

Sun GlassFish Enterprise Server v2.1.1 Release Notes

Copyright © 2010, 2013, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS. Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Overview

Sun GlassFish Enterprise Server product is a Java Platform, Enterprise Edition (Java EE) 5 platform-compatible server for the development and deployment of Java EE applications and Java Web Services. Production use of this server is free of charge. Sun GlassFish Enterprise Server is free for development, deployment, and redistribution. If you are a customer who is interested in redistribution, contact [Sun OEM](#) sales for a redistribution license. Sun offers cost-efficient and flexible Enterprise Server subscriptions. For more details, see [Sun GlassFish Enterprise Server Subscriptions](#).

The Sun GlassFish Enterprise Server is an easy, fast, and industry-leading application server based on Java Platform, Enterprise Edition (Java EE) technology for developing and delivering web applications and web services. It provides superior performance, clustering, and high availability features for scalable, carrier-grade services that continue to operate despite software and hardware faults.

- “Additional Sun Resources” on page 7

About These Notes

These Release Notes contain important information available at the time of release of Sun GlassFish Enterprise Server v2.1.1 Patch 7. Enhancements, known problems, and other late-breaking issues are addressed here. Read this document before you begin using Enterprise Server.

The most up-to-date version of these release notes can be found at the Enterprise Server documentation web site (<http://www.oracle.com/technetwork/indexes/documentation/>

[index.html](#)). Check the web site prior to installing and setting up your software and then periodically thereafter to view the most up-to-date release notes and product documentation.

Third-party URLs are referenced in this document and provide additional, related information.

Note – Sun is not responsible for the availability of third-party Web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other materials that are available on or through such sites or resources. Sun will not be responsible or liable for any actual or alleged damage or loss caused by or in connection with the use of or reliance on any such content, goods, or services that are available on or through such sites or resources.

Release Notes Revision History

This section lists the changes that have been made in these release notes after the initial release of the Sun GlassFish Enterprise Server product.

TABLE 1-1 Release Notes Revision History

Revision Date	Description
October 2009	FCS release of the Enterprise Server v2.1.1 product.
January 2010	Bug fixes and mention of support for AIX 6.1 with Java SE 6
April 2010	Mention of 64-bit SUSE Linux Enterprise Server 11.
July 2010	Patch 6 Updates: Added SUSE 10, 11 to the list of supported operating systems for Sun Java System Web Server and Apache Web Server in the Supported Web Servers table. Added bug 6958492 to the Known Issues section. Added support for REQUESTED client authentication, per change request 6966798.
August 2010	Patch 7 Updates: Added information about OAM support. Added AIX 6.1 and Windows 2008 R2 to list of supported platforms. Added bug 6977626 to the Known Issues and Limitations section.
October 2010	Patch 8 Updates: Added information about PRLB support. Updated titles in Related Documentation section. Updated links to Oracle Technology Forums. Fixed several typographical errors.
March 2011	Patch 11 Updates: Added several new issues to Known Issues section.
June 2011	Added new issue to Known Issues section.
October 2012	Added “ Setting the Interval for Rotating a Node Agent's Log File ” on page 32 and “ Misleading Documentation for Configuring JMS Physical Destinations ” on page 53.
January 2013	Added “ Upgrade Procedure is Confusing ” on page 54.

TABLE 1–1 Release Notes Revision History (Continued)

Revision Date	Description
October 2013	Patch 22 Updates: Added “Expired Root CA for CN=GTE CyberTrust Root 5, OU=GTE CyberTrust Solutions, Inc. (17405362)” on page 75 and “Modify Policy Files for Existing Domains (17419736 and 17574160)” on page 78 to Known Issues section.

Accessibility Features

To obtain accessibility features that have been released since the publishing of this media, consult Section 508 product assessments available from Sun upon request to determine which versions are best suited for deploying accessible solutions. Updated versions of applications can be found at: <http://www.oracle.com/index.html>

For information on Sun's commitment to accessibility, visit <http://www.oracle.com/index.html>.

Related Documentation

TABLE 1–2 Books in the Enterprise Server Documentation Set

Book Title	Description
<i>Documentation Center</i>	Enterprise Server documentation topics organized by task and subject.
<i>Release Notes</i>	Late-breaking information about the software and the documentation. Includes a comprehensive, table-based summary of the supported hardware, operating system, Java Development Kit (JDK), and database drivers.
<i>Quick Start Guide</i>	How to get started with the Enterprise Server product.
<i>Installation Guide</i>	Installing the software and its components.
<i>Application Deployment Guide</i>	Deployment of applications and application components to the Enterprise Server. Includes information about deployment descriptors.
<i>Developer's Guide</i>	Creating and implementing Java Platform, Enterprise Edition (Java EE platform) applications intended to run on the Enterprise Server that follow the open Java standards model for Java EE components and APIs. Includes information about developer tools, security, debugging, and creating lifecycle modules.
<i>Java EE 5 Tutorial</i>	Using Java EE 5 platform technologies and APIs to develop Java EE applications.
<i>Java WSIT Tutorial</i>	Developing web applications using the Web Service Interoperability Technologies (WSIT). Describes how, when, and why to use the WSIT technologies and the features and options that each technology supports.
<i>Administration Guide</i>	System administration for the Enterprise Server, including configuration, monitoring, security, resource management, and web services management.

TABLE 1–2 Books in the Enterprise Server Documentation Set (Continued)

Book Title	Description
<i>High Availability Administration Guide</i>	Setting up clusters, working with node agents, and using load balancers.
<i>Administration Reference</i>	Editing the Enterprise Server configuration file, <code>domain.xml</code> .
<i>Performance Tuning Guide</i>	Tuning the Enterprise Server to improve performance.
<i>Reference Manual</i>	Utility commands available with the Enterprise Server; written in man page style. Includes the <code>asadmin</code> command line interface.

How to Report Problems and Provide Feedback

If you have problems with Sun GlassFish Enterprise Server, contact Sun using one of the following mechanisms:

- [GlassFish mailing lists \(https://glassfish.dev.java.net/servlets/ProjectMailingListList\)](https://glassfish.dev.java.net/servlets/ProjectMailingListList) — A variety of GlassFish community mailing lists for various interests and feedback
- [GlassFish Issue Tracker \(https://glassfish.dev.java.net/servlets/ProjectIssues\)](https://glassfish.dev.java.net/servlets/ProjectIssues) — The bug database for Sun GlassFish Enterprise Server
- [Oracle Technology Forums \(http://forums.oracle.com/forums/main.jspa?categoryID=84\)](http://forums.oracle.com/forums/main.jspa?categoryID=84) — An interactive message board for sharing knowledge and questions about Java technologies and programming techniques

Note – The Oracle Technology Forums replace the Sun [Java Technology Forums](#). For information about the migration of content from the Sun forums to the Oracle forums, see the [Sun Forums Migration FAQ \(http://wikis.sun.com/display/ForumsMigration/Home\)](http://wikis.sun.com/display/ForumsMigration/Home).

- [Sun Support Center \(http://www.oracle.com/us/support/044752.html\)](http://www.oracle.com/us/support/044752.html) — Links to the Knowledge Base, Online Support Center, and Product Tracker, as well as to maintenance programs and support contact numbers
 - The telephone dispatch number associated with your maintenance contract
- So that we can best assist you in resolving problems, please have the following information available when you contact support:
- Description of the problem, including the situation where the problem occurs and its impact on your operation
 - Machine type, operating system version, and product version, including any patches and other software that might be affecting the problem
 - Detailed steps on the methods you have used to reproduce the problem

- Any error logs or core dumps

Sun Welcomes Your Comments

Sun is interested in improving its documentation and welcomes your comments and suggestions.

To share your comments, go to <http://www.oracle.com/technetwork/indexes/documentation/index.html> and click Feedback. In the online form, provide the document title and part number. The part number is a seven-digit or nine-digit number that can be found on the title page of the book or at the top of the document. For example, the title of this book is *Sun GlassFishEnterprise Server v2.1.1 Release Notes*, and the part number is 821-0188-21.

- [“More About WSIT Integration” on page 33](#)

What's New in Sun GlassFish Enterprise Server v2.1.1

The following new features were introduced in Sun GlassFish Enterprise Server v2.1.1.

- **Support for Oracle Access Manager (OAM) integration** – Enterprise Server v2.1.1 Patch 7 supports integration with OAM security providers. See [Using Oracle Access Manager with Enterprise Server](#) for more information.
- **Support for Per Request Load Balancing** — Enterprise Server v2.1.1 supports Per Request Load Balancing (PRLB). PRLB is a new method for load balancing stateless EJBs that enables load-balancing for each request to an EJB instance. Per-request load balancing chooses the first node in the cluster to use on each request. By contrast, the older load balancing model chose the first node to use when the `InitialContext` was created, and each request thereafter used the same node unless a failure occurred.

PRLB is enabled by means of a new `per-request-load-balancing` (boolean) property in the `sun-ejb-jar.xml` file. If this property is not set, the original Load Balancing behavior is preserved.

See [PRLB feature in GlassFish 2.1.1](#) for more information.

- **Support for the Client-Auth REQUESTED SSL value** – Enterprise Server v2.1.1 Patch 6 supports the REQUESTED client authentication option. To enable this support, add the following property to the `http-listener` element for the domain:

```
<property name="com.sun.grizzly.ssl.auth" value="want"/>
```

For more information, see [Client-Auth REQUESTED in GlassFish](#).

- **Grizzly 1.0.30** – In addition to integrating Grizzly 1.0.30, improvements have been made to Grizzly for quicker and more reliable instance failover in Enterprise Server.
- **Support for Apache Web Server via the mod_jk plug-in** – For more details on how Enterprise Server v2.1.1 supports Apache Web Server, see [“Web Stack Support” on page 27](#).
- **Support for JSF 1.2_13** – Enterprise Server v2.1.1 supports JSF 1.2_13.
- **Support for Jersey 1.0.3** – Enterprise Server v2.1.1 supports Jersey 1.0.3.
- **Support for Sun GlassFish Message Queue 4.4** – Enterprise Server v2.1.1 supports Sun GlassFish Message Queue 4.4. For more details, see [“Message Queue Versions” on page 20](#).
- **Bug fixes and enhancements** – To view the complete list of bugs fixed in the release, see the [GlassFish IssueTracker](#) and [bugs.sun.com](#).
- Sun GlassFish Enterprise Server v2.1.1 is equivalent to Sun GlassFish Enterprise Server v2.1 patch 06, which is available from [SunSolve](#) (<http://sunsolve.sun.com>).

Sun GlassFish Enterprise Server Features

Sun GlassFish Enterprise Server v2.1.1 includes the following features:

- **Registration with Sun Connection** — You can use the installer, the Admin Console GUI, or the Update Center to register the product with [Sun Connection](http://www.sun.com/service/sunconnection/index.jsp) (<http://www.sun.com/service/sunconnection/index.jsp>). By registering the Enterprise Server with Sun Connection you receive benefits such as:
 - Patch information and bug updates
 - Screencasts and tutorials
 - News and events
 - Support and training offerings
- **AIX operating system support** — Enterprise Server is supported on the AIX operating system for domains that are created with the developer profile or the cluster profile.
Sun GlassFish Enterprise Server v2.1.1 Update 7 supports 32-bit and 64-bit AIX 6.1 with JDK 1.6 Update 17. You need to apply IBM patch PMR: 56151,756,000.

Note – The enterprise profile is not supported on the AIX operating system because HADB and NSS are not supported on the AIX operating system.

- **Ubuntu operating system support** — Enterprise Server is bundled with the Ubuntu Linux operating system.

Note – Installation information in the Enterprise Server documentation set is not relevant to this operating system. The enterprise profile is not supported on the Ubuntu Linux operating system because HADB and NSS are not supported on the Ubuntu Linux operating system.

- **SUSE Linux 64-bit support**
- **Multilevel relationship prefetching support** — Multilevel relationship prefetching for container-managed persistence (CMP) 2.1 entity beans is now supported. For more information, see [“Enabling Multilevel Relationship Prefetching” on page 32](#).
- **Enhanced JBI support** — You can update a JBI component through the Admin Console GUI or from the command line without the need to redeploy any service assemblies that are already deployed.
- **Java EE 5 platform support** — Sun GlassFish Enterprise Server implements the Java EE 5 specification to deliver one of the best application runtimes for next-generation enterprise applications and web services. Enterprise Server implements the following Java EE standards:
 - Enterprise Java Beans 3.0

- JAXB 2.0
- Java Persistence
- Java Server Faces 1.2
- Java Server Pages 2.1 (JSP 2.1)
- Java Server Pages Standard Tag Library (JSTL) 1.2
- Streaming API for XML (StAX)
- Web Services Metadata
- Java API for XML based Web Services 2.0 (JAX-WS 2.0)
- Common Annotations for the Java Platform 1.0 (CAJ 1.0)
- Java Servlet 2.5

The complete list of Java EE 5 platform technologies is provided later in these notes.

- **Web Services Interoperability Technologies (WSIT) support** – Sun is working closely with Microsoft to ensure interoperability of Web services enterprise technologies such as message optimization, reliable messaging, and security. The initial release of WSIT is a product of this joint effort. WSIT is an implementation of a number of open web services specifications to support enterprise features. In addition to message optimization, reliable messaging, and security, WSIT includes a bootstrapping and configuration technology. Starting with the core XML support currently built into the Java platform, WSIT uses or extends existing features and adds new support for interoperable web services, including:
 - Bootstrapping and Configuration
 - Message Optimization Technology
 - Reliable Messaging Technology
 - Security Technology

See [“More About WSIT Integration” on page 33](#) later in this chapter for more information about WSIT integration in Enterprise Server.

- **JBISupport** – JBI extends Java EE with business integration Service Provider Interfaces (SPI). These SPI enable developers to create or implement a Java business integration environment for specifications such as WSCI, BPEL4WS and the W3C Choreography Working Group. A JBI implementation is installed directly by the Enterprise Server installer, mostly in the *as-install/jbi* directory. This directory contains all common JAR files and system components for the JBI including a lifecycle module that starts the JBI framework in the Enterprise Server JVM.
- **In-memory replication support** – In-memory replication on other servers provides lightweight storage of session state data without the need to obtain a separate database, such as HADB. This type of replication uses memory on other servers for high availability storage of HTTP session and stateful session bean data. Clustered server instances replicate session state in a ring topology. Each backup instance stores the replicated data in memory. Replication of session state data in memory on other servers enables sessions to be distributed. The use of in-memory replication requires the Group Management Service (GMS) to be enabled (which is true by default).

- **Usage profiles** – Every administrative domain is associated with a usage profile, which identifies the capabilities of that domain. Enterprise Server provides the following profiles:
 - *Developer* – Use this profile if you are running your domain in a development environment and if your applications do not need clustering features, such as load balancing, high availability, and session replication. Note that the actual name of the profile is “*developer*” (case sensitive).
 - *Cluster* – Use this profile if you want to create clusters of application server instances imparting scalability and high availability to the deployed Java EE applications. The state of the applications is persisted *in-memory*. Note that the actual name of the profile is “*cluster*” (case sensitive).
 - *Enterprise* – Use this profile if you need HADB and NSS. This profile is not usable unless you install HADB and NSS separately or install the Enterprise Server as part of the Java Enterprise System (Java ES).
- **Load balancing enhancements** – Several enhancements have been added to the load balancing plugin. Briefly, these include
 - *Weighted Round Robin* – An optional attribute called *weight* has been added to the instance `Loadbalancer.xml` file. This option enables the load balancer plugin to route requests according to the weight. For example, for every 500 requests, 100 will go to `instance1` and 400 would go to `instance2`. The default weight is 100. The weight is assigned to each instance from the admin console or command line, and the server `domain.xml` has an attribute for every instance indicating the weight.
 - *User-Defined Load Balancer Decision* – Enables users to define custom logic for load balancing; for example, user identity-based redirects and mime-based load balancing. This feature is implemented by means of a user-defined shared library that gets loaded by the load balancer. This custom shared library implements the interface as defined in `loadbalancer.h`, which is placed in `as-install/lib/install/templates/`.
 - *Administration Enhancements* – Previous versions of Enterprise Server required that the `loadbalancer.xml` file be manually copied to the particular server's config directory. Enterprise Server includes push automations for performing such copies between the Web server and Enterprise Server. The load balancer itself is configured in the server's `domain.xml` file.
- **Open Source and GlassFish Community** — In June 2005, Sun launched the [GlassFish](http://www.oracle.com/technetwork/java/javaee/community/index.html) (<http://www.oracle.com/technetwork/java/javaee/community/index.html>) community with the goal of developing a free, open source, commercial-grade application server that implements the newest features of the Java EE 5 platform and related enterprise technologies. Enterprise Server is based on the source code developed by Sun engineers and the GlassFish community.
- **Update Center Support** – The Enterprise Server Update Center provides automated Enterprise Server updates and easy access to additional components. See “[Using the Update Center](#)” on page 30 for more information.

Hardware and Software Requirements

This section lists the requirements that must be met before installing Sun GlassFish Enterprise Server.

- [“Supported Platforms” on page 14](#)
- [“System Virtualization Support” on page 17](#)
- [“Important Patch Information” on page 17](#)
- [“JDK Version” on page 17](#)
- [“To Switch to the Supported Java SE Version” on page 17](#)
- [“Apache Ant Version” on page 18](#)
- [“JDBC Drivers and Databases” on page 18](#)
- [“Using the Bundled Java DB Database” on page 19](#)
- [“Message Queue Versions” on page 20](#)
- [“Web Servers for the Load Balancing Plugin” on page 20](#)
- [“Browsers” on page 21](#)
- [“HADB Requirements and Supported Platforms” on page 21](#)
- [“Upgrading the Enterprise Server” on page 22](#)
- [“Required Free Ports” on page 22](#)
- [“Other Requirements” on page 23](#)

Supported Platforms

The following table lists the operating systems with which the Sun GlassFish Enterprise Server v2.1.1 is compatible. All supported operating systems are 32-bit unless indicated otherwise. 64-bit JDK is only supported on 64-bit supported operating systems.

Note – The table lists the minimum required version of each supported operating system. Service pack updates to the minimum required version are also supported.

TABLE 2-1 Supported Operating Systems

Operating System	Minimum Memory	Recommended Memory	Minimum Disk Space	Recommended Disk Space	JVM
Sun Solaris 9, 10 (SPARC)	512 MB	512 MB	250 MB free	500 MB free	J2SE 5.0
Solaris 9, 10 (x86)					Java SE 6
64-bit Sun Solaris 10 (SPARC, x86)	512 MB	512 MB	250 MB free	500 MB free	J2SE 5.0 Java SE 6

TABLE 2-1 Supported Operating Systems (Continued)

Operating System	Minimum Memory	Recommended Memory	Minimum Disk Space	Recommended Disk Space	JVM
Red Hat Enterprise Linux 3.0 Update 1, 4.0, and 5.x	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
64-bit Red Hat Enterprise Linux 5.x	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
SUSE Linux Enterprise Server 10 (SP1, SP2 are also supported)	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
64-bit SUSE Linux Enterprise Server 10 (SP1 is also supported)	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
64-bit SUSE Linux Enterprise Server 11	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
Ubuntu Linux 8.04, Hardy Release Supported only as a developer platform.	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
AIX 5.2, 5.3, 6.1	512 MB	1 GB	250 MB free	500 MB free	J2SE 5.0 Java SE 6
64-bit AIX 6.1	512 MB	1 GB	250 MB free	500 MB free	JDK 1.6.0 SR6

TABLE 2-1 Supported Operating Systems (Continued)

Operating System	Minimum Memory	Recommended Memory	Minimum Disk Space	Recommended Disk Space	JVM
Windows 2000 SP4+ Advanced Server SP4+ Windows Server 2003, 2008 Windows XP Pro SP3 Windows Vista Windows 2008	1 GB	2 GB	500 MB free	1 GB free	J2SE 5.0 Java SE 6
64-bit Windows 2008 R2	1 GB	2 GB	500 MB free	1 GB free	JDK 1.6.0_23
Windows 7 Supported only as a developer platform	1 GB	2 GB	500 MB free	1 GB free	J2SE 5.0 Java SE 6
Macintosh OS 10.4, 10.5 (Intel, Power) Supported only as a developer platform.	512 MB	512 MB	250 MB free	500 MB free	Java SE 5
OpenSolaris Evaluation support only	512 MB	512 MB	250 MB free	500 MB free	Java SE 5 Java SE 6

On UNIX, you can check your operating system version using the `uname` command. Disk space can be checked using the `df` command.

Note –

1. The Enterprise Server **enterprise** profile is not supported on any 64-bit platform.
 2. Its recommended that you use the NTFS file system rather than FAT or FAT32 when running the Enterprise Server on any Microsoft Windows platform.
 3. Although Mac OS is not supported for production deployments, it is supported for development purposes. You can get information on downloading the Macintosh operating system from the GlassFish downloads page , or through the SDK page where Mac is listed. For example, on the [Java EE 5 SDK Update 5 download page](#).
-

System Virtualization Support

System virtualization is a technology that enables multiple operating system (OS) instances to execute independently on shared hardware. Functionally, software deployed to an OS hosted in a virtualized environment is generally unaware that the underlying platform has been virtualized. Sun performs testing of its Sun Java System products on select system virtualization and OS combinations to help validate that the Sun Java System products continue to function on properly sized and configured virtualized environments as they do on non-virtualized systems.

Important Patch Information**Solaris Patch Requirements**

It is recommended that Solaris 10 (x86, SPARC) users have the “Sun recommended patch cluster” installed. This patch cluster is available under “Recommended and Security Patches” on the [SunSolve \(http://sunsolve.sun.com/pub-cgi/show.pl?target=patchpage\)](http://sunsolve.sun.com/pub-cgi/show.pl?target=patchpage) Web site.

JDK Version

The minimum (and certified) version of JDK required for Enterprise Server is **1.6.0_23**.

▼ To Switch to the Supported Java SE Version

You can switch to a supported Java SE version by editing the `asenv` file as described here.

- 1 **If you have not already done so, install the new Java SE version on your system.**

The Java SE SDK can be downloaded from <http://java.sun.com/javase>

- 2 **Stop the Enterprise Server.**

- From the command line:

```
install_dir/bin/asadmin stop-domain
```

- From the Administration Console:
 - a. Click the Application Server node.
 - b. Click Stop Instance.
- 3 **Edit the `install_dir/config/asenv.conf` file (`asenv.bat` on Windows), changing the value for `AS_JAVA` to point to the new Java home directory:**
- 4 **Edit the `as-install/samples/common.properties` file, changing the line beginning `com.sun.aas.javaRoot...` to reference the new Java home directory.**
- 5 **Restart the Application Server.**
 - From the command line:
`as-install/bin/asadmin start-domain`
 - From the Administration Console:
 - a. Click the Application Server node.
 - b. Click Start Instance.

Apache Ant Version

Version **1.6.5** of Apache Ant is bundled with Enterprise Server on all operating systems except Ubuntu Linux. Version **1.7.0** of Apache Ant is bundled with Ubuntu Linux and used with Enterprise Server .

JDBC Drivers and Databases

[Table 2–2](#) lists databases and drivers that meet the Java EE compatibility requirements. All supported configurations of the Sun GlassFish Enterprise Server must contain at least one database/driver combination from this table, such as the bundled Java DB database and driver. In addition, the Enterprise Server is designed to support JDBC connectivity to any additional DBMS with a corresponding JDBC driver.

TABLE 2–2 Java EE-Compatible JDBC Drivers

JDBC Driver Vendor	JDBC Driver Type	Supported Database Server
Derby Network Client	Type 4	Derby 10.2
DataDirect 3.6.x, 3.7.x (Also known as Sun JDBC drivers) Note – Sun JDBC drivers are provided only with Enterprise-profile capable installation bundles.	Type 4	Oracle 10g Oracle 9i Sybase ASE 12.5, 15 MS SQL 2000, 2005 DB2 9.1 DB2 8.1, 8.2

TABLE 2-2 Java EE-Compatible JDBC Drivers (Continued)

JDBC Driver Vendor	JDBC Driver Type	Supported Database Server
MySQL Connector/J Driver 3.1	Type 4	MySQL 5.0
Oracle 10g, 11g	Type 4	Oracle 10g, Oracle 11g -RAC
PostGres	Type 4	8.1, 8.2.x

In general, the Enterprise Server v2.1.1 supports all JDBC drivers that meet the Java EE specification.

Using the Bundled Java DB Database

This section provides instructions for using the Java DB database implementation bundled with Enterprise Server v2.1.1. Java DB is based on the [Apache Derby database](#).

- “Starting and Stopping the Java DB Database” on page 19
- “Java DB Utility Scripts” on page 19

Starting and Stopping the Java DB Database

Sun GlassFish Enterprise Server has the following `asadmin` commands for starting and stopping the Java DB Network Server.

- Use the `asadmin start-database` command to start an instance of the Java DB network server:

```
asadmin start-database [--dbhost 0.0.0.0] [--dbport 1527] [--dbhome path]
```

The default value for the host is `0.0.0.0`, which enables Java DB to listen on `localhost` as well as the IP/hostname interfaces. The value for the `dbhome` property is the location of where the Java DB databases reside. The default path is `as-install/javadb`.

- Use the `asadmin stop-database` command to shut down a running instance of the Java DB network server:

```
asadmin stop-database [--dbhost 0.0.0.0] [--dbport 1527]
```

Java DB Utility Scripts

The Java DB configuration that is supplied with Enterprise Server 2.1.1 includes scripts that can help you use Java DB. The following scripts are available for use in the `as-install/javadb/bin` directory:

- `startNetworkServer`, `startNetworkServer.bat`— Script to start the network server
- `stopNetworkServer`, `stopNetworkServer.bat`— Script to stop the network server
- `ij`, `ij.bat`— Interactive JDBC scripting tool
- `dblook`, `dblook.bat`— Script to view all or part of the DDL for a database

- `sysinfo`, `sysinfo.bat` — Script to display versioning information about the Java DB environment
- `NetworkServerControl`, `NetworkServerControl.bat` — Script which provides a means of executing commands on the `NetworkServerControl` API

▼ **To Configure Your Environment to Run the Java DB Utility Scripts**

- 1 **Ensure that the `JAVA_HOME` environment variable specifies the directory where the JDK is installed.**
- 2 **Set the `DERBY_HOME` environment variable to point to the `as-install/javadb` directory.**

See Also For more information about these utilities, see the following Derby documentation:

- [Derby Tools and Utilities Guide](http://db.apache.org/derby/docs/10.1/tools/) (<http://db.apache.org/derby/docs/10.1/tools/>)
- [Derby Server and Administration Guide](http://db.apache.org/derby/docs/10.1/adminguide/) (<http://db.apache.org/derby/docs/10.1/adminguide/>)

Message Queue Versions

For file-based installations, Message Queue 4.4 is co-packaged with Enterprise Server.

The embedded Sun GlassFish Message Queue code that is supplied as part of Enterprise Server is only tested and certified (typically) against the equivalent version of the Message Queue broker. This means that using the supplied embedded Message Queue code to connect to a remote (not managed by Enterprise Server) Message Queue broker running a different version of the Message Queue code is not supported.

Web Servers for the Load Balancing Plugin

This section lists the Web servers that are supported for the Sun GlassFish Enterprise Server load balancing plugin.

TABLE 2-3 Supported Web Servers

Web Server	Version	Operating System ¹
Sun Java System Web Server (32-bit)	6.1, 7.0	Solaris SPARC 9, 10 Solaris x86 9, 10 Red Hat Enterprise Linux 3, 4, 5 SUSE Linux 10, 11

¹ Only 32-bit platforms are supported.

TABLE 2-3 Supported Web Servers (Continued)

Web Server	Version	Operating System ¹
Apache Web Server (32-bit)	2.0.x, 2.2.x	Solaris SPARC 9, 10 Solaris x86 10 Red Hat Enterprise Linux 3, 4, 5 SUSE Linux 10, 11
Microsoft IIS (32-bit)	5.0+, 6	Windows Server 2003

¹ Only 32-bit platforms are supported.

Browsers

This section lists the browsers that are supported with the Sun GlassFish Enterprise Server v2.1.1.

TABLE 2-4 Supported Web Browsers

Browser	Version
Mozilla	1.7.12
Internet Explorer	6.0 Service Pack 2, 7.0
Firefox	2.x, 3.x
Safari	3.x, 4.x
Netscape	8.0.4, 8.1, 9.0, 9.0.x

HADB Requirements and Supported Platforms

In addition to the requirements listed in [“Hardware and Software Requirements” on page 14](#), verify that your system meets the requirements listed below for running HADB.

- [“Supported Platforms” on page 21](#)
- [“HADB Server Host Requirements” on page 22](#)
- [“HADB Management Host Requirements” on page 22](#)
- [“HADB Client Host Requirements” on page 22](#)

Note – HADB is only bundled with the Enterprise Server v2.1.1 Enterprise profile. Also note that the Java components of the system have been built and tested on JDK 5 and JDK 6.

Supported Platforms

- **Solaris (SPARC).** – Solaris 8 MU7, Solaris 9 MU7, Solaris 10 RR.
- **Solaris (x86).** – Solaris 9 MU7, Solaris 10 RR.

- **Red Hat Enterprise Linux.** 2.1 U5 (only ext2 file system is supported, not ext3). 3.0 U4 (both ext2 and ext3,4, 5 are supported. Updates before U4 are not recommended due to excessive swapping.) Note that HADB is tested on these operating system versions in 32-bit mode only. Also, note that HADB does not support Red Hat Enterprise Linux 3.0 running in 64-bit mode due to a bug in the operating system (see known bug 6249685 in the “[High Availability](#)” on page 55 section for details about impact on HADB). Versions 4 and 5 are also supported.
- **Microsoft Windows.** – Microsoft Windows 2000 Advanced Server Service Pack 4 and Microsoft Windows 2003 Enterprise Edition, Windows 2008, Windows XP Professional are supported. Note that HADB does not support any of the forthcoming Microsoft Windows operating system versions in 64-bit mode.

HADB Server Host Requirements

- **Minimum memory** - 320 MB per node.
- **Minimum free disk space** - 70 MB for HADB binaries per host. In addition, disk space is needed for the data devices, 512 MB for a test installation per node.
- **Recommended memory** - 512 MB per node.
- **Recommended free disk space** - 70 MB for HADB binaries per host. In addition, disk space is needed for the data devices, 1200 MB for a test installation per node.

Note – Make sure write caching is disabled on devices storing HADB data and log files. Write caching is enabled by default on some Solaris platforms; for example, Solaris x86.

HADB Management Host Requirements

- **Minimum memory** - 128 MB
- **Minimum free disk space** - 70 MB for HADB binaries per node

HADB Client Host Requirements

- **Minimum memory** - 120 MB
- **Minimum free disk space** - 20 MB

Upgrading the Enterprise Server

Refer to the *Sun GlassFish Enterprise Server v2.1.1 Upgrade Guide* for complete instructions for upgrading from a previous version of the Enterprise Server to the current version.

Required Free Ports

You must have seventeen unused ports available for the ports Enterprise Server uses. The installation program automatically detects ports that are in use and suggests currently unused ports for the default settings. The initial default port assignments are listed in the following

table. If these default port numbers are in use, the installation program assigns a randomly selected port number from the dynamic port range. The selected port number might not be the next available port number.

TABLE 2-5 Default Port Assignments for Enterprise Server

Port Number	Usage
4848	Admin Console
8080	HTTP
8081	HTTPS
8686	Pure JMX clients
3700	IIOP
3820	IIOP/SSL
3920	IIOP/SSL with mutual authentication
22	SSH port
9009	Java debugger
6666	OSGi shell telnet port
7676	JMS provider
Auto-generated from the operating system's dynamic port range	Message Queue TCP port
Auto-generated from the operating system's dynamic port range	Message Queue Admin port
9090	GMS TCP start port
9200	GMS TCP end port
Auto-generated between GMS TCP start and end ports	GMS listener port
Auto generated between 2048 and 32000	GMS multicast port

Other Requirements

The following additional requirements should be met before installing the Sun GlassFish Enterprise Server software.

- **Free space:** your temporary directory must have a minimum of 35MB free for Sun GlassFish Enterprise Server installation, and 250 MB of free space for the SDK installation.

- **Using the uninstall program:** If you need to remove the Enterprise Server from your system, it is important to use the uninstall program that is included with the software. If you attempt to use another method, problems will arise when you try to reinstall the same version, or when you install a new version.
- **Replacing previously-installed servers (UNIX)** — Refer to the *Sun GlassFish Enterprise Server v2.1.1 Upgrade Guide* for complete instructions for upgrading from a previous version of the Enterprise Server.
- **Shutting down firewall (Microsoft Windows)** — You must stop any firewall software before installing the Sun GlassFish Enterprise Server software, because some of this software disables all ports by default. The installation program must be able to accurately determine which ports are available.

For further compatibility information, see the *Sun GlassFish Enterprise Server v2.1.1 Upgrade Guide*.

Java EE 5 Platform APIs

The Sun GlassFish Enterprise Server v2.1.1 supports the Java EE 5 platform. The following table lists the enhanced APIs available on the Java EE 5 platform.

TABLE 2-6 Major API changes on the Java EE 5 Platform

API	JSR
Java EE 5	
Java Platform, Enterprise Edition 5 (http://download.oracle.com/javaee/5/api/)	JSR 244 (http://jcp.org/aboutJava/communityprocess/pr/jsr244/)
Web Services Technologies	
Implementing Enterprise Web Services	JSR 109 (http://jcp.org/en/jsr/detail?id=109)
Java API for XML-Based Web Services (JAX-WS) 2.0 (https://jax-ws.dev.java.net/)	JSR 224 (http://jcp.org/en/jsr/detail?id=224)
Java API for XML-Based RPC (JAX-RPC) 1.1 (https://jax-rpc.dev.java.net/)	JSR 101 (http://jcp.org/en/jsr/detail?id=101)
Java Architecture for XML Binding (JAXB) 2.0 (https://jaxb.dev.java.net/)	JSR 222 (http://jcp.org/en/jsr/detail?id=222)
SOAP with Attachments API for Java (SAAJ) (https://saaj.dev.java.net/)	JSR 67 (http://jcp.org/en/jsr/detail?id=67)
Streaming API for XML (http://download.oracle.com/docs/cd/E17802_01/webservices/webservices/docs/1.6/tutorial/doc/SJSXP.html)	JSR 173 (http://jcp.org/en/jsr/detail?id=173)

TABLE 2-6 Major API changes on the Java EE 5 Platform (Continued)

API	JSR
Web Service Metadata for the Java Platform	JSR 181 (http://jcp.org/en/jsr/detail?id=181)
Component Model Technologies	
Enterprise JavaBeans 3.0 (http://www.oracle.com/technetwork/java/index-jsp-140203.html)	JSR 220 (http://jcp.org/en/jsr/detail?id=220)
J2EE Connector Architecture 1.5 (http://java.sun.com/j2ee/connector/)	JSR 112 (http://jcp.org/en/jsr/detail?id=112)
Java Servlet 2.5 (http://www.oracle.com/technetwork/java/index-jsp-135475.html)	JSR 154 (http://jcp.org/en/jsr/detail?id=154)
JavaServer Faces 1.2 (http://www.oracle.com/technetwork/java/javaee/javaserverfaces-139869.html)	JSR 252 (http://jcp.org/en/jsr/detail?id=252)
JavaServer Pages 2.1 (http://www.oracle.com/technetwork/java/javaee/jsp/index.html)	JSR 245 (http://jcp.org/en/jsr/detail?id=245)
JavaServer Pages Standard Tag Library 1.2 (http://www.oracle.com/technetwork/java/index-jsp-135995.html)	JSR 52 (http://jcp.org/en/jsr/detail?id=52)
Management Technologies

Java EE 5 SDK

Sun GlassFish Enterprise Server v2.1.1 is available as part of the Java EE 5 SDK.

There are two Java EE 5 SDK versions:

- Java Application Platform SDK (<http://www.oracle.com/technetwork/java/javaee/downloads/index.html>)
- Java EE 5 SDK (<http://www.oracle.com/technetwork/java/javaee/downloads/index.html>)

In addition, you can download these SDK distributions with the JDK. For more information, access the download page at <http://www.oracle.com/technetwork/java/javaee/downloads/index.html>.

Switching to Another Supported Java Version

Sun GlassFish Enterprise Server v2.1.1 requires Java SE 5.0 or greater as the underlying JVM. If you want to switch from one Java version to another, perform the following general steps. (Windows and Unix)

Note – Downgrading to an earlier Java version is not recommended after a domain has been created with a newer Java VM. If you must downgrade your JVM, it is recommended that you do it on a per-domain basis. The following procedure describes how to do this.

▼ To Switch to Another Supported Java Version

- 1 Download the desired Java SDK (not the JRE) and install it on your system, if you have not already done so.

The Java SDK can be downloaded from <http://www.oracle.com/technetwork/java/javase/overview/index.html>.

- 2 Start the domain for which you want to change the JDK:

as-install/bin/asadmin start-domain domain-name

3 Log in to the Admin console and change the JVM attributes for the domain.

In particular, you may want to change the `JAVA_HOME` variable on the JVM Settings page for the domain.

Alternatively, you can use the `asadmin` command:

```
as-install/bin/asadmin set "server.java-config.java-home=path-to-java-home"
```

Known Java ES 5 Compatibility Issues

There are two known compatibility issues between Enterprise Server v2.1.1 and Java ES 5 (JES5).

1. The JES5 Service Registry is not compatible with Enterprise Server v2.1.1 because of the JSF 1.2 version provided by Enterprise Server v2.1.1. The Service Registry needs to be upgraded to JES5u1 prior the Enterprise Server upgrade to v2.1.1. This limitation is also documented in the Service Registry documentation.
2. The JES5 Portal Server is not compatible with Enterprise Server v2.1.1 because of the JSF 1.2 version provided by Enterprise Server v2.1.1. Portal Server needs to be upgraded to JES5u1 prior the v2.1.1 upgrade to v2.1.1.

On a Java ES 5 setup that has Portal Server on Enterprise Server 8.2, upgrading Enterprise Server 8.2 to v2.1.1 makes the Portal Server unusable. Enterprise Server v2.1.1 uses JSF 1.2, but the JSF-Portlet bridge in Release 5 Portal Server does not support JSF 1.2. On Solaris/Linux the Portal Server needs to be upgraded to JavaES5 Update 1. On Windows do not upgrade Enterprise Server to v2.1.1 if you want to continue using the Release 5 Portal Server, as Portal Server is not supported in Java ES 5 Update 1 on Windows.

Oracle Access Manager Integration

Oracle Access Manager (OAM) is an identity management and access control system that can be shared by all applications deployed on Enterprise Server to provide centralized and automated single sign-on (SSO) services. OAM is available as a standalone product or as part of the [Oracle Identity & Access Management Suite](#).

See the [OAM product page](#) for more information about OAM. See [Using Oracle Access Manager with Enterprise Server](#) for more information about configuring Enterprise Server v2.1.1 to work with OAM providers.

Web Stack Support

You can use Enterprise Server with Sun GlassFish Web Stack, which pre-integrates and bundles components such as Apache HTTP Server, PHP, Ruby, and more. For more information about Sun GlassFish Web Stack, see the [Sun GlassFish Web Stack Documentation](#) wiki.

Enterprise Server provides support for load balancing by using the load balancer plug-in front-ended by Sun Java System Web Server, Apache Web Server and Microsoft IIS. Another technique for front-ending Enterprise Server is to use Apache `httpd` with the `mod_jk` connector.

▼ Front-ending Enterprise Server with Apache httpd and mod_jk

1 Create an Enterprise Server cluster.

2 Define the following JVM options as follows:

- `asadmin create-jvm-options --target cluster_name "-DjvmRoute=\${AJP_INSTANCE_NAME}"`
- `asadmin create-jvm-options --target cluster_name "-Dcom.sun.enterprise.web.connector.enableJK=\${AJP_PORT}"`

3 Configure the JVM options, AJP_PORT and AJP_INSTANCE_NAME, for each instance in the cluster with the following command:

```
asadmin create-system-properties --target instance_name
AJP_INSTANCE_NAME=instance_name
```

```
asadmin create-system-properties --target instance_name AJP_PORT=port-number
```

4 Restart the cluster

5 Install Apache httpd.

Apache httpd is available from <http://httpd.apache.org/download.cgi>

6 Install mod_jk.

The mod_jk connector is available from <http://www.apache.org/dist/tomcat/tomcat-connectors/jk/binaries/>

7 Add the following lines to the `mod_jk.so` file:

```
LoadModule jk_module path_to_mod_jk.so
JkWorkersFile /etc/apache2/worker.properties
# Where to put jk logs
JkLogFile /var/log/httpd/mod_jk.log
# Set the jk log level [debug/error/info]
JkLogLevel debug
# Select the log format
JkLogStampFormat "[%a %b %d %H:%M:%S %Y] "
# JkRequestLogFormat set the request format
JkRequestLogFormat "%w %V %T"
# Send all jsp requests to GlassFish
JkMount /*.jsp loadbalancer.
```

8 Create a new file named `/etc/apache2/worker.properties` and add the following lines:

```
# Define 1 real worker using ajp13
worker.list=loadbalancer
# Set properties for instance1
```

```

worker.instance1.type=ajp13
worker.instance1.host=localhost
worker.instance1.port=9090
worker.instance1.lbfactor=50
worker.instance1.cachesize=10
worker.instance1.cache_timeout=600
worker.instance1.socket_keepalive=1
worker.instance1.socket_timeout=300
# Set properties for instance2
worker.instance2.type=ajp13
worker.instance2.host=localhost
worker.instance2.port=9091
worker.instance2.lbfactor=50
worker.instance2.cachesize=10
worker.instance2.cache_timeout=600
worker.instance2.socket_keepalive=1
worker.instance2.socket_timeout=300
# Set properties for instance3
worker.instance3.type=ajp13
worker.instance3.host=localhost
worker.instance3.port=9092
worker.instance3.lbfactor=50
worker.instance3.cachesize=10
worker.instance3.cache_timeout=600
worker.instance3.socket_keepalive=1
worker.instance3.socket_timeout=300

worker.loadbalancer.type=lb
worker.loadbalancer.balance_workers=instance1,instance2,instance3

```

- 9 Copy the `tomcat-ajp.jar` file from the Apache 5.5.x installation to the Enterprise Server Lib directory.
- 10 Copy the `commons-logging.jar` (version 1.1.1) and the `commons-modeler.jar` (version 2.0.1) file from the Jakarta Commons web site at <http://commons.apache.org>.
- 11 Restart the cluster and start `httpd`.

Features Not Supported on All Operating Systems

Some features of the Enterprise Server are not supported on all operating systems. Details about these features are provided in the subsections that follow.

Features Not Supported on the AIX Operating System

If you are using the AIX operating system, the following limitations apply:

- Enterprise Server v2.1.1 is supported on the AIX operating system *only* for domains that are created with the developer profile or the cluster profile. The enterprise profile is *not* supported on the AIX operating system because HADB and NSS are not supported on the AIX operating system.
- For the AIX operating system, the native launcher is not available.

Features Not Supported on the Linux Operating System

If you are using the Linux operating system, the following limitations apply:

- For the SUSE Linux 64-bit operating system and RHEL 64-bit operating system on 64-bit JVM, the native application server launcher is not available. Use the 32-bit JVM instead.
- For the SUSE Linux 64-bit operating system and RHEL 64-bit operating system on 64-bit JVM, the installer is not available. Use the 32-bit JVM instead.
- The enterprise profile is *not* supported on the following platforms:

Note – For a description of the supported profiles, see “Usage Profiles” in *Sun GlassFish Enterprise Server v2.1.1 Administration Guide*.

- Red Hat Enterprise Linux 64-bit operating system and 64-bit JVM
- SUSE Linux 64-bit operating system and 64-bit JVM

Features Not Supported on the Ubuntu Operating System

If you are using the Ubuntu Linux operating system, the following limitations apply:

- Because Enterprise Server v2.1.1 is bundled with the Ubuntu Linux operating system, installation information in the Enterprise Server v2.1.1 documentation set is not relevant to this operating system.
- The enterprise profile is *not* supported on the Ubuntu Linux operating system because HADB and NSS are not supported on the Ubuntu Linux operating system.

Sun GlassFish Enterprise Manger

Sun GlassFish Enterprise Manager offers improved management and performance visibility of production Sun GlassFish Enterprise Server v2.1.1 deployments. It also enables IT to reduce time to deployment, optimize and troubleshoot performance, and address potential problems before they occur. For more details, see <http://www.oracle.com/goto/glassfish>

Using the Update Center

The Update Center provides automated Enterprise Server updates and easy access to additional components.

When the Update Center is enabled, it performs an automated software update. During this automated update process, the Update Center collects and transmits the following data to Sun Microsystems (or its service provider):

- Unique installation ID (GUID)
- IP address
- Operating system information (name, version, architecture, locale)

- JDK version
- Module download information (module name, date, time, status, download time, number of bytes downloaded)

No personally identifiable information is tracked. No personally identifiable information is associated with any other data or used for reporting purposes.

▼ To Use the Update Center

To ensure explicit agreement of the automated update, the Update Center is disabled by default. To enable the Update Center to perform periodic checks and automated updates:

1 Start the Update Center.

- On Unix: `<installdir>/updatecenter/bin/updatetool`
- On Windows: `<installdir>\updatecenter\bin\updatetool.bat`

2 Select the Preferences tab.

3 In the Update Scheduling window, change the Check for Updates drop-down box value from Never (Manual) to a desired value. For example, daily or weekly.

4 Specify the desired day of the week and time of the day for the update.

5 Select the Save button to save your changes.

The Update Center will now automatically check for Enterprise Server component updates according to the schedule specified. When an update is available, the Update Center will launch and notify you of the component available to update.

Upgrading the Enterprise Server on the Ubuntu Operating System

On the Ubuntu Linux operating system, installing GlassFish v2 does not override an existing installation of GlassFish v1. The `asadmin` script in `/usr/bin` administers GlassFish v2. To administer GlassFish v1, use its local `asadmin` utility in `/usr/share/sunappserver/bin`. To upgrade the v1 domain to v2, use the `asupgrade` tool located in `/usr/share/glassfishv2/bin`.

Using the global `asadmin` script to start a v1 domain results in the upgrade tool being invoked automatically. However, this causes an error due to a bug that uses the default domain location of the server for other (non-Ubuntu) platforms. To avoid this error, use the `asupgrade` tool instead.

Enabling Multilevel Relationship Prefetching

Multilevel relationship prefetching is supported for CMP 2.1 entity beans.

To enable multilevel relationship prefetching, set the following property:

```
-Dcom.sun.jdo.spi.persistence.support.sqlstore.MULTILEVEL_PREFETCH=true
```

For more information about relationship prefetching, see “Relationship Prefetching” in *Sun GlassFish Enterprise Server v2.1.1 Developer’s Guide*.

Setting the Interval for Rotating a Node Agent's Log File

By default, Enterprise Server rotates a node agent's log file when the size of file exceeds a specified limit. This limit is set by the value of the `log-rotation-limit-in-bytes` attribute of the node agent's `log-service` element.

When you set an interval for rotating a node agent's log file, Enterprise Server rotates the log file periodically, regardless of the file's size.

To prevent unnecessary rotations of the log file, Enterprise Server determines whether to rotate the log file as follows:

- After the specified interval has elapsed, Enterprise Server rotates the log file the next time logging activity occurs, for example:
 - The node agent is restarted.
 - Log levels are changed.
 - The log file is written to.
- If no logging activity occurs during the interval, Enterprise Server does *not* rotate the log file.

▼ To Set the Interval for Rotating a Node Agent's Log File

- 1 Ensure that the DAS for the domain that contains the node agent is running.
- 2 Set the `log-rotation-timelimit-in-minutes` attribute of the node agent's `log-service` element to the interval in minutes that you require.

```
asadmin> set domain.node-agent.node-agent-name.log-service.log-rotation-timelimit-in-minutes=interval
```

<i>node-agent-name</i>	The name of the node agent for which you are setting the interval for rotating the log file.
<i>interval</i>	A positive integer that specifies the required interval in minutes.

Note – If *interval* is 0, Enterprise Server rotates the node agent's log file on the basis of the file's size, not periodically.

3 Restart the DAS for the domain that contains the node agent.

Example 2-1 Setting the Interval for Rotating a Node Agent's Log File

This example sets the interval for rotating the log file of the node agent n1 to one hour.

```
asadmin> set domain.node-agent.n1.log-service.log-rotation-timelimit-in-minutes=60
domain.node-agent.n1.log-service.log-rotation-timelimit-in-minutes = 60
```

More About WSIT Integration

For detailed information about WSIT status, refer to the [WSIT Status Notes](#) page. Also refer to the *The WSIT Tutorial* for information about using WSIT with Enterprise Server.

Known Issues and Limitations

This chapter describes known problems and associated workarounds for the Sun GlassFish Enterprise Server v2.1.1 software. If a summary statement does not specify a particular platform, the problem applies to all platforms.

- “Administration” on page 35

Administration

This section describes known administration issues and associated solutions.

Enterprise Server does not detect conflicts with the heartbeat port of a cluster (Issue number 1967)**Description**

When a cluster is created, Enterprise Server randomly assigns a heartbeat port between 1026 to 45556. For default-cluster, which is the default cluster created by a Enterprise Server installation, a random number selected between 0 to 45556. The cluster creation process does not accurately detect if the heartbeat port is already being used by another service.

Solution

If automated cluster creation configuration selects a heartbeat port that is in conflict with another service that is already using that port, update the cluster heartbeat port to a port that is not being used by the system.

To change the heartbeat port of a cluster, use the following `asadmin` command:

```
asadmin set cluster-name.heartbeat-port=newportnumber
```

Domain creation stops on NFS server running 64-bit Linux (Issue Number 1961)**Description**

The `asadmin create-domain` command may fail while attempting to create a domain on a Network File System (NFS) mounted file system with the NFS server running on 64-bit Linux.

Solution

No known solution.

Performance degradation seen when a huge log file is rotated (6718611)**Description**

When a huge log file is rotated, a slight increase in the response time is observed.

Solution

Performance degradation can be minimized by modifying the values for File Rotation Limit and File Rotation Time Limit in the Logger settings. The values for these properties would depend on your application and environment.

Failed to Deploy Generic RA Resource Adapter against IBM MQ (Issue 6605)**Description**

Deployment of a generic RA adapter against IBM Message Queue product fails. The permissions granted in the `server.policy` file is as follows.

```
grant {
    permission java.util.logging.LoggingPermission "control";
    permission java.util.PropertyPermission "*", "read,write";
}
```

Solution

Change the permissions in the `server.policy` file as follows:

```
grant codeBase
"file:${com.sun.aas.installRoot}/lib/install/applications/adminapp/-" {
    permission java.util.logging.LoggingPermission "control";
};
```

Standalone instances sometimes obtain files from other instances (6698604)

Description

In some circumstances, files installed on the DAS intending to be synchronized with a specific instance actually get sent to additional instances.

Solution

No known solution.

Startup Message from the start-cluster command are too verbose (6728317)

Description

The `asadmin start-cluster` command shows too many messages even when non-critical components fail during startup. See the following example command output when non-critical elements (related to the instances in the cluster) fail:

```
./asadmin start-cluster --port 9898 cluster1
Please enter the admin user name>admin
Please enter the admin password>
The clustered instance, instance2, was successfully started.
error 0 [#|2008-07-17T14:58:16.496+0200|WARNING|sun-appserver9.1|javax.jms|

```

Command start-cluster executed successfully.

Solution

No known solution. These (exceptions) messages can be ignored.

Failed to Deploy Generic RA Resource Adapter against IBM MQ (Issue 6605)

Description

Deployment of a generic RA adapter against IBM Message Queue product fails. The permissions granted in the server.policy file is as follows.

```
grant {
    permission java.util.logging.LoggingPermission "control";
    permission java.util.PropertyPermission "*", "read,write";
}
```

Solution

Change the permissions in the server.policy file as follows:

```
grant codeBase
"file:${com.sun.aas.installRoot}/lib/install/applications/adminapp/-" {
    permission java.util.logging.LoggingPermission "control";
};
```

The package-appclient script does not work if domain1 is not present (6171458)

Description

By default, there is a hard-coded value in *as-install/lib/package-appclient.xml* for the `AS_ACC_CONFIG` variable for `domain1` that is pointed to by *asenv.conf*. If `domain1` is deleted and a new domain created, the `AS_ACC_CONFIG` variable is not updated with the new domain name, which causes the *package-appclient* script to fail.

Solution

Do one of the following:

1. Leave `domain1` intact, and create your other domains around it.
2. Remove `domain1` and replace the hard-coded value for `domain1` in *as-install/lib/package-appclient.xml* with the new domain name.

This will have to be done every time a new domain is created if `domain1` is not present.

Starting the Server with additional JMX Agent is not supported (6200011)

Description

J2SE 1.4.x, 5.0, or later can be configured on the server. An integral feature of J2SE 5.0 platform is the ability to start a JMX agent. This is activated when you explicitly set system properties at the server startup.

Example values include:

```
name="com.sun.management.jmxremote" value="true"
name="com.sun.management.jmxremote.port" value="9999"
name="com.sun.management.jmxremote.authenticate" value="false"
name="com.sun.management.jmxremote.ssl" value="false"
```

After configuring JMX properties and starting the server, a new *jmx-connector* server is started within the Virtual Machine. An undesirable side-effect of this is that the administration functions are affected adversely, and the Administration Console and command—line interface may produce unexpected results. The problem is that there are some conflicts between the built in *jmx-connector* server and the new *jmx-connector* server.

Solution

If using *jconsole* (or any other JMX-compliant client), consider reusing the standard JMX Connector Server that is started with server startup.

When the server starts up, a line similar to the one shown below appears in the *server.log*. You can connect to the *JMXService* URL specified there and perform the same management/configuration operations after successfully providing the credentials; for example:

```
[#|2004-11-24T17:49:08.203-0800|INFO|sun-appserver-ee8.1|  
javax.enterprise.system.tools.admin|_ThreadID=10;|ADM1501:  
Here is the JMXServiceURL for the JMXConnectorServer:  
[service:jmx:rmi:///jndi/rmi://hostname:8686/management/  
rmi-jmx-connector]. This is where the remote administrative  
clients should connect using the JSR 160 JMX Connectors.|#]
```

For more information, refer to the *Sun GlassFish Enterprise Server v2.1.1 Administration Guide*.

Load balancer configuration file does not get created with the endpoint URL of any web service (6236544,6275436)

Description

When setting up the load balancer configuration with an application that has an EJB module that exports a web service URL, the context root for the web service isn't in the resulting `loadbalancer.xml` file.

Solution

1. Edit the `loadbalancer.xml` file to add the missing web module as follows:

```
<web-module context-root="context-root-name"  
disable-timeout-in-minutes="30" enabled="true"/>
```

2. Replace `context-root-name` value with the context root name of the web service that was exposed as an EJB.

.asadmintruststore file not described in the Enterprise Server documentation (6315957)

Description

The `.asadmintruststore` file is not described in the Enterprise Server documentation. If this file does not exist in the server administrator's home directory, you may experience serious bugs when upgrading certain applications hosted on the server.

Solution

- If possible, the `asadmin start-domain domain1` command should be run by the user who installed the server.
- If it is not run by that user, the `.asadmintruststore` should be moved or copied from the home directory of the user who performed the installation to the home directory of the user who is running the server.
- Note that if the file is moved (not copied) from the installing user's home directory to the running user's home directory, you might experience application upgrade problems, as described in bugs 6309079, 6310428 and 6312869, because the upgrade/install user (normally root in Java ES) will no longer have the `.asadmintruststore` file in his or her home directory.

Clustered instances fail to start due to a timeout in reaching the JMS broker (6523663)

Description

The default MQ integration mode for a Enterprise Server cluster instance is LOCAL. When Enterprise Server is installed in a location (PATH) that is long (read “not short”), `imqbrokersvc.exe` crashes when the cluster instance starts. The problem is a memory allocation problem in `imqbrokersvc`.

Solution

The JMS service type for the cluster instance must be changed from the default LOCAL to REMOTE. In this configuration, all the instances point back to the DAS broker. Follow the instructions below to configure a cluster in REMOTE mode.

Note – When using REMOTE mode, all instances are using one broker (DAS), and therefore no broker cluster is created when the Enterprise Server cluster starts up. See “Auto-clustering” in Section 4.1, Division iii of the one-pager at <http://wikis.sun.com/display/GlassFish> for more information. The above functionality will not be available!

▼ Using the command-line

Before You Begin Modify the port and password file according to your environment. Note that in the instructions below, the cluster name is `raccluster`, the DAS admin port is 5858, and the DAS JMS port is 7676.

1 Modify the cluster configuration, changing the JMS type to REMOTE.

```
as-install/bin/asadmin.bat set --port 5858 --user admin --passwordfile \
as-install/bin/password_file raccluster.jms-service.type=REMOTE
```

2 Create a JMS host corresponding to the DAS JMS host.

```
as-install/bin/asadmin.bat create-jms-host --port 5858 --user admin --passwordfile \
as-install/bin/password_file --target raccluster --mqhost localhost --mqport 7676 \
--mquser admin --mqpassword admin dashost
```

3 Set the default JMS host to be the DAS JMS host created in the previous step.

```
as-install/bin/asadmin.bat set --port 5858 --user admin --passwordfile \
as-install/bin/password_file raccluster.jms-service.default-jms-host=dashost
```

▼ Using the Admin GUI

1 Go to Configurations->cluster-name-config->Java Message Service->JMS Hosts.

2 Click *New* to create a new JMS host; name it `dashost`.

3 Enter configuration settings corresponding to the JMS service for the DAS; defaults are as follows:

- Hostname: localhost
- Port: 7676
- Admin user: admin
- Password: admin

Modify these settings as appropriate for your DAS JMS service.

4 Navigate back to the Java Message Service tab, and change the JMS service type to REMOTE (default is LOCAL).

5 Choose dashost from the default-jms-host drop-down list.

6 Save the changes, and then start your node-agent or cluster.

Cannot display jmaki chart in Netscape 8.1.3, Mozilla 1.7 and Safari 2.0.4 browsers (6543014)

Description

When trying to display a chart from the Log Statistics Monitoring page using some unsupported browsers, the following error may be thrown:

```
Error loading jmaki.widgets.jmaki.charting.line.Widget : id=form1:jmaki_chart11
Script: http://easqelx5.red.ipplanet.com:4848/resources/jmaki/charting/ \
line/component.js (line:5437).
Message: area.initialize is not a function
```

Solution

Use a supported browser. Refer to [“Browsers” on page 21](#) for a list of browsers supported by Enterprise Server v2.1.1.

Default ports changing in each AS major release (6566481)

Description

The default admin port has changed in each of the past three major Enterprise Server releases. Specifically, the default admin ports in 7.x, 8.x, and 9.x are as follows:

- AS 7.x: 4848
- AS 8.x: 4849
- AS 9.x: 4848

Solution

This is not a bug, but something to be aware of. The default admin port is just a recommendation. It is anticipated that future Enterprise Server releases going forward will retain the default 4848 port.

The create-domain command fails with custom master password in AIX (6628170)

Description

On the AIX operating system, an attempt to create a domain with a custom master password fails with the following error:

```
keytool error (likely untranslated): java.lang.NullPointerException
Enter keystore password: New keystore password:
```

▼ Solution: (AIX) To Create a Domain With a Custom Master Password

Note – In the procedure that follows, only the options that are required in each step are provided. If you require additional options for a command, specify these options in the command. For information about Enterprise Server commands, see *Sun GlassFish Enterprise Server v2.1.1 Reference Manual*.

1 Create a shell script that contains the following lines of code:

```
#!/bin/sh
changeKeystorePass() {
    keytool -storepasswd -keystore ${KEystore} -storepass ${OLD} -new ${NEW}
}
changeTruststorePass() {
    keytool -storepasswd -keystore ${TRUSTSTORE} -storepass ${OLD} -new ${NEW}
}
changeKeyPass() {
    keytool -keypasswd -alias slas -keystore ${KEystore} -storepass ${NEW} -keypass ${OLD} -new ${NEW}
}
changeDomainPasswordEntry() {
    keytool -storepasswd -storetype JCEKS -keystore ${DOMAINPASSWORDS} -storepass ${OLD} -new ${NEW}
}
deleteMasterPasswordFile() {
    if [ -f ${DOMAIN_PATH}/master-password ] ; then
        echo Deleting ${DOMAIN_PATH}/master-password
        rm -f ${DOMAIN_PATH}/master-password
    fi
}
DOMAIN_PATH=$1
OLD=$2
NEW=$3
if [ $# != 3 ] ; then
    echo Usage: $0 domain-path old-master-pass new-master-pass
    exit 1
fi
echo Processing ...
if [ ! -f ${DOMAIN_PATH}/config/domain.xml ] ; then
    echo "Domain with folder ${DOMAIN_PATH} does not exist, create it first"
    exit 2
else
    KEystore=${DOMAIN_PATH}/config/keystore.jks
    TRUSTSTORE=${DOMAIN_PATH}/config/cacerts.jks
    DOMAINPASSWORDS=${DOMAIN_PATH}/config/domain-passwords
```

```
changeKeystorePass
changeTruststorePass
changeKeyPass
changeDomainPasswordEntry
deleteMasterPasswordFile
fi
```

2 Create a domain, specifying the default master password.

```
asadmin create-domain {--adminport adminportno|--portbase portbase} domain-name
Please enter the admin user name>admin-user
Please enter the admin password>admin-user-password
Please enter the admin password again>admin-user-password
Please enter the master password [Enter to accept the default]:>
Please enter the master password again [Enter to accept the default]:>

The default master password is changeit.
```

3 Change the master password of the domain that you have just created.

To change the master password, run the script that you created in [Step 1](#).

```
script-name domain-path old-password new-password
```

4 Start the domain that you created in [Step 2](#).

```
asadmin start-domain domain-name
```

Because the domain has a custom master password, you are prompted for the master password.

5 In response to the prompt, type the new master password.

6 For domains that are configured to support clusters, create and start a node agent.

a. Create a node agent for the domain that you created in [Step 2](#).

```
asadmin create-node-agent --port portno --user admin-user
```

b. Start the node agent that you created in [Step a](#).

```
asadmin start-node-agent
```

Because the domain has a custom master password, you are prompted for the master password.

c. In response to the prompt, type the new master password.

See Also The following Enterprise Server man pages:

- `create-domain(1)`
- `create-node-agent(1)`
- `start-domain(1)`
- `start-node-agent(1)`

AIX: 0403-027 The parameter list is too long (6625591)

Description

On the AIX operating system, some OS-related operations might fail with the following error:

```
0403-027 The parameter list is too long
```

Examples of OS-related operations are deploying applications or running the application client container.

This issue is commonly caused by long file paths in the CLASSPATH environment variable.

Solution

Use one of the following solutions:

- Increase the maximum length of the command line. For more information, see [“\(AIX\) To Increase the Maximum Length of the Command Line” on page 45](#).
- Use the xargs command to construct the argument list and start the command. The xargs command allows commands to exceed the maximum length of the command line.

▼ (AIX) To Increase the Maximum Length of the Command Line

The ncargs attribute determines maximum length of the command line, including environment variables. On the AIX operating system, the default value of the ncargs attribute is four, 4-Kbyte blocks. To ensure that Enterprise Server commands do not exceed the maximum length of the command line, increase this value to 16 4-Kbyte blocks.

Note – After the value of the ncargs attribute is changed, no reboot or refresh of daemons is required.

1 Determine the value of the ncargs attribute.

```
lsattr -EH -l sys0 | grep ncargs
```

2 If the value of the ncargs attribute is less than 16 4-Kbyte blocks, increase the value to 16.

```
chdev -l sys0 -a ncargs=16
```

Apache and Load Balancer Plugin

This section describes known Apache Web server and load balancer plugin issues and associated solutions.

SGES 2.1.1 Patch 2 LB plugin on WS7u8 crashes the web server on SUSE Linux 10 SP2 (6928066)

Description

Enabling the Sun GlassFish Enterprise Server v2.1.1 Patch 2 Load Balancer on SUSE Linux Enterprise Server 10 SP2 with Sun Java System Web Server 7u8 crashes the Web server.

Solution

Add the following lines to the startup script for the Sun Java System Web Server:

```
LD_PRELOAD=/usr/lib/libstdc++-libc6.2-2.so.3
export LD_PRELOAD
```

Deployment of Java EE application with EJB as a Web Service is not captured by load balancing plug-in (Issue 685)

Description

When you deploy any WAR (or EAR) with a servlet-based web service, the HTTP Load Balancer is updated with information about the web service. When an EJB-based web service is deployed, the configuration of the HTTP Load Balancer is not updated to reflect the new object.

Solution

Add these context roots manually to the load balancer configuration file (loadbalancer.xml). However, dynamic reconfiguration of load balancer configuration (using the auto-apply feature) would result in older manual edits being lost.

Turn off the auto-apply feature from DAS and instead use the manual export feature to edit and apply the load balancer configuration onto the Web Server.

The High-Availability Administration Guide does not contain instructions for using a certificate for Apache 2.0 (6307976)

To run Apache security, you must use a certificate. For instructions on obtaining a certificate from a certificate authority, see the information on certificates in the [modssl FAQ](http://www.modssl.org/docs/2.8/ssl_faq.html#ToC24) (http://www.modssl.org/docs/2.8/ssl_faq.html#ToC24).

Must start Apache Web Server as root (6308021)

On Solaris, if your Application Server was installed under root, you must start the Apache Web Server as root. Java Enterprise System installations are installed as root. For Apache 2.0, after starting as root, Apache switches and runs as another user you designate. You designate that user in the /conf/httpd.conf file. To start as root, on many systems you must edit the httpd.conf file to designate the correct group. Replace the line:

```
Group #-1
```

with

Group nobody

More information on user/group use is included in the `httpd.conf` file.

Application Client

This section describes known application client issues and associated solutions.

Library JAR packaged in Application Client Archive overwrites MANIFEST file (6193556)

Description

If you have a top level JAR file inside your client JAR (in this case, `reporter.jar`), when you deploy the client JAR, the MANIFEST file for that JAR overwrites the MANIFEST file for the client JAR.

Solution

None at this time.

ACC always tries to connect to localhost:3700 (6527987)

Description

The application client always tries to connect to `localhost:3700`. The problem is that several system properties need to be read before the client code is invoked.

Solution

Set the following as system properties (`-D` in your `JAVA_CMD`). Do *not* set them in your `apclient` code:

```
org.omg.CORBA.ORBInitialHost = server-instance-host  
org.omg.CORBA.ORBInitialPort = server-instance-port
```

Unable to start domain , missing sunpkcs11 . jar (6571044)

Description

Running on 64-bit Linux, the following exception when starting a domain. The issue is a missing `sunpkcs11.jar` under `jdk1.5.0_11/jre/lib/ext/`.

Solution

This is a known JDK bug with 64-bit Linux, and will be fixed in JDK 1.5.0_13.

ASQuickStartup breaks SocketChannel.keyFor(), returning null instead of the SelectionKey (Issue Tracker 3027)**Description**

When a `SocketChannel` is registered on several `Selectors`, doing `socketChannel.keyFor(lastRegisteredSelector)` returns null instead of the `SelectionKey`.

Solution

This is related to a JDK bug, 6562829, and is expected to be fixed in 6.0 U3. A workaround has been included in Enterprise Server 2.1, such that the selector is unwrapped before the `keyFor` API is called. This enables the `keyFor` to succeed until JDK bug is fixed.

Bundled Sun JDBC Drivers

This section describes known bundled Sun JDBC driver issues and associated solutions.

PreparedStatement errors (6170432)**Description 1**

If an application generates more than 3000 `PreparedStatement` objects in one transaction, the following error may occur with DB2:

```
[sunm][DB2 JDBC Driver] No more available statements.Please recreate your package with a larger dynamicSections value.
```

Solution 1

Add following properties to the connection pool definition to get the driver to rebind DB2 packages with a larger dynamic sections value:

```
createDefaultPackage=true replacePackage=true dynamicSections=1000
```

See the *Sun GlassFish Enterprise Server v2.1.1 Administration Guide* for details about configuring connection pools.

Description 2

Related to the `PrepardStatement` error above, another error message that may be thrown is:

```
[sunm][DB2 JDBC Driver][DB2]Virtual storage or database resource is not available.
```

Solution 2

Increase the DB2 server configuration parameter `APPLHEAPSZ`. A good value is 4096.

Description 3

Isolation level TRANSACTION_SERIALIZABLE. If your application uses isolation level TRANSACTION_SERIALIZABLE and uses one of the parameters suggested above, it might hang while obtaining a connection.

Solution 3

To set desired isolation level for a connection, the corresponding connection pool has to be created at that isolation level. See the *Sun GlassFish Enterprise Server v2.1.1 Administration Guide* for instructions.

Java DB is not started after machine reboot or server start (6515124)

Description

The bundled Java DB database is not automatically restarted after a host system or Solaris zone reboot, or an Enterprise Server start. This is not a bug, but expected behavior for any bundled or third-party application. The problem is that the Java DB must be started before the Enterprise Server instance.

Solution

After rebooting the host machine or Solaris zone, be sure to start the Java DB *before* starting Enterprise Server; for example:

```
/opt/SUNWappserver/appserver/bin/asadmin start-database
```

Refer to “Administration Tools” in *Sun GlassFish Enterprise Server v2.1.1 Quick Start Guide* in the *Sun GlassFish Enterprise Server v2.1.1 Quick Start Guide* for more information about asadmin command options.

Deployment

Autodeployment fails on a cluster sometimes (6610527)

Description

Timing issues sometimes cause autodeployment to fail in domains that are configured to support clusters. The issue is not observed in domains that do not support clusters.

Solution

Use one of the following solutions:

- Use autodeployment as follows:
 - Automatically deploy individual applications sequentially.
 - Introduce a delay between autodeployments of individual applications

- Deploy applications manually by using either the Admin Console GUI or the command line.

Bundled ANT throws `java.lang.NoClassDefFoundError` (6265624)

Description

The following exception is thrown in thread "main" `java.lang.NoClassDefFoundError: org/apache/tools/ant/launch/Launcher`.

Solution

Use of the bundled ANT for things outside the Enterprise Server is not recommended.

Application specific classloader not used by JSP compilation (6693246)

Description

The application-specific classloader (applibs or --libraries) is not used by the JSP compilation. As a result, JSPs referencing these JARs will not compile.

Solution

No known solution.

Documentation

This section describes known documentation issues and associated solutions.

Javadoc Inconsistencies (various IDs)

The Javadoc for several AMX interfaces and methods is either missing or incorrect:

- Getter methods for `NumConnAcquired` and `NumConnReleased` statistics are missing from `ConnectorConnectionPoolStats` and `AltJDBCConnectionPoolStats`. These getter methods will be added in a future release as `getNumConnAcquired()` and `getNumConnReleased()`.
- Calling the following methods in `EJBCacheStats` will throw an exception: `getPassivationSuccesses()`, `getExpiredSessionsRemoved()`, `getPassivationErrors()`, `getPassivations()`. This will be fixed in a future release.
- The AMX MBeans may require several seconds after server startup before they are all registered and available for use. A future release will make it possible to determine when the AMX MBeans are fully loaded.
- The constant `XTypes.CONNECTOR_CONNECTION_POOL_MONITOR` is misspelled ("NNN"). This will be corrected in a future release.

GlassFish 2.x documentation referring to invalid `create-session-store` command (6935976)

Description

Several locations in the GlassFish 2.x documentation set refer to the deprecated `create-session-store` subcommand.

Solution

Use the `create-ha-store` subcommand instead of the deprecated `create-session-store` subcommand. For example, change the following command:

```
asadmin create-session-store --storeurl url --storeuser user --storepassword password --dbssystempassword password
```

to

```
asadmin create-ha-store --user user --passwordfile filename databasename
```

GlassFish 2.1.1: behavior with applications containing identical context roots is undocumented (7002836)

Description

The Domain Administration Server (DAS) in versions of Sun GlassFish Enterprise Server prior to v2.1.1 did not allow multiple applications to be deployed using the same web context root, even if those applications were targeted for different Enterprise Server instances.

This behavior was changed in Enterprise Server v2.1.1, and the DAS now supports the deployment of applications using the same context root as long as those applications are deployed to different Enterprise Server instances. However, this new DAS support is not sufficiently documented.

Solution

“Deploying a WAR Module” in *Sun GlassFish Enterprise Server v2.1.1 Application Deployment Guide* states:

Web module context roots must be unique within a server instance.

While technically accurate, it is useful to add the following further clarification to this statement:

The DAS in Sun GlassFish Enterprise Server versions v2.1.1 and later supports the deployment of multiple web applications using the same web context root as long as those applications are deployed to different Enterprise Server instances. Deploying multiple applications using the same context root within a single Enterprise Server instance will produce a DAS error.

HTTP Service Statistics attributes discrepancies (7018903)

Description

There are typographical errors in the names of two HTTP Service statistics listed in “HTTP Service Statistics” in *Sun GlassFish Enterprise Server v2.1.1 Administration Guide*.

Solution

Please note the following corrections in the list of HTTP Service statistic names:

- `processing-time` should be `processingtime`
- `request-count` should be `requestcount`

Glassfish GFv2 Mod_JK AJP listens to all interfaces (7008190)

Description

The instructions provided in “Using `mod_jk`” in *Sun GlassFish Enterprise Server v2.1.1 Developer's Guide* for configuring an Apache JServ Protocol (AJP) listener with `mod_jk` are incorrect with regard to port, address, and other connector configuration options. The instructions as written will configure the AJP listener to listen on all interfaces rather than on any specific interface that you may try to define in the `worker.properties` file.

Solution

The documentation implies that, in addition to setting the required options in the `httpd.conf` file, AJP listener configuration settings can be defined in either the `worker.properties` file *or* the `glassfish-jk.properties` file. However, it is necessary to define configuration settings in both `worker.properties` and `glassfish-jk.properties`, rather than in just one or the other.

The following examples augment the instructions in “Using `mod_jk`” in *Sun GlassFish Enterprise Server v2.1.1 Developer's Guide*.

The first example shows a `workers.properties` file that is configured for `mod_jk`.

```
# Define 1 real worker using ajp13
worker.list=worker1
# Set properties for worker1 (ajp13)
worker.worker1.type=ajp13
worker.worker1.host=localhost worker.worker1.port=8009
```

The next example shows the corresponding Enterprise Server configuration settings that are defined in the `glassfish-jk.properties` file.

```
# Set the glassfish-jk.properties (for port)
# See http://tomcat.apache.org/tomcat-5.5-doc/config/ajp.html for other options
port=8009
```

The `glassfish-jk.properties` is also where you should specify any other options for the connector on the Enterprise Server side.

[UB]The *Global Transaction support box* is nowhere to be found (7536)

Description

The following statement appears in “Transaction Scope” in *Sun GlassFish Enterprise Server v2.1.1 Developer’s Guide*:

In the Enterprise Server, a JDBC resource is non-XA if it meets any of the following criteria:

- In the JDBC connection pool configuration, the DataSource class does not implement the javax.sql.XADataSource interface.
- The Global Transaction Support box is not checked, or the Resource Type setting does not exist or is not set to javax.sql.XADataSource.

There are several errors in this statement:

- The word “any” in the first sentence should be “either.”
- “DataSource” is a class name but the text formatting does not reflect this.
- A “Global Transaction Support” checkbox does not exist anywhere in the Enterprise Server 2.1 or v2.1.1 Admin Console.

Solution

The correct statement should read:

In the Enterprise Server, a JDBC resource is non-XA if it meets either of the following criteria:

- In the JDBC connection pool configuration, the DataSource class does not implement the javax.sql.XADataSource interface.
- The Resource Type setting is not set to javax.sql.XADataSource.

Misleading Documentation for Configuring JMS Physical Destinations

Description

The following statement appears in “JMS Physical Destinations” in *Sun GlassFish Enterprise Server v2.1.1 Administration Guide*:

To create a physical destination from the Admin Console, select Configuration > Java Message Service > Physical Destinations.

Solution

The statement should read:

To create a physical destination from the Admin Console:

1. Navigate to the Physical Destinations page.
 - For a cluster in a domain that supports clusters and stand-alone instances, select Clusters > *cluster-name* > Physical Destinations.

cluster-name is the name of cluster for which you are creating a physical destination.

Domains that are created with the cluster profile or enterprise profile support clusters and stand-alone instances.

- For an instance or the DAS in a domain that supports clusters and stand-alone instances, select Stand-Alone Instances > *instance-name* > Physical Destinations.

instance-name is the name of instance for which you are creating a physical destination. For the DAS, *instance-name* is server (Admin Server).

- In a domain that does *not* support clusters and stand-alone instances, select Configuration > Java Message Service > Physical Destinations.

Domains that are created with the developer profile do not support clusters and stand-alone instances.

2. On the Physical Destinations page, click New.

The New Physical Destination page opens.

Furthermore, references to “Create Physical Destinations page” should read “New Physical Destination page.”

Upgrade Procedure is Confusing

Description

The following information in “Upgrading the Runtime Binaries of a Package-Based Installation of Application Server” in *Sun GlassFish Enterprise Server v2.1.1 Upgrade Guide* is no longer correct:

- The statement in the introduction that patches are available from the SunSolve program site
- The list of links in Step 2 of the procedure

Solution

Ignore the statement in the introduction and the links in Step 2 of the procedure. Instead, search the [My Oracle Support \(https://support.oracle.com\)](https://support.oracle.com) site for patches to download. In your search, specify the following filters:

- Product: Sun GlassFish Enterprise Server
- Release: Sun GlassFish Enterprise Server v2.1.1

EJB

Resource Injection does not work in HandlerChain (6750245)

Description

Resource Injection does not work in HandlerChain due to EJB initialization order.

Solution

No known solution.

High Availability

This section describes known high availability database (HADB) issues and associated solutions.

Load balancer plugin healthcheck generates a large number of connection/disconnection at the background (load) (6453946)

Description

Load balancer plug-in healthcheck generates a large number of connection/disconnection at the background (load). For health check purposes, a `runDaemonMonitor` thread performs connect/disconnect for every Application Server listener. This can lead to connection saturation on Enterprise Server.

Solution

A new attribute, `monitor-interval-in-seconds`, has been developed for the `loadbalancer.xml` file. This attribute can be used to insert a pause between connect/disconnect events in the case where hundreds of listeners are configured for the load balancer plug-in. Default pause value is 0.

HADB Configuration with Double Networks (no ID)

HADB configured with double networks on two subnets works properly on Solaris SPARC. However, due to problems in the operating system or network drivers on some hardware platforms, it has been observed that Solaris x86 and Linux platforms do not always handle double networks properly. This causes the following problems with HADB:

- On Linux, some of the HADB processes are blocked when sending messages. This causes HADB node restarts and network partitioning.
- On Solaris x86, some problems may arise after a network failure that prevent switching to the other network interface. This does not happen all the time, so it is still better to have two networks than one. These problems are partially solved in Solaris 10.
- Trunking is not supported.

- HADB does not support double networks on Windows 2003 (ID 5103186).

HADB Database Creation Fails (no ID)

Description

Creating a new database may fail with the following error, stating that too few shared memory segments are available:

```
HADB-E-21054: System resource is unavailable: HADB-S-05512: Attaching shared
memory segment with key "xxxxx" failed, OS status=24 OS error message: Too many
open files.
```

Solution

Verify that shared memory is configured and the configuration is working. In particular, on Solaris 8, inspect the file `/etc/system`, and check that the value of the variable `shmsys:shminfo_shmseg` is at least six times the number of nodes per host.

hadbm set does not check resource availability (disk and memory space) (5091280)

Description

When increasing device or buffer sizes using `hadbm set`, the management system checks resource availability when creating databases or adding nodes, but does not check if there are sufficient resources available when device or main-memory buffer sizes are changed.

Solution

Verify that there is enough free disk/memory space on all hosts before increasing any of the `devicesize` or `buffersize` configuration attributes.

Heterogeneous paths for packagepath not supported (5091349)

Description

It is not possible to register the same software package with the same name with different locations at different hosts; for example:

```
hadbm registerpackage test --packagepath=/var/install1 --hosts europa11
Package successfully registered.
hadbm registerpackage test --packagepath=/var/install2 --hosts europa12
hadbm:Error 22171: A software package has already been registered with
the package name test.
```

Solution

HADB does not support heterogeneous paths across nodes in a database cluster. Make sure that the HADB server installation directory (`--packagepath`) is the same across all participating hosts.

hadbm createdomain may fail (6173886, 6253132)

Description

If running the management agent on a host with multiple network interfaces, the createdomain command may fail if not all network interfaces are on the same subnet:

```
hadbm:Error 22020: The management agents could not establish a
domain, please check that the hosts can communicate with UDP multicast.
```

The management agents will (if not configured otherwise) use the "first" interface for UDP multicasts ("first" as defined by the result from `java.net.NetworkInterface.getNetworkInterfaces()`).

Solution

The best solution is to tell the management agent which subnet to use (set `ma.server.mainternal.interfaces` in the configuration file, e.g., `ma.server.mainternal.interfaces=10.11.100.0`). Alternatively one may configure the router between the subnets to route multicast packets (the management agent uses multicast address 228.8.8.8).

Before retrying with a new configuration of the management agents, you may have to clean up the management agent repository. Stop all agents in the domain, and delete all files and directories in the repository directory (identified by `repository.dr.path` in the management agent configuration file). This must be done on all hosts before restarting the agents with a new configuration file.

Starting, stopping, and reconfiguring HADB may fail or hang (6230792, 6230415)

Description

On Solaris 10 Opteron, starting, stopping or reconfiguring HADB using the hadbm command may fail or hang with one of the following errors:

```
hadbm:Error 22009: The command issued had no progress in the last
300 seconds.
HADB-E-21070: The operation did not complete within the time limit,
but has not been cancelled and may complete at a later time.
```

This may happen if there are inconsistencies reading/writing to a file (`nomandev`) which the `clu_noman_srv` process uses. This problem can be detected by looking for the following messages in the HADB history files:

```
n:3 NSUP INF 2005-02-11 18:00:33.844 p:731 Child process noman3 733 does not respond.
n:3 NSUP INF 2005-02-11 18:00:33.844 p:731 Have not heard from it in 104.537454 sec.
n:3 NSUP INF 2005-02-11 18:00:33.844 p:731 Child process noman3 733 did not start.
```

Solution

The following workaround is unverified, as the problem has not been reproduced manually. However, running this command for the affected node should solve the problem.

```
hadbm restartnode --level=clear nodeno dbname
```

Note that all devices for the node will be reinitialized. You may have to stop the node before reinitializing it.

The management agent terminates with the exception "IPV6_MULTICAST_IF failed" (6232140)

Description

When starting on a host running Solaris 8 with several NIC cards installed, if there is a mixture of cards with IPv6 and IPv4 enabled, the management agent may terminate with the exception "IPV6_MULTICAST_IF failed."

Solution

Set the environment variable JAVA_OPTIONS to -Djava.net.preferIPv4Stack=true; for example:

```
export JAVA_OPTIONS="-Djava.net.preferIPv4Stack=true"
```

Alternatively, use Solaris 9 or later, which do not exhibit this problem.

clu_trans_srv cannot be interrupted (6249685)

Description

There is a bug in the 64-bit version of Red Hat Enterprise Linux 3.0 that makes the clu_trans_srv process end up in an uninterruptible mode when performing asynchronous I/O. This means that kill -9 does not work and the operating system must be rebooted.

Solution

Use a 32-bit version of Red Hat Enterprise Linux 3.0.

hadbm does not support passwords containing capital letters (6262824)

Description

Capital letters in passwords are converted to lowercase when the password is stored in hadb.

Solution

Do not use passwords containing capital letters.

Downgrading from HADB Version 4.4.2.5 to HADB Version 4.4.1.7 causes ma to fail with different error codes (6265419)

Description

When downgrading to a previous HADB version, the management agent may fail with different error codes.

Solution

It is possible to downgrade the HADB database, however the management agent cannot be downgraded if there changes have been made in the repository objects. After a downgrade, you must keep use the management agent from the latest HADB version.

Install/removal and symLink preservation (6271063)

Description

Regarding install/removal of HADB c package (Solaris: SUNWhadb, Linux: sun-hadb-c) version <m.n.u-p>, the symLink /opt/SUNWhadb/<m> is never touched once it exists. Thus, it is possible that an orphaned symLink will exist.

Solution

Delete the symLink before install or after uninstall unless in use.

Management agents in global and local zones may interfere (6273681)

Description

On Solaris 10, stopping a management agent by using the ma-initd script in a global zone stops the management agent in the local zone as well.

Solution

Do not install the management agent both in the global and local zone.

hadbm/ma should give a better error message when a session object has timed out and deleted at MA (6275103)

Description

Sometimes, a resource contention problem on the server may cause a management client to become disconnected, When reconnecting, a misleading error message "hadbm:Error 22184: A password is required to connect to the management agent" may be returned.

Solution

Sometimes, a resource contention problem on the server may cause a management client to become disconnected, When reconnecting, a misleading error message "hadbm:Error 22184: A password is required to connect to the management agent" may be returned.

Check if there is a resource problem on the server, take proper action (e.g., add more resources), and retry the operation.

Non-root users cannot manage HADB (6275319)

Description

Installing with Java Enterprise System (as root) does not permit non-root users to manage HADB.

Solution

Always login as root to manage HADB.

The Management Agent should not use special-use interfaces (6293912)

Description

Special use interfaces with IP addresses like 0.0.0.0 should not be registered as valid interfaces to be used for HADB nodes in the Management Agent. Registering such interfaces may cause problems if HADB nodes are set up on these interfaces by means of a user issuing a `hadbm create` command using host names instead of IP addresses. The nodes will then be unable to communicate, causing the `create` command to hang.

Solution

When using `hadbm create` on hosts with multiple interfaces, always specify the IP addresses explicitly using DDN notation.

Reassembly failures on Windows (6291562)

Description

On the Windows platform, with certain configurations and loads, there may be a large number of reassembly failures in the operating system. The problem has been seen with configurations of more than twenty nodes when running several table scans (`select *`) in parallel. The symptoms may be that transactions abort frequently, repair or recovery may take a long time to complete, and there may be frequent timeouts in various parts of the system.

Solution

To fix the problem, the Windows registry variable `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters` can be set to a value higher than the default 100. It is recommended that you increase this value to 0x1000 (4096). For more information, see article 811003 (<http://support.microsoft.com/default.aspx?scid=kb;en-us;811003>) from the Microsoft support pages.

Session state not maintained if the browser has another cookie with / path (6553415)**Description**

Cookies with a path equal to “/” interfere with the cookies of a highly available web application deployed at a context root other than “/” that uses in-memory replication as its persistence type, making it impossible for the highly available web application to maintain any HTTP session state. One common scenario where this may happen is when using the same browser to access both the Admin GUI (which is deployed at “/”) and the highly available web application.

Solution

Access the web application deployed at “/” from a different browser.

LB does not work with IIS 6; SASL32.DLL and ZLIB.DLL missing under *as-install/lib* (6572184)**Description**

SASL32.DLL and ZLIB.DLL are required files for Load Balancer to work with Windows IIS 6. These files are currently not available under *as-install/lib*.

Solution

Copy the two DLL files manually to *as-install/lib*. These files can be downloaded from:

<http://download.java.net/javaee5/external/OS/aslb/jars/>

Where OS represents the desired platform, and can be one of the following values:

- SunOS
- SunOS_X86
- Linux
- WINNT

DAS creation/startup and HA package propagation issues in Global Zone (6573511)**Description**

Two issues arise when installing or uninstalling Enterprise Server with High Availability packages in a Global Zone:

1. HA packages get installed in all zones, which may not be desirable.
2. When uninstalling, HA, MQ, JDK packages get removed from all zones, which may not be desirable.

This problem does not occur when installing or uninstalling from a root local zone.

Solution

Perform installation and uninstallations from a local root zone rather than a global zone.

Highly available webapps deployed at “/” unable to resume in-memory replicated HTTP sessions (Issue Tracker 2972)

Description

Highly available web applications deployed at “/” are unable to maintain any HTTP sessions when using in-memory replication as their persistence type.

Solution

Deploy highly available web applications that use in-memory replication as their persistence type to a context root other than “/”. If you want to make such a web application available at “/”, you may designate it as the default-web-module of the virtual server to which the web application has been deployed.

AS LB installer did not put /usr/lib/mps path in apachectl LD_LIBRARY_PATH, can not start Apache SSL (6591878)

Description

During Enterprise Server Load Balancer installation for Apache on Solaris, the installer updates LD_LIBRARY_PATH in the apachectl script. However, the installer does not correctly write the /usr/lib/mps path. On Solaris, the Apache security instance will not start without this path in LD_LIBRARY_PATH.

Solution

This issue exists only on Solaris platforms. To work around the issue, add /opt/SUNWappserver/appserver/lib/lbplugin/lib to your LD_LIBRARY_PATH.

Enable/disable LB for an instance/cluster should show correct status (6595113)

Description

The *Enable LoadBalance* button is always enabled on the Clustered/Instance general page, regardless of what is saved in domain.xml.

Solution

- For clustered instances, select *Instances* tab, and then click the *Quiesce* action from the table pull-down.
- For standalone instances, make sure the instance is running, and then click the *Quiesce* button on instance General screen.

AS9.1 EE IFR b58f/JES5 UR1. Cannot install Registry Server, because “incomplete” HA was detected. (6602508)

Description

(*Solaris only*) After installing Enterprise Server v2.1.1 on SPARC Solaris 10 with HADB, you may receive the following error after starting Enterprise Server and then attempting to install JES 5 UR1 with Registry Server:

Dependency Error: Installation can not proceed because the version of HA Session Store 4.4.3 detected on this host is incomplete , and a compatible version is required by Servservice Registry Deployment Support.

Solution

It is not possible to install Registry Server from JES 5 UR1 with Enterprise Server IFR on Solaris machines. The Registry Server packages have to be installed manually using the pkgadd command from the following JES5 UR1 distribution directory:

path/OS/Products/registry-svr/Packages

Internet Explorer 6.0/7.0 browser specific: Exporting load balancer configuration file throws error (6516068)

Description

(*Internet Explorer 6 and 7 only*) When attempting to export the Load Balancer configuration file (loadbalancer.xml) from Internet Explorer 6 or 7, the browser displays an error message saying that the sun-loadbalancer_1_2.dtd DTD file cannot be located.

Solution

To save the file, use the following workaround:

1. Click *Export* on the Load Balancer page in Internet Explorer.
The “XML page cannot be displayed” message is displayed.
2. Click the error frame, and then choose *File->Save As* from the Internet Explorer.
3. Save the loadbalancer.xml file to the directory of your choice.

Installation

This section describes known installation issues and associated solutions.

Installer decoration image shows old product version (6862674)

Description

The image on the left-hand side of the installer shows an older product version instead of v2.1.1.

Solution

None.

The start-domain Command Times Out on OpenSolaris 2008.11 (6820169 and 6741572)**Description**

On OpenSolaris 2008.11, when you attempt to start the domain with the `asadmin start-domain` command, the following error message is displayed:

```
Timeout waiting for domain domain1 to go to starting state.  
CLI156 Could not start the domain domain1.
```

Solution

The domain has started successfully. Correct the time and date after rebooting the machine.

Enterprise profile installation is not supported with a 64-bit JVM on a 64-bit platform (6977626)**Description**

Installation of Enterprise Server v2.1.1 Patch 7 with the enterprise profile does not work on any 64-bit JVM.

Solution

Do one of the following:

- If the operating system supports running a 32-bit JVM on a 64-bit platform, you can run the enterprise profile with a 32-bit JVM.
- You can run the cluster profile or the developer profile using a 64-bit JVM on a 64-bit platform.

For Oracle's policy with regard to Enterprise Server support on 64-bit platforms, refer to Doc ID 1320311.1 at [My Oracle Support \(http://support.oracle.com/\)](http://support.oracle.com/).

Installation with 64-bit JDK Fails (6796171)**Description**

Installation fails on 64-bit systems that have 64-bit JDK because the installer tries to use the 64-bit JDK.

Solution

If you are installing Sun GlassFish Enterprise Server on a 64-bit system, download the 32-bit JDK and use it to install Sun GlassFish Enterprise Server on your 64-bit machine. You will need to use the following command: `./distribution_filename -javahome path to 32-bit JDK location`

After installation, to ensure that Sun GlassFish Enterprise Server uses a 64-bit JDK, edit the value of the `AS_JAVA` variable in the `asenv.conf` file to point to the 64-bit JDK installation.

Enterprise Server installer crashes on Linux (6739013)

Description

This problem has been observed on systems running Linux with the environment variable, `MALLOC_CHECK_`, set to 2.

Solution

Set the environment variable, `MALLOC_CHECK_` to 0. Run one of the following commands:

- For Bourne shell:

```
MALLOC_CHECK_=0;
export MALLOC_CHECK_
```
- For bash shell:

```
export MALLOC_CHECK_=0
```
- For csh, tcsh shell:

```
setenv MALLOC_CHECK_ 0
```

Installation shutdown hanging on some Linux systems after clicking the "Finish" button (5009728)

Description

This problem has been observed on several Linux systems. It is most common on Java Desktop System 2 but has also been observed on Linux Red Hat distributions.

After clicking the "Finish" button on the last installer screen, the installer fails to launch a browser window containing the product About page or product registration page, and hangs indefinitely, not returning the command prompt.

Solution

Exit the installer by pressing Ctrl+C in the terminal window in which the installer was started. After doing this, browser window containing product About page or registration page will sometimes be launched, but if it does not show up, start the browser and enter following URL in order to review About page:

```
file://as-install/docs-ee/about.html
```

If you also selected the installation option to register the product, follow the link to registration page available on product About page.

On Windows, the imq directory needs to be created during installation (6199697)**Description**

On Windows, immediately after installation, the Message Queue broker fails on startup with a message saying the directory drive:\as\domains\domain1\imq does not exist.

Note that if the broker is started after starting domain1, the directory will be created by the Application Server and the problem will not occur.

Solution

1. Create the `var_home_dir_location` before creating the broker:

```
$imqbrokerd -varhome var_home_dir_location
```

For example:

```
$imqbrokerd -varhome D:\as\domains\domain1\imq
```

Uninstall does not update productregistry file properly; unable to use silent mode to install (6571598)**Description**

If the Enterprise Server `productregistry` file contains shared component configurations, an Enterprise Server uninstallation procedure does not update the `productregistry` file correctly, and you will not be able to use silent mode in a subsequent installation unless the `productregistry` file is renamed or removed. Leaving the shared components entries in the `productregistry` file intact is by design, but it leads to confusion with subsequent silent installs.

Solution

After a successful uninstallation is reported back through uninstall log files, delete the `productregistry` file prior to running a subsequent installation. To verify that a previous uninstallation has completed successfully, look for a `appserv_uninstall.class` file in *as-install*. This file will *not* be present if the uninstallation was successful.

Note – Do not delete the `productregistry` if the uninstallation was not successful.

The `productregistry` file is located in `/var/sadm/install` on Solaris and `/var/tmp` on Linux.

IFR. Was not able to install AS in the sparse local zone, MQ packages issue. (6555578)**Description**

When installing Enterprise Server in a sparse local zone, the installation fails if Message Queue (MQ) is not installed first. The installer attempts to install MQ, and then the whole installation fails.

Solution

MQ must be manually installed in the global zone before installing Enterprise Server in a sparse local zone. There are two work-arounds for this issue:

1. Install MQ 4.1 manually in the global zone from the same media on which Enterprise Server IFR installation is located to get the latest MQ packages.

- a. Use the installer that corresponds to your platform:

```
mq4_1-installer-SunOS.zip
mq4_1-installer-SunOS_X86.zip
mq4_1-installer-Linux_X86.zip
mq4_1-installer-WINNT.zip
```

- b. Unzip the bits and run the installer.

The installer will be in the `mq4_1-installer` directory.

2. Install any component of IFR installation in global zone. This action would check the version of MQ in GZ and if required upgrade it to the one bundled in Enterprise Server IFR. Even Selecting and Installing the Sample Applications component upgrades MQ to IFR version.

- a. Run the Enterprise Server installation in the global zone, but select only the sample components.

The sample component installation also installs MQ and Enterprise Server shared components in all zones.

- b. Run the Enterprise Server installation again, this time in the local sparse zone.

Installation should complete without any problems.

IFR Installation -console prompt has to be removed: "Do you want to upgrade from previous Application?" (6592454)

Description

When running the Enterprise Server IFR installer with the `-console` option (command-line mode), you are prompted:

```
Do you want to upgrade from previous Application Server version?
```

Unfortunately, the IFR installer does not support such upgrades, and so this prompt is erroneous. If you answer yes to the prompt, the installation proceeds normally, but no indication that a complete installation was performed, rather than an upgrade.

Solution

Use the upgrade tool if you want to upgrade your Enterprise Server installation.

After upgrade, the following exceptions are seen in the log when a domain is started. (6774663)

Description

The following exceptions might be thrown:

```
#|2008-11-19T01:44:37.422+0530|SEVERE|sun-appserver9.1|org.apache.catalina.session.Manager

-8515037662877107054 java.io.InvalidClassException:
org.apache.catalina.session.StandardSession; local class incompatible: stream
classdesc serialVersionUID = 864 7852380089530442, local class serialVersionUID
= -8515037662877107054..... ..
```

Solution

After upgrade is done and the upgrade domain is started, these exceptions can be ignored if they occur.

Java EE Tutorial

When using the Administration Console to create any resource, use the Targets tab to specify the server as the target. If you use the command line or an asant target, the server is the default target, no further action is required.

Java Persistence

TopLink expects my Collection field/property to be cloneable (Issue Tracker 556)

Description

If the `java.util.Arrays.asList()` API is used to convert an `Object[]` to `Collection`, the JDK returns an implementation of `java.util.ArrayList` that is not cloneable. This results in the following exception:

```
The method invocation of the method [protected native java.lang.Object
java.lang.Object.clone() throws java.lang.CloneNotSupportedException] on the object
[[pkg.A id = xxx]], of class [class java.util.Arrays$ArrayList], triggered an
exception. Internal Exception: java.lang.reflect.InvocationTargetException Target
Invocation Exception: java.lang.CloneNotSupportedException:
java.util.Arrays$ArrayList
```

This issue is tracked at <http://java.net/jira/browse/GLASSFISH-556>.

Solution

Create another collection using its constructor; for example:

```
myCollection = new ArrayList(java.util.Arrays.asList(a))
```

GenerationType.IDENTITY and DataDirect Driver with SyBase (Issue Tracker 2431)**Description**

An attempt to insert an entity that uses `GenerationType.IDENTITY` fails when the `DataDirect` driver is used with SyBase. The attempt fails because the `DataDirect` driver creates a stored procedure for every parameterized prepared statement.

Solution

In the `domain.xml` file, set the property `PrepareMethod=direct` on the corresponding data source.

Lifecycle Management

This section describes known lifecycle management issues and associated solutions.

Setting ejb-timer-service property causes set command to fail (6193449)**Description**

After setting the `ejb-timer-service` property `minimum-delivery-interval` to `9000`, an attempt to set the `ejb-timer-service` property `redelivery-interval-in-millis` to `7000` causes the set command to fail with the following error:

```
[echo] Doing admin task set
[exec] [Attribute(id=redelivery-interval-internal-in-millis) :
Redelivery-Interval (7,000)
should be greater than or equal to Minimum-delivery-interval-
in-millis (9,000)]
[exec] CLI137 Command set failed.
```

- `minimum-delivery-interval` is the minimal interval duration between deliveries of the same periodic timer.
- `redelivery-interval-in-millis` is the time the timer service will wait after a failed `ejbTimeout` before attempting redelivery.

The problem is that the logic that relates the redelivery interval property to the minimum delivery property is incorrect and prevents you from using the GUI or the CLI to set any value where the minimum delivery interval is greater than redelivery interval.

The `minimum-delivery-interval-in-millis` must always be set equal to or higher than `ejb-timer-service` property `redelivery-interval-in-millis`. The problem is that there is

an erroneous validation check in the aerver to verify that the value for `redelivery-interval-in-millis` is greater than the value for `minimum-delivery-interval-in-millis`.

Solution

Use the default values for these properties, as follows:

```
minimum-delivery-interval(default)=7000  
redelivery-interval-in-millis(default)=5000
```

Values other than these defaults will generate an error.

Error thrown when list JMS physical destinations within non-DAS config (6532532)

Description

If you are trying to view the JMS Physical Destinations using the default-config, you will see an error message.

Solution

This is expected behavior. In Enterprise Server, `default-config` is a template of configuration information and hence JMS operations (such as `list` and `create`) cannot be executed for the `default-config`. These JMS operations can, however, be executed for the configurations of your cluster or standalone instances.

Win2003 only: Non-paged pool leak memory, breaking tcp stack and richaccess test (6575349)

Description

(Windows 2003 only) There are memory leaks on Windows 2003 systems when performing rich access functions. The problem occurs because the Win32 nonpaged pool keeps growing, eventually bringing down the entire TCP/IP stack. Once the failure happens, the TCP/IP stack is left in an recoverable state, and the only way restore it is by rebooting the Windows 2003 system.

Workaround

There are two workarounds to this issue:

- Use Grizzly blocking mode by configuring the `domain.xml` `http-listener` attribute, `blocking-enabled="true"` or add the following `http-listener` property:

```
<property name="blocking" value="true"/>
```
- Use Windows Vista or Windows XP.

Logging

This section describes known logging issues and solutions.

Setting debug statement for access, failure causes hang in server startup (6180095)**Description**

Setting the `java.security.debug` option for the JVM will cause the server instance startup to freeze with a deadlock; for example, setting the following in `domain.xml` causes the problem:

```
<jvm-options>-Djava.security.debug=access,failure</jvm-options>
```

Solution

None at this time. Please avoid setting this flag.

Log level Setting for Persistence Cannot Be Made Persistent (13253247)**Description**

The log level setting for Java Persistence in Enterprise Server reverts to the default value of INFO when you attempt to set it.

Solution

At the bottom of the Log Levels page in the Admin Console, add a property with the name `oracle.toplink.essentials` and the value `FINEST`.

Message Queue

This section describes known Java message queue issues and associated solutions.

Enterprise Server Does Not Start If MQ Broker is Not Started (6740797)**Description**

If you configure JMS to be REMOTE, Enterprise Server fails to start if the MQ broker is not started.

Solution

Set the following JVM option as follows:

`com.sun.enterprise.jms.CONNECT_MQ_LAZILY=true`. After setting this JVM option, you can start Enterprise Server if the MQ broker is not started. However, it is recommended that you start MQ before starting the server.

JMS reconnection does not successfully complete in certain cases that are timing dependent (6173308, 6189645, 6198481, 6199510, 6208728)**Description**

Failures to reconnect in timing-dependent scenarios can be caused by several problems.

Solution

You can work around these problems by:

- Restarting the brokers involved
- Restarting the instances involved

MQ broker fails to start with cluster profile on Linux (6524871)

Description

After creating a domain with a cluster profile on a Linux system, you may encounter a `java.lang.OutOfMemoryError: Java heap space` error, and the server instance may fail to restart because the MQ broker does not start. The system never recovers after this condition. The problem is a misconfigured `/etc/hosts` file; specifically, the server host name is pointing to the loopback address `127.0.0.1`.

Solution

By design, an MQ broker cluster cannot start with the network device configured to point to the loopback address. This is not a bug. The solution is to make sure that the `/etc/hosts` file for the Enterprise Server host does not point to `127.0.0.1`.

Mismatch of old and new classes is created when `imqjmsra.jar` is loaded before upgrade (6740794)

Description

During server startup, the server checks the Message Queue version. If the Message Queue version is incorrect, then the server upgrades using the `imqjmsra.jar`. This upgrade JAR and its classes will not be available to the server until the next restart. This situation only occurs if Message Queue is upgraded alone, or if Application Server is patched alone. A side effect of this situation is that sometimes server does not start.

Solution

Both Message Queue and Enterprise Server need to be maintained at the same patch level, or restart the server.

Monitoring

This section describes known monitoring issues and associated solutions.

Some of the HTTP Service monitoring statistics do not present useful information and should be ignored (6174518)

Description

When viewing the monitoring statistics of some elements of the HTTP Service, some values presented do not correspond to current values or are always 0. Specifically, the following HTTP Service statistics do not present information applicable to the Enterprise Server, and should be ignored:

- `http-service`
 - `load1MinuteAverage`
 - `load5MinuteAverage`
 - `load15MinuteAverage`
 - `rateBytesTransmitted`
 - `rateBytesReceived`
- `psc-thread-pool` (the element)

Solution

These monitors will be removed in future releases and replaced with more appropriate information.

Open JNDI Browsing from Admin UI dumps a huge amount of exceptions in the server .log (6591734)

Description

Many exceptions are thrown when the JNDI browser is opened from the Admin GUI.

Solution

None at this time.

Packaging

This section describes known issues and associated solutions related to the packaging of the software code for the Enterprise Server product.

AIX: `monitor` command doesn't work on AIX (6655731)

Description

The `monitor` command cannot be run on the AIX operating system because the `libcliutil.so` library file is not packaged in Enterprise Server.

▼ **Solution: To Install the Missing libcliutil.so Library File**

- 1 Download the JAR file from (<http://download.java.net/javase5/external/AIX/appserv-native/jars/appserv-native-9.1.1-b16a.jar>).
- 2 Change to the directory to where you downloaded the appserv-native-9.1.1-b16a.jar file.
prompt% `cd destination-dir`
- 3 Extract the contents of the appserv-native-9.1.1-b16a.jar file.
prompt% `jar xf appserv-native-9.1.1-b16a.jar`
- 4 Copy the libcliutil.so file to the *as-install/lib* directory.
prompt% `cp libcliutil.so as-install/lib`

Samples

This section describes known issues and associated solutions related to the sample code included with the Enterprise Server product.

Installation Log Shows Failures for Samples Installation (6802286)

Description

After installing Sun GlassFish Enterprise Server, the installation log files show that some files for samples are not created.

Solution

No known solution. This problem does not affect basic samples functionality.

After upgrade Enterprise Server samples and JES5 portal samples compete on derby port 1527 (6574563)

Description

On Windows, after upgrading to Enterprise Server v2.1.1, the samples and JES5 portal samples compete on Derby port 1527. Specifically, Enterprise Server v2.1.1 automatically starts JavaDB on port 0.0.0.0:1527 with APP:APP, however the JES5 Portal JavaDB wants to bind to hostnameIP:1527 with portal:portal.

This bug describes an issue that was already seen for JES 5, Bug 6472173. The workaround for bug 6472173 is documented in the Sun Java Enterprise System 5 Installation Guide for Microsoft Windows on <http://docs.sun.com>.

Solution

Start the Derby database using the following command:

```
JES-installation-dir\appserver\bin\asadmin start-database --dbhome JES-installation-dir\portal\data\derby
```

Security

This section describes known issues and associated solutions related to Enterprise Server and web application security and certificates.

Expired Root CA for CN=GTE CyberTrust Root 5, OU=GTE CyberTrust Solutions, Inc. (17405362)

Description

During startup of an Enterprise Server instance, an expired certificate is reported in the instance's `server.log` log file as follows:

The "GTE CyberTrust Root 5" certificate expired on August 15th 2013

The log file shows the validity of the certificate as follows:

```
Subject: CN=GTE CyberTrust Root 5, OU="GTE CyberTrust Solutions, Inc.", O=GTE Corporation, C=US
...
Validity: [From: Fri Aug 14 15:50:00 BST 1998,
To: Thu Aug 15 00:59:00 BST 2013]
```

Solution

The solution depends on whether the instance is configured to use a server SSL certificate that uses this certificate as part of its trust path.

- If the instance is *not* configured this way, ignore the warning. The functionality of the instance is unaffected.
- If no server certificate has been signed by GTE CyberTrust Root 5 certificate, delete the certificate from the truststore. For instructions, see [“To Delete the GTE CyberTrust Root 5 Certificate From the Truststore” on page 76](#).

Note – In the latest releases of Java SE 6 and Java SE 7, this certificate is no longer present by default. The only GTE certificate has the alias `gtecybertrustglobalca` and does not expire until August 2018.

- Otherwise, contact the issuing certificate authority (CA) to resolve the issue.
- The CA will either reissue the certificate with an up to date or alternate root certificate or will provide an updated certificate to install in the truststore.
- To determine that the new certificate is correct, confirm that the issuer's subject is as follows:

CN=GTE CyberTrust Global Root, OU="GTE CyberTrust Solutions, Inc."

▼ To Delete the GTE CyberTrust Root 5 Certificate From the Truststore

Note – How to perform some steps in this task depends on whether the domain uses a JKS keystore or an NSS keystore. The keystore that a domain uses depends on the profile with which the domain was created:

- A domain that is created with the developer profile or the cluster profile uses a JKS keystore.
 - A domain that is created with the enterprise profile uses an NSS keystore.
-

1 Back up the existing certificate database files in the domain's configuration directory.

a. Change to the domain's config directory.

```
prompt% cd as-install/domains/domain-name/config/
```

b. Copy the certificate database files.

The files to copy depend on the type of the keystore.

- For a JKS keystore, copy the `cacerts.jks` file.
- For an NSS keystore, copy these files:
 - `cert8.db`
 - `key3.db`

2 Delete the `gtcybertrust5ca` certificate from the certificate database.

- For a JKS keystore, use the `keytool` command for this purpose.

```
prompt% keytool -delete -alias gtcybertrust5ca -keystore cacerts.jks
```

When prompted, provide the master password of the domain.

- For an NSS keystore, use the `certutil` command for this purpose.

```
prompt% certutil -D -d . -n gtcybertrust5ca
```

When prompted, provide the master password of the domain.

- 3 If additional domains are to be created from the existing Enterprise Server installation, delete the expired certificate from the template keystores.

Deleting the expired certificate prevents the certificate from being propagated to new domains.

- a. Back up the existing template keystores.

- i. Change to the `templates` directory of your Enterprise Server installation.

```
prompt% cd as-install/lib/install/templates
```

- ii. Copy the files for the template keystores.

The files to copy depend on the type of the keystore.

- For a JKS keystore, copy the `cacerts.jks` file in the current working directory and in the `ee` subdirectory of the current working directory.
- For an NSS keystore, copy these files in the current working directory and in the `ee` subdirectory of the current working directory:
 - `cert8.db`
 - `key3.db`

- b. Delete the `gtcybertrust5ca` certificate from the template keystores in the current working directory and in the `ee` subdirectory of the current working directory.

- For a JKS keystore, use the `keytool` command for this purpose.

```
prompt% keytool -delete -alias gtcybertrust5ca -keystore cacerts.jks
```

```
prompt% keytool -delete -alias gtcybertrust5ca -keystore ee/cacerts.jks
```

When prompted, provide the master password of the domain.

- For an NSS keystore, use the `certutil` command for this purpose.

```
prompt% certutil -D -d . -n gtcybertrust5ca
```

```
prompt% certutil -D -d ee -n gtcybertrust5ca
```

When prompted, provide the master password of the domain.

- 4 Propagate the changes to the DAS and all Enterprise Server instances in the domain.

- a. Stop the domain and all Enterprise Server instances in the domain.

- b. Start only the domain, not the instances in the domain.

- c. After the domain is started, start all Enterprise Server instances in the domain.

Note – To ensure that the instances are synchronized with the DAS, you *must* start the instances individually, even if the instances are members of a cluster. Starting a cluster does *not* synchronize the instances in the cluster.

If you start an instance by starting the node agent for the host where the instance resides, you must specify the `--syncinstances` option of the `start-node-agent` command. Otherwise, the instance is not synchronized.

Modify Policy Files for Existing Domains (17419736 and 17574160)

Description

As a result of changes to the security implementation in JDK 1.6.0_51, additional permissions are required to prevent some operations from failing. For example, an attempt by an application to perform a transaction might fail with the `java.io.SerializablePermission` `enableSubclassImplementation` exception.

Solution

For each existing domain, add the following permissions to the grant block for the basic set of permissions in the `domain-dir/config/server.policy` file:

```
permission java.io.SerializablePermission "enableSubclassImplementation";
permission java.lang.RuntimePermission "accessClassInPackage.com.sun.org.apache.xml.internal.utils";
permission java.lang.RuntimePermission "accessClassInPackage.com.sun.org.apache.xerces.internal.dom";
permission java.lang.RuntimePermission "accessClassInPackage.com.sun.org.apache.xerces.internal.jaxp";
```

CA Certificate bundled with Enterprise Server v2.1.1 has expired (12287499)

Description

The CA certificate bundled with Enterprise Server v2.1.1 has expired since Jan 08, 2010. Hence some SEVERE log messages may be observed while starting the domain.

Solution

These messages are harmless but can be eliminated. Remove the expired certificate from the keystore. To remove the certificate from the JKS keystore, use the following command:

```
keytool delete -alias verisignserverca -keystore domain-dir/config/cacerts.jks
```

To remove the certificate from the NSS keystore, use the following command:

```
certutil -D -n verisignserverca -d domain-dir/config
```

OutOfMemory Error in SSL Scenarios During Heavy Stress (JDK 6 Issue 23)

Description

A JDK bug (See: https://jdk6.dev.java.net/issues/show_bug.cgi?id=23) in JDK6 Sun PKCS11 Provider could cause an OutOfMemoryError when running certain SSL scenarios under heavy stress.

Solution

If you run into this issue, remove `sun.security.pkcs11.SunPKCS11` provider from the `java.security` file in your JRE installation.

AIX: WSS dynamic encrypt key test failed due to server side certification validation error (6627379)

Description

On the AIX platform, dynamic encryption for the determination of an encryption key for a response is failing. The failure occurs during the validation of the certificate on the server side.

In response to the failure, the following error messages are written to the server's log file `server.log`:

```
Unable to validate certificate
```

```
Error occurred while resolving key information
com.sun.xml.wss.impl.WssSoapFaultException: Certificate validation failed
```

Solution

Install Metro 1.1 on Enterprise Server v2.1.1

AIX: @RunAs at EJB module authorization test failed AccessLocalException: Client not authorized (6627385)

Description

A method in an enterprise bean whose run-as, or propagated, security identity is defined by using the `@RunAs` annotation attempts to invoke a method in another enterprise bean. If no run-as principal is defined in the `sun-ejb-jar.xml` deployment descriptor file, the attempt might fail with a `javax.ejb.AccessLocalException` exception.

```
javax.ejb.AccessLocalException: Client not authorized for this invocation.
```

Solution

In the `sun-ejb-jar.xml` deployment descriptor file, define in the `principal-name` element the principal name for which the run-as role specified.

SSL termination is not working (6269102)

Description

SSL termination is not working; when Load Balancer (Hardware) is configured for SSL termination, the Enterprise Server changes the protocol from https to http during redirection.

Solution

Add a software load balancer between the hardware load balancer and the Enterprise Server.

Socket connection leak with SSL (6492477)

Description

Because of a JVM bug, there is a leak issue with some JDK versions when security-enabled is set to true on an HTTP listener. Specifically, the steps to reproduce this bug are as follows:

1. Set security-enabled to true on the HTTP listener:

```
<http-listener acceptor-threads="1" address="0.0.0.0"
blocking-enabled="false" default-virtual-server="server" enabled="true"
family="inet" id="http-listener-1" port="8080" security-enabled="true"
server-name="" xpowered-by="true">
```

2. Comment out stopping domain at the end of quicklook tests.

3. Run quicklook tests.

4. Check socket usage:

```
netstat -an | grep 8080
```

The following are shown to be in use:

*.8080	*.*	0	0 49152	0 LISTEN
*.8080	*.*	0	0 49152	0 BOUND

This issue is tracked on the GlassFish site at <http://java.net/jira/browse/GLASSFISH-849>.

Solution

Upgrade to the latest JDK version.

General Vulnerability Assessment (Issue 17287)

Description

An unspecified vulnerability in Oracle Sun GlassFish Enterprise Server 2.1, 2.1.1, and 3.0.1, and Sun Java System Application Server 9.1, allows remote attackers to affect confidentiality, integrity, and availability via unknown vectors related to Administration. See <http://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2011-0807>.

Solution

Upgrade to Oracle GlassFish Server 3.1 or later.

Upgrade

This section describes known upgrade issues and associated solutions.

On some Linux systems, the installer running "Upgrade in place" fails to start upgrade tool after clicking on the "Start Upgrade Wizard" button (6207337)

Description

This problem has been observed on several Linux systems, it is most common on Java Desktop System 2 but has also been observed on Red Hat distributions.

After clicking the "Start Upgrade Tool" button on the final installer screen, the installer fails to launch the upgrade tool to complete the upgrade process, and hangs indefinitely, not returning the command prompt.

Solution

This issue is not encountered if command line installation mode is used to run upgrade in place.

1. If you ran upgrade in place in GUI mode and encountered this problem, exit the installer by pressing Ctrl+C in the terminal window in which the installer was started.
2. Start upgrade tool from the terminal window, using following command:

```
as-install/bin/asupgrade --source as-install/domains --target
as-install --adminuser adminuser --adminpassword adminpassword
--masterpassword changeit
```

adminuser and *adminpassword* should match the values used for the installation you are upgrading.

3. When the upgrade tool completes the upgrade process you can also start the browser and enter following URL in order to review About page:

```
file://as-install/docs-ee/about.html
```

If you also selected the installation option to register the product, follow the link to registration page available on product About page.

Self-signed certificate is not trusted during and after upgrade from 8.0 Platform Edition (PE) to 8.1 Enterprise Edition (EE) UR2 (6296105)

Solution

Remove the following entries from the target `domain.xml` (after the upgrade) and restart the server:

```
<jvm-options>-Djavax.net.ssl.keyStore=${com.sun.aas.instanceRoot}
/config/keystore.jks</jvm-options>-
<jvm-options>Djavax.net.ssl.trustStore=${com.sun.aas.instanceRoot}
/config/cacerts.jks</jvm-options>
```

(sbs-manual, sbs-installer) throws Server Instance server does not have a system connector named null (6545145)**Description**

When upgrading from Enterprise Server 8.0PE to v2.1.1, an error is thrown saying the server does not have system connector named `null`, and invalid user information as seen in `sbs-manual`. Even after changing the hardcoded values, the same error message is seen.

Solution

You can only encounter this bug while upgrading from a 8.0 PE to Enterprise Server. The workaround is to upgrade to either 8.1, 8.2, or 9.0 and then upgrade to Enterprise Server.

Different domains are lost during upgrade when different build combinations are used (6546130)**Description**

When performing an inplace upgrade, in cases where there are multiple domains in the source, the installer invokes upgrade tool even though the process is killed. This happens when it is invoked in GUI mode.

Solution

1. Install inplace in the CLI mode, and exit when the installer prompts you to select the upgrade tool at the end of installation process. This does not delete any of the domains present in the domains directory. Upgrade tool should be manually invoked from the `bin` directory.
2. When installing inplace in GUI mode, make a backup of the domains present in the domains root to prevent losing any domains in the process. At the end of the installation process, exit when the installer prompts you to invoke the upgrade tool. Copy any backed up domains into the domains directory if they have been lost. Launch upgrade tool manually to do an upgrade.

Solaris: pre-filled Master password in upgrade Tool is from Enterprise Server v2.1.1 and not from AS8.2 (6565825)**Description**

When upgrading from AS 8.2, the master password from the 8.2 installation is not inherited in the target installation. This subsequently causes an authentication error at the next admin login.

Solution

The default admin password in Enterprise Server v2.1.1 is `changeit`. To avoid problems when logging in to the Enterprise Server after upgrading from 8.2, do one of the three following things:

- Change the 8.2 admin password to change it before performing the upgrade.
- Do not accept the default admin password during the upgrade process, but instead explicitly enter the password you want to use.
- Log in to Enterprise Server v2.1.1 with the default password, and then immediately change it.

Localized Online Help for asupgrade GUI Does Not Exist (6610170)

Description

When running the asupgrade GUI in a language other than English, the online help for the GUI is not localized for the selected non-English language.

Solution

None at the time. Online help is scheduled to be localized in all non-English target languages.

Upgrade Tool deleted nodeagents directory when upgrade (reverse order) with multiple domains (6636871)

Description

After a side-by-side upgrade of a configuration that contains multiple domains, only the node agents of the last processed domain are present. This issue occurs because Upgrade Tool removes and re-creates the nodeagents directory in the target each time Upgrade Tool processes a domain.

▼ **Solution: To Preserve All Node Agents in a Side-by-Side Upgrade of Multiple Domains**

- 1 **After processing each domain, create a zip file of the nodeagents directory.**
- 2 **When all domains have been processed, unzip the files that you created.**
All node agents should now be present.

In-place upgrade does not update the index.html file of existing domain (6831429)

Description

While performing in-place upgrade, the index.html file of a domain that already exists is not replaced. It might still show the old version of the server. This index.html file could be replaced by the index.html file from *SGES_BASE*.

```
SGES_BASE/lib/install/templates/ee/index.html DOMAIN_DIR/docroot/index.html
```

Web Container

This section describes known web container issues and associated solutions.

On Windows, deploying an application using `--precompilejsp=true` can lock JAR files in the application, causing later undeployment or redeployment to fail (5004315)

Description

If you request precompilation of JSPs when you deploy an application on Windows, later attempts to undeploy that application or to redeploy it (or any application with the same module ID) will not work as expected. The problem is that JSP precompilation opens JAR files in your application but does not close them, and Windows prevents the undeployment from deleting those files or the redeployment from overwriting them.

Note that undeployment succeeds to a point, in that the application is logically removed from the Application Server. Also note that no error message is returned by the `asadmin` utility, but the application's directory and the locked jar files remain on the server. The server's log file will contain messages describing the failure to delete the files and the application's directory.

Attempts to redeploy the application after undeploying fail because the server tries to remove the existing files and directory, and these attempts also fail. This can happen if you try to deploy any application that uses the same module ID as the originally deployed application, because the server uses the module ID in choosing a directory name to hold the application's files.

Attempts to redeploy the application without undeploying it first will fail for the same reasons.

Diagnostics

If you attempt to redeploy the application or deploy it after undeploying it, the `asadmin` utility returns an error similar to the one below.

```
An exception occurred while running the command. The exception
message is: CLI171 Command deploy failed : Deploying application in
domain failed; Cannot deploy. Module directory is locked and can't
be deleted.
```

Solution

If you specify `--precompilejsps=false` (the default setting) when you deploy an application, then this problem will not occur. Be aware that the first use of the application will trigger the JSP compilation, so the response time to the first request will be longer than for later requests.

Note also that if you do precompile, you should stop and restart the server before undeploying or redeploying the application. The shutdown frees the locked JAR files so the undeployment or redeployment after the restart can succeed.

Unable to deploy WAR with Servlet 2.4-based web.xml that contains an empty <load-on-startup> element (6172006)

Description

The optional load-on-startup servlet element in a web.xml indicates that the associated servlet is to be loaded and initialized as part of the startup of the web application that declares it.

The optional content of this element is an integer indicating the order in which the servlet is to be loaded and initialized with respect to the web application's other servlets. An empty <load-on-startup> indicates that the order is irrelevant, as long as the servlet is loaded and initialized during the startup of its containing web application.

The Servlet 2.4 schema for web.xml no longer supports an empty <load-on-startup>, meaning that an integer must be specified when using a Servlet 2.4 based web.xml. If specifying an empty <load-on-startup>, as in <load-on-startup/>, the web.xml will fail validation against the Servlet 2.4 schema for web.xml, causing deployment of the web application to fail.

Backwards compatibility issue. Specifying an empty <load-on-startup> still works with Servlet 2.3 based web.xml.

Solution

Specify <load-on-startup>0</load-on-startup> when using a Servlet 2.4 based web.xml to indicate that servlet load order does not matter.

Unable to compile JSP page on resource constrained servers (6184122)

Description

The JSP page is accessed but fails to compile, and the server log contains the error message "Unable to execute command" with the following stack trace:

```
at org.apache.tools.ant.taskdefs.Execute$Java13CommandLauncher.  
exec(Execute.java:655) at org.apache.tools.ant.taskdefs.Execute.  
launch(Execute.java:416)  
at org.apache.tools.ant.taskdefs.Execute.execute(Execute.java:427)  
at org.apache.tools.ant.taskdefs.compilers.DefaultCompilerAdapter.  
executeExternalCompile(DefaultCompilerAdapter.java:448)  
at org.apache.tools.ant.taskdefs.compilers.JavacExternal.execute  
(JavacExternal.java:81)  
at org.apache.tools.ant.taskdefs.Javac.compile(Javac.java:842)  
at org.apache.tools.ant.taskdefs.Javac.execute(Javac.java:682)  
at org.apache.jasper.compiler.Compiler.generateClass(Compiler.java:396)
```

Solution

Set the JSP compilation switch "fork" to "false."

This can be done either of two ways:

- Globally, by setting the fork init parameter of the JspServlet in *domain-dir/config/default-web.xml* to false:

```
<servlet> <servlet-name>jsp</servlet-name>
<servlet-class>org.apache.jasper.servlet.JspServlet</servlet-class>
... <init-param>
<param-name>fork</param-name> <param-value>>false</param-value>
</init-param> ... </servlet>
```

- On a per-web application basis, by setting the fork JSP configuration property in *sun-web.xml* to false:

```
<sun-web-app> <jsp-config> <property name="fork" value="false" />
</jsp-config> </sun-web-app>
```

Either setting will prevent ant from spawning a new process for javac compilation.

Enterprise Server does not support auth-pass through Web Server 6.1 Add-On (6188932)

Description

The Sun GlassFish Enterprise Server v2.1.1 adds support for the functionality provided by the auth-pass through plugin function available with Sun GlassFish Enterprise Server Enterprise Edition 7.1. However, in Enterprise Server v2.1.1, the auth-pass through plugin feature is configured differently.

The auth-pass through plugin function in Enterprise Server Enterprise Edition 7.1 has been useful in two-tier deployment scenarios, where:

- Application Server instance is protected by a second firewall behind the corporate firewall.
- No client connections are permitted directly to the Application Server instance.

In such network architectures, a client connects to a front-end web server, which has been configured with the service-pass through plugin function and forwards HTTP requests to the proxied Application Server instance for processing. The Application Server instance can only receive requests from the web server proxy, but never directly from any client hosts. As a result of this, any applications deployed on the proxied Application Server instance that query for client information, such as the client's IP address, will receive the proxy host IP, since that is the actual originating host of the relayed request.

Solution

In Application Server Enterprise Edition 7.1, the auth-pass through plugin function could be configured on the proxied Application Server instance in order to make the remote client's information directly available to any applications deployed on it; as if the proxied Application Server instance had received the request directly, instead of via an intermediate web server running the service-pass through plugin.

In Enterprise Server v2.1.1, the auth-pass through feature may be enabled by setting the `authPassThroughEnabled` property of the `<http-service>` element in *domain.xml* to `TRUE`, as follows:

```
<property name="authPassthroughEnabled" value="true"/>
```

The same security considerations of the auth-passthrough plugin function in Application Server Enterprise Edition 7.1 also apply to the authPassthroughEnabled property in Enterprise Server v2.1.1. Since authPassthroughEnabled makes it possible to override information that may be used for authentication purposes (such as the IP address from which the request originated, or the SSL client certificate), it is essential that only trusted clients or servers be allowed to connect to an Enterprise Server v2.1.1 instance with authPassthroughEnabled set to TRUE. As a precautionary measure, it is recommended that only servers behind the corporate firewall should be configured with authPassthroughEnabled set to TRUE. A server that is accessible through the Internet must never be configured with authPassthroughEnabled set to TRUE.

Notice that in the scenario where a proxy web server has been configured with the service-passthrough plugin and forwards requests to an Enterprise Server instance with authPassthroughEnabled set to TRUE, SSL client authentication may be enabled on the web server proxy, and disabled on the proxied Enterprise Server instance. In this case, the proxied Enterprise Server instance will still treat the request as though it was authenticated via SSL, and provide the client's SSL certificate to any deployed applications requesting it.

Web Server

This section describes known web server issues and associated solutions.

Jroute cookie missing when you set "rewrite-cookies" value to false in the loadbalancer.xml (6978685, 6980807)

Description

When Enterprise Server v2.1.1 is configured for load balancing with Web Server 7.0, Jroute cookies are no longer generated. The problem is that the default loadbalancer.xml file sets the rewrite-cookies property to false.

```
<property name="rewrite-cookies" value="false"/>
```

Solution

Remove the rewrite-cookies property from loadbalancer.xml; that is, remove the line that reads:

```
<property name="rewrite-cookies" value="false"/>
```

You may also find it necessary to modify the relaxVersionSemantics property in sun-web.xml. For more information, see [Memory Replication & Multi-threaded Concurrent Access to HttpSessions](#).

Restart the Web Server after making either of these changes.

AS 9.1 b50e.Linux. Can not start WS after AS LB installation: libjvm.so:cannot open shared (6572654)**Description**

This issue only applies you are using the Sun GlassFish Web Server with Enterprise Server and Load Balancer on a Linux system. In such a case, after installing Enterprise Server and a load balancer, the Web Server may fail to start because `libcui18n.so.2` and `libcuc.so.2` are in conflict. These libraries are present in both `/opt/sun/private/lib` and `/opt/sun/appserver/lib`.

Solution

The correct libraries to use are the ones in `/opt/sun/appserver/lib` because `lbplugin` is built against those libraries. Once you remove the two libraries from `/opt/sun/private/lib`, Web Server should start without error.

Alternatively, if you do not want to delete the libraries from `/opt/sun/private/lib`, you can instead put `/opt/sun/appserver/lib` before `/opt/sun/private/lib` in `LD_LIBRARY_PATH` in the Web Server `startserv` script; that is, replace:

```
# Add instance-specific information to LD_LIBRARY_PATH for Solaris and Linux
LD_LIBRARY_PATH="${SERVER_LIB_PATH}:${SERVER_JVM_LIBPATH}:${LD_LIBRARY_PATH}:"
/opt/sun/appserver/lib:/opt/sun/appserver/lbplugin/lib"; export LD_LIBRARY_PATH
```

with:

```
# Add instance-specific information to LD_LIBRARY_PATH for Solaris and Linux
LD_LIBRARY_PATH="/opt/sun/appserver/lib:/opt/sun/appserver/lbplugin/lib:
${SERVER_LIB_PATH}:${SERVER_JVM_LIBPATH}:${LD_LIBRARY_PATH}"; export LD_LIBRARY_PATH
```

Web Services

Ant task `wsimport` fails with Java EE SDK b33d (using JDK 1.6) with `NoClassDefFoundError` (6527842)**Description**

You may encounter a problem when running the JAX—WS tests with the JDK 1.6 included with the Java EE SDK b33d. The tests immediately abort with the following message:

```
[wsimport] Exception in thread "main" java.lang.NoClassDefFoundError: \
com/sun/tools/ws/WsImport
```

This error occurs even though the `webservices-tools.jar` does contain `com/sun/tools/ws/WsImport.class`, `com/sun/tools/ws/ant/WsImport.class`, and `com/sun/tools/ws/ant/WsImport2.class`. Moreover, the same test workspace works without problem using the 1.5.0-10 JDK.

Solution

Copy the `webservices-api.jar` to `$JAVA_HOME/jre/lib/endorsed` before running the JAX-WS tests.

publish-to-registry commands fail in IFR EE builds (6602046)

Description

JAXR uses SAAJ to send soap messages to the registry. In the non-IFR case, the SAAJ impl classes are under `lib/webservices-rt.jar`. In the IFR case, the SAAJ classes are still under `lib/webservices-rt.jar`. In addition, `saaj-impl.jar` is located in the `/usr/share/lib` directory. This jar file is picked up by Enterprise Server and has precedence over classes from `webservices-rt.jar`. This jar file does not have the necessary security permissions to send soap messages to the Web services registry. The packaging should be modified to grant permissions to the jars under `/usr/share/lib` directory or not depend on the `/usr/share/lib` jars.

Solution

Add the following to the `server.policy` file:

```
grant codeBase "file:/usr/share/lib/saaj-impl.jar" {
    permission java.security.AllPermission;
};
```

wscompile fails with "package javax.xml.rpc does not exist" on JDK6 u4 b3 (6638567)

Description

The `wscompile` ant task fails for JDK 6 Update 4. For each JAX-RPC API class, the following error message is displayed:

```
package package-name does not exist
```

Solution

Before running the `wscompile` ant task, ensure that `javaee.jar` is specified in the class path, *not* `j2ee.jar`.
