). The sysidtool programs run automatically at system installation, or during the first boot after a machine has been successfully unconfigured.</p> <p>These programs have no effect except at such times, and should never be run manually.</p> <p>The sysidtool programs set up the appropriate information in the machine's configuration files, in the kernel, and on the machine's network interface. The following list shows the available commands and the information for which each of the commands lists.</p> <table><tr><td>sysidnet: network configuration</td><td>Machine's default locale. Machine's console type. Machine's host name. Machine's IP address.</td></tr><tr><td>sysidns: Name Service configuration</td><td>Name service choice: NIS, NIS+, DNS, LDAP, or none. Machine's IP subnet mask (if no NIS/NIS+ server can automatically be located on the machine's sub-network. Domain name for chosen name service. Hostname and IP address of name server(s). DNS search list (DNS name service only)</td></tr><tr><td>sysidsys: miscellaneous system configuration</td><td>Machine's IP subnet mask (if an NIS/NIS+ server was automatically located on the machine's sub-network). Machine's time zone. Date and time.</td></tr><tr><td>sysidroot: control superuser information</td><td>Machine's root password.</td></tr><tr><td>sysidpm: Power Management configuration</td><td>Auto-shutdown confirmation if the system is Energystar-V2 compliant, that is, a new system model shipped after October 1, 1995.</td></tr><tr><td>sysidconfig: host or platform-specific configuration</td><td>This command controls specification and execution of custom configuration applications that may be specified for a particular host or a particular platform. See sysidconfig(1M).</td></tr></table> |  | sysidnet: network configuration | Machine's default locale. Machine's console type. Machine's host name. Machine's IP address. | sysidns: Name Service configuration | Name service choice: NIS, NIS+, DNS, LDAP, or none. Machine's IP subnet mask (if no NIS/NIS+ server can automatically be located on the machine's sub-network. Domain name for chosen name service. Hostname and IP address of name server(s). | sysidpm: Power Management configuration              | Auto-shutdown confirmation if the system is Energystar-V2 compliant, that is, a new system model shipped after October 1, 1995.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |                                 |                                                                                              |                                     |                                                                                                                                                                                                                                                                                        |                                              |                                                                                                                                              |                                          |                          |                                         |                                                                                                                                 |                                                      |                                                                                                                                                                                   |
| sysidconfig: host or platform-specific configuration | This command controls specification and execution of custom configuration applications that may be specified for a particular host or a particular platform. See sysidconfig(1M).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |                                 |                                                                                              |                                     |                                                                                                                                                                                                                                                                                        |                                              |                                                                                                                                              |                                          |                          |                                         |                                                                                                                                 |                                                      |                                                                                                                                                                                   |

The `sysidtool` programs attempt to obtain system configuration information from various name service databases, for example, NIS, or from the `sysidcfg(4)` file, and you are prompted to provide the information if it cannot be found. However, you can avoid one or more of the prompts by preconfiguring the appropriate configuration information in the name service databases or in the `sysidcfg(4)` file.

To preconfigure the information in the name service databases, you must use the name service commands or the Solstice AdminSuite tools. See *Solaris 9 Installation Guide* for more details about how to preconfigure the system configuration information.

The machine's configuration information is set up in its `/etc` and `/var` files.

If a system has more than one network interface, you can use `sysidtool` to configure only the primary interface on the system. All other interfaces on the system must be configured manually.

You cannot use the name service databases or the `sysidcfg(4)` file to suppress the Power Management configuration prompt. However, you can suppress it by creating either the `/autoshtutdown` or `/noautoshtutdown` file before installation reboot. Accordingly, the auto-shutdown feature is silently configured. The `/autoshtutdown` or `/noautoshtutdown` files are removed by `sysidpm` before it exits.

| SYNOPSIS    | <b>/usr/sbin/syslogd</b> [-d] [-f <i>configfile</i> ] [-m <i>markinterval</i> ] [-p <i>path</i> ] [-t<br>  -T]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DESCRIPTION | <p>syslogd reads and forwards system messages to the appropriate log files or users, depending upon the priority of a message and the system facility from which it originates. The configuration file <i>/etc/syslog.conf</i> (see <i>syslog.conf(4)</i>) controls where messages are forwarded. syslogd logs a mark (timestamp) message every <i>markinterval</i> minutes (default 20) at priority LOG_INFO to the facility whose name is given as mark in the <i>syslog.conf</i> file.</p> <p>A system message consists of a single line of text, which may be prefixed with a priority code number enclosed in angle-brackets (&lt; &gt;); priorities are defined in &lt;sys/syslog.h&gt;.</p> <p>syslogd reads from the STREAMS log driver, <i>/dev/log</i>, and from any transport provider specified in <i>/etc/netconfig</i>, <i>/etc/net/transport/hosts</i>, and <i>/etc/net/transport/services</i>.</p> <p>syslogd reads the configuration file when it starts up, and again whenever it receives a HUP signal (see <i>signal(3HEAD)</i>), at which time it also closes all files it has open, re-reads its configuration file, and then opens only the log files that are listed in that file. syslogd exits when it receives a TERM signal.</p> <p>As it starts up, syslogd creates the file <i>/etc/syslog.pid</i>, if possible, containing its process identifier (PID).</p> <p>If message ID generation is enabled (see <i>log(7D)</i>), each message will be preceded by an identifier in the following format: [<i>ID msgid facility . priority</i>]. <i>msgid</i> is the message's numeric identifier described in <i>msgid(1M)</i>. <i>facility</i> and <i>priority</i> are described in <i>syslog.conf(4)</i>. [<i>ID 123456 kern.notice</i>] is an example of an identifier when message ID generation is enabled.</p> <p>If the message originated in a loadable kernel module or driver, the kernel module's name (for example, <i>ufs</i>) will be displayed instead of <i>unix</i>. See <i>EXAMPLES</i> for sample output from syslogd with and without message ID generation enabled.</p> <p>In an effort to reduce visual clutter, message IDs are not displayed when writing to the console; message IDs are only written to the log file. See <i>EXAMPLES</i>.</p> <p>The <i>/etc/default/syslogd</i> file contains the following default parameter settings. See <i>FILES</i>.</p> <p>LOG_FROM_REMOTE      Specifies whether remote messages are logged.<br/>LOG_FROM_REMOTE=NO is equivalent to the -t<br/>command-line option. The default value for<br/>LOG_FROM_REMOTE is YES.</p> |
| OPTIONS     | The following options are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## syslogd(1M)

|                        |                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -d                     | Turn on debugging. This option should only be used interactively in a root shell once the system is in multi-user mode. It should <i>not</i> be used in the system start-up scripts, as this will cause the system to hang at the point where <code>syslogd</code> is started. |
| -f <i>configfile</i>   | Specify an alternate configuration file.                                                                                                                                                                                                                                       |
| -m <i>markinterval</i> | Specify an interval, in minutes, between mark messages.                                                                                                                                                                                                                        |
| -p <i>path</i>         | Specify an alternative log device name. The default is <code>/dev/log</code> .                                                                                                                                                                                                 |
| -T                     | Enable the <code>syslogd</code> UDP port to turn on logging of remote messages. This is the default behavior. See FILES.                                                                                                                                                       |
| -t                     | Disable the <code>syslogd</code> UDP port to turn off logging of remote messages. See FILES.                                                                                                                                                                                   |

### EXAMPLES

#### EXAMPLE 1 syslogd Output Without Message ID Generation Enabled

The following example shows the output from `syslogd` when message ID generation *is not* enabled:

```
Sep 29 21:41:18 cathy unix: alloc /: file system full
```

#### EXAMPLE 2 syslogd Output with ID generation Enabled

The following example shows the output from `syslogd` when message ID generation *is* enabled. The message ID is displayed when writing to log file `/var/adm/messages`.

```
Sep 29 21:41:18 cathy ufs: [ID 845546 kern.notice]
 alloc /: file system full
```

#### EXAMPLE 3 syslogd Output with ID Generation Enabled

The following example shows the output from `syslogd` when message ID generation *is* enabled when writing to the console. Even though message ID is enabled, the message ID is not displayed at the console.

```
Sep 29 21:41:18 cathy ufs: alloc /: file system full
```

**NOTES** The mark message is a system time stamp, and so it is only defined for the system on which syslogd is running. It can not be forwarded to other systems.

When syslogd receives a HUP signal, it attempts to complete outputting pending messages, and close all log files to which it is currently logging messages. If, for some reason, one (or more) of these files does not close within a generous grace period, syslogd discards the pending messages, forcibly closes these files, and starts reconfiguration. If this shutdown procedure is disturbed by an unexpected error and syslogd cannot complete reconfiguration, syslogd sends a mail message to the superuser on the current system stating that it has shut down, and exits.

Care should be taken to ensure that each window displaying messages forwarded by syslogd (especially console windows) is run in the system default locale (which is syslogd's locale). If this advice is not followed, it is possible for a syslog message to alter the terminal settings for that window, possibly even allowing remote execution of arbitrary commands from that window.

## sys-unconfig(1M)

| NAME        | sys-unconfig – undo a system’s configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SYNOPSIS    | <b>/usr/sbin/sys-unconfig</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DESCRIPTION | <p>The <code>sys-unconfig</code> command is used to restore a system’s configuration to an “as-manufactured” state, ready to be reconfigured again. The system’s configuration consists of hostname, Network Information Service (NIS) domain name, timezone, IP address, IP subnet mask, and root password. This operation is the inverse of those performed by the <code>sysidnet(1M)</code>, <code>sysidns(1M)</code>, and <code>sysidsys(1M)</code> programs run at boot. See <code>sysidtool(1M)</code>.</p> <p><code>sys-unconfig</code> does the following:</p> <ul style="list-style-type: none"><li>■ Saves current <code>/etc/inet/hosts</code> file information in <code>/etc/inet/hosts.saved</code>.</li><li>■ If the current <code>/etc/vfstab</code> file contains NFS mount entries, saves the <code>/etc/vfstab</code> file to <code>/etc/vfstab.orig</code>.</li><li>■ Restores the default <code>/etc/inet/hosts</code> file.</li><li>■ Removes the default hostname in <code>/etc/hostname.interface</code> files for all interfaces configured when this command is run. To determine which interfaces are configured, run the command <code>'ifconfig-a'</code>. The <code>/etc/hostname.interface</code> files corresponding to all of the interfaces listed in the resulting output, with the exception of the loopback interface (lo0), will be removed.</li><li>■ Removes the default domainname in <code>/etc/defaultdomain</code>.</li><li>■ Restores the timezone to PST8PDT in <code>/etc/TIMEZONE</code>.</li><li>■ Disables the Network Information Service (NIS) and Network Information Service Plus (NIS+) if either NIS or NIS+ was configured.</li><li>■ Removes the entries for this host in <code>/etc/net/*/hosts</code>.</li><li>■ Removes the file <code>/etc/inet/netmasks</code>.</li><li>■ Removes the file <code>/etc/defaultrouter</code>.</li><li>■ Removes the password set for root in <code>/etc/shadow</code>.</li><li>■ Removes the file <code>/etc/.rootkey</code>.</li><li>■ Executes all system configuration applications. These applications are defined by prior executions of a <code>sysidconfig -a application</code>. (See <code>sysidconfig(1M)</code>). When <code>sys-unconfig</code> is run, all system configuration applications are passed one argument, <code>-u</code>.</li><li>■ Removes the file <code>/etc/resolv.conf</code>.</li><li>■ Disables LDAP by removing <code>/var/ldap/ldap_client_cache</code>, <code>/var/ldap/ldap_client_file</code>, <code>/var/ldap/ldap_client_cred</code>, and <code>/var/ldap/cachemgr.log</code>.</li></ul> <p>When <code>sys-unconfig</code> is finished, it performs a system shutdown. <code>sys-unconfig</code> is a potentially dangerous utility and can only be run by the super user.</p> |

| NAME                     | tapes – creates /dev entries for tape drives attached to the system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SYNOPSIS                 | <b>/usr/sbin/tapes</b> [-r <i>rootdir</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DESCRIPTION              | <p>devfsadm(1M) is now the preferred command for /dev and /devices and should be used instead of tapes.</p> <p>tapes creates symbolic links in the /dev/rmt directory to the actual tape device special files under the /devices directory tree. tapes searches the kernel device tree to see what tape devices are attached to the system. For each equipped tape drive, the following steps are performed:</p> <ol style="list-style-type: none"><li>1. The /dev/rmt directory is searched for a /dev/rmt/<i>n</i> entry that is a symbolic link to the /devices special node of the current tape drive. If one is found, this determines the logical controller number of the tape drive.</li><li>2. The rest of the special devices associated with the drive are checked, and incorrect symbolic links are removed and necessary ones added.</li><li>3. If none are found, a new logical controller number is assigned (the lowest-unused number), and new symbolic links are created for all the special devices associated with the drive.</li></ol> <p>tapes does not remove links to non-existent devices; these must be removed by hand.</p> <p>tapes is run each time a reconfiguration-boot is performed, or when add_drv(1M) is executed. When invoking tapes(1M) manually, first run drvconfig(1M) to ensure /devices is consistent with the current device configuration.</p>                                                                                                                                                                                                                                                                                 |
| Notice to Driver Writers | <p>tapes(1M) considers all devices with the node type DDI_NT_TAPE to be tape devices; these devices must have their minor name created with a specific format. The minor name encodes operational modes for the tape device and consists of an ASCII string of the form [ <i>l,m,h,c,u</i> ][ <i>b</i> ][ <i>n</i> ].</p> <p>The first character set is used to specify the tape density of the device, and are named low (<i>l</i>), medium (<i>m</i>), high (<i>h</i>), compressed (<i>c</i>), and ultra (<i>u</i>). These specifiers only express a relative density; it is up to the driver to assign specific meanings as needed. For example, 9 track tape devices interpret these as actual bits-per-inch densities, where <i>l</i> means 800 BPI, <i>m</i> means 1600 BPI, and <i>h</i> means 6250 BPI, whereas 4mm DAT tapes defines <i>l</i> as standard format, and <i>m</i>, <i>h</i>, <i>c</i> and <i>u</i> as compressed format. Drivers may choose to implement any or all of these format types.</p> <p>During normal tape operation (non-BSD behavior), once an EOF mark has been reached, subsequent reads from the tape device return an error. An explicit IOCTL must be issued to space over the EOF mark before the next file can be read. <i>b</i> instructs the device to observe BSD behavior, where reading at EOF will cause the tape device to automatically space over the EOF mark and begin reading from the next file.</p> <p><i>n</i> or no-rewind-on-close instructs the driver to not rewind to the beginning of tape when the device is closed. Normal behavior for tape devices is to reposition to BOT when closing. See mtio(7I).</p> |

The minor number for tape devices should be created by encoding the device's instance number using the tape macro MTMINOR and ORing in the proper combination of density, BSD behavior, and no-rewind flags. See `mtio(7I)`.

To prevent tapes from attempting to automatically generate links for a device, drivers must specify a private node type and refrain from using the node type string DDI\_NT\_TAPE when calling `ddi_create_minor_node(9F)`.

**OPTIONS**     `-r rootdir`                Causes tapes to presume that the `/dev/rmt` directory tree is found under *rootdir*, not directly under `/`.

**ERRORS**     If tapes finds entries of a particular logical controller linked to different physical controllers, it prints an error message and exits without making any changes to the `/dev` directory, since it cannot determine which of the two alternative logical to physical mappings is correct. The links should be manually corrected or removed before another reconfiguration boot is performed.

**EXAMPLES**     **EXAMPLE 1** Creating Tape Device Nodes From Within the Driver's `attach()` Function

This example demonstrates creating tape device nodes from within the `xktape` driver's `attach(9E)` function.

```
#include <sys/mtio.h>
struct tape_minor_info {
 char *minor_name;
 int minor_mode;
};
/*
 * create all combinations of logical tapes
 */
static struct tape_minor_info example_tape[] = {
 {"", 0}, /* default tape */
 {"l", MT_DENSITY1},
 {"lb", MT_DENSITY1 | MT_BSD},
 {"lbn", MT_DENSITY1 | MT_BSD | MT_NOREWIND},
 {"m", MT_DENSITY2},
 {"mb", MT_DENSITY2 | MT_BSD},
 {"mbn", MT_DENSITY2 | MT_BSD | MT_NOREWIND},
 {"h", MT_DENSITY3},
 {"hb", MT_DENSITY3 | MT_BSD},
 {"hbn", MT_DENSITY3 | MT_BSD | MT_NOREWIND},
 {"c", MT_DENSITY4},
 {"cb", MT_DENSITY4 | MT_BSD},
 {"cbn", MT_DENSITY4 | MT_BSD | MT_NOREWIND},
 {NULL, 0},
};

int
xktapeattach(dev_info_t *dip, ddi_attach_cmd_t cmd)
{
 int instance;
 struct tape_minor_info *mdp;
 /* other stuff in attach... */
 instance = ddi_get_instance(dip);
```

**EXAMPLE 1** Creating Tape Device Nodes From Within the Driver's `attach()` Function  
(Continued)

```

for (mdp = example_tape; mdp->minor_name != NULL; mdp++) {
 ddi_create_minor_node(dip, mdp->minor_name, S_IFCHR,
 (MTMINOR(instance) | mdp->minor_mode), DDI_NT_TAPE, 0);
}

```

Installing the `xktape` driver on a SPARCstation 20, with the driver controlling a SCSI tape (target 4 attached to an `esp(7D)` SCSI HBA) and performing a reconfiguration-boot creates the following special files in `/devices`.

```

ls -l /devices/iommu@f,e0000000/sbus@f,e0001000/espdma@f,400000/esp@f,800000/

crw-rw-rw- 1 root sys 33,140 Aug 29 00:02 xktape@4,0:n

```

`/dev/rmt` will contain the logical tape devices (symbolic links to tape devices in `/devices`).

```

ls -l /dev/dsk
/dev/rmt/0 -> ../../devices/[...]/xktape@4,0:
/dev/rmt/0b -> ../../devices/[...]/xktape@4,0:b
/dev/rmt/0bn -> ../../devices/[...]/xktape@4,0:bn
/dev/rmt/0c -> ../../devices/[...]/xktape@4,0:c
/dev/rmt/0cb -> ../../devices/[...]/xktape@4,0:cb
/dev/rmt/0cbn -> ../../devices/[...]/xktape@4,0:cbn
/dev/rmt/0cn -> ../../devices/[...]/xktape@4,0:cn
/dev/rmt/0h -> ../../devices/[...]/xktape@4,0:h
/dev/rmt/0hb -> ../../devices/[...]/xktape@4,0:hb
/dev/rmt/0hbn -> ../../devices/[...]/xktape@4,0:hbn
/dev/rmt/0hn -> ../../devices/[...]/xktape@4,0:hn
/dev/rmt/0l -> ../../devices/[...]/xktape@4,0:l
/dev/rmt/0lb -> ../../devices/[...]/xktape@4,0:lb
/dev/rmt/0lbn -> ../../devices/[...]/xktape@4,0:lbn
/dev/rmt/0ln -> ../../devices/[...]/xktape@4,0:ln
/dev/rmt/0m -> ../../devices/[...]/xktape@4,0:m
/dev/rmt/0mb -> ../../devices/[...]/xktape@4,0:mb

```

**EXAMPLE 1** Creating Tape Device Nodes From Within the Driver's attach() Function  
(Continued)

```
/dev/rmt/0mbn -> ../../devices/[...]/xktape@4,0:mbn
/dev/rmt/0mn -> ../../devices/[...]/xktape@4,0:mn
/dev/rmt/0n -> ../../devices/[...]/xktape@4,0:n
```

**FILES** /dev/rmt/\*      logical tape devices  
         /devices/\*    tape device nodes

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** add\_drv(1M), devfsadm(1M), devlinks(1M), disks(1M), drvconfig(1M), ports(1M), attributes(5), esp(7D), mtio(7I), attach(9E), ddi\_create\_minor\_node(9F)

*Writing Device Drivers*

**BUGS** tapes silently ignores malformed minor device names.

## taskstat(1M)

| <b>NAME</b>                     | taskstat – prints ASET tasks status                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                 |                                                                                                                                                                                             |              |         |

| <b>DESCRIPTION</b>              | <p>taskstat is located in the <code>/usr/aset/util</code> directory. <code>/usr/aset</code> is the default operating directory of the Automated Security Enhancement Tool (ASET). An alternative working directory can be specified by the administrators through the <code>aset -d</code> command or the <code>ASETDIR</code> environment variable. See <code>aset(1M)</code>. Because <code>aset</code> dispatches its tasks to run in the background, when it returns, these tasks may or may not have completed. <code>taskstat</code> prints the status of the tasks, listing those that are completed and those that are still executing.</p> <p>The ASET reports, which are located in the <code>/usr/aset/reports</code> directory (see the <code>-d</code> option), are not complete until all the tasks finish executing.</p> |                                 |                                                                                                                                                                                             |              |         |
| <b>OPTIONS</b>                  | <table><tr><td><code>-d <i>aset_dir</i></code></td><td>Specify the working directory for ASET. By default, this directory is <code>/usr/aset</code>. With this option, the <code>reports</code> directory will be located under <i>aset_dir</i>.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <code>-d <i>aset_dir</i></code> | Specify the working directory for ASET. By default, this directory is <code>/usr/aset</code> . With this option, the <code>reports</code> directory will be located under <i>aset_dir</i> . |              |         |
| <code>-d <i>aset_dir</i></code> | Specify the working directory for ASET. By default, this directory is <code>/usr/aset</code> . With this option, the <code>reports</code> directory will be located under <i>aset_dir</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                 |                                                                                                                                                                                             |              |         |

| <b>SYNOPSIS</b>        | <b>/usr/sbin/tcxconfig</b> [linear   nonlinear]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                     |                                                                                                         |                        |                                                                 |
| <b>DESCRIPTION</b>     | <p>The <code>tcxconfig</code> script changes the default linearity of a 24-bit TrueColor Visual for OpenWindows on a system with an S24 frame buffer. When the S24 graphics driver for OpenWindows is installed, the default 24-bit TrueColor Visual is nonlinear. You can run <code>tcxconfig</code> with an argument that specifies the setting you want.</p> <p>OpenWindows should not be running when you execute the <code>tcxconfig</code> script with an option. Start OpenWindows after <code>tcxconfig</code> has set the linearity you desire.</p> |                     |                                                                                                         |                        |                                                                 |
| <b>OPTIONS</b>         | <p>If you specify no option, <code>tcxconfig</code> displays the current default setting.</p> <p>You must become superuser before you can execute <code>tcxconfig</code> with one of the following options.</p> <table> <tr> <td><code>linear</code></td><td>Set linear visual to be the default 24-bit TrueColor Visual. This means colors will be gamma-corrected.</td></tr> <tr> <td><code>nonlinear</code></td><td>Set nonlinear visual to be the default 24-bit TrueColor Visual.</td></tr> </table>                                                    | <code>linear</code> | Set linear visual to be the default 24-bit TrueColor Visual. This means colors will be gamma-corrected. | <code>nonlinear</code> | Set nonlinear visual to be the default 24-bit TrueColor Visual. |
| <code>linear</code>    | Set linear visual to be the default 24-bit TrueColor Visual. This means colors will be gamma-corrected.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                     |                                                                                                         |                        |                                                                 |
| <code>nonlinear</code> | Set nonlinear visual to be the default 24-bit TrueColor Visual.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                     |                                                                                                         |                        |                                                                 |

| DESCRIPTION | <p>The <code>th_define</code> utility provides an interface to the <code>bus_ops</code> fault injection <code>bofi</code> device driver for defining error injection specifications (referred to as <code>errdefs</code>). An <code>errdef</code> corresponds to a specification of how to corrupt a device driver's accesses to its hardware. The command line arguments determine the precise nature of the fault to be injected. If the supplied arguments define a consistent <code>errdef</code>, the <code>th_define</code> process will store the <code>errdef</code> with the <code>bofi</code> driver and suspend itself until the criteria given by the <code>errdef</code> become satisfied (in practice, this will occur when the access counts go to zero).</p> <p>You use the <code>th_manage(1M)</code> command with the <code>start</code> option to activate the resulting <code>errdef</code>. The effect of <code>th_manage</code> with the <code>start</code> option is that the <code>bofi</code> driver acts upon the <code>errdef</code> by matching the number of hardware accesses—specified in <i>count</i>, that are of the type specified in <i>acc_types</i>, made by instance number <i>instance</i>—of the driver whose name is <i>name</i>, (or by the driver instance specified by <i>path</i>) to the register set (or DMA handle) specified by <i>reg_number</i>, that lie within the range <i>offset</i> to <i>offset</i> + <i>length</i> from the beginning of the register set or DMA handle. It then applies <i>operator</i> and <i>operand</i> to the next <i>failcount</i> matching accesses.</p> <p>If <i>acc_types</i> includes <code>log</code>, <code>th_define</code> runs in automatic test script generation mode, and a set of test scripts (written in the Korn shell) is created and placed in a sub-directory of the current directory with the name <code>&lt;driver&gt;.test.&lt;id&gt;</code> (for example, <code>glm.test.978177106</code>). A separate, executable script is generated for each access handle that matches the logging criteria. The log of accesses is placed at the top of each script as a record of the session. If the current directory is not writable, file output is written to standard output. The base name of each test file is the driver name, and the extension is a number that discriminates between different access handles. A control script (with the same name as the created test directory) is generated that will run all the test scripts sequentially.</p> <p>Executing the scripts will install, and then activate, the resulting error definitions. Error definitions are activated sequentially and the driver instance under test is taken offline and brought back online before each test (refer to the <code>-e</code> option for more information). By default, logging applies to all PIO accesses, all interrupts, and all</p> |

th\_define(1M)

DMA accesses to and from areas mapped for both reading and writing. You can constrain logging by specifying additional *acc\_types*, *reg\_number*, *offset* and *length*. Logging will continue for *count* matching accesses, with an optional time limit of *collect\_time* seconds.

Either the *-n* or *-P* option must be provided. The other options are optional. If an option (other than *-a*) is specified multiple times, only the final value for the option is used. If an option is not specified, its associated value is set to an appropriate default, which will provide maximal error coverage as described below.

## OPTIONS

The following options are available:

*-n name*

Specify the name of the driver to test. (String)

*-i instance*

Test only the specified driver instance (*-1* matches all instances of driver). (Numeric)

*-P path*

Specify the full device path of the driver to test. (String)

*-r reg\_number*

Test only the given register set or DMA handle (*-1* matches all register sets and DMA handles). (Numeric)

*-a acc\_types*

Only the specified access types will be matched. Valid values for the *acc\_types* argument are *log*, *pio*, *pio\_r*, *pio\_w*, *dma*, *dma\_r*, *dma\_w* and *intr*. Multiple access types, separated by spaces, can be specified. The default is to match all hardware accesses.

If *acc\_types* is set to *log*, logging will match all *PIO* accesses, interrupts and DMA accesses to and from areas mapped for both reading and writing. *log* can be combined with other *acc\_types*, in which case the matching condition for logging will be restricted to the specified additional *acc\_types*. Note that *dma\_r* will match only DMA handles mapped for reading only; *dma\_w* will match only DMA handles mapped for writing only; *dma* will match only DMA handles mapped for both reading and writing.

*-l offset [length]*

Constrain the range of qualifying accesses. The *offset* and *length* arguments indicate that any access of the type specified with the *-a* option, to the register set or DMA handle specified with the *-r* option, lie at least *offset* bytes into the register set or DMA handle and at most *offset + length* bytes into it. The default for *offset* is 0. The default for *length* is the maximum value that can be placed in an *offset\_t* C data type (see *types.h*). Negative values are converted into unsigned quantities. Thus, *th\_define -l 0 -1* is maximal.

*-c count [failcount]*

Wait for *count* number of matching accesses, then apply an operator and operand (see the *-o* option) to the next *failcount* number of matching accesses. If the access

## th\_define(1M)

type (see the `-a` option) includes logging, the number of logged accesses is given by  $count + failcount - 1$ . The `-1` is required because the last access coincides with the first faulting access.

Note that access logging may be combined with error injection if *failcount* and *operator* are nonzero and if the access type includes logging and any of the other access types (`pio`, `dma` and `intr`) See the description of access types in the definition of the `-a` option, above.

When the *count* and *failcount* fields reach zero, the status of the `errdef` is reported to standard output. When all active `errdefs` created by the `th_define` process complete, the process exits. If *acc\_types* includes `log`, *count* determines how many accesses to log. If *count* is not specified, a default value is used. If *failcount* is set in this mode, it will simply increase the number of accesses logged by a further *failcount* - 1.

### -o *operator* [*operand*]

For qualifying PIO read and write accesses, the value read from or written to the hardware is corrupted according to the value of *operator*:

- `EQ`        *operand* is returned to the driver.
- `OR`        *operand* is bitwise ORed with the real value.
- `AND`       *operand* is bitwise ANDed with the real value.
- `XOR`       *operand* is bitwise XORed with the real value.

For PIO write accesses, the following operator is allowed:

- `NO`        Simply ignore the driver's attempt to write to the hardware.

Note that a driver performs PIO via the `ddi_getX()`, `ddi_putX()`, `ddi_rep_getX()` and `ddi_rep_putX()` routines (where *X* is 8, 16, 32 or 64). Accesses made using `ddi_getX()` and `ddi_putX()` are treated as a single access, whereas an access made using the `ddi_rep_*(9F)` routines are broken down into their respective number of accesses, as given by the *repcount* parameter to these DDI calls. If the access is performed via a DMA handle, *operator* and *value* are applied to every access that comprises the DMA request. If interference with interrupts has been requested then the operator may take any of the following values:

- `DELAY`    After *count* accesses (see the `-c` option), delay delivery of the next *failcount* number of interrupts for *operand* number of microseconds.
- `LOSE`     After *count* number of interrupts, fail to deliver the next *failcount* number of real interrupts to the driver.
- `EXTRA`    After *count* number of interrupts, start delivering *operand* number of extra interrupts for the next *failcount* number of real interrupts.

The default value for *operand* and *operator* is to corrupt the data access by flipping each bit (XOR with `-1`).

th\_define(1M)

-f *acc\_chk*

If the *acc\_chk* parameter is set to 1 or *pio*, then the driver's calls to `ddi_check_acc_handle(9F)` return `DDI_FAILURE` when the access count goes to 1. If the *acc\_chk* parameter is set to 2 or *dma*, then the driver's calls to `ddi_check_dma_handle(9F)` return `DDI_FAILURE` when the access count goes to 1.

-w *max\_wait\_period* [*report\_interval*]

Constrain the period for which an error definition will remain active. The option applies only to non-logging errdefs. If an error definition remains active for *max\_wait\_period* seconds, the test will be aborted. If *report\_interval* is set to a nonzero value, the current status of the error definition is reported to standard output every *report\_interval* seconds. The default value is zero. The status of the errdef is reported in parsable format (eight fields, each separated by a colon (:) character, the last of which is a string enclosed by double quotes and the remaining seven fields are integers):

*ft:mt:ac:fc:chk:ec:s:"message"* which are defined as follows:

|                  |                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>ft</i>        | The UTC time when the fault was injected.                                                                               |
| <i>mt</i>        | The UTC time when the driver reported the fault.                                                                        |
| <i>ac</i>        | The number of remaining non-faulting accesses.                                                                          |
| <i>fc</i>        | The number of remaining faulting accesses.                                                                              |
| <i>chk</i>       | The value of the <i>acc_chk</i> field of the errdef.                                                                    |
| <i>ec</i>        | The number of fault reports issued by the driver against this errdef ( <i>mt</i> holds the time of the initial report). |
| <i>s</i>         | The severity level reported by the driver.                                                                              |
| <i>"message"</i> | Textual reason why the driver has reported a fault.                                                                     |

-h

Display the command usage string.

-s *collect\_time*

If *acc\_types* is given with the *-a* option and includes *log*, the errdef will log accesses for *collect\_time* seconds (the default is to log until the log becomes full). Note that, if the errdef specification matches multiple driver handles, multiple logging errdefs are registered with the *bofi* driver and logging terminates when all logs become full or when *collect\_time* expires or when the associated errdefs are cleared. The current state of the log can be checked with the `th_manage(1M)` command, using the *broadcast* parameter. A log can be terminated by running `th_manage(1M)` with the *clear\_errdefs* option or by sending a *SIGALRM* signal to the `th_define` process. See *alarm(2)* for the semantics of *SIGALRM*.

-p *policy*

Applicable when the *acc\_types* option includes *log*. The parameter modifies the policy used for converting from logged accesses to errdefs. All policies are inclusive:

## th\_define(1M)

- Use `rare` to bias error definitions toward rare accesses (default).
- Use `operator` to produce a separate error definition for each operator type (default).
- Use `common` to bias error definitions toward common accesses.
- Use `median` to bias error definitions toward median accesses.
- Use `maximal` to produce multiple error definitions for duplicate accesses.
- Use `unbiased` to create unbiased error definitions.
- Use `onebyte`, `twobyte`, `fourbyte`, or `eightbyte` to select `errdefs` corresponding to 1, 2, 4 or 8 byte accesses (if chosen, the `-xr` option is enforced in order to ensure that `ddi_rep_*()` calls are decomposed into *multiple single accesses*).
- Use `multibyte` to create error definitions for multibyte accesses performed using `ddi_rep_get*()` and `ddi_rep_put*()`.

Policies can be combined by adding together these options. See the NOTES section for further information.

### `-x flags`

Applicable when the `acc_types` option includes `log`. The `flags` parameter modifies the way in which the `bofi` driver logs accesses. It is specified as a string containing any combination of the following letters:

- |                |                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>w</code> | Continuous logging (that is, the log will wrap when full).                                                                                                                                                                                                                                                                                                  |
| <code>t</code> | Timestamp each log entry (access times are in seconds).                                                                                                                                                                                                                                                                                                     |
| <code>r</code> | Log repeated I/O as individual accesses (for example, a <code>ddi_rep_get16(9F)</code> call which has a <code>repcount</code> of <i>N</i> is logged <i>N</i> times with each transaction logged as size 2 bytes. Without this option, the default logging behavior is to log this access once only, with a transaction size of twice the <i>repcount</i> ). |

### `-C comment_string`

Applicable when the `acc_types` option includes `log`. It provides a comment string to be placed in any generated test scripts. The string must be enclosed in double quotes.

### `-e fixup_script [args]`

Applicable when the `acc_types` option includes `log`. The output of a logging `errdefs` is to generate a test script for each driver access handle. Use this option to embed a command in the resulting script before the errors are injected. The generated test scripts will take an instance offline and bring it back online before injecting errors in order to bring the instance into a known fault-free state. The executable `fixup_script` will be called twice with the set of optional `args`— once just before the instance is taken offline and again after the instance has been brought online. The following variables are passed into the environment of the called executable:

- |                              |                                               |
|------------------------------|-----------------------------------------------|
| <code>DRIVER_PATH</code>     | Identifies the device path of the instance.   |
| <code>DRIVER_INSTANCE</code> | Identifies the instance number of the device. |

th\_define(1M)

|                    |                                                                 |
|--------------------|-----------------------------------------------------------------|
| DRIVER_UNCONFIGURE | Has the value 1 when the instance is about to be taken offline. |
| DRIVER_CONFIGURE   | Has the value 1 when the instance has just been brought online. |

Typically, the executable ensures that the device under test is in a suitable state to be taken offline (unconfigured) or in a suitable state for error injection (for example configured, error free and servicing a workload). A minimal script for a network driver could be:

```
#!/bin/ksh

driver=xyznetdriver
ifnum=$driver$DRIVER_INSTANCE

if [[$DRIVER_CONFIGURE = 1]]; then
 ifconfig $ifnum plumb
 ifconfig $ifnum ...
 ifworkload start $ifnum
elif [[$DRIVER_UNCONFIGURE = 1]]; then
 ifworkload stop $ifnum
 ifconfig $ifnum down
 ifconfig $ifnum unplumb
fi
exit $?
```

The `-e` option must be the last option on the command line.

If the `-a log` option is selected but the `-e` option is not given, a default script is used. This script repeatedly attempts to detach and then re-attach the device instance under test.

#### Examples of Error Definitions

```
th_define -n foo -i 1 -a log
```

Logs all accesses to all handles used by instance 1 of the `foo` driver while running the default workload (attaching and detaching the instance). Then generates a set of test scripts to inject appropriate errdefs while running that default workload.

```
th_define -n foo -i 1 -a log pio
```

Logs PIO accesses to each PIO handle used by instance 1 of the `foo` driver while running the default workload (attaching and detaching the instance). Then generates a set of test scripts to inject appropriate errdefs while running that default workload.

```
th_define -n foo -i 1 -p onebyte median -e fixup arg -now
```

## th\_define(1M)

Logs all accesses to all handles used by instance 1 of the `foo` driver while running the workload defined in the fixup script `fixup` with arguments `arg` and `-now`. Then generates a set of test scripts to inject appropriate `errdefs` while running that workload. The resulting error definitions are requested to focus upon single byte accesses to locations that are accessed a *median* number of times with respect to frequency of access to I/O addresses.

```
th_define -n se -l 0x20 1 -a pio_r -o OR 0x4 -c 10 1000
```

Simulates a stuck serial chip command by forcing 1000 consecutive read accesses made by any instance of the `se` driver to its command status register, thereby returning status busy.

```
th_define -n foo -i 3 -r 1 -a pio_r -c 0 1 -f 1 -o OR 0x100
```

Causes 0x100 to be ORed into the next physical I/O read access from any register in register set 1 of instance 3 of the `foo` driver. Subsequent calls in the driver to `ddi_check_acc_handle()` return `DDI_FAILURE`.

```
th_define -n foo -i 3 -r 1 -a pio_r -c 0 1 -o OR 0x0
```

Causes 0x0 to be ORed into the next physical I/O read access from any register in register set 1 of instance 3 of the `foo` driver. This is of course a no-op.

```
th_define -n foo -i 3 -r 1 -l 0x8100 1 -a pio_r -c 0 10 -o EQ 0x70003
```

Causes the next ten next physical I/O reads from the register at offset 0x8100 in register set 1 of instance 3 of the `foo` driver to return 0x70003.

```
th_define -n foo -i 3 -r 1 -l 0x8100 1 -a pio_w -c 100 3 -o AND 0xffffffffffffefff
```

The next 100 physical I/O writes to the register at offset 0x8100 in register set 1 of instance 3 of the `foo` driver take place as normal. However, on each of the three subsequent accesses, the 0x1000 bit will be cleared.

```
th_define -n foo -i 3 -r 1 -l 0x8100 0x10 -a pio_r -c 0 1 -f 1 -o XOR 7
```

Causes the bottom three bits to have their values toggled for the next physical I/O read access to registers with offsets in the range 0x8100 to 0x8110 in register set 1 of instance 3 of the `foo` driver. Subsequent calls in the driver to `ddi_check_acc_handle()` return `DDI_FAILURE`.

```
th_define -n foo -i 3 -a pio_w -c 0 1 -o NO 0
```

Prevents the next physical I/O write access to any register in any register set of instance 3 of the `foo` driver from going out on the bus.

th\_define(1M)

```
th_define -n foo -i 3 -l 0 8192 -a dma_r -c 0 1 -o OR 7
```

Causes 0x7 to be ORed into each long long in the first 8192 bytes of the next DMA read, using any DMA handle for instance 3 of the `foo` driver.

```
th_define -n foo -i 3 -r 2 -l 0 8 -a dma_r -c 0 1 -o OR
0x7070707070707070
```

Causes 0x70 to be ORed into each byte of the first long long of the next DMA read, using the DMA handle with sequential allocation number 2 for instance 3 of the `foo` driver.

```
th_define -n foo -i 3 -l 256 256 -a dma_w -c 0 1 -f 2 -o OR 7
```

Causes 0x7 to be ORed into each long long in the range from offset 256 to offset 512 of the next DMA write, using any DMA handle for instance 3 of the `foo` driver. Subsequent calls in the driver to `ddi_check_dma_handle()` return `DDI_FAILURE`.

```
th_define -n foo -i 3 -r 0 -l 0 8 -a dma_w -c 100 3 -o AND
0xffffffffffffefff
```

The next 100 DMA writes using the DMA handle with sequential allocation number 0 for instance 3 of the `foo` driver take place as normal. However, on each of the three subsequent accesses, the 0x1000 bit will be cleared in the first long long of the transfer.

```
th_define -n foo -i 3 -a intr -c 0 6 -o LOSE 0
```

Causes the next six interrupts for instance 3 of the `foo` driver to be lost.

```
th_define -n foo -i 3 -a intr -c 30 1 -o EXTRA 10
```

When the thirty-first subsequent interrupt for instance 3 of the `foo` driver occurs, a further ten interrupts are also generated.

```
th_define -n foo -i 3 -a intr -c 0 1 -o DELAY 1024
```

Causes the next interrupt for instance 3 of the `foo` driver to be delayed by 1024 microseconds.

**NOTES** The policy option in the `th_define -p` syntax determines how a set of logged accesses will be converted into the set of error definitions. Each logged access will be matched against the chosen policies to determine whether an error definition should be created based on the access.

Any number of policy options can be combined to modify the generated error definitions.

th\_define(1M)

**Bytewise Policies**

These select particular I/O transfer sizes. Specifying a byte policy will exclude other byte policies that have not been chosen. If none of the byte type policies is selected, all transfer sizes are treated equally. Otherwise, only those specified transfer sizes will be selected.

|           |                                                            |
|-----------|------------------------------------------------------------|
| onebyte   | Create errdefs for one byte accesses (ddi_get8())          |
| twobyte   | Create errdefs for two byte accesses (ddi_get16())         |
| fourbyte  | Create errdefs for four byte accesses (ddi_get32())        |
| eightbyte | Create errdefs for eight byte accesses (ddi_get64())       |
| multibyte | Create errdefs for repeated byte accesses (ddi_rep_get*()) |

**Frequency of Access Policies**

The frequency of access to a location is determined according to the access type, location and transfer size (for example, a two-byte read access to address A is considered distinct from a four-byte read access to address A). The algorithm is to count the number of accesses (of a given type and size) to a given location, and find the locations that were most and least accessed (let *maxa* and *mina* be the number of times these locations were accessed, and *mean* the total number of accesses divided by total number of locations that were accessed). Then a rare access is a location that was accessed less than

$(mean - mina) / 3 + mina$

times. Similarly for the definition of common accesses:

$maxa - (maxa - mean) / 3$

A location whose access patterns lies within these cutoffs is regarded as a location that is accessed with median frequency.

|        |                                                                    |
|--------|--------------------------------------------------------------------|
| rare   | Create errdefs for locations that are rarely accessed.             |
| common | Create errdefs for locations that are commonly accessed.           |
| median | Create errdefs for locations that are accessed a median frequency. |

**Policies for Minimizing errdefs**

If a transaction is duplicated, either a single or multiple errdefs will be written to the test scripts, depending upon the following two policies:

|           |                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maximal   | Create multiple errdefs for locations that are repeatedly accessed.                                                                                                                                                                            |
| unbiased  | Create a single errdef for locations that are repeatedly accessed.                                                                                                                                                                             |
| operators | For each location, a default operator and operand is typically applied. For maximal test coverage, this default may be modified using the operators policy so that a separate errdef is created for each of the possible corruption operators. |

| DESCRIPTION   | <p>th_manage applies the action specified by <i>command</i> to the instance specified by <i>instance</i> of the driver specified by <i>name</i> (or the driver instance specified by <i>path</i>). The driver instance must be running fault injection specifications (errdefs) defined by th_define(1M).</p> <p>th_manage supports several commands that operate on the driver instance specified by <i>name</i> and <i>instance</i> (or <i>path</i>). The commands are:</p> <table> <tr> <td>broadcast</td><td>Awaken all th_define processes, causing them to display their current status and exit if the errdef is now defunct (that is, if <i>count</i>, <i>failcount</i>, and <i>acc_chk</i> are all zero).</td></tr> <tr> <td>clear_acc_chk</td><td>Awaken all th_define processes. If <i>count</i> and <i>failcount</i> are already zero, then set <i>acc_chk</i> to zero, so that th_define exits once it has displayed its status.</td></tr> <tr> <td>clear_errdefs</td><td>Awaken all th_define processes. <i>count</i>, <i>failcount</i> and <i>acc_chk</i> are all set to zero so that all th_define commands exit once they have displayed their status.</td></tr> <tr> <td>clear_errors</td><td>Awaken all th_define processes. If <i>count</i> is already zero, set <i>failcount</i> and <i>acc_chk</i> to zero, so that th_define exits once it has displayed its status.</td></tr> <tr> <td>get_handles</td><td>List all the access handles.</td></tr> <tr> <td>start</td><td>Begin or resume execution of all errdefs.</td></tr> <tr> <td>stop</td><td>Suspend all errdefs for this <i>name</i> and <i>instance</i> (or <i>path</i>).</td></tr> </table> | broadcast | Awaken all th_define processes, causing them to display their current status and exit if the errdef is now defunct (that is, if <i>count</i> , <i>failcount</i> , and <i>acc_chk</i> are all zero). | clear_acc_chk | Awaken all th_define processes. th\_manage(1M)

**EXAMPLE 1** Useful Commands     *(Continued)*

```
th_manage foo 0 clear_errors
```

and bring the driver online again using libdevice.

To terminate testing, enter:

```
th_manage foo 0 clear_errdefs
```

| <b>SYNOPSIS</b>    | <b>tic</b> [-v [ <i>n</i> ]] [-c] <i>file</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The command <b>tic</b> translates a <b>terminfo</b> file from the source format into the compiled format. The results are placed in the directory <code>/usr/share/lib/terminfo</code>. The compiled format is necessary for use with the library routines in <b>curses(3CURSES)</b>.</p> <p>If the environment variable <b>TERMINFO</b> is set, the compiled results are placed there instead of <code>/usr/share/lib/terminfo</code>.</p> <p>Total compiled entries cannot exceed 4096 bytes. The name field cannot exceed 128 bytes. Terminal names exceeding 14 characters will be truncated to 14 characters and a warning message will be printed.</p>                                                                                                                      |                |                 |              |         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li><b>-c</b> Specifies to check only <i>file</i> for errors. Errors in <code>use=</code> links are not detected.</li> <li><b>-v[<i>n</i>]</b> Specify that (verbose) output be written to standard error trace information showing <b>tic</b>'s progress. The optional integer <i>n</i> is a number from 1 to 10, indicating the desired level of detail of information. If <i>n</i> is omitted, the default level is 1. If <i>n</i> is specified and greater than 1, the level of detail is increased.</li> </ul>                                                                                                                                                                                   |                |                 |              |         |
| <b>OPERANDS</b>    | <p><b>file</b> Contains one or more <b>terminfo</b> terminal descriptions in source format [see <b>terminfo(4)</b>]. Each description in the file describes the capabilities of a particular terminal. When a <code>use=entry-name</code> field is discovered in a terminal entry currently being compiled, <b>tic</b> reads in the binary from <code>/usr/share/lib/terminfo</code> to complete the entry. (Entries created from <i>file</i> will be used first. If the environment variable <b>TERMINFO</b> is set, that directory is searched instead of <code>/usr/share/lib/terminfo</code>.) <b>tic</b> duplicates the capabilities in <i>entry-name</i> for the current entry, with the exception of those capabilities that are explicitly defined in the current entry.</p> |                |                 |              |         |
| <b>FILES</b>       | <code>/usr/share/lib/terminfo/?/*</code> Compiled terminal description database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |         |

| DESCRIPTION | <p>The Internet is a large and complex aggregation of network hardware, connected by gateways. Tracking the route a packet follows can be difficult. The utility <code>traceroute</code> traces the route that an IP packet follows to another internet host.</p> <p>The <code>traceroute</code> utility utilizes the both the IPv4 and IPv6 protocols. Use the <code>-A</code> option to override the default behavior. <code>traceroute</code> uses the IPv4 protocol <i>tll</i> (time to live) field or the IPv6 field <i>hop limit</i>. It attempts to elicit an ICMP or ICMP6 <code>TIME_EXCEEDED</code> response from each <i>gateway</i> along the path, and a <code>PORT_UNREACHABLE</code>(or <code>ECHO_REPLY</code> if <code>-I</code> is used) response from the destination host. It starts by sending probes with a <i>tll</i> or <i>hop limit</i> of 1 and increases by 1 until it either gets to the host, or it hits the maximum <i>max_hop</i>. The default maximum <i>max_hop</i> is 30 hops, but this can be set by the <code>-m</code> option.</p> <p>Three probes are sent at each <i>tll</i> (<i>hop limit</i>) setting, and a line is printed showing the <i>tll</i> (<i>hop limit</i>), the hostname and the address of the gateway, and the <i>rtt</i> (round trip time) of each probe. The number of probes may be specifically set using the <code>-q</code> option. If the probe answers come from different gateways, the hostname and the address of each responding system will be printed. If there is no response within a 5 second timeout interval, a "*" is printed for that probe. The <code>-w</code> option may be used to set the timeout interval. Other possible annotations that may appear after the time are:</p> <pre> !           the <i>tll</i> (<i>hop limit</i>) value in the received packet is &lt;= 1. !H          host unreachable. !X          communication administratively prohibited. &lt;!N&gt;       ICMP (ICMP6) unreachable code N. </pre> <p>The following annotations appear only for IPv4:</p> <pre> !F          fragmentation needed. This should never occur. If this is seen, the             associated gateway is broken. !N          network unreachable. !P          protocol unreachable. !S          source route failed. This should never occur. If this is seen, the associated             gateway is broken. !T          unreachable for the specified <i>tos</i> (type-of-service). !U          source host isolated or precedence problem. </pre> <p>The following annotations appear only for IPv6:</p> |

- !A      host unreachable for a reason other than lack of an entry in the routing table.
- !B      packet too big.
- !E      destination is not a neighbor.
- !R      unrecognized next header.

If almost all the probes result in some kind of unreachable code, then `tracert` gives up and exits.

The destination *host* is not supposed to process the UDP probe packets, so the destination *port* default is set to an unlikely value. However, if some application on the destination is using that value, the value of *port* can be changed with the `-p` option.

The only mandatory parameter is the destination *host* name or IP number. The default probe datagram length is 40 bytes (60 bytes for IPv6), but this may be increased by specifying a packet length (in bytes) after the destination *host* name.

All integer arguments to `tracert` can be specified in either decimal or hexadecimal notation. For example, *packetlen* can be specified either as 256 or 0x100.

## OPTIONS

- A *addr\_family*      Specify the address family of the target host. *addr\_family* can be either `inet` or `inet6`. Address family determines which protocol to use. For an argument of `inet`, IPv4 is used. For `inet6`, IPv6 is used.  
  
By default, if the name of a host is provided, not the literal IP address, and a valid IPv6 address exists in the name service database, `tracert` will use this address. Otherwise, if the name service database contains an IPv4 address, it will try the IPv4 address.  
  
Specify the address family `inet` or `inet6` to override the default behavior. If the argument specified is `inet`, `tracert` will use the IPv4 address associated with the hostname. If none exists, `tracert` will state that the host is unknown and exit. It will not try to determine if an IPv6 address exists in the name service database.  
  
If the specified argument is `inet6`, `tracert` will use the IPv6 address that is associated with the hostname. If none exists, `tracert` will state that the host is unknown and exit.
- a      Probe all of the addresses of a multi-homed destination. The output looks like `tracert` has been run once for each IP address of the destination. If

## traceroute(1M)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | this option is used together with <code>-A</code> , <code>traceroute</code> probes only the addresses that are of the specified address family. While probing one of the addresses of the destination, user can skip to the next address by sending a <code>SIGINT</code> , or exit <code>traceroute</code> by sending a <code>SIGQUIT</code> signal. See <code>signal(3C)</code>                                                    |
| <code>-c traffic_class</code> | Specify the traffic class of probe packets. The value must be an integer in the range from 0 to 255. Gateways along the path may route the probe packet differently depending upon the value of <code>traffic_class</code> set in the probe packet. This option is valid only on IPv6.                                                                                                                                               |
| <code>-d</code>               | Set the <code>SO_DEBUG</code> socket option.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>-F</code>               | Set the "don't fragment" bit. This option is valid only on IPv4.                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-f first_hop</code>     | Set the starting <code>ttl</code> ( <i>hop limit</i> ) value to <code>first_hop</code> , to override the default value 1. <code>traceroute</code> skips processing for those intermediate gateways which are less than <code>first_hop</code> hops away.                                                                                                                                                                             |
| <code>-g gateway</code>       | Specify a loose source route <i>gateway</i> . The user can specify more than one <i>gateway</i> by using <code>-g</code> for each gateway. The maximum number of gateways is 8 for IPv4 and 127 for IPv6. Note that some factors such as the link MTU can further limit the number of gateways for IPv6. This option cannot be used with the <code>-r</code> option.                                                                 |
| <code>-I</code>               | Use ICMP (ICMP6) ECHO instead of UDP datagrams.                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>-i iface</code>         | For IPv4, this option specifies a network interface to obtain the source IP address. This is normally only useful on a multi-homed host. The <code>-s</code> option is also another way to do this. For IPv6, it specifies the network interface on which probe packets are transmitted. The argument can be either an interface index, for example, 1, 2, or an interface name, for example, <code>le0</code> , <code>hme0</code> . |
| <code>-L flow_label</code>    | Specify the flow label of probe packets. The value must be an integer in the range from 0 to 1048575. This option is valid only on IPv6.                                                                                                                                                                                                                                                                                             |
| <code>-l</code>               | Print the value of the <code>ttl</code> ( <i>hop limit</i> ) field in each packet received.                                                                                                                                                                                                                                                                                                                                          |
| <code>-m max_hop</code>       | Set the maximum <code>ttl</code> ( <i>hop limit</i> ) used in outgoing probe packets. The default is 30 hops, which is the same default used for TCP connections.                                                                                                                                                                                                                                                                    |

## traceroute(1M)

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -n                    | Print hop addresses numerically rather than symbolically and numerically. This saves a nameserver address-to-name lookup for each gateway found on the path.                                                                                                                                                                                                                                                                                                                                                                                                             |
| -P <i>pause_sec</i>   | Specify a delay, in seconds, to pause between probe packets. This may be necessary if the final destination does not accept undeliverable packets in bursts. By default, <code>traceroute</code> sends the next probe as soon as it has received a reply. Note that <i>pause_sec</i> is a real number.                                                                                                                                                                                                                                                                   |
| -p <i>port</i>        | Set the base UDP <i>port</i> number used in probes. The default is 33434. <code>traceroute</code> hopes that nothing is listening on UDP <i>ports</i> (base+ (nhops-1) *nqueries) to (base+ (nhops*nqueries) -1) at the destination host, so that an ICMP (ICMP6) PORT_UNREACHABLE message will be returned to terminate the route tracing. If something is listening on a <i>port</i> in the default range, this option can be used to select an unused <i>port</i> range. nhops is defined as the number of hops between the source and the destination.               |
| -Q <i>max_timeout</i> | Stop probing this hop after <i>max_timeout</i> consecutive timeouts are detected. The default value is 5. Useful in combination with the -q option if you have specified a large <i>nqueries</i> probe count.                                                                                                                                                                                                                                                                                                                                                            |
| -q <i>nqueries</i>    | Set the desired number of probe queries. The default is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| -r                    | Bypass the normal routing tables and send directly to a host on an attached network. If the host is not on a directly-attached network, an error is returned. This option can be used to send probes to a local host through an interface that has been dropped by the router daemon. See <code>in.routed(1M)</code> . You cannot use this option if the -g option is used.                                                                                                                                                                                              |
| -s <i>src_addr</i>    | Use the following address, which usually is given as a literal IP address, not a hostname, as the source address in outgoing probe packets. On multi-homed hosts, those with more than one IP address, this option can be used to force the source address to be something other than the IP address <code>traceroute</code> picks by default. If the IP address is not one of this machine's interface addresses, an error is returned and nothing is sent. For IPv4, when used together with the -i option, the given IP address should be configured on the specified |

## traceroute(1M)

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <p>interface. Otherwise, an error will be returned. In the case of IPv6, the interface name and the source address do not have to match.</p> <p><b>-t <i>tos</i></b> Set the <i>tos</i>(type-of-service) in probe packets to the specified value. The default is zero. The value must be an integer in the range from 0 to 255. Gateways along the path may route the probe packet differently depending upon the <i>tos</i> value set in the probe packet. This option is valid only on IPv4.</p> <p><b>-v</b> Verbose output. For each hop, the size and the destination of the response packets is displayed. Also ICMP (ICMP6) packets received other than <code>TIME_EXCEEDED</code> and <code>UNREACHABLE</code> are listed as well.</p> <p><b>-w <i>waittime</i></b> Set the time, in seconds, to wait for a response to a probe. The default is 5 seconds.</p> <p><b>-x</b> Prevent <code>traceroute</code> from calculating checksums. Note that checksums are usually required for the last hop when using ICMP <code>ECHO</code> probes. This option is valid only on IPv4. See the <code>-I</code> option.</p>                                                                                                                                                                                                                                      |
| <b>OPERANDS</b> | <p>The following operands are supported:</p> <p><i>host</i> The network host.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>EXAMPLES</b> | <p><b>EXAMPLE 1</b> Sample Output From the <code>traceroute</code> Utility</p> <p>Some sample output from the <code>traceroute</code> utility might be:</p> <pre>istanbul% traceroute london traceroute: Warning: london has multiple addresses; \     using 4::114:a00:20ff:ab3d:83ed traceroute: Warning: Multiple interfaces found; \     using 4::56:a00:20ff:fe93:8dde @ 1e0:2 traceroute to london (4::114:a00:20ff:ab3d:83ed), 30 hops max, \     60 byte packets  1  frblgdg7c-86 (4::56:a00:20ff:felf:65a1)  1.786 ms  1.544 ms  1.719 ms  2  frblgdg7b-77 (4::255:0:0:c0a8:517)  2.587 ms  3.001 ms  2.988 ms  3  london (4::114:a00:20ff:ab3d:83ed)  3.122 ms  2.744 ms  3.356 ms</pre> <p>The target host, london, has both IPv4 and IPv6 addresses in the name service database. According to the default behavior, <code>traceroute</code> uses IPv6 address of the destination host.</p> <p><b>EXAMPLE 2</b> Using the <code>traceroute</code> Utility For a Host Which has Only IPv4 Addresses</p> <p>In the following examples, <code>traceroute</code> is tracking the route to host sanfrancisco, which has only IPv4 addresses in the name service database. Therefore <code>traceroute</code> uses only IPv4 addresses. The following shows the 7-hop path that a packet would follow from the host istanbul to the host sanfrancisco.</p> |

**EXAMPLE 2** Using the traceroute Utility For a Host Which has Only IPv4 Addresses  
(Continued)

```
istanbul% traceroute sanfrancisco
traceroute: Warning: Multiple interfaces found; using 172.31.86.247 @ le0
traceroute to sanfrancisco (172.29.64.39), 30 hops max, 40 byte packets
 1 frbldg7c-86 (172.31.86.1) 1.516 ms 1.283 ms 1.362 ms
 2 bldg1a-001 (172.31.1.211) 2.277 ms 1.773 ms 2.186 ms

 4 bldg6-bldg4 (172.30.4.49) 2.655 ms 3.042 ms 2.344 ms
 5 ferbldg11a-001 (172.29.1.236) 2.636 ms 3.432 ms 3.830 ms
 6 frbldg12b-153 (172.29.153.72) 3.452 ms 3.146 ms 2.962 ms
 7 sanfrancisco (172.29.64.39) 3.430 ms 3.312 ms 3.451 ms
```

**EXAMPLE 3** Using the traceroute Utility With Source Routing

The following example shows the path of a packet that goes from istanbul to sanfrancisco through the hosts cairo and paris, as specified by the -g option. The -I option makes traceroute send ICMP ECHO probes to the host sanfrancisco. The -i options sets the source address to the IP address configured on the interface qe0.

```
istanbul% traceroute -g cairo -g paris -i qe0 -q 1 -I sanfrancisco
traceroute to sanfrancisco (172.29.64.39), 30 hops max, 56 byte packets
 1 frbldg7c-86 (172.31.86.1) 2.012 ms
 2 flrbldg7u (172.31.17.131) 4.960 ms
 3 cairo (192.168.163.175) 4.894 ms
 4 flrbldg7u (172.31.17.131) 3.475 ms
 5 frbldg7c-017 (172.31.17.83) 4.126 ms
 6 paris (172.31.86.31) 4.086 ms
 7 frbldg7b-82 (172.31.82.1) 6.454 ms
 8 bldg1a-001 (172.31.1.211) 6.541 ms
 9 bldg6-bldg4 (172.30.4.49) 6.518 ms
10 ferbldg11a-001 (172.29.1.236) 9.108 ms
11 frbldg12b-153 (172.29.153.72) 9.634 ms
12 sanfrancisco (172.29.64.39) 14.631 ms
```

**EXIT STATUS** The following exit values are returned:

- 0 Successful operation.
- >0 An error occurred.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

|                 |                                                                                                                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WARNINGS</b> | This utility is intended for use in network testing, measurement and management. It should be used primarily for manual fault isolation. Because of the load it could impose on the network, it is unwise to use <code>traceroute(1M)</code> during normal operations or from automated scripts. |

| NAME        | trapstat – report trap statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SYNOPSIS    | <pre> /usr/platform/ platform-name /sbin/trapstat [-t   -T   -e entry]           [-C processor_set_id   -c cpulist] [-P] [-a] [-r rate] [ [interval           [count]]   command   [args]]  /usr/platform/ platform-name /sbin/trapstat -l </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DESCRIPTION | <p>The trapstat utility gathers and displays run-time trap statistics on UltraSPARC-based systems. The default output is a table of trap types and CPU IDs, with each row of the table denoting a trap type and each column of the table denoting a CPU. If standard output is a terminal, the table contains as many columns of data as can fit within the terminal width; if standard output is not a terminal, the table contains at most six columns of data. By default, data is gathered and displayed for all CPUs; if the data cannot fit in a single table, it is printed across multiple tables. The set of CPUs for which data is gathered and displayed can be optionally specified with the <code>-c</code> or <code>-C</code> option.</p> <p>Unless the <code>-r</code> option or the <code>-a</code> option is specified, the value displayed in each entry of the table corresponds to the number of traps per second. If the <code>-r</code> option is specified, the value corresponds to the number of traps over the interval implied by the specified sampling rate; if the <code>-a</code> option is specified, the value corresponds to the accumulated number of traps since the invocation of trapstat.</p> <p>By default, trapstat displays data once per second, and runs indefinitely; both of these behaviors can be optionally controlled with the <i>interval</i> and <i>count</i> parameters, respectively. The <i>interval</i> is specified in seconds; the <i>count</i> indicates the number of intervals to be executed before exiting. Alternatively, <i>command</i> can be specified, in which case trapstat executes the provided command and continues to run until the command exits. A positive integer is assumed to be an <i>interval</i>; if the desired <i>command</i> cannot be distinguished from an integer, the full path of <i>command</i> must be specified.</p> <p>UltraSPARC I, II and III handle translation lookaside buffer (TLB) misses by trapping to the operating system. TLB miss traps can be a significant component of overall system performance for some workloads; the <code>-t</code> option provides in-depth information on these traps. When run with this option, trapstat displays both the rate of TLB miss traps and the percentage of time spent processing those traps. Additionally, TLB misses that hit in the translation storage buffer (TSB) are differentiated from TLB misses that further miss in the TSB. (The TSB is a software structure used as a translation entry cache to allow the TLB to be quickly filled; it is discussed in detail in the <i>UltraSPARC I&amp;II User's Manual</i>.) The TLB and TSB miss information is further broken down into user- and kernel-mode misses.</p> <p>Workloads with working sets that exceed the TLB reach may spend a significant amount of time missing in the TLB. To accommodate such workloads, the operating system supports multiple page sizes: larger page sizes increase the effective TLB reach and thereby reduce the number of TLB misses. To provide insight into the relationship</p> |

## trapstat(1M)

between page size and TLB miss rate, `trapstat` optionally provides in-depth TLB miss information broken down by page size using the `-T` option. The information provided by the `-T` option is a superset of that provided by the `-t` option; only one of `-t` and `-T` can be specified.

### OPTIONS

The following options are supported:

- `-a` Displays the number of traps as accumulating, monotonically increasing values instead of per-second or per-interval rates.
- `-c cpulist` Enables `trapstat` only on the CPUs specified by *cpulist*.  
  
*cpulist* can be a single processor ID (for example, 4), a range of processor IDs (for example, 4-6), or a comma separated list of processor IDs or processor ID ranges (for example, 4, 5, 6 or 4, 6-8).
- `-C processor_set_id` Enables `trapstat` only on the CPUs in the processor set specified by *processor\_set\_id*.  
  
`trapstat` modifies its output to always reflect the CPUs in the specified processor set. If a CPU is added to the set, `trapstat` modifies its output to include the added CPU; if a CPU is removed from the set, `trapstat` modifies its output to exclude the removed CPU. At most one processor set can be specified.
- `-e entrylist` Enables `trapstat` only for the trap table entry or entries specified by *entrylist*. A trap table entry can be specified by trap number or by trap name (for example, the level-10 trap can be specified as 74, 0x4A, 0x4a, or level-10).  
  
*entrylist* can be a single trap table entry or a comma separated list of trap table entries. If the specified trap table entry is not valid, `trapstat` prints a table of all valid trap table entries and values. A list of valid trap table entries is also found in *The SPARC Architecture Manual, Version 9* and the *Sun Microelectronics UltraSPARC I&II User's Manual*. If the parsable option (`-P`) is specified in addition to the `-e` option, the format of the data is as follows:

| Field | Contents                            |
|-------|-------------------------------------|
| 1     | Timestamp (nanoseconds since start) |

| Field | Contents                     |
|-------|------------------------------|
| 2     | CPU ID                       |
| 3     | Trap number (in hexadecimal) |
| 4     | Trap name                    |
| 5     | Trap rate per interval       |

Each field is separated with whitespace. If the format is modified, it will be modified by adding potentially new fields beginning with field 6; exant fields will remain unchanged.

-l

Lists trap table entries. By default, a table is displayed containing all valid trap numbers, their names and a brief description. The trap name is used in both the default output and in the *entrylist* parameter for the *-e* argument. If the parsable option (*-P*) is specified in addition to the *-l* option, the format of the data is as follows:

| Field     | Contents                   |
|-----------|----------------------------|
| 1         | Trap number in hexadecimal |
| 2         | Trap number in decimal     |
| 3         | Trap name                  |
| Remaining | Trap description           |

-P

Generates parsable output. When run without other data gathering modifying options (that is, *-e*, *-t* or *-T*), *trapstat*'s the parsable output has the following format:

| Field | Contents                            |
|-------|-------------------------------------|
| 1     | Timestamp (nanoseconds since start) |
| 2     | CPU ID                              |
| 3     | Trap number (in hexadecimal)        |

## trapstat(1M)

| Field | Contents               |
|-------|------------------------|
| 4     | Trap name              |
| 5     | Trap rate per interval |

Each field is separated with whitespace. If the format is modified, it will be modified by adding potentially new fields beginning with field 6; extant fields will remain unchanged.

**-r *rate***  
Explicitly sets the sampling rate to be *rate* samples per second. If this option is specified, *trapstat*'s output changes from a traps-per-second to traps-per-sampling-interval.

**-t**  
Enables TLB statistics.

A table is displayed with four principal columns of data: *itlb-miss*, *itsb-miss*, *dtlb-miss*, and *dtlsb-miss*. The columns contain both the rate of the corresponding event and the percentage of CPU time spent processing the event. The percentage of CPU time is given only in terms of a single CPU. The rows of the table correspond to CPUs, with each CPU consuming two rows: one row for user-mode events (denoted with *u*) and one row for kernel-mode events (denoted with *k*). For each row, the percentage of CPU time is totalled and displayed in the rightmost column. The CPUs are delineated with a solid line. If the parsable option (*-P*) is specified in addition to the *-t* option, the format of the data is as follows:

| Field | Contents                                               |
|-------|--------------------------------------------------------|
| 1     | Timestamp (nanoseconds since start)                    |
| 2     | CPU ID                                                 |
| 3     | Mode ( <i>k</i> denotes kernel, <i>u</i> denotes user) |
| 4     | I-TLB misses                                           |
| 5     | Percentage of time in I-TLB miss handler               |
| 6     | I-TSB misses                                           |

| Field | Contents                                 |
|-------|------------------------------------------|
| 7     | Percentage of time in I-TSB miss handler |
| 8     | D-TLB misses                             |
| 9     | Percentage of time in D-TLB miss handler |
| 10    | D-TSB misses                             |
| 11    | Percentage of time in D-TSB miss handler |

Each field is separated with whitespace. If the format is modified, it will be modified by adding potentially new fields beginning with field 12; extant fields will remain unchanged.

-T

Enables TLB statistics, with page size information. As with the `-t` option, a table is displayed with four principal columns of data: *itlb-miss*, *itsb-miss*, *dtlb-miss*, and *dtsb-miss*. The columns contain both the absolute number of the corresponding event, and the percentage of CPU time spent processing the event. The percentage of CPU time is given only in terms of a single CPU. The rows of the table correspond to CPUs, with each CPU consuming two sets of rows: one set for user-level events (denoted with *u*) and one set for kernel-level events (denoted with *k*). Each set, in turn, contains as many rows as there are page sizes supported (see `getpagesizes(3C)`). For each row, the percentage of CPU time is totalled and displayed in the right-most column. The two sets are delineated with a dashed line; CPUs are delineated with a solid line. If the parsable option (`-P`) is specified in addition to the `-T` option, the format of the data is as follows:

| Field | Contents                                             |
|-------|------------------------------------------------------|
| 1     | Timestamp (nanoseconds since start)                  |
| 2     | CPU ID                                               |
| 3     | Mode <i>k</i> denotes kernel, <i>u</i> denotes user) |
| 4     | Page size, in decimal                                |

trapstat(1M)

| Field | Contents                                 |
|-------|------------------------------------------|
| 5     | I-TLB misses                             |
| 6     | Percentage of time in I-TLB miss handler |
| 7     | I-TSB misses                             |
| 8     | Percentage of time in I-TSB miss handler |
| 9     | D-TLB misses                             |
| 10    | Percentage of time in D-TLB miss handler |
| 11    | D-TSB misses                             |
| 12    | Percentage of time in D-TSB miss handler |

Each field is separated with whitespace. If the format is modified, it will be modified by adding potentially new fields beginning with field 13; extant fields will remain unchanged.

## EXAMPLES

### EXAMPLE 1 Using trapstat Without Options

When run without options, `trapstat` displays a table of trap types and CPUs. At most six columns can fit in the default terminal width; if (as in this example) there are more than six CPUs, multiple tables are displayed:

```
example# trapstat
vct name | cpu0 cpu1 cpu4 cpu5 cpu8 cpu9
-----+-----
24 cleanwin | 6446 4837 6368 2153 2623 1321
41 level-1 | 100 0 0 0 1 0
44 level-4 | 0 1 1 1 0 0
45 level-5 | 0 0 0 0 0 0
47 level-7 | 0 0 0 0 9 0
49 level-9 | 100 100 100 100 100 100
4a level-10 | 100 0 0 0 0 0
4d level-13 | 6 10 7 16 13 11
4e level-14 | 100 0 0 0 1 0
60 int-vec | 2607 2740 2642 2922 2920 3033
64 itlb-miss | 3129 2475 3167 1037 1200 569
68 dtlb-miss | 121061 86162 109838 37386 45639 20269
6c dtlb-prot | 997 847 1061 379 406 184
84 spill-user-32 | 2809 2133 2739 200806 332776 454504
88 spill-user-64 | 45819 207856 93487 228529 68373 77590
8c spill-user-32-cln | 784 561 767 274 353 215
90 spill-user-64-cln | 9 37 17 39 12 13
98 spill-kern-64 | 62913 50145 63869 21916 28431 11738
a4 spill-asuser-32 | 1327 947 1288 460 572 335
a8 spill-asuser-64 | 26 48 18 54 10 14
```

**EXAMPLE 3** Using trapstat with TLB Statistics

The `-t` option displays in-depth TLB statistics, including the amount of time spent performing TLB miss processing. The following example shows that the machine is spending 14.1 percent of its time just handling D-TLB misses:

```
example# trapstat -t
cpu m | itlb-miss %tim itsb-miss %tim | dtlb-miss %tim dtsb-miss %tim | %tim
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 0 u | 2571 0.3 0 0.0 | 10802 1.3 0 0.0 | 1.6
 0 k | 0 0.0 0 0.0 | 106420 13.4 184 0.1 |13.6
-----+-----+-----+-----+-----+-----+-----+
 1 u | 3069 0.3 0 0.0 | 10983 1.2 100 0.0 | 1.6
 1 k | 27 0.0 0 0.0 | 106974 12.6 19 0.0 |12.7
-----+-----+-----+-----+-----+-----+-----+
 2 u | 3033 0.3 0 0.0 | 11045 1.2 105 0.0 | 1.6
 2 k | 43 0.0 0 0.0 | 107842 12.7 108 0.0 |12.8
-----+-----+-----+-----+-----+-----+-----+
 3 u | 2924 0.3 0 0.0 | 10380 1.2 121 0.0 | 1.6
 3 k | 54 0.0 0 0.0 | 102682 12.2 16 0.0 |12.2
-----+-----+-----+-----+-----+-----+-----+
 4 u | 3064 0.3 0 0.0 | 10832 1.2 120 0.0 | 1.6
 4 k | 31 0.0 0 0.0 | 107977 13.0 236 0.1 |13.1
=====+=====+=====+=====+=====+=====+=====+=====+=====+=====+
ttl | 14816 0.3 0 0.0 | 585937 14.1 1009 0.0 |14.5
```

**EXAMPLE 4** Using trapstat with TLB Statistics and Page Size Information

By specifying the `-T` option, trapstat shows TLB misses broken down by page size. In this example, CPU 0 is spending 7.9 percent of its time handling user-mode TLB misses on 8K pages, and another 2.3 percent of its time handling user-mode TLB misses on 64K pages.

**EXAMPLE 4** Using trapstat with TLB Statistics and Page Size Information (Continued)

```
example# trapstat -T -c 0
```

| cpu | m | size | itlb-miss | %tim | itsb-miss | %tim | dtlb-miss | %tim | dtlb-miss | %tim | %tim |
|-----|---|------|-----------|------|-----------|------|-----------|------|-----------|------|------|
| 0   | u | 8k   | 1300      | 0.1  | 15        | 0.0  | 104897    | 7.9  | 90        | 0.0  | 8.0  |
| 0   | u | 64k  | 0         | 0.0  | 0         | 0.0  | 29935     | 2.3  | 7         | 0.0  | 2.3  |
| 0   | u | 512k | 0         | 0.0  | 0         | 0.0  | 3569      | 0.2  | 2         | 0.0  | 0.2  |
| 0   | u | 4m   | 0         | 0.0  | 0         | 0.0  | 233       | 0.0  | 2         | 0.0  | 0.0  |
| 0   | k | 8k   | 13        | 0.0  | 0         | 0.0  | 71733     | 6.5  | 110       | 0.0  | 6.5  |
| 0   | k | 64k  | 0         | 0.0  | 0         | 0.0  | 0         | 0.0  | 0         | 0.0  | 0.0  |
| 0   | k | 512k | 0         | 0.0  | 0         | 0.0  | 0         | 0.0  | 206       | 0.1  | 0.1  |
| 0   | k | 4m   | 0         | 0.0  | 0         | 0.0  | 0         | 0.0  | 0         | 0.0  | 0.0  |
| ttl |   |      | 1313      | 0.1  | 15        | 0.0  | 210367    | 17.1 | 417       | 0.2  | 17.5 |

**EXAMPLE 5** Using trapstat with Entry Filtering

By specifying the `-e` option, `trapstat` displays statistics for only specific trap types. Using this option minimizes the probe effect when seeking specific data. This example yields statistics for only the `dtlb-prot` and `syscall-32` traps on CPUs 12 through 15:

```
example# trapstat -e dtlb-prot,syscall-32 -c 12-15
```

| vct | name       | cpu12 | cpu13 | cpu14 | cpu15 |
|-----|------------|-------|-------|-------|-------|

**EXAMPLE 6** Using trapstat with a Higher Sampling Rate

The following example uses the `-r` option to specify a sampling rate of 1000 samples per second, and filter only for the level-10 trap. Additionally, specifying the `-P` option yields parsable output.

Notice the timestamp difference between the level-10 events: 9,998,000 nanoseconds and 10,007,000 nanoseconds. These level-10 events correspond to the system clock, which by default ticks at 100 hertz (that is, every 10,000,000 nanoseconds).

```
example# trapstat -e level-10 -P -r 1000
```

```
1070400 0 4a level-10 0
2048600 0 4a level-10 0
3030400 0 4a level-10 1
4035800 0 4a level-10 0
5027200 0 4a level-10 0
6027200 0 4a level-10 0
7027400 0 4a level-10 0
8028200 0 4a level-10 0
9026400 0 4a level-10 0
```

**NOTES**

When enabled, trapstat induces a varying probe effect, depending on the type of information collected. While the precise probe effect depends upon the specifics of the hardware, the following table can be used as a rough guide:

| Option  | Approximate probe effect                                                                    |
|---------|---------------------------------------------------------------------------------------------|
| default | 3-5% per trap                                                                               |
| -e      | 3-5% per specified trap                                                                     |
| -t, -T  | 40-45% per TLB miss trap hitting in the TSB,<br>25-30% per TLB miss trap missing in the TSB |

These probe effects are *per trap* not for the system as a whole. For example, running trapstat with the default options on a system that spends 7% of total time handling traps induces a performance degradation of less than one half of one percent; running trapstat with the -t or -T option on a system spending 5% of total time processing TLB misses induce a performance degradation of no more than 2.5%.

When run with the -t or -T option, trapstat accounts for its probe effect when calculating the %tim fields. This assures that the %tim fields are a reasonably accurate indicator of the time a given workload is spending handling TLB misses — regardless of the perturbing presence of trapstat.

While the %tim fields include the explicit cost of executing the TLB miss handler, they do *not* include the implicit costs of TLB miss traps (for example, pipeline effects, cache pollution, etc). These implicit costs become more significant as the trap rate grows; if high %tim values are reported (greater than 50%), you can accurately infer that much of the balance of time is being spent on the implicit costs of the TLB miss traps.

Due to the potential system wide degradation induced, only the super-user can run trapstat.

Due to the limitation of the underlying statistics gathering methodology, only one instance of trapstat can run at a time.

| NAME        | ttyadm – format and output port monitor-specific information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SYNOPSIS    | <pre> /usr/sbin/ttyadm [-b] [-c] [-h] [-I] [-r count] [-i msg] [-m modules]                  [-p prompt] [-t timeout] [-S y   n] [-T termtype] -d device -l ttylabel                  -s service  /usr/sbin/ttyadm -V           </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DESCRIPTION | <p>The <code>ttyadm</code> command is an administrative command that formats <code>ttymon</code>(1M)-specific information and writes it to standard output. The Service Access Facility (SAF) requires each port monitor to provide such a command. Note that the port monitor administrative file is updated by the Service Access Controller's administrative commands, <code>sacadm</code>(1M) and <code>pmadm</code>(1M). <code>ttyadm</code> provides a means of presenting formatted port monitor-specific (<code>ttymon</code>-specific) data to these commands.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OPTIONS     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-b                   Set the “bi-directional port” flag. When this flag is set, the line can be used in both directions. <code>ttymon</code> will allow users to connect to the service associated with the port, but if the port is free, <code>uucico</code>(1M), <code>cu</code>(1C), or <code>ct</code>(1C) can use it for dialing out.</li> <li>-c                   Set the connect-on-carrier flag for the port. If the <code>-c</code> flag is set, <code>ttymon</code> will invoke the port's associated service immediately when a connect indication is received (that is, no prompt is printed and no baud-rate searching is done).</li> <li>-d <i>device</i>           <i>device</i> is the full pathname of the device file for the TTY port.</li> <li>-h                   Set the hangup flag for the port. If the <code>-h</code> flag is not set, <code>ttymon</code> will force a hangup on the line by setting the speed to 0 before setting the speed to the default or specified value.</li> <li>-i <i>message</i>           Specify the inactive (disabled) response message. This message will be sent to the TTY port if the port is disabled or the <code>ttymon</code> monitoring the port is disabled.</li> <li>-I                   Initialize only. If the <code>-I</code> option is used, <code>ttymon</code> will invoke the service only once. This can be used to configure a particular device without actually monitoring it, as with software carrier.</li> <li>-l <i>ttylabel</i>           Specify which <i>ttylabel</i> in the <code>/etc/ttydefs</code> file to use as the starting point when searching for the proper baud rate.</li> <li>-m <i>modules</i>           Specify a list of pushable STREAMS modules. The modules will be pushed in the order in which they are specified before the service is invoked. <i>modules</i> must be a comma-separated list of modules, with no white space included. Any modules currently on the stream will be popped before these modules are pushed.</li> <li>-p <i>prompt</i>           Specify the prompt message, for example, “login:”.</li> </ul> |

## ttyadm(1M)

|                           |                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-r</b> <i>count</i>    | When the <b>-r</b> option is invoked, <code>ttymon</code> will wait until it receives data from the port before it displays a prompt. If <i>count</i> is 0, <code>ttymon</code> will wait until it receives any character. If <i>count</i> is greater than 0, <code>ttymon</code> will wait until <i>count</i> newlines have been received. |
| <b>-s</b> <i>service</i>  | <i>service</i> is the full pathname of the service to be invoked when a connection request is received. If arguments are required, the command and its arguments must be enclosed in double quotes ("").                                                                                                                                    |
| <b>-S</b> <i>y n</i>      | Set the software carrier value. <i>y</i> will turn software carrier on. <i>n</i> will turn software carrier off.                                                                                                                                                                                                                            |
| <b>-t</b> <i>timeout</i>  | Specify that <code>ttymon</code> should close a port if the open on the port succeeds, and no input data is received in <i>timeout</i> seconds.                                                                                                                                                                                             |
| <b>-T</b> <i>termtype</i> | Set the terminal type. The <code>TERM</code> environment variable will be set to <i>termtype</i> .                                                                                                                                                                                                                                          |
| <b>-v</b>                 | Display the version number of the current <code>/usr/lib/saf/ttymon</code> command.                                                                                                                                                                                                                                                         |

**OUTPUT** If successful, `ttyadm` will generate the requested information, write it to standard output, and exit with a status of 0. If `ttyadm` is invoked with an invalid number of arguments or invalid arguments, or if an incomplete option is specified, an error message will be written to standard error and `ttymon` will exit with a non-zero status.

**FILES** `/etc/ttydefs`

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

| DESCRIPTION | <p>ttymon is a STREAMS-based TTY port monitor. Its function is to monitor ports, to set terminal modes, baud rates, and line disciplines for the ports, and to connect users or applications to services associated with the ports. Normally, ttymon is configured to run under the Service Access Controller, sac(1M), as part of the Service Access Facility (SAF). It is configured using the sacadm(1M) command. Each instance of ttymon can monitor multiple ports. The ports monitored by an instance of ttymon are specified in the port monitor's administrative file. The administrative file is configured using the pmadm(1M) and ttyadm(1M) commands. When an instance of ttymon is invoked by the sac command, it starts to monitor its ports. For each port, ttymon first initializes the line disciplines, if they are specified, and the speed and terminal settings. For ports with entries in /etc/logindevperm, device owner, group and permissions are set. (See logindevperm(4).) The values used for initialization are taken from the appropriate entry in the TTY settings file. This file is maintained by the sttydefs(1M) command. Default line disciplines on ports are usually set up by the autopush(1M) command of the Autopush Facility.</p> <p>ttymon then writes the prompt and waits for user input. If the user indicates that the speed is inappropriate by pressing the BREAK key, ttymon tries the next speed and writes the prompt again. When valid input is received, ttymon interprets the per-service configuration file for the port, if one exists, creates a utmpx entry if required (see utmpx(4)), establishes the service environment, and then invokes the service associated with the port. Valid input consists of a string of at least one non-newline character, terminated by a carriage return. After the service terminates, ttymon cleans up the utmpx entry, if one exists, and returns the port to its initial state.</p> <p>If <i>autobaud</i> is enabled for a port, ttymon will try to determine the baud rate on the port automatically. Users must enter a carriage return before ttymon can recognize the baud rate and print the prompt. Currently, the baud rates that can be determined by <i>autobaud</i> are 110, 1200, 2400, 4800, and 9600.</p> <p>If a port is configured as a bidirectional port, ttymon will allow users to connect to a service, and, if the port is free, will allow uucico(1M), cu(1C), or ct(1C) to use it for dialing out. If a port is bidirectional, ttymon will wait to read a character before it prints a prompt.</p> <p>If the <i>connect-on-carrier</i> flag is set for a port, ttymon will immediately invoke the port's associated service when a connection request is received. The prompt message will not be sent.</p> <p>If a port is disabled, ttymon will not start any service on that port. If a disabled message is specified, ttymon will send out the disabled message when a connection request is received. If ttymon is disabled, all ports under that instance of ttymon will also be disabled.</p> |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SERVICE INVOCATION</b> | <p>The service <code>ttymon</code> invokes for a port is specified in the <code>ttymon</code> administrative file. <code>ttymon</code> will scan the character string giving the service to be invoked for this port, looking for a <code>%d</code> or a <code>%%</code> two-character sequence. If <code>%d</code> is found, <code>ttymon</code> will modify the service command to be executed by replacing those two characters by the full path name of this port (the device name). If <code>%%</code> is found, they will be replaced by a single <code>%</code>. When the service is invoked, file descriptor 0, 1, and 2 are opened to the port device for reading and writing. The service is invoked with the user ID, group ID and current home directory set to that of the user name under which the service was registered with <code>ttymon</code>. Two environment variables, <code>HOME</code> and <code>TTY PROMPT</code>, are added to the service's environment by <code>ttymon</code>. <code>HOME</code> is set to the home directory of the user name under which the service is invoked. <code>TTY PROMPT</code> is set to the prompt string configured for the service on the port. This is provided so that a service invoked by <code>ttymon</code> has a means of determining if a prompt was actually issued by <code>ttymon</code> and, if so, what that prompt actually was.</p> <p>See <code>ttysadm(1M)</code> for options that can be set for ports monitored by <code>ttymon</code> under the Service Access Controller.</p> |
| <b>SECURITY</b>           | <p><code>ttymon</code> uses <code>pam(3PAM)</code> for session management. The PAM configuration policy, listed through <code>/etc/pam.conf</code>, specifies the modules to be used for <code>ttymon</code>. Here is a partial <code>pam.conf</code> file with entries for <code>ttymon</code> using the UNIX session management module.</p> <pre>ttymon session required /usr/lib/security/pam_unix.so.1</pre> <p>If there are no entries for the <code>ttymon</code> service, then the entries for the "other" service will be used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>OPTIONS</b>            | <p><code>-g</code> A special invocation of <code>ttymon</code> is provided with the <code>-g</code> option. This form of the command should only be called by applications that need to set the correct baud rate and terminal settings on a port and then connect to <code>login</code> service, but that cannot be pre-configured under the SAC. The following combinations of options can be used with <code>-g</code>:</p> <p><code>-d device</code> <i>device</i> is the full path name of the port to which <code>ttymon</code> is to attach. If this option is not specified, file descriptor 0 must be set up by the invoking process to a TTY port.</p> <p><code>-h</code> If the <code>-h</code> flag is not set, <code>ttymon</code> will force a hangup on the line by setting the speed to zero before setting the speed to the default or specified speed.</p> <p><code>-l ttylabel</code> <i>ttylabel</i> is a link to a speed and TTY definition in the <code>ttymondefs</code> file. This definition tells <code>ttymon</code> at what speed to run initially, what the initial TTY settings are, and what speed to try next if the user indicates that the speed is inappropriate by pressing the <code>BREAK</code> key. The default speed is 9600 baud.</p> <p><code>-m modules</code> When initializing the port, <code>ttymon</code> will pop all modules on the port, and then push <i>modules</i> in the order specified. <i>modules</i> is a</p>                                                                                      |

## ttymon(1M)

### ENVIRONMENT VARIABLES

- comma-separated list of pushable modules. Default modules on the ports are usually set up by the Autopush Facility.
- p *prompt*** Allows the user to specify a prompt string. The default prompt is `Login: .`
- t *timeout*** Specifies that `ttymon` should exit if no one types anything in *timeout* seconds after the prompt is sent.
- T *termtype*** Sets the `TERM` environment variable to *termtype*.

If any of the `LC_*` variables ( `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, `LC_COLLATE`, `LC_NUMERIC`, and `LC_MONETARY` ) (see `environ(5)`) are not set in the environment, the operational behavior of `ttymon` for each corresponding locale category is determined by the value of the `LANG` environment variable. If `LC_ALL` is set, its contents are used to override both the `LANG` and the other `LC_*` variables. If none of the above variables is set in the environment, the "C" (U.S. style) locale determines how `ttymon` behaves.

**LC\_CTYPE** Determines how `ttymon` handles characters. When `LC_CTYPE` is set to a valid value, `ttymon` can display and handle text and filenames containing valid characters for that locale. `ttymon` can display and handle Extended Unix Code (EUC) characters where any individual character can be 1, 2, or 3 bytes wide. `ttymon` can also handle EUC characters of 1, 2, or more column widths. In the "C" locale, only characters from ISO 8859-1 are valid.

### FILES

`/etc/logindevperm`

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

### SEE ALSO

*System Administration Guide: Basic Administration*

### NOTES

If a port is monitored by more than one `ttymon`, it is possible for the `ttymons` to send out prompt messages in such a way that they compete for input.

The `pam_unix(5)` module might not be supported in a future release. Similar functionality is provided by `pam_authtok_check(5)`, `pam_authtok_get(5)`, `pam_authtok_store(5)`, `pam_dhkeys(5)`, `pam_passwd_auth(5)`, `pam_unix_account(5)`, `pam_unix_auth(5)`, and `pam_unix_session(5)`.

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| DESCRIPTION | <p>tunefs is designed to change the dynamic parameters of a file system which affect the layout policies. When using tunefs with <i>filesystem</i>, <i>filesystem</i> must be in /etc/vfstab. The parameters which are to be changed are indicated by the options given below.</p> <p>Generally, one should optimize for time unless the file system is over 90% full.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OPTIONS     | <p>The following options are supported:</p> <p>-a <i>maxcontig</i><br/>Specifies the maximum number of contiguous logical blocks that will be laid out before forcing a rotational delay (see -d). The default value is determined from the disk drive's maximum transfer rate.</p> <p>UFS supports no more than 1048576 byte (1MB) runs. With a logical block size of 4096, this gives a <i>maxcontig</i> limit of 256. With 8192, the limit is 128.</p> <p>-d <i>rotdelay</i><br/>Specifies the expected time (in milliseconds) to service a transfer completion interrupt and initiate a new transfer on the same disk. It is used to decide how much rotational spacing to place between successive blocks in a file.</p> <p>-e <i>maxbpg</i><br/>Indicates the maximum number of contiguous logical blocks any single file can allocate out of a cylinder group before it is forced to begin allocating blocks from another cylinder group. Typically this value is set to approximately one quarter of the total contiguous logical blocks in a cylinder group. The intent is to prevent any single file from using up all the blocks in a single cylinder group, thus degrading access times for all files subsequently allocated in that cylinder group. The effect of this limit is to cause big files to do long seeks more frequently than if they were allowed to allocate all the blocks in a cylinder group before seeking elsewhere. For file systems with exclusively large files, this parameter should be set higher.</p> <p>-m <i>minfree</i><br/>Specifies the percentage of space held back from normal users; the minimum free space threshold. This value can be set to 0; however, up to a factor of three in throughput will be lost over the performance obtained at a 10% threshold. <i>Note:</i> If the value is raised above the current usage level, users will be unable to allocate files until enough files have been deleted to get under the higher threshold.</p> <p>-o [space   time]<br/>Changes optimization strategy for the file system.</p> <p>space: conserves space</p> <p>time: attempt to organize file layout to minimize access time</p> |

tunefs(1M)

**USAGE** See `largefile(5)` for the description of the behavior of `tunefs` when encountering files greater than or equal to 2 Gbyte (  $2^{31}$  bytes).

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>DESCRIPTION</b> | <p>The uadmin command provides control for basic administrative functions. This command is tightly coupled to the system administration procedures and is not intended for general use. It may be invoked only by the super-user.</p> <p>Both the <i>cmd</i> (command) and <i>fcn</i> (function) arguments are converted to integers and passed to the uadmin system call. The optional <i>mdep</i> (machine dependent) argument is only available for the <i>cmd</i> values of 1 (A_REBOOT) or 2 (A_SHUTDOWN), to pass a single string of boot arguments to the uadmin system call. For any other <i>cmd</i> value, no <i>mdep</i> command-line argument is allowed.</p> <p>When passing an <i>mdep</i> value that contains whitespaces, the string must be grouped together as a single argument enclosed within quotes (for example, <b>uadmin 1 1 "-s kernel/unix"</b>).</p> |                |                 |              |         |

| NAME                  | ufsdump – incremental file system dump                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                       |                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                                                                                                                        |
| SYNOPSIS              | <b>/usr/sbin/ufsdump</b> [ <i>options</i> ] [ <i>arguments</i> ] <i>files_to_dump</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                       |                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                                                                                                                        |
| DESCRIPTION           | <p>ufsdump backs up all files specified by <i>files_to_dump</i> (normally either a whole file system or files within a file system changed after a certain date) to magnetic tape, diskette, or disk file. When running ufsdump, the file system must be inactive; otherwise, the output of ufsdump may be inconsistent and restoring files correctly may be impossible. A file system is inactive when it is unmounted or the system is in single user mode. A file system is not considered inactive if one tree of the file system is quiescent while another tree has files or directories being modified.</p> <p><i>options</i> is a single string of one-letter ufsdump options.</p> <p><i>arguments</i> may be multiple strings whose association with the options is determined by order. That is, the first argument goes with the first option that takes an argument; the second argument goes with the second option that takes an argument, and so on.</p> <p><i>files_to_dump</i> is required and must be the last argument on the command line. See OPERANDS for more information.</p> <p>With most devices ufsdump can automatically detect the end-of-media. Consequently, the <i>d</i>, <i>s</i>, and <i>t</i> options are not necessary for multi-volume dumps, unless ufsdump does not understand the way the device detects the end-of-media, or the files are to be restored on a system with an older version of the <i>restore</i> command.</p> |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                       |                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                                                                                                                        |
| OPTIONS               | <p>The following options are supported:</p> <table> <tr> <td><i>0-9</i></td><td>The “dump level.” All files specified by <i>files_to_dump</i> that have been modified since the last ufsdump at a lower dump level are copied to the <i>dump_file</i> destination (normally a magnetic tape device). For instance, if a “level 2” dump was done on Monday, followed by a “level 4” dump on Tuesday, a subsequent “level 3” dump on Wednesday would contain all files modified or added since the “level 2” (Monday) backup. A “level 0” dump copies the entire file system to the <i>dump_file</i>.</td></tr> <tr> <td><i>a archive_file</i></td><td>Archive file. Archive a dump table-of-contents in the specified <i>archive_file</i> to be used by ufsrestore(1M) to determine whether a file is in the dump file that is being restored.</td></tr> <tr> <td><i>b factor</i></td><td>Blocking factor. Specify the blocking factor for tape writes. The default is 20 blocks per write for tapes of density less than 6250BPI (bytes-per-inch). The default blocking factor for tapes of density 6250BPI and greater is 64. The default blocking factor for cartridge tapes (<i>c</i> option) is 126. | <i>b factor</i>       | Blocking factor. Specify the blocking factor for tape writes. The default is 20 blocks per write for tapes of density less than 6250BPI (bytes-per-inch). The default blocking factor for tapes of density 6250BPI and greater is 64. The default blocking factor for cartridge tapes ( <i>c</i> option) is 126. The highest blocking factor available                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                       |                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                                                                                                                        |

## ufsdump(1M)

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | with most tape drives is 126. Note: the blocking factor is specified in terms of 512-byte blocks, for compatibility with <code>tar(1)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>c</code>           | Cartridge. Set the defaults for cartridge instead of the standard half-inch reel. This sets the density to 1000BPI and the blocking factor to 126. Since <code>ufsdump</code> can automatically detect the end-of-media, only the blocking parameter normally has an effect. When cartridge tapes are used, and this option is <i>not</i> specified, <code>ufsdump</code> will slightly miscompute the size of the tape. If the <code>b</code> , <code>d</code> , <code>s</code> or <code>t</code> options are specified with this option, their values will override the defaults set by this option.                                                                                                                                                                                                                              |
| <code>d bpi</code>       | Tape density. Not normally required, as <code>ufsdump</code> can detect end-of-media. This parameter can be used to keep a running tab on the amount of tape used per reel. The default density is 6250BPI except when the <code>c</code> option is used for cartridge tape, in which case it is assumed to be 1000BPI per track. Typical values for tape devices are:<br><br>1/2 inch tape<br>6250 BPI<br><br>1/4 inch cartridge<br>1000 BPI The tape densities and other options are documented in the <code>st(7D)</code> man page.                                                                                                                                                                                                                                                                                              |
| <code>D</code>           | Diskette. Dump to diskette.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>f dump_file</code> | Dump file. Use <i>dump_file</i> as the file to dump to, instead of <code>/dev/rmt/0</code> . If <i>dump_file</i> is specified as <code>-</code> , dump to standard output.<br><br>If the name of the file is of the form <i>machine:device</i> , the dump is done from the specified machine over the network using <code>rmt(1M)</code> . Since <code>ufsdump</code> is normally run by root, the name of the local machine must appear in the <code>/etc/hosts</code> file of the remote machine. If the file is specified as <i>user@machine:device</i> , <code>ufsdump</code> will attempt to execute as the specified user on the remote machine. The specified user must have a <code>.hosts</code> file on the remote machine that allows the user invoking the command from the local machine to access the remote machine. |
| <code>l</code>           | Autoload. When the end-of-tape is reached before the dump is complete, take the drive offline and wait up to two minutes for the tape drive to be ready again. This                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             | gives autoloading (stackloader) tape drives a chance to load a new tape. If the drive is ready within two minutes, continue. If it is not, prompt for another tape and wait.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>L</b> <i>string</i>      | Sets the tape label to <i>string</i> , instead of the default none. <i>string</i> may be no more than sixteen characters long. If it is longer, it is truncated and a warning printed; the dump will still be done. The tape label is specific to the ufsdump tape format, and bears no resemblance to IBM or ANSI-standard tape labels.                                                                                                                                                                                                                                                                                    |
| <b>n</b>                    | Notify all operators in the sys group that ufsdump requires attention by sending messages to their terminals, in a manner similar to that used by the wall(1M) command. Otherwise, such messages are sent only to the terminals (such as the console) on which the user running ufsdump is logged in.                                                                                                                                                                                                                                                                                                                       |
| <b>N</b> <i>device_name</i> | Use <i>device_name</i> when recording information in /etc/dumpdates (see the u option) and when comparing against information in /etc/dumpdates for incremental dumps. The <i>device_name</i> provided can contain no white space as defined in scanf(3C) and is case-sensitive.                                                                                                                                                                                                                                                                                                                                            |
| <b>o</b>                    | Offline. Take the drive offline when the dump is complete or the end-of-media is reached and rewind the tape, or eject the diskette. In the case of some autoloading 8mm drives, the tape is removed from the drive automatically. This prevents another process which rushes in to use the drive, from inadvertently overwriting the media.                                                                                                                                                                                                                                                                                |
| <b>s</b> <i>size</i>        | Specify the <i>size</i> of the volume being dumped to. Not normally required, as ufsdump can detect end-of-media. When the specified size is reached, ufsdump waits for you to change the volume. ufsdump interprets the specified size as the length in feet for tapes and cartridges, and as the number of 1024-byte blocks for diskettes. The values should be a little smaller than the actual physical size of the media (for example, 425 for a 450-foot cartridge). Typical values for tape devices depend on the c option, for cartridge devices, and the D option for diskettes:<br><br>1/2 inch tape<br>2300 feet |

## ufsdump(1M)

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | 60-Mbyte 1/4 inch cartridge<br>425 feet                                                                                                                                                                                                                                                                                                                                                                              |
|                          | 150-Mbyte 1/4 inch cartridge<br>700 feet                                                                                                                                                                                                                                                                                                                                                                             |
|                          | diskette<br>1422 blocks (Corresponds to a 1.44-Mbyte diskette,<br>with one cylinder reserved for bad block<br>information.)                                                                                                                                                                                                                                                                                          |
| S                        | Size estimate. Determine the amount of space that is<br>needed to perform the dump without actually doing it,<br>and display the estimated number of bytes it will take.<br>This is useful with incremental dumps to determine<br>how many volumes of media will be needed.                                                                                                                                          |
| t <i>tracks</i>          | Specify the number of tracks for a cartridge tape. Not<br>normally required, as <code>ufsdump</code> can detect<br>end-of-media. The default is 9 tracks. The <code>t</code> option is<br>not compatible with the <code>D</code> option. Values for<br>Sun-supported tape devices are:<br><br>60-Mbyte 1/4 inch cartridge                      9 tracks<br>150-Mbyte 1/4 inch cartridge                    18 tracks |
| T <i>time_wait</i> [hms] | Sets the amount of time to wait for an <code>autoload</code><br>command to complete. This option is ignored unless<br>the <code>l</code> option has also been specified. The default time<br>period to wait is two minutes. Specify time units with a<br>trailing <code>h</code> ( for hours), <code>m</code> (for minutes), or <code>s</code> (for<br>seconds). The default unit is minutes.                        |
| u                        | Update the dump record. Add an entry to the file<br><code>/etc/dumpdates</code> , for each file system successfully<br>dumped that includes the file system name (or<br><i>device_name</i> as specified with the <code>N</code> option), date, and<br>dump level.                                                                                                                                                    |
| v                        | Verify. After each tape or diskette is written, verify the<br>contents of the media against the source file system. If<br>any discrepancies occur, prompt for new media, then<br>repeat the dump/verification process. The file system<br><i>must</i> be unmounted. This option cannot be used to<br>verify a dump to standard output.                                                                               |
| w                        | Warning. List the file systems that have not been<br>backed up within a day. This information is gleaned<br>from the files <code>/etc/dumpdates</code> and <code>/etc/vfstab</code> .<br>When the <code>w</code> option is used, all other options are<br>ignored. After reporting, <code>ufsdump</code> exits immediately.                                                                                          |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | W                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Warning with highlight. Similar to the w option, except that the W option includes all file systems that appear in /etc/dumpdates, along with information about their most recent dump dates and levels. File systems that have not been backed up within a day are highlighted. |
| OPERANDS    | The following operand is supported:<br><br><i>files_to_dump</i> Specifies the files to dump. Usually it identifies a whole file system by its raw device name (for example, /dev/rdisk/c0t3d0s6). Incremental dumps (levels 1 to 9) of files changed after a certain date only apply to a whole file system. Alternatively, <i>files_to_dump</i> can identify individual files or directories. All named directories that may be examined by the user running ufsdump, as well as any explicitly-named files, are dumped. This dump is equivalent to a level 0 dump of the indicated portions of the filesystem, except that /etc/dumpdates is not updated even if the -u option has been specified. In all cases, the files must be contained in the same file system, and the file system must be local to the system where ufsdump is being run.<br><br><i>files_to_dump</i> is required and must be the last argument on the command line.<br><br>If no <i>options</i> are given, the default is 9uf /dev/rmt/0 <i>files_to_dump</i> . |                                                                                                                                                                                                                                                                                  |
| USAGE       | See largefile(5) for the description of the behavior of ufsdump when encountering files greater than or equal to 2 Gbyte ( 2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                  |
| EXAMPLES    | <b>EXAMPLE 1</b> A sample display of the ufsdump command.<br><br>To make a full dump of a root file system on c0t3d0, on a 150-MByte cartridge tape unit 0, use:<br><br>example# ufsdump 0cfu /dev/rmt/0 /dev/rdisk/c0t3d0s0<br><br>To make and verify an incremental dump at level 5 of the usr partition of c0t3d0, on a 1/2 inch reel tape unit 1, use:<br><br>example# ufsdump 5fuv /dev/rmt/1 /dev/rdisk/c0t3d0s6                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                  |

| FILES       | /dev/rmt/0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | default unit to dump to                                                                                                                                                                                                                                                          |

## ufsdump(1M)

/etc/dumpdates            dump date record  
/etc/group                to find group sys  
/etc/hosts                to gain access to remote system with drive  
/etc/vfstab               list of file systems

**ATTRIBUTES**    See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO**    cpio(1), tar(1), dd(1M), devnm(1M), prtvtoc(1M), rmt(1M), shutdown(1M), ufsrestore(1M), volcopy(1M), wall(1M), scanf(3C), attributes(5), largefile(5), st(7D)

**Read Errors**    Fewer than 32 read errors on the file system are ignored.

**Process Per Reel**    Because each reel requires a new process, parent processes for reels that are already written hang around until the entire tape is written.

**Operator Intervention**    ufsdump requires operator intervention on these conditions: end of volume, end of dump, volume write error, volume open error or disk read error (if there are more than a threshold of 32). In addition to alerting all operators implied by the *n* option, ufsdump interacts with the operator on ufsdump's control terminal at times when ufsdump can no longer proceed, or if something is grossly wrong. All questions ufsdump poses *must* be answered by typing *yes* or *no*, as appropriate.

Since backing up a disk can involve a lot of time and effort, ufsdump checkpoints at the start of each volume. If writing that volume fails for some reason, ufsdump will, with operator permission, restart itself from the checkpoint after a defective volume has been replaced.

**Suggested Dump Schedule**    It is vital to perform full, "level 0", dumps at regular intervals. When performing a full dump, bring the machine down to single-user mode using shutdown(1M). While preparing for a full dump, it is a good idea to clean the tape drive and heads. Incremental dumps should be performed with the system running in single-user mode.

Incremental dumps allow for convenient backup and recovery of active files on a more frequent basis, with a minimum of media and time. However, there are some tradeoffs. First, the interval between backups should be kept to a minimum (once a day at least). To guard against data loss as a result of a media failure (a rare, but possible occurrence), capture active files on (at least) two sets of dump volumes. Another consideration is the desire to keep unnecessary duplication of files to a minimum to

save both operator time and media storage. A third consideration is the ease with which a particular backed-up version of a file can be located and restored. The following four-week schedule offers a reasonable tradeoff between these goals.

|         | Sun  | Mon | Tue | Wed | Thu | Fri |
|---------|------|-----|-----|-----|-----|-----|
| Week 1: | Full | 5   | 5   | 5   | 5   | 3   |
| Week 2: |      | 5   | 5   | 5   | 5   | 3   |
| Week 3: |      | 5   | 5   | 5   | 5   | 3   |
| Week 4: |      | 5   | 5   | 5   | 5   | 3   |

Although the Tuesday through Friday incrementals contain “extra copies” of files from Monday, this scheme assures that any file modified during the week can be recovered from the previous day’s incremental dump.

#### Process Priority of ufsdump

ufsdump uses multiple processes to allow it to read from the disk and write to the media concurrently. Due to the way it synchronizes between these processes, any attempt to run dump with a *nice* (process priority) of ‘-5’ or better will likely make ufsdump run *slower* instead of faster.

#### Overlapping Partitions

Most disks contain one or more overlapping slices because slice 2 covers the entire disk. The other slices are of various sizes and usually do not overlap. For example, a common configuration places `root` on slice 0, `swap` on slice 1, `/opt` on slice 5 and `/usr` on slice 6.

It should be emphasized that ufsdump dumps one `ufs` file system at a time. Given the above scenario where slice 0 and slice 2 have the same starting offset, executing ufsdump on slice 2 with the intent of dumping the entire disk would instead dump only the `root` file system on slice 0. To dump the entire disk, the user must dump the file systems on each slice separately.

#### BUGS

The `/etc/vfstab` file does not allow the desired frequency of backup for file systems to be specified (as `/etc/fstab` did). Consequently, the `w` and `W` options assume file systems should be backed up daily, which limits the usefulness of these options.

## h1&gt;ufsrestore(1M)

| DESCRIPTION      | <p>The ufsrestore utility restores files from backup media created with the ufsdump command. ufsrestore's actions are controlled by the <i>key</i> argument. The <i>key</i> is exactly one function <i>letter</i> (i, r, R, t, or x) and zero or more <i>function modifiers</i> (letters). The <i>key</i> string contains no SPACE characters. Function modifier arguments are listed on the command line in the same order as their corresponding function modifiers appear in the <i>key</i> string.</p> <p><i>filename</i> arguments which appear on the command line, or as arguments to an interactive command, are treated as shell glob patterns by the x and t functions; any files or directories matching the patterns are selected. The metacharacters *, ?, and [ ] must be protected from the shell if they appear on the command line. There is no way to quote these metacharacters to explicitly match them in a filename.</p> <p>The temporary files rstdir* and rstmode* are placed in /tmp by default. If the environment variable TMPDIR is defined with a non-empty value, that location is used instead of /tmp.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |                                                                                                                                                                                                                                                                                                                                                                     |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |                                                                                                                                                                                                                    |
| Function Letters | <p>You must specify one (and only one) of the function letters listed below. Note that i, x, and r are intended to restore files into an empty directory. The R function is intended for restoring into a populated directory.</p> <table> <tr> <td>i</td><td>Interactive. After reading in the directory information from the media, ufsrestore invokes a shell-like interface that allows you to browse through the dump file's directory hierarchy and select individual files to be extracted. Restoration has the same semantics as x (see below). See Interactive Commands, below, for a description of available commands.</td></tr> <tr> <td>r</td><td>Recursive. Starting with an empty directory and a level 0 dump, the r function recreates the filesystem relative to the current working directory, exactly as it appeared when the dump was made. Information used to restore incremental dumps on top of the full dump (for example, restoresymtable) is also included. Several ufsrestore runs are typical, one for each higher level of dump (0, 1, ..., 9). Files that were deleted between the level 0 and a subsequent incremental dump will not exist after the final restore. To completely restore a file system, use the r function restore the level 0 dump, and again for each incremental dump. Although this function letter is intended for a complete restore onto a new file system (one just created with newfs(1M)), if the file system contains files not on the backup media, they are preserved.</td></tr> <tr> <td>R</td><td>Resume restoring. If an r-mode ufsrestore was interrupted, this function prompts for the volume from which to resume restoring and continues the restoration from where it was left off. Otherwise identical to r.</td></tr> </table> | i | Interactive. | r                | Recursive. Starting with an empty directory and a level 0 dump, the r function recreates the filesystem relative to the current working directory, exactly as it appeared when the dump was made. Information used to restore incremental dumps on top of the full dump (for example, restoresymtable) is also included. Several ufsrestore runs are typical, one for each higher level of dump (0, 1, ..., 9). Files that were deleted between the level 0 and a subsequent incremental dump will not exist after the final restore. To completely restore a file system, use the r function restore the level 0 dump, and again for each incremental dump. Although this function letter is intended for a complete restore onto a new file system (one just created with newfs(1M)), if the file system contains files not on the backup media, they are preserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |                                                                                                                                                                                                                                                                                                                                                                     |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |                                                                                                                                                                                                                    |
| R                | Resume restoring. If an r-mode ufsrestore was interrupted, this function prompts for the volume from which to resume restoring and continues the restoration from where it was left off. Otherwise identical to r.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |                                                                                                                                                                                                                                                                                                                                                                     |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |                                                                                                                                                                                                                    |

|                    |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function Modifiers | t                     | Table of contents. List each <i>filename</i> that appears on the media. If no <i>filename</i> argument is given, the root directory is listed. This results in a list of all files on the media, unless the <i>h</i> function modifier is in effect. The table of contents is taken from the media or from the specified archive file, when the <i>a</i> function modifier is used. The <i>a</i> function modifier is mutually exclusive with the <i>x</i> and <i>r</i> function letters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                    | x                     | <p>Extract the named files from the media. Files are restored to the same relative locations that they had in the original file system.</p> <p>If the <i>filename</i> argument matches a directory whose contents were written onto the media, and the <i>h</i> modifier is not in effect, the directory is recursively extracted, relative to the current directory, which is expected to be empty. For each file, the owner, modification time, and mode are restored (if possible).</p> <p>If you omit the <i>filename</i> argument or specify <i>.</i>, the root directory is extracted. This results in the entire tape being extracted, unless the <i>h</i> modifier is in effect. <i>.</i> With the <i>x</i> function, existing files are overwritten and <i>ufsrestore</i> displays the names of the overwritten files. Overwriting a currently-running executable can have unfortunate consequences.</p> <p>Use the <i>x</i> option to restore partial file system dumps, as they are (by definition) not entire file systems.</p> |
|                    | a <i>archive_file</i> | Read the table of contents from <i>archive_file</i> instead of the media. This function modifier can be used in combination with the <i>t</i> , <i>i</i> , or <i>x</i> function letters, making it possible to check whether files are on the media without having to mount the media. When used with the <i>x</i> and interactive ( <i>i</i> ) function letters, it prompts for the volume containing the file(s) before extracting them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                    | b <i>factor</i>       | Blocking factor. Specify the blocking factor for tape reads. For variable length SCSI tape devices, unless the data was written with the default blocking factor, a blocking factor at least as great as that used to write the tape must be used; otherwise, an error will be generated. Note that a tape block is 512 bytes. Refer to the man page for your specific tape driver for the maximum blocking factor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                    | c                     | Convert the contents of the media in 4.1BSD format to the new <i>ufs</i> file system format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                    | d                     | Debug. Turn on debugging output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                    | f <i>dump_file</i>    | Use <i>dump_file</i> instead of <i>/dev/rmt/0</i> as the file to restore from. Typically <i>dump_file</i> specifies a tape or diskette drive. If <i>dump_file</i> is specified as <i>'-'</i> , <i>ufsrestore</i> reads from the standard input. This allows <i>ufsdump(1M)</i> and <i>ufsrestore</i> to be used in a pipeline to copy a file system:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## ufsrestore(1M)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <pre>example# ufsdump 0f - /dev/rdisk/c0t0d0s7 \   (cd /home;ufsrestore xf -)</pre> <p>If the name of the file is of the form <i>machine:device</i>, the restore is done from the specified machine over the network using <i>rmt(1M)</i>. Since <i>ufsrestore</i> is normally run by root, the name of the local machine must appear in the <i>.rhosts</i> file of the remote machine. If the file is specified as <i>user@machine:device</i>, <i>ufsrestore</i> will attempt to execute as the specified user on the remote machine. The specified user must have a <i>.rhosts</i> file on the remote machine that allows the user invoking the command from the local machine to access the remote machine.</p> |
| h              | Extract or list the actual directory, rather than the files that it references. This prevents hierarchical restoration of complete subtrees from the tape.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| l              | Autoload. When the end-of-tape is reached before the restore is complete, take the drive off-line and wait up to two minutes (the default, see the T function modifier) for the tape drive to be ready again. This gives autoloading (stackloader) tape drives a chance to load a new tape. If the drive is ready within two minutes, continue. If it is not, prompt for another tape and wait.                                                                                                                                                                                                                                                                                                                    |
| L <i>label</i> | The label that should appear in the header of the dump file. If the labels do not match, <i>ufsrestore</i> issues a diagnostic and exits. The tape label is specific to the <i>ufsdump</i> tape format, and bears no resemblance to IBM or ANSI-standard tape labels.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| m              | Extract by inode numbers rather than by filename to avoid regenerating complete pathnames. Regardless of where the files are located in the dump hierarchy, they are restored into the current directory and renamed with their inode number. This is useful if only a few files are being extracted.                                                                                                                                                                                                                                                                                                                                                                                                              |
| o              | Offline. Take the drive off-line when the restore is complete or the end-of-media is reached and rewind the tape, or eject the diskette. In the case of some autoloading 8mm drives, the tape is removed from the drive automatically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| s <i>n</i>     | <p>Skip to the <i>n</i>'th file when there are multiple dump files on the same tape. For example, the command:</p> <pre>example# ufsrestore xfs /dev/rmt/0hn 5</pre> <p>would position you to the fifth file on the tape when reading volume 1 of the dump. If a dump extends over more than one volume, all volumes except the first are assumed to start at position 0, no matter what "s <i>n</i>" value is specified.</p>                                                                                                                                                                                                                                                                                      |

|                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                | If " <i>s n</i> " is specified, the backup media must be at BOT (beginning of tape). Otherwise, the initial positioning to read the table of contents will fail, as it is performed by skipping the tape forward <i>n</i> - 1 files rather than by using absolute positioning. This is because on some devices absolute positioning is very time consuming.                                               |
| T timeout [hms]                                                                                                                                                                                                                                | Sets the amount of time to wait for an autoloading command to complete. This function modifier is ignored unless the l function modifier has also been specified. The default timeout period is two minutes. The time units may be specified as a trailing h (hours), m (minutes), or s (seconds). The default unit is minutes.                                                                           |
| v                                                                                                                                                                                                                                              | Verbose. ufsrestore displays the name and inode number of each file it restores, preceded by its file type.                                                                                                                                                                                                                                                                                               |
| y                                                                                                                                                                                                                                              | Do not ask whether to abort the restore in the event of tape errors. ufsrestore tries to skip over the bad tape block(s) and continue as best it can.                                                                                                                                                                                                                                                     |
| ufsrestore enters interactive mode when invoked with the i function letters. Interactive commands are reminiscent of the shell. For those commands that accept an argument, the default is the current directory. The interactive options are: |                                                                                                                                                                                                                                                                                                                                                                                                           |
| add [filename]                                                                                                                                                                                                                                 | Add the named file or directory to the list of files to extract. If a directory is specified, add that directory and its files (recursively) to the extraction list (unless the h modifier is in effect).                                                                                                                                                                                                 |
| cd directory                                                                                                                                                                                                                                   | Change to <i>directory</i> (within the dump file).                                                                                                                                                                                                                                                                                                                                                        |
| delete [filename]                                                                                                                                                                                                                              | Delete the current directory, or the named file or directory from the list of files to extract. If a directory is specified, delete that directory and all its descendents from the extraction list (unless the h modifier is in effect). The most expedient way to extract a majority of files from a directory is to add that directory to the extraction list, and then delete specific files to omit. |
| extract                                                                                                                                                                                                                                        | Extract all files on the extraction list from the dump media. ufsrestore asks which volume the user wishes to mount. The fastest way to extract a small number of files is to start with the last volume and work toward the first. If " <i>s n</i> " is given on the command line, volume 1 will automatically be positioned to file <i>n</i> when it is read.                                           |
| help                                                                                                                                                                                                                                           | Display a summary of the available commands.                                                                                                                                                                                                                                                                                                                                                              |
| ls [directory]                                                                                                                                                                                                                                 | List files in <i>directory</i> or the current directory, represented by a '.' (period). Directories are appended with a '/' (slash). Entries marked for extraction are                                                                                                                                                                                                                                    |

## ufsrestore(1M)

|          |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                                       | prefixed with a '*' (asterisk). If the verbose option is in effect, inode numbers are also listed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|          | marked [ <i>directory</i> ]           | Like <code>ls</code> , except only files marked for extraction are listed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|          | pager                                 | Toggle the pagination of the output from the <code>ls</code> and <code>marked</code> commands. The pager used is that defined by the <code>PAGER</code> environment variable, or <code>more(1)</code> if that <code>env</code> is not defined. The <code>PAGER</code> <code>env</code> may include white-space-separated arguments for the pagination program.                                                                                                                                                                                                                                                                                                 |
|          | pwd                                   | Print the full pathname of the current working directory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|          | quit                                  | <code>ufsrestore</code> exits immediately, even if the extraction list is not empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|          | setmodes                              | Prompts: set owner/mode for '.' (period). Type <code>y</code> for yes to set the mode (permissions, owner, times) of the current directory '.' (period) into which files are being restored equal to the mode of the root directory of the file system from which they were dumped. Normally, this is what you want when restoring a whole file system, or restoring individual files into the same locations from which they were dumped. Type <code>n</code> for no, to leave the mode of the current directory unchanged. Normally, this is what you want when restoring part of a dump to a directory other than the one from which the files were dumped. |
|          | setpager <i>command</i>               | Sets the command to use for paginating output instead of the default or that inherited from the environment. The <i>command</i> string may include arguments in addition to the command itself.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|          | verbose                               | Toggle the status of the <code>v</code> modifier. While <code>v</code> is in effect, the <code>ls</code> command lists the inode numbers of all entries, and <code>ufsrestore</code> displays information about each file as it is extracted.                                                                                                                                                                                                                                                                                                                                                                                                                  |
|          | what                                  | Display the dump header on the media.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OPERANDS | The following operands are supported. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|          | <i>filename</i>                       | Specifies the pathname of files (or directories) to be restored to disk. Unless the <code>h</code> function modifier is also used, a directory name refers to the files it contains, and (recursively) its subdirectories and the files they contain. <i>filename</i> is associated with either the <code>x</code> or <code>t</code> function letters, and must come last.                                                                                                                                                                                                                                                                                     |

| USAGE                 | See largefile(5) for the description of the behavior of ufsrestore when encountering files greater than or equal to 2 Gbyte ( 2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                    |                |                 |              |         |

| DIAGNOSTICS           | <p>ufsrestore complains about bad option characters.</p> <p>Read errors result in complaints. If y has been specified, or the user responds y, ufsrestore will attempt to continue.</p> <p>If the dump extends over more than one tape, ufsrestore asks the user to change tapes. If the x or i function letter has been specified, ufsrestore also asks which volume the user wishes to mount. If the s modifier has been specified, and volume 1 is mounted, it is automatically positioned to the indicated file.</p> <p>There are numerous consistency checks that can be listed by ufsrestore. Most checks are self-explanatory or can “never happen”. Common errors are given below.</p> <p>Converting to new file system format<br/>A dump tape created from the old file system has been loaded. It is automatically converted to the new file system format.</p> |                                                                                                                                    |                |                 |              |         |

## ufsrestore(1M)

*filename*: not found on tape

The specified file name was listed in the tape directory, but was not found on the tape. This is caused by tape read errors while looking for the file, using a dump tape created on an active file system, or restoring a partial dump with the *r* function.

expected next file *inumber*, got *inumber*

A file that was not listed in the directory showed up. This can occur when using a dump tape created on an active file system.

Incremental tape too low

When doing an incremental restore, a tape that was written before the previous incremental tape, or that has too low an incremental level has been loaded.

Incremental tape too high

When doing incremental restore, a tape that does not begin its coverage where the previous incremental tape left off, or one that has too high an incremental level has been loaded.

media read error: invalid argument

Blocking factor specified for read is smaller than the blocking factor used to write data.

Tape read error while restoring

Tape read error while skipping over inode *inumber*

Tape read error while trying to resynchronize

A tape read error has occurred

If a file name is specified, then its contents are probably partially wrong. If an inode is being skipped or the tape is trying to resynchronize, then no extracted files have been corrupted, though files may not be found on the tape.

resync ufsrestore, skipped *num*

After a tape read error, ufsrestore may have to resynchronize itself. This message lists the number of blocks that were skipped over.

Incorrect tape label. Expected 'foo', got 'bar'.

The *L* option was specified, and its value did not match what was recorded in the header of the dump file.

### NOTES

ufsrestore can get confused when doing incremental restores from dump tapes that were made on active file systems.

A level 0 dump must be done after a full restore. Because ufsrestore runs in user mode, it has no control over inode allocation. This means that ufsrestore repositions the files, although it does not change their contents. Thus, a full dump must be done to get a new set of directories reflecting the new file positions, so that later incremental dumps will be correct.

| <b>NAME</b>        | unshare – make local resource unavailable for mounting by remote systems                                                                                                                                                                                                                                                                                                          |                |                 |              |         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| <b>SYNOPSIS</b>    | <b>unshare</b> [-F <i>FSType</i> ] [-o <i>specific_options</i> ] [ <i>pathname</i>   <i>resourcename</i> ]                                                                                                                                                                                                                                                                        |                |                 |              |         |
| <b>DESCRIPTION</b> | The unshare command makes a shared local resource unavailable as file system type <i>FSType</i> . If the option -F <i>FSType</i> is omitted, then the first file system type listed in file <i>/etc/dfs/fstypes</i> will be used as the default. <i>Specific_options</i> , as well as the semantics of <i>resourcename</i> , are specific to particular distributed file systems. |                |                 |              |         |

## unshare\_nfs(1M)

|                    |                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAME</b>        | unshare_nfs – make local NFS file systems unavailable for mounting by remote systems                                                                                                                   |
| <b>SYNOPSIS</b>    | <b>unshare</b> [-F nfs] <i>pathname</i>                                                                                                                                                                |
| <b>DESCRIPTION</b> | The unshare command makes local file systems unavailable for mounting by remote systems. The shared file system must correspond to a line with NFS as the <i>FSType</i> in the file /etc/dfs/sharetab. |
| <b>OPTIONS</b>     | The following options are supported:<br><br>-F            This option may be omitted if NFS is the first file system type listed in the file /etc/dfs/fstypes.                                         |
| <b>FILES</b>       | /etc/dfs/fstypes<br>/etc/dfs/sharetab                                                                                                                                                                  |
| <b>ATTRIBUTES</b>  | See attributes(5) for descriptions of the following attributes:                                                                                                                                        |

**SEE ALSO** share(1M), attributes(5)

**NOTES** If the file system being unshared is a symbolic link to a valid pathname, the canonical path (the path which the symbolic link follows) will be unshared.

For example, if /export/foo is a symbolic link to /export/bar (/export/foo -> /export/bar), the following unshare command will result in /export/bar as the unshared pathname (and not /export/foo):

```
example# unshare -F nfs /export/foo
```

|                    |                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAME</b>        | update_drv – modify device driver attributes                                                                                                                                                                         |
| <b>SYNOPSIS</b>    | <b>update_drv</b> [-f] <i>device_driver</i>                                                                                                                                                                          |
| <b>DESCRIPTION</b> | The update_drv command is used to inform the system about attribute changes to an installed device driver. By default, the system rereads the <code>driver.conf(4)</code> file and reloads the driver binary module. |
| <b>OPTIONS</b>     | The following option is supported:<br>-f            Force the system to reread the <code>driver.conf</code> file even if the driver module cannot be unloaded.                                                       |
| <b>EXIT STATUS</b> | The following exit values are returned:<br>0            Successful completion.<br>>0          An error occurred.                                                                                                     |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                         |

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

**SEE ALSO**    `add_drv(1M)`, `modunload(1M)`, `driver.conf(4)`, `attributes(5)`

**NOTES**     A forced update of the `driver.conf` file reloads the `driver.conf` file without reloading the driver binary module. In this case, devices which can not be detached reference driver global properties from the old `driver.conf` file, while the remaining driver instances reference global properties in the new `driver.conf` file.

| <b>DESCRIPTION</b>                   | <p>useradd adds a new user to the <code>/etc/passwd</code> and <code>/etc/shadow</code> and <code>/etc/user_attr</code> files. The <code>-A</code> and <code>-P</code> options respectively assign authorizations and profiles to the user. The <code>-R</code> option assigns roles to a user. The <code>-p</code> option associates a project with a user.</p> <p>useradd also creates supplementary group memberships for the user (<code>-G</code> option) and creates the home directory (<code>-m</code> option) for the user if requested. The new login remains locked until the <code>passwd(1)</code> command is executed.</p> <p>Specifying <code>useradd -D</code> with the <code>-g</code>, <code>-b</code>, <code>-f</code>, <code>-e</code>, <code>-A</code>, <code>-P</code>, <code>-p</code>, or <code>-R</code> option (or any combination of these options) sets the default values for the respective fields. See the <code>-D</code> option, below. Subsequent <code>useradd</code> commands without the <code>-D</code> option use these arguments.</p> <p>The system file entries created with this command have a limit of 512 characters per line. Specifying long arguments to several options can exceed this limit.</p> <p>The login (<code>login</code>) and role (<code>role</code>) fields accept a string of no more than eight bytes consisting of characters from the set of alphabetic characters, numeric characters, period (<code>.</code>), underscore (<code>_</code>), and hyphen (<code>-</code>). The first character should be alphabetic and the field should contain at least one lower case alphabetic character. A warning message will be written if these restrictions are not met. A future Solaris release may refuse to accept login and role fields that do not meet these requirements.</p> <p>The login and role fields must contain at least one character and must not contain a colon (<code>:</code>) or a newline (<code>\n</code>).</p> |                                      |                                                                                                                                                                              |                                 |                                                                                                                                                                                                                                                      |                                |                                                                                                                                                                                                          |

| <code>-d dir</code>      | The home directory of the new user. It defaults to <i>base_dir/account_name</i> , where <i>base_dir</i> is the base directory for new login home directories and <i>account_name</i> is the new login name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |              |                  |                 |       |                 |           |              |         |                 |   |               |      |              |      |                 |      |             |   |                 |         |              |      |
| <code>-D</code>          | <p>Display the default values for <i>group</i>, <i>base_dir</i>, <i>skel_dir</i>, <i>shell</i>, <i>inactive</i>, <i>expire</i>, <i>proj</i> and <i>projname</i>. When used with the <code>-g</code>, <code>-b</code>, <code>-f</code>, <code>-e</code>, <code>-A</code>, <code>-P</code>, <code>-p</code>, or <code>-R</code> options, the <code>-D</code> option sets the default values for the specified fields. The default values are:</p> <table> <tr> <td><i>group</i></td><td>other (GID of 1)</td></tr> <tr> <td><i>base_dir</i></td><td>/home</td></tr> <tr> <td><i>skel_dir</i></td><td>/etc/skel</td></tr> <tr> <td><i>shell</i></td><td>/bin/sh</td></tr> <tr> <td><i>inactive</i></td><td>0</td></tr> <tr> <td><i>expire</i></td><td>null</td></tr> <tr> <td><i>auths</i></td><td>null</td></tr> <tr> <td><i>profiles</i></td><td>null</td></tr> <tr> <td><i>proj</i></td><td>3</td></tr> <tr> <td><i>projname</i></td><td>default</td></tr> <tr> <td><i>roles</i></td><td>null</td></tr> </table> | <i>group</i> | other (GID of 1) | <i>base_dir</i> | /home | <i>skel_dir</i> | /etc/skel | <i>shell</i> | /bin/sh | <i>inactive</i> | 0 | <i>expire</i> | null | <i>auths</i> | null | <i>profiles</i> | null | <i>proj</i> | 3 | <i>projname</i> | default | <i>roles</i> | null |

| <code>-e expire</code>   | <p>Specify the expiration date for a login. After this date, no user will be able to access this login. The <i>expire</i> option argument is a date entered using one of the date formats included in the template file <i>/etc/datemsk</i>. See <i>getdate(3C)</i>.</p> <p>If the date format that you choose includes spaces, it must be quoted. For example, you can enter <i>10/6/90</i> or <i>"October 6, 1990"</i>. A null value (<i>" "</i>) defeats the status of the expired date. This option is useful for creating temporary logins.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |              |                  |                 |       |                 |           |              |         |                 |   |               |      |              |      |                 |      |             |   |                 |         |              |      |
| <code>-f inactive</code> | The maximum number of days allowed between uses of a login ID before that ID is declared invalid. Normal values are positive integers. A value of 0 defeats the status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |              |                  |                 |       |                 |           |              |         |                 |   |               |      |              |      |                 |      |             |   |                 |         |              |      |
| <code>-g group</code>    | An existing group's integer ID or character-string name. Without the <code>-D</code> option, it defines the new user's                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |              |                  |                 |       |                 |           |              |         |                 |   |               |      |              |      |                 |      |             |   |                 |         |              |      |

## useradd(1M)

|              |                           |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                           | primary group membership and defaults to the default group. You can reset this default value by invoking <code>useradd -D -g group</code> .                                                                                                                                                                                                                                                                                  |
|              | <code>-G group</code>     | An existing group's integer ID or character-string name. It defines the new user's supplementary group membership. Duplicates between <i>group</i> with the <code>-g</code> and <code>-G</code> options are ignored. No more than <code>NGROUPS_MAX</code> groups can be specified.                                                                                                                                          |
|              | <code>-k skel_dir</code>  | A directory that contains skeleton information (such as <code>.profile</code> ) that can be copied into a new user's home directory. This directory must already exist. The system provides the <code>/etc/skel</code> directory that can be used for this purpose.                                                                                                                                                          |
|              | <code>-m</code>           | Create the new user's home directory if it does not already exist. If the directory already exists, it must have read, write, and execute permissions by <i>group</i> , where <i>group</i> is the user's primary group.                                                                                                                                                                                                      |
|              | <code>-o</code>           | This option allows a UID to be duplicated (non-unique).                                                                                                                                                                                                                                                                                                                                                                      |
|              | <code>-P profile</code>   | One or more comma-separated execution profiles defined in <code>prof_attr(4)</code> .                                                                                                                                                                                                                                                                                                                                        |
|              | <code>-p projname</code>  | Name of the project with which the added user is associated. See the <i>projname</i> field as defined in <code>project(4)</code> .                                                                                                                                                                                                                                                                                           |
|              | <code>-R role</code>      | One or more comma-separated execution profiles defined in <code>user_attr(4)</code> . Roles cannot be assigned to other roles.                                                                                                                                                                                                                                                                                               |
|              | <code>-s shell</code>     | Full pathname of the program used as the user's shell on login. It defaults to an empty field causing the system to use <code>/bin/sh</code> as the default. The value of <i>shell</i> must be a valid executable file.                                                                                                                                                                                                      |
|              | <code>-u uid</code>       | The UID of the new user. This UID must be a non-negative decimal integer below <code>MAXUID</code> as defined in <code>&lt;sys/param.h&gt;</code> . The UID defaults to the next available (unique) number above the highest number currently assigned. For example, if UIDs 100, 105, and 200 are assigned, the next default UID number will be 201. (UIDs from 0-99 are reserved for possible use in future applications.) |
| <b>FILES</b> | <code>/etc/datemsk</code> |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|              | <code>/etc/passwd</code>  |                                                                                                                                                                                                                                                                                                                                                                                                                              |

/etc/shadow  
 /etc/group  
 /etc/skel  
 /usr/include/limits.h  
 /etc/user\_attr

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** passwd(1), profiles(1), roles(1), users(1B), groupadd(1M), groupdel(1M), groupmod(1M), grpck(1M), logins(1M), pwck(1M), userdel(1M), usermod(1M), getdate(3C), auth\_attr(4), passwd(4), prof\_attr(4), project(4), user\_attr(4), attributes(5)

**DIAGNOSTICS** In case of an error, useradd prints an error message and exits with a non-zero status.

The following indicates that login specified is already in use:

UX: useradd: ERROR: login is already in use. Choose another.

The following indicates that the *uid* specified with the -u option is not unique:

UX: useradd: ERROR: uid *uid* is already in use. Choose another.

The following indicates that the *group* specified with the -g option is already in use:

UX: useradd: ERROR: group *group* does not exist. Choose another.

The following indicates that the *uid* specified with the -u option is in the range of reserved UIDs (from 0-99):

UX: useradd: WARNING: uid *uid* is reserved.

The following indicates that the *uid* specified with the -u option exceeds MAXUID as defined in <sys/param.h>:

UX: useradd: ERROR: uid *uid* is too big. Choose another.

The following indicates that the /etc/passwd or /etc/shadow files do not exist:

UX: useradd: ERROR: Cannot update system files - login cannot be created.

**NOTES** The useradd utility adds definitions to only the local /etc/group, etc/passwd, /etc/passwd, /etc/shadow, /etc/project, and /etc/user\_attr files. If a network name service such as NIS or NIS+ is being used to supplement the local

## useradd(1M)

/etc/passwd file with additional entries, useradd cannot change information supplied by the network name service. However useradd will verify the uniqueness of the user name (or role) and user id and the existence of any group names specified against the external name service.

| <b>NAME</b>        | userdel – delete a user’s login from the system                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>userdel</b> [-r] <i>login</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |
| <b>DESCRIPTION</b> | The userdel utility deletes a user account from the system and makes the appropriate account-related changes to the system file and file system.                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p>-r            Remove the user’s home directory from the system. This directory must exist. The files and directories under the home directory will no longer be accessible following successful execution of the command.</p>                                                                                                                                                                                                                                           |                |                 |              |         |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>login</i>        An existing login name to be deleted.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |         |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0            Successful completion.</p> <p>2            Invalid command syntax. A usage message for the userdel command is displayed.</p> <p>6            The account to be removed does not exist.</p> <p>8            The account to be removed is in use.</p> <p>10          Cannot update the /etc/group or /etc/user_attr file but the login is removed from the /etc/passwd file.</p> <p>12          Cannot remove or otherwise modify the home directory.</p> |                |                 |              |         |
| <b>FILES</b>       | <p>/etc/passwd                    system password file</p> <p>/etc/shadow                    system file contain users’ encrypted passwords and related information</p> <p>/etc/group                    system file containing group definitions</p> <p>/etc/user_attr                system file containing additional user attributes</p>                                                                                                                                                                           |                |                 |              |         |

## userdel(1M)

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NOTES</b> | The <code>userdel</code> utility only deletes an account definition that is in the local <code>/etc/group</code> , <code>/etc/passwd</code> , <code>/etc/shadow</code> , and <code>/etc/user_attr</code> file. If a network name service such as NIS or NIS+ is being used to supplement the local <code>/etc/passwd</code> file with additional entries, <code>userdel</code> cannot change information supplied by the network name service. |

| DESCRIPTION             | <p>The usermod utility modifies a user’s login definition on the system. It changes the definition of the specified login and makes the appropriate login-related system file and file system changes.</p> <p>The system file entries created with this command have a limit of 512 characters per line. Specifying long arguments to several options may exceed this limit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |
| OPTIONS                 | <p>The following options are supported:</p> <table> <tr> <td>-A <i>authorization</i></td><td>One or more comma separated authorizations as defined in <code>auth_attr(4)</code>. Only a user or role who has grant rights to the <code>authorization</code> can assign it to an account. This replaces any existing authorization setting.</td></tr> <tr> <td>-c <i>comment</i></td><td>Specify a comment string. <i>comment</i> can be any text string. It is generally a short description of the login, and is currently used as the field for the user’s full name. This information is stored in the user’s <code>/etc/passwd</code> entry.</td></tr> <tr> <td>-d <i>dir</i></td><td>Specify the new home directory of the user. It defaults to <code>base_dir/login</code>, where <i>base_dir</i> is the base directory for new login home directories, and <i>login</i> is the new login.</td></tr> <tr> <td>-e <i>expire</i></td><td>Specify the expiration date for a login. After this date, no user will be able to access this login. The expire option argument is a date entered using one of the date formats included in the template file <code>/etc/datemsk</code>. See <code>getdate(3C)</code>.</td></tr> <tr> <td>-f <i>inactive</i></td><td>Specify the maximum number of days allowed between uses of a login ID before that login ID is declared invalid. Normal values are positive integers. A value of 0 defeats the status.</td></tr> <tr> <td>-g <i>group</i></td><td>Specify an existing group’s integer ID or character-string name. It redefines the user’s primary group membership.</td></tr> </table> | -A <i>authorization</i> | One or more comma separated authorizations as defined in <code>auth_attr(4)</code> . Only a user or role who has grant rights to the <code>authorization</code> can assign it to an account. This replaces any existing authorization setting. | -c <i>comment</i> | Specify a comment string. <i>comment</i> can be any text string. It is generally a short description of the login, and is currently used as the field for the user’s full name. This information is stored in the user’s <code>/etc/passwd</code> entry. | -d <i>dir</i> | Specify the new home directory of the user. It defaults to <code>base_dir/login</code> , where <i>base_dir</i> is the base directory for new login home directories, and <i>login</i> is the new login. | -e <i>expire</i> | Specify the expiration date for a login. After this date, no user will be able to access this login. The expire option argument is a date entered using one of the date formats included in the template file <code>/etc/datemsk</code> . See <code>getdate(3C)</code> . | -f <i>inactive</i> | Specify the maximum number of days allowed between uses of a login ID before that login ID is declared invalid. Normal values are positive integers. A value of 0 defeats the status. | -g <i>group</i> | Specify an existing group’s integer ID or character-string name. It redefines the user’s primary group membership. |
| -A <i>authorization</i> | One or more comma separated authorizations as defined in <code>auth_attr(4)</code> . Only a user or role who has grant rights to the <code>authorization</code> can assign it to an account. This replaces any existing authorization setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |
| -c <i>comment</i>       | Specify a comment string. <i>comment</i> can be any text string. It is generally a short description of the login, and is currently used as the field for the user’s full name. This information is stored in the user’s <code>/etc/passwd</code> entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |
| -d <i>dir</i>           | Specify the new home directory of the user. It defaults to <code>base_dir/login</code> , where <i>base_dir</i> is the base directory for new login home directories, and <i>login</i> is the new login.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |
| -e <i>expire</i>        | Specify the expiration date for a login. After this date, no user will be able to access this login. The expire option argument is a date entered using one of the date formats included in the template file <code>/etc/datemsk</code> . See <code>getdate(3C)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |
| -f <i>inactive</i>      | Specify the maximum number of days allowed between uses of a login ID before that login ID is declared invalid. Normal values are positive integers. A value of 0 defeats the status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |
| -g <i>group</i>         | Specify an existing group’s integer ID or character-string name. It redefines the user’s primary group membership.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                         |                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                          |               |                                                                                                                                                                                                         |                  |                                                                                                                                                                                                                                                                          |                    |                                                                                                                                                                                       |                 |                                                                                                                    |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -G <i>group</i>       | Specify an existing group's integer "ID" "", or character string name. It redefines the user's supplementary group membership. Duplicates between <i>group</i> with the -g and -G options are ignored. No more than NGROUPS_UMAX groups may be specified as defined in <param.h>.                                                                                                                                                                                                                                                                                                                                                                           |
| -l <i>new_logname</i> | Specify the new login name for the user. The <i>new_logname</i> argument is a string no more than eight bytes consisting of characters from the set of alphabetic characters, numeric characters, period (.), underline (_), and hyphen (-). The first character should be alphabetic and the field should contain at least one lower case alphabetic character. A warning message will be written if these restrictions are not met. A future Solaris release may refuse to accept login fields that do not meet these requirements. The <i>new_logname</i> argument must contain at least one character and must not contain a colon (:) or NEWLINE (\n). |
| -m                    | Move the user's home directory to the new directory specified with the -d option. If the directory already exists, it must have permissions read/write/execute by <i>group</i> , where <i>group</i> is the user's primary group.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -o                    | This option allows the specified UID to be duplicated (non-unique).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -P <i>profile</i>     | One or more comma-separated execution profiles defined in auth_attr(4). This replaces any existing profile setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -R <i>role</i>        | One or more comma-separated execution profiles defined in auth_attr(4). This replaces any existing role setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -s <i>shell</i>       | Specify the full pathname of the program that is used as the user's shell on login. The value of <i>shell</i> must be a valid executable file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| -u <i>uid</i>         | Specify a new UID for the user. It must be a non-negative decimal integer less than MAXUID as defined in <param.h>. The UID associated with the user's home directory is not modified with this option; a user will not have access to their home directory until the UID is manually reassigned using chown(1M).                                                                                                                                                                                                                                                                                                                                           |
| <b>OPERANDS</b>       | The following operands are supported:<br><br>login     An existing login name to be modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| EXIT STATUS    | In case of an error, usermod prints an error message and exits with one of the following values:                                                                                                                        |                                                                                                        |                |                 |              |         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
|                | 2                                                                                                                                                                                                                       | The command syntax was invalid. A usage message for the usermod command is displayed.                  |                |                 |              |         |

## usermod(1M)

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NOTES</b> | <p>The usermod utility modifies passwd definitions only in the local <code>/etc/passwd</code> and <code>/etc/shadow</code> files. If a network nameservice such as NIS or NIS+ is being used to supplement the local files with additional entries, usermod cannot change information supplied by the network nameservice. However usermod will verify the uniqueness of user name and user ID against the external nameservice.</p> <p>The usermod utility uses the <code>/etc/datemsk</code> file, available with SUNWaccr, for date formatting.</p> |

| DESCRIPTION    | <p>The utmpd daemon monitors the /var/adm/utmpx file. See utmpx(4) (and utmp(4) for historical information).</p> <p>utmpd receives requests from pututxline(3C) by way of a named pipe. It maintains a table of processes and uses poll(2) on /proc files to detect process termination. When utmpd detects that a process has terminated, it checks that the process has removed its utmpx entry from /var/adm/utmpx. If the process’ utmpx entry has not been removed, utmpd removes the entry. By periodically scanning the /var/adm/utmpx file, utmpd also monitors processes that are not in its table.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |                |                                                                                                                                    |              |                                                                                            |
| OPTIONS        | <p>-debug     Run in debug mode, leaving the process connected to the controlling terminal. | <b>NAME</b>        | uucico – file transport program for the uucp system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>SYNOPSIS</b>    | <b>/usr/lib/uucp/uucico</b> [-f] [-c <i>type</i> ] [-d <i>spool-directory</i> ] [-i <i>interface</i> ]<br>[-r <i>role-number</i> ] [-s <i>system-name</i> ] [-x <i>debug-level</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DESCRIPTION</b> | uucico is the file transport program for uucp work file transfers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-f This option is used to "force execution" of uucico by ignoring the limit on the maximum number of uucicos defined in the /etc/uucp/Limits file.</li> <li>-c <i>type</i> The first field in the Devices file is the "Type" field. The -c option forces uucico to only use entries in the "Type" field that match the user specified type. The specified type is usually the name of a local area network.</li> <li>-d <i>spool-directory</i> This option specifies the directory <i>spool-directory</i> that contains the uucp work files to be transferred. The default spool directory is /var/spool/uucp.</li> <li>-i <i>interface</i> This option defines the <i>interface</i> used with uucico. The interface only affects slave mode. Known interfaces are UNIX (default), TLI (basic Transport Layer Interface), and TLIS (Transport Layer Interface with Streams modules, read/write).</li> <li>-r <i>role-number</i> The <i>role-number</i> 1 is used for master mode. <i>role-number</i> 0 is used for slave mode (default). When uucico is started by a program or cron, <i>role-number</i> 1 should be used for master mode.</li> <li>-s <i>system-name</i> The -s option defines the remote system (<i>system-name</i>) that uucico will try to contact. It is required when the role is master; <i>system-name</i> must be defined in the Systems file.</li> <li>-x <i>debug-level</i> Both uux and uucp queue jobs that will be transferred by uucico. These jobs are normally started by the uusched scheduler, for debugging purposes, and can be started manually. For example, the shell Uutry starts uucico with debugging turned on. The <i>debug-level</i> is a number between 0 and 9. Higher numbers give more detailed debugging information.</li> </ul> |

| SYNOPSIS              | <b>/usr/lib/uucp/uucleanup</b> [-C <i>time</i> ] [-D <i>time</i> ] [-m <i>string</i> ] [-o <i>time</i> ]<br>[-s <i>system</i> ] [-W <i>time</i> ] [-x <i>debug-level</i> ] [-X <i>time</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |                                                                                                                                  |                |                                                                                                                                                              |                  |                                                                                                                                                    |                |                                                                              |                  |                                                 |                |                                                                                                                                                                                                                                                                                                                                                           |                       |                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                  |
| DESCRIPTION           | <p>uucleanup will scan the spool directories for old files and take appropriate action to remove them in a useful way:</p> <ul style="list-style-type: none"> <li>■ Inform the requester of send/receive requests for systems that can not be reached.</li> <li>■ Return undeliverable mail to the sender.</li> <li>■ Deliver rnews files addressed to the local system.</li> <li>■ Remove all other files.</li> </ul> <p>In addition, there is a provision to warn users of requests that have been waiting for a given number of days (default 1 day). Note: uucleanup will process as if all option times were specified to the default values unless time is specifically set.</p> <p>This program is typically started by the shell uudemond.cleanup, which should be started by cron(1M).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                                                                                                                                  |                |                                                                                                                                                              |                  |                                                                                                                                                    |                |                                                                              |                  |                                                 |                |                                                                                                                                                                                                                                                                                                                                                           |                       |                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                  |
| OPTIONS               | <table> <tr> <td>-C<i>time</i></td><td>Remove any C. files greater or equal to <i>time</i> days old and send appropriate information to the requester (default 7 days).</td></tr> <tr> <td>-D<i>time</i></td><td>Remove any D. files greater or equal to <i>time</i> days old, make an attempt to deliver mail messages, and execute rnews when appropriate (default 7 days).</td></tr> <tr> <td>-m<i>string</i></td><td>Include <i>string</i> in the warning message generated by the -W option. The default line is "See your local administrator to locate the problem".</td></tr> <tr> <td>-o<i>time</i></td><td>Delete other files whose age is more than <i>time</i> days (default 2 days).</td></tr> <tr> <td>-s<i>system</i></td><td>Execute for <i>system</i> spool directory only.</td></tr> <tr> <td>-W<i>time</i></td><td>Any C. files equal to <i>time</i> days old will cause a mail message to be sent to the requester warning about the delay in contacting the remote. The message includes the <i>JOBID</i>, and in the case of mail, the mail message. The administrator may include a message line telling whom to call to check the problem (-m option) (default 1 day).</td></tr> <tr> <td>-x<i>debug-level</i></td><td>Produce debugging output on standard output. <i>debug-level</i> is a single digit between 0 and 9; higher numbers give more detailed debugging information. (This option may not be available on all systems.)</td></tr> <tr> <td>-X<i>time</i></td><td>Any X. files greater or equal to <i>time</i> days old will be removed. The D. files are probably not present (if they were, the X. could get executed). But if there are D. files, they will be taken care of by D. processing (default 2 days).</td></tr> </table> | -C <i>time</i> | Remove any C. files greater or equal to <i>time</i> days old and send appropriate information to the requester (default 7 days). | -D <i>time</i> | Remove any D. files greater or equal to <i>time</i> days old, make an attempt to deliver mail messages, and execute rnews when appropriate (default 7 days). | -m <i>string</i> | Include <i>string</i> in the warning message generated by the -W option. | -s <i>system</i>      | Execute for <i>system</i> spool directory only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                                                                                                                                  |                |                                                                                                                                                              |                  |                                                                                                                                                    |                |                                                                              |                  |                                                 |                |                                                                                                                                                                                                                                                                                                                                                           |                       |                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                  |
| -W <i>time</i>        | Any C. files equal to <i>time</i> days old will cause a mail message to be sent to the requester warning about the delay in contacting the remote. The message includes the <i>JOBID</i> , and in the case of mail, the mail message. The administrator may include a message line telling whom to call to check the problem (-m option) (default 1 day).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                                                                                                                                  |                |                                                                                                                                                              |                  |                                                                                                                                                    |                |                                                                              |                  |                                                 |                |                                                                                                                                                                                                                                                                                                                                                           |                       |                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                  |
| -x <i>debug-level</i> | Produce debugging output on standard output. <i>debug-level</i> is a single digit between 0 and 9; higher numbers give more detailed debugging information. (This option may not be available on all systems.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                                                                                                                                  |                |                                                                                                                                                              |                  |                                                                                                                                                    |                |                                                                              |                  |                                                 |                |                                                                                                                                                                                                                                                                                                                                                           |                       |                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                  |
| -X <i>time</i>        | Any X. files greater or equal to <i>time</i> days old will be removed. The D. files are probably not present (if they were, the X. could get executed). But if there are D. files, they will be taken care of by D. processing (default 2 days).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                                                                                                                                  |                |                                                                                                                                                              |                  |                                                                                                                                                    |                |                                                                              |                  |                                                 |                |                                                                                                                                                                                                                                                                                                                                                           |                       |                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                  |

| <b>SYNOPSIS</b>    | <b>/usr/lib/uucp/uusched</b> [-u <i>debug-level</i> ] [-x <i>debug-level</i> ]                                                                                                                                                                                                                                                                                                                            |                |                 |              |          |
| <b>DESCRIPTION</b> | <p>uusched is the uucp(1C) file transport scheduler. It is usually started by the daemon <i>uudemon.hour</i> that is started by <i>cron(1M)</i> from an entry in user uucp's crontab file:</p> <pre>11,41 * * * * /etc/uucp/uucp/uudemon.hour</pre>                                                                                                                                                       |                |                 |              |          |
| <b>OPTIONS</b>     | <p>The options are for debugging purposes only. <i>debug-level</i> is a number between 0 and 9. Higher numbers give more detailed debugging information:</p> <p>The following options are supported:</p> <p>-u <i>debug-level</i>      Passes the -u <i>debug-level</i> option <i>uucico(1M)</i> as -x <i>debug-level</i>.</p> <p>-x <i>debug-level</i>      Outputs debugging messages from uusched.</p> |                |                 |              |          |

| SYNOPSIS       | <b>/usr/lib/uucp/Uutry</b> [-r] [-c <i>type</i> ] [-x <i>debug-level</i> ] <i>system-name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                 |              |          |
| DESCRIPTION    | Uutry is a shell script that is used to invoke uucico(1M) to call a remote site. Debugging is initially turned on and is set to the default value of 5. The debugging output is put in file <i>/tmp/system-name</i> .                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |          |
| OPTIONS        | <p>The following options are supported:</p> <p>-r                      This option overrides the retry time that is set in file <i>/var/uucp/.Status/system-name</i>.</p> <p>-c <i>type</i>                The first field in the Devices file is the "Type" field. The -c option forces uucico to use only entries in the "Type" field that match the user-specified type. The specified type is usually the name of a local area network.</p> <p>-x <i>debug-level</i>        <i>debug-level</i> is a number from 0 to 9. Higher numbers give more detailed debugging information.</p> |                |                 |              |          |

| <b>SYNOPSIS</b>    | <b>/usr/lib/uucp/uuxqt</b> [-s <i>system</i> ] [-x <i>debug-level</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |          |
| <b>DESCRIPTION</b> | <p>uuxqt is the program that executes remote job requests from remote systems generated by the use of the uux command. (mail uses uux for remote mail requests). uuxqt searches the spool directories looking for execution requests. For each request, uuxqt checks to see if all the required data files are available, accessible, and the requested commands are permitted for the requesting system. The Permissions file is used to validate file accessibility and command execution permission.</p> <p>There are two environment variables that are set before the uuxqt command is executed:</p> <ul style="list-style-type: none"> <li>■ UU_MACHINE is the machine that sent the job (the previous one).</li> <li>■ UU_USER is the user that sent the job.</li> </ul> <p>These can be used in writing commands that remote systems can execute to provide information, auditing, or restrictions.</p> |                |                 |              |          |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p>-s <i>system</i>                Specifies the remote <i>system</i> name.</p> <p>-x <i>debug-level</i>        <i>debug-level</i> is a number from 0 to 9. Higher numbers give more detailed debugging information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                 |              |          |

| NAME        | vmstat – report virtual memory statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SYNOPSIS    | <b>vmstat</b> [-cipsS] [disks] [interval [count]]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DESCRIPTION | <p>vmstat reports virtual memory statistics regarding kernel thread, virtual memory, disk, trap, and CPU activity.</p> <p>On MP (multi-processor) systems, vmstat averages the number of CPUs into the output. For per-processor statistics, see mpstat(1M).</p> <p>vmstat only supports statistics for certain devices. For more general system statistics, use sar(1), iostat(1M), or sar(1M).</p> <p>Without options, vmstat displays a one-line summary of the virtual memory activity since the system was booted.</p> <p>During execution of this kernel status command, the "state" of the kernel can change. An example would be CPUs going online or offline. vmstat will report this as &lt;&lt;State change&gt;&gt;.</p> <p>See <i>System Administration Guide: Advanced Administration</i> for device naming conventions for disks.</p>                                                                                                                                                                                                                                                                                     |
| OPTIONS     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-c        Report cache flushing statistics. By default, report the total number of each kind of cache flushed since boot time. The types are: user, context, region, segment, page, and partial-page.</li> <li>-i        Report the number of interrupts per device. <i>count</i> and <i>interval</i> does not apply to the -i option.</li> <li>-p        Report paging activity in details. This option will display the following, respectively: <ul style="list-style-type: none"> <li>epi        Executable page-ins.</li> <li>epo        Executable page-outs.</li> <li>epf        Executable page-frees.</li> <li>api        Anonymous page-ins.</li> <li>apo        Anonymous page-outs.</li> <li>apf        Anonymous page-frees.</li> <li>fpi        File system page-ins.</li> <li>fpo        File system page-outs.</li> <li>fpf        File system page-frees.</li> </ul> </li> <li>-s        Display the total number of various system events since boot. <i>count</i> and <i>interval</i> does not apply to the -s option.</li> </ul> |

**-S** Report on swapping rather than paging activity. This option will change two fields in `vmstat`'s "paging" display: rather than the "re" and "mf" fields, `vmstat` will report "si" (swap-ins) and "so" (swap-outs).

## OPERANDS

The following operands are supported:

**count** Specifies the number of times that the statistics are repeated. *count* does not apply to the **-i** and **-s** options.

**disks** Specifies which disks are to be given priority in the output (only four disks fit on a line). Common disk names are *id*, *sd*, *xd*, or *xy*, followed by a number (for example, *sd2*, *xd0*, and so forth).

**interval** Specifies the last number of seconds over which `vmstat` summarizes activity. This number of seconds repeats forever. *interval* does not apply to the **-i** and **-s** options.

## EXAMPLES

### EXAMPLE 1 Using vmstat

The following command displays a summary of what the system is doing every five seconds.

```
example% vmstat 5
kthr memory page disk faults cpu
r b w swap free re mf pi p fr de sr s0 s1 s2 s3 in sy cs us sy id
0 0 0 11456 4120 1 41 19 1 3 0 2 0 4 0 0 48 112 130 4 14 82
0 0 1 10132 4280 0 4 44 0 0 0 0 0 23 0 0 211 230 144 3 35 62
0 0 1 10132 4616 0 0 20 0 0 0 0 0 19 0 0 150 172 146 3 33 64
0 0 1 10132 5292 0 0 9 0 0 0 0 0 21 0 0 165 105 130 1 21 78
1 1 1 10132 5496 0 0 5 0 0 0 0 0 23 0 0 183 92 134 1 20 79
1 0 1 10132 5564 0 0 25 0 0 0 0 0 18 0 0 131 231 116 4 34 62

^Cexample%
```

The fields of `vmstat`'s display are

**kthr** Report the number of kernel threads in each of the three following states:

- r** in run queue
- b** blocked for resources I/O, paging, and so forth
- w** swapped

**memory** Report on usage of virtual and real memory.

- swap** amount of swap space currently available (Kbytes)
- free** size of the free list (Kbytes)

**page** Report information about page faults and paging activity. The information on each of the following activities is given in units per second.

## vmstat(1M)

### EXAMPLE 1 Using vmstat (Continued)

|        |    |                                                                                                                                                                                                                                                 |

|        | po | kilobytes paged out                                                                                                                                                                                                                             |
|        | fr | kilobytes freed                                                                                                                                                                                                                                 |
|        | de | anticipated short-term memory shortfall (Kbytes)                                                                                                                                                                                                |
|        | sr | pages scanned by clock algorithm                                                                                                                                                                                                                |
| disk   |    | Report the number of disk operations per second. There are slots for up to four disks, labeled with a single letter and number. The letter indicates the type of disk (s = SCSI, i = IPI, and so forth); the number is the logical unit number. |
| faults |    | Report the trap/interrupt rates (per second).                                                                                                                                                                                                   |
|        | in | interrupts                                                                                                                                                                                                                                      |
|        | sy | system calls                                                                                                                                                                                                                                    |
|        | cs | CPU context switches                                                                                                                                                                                                                            |
| cpu    |    | Give a breakdown of percentage usage of CPU time. On MP systems, this is an average across all processors.                                                                                                                                      |
|        | us | user time                                                                                                                                                                                                                                       |
|        | sy | system time                                                                                                                                                                                                                                     |
|        | id | idle time                                                                                                                                                                                                                                       |

| <b>DESCRIPTION</b> | volcopy makes a literal copy of the file system. This command may not be supported for all <i>FSTypes</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <div> <div>-F <i>FSType</i></div> <div>Specify the <i>FSType</i> on which to operate. The <i>FSType</i> should either be specified here or be determinable from <code>/etc/vfstab</code> by matching the <i>operands</i> with an entry in the table. Otherwise, the default file system type specified in <code>/etc/default/fs</code> will be used.</div> </div> <div> <div>-V</div> <div>Echo the complete command line, but do not execute the command. The command line is generated by using the options and arguments provided by the user and adding to them information derived from <code>/etc/vfstab</code>. This option should be used to verify and validate the command line.</div> </div> <div> <div><i>generic_options</i></div> <div>Options that are commonly supported by most <i>FSType</i>-specific command modules. The following options are available:</div> <div> <div>-a</div> <div>Require the operator to respond “yes” or “no” instead of simply waiting ten seconds before the copy is made.</div> </div> <div> <div>-s</div> <div>(Default) Invoke the DEL if wrong verification sequence.</div> </div> </div> <div> <div>-o <i>FSType-specific_options</i></div> <div>Specify <i>FSType</i>-specific options in a comma separated (without spaces) list of suboptions and keyword-attribute pairs for interpretation by the <i>FSType</i>-specific module of the command.</div> </div> |  |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <div> <div><i>operands</i></div> <div>generally include the device and volume names and are file system specific. A detailed description of the <i>operands</i> can be found on the <i>FSType</i>-specific man pages of volcopy.</div> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
| <b>EXIT STATUS</b> | The following exit values are returned:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |

0 Successful file system copy

1 An error has occurred.

| <b>NAME</b>                  | vold – Volume Management daemon to manage CD-ROM and floppy, ZIP/JAZ, and DVD-ROM devices                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYNOPSIS</b>              | <b>/usr/sbin/vold</b> [-n] [-t] [-v] [-f <i>config-file</i> ] [-l <i>log-file</i> ] [-d <i>root-dir</i> ] [-L <i>debug-level</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>DESCRIPTION</b>           | <p>The Volume Management daemon, vold, creates and maintains a file system image rooted at <i>root-dir</i> that contains symbolic names for floppies, CD-ROMs and other removable devices. The default <i>root-dir</i> is set to /vol if no directory is specified by the -d option.</p> <p>vold reads the /etc/vold.conf configuration file upon startup. If the configuration file is modified later, vold must be told to reread the /etc/vold.conf file. Do this by entering</p> <pre>example# kill -HUP vold_pid</pre> <p>To tell vold to clean up and exit, the SIGTERM signal is used:</p> <pre>example# kill -TERM vold_pid</pre> <p>where vold_pid is the process ID of vold.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>OPTIONS</b>               | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-n               Never writeback. Volume Management updates media labels with unique information if labels are not unique. This flag keeps Volume Management from changing your media. The default setting is FALSE.</li> <li>-t               Dump NFS trace information to the log file. The default setting is FALSE.</li> <li>-v               Provide lots of status information to the log file. The default setting is FALSE (do not provide status info to log file).</li> <li>-d <i>root-dir</i>     Specify an alternate root directory. The default location is /vol. Setting this will also cause other Volume Management utilities to use this as the default root directory.</li> <li>-f <i>config-file</i>   Specify an alternate configuration file. The default file is /etc/vold.conf.</li> <li>-l <i>log-file</i>      Specify an alternate log file. The default log file is /var/adm/vold.log.</li> <li>-L <i>debug-level</i>   Change the level (verbosity) of debug messages sent to the log file. The range is 0 to 99 where 0 is nothing and 99 is everything. The default level is 0.</li> </ul> |
| <b>ENVIRONMENT VARIABLES</b> | vold sets the following environment variables to aid programs which are called when events such as insert, notify, and eject occur:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## vold(1M)

|       |                                   |                                                                                                                                                                          |
|-------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | VOLUME_ACTION                     | Event that caused this program to be executed.                                                                                                                           |
|       | VOLUME_PATH                       | Pathname of the matched <i>regex</i> from the <code>vold.conf</code> file.                                                                                               |
|       | VOLUME_DEVICE                     | Device (in <code>/vol/dev</code> ) that applies to the media.                                                                                                            |
|       | VOLUME_NAME                       | Name of the volume in question.                                                                                                                                          |
|       | VOLUME_USER                       | User ID of the user causing the event to occur.                                                                                                                          |
|       | VOLUME_SYMNAME                    | Symbolic name of a device containing the volume.                                                                                                                         |
|       | VOLUME_MEDIATYPE                  | Name of the type of media (CD-ROM, floppy or rmdisk)                                                                                                                     |
| FILES | <code>/etc/vold.conf</code>       | Volume Management daemon configuration file. Directs the Volume Management daemon to control certain devices, and causes events to occur when specific criteria are met. |
|       | <code>/usr/lib/vold/*.so.1</code> | Shared objects called by Volume Management daemon when certain actions occur.                                                                                            |
|       | <code>/var/adm/vold.log</code>    | the default log file location (see the <code>-l</code> option for a description).                                                                                        |
|       | <code>/vol</code>                 | the default Volume Management root directory.                                                                                                                            |

| SYNOPSIS              | <code>/usr/sbin/wall [-a] [-g grpname] [filename]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                                                        |                   |                                                                                                        |
| DESCRIPTION           | <p>wall reads its standard input until an end-of-file. It then sends this message to all currently logged-in users preceded by:</p> <pre>Broadcast Message from . . .</pre> <p>If <i>filename</i> is given, then the message is read in from that file. Normally, pseudo-terminals that do not correspond to rlogin sessions are ignored. Thus, when using a window system, the message appears only on the console window. However, -a will send the message even to such pseudo-terminals.</p> <p>It is used to warn all users, typically prior to shutting down the system.</p> <p>The sender must be superuser to override any protections the users may have invoked. See <code>mesg(1)</code>.</p> <p>wall runs <code>setgid()</code> to the group ID <code>tty</code>, in order to have write permissions on other user's terminals. See <code>setuid(2)</code>.</p> <p>wall will detect non-printable characters before sending them to the user's terminal. Control characters will appear as a " ^ " followed by the appropriate ASCII character; characters with the high-order bit set will appear in "meta" notation. For example, '\003' is displayed as '^C' and '\372' as 'M-z'.</p> |                |                                                        |                   |                                                                                                        |
| OPTIONS               | <p>The following options are supported:</p> <table><tr><td>-a</td><td>Broadcast message to the console and pseudo-terminals.</td></tr><tr><td>-g <i>grpname</i></td><td>Broadcast to the users in a specified group only, per the group database (see <code>group(4)</code>).</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | -a             | Broadcast message to the console and pseudo-terminals. | -g <i>grpname</i> | Broadcast to the users in a specified group only, per the group database (see <code>group(4)</code> ). |
| -a                    | Broadcast message to the console and pseudo-terminals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |                                                        |                   |                                                                                                        |
| -g <i>grpname</i>     | Broadcast to the users in a specified group only, per the group database (see <code>group(4)</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |                                                        |                   |                                                                                                        |
| ENVIRONMENT VARIABLES | <p>If the <code>LC_*</code> variables (<code>LC_CTYPE</code>, <code>LC_TIME</code>, <code>LC_COLLATE</code>, <code>LC_NUMERIC</code>, and <code>LC_MONETARY</code>) are not set in the environment, the operational behavior of wall for each corresponding locale category is determined by the value of the <code>LANG</code> environment variable. See <code>environ(5)</code>. If <code>LC_ALL</code> is set, its contents are used to override both the <code>LANG</code> and the other <code>LC_*</code> variables. If none of the above variables are set in the environment, the "C" (U.S. style) locale determines how wall behaves.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                                                        |                   |                                                                                                        |

| SYNOPSIS                       | <code>/usr/sadm/bin/wbemadmin</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                           |                                                                                                                                              |                                |                                                                                                              |
| DESCRIPTION                    | <p>The <code>wbemadmin</code> utility starts Sun WBEM User Manager, a graphical user interface that enables you to add and delete authorized WBEM users and to set their access privileges. Use this application to manage access to groups of managed resources, such as disks and installed software, in the Solaris operating environment.</p> <p>The <code>wbemadmin</code> utility allows you to perform the following tasks:</p> <table><tr><td>Manage user access rights</td><td>Use the <code>wbemadmin</code> utility to add, delete, or modify an individual user’s access rights to a namespace on a WBEM-enabled system.</td></tr><tr><td>Manage namespace access rights</td><td>Use the <code>wbemadmin</code> utility to add, delete, or modify access rights for all users to a namespace.</td></tr></table> <p>The Sun WBEM User Manager displays a Login dialog box. You must log in as root or a user with write access to the <code>root\security</code> namespace to grant access rights to users. By default, Solaris users have guest privileges, which grants them read access to the default namespaces.</p> <p>Managed resources are described using a standard information model called Common Information Model (CIM). A CIM object is a computer representation, or model, of a managed resource, such as a printer, disk drive, or CPU. CIM objects can be shared by any WBEM-enabled system, device, or application. CIM objects are grouped into meaningful collections called schema. One or more schemas can be stored in directory-like structures called namespaces.</p> <p>All programming operations are performed within a namespace. Two namespaces are created by default during installation:</p> <ul style="list-style-type: none"><li>■ <code>root\cimv2</code> — Contains the default CIM classes that represent objects on your system.</li><li>■ <code>root\security</code> — Contains the security classes used by the CIM Object Manager to represent access rights for users and namespaces.</li></ul> <p>When a WBEM client application connects to the CIM Object Manager in a particular namespace, all subsequent operations occur within that namespace. When you connect to a namespace, you can access the classes and instances in that namespace (if they exist) and in any namespaces contained in that namespace.</p> <p>When a WBEM client application accesses CIM data, the WBEM system validates the user’s login information on the current host. By default, a validated WBEM user is granted read access to the Common Information Model (CIM) Schema. The CIM Schema describes managed objects on your system in a standard format that all WBEM-enabled systems and applications can interpret.</p> | Manage user access rights | Use the <code>wbemadmin</code> utility to add, delete, or modify an individual user’s access rights to a namespace on a WBEM-enabled system. | Manage namespace access rights | Use the <code>wbemadmin</code> utility to add, delete, or modify access rights for all users to a namespace. |
| Manage user access rights      | Use the <code>wbemadmin</code> utility to add, delete, or modify an individual user’s access rights to a namespace on a WBEM-enabled system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                           |                                                                                                                                              |                                |                                                                                                              |
| Manage namespace access rights | Use the <code>wbemadmin</code> utility to add, delete, or modify access rights for all users to a namespace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                           |                                                                                                                                              |                                |                                                                                                              |

## wbemadmin(1M)

You can set access privileges on individual namespaces or for a user-namespace combination. When you add a user and select a namespace, by default the user is granted read access to CIM objects in the selected namespace. An effective way to combine user and namespace access rights is to first restrict access to a namespace. Then grant individual users read, read and write, or write access to that namespace.

You cannot set access rights on individual managed objects. However you can set access rights for all managed objects in a namespace as well as on a per-user basis.

If you log in to the root account, you can set the following types of access to CIM objects:

- Read Only — Allows read-only access to CIM Schema objects. Users with this privilege can retrieve instances and classes, but cannot create, delete, or modify CIM objects.
- Read/Write — Allows full read, write, and delete access to all CIM classes and instances.
- Write — Allows write and delete, but not read access to all CIM classes and instances.
- None — Allows no access to CIM classes and instances.

Context help is displayed in the left side of the wbemadmin dialog boxes. When you click on a field, the help content changes to describe the selected field. No context help is available on the main User Manager window.

The wbemadmin security administration tool updates the following Java classes in the root\security namespace:

- Solaris\_UserAcl — Updated when access rights are granted or changed for a user.
- Solaris\_namespaceAcl — Updated when access rights are granted or changed for a namespace.

**USAGE** The wbemadmin utility is not the tool for a distributed environment. It is used for local administration on the machine on which the CIM Object Manager is running.

**EXIT STATUS** The wbemadmin utility terminates with exit status 0.

**WARNING** The root\security namespace stores access privileges. If you grant other users access to the root\security namespace, those users can grant themselves or other users rights to all other namespaces.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| <b>SYNOPSIS</b>      | <code>/usr/sadm/lib/wbem/wbemconfig convert</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                      |                                                                            |              |           |
| <b>DESCRIPTION</b>   | <p>A Reliable Log directory is created that contains the converted data. This directory is named <code>/var/sadm/wbem/logr</code>.</p> <p>The <code>convert</code> argument is the only supported option of this command. You should only run this command after stopping WBEM (CIM Object Manager) with the <code>init.wbem stop</code> command. Otherwise your data may be corrupted.</p> <p>This command successfully converts any proprietary custom MOFs you have created in the datastore, but not any CIM or Solaris MOFs you have modified. These will be destroyed. To recompile any modified CIM or Solaris MOFs into the new datastore, run the <code>mofcomp</code> command on the MOF files containing the class definitions.</p> <p>Because the <code>wbemconfig convert</code> command invokes the JVM (Java Virtual Machine) to perform conversion of the JavaSpaces datastore, you must be running the same version of the JVM as when the original JavaSpaces storage was created. After the <code>wbemconfig convert</code> command is completed, you can change to any version of the JVM you want.</p> <p>To see what version of the JVM you are running, issue the <code>java -version</code> command.</p> |                      |                                                                            |              |           |
| <b>OPTIONS</b>       | <p>The following options are supported:</p> <table><tr><td><code>convert</code></td><td>Convert a JavaSpaces datastore to the newer Reliable Log datastore format.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <code>convert</code> | Convert a JavaSpaces datastore to the newer Reliable Log datastore format. |              |           |
| <code>convert</code> | Convert a JavaSpaces datastore to the newer Reliable Log datastore format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                      |                                                                            |              |           |

| <b>DESCRIPTION</b> | <p>The <code>wbemlogviewer</code> utility starts the WBEM Log Viewer graphical user interface, which enables administrators to view and maintain log records created by WBEM clients and providers. The WBEM Log Viewer displays a Login dialog box. You must log in as root or a user with write access to the <code>root\cimv2</code> namespace to view and maintain log files. Namespaces are described in <code>wbemadmin(1M)</code>.</p> <p>Log events can have three severity levels.</p> <ul style="list-style-type: none"> <li>■ Errors</li> <li>■ Warnings</li> <li>■ Informational</li> </ul> <p>The WBEM log file is created in the <code>/var/sadm/wbem/log</code> directory, with the name <code>wbem_log</code>. The first time the log file is backed up, it is renamed <code>wbem_log.1</code>, and a new <code>wbem_log</code> file is created. Each succeeding time the <code>wbem_log</code> file is backed up, the file extension number of each backup log file is increased by 1, and the oldest backup log file is removed <i>if</i> the limit, which in turn is specified in the log service settings, on the number of logfiles is exceeded. Older backup files have higher file extension numbers than more recent backup files.</p> <p>The log file is renamed with a <code>.1</code> file extension and saved when one of the following two conditions occur:</p> <ul style="list-style-type: none"> <li>■ The current file reaches the specified file size limit.</li> <li>■ A WBEM client application uses the <code>clearLog()</code> method in the <code>Solaris_LogService</code> class to clear the current log file.</li> <li>■ A WBEM client application uses the <code>clearLog()</code> method in the <code>Solaris_LogService</code> class to clear the current log file.</li> <li>■ A user chooses Action-&gt;Back Up Now in the Log Viewer application.</li> </ul> <p>Help is displayed in the left panel of each dialog box. Context help is not displayed in the main Log Viewer window.</p> |
| <b>USAGE</b>       | <p>The WBEM Log Viewer is not the tool for a distributed environment. It is used for local administration.</p> <p>The WBEM Log Viewer allows you to perform the following tasks:</p> <p>View the logs</p> <p>Set properties of log files      Click Action-&gt;Log File Settings to specify log file parameters and the log file directory.</p> <p>Back up a log file      Click Action-&gt;Back Up Now to back up and close the current log file and start a new log file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## wbemlogviewer(1M)

|                           |                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open historical log files | Click Action->Open Log File to open a backed-up log file.                                                                                                                                         |
| Delete an old log file    | Open the file and then click Action->Delete Log File. You can only delete backed-up log files.                                                                                                    |
| View log record details   | Double-click a log entry or click View->Log Entry Details to display the details of a log record.                                                                                                 |
| Sort the logs             | Click View->Sort By to sort displayed entries. You can also click any column heading to sort the list. By default, the log entries are displayed in reverse chronological order (new logs first). |

**EXIT STATUS** The `wbemlogviewer` utility terminates with exit status 0.

**FILES** `/var/sadm/wbem/log/wbem_log`  
WBEM log file

| <b>SYNOPSIS</b>    | <b>/usr/sbin/whodo</b> [-h] [-l] [ <i>user</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DESCRIPTION</b> | <p>The whodo command produces formatted and dated output from information in the /var/adm/utmpx, /tmp/ps_data, and /proc/pid files.</p> <p>The display is headed by the date, time, and machine name. For each user logged in, device name, user-ID and login time is shown, followed by a list of active processes associated with the user-ID. The list includes the device name, process-ID, CPU minutes and seconds used, and process name.</p> <p>If <i>user</i> is specified, output is restricted to all sessions pertaining to that user.</p>                                                                                                                              |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-h            Suppress the heading.</li> <li>-l            Produce a long form of output. The fields displayed are: the user's login name, the name of the tty the user is on, the time of day the user logged in (in <i>hours:minutes</i>), the idle time — that is, the time since the user last typed anything (in <i>hours:minutes</i>), the CPU time used by all processes and their children on that terminal (in <i>minutes:seconds</i>), the CPU time used by the currently active processes (in <i>minutes:seconds</i>), and the name and arguments of the current process.</li> </ul> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Using the whodo Command</p> <p>The command:</p> <pre>example% whodo</pre> <p>produces a display like this:</p> <pre>Tue Mar 12 15:48:03 1985 bailey tty09      mcn          8:51           tty09      28158      0:29 sh  tty52      bdr          15:23           tty52      21688      0:05 sh           tty52      22788      0:01 whodo           tty52      22017      0:03 vi           tty52      22549      0:01 sh  xt162      lee          10:20           tty08      6748       0:01 layers           xt162      6751       0:01 sh           xt163      6761       0:05 sh           tty08      6536       0:05 sh</pre>                            |

whodo(1M)

**EXAMPLE 1** Using the whodo Command (Continued)

**ENVIRONMENT  
VARIABLES**

If any of the LC\_\* variables ( LC\_CTYPE, LC\_MESSAGES, LC\_TIME, LC\_COLLATE, LC\_NUMERIC, and LC\_MONETARY ) (see environ(5)) are not set in the environment, the operational behavior of whodo(1) for each corresponding locale category is determined by the value of the LANG environment variable. If LC\_ALL is set, its contents are used to override both the LANG and the other LC\_\* variables. If none of the above variables is set in the environment, the "C" (U.S. style) locale determines how whodo behaves.

LC\_CTYPE                Determines how whodo handles characters. When LC\_CTYPE is set to a valid value, whodo can display and handle text and filenames containing valid characters for that locale. The whodo command can display and handle Extended Unix code (EUC) characters where any individual character can be 1, 2, or 3 bytes wide. whodo can also handle EUC characters of 1, 2, or more column widths. In the "C" locale, only characters from ISO 8859-1 are valid.

LC\_MESSAGES            Determines how diagnostic and informative messages are presented. This includes the language and style of the messages, and the correct form of affirmative and negative responses. In the "C" locale, the messages are presented in the default form found in the program itself (in most cases, U.S. English).

LC\_TIME                Determines how whodo handles date and time formats. In the "C" locale, date and time handling follow the U.S. rules.

**EXIT STATUS**

The following exit values are returned:

0                      Successful completion.

non-zero              An error occurred.

**FILES**

/etc/passwd            System password file

/tmp/ps\_data

/var/adm/utmpx            User access and administration information

/proc/pid

| <b>NAME</b>        | wracct – write extended accounting records for active processes and tasks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>SYNOPSIS</b>    | <code>/usr/sbin/wracct [-t <i>record_type</i>] <i>i id_list</i> {<i>task</i>   <i>process</i>}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b> | <p>The wracct utility allows the administrator to invoke the extended accounting system, if active, to write intermediate records representing the resource usage of a selected set of processes or tasks. For tasks, a <i>record_type</i> option is also supported, allowing the administrator to request the writing of a partial record, which leaves the current task usage unchanged, or an interval record, which resets the task usage to zero for that system task, with respect to the extended accounting subsystem. If interval records are used, the total task usage is the sum of all interval records and the final record written at the task's completion. If partial records are used, the completion record reflects the total resource usage.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li><code>-i <i>id_list</i></code> Select the IDs of the tasks or processes to write records for. Specify <i>id_list</i> as a comma- or space-separated list of IDs, presented as a single argument. For some shells, this requires appropriate quoting of the argument.</li> <li><code>-t <i>record_type</i></code> Select type of record to write for the selected task or process. For tasks, <i>record_type</i> can be <i>partial</i> or <i>interval</i>. <i>partial</i> is the the default type, and the only type available for process records.</li> </ul>                                                                                                                      |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <ul style="list-style-type: none"> <li><i>process</i> Treat the given ID as a process ID for the purposes of constructing and writing an extended accounting record.</li> <li><i>task</i> Treat the given ID as a task ID for the purposes of constructing and writing an extended accounting record.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Writing a partial record</p> <p>Write a partial record for all active <i>sendmail</i> processes.</p> <pre># /usr/sbin/wracct -i "`pgrep sendmail`" process</pre> <p><b>EXAMPLE 2</b> Writing an interval record</p> <p>Write an interval record for the task with ID 182.</p> <pre># /usr/sbin/wracct -t interval -i 182 task</pre>                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <ul style="list-style-type: none"> <li>0 Successful completion.</li> <li>1 An error occurred.</li> <li>2 Invalid command line options were specified.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| DESCRIPTION | wrsmconf provides a means to create, install, retrieve, and remove configurations for WCI remote shared memory (RSM) controllers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OPTIONS     | <p>The following options are supported:</p> <p><b>create -c controller_id -f config_file</b><br/> Create a set of per-node configurations for the specified controller and store them to the file <i>config_file</i>. The created file contains a per-node configuration for each node specified in the input for the specified controller. The file has a checksum on it and cannot be modified directly. This file can be used in a <i>wrsmconf initial</i> call on each node to install the node's configuration into the local driver.</p> <p>A list of nodes and WCI devices connected to those nodes is read from standard input. For each connected pair of links, specify the nodename (uname -n), safari port id, and link number on both sides of the connection. The format of the information looks like this:</p> <pre> &lt;nodename&gt;.&lt;wrsmb-portid&gt;.&lt;linkno&gt;=&lt;nodename&gt;.&lt;wrsmb-portid&gt;.&lt;linkno&gt; &lt;nodename&gt;.&lt;wrsmb-portid&gt;.&lt;linkno&gt;=&lt;nodename&gt;.&lt;wrsmb-portid&gt;.&lt;linkno&gt; </pre> <p>This interface is intended for installing configurations for testing (such as for SunVTS). Only direct-connect, non-striped configurations for 1 to 3 nodes can be specified. FM node ids and RSM hardware addresses are assigned to the specified nodes contiguously and in order starting from 0.</p> <p><b>initial -f config_file [-c controller_id]</b><br/> Install the configuration for the local node stored in the file <i>config_file</i> into the driver as the initial configuration for the specified controller. This command fails under the following circumstances:</p> <ul style="list-style-type: none"> <li>■ If <i>controller_id</i> is specified and the configuration in the file is not for the specified controller.</li> <li>■ If the file does not contain a valid configuration for the local node or if the checksum in the file shows it has been modified.</li> <li>■ If a configuration has already been installed for the controller. If this happens, use <i>wrsmconf remove</i> to remove the existing configuration.</li> </ul> <p><b>remove [-c controller_id]</b><br/> Disable communication through the installed configuration for all controllers or the specified controller and remove the configuration(s) from the driver.</p> |

## wrsmconf(1M)

**topology -c *controller\_id***

For each installed controller (or for the specified controller), print to stdout the set of nodes this controller is configured to reach, including the nodename, FM node id, and RSM hardware address for each node. The following is example output:

| FM Node ID | Node Name | Controller Instance | Controller HW Addr |
|------------|-----------|---------------------|--------------------|
| 0          | hpc00     | 0                   | 101                |
| 0          | hpc00     | 1                   | 333                |
| 1          | hpc01     | 0                   | 102                |
| 1          | hpc01     | 1                   | 54                 |
| 1          | hpc01     | 2                   | 34                 |
| 2          | hpc03     | 0                   | 103                |
| 2          | hpc03     | 1                   | 103                |
| 2          | hpc03     | 2                   | 103                |

**dump -c *controller-id* -f *config\_file***

Fetch the installed configuration for the specified controller from the driver and store it into the file *config\_file* along with a checksum to protect the data. This configuration can later be installed with the command `wrsmconf initial`.

**EXIT STATUS** This command returns 0 on successful completion, and a non-zero value if an error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| DESCRIPTION | <p>The wrsmstat command provides statistics on remote shared memory (RSM) controllers, routes to nodes, and WCI interfaces managed by the WCI RSM driver (wrsm). It also provides an interface for setting extended performance counter control registers that constrain the wrsm counters available through busstat(1M).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OPTIONS     | <p>The following options are supported:</p> <p><b>controller [ -c controller_id ]</b><br/> Displays information describing the state of the specified controller, or of all controllers if none is specified. The following is sample output:</p> <pre> \$ wrsmstat controller -c 5 Controller 5 ----- Controller state: up Local RSM Hardware address: 0x4 Exported segments: 0 # published: 0 # connections: 0 total bound memory: 0 Imported segments: 0 Send Queues: 0 Registered Handlers: 0 Assigned WCIs: 4 Available WCIs: 2 </pre> <p><b>wrsm [ -i wrsm wrsm_instance_num ] [ -v ]</b><br/> Displays information describing the state of the specified RSM WCI, or of all RSM WCIs if none is specified. The following is sample output:</p> <pre> \$ wrsmstat wrsm -i 7 WCI instance 7 ----- Portid: 5 Controller ID: 0 Config Version: 5 Link Error Shutdown Trigger: 40000 Link #0 is not present. Link #1 Link Enabled: yes Link State: up Remote RSM HW addr: 1 Remote wnode ID: 1 Remote link num: 1 Remote WCI port ID: 3 </pre> |

## wrsmstat(1M)

```
Error takedowns: 0
Bad Config takedowns: 0
Failed bringups: 0
Total link errors: 0
Maximum link errors: 0
Average link errors: 0
Auto shutdown enabled: yes
Link #2 is not present.
```

If you specify the `-v` option, the following additional information is displayed:

```
Cluster Error Count: 0
Uncorrectable SRAM ECC error: no
Maximum SRAM ECC errors: 0
Average SRAM ECC errors: 0
```

`route [ -c controller_id ] [ -h nodename ]`

Displays the route to the specified node through the specified controller. If no node is specified, displays the routes to all nodes. If no controller is specified, displays the specified node's route through all controllers. If neither is specified, displays the routes to all nodes through all controllers. The following is sample output:

```
$ wrsmstat node -c 3 -h fred
Controller 3 - Route to fred

Config Version: 1
FM node id: 0x345543
RSM hardware address: 0x9
Route Changes: 3
Route Type: Passthrough
Number of WCIs: 2
Stripes: 4
WCI #0
 Port ID: 3
 Instance: 0
 Num of hops: 2
 Num of links: 2
 link# 1, first hop RSM HW addr: 0x4
 link# 2, first hop RSM HW addr: 0x2
WCI #1
 Port ID: 13
 Instance: 1
 Num of hops: 2
 Num of links: 2
 link# 0, first hop RSM HW addr: 0x4
 link# 2, first hop RSM HW addr: 0x2
```

`set [ -i wrsm_instance_num ] -c cmmu -s <start> -e <end>`

For the specified WCI (or for each RSM WCI if none specified), configure the specified range of CMMU entries so that transactions through them are counted by *wrsm* busstat kstats. Each call will cause transactions to be counted through the new ranges of cmmu entries in addition to the previously specified ranges. To count transactions through all CMMUs, specify a start value of 0 and end value of 0. To clear all ranges (and not count transactions through any cmmu entries), specify a start value of 0 and end value of -1.

wrsmstat(1M)

**EXIT STATUS** This command returns 0 on successful completion, and a non-zero value if an error occurred.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| DESCRIPTION          | <p>xntpd is a daemon which sets and maintains a UNIX system time-of-day in agreement with Internet standard time servers. xntpd is a complete implementation of the Network Time Protocol (NTP) version 3 standard, as defined by <i>RFC 1305</i>. It also retains compatibility with version 1 and 2 servers as defined by <i>RFC 1059</i> and <i>RFC 1119</i>, respectively. The computations done in the protocol and clock adjustment code are carried out with high precision and with attention to the details which might introduce systematic bias into the computations. This is done to try to maintain an accuracy suitable for synchronizing with even the most precise external time source.</p> <p>Ordinarily, xntpd reads its configuration from a configuration file at startup time. The default configuration file name is <code>/etc/inet/ntp.conf</code>, although this may be overridden from the command line. It is also possible to specify a working, although limited, xntpd configuration entirely on the command line, obviating the need for a configuration file. This may be particularly appropriate when xntpd is to be configured as a broadcast or multicast client, with all peers being determined by listening to broadcasts at run time. Through the use of the <code>ntpq(1M)</code> program, various internal xntpd variables can be displayed and configuration options altered while the daemon is running.</p> <p>The daemon can operate in any of several modes, including symmetric active/passive, client/server and broadcast/multicast. A broadcast/multicast client can automatically discover remote servers, compute one-way delay correction factors and configure itself automatically. This makes it possible to deploy a fleet of workstations without specifying a configuration file or configuration details specific to its environment.</p> |    |                             |    |                              |    |                                                         |                     |                                          |    |                                                                                                                        |                      |                                                                                              |                      |                                         |                    |                                                                              |

This flag may occur multiple times, with each occurrence indicating greater detail of display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |    |                             |    |                              |    |                                                         |                     |                                          |    |                                                                                                                        |                      |                                                                                              |                      |                                         |                    |                                                                              |
| -e <i>auth</i> delay | Specify the time (in seconds) it takes to compute the NTP encryption field on this computer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |    |                             |    |                              |    |                                                         |                     |                                          |    |                                                                                                                        |                      |                                                                                              |                      |                                         |                    |                                                                              |
| -f <i>drift</i> file | Specify the location of the drift file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |    |                             |    |                              |    |                                                         |                     |                                          |    |                                                                                                                        |                      |                                                                                              |                      |                                         |                    |                                                                              |
| -k <i>key</i> file   | Specify the location of the file which contains the NTP authentication keys.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |    |                             |    |                              |    |                                                         |                     |                                          |    |                                                                                                                        |                      |                                                                                              |                      |                                         |                    |                                                                              |

|                            |                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-l logfile</code>    | Specify a log file instead of logging to syslog.                                                                                                                                                                |
| <code>-m</code>            | Listen for multicast messages and synchronize to them if available (requires multicast kernel).                                                                                                                 |
| <code>-p pidfile</code>    | Specify the name of the file to record the daemon's process id.                                                                                                                                                 |
| <code>-r broadcast</code>  | Ordinarily, the daemon automatically compensates for the network delay between the broadcast/multicast server and the client; if the calibration procedure fails, use the specified default delay (in seconds). |
| <code>-s statsdir</code>   | Specify the directory to be used for creating statistics files.                                                                                                                                                 |
| <code>-t trustedkey</code> | Add a key number to the trusted key list.                                                                                                                                                                       |
| <code>-v variable</code>   | Add a system variable.                                                                                                                                                                                          |
| <code>-V variable</code>   | Add a system variable listed by default.                                                                                                                                                                        |

**USAGE** xntpd's configuration file format is similar to other Unix configuration files. Comments begin with a '#' character and extend to the end of the line. Blank lines are ignored. Configuration commands consist of an initial keyword followed by a list of arguments, separated by whitespace. Some arguments may be optional. These commands may not be continued over multiple lines. Arguments may be host names, host addresses written in dotted-decimal, integers, floating point numbers (when specifying times in seconds) and text strings.

### Configuration Commands

In the following descriptions, optional arguments are delimited by '[ ]', while alternatives are separated by '|'. The first three commands specify various time servers to be used and time services to be provided.

`peer host_address [ key # ] [ version # ][ prefer ]`

Specifies that the local server is to operate in "symmetric active" mode with the remote server *host\_address* named in the command. In this mode, the local server can be synchronized to the remote server. In addition, the remote server can be synchronized by the local server. This is useful in a network of servers where, depending on various failure scenarios, either the local or remote server host may be the better source of time. The `peer` command, and the `server` and `broadcast` commands that follow, can take the following arguments:

|                      |                                                                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>key</code>     | Indicates that all packets sent to the address are to include authentication fields, encrypted using the specified key number. The range of this number is that of an unsigned 32 bit integer. By default, an encryption field is not included. |
| <code>version</code> | Specifies the version number to be used for outgoing NTP packets. Versions 1, 2, and 3 are the choices; version 3 is the default.                                                                                                               |
| <code>prefer</code>  | Marks the host as a preferred host. This host will be preferred for synchronization over other comparable hosts.                                                                                                                                |

## xntpd(1M)

`server host_address [ key # ] [ version fl# ]`

`[ prefer ] [ mode fl# ] server`

Specifies that the local server is to operate in “client” mode with the remote server named in the command. In this mode the local server can be synchronized to the remote server, but the remote server can never be synchronized to the local server.

`broadcast host_address [ key # ] [ version # ] [ ttl # ]`

Specifies that the local server is to operate in “broadcast” mode where the local server sends periodic broadcast messages to a client population at the broadcast/multicast address named in the command. Ordinarily, this specification applies only to the local server operating as a transmitter. For operation as a broadcast client, see `broadcastclient` or `multicastclient` commands elsewhere in this document. In broadcast mode the *host\_address* is usually the broadcast address on a local network or a multicast address assigned to NTP. The IANA has assigned the network, 224.0.0.0 to NTP. This is presently the only network that should be used. The following option is used only with the broadcast mode:

`ttl` Specifies the time-to-live (TTL) to use on multicast packets. Selection of the proper value, which defaults to 127, is something of a black art and must be coordinated with the network administrator(s).

`broadcastclient`

Directs the local server to listen for broadcast messages on the local network, in order to discover other servers on the same subnet. Upon hearing a broadcast message for the first time, the local server measures the nominal network delay using a brief client/server exchange with the remote server. Then the server enters the “broadcastclient” mode, in which it listens for and synchronizes to succeeding broadcast messages. In order to avoid accidental or malicious disruption in this mode, both the local and remote servers must operate using authentication, with the same trusted key and key identifier.

`multicastclient`

`[ IP address ... ]` Used in the same way as the `broadcastclient` command, but operates using IP multicasting. Support for this command requires the use of authentication. If one or more IP addresses are given, the server joins the respective multicast group(s). If none are given, the IP address assigned to NTP (224.0.0.0) is assumed.

`driftfile filename`

Specifies the name of the file used to record the frequency offset of the local clock oscillator. If the file exists, it is read at startup in order to set the initial frequency offset. Then the file is updated once per hour with the current offset computed by the daemon. If the file does not exist or this command is not given, the initial frequency offset is assumed to be zero. In this case, it may take some hours for the frequency to stabilize and the residual timing errors to subside. The file contains a single floating point value equal to the offset in parts-per-million (ppm). The file is updated by first writing the current drift value into a temporary file and then using `rename(2)` to replace the old version. This implies that `xntpd` must have write

permission for the directory the drift file is located in, and that file system links, symbolic or otherwise, should probably be avoided.

```
enable auth | bclient | pll | monitor | stats [...]
disable auth | bclient | pll | monitor | stats
[...]
```

Provides a way to enable or disable various server options. To do so, execute a two word command, where the first word is `enable` or `disable` and the second is the flag. Flags not mentioned are unaffected. Flags that can be changed are described below, along with their default values.

| Flag    | Default | Description                                                                                                                                                                                                                                                                                  |
|---------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth    | disable | Causes the server to synchronize with unconfigured peers only if the peer has been correctly authenticated using a trusted key and key identifier.                                                                                                                                           |
| bclient | disable | Causes the server to listen for a message from a broadcast or multicast server. After this occurs, an association is automatically instantiated for that server. default for this flag is disable (off).                                                                                     |
| pll     | enable  | Enables the server to adjust its local clock. If not set, the local clock free-runs at its intrinsic time and frequency offset. This flag is useful in case the local clock is controlled by some other device or protocol and NTP is used only to provide synchronization to other clients. |
| monitor | disable | Enables the monitoring facility (see elsewhere).                                                                                                                                                                                                                                             |
| stats   | enable  | Enables statistics facility filegen (see <a href="#">Monitoring Commands</a> below).                                                                                                                                                                                                         |

```
slewalways [yes|no]
```

Force xntpd to always slew the time.

#### Authentication Commands

```
keys filename
```

Specifies the name of a file which contains the encryption keys and key identifiers used by xntpd when operating in authenticated mode. The format of this file is described later in this document.

```
trustedkey
```

# [ # . . . ] Specifies the encryption key identifiers which are trusted for the purposes of authenticating peers suitable for synchronization. The authentication procedures require that both the local and remote servers share the same key and key identifier, defined to be used for this purpose. However, different keys can be used with different servers. The arguments are 32 bit unsigned integers. Note, however, that key 0 is

## xntpd(1M)

### Access Control Commands

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |        |                                                                                                                                             |         |                                                              |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------------------------------------|
| controlkey #                                                    | <p>fixed and globally known. If meaningful authentication is to be performed, the 0 key should not be trusted.</p> <p>Specifies the key identifier to use with the ntpq(1M) program, which is useful to diagnose and repair problems that affect xntpd operation. The operation of the ntpq program and xntpd conform to those specified in <i>RFC 1305</i>. Requests from a remote ntpq program which affect the state of the local server must be authenticated. This requires that both the remote program and local server share a common key and key identifier. The argument to this command is a 32 bit unsigned integer. If no controlkey command is included in the configuration file, or if the keys don't match. These requests are ignored.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |        |                                                                                                                                             |         |                                                              |
| restrictaddress<br>[ mask<br>numeric_mask ] [<br>flag ] [ ... ] | <p>xntpd implements a general purpose address-and-mask based restriction list. The list is sorted by IP address and mask, and the list is searched in this order for matches, with the last match found defining the restriction flags associated with the incoming packets. The source address of incoming packets is used for the match, with the 32 bit address being logically and'ed with the mask associated with the restriction entry and then compared with the entry's address (which has also been and'ed with the mask) to look for a match. The "mask" argument defaults to 255.255.255.255, meaning that the "address" is treated as the address of an individual host. A default entry (address 0.0.0.0, mask 0.0.0.0) is always included and, given the sort algorithm, is always the first entry in the list. Note that, while "address" is normally given in dotted-quad format, the text string "default", with no mask option, may be used to indicate the default entry.</p> <p>In the current implementation, flags always restrict access, i.e., an entry with no flags indicates that free access to the server is to be given. The flags are not orthogonal, in that more restrictive flags often make less restrictive ones redundant. The flags can generally be classed into two categories, those which restrict time service and those which restrict informational queries and attempts to do run time reconfiguration of the server.</p> <p>One or more of the following flags may be specified:</p> <table> <tr> <td data-bbox="664 1535 756 1560">ignore</td><td data-bbox="1011 1535 1412 1654">Ignore all packets from hosts which match this entry. If this flag is specified neither queries nor time server polls will be responded to.</td></tr> <tr> <td data-bbox="664 1675 773 1701">noquery</td><td data-bbox="1011 1675 1412 1728">Ignore all NTP mode 7 packets (i.e., information queries and</td></tr> </table> | ignore | Ignore all packets from hosts which match this entry. If this flag is specified neither queries nor time server polls will be responded to. | noquery | Ignore all NTP mode 7 packets (i.e., information queries and |
| ignore                                                          | Ignore all packets from hosts which match this entry. If this flag is specified neither queries nor time server polls will be responded to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |        |                                                                                                                                             |         |                                                              |
| noquery                                                         | Ignore all NTP mode 7 packets (i.e., information queries and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |        |                                                                                                                                             |         |                                                              |

|             |                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | configuration requests) from the source. Time service is not affected.                                                                                                                                                                                                                                                                                                                          |
| nomodify    | Ignore all NTP mode 7 packets which attempt to modify the state of the server (i.e., run time reconfiguration). Queries which return information are permitted.                                                                                                                                                                                                                                 |
| notrap      | Decline to provide mode 6 control message trap service to matching hosts. The trap service is a subsystem of the mode 6 control message protocol which is intended for use by remote event logging programs.                                                                                                                                                                                    |
| lowpriotrap | Declare traps set by matching hosts to be low priority. The number of traps a server can maintain is limited. The current limit is 3. Traps are usually assigned on a first come, first served basis, with later trap requestors being denied service. This flag modifies the assignment algorithm by allowing low priority traps to be overridden by later requests for normal priority traps. |
| noserve     | Ignore NTP packets whose mode is other than 7. In effect, time service is denied, though queries may still be permitted.                                                                                                                                                                                                                                                                        |
| nopeer      | Provide stateless time service to polling hosts, but do not allocate peer memory resources to these hosts even if they otherwise might be considered useful as future synchronization partners.                                                                                                                                                                                                 |
| notrust     | Treat these hosts normally in other respects, but never use them as synchronization sources.                                                                                                                                                                                                                                                                                                    |
| limited     | These hosts are subject to a limitation on number of clients from the same net that will be accepted. Net in this context refers                                                                                                                                                                                                                                                                |

to the IP notion of net (class A, class B, class C, etc.). Only the first *client\_limit* hosts that have shown up at the server and that have been active during the last *client\_limit\_period* seconds are accepted. Requests from other clients from the same net are rejected. Only time request packets are taken into account. "Private", "control", and "broadcast" packets are not subject to client limitation and therefore do not contribute to client count. A history of clients is kept using the monitoring capability of xntpd. Thus, monitoring is active as long as there is a restriction entry with the *limited* flag. The default value for *client\_limit* is 3. The default value for *client\_limit\_period* is 3600 seconds. Currently both variables are not runtime configurable.

#### ntpport

This is actually a match algorithm modifier, rather than a restriction flag. Its presence causes the restriction entry to be matched only if the source port in the packet is the standard NTP UDP port (123). Both *ntpport* and *non-ntpport* may be specified. The *ntpport* is considered more specific and is sorted later in the list.

Default restriction list entries, with the flags, *ignore*, *ntpport*, for each of the local host's interface addresses are inserted into the table at startup to prevent the server from attempting to synchronize to its own time. A default entry is also always present, though if it is otherwise unconfigured no flags are associated with the default entry (i.e., everything besides your own NTP server is unrestricted).

## xntpd(1M)

The restriction facility was added to allow the current access policies of the time servers running on the NSF net backbone to be implemented with xntpd as well. This facility may be useful for keeping unwanted or broken remote time servers from affecting your own. However, it should not be considered an alternative to the standard NTP authentication facility.

`clientlimit limit` Sets *client\_limit* to *limit*; allows configuration of client limitation policy. This variable defines the number of clients from the same network that are allowed to use the server.

`clientperiod period` Sets *client\_limit\_period*; allows configuration of client limitation policy. This variable specifies the number of seconds after which a client is considered inactive and thus no longer is counted for client limit restriction.

## Monitoring Commands

`statsdir /directory path/`

Indicates the full path of a directory where statistics files should be created (see below). This keyword allows the (otherwise constant) `filegen` filename prefix to be modified for file generation sets used for handling statistics logs (see `filegen` statement below).

`statistics name...`

Enables writing of statistics records. Currently, three kinds of statistics are supported. Each type is described below by giving its *name*, a sample line of data, and an explanation of each field:

`loopstats` enables recording of loop filter statistics information. Each update of the local clock outputs a line of the following form to the file generation set named "loopstats":

```
48773 10847.650 0.0001307 17.3478 2
```

| Field No. | Description                                       |
|-----------|---------------------------------------------------|
| 1         | The date (Modified Julian day)                    |
| 2         | The time (seconds and fraction past UTC midnight) |
| 3         | Time offset in seconds                            |

## xntpd(1M)

|            |                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 4          | The last timecode received from the clock in decoded ASCII format, where meaningful                                                                                                                                                                                                                                                                                                                                   |
|            | <p>In some clock drivers a good deal of additional information can be gathered and displayed as well.</p> <p>Statistic files are managed using file generation sets (see <code>filegen</code> below). The information obtained by enabling statistics recording allows analysis of temporal properties of a <code>xntpd</code> server. It is usually only useful to primary servers or maybe main campus servers.</p> |

```
filegen name [file filename] [type typename] [flag flagval]
[link | nolinek] [enable | disable]
```

Configures setting of generation file set *name*. Generation file sets provide a means for handling files that are continuously growing during the lifetime of a server. Server statistics are a typical example for such files. Generation file sets provide access to a set of files used to store the actual data. At any time at most one element of the set is being written to. The *type* given specifies when and how data will be directed to a new element of the set. This way, information stored in elements of a file set that are currently unused are available for administrative operations without the risk of disturbing the operation of xntpd. (Most important: they can be removed to free space for new data produced.)

Filenames of set members are built from three elements:

*prefix* This is a constant filename path. It is not subject to modifications via the *filegen* statement. It is defined by the server, usually specified as a compile time constant. It may, however, be configurable for individual file generation sets via other commands. For example, the prefix used with “loopstats” and “peerstats” filegens can be configured using the *statsdir* statement explained above.

*filename* This string is directly concatenated to the *prefix* mentioned above (no intervening ‘/’ (slash)). This can be modified using the *file* argument to the *filegen* statement. No ‘.’ elements are allowed in this component to prevent filenames referring to parts outside the filesystem hierarchy denoted by *prefix*.

*suffix* This part reflects individual elements of a file set. It is generated according to the *type* of a file set as explained below. A file generation set is characterized by its type. The following types are supported:

*none* The file set is actually a single plain file.

*pid* One element of file set is used per incarnation of a xntpd server. This type does not perform any changes to file set members during runtime. However it provides an easy way of separating files belonging to different xntpd server incarnations. The set member filename is built by appending a ‘.’ (dot) to concatenated *prefix* and *filename* strings, and appending the decimal representation of the process id of the xntpd server process.

*day* One file generation set element is created per day. The term *day* is based on UTC. A day is defined as the period between 00:00 and 24:00 UTC. The file set member suffix consists of a ‘.’ (dot) and a day specification in the form, *YYYYMMDD*. *YYYY* is a 4 digit year number (e.g., 1992). *MM* is a two digit month number. *DD* is a two digit day number. Thus, all information written at December 10th, 1992 would end up in a file named, *PrefixFilename.19921210*.

*week* Any file set member contains data related to a certain week of a year. The term *week* is defined by computing “day of year” modulo 7. Elements of such a file generation set are distinguished by appending the following

## xntpd(1M)

|       |                                                                                                                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | suffix to the file set filename base: a dot, a four digit year number, the letter 'W', and a two digit week number. For example, information from January, 5th 1992 would end up in a file with suffix ".1992W1".                                                                                                         |
| month | One generation file set element is generated per month. The file name suffix consists of a dot, a four digit year number, and a two digit month.                                                                                                                                                                          |
| year  | One generation file element is generated per year. The filename suffix consists of a dot and a 4 digit year number.                                                                                                                                                                                                       |
| age   | This type of file generation sets changes to a new element of the file set every 24 hours of server operation. The filename suffix consists of a dot, the letter 'a', and an eight digit number. This number is taken to be the number of seconds the server is running at the start of the corresponding 24 hour period. |

Information is only written to a file generation set when this set is enabled. Output is prevented by specifying, disabled.

It is convenient to be able to access the current element of a file generation set by a fixed name. This feature is enabled by specifying `link` and disabled using `nolink`. If `link` is specified, a hard link from the current file set element to a file without suffix is created. When there is already a file with this name and the number of links of this file is one, it is renamed appending a dot, the letter, 'C', and the pid of the xntpd server process. When the number of links is greater than one, the file is unlinked. This allows the current file to be accessed by a constant name.

### Miscellaneous Commands

`broadcastdelay seconds`

The broadcast and multicast modes require a special calibration to determine the network delay between the local and remote servers. Ordinarily, this is done automatically by the initial protocol exchanges between the local and remote servers. In some cases, the calibration procedure may fail due to, for example, network or server access controls. This command specifies the default delay to be used under these circumstances. Typically (for Ethernet), a number between 0.003 and 0.007 is appropriate for *seconds*. When this command is not used, the default is 0.004 seconds.

`trap host_address [ port port_number ]`  
`[ interface interface_address ]`

Configures a trap receiver at the given *host\_address* and *port\_number* for sending messages with the specified local *interface\_address*. If the port number is unspecified, a value of 18447 is used. If the interface address is not specified, the message is sent with the source address of the local interface the message is sent through. On a multi-homed host, the interface used may change with routing changes.

C information from the server in a log file. While such monitor programs may also request their own trap dynamically, configuring a trap receiver ensures that no messages are lost when the server is started.

`setvar variable [ default ]`

This command adds an additional system variable. Variables like this can be used to distribute additional information such as the access policy. If the variable of the form, *variable\_name=value* is followed by the *default* keyword, the variable will be listed as one of the default system variables (see the `ntp(1M)` command). Additional variables serve informational purposes only. They can be listed; but they are not related to the protocol. The known protocol variables always override any variables defined via the `setvar` mechanism.

Three special variables contain the names of all variable of the same group. *sys\_var\_list* holds the names of all system variables. *peer\_var\_list* holds the names of all peer variables. And *clock\_var\_list* hold the names of the reference clock variables.

`monitor [ yes | no ]`

`authenticate [ yes | no ]`

These commands have been superseded by the `enable` and `disable` commands. They are listed here for historical purposes.

`logconfig configkeyword`

Controls the amount of output written to syslog or the logfile. By default all output is turned on. *configkeyword* is formed by concatenating the message class with the event class. It is permissible to use the prefix, *all*, instead of a message class. A message class may also be followed by the keyword, *all*, meaning to enable/disable all of the respective message class. All *configkeywords* can be prefixed with the symbols, '=', '+' and '-'. Here, '=' sets the syslogmask, '+' adds messages, and '-' removes messages. Syslog messages can be controlled in four classes: *sys*, *peer*, *clock*, *sync*. Within these classes four types of messages can be controlled. Each is described below, along with its *configkeyword*:

| Configkeyword           | Message type                                                                                |
|-------------------------|---------------------------------------------------------------------------------------------|
| <code>info</code>       | Informational messages control configuration information.                                   |
| <code>events</code>     | Event messages control logging of events (reachability, synchronization, alarm conditions). |
| <code>statistics</code> | Statistical messages control statistical output.                                            |
| <code>status</code>     | Status messages describe mainly the synchronization status.                                 |

A minimal log configuration might look like this:

```
logconfig =syncstatus +sysevents
```

A configuration like this lists, just the synchronization state of `xntp` and the major system events. For a simple reference server, the following minimum message configuration could be useful:

```
logconfig =syncall +clockall
```

This configuration lists all clock information and synchronization information. All other events and messages about peers, system events and so on, is suppressed.

## xntpd(1M)

### Authentication Key File Format

The NTP standard specifies an extension to allow verification of the authenticity of received NTP packets, and to provide an indication of authenticity in outgoing packets. This is implemented in `xntpd` using the DES or MD5 algorithms to compute a digital signature, or message-digest. The specification allows any one of possibly 4 billion keys, numbered with 32 bit key identifiers, to be used to authenticate an association. The servers involved in an association must agree on the key and key identifier used to authenticate their data. However they must each learn the key and key identifier independently. In the case of DES, the keys are 56 bits long with, depending on type, a parity check on each byte. In the case of MD5, the keys are 64 bits (8 bytes). `xntpd` reads its keys from a file specified using the `-k` command line option or the `keys` statement in the configuration file. While key number 0 is fixed by the NTP standard (as 56 zero bits) and may not be changed, one or more of the keys numbered 1 through 15 may be arbitrarily set in the keys file.

The key file uses the same comment conventions as the configuration file. Key entries use a fixed format of the form, *keyno type key*. Here, *keyno* is a positive integer, *type* is a single character which defines the format the key is given in, and *key* is the key itself.

The *key* may be given in one of several different formats, controlled by the *type* character. The different key types, and corresponding formats, are described below:

|         |                                                                                                                                                                                                                                                                                                                                                                                                |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key:    | S                                                                                                                                                                                                                                                                                                                                                                                              |
| Format: | A 64 bit hexadecimal number in DES format                                                                                                                                                                                                                                                                                                                                                      |
|         | In this format, the high order 7 bits of each octet are used to form the 56 bit key while the low order bit of each octet is given a value such that odd parity is maintained for the octet. Leading zeroes must be specified (i.e., the key must be exactly 16 hex digits long) and odd parity must be maintained. Hence a zero key, in standard format, would be given as: 0101010101010101. |
| Key:    | N                                                                                                                                                                                                                                                                                                                                                                                              |
| Format: | A 64 bit hexadecimal number in NTP format                                                                                                                                                                                                                                                                                                                                                      |
|         | This format is the same as the DES format except the bits in each octet have been rotated one bit right so that the parity bit is now the high order bit of the octet. Leading zeroes must be specified and odd parity must be maintained. A zero key in NTP format would be specified as: 8080808080808080.                                                                                   |
| Key:    | A                                                                                                                                                                                                                                                                                                                                                                                              |
| Format: | A 1-to-8 character ASCII string                                                                                                                                                                                                                                                                                                                                                                |
|         | A key is formed from this by using the lower order 7 bits of the ASCII representation of each character in the string. Zeroes are added on the right when necessary to form a full width 56 bit key.                                                                                                                                                                                           |
| Key:    | M                                                                                                                                                                                                                                                                                                                                                                                              |

**Primary Clock  
Support**

**Format :** A 1-to-8 character ASCII string, using the MD5 authentication scheme.

Note that both the keys and the authentication schemes (DES or MD5) must be identical between a set of peers sharing the same key number.

xntpd has been built to be compatible with all supported types of reference clocks. A reference clock is generally (though not always) a radio timecode receiver which is synchronized to a source of standard time such as the services offered by the NRC in Canada and NIST in the U.S. The interface between the computer and the timecode receiver is device dependent and will vary, but it is often a serial port.

For the purposes of configuration, xntpd treats reference clocks in a manner analogous to normal NTP peers as much as possible. Reference clocks are referred to by address, much as a normal peer is. However, an invalid IP address is used to distinguish them from normal peers. Reference clock addresses are of the form *127.127.t.u* where *t* is an integer denoting the clock type and *u* indicates the type-specific unit number. Reference clocks are configured using a *server* statement in the configuration file where the *host\_address* is the clock address. The *key*, *version* and *tTL* options are not used for reference clock support. Some reference clocks require a *mode* option to further specify their operation. The *prefer* option can be useful to persuade the server to cherish a reference clock with somewhat more enthusiasm than other reference clocks or peers. Clock addresses may generally be used anywhere in the configuration file that a normal IP address can be used. For example, they can be used in *restrict* statements, although such use would normally be considered strange.

Reference clock support provides the *fudge* command, which can be used to configure reference clocks in special ways. The generic format that applies to this command is,

```
fudge 127.127.t.u [time1 secs] [time2 secs] \
 [stratum int] [refid int] \
 [flag1 0|1] [flag2 0|1] [flag3 0|1] [flag4 0|1]
```

with options described as follows:

*time1*

*time2*

Are specified in fixed point seconds and used in some clock drivers as calibration constants. By convention, and unless indicated otherwise, *time1* is used as a calibration constant to adjust the nominal time offset of a particular clock to agree with an external standard, such as a precision PPS signal. The specified offset is in addition to the propagation delay provided by other means, such as internal DIP switches.

*stratum*

Is a number in the range zero to 15 and is used to assign a nonstandard operating stratum to the clock.

## xntpd(1M)

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                          |       |                                                               |    |                                                                                                 |

The interpretation of these values, and whether they are used at all, is a function of the needs of the particular clock driver. However, by convention, and unless indicated otherwise, <i>flag3</i> is used to attach the ppsclock streams module to the configured driver, while <i>flag4</i> is used to enable recording verbose monitoring data to the clockstats file configured with the <i>filegen</i> command. Further information on the ppsclock streams module is in the README file in the <i>./kernel</i> directory in the current xntp3 program distribution. Further information on this feature is available in the <i>./scripts/stats</i> directory in the same distribution. |    |                                                                                          |       |                                                               |    |                                                                                                 |
|           | <p>Ordinarily, the stratum of a reference clock is zero, by default. Since the xntpd daemon adds one to the stratum of each peer, a primary server ordinarily displays stratum one. In order to provide engineered backups, it is often useful to specify the reference clock stratum as greater than zero. The <i>stratum</i> option is used for this purpose. Also, in cases involving both a reference clock and a 1-pps discipline signal, it is useful to specify the reference clock identifier as other than the default, depending on the driver. The <i>refid</i> option is used for this purpose. Except where noted, these options apply to all clock drivers.</p> <p>xntpd on Unix machines currently supports several different types of clock hardware. It also supports a special pseudo-clock used for backup or when no other clock source is available. In the case of most of the clock drivers, support for a 1-pps precision timing signal is available as described in the README file in the <i>./doc</i> directory of the xntp3 program distribution. The clock drivers, and the addresses used to configure them, are described in the file, <i>README.refclocks</i>, in the <i>doc</i> directory of the current program distribution.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                          |       |                                                               |    |                                                                                                 |
| Variables | <p>Most variables used by the NTP protocol can be examined with <i>ntpq</i> (mode 6 messages). Currently very few variables can be modified via mode 6 messages. These variables are either created with the <i>setvar</i> directive or the leap warning variables. The leap warning bits that can be set in the <i>leapwarning</i> variable (up to one month ahead). Both, the <i>leapwarning</i> and in the <i>leapindication</i> variable, have a slightly different encoding than the usual <i>leap</i> bits interpretation:</p> <table><tr><td>00</td><td>The daemon passes the leap bits of its synchronization source (usual mode of operation).</td></tr><tr><td>01/10</td><td>A leap second is added/deleted (operator forced leap second).</td></tr><tr><td>11</td><td>Leap information from the synchronization source is ignored (thus LEAP_NOWARNING is passed on).</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 00 | The daemon passes the leap bits of its synchronization source (usual mode of operation). | 01/10 | A leap second is added/deleted (operator forced leap second). | 11 | Leap information from the synchronization source is ignored (thus LEAP_NOWARNING is passed on). |

| NAME                    | xntpd – special NTP query program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                         |                                                                                                                                               |  |                                       |    |                                             |  |                                                                                           |    |                                                        |  |                                                                                       |
| SYNOPSIS                | <b>xntpd</b> [-ilnps] [-c <i>command</i> ] [ <i>host</i> ] [...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                         |                                                                                                                                               |  |                                       |    |                                             |  |                                                                                           |    |                                                        |  |                                                                                       |
| DESCRIPTION             | <p>xntpd queries the xntpd daemon about its current state and requests changes in that state. You can run xntpd in interactive mode or in controlled using command line arguments.</p> <p>Extensive state and statistics information is available through the xntpd interface. In addition, nearly all the configuration options which can be specified at start up using xntpd's configuration file may also be specified at run time using xntpd.</p> <p>If one or more request options is included on the command line when xntpd is executed, each of the requests is sent to the NTP servers running on each of the hosts given as command line arguments, or on the local host by default. If no request options are given, xntpd attempts to read commands from the standard input and execute these on the NTP server running on the first host specified on the command line, again defaulting to the local host when no other host is specified. xntpd prompts for commands if the standard input is a terminal device.</p> <p>xntpd uses NTP mode 7 packets to communicate with the NTP server, and can be used to query any compatible server on the network which permits it. As NTP is a UDP protocol, this communication is somewhat unreliable, especially over large distances. xntpd does not attempt to re-transmit requests, and times requests out if the remote host is not heard from within a suitable timeout time.</p> <p>The operation of xntpd is specific to the particular implementation of the xntpd daemon. You can expect xntpd to work only with this and maybe some previous versions of the daemon. Requests from a remote xntpd program that affect the state of the local server must be authenticated. This requires that both the remote program and local server share a common key and key identifier.</p> |                         |                                                                                                                                               |  |                                       |    |                                             |  |                                                                                           |    |                                                        |  |                                                                                       |
| OPTIONS                 | <p>xntpd reads interactive format commands from the standard input. This option is equivalent to -c dmpeers. See dmpeers in Control Message Commands.                                                                                                                          |
| OPERANDS             | The following operands are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                      |
| Interactive Commands | The interactive commands consist of a keyword ( <i>command_keyword</i> ) followed by zero to four arguments. You need to entry only enough characters of the <i>command_keyword</i> to uniquely identify it. The output of an interactive command is sent to the standard output by default. You can send the output of an interactive command to a file by appending a <, followed by a file name, to the command line.<br><br>A number of interactive format commands are executed entirely within the xntpd program itself and do not result in NTP mode.<br><br>The following interactive commands are supported: |                                                                                                                                                                                                                                                                                                                                                      |
|                      | ? [ <i>command_keyword</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Without an argument, print a list of ntpq command keywords. If the password does not correspond to the key configured for use by the NTP server, requests are not successful. |
|                                 | quit                                                                                                                                                                                                                                 | Exit xntpd.                                                                                                                                                                                                                             |
|                                 | timeout <i>milliseconds</i>                                                                                                                                                                                                          | Specify a timeout period for responses to server queries.                                                                                                                                                                               |
|                                 |                                                                                                                                                                                                                                      | The default is approximately 8000 milliseconds. As xntpd retries each query once after a timeout, the total waiting time for a timeout is twice the timeout value set.                                                                  |
| <b>Control Message Commands</b> | Query commands result in NTP mode 7 packets containing requests for information being sent to the server. These control message commands are read-only commands in that they make no modification of the server configuration state. |                                                                                                                                                                                                                                         |
|                                 | The following control message commands are supported:                                                                                                                                                                                |                                                                                                                                                                                                                                         |
|                                 | clkbug                                                                                                                                                                                                                               | Obtain debugging information for a reference clock driver. This information is provided only by some clock drivers.                                                                                                                     |
|                                 | clockinfo <i>clock_peer_address</i> [...]                                                                                                                                                                                            | Obtain and print information concerning a peer clock.                                                                                                                                                                                   |

The values obtained provide information on the setting of fudge factors and other clock performance information.

#### dmpeers

Obtain a list of peers for which the sserver is maintaining state, along with a summary of that state.

The peer summary list is identical to the output of the `peers` command, except for the character in the leftmost column. Characters only appear beside peers which were included in the final stage of the clock selection algorithm. A `.` indicates that this peer was cast off in the falseticker detection, while a `+` indicates that the peer made it through. A `*` denotes the peer with which the server is currently synchronizing.

#### iostats

Print statistics counters maintained in the input-output module.

#### kerninfo

Obtain and print kernel phase-lock loop operating parameters.

This information is available only if the kernel has been specially modified for a precision timekeeping function.

#### listpeers

Obtain and print a brief list of the peers for which the server is maintaining state.

These should include all configured peer associations as well as those peers whose stratum is such that they are considered by the server to be possible future synchronization candidates.

#### loopinfo [ oneline | multiline ]

Print the values of selected loop filter variables.

The loop filter is the part of NTP which deals with adjusting the local system clock.

The `oneline` and `multiline` options specify the format in which this information is printed. `multiline` is the default.

The `offset` is the last offset given to the loop filter by the packet processing code. The `frequency` is the frequency error of the local clock in parts-per-million (ppm). The `time_const` controls the stiffness of the phase-lock loop and thus the speed at which it can adapt to oscillator drift. The `watchdog` timer value is the number of seconds which have elapsed since the last sample offset was given to the loop filter.

#### memstats

Print statistics counters related to memory allocation code.

#### monlist [version]

Obtain and print traffic counts collected and maintained by the monitor facility. The version number should not normally need to be specified.

## xntpd(1M)

### peers

Obtain a list of peers for which the server is maintaining state, along with a summary of that state.

The following summary information is included:

- Address of the remote peer.
- Local interface address. If a local address has yet to be determined it is 0.0.0.0.
- Stratum of the remote peer. A stratum of 16 indicates the remote peer is unsynchronized.
- Polling interval, in seconds.
- Reachability register, in octal.
- Current estimated delay, offset and dispersion of the peer, in seconds.
- Mode in which the peer entry is operating.

This is represented by the character in the left margin. A + denotes symmetric active, a - indicates symmetric passive, a = means the remote server is being polled in client mode, a ^ indicates that the server is broadcasting to this address, a ~ denotes that the remote peer is sending broadcasts and a \* marks the peer the server is currently synchronizing to.

- Host.

This field may contain a host name, an IP address, a reference clock implementation name with its parameter or REFCLK (implementation number, parameter). On hostnames no only IP-addresses is displayed.

### stats *peer\_address* [...]

Show the per-peer statistic counters associated with the specified peers.

### reslist

Obtain and print the server's restriction list.

Generally, this list is printed in sorted order.

### showpeer *peer\_address* [...]

Show a detailed display of the current peer variables for one or more peers. Most of these values are described in the NTP Version 2 specification.

### sysinfo

Print a variety of system state variables that are related to the local server.

The output from `sysinfo` is described in NTP Version 3 specification, RFC-1305. All except the last four lines are described in the NTP Version 3 specification, RFC-1305.

The `system flags` show various system flags, some of which can be set and cleared by the `enable` and `disable` configuration commands, respectively. These are the `auth`, `bclient`, `monitor`, `pll`, `pps` and `stats` flags. See the `xntpd`

**Runtime  
Configuration  
Requests**

documentation for the meaning of these flags. There are two additional flags which are read only, the `kernel_pll` and `kernel_pps`. These flags indicate the synchronization status when the precision time kernel modifications are in use. The `kernel_pll` indicates that the local clock is being disciplined by the kernel, while the `kernel_pps` indicates the kernel discipline is provided by the PPS signal. The `stability` is the residual frequency error remaining after the system frequency correction is applied and is intended for maintenance and debugging. In most architectures, this value initially decreases from as high as 500 ppm to a nominal value in the range .01 to 0.1 ppm. If it remains high for some time after starting the daemon, something may be wrong with the local clock, or the value of the `kernel` variable tick may be incorrect. The `broadcastdelay` shows the default broadcast delay, as set by the `broadcastdelay` configuration command. The `authdelay` shows the default authentication delay, as set by the `authdelay` configuration command.

**sysstats**

Print statistics counters maintained in the protocol module.

**timerstats**

Print statistics counters maintained in the timer/event queue support code.

The server authenticates all requests that cause state changes in the server. The server uses a configured NTP key to accomplish this. This facility can also be disabled by the server by not configuring a key).

You must make the key number and the corresponding key known to `xntpd`. Use the `keyid` or `passwd` commands to do so.

The `passwd` command prompts users for a password to use as the encryption key. It also prompts automatically for both the key number and password the first time a command which would result in an authenticated request to the server is given. Authentication provides verification that the requester has permission to make such changes. It also gives an extra degree of protection against transmission errors.

Authenticated requests always include a time stamp in the packet data. The time stamp is included in the computation of the authentication code. This timestamp is compared by the server to its receive time stamp. If the time stamps differ by more than a small amount the request is rejected.

Time stamps are rejected for two reasons. First, it makes simple replay attacks on the server, by someone who might be able to overhear traffic on your LAN, much more difficult. Second, it makes it more difficult to request configuration changes to your server from topologically remote hosts.

While the reconfiguration facility works well with a server on the local host, and may work adequately between time-synchronized hosts on the same LAN, it works very poorly for more distant hosts. If reasonable passwords are chosen, care is taken in the distribution and protection of keys and appropriate source address restrictions are applied, the run time reconfiguration facility should provide an adequate level of security.

The following commands make authenticated requests.

**addpeer** *peer\_address* [ *keyid* ] [ *version* ] [ *prefer* ]

Add a configured peer association at the given address and operating in symmetric active mode. An existing association with the same peer may be deleted when this command is executed, or may simply be converted to conform to the new configuration, as appropriate.

If the optional *keyid* is a non-zero integer, all outgoing packets to the remote server will have an authentication field attached encrypted with this key. If the *keyid* is 0 or omitted, no authentication is done.

Specify *version* as 1, 2 or 3. The default is 3.

The *prefer* keyword indicates a preferred peer. This keyword is used primarily for clock synchronisation if possible. The preferred peer also determines the validity of the PPS signal - if the preferred peer is suitable for synchronisation so is the PPS signal.

**addserver** *peer\_address* [ *keyid* ] [ *version* ] [ *prefer* ]

Identical to the **addpeer** command, except that the operating mode is client.

**addtrap** [ *address* [ *port* ] [ *interface* ]

Set a trap for asynchronous messages.

**authinfo**

Return information concerning the authentication module, including known keys and counts of encryptions and decryptions which have been done.

**broadcast** *peer\_address* [ *keyid* ] [ *version* ] [ *prefer* ]

Identical to the **addpeer** command, except that the operating mode is broadcast. In this case a valid key identifier and key are required. The *peer\_address* parameter can be the broadcast address of the local network or a multicast group address assigned to NTP. If a multicast address, a multicast-capable kernel is required.

**clrtrap** [ *address* [ *port* ] [ *interface* ]

Clear a trap for asynchronous messages.

**delrestrict** *address mask* [ *ntpport* ]

Delete the matching entry from the restrict list.

**fudge** *peer\_address* [ *time1* ] [ *time2* ] [ *stratum* ] [ *refid* ]

Provide a way to set certain data for a reference clock.

**readkeys**

Cause the current set of authentication keys to be purged and a new set to be obtained by re-reading the keys file. The keys file must have been specified in the **xntpd** configuration file. This enables encryption keys to be changed without restarting the server.

**restrict** *address mask flag* [*flag* ]

This command operates in the same way as the restrict configuration file commands of xntpd.

**reset**

Clear the statistics counters in various modules of the server.

**traps**

Display the traps set in the server.

**trustkey** *keyid* [...]

**untrustkey** *keyid* [...]

These commands operate in the same way as the trustedkey and untrustkey configuration file commands of xntpd.

**unconfig** *peer\_address* [...]

Cause the configured bit to be removed from the specified peers. In many cases this causes the peer association to be deleted. When appropriate, however, the association may persist in an unconfigured mode if the remote peer is willing to continue on in this fashion.

**unrestrict** *address mask flag* [*flag* ]

Unrestrict the matching entry from the restrict list.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| NAME                    | ypbind – NIS binder process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                         |                                                                                                               |
| SYNOPSIS                | <code>/usr/lib/netsvc/yp/ypbind</code> [-broadcast   -ypset   -ypsetme]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                         |                                                                                                               |
| DESCRIPTION             | <p>NIS provides a simple network lookup service consisting of databases and processes. The databases are stored at the machine that runs an NIS server process. The programmatic interface to NIS is described in <code>ypclnt(3NSL)</code>. Administrative tools are described in <code>ypinit(1M)</code>, <code>ypwhich(1)</code>, and <code>ypset(1M)</code>. Tools to see the contents of NIS maps are described in <code>ypcat(1)</code>, and <code>ypmatch(1)</code>.</p> <p><code>ypbind</code> is a daemon process that is activated at system startup time from the startup script <code>/etc/init.d/rpc</code>. By default, it is invoked as <code>ypbind -broadcast</code>. <code>ypbind</code> runs on all client machines that are set up to use NIS. See <code>sysidtool(1M)</code>. The function of <code>ypbind</code> is to remember information that lets all NIS client processes on a node communicate with some NIS server process. <code>ypbind</code> must run on every machine which has NIS client processes. The NIS server may or may not be running on the same node, but must be running somewhere on the network. If the NIS server is a NIS+ server in NIS (YP) compatibility mode, see the NOTES section of the <code>ypfiles(4)</code> man page for more information.</p> <p>The information <code>ypbind</code> remembers is called a <i>binding</i> — the association of a domain name with a NIS server. The process of binding is driven by client requests. As a request for an unbound domain comes in, if started with the <code>-broadcast</code> option, the <code>ypbind</code> process broadcasts on the net trying to find an NIS server, either a <code>ypserv</code> process serving the domain or an <code>rpc.nisd</code> process in "YP-compatibility mode" serving NIS+ directory with name the same as (case sensitive) the domain in the client request. Since the binding is established by broadcasting, there must be at least one NIS server on the net. If started without the <code>-broadcast</code> option, <code>ypbind</code> process steps through the list of NIS servers that was created by <code>ypinit -c</code> for the requested domain. There must be an NIS server process on at least one of the hosts in the NIS servers file. All the hosts in the NIS servers file must be listed in either the <code>/etc/hosts</code> or <code>/etc/inet/ipnodes</code> files along with their IP addresses. Once a domain is bound by <code>ypbind</code>, that same binding is given to every client process on the node. The <code>ypbind</code> process on the local node or a remote node may be queried for the binding of a particular domain by using the <code>ypwhich(1)</code> command.</p> <p>If <code>ypbind</code> is unable to speak to the NIS server process it is bound to, it marks the domain as unbound, tells the client process that the domain is unbound, and tries to bind the domain once again. Requests received for an unbound domain will wait until the requested domain is bound. In general, a bound domain is marked as unbound when the node running the NIS server crashes or gets overloaded. In such a case, <code>ypbind</code> will try to bind to another NIS server using the process described above. <code>ypbind</code> also accepts requests to set its binding for a particular domain. The request is usually generated by the <code>ypset(1M)</code> command. In order for <code>ypset</code> to work, <code>ypbind</code> must have been invoked with flags <code>-ypset</code> or <code>-ypsetme</code>.</p> |                         |                                                                                                               |
| OPTIONS                 | <table><tr><td><code>-broadcast</code></td><td>Send a broadcast datagram using UDP/IP that requests the information needed to bind to a specific NIS server.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <code>-broadcast</code> | Send a broadcast datagram using UDP/IP that requests the information needed to bind to a specific NIS server. |
| <code>-broadcast</code> | Send a broadcast datagram using UDP/IP that requests the information needed to bind to a specific NIS server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                         |                                                                                                               |

## ypbind(1M)

This option is analogous to ypbind with no options in earlier Sun releases and is recommended for ease of use.

-ypset

Allow users from any remote machine to change the binding by means of the ypset command. By default, no one can change the binding. This option is insecure.

-ypsetme

Only allow root on the local machine to change the binding to a desired server by means of the ypset command. ypbind can verify the caller is indeed a root user by accepting such requests only on the loopback transport. By default, no external process can change the binding.

**FILES** /var/yp/binding/ypdomain/ypservers  
/etc/inet/hosts  
/etc/inet/ipnodes

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

**SEE ALSO** ypcat(1), ypmatch(1), ypwhich(1), ifconfig(1M), rpc.nisd(1M), ypinit(1M), ypset(1M), ypclnt(3NSL), hosts(4), ipnodes(4), ypfiles(4), attributes(5)

**NOTES** ypbind supports multiple domains. The ypbind process can maintain bindings to several domains and their servers, the default domain is the one specified by the domainname(1M) command at startup time.

The -broadcast option works only on the UDP transport. It is insecure since it trusts "any" machine on the net that responds to the broadcast request and poses itself as an NIS server.

## ypinit(1M)

| NAME                    | ypinit – set up NIS client                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                |                           |              |                                    |                         |                                                                                                                                 |

| SYNOPSIS                | <b>/usr/sbin/ypinit</b> [-c] [-m] [-s <i>master_server</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                           |              |                                    |                         |                                                                                                                                 |
| DESCRIPTION             | <p>ypinit can be used to set up an NIS client system. You must be the superuser to run this command. This script need not be used at all if ypbind(1M) is started with the -broadcast option (it is invoked with this option from the start up script /etc/init.d/rpc).</p> <p>Normally, ypinit is run only once after installing the system. It may be run whenever a new NIS server is added to the network or an existing one is decommissioned.</p> <p>ypinit prompts for a list of NIS servers to bind the client to; this list should be ordered from the closest to the furthest server. Each of these NIS servers must be listed in either the /etc/hosts or the /etc/inet/ipnodes file along with its IP address. ypinit stores the list in file /var/yp/binding/domain/ypservers. This file is used by ypbind when run without the -broadcast option.</p> |                |                           |              |                                    |                         |                                                                                                                                 |

| BUGS                    | ypinit sets up the list of NIS servers only for the current domain on the system when it is run, that is, the domain returned by the SI_SRPC_DOMAIN command to sysinfo(2). Care should be taken to ensure that this is the same as the desired domain for NIS client processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                           |              |                                    |                         |                                                                                                                                 |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                      |                                               |                              |                    |                        |                                                         |                   |                                                                      |

| <b>DESCRIPTION</b>           | <p>The file called <code>Makefile</code> in <code>/var/yp</code> is used by <code>make(1)</code> to build the Network Information Service (NIS) database. With no arguments, <code>make</code> creates <code>dbm</code> databases for any NIS maps that are out-of-date, and then executes <code>yppush(1M)</code> to notify slave databases that there has been a change.</p> <p>If you supply a <i>map</i> on the command line, <code>make</code> will update that map only. Typing <code>make passwd</code> will create and <code>yppush</code> the password database (assuming it is out of date). Likewise, <code>make ipnodes</code> and <code>make networks</code> will create and <code>yppush</code> the <code>ipnodes</code> and <code>network</code> files, <code>\$(INETDIR)/ipnodes</code> and <code>\$(DIR)/networks</code>.</p> <p>There are four special variables used by <code>make</code>: <code>DIR</code>, which gives the directory of the source files; <code>NOPUSH</code>, which when non-null inhibits doing a <code>yppush</code> of the new database files; <code>INETDIR</code>, which gives the directory of the <code>ipnodes</code> source file; and <code>DOM</code>, which is used to construct a domain other than the master's default domain. The default for <code>DIR</code> is <code>/etc</code>, and the default for <code>INETDIR</code> is <code>/etc/inet</code>. The default for <code>NOPUSH</code> is the null string.</p> <p>Refer to <code>ypfiles(4)</code> and <code>ypserv(1M)</code> for an overview of the NIS service.</p> |                      |                                               |                              |                    |                        |                                                         |                   |                                                                      |

| <b>NOTES</b>                 | <p>The NIS <code>makefile</code> is only used when running the <code>ypserv(1M)</code> server to provide NIS services. If these are being provided by the NIS+ server running in NIS compatibility mode, see <code>rpc.nisd(1M)</code>; this <code>makefile</code> is not relevant. See <code>ypfiles(4)</code> for more details.</p> <p>The Network Information Service (NIS) was formerly known as Sun Yellow Pages (YP). The functionality of the two remains the same; only the name has changed. The name Yellow Pages is a registered trademark in the United Kingdom of British Telecommunications plc, and may not be used without permission.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                      |                                               |                              |                    |                        |                                                         |                   |                                                                      |

## yppoll(1M)

| <b>NAME</b>        | yppoll – return current version of a NIS map at a NIS server host                                                                                                                                                                                                                                                                                                             |                    |                                                    |                |                                                                                                                                                                                                                         |

| <b>DESCRIPTION</b> | <p>yppush copies a new version of a Network Information Service (NIS) map from the master NIS server to the slave NIS servers. It is normally run only on the master NIS server by the Makefile in /var/yp after the master databases are changed. It first constructs a list of NIS server hosts by reading the NIS ypservers map within the <i>domain</i>. Keys within the ypservers map are the ASCII names of the machines on which the NIS servers run.</p> <p>A “transfer map” request is sent to the NIS server at each host, along with the information needed by the transfer agent (the program that actually moves the map) to call back the yppush. When the attempt has completed (successfully or not), and the transfer agent has sent yppush a status message, the results can be printed to stdout. Messages are also printed when a transfer is not possible, for instance, when the request message is undeliverable, or when the timeout period on responses has expired.</p> <p>Refer to ypfiles(4) and ypserv(1M) for an overview of the NIS service.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-d <i>domain</i> Specifies a <i>domain</i>.</li> <li>-h <i>host</i> Propagates only to the named <i>host</i>.</li> <li>-p #<i>parallel-xfrs</i> Allows the specified number of map transfers to occur in parallel.</li> <li>-v Verbose. This prints messages when each server is called, and for each response. If this flag is omitted, only error messages are printed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |

- |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NOTES</b> | The Network Information Service (NIS) was formerly known as Sun Yellow Pages (YP). The functionality of the two remains the same; only the name has changed. The name Yellow Pages is a registered trademark in the United Kingdom of British Telecommunications PLC, and must not be used without permission.                                                                                                                                                                                                                                                                                                                                                          |
| <b>BUGS</b>  | In the current implementation (version 2 NIS protocol), the transfer agent is <code>ypxfr(1M)</code> , which is started by the <code>ypserv</code> program. If <code>yppush</code> detects that it is speaking to a version 1 NIS protocol server, it uses the older protocol, sending a version 1 <code>YPPROC_GET</code> request and issues a message to that effect. Unfortunately, there is no way of knowing if or when the map transfer is performed for version 1 servers. <code>yppush</code> prints a message saying that an "old-style" message has been sent. The system administrator should later check to see that the transfer has actually taken place. |

| NAME           | ypserv, ypxfrd – NIS server and binder processes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                                                                                                                           |
| SYNOPSIS       | <pre>/usr/lib/netsvc/yp/ypserv [-dv] /usr/lib/netsvc/yp/ypxfrd</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                                                                                                                           |
| DESCRIPTION    | <p>The Network Information Service (NIS) provides a simple network lookup service consisting of databases and processes. The databases are ndbm files in a directory tree rooted at /var/yp. See ndbm(3C). These files are described in ypfiles(4). The processes are /usr/lib/netsvc/yp/ypserv, the NIS database lookup server, and /usr/lib/netsvc/yp/ypbind, the NIS binder. The programmatic interface to the NIS service is described in ypclnt(3NSL). Administrative tools are described in yppoll(1M), yppush(1M), ypset(1M), ypxfr(1M), and ypwhich(1). Tools to see the contents of NIS maps are described in ypcat(1), and ypmatch(1). Database generation and maintenance tools are described in ypinit(1M), ypmake(1M), and makedbm(1M).</p> <p>The ypserv utility is a daemon process typically activated at system startup from /etc/init.d/rpc. Alternatively, you can, as the root user, start NIS services using ypstart(1M) from the command-line. ypserv runs only on NIS server machines with a complete NIS database. You can halt all NIS services using the ypstop(1M) command.</p> <p>The ypxfrd utility transfers entire NIS maps in an efficient manner. For systems that use this daemon, map transfers are 10 to 100 times faster, depending on the map. To use this daemon, be sure ypxfrd is running on the master server. See /usr/lib/netsvc/yp/ypstart. ypxfr attempts to use ypxfrd first. If that fails, it prints a warning, then uses the older transfer method.</p> <p>The ypserv daemon's primary function is to look up information in its local database of NIS maps.</p> <p>The operations performed by ypserv are defined for the implementor by the <i>YP Protocol Specification</i>, and for the programmer by the header file <code>rpcsvc/yp_prot.h</code>.</p> <p>Communication to and from ypserv is by means of RPC calls. Lookup functions are described in ypclnt(3NSL), and are supplied as C-callable functions in the <code>libnsl(3LIB)</code> library. There are four lookup functions, all of which are performed on a specified map within some NIS domain: <code>yp_match(3NSL)</code>, <code>yp_first(3NSL)</code>, <code>yp_next(3NSL)</code>, and <code>yp_all(3NSL)</code>. The <code>yp_match</code> operation takes a key, and returns the associated value. The <code>yp_first</code> operation returns the first key-value pair from the map, and <code>yp_next</code> can be used to enumerate the remainder. <code>yp_all</code> ships the entire map to the requester as the response to a single RPC request.</p> <p>A number of special keys in the DBM files can alter the way in which ypserv operates. The keys of interest are:</p> <table> <tr> <td>YP_INTERDOMAIN</td><td>The presence of this key causes ypserv to forward to a DNS server host lookups that cannot be satisfied by the DBM files.</td></tr> </table> | YP_INTERDOMAIN | The presence of this key causes ypserv to forward to a DNS server host lookups that cannot be satisfied by the DBM files. |
| YP_INTERDOMAIN | The presence of this key causes ypserv to forward to a DNS server host lookups that cannot be satisfied by the DBM files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                                                                                                                           |

## ypserv(1M)

**YP\_SECURE** This key causes ypserv to answer only questions coming from clients on reserved ports.

**YP\_MULTI\_hostname** This is a special key in the form, *YP\_MULTI\_hostname addr1,...,addrN*. A client looking for *hostname* receives the “closest” address.

Two other functions supply information about the map, rather than map entries: *yp\_order(3NSL)*, and *yp\_master(3NSL)*. In fact, both order number and master name exist in the map as key-value pairs, but the server will not return either through the normal lookup functions. If you examine the map with *makedbm(1M)*, however, they are visible. Other functions are used within the NIS service subsystem itself, and are not of general interest to NIS clients. They include *do\_you\_serve\_this\_domain?*, *transfer\_map*, and *reinitialize\_internal\_state*.

**ypserv** **-d** The NIS service should go to the DNS for more host information. This requires the existence of a correct */etc/resolv.conf* file pointing at a machine running *in.named(1M)*. This option turns on DNS forwarding regardless of whether or not the *YP\_INTERDOMAIN* flag is set in the *hosts* maps. See *makedbm(1M)*. In the absence of an */etc/resolv.conf* file, ypserv complains, but ignores the **-d** option.

**-v** Operate in the verbose mode, printing diagnostic messages to *stderr*.

**FILES** */var/yp/securenets* Defines the hosts and networks that are granted access to information in the served domain; it is read at startup time by both ypserv and *ypxfrd*.

*/etc/init.d/rpc* Startup file that starts up basic RPC services and NIS by calling *ypstart(1M)*. If the */var/yp/ypserv.log* file exists when ypserv starts up, log information is written to it when error conditions arise. The file */var/yp/binding/domainname/ypservers* is used to list the NIS server hosts that *ypbind* can bind to.

**ATTRIBUTES** See *attributes(5)* for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWypu         |

**SEE ALSO** *ypcat(1)*, *ypmatch(1)*, *ypwhich(1)*, *domainname(1M)*, *in.named(1M)*, *makedbm(1M)*, *ypbind(1M)*, *ypinit(1M)*, *ypmake(1M)*, *ypoll(1M)*, *yppush(1M)*, *ypset(1M)*, *ypstart(1M)*, *ypstop(1M)*, *ypxfr(1M)*, *ndbm(3C)*, *ypclnt(3NSL)*, *libnsl(3LIB)*, *securenets(4)*, *ypfiles(4)*, *attributes(5)*

*System Administration Guide: Basic Administration*

**NOTES** ypserv supports multiple domains. The ypserv process determines the domains it serves by looking for directories of the same name in the directory `/var/yp`. It replies to all broadcasts requesting yp service for that domain.

The Network Information Service (NIS) was formerly known as Sun Yellow Pages (YP). The functionality of the two remains the same; only the name has changed. The name Yellow Pages is a registered trademark in the United Kingdom of British Telecommunications PLC, and must not be used without permission.

NIS uses `ndbm()` files to store maps. Therefore, it is subject to the 1024 byte limitations described in the USAGE and NOTES sections of the `ndbm(3C)` manual page.

## ypset(1M)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                    |                                                      |                |                                                                                                  |

| NAME               | ypset – point ypbind at a particular server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                    |                                                      |                |                                                                                                  |
| SYNOPSIS           | <b>/usr/sbin/ypset</b> [-d <i>ypdomain</i> ] [-h <i>host</i> ] <i>server</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                    |                                                      |                |                                                                                                  |
| DESCRIPTION        | <p>In order to run <i>ypset</i>, <i>ypbind</i> must be initiated with the <i>-ypset</i> or <i>-ypsetme</i> options. See <i>ypbind</i>(1M). <i>ypset</i> tells <i>ypbind</i> to get NIS services for the specified <i>ypdomain</i> from the <i>ypserv</i> process running on <i>server</i>. If <i>server</i> is down, or is not running <i>ypserv</i>, this might not be discovered until an NIS client process tries to obtain a binding for the domain. At this point, the binding set by <i>ypset</i> is tested by <i>ypbind</i>. If the binding is invalid, <i>ypbind</i> attempts to rebind for the same domain.</p> <p><i>ypset</i> is useful for binding a client node that is not on a broadcast net, or is on a broadcast net that is not running an NIS server host. It is also useful for debugging NIS client applications, for instance, where an NIS map exists only at a single NIS server host.</p> <p>Where several hosts on the local net are supplying NIS services, <i>ypbind</i> can rebind to another host, even while you attempt to find out if the <i>ypset</i> operation succeeded. For example, if you enter the <i>ypset</i> command below, you might get the subsequent response from <i>ypwhich</i>:</p> <pre>example% ypset host1 example% ypwhich host2</pre> <p>The sequence shown above is a function of the NIS subsystem's attempt to load-balance among the available NIS servers, and occurs when <i>host1</i> does not respond to <i>ypbind</i> because it is not running <i>ypserv</i> (or is overloaded), and <i>host2</i>, running <i>ypserv</i>, obtains the binding.</p> <p><i>server</i> indicates which NIS server to bind to, and must be specified as a name or an IP address. This works only if the node has a current valid binding for the domain in question and <i>ypbind</i> has been set to allow use of <i>ypset</i>. In most cases, <i>server</i> should be specified as an IP address.</p> <p><i>ypset</i> tries to bind over a connectionless transport. The NIS library call, <i>yp_all()</i>, uses connection-oriented transport and derives the NIS server's address based on the connectionless address supplied by <i>ypset</i>.</p> <p>Refer to <i>ypfiles</i>(4) for an overview of the NIS name service.</p> |                    |                                                      |                |                                                                                                  |

## ypstart(1M)

**NAME** ypstart, ypstop – Start and stop NIS services

**SYNOPSIS** `/usr/lib/netsvc/yp/ypstart`  
`/usr/lib/netsvc/yp/ypstop`

**DESCRIPTION** The `ypstart` command is used to start the Network Information Service (NIS). After the host has been configured using the `ypinit(1M)` command, `ypstart` automatically determines the NIS status of the machine and starts the appropriate daemons.

The `ypstop` command is used to stop the Network Information Service (NIS).

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

*System Administration Guide: Basic Administration*

**NOTES** The Network Information Service (NIS) was formerly known as Sun Yellow Pages (YP). The functionality of the two services remains the same; only the name has changed. The name Yellow Pages is a registered trademark in the United Kingdom of British Telecommunications PLC, and must not be used without permission.

| NAME        | ypxfr, ypxfr_1perday, ypxfr_1perhour, ypxfr_2perday – transfer NIS map from a NIS server to host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                      |
| SYNOPSIS    | <b>/usr/lib/netsvc/yp/ypxfr</b> [-c] [-f] [-C <i>tid prog server</i> ] [-d <i>ypdomain</i> ] [-h <i>host</i> ] [-s <i>ypdomain</i> ] <i>mapname</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                      |
| DESCRIPTION | <p>The <b>ypxfr</b> command moves an NIS map in the default domain for the local host to the local host by making use of normal NIS services. It creates a temporary map in the directory <code>/var/yp/ypdomain</code> (this directory must already exist; <i>ypdomain</i> is the default domain for the local host), fills it by enumerating the map's entries, fetches the map parameters (master and order number), and loads them. It then deletes any old versions of the map and moves the temporary map to the real <i>name</i>.</p> <p>If run interactively, <b>ypxfr</b> writes its output to the terminal. However, if it is started without a controlling terminal, and if the log file <code>/var/yp/ypxfr.log</code> exists, it appends all its output to that file. Since <b>ypxfr</b> is most often run from the privileged user's <code>crontab</code> file, or by <b>ypserv</b>, the log file can retain a record of what was attempted, and what the results were.</p> <p>For consistency between servers, <b>ypxfr</b> should be run periodically for every map in the NIS data base. Different maps change at different rates: a map might not change for months at a time, for instance, and can therefore be checked only once a day. Some maps might change several times per day. In such a case, you might want to check hourly for updates. A <code>crontab(1)</code> entry can be used to automatically perform periodic updates. Rather than having a separate <code>crontab</code> entry for each map, you can group commands to update several maps in a shell script. Examples (mnemonically named) are in <code>/usr/sbin/yp: ypxfr_1perday, ypxfr_2perday, and ypxfr_1perhour</code>.</p> <p>Refer to <code>ypfiles(4)</code> for an overview of the NIS name service.</p> |                                                                                                                                                                                                                                                                                                      |
| OPTIONS     | -c                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Do not send a "Clear current map" request to the local <b>ypserv</b> process. Use this flag if <b>ypserv</b> is not running locally at the time you are running <b>ypxfr</b> . Otherwise, <b>ypxfr</b> complains that it cannot communicate with the local <b>ypserv</b> , and the transfer fails.   |
|             | -f                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Force the transfer to occur even if the version at the master is not more recent than the local version.                                                                                                                                                                                             |

| SYNOPSIS                             | <b>zdump</b> [-v] [-c <i>cutoffyear</i> ] [ <i>zonename</i> ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                      |                                                                            |
| DESCRIPTION                          | <p>The <b>zdump</b> command prints the current time for each time zone (<i>zonename</i>) listed on the command line. Specify <i>zonename</i> as the name of the time zone database file relative to <code>/usr/share/lib/zoneinfo</code>.</p> <p>Specifying an invalid time zone (<i>zonename</i>) to <b>zdump</b> does not return an error, rather <b>zdump</b> uses GMT. This is consistent with the behavior of the library calls; <b>zdump</b> reflects the same behavior of the time routines in <code>libc</code>. See <code>ctime(3C)</code> and <code>mktime(3C)</code>.</p>                                                                                                                                                                                                                                                                                                         |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                      |                                                                            |
| OPTIONS                              | <p>The following options are supported:</p> <table><tr><td>-v</td><td>Displays the entire contents of the time zone database file for <i>zonename</i>. Prints the time at the lowest possible time value; the time one day after the lowest possible time value; the times both one second before and exactly at each time at which the rules for computing local time change; the time at the highest possible time value; and the time at one day less than the highest possible time value. See <code>mktime(3C)</code> and <code>ctime(3C)</code> for information regarding time value (<code>time_t</code>). Each line of output ends with <code>isdst=1</code> if the given time is Daylight Saving Time, or <code>isdst=0</code> otherwise.</td></tr><tr><td>-c <i>cutoffyear</i></td><td>Cuts off the verbose output near the start of the year <i>cutoffyear</i>.</td></tr></table> | -v                                   | Displays the entire contents of the time zone database file for <i>zonename</i> . | SYNOPSIS    | <b>zic</b> [-s] [-v] [-l <i>localtime</i> ] [-p <i>posixrules</i> ] [-d <i>directory</i> ] [-y <i>yearistype</i> ] [ <i>filename...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |      |                                                                      |        |                                                                                                                                                                                                                                             |         |                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                               |        |                                                       |         |                                                                        |      |                                          |     |                                         |
| DESCRIPTION | <p>zic reads text from the file(s) named on the command line and creates the time conversion information files specified in this input. If a <i>filename</i> is '-', the standard input is read.</p> <p>Input lines are made up of fields. Fields are separated by any number of white space characters. Leading and trailing white space on input lines is ignored. A pound sign (#) indicates a comment that extends to the end of the line. White space characters and pound signs can be enclosed within double quotes ( " ") if they are to be used as part of a field. Any line that is blank (after comment stripping) is ignored. Non-blank lines are expected to be of one of three types: rule lines, zone lines, or link lines.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |      |                                                                      |        |                                                                                                                                                                                                                                             |         |                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                               |        |                                                       |         |                                                                        |      |                                          |     |                                         |
| Rule        | <p>A rule line has the form:</p> <p>For example:</p> <pre>Rule    NAME    FROM    TO    TYPE    IN    ON        AT    SAVE    LETTER/S</pre> <p>The fields that make up a rule line are:</p> <pre>Rule    USA    1969    1973    -    Apr lastSun 2:00    1:00    D</pre> <table><tr><td>NAME</td><td>Gives the (arbitrary) name of the set of rules this rule is part of.</td></tr><tr><td>FROM</td><td>Gives the first year in which the rule applies. The word minimum (or an abbreviation) means the minimum year with a representable time value. The word maximum (or an abbreviation) means the maximum year with a representable time value.</td></tr><tr><td>TO</td><td>Gives the final year in which the rule applies. In addition to minimum and maximum (as above), the word only (or an abbreviation) can be used to repeat the value of the FROM field.</td></tr><tr><td>TYPE</td><td>Gives the type of year in which the rule applies. If TYPE is:<br/><table><tr><td>'_'</td><td>The rule applies in all years between FROM and TO, inclusive.</td></tr><tr><td>uspres</td><td>The rule applies in U.S. Presidential election years.</td></tr><tr><td>nonpres</td><td>The rule applies in years other than U.S. Presidential election years.</td></tr><tr><td>even</td><td>The rule applies to even-numbered years.</td></tr><tr><td>odd</td><td>The rule applies to odd-numbered years.</td></tr></table></td></tr></table> | NAME | Gives the (arbitrary) name of the set of rules this rule is part of. | FROM   | Gives the first year in which the rule applies. The word minimum (or an abbreviation) means the minimum year with a representable time value. The word maximum (or an abbreviation) means the maximum year with a representable time value. | TO      | Gives the final year in which the rule applies. In addition to minimum and maximum (as above), the word only (or an abbreviation) can be used to repeat the value of the FROM field. | TYPE | Gives the type of year in which the rule applies. If TYPE is:<br><table><tr><td>'_'</td><td>The rule applies in all years between FROM and TO, inclusive.</td></tr><tr><td>uspres</td><td>The rule applies in U.S. Presidential election years.</td></tr><tr><td>nonpres</td><td>The rule applies in years other than U.S. Presidential election years.</td></tr><tr><td>even</td><td>The rule applies to even-numbered years.</td></tr><tr><td>odd</td><td>The rule applies to odd-numbered years.</td></tr></table> | '_' | The rule applies in all years between FROM and TO, inclusive. | uspres | The rule applies in U.S. Presidential election years. | nonpres | The rule applies in years other than U.S. Presidential election years. | even | The rule applies to even-numbered years. | odd | The rule applies to odd-numbered years. |
| NAME        | Gives the (arbitrary) name of the set of rules this rule is part of.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |      |                                                                      |        |                                                                                                                                                                                                                                             |         |                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                               |        |                                                       |         |                                                                        |      |                                          |     |                                         |
| FROM        | Gives the first year in which the rule applies. The word minimum (or an abbreviation) means the minimum year with a representable time value. The word maximum (or an abbreviation) means the maximum year with a representable time value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |      |                                                                      |        |                                                                                                                                                                                                                                             |         |                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                               |        |                                                       |         |                                                                        |      |                                          |     |                                         |
| TO          | Gives the final year in which the rule applies. In addition to minimum and maximum (as above), the word only (or an abbreviation) can be used to repeat the value of the FROM field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |      |                                                                      |        |                                                                                                                                                                                                                                             |         |                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |                                                               |        |                                                       |         |                                                                        |      |                                          |     |                                         |
| TYPE        | Gives the type of year in which the rule applies. If TYPE is:<br><table><tr><td>'_'</td><td>The rule applies in all years between FROM and TO, inclusive.</td></tr><tr><td>uspres</td><td>The rule applies in U.S. Presidential election years.</td></tr><tr><td>nonpres</td><td>The rule applies in years other than U.S. Presidential election years.</td></tr><tr><td>even</td><td>The rule applies to even-numbered years.</td></tr><tr><td>odd</td><td>The rule applies to odd-numbered years.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | '_'  | The rule applies in all years between FROM and TO, inclusive.        | uspres | The rule applies in U.S. Presidential election years.                                                                                                                                                                                       | nonpres | The rule applies in years other than U.S. Presidential election years.                                                                                                               | even | The rule applies to even-numbered years.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | odd | The rule applies to odd-numbered years.                       |        |                                                       |         |                                                                        |      |                                          |     |                                         |

If TYPE is something else, then `zic` will attempt to execute the command

```
yearistype year type
```

to check the type of a year: an exit status of 0 means that the year is of the given type; an exit status of 1 means that the year is not of the given type. The `yearistype` command is not currently provided in the Solaris environment.

| 1:28:14  | Time in hours, minutes, and seconds, where hour 0 is midnight at the start of the day and hour 24 is midnight at the end of the day.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |                            |         |                              |         |                                            |         |                                                                                                                                      |         |                                   |
| SAVE     | Gives the amount of time to be added to local standard time when the rule is in effect. This field has the same format as the AT field (without the <code>w</code> and <code>s</code> suffixes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |                            |         |                              |         |                                            |         |                                                                                                                                      |         |                                   |
| LETTER/S | Gives the “variable part” (for example, the “S” or “D” in “EST” or “EDT” of time zone abbreviations to be used when this rule is in effect. If this field is ‘-’, the variable part is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |                            |         |                              |         |                                            |         |                                                                                                                                      |         |                                   |

zic(1M)

## Zone

A zone line has the form:

```
Zone NAME GMTOFF RULES/SAVE FORMAT [UNTIL]
```

For example:

```
Zone Australia/SouthWest 9:30 - CST 1992 Mar 15 12:00
 8:30 Aus CST
```

The fields that make up a zone line are:

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | The name of the time zone. This is the name used in creating the time conversion information file for the zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| GMTOFF     | The amount of time to add to UTC to get standard time in this zone. This field has the same format as the AT and SAVE fields of rule lines; begin the field with a minus sign to subtract time from UTC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| RULES/SAVE | The name of the rule(s) that apply in the time zone or, alternately, an amount of time to add to local standard time. If this field is '-', then standard time always applies in the time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FORMAT     | The format for time zone abbreviations in this time zone. The pair of characters %s is used to show where the "variable part" of the time zone abbreviation goes. Alternately, a slash (/) separates standard and daylight abbreviations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| UNTIL      | <p>The time at which the UTC offset or the rule(s) change for a location. It is specified as a year, a month, a day, and a time of day. The time of day has the same format as the AT field of rule lines. If this is specified, the time zone information is generated from the given UTC offset and rule change until the time specified.</p> <p>The month, day, and time of day have the same format as the IN, ON, and AT columns of a rule; trailing columns can be omitted, and default to the earliest possible value for the missing columns.</p> <p>The next line must be a "continuation" line. This line has the same form as a zone line except that the string "Zone" and the name are omitted. The continuation line places information starting at the time specified as the UNTIL field in the previous line in the file used by the previous line. Continuation lines can contain an UNTIL field, just as zone lines do, indicating that the next line is a further continuation.</p> |

## Link

A link line has the form:

```
Link LINK-FROM LINK-TO
```

For example:

Link Europe/Istanbul Asia/Istanbul

The LINK-FROM field should appear as the NAME field in some zone line; the LINK-TO field is used as an alternate name for that zone.

Except for continuation lines, lines can appear in any order in the input.

OPTIONS

- d *directory* Creates time conversion information files in the directory *directory* rather than in the standard directory /usr/share/lib/zoneinfo.
- l *localtime* Uses the given time zone as local time *localtime*. zic acts as if the file contained a link line of the form:  
  
Link *localtime* localtime
- p *posixrules* Uses the rules of the given time zone *posixrules* when handling POSIX-format time zone environment variables. zic acts as if the input contained a link line of the form:  
  
Link *posixrules* posixrules
- s This option is not used by ctime(3C) and mktime(3C) in the Solaris environment.
- v Limits time values stored in output files to values that are the same whether they are taken to be signed or unsigned. You can use this option to generate SVVS-compatible files.
- y *yearistype* Complains if a year that appears in a data file is outside the range of years representable by system time values (0:00:00 a.m. UTC, January 1, 1970, to 3:14:07 a.m. UTC, January 19, 2038).
- y *yearistype* Uses the given command *yearistype* rather than yearistype when checking year types (see Rules under DESCRIPTION).

OPERANDS

- filename* A file containing input lines that specify the time conversion information files to be created. If a *filename* is '-', the standard input is read.

FILES

- /usr/share/lib/zoneinfo Standard directory used for created files
- /usr/share/lib/zoneinfo/src Directory containing source files

**SEE ALSO** time(1), zdump(1M), ctime(3C), mktime(3C), attributes(5)

**NOTES** For areas with more than two types of local time, you might need to use local standard time in the AT field of the earliest transition time's rule to ensure that the earliest transition time recorded in the compiled file is correct.

# Index

---

## Numbers and Symbols

- ikecert, 526
- logadm, 779
- mount\_xmemfs, 1056
- projadd, 1310
- rctladm, 1350
- sftp-server, 1481
- sshd, 1641

## C

construct a udfs file system — mkfs\_udfs, 1000

## Numbers and Symbols

24-bit TrueColor Visual for OpenWindows with  
an S24 frame buffer system (TCX) —  
tcxconfig, configure the default  
linearity, 1719

## A

accept — accept print requests, 28  
access system administration tools with a  
graphical user interface — solstice, 1631  
accounting, run daily — runacct, 1421  
accounting commands

- acctcms, 36
- acctcon, 38
- acctdisk, 30

## accounting commands (Continued)

- acctdusg, 30
- acctmerg, 40
- accton, 30
- acctprc, 41
- acctwtmp, 30
- closewtmp, 30
- fwtmp, 464
- utmp2wtmp, 30
- wtmpfix, 464

## accounting shell procedures

- chargefee, 43
- ckpacct, 43
- dodisk, 43
- lastlogin, 43
- monacct, 43
- nulladm, 43
- prctmp, 43
- prdaily, 43
- prtacct, 43
- runacct, 43
- shutacct, 43
- startup, 43
- turnacct, 43

acct — miscellaneous accounting  
commands, 30

acctadm — configure extended accounting  
facility, 33

acctcms — command summary from process  
accounting records, 36

acctcon — create summary of connect  
records, 38

acctcon1 — create summary of connect records, 38

acctcon2 — create summary of connect records, 38

acctdisk — create disk usage records, 30

acctdusg — compute disk usage by login, 30

acctmerg — merge or add total disk accounting files, 40

accton — turn on process accounting, 30

acctprc — summary of process accounting, 41

acctprc1 — summary of process accounting, 41

acctprc2 — summary of process accounting, 41

acctsh — shell procedures for accounting, 43

acctwtmpt — create connect accounting record in /var/adm/wtmp, 30

adb scripts, generate — adbggen, 46

adbggen — generate adb script, 46

add (create) a new group definition on the system — groupadd, 478

add a new device driver to the system — add\_drv, 51

add\_drv — add a new device driver to the system, 51

addbadsec — map out defective disk blocks, 49

address resolution display and control — arp, 70

adds an application to the Solstice application registry — soladdapp, 1629

administer a new role account on the system — roleadd, 1367

administer disk space used for caching file systems with the Cache File-System (CacheFS) — cfsadmin, 204

administer files available as block devices through lofi — lofiadm, 774

administer flash archives — flar, 377

administer FTP Server enhanced group access file — privatepw, 1307

administer NIS+ aliases, — aliasadm, 65

administration program for the Sun Enterprise Network Array (SENA), RSM, SPARCstorage Array (SSA) subsystems, Sun Fire 880 internal storage subsystem, and individual Fiber Channel Arbitrated Loop (FC\_AL) devices — luxadm, 871

admintool — system administration tool with a graphical interface, 55

afbconfig — configure the AFB Graphics Accelerator, 57

aliasadm — administer NIS+ aliases, 65

ancillary agent for inbound zone transfers — named-xfer, 1063

answerbook2\_admin — bring up AnswerBook2 administration tool GUI, 67

AnswerBook2 administration tool GUI — answerbook2\_admin, 67

apache — Apache hypertext transfer protocol server overview, 68

Apache hypertext transfer protocol server overview — apache, 68

apply a patch package to a Solaris 2 system — patchadd, 1195

arp — address resolution display and control, 70

ASET

- monitors or restricts accesses to system files and directories — aset, 72
- prints tasks status — taskstat, 1718

aset.restore — restore files and directories to the state before ASET was installed, 78

audit — maintain audit trail, 79

audit records, select or merge from audit trail files — auditreduce, 88

audit\_startup shell script, 96

audit statistics report — auditstat, 97

audit trail file, select records from — auditreduce, 88

audit\_warn — audit daemon warning script, 99

auditconfig — get and set kernel audit parameters, 80

auditd — audit daemon, 86

auditreduce — select or merge audit records from audit trail files, 88

auditstat — display kernel audit statistics, 97

autoboot procedures — boot, 630

autofs, automatically mount file systems — automount, 101

Autofs, mount/unmount request server — automountd, 108

Automated conversational exchange tool — chat, 210

Automated Security Enhancement Tool  
*See* ASET  
 automount — automatically mount file systems, 101  
 automountd — Autofs mount/unmount request server, 108  
 autopush — configures lists of automatically pushed STREAMS modules, 109

## B

backup NIS+ directories — nisbackup, 1111  
 Basic Security Module, enable — bsmconv, bsmunconv, 127  
 Basic Security Module commands  
   — audit, 79  
   — audit\_startup, 96  
   — audit\_warn, 99  
   — auditconfig, 80  
   — auditd, 86  
   — auditreduce, 88  
   — auditstat, 97  
 bdconfig — configures the bd (buttons and dials) stream, 111  
 snmpXwbemd — SNMP Adapter Subagent for WBEM, 1614  
 boot — bootstrap procedures, 113  
 boot parameter server — rpc.bootparamd, 1384  
 boot — system startup procedures, 630  
 BOOTP  
   DHCP network table management utility — pntadm, 1248  
   administration — dhtadm, 285  
   server — in.dhcpd, 563  
   service — dhcpconfig, 276  
 bootstrap procedures — boot, 630  
 bootstrap PROM monitor program — monitor, 1015  
 Bootstrap Protocol  
   *See* 'DHCP'  
 Bourne shell, — rsh, 1416  
 broadcast message  
   network wall server — rpc.rwalld, 1404  
   write to all users — wall, 1805  
   write to all users of a group — wall, 1805  
   write to all users over a network — rwall, 1424

bsmconv — enable Solaris system to use Basic Security Module, 127  
 bsmrecord — verify Basic Security Module (BSM) configuration files, 129  
 bsmunconv — enable Solaris system to use Basic Security Module, 127  
 build class list and compile Solaris Management Console service beans for remote use — smccompile, 1516  
 busstat — report bus-related performance statistics, 132

## C

cachefs  
   cachefslog — Cache File System logging, 137  
   cachefsstat — Cache File System statistics, 141  
   cachefswssize — Determine working set size for cachefs, 143  
   cfsadmin — administer disk space used for caching file systems with the Cache File-System (CacheFS), 204  
   fsck\_cachefs — check integrity of data cached with CacheFS, 418  
   mount\_cachefs — mount CacheFS file systems, 1032  
 CacheFS daemon — cachefsd, 136  
 cachefsd — CacheFS daemon, 136  
 cachefspack — pack files and file systems in the cache, 139  
 captinfo — convert termcap description to terminfo description, 145  
 catman — create formatted files for manual pages, 146  
 CD-ROM, packages on — pkgadd, 1230  
 CD-ROM, managing, — rmmount, 1362  
 CD-ROM, mounting, — rmmount, 1362  
 cfgadm — configuration administration, 150  
 cfgadm\_ac — EXX00 memory system administration, 161  
 cfgadm\_scsi — SCSI hardware specific commands for cfgadm, 184  
 cfgadm\_sysctrl — EXX00 system board administration, 190

cfs  
     *See* cachefs

cfsadmin — administer disk space used for caching file systems with the Cache File-System (CacheFS), 204  
     CacheFS Resource Parameters, 205

cg14config — configure the cgfourteen device, 208

change processor operational status — psradm, 1327

chargefee — accounting shell procedure, 43

chat — Automated conversational exchange tool, 210

check-hostname — check if sendmail can determine the system's fully-qualified host name, 218

check if sendmail can determine the system's fully-qualified host name — check-hostname, 218

check integrity of data cached with CacheFS — fsck\_cachefs, 418

check-permissions — check permissions on mail rerouting files, 219

check permissions on mail rerouting files — check-permissions, 219

chown — change owner of file, 220

chroot — change root directory for a command, 221

CIM Boot Manager, starting, 590

CIM Object Manager, stopping, 590

ckpacct — accounting shell procedure, 43

clear inode  
     — cli, 226  
     — dcopy, 226

clear\_locks — clear locks held on behalf of an NFS client, 224

clear locks held on behalf of an NFS client — clear\_locks, 224

client configuration daemon — dhcpagent, 272

clinfo — display cluster information, 225

close down the FTP Servers at a given time — ftpshut, 460

closewtmp — puts a false DEAD\_PROCESS record in /var/adm/wtmpx file, 30

cli — clear inode, 226

command used to launch the MQ Administration Console, a graphical user interface for performing MQ administration tasks — imqadmin, 531

compile MOF files into CIM classes — mofcomp, 1009

configuration applications, execute or define — sysidconfig, 1703

configure the AFB Graphics Accelerator — afbconfig, 57

configure the FFB Graphics Accelerator — ffbconfig, 368

configure the M64 Graphics Accelerator — m64config, 887

configure the PGX32 Graphics Accelerator — pgxconfig, 1218

configure the Raptor GFX Graphics Accelerator — GFXconfig, 1218

configure  
     cgfourteen device — cg14config, 208  
     contiguous memory for sx video — sxconfig, 1682  
     undo system configuration — sys-unconfig, 1712

configure and administer a smartcard — smartcard, 1499

configure extended accounting facility — acctadm, 33

configure Mobility IP Agent — mipagentconfig, 982

configure operating system crash dump — dumpadm, 339

configure or unconfigure mouse, keyboard, display — kdmconfig, 714

configure system wide IPsec policy — ipsecconf, 667

Configure the power management system — pmconfig, 1246

configure the Solaris Management Console — smcconf, 1520

configure the XVR-1000 Graphics Accelerator — SUNWgfb\_config, 1662

configure transport providers for use by sockets — soconfig, 1627

configures the bd (buttons and dials) stream — bdconfig, 111

connect accounting  
     — acctcon, 38

- connect accounting (Continued)
  - fwtmp, 464
  - utmp2wtmp, 30
  - wtmpfix, 464
- consadm — select or display devices used as auxiliary console devices, 227
- construct a FAT file system — mkfs\_pcfs, 996
- control and query bindings of processes to processors — pbind, 1211
- conv\_lp — convert LP configuration, 229
- conv\_lpd — convert LPD configuration, 230
- convert a JavaSpaces datastore to the newer Reliable Log datastore format — wbemconfig, 1810
- convert LP configuration — conv\_lp, 229
- convert LPD configuration — conv\_lpd, 230
- convert name server configuration files — named-bootconf, 1062
- copy FNS contexts — fncopy, 387
- coradm — core file administration, 232
- core file administration — coradm, 232
- CPU PROM monitor, program — monitor, 1015
- cpustat — monitor system behavior using CPU performance counters, 236
- create, NIS dbm file — makedbm, 894
- create a flash archive from a master system — flarcreate, 380
- create a temporary snapshot of a UFS file system — fssnap\_ufs, 450
- create an FNS context — fncreate, 389
- create FNS file system contexts — fncreate\_fs, 396
- create LDAP entries from corresponding /etc files — ldapaddent, 738
- create new printers in the FNS namespace — fncreate\_printer, 401
- create temporary snapshots of a file system — fssnap, 448
- creation and management of processor sets — psrset, 1332
- cron — clock daemon, 239
- cvcd — virtual console daemon, 241

## D

- daemon, distributed system administration — sadmind, 1432

- daemon for DHCP client configuration — dhcpagent, 272
- daemon for the Internet Key Exchange (IKE) — in.iked, 583
- daemon to monitor metadevices — mdmonitord, 900
- daemons
  - clock daemon — cron, 239
  - Internet Trivial File Transfer Protocol — in.tftpd, 648
  - kernel statistics — rpc.rstatd, 1402
  - network router discovery daemon — in.rdisc, 607
  - network username server — rpc.rusersd, 1403
  - network wall server — rpc.rwall, 1404
  - network status monitor — statd, 1649
  - NFS — nfsd, 1088
  - NIS+ service — rpc.nisd, 1392
  - remote quota — rquotad, 1415
  - RPC-based remote execution — rpc.rexd, 1400
  - server which records packets sent by spray — rpc.sprayd, 1406
- date, set system date from a remote host — rdate, 1352
- dcopy — clear inode, 226
- dcs — domain configuration server, 242
- dd — convert and copy a file, 243
- debug tools, generate adb script — adbgen, 46
- delete a project from the system — projdel, 1312
- delete a user's login from the system — roledel, 1371
- destroy an FNS context — fndestroy, 404
- devattr — displays the values for a device's attributes, 249
- devfsadm — administration command for /dev and /devices, 251
- devfsadmd — administration daemon for /dev and /devices, 251
- device access, verifies accessibility — getvol, 474
- device\_maps, display entries — dminfo, 330
- devices
  - add, modify remove device entry from table — putdev, 1336

## devices (Continued)

- add, remove and change device group table
  - putdgrp, 1339
- adds /dev entries for miscellaneous devices and pseudo-devices — devlinks, 254
- adds /dev entries for tape drives attached to the system — tapes, 1714
- cgfourteen — configure the cgfourteen device, 208
- display access control entries from device\_maps, 330
- display attributes — devattr, 249
- group list — getdgrp, 467
- list — getdev, 465
- lists members of a group — listdgrp, 754
- name — devnm, 258
- print information about disk devices — devinfo, 253
- print VTOC of a block device — prtvtoc, 1325
- release from exclusive use — devfree, 250
- remove a device driver from the system — rm\_drv, 1355
- reserve for exclusive use — devfree, 259
- /devices directory, configure — drvconfig, 336
- devinfo — print device specific information, 253
- df — display amount of used and available disk space, 261
- df\_ufs — display amount of space occupied by ufs, 271
- dfmounts — displays information on resources shared through DFS, 265
- dfmounts\_nfs — displays information on resources shared through NFS, 267

## DFS

- display information on resources shared — dfmounts, 265
- list available resources from remote or local systems — dfshares, 268

## dfshares

- list available resources from remote or local systems, 268

## dfshares\_nfs

- list available resources from remote systems, 269

## DHCP

- network table management utility — pntadm, 1248
- administration — dhtadm, 285

## DHCP (Continued)

- server — in.dhcpd, 563
- service — dhcpconfig, 276

## DHCP client configuration daemon

- dhcpagent, 272

## DHCP service lock daemon

- dsvclockd, 338

## dhcpagent

- daemon for DHCP client configuration, 272

## dhcpconfig

- DHCP service configuration utility, 276

## dhcpmgr

- graphical interface for managing DHCP service, 283

## dhtadm

- DHCP configuration table management utility, 285

## Diffie-Hellman key pair

- , 1086

## directories, move

- mvdir, 1061

## directoryserver

- front end for the Directory Server (DS), 298

## disk accounting

- acctdisk, 30
- acctdusg, 30
- acctmerg, 40

## disk blocks, display free ones

- df, 261

## disk quotas, remote quota daemon

- rquotad, 1415

## disk quotas and usage, display for a user's ufs file system

- quota, 1346

## diskettes, packages on

- pkgadd, 1230

## disks

- adds /dev entries for hard disks attached to the system, 317

## disks, partitioning and maintenance utility

- format, 408

## diskscan

- perform surface analysis, 321

## display

- system configuration information — prtconf, 1320
- system diagnostic information — prtdiag, 1322

## display cluster information

- clinfo, 225

## SNMP Adapter Subagent for WBEM

- snmpXwbemd, 1614

## display kernel statistics

- kstat, 727

## display or set boot environment description

- ludesc, 849

## displays information about processors

- psrinfo, 1330

Distributed File System  
*See* DFS  
dmesg — create error log from system diagnostic messages, 325  
dmi\_cmd — DMI command line interface utility, 326  
DMI command line interface utility — dmi\_cmd, 326  
DMI command line retrieval utility — dmiaget, 329  
dmiaget — DMI command line retrieval utility, 329  
dminfo — display device\_maps entries, 330  
dmisspd — Sun Solstice Enterprise DMI Service Provider, 332  
DoD Internet, host table — gettable, 471  
DoD Internet format host table, convert — htable, 492  
dodisk — accounting shell procedure, 43  
domain configuration server — dcs, 242  
domainname — display name of current domain, 335  
domainname — set name of current domain, 335  
driver statistics from a synchronous serial link, report — syncstat, 1692  
drvconfig — configure /devices, 336  
dsvclockd — DHCP service lock daemon, 338  
dumpadm — configure operating system crash dump, 339  
Dynamic Host Configuration Protocol  
*See* 'DHCP'

## E

edquota — edit user quotas for ufs file system, 346  
EEPROM display and load program — eeprom, 348  
efdaemon — embedded FCode interpreter daemon, 355  
embedded FCode interpreter daemon — efdaemon, 355  
encryption keys, server for storing private keys — keyserv, 720

environment variables, convert termcap description into terminfo description — captainfo, 145  
error log, create from system diagnostic messages — dmesg, 325  
etrn — send ETRN commands to start mail queue, 356  
EXX00 memory system administration — cfgadm\_ac, 161  
EXX00 system board administration — cfgadm\_sysctrl, 190

## F

fbconfig — Frame Buffer configuration utility, 358  
fdetach — detach a name from STREAMS-based file descriptor, 360  
fdisk — create or modify fixed disk partition table, Menu Options, 361  
ffbconfig — configure the FFB Graphics Accelerator, 368  
FIFO, make FIFO special file — mkfifo, 992  
FIFO, make — mknod, 1005  
File Transfer Protocol Server — ftpd, 576  
File Transfer Protocol Server — in.ftpd, 576  
file system  
  cache file systems  
    *See* cacheefs  
  change the dynamic parameters — tuneefs, 1755  
  check and repair — fsck, 414  
  check and repair ufs — fsck\_ufs, 424  
  construct — mkfs, 994  
  construct ufs — mkfs\_ufs, 1002  
  create new — newfs, 1082  
  debugger — fsdb, 428  
  display amount of used disk space occupied by ufs — df\_ufs, 271  
  display amount of used and available disk space — df, 261  
  grow — growfs, 483  
  link and unlink files and directories — link, 753  
  list file names and statistics — ff, 366  
  list file names and statistics for ufs — ff\_ufs, 376

file system (Continued)

- loopback — mount, 1027
- make literal copy — volcopy, 1800
- mount — mount, 1027
- mount — mountall, 1030
- mount ufs — mount\_ufs, 1052
- move directory — mvdir, 1061
- provide labels — labelit, 732
- provide labels for ufs — labelit\_ufs, 737
- report processes using file or file structure — fuser, 462
- share multiple resources — shareall, 1484
- ufs, make image copy — volcopy\_ufs, 1802
- unmount — umount, 1027
- unmount — umountall, 1030
- unshare multiple resources — unshareall, 1484

file system consistency check and interactive — fsck\_pcfs, 419

file system type, determine — fstyp, 455

files

- change ownership — chown, 220
- convert and copy — dd, 243

flar — administer flash archives, 377

flarcreate — create a flash archive from a master system, 380

floppy, managing, — rmmount, 1362

floppy, mounting, — rmmount, 1362

flush disk activity — sync, 1685

fmthard — populate Volume Table of Contents on hard disks, 383

fnccopy — copy FNS contexts, 387

fncreate — create an FNS context, 389

fncreate\_fs — create FNS file system contexts, 396

fncreate\_printer — create new printers in the FNS namespace, 401

fndestroy — destroy an FNS context, 404

FNS

- copy FNS contexts — fnccopy, 387
- create context — fncreate, 389
- create FNS file system contexts — fncreate\_fs, 396
- select naming service for FNS Initial Context — fnselect, 405

fnselect — select naming service for FNS Initial Context, 405

format — disk partitioning and maintenance utility, 408

Frame Buffer configuration utility — fbconfig, 358

front end for the Directory Server (DS) — directoryserver, 298

fruadm — prints and updates customer data associated with FRUs, 412

fsck\_cachefs — check integrity of data cached with CacheFS, 418

fsck — check and repair file systems, 414

fsck\_pcfs — file system consistency check and interactive, 419

fsck\_ufs — check and repair ufs, 424

fsdb — file system debugger, 428

fsdb\_ufs — ufs file system debugger, 437

- Commands, 440
- Expressions, 438
- Formatted Output, 443
- Inode Commands, 442

fsirand — install random inode generation numbers, 447

fssnap — create temporary snapshots of a file system, 448

fssnap\_ufs — create a temporary snapshot of a UFS file system, 450

fstyp — determine file system type, 455

ftpaddhost — set up a virtual FTP host, 456

ftpconfig — set up anonymous FTP, 458

ftpd — File Transfer Protocol Server, 576

ftprestart — restart previously shutdown FTP Servers, 459

ftpshtut — close down the FTP Servers at a given time, 460

fuser — identify processes using file or file structure, 462

fwtmp — convert connect accounting records to ASCII, 464

## G

generate message IDs — msgid, 1060

get printer configuration — lpget, 816

getdev — lists devices that match given criteria, 465

getdgrp — lists device groups which contain devices that match given criteria, 467

getent — gets a list of entries from administrative databases, 469  
 gettable — get DoD Internet host table, 471  
 getty — set terminal type, modes, speed, and line discipline, 472  
 getvol — verifies device accessibility, 474  
 GFXconfig — configure the Raptor GFX Graphics Accelerator, 1218  
 graphical interface for managing DHCP service — dhcpcmgr, 283  
 group file, check for inconsistencies — grpck, 1341  
 groupadd — add (create) a new group definition on the system, 478  
 groupdel — delete a group definition on the system, 480  
 groupmod — modify a group definition on the system, 481  
 growfs — grow file system, 483

## H

halt — stop the processor, 489  
 hard disks, populate Volume Table of Contents — fmthard, 383  
 hostconfig — configure a system's host parameters, 490  
 hsf  
   labels for hsf file systems, provide and print — labelit\_hsf, 734  
   mount — mount\_hsf, 1036  
 htable — convert DoD Internet format host table, 492

## I

I/O statistics report — iostat, 653  
 IA Network Booting RPL (Remote Program Load) Server — rpld, 1410  
 ICMP, router discovery daemon — in.rdisc, 607  
 id — return user identity, 493  
 idsconfig — prepare an iPlanet Directory Server (iDS) to be populated with data and serve LDAP clients, 496  
 ifconfig — configure network interface parameters, 498

ikeadm — manipulate Internet Key Exchange (IKE) parameters and state, 519  
 ikecert —, 526  
 imqadmin — command used to launch the MQ Administration Console, a graphical user interface for performing MQ administration tasks, 531  
 in.comsat — biff server, 562  
 in.dhcpd — DHCP server, 563  
 in.fingerd — remote user information server, 571  
 in.ftpd — File Transfer Protocol Server, 576  
 in.iked — daemon for the Internet Key Exchange (IKE), 583  
 in.lpd — print job listener, 592  
 in.rarpd — Reverse Address Resolution Protocol server, 605  
 in.rdisc — ICMP router discovery daemon, 607  
 in.rexecd — remote execution server, 609  
 in.ripngd — network routing daemon for IPv6, 611  
 in.rlogind — remote login server, 614  
 in.routed — network routing daemon, 617  
 in.rshd — remote shell server, 623  
 in.rwhod — system status server, 626  
 in.talkd — talk server, 644  
 in.telnetd — DARPA TELNET virtual terminal protocol server, 645  
 in.tftpd — Internet Trivial File Transfer Protocol server, 648  
 in.tnamed — DARPA trivial name server, 650  
 in.uucpd — UUCP server, 651  
 incremental file system dump —  
   ufsdump, 1759  
 inetd — Internet services daemon, 568  
 init — process control initialization, 585  
   /etc/defaults/init file, 586  
   init and System Booting, 585  
   inittab Additions, 586  
   Run Level Changes, 586  
   Run Level Defined, 585  
   telinit, 586  
 init.wbem — start CIM Boot Manager, 590  
 init.wbem — stop CIM Object Manager, 590  
 inode, clear — clri, 226  
 install — install commands, 628  
 install, SunOS/SVR4 — suninstall, 1661  
 installboot procedures — boot, 630

installer — Solaris Web Start installer utility, 632  
 installf — add a file to software installation database, 633  
 Internet  
   biff server — in.comsat, 562  
   DARPA TELNET virtual terminal protocol server — in.telnetd, 645  
   DARPA trivial name server — in.tnamed, 650  
   DHCP server — in.dhcpd, 563  
   DHCP service configuration — dhcpconfig, 276  
   ICMP router discovery daemon — in.rdisc, 607  
   network routing daemon — in.routed, 617  
   query domain name servers — nslookup, 1162  
   query domain name servers — nstest, 1170  
   RARP server — in.rarpd, 605  
   remote user information server — in.fingerd, 571  
   send ICMP ECHO\_REQUEST packets to network hosts — ping, 1225  
   server for talk program — in.talkd, 644  
   services daemon — inetd, 568  
   system status server — in.rwhod, 626  
   Trivial File Transfer Protocol server — in.tftpd, 648  
 Internet Control Message Protocol  
   *See* ICMP  
 Internet Protocol, to Ethernet addresses — arp, 70  
 Interprocess Communication, make FIFO special file — mkfifo, 992  
 iostat — report I/O statistics, 653  
 ipsecconf — configure system wide IPsec policy, 667  
 ipseckey — manually manipulate an IPsec Security Association Database (SABD), 683

## K

kadb — a kernel debugger, 692  
 kdb5\_util — Kerberos Database maintenance utility, 712

kdmconfig — configure or unconfigure keyboard, display, and mouse options, 714  
 Kerberos Database maintenance utility — kdb5\_util, 712  
 Kerberos warning daemon — ktkd\_warnd, 731  
 kernel — UNIX system executable file containing basic operating system services, 717  
 kernel  
   debugger — kadb, 692  
   display status of loaded modules — modload, 1006  
   load a module — modload, 1007  
 kernel — UNIX system executable file containing basic operating system services SPARC Only, 717, 719  
 kernel  
   unload a module — modunload, 1008  
 kernel debugger — kadb, 692  
 Kernel Symbolic Debugging for OpenBoot Firmware — obpsym, 1189  
 kernel system event command invocation daemon — syseventconfd, 1700  
 kernel system event notification daemon — syseventd, 1701  
 keyserv — server for storing private encryption keys, 720  
 killall — kill all active processes, 722  
 kstat — display kernel statistics, 727  
 ktkd\_warnd — Kerberos warning daemon, 731

## L

labelit — provide labels for file systems, 732  
 labelit\_hfs — provide and print labels for hfs file systems, 734  
 labelit\_ufs — provide labels for ufs, 737  
 lastlogin — accounting shell procedure, 43  
 ldapaddent — create LDAP entries from corresponding /etc files, 738  
 link — link and unlink files and directories, 753  
 listdgrp — lists members of a device group, 754  
 listen — network listener daemon, 755  
 llc2\_loop — loopback diagnostics to test the driver, adapter and network., 757  
 lock, — lockstat, 766

- lockd — network lock daemon, 761
- lockfs — lock file system, 763
- lockstat — report kernel lock and profiling statistics, 766
- lofiadm — administer files available as block devices through lofi, 774
- log files and system log daemon — syslogd, 1709
- logadm —, 779
- logins — list user and system login information, 788
- loopback diagnostics to test the driver, adapter and network. — llc2\_loop, 757
- loopback file system, mount — mount, 1027
- LP print services
  - administer filters — lpfilter, 803
  - administer forms — lpforms, 809
  - configure — lpadmin, 790
  - register remote systems — lpsystem, 825
  - set printing queue priorities — lpusers, 826
- lpadmin — configure LP print service, 790
- lpfilter — administer filters used with LP print service, 803
- lpforms — administer forms used with LP print service, 809
- lpforms — administer forms used with the LP print service
  - Adding or Changing a Form, 809
  - Allowing and Denying Access to a Form, 812
- lpforms — administer forms used with the,
  - Deleting a Form, 811
- lpforms — administer forms used with the LP print service
  - Listing Form Attributes, 812
  - Listing the Current Alert, 814
  - Removing an Alert Definition, 814
  - Setting an Alert to Mount a Form, 812
  - Terminating an Active Alert, 814
- lpget — get printer configuration, 816
- lpmove — moves print requests that are queued, 818
- lpsched — start the LP print service, 820
- lpset — set printing configuration, 821
- lpshut — stop the LP print service, 824
- lpsystem — register remote systems with LP print service, 825
- lpusers — set printing queue priorities, 826
- lu, 828
- luactivate, 831
- lucancel, 833
- lucompare, 834
- lucreate, 837
- lucurr, 845
- ludelete, 847
- ludesc — display or set boot environment description, 849
- ludesc, 849
- lufslst, 852
- lumake, 854
- lumount, 856
- lurename, 859
- lustatus, 861
- luupgrade, 863
- luxadm — administration program for the Sun Enterprise Network Array (SENA), RSM, SPARCstorage Array (SSA) subsystems, Sun Fire 880 internal storage subsystem, and individual Fiber Channel Arbitrated Loop (FC\_AL) devices, 871
- luxadm — administration program for the Sun Enterprise Network Array (SENA), RSM and SPARCstorage Array (SSA) subsystems
  - Enclosure, 873
  - Enclosure Services Card Subcommands, 881
  - Other Expert Mode Subcommands, 882
  - Pathname, 871
  - SENA Expert Mode Subcommands, 881
  - SPARCstorage Array Subcommands, 880
  - Subcommands, 873
  - usr/sbin, 885

**M**

- m64config — configure the M64 Graphics Accelerator, 887
- mail delivery server — sendmail, 1459
- mail.local — store mail in a mailbox, 892
- mail utilities
  - biff server — in.comsat, 562
  - create aliases database — newaliases, 1080
- make device\_allocate entries — mkdevalloc, 990
- make device\_maps entries — mkdevmaps, 991
- make FIFO — mknod, 1005

make FIFO special file — mkfifo, 992  
 make local NFS file systems available for  
   mounting by remote systems —  
   share\_nfs, 1485  
 make named pipe — mkfifo, 992  
 make named pipe — mknod, 1005  
 make special file — mknod, 1005  
 makedbm — make NIS ndbm file, 894  
 manage and view WBEM log files —  
   smlog, 1558  
 manage bulk operations on user accounts —  
   smmultiuser, 1565  
 manage diskless client support for a server —  
   smdiskless, 1544  
 manage email alias entries — smmaillist, 1561  
 manage entries in the exec\_attr database —  
   smexec, 1550  
 manage group entries — smgroup, 1554  
 manage jobs in the crontab database —  
   smcron, 1537  
 manage OS services — smoservice, 1570  
 manage patches — smpatch, 1575  
 manage profiles in the prof\_attr and exec\_attr  
   databases — smprofile, 1581  
 manage roles and users in role accounts —  
   smrole, 1587  
 manage serial port — smserialport, 1595  
 manage user entries — smuser, 1601  
 manipulate Internet Key Exchange (IKE)  
   parameters and state — ikeadm, 519  
 manual pages, create formatted files for —  
   catman, 146  
 manually manipulate an IPsec Security  
   Association Database (SABD) —  
   ipseckey, 683  
 map out defective disk blocks — addbadsec, 49  
 mdmonitord — daemon to monitor  
   metadevices, 900  
 medstat command, 901  
 metaclear command, 903  
 metadb file, 905  
 metadetch command, 950  
 metadevadm command, 910  
 metahs command, 912  
 metainit command, 915  
 metaoffline command, 925  
 metaonline command, 925  
 metaparam command, 927  
 metarecover — recover soft partition  
   information, 929  
 metarename command, 931  
 metareplace command, 935  
 metaroot command, 938  
 metaset command, 940  
 metastat command, 945  
 metasync command, 948  
 metattach command, 950  
 mibiisa — Sun SNMP Agent, 956  
 mipagent — Mobile IP agent, 979  
 mipagentconfig — configure Mobility IP  
   Agent, 982  
 mipagentstat — show Mobile IP Mobility Agent  
   status, 988  
 mkdevalloc — make device\_allocate  
   entries, 990  
 mkdevmaps — make device\_maps entries, 991  
 mkfifo — make FIFO special file, 992  
 mkfile — create a file, 993  
 mkfs — make file system, 994  
 mkfs\_pcfs — construct a FAT file system, 996  
 mkfs\_udfs — construct a udfs file system, 1000  
 mkfs\_ufs — construct ufs, 1002  
 mknod — make special file, 1005  
 Mobile IP agent — mipagent, 979  
 modify a project's information on the system —  
   projmod, 1313  
 modify a role's login information on the system  
   — rolemod, 1373  
 modify device driver attributes —  
   update\_drv, 1775  
 modinfo — display status of loaded kernel  
   modules, 1006  
 modload — load a kernel module, 1007  
 modunload — unload a kernel module, 1008  
 mofcomp — compile MOF files into CIM  
   classes, 1009  
 monacct — accounting shell procedure, 43  
 monitor program — monitor, 1015  
 monitor system behavior using CPU  
   performance counters — cpustat, 236  
 mount — mount filesystems and remote  
   resources, 1027  
 mount, show all remote mounts —  
   showmount, 1492  
 mount\_cachefs — mount CacheFS file  
   systems, 1032

- mount\_hfs — mount hfs file systems, 1036
- mount hfs file systems — mount\_hfs, 1036
- mount\_nfs — mount remote NFS
  - resources, 1038
- mount\_pcfs — mount pcfs file systems, 1046
- mount pcfs file systems — mount\_pcfs, 1046
- mount\_tmpfs — mount tmpfs, 1048
- mount\_ufs — mount ufs, 1052
- mount\_xmemfs —, 1056
- mountall — mount multiple filesystems, 1030
- mountd — NFS mount request server, 1035
- mouse, keyboard, display, configure or
  - unconfigure — kdmconfig, 714
- mpstat — report per-processor statistics, 1058
- msgid — generate message IDs, 1060
- mvdir — move a directory, 1061

## N

- name service cache daemon — nscd, 1160
- named-bootconf — convert name server
  - configuration files, 1062
- named pipe, make — mkfifo, 992
- named pipe, make — mknod, 1005
- named-xfer — ancillary agent for inbound zone
  - transfers, 1063
- ncaconfd — Solaris Network Cache and
  - Accelerator (NCA) configuration
  - daemon, 1065
- ncheck — generate a list of path names vs
  - i-numbers of all files on special, 1066
- ncheck\_ufs — generate a list of pathnames vs
  - i-numbers for ufs, 1068
- ndd — get and set driver configuration
  - parameters, 1071
- netstat — show network status, 1073
- netstat — display network status
  - Active Sockets (First Form), 1076
  - DHCP Interface Information (Sixth Form), 1078
  - Interface Status (Third Form), 1077
  - Multicast Routing Tables (Fifth Form), 1078
  - Network Data Structures (Second Form), 1076
  - Routing Table (Fourth Form), 1078
  - TCP Sockets, 1076
- network routing daemon — in.routed, 617

- network
  - listener daemon — listen, 755
  - lock daemon — lockd, 761
  - test connections to hosts using ICMP —
    - ping, 1225
- Network File System
  - See* NFS
- network interface parameters, configure —
  - ifconfig, 498
- network listener service, administration —
  - nlsadmin, 1154
- network packets capture and inspection —
  - snoop, 1616
- network routing daemon for IPv6 —
  - in.ripngd, 611
- Network Time Protocol daemon — xntpd, 1822
- newaliases — make mail aliases database, 1080
- newfs — make new file system, 1082
- newkey — create a new key in publickey
  - database, 1086
- NFS
  - crash and recovery functions for locking
    - services — statd, 1649
  - create files for use as NFS mounted swap
    - areas — mkfile, 993
  - daemon — nfsd, 1088
  - display information on resources shared —
    - dfmounts\_nfs, 267
  - display statistics — nfsstat, 1093
  - list available resources from remote systems
    - dfshares\_nfs, 269
  - make local NFS filesystem unavailable for
    - mounting by remote systems —
      - unshare\_nfs, 1774
  - mount — mount\_nfs, 1038
  - mount request server — mountd, 1035
- NFS, secure, create a new key in publickey
  - database — newkey, 1086
- NFS security, server for storing private
  - encryption keys — keyserve, 720
- nfsstat — display NFS statistics, 1093
- NIS
  - binder process — ypbind, 1846
  - make ndbm file — makedbm, 894
  - point binder process ypbind at a particular
    - server — ypset, 1856
  - rebuild database — ypmake, 1849

## NIS (Continued)

- return current version of a NIS map at a NIS server host — `yppoll`, 1850
- transfer NIS map from a NIS server to host — `ypxfr`, 1859

## NIS+

- add /etc files and NIS maps into their corresponding NIS+ tables — `nisaddent`, 1104
- client and root server initialization utility — `nisinit`, 1121
- credential creation tool — `nisaddcred`, 1098
- display the contents of the NIS+ transaction log — `nislog`, 1129
- initialize a domain to store system administration information— `nissetup`, 1148
- `nisping` — ping NIS+ servers, 1130
- `nissetup` — initialize a NIS+ domain to serve clients, 1148
- `nisstat` — report NIS+ server statistics, 1150
- service daemon — `rpc.nisd`, 1392
- update public keys in NIS+ directory object — `nisupdkeys`, 1152
- utility to cache location information about NIS+ servers — `nis_cachemgr`, 1114
- utility to print out the contents of the shared cache file — `nisshowcache`, 1149
- NIS+ credentials for NIS+ principals, initialize — `nisclient`, 1116
- NIS+ password update daemon
  - `nisspasswd`, 1398
  - `rpc.nisspasswd`, 1398
- NIS+ servers, set up — `nissserver`, 1145
- NIS+ utility to set server preferences for NIS+ clients — `nisprefadm`, 1138
- NIS server and binder processes
  - `ypserv`, 1853
  - `ypxfrd`, 1853
- NIS services, start, — `ypstart`, 1858
- NIS services, stop, — `ypstop`, 1858
- `nisaddcred` — create NIS+ credentials, 1098
- `nisaddent` — add /etc files and NIS maps into their corresponding NIS+ tables, 1104
- `nisbackup` — backup NIS+ directories, 1111
- `nisclient` — initialize NIS+ credentials for NIS+ principals, 1116

- `nisldapmaptest` — test NIS+ and LDAP mapping configuration files, 1125
- `nisspasswd` — NIS+ password update daemon, 1398
- `nisping` — ping NIS+ servers, 1130
- `nispopulate` — populate the NIS+ tables in a NIS+ domain, 1133
- `nisprefadm` — NIS+ utility to set server preferences for NIS+ clients, 1138
- `nisrestore` — restore NIS+ directory backup, 1142
- `nissserver` — set up NIS+ servers, 1145
- `nissetup` — initialize a domain to serve clients, 1148
- `nisshowcache` — NIS+ utility to print out the contents of the shared cache file, 1149
- `nisstat` — report NIS+ server statistics, 1150
- `nscd` — name service cache daemon, 1160
- `nslookup` — query Internet domain name servers, 1162
- `nstest` — query Internet domain name servers, 1170
- `nsupdate` — update Internet name servers interactively, 1174
- `ntpdate` — set the date and time by way of NTP, 1177
- `ntpq` — standard Network Time Protocol query program, 1180
  - Control Message Commands, 1182
  - Interactive Commands, 1181
- `ntptrace` — trace a chain of NTP hosts back to their master time source, 1187
- `nulladm` — accounting shell procedure, 43

## O

- `obpsym` — Kernel Symbolic Debugging for OpenBoot Firmware, 1189
  - Kernel Symbolic Name Syntax, 1189
- OCF server — `ocfserv`, 1191
- `ocfserv` — OCF server, 1191
- operating system
  - install SunOS/SVR4 — `suninstall`, 1661
  - save core dump — `savecore`, 1455
- operating system, bootable, load and execute — boot, 113

output system definition, display current —  
sysdef, 1694  
owner of file, change — chown, 220

## P

pack files and file systems in the cache —  
cachefspack, 139  
packages, install, upgrade, and remove software  
— swmtool, 1681  
parse clustertoc file based on dynamic entries —  
parse\_dynamic\_clustertoc, 1192  
parse\_dynamic\_clustertoc — parse clustertoc  
file based on dynamic entries, 1192  
passmgmt — password files management, 1193  
password file, check for inconsistencies —  
pwck, 1341  
passwords  
installs and updates /etc/shadow with  
information from /etc/passwd —  
pwconv, 1342  
management — passmgmt, 1193  
patchadd — apply a patch package to a Solaris  
2 system, 1195  
patchrm — remove a Solaris patch package and  
restore previously saved files, 1205  
pbind — control and query bindings of  
processes to processors, 1211  
Binding processes, 1211  
Querying Bindings, 1212  
Unbinding a process, 1212  
pcfs, mount — mount\_pcfs, 1046  
PCMCIA user daemon — pcmciad, 1213  
pcmciad — PCMCIA user daemon, 1213  
per-processor statistics report — mpstat, 1058  
perform surface analysis — diskscan, 321  
pfinstall — tests installation profiles, 1214  
pgxconfig — configure the PGX32 Graphics  
Accelerator, 1218  
PICL daemon — picld, 1223  
picld — PICL daemon, 1223  
pkgadd — transfer software packages to  
system, 1230  
pkgask — stores answers to an interactive  
software package, 1233  
pkgchk — check package installation  
accuracy, 1235

pkgrm — remove package from system, 1238  
pmconfig — Configure the power management  
system, 1246  
pntadm — DHCP network table management  
utility, 1248  
Point to point protocol daemon — pppd, 1268  
pool administration utility — pooladm, 1255  
pool binding command — poolbind, 1257  
pooladm — pool administration utility, 1255  
poolbind — pool binding command, 1257  
populate security attribute databases in a name  
service — smattrpop, 1507  
populate the NIS+ tables in a NIS+ domain —  
nispopulate, 1133  
ports  
add or remove a service — pmadm, 1241  
create /dev entries and inittab entries for  
serial lines — ports, 1263  
enable or disable a service — pmadm, 1241  
install or replace a service configuration  
script — pmadm, 1241  
print requested service information —  
pmadm, 1241  
service administration — pmadm, 1241  
power manager daemon — powerd, 1267  
powerd — power manager daemon, 1267  
poweroff — stop the processor, 489  
PPP tunneling driver utility — sppptun, 1632  
pppd — Point to point protocol daemon, 1268  
PPPoE chat utility — pppoec, 1293  
PPPoE server daemon — pppoed, 1296  
pppoec — PPPoE chat utility, 1293  
pppoed — PPPoE server daemon, 1296  
pppstats — Print PPP statistics, 1301  
praudit — display audit trail, 1304  
prctmp — accounting shell procedure, 43  
prdaily — accounting shell procedure, 43  
prepare an iPlanet Directory Server (iDS) to be  
populated with data and serve LDAP clients  
— idsconfig, 496  
print device specific information —  
devinfo, 253  
print FRUID-specific information about the  
FRUs on a system or domain — prtfru, 1323  
print PICL tree — prtpicl, 1324  
Print PPP statistics, 1301  
print queue, accept or reject requests — accept,  
reject, 28

print requests, accept or reject — accept, reject, 28  
 print service, LP, — lpmove, 818  
 printer filters  
   add and change — lpfilter, 803  
   list attributes — lpfilter, 803  
   remove — lpfilter, 803  
 printer forms  
   add or change — lpforms, 809  
   delete — lpforms, 811  
   list attributes — lpforms, 812  
   listing the current alert — lpforms, 814  
   provide access — lpforms, 812  
   removing an alert definition — lpforms, 814  
   setting an alert to mount a form — lpforms, 812  
   terminating an active alert — lpforms, 814  
 printers  
   add and change printers — lpadmin, 790  
   define alerts for printer faults — lpadmin, 790  
   mount printer wheels — lpadmin, 790  
   remove printers — lpadmin, 790  
   set or change system default destination — lpadmin, 790  
   setting priorities — lpusers, 826  
 printmgr.lm — Solaris Print Manager is a graphical user interface for managing printers in a network, 1305  
 prints and updates customer data associated with FRUs — fruadm, 412  
 privatepw — administer FTP Server enhanced group access file, 1307  
 process accounting  
   — acctcms, 36  
   — accton, 30  
   — acctprc, 41  
 process scheduler, administration — dispadmin, 322  
 processes  
   initialization — init, 585  
   kill all active processes — killall, 722  
   using file or file structure — fuser, 462  
 prodreg — Solaris Product Registry, 1309  
 program, standalone, load and execute — boot, 113  
 programming tools, install — install commands, 628  
 projadd —, 1310  
 projdel — delete a project from the system, 1312  
 projmod — modify a project's information on the system, 1313  
 PROM monitor program — monitor, 1015  
 PROM monitor program, display and load program — eeprom, 348  
 prstat — report active process statistics, 1315  
 prtacct — accounting shell procedure, 43  
 prtconf — print system configuration information, 1320  
 prtdiag — print system diagnostic information, 1322  
 prtfru — print FRUID-specific information about the FRUs on a system or domain, 1323  
 prtpicl — print PICL tree, 1324  
 prtvtoc — print the VTOC of a block device, 1325  
 psradm — change processor operational status, 1327  
 psrinfo — displays information about processors, 1330  
 psrset — creation and management of processor sets, 1332  
 putdev — add, modify remove device entry from table, 1336  
 putdgrep — add, remove and change device group table, 1339

## Q

query routing daemons for their routing tables — rtquery, 1419  
 quick halt, — halt, 489  
 quota, remote quota daemon — rquotad, 1415  
 quotas  
   check file system quota for inconsistencies — quotacheck, 1347  
   display a user's disk quota and usage — quota, 1346  
   displays number of blocks in filesystem currently owned by each user — quot, 1344  
   summarize quotas for a file system — repquota, 1358  
   turn off file system quotas — quotaoff, 1348

quotas (Continued)  
    turn on file system quotas — quotaon, 1348  
quotas, user, edit — edquota, 346

## R

RARP, server — in.rarpd, 605  
re-preinstall — restore a system to its original factory condition, 1359  
real-time clock and GMT-lag management, provide — rtc, 1418  
reboot — restart the operating system, 1353  
rebuild NIS database — ypmake, 1849  
recover soft partition information — metarecover, 929  
reject — reject print requests, 28  
remote execution server — in.rexecd, 609  
remote login server — in.rlogind, 614  
remote shell server — in.rshd, 623  
remote shell server — rshd, 623  
remote system with debugging on, try to contact — Uutry, 1794  
remote login server — in.rlogind, rlogind, 614  
remote system with debugging on, try to contact — Uutry, uutry, 1794  
remote magtape protocol server — rmt, 1365  
Remote Program Load Server  
    *See* rpld  
remote resources  
    mount or unmount — mount, 1027  
    mount NFS — mount\_nfs, 1038  
remote system  
    execute remote command requests — uuxqt, 1795  
    make local resource unavailable for mounting — unshare, 1773  
    register with LP print service — lpssystem, 825  
    set system date — rdate, 1352  
    user information server — in.fingerd, 571  
removable media device server — rpc.smsvervd, 1405  
removable media mounter for CD-ROM and floppy — rmmount, 1362  
remove a Solaris patch package and restore previously saved files — patchrm, 1205

removef — remove a file from software database, 1356  
removes an application from the Solstice application registry — soldelapp, 1630  
report active process statistics — prstat, 1315  
report bus-related performance statistics — busstat, 132  
report I/O statistics — iostat, 653  
report trap statistics — trapstat, 1739  
restart previously shutdown FTP Servers — ftprestart, 459  
restore, incremental file system restore — ufsrestore, 1766  
restore NIS+ directory backup — nisrestore, 1142  
return user identity — id, 493  
Reverse Address Resolution Protocol  
    *See* RARP  
rlogind — remote login server, 614  
rm\_drv — remove a device driver from the system, 1355  
rmmount — removable media mounter for CD-ROM and floppy, 1362  
rmt — remote magtape protocol server, 1365  
roleadd — administer a new role account on the system, 1367  
roledel — delete a user's login from the system, 1371  
rolemod — modify a role's login information on the system, 1373  
root directory, change for a command — chroot, 221  
route — manually manipulate routing tables, 1376  
RPC  
    kernel statistics server — rpc.rstatd, 1402  
    network username server — rpc.rusersd, 1403  
    network wall server — rpc.rwall, 1404  
    NIS+ service daemon — rpc.nisd, 1392  
    program number to universal addresses mapping — rpcbind, 1382  
    remote execution server — rpc.rexd, 1400  
    remote quota daemon — rquotad, 1415  
    report information — rpcinfo, 1385  
    sends one-way stream of packets to host — spray, 1634

## RPC (Continued)

- server which records packets sent by spray
  - `rpc.sprayd`, 1406
- server, Autofs mount/unmount requests — `automountd`, 108
- server, NFS mount requests — `mountd`, 1035
- RPC, secure, create a new key in publickey database — `newkey`, 1086
- `rpc.bootparamd` — boot parameter server, 1384
- `rpc.metad` command, 1389
- `rpc.metamedd` command, 1390
- `rpc.metamhd` command, 1391
- `rpc.nisd` — NIS+ service daemon, 1392
  - `rpc.nisd_resolv`, 1392, 1397
- `rpc.nispasswdd` — NIS+ password update daemon, 1398
- `rpc.rexd` — remote execution daemon, 1400
- `rpc.rstatd` — kernel statistics server, 1402
- `rpc.ruserd` — network username server, 1403
- `rpc.rwalld` — network wall server, 1404
- `rpc.smservd` — removable media device server, 1405
- `rpc.sprayd` — records packets sent by spray, 1406
- `rpc.ypupdated` — server for changing NIS information, 1409
- `rpcbind` — converts RPC program numbers to universal addresses, 1382
- `rpcinfo` — report RPC information, 1385
- `rpld` — IA Network Booting RPL (Remote Program Load) Server, 1410
- `rquotad` — remote quota server, 1415
- `rsh` — the restricted shell command interpreter, 1416
- `rshd` — remote shell server, 623
- `rtc` — provide all real-time clock and GMT-lag management, 1418
- `rtquery` — query routing daemons for their routing tables, 1419
- `runacct` — run daily accounting, 1421
- `rwall` — write to all users over a network, 1424
- `rwall` daemon, network wall server — `rpc.rwalld`, 1404

## S

- `sac` — Service Access Controller (SAC), 1425

- `sacadm` — Service Access Controller administration, 1428
- `sadmind` — Distributed system administration daemon, 1432
- `saf` — Service Access Facility (SAF), 1436
- SAF
  - format and output port monitor-specific information — `ttyadm`, 1750
  - port monitor for terminal ports — `ttymon`, 1752
- `savecore` — save OS core dump, 1455
- scheduler, process, administration — `dispadmin`, 322
- `sckmd` — Sun Fire 15K key management daemon, 1457
- SCSI hardware specific commands for `cfgadm` — `cfgadm_scsi`, 184
- select a time zone — `tzselect`, 1757
- select naming service for FNS Initial Context — `fnselect`, 405
- select or display devices used as auxiliary console devices — `consadm`, 227
- `sendmail` — mail delivery system, 1459
- set serial line interface, set operating parameters — `syncinit`, 1686
- server for changing NIS information
  - `rpc.ypupdated`, 1409
  - `ypupdated`, 1409
- servers
  - `automountd` — mount/unmount request server, 108
  - biff server — `in.comsat`, 562
  - DARPA TELNET virtual terminal protocol server — `in.telnetd`, 645
  - DARPA trivial name server — `in.tnamed`, 650
  - DHCP server — `in.dhcpd`, 563
  - `in.rexecd` — remote execution server, 609
  - `in.uucpd` — UUCP server, 651
  - `inetd` — Internet services daemon, 568
  - `mountd` — mount request server, 1035
  - RARP server — `in.rarpd`, 605
  - system status server — `in.rwhod`, 626
  - talk program server — `in.talkd`, 644
  - `yppasswdd` — NIS password server, 1407
- servers, NIS+, location information — `nis_cachemgr`, 1114

Service Access Controller  
*See* SAC

Service Access Facility  
*See* SAF

Service Location Protocol Daemon —  
 slpd, 1497

set printing configuration — lpset, 821

set the date and time by way of NTP —  
 ntpdate, 1177

set up a virtual FTP host — ftpaddhost, 456

set up anonymous FTP — ftpconfig, 458

setuname — changes machine  
 information, 1479

sf880drd — Sun Fire 880 Dynamic  
 Reconfiguration daemon, 1480

share — make local resource available for  
 mounting by remote systems, 1482

share\_nfs — make local NFS file system  
 available for mounting by remote  
 systems, 1485

shareall — multiple resources, 1484

SHELL variable — rsh, 1416

shells, the restricted shell command interpreter  
 — rsh, 1416

show Mobile IP Mobility Agent status —  
 mipagentstat, 988

show network status — netstat, 1073

showmount — display remote mounts, 1492

showrev — displays revision information for  
 current hardware and software, 1493

shutacct — accounting shell procedure, 43

shutdown — shutdown system, change system  
 state, 1495

slpd — Service Location Protocol  
 Daemon, 1497

smartcard — configure and administer a  
 smartcard, 1499

smattrpop — populate security attribute  
 databases in a name service, 1507

smc — start the Solaris Management  
 Console, 1512

smccompile — build class list and compile  
 Solaris Management Console service beans  
 for remote use, 1516

smconf — configure the Solaris Management  
 Console, 1520

smcron — manage jobs in the crontab  
 database, 1537

smdiskless — manage diskless client support  
 for a server, 1544

smexec — manage entries in the exec\_attr  
 database, 1550

smgroup — manage group entries, 1554

smlog — manage and view WBEM log  
 files, 1558

smmaillist — manage email alias entries, 1561

smmultiuser — manage bulk operations on user  
 accounts, 1565

smosservice — manage OS services, 1570

smpatch — manage patches, 1575

smprofile — manage profiles in the prof\_attr  
 and exec\_attr databases, 1581

smrole — manage roles and users in role  
 accounts, 1587

smserialport — manage serial port, 1595

smuser — manage user entries, 1601

snmpdx — Sun Solstice Enterprise Master  
 Agent, 1609

snmpXdmid — Sun Solstice Enterprise  
 SNMP-DMI mapper subagent, 1612

snoop — capture and inspect network  
 packets, 1616

soconfig — configure transport providers for  
 use by sockets, 1627

software package  
 add a file to the software installation  
 database — installf, 633  
 check installation accuracy — pkgchk, 1235  
 remove a file from software database —  
 removef, 1356  
 remove package from system —  
 pkgrm, 1238  
 stores answers to an interactive package —  
 pkgask, 1233

soladdapp — adds an application to the Solstice  
 application registry, 1629

Solaris Network Cache and Accelerator (NCA)  
 configuration daemon — ncaconfd, 1065

Solaris Print Manager is a graphical user  
 interface for managing printers in a network  
 — printmgr.lm, 1305

Solaris Product Registry  
*See* ProdReg

Solaris Web Start installer utility —  
 installer, 632

soldelapp — removes an application from the Solstice application registry, 1630  
 solstice — access system administration tools with a graphical user interface, 1631  
 SPARCstorage Array, administration program — ssaadm, 1635  
 special NTP query program — xntpd, 1838  
 sppptun — PPP tunneling driver utility, 1632  
 spray — sends one-way stream of packets to host, 1634  
 ssaadm — administration program for the SPARCstorage Array, 1635  
 standard Network Time Protocol query program — ntpq, 1180  
 Start and stop NIS services, — ypstart, 1858  
 Start NIS services, — ypstart, 1858  
 start Sun WBEM User Manager — wbemadmin, 222, 1807  
 start the LP print service — lpsched, 820  
 start the Solaris Management Console — smc, 1512  
 start WBEM Log Viewer — wbemlogviewer, 1811  
 startup — accounting shell procedure, 43  
 startup procedures — boot, 630  
 statd — network status monitor, 1649  
 statistics  
     audit — auditstat, 97  
     for file system — ff, 366  
     for ufs file system — ff, 376  
     I/O — iostat, 653  
     NFS, display — nfsstat, 1093  
     per-processor — mpstat, 1058  
 stop the processor — halt, 489  
 stop the processor — poweroff, poweroff, 489  
 Stop NIS services, — ypstop, 1858  
 stop the LP print service — lpshut, 824  
 store mail in a mailbox — mail.local, 892  
 STREAMS  
     automatically pushed modules — autopush, 109  
     detach a name from file descriptor — fdetach, 360  
     error logger cleanup program — strclean, 1652  
     error logger daemon — strerr, 1653  
     port monitor for terminal ports — ttymon, 1752

## STREAMS (Continued)

    print trace messages — strace, 1650  
 su — become super user or another user, 1657  
 sulogin — single-user mode automatically invoked when system is first started, 1660  
 Sun Fire 880 Dynamic Reconfiguration daemon — sf880drd, 1480  
 Sun Fire 15K key management daemon — sckmd, 1457  
 Sun SNMP Agent — mibiisa, 956  
 Sun Solstice Enterprise DMI Service Provider — dmispd, 332  
 Sun Solstice Enterprise Master Agent — snmpdx, 1609  
 Sun Solstice Enterprise SNMP-DMI mapper subagent — snmpXdmid, 1612  
 SUNWgfb\_config — configure the XVR-1000 Graphics Accelerator, 1662  
 suninstall — install SunOS/SVR4, 1661  
 super user command — su, 1657  
 swap — administer the system swap areas, 1678  
 swmtool — install, upgrade and remove software packages, 1681  
 sxconfig — configure contiguous memory for sx video, 1682  
 sync — update super block, 1685  
 synchronous serial link, report driver statistics — syncstat, 1692  
 synchronous serial loopback test program — syncloop, 1689  
 syncinit — set serial line interface operating parameters., 1686  
 syncloop — synchronous serial loopback test program, 1689  
 syncstat — report driver statistics from a synchronous serial link., 1692  
 sys-unconfig — undo system configuration, 1712  
 sysdef — displays current system definition, 1694  
 sysevent event specification administration — syseventadm, 1696  
 syseventadm — sysevent event specification administration, 1696  
 syseventconfd — kernel system event command invocation daemon, 1700

- syseventd — kernel system event notification daemon, 1701
- sysidconfig — execute or define configuration applications, 1703
- sysidnet — system configuration, 1706
- sysidpm — system configuration, 1706
- sysidroot — system configuration, 1706
- sysidtool — system configuration, 1706
- syslogd — system log message daemon, 1709
- system activity reports — sar, 1453
- system status server — in.rwhod, 626
- system administration
  - access control lists — admintool, 55
  - add a file to the software installation database — installf, 633
  - control for basic administrative functions — uadmin, 1758
  - create formatted files for manual pages — catman, 146
  - get entries from administrative database — getent, 469
  - install commands — install, 628
  - NIS+ aliases — aliasadm, 65
  - system databases — admintool, 55
- system configuration
  - print information — prtconf, 1320
  - sysidnet, 1706
  - sysidpm, 1706
  - sysidroot, 1706
  - sysidtool, 1706
  - undo — sys-unconfig, 1712
- system definition, display current — sysdef, 1694
- system diagnostic, print information — prtdiag, 1322
- system diagnostic messages, error log — dmesg, 325
- system information, displays revision
  - information for current hardware and software — showrev, 1493
- system log daemon — syslog, 1709
- system parameters, change value — setuname, 1479
- System Performance Analysis Utilities Tools,
  - system activity report package — sar, 1453
- system PROM monitor program —
  - monitor, 1015
- system shutdown, — halt, 489

## T

- tapes — adds /dev entries for tape drives attached to the system, 1714
- tcxconfig — configure the default linearity of the 24-bit TrueColor Visual for OpenWindows with an S24 frame buffer system (TCX), 1719
- telinit — process control initialization, 585
- terminal
  - compare or print terminfo descriptions — infocmp, 572
  - set type, modes, speed, and line discipline — getty, 472
- terminfo, compiler — tic, 1731
- test installation profiles — pfinstall, 1214
- test NIS+ and LDAP mapping configuration files — nisldapmaptest, 1125
- time zone
  - compiler — zic, 1862
  - print current time in each named on command line — zdump, 1861
- timed event services, daemon for cron — cron, 239
- tmpfs, mount — mount\_tmpfs, 1048
- trace a chain of NTP hosts back to their master time source — ntptrace, 1187
- trace messages, STREAMS — strace, 1650
- transfer software packages to system — pkgadd, 1230
- trapstat — report trap statistics, 1739
- TTY ports, maintain line settings and hunt sequences — sttydefs, 1655
- tyadm — format and output port
  - monitor-specific information, 1750
- ttymon — port monitor for terminal ports, 1752
- tunefs — tuneup an existing file system, 1755
- turnacct — accounting shell procedure, 43
- tzselect — select a time zone, 1757

## U

- ufs
  - check and repair — fsck\_ufs, 424
  - construct file system — mkfs\_ufs, 1002
  - display amount of disk space — df\_ufs, 271
  - generate a list of pathnames vs i-numbers — ncheck\_ufs, 1068

ufs (Continued)

- incremental file system restore —  
ufsrestore, 1766
- make image copy of file system—  
volcopy\_ufs, 1802
- mount — mount\_ufs, 1052
- provide labels for ufs — labelit\_ufs, 737
- ufs file system debugger — fsdb\_ufs, 437
- ufsdump — incremental file system  
dump, 1759
- umount — unmount file systems and remote  
resources, 1027
- umountall — unmount multiple file  
systems, 1030
- unconfigure, undo system configuration —  
sys-unconfig, 1712
- UNIX system executable file containing basic  
operating system services — kernel, 717
- unshare — make local resource unavailable for  
mounting by remote systems, 1773
- unshare\_nfs — make local NFS filesystem  
unavailable for mounting by remote  
systems, 1774
- unshareall — multiple resources, 1484
- update\_drv — modify device driver  
attributes, 1775
- update Internet name servers interactively —  
nsupdate, 1174
- update super block — sync, 1685
- user IDs
  - administer a new user login on the system —  
useradd, 1776
  - become super user or another user —  
su, 1657
- user information, server, remote —  
in.fingerd, 571
- user quotas, remote quota daemon —  
rquotad, 1415
- useradd — administer a new user login on the  
system, 1776
- userdel — delete a user's login from the  
system, 1781
- usermod — modify a user's login information  
on the system, 1783
- users
  - list login information — logins, 788
  - who is doing what — whodo, 1813
- utmp2wtmp — create an entry for each user  
logged on in file /var/adm/wtmpx, 30
- utmpd — utmpx monitoring daemon, 1787
- utmpx monitoring daemon — utmpd, 1787
- uucheck — check the uucp directories and  
permissions file, 1788
- uucico — file transport program for uucp  
system, 1789
- uucleanup — uucp spool directory  
clean-up, 1791
- uucp
  - check directories and permissions file —  
uuccheck, 1788
  - clean-up of spool directory —  
uucleanup, 1791
  - file transport program — uucico, 1789
  - scheduler for file transport program —  
uusched, 1793
  - server — in.uucpd, 651
- uusched — scheduler for uucp transport  
program, 1793
- Uutry — try to contact remote system with  
debugging on, 1794
- uutry — try to contact remote system with  
debugging on, 1794
- uuxqt — execute remote command  
requests, 1795

## V

- verify Basic Security Module (BSM)  
configuration files — bsmrecord, 129
- virtual console daemon — cvcd, 241
- virtual memory, display statistics —  
vmstat, 1796
- vmstat — display virtual memory  
statistics, 1796
- vold — Volume Management daemon to  
manage CD-ROM and floppy devices, 1803
- Volume Management  
floppy and CD-ROM management daemon  
— vold, 1803
- removable media mouter —  
rmmount, 1362
- vtoc, print VTOC of a block device —  
prtvtoc, 1325

## W

wall — write to all users, 1805  
wbemadmin — start Sun WBEM User Manager, 222, 1807  
wbemconfig — convert a JavaSpaces datastore to the newer Reliable Log datastore format, 1810  
wbemlogviewer — start WBEM Log Viewer, 1811  
whodo — who is doing what, 1813  
wracct — write extended accounting records for active processes and tasks, 1815  
write extended accounting records for active processes and tasks — wracct, 1815  
wtmfix — correct connect accounting records date/time stamp, 464

## X

xntpd — Network Time Protocol daemon, 1822  
    Access Control Commands, 1826  
    Authentication Commands, 1825  
    Authentication Key File Format, 1834  
    Configuration Commands, 1823  
    Miscellaneous Commands, 1832  
    Monitoring Commands, 1829  
    Primary Clock Support, 1835  
xntpd — special NTP query program, 1838

## Y

YP  
    make ndbm file — makedbm, 894  
    rebuild database — ypmake, 1849  
ypbind — NIS binder process, 1846  
ypinit — set up NIS client, 1848  
ypmake — rebuild NIS database, 1849  
yppoll — return current version of a NIS map at a NIS server host, 1850  
yppush — force propagation of changed NIS map, 1851  
ypserv — NIS server and binder  
    processes, 1853  
    ypserv, 1854  
ypset — point NIS binder process ypbind at a particular server, 1856

ypstart — Start and stop NIS services, 1858  
ypstop — Start and stop NIS services, 1858  
ypupdated — server for changing NIS information, 1409  
ypxfr — transfer NIS map from a NIS server to host, 1859  
ypxfrd — NIS server and binder  
    processes, 1853  
yppasswdd — NIS password server, 1407

## Z

zdump — prints the current time in each zonename named on command line, 1861  
zic — time zone compiler, 1862
