

**Oracle[®] Integrated Lights Out Manager (ILOM)
3.0**

Supplement for Sun Fire X4170 M2 and X4270 M2
Servers

Copyright © 2010, 2011, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related software documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS. Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle America, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications which may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. UNIX is a registered trademark licensed through X/Open Company, Ltd.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Using This Documentation

This supplement contains information about the Integrated Lights Out Manager (ILOM) 3.0 that is specific to the Sun Fire X4170 M2 and X4270 M2 Servers from Oracle®.

For a complete discussion of Oracle ILOM 3.0 firmware and its capabilities, along with user procedures, see the Oracle ILOM 3.0 Documentation Collection listed in “[Related Documentation](#)” on page vi. You can also access the Oracle ILOM 3.0 Documentation Collection at:

<http://www.oracle.com/documentation>

Note – The Oracle Integrated Lights Out Manager formerly was called Sun Integrated Lights Out Manager.

This preface contains the following topics:

- “[Product Information](#)” on page vi
- “[Related Documentation](#)” on page vi
- “[Documentation, Support, and Training](#)” on page viii
- “[Typographic Conventions](#)” on page viii

Product Information

For information about the Sun Fire X4170 M2 and X4270 M2 Servers, go to the following web sites:

Oracle ILOM 3.0 Feature Sets

This chapter provides a brief overview about Oracle ILOM, as well as defines the purpose of Oracle ILOM's common and platform features offered in Oracle ILOM 3.0. The following topics are discussed in this chapter:

- [“Oracle ILOM Overview” on page 1](#)
 - [“Oracle ILOM 3.0 Common Feature Set and Server Specific Features” on page 1](#)
 - [“Oracle ILOM 3.0 Common Feature Set Documentation Collection” on page 2](#)

Oracle ILOM Overview

Oracle Integrated Lights Out Manager (ILOM) is system management firmware that is preinstalled on all of Oracle's x86-based servers and some SPARC servers. Oracle ILOM enables you to actively manage and monitor components installed in your server. Oracle ILOM provides a browser-based interface and a command-line interface, as well as SNMP and IPMI interfaces.

Oracle ILOM 3.0 Common Feature Set and Server Specific Features

Oracle's Sun Fire X4170 M2 and X4270 M2 Servers support the entire Oracle ILOM feature set provided in Oracle ILOM 3.0. In addition, the servers support Oracle ILOM features that are specific to the Sun Fire X4170 M2 and X4270 M2 Servers.

For details on how to use the features that are common to all server platforms, refer to the Oracle Integrated Lights Out Manager (ILOM) 3.0 Documentation Collection (formerly called Sun Integrated Lights Out Manager 3.0 Documentation Collection).

For a detailed description of the guides comprising the Oracle ILOM 3.0 Documentation Collection, see [“Oracle ILOM 3.0 Common Feature Set Documentation Collection”](#) on page 2.

For details on the Oracle ILOM features that are specific to the Sun Fire X4170 M2 and X4270 M2 Servers, see [Chapter 2](#).

Oracle ILOM 3.0 Common Feature Set Documentation Collection

TABLE 1-1 identifies the guides in the Oracle ILOM 3.0 Documentation Collection. Refer to these guides for information about using Oracle ILOM features that are common to all server platforms.

TABLE 1-1 Oracle ILOM 3.0 Common Feature Set Documentation Collection

<i>Oracle Integrated Lights Out Manager (ILOM) 3.0 Management Protocols Reference Guide</i>	This guide provides information about accessing Oracle ILOM functions when using management protocols such as: <ul style="list-style-type: none"><li data-bbox="758 430 1272 456">• Simple Network Management Protocol (SNMP)<li data-bbox="758 465 1296 491">• Intelligent Platform Management Interface (IPMI)<li data-bbox="758 499 1308 552">• Web Service Management (WS-Man) and Common Information Model (CIM)
<i>Oracle Integrated Lights Out Manager (ILOM) CMM Administration Guide for Sun Blade 6000 and Sun Blade 6048 Modular Systems</i>	This guide provides instructions for managing the Sun Blade Modular System Chassis using a modified version of the Oracle Integrated Lights Out Manager (ILOM) called the chassis monitoring module (CMM).

You can view and download the guides in the Oracle ILOM 3.0 Documentation Collection at:

<http://www.oracle.com/documentation>

Oracle ILOM Platform Features for the Sun Fire X4170 M2 and X4270 M2 Servers

Oracle ILOM 3.0 operates on many platforms, supporting features that are common to all platforms. Some Oracle ILOM 3.0 features belong to a subset of platforms and not to all. This chapter describes the features that are specific to the Sun Fire X4170 M2 and X4270 M2 Servers.

For detailed information about Oracle ILOM features that are common to all server platforms, see the Oracle Integrated Lights Out Manager (ILOM) 3.0 Documentation Collection (formerly called Sun Integrated Lights Out Manager 3.0 Documentation Collection), as described in [“Oracle ILOM 3.0 Common Feature Set Documentation Collection”](#) on page 2.

Oracle ILOM features discussed in this chapter, which are specific to the Sun Fire X4170 M2 and X4270 M2 Servers, are as follows:

- [“Supported Server Firmware”](#) on page 6
- [“Hardware Management Pack for Single Server Management”](#) on page 7
- [“Oracle ILOM Sideband Management”](#) on page 9
- [“Switch Serial Port Output Between SP and Host Console”](#) on page 16
- [“FRU Top-Level Indicator Auto-Update”](#) on page 18
- [“Monitoring Flash-Based PCIe Card Power-On Hours”](#) on page 19
- [“Clearing Server Faults”](#) on page 19
- [“Server Chassis Intrusion Sensors”](#) on page 24
- [“Sensors and Indicators Reference Information”](#) on page 26
- [“SNMP and PET Message Reference Information”](#) on page 34

Supported Server Firmware

TABLE 2-1 identifies the Oracle ILOM firmware version that is supported on the servers.

TABLE 2-1 Supported Oracle ILOM Firmware

Oracle ILOM SP Version	Applicable Hardware
3.0.14.11*	Sun Fire X4170 M2 and X4270 M2 Servers

* For up-to-date Oracle ILOM version information, see the *Sun Fire X4170 M2 and X4270 M2 Servers Product Notes*

For information about how to update the firmware on your server, refer to the Oracle ILOM 3.0 Common Feature Set Documentation Collection at:

<http://www.oracle.com/documentation>

Hardware Management Pack for Single Server Management

The Sun Server Hardware Management Pack (Hardware Management Pack) from Oracle provides tools to help you manage and configure your Oracle servers from the host operating system. To use these tools, you must install the Hardware Management Pack software on your server. After installing the Hardware Management Pack software, you will be able to perform the following server management tasks described in [TABLE 2-2](#).

TABLE 2-2 Hardware Management Pack – Server Management Tasks

Server Management Task From Host OS*	Hardware Management Pack Implementation	Tool
Monitor Oracle hardware with host IP address	Use the Hardware Management Agent and the associated Simple Network Management Protocol (SNMP) Plugins at the operating-system level to enable in-band monitoring of your Oracle hardware. This in-band monitoring functionality enables you to use your host operating system IP address to monitor your Oracle servers without the need of connecting the Oracle ILOM management port to your network.	Host OS-level management tool
Monitor storage devices, including RAID arrays	Use the Server Storage Management Agent at the operating-system level to enable in-band monitoring of the storage devices configured on your Oracle servers. The Server Storage Management Agent provides an operating-system daemon that gathers information about your server's storage devices such as hard disk drives (HDDs) and RAID arrays, and sends this information to the Oracle ILOM service processor. The Storage Monitoring features in Oracle ILOM enable you to view and monitor the information provided by the Server Storage Management Agent. You can access the Storage Monitoring features in Oracle ILOM from the command-line interface (CLI).	Oracle ILOM 3.0 CLI Storage Monitoring features
Configure BIOS CMOS settings, device boot order, and some SP settings	Use the biosconfig CLI tool from the host operating system to configure your Oracle x86 servers BIOS CMOS settings, device boot order, and some service processor (SP) settings.	Host OS-level biosconfig CLI

*Supported host operating systems include: Oracle Solaris, Oracle Linux, Red Hat Linux, SUSE Linux, Windows, Oracle VM, and VM-ware

TABLE 2-2 Hardware Management Pack – Server Management Tasks (Continued)

Server Management Task From Host OS*	Hardware Management Pack Implementation	Tool
Query, update, and validate firmware versions on supported SAS storage devices	Use the fwupdate CLI tool from the host operating system to query, update, and validate firmware versions on supported storage devices such as SAS host bus adapters (HBAs), embedded SAS storage controllers, LSI SAS storage expanders, and disk drives (spinning media and flash drives).	Host OS-level fwupdate CLI
Restore, set, and view Oracle ILOM configuration settings	Use the Oracle ILOMconfig CLI tool from the host operating system to restore Oracle ILOM configuration settings, as well as to view and set Oracle ILOM properties that are associated with network management, clock configuration, and user management.	Host OS-level ilomconfig CLI
View or create RAID volumes on storage drives	Use the raidconfig CLI tool from the host operating system to view and create RAID volumes on storage drives that are attached to RAID controllers, including storage arrays.	Host OS-level raidconfig CLI
Use IPMItool to access and manage Oracle servers	Use the open source command-line IPMItool from the host operating system to access and manage your Oracle servers via the IPMI protocol.	Host OS-level command-line IPMItool

*Supported host operating systems include: Oracle Solaris, Oracle Linux, Red Hat Linux, SUSE Linux, Windows, Oracle VM, and VM-ware

View Support Matrix and Download Hardware Management Pack Software

Refer to the following table to view the support matrix for the Hardware Management Pack software or to download the Hardware Management Pack software.

Description	URL
View operating system and hardware support for the Hardware Management Pack	http://www.oracle.com/us/support/044752.html
Download the Hardware Management Pack software	http://www.oracle.com/us/support/044752.html

Hardware Management Pack Documentation

For instructions for installing the management pack software or using its components, see the following Hardware Management Pack documentation:

- *Sun Server Hardware Management Pack 2.0 User's Guide*
- *Sun Server Management Agent 2.0 User's Guide*
- *Sun Server CLI and IPMItool 2.0 User's Guide*

For additional details about how to use the Storage Monitoring features in Oracle ILOM, see Chapter 4 of the *Oracle Integrated Lights Out Manager (ILOM) 3.0 Feature Updates and Release Notes*.

For additional details about accessing and managing your server via SNMP or IPMI, see the *Oracle Integrated Lights Out Manager (ILOM) 3.0 Management Protocols Reference Guide*.

Oracle ILOM Sideband Management

By default, you connect to the server's service processor (SP) using the out-of-band network management port (NET MGT). The Oracle ILOM sideband management feature enables you to select either the NET MGT port or one of the server's Gigabit Ethernet ports (NET 0, 1, 2, 3), which are in-band ports, to send and receive Oracle ILOM commands to and from the server SP. In-band ports are also called sideband ports.

The advantage of using a sideband management port to manage the server's SP is that one fewer cable connection and one fewer network switch port is needed. In configurations where a great number of servers are being managed, such as data centers, sideband management can represent a significant savings in hardware and network utilization.

You can configure sideband management using either the web interface, the command-line interface (CLI), the BIOS, or IPMI. For special considerations and configuration instructions, see the following sections:

- ["Special Considerations for Sideband Management" on page 10](#)
- ["Configure Sideband Management Using the Web Interface" on page 11](#)
- ["Configure Sideband Management Using the CLI" on page 12](#)
- ["Configure Sideband Management Using the Host BIOS Setup Utility" on page 13](#)

Special Considerations for Sideband Management

When sideband management is enabled in Oracle ILOM, the following conditions might occur:

- Connectivity to the server SP might be lost when the SP management port configuration is changed while you are connected to the SP using a network connection, such as SSH, web, or Oracle ILOM Remote Console.
- In-chip connectivity between the SP and the host operating system might not be supported by the on-board host Gigabit Ethernet controller. If this condition occurs, use a different port or route to transmit traffic between the source and destination targets instead of using L2 bridging/switching.
- Server host power cycles might cause a brief interruption of network connectivity for server Gigabit Ethernet ports (NET 0, 1, 2, 3) that are configured for sideband management. If this condition occurs, configure the adjacent switch/bridge ports as host ports.

Note – If the ports are configured as switch ports and participate in the Spanning Tree Protocol (STP), you might experience longer outages due to spanning tree recalculation.

▼ Configure Sideband Management Using the Web Interface

1. Log in to the Oracle ILOM web interface.

2. Select Configuration --> Network.

The Network Settings page appears.

System Information **System Monitoring** **Power Management**

System Management Access Alert Management Network DNS

Network Settings

View the MAC address and configure network settings for the Service Processor Netmask, and Gateway. You may also select which port you wish to use for management.

State: Enabled

MAC Address:

Out Of Band MAC Address:

Sideband MAC Address:

Management Port: /SYS/SP/NET0

IP Discovery Mode: DHCP Static

IP Address:

Netmask:

Gateway:

Save

3. In the Network Settings page, do the following:

a. Select DHCP to acquire the IP address automatically or specify the appropriate IP address.

b. To select a sideband management port, click the Management Port drop-down list and select the desired management port.

The drop-down list enables you to change to any one of the four Gigabit Ethernet ports, /SYS/MB/NET n , where n is 0 to 3. The SP NET MGT port, /SYS/SP/NET0, is the default.

c. Click Save for the changes to take effect.

▼ Configure Sideband Management Using the CLI

1. Log in to Oracle ILOM using the CLI.

Note – Using a serial connection for this procedure eliminates the possibility of losing connectivity during sideband management configuration changes.

2. If you logged in using the serial port, you can assign a static IP address.

For instructions, see the information about assigning an IP address in the *Sun Fire X4170 M2 and X4270 M2 Servers Installation Guide*.

3. To show the current port settings, type:

-> **show /SP/network**

The network properties appear. For example:

```
/SP/network
Targets:
Properties:
  commitpending = (Cannot show property)
  dhcp_server_ip = none
  ipaddress = xx.xx.xx.xx
  ipdiscovery = static
  ipgateway = xx.xx.xx.xx
  ipnetmask = xx.xx.xx.xx
  macaddress = 11.11.11.11.11.86
  managementport = /SYS/SP/NET0
  outofbandmacaddress = 11.11.11.11.11.86
  pendingipaddress = xx.xx.xx.xx
  pendingipdiscovery = static
  pendingipgateway = xx.xx.xx.xx
  pendingipnetmask = xx.xx.xx.xx
  pendingmanagementport = /SYS/SP/NET0
  sidebandmacaddress = 11.11.11.11.11.87
  state = enabled
```

In the above output the current active macaddress is the same as the SP's outofbandmacaddress and the current active managementport is set to the default (/SYS/SP/NET0).

4. To set the SP management port to a sideband port, type the following commands:

-> **set /SP/network pendingmanagementport=/SYS/MB/NET n**

Where n equals 0, 1, 2, or 3.

-> **set commitpending=true**

5. To view the change, type:

-> **show /SP/network**

The network properties appear and show that the change has taken effect. For example:

```
/SP/network
Targets:
Properties:
  commitpending = (Cannot show property)
  dhcp_server_ip = none
  ipaddress = xx.xx.xx.xx
  ipdiscovery = static
  ipgateway = xx.xx.xx.xx
  ipnetmask = xx.xx.xx.xx
macaddress = 11.11.11.11.11.87
managementport = /SYS/MB/NETn
  outofbandmacaddress = 11.11.11.11.11.86
  pendingipaddress = xx.xx.xx.xx
  pendingipdiscovery = static
  pendingipgateway = xx.xx.xx.xx
  pendingipnetmask = xx.xx.xx.xx
pendingmanagementport = /SYS/MB/NETn
sidebandmacaddress = 11.11.11.11.11.87
  state = enabled
```

In the above output the macaddress matches the sidebandmacaddress, and the managementport matches the pendingmanagementport.

▼ Configure Sideband Management Using the Host BIOS Setup Utility

You can access the BIOS Setup Utility screens from the following interfaces:

- Use a USB keyboard, mouse, and VGA monitor connected directly to the server.
- Use a terminal (or terminal emulator connected to a computer) through the serial port on the back panel of the server.
- Connect to the server using the Oracle ILOM Remote Console.

To configure sideband management using the host BIOS Setup Utility, perform the following steps:

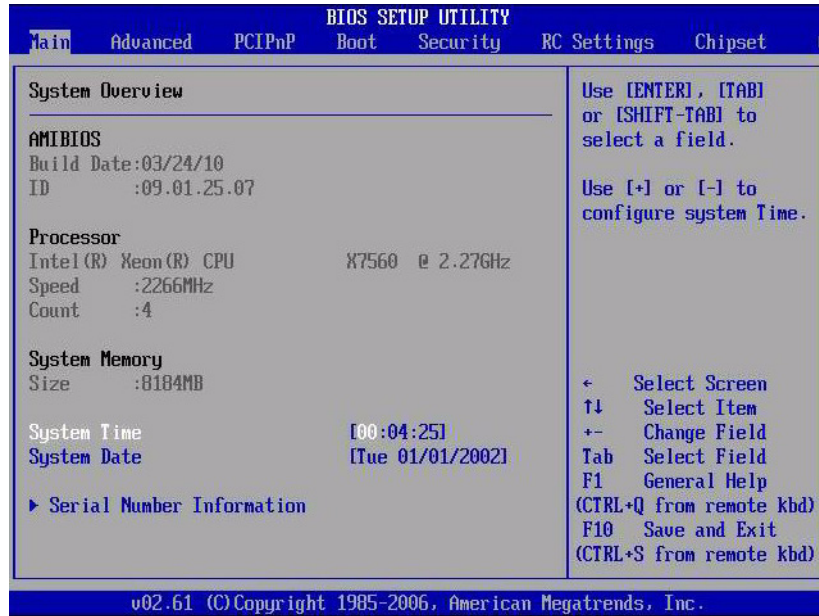

1. **Power on or power cycle the server.**
2. **To enter the BIOS Setup Utility, press the F2 key while the system is performing the power-on self-test (POST).**

```

Initializing USB Controllers .. Done.
Press F2 to run Setup (CTRL+E on Remote Keyboard)
Press F8 for BBS POPUP (CTRL+P on Remote Keyboard)
Press F12 to boot from the network (CTRL+N on Remote Keyboard)

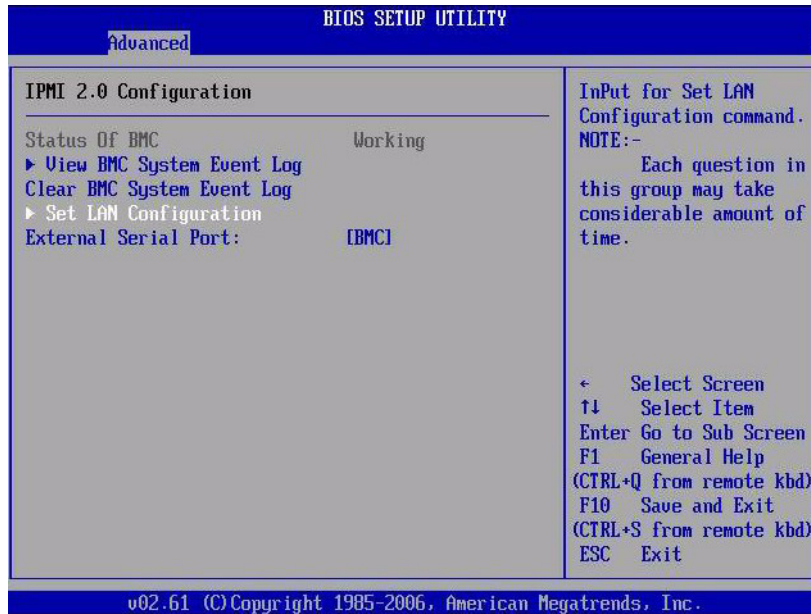

```

When BIOS is started, the main BIOS Setup Utility top-level screen appears. This screen provides seven menu options across the top of the screen.

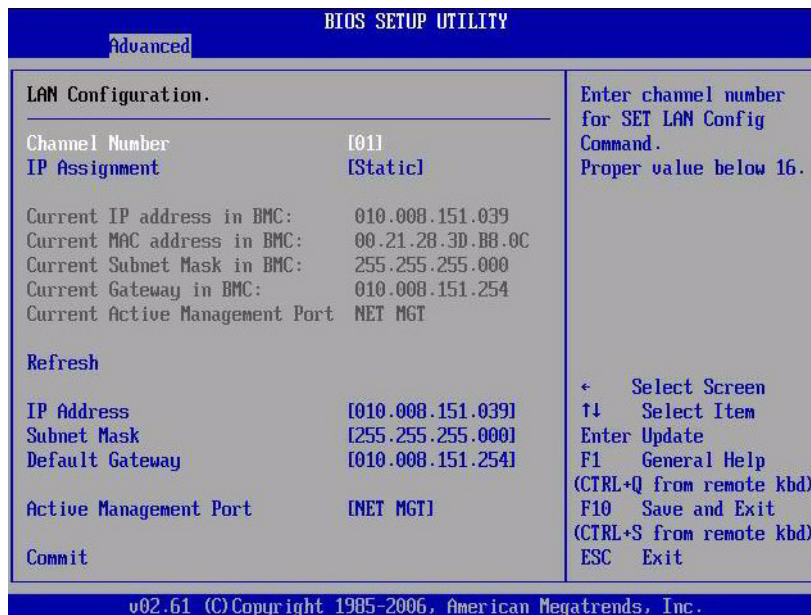

3. In the main screen, select Advanced --> IPMI Configuration.

The IPMI 2.0 Configuration screen appears.

- In the IPMI 2.0 Configuration screen, select the Set LAN Configuration option. The LAN Configuration screen appears.

- In the LAN Configuration screen, do the following:

- a. Use the left and right arrow keys to select the IP Assignment option and set it to DHCP.
- b. Use the left and right arrow keys to select the Active Management Port option and set the port to a sideband management port (NET0, NET1, NET2, NET3).
The NET MGT port is the default.
- c. Select Commit for the change to take effect.

Switch Serial Port Output Between SP and Host Console

You can switch the serial port output of the Sun Fire X4170 M2 and X4270 M2 Servers between the SP console (SER MGT) and the host console (COM1). By default, the SP console is connected to the system serial port. This feature is beneficial for Windows kernel debugging, as it enables you to view non-ASCII character traffic from the host console.

You can switch serial port output using either the Oracle ILOM web interface or the Oracle ILOM command-line interface (CLI). For instructions, see the following sections:

- [“Switch Serial Port Output Using the Web Interface” on page 17](#)
- [“Switch Serial Port Output Using the CLI” on page 18](#)

Caution – You should set up the network on the SP before attempting to switch the serial port owner to the host server. If a network is not set up, and you switch the serial port owner to the host server, you will be unable to connect using the CLI or web interface to change the serial port owner back to the SP. To change the serial port owner back to the SP, you must use the Oracle ILOM Preboot Menu to restore access to the serial port over the network. For instructions, refer to “Restoring Access to the Serial Console” in the *Sun Fire X4170 M2 Server Service Manual* or the *Sun Fire X4270 M2 Server Service Manual*.

▼ Switch Serial Port Output Using the Web Interface

1. Log in to the Oracle ILOM web interface.

2. Select Configuration --> Serial Port.

The Serial Port Settings page appears.

System Information	System Monitoring	Power Management	Storage	Configuration	
System Management Access	Alert Management	Network	DNS	Serial Port	Clock

Serial Port Settings

The Host Serial Port is the connection between the host server and the service processor that allows a service processor console port on the host server, often referred to as serial port 0, COM0, or /dev/ttyS0. The External Serial Port is the same speed to avoid flow control issues when connecting to the host console from the SP external serial port. Si

Serial Port Sharing

 This setting controls whether the external serial port is electrically connected to the Host Server or the Service Processor. The setting will be that of the Host Server.

Owner:

Host Serial Port

 This setting must match the setting for Serial Port 0, COM1 or /dev/ttyS0 on the host operating system.

Baud Rate:

Flow Control:

External Serial Port

Baud Rate:

Flow Control:

3. To select a serial port owner, click the Owner drop-down list and select the desired serial port owner.

The drop-down list enables you to select either Service Processor or Host Server.

By default, Service Processor is selected.

4. Click Save for your change to take effect.

▼ Switch Serial Port Output Using the CLI

1. Log in to the Oracle ILOM CLI.

2. To set the serial port owner, type:

```
-> set /SP/serial/portsharing/owner=host
```

By default, owner=SP.

FRU Top-Level Indicator Auto-Update

Oracle ILOM includes a top-level indicator (TLI) auto-update feature that ensures that the TLI stored in the Sun Fire X4270 M2 Server's field-replaceable units (FRUs) is always correct. The TLI, which is unique to every server, is used to track the server's service entitlement and warranty coverage. When a server requires service, the server's TLI is used to verify that the server's warranty has not expired.

To ensure that Oracle ILOM can maintain the accuracy of the server's TLI, the TLI is stored in the FRUID (field-replaceable unit identifiers) of the following three server components:

- Power distribution board (PDB)
- Motherboard (MB)
- Disk Backplane (DBP)

The following table lists the TLI identifiers contained in each component FRUID.

Identifier	Example Content
PPN (product part number)	0123456789
PSN (product serial number)	123-4567-89
Product Name	SUN FIRE X4270 M2 SERVER
WWN (world-wide name)	508002004fcfb62

Whenever one of the server's FRUs that contains the TLI is removed and a replacement module is installed, the TLI of the replacement module is programmed by Oracle ILOM to contain the same TLI as the other two modules.

Note – The TLI auto update feature is not supported on the Sun Fire X4170 M2 Server. For Sun Fire X4170 M2 Servers, authorized service personnel must update the TLI in the replacement module manually.

Monitoring Flash-Based PCIe Card Power-On Hours

The 96-GB, flash-based PCIe card (TA-FAS-S3IE96GB-N) contains an energy storage module (ESM) that supplies backup power to the card. The backup power enables cached volatile data on the card to be written back to non-volatile (flash) storage in the event of unexpected loss of main power to the flash-based PCIe card.

Because the ESM has a limited service life, Oracle ILOM monitors and records the power-on hours in the PCIe card FRUID and notifies the user before the ESM reaches its End of Lifetime.

Note – For instructions on replacing the ESM on the flashed-based PCIe card, see the *Sun Flash Accelerator F20 PCIe Card User's Guide*.

Clearing Server Faults

When a server component fails, the server generates a component-specific fault that is captured by the Oracle ILOM SP. Some faults are cleared automatically when the failed component is replaced, but faults generated for components that are *not* hot-serviceable must be cleared manually. You can use either the Oracle ILOM web interface or the command-line interface (CLI) to manually clear faults.

For the Sun Fire X4170 M2 and X4270 M2 Servers, the following types of faults must be cleared manually after the faulty component is replaced:

- DIMM faults
- PCIe faults
- CPU faults
- Motherboard faults (not necessary if the motherboard is replaced)

In addition, the following fault does not require replacement of a faulty part; however, user action is needed to clear it:

- `fault.security.integrity-compromised@/sys/sp`

This fault is generated when the server's top cover is removed while the AC power cords are still connected to the power supply, that is, power is not completely removed from the server.

When clearing faults, give consideration to the following:

- PCIe faults can cover one or more of the following components: network ports (/SYS/MB/NET*n*) and PCIe cards (/SYS/MB/RISER*n*/PCIEN).

The procedure for clearing a fault differs depending on the type of fault:

- To clear the `fault.security.integrity-compromised@/sys/sp` fault, replace the server's top cover and either reboot the server's SP or remove the AC power cords, and then reconnect the cords.
- To clear DIMM, ESM riser, ESM, PCIe faults, CPU, and motherboard faults, access the server's Oracle ILOM SP and clear the fault for the failed component.

The following sections provide specific instructions on how to clear faults on server components:

- [“Clear DIMM Fault Using the Oracle ILOM CLI” on page 2-20](#)
- [“Clear PCIe Riser Fault Using the Oracle ILOM CLI” on page 2-21](#)
- [“Clear PCIe Card Fault Using the Oracle ILOM CLI” on page 2-21](#)
- [“Clear CPU Fault Using the Oracle ILOM CLI” on page 2-22](#)
- [“Clear Solaris-Based CPU Fault Using the Solaris Operating System” on page 2-23](#)
- [“Clear Motherboard Fault” on page 2-23](#)

Note – Oracle ILOM-based faults are persistent and require service actions to clear the fault after the component is physically replaced. Additionally, on servers running the Oracle Solaris Operating System, Solaris-based faults are always persistent and must be cleared.

▼ Clear DIMM Fault Using the Oracle ILOM CLI

1. Log in to the server as `root` using the Oracle ILOM CLI.
2. To view server faults, type the following command to list all known faults on the system:

```
-> show /SP/faultmgmt
```

The server lists all known faults, for example:

```
SP/faultmgmt
Targets:
  0 (/SYS/MB/P0/D2)
Properties:
Commands:
  cd
  show
```

3. To clear the DIMM fault, type the following command:

```
-> set /SYS/MB/P0/Dn clear_fault_action=true
```

For example, to clear a fault on the DIMM in location D2 on CPU0:

```
-> set /SYS/MB/P0/D2 clear_fault_action=true
Are you sure you want to clear /SYS/MB/P0 (y/n)? y
Set 'clear_fault_action' to 'true'
```

▼ Clear PCIe Riser Fault Using the Oracle ILOM CLI

1. Log in to the server as `root` using the Oracle ILOM CLI.

2. To view server faults, type the following command to list all known faults on the system:

```
-> show /SP/faultmgmt
```

The server lists all known faults, for example:

```
SP/faultmgmt
Targets:
  0 (/SYS/MB/RISER1)
Properties:
Commands:
  cd
  show
```

3. To clear a PCIe riser fault, type the following command:

```
-> set /SYS/MB/RISERn clear_fault_action=true
```

For example, to clear a fault on the riser in slot 1:

```
-> set /SYS/MB/RISER1 clear_fault_action=true
Are you sure you want to clear /SYS/MB/RISER1 (y/n)? y
Set 'clear_fault_action' to 'true'
```

▼ Clear PCIe Card Fault Using the Oracle ILOM CLI

1. Log in to the server as `root` using the Oracle ILOM CLI.

2. To view server faults, type the following command to list all known faults on the system:

-> **show /SP/faultmgmt**

The server lists all known faults, for example:

```
SP/faultmgmt
Targets:
  0 (/SYS/MB/RISER2/PCIE5)
Properties:
Commands:
  cd
  show
```

3. To clear a PCIe card fault, type the following command:

-> **set /SYS/MB/RISERn/PCIEn clear_fault_action=true**

For example, to clear a fault on the PCIe card in PCIe slot 2:

```
-> set /SYS/MB/RISER2/PCIE2 clear_fault_action=true
Are you sure you want to clear /SYS/MB/RISER2/PCIE2 (y/n)? y
Set 'clear_fault_action' to 'true'
```

▼ Clear CPU Fault Using the Oracle ILOM CLI

1. Log in to the server as `root` using the Oracle ILOM CLI.
2. To view server faults, type the following command to list all known faults on the system:

-> **show /SP/faultmgmt**

The server lists all known faults, for example:

```
SP/faultmgmt
Targets:
  0 (/SYS/MB/P0)
Properties:
Commands:
  cd
  show
```

3. To clear the CPU fault, type the following command:

```
-> set /SYS/MB/Pn clear_fault_action=true
```

For example, to clear a fault on CP0:

```
-> set /SYS/MB/P0 clear_fault_action=true
Are you sure you want to clear /SYS/MB/P0 (y/n)? y
Set 'clear_fault_action' to 'true'
```

▼ Clear Solaris-Based CPU Fault Using the Solaris Operating System

If you are running the Oracle Solaris operating system, the Predictive Self-Healing capabilities will diagnose this same CPU fault as is diagnosed by Oracle ILOM and causes the processor to be placed off line upon a system reboot. Placing the processor off line prevents future system interruptions until the processor can be replaced.

- Use the Solaris Fault Management utilities to clear a processor fault and enable the processor.

▼ Clear Motherboard Fault

Note – Because the Oracle ILOM service processor, which contains the fault telemetry, is embedded in the motherboard, if you replaced the motherboard, it is not necessary to clear Oracle ILOM-based faults that occur on the motherboard. However, if you are sure that the motherboard is not at fault, and, therefore, you did not replace it, you can use this procedure to clear the motherboard fault.

1. Log in to the server as `root` using the Oracle ILOM CLI.

2. To view server faults, type the following command to list all known faults on the system:

```
-> show /SP/faultmgmt
```

The server lists all known faults, for example:

```
SP/faultmgmt
Targets:
  0 (/SYS/MB)
Properties:
```

```
Commands:
  cd
  show
```

3. To clear the motherboard fault, type the following command:

```
-> set /SYS/MB clear_fault_action=true
```

For example:

```
-> set /SYS/MB clear_fault_action=true
Are you sure you want to clear /SYS/MB (y/n)? y
Set 'clear_fault_action' to 'true'
```

Server Chassis Intrusion Sensors

The `/SYS/INTSW` sensor and the `/SYS/SP/SP_NEEDS_REBOOT` sensor are asserted when the server's top cover is removed while power is being applied to the server. This is an improper service action so these sensors serve to alert you to any unauthorized and inadvertent removal of the server's cover. Thus, these sensors enable system administrators to have confidence that the physical integrity of the server has not been violated. This is particularly beneficial when the server is in a remote or uncontrolled location.

How the `/SYS/INTSW` Sensor Works

The `/SYS/INTSW` sensor is asserted when the chassis intrusion switch trips while the server is powered-on. If the AC power cords are connected to the server, power is being applied to the server. Even when you shut down the server's host, power is still being applied to the server. The only way to remove power from the server completely is to disconnect the server's AC power cords.

The chassis intrusion switch will trip if the server's cover is removed, the switch itself is misaligned, or the cover is not properly seated. This sensor is de-asserted when the integrity of the server's chassis is restored, that is, when the removed cover is properly reinstalled returning the chassis intrusion switch to its closed state.

Caution – Removing the server's top cover while the power cords are connected to the system is not an authorized service action. Proper service action requires that host and SP shutdown operations be observed and that the power cords be disconnected from the system before the cover is opened. If proper service actions

are taken, you should not see either the `/SYS/INTSW` or `/SYS/SP/SP_NEEDS_REBOOT` sensors asserted unless there are other issues, such as a misaligned chassis intrusion switch.

How the `/SYS/SP/SP_NEEDS_REBOOT` Sensor Works

Like the `/SYS/INTSW` sensor, the `/SYS/SP/SP_NEEDS_REBOOT` sensor is asserted when the server's chassis intrusion switch is tripped while power is being applied to the server. Shutting down the server's host or shutting down the server by pressing the Power button does not shut down the SP because the SP continues to run when the server's power is placed in Standby mode. The only way to remove power from the SP is to disconnect the AC power cords. To clear this sensor, you must replace the server's cover and either reboot or power cycle the SP.

Assertion of the `/SYS/SP/SP_NEEDS_REBOOT` sensor indicates that the SP has been placed in a degraded mode of operation. In degraded mode, Oracle ILOM stops taking DIMM inventory. This action is taken as a safety precaution because the SP has no way of knowing the real configuration of the server's memory. For example, some of the DIMMs could have been removed while the server's cover was improperly removed. To protect against such an occurrence, the SP is placed in the degraded mode.

Note – If the chassis intrusion switch is not properly aligned or the server's cover has not been properly seated, both the `/SYS/INTSW` and `/SYS/SP/SP_NEEDS_REBOOT` sensors will be asserted and the SP will operate in a degraded mode.

TABLE 2-3 shows how the /SYS/INTSW sensor and the /SYS/SP/SP_NEEDS_REBOOT sensor work together to indicate the state of the server.

TABLE 2-3 Server Condition as Indicated by the /SYS/INTSW and /SYS/SP/SP_NEEDS_REBOOT Sensors

/SYS/INTSW	/SYS/SP/SP_NEEDS_REBOOT	Server Condition
De-asserted	De-asserted	Normal system state.
Asserted	Asserted	The server's top cover was opened while the SP was running. The server's DIMM inventory can no longer be considered valid so the SP is placed in a degraded mode of operation. This condition can also be caused by a misaligned chassis intrusion switch or an improperly seated cover.
De-asserted	Asserted	The server's top cover has been replaced, but the SP was not subsequently rebooted. The server's DIMM inventory can no longer be considered valid so the SP is placed in a degraded mode of operation. The SP needs to be rebooted while the host power is held off before the DIMM inventory will be valid. Note - The server's host can be powered on in this state.

Sensors and Indicators Reference Information

The server includes several of sensors that report on hardware conditions. Many of the sensor readings are used to adjust the fan speeds and perform other actions, such as illuminating LEDs and powering off the server.

This section describes the sensors that Oracle ILOM monitors for the Sun Fire X4170 M2 and X4270 M2 Servers.

The following types of sensors are described:

- [“Chassis Sensors and Indicators” on page 27](#)
- [“Cooling Unit Sensors and Indicators” on page 29](#)
- [“Disk Sensors and Indicators” on page 30](#)
- [“Memory Device Sensors and Indicators” on page 31](#)

- “Power Supply Sensors and Indicators” on page 31
- “Power Supply Sensors and Indicators” on page 31
- “Processor Sensors and Indicators” on page 32
- “System Board Sensors and Indicators” on page 32
- “Temperature Sensors and Indicators” on page 33

Note – For information about how to obtain sensor readings or to determine the state of system indicators in Oracle ILOM, see the *Oracle Integrated Lights Out Manager (ILOM) 3.0 CLI Procedures Guide* and *Oracle Integrated Lights Out Manager (ILOM) 3.0 Web Interface Procedures Guide*.

Chassis Sensors and Indicators

TABLE 2-4 describes the chassis sensors and indicators.

TABLE 2-4 Chassis Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/PWRBS	Discrete sensor	Power budget status
/SYS/VPS	Threshold sensor	Power consumption sensor

TABLE 2-4 Chassis Sensors and Indicators (Continued)

Sensor Name	Sensor Type	Component Description
/SYS/INTSW	Discrete sensor	<p>Top cover intrusion switch sensor. This sensor tracks the state of the chassis intrusion switch. If the server's top cover is opened while the AC power cords are still connected so that power is being applied to the server, this sensor asserts. If the top cover is subsequently replaced, this sensor is de-asserted.</p> <p>For more information, see "Server Chassis Intrusion Sensors" on page 24.</p>
/SYS/TEMP_FAULT	Indicator	Temperature fault LED
/SYS/SP/SP_NEEDS_REBOOT	Physical security	<p>This sensor asserts when the server's cover is removed while the AC power cords are still connected so that power is being applied to the server. However, this sensor is not cleared by merely replacing the cover.</p> <p>This sensor indicates a server fault that must be cleared; otherwise, the SP will operate in a degraded mode.</p> <p>To clear this fault, replace the server's top cover, power down the server's host, and reboot the server's SP.</p> <p>For more information, see "Server Chassis Intrusion Sensors" on page 24.</p>

Cooling Unit Sensors and Indicators

TABLE 2-5 describes the cooling unit sensors and indicators.

TABLE 2-5 Cooling Unit Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/FB/PRSNT	Discrete sensor	Fan board is present.
/SYS/FB/FM n /PRSNT	Discrete sensor	Fan board; Fan module n is present.
/SYS/FB/FM n /Fn/TACH	Threshold sensor	Fan board; Fan module n ; Fan n tachometer. This is a threshold sensor that senses the fan speed in n in the fan module.
/SYS/FB/FM n /SERVICE	Indicator	Fan board; Fan module n ; SERVICE. This is a fan module fault LED. It illuminates amber to indicate that the fan module has failed. For Sun Fire X4170 M2 Server: located on the fan module. For Sun Fire X4270 M2 Server: located on the server chassis sidewall adjacent to fan modules.
/SYS/FB/FM n /OK	Indicator	Fan board; Fan module n ; OK. This is a fan OK LED. It illuminates green to indicate that the fan module is operating properly. For Sun Fire X4170 M2 Server: located on the fan module. For Sun Fire X4270 M2 Server: located on the server chassis sidewall adjacent to fan modules.
/SYS/FAN_FAULT	Indicator	Top fan fault LED. This LED illuminates amber when any of the fan modules fails. It is located on the server front panel.

Disk Sensors and Indicators

TABLE 2-6 describes the disk sensors and indicators. These sensors monitor the status of the disk backplane and the hard drives.

TABLE 2-6 Disk Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/DBP/PRSNT	Discrete sensor	Disk backplane is present sensor.
/SYS/DBP/HDD n /PRSNT	Discrete sensor	Hard disk n is present sensor.
/SYS/DBP/HDD n /SERVICE	Indicator	Hard disk n service LED. Illuminates amber when the hard disk needs servicing.
/SYS/DBP/HDD n /OK2RM	Indicator	Hard disk n ready to remove LED.

Memory Device Sensors and Indicators

TABLE 2-7 describes the memory device sensors and indicators. These sensors monitor the status of the host CPU memory DIMMs.

TABLE 2-7 Memory Device Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/MB/Pn/Dn/PRSNT	Discrete sensor	Motherboard; Host CPU <i>n</i> ; DIMM <i>n</i> is present.
/SYS/MB/Pn/Dn/SERVICE	Indicator	Host CPU <i>n</i> DIMM <i>n</i> service LED. Illuminates amber when a DIMM fails and the Fault Remind button is pressed.

Power Supply Sensors and Indicators

TABLE 2-8 describes the power supply sensors and indicators. In the table, *n* designates the numbers 0-1.

TABLE 2-8 Power Supply Sensors

Sensor Name	Sensor Type	Component Description
/SYS/PS_FAULT	Indicator	Power supply service LED
/SYS/PSn/PRSNT	Discrete sensor	Power supply <i>n</i> is present.
/SYS/PSn/VINOK	Discrete sensor	Power supply <i>n</i> voltage in is OK.
/SYS/PSn/PWROK	Discrete sensor	Power supply <i>n</i> is OK.
/SYS/PSn/CUR_FAULT	Discrete sensor	Power supply <i>n</i> current error
/SYS/PSn/VOLT_FAULT	Discrete sensor	Power supply <i>n</i> voltage error
/SYS/PSn/FAN_FAULT	Discrete sensor	Power supply <i>n</i> fan error
/SYS/PSn/TEMP_FAULT	Discrete sensor	Power supply <i>n</i> temperature error
/SYS/PSn/V_IN	Threshold sensor	Power supply unit <i>n</i> input voltage
/SYS/PSn/I_IN	Threshold sensor	Power supply unit <i>n</i> input current in amps
/SYS/PSn/V_OUT	Threshold sensor	Power supply unit <i>n</i> output voltage

TABLE 2-8 Power Supply Sensors (*Continued*)

Sensor Name	Sensor Type	Component Description
/SYS/PSn/I_OUT	Threshold sensor	Power supply unit <i>n</i> output current in amps
/SYS/PSn/INPUT_POWER	Threshold sensor	Power supply unit <i>n</i> input power in watts
/SYS/PSn/OUTPUT_POWER	Threshold sensor	Power supply unit <i>n</i> output power in watts

Processor Sensors and Indicators

TABLE 2-9 describes the processor sensors and indicators.

TABLE 2-9 Processor Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/MB/Pn/PRSNT	Discrete sensor	Motherboard; Host CPU <i>n</i> is present.
/SYS/MB/Pn/SERVICE	Indicator	Host CPU service LED. If the CPU fails, this LED illuminates amber when the Fault Remind button is pressed.

System Board Sensors and Indicators

TABLE 2-10 describes the system board sensors and indicators.

TABLE 2-10 System Board Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/ACPI	State sensor	Precondition for sensors that need to know if the host is on. Note - This sensor is not visible to the Oracle ILOM user interfaces.
/SYS/T_AMB	Threshold sensor	System ambient temperature sensor. This sensor is located on the underside of the fan board.
/SYS/SP/SERVICE	Indicator	SP Service LED

TABLE 2-10 System Board Sensors and Indicators (Continued)

Sensor Name	Sensor Type	Component Description
/SYS/OK	Indicator	System Power OK LED. This LED is located on the server's front panel. It illuminates green and blinks or is steady on depending on the status of server power-on/boot process.
/SYS/SERVICE	Indicator	System Service LED. This LED is located on the server's front panel. It illuminates amber to indicate a fault on a server component.
/SYS/LOCATE	indicator	System Locate LED. This LED is located on the server's front panel. It illuminates white and blinks on and off to assist you in physically locating the server.
/SYS/MB/RISER _n /PRSNT	Discrete sensor	Senses if PCIe riser _n is present.
/SYS/MB/RISER _n /PCI _n /PRSNT	Discrete sensor	Senses if an option card is inserted in PCIe slot _n .
/SYS/SAS_EXP/PRSNT	Discrete sensor	SAS Expander board is present. This board connects to the disk backplane and the SAS cables connect to it. Note - This sensor is only supported on the Sun Fire X4270 M2 Server.

Temperature Sensors and Indicators

[TABLE 2-11](#) describes the temperature sensors and indicators.

TABLE 2-11 Temperature Sensors and Indicators

Sensor Name	Sensor Type	Component Description
/SYS/MB/T_OUT0, /SYS/MB/T_OUT1, and /SYS/MB/T_OUT2	Discrete sensor	Motherboard ambient temperature sensors. These sensors are located in the rear of the chassis.

SNMP and PET Message Reference Information

This section describes Simple Network Management Protocol (SNMP) and Platform Event Trap (PET) messages that are generated by devices that are monitored by Oracle ILOM.

- [“SNMP Traps” on page 34](#)
- [“PET Event Messages” on page 45](#)

SNMP Traps

SNMP Traps are generated by the SNMP agents that are installed on the SNMP devices being managed by Oracle ILOM. Oracle ILOM receives the SNMP Traps and converts them into SNMP event messages that appear in the event log.

Note – If trap a number appears in the event log and the trap is not identified by name, you can use the id assigned to each trap in the MIB to determine the trap’s name. For example, traps 53 and 54 translate to sunHwTrapComponentError and sunHwTrapComponentOk respectively.

For more information about the SNMP event messages that might be generated on your system, see the following tables.

- For memory event messages, see [TABLE 2-12](#).
- For environment event messages, see [TABLE 2-13](#).
- For power supply event messages, see [TABLE 2-14](#).
- For sensor event messages, see [TABLE 2-15](#).
- For system security event messages, see [TABLE 2-16](#).
- For fan event messages, see [TABLE 2-17](#).
- For hard drive event messages, see [TABLE 2-18](#).
- For PCIe card event messages, see [TABLE 2-19](#).
- For generic component messages, see [TABLE 2-20](#).

TABLE 2-12 describes the memory SNMP event messages.

TABLE 2-12 Memory SNMP Events

SNMP Trap Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapMemoryFault	fault.memory.channel.misc onfigured	Major; a memory component is suspected of causing a fault.	/SYS/MB/P/D
	fault.memory.intel.dimm.in compatible		
	fault.memory.intel.dimm.in compatible-maxranks		
	fault.memory.intel.dimm.in compatible-quadrank		
	fault.memory.intel.dimm.p opulation-invalid		
sunHwTrapMemoryFault Cleared	fault.memory.channel.miso nfigured	Informational; a memory component fault has been cleared. This generic component trap is generated when the SNMP agent does not recognize the component type.	/SYS/MB/P/D
	fault.memory.intel.dimm.in compatible		
	fault.memory.intel.dimm.in compatible-maxranks		
	fault.memory.intel.dimm.in compatible-quadrank		
	fault.memory.intel.dimm.p opulation-invalid		
sunHwTrapComponentFa ult	fault.memory.intel.dimmno ne	Major; a memory component is suspected of causing a fault. This generic component trap is generated when the SNMP agent does not recognize the component type.	/SYS/MB
	fault.memory.intel.dimm.p opulation-invalid		
	fault.memory.controller.init -failed		
	fault.memory.controller.inp ut-invalid		
	fault.memory.intel.dimm.p opulation-invalid		/SYS/MB/P/D

TABLE 2-12 Memory SNMP Events (*Continued*)

SNMP Trap Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentFaultCleared	fault.memory.intel.dimmemone	Informational; a memory component fault has been cleared.	/SYS/MB
	fault.memory.intel.dimmpopulation-invalid	This generic component trap is generated when the SNMP agent does not recognize the component type.	
	fault.memory.controller.init-failed		
	fault.memory.controller.input-invalid		

TABLE 2-13 describes the system environmental event messages.

TABLE 2-13 Environmental SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentFault	fault.chassis.env.temp.over-fail	Major; a component is suspected of causing a fault.	/SYS
sunHwTrapComponentFaultCleared	fault.chassis.env.temp.over-fail	Informational; a component fault has been cleared.	/SYS
sunHwTrapPowerSupplyFault	fault.chassis.power.overtemperature	Major; a power supply component is suspected of causing a fault.	/SYS/PS
sunHwTrapPowerSupplyFaultCleared	fault.chassis.power.overtemperature	Informational; a power supply component fault has been cleared.	/SYS/PS
sunHwTrapTempCritThresholdExceeded	Lower critical threshold exceeded	Major; a temperature sensor has reported that its value has gone below a lower critical threshold setting.	/SYS/MB/T_AMB
sunHwTrapTempCritThresholdDeasserted	Lower critical threshold no longer exceeded	Informational; a temperature sensor has reported that its value has gone above a lower critical threshold setting.	/SYS/MB/T_AMB
sunHwTrapTempCritThresholdExceeded	Upper critical threshold exceeded	Major; a temperature sensor has reported that its value has gone above an upper critical threshold setting.	/SYS/MB/T_AMB /SYS/MB/T_OUTn /SYS/T_AMB

TABLE 2-13 Environmental SNMP Events (Continued)

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapTempCriticalThresholdDeasserted	Upper critical threshold no longer exceeded	Informational; a temperature sensor has reported that its value has gone below an upper critical threshold setting or above a lower critical threshold setting.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n /SYS/T_AMB
sunHwTrapTempNonCriticalThresholdExceeded	Upper noncritical threshold exceeded	Minor; a temperature sensor has reported that its value has gone above an upper critical threshold setting or below a lower critical threshold setting.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
sunHwTrapTempOk	Upper noncritical threshold no longer exceeded	Informational; a temperature sensor has reported that its value is in the normal operating range.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
sunHwTrapTempFatalThresholdExceeded	Lower fatal threshold exceeded	Critical; a temperature sensor has reported that its value has gone below a lower fatal threshold setting.	/SYS/MB/T_AMB
sunHwTrapTempFatalThresholdDeasserted	Lower fatal threshold no longer exceeded	Informational; a temperature sensor has reported that its value has gone above a lower fatal threshold setting.	/SYS/MB/T_AMB
sunHwTrapTempFatalThresholdExceeded	Upper fatal threshold exceeded	Critical; a temperature sensor has reported that its value has gone above an upper fatal threshold setting.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n /SYS/T_AMB
sunHwTrapTempFatalThresholdDeasserted	Upper fatal threshold no longer exceeded	Informational; a temperature sensor has reported that its value has gone below an upper fatal threshold setting.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n /SYS/T_AMB

TABLE 2-14 describes the power supply SNMP event messages.

TABLE 2-14 Power Supply SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentFault	fault.chassis.power.overflow	Major; a component is suspected of causing a fault.	/SYS
sunHwTrapComponentFaultCleared	fault.chassis.power.overflow	Informational; a component fault has been cleared.	/SYS
sunHwTrapPowerSupplyFault	fault.chassis.env.power.loss	Major; a power supply component is suspected of causing a fault.	/SYS/PS
sunHwTrapPowerSupplyFaultCleared	fault.chassis.env.power.loss	Informational; a power supply component fault has been cleared.	/SYS/PS
sunHwTrapPowerSupplyError	Assert	Major; a power supply sensor has detected an error.	/SYS/PWRBS /SYS/PSn/CUR_FAULT /SYS/PSn/VOLT_FAULT /SYS/PSn/FAN_FAULT /SYS/PSn/TEMP_FAULT
	Deassert		/SYS/PSn/VINOK /SYS/PSn/PWROK
sunHwTrapPowerSupplyOk	Assert	Informational; a power supply sensor has returned to its normal state.	/SYS/PSn/VINOK /SYS/PSn/PWROK
	Deassert		/SYS/PWRBS /SYS/PSn/CUR_FAULT /SYS/PSn/VOLT_FAULT /SYS/PSn/FAN_FAULT /SYS/PSn/TEMP_FAULT
sunHwTrapComponentError	ACPI_ON_WORKING ASSERT	Major; a sensor has detected an error. The component type was not recognized.	/SYS/ACPI
	ACPI_ON_WORKING DEASSERT		
	ACPI_SOFT_OFF ASSERT		
	ACPI_SOFT_OFF DEASSERT		

TABLE 2-14 Power Supply SNMP Events (Continued)

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapVoltageCritThresholdExceeded	Lower Critical threshold exceeded	Major; a voltage sensor has reported that its value has gone below a lower critical threshold setting.	/SYS/PSn/V_IN /SYS/PSn/V_OUT
	Upper critical threshold exceeded	Major; a voltage sensor has reported that its value has gone above an upper critical threshold setting.	
sunHwTrapVoltageCritThresholdDeasserted	Lower Critical threshold no longer exceeded	Informational; A voltage sensor has reported that its value has gone above a lower critical threshold setting.	/SYS/PSn/V_IN /SYS/PSn/V_OUT
	Upper critical threshold no longer exceeded	Informational; a voltage sensor has reported that its value has gone below an upper non-critical threshold setting.	
sunHwTrapVoltageNonCriticalThresholdExceeded	Upper noncritical threshold exceeded	Minor; a voltage sensor has reported that its value has gone above an upper non-critical threshold setting, or below a lower non-critical threshold setting.	/SYS/PSn/V_IN /SYS/PSn/V_OUT
sunHwTrapVoltageOk	Upper noncritical threshold no longer exceeded	Informational; a voltage sensor has reported that its value is in the normal operating range.	/SYS/PSn/V_IN /SYS/PSn/V_OUT

TABLE 2-14 Power Supply SNMP Events (Continued)

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapVoltageFatalThresholdExceeded	Lower fatal threshold exceeded	Critical; a voltage sensor has reported that its value has gone below a lower fatal threshold setting.	/SYS/PSn/V_IN /SYS/PSn/V_OUT
	Upper fatal threshold exceeded	Critical; a voltage sensor has reported that its value has gone above an upper fatal threshold setting.	
sunHwTrapVoltageFatalThresholdDeasserted	Lower fatal threshold no longer exceeded	Informational; a voltage sensor has reported that its value has gone above a lower fatal threshold setting.	/SYS/PSn/V_IN /SYS/PSn/V_OUT
	Upper fatal threshold no longer exceeded	Informational; a voltage sensor has reported that its value has gone below an upper fatal threshold setting.	

TABLE 2-15 describes the sensor SNMP event messages.

TABLE 2-15 Sensor SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapSensorCriticalThresholdExceeded	Upper critical threshold exceeded	Major; a sensor has reported that its value has gone above an upper critical threshold setting or below a lower critical threshold setting. The generic sensor trap is generated when the SNMP agent does not recognize the component type. The sunHwTrapThresholdType object indicates whether the threshold was an upper or lower.	/SYS/MB/RISER n /PCIE n /F20CARD/UPTIME
sunHwTrapSensorCriticalThresholdDeasserted	Upper critical threshold no longer exceeded	Informational; a sensor has reported that its value has gone below an upper critical threshold setting or above a lower critical threshold setting. The generic sensor trap is generated when the SNMP agent does not recognize the component type. The sunHwTrapThresholdType object indicates whether the threshold was an upper or lower.	/SYS/MB/RISER n /PCIE n /F20CARD/UPTIME
sunHwTrapSensorNonCriticalThresholdExceeded	Upper noncritical threshold exceeded	Minor; a sensor has reported that its value has gone above an upper non-critical threshold setting or below a lower non-critical threshold setting. The generic sensor trap is generated when the SNMP agent does not recognize the component type. The sunHwTrapThresholdType object indicates whether the threshold was an upper or lower.	/SYS/MB/RISER n /PCIE n /F20CARD/UPTIME

TABLE 2-15 Sensor SNMP Events (Continued)

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapSensorThresholdOk	Upper noncritical threshold no longer exceeded	Informational; a sensor has reported that its value is in the normal operating range. The generic sensor trap is generated when the SNMP agent does not recognize the component type.	/SYS/MB/RISER _n /PCIE _n /F20CARD/UPTIME
sunHwTrapSensorFatalThresholdExceeded	Upper fatal threshold exceeded	Critical; a sensor has reported that its value has gone above an upper fatal threshold setting or below a lower fatal threshold setting. The generic sensor trap is generated when the SNMP agent does not recognize the component type. The sunHwTrapThresholdType object indicates whether the threshold was an upper or lower.	/SYS/MB/RISER _n /PCIE _n /F20CARD/UPTIME
sunHwTrapSensorFatalThresholdDeasserted	Upper fatal threshold no longer exceeded	Informational; a sensor has reported that its value has gone below an upper fatal threshold setting or above a lower fatal threshold setting. The generic sensor trap is generated when the SNMP agent does not recognize the component type. The sunHwTrapThresholdType object indicates whether the threshold was an upper or lower.	/SYS/MB/RISER _n /PCIE _n /F20CARD/UPTIME

TABLE 2-16 describes the system security event messages.

TABLE 2-16 System Security SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentFault	fault.chassis.device.fan.column-fail	Major; a component is suspected of causing a fault.	/SYS
	fault.security.enclosure-open		/SYS/SP
	fault.security.integrity-compromised		

TABLE 2-16 System Security SNMP Events (Continued)

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentFaultCleared	fault.chassis.device.fan.column-fail	Informational; a component fault has been cleared.	/SYS
	fault.security.enclosure-open		/SYS/SP
	fault.security.integrity-compromised		
sunHwTrapSecurityIntrusion	ASSERT	Major; an intrusion sensor has detected that someone may have physically tampered with the system.	/SYS/INTSW
	DEASSERT		/SYS/SP/SP_NEEDS_REBOOT

TABLE 2-17 describes the fan speed SNMP event messages.

TABLE 2-17 Fan SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapFanSpeedCriticalThresholdExceeded	Lower critical threshold exceeded	Major; a fan speed sensor has reported that its value has gone below a lower critical threshold setting.	/SYS/FB/FAN n /TACH
sunHwTrapFanSpeedCriticalThresholdDeasserted	Lower critical threshold no longer exceeded	Informational; a fan speed sensor has reported that its value has gone above a lower critical threshold setting.	
sunHwTrapFanSpeedFatalThresholdExceeded	Lower fatal threshold exceeded	Critical; a fan speed sensor has reported that its value has gone below a lower fatal threshold setting.	
sunHwTrapFanSpeedFatalThresholdDeasserted	Lower fatal threshold no longer exceeded	Informational; a fan speed sensor has reported that its value has gone above a lower fatal threshold setting.	

TABLE 2-18 describes the hard drive SNMP event messages.

TABLE 2-18 Rear Hard Drive SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapHardDriveStatus	DRIVE_FAULT ASSERT	Informational; the hard drive identified by sunHwTrapComponent Name has changed state.	/SYS/MB/RHDDn/STATE
	DRIVE_FAULT DEASSERT		
	PREDICTIVE_FAILURE ASSERT	Informational; a rear hard drive has changed state.	/SYS/MB/RHDDn/STATE
	PREDICTIVE_FAILURE DEASSERT		
	HOT_SPARE ASSERT		
	HOT_SPARE DEASSERT		

TABLE 2-19 describes the PCIe card SNMP event messages.

TABLE 2-19 PCIe Card SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentFault	fault.io.pciex.fabric.fatal	Major; a component is suspected of causing a fault. This generic component trap is generated when the SNMP agent does not recognize the component type.	/SYS/MB/RISER/PCIE
	fault.io.pciex.fabric.nonfatal		
	fault.chassis.device.esm.eol.exceeded		/SYS/MB/RISER/PCIE/F20CARD
sunHwTrapComponentFault Cleared	fault.io.pciex.fabric.fatal	Informational; a component fault has been cleared. This generic component trap is generated when the SNMP agent does not recognize the component type.	/SYS/MB/RISER/PCIE
	fault.io.pciex.fabric.nonfatal		
	fault.chassis.device.esm.eol.exceeded		/SYS/MB/RISER/PCIE/F20CARD

[TABLE 2-20](#) describes generic component SNMP event messages. These events occur when to component generating the trap does not have specific trap.

TABLE 2-20 Generic Components SNMP Events

SNMP Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
sunHwTrapComponentError	ACPI_ON_WORKING ASSERT	Major; a sensor has detected an error. This generic component trap is generated when the SNMP agent does not recognize the component.	/SYS/ACPI
	ACPI_ON_WORKING DEASSERT		
	ACPI_SOFT_OFF ASSERT		
	ACPI_SOFT_OFF DEASSERT		
sunHwTrapComponentOk	Deassert	Informational; a sensor has returned to its normal state. This generic component trap is generated when the SNMP agent does not recognize the component type.	/SYS/HOT /SYS/PSn/V_OUT_OK

PET Event Messages

PET event messages are generated by systems with Alert Standard Format (ASF) or an IPMI baseboard management controller. The PET events provide advance warning of possible system failures. For more information about the PET event messages that might occur on your system, see the following tables.

- For system power event messages, see [TABLE 2-21](#).
- For entity present event messages, see [TABLE 2-22](#).
- For environmental event messages, see [TABLE 2-23](#).
- For system security event messages, see [TABLE 2-24](#).
- For power supply event messages, see [TABLE 2-25](#).
- For fan speed event messages, see [TABLE 2-26](#).

TABLE 2-21 describes the system power PET event messages.

TABLE 2-21 System Power PET Events

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
petTrapPowerUnitStateDeassertedAssert	PowerSupply sensor ASSERT	Critical; a run-time power fault has occurred.	/SYS/PWRBS /SYS/PSn/CUR_FAULT /SYS/PSn/VOLT_FAULT /SYS/PSn/FAN_FAULT /SYS/PSn/TEMP_FAULT
petTrapPowerSupplyStateAssertedAssert	PowerSupply sensor DEASSERT	Informational; a power supply is connected to AC Power.	/SYS/PWRBS /SYS/PSn/VINOK /SYS/PSn/PWROK /SYS/PSn/CUR_FAULT /SYS/PSn/VOLT_FAULT /SYS/PSn/FAN_FAULT /SYS/PSn/TEMP_FAULT
petTrapACPIPowerStateS5G2SoftOffAssert	SystemACPI ACPI_ON_WORKING'	Informational; system ACPI Power State S5/G2 - soft-of.f	/SYS/ACPI
petTrapSystemBootPowerUp	SystemACPI ACPI_SOFT_OFF'	Informational; system boot initiated by power up.	/SYS/ACPI

TABLE 2-22 describes the entity present PET event messages.

TABLE 2-22 Entity Present PET Events

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
petTrapProcessorPresenceDetectedDeassert	EntityPresenceRemove	Critical; a processor component is absent or has been removed.	/SYS/MB/Pn/PRSNT /SYS/MB/Pn/Dn/PRSNT /SYS/MB/RISERn/PRSNT /SYS/MB/RISERn/PCIEn/PRSNT /SYS/FB/PRSNT /SYS/DBP/PRSNT /SYS/SAS_EXP/PRSNT* /SYS/PSn/PRSNT /SYS/FB/FMn/PRSNT /SYS/DBP/HDDn/PRSNT /SYS/MB/RHDDn/PRSNT†
petTrapEntityPresenceDeviceInsertedAssert	EntityPresenceInsert	Informational; a device is present or has been inserted.	SYS/MB/Pn/PRSNT /SYS/MB/Pn/Dn/PRSNT /SYS/MB/RISERn/PRSNT /SYS/MB/RISERn/PCIEn/PRSNT /SYS/FB/PRSNT /SYS/DBP/PRSNT /SYS/SAS_EXP/PRSNT‡ /SYS/PSn/PRSNT /SYS/FB/FMn/PRSNT /SYS/DBP/HDDn/PRSNT /SYS/MB/RHDDn/PRSNT**

* This sensor is only supported on the Sun Fire X4270 M2 Server.

† This sensor is only supported in the Sun Fire X4270 M2 Server.

‡ This sensor is only supported on the Sun Fire X4270 M2 Server.

** This sensor is only supported in the Sun Fire X4270 M2 Server.

TABLE 2-23 describes the environmental PET event messages.

TABLE 2-23 Environmental PET Events

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
petTrapTemperatureUpperNonRecoverableGoingLowDeassert	Temperature Upper non-critical threshold has been exceeded	Major; a system temperature has decreased below upper non-recoverable threshold.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
petTrapTemperatureStateAssertedAssert	Temperature Upper non-critical threshold no longer exceeded	Major; a temperature event has occurred. Possible cause: CPU is too hot.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
petTrapTemperatureUpperCriticalGoingHigh	Temperature Lower fatal threshold has been exceeded	Major; a system temperature has increased above upper critical threshold.	//SYS/MB/T_AMB /SYS/MB/T_OUT _n
petTrapTemperatureUpperCriticalGoingLowDeassert	Temperature Lower fatal threshold no longer exceeded	Warning; a system temperature has decreased below upper critical threshold.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
petTrapTemperatureLowerNonCriticalGoingLow	Temperature Lower critical threshold has been exceeded	Warning; a system temperature has decreased below lower non-critical threshold.	/SYS/MB/T_AMB
petTrapTemperatureLowerNonCriticalGoingHighDeassert	Temperature Lower critical threshold no longer exceeded	Informational; a system temperature has returned to normal.	/SYS/MB/T_AMB
petTrapTemperatureUpperNonCriticalGoingHigh	Temperature Upper critical threshold has been exceeded	Warning; a system temperature has increased above upper non-critical threshold.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
petTrapTemperatureUpperNonCriticalGoingLowDeassert	Temperature Upper critical threshold no longer exceeded	Informational; a system temperature has returned to normal.	/SYS/MB/T_AMB /SYS/MB/T_OUT _n
petTrapTemperatureLowerCriticalGoingLow	Temperature Lower fatal threshold has been exceeded	Major; a system temperature has decreased below lower critical threshold.	/SYS/MB/T_AMB

TABLE 2-23 Environmental PET Events (Continued)

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
petTrapTemperatureLowerCriticalGoingHighDeassert	Temperature Lower fatal threshold no longer exceeded	Warning; a system temperature has increased above lower critical threshold.	/SYS/MB/T_AMB
petTrapTemperatureLowerNonRecoverableGoingHighDeassert	Temperature Lower non-critical threshold has been exceeded	Major; a system temperature has increased above lower non-recoverable threshold.	/SYS/MB/T_AMB
petTrapTemperatureUpperNonRecoverableGoingHigh	Temperature Lower non-critical threshold no longer exceeded	Critical; a system temperature has increased above upper non-recoverable threshold.	/SYS/MB/T_AMB

[TABLE 2-24](#) describes the system security PET event messages.

TABLE 2-24 System Security PET Events

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
Undocumented PET 328449	PhysicalSecurity sensor ASSERT	NA; the system cover was removed while power was applied to the system.	/SYS/INTSW /SYS/SP/SP_NEEDS_REBOOT
328448- Deassert	PhysicalSecurity sensor DEASSERT	NA; the system cover was replaced and system was power cycled.	/SYS/INTSW /SYS/SP/SP_NEEDS_REBOOT

[TABLE 2-25](#) describes the power supply PET event messages.

TABLE 2-25 Power Supply PET Events

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
petTrapVoltageLowerCriticalGoingLow	Voltage Lower fatal threshold has been exceeded	Major; the voltage of system power supply <i>n</i> has decreased below the lower critical threshold.	/SYS/PS <i>n</i> /V_IN /SYS/PS <i>n</i> /V_OUT
petTrapVoltageLowerCriticalGoingHighDeassert	Voltage Lower fatal threshold no longer exceeded	Warning; the voltage of system power supply <i>n</i> has increased above the lower critical threshold.	/SYS/PS <i>n</i> /V_IN /SYS/PS <i>n</i> /V_OUT
petTrapVoltageUpperNonCriticalGoingHigh	Voltage Upper critical threshold has been exceeded	Warning; the voltage of system power supply <i>n</i> has increased above the upper non-critical threshold.	/SYS/PS <i>n</i> /V_IN /SYS/PS <i>n</i> /V_OUT

TABLE 2-25 Power Supply PET Events (Continued)

PET Event Message	Oracle ILOM Event Message	Severity and Description	Sensor Name
