`mysql_insert_id()` returns `0` if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function will contain the value of the first automatically generated value that was successfully inserted. `LAST_INSERT_ID()` is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific nonspecial value. See Section 11.14, “Information Functions”.

`mysql_insert_id()` returns `0` following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

Return Values

Described in the preceding discussion.

Errors

None.

20.9.3.38. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

Description

Asks the server to kill the thread specified by `pid`.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `KILL` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.39. `mysql_library_end()`

```
void mysql_library_end(void)
```

Description

This function finalizes the MySQL library. You should call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

For usage information, see Section 20.9.2, “C API Function Overview”, and Section 20.9.3.40, “`mysql_library_init()`”.

20.9.3.40. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

Description

This function should be called to initialize the MySQL library before you call any other MySQL function, whether your application is a regular client program or uses the embedded server. If the application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See Section 20.9.3.39, “`mysql_library_end()`”.

The choice of whether the application operates as a regular client or uses the embedded server depends on whether you use the `libmysqlclient` or `libmysqld` library at link time to produce the final executable. For additional information, see Section 20.9.2, “C API Function Overview”.

In a nonmulti-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly via `mysql_init()`. This should be done prior to any other client library call.

The `argc` and `argv` arguments are analogous to the arguments to `main()`, and enable passing of options to the embedded server. For convenience, `argc` may be `0` (zero) if there are no command-line arguments for the server. This is the usual case for applications intended for use only as regular (nonembedded) clients, and the call typically is written as `mysql_library_init(0, NULL, NULL)`.

```
#include <mysql.h>
#include <stdlib.h>

int main(void) {
  if (mysql_library_init(0, NULL, NULL)) {
    fprintf(stderr, "could not initialize MySQL library\n");
    exit(1);
  }

  /* Use any MySQL API functions here */
```

```
  mysql_library_end();

  return EXIT_SUCCESS;
}
```

When arguments are to be passed (`argc` is greater than `0`), the first element of `argv` is ignored (it typically contains the program name). `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

For embedded applications, if you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument should be an array of strings that indicate the groups in option files from which options should be read. See Section 4.2.3.3, "Using Option Files". The final entry in the array should be `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
  "this_program",       /* this string is not used */
  "--datadir=.",
  "--key_buffer_size=32M"
};
static char *server_groups[] = {
  "embedded",
  "server",
  "this_program_SERVER",
  (char *)NULL
};

int main(void) {
  if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                         server_args, server_groups)) {
    fprintf(stderr, "could not initialize MySQL library\n");
    exit(1);
  }

  /* Use any MySQL API functions here */

  mysql_library_end();

  return EXIT_SUCCESS;
}
```

Return Values

Zero if successful. Nonzero if an error occurred.

20.9.3.41. `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters "`%`" or "`_`", or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.42. `mysql_list_fields()`

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters "`%`" or "`_`", or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.43. `mysql_list_processes()`

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

Return Values

A MYSQL_RES result set for success. NULL if an error occurred.

Errors

- CR_COMMANDS_OUT_OF_SYNC

  Commands were executed in an improper order.

- CR_SERVER_GONE_ERROR

  The MySQL server has gone away.

- CR_SERVER_LOST

  The connection to the server was lost during the query.

- CR_UNKNOWN_ERROR

  An unknown error occurred.

20.9.3.44. mysql_list_tables()

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the wild parameter. wild may contain the wildcard characters "%" or "_", or may be a NULL pointer to match all tables. Calling mysql_list_tables() is similar to executing the query SHOW TABLES [LIKE *wild*].

You must free the result set with mysql_free_result().

Return Values

A MYSQL_RES result set for success. NULL if an error occurred.

Errors

- CR_COMMANDS_OUT_OF_SYNC

  Commands were executed in an improper order.

- CR_SERVER_GONE_ERROR

  The MySQL server has gone away.

- CR_SERVER_LOST

  The connection to the server was lost during the query.

- CR_UNKNOWN_ERROR

  An unknown error occurred.

20.9.3.45. mysql_more_results()

```
my_bool mysql_more_results(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute CALL statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See Section 20.9.12, "C API Support for Multiple Statement Execution", and Section 20.9.3.46, "`mysql_next_result()`".

Errors

None.

20.9.3.46. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`).

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see Section 20.9.12, "C API Support for Multiple Statement Execution".

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order. For example, if you didn't call `mysql_use_result()` for a previous result set.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.47. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See Section 20.9.10.1, "Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success".

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result)  // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else  // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_errno(&mysql))
        {
           fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}
```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a

check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

20.9.3.48. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

20.9.3.49. `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, `arg` should point to the value of the integer.

The following list describes the possible options, their effect, and how `arg` is used for each option. Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked against the `libmysql` client library. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- `MYSQL_INIT_COMMAND` (argument type: `char *`)

  SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- `MYSQL_OPT_COMPRESS` (argument: not used)

  Use the compressed client/server protocol.

- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)

  Connect timeout in seconds.

- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)

  For an application linked against the `libmysqld` embedded server library, this allows the library to guess whether to use the embedded server or a remote server. “Guess” means that if the host name is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)

  If no pointer is given or if pointer points to an `unsigned int` that has a nonzero value, the `LOAD LOCAL INFILE` statement is

enabled.

- `MYSQL_OPT_NAMED_PIPE` (argument: not used)

  Use named pipes to connect to a MySQL server on Windows, if the server allows named-pipe connections.

- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)

  Type of protocol to use. Should be one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

  The timeout in seconds for attempts to read from the server. Each attempt uses this timeout value and there are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes. This option works only for TCP/IP connections.

- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)

  Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly.

- `MYSQL_SET_CLIENT_IP` (argument type: `char *`)

  For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)

  Enable or disable verification of the server's Common Name value in its certificate against the host name used when connecting to the server. The connection is rejected if there is a mismatch. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default.

- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

  For an application linked against the `libmysqld` embedded server library, this forces the use of the embedded server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

  For an application linked against the `libmysqld` embedded server library, this forces the use of a remote server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

  This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

  The timeout in seconds for attempts to write to the server. Each attempt uses this timeout value and there are `net_retry_count` retries if necessary, so the total effective timeout value is `net_retry_count` times the option value. This option works only for TCP/IP connections.

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

  Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

  Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

  Enable or disable reporting of data truncation errors for prepared statements via the `error` member of `MYSQL_BIND` structures. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `my_bool *`)

  Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later.

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

  The path name to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

  The name of the character set to use as the default character set.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

  The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Should have the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options.

Option	Description
`character-sets-dir=`*`path`*	The directory where character sets are installed.
`compress`	Use the compressed client/server protocol.
`connect-timeout=`*`seconds`*	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
`database=`*`db_name`*	Connect to this database if no database was specified in the connect command.
`debug`	Debug options.
`default-character-set=`*`char-set_name`*	The default character set to use.
`disable-local-infile`	Disable use of `LOAD DATA LOCAL`.
`host=`*`host_name`*	Default host name.
`init-command=`*`stmt`*	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
`interactive-timeout=`*`seconds`*	Same as specifying `CLIENT_INTERACTIVE` to `mysql_real_connect()`. See Section 20.9.3.52, “`mysql_real_connect()`”.
`local-infile[={0|1}]`	If no argument or nonzero argument, enable use of `LOAD DATA LOCAL`; otherwise disable.
`max_allowed_packet=`*`bytes`*	Maximum size of packet that client can read from server.
`multi-queries`, `multi-results`	Allow multiple result sets from multiple-statement executions or stored procedures.
`multi-statements`	Allow the client to send multiple statements in a single string (separated by “`;`”).
`password=`*`password`*	Default password.
`pipe`	Use named pipes to connect to a MySQL server on Windows.
`port=`*`port_num`*	Default port number.
`pro-tocol={TCP|SOCKET|PIPE|MEMORY}`	The protocol to use when connecting to the server.
`return-found-rows`	Tell `mysql_info()` to return found rows instead of updated rows when using `UP-DATE`.
`shared-memory-base-name=`*`name`*	Shared-memory name to use to connect to server.
`socket=`*`path`*	Default socket file.
`ssl-ca=`*`file_name`*	Certificate Authority file.
`ssl-capath=`*`path`*	Certificate Authority directory.
`ssl-cert=`*`file_name`*	Certificate file.

ssl-cipher=*cipher_list*	Allowable SSL ciphers.
ssl-key=*file_name*	Key file.
timeout=*seconds*	Like connect-timeout.
user	Default user.

timeout has been replaced by connect-timeout, but timeout is still supported in MySQL 5.4 for backward compatibility.

For more information about option files, see Section 4.2.3.3, “Using Option Files”.

Return Values

Zero for success. Nonzero if you specify an unknown option.

Example

The following mysql_options() calls request the use of compression in the client/server protocol, cause options to be read from the [odbc] group of option files, and disable transaction autocommit mode:

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_COMPRESS,0);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"odbc");
mysql_options(&mysql,MYSQL_INIT_COMMAND,"SET autocommit=0");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
          mysql_error(&mysql));
}
```

This code requests that the client use the compressed client/server protocol and read the additional options from the odbc section in the my.cnf file.

20.9.3.50. mysql_ping()

```
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, mysql_ping() returns an error.

Auto-reconnect is disabled by default. To enable it, call mysql_options() with the MYSQL_OPT_RECONNECT option. For details, see Section 20.9.3.49, “mysql_options()”.

mysql_ping() can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

If mysql_ping()) does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call mysql_thread_id() to get the original connection identifier before calling mysql_ping(), then call mysql_thread_id() again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see Section 20.9.11, “Controlling Automatic Reconnection Behavior”.

Return Values

Zero if the connection to the server is alive. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- CR_COMMANDS_OUT_OF_SYNC

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.51. `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“`;`”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 20.9.12, “C API Support for Multiple Statement Execution”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “`\0`” character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See Section 20.9.3.22, “`mysql_field_count()`”.

Return Values

Zero if the statement was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.52. `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char
*passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long cli-
ent_flag)
```

Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()` you must call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See Section 20.9.3.49, “`mysql_options()`”.
- The value of `host` may be either a host name or an IP address. If `host` is `NULL` or the string `"localhost"`, a connection to the local host is assumed: For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of `"."` on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string `""`, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the MyODBC section of Chapter 20, *Connectors and APIs*.
- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This allows the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

  > **Note**
  >
  > Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `latin1`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.
- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features.

Flag Name	Flag Description
`CLIENT_COMPRESS`	Use compression protocol.
`CLIENT_FOUND_ROWS`	Return the number of found (matched) rows, not the number of changed rows.
`CLIENT_IGNORE_SIGPIPE`	Prevents the client library from installing a `SIGPIPE` signal handler. This can be used to avoid conflicts with a handler that the application has already installed.
`CLIENT_IGNORE_SPACE`	Allow spaces after function names. Makes all functions names reserved words.
`CLIENT_INTERACTIVE`	Allow `interactive_timeout` seconds (instead of `wait_timeout` seconds) of inactivity before closing the connection. The client's session `wait_timeout` variable is set to the value of the session `interactive_timeout` variable.
`CLIENT_LOCAL_FILES`	Enable `LOAD DATA LOCAL` handling.
`CLIENT_MULTI_RESULTS`	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if `CLIENT_MULTI_STATEMENTS` is enabled. See the note following this table for more information about this flag.
`CLIENT_MULTI_STATEMENTS`	Tell the server that the client may send multiple statements in a single string (separated by “`;`”). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
`CLIENT_NO_SCHEMA`	Do not allow the *`db_name.tbl_name.col_name`* syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
`CLIENT_ODBC`	Unused.

CLIENT_SSL	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use mysql_ssl_set() before calling mysql_real_connect().
CLIENT_REMEMBER_OPTIONS	Remember options specified by calls to mysql_options(). Without this option, if mysql_real_connect() fails, you must repeat the mysql_options() calls before trying to connect again. With this option, the mysql_options() calls need not be repeated.

If your program uses CALL statements to execute stored procedures, the CLIENT_MULTI_RESULTS flag must be enabled. This is because each CALL returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because CALL can return multiple results, you should process them using a loop that calls mysql_next_result() to determine whether there are more results.

CLIENT_MULTI_RESULTS can be enabled when you call mysql_real_connect(), either explicitly by passing the CLIENT_MULTI_RESULTS flag itself, or implicitly by passing CLIENT_MULTI_STATEMENTS (which also enables CLIENT_MULTI_RESULTS).

If you enable CLIENT_MULTI_STATEMENTS or CLIENT_MULTI_RESULTS, you should process the result for every call to mysql_query() or mysql_real_query() by using a loop that calls mysql_next_result() to determine whether there are more results. For an example, see Section 20.9.12, “C API Support for Multiple Statement Execution”.

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the mysql_real_connect() call. To do this, call mysql_options() with the MYSQL_READ_DEFAULT_FILE or MYSQL_READ_DEFAULT_GROUP option before calling mysql_real_connect(). Then, in the mysql_real_connect() call, specify the “no-value” value for each parameter to be read from an option file:

- For host, specify a value of NULL or the empty string ("").
- For user, specify a value of NULL or the empty string.
- For passwd, specify a value of NULL. (For the password, a value of the empty string in the mysql_real_connect() call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For db, specify a value of NULL or the empty string.
- For port, specify a value of 0.
- For unix_socket, specify a value of NULL.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A MYSQL* connection handle if the connection was successful, NULL if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- CR_CONN_HOST_ERROR

  Failed to connect to the MySQL server.

- CR_CONNECTION_ERROR

  Failed to connect to the local MySQL server.

- CR_IPSOCK_ERROR

Failed to create an IP socket.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SOCKET_CREATE_ERROR`

  Failed to create a Unix socket.

- `CR_UNKNOWN_HOST`

  Failed to find the IP address for the host name.

- `CR_VERSION_ERROR`

  A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.

- `CR_NAMEDPIPEOPEN_ERROR`

  Failed to create a named pipe on Windows.

- `CR_NAMEDPIPEWAIT_ERROR`

  Failed to wait for a named pipe on Windows.

- `CR_NAMEDPIPESETSTATE_ERROR`

  Failed to get a pipe handler on Windows.

- `CR_SERVER_LOST`

  If `connect_timeout` > 0 and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

Example

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"your_prog_name");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
          mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

20.9.3.53. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned
long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See Section 8.1.1, “Strings”.

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), "`\n`", "`\r`", "`\`", "`'`", "`"`", and Control-Z (see Section 8.1, "Literal Values"). (Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
*end++ = '\'';
end += mysql_real_escape_string(&mysql, end,"What is this",12);
*end++ = '\'';
*end++ = ',';
*end++ = '\'';
end += mysql_real_escape_string(&mysql, end,"binary data: \0\r\n",16);
*end++ = '\'';
*end++ = ')';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
   fprintf(stderr, "Failed to insert row, Error: %s\n",
           mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

20.9.3.54. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

Description

Executes the SQL statement pointed to by `stmt_str`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon ("`;`") or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 20.9.12, "C API Support for Multiple Statement Execution".

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the "`\0`" character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See Section 20.9.3.22, "`mysql_field_count()`".

Return Values

Zero if the statement was successful. Nonzero if an error occurred.

Errors

- CR_COMMANDS_OUT_OF_SYNC

  Commands were executed in an improper order.

- CR_SERVER_GONE_ERROR

  The MySQL server has gone away.

- CR_SERVER_LOST

  The connection to the server was lost during the query.

- CR_UNKNOWN_ERROR

  An unknown error occurred.

20.9.3.55. mysql_refresh()

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

Description

This function flushes tables or caches, or resets replication server information. The connected user must have the RELOAD privilege.

The options argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- REFRESH_GRANT

  Refresh the grant tables, like FLUSH PRIVILEGES.

- REFRESH_LOG

  Flush the logs, like FLUSH LOGS.

- REFRESH_TABLES

  Flush the table cache, like FLUSH TABLES.

- REFRESH_HOSTS

  Flush the host cache, like FLUSH HOSTS.

- REFRESH_STATUS

  Reset status variables, like FLUSH STATUS.

- REFRESH_THREADS

  Flush the thread cache.

- REFRESH_SLAVE

  On a slave replication server, reset the master server information and restart the slave, like RESET SLAVE.

- REFRESH_MASTER

  On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like RESET MASTER.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.56. `mysql_reload()`

```
int mysql_reload(MYSQL *mysql)
```

Description

Asks the MySQL server to reload the grant tables. The connected user must have the `RELOAD` privilege.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `FLUSH PRIVILEGES` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.57. `mysql_rollback()`

```
my_bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

20.9.3.58. mysql_row_seek()

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset that should be a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

Errors

None.

20.9.3.59. mysql_row_tell()

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

20.9.3.60. mysql_select_db()

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.61. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

Return Values

Zero for success. Nonzero if an error occurred.

Example

```
MYSQL mysql;

mysql_init(&mysql);
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
          mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
           mysql_character_set_name(&mysql));
}
```

20.9.3.62. `mysql_set_local_infile_default()`

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

Description

Sets the `LOAD LOCAL DATA INFILE` handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

Return Values

None.

Errors

None.

20.9.3.63. `mysql_set_local_infile_handler()`

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **, const
char *, void *), int (*local_infile_read)(void *, char *, unsigned int), void
(*local_infile_end)(void *), int (*local_infile_error)(void *, char*, unsigned int), void
*userdata);
```

Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, nonzero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initalization function returns an error.

```
int
local_infile_error(void *ptr,
                   char *error_msg,
                   unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len`–1 bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

Return Values

None.

Errors

None.

20.9.3.64. mysql_set_server_option()

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

Description

Enables or disables an option for the connection. `option` can have one of the following values.

`MYSQL_OPTION_MULTI_STATEMENTS_ON`	Enable multiple-statement support
`MYSQL_OPTION_MULTI_STATEMENTS_OFF`	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 20.9.12, "C API Support for Multiple Statement Execution".

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL` SQL statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to allow the use of `CALL`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `ER_UNKNOWN_COM_ERROR`

  The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

20.9.3.65. mysql_shutdown()

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

Description

Asks the database server to shut down. The connected user must have the `SHUTDOWN` privilege. MySQL 5.4 servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in Section 5.1.10, "The Shutdown Process".

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.66. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. `'00000'` means "no error". The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, *Errors, Error Codes, and Common Problems*.

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

Return Values

A null-terminated character string containing the SQLSTATE error code.

See Also

See Section 20.9.3.14, "`mysql_errno()`", Section 20.9.3.15, "`mysql_error()`", and Section 20.9.7.26, "`mysql_stmt_sqlstate()`".

20.9.3.67. `mysql_ssl_set()`

```
my_bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca,
const char *capath, const char *cipher)
```

Description

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the path name to the key file.

- `cert` is the path name to the certificate file.
- `ca` is the path name to the certificate authority file.
- `capath` is the path name to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

Return Values

This function always returns `0`. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

20.9.3.68. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.
- `CR_SERVER_LOST`

  The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.69. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later on).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 20.9.12, “C API Support for Multiple Statement Execution”.

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See Section 20.9.3.22, “`mysql_field_count()`”.

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement didn't return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that isn't a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See Section 20.9.10.1, “Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success”.

Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.3.70. `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Return Values

The thread ID of the current connection.

Errors

None.

20.9.3.71. mysql_use_result()

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use `mysql_use_result()` if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.9.3.72. mysql_warning_count()

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

Description

Returns the number of warnings generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

20.9.4. C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following SQL statements can be used as prepared statements:

```
CALL
CREATE TABLE
DELETE
DO
INSERT
REPLACE
SELECT
SET
UPDATE
ANALYZE TABLE
OPTIMIZE TABLE
REPAIR TABLE
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
  | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

Other statements are not yet supported in MySQL 5.4.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 12.6.4, “Automatic Prepared Statement Repreparation”.

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about using prepared statements in the Knowledge Base article, How can I create server-side prepared statements?. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.9.5. C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handle, pass a `MYSQL` connection handler to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the `MYSQL_STMT` pointer and the statement string to `mysql_stmt_prepare()`.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see Section 20.9.7.10, “`mysql_stmt_execute()`”, and Section 20.9.7.11, “`mysql_stmt_fetch()`”.

- `MYSQL_STMT`

  This structure is a handle for a prepared statement. A handle is created by calling `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT`. The handle is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handle becomes invalid.

  The `MYSQL_STMT` structure has no members intended for application use. Applications should not try to copy a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

  Multiple statement handles can be associated with a single connection. The limit on the number of handles depends on the available system resources.

- `MYSQL_BIND`

  This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

  - For input, use `MYSQL_BIND` structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
  - For output, use `MYSQL_BIND` structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for use in fetching rows with `mysql_stmt_fetch()`.

  To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

  ```
  MYSQL_BIND bind[3];
  memset(bind, 0, sizeof(bind));
  ```

  The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

  - `enum enum_field_types buffer_type`

    The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For allowable `buffer_type`

values, see Section 20.9.5.1, “C API Prepared Statement Type Codes”.

- `void *buffer`

  A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

  For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL use the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).

  For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

  To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

  - For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.
  - For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.
  - For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

  For guidelines about mapping between C types and SQL types and notes about type conversions, see Section 20.9.5.1, “C API Prepared Statement Type Codes”, and Section 20.9.5.2, “C API Prepared Statement Type Conversions”.

- `unsigned long buffer_length`

  The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

  A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. `length` is used for character or binary C data.

  For input parameter data binding, set `*length` to indicate the actual length of the parameter value stored in `*buffer`. This is used by `mysql_stmt_execute()`.

  For output value binding, MySQL sets `*length` when you call `mysql_stmt_fetch()`. The `mysql_stmt_fetch()` return value determines how to interpret the length:

  - If the return value is 0, `*length` indicates the actual length of the parameter value.
  - If the return value is `MYSQL_DATA_TRUNCATED`, `*length` indicates the nontruncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

  `length` is ignored for numeric and temporal data types because the `buffer_type` value determines the length of the data value.

  If you must determine the length of a returned value before fetching it, see Section 20.9.7.11, “`mysql_stmt_fetch()`”, for some strategies.

- `my_bool *is_null`

  This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

  `is_null` is a *pointer* to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify `NULL` values:

  - If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column.

The other MYSQL_BIND members, including is_null, do not matter.

- If your data values are always NOT NULL, set is_null = (my_bool*) 0, and set the other members appropriately for the variable you are binding.
- In all other cases, set the other members appriopriately and set is_null to the address of a my_bool variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is NULL or NOT NULL, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by is_null to true or false according to whether the result set column value returned from the statement is or is not NULL.

- my_bool is_unsigned

  This member applies for C variables with data types that can be unsigned (char, short int, int, long long int). Set is_unsigned to true if the variable pointed to by buffer is unsigned and false otherwise. For example, if you bind a signed char variable to buffer, specify a type code of MYSQL_TYPE_TINY and set is_unsigned to false. If you bind an unsigned char instead, the type code is the same but is_unsigned should be true. (For char, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using signed char or unsigned char.)

  is_unsigned applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an int variable to supply a value for a BIGINT UNSIGNED column, is_unsigned should be false because int is a signed type. If you use an unsigned int variable to supply a value for a BIGINT column, is_unsigned should be true because unsigned int is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- my_bool *error

  For output, set this member to point to a my_bool variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, mysql_stmt_fetch() returns MYSQL_DATA_TRUNCATED and *error is true in the MYSQL_BIND structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling mysql_options() with the MYSQL_REPORT_DATA_TRUNCATION option.

- MYSQL_TIME

  This structure is used to send and receive DATE, TIME, DATETIME, and TIMESTAMP data directly to and from the server. Set the buffer member to point to a MYSQL_TIME structure, and set the buffer_type member of a MYSQL_BIND structure to one of the temporal types (MYSQL_TYPE_TIME, MYSQL_TYPE_DATE, MYSQL_TYPE_DATETIME, MYSQL_TYPE_TIMESTAMP).

  The MYSQL_TIME structure contains the members listed in the following table.

Member	Description
unsigned int year	The year
unsigned int month	The month of the year
unsigned int day	The day of the month
unsigned int hour	The hour of the day
unsigned int minute	The minute of the hour
unsigned int second	The second of the minute
my_bool neg	A boolean flag indicating whether the time is negative
unsigned long second_part	The fractional part of the second in microseconds; currently unused

Only those parts of a MYSQL_TIME structure that apply to a given type of temporal value are used. The year, month, and day elements are used for DATE, DATETIME, and TIMESTAMP values. The hour, minute, and second elements are used for TIME, DATETIME, and TIMESTAMP values. See Section 20.9.14, “C API Prepared Statement Handling of Date and Time Values”.

20.9.5.1. C API Prepared Statement Type Codes

The `buffer_type` member of `MYSQL_BIND` structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.

The following table shows the allowable values for the `buffer_type` member of `MYSQL_BIND` structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

Input Variable C Type	`buffer_type` Value	SQL Type of Destination Value
`signed char`	`MYSQL_TYPE_TINY`	`TINYINT`
`short int`	`MYSQL_TYPE_SHORT`	`SMALLINT`
`int`	`MYSQL_TYPE_LONG`	`INT`
`long long int`	`MYSQL_TYPE_LONGLONG`	`BIGINT`
`float`	`MYSQL_TYPE_FLOAT`	`FLOAT`
`double`	`MYSQL_TYPE_DOUBLE`	`DOUBLE`
`MYSQL_TIME`	`MYSQL_TYPE_TIME`	`TIME`
`MYSQL_TIME`	`MYSQL_TYPE_DATE`	`DATE`
`MYSQL_TIME`	`MYSQL_TYPE_DATETIME`	`DATETIME`
`MYSQL_TIME`	`MYSQL_TYPE_TIMESTAMP`	`TIMESTAMP`
`char[]`	`MYSQL_TYPE_STRING`	`TEXT`, `CHAR`, `VARCHAR`
`char[]`	`MYSQL_TYPE_BLOB`	`BLOB`, `BINARY`, `VARBINARY`
	`MYSQL_TYPE_NULL`	`NULL`

Use `MYSQL_TYPE_NULL` as indicated in the description for the `is_null` member in Section 20.9.5, “C API Prepared Statement Data Structures”.

For input string data, use `MYSQL_TYPE_STRING` or `MYSQL_TYPE_BLOB` depending on whether the value is a character (nonbinary) or binary string:

- `MYSQL_TYPE_STRING` indicates character input string data. The value is assumed to be in the character set indicated by the `character_set_client` system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.
- `MYSQL_TYPE_BLOB` indicates binary input string data. The value is treated as having the `binary` character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the allowable values for the `buffer_type` member of `MYSQL_BIND` structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

SQL Type of Received Value	`buffer_type` Value	Output Variable C Type
`TINYINT`	`MYSQL_TYPE_TINY`	`signed char`
`SMALLINT`	`MYSQL_TYPE_SHORT`	`short int`
`MEDIUMINT`	`MYSQL_TYPE_INT24`	`int`
`INT`	`MYSQL_TYPE_LONG`	`int`
`BIGINT`	`MYSQL_TYPE_LONGLONG`	`long long int`
`FLOAT`	`MYSQL_TYPE_FLOAT`	`float`
`DOUBLE`	`MYSQL_TYPE_DOUBLE`	`double`

DECIMAL	MYSQL_TYPE_NEWDECIMAL	char[]
YEAR	MYSQL_TYPE_SHORT	short int
TIME	MYSQL_TYPE_TIME	MYSQL_TIME
DATE	MYSQL_TYPE_DATE	MYSQL_TIME
DATETIME	MYSQL_TYPE_DATETIME	MYSQL_TIME
TIMESTAMP	MYSQL_TYPE_TIMESTAMP	MYSQL_TIME
CHAR, BINARY	MYSQL_TYPE_STRING	char[]
VARCHAR, VARBINARY	MYSQL_TYPE_VAR_STRING	char[]
TINYBLOB, TINYTEXT	MYSQL_TYPE_TINY_BLOB	char[]
BLOB, TEXT	MYSQL_TYPE_BLOB	char[]
MEDIUMBLOB, MEDIUMTEXT	MYSQL_TYPE_MEDIUM_BLOB	char[]
LONGBLOB, LONGTEXT	MYSQL_TYPE_LONG_BLOB	char[]
BIT	MYSQL_TYPE_BIT	char[]

20.9.5.2. C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value in the `MYSQL_BIND` structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL converts the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array is a 4-byte string `'255\0'`.
- MySQL returns `DECIMAL` values as the string representation of the original server-side value, which is why the corresponding C type is `char[]`. For example, `12.345` is returned to the client as `'12.345'`. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer, which is why the corresponding C type is `char[]`. The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

  ```
  SELECT bit_col + 0 FROM t
  SELECT CAST(bit_col AS UNSIGNED) FROM t
  ```

  To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in Section 20.9.7.22, “`mysql_stmt_result_metadata()`”, and Section 20.9.1, “C API Data Structures”.

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see Section 20.9.1, “C API Data Structures”). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any `TINYINT` value requires only 1 byte for storage, so you can supply a `signed char` variable in which to store the value and set `is_unsigned` to indicate that values are signed.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 12.6.4, “Automatic Prepared Statement Repreparation”.

20.9.6. C API Prepared Statement Function Overview

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See Section 20.9.7, “C API Prepared Statement Function Descriptions”.

Function	Description
`mysql_stmt_affected_rows()`	Returns the number of rows changed, deleted, or inserted by prepared `UPDATE`, `DELETE`, or `INSERT` statement
`mysql_stmt_attr_get()`	Gets value of an attribute for a prepared statement
`mysql_stmt_attr_set()`	Sets an attribute for a prepared statement
`mysql_stmt_bind_param()`	Associates application data buffers with the parameter markers in a prepared SQL statement
`mysql_stmt_bind_result()`	Associates application data buffers with columns in a result set
`mysql_stmt_close()`	Frees memory used by a prepared statement
`mysql_stmt_data_seek()`	Seeks to an arbitrary row number in a statement result set
`mysql_stmt_errno()`	Returns the error number for the last statement execution
`mysql_stmt_error()`	Returns the error message for the last statement execution
`mysql_stmt_execute()`	Executes a prepared statement
`mysql_stmt_fetch()`	Fetches the next row of data from a result set and returns data for all bound columns
`mysql_stmt_fetch_column()`	Fetch data for one column of the current row of a result set
`mysql_stmt_field_count()`	Returns the number of result columns for the most recent statement
`mysql_stmt_free_result()`	Free the resources allocated to a statement handle
`mysql_stmt_init()`	Allocates memory for a `MYSQL_STMT` structure and initializes it
`mysql_stmt_insert_id()`	Returns the ID generated for an `AUTO_INCREMENT` column by a prepared statement
`mysql_stmt_num_rows()`	Returns the row count from a buffered statement result set
`mysql_stmt_param_count()`	Returns the number of parameters in a prepared statement
`mysql_stmt_param_metadata()`	(Return parameter metadata in the form of a result set) Currently, this function does nothing
`mysql_stmt_prepare()`	Prepares an SQL statement string for execution
`mysql_stmt_reset()`	Resets the statement buffers in the server
`mysql_stmt_result_metadata()`	Returns prepared statement metadata in the form of a result set
`mysql_stmt_row_seek()`	Seeks to a row offset in a statement result set, using value returned from `mysql_stmt_row_tell()`
`mysql_stmt_row_tell()`	Returns the statement row cursor position
`mysql_stmt_send_long_data()`	Sends long data in chunks to server
`mysql_stmt_sqlstate()`	Returns the SQLSTATE error code for the last statement execution

`mysql_stmt_store_result()`	Retrieves a complete result set to the client

Call `mysql_stmt_init()` to create a statement handle, then `mysql_stmt_prepare()` to prepare the statement string, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

You can send text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See Section 20.9.7.25, "`mysql_stmt_send_long_data()`".

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

When statement execution has been completed, close the statement handle using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an

okay status and the number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string `"SELECT ?"`.
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare  [1] SELECT ?
Execute  [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. *`N`* is a positive integer. If there are multiple prepared statements active simultaneously for the client, *`N`* may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

20.9.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handle, use the `mysql_stmt_init()` function.

20.9.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See Section 20.9.3.1, “`mysql_affected_rows()`”.

Errors

None.

Example

See the Example in Section 20.9.7.10, “`mysql_stmt_execute()`”.

20.9.7.2. mysql_stmt_attr_get()

```
my_bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See Section 20.9.7.3, "`mysql_stmt_attr_set()`", for a list of options and option types.

Return Values

Zero if successful. Nonzero if `option` is unknown.

Errors

None.

20.9.7.3. mysql_stmt_attr_set()

```
my_bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void
*arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

Option	Argument Type	Function
`STMT_ATTR_UPDATE_MAX_LENGTH`	`my_bool *`	If set to 1, causes `mysql_stmt_store_result()` to update the metadata `MYSQL_FIELD->max_length` value.
`STMT_ATTR_CURSOR_TYPE`	`unsigned long *`	Type of cursor to open for statement when `mysql_stmt_execute()` is invoked. `*arg` can be `CURSOR_TYPE_NO_CURSOR` (the default) or `CURSOR_TYPE_READ_ONLY`.
`STMT_ATTR_PREFETCH_ROWS`	`unsigned long *`	Number of rows to fetch from server at a time when using a cursor. `*arg` can be in the range from 1 to the maximum value of `unsigned long`. The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

Return Values

Zero if successful. Nonzero if `option` is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                         (void*) &prefetch_rows);
/* ... check return value ... */
```

20.9.7.4. mysql_stmt_bind_param()

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each "`?`" parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

Section 20.9.5, "C API Prepared Statement Data Structures", describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

  The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 20.9.7.10, "`mysql_stmt_execute()`".

20.9.7.5. mysql_stmt_bind_result()

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. Section 20.9.5, “C API Prepared Statement Data Structures”, describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

  The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 20.9.7.11, “`mysql_stmt_fetch()`”.

20.9.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *)
```

Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Return Values

Zero if the statement was freed successfully. Nonzero if an error occurred.

Errors

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 20.9.7.10, “`mysql_stmt_execute()`”.

20.9.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from `0` to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

None.

Errors

None.

20.9.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at Appendix B, *Errors, Error Codes, and Common Problems*.

Return Values

An error code value. Zero if no error occurred.

Errors

None.

20.9.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string (`""`) is returned if no error occurred. This means the following two tests are equivalent:

```
if(*mysql_stmt_errno(stmt))
{
  // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
  // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

Return Values

A character string that describes the error. An empty string if no error occurred.

Errors

None.

20.9.7.10. mysql_stmt_execute()

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an `UPDATE`, `DELETE`, or `INSERT`, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.
- For a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to Section 20.9.7.11, “`mysql_stmt_fetch()`”.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 12.6.4, “Automatic Prepared Statement Repreparation”.

Return Values

Zero if execution was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle. For an example that shows how to retrieve data, see Section 20.9.7.11, “`mysql_stmt_fetch()`”.

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                                     col2 VARCHAR(40),\
                                                     col3 SMALLINT,\
                                                     col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO \
                       test_table(col1,col2,col3) \
                       VALUES(?,?,?)"

MYSQL_STMT    *stmt;
MYSQL_BIND    bind[3];
my_ulonglong  affected_rows;
int           param_count;
short         small_data;
int           int_data;
char          str_data[STRING_SIZE];

str_length= strlen(str_data);

/* INSERT SMALLINT data as NULL */
is_null= 1;

/* Execute the INSERT statement - 1*/
if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, " mysql_stmt_execute(), 1 failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Get the number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
               (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
  fprintf(stderr, " invalid affected rows by MySQL\n");
  exit(0);
}

/* Specify data values for second row,
   then re-execute the statement */
int_data= 1000;
strncpy(str_data, "
        The most popular Open Source database",
        STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000;         /* smallint */
is_null= 0;               /* reset */

/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, " mysql_stmt_execute, 2 failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
               (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
  fprintf(stderr, " invalid affected rows by MySQL\n");
  exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
  fprintf(stderr, " failed while closing the statement\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}
```

Note

For complete examples on the use of prepared statement functions, refer to the file `tests/mysql_client_test.c`. This file can be obtained from a MySQL source distribution or from the Bazaar source repository.

20.9.7.11. `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before caling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
`MYSQL_TYPE_TINY`	1
`MYSQL_TYPE_SHORT`	2
`MYSQL_TYPE_LONG`	4
`MYSQL_TYPE_LONGLONG`	8
`MYSQL_TYPE_FLOAT`	4
`MYSQL_TYPE_DOUBLE`	8
`MYSQL_TYPE_TIME`	`sizeof(MYSQL_TIME)`
`MYSQL_TYPE_DATE`	`sizeof(MYSQL_TIME)`
`MYSQL_TYPE_DATETIME`	`sizeof(MYSQL_TIME)`
`MYSQL_TYPE_STRING`	`data length`
`MYSQL_TYPE_BLOB`	`data_length`

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```
real_length= 0;

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
  data= malloc(real_length);
  bind[0].buffer= data;
  bind[0].buffer_length= real_length;
  mysql_stmt_fetch_column(stmt, bind, 0, 0);
}
```

Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling `mysql_stmt_errno()` and `mysql_stmt_error()`.
`MYSQL_NO_DATA`	No more rows/data exists
`MYSQL_DATA_TRUNCATED`	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

- `CR_UNSUPPORTED_PARAM_TYPE`

  The buffer type is `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, but the data type is not `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP`.

- All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

Example

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`. (This example expects to retrieve the two rows inserted by the example shown in Section 20.9.7.10, “`mysql_stmt_execute()`”.) The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \
                       FROM test_table"

MYSQL_STMT    *stmt;
MYSQL_BIND    bind[4];
MYSQL_RES     *prepare_meta_result;
MYSQL_TIME    ts;
unsigned long length[4];
int           param_count, column_count, row_count;
short         small_data;
int           int_data;
char          str_data[STRING_SIZE];
my_bool       is_null[4];
my_bool       error[4];

/* Prepare a SELECT query to fetch data from test_table */
```

```
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  fprintf(stderr, " mysql_stmt_init(), out of memory\n");
  exit(0);
}
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{
  fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}
fprintf(stdout, " prepare, SELECT successful\n");

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in SELECT: %d\n", param_count);

if (param_count != 0) /* validate parameter count */
{
  fprintf(stderr, " invalid parameter count returned by MySQL\n");
  exit(0);
}

/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);

  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}
```

20.9.7.12. mysql_stmt_fetch_column()

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, un-
signed long offset)
```

Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is

the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Return Values

Zero if the value was fetched successfully. Nonzero if an error occurred.

Errors

- `CR_INVALID_PARAMETER_NO`

  Invalid column number.

- `CR_NO_DATA`

  The end of the result set has already been reached.

20.9.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

20.9.7.14. `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

Return Values

Zero if the result set was freed successfully. Nonzero if an error occurred.

Errors

20.9.7.15. `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

Description

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

Return values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

Errors

- `CR_OUT_OF_MEMORY`

  Out of memory.

20.9.7.16. `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See Section 20.9.3.37, "`mysql_insert_id()`", for more information.

Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

Errors

None.

20.9.7.17. `mysql_stmt_num_rows()`

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handle. If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

20.9.7.18. `mysql_stmt_param_count()`

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

See the Example in Section 20.9.7.10, “mysql_stmt_execute()”.

20.9.7.19. mysql_stmt_param_metadata()

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

Description

Return Values

Errors

20.9.7.20. mysql_stmt_prepare()

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

Description

Given the statement handle returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (“`;`”) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (“`?`”) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not allowed for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 12.6.4, “Automatic Prepared Statement Repreparation”.

Return Values

Zero if the statement was prepared successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

See the Example in Section 20.9.7.10, “`mysql_stmt_execute()`”.

20.9.7.21. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero if the statement was reset successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.7.22. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`

- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 20.9.7.11, “`mysql_stmt_fetch()`”.

20.9.7.23. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

20.9.7.24. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

20.9.7.25. mysql_stmt_send_long_data()

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const
char *data, unsigned long length)
```

Description

Allows an application to send parameter data to the server in pieces (or "chunks"). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

> **Note**
>
> The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See Section 20.9.7.21, "`mysql_stmt_reset()`".

Return Values

Zero if the data is sent successfully to server. Nonzero if an error occurred.

Errors

- `CR_INVALID_BUFFER_USE`

  The parameter does not have a string or binary type.

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value `'MySQL - The most popular Open Source database'` into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO \
                      test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long       length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
```

```
  fprintf(stderr, " mysql_stmt_init(), out of memory\n");
  exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
  fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}
 memset(bind, 0, sizeof(bind));
 bind[0].buffer_type= MYSQL_TYPE_STRING;
 bind[0].length= &length;
 bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
  fprintf(stderr, "\n param bind failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

 /* Supply data in chunks to server */
 if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
  fprintf(stderr, "\n send_long_data failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

 /* Supply the next piece of data */
 if (mysql_stmt_send_long_data(stmt,0,
           " - The most popular Open Source database",40))
{
  fprintf(stderr, "\n send_long_data failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

 /* Now, execute the query */
 if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, "\n mysql_stmt_execute failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}
```

20.9.7.26. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. `"00000"` means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, *Errors, Error Codes, and Common Problems*.

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value `"HY000"` (general error) is used for unmapped errors.

Return Values

A null-terminated character string containing the SQLSTATE error code.

20.9.7.27. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by executing prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see Section 20.9.7.11, “`mysql_stmt_fetch()`”.)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`,

`mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to Section 20.9.7.22, "`mysql_stmt_result_metadata()`".

> **Note**
>
> MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications don't need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See Section 20.9.7.3, "`mysql_stmt_attr_set()`".

Return Values

Zero if the results are buffered successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

20.9.8. C API Threaded Function Descriptions

You need to use the following functions when you want to create a threaded client. See Section 20.9.16.2, "How to Make a Threaded Client".

20.9.8.1. `my_init()`

```
void my_init(void)
```

Description

`my_init()` initializes some global variables that MySQL needs. If you are using a thread-safe client library, it also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access the prototype for `my_init()`, your program should include these header files:

```
#include <my_global.h>
#include <my_sys.h>
```

Return Values

None.

20.9.8.2. mysql_thread_end()

```
void mysql_thread_end(void)
```

Description

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` *is not invoked automatically by the client library*. It must be called explicitly to avoid a memory leak.

Return Values

None.

20.9.8.3. mysql_thread_init()

```
my_bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` will be called for you.

Return Values

Zero if successful. Nonzero if an error occurred.

20.9.8.4. mysql_thread_safe()

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

20.9.9. C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See Section 20.8, “libmysqld, the Embedded MySQL Server Library”. To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-lmysqlclient` flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See Section 20.9.2, “C API Function Overview”.

20.9.9.1. mysql_server_init()

```
int mysql_server_init(int argc, char **argv, char **groups)
```

Description

This function initializes the MySQL library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See Section 20.9.3.40, “`mysql_library_init()`”.

Return Values

Zero if successful. Nonzero if an error occurred.

20.9.9.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

Description

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See Section 20.9.3.39, “`mysql_library_end()`”.

Return Values

None.

20.9.10. Common Questions and Problems When Using the C API

> **MySQL Enterprise**
> Subscribers to MySQL Enterprise will find articles about the C API in the MySQL Knowledge Base. Access to the Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.9.10.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

20.9.10.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

  For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See Section 20.9.3.37, “`mysql_insert_id()`”.
- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

20.9.10.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a nonmagic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
    VALUES(NULL,'text');         # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
    VALUES(LAST_INSERT_ID(),'text');  # use ID in second table
```

Note that `mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see Section 11.14, “Information Functions”.
- For information on `mysql_insert_id()`, the function you use from within the C API, see Section 20.9.3.37, “`mysql_insert_id()`”.
- For information on obtaining the auto-incremented value when using Connector/J, see Section 20.3.5, “Connector/J Notes and Tips”.
- For information on obtaining the auto-incremented value when using Connector/ODBC, see Section 20.1.7.1.1, “Obtaining Auto-Increment Values”.

20.9.11. Controlling Automatic Reconnection Behavior

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. In this case, the library tries once to reconnect to the server and send the statement again.

If it is important for your application to know that the connection has been dropped (so that is can exit or take action to adjust for the loss of state information), be sure to disable auto-reconnect. This can be done explicitly by calling `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

In MySQL 5.4, auto-reconnect is disabled by default.

If the connection has gone down, the `mysql_ping()` function performs a reconnect if auto-reconnect is enabled. If auto-reconnect is disabled, `mysql_ping()` returns an error instead.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session variables are reinitialized to the values of the corresponding variables. This also affects variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

20.9.12. C API Support for Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL 5.4 also supports the execution of a string containing multiple statements separated by semicolon (“`;`”) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling` `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

  In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve mul-

tiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See Section 20.9.4, “C API Prepared Statements”.

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevent:
  - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`.
  - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to allow processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which allows a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
  printf("mysql_real_connect() failed\n");
  mysql_close(mysql);
  exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
                     "DROP TABLE IF EXISTS test_table;\
                      CREATE TABLE test_table(id INT);\
                      INSERT INTO test_table VALUES(10);\
                      UPDATE test_table SET id=20 WHERE id=10;\
                      SELECT * FROM test_table;\
                      DROP TABLE test_table");
if (status)
```

```
{
  printf("Could not execute statement(s)");
  mysql_close(mysql);
  exit(0);
}

/* process each statement result */
do {
  /* did current statement return data? */
  result = mysql_store_result(mysql);
  if (result)
  {
    /* yes; process rows and free the result set */
    process_result_set(mysql, result);
    mysql_free_result(result);
  }
  else          /* no result set or error */
  {
    if (mysql_field_count(mysql) == 0)
    {
      printf("%lld rows affected\n",
             mysql_affected_rows(mysql));
    }
    else  /* some error occurred */
    {
      printf("Could not retrieve result set\n");
      break;
    }
  }
  /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
  if ((status = mysql_next_result(mysql)) > 0)
    printf("Could not execute statement\n");
} while (status == 0);

mysql_close(mysql);
```

20.9.13. C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Prepared statements use the query cache under the conditions described in Section 7.5.5.1, “How the Query Cache Operates”.
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by “`;`” characters).
- In MySQL 5.4, prepared `CALL` statements cannot invoke stored procedures that return result sets because prepared statements do not support multiple result sets. Nor can the calling application access a stored procedure's `OUT` or `INOUT` parameters when the procedure returns. These capabilities are supported beginning with MySQL 5.5.

20.9.14. C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol allows you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in Section 20.9.5, “C API Prepared Statement Data Structures”.

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling `mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.
2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the tem-

poral value.

3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_stmt_bind_result()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```
MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
                           timestamp_field) VALUES(?,?,?");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  fprintf(stderr, " mysql_stmt_init(), out of memory\n");
  exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
  fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..
```

20.9.15. C API Support for Prepared `CALL` Statements

In MySQL 5.4, prepared `CALL` statements can be used only for stored procedures that produce at most one result set. Nor can the calling application use placeholders for `OUT` or `INOUT` parameters.

MySQL 5.5 expands prepared `CALL` statement support for stored procedures that produce multiple result sets and to provide placeholder access to `OUT` and `INOUT` parameters.

20.9.16. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-`

`I/usr/local/mysql/include`), so that the compiler can find the header files.

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See Section 4.7.2, "`mysql_config` — Get Compile Options for Compiling Clients".

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o progname `$CFG --cflags` progname.c `$CFG --libs`"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

> **MySQL Enterprise**
> Subscribers to MySQL Enterprise will find an example client program in the Knowledge Base article, Sample C program using the embedded MySQL server library . Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.9.16.1. Problems Linking with the C API

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql \
                        -lmysqlclient -lsocket -lnsl

Undefined        first referenced
 symbol          in file
floor            /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client
```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

Linking with the single-threaded library (`libmysqlclient`) may lead to linker errors related to `pthread` symbols. When using the single-threaded library, please compile your client with `MYSQL_CLIENT_NO_THREADS` defined. This can be done on the command line by using the `-D` option to the compiler, or in your source code before including the MySQL header files. This define should not be used when building for use with the thread-safe client library (`libmysqlclient_r`).

20.9.16.2. How to Make a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. If you want to use your own `SIGPIPE` handler, you should first call `mysql_library_init()` and then install your handler.

Current binary distributions should have both a normal and a thread-safe client library.

The thread-safe client library, `libmysqlclient_r`, is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between calls to `mysql_query()` and `mysql_store_result()` no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if you have a thread that is calling MySQL functions which did not create the connection to the MySQL database:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To get things to work smoothly you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.
2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, they will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

If “undefined symbol” errors occur when linking your client with `libmysqlclient_r`, in most cases this is because you haven't included the thread libraries on the link/compile command.

20.10. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- `mysql`: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 4.1, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 4.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see Section B.5.2.4, “`Client does not support authentication protocol`”). This extension is documented on the PHP Web site at http://php.net/mysql.
- Section 20.10.2, “MySQL Improved Extension (`Mysqli`)” - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the authentication protocol used in MySQL 5.0, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the `mysqli` extension at http://php.net/mysqli. Helpful article can be found at http://devzone.zend.com/node/view/id/686 and http://devzone.zend.com/node/view/id/687.

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, see Section 20.10.7, “Enabling Both `mysql` and `mysqli` in PHP”.

The PHP distribution and documentation are available from the PHP Web site.

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about MySQL and PHP in the Knowledge Base articles found at PHP. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. 20.10.1. MySQL

Copyright 1997-2010 the PHP Documentation Group.

These functions allow you to access MySQL database servers. More information about MySQL can be found at http://www.mysql.com/.

Documentation for MySQL can be found at http://dev.mysql.com/doc/.

For an overview of MySQL database connectivity terms and products see Section 20.10.2.2, “Overview”.

20.10.1.1. Installing/Configuring

Copyright 1997-2010 the PHP Documentation Group.

20.10.1.1.1. Requirements

Copyright 1997-2010 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with MySQL support.

20.10.1.1.2. Installation

Copyright 1997-2010 the PHP Documentation Group.

For compiling, simply use the `--with-mysql[=DIR]` configuration option where the optional `[DIR]` points to the MySQL installation directory.

Although this MySQL extension is compatible with MySQL 4.1.0 and greater, it doesn't support the extra functionality that these versions provide. For that, use the MySQLi extension.

If you would like to install the mysql extension along with the mysqli extension you have to use the same client library to avoid any conflicts.

20.10.1.1.2.1. Installation on Linux Systems

Copyright 1997-2010 the PHP Documentation Group.

20.10.1.1.2.1.1. PHP 4

Copyright 1997-2010 the PHP Documentation Group.

The option `--with-mysql` is enabled by default. This default behavior may be disabled with the `--without-mysql` configure option. If MySQL is enabled without specifying the path to the MySQL install DIR, PHP will use the bundled MySQL client libraries.

Users who run other applications that use MySQL (for example, `auth-mysql`) should not use the bundled library, but rather specify the path to MySQL's install directory, like so: `--with-mysql=/path/to/mysql`. This will force PHP to use the client libraries installed by MySQL, thus avoiding any conflicts.

20.10.1.1.2.1.2. PHP 5+

Copyright 1997-2010 the PHP Documentation Group.

MySQL is not enabled by default, nor is the MySQL library bundled with PHP. Read this FAQ for details on why. Use the `--with-mysql[=DIR]` configure option to include MySQL support. You can download *headers and libraries* from http://www.mysql.com/.

20.10.1.1.2.2. Installation on Windows Systems

Copyright 1997-2010 the PHP Documentation Group.

20.10.1.1.2.2.1. PHP 4

Copyright 1997-2010 the PHP Documentation Group.

The PHP MySQL extension is compiled into PHP.

20.10.1.1.2.2.2. PHP 5+

Copyright 1997-2010 the PHP Documentation Group.

MySQL is no longer enabled by default, so the `php_mysql.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows systems `PATH`. See the FAQ titled "How do I add my PHP directory to the `PATH` on Windows" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysql.dll`), the PHP directive extension_dir should be set to the directory where the PHP extensions are located. See also the Manual Windows Installation Instructions. An example extension_dir value for PHP 5 is `c:\php\ext`

> **Note**
>
> If when starting the web server an error similar to the following occurs: `"Unable to load dynamic library './php_mysql.dll'"`, this is because `php_mysql.dll` and/or `libmysql.dll` cannot be found by the system.

20.10.1.1.2.3. MySQL Installation Notes

Copyright 1997-2010 the PHP Documentation Group.

> **Warning**
>
> Crashes and startup problems of PHP may be encountered when loading this extension in conjunction with the recode extension. See the recode extension for more information.

> **Note**
>
> If you need charsets other than *latin* (default), you have to install external (not bundled) libmysql with compiled charset support.

20.10.1.1.3. Runtime Configuration

Copyright 1997-2010 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 20.4. MySQL Configuration Options

Name	Default	Changeable	Changelog
mysql.allow_persistent	"1"	PHP_INI_SYSTEM	
mysql.max_persistent	"-1"	PHP_INI_SYSTEM	
mysql.max_links	"-1"	PHP_INI_SYSTEM	
mysql.trace_mode	"0"	PHP_INI_ALL	Available since PHP 4.3.0.
mysql.default_port	NULL	PHP_INI_ALL	
mysql.default_socket	NULL	PHP_INI_ALL	Available since PHP 4.0.1.
mysql.default_host	NULL	PHP_INI_ALL	
mysql.default_user	NULL	PHP_INI_ALL	
mysql.default_password	NULL	PHP_INI_ALL	
mysql.connect_timeout	"60"	PHP_INI_ALL	PHP_INI_SYSTEM in PHP <= 4.3.2. Available since PHP 4.3.0.

For further details and definitions of the PHP_INI_* modes, see the configuration.changes.modes.

Here's a short explanation of the configuration directives.

mysql.allow_persistent boolean	Whether to allow persistent connections to MySQL.
mysql.max_persistent integer	The maximum number of persistent MySQL connections per process.
mysql.max_links integer	The maximum number of MySQL connections per process, including persistent connections.
mysql.trace_mode boolean	Trace mode. When mysql.trace_mode is enabled, warnings for table/index scans, non free result sets, and SQL-Errors will be displayed. (Introduced in PHP 4.3.0)
mysql.default_port string	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the MYSQL_TCP_PORT environment variable, the mysql-tcp entry in /etc/services or the compile-time MYSQL_PORT constant, in that order. Win32 will only use the MYSQL_PORT constant.
mysql.default_socket string	The default socket name to use when connecting to a local database server if no other socket name is specified.
mysql.default_host string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in SQL safe mode.
mysql.default_user string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in SQL safe mode.
mysql.default_password string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in SQL safe mode.
mysql.connect_timeout integer	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.

20.10.1.1.4. Resource Types

Copyright 1997-2010 the PHP Documentation Group.

There are two resource types used in the MySQL module. The first one is the link identifier for a database connection, the second a resource which holds the result of a query.

20.10.1.2. Predefined Constants

Copyright 1997-2010 the PHP Documentation Group.

The constants below are defined by this extension, and will only be available when the extension has either been compiled into PHP or dynamically loaded at runtime.

Since PHP 4.3.0 it is possible to specify additional client flags for the mysql_connect and mysql_pconnect functions. The following constants are defined:

Table 20.5. MySQL client constants

Constant	Description
MYSQL_CLIENT_COMPRESS	Use compression protocol
MYSQL_CLIENT_IGNORE_SPACE	Allow space after function names
MYSQL_CLIENT_INTERACTIVE	Allow interactive_timeout seconds (instead of wait_timeout) of inactivity before closing the connection.
MYSQL_CLIENT_SSL	Use SSL encryption. This flag is only available with version 4.x of the MySQL client library or newer. Version 3.23.x is bundled both with PHP 4 and Windows binaries of PHP 5.

The function mysql_fetch_array uses a constant for the different types of result arrays. The following constants are defined:

Table 20.6. MySQL fetch constants

Constant	Description
MYSQL_ASSOC	Columns are returned into the array having the fieldname as the array index.
MYSQL_BOTH	Columns are returned into the array having both a numerical index and the fieldname as the array index.
MYSQL_NUM	Columns are returned into the array having a numerical index to the fields. This index starts with 0, the first field in the result.

20.10.1.3. Examples

Copyright 1997-2010 the PHP Documentation Group.

20.10.1.3.1. Basic

This simple example shows how to connect, execute a query, print resulting rows and disconnect from a MySQL database.

Example 20.13. MySQL extension overview example

Copyright 1997-2010 the PHP Documentation Group.

```
<?php
// Connecting, selecting database
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
    or die('Could not connect: ' . mysql_error());
echo 'Connected successfully';
mysql_select_db('my_database') or die('Could not select database');

// Performing SQL query
$query = 'SELECT * FROM my_table';
$result = mysql_query($query) or die('Query failed: ' . mysql_error());

// Printing results in HTML
echo "<table>\n";
while ($line = mysql_fetch_array($result, MYSQL_ASSOC)) {
    echo "\t<tr>\n";
    foreach ($line as $col_value) {
        echo "\t\t<td>$col_value</td>\n";
    }
    echo "\t</tr>\n";
}
echo "</table>\n";

// Free resultset
mysql_free_result($result);

// Closing connection
mysql_close($link);
?>
```

20.10.1.4. MySQL Functions

Copyright 1997-2010 the PHP Documentation Group.

> **Note**
>
> Most MySQL functions accept *link_identifier* as the last optional parameter. If it is not provided, last opened connection is used. If it doesn't exist, connection is tried to establish with default parameters defined in php.ini. If it is not successful, functions return FALSE .

20.10.1.4.1. mysql_affected_rows

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_affected_rows`

  Get number of affected rows in previous MySQL operation

Description

```
int mysql_affected_rows(resource link_identifier);
```

Get the number of affected rows by the last INSERT, UPDATE, REPLACE or DELETE query associated with *`link_identifier`*.

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the number of affected rows on success, and -1 if the last query failed.

If the last query was a DELETE query with no WHERE clause, all of the records will have been deleted from the table but this function will return zero with MySQL versions prior to 4.1.2.

When using UPDATE, MySQL will not update columns where the new value is the same as the old value. This creates the possibility that `mysql_affected_rows` may not actually equal the number of rows matched, only the number of rows that were literally affected by the query.

The REPLACE statement first deletes the record with the same primary key and then inserts the new record. This function returns the number of deleted records plus the number of inserted records.

Examples

Example 20.14. `mysql_affected_rows` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* this should return the correct numbers of deleted records */
mysql_query('DELETE FROM mytable WHERE id < 10');
printf("Records deleted: %d\n", mysql_affected_rows());

/* with a where clause that is never true, it should return 0 */
mysql_query('DELETE FROM mytable WHERE 0');
printf("Records deleted: %d\n", mysql_affected_rows());
?>
```

The above example will output something similar to:

```
Records deleted: 10
Records deleted: 0
```

Example 20.15. `mysql_affected_rows` example using transactions

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* Update records */
mysql_query("UPDATE mytable SET used=1 WHERE id < 10");
printf ("Updated records: %d\n", mysql_affected_rows());
mysql_query("COMMIT");
?>
```

The above example will output something similar to:

```
Updated Records: 10
```

Notes

> **Transactions**
>
> If you are using transactions, you need to call `mysql_affected_rows` after your INSERT, UPDATE, or DELETE query, not after the COMMIT.

> **SELECT Statements**
>
> To retrieve the number of rows returned by a SELECT, it is possible to use `mysql_num_rows`.

> **Cascaded Foreign Keys**
>
> `mysql_affected_rows` does not count rows affected implicitly through the use of ON DELETE CASCADE and/or ON UPDATE CASCADE in foreign key constraints.

See Also

`mysql_num_rows`
`mysql_info`

20.10.1.4.2. `mysql_client_encoding`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_client_encoding`

  Returns the name of the character set

Description

```
  string mysql_client_encoding(resource link_identifier);
```

Retrieves the `character_set` variable from MySQL.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns the default character set name for the current connection.

Examples

Example 20.16. mysql_client_encoding example

```
<?php
$link    = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$charset = mysql_client_encoding($link);

echo "The current character set is: $charset\n";
?>
```

The above example will output something similar to:

```
The current character set is: latin1
```

See Also

mysql_set_charset
mysql_real_escape_string

20.10.1.4.3. mysql_close

Copyright 1997-2010 the PHP Documentation Group.

- mysql_close

  Close MySQL connection

Description

```
  bool mysql_close(resource link_identifier);
```

mysql_close closes the non-persistent connection to the MySQL server that's associated with the specified link identifier. If *link_identifier* isn't specified, the last opened link is used.

Using mysql_close isn't usually necessary, as non-persistent open links are automatically closed at the end of the script's execution. See also freeing resources.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.17. mysql_close example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

The above example will output:

```
Connected successfully
```

Notes

> **Note**
>
> mysql_close will not close persistent links created by mysql_pconnect.

See Also

mysql_connect
mysql_free_result

20.10.1.4.4. mysql_connect

Copyright 1997-2010 the PHP Documentation Group.

- mysql_connect

  Open a connection to a MySQL Server

Description

```
  resource mysql_connect(string server= =ini_get("mysql.default_host"),
                         string username= =ini_get("mysql.default_user"),
                         string password= =ini_get("mysql.default_password"),
                         bool new_link= =false,
                         int client_flags= =0);
```

Opens or reuses a connection to a MySQL server.

Parameters

server	The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost. If the PHP directive mysql.default_host is undefined (default), then the default value is 'localhost:3306'. In SQL safe mode, this parameter is ignored and value 'localhost:3306' is always used.
username	The username. Default value is defined by mysql.default_user. In SQL safe mode, this parameter is ignored and the name of the user that owns the server process is used.
password	The password. Default value is defined by mysql.default_password. In SQL safe mode, this parameter is ignored and empty password is used.
new_link	If a second call is made to `mysql_connect` with the same arguments, no new link will be established, but instead, the link identifier of the already opened link will be returned. The *new_link* parameter modifies this behavior and makes `mysql_connect` always open a new link, even if `mysql_connect` was called before with the same parameters. In SQL safe mode, this parameter is ignored.
client_flags	The *client_flags* parameter can be a combination of the following constants: 128 (enable `LOAD DATA LOCAL` handling), `MYSQL_CLIENT_SSL` , `MYSQL_CLIENT_COMPRESS` , `MYSQL_CLIENT_IGNORE_SPACE` or `MYSQL_CLIENT_INTERACTIVE` . Read the section about Table 20.5, “MySQL client constants” for further information. In SQL safe mode, this parameter is ignored.

Return Values

Returns a MySQL link identifier on success or `FALSE` on failure.

Changelog

Version	Description
4.3.0	Added the *client_flags* parameter.
4.2.0	Added the *new_link* parameter.

Examples

Example 20.18. `mysql_connect` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Example 20.19. `mysql_connect` example using `hostname:port` syntax

```
<?php
// we connect to example.com and port 3307
$link = mysql_connect('example.com:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// we connect to localhost at port 3307
$link = mysql_connect('127.0.0.1:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Example 20.20. `mysql_connect` example using ":/path/to/socket" syntax

```
<?php
// we connect to localhost and socket e.g. /tmp/mysql.sock

//variant 1: ommit localhost
$link = mysql_connect(':/tmp/mysql', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// variant 2: with localhost
$link = mysql_connect('localhost:/tmp/mysql.sock', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Notes

> **Note**
>
> Whenever you specify "localhost" or "localhost:port" as server, the MySQL client library will override this and try to connect to a local socket (named pipe on Windows). If you want to use TCP/IP, use "127.0.0.1" instead of "localhost". If the MySQL client library tries to connect to the wrong local socket, you should set the correct path as *`mysql.default_host`* string in your PHP configuration and leave the server field blank.

> **Note**
>
> The link to the server will be closed as soon as the execution of the script ends, unless it's closed earlier by explicitly calling `mysql_close`.

> **Note**
>
> You can suppress the error message on failure by prepending a @ to the function name.

> **Note**
>
> Error "Can't create TCP/IP socket (10106)" usually means that the variables_order configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

mysql_close

20.10.1.4.5. mysql_create_db

Copyright 1997-2010 the PHP Documentation Group.

- mysql_create_db

  Create a MySQL database

Description

```
bool mysql_create_db(string database_name,
                     resource link_identifier);
```

mysql_create_db attempts to create a new database on the server associated with the specified link identifier.

Parameters

database_name	The name of the database being created.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.21. mysql_create_db alternative example

The function mysql_create_db is deprecated. It is preferable to use mysql_query to issue a sql CREATE DATABASE statement instead.

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'CREATE DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db created successfully\n";
} else {
    echo 'Error creating database: ' . mysql_error() . "\n";
}
?>
```

The above example will output something similar to:

```
Database my_db created successfully
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: `mysql_createdb`

> **Note**
>
> This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

`mysql_query`
`mysql_select_db`

20.10.1.4.6. `mysql_data_seek`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_data_seek`

  Move internal result pointer

Description

```
bool mysql_data_seek(resource result,
                     int row_number);
```

`mysql_data_seek` moves the internal row pointer of the MySQL result associated with the specified result identifier to point to the specified row number. The next call to a MySQL fetch function, such as `mysql_fetch_assoc`, would return that row.

`row_number` starts at 0. The *`row_number`* should be a value in the range from 0 to `mysql_num_rows` - 1. However if the result set is empty (`mysql_num_rows` == 0), a seek to 0 will fail with a E_WARNING and `mysql_data_seek` will return `FALSE` .

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`row_number`	The desired row number of the new result pointer.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.22. `mysql_data_seek` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
$db_selected = mysql_select_db('sample_db');
if (!$db_selected) {
    die('Could not select database: ' . mysql_error());
```

```
}
$query = 'SELECT last_name, first_name FROM friends';
$result = mysql_query($query);
if (!$result) {
    die('Query failed: ' . mysql_error());
}
/* fetch rows in reverse order */
for ($i = mysql_num_rows($result) - 1; $i >= 0; $i--) {
    if (!mysql_data_seek($result, $i)) {
        echo "Cannot seek to row $i: " . mysql_error() . "\n";
        continue;
    }

    if (!($row = mysql_fetch_assoc($result))) {
        continue;
    }

    echo $row['last_name'] . ' ' . $row['first_name'] . "<br />\n";
}

mysql_free_result($result);
?>
```

Notes

> **Note**
>
> The function `mysql_data_seek` can be used in conjunction only with `mysql_query`, not with `mysql_unbuffered_query`.

`mysql_fetch_object`

20.10.1.4.7. `mysql_db_name`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_db_name`

  Get result data

Description

```
  string mysql_db_name(resource result,
                       int row,
                       mixed field);
```

Retrieve the database name from a call to `mysql_list_dbs`.

Parameters

`result`	The result pointer from a call to `mysql_list_dbs`.
`row`	The index into the result set.
`field`	The field name.

Return Values

Returns the database name on success, and `FALSE` on failure. If `FALSE` is returned, use `mysql_error` to determine the nature of the error.

Examples

Example 20.23. `mysql_db_name` example

```
<?php
error_reporting(E_ALL);

$link = mysql_connect('dbhost', 'username', 'password');
$db_list = mysql_list_dbs($link);

$i = 0;
$cnt = mysql_num_rows($db_list);
while ($i < $cnt) {
    echo mysql_db_name($db_list, $i) . "\n";
    $i++;
}
?>
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: `mysql_dbname`

See Also

`mysql_list_dbs`
`mysql_tablename`

20.10.1.4.8. `mysql_db_query`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_db_query`

  Send a MySQL query

Description

```
  resource mysql_db_query(string database,
                          string query,
                          resource link_identifier);
```

`mysql_db_query` selects a database, and executes a query on it.

> **Warning**
>
> This function has been *DEPRECATED* as of PHP 5.3.0. Relying on this feature is highly discouraged.

Parameters

`database`	The name of the database that will be selected.
`query`	The MySQL query.

Data inside the query should be properly escaped.

link_identifier — The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a positive MySQL result resource to the query result, or `FALSE` on error. The function also returns `TRUE` / `FALSE` for `INSERT`/`UPDATE`/`DELETE` queries to indicate success/failure.

Changelog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.0.6	This function is deprecated, do not use this function. Use `mysql_select_db` and `mysql_query` instead.

Examples

Example 20.24. `mysql_db_query` alternative example

```
<?php

if (!$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

if (!mysql_select_db('mysql_dbname', $link)) {
    echo 'Could not select database';
    exit;
}

$sql    = 'SELECT foo FROM bar WHERE id = 42';
$result = mysql_query($sql, $link);

if (!$result) {
    echo "DB Error, could not query the database\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_assoc($result)) {
    echo $row['foo'];
}

mysql_free_result($result);

?>
```

Notes

> **Note**
>
> Be aware that this function does *NOT* switch back to the database you were connected before. In other words, you can't use this function to *temporarily* run a sql query on another database, you would have to manually switch back. Users are strongly encouraged to use the `database.table` syntax in their sql queries or `mysql_select_db` instead of this function.

See Also

mysql_query
mysql_select_db

20.10.1.4.9. mysql_drop_db

Copyright 1997-2010 the PHP Documentation Group.

- mysql_drop_db

  Drop (delete) a MySQL database

Description

```
bool mysql_drop_db(string database_name,
                   resource link_identifier);
```

mysql_drop_db attempts to drop (remove) an entire database from the server associated with the specified link identifier. This function is deprecated, it is preferable to use mysql_query to issue a sql DROP DATABASE statement instead.

Parameters

database_name	The name of the database that will be deleted.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.25. mysql_drop_db alternative example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'DROP DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db was successfully dropped\n";
} else {
    echo 'Error dropping database: ' . mysql_error() . "\n";
}
?>
```

Notes

Warning

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_dropdb`

See Also

`mysql_query`

20.10.1.4.10. `mysql_errno`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_errno`

  Returns the numerical value of the error message from previous MySQL operation

Description

```
int mysql_errno(resource link_identifier);
```

Returns the error number from the last MySQL function.

Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_errno` to retrieve the error code. Note that this function only returns the error code from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the error number from the last MySQL function, or `0` (zero) if no error occurred.

Examples

Example 20.26. `mysql_errno` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");

if (!mysql_select_db("nonexistentdb", $link)) {
    echo mysql_errno($link) . ": " . mysql_error($link). "\n";
}

mysql_select_db("kossu", $link);
if (!mysql_query("SELECT * FROM nonexistenttable", $link)) {
    echo mysql_errno($link) . ": " . mysql_error($link) . "\n";
}
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

See Also

mysql_error
MySQL error codes

20.10.1.4.11. mysql_error

Copyright 1997-2010 the PHP Documentation Group.

- mysql_error

  Returns the text of the error message from previous MySQL operation

Description

```
string mysql_error(resource link_identifier);
```

Returns the error text from the last MySQL function. Errors coming back from the MySQL database backend no longer issue warnings. Instead, use mysql_error to retrieve the error text. Note that this function only returns the error text from the most recently executed MySQL function (not including mysql_error and mysql_errno), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns the error text from the last MySQL function, or '' (empty string) if no error occurred.

Examples

Example 20.27. mysql_error example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");

mysql_select_db("nonexistentdb", $link);
echo mysql_errno($link) . ": " . mysql_error($link). "\n";

mysql_select_db("kossu", $link);
mysql_query("SELECT * FROM nonexistenttable", $link);
echo mysql_errno($link) . ": " . mysql_error($link) . "\n";
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

`mysql_errno`
MySQL error codes

20.10.1.4.12. `mysql_escape_string`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_escape_string`

  Escapes a string for use in a mysql_query

Description

```
string mysql_escape_string(string unescaped_string);
```

This function will escape the *`unescaped_string`*, so that it is safe to place it in a `mysql_query`. This function is deprecated.

This function is identical to `mysql_real_escape_string` except that `mysql_real_escape_string` takes a connection handler and escapes the string according to the current character set. `mysql_escape_string` does not take a connection argument and does not respect the current charset setting.

> **Warning**
>
> This function has been *DEPRECATED* as of PHP 5.3.0. Relying on this feature is highly discouraged.

Parameters

`unescaped_string`	The string that is to be escaped.

Return Values

Returns the escaped string.

Changelog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.3.0	This function became deprecated, do not use this function. Instead, use `mysql_real_escape_string`.

Examples

Example 20.28. `mysql_escape_string` example

```
<?php
$item = "Zak's Laptop";
$escaped_item = mysql_escape_string($item);
printf("Escaped string: %s\n", $escaped_item);
```

```
?>
```

The above example will output:

```
Escaped string: Zak\'s Laptop
```

Notes

> **Note**
>
> `mysql_escape_string` does not escape `%` and `_`.

See Also

`mysql_real_escape_string`
`addslashes`
The magic_quotes_gpc directive.

20.10.1.4.13. `mysql_fetch_array`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_array`

  Fetch a result row as an associative array, a numeric array, or both

Description

```
 array mysql_fetch_array(resource result,
                         int result_type= =MYSQL_BOTH);
```

Returns an array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`result_type`	The type of array that is to be fetched. It's a constant and can take the following values: `MYSQL_ASSOC` , `MYSQL_NUM` , and `MYSQL_BOTH` .

Return Values

Returns an array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows. The type of returned array depends on how *`result_type`* is defined. By using `MYSQL_BOTH` (default), you'll get an array with both associative and number indices. Using `MYSQL_ASSOC` , you only get associative indices (as `mysql_fetch_assoc` works), using `MYSQL_NUM` , you only get number indices (as `mysql_fetch_row` works).

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you must use the numeric index of the column or make an alias for the column. For aliased columns, you cannot access the contents with the original column name.

Examples

Example 20.29. Query with aliased duplicate field names

```
SELECT table1.field AS foo, table2.field AS bar FROM table1, table2
```

Example 20.30. `mysql_fetch_array` with `MYSQL_NUM`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_NUM)) {
    printf("ID: %s  Name: %s", $row[0], $row[1]);
}

mysql_free_result($result);
?>
```

Example 20.31. `mysql_fetch_array` with `MYSQL_ASSOC`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_ASSOC)) {
    printf("ID: %s  Name: %s", $row["id"], $row["name"]);
}

mysql_free_result($result);
?>
```

Example 20.32. `mysql_fetch_array` with `MYSQL_BOTH`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_BOTH)) {
    printf ("ID: %s  Name: %s", $row[0], $row["name"]);
}

mysql_free_result($result);
?>
```

Notes

> **Performance**
>
> An important thing to note is that using `mysql_fetch_array` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP `NULL` value.

See Also

`mysql_fetch_row`
`mysql_fetch_assoc`
`mysql_data_seek`
`mysql_query`

20.10.1.4.14. `mysql_fetch_assoc`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_assoc`

  Fetch a result row as an associative array

Description

```
array mysql_fetch_assoc(resource result);
```

Returns an associative array that corresponds to the fetched row and moves the internal data pointer ahead. `mysql_fetch_assoc` is equivalent to calling `mysql_fetch_array` with MYSQL_ASSOC for the optional second parameter. It only returns an associative array.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns an associative array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysql_fetch_row` or add alias names. See the example at the `mysql_fetch_array` description about aliases.

Examples

Example 20.33. An expanded `mysql_fetch_assoc` example

```
<?php
$conn = mysql_connect("localhost", "mysql_user", "mysql_password");
```

```
if (!$conn) {
    echo "Unable to connect to DB: " . mysql_error();
    exit;
}

if (!mysql_select_db("mydbname")) {
    echo "Unable to select mydbname: " . mysql_error();
    exit;
}

$sql = "SELECT id as userid, fullname, userstatus
        FROM   sometable
        WHERE  userstatus = 1";

$result = mysql_query($sql);

if (!$result) {
    echo "Could not successfully run query ($sql) from DB: " . mysql_error();
    exit;
}

if (mysql_num_rows($result) == 0) {
    echo "No rows found, nothing to print so am exiting";
    exit;
}

// While a row of data exists, put that row in $row as an associative array
// Note: If you're expecting just one row, no need to use a loop
// Note: If you put extract($row); inside the following loop, you'll
//       then create $userid, $fullname, and $userstatus
while ($row = mysql_fetch_assoc($result)) {
    echo $row["userid"];
    echo $row["fullname"];
    echo $row["userstatus"];
}

mysql_free_result($result);

?>
```

Notes

> **Performance**
>
> An important thing to note is that using `mysql_fetch_assoc` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

`mysql_query`
`mysql_error`

20.10.1.4.15. `mysql_fetch_field`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_field`

  Get column information from a result and return as an object

Description

```
  object mysql_fetch_field(resource result,
                           int field_offset= =0);
```

Returns an object containing field information. This function can be used to obtain information about fields in the provided query result.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`field_offset`	The numerical field offset. If the field offset is not specified, the next field that was not yet retrieved by this function is retrieved. The *`field_offset`* starts at `0`.

Return Values

Returns an object containing field information. The properties of the object are:

- name - column name
- table - name of the table the column belongs to
- def - default value of the column
- max_length - maximum length of the column
- not_null - 1 if the column cannot be `NULL`
- primary_key - 1 if the column is a primary key
- unique_key - 1 if the column is a unique key
- multiple_key - 1 if the column is a non-unique key
- numeric - 1 if the column is numeric
- blob - 1 if the column is a BLOB
- type - the type of the column
- unsigned - 1 if the column is unsigned
- zerofill - 1 if the column is zero-filled

Examples

Example 20.34. `mysql_fetch_field` example

```
<?php
$conn = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$conn) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('database');
$result = mysql_query('select * from table');
if (!$result) {
    die('Query failed: ' . mysql_error());
}
/* get column metadata */
$i = 0;
while ($i < mysql_num_fields($result)) {
    echo "Information for column $i:<br />\n";
```

```
    $meta = mysql_fetch_field($result, $i);
    if (!$meta) {
        echo "No information available<br />\n";
    }
    echo "<pre>
blob:         $meta->blob
max_length:   $meta->max_length
multiple_key: $meta->multiple_key
name:         $meta->name
not_null:     $meta->not_null
numeric:      $meta->numeric
primary_key:  $meta->primary_key
table:        $meta->table
type:         $meta->type
default:      $meta->def
unique_key:   $meta->unique_key
unsigned:     $meta->unsigned
zerofill:     $meta->zerofill
</pre>";
    $i++;
}
mysql_free_result($result);
?>
```

Notes

> **Note**
>
> Field names returned by this function are *case-sensitive*.

See Also

`mysql_field_seek`

20.10.1.4.16. `mysql_fetch_lengths`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_lengths`

  Get the length of each output in a result

Description

```
  array mysql_fetch_lengths(resource result);
```

Returns an array that corresponds to the lengths of each field in the last row fetched by MySQL.

`mysql_fetch_lengths` stores the lengths of each result column in the last row returned by `mysql_fetch_row`, `mysql_fetch_assoc`, `mysql_fetch_array`, and `mysql_fetch_object` in an array, starting at offset 0.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

An array of lengths on success or `FALSE` on failure.

Examples

Example 20.35. A `mysql_fetch_lengths` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row     = mysql_fetch_assoc($result);
$lengths = mysql_fetch_lengths($result);

print_r($row);
print_r($lengths);
?>
```

The above example will output something similar to:

```
Array
(
    [id] => 42
    [email] => user@example.com
)
Array
(
    [0] => 2
    [1] => 16
)
```

See Also

`mysql_field_len`
`mysql_fetch_row`
`strlen`

20.10.1.4.17. `mysql_fetch_object`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_object`

  Fetch a result row as an object

Description

```
  object mysql_fetch_object(resource result,
                            string class_name,
                            array params);
```

Returns an object with properties that correspond to the fetched row and moves the internal data pointer ahead.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`class_name`	The name of the class to instantiate, set the properties of and return. If not specified, a `stdClass` object is returned.

params An optional array of parameters to pass to the constructor for *class_name* objects.

Return Values

Returns an object with string properties that correspond to the fetched row, or FALSE if there are no more rows.

Changelog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 20.36. mysql_fetch_object example

```
<?php
mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");
$result = mysql_query("select * from mytable");
while ($row = mysql_fetch_object($result)) {
    echo $row->user_id;
    echo $row->fullname;
}
mysql_free_result($result);
?>
```

Example 20.37. mysql_fetch_object example

```
<?php
class foo {
    public $name;
}

mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");

$result = mysql_query("select name from mytable limit 1");
$obj = mysql_fetch_object($result, 'foo');
var_dump($obj);
?>
```

Notes

Performance

Speed-wise, the function is identical to mysql_fetch_array, and almost as quick as mysql_fetch_row (the difference is insignificant).

Note

mysql_fetch_object is similar to mysql_fetch_array, with one difference - an object is returned, instead of an array. Indirectly, that means that you can only access the data by the field names, and not by their offsets (numbers are illegal property names).

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

`mysql_data_seek`
`mysql_query`

20.10.1.4.18. `mysql_fetch_row`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_row`

  Get a result row as an enumerated array

Description

```
  array mysql_fetch_row(resource result);
```

Returns a numerical array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns an numerical array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

`mysql_fetch_row` fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

Examples

Example 20.38. Fetching one row with `mysql_fetch_row`

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row = mysql_fetch_row($result);

echo $row[0]; // 42
echo $row[1]; // the email value
?>
```

Notes

> **Note**
>
> This function sets NULL fields to the PHP `NULL` value.

`mysql_result`

20.10.1.4.19. `mysql_field_flags`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_flags`

  Get the flags associated with the specified field in a result

Description

```
  string mysql_field_flags(resource result,
                           int field_offset);
```

`mysql_field_flags` returns the field flags of the specified field. The flags are reported as a single word per flag separated by a single space, so that you can split the returned value using `explode`.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`field_offset`	The numerical field offset. The *`field_offset`* starts at `0`. If *`field_offset`* does not exist, an error of level `E_WARNING` is also issued.

Return Values

Returns a string of flags associated with the result or `FALSE` on failure.

The following flags are reported, if your version of MySQL is current enough to support them: `"not_null"`, `"primary_key"`, `"unique_key"`, `"multiple_key"`, `"blob"`, `"unsigned"`, `"zerofill"`, `"binary"`, `"enum"`, `"auto_increment"` and `"timestamp"`.

Examples

Example 20.39. A `mysql_field_flags` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$flags = mysql_field_flags($result, 0);

echo $flags;
print_r(explode(' ', $flags));
?>
```

The above example will output something similar to:

```
not_null primary_key auto_increment
Array
(
    [0] => not_null
    [1] => primary_key
    [2] => auto_increment
)
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: `mysql_fieldflags`

See Also

`mysql_field_type`
`mysql_field_len`

20.10.1.4.20. `mysql_field_len`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_len`

  Returns the length of the specified field

Description

```
int mysql_field_len(resource result,
                    int field_offset);
```

`mysql_field_len` returns the length of the specified field.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`field_offset`	The numerical field offset. The *`field_offset`* starts at `0`. If *`field_offset`* does not exist, an error of level `E_WARNING` is also issued.

Return Values

The length of the specified field index on success or `FALSE` on failure.

Examples

Example 20.40. `mysql_field_len` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

// Will get the length of the id field as specified in the database
// schema.
$length = mysql_field_len($result, 0);
echo $length;
?>
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: `mysql_fieldlen`

See Also

`mysql_fetch_lengths`
`strlen`

20.10.1.4.21. `mysql_field_name`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_name`

  Get the name of the specified field in a result

Description

```
  string mysql_field_name(resource result,
                          int field_offset);
```

`mysql_field_name` returns the name of the specified field index.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`field_offset`	The numerical field offset. The *`field_offset`* starts at `0`. If *`field_offset`* does not exist, an error of level `E_WARNING` is also issued.

Return Values

The name of the specified field index on success or `FALSE` on failure.

Examples

Example 20.41. `mysql_field_name` example

```
<?php
/* The users table consists of three fields:
*   user_id
*   username
*   password.
```

```
*/
$link = @mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect to MySQL server: ' . mysql_error());
}
$dbname = 'mydb';
$db_selected = mysql_select_db($dbname, $link);
if (!$db_selected) {
    die("Could not set $dbname: " . mysql_error());
}
$res = mysql_query('select * from users', $link);

echo mysql_field_name($res, 0) . "\n";
echo mysql_field_name($res, 2);
?>
```

The above example will output:

```
user_id
password
```

Notes

> **Note**
>
> Field names returned by this function are *case-sensitive*.

`mysql_field_type`
`mysql_field_len`

20.10.1.4.22. `mysql_field_seek`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_seek`

  Set result pointer to a specified field offset

Description

```
  bool mysql_field_seek(resource result,
                        int field_offset);
```

Seeks to the specified field offset. If the next call to `mysql_fetch_field` doesn't include a field offset, the field offset specified in `mysql_field_seek` will be returned.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`field_offset`	The numerical field offset. The *`field_offset`* starts at `0`. If *`field_offset`* does not exist,

an error of level E_WARNING is also issued.

Return Values

Returns TRUE on success or FALSE on failure.

mysql_fetch_field

20.10.1.4.23. mysql_field_table

Copyright 1997-2010 the PHP Documentation Group.

- mysql_field_table

  Get name of the table the specified field is in

Description

```
  string mysql_field_table(resource result,
                           int field_offset);
```

Returns the name of the table that the specified field is in.

Parameters

result	The result resource that is being evaluated. This result comes from a call to mysql_query.
field_offset	The numerical field offset. The *field_offset* starts at 0. If *field_offset* does not exist, an error of level E_WARNING is also issued.

Return Values

The name of the table on success.

Examples

Example 20.42. A mysql_field_table example

```
<?php

$query = "SELECT account.*, country.* FROM account, country WHERE country.name = 'Portugal' AND account.country_id = count

// get the result from the DB
$result = mysql_query($query);

// Lists the table name and then the field name
for ($i = 0; $i < mysql_num_fields($result); ++$i) {
    $table = mysql_field_table($result, $i);
    $field = mysql_field_name($result, $i);

    echo  "$table: $field\n";
}

?>
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: `mysql_fieldtable`

See Also

`mysql_list_tables`

20.10.1.4.24. `mysql_field_type`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_type`

  Get the type of the specified field in a result

Description

```
  string mysql_field_type(resource result,
                          int field_offset);
```

`mysql_field_type` is similar to the `mysql_field_name` function. The arguments are identical, but the field type is returned instead.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`field_offset`	The numerical field offset. The *`field_offset`* starts at `0`. If *`field_offset`* does not exist, an error of level `E_WARNING` is also issued.

Return Values

The returned field type will be one of `"int"`, `"real"`, `"string"`, `"blob"`, and others as detailed in the MySQL documentation.

Examples

Example 20.43. `mysql_field_type` example

```
<?php
mysql_connect("localhost", "mysql_username", "mysql_password");
mysql_select_db("mysql");
$result = mysql_query("SELECT * FROM func");
$fields = mysql_num_fields($result);
$rows   = mysql_num_rows($result);
$table  = mysql_field_table($result, 0);
echo "Your '" . $table . "' table has " . $fields . " fields and " . $rows . " record(s)\n";
echo "The table has the following fields:\n";
for ($i=0; $i < $fields; $i++) {
    $type  = mysql_field_type($result, $i);
    $name  = mysql_field_name($result, $i);
    $len   = mysql_field_len($result, $i);
    $flags = mysql_field_flags($result, $i);
    echo $type . " " . $name . " " . $len . " " . $flags . "\n";
}
mysql_free_result($result);
mysql_close();
?>
```

The above example will output something similar to:

```
Your 'func' table has 4 fields and 1 record(s)
The table has the following fields:
string name 64 not_null primary_key binary
int ret 1 not_null
string dl 128 not_null
string type 9 not_null enum
```

`mysql_field_name`
`mysql_field_len`

20.10.1.4.25. `mysql_free_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_free_result`

  Free result memory

Description

```
  bool mysql_free_result(resource result);
```

`mysql_free_result` will free all memory associated with the result identifier *`result`*.

`mysql_free_result` only needs to be called if you are concerned about how much memory is being used for queries that return large result sets. All associated result memory is automatically freed at the end of the script's execution.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

If a non-resource is used for the *`result`*, an error of level E_WARNING will be emitted. It's worth noting that `mysql_query` only returns a resource for SELECT, SHOW, EXPLAIN, and DESCRIBE queries.

Examples

Example 20.44. A `mysql_free_result` example

```
<?php
```

```
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
/* Use the result, assuming we're done with it afterwards */
$row = mysql_fetch_assoc($result);

/* Now we free up the result and continue on with our script */
mysql_free_result($result);

echo $row['id'];
echo $row['email'];
?>
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: `mysql_freeresult`

See Also

`mysql_query`
`is_resource`

20.10.1.4.26. `mysql_get_client_info`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_get_client_info`

  Get MySQL client info

Description

```
  string mysql_get_client_info();
```

`mysql_get_client_info` returns a string that represents the client library version.

Return Values

The MySQL client version.

Examples

Example 20.45. `mysql_get_client_info` example

```
<?php
printf("MySQL client info: %s\n", mysql_get_client_info());
?>
```

The above example will output something similar to:

```
MySQL client info: 3.23.39
```

mysql_get_proto_info
mysql_get_server_info

20.10.1.4.27. mysql_get_host_info

Copyright 1997-2010 the PHP Documentation Group.

- mysql_get_host_info

  Get MySQL host info

Description

```
  string mysql_get_host_info(resource link_identifier);
```

Describes the type of connection in use for the connection, including the server host name.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns a string describing the type of MySQL connection in use for the connection or FALSE on failure.

Examples

Example 20.46. mysql_get_host_info example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL host info: %s\n", mysql_get_host_info());
?>
```

The above example will output something similar to:

```
MySQL host info: Localhost via UNIX socket
```

See Also

mysql_get_server_info

20.10.1.4.28. mysql_get_proto_info

Copyright 1997-2010 the PHP Documentation Group.

- mysql_get_proto_info

  Get MySQL protocol info

Description

```
int mysql_get_proto_info(resource link_identifier);
```

Retrieves the MySQL protocol.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns the MySQL protocol on success or FALSE on failure.

Examples

Example 20.47. mysql_get_proto_info example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL protocol version: %s\n", mysql_get_proto_info());
?>
```

The above example will output something similar to:

```
MySQL protocol version: 10
```

- `mysql_get_server_info`

  Get MySQL server info

Description

```
  string mysql_get_server_info(resource link_identifier);
```

Retrieves the MySQL server version.

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the MySQL server version on success or `FALSE` on failure.

Examples

Example 20.48. `mysql_get_server_info` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL server version: %s\n", mysql_get_server_info());
?>
```

The above example will output something similar to:

```
MySQL server version: 4.0.1-alpha
```

`phpversion`

20.10.1.4.30. `mysql_info`

Copyright 1997-2010 the PHP Documentation Group.

- mysql_info

  Get information about the most recent query

Description

```
string mysql_info(resource link_identifier);
```

Returns detailed information about the last query.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns information about the statement on success, or FALSE on failure. See the example below for which statements provide information, and what the returned value may look like. Statements that are not listed will return FALSE .

Examples

Example 20.49. Relevant MySQL Statements

Statements that return string values. The numbers are only for illustrating purpose; their values will correspond to the query.

```
INSERT INTO ... SELECT ...
String format: Records: 23 Duplicates: 0 Warnings: 0
INSERT INTO ... VALUES (...),(...),(...)...
String format: Records: 37 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...
String format: Records: 42 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE
String format: Records: 60 Duplicates: 0 Warnings: 0
UPDATE
String format: Rows matched: 65 Changed: 65 Warnings: 0
```

Notes

> **Note**
>
> mysql_info returns a non- FALSE value for the INSERT ... VALUES statement only if multiple value lists are specified in the statement.

See Also

mysql_affected_rows
mysql_insert_id
mysql_stat

20.10.1.4.31. mysql_insert_id

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_insert_id`

  Get the ID generated in the last query

Description

```
int mysql_insert_id(resource link_identifier);
```

Retrieves the ID generated for an AUTO_INCREMENT column by the previous query (usually INSERT).

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The ID generated for an AUTO_INCREMENT column by the previous query on success, `0` if the previous query does not generate an AUTO_INCREMENT value, or `FALSE` if no MySQL connection was established.

Examples

Example 20.50. `mysql_insert_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

mysql_query("INSERT INTO mytable (product) values ('kossu')");
printf("Last inserted record has id %d\n", mysql_insert_id());
?>
```

Notes

> **Caution**
>
> `mysql_insert_id` will convert the return type of the native MySQL C API function `mysql_insert_id()` to a type of `long` (named int in PHP). If your AUTO_INCREMENT column has a column type of BIGINT (64 bits) the conversion may result in an incorrect value. Instead, use the internal MySQL SQL function LAST_INSERT_ID() in an SQL query. For more information about PHP's maximum integer values, please see the integer documentation.

> **Note**
>
> Because `mysql_insert_id` acts on the last performed query, be sure to call `mysql_insert_id` immediately after the query that generates the value.

> **Note**
>
> The value of the MySQL SQL function `LAST_INSERT_ID()` always contains the most recently generated AUTO_INCREMENT value, and is not reset between queries.

See Also

mysql_query
mysql_info

20.10.1.4.32. mysql_list_dbs

Copyright 1997-2010 the PHP Documentation Group.

- mysql_list_dbs

  List databases available on a MySQL server

Description

```
  resource mysql_list_dbs(resource link_identifier);
```

Returns a result pointer containing the databases available from the current mysql daemon.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns a result pointer resource on success, or FALSE on failure. Use the mysql_tablename function to traverse this result pointer, or any function for result tables, such as mysql_fetch_array.

Examples

Example 20.51. mysql_list_dbs example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$db_list = mysql_list_dbs($link);

while ($row = mysql_fetch_object($db_list)) {
     echo $row->Database . "\n";
}
?>
```

The above example will output something similar to:

```
database1
database2
database3
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_listdbs`

See Also

`mysql_db_name`
`mysql_select_db`

20.10.1.4.33. `mysql_list_fields`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_list_fields`

  List MySQL table fields

Description

```
  resource mysql_list_fields(string database_name,
                             string table_name,
                             resource link_identifier);
```

Retrieves information about the given table name.

This function is deprecated. It is preferable to use `mysql_query` to issue a SQL `SHOW COLUMNS FROM table [LIKE 'name']` statement instead.

Parameters

`database_name`	The name of the database that's being queried.
`table_name`	The name of the table that's being queried.
`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

The returned result can be used with `mysql_field_flags`, `mysql_field_len`, `mysql_field_name` and `mysql_field_type`.

Examples

Example 20.52. Alternate to deprecated `mysql_list_fields`

```
<?php
$result = mysql_query("SHOW COLUMNS FROM sometable");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
if (mysql_num_rows($result) > 0) {
    while ($row = mysql_fetch_assoc($result)) {
        print_r($row);
    }
}
?>
```

The above example will output something similar to:

```
Array
(
    [Field] => id
    [Type] => int(7)
    [Null] =>
    [Key] => PRI
    [Default] =>
    [Extra] => auto_increment
)
Array
(
    [Field] => email
    [Type] => varchar(100)
    [Null] =>
    [Key] =>
    [Default] =>
    [Extra] =>
)
```

Notes

20.10.1.4.34. `mysql_list_processes`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_list_processes`

  List MySQL processes

Description

```
  resource mysql_list_processes(resource link_identifier);
```

Retrieves the current MySQL server threads.

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success or `FALSE` on failure.

Examples

Example 20.53. `mysql_list_processes` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');

$result = mysql_list_processes($link);
while ($row = mysql_fetch_assoc($result)){
    printf("%s %s %s %s %s\n", $row["Id"], $row["Host"], $row["db"],
        $row["Command"], $row["Time"]);
}
mysql_free_result($result);
?>
```

The above example will output something similar to:

```
1 localhost test Processlist 0
4 localhost mysql sleep 5
```

See Also

`mysql_thread_id`
`mysql_stat`

20.10.1.4.35. `mysql_list_tables`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_list_tables`

  List tables in a MySQL database

Description

```
  resource mysql_list_tables(string database,
                             resource link_identifier);
```

Retrieves a list of table names from a MySQL database.

This function is deprecated. It is preferable to use `mysql_query` to issue a SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

`database`	The name of the database
`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success or `FALSE` on failure.

Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

Changelog

Version	Description
4.3.7	This function became deprecated.

Examples

Example 20.54. `mysql_list_tables` alternative example

```
<?php
$dbname = 'mysql_dbname';

if (!mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

$sql = "SHOW TABLES FROM $dbname";
$result = mysql_query($sql);

if (!$result) {
    echo "DB Error, could not list tables\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_row($result)) {
    echo "Table: {$row[0]}\n";
}

mysql_free_result($result);
?>
```

20.10.1.4.36. `mysql_num_fields`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_num_fields`

  Get number of fields in result

Description

```
  int mysql_num_fields(resource result);
```

Retrieves the number of fields from a query.

Parameters

result	The result resource that is being evaluated. This result comes from a call to mysql_query.

Return Values

Returns the number of fields in the result set resource on success or FALSE on failure.

Examples

Example 20.55. A mysql_num_fields example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

/* returns 2 because id,email === two fields */
echo mysql_num_fields($result);
?>
```

Notes

mysql_num_rows

20.10.1.4.37. mysql_num_rows

Copyright 1997-2010 the PHP Documentation Group.

- mysql_num_rows

  Get number of rows in result

Description

```
  int mysql_num_rows(resource result);
```

Retrieves the number of rows from a result set. This command is only valid for statements like SELECT or SHOW that return an actual result set. To retrieve the number of rows affected by a INSERT, UPDATE, REPLACE or DELETE query, use mysql_affected_rows.

Parameters

result	The result resource that is being evaluated. This result comes from a call to mysql_query.

Return Values

The number of rows in a result set on success or FALSE on failure.

Examples

Example 20.56. mysql_num_rows example

```
<?php

$link = mysql_connect("localhost", "mysql_user", "mysql_password");
mysql_select_db("database", $link);

$result = mysql_query("SELECT * FROM table1", $link);
$num_rows = mysql_num_rows($result);

echo "$num_rows Rows\n";

?>
```

Notes

> **Note**
>
> If you use mysql_unbuffered_query, mysql_num_rows will not return the correct value until all the rows in the result set have been retrieved.

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: mysql_numrows

mysql_data_seek
mysql_select_db
mysql_query

20.10.1.4.38. mysql_pconnect

Copyright 1997-2010 the PHP Documentation Group.

- mysql_pconnect

  Open a persistent connection to a MySQL server

Description

```
  resource mysql_pconnect(string server= =ini_get("mysql.default_host"),
                          string username= =ini_get("mysql.default_user"),
                          string password= =ini_get("mysql.default_password"),
                          int client_flags);
```

Establishes a persistent connection to a MySQL server.

`mysql_pconnect` acts very much like `mysql_connect` with two major differences.

First, when connecting, the function would first try to find a (persistent) link that's already open with the same host, username and password. If one is found, an identifier for it will be returned instead of opening a new connection.

Second, the connection to the SQL server will not be closed when the execution of the script ends. Instead, the link will remain open for future use (`mysql_close` will not close links established by `mysql_pconnect`).

This type of link is therefore called 'persistent'.

Parameters

`server`	The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost. If the PHP directive mysql.default_host is undefined (default), then the default value is 'localhost:3306'
`username`	The username. Default value is the name of the user that owns the server process.
`password`	The password. Default value is an empty password.
`client_flags`	The *`client_flags`* parameter can be a combination of the following constants: 128 (enable `LOAD DATA LOCAL` handling), `MYSQL_CLIENT_SSL` , `MYSQL_CLIENT_COMPRESS` , `MYSQL_CLIENT_IGNORE_SPACE` or `MYSQL_CLIENT_INTERACTIVE` .

Return Values

Returns a MySQL persistent link identifier on success, or `FALSE` on failure.

Changelog

Version	Description
4.3.0	Added the *`client_flags`* parameter.

Notes

> **Note**
>
> Note, that these kind of links only work if you are using a module version of PHP. See the Persistent Database Connections section for more information.

> **Warning**
>
> Using persistent connections can require a bit of tuning of your Apache and MySQL configurations to ensure that you do not exceed the number of connections allowed by MySQL.

> **Note**
>
> You can suppress the error message on failure by prepending a @ to the function name.

See Also

`mysql_connect`
Persistent Database Connections

20.10.1.4.39. `mysql_ping`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_ping`

  Ping a server connection or reconnect if there is no connection

Description

```
bool mysql_ping(resource link_identifier);
```

Checks whether or not the connection to the server is working. If it has gone down, an automatic reconnection is attempted. This function can be used by scripts that remain idle for a long while, to check whether or not the server has closed the connection and reconnect if necessary.

> **Note**
>
> Since MySQL 5.0.13, automatic reconnection feature is disabled.

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` if the connection to the server MySQL server is working, otherwise `FALSE` .

Examples

Example 20.57. A `mysql_ping` example

```
<?php
set_time_limit(0);

$conn = mysql_connect('localhost', 'mysqluser', 'mypass');
$db   = mysql_select_db('mydb');

/* Assuming this query will take a long time */
$result = mysql_query($sql);
if (!$result) {
    echo 'Query #1 failed, exiting.';
    exit;
}

/* Make sure the connection is still alive, if not, try to reconnect */
if (!mysql_ping($conn)) {
    echo 'Lost connection, exiting after query #1';
    exit;
}
mysql_free_result($result);

/* So the connection is still alive, let's run another query */
$result2 = mysql_query($sql2);
?>
```

`mysql_thread_id`

mysql_list_processes

20.10.1.4.40. mysql_query

Copyright 1997-2010 the PHP Documentation Group.

- mysql_query

  Send a MySQL query

Description

```
  resource mysql_query(string query,
                       resource link_identifier);
```

mysql_query sends a unique query (multiple queries are not supported) to the currently active database on the server that's associated with the specified *link_identifier*.

Parameters

query	A SQL query The query string should not end with a semicolon. Data inside the query should be properly escaped.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE, EXPLAIN and other statements returning resultset, mysql_query returns a resource on success, or FALSE on error.

For other type of SQL statements, INSERT, UPDATE, DELETE, DROP, etc, mysql_query returns TRUE on success or FALSE on error.

The returned result resource should be passed to mysql_fetch_array, and other functions for dealing with result tables, to access the returned data.

Use mysql_num_rows to find out how many rows were returned for a SELECT statement or mysql_affected_rows to find out how many rows were affected by a DELETE, INSERT, REPLACE, or UPDATE statement.

mysql_query will also fail and return FALSE if the user does not have permission to access the table(s) referenced by the query.

Examples

Example 20.58. Invalid Query

The following query is syntactically invalid, so mysql_query fails and returns FALSE .

```
<?php
$result = mysql_query('SELECT * WHERE 1=1');
if (!$result) {
    die('Invalid query: ' . mysql_error());
}

?>
```

Example 20.59. Valid Query

The following query is valid, so `mysql_query` returns a resource.

```
<?php
// This could be supplied by a user, for example
$firstname = 'fred';
$lastname  = 'fox';

// Formulate Query
// This is the best way to perform a SQL query
// For more examples, see mysql_real_escape_string()
$query = sprintf("SELECT firstname, lastname, address, age FROM friends WHERE firstname='%s' AND lastname='%s'",
    mysql_real_escape_string($firstname),
    mysql_real_escape_string($lastname));

// Perform Query
$result = mysql_query($query);

// Check result
// This shows the actual query sent to MySQL, and the error. Useful for debugging.
if (!$result) {
    $message  = 'Invalid query: ' . mysql_error() . "\n";
    $message .= 'Whole query: ' . $query;
    die($message);
}

// Use result
// Attempting to print $result won't allow access to information in the resource
// One of the mysql result functions must be used
// See also mysql_result(), mysql_fetch_array(), mysql_fetch_row(), etc.
while ($row = mysql_fetch_assoc($result)) {
    echo $row['firstname'];
    echo $row['lastname'];
    echo $row['address'];
    echo $row['age'];
}

// Free the resources associated with the result set
// This is done automatically at the end of the script
mysql_free_result($result);
?>
```

`mysql_unbuffered_query`

20.10.1.4.41. `mysql_real_escape_string`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_real_escape_string`

  Escapes special characters in a string for use in a SQL statement

Description

```
  string mysql_real_escape_string(string unescaped_string,
                                  resource link_identifier);
```

Escapes special characters in the *`unescaped_string`*, taking into account the current character set of the connection so that it is safe

to place it in a `mysql_query`. If binary data is to be inserted, this function must be used.

`mysql_real_escape_string` calls MySQL's library function mysql_real_escape_string, which prepends backslashes to the following characters: `\x00`, `\n`, `\r`, `\`, `'`, `"` and `\x1a`.

This function must always (with few exceptions) be used to make data safe before sending a query to MySQL.

Parameters

`unescaped_string`	The string that is to be escaped.
`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the escaped string, or `FALSE` on error.

Examples

Example 20.60. Simple `mysql_real_escape_string` example

```
<?php
// Connect
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
    OR die(mysql_error());

// Query
$query = sprintf("SELECT * FROM users WHERE user='%s' AND password='%s'",
            mysql_real_escape_string($user),
            mysql_real_escape_string($password));
?>
```

Example 20.61. An example SQL Injection Attack

```
<?php
// Query database to check if there are any matching users
$query = "SELECT * FROM users WHERE user='{$_POST['username']}' AND password='{$_POST['password']}'";
mysql_query($query);

// We didn't check $_POST['password'], it could be anything the user wanted! For example:
$_POST['username'] = 'aidan';
$_POST['password'] = "' OR ''='";

// This means the query sent to MySQL would be:
echo $query;
?>
```

The query sent to MySQL:

```
SELECT * FROM users WHERE user='aidan' AND password='' OR ''=''
```

This would allow anyone to log in without a valid password.

Notes

> **Note**
>
> A MySQL connection is required before using `mysql_real_escape_string` otherwise an error of level `E_WARNING` is generated, and `FALSE` is returned. If *`link_identifier`* isn't defined, the last MySQL connection is used.

> **Note**
>
> If magic_quotes_gpc is enabled, first apply `stripslashes` to the data. Using this function on data which has already been escaped will escape the data twice.

> **Note**
>
> If this function is not used to escape data, the query is vulnerable to SQL Injection Attacks.

> **Note**
>
> `mysql_real_escape_string` does not escape `%` and `_`. These are wildcards in MySQL if combined with `LIKE`, `GRANT`, or `REVOKE`.

20.10.1.4.42. `mysql_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_result`

  Get result data

Description

```
string mysql_result(resource result,
                    int row,
                    mixed field= =0);
```

Retrieves the contents of one cell from a MySQL result set.

When working on large result sets, you should consider using one of the functions that fetch an entire row (specified below). As these functions return the contents of multiple cells in one function call, they're MUCH quicker than `mysql_result`. Also, note that specifying a numeric offset for the field argument is much quicker than specifying a fieldname or tablename.fieldname argument.

Parameters

`result`	The result resource that is being evaluated. This result comes from a call to `mysql_query`.
`row`	The row number from the result that's being retrieved. Row numbers start at `0`.
`field`	The name or offset of the field being retrieved.

It can be the field's offset, the field's name, or the field's table dot field name (tablename.fieldname). If the column name has been aliased ('select foo as bar from...'), use the alias instead of the column name. If undefined, the first field is retrieved.

Return Values

The contents of one cell from a MySQL result set on success, or `FALSE` on failure.

Examples

Example 20.62. `mysql_result` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
if (!mysql_select_db('database_name')) {
    die('Could not select database: ' . mysql_error());
}
$result = mysql_query('SELECT name FROM work.employee');
if (!$result) {
    die('Could not query:' . mysql_error());
}
echo mysql_result($result, 2); // outputs third employee's name

mysql_close($link);
?>
```

Notes

> **Note**
>
> Calls to `mysql_result` should not be mixed with calls to other functions that deal with the result set.

See Also

20.10.1.4.43. `mysql_select_db`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_select_db`

  Select a MySQL database

Description

```
  bool mysql_select_db(string database_name,
                       resource link_identifier);
```

Sets the current active database on the server that's associated with the specified link identifier. Every subsequent call to `mysql_query` will be made on the active database.

Parameters

database_name	The name of the database that is to be selected.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.63. mysql_select_db example

```
<?php

$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Not connected : ' . mysql_error());
}

// make foo the current db
$db_selected = mysql_select_db('foo', $link);
if (!$db_selected) {
    die ('Can\'t use foo : ' . mysql_error());
}
?>
```

Notes

> **Note**
>
> For backward compatibility, the following deprecated alias may be used: mysql_selectdb

See Also

mysql_connect

mysql_query

20.10.1.4.44. mysql_set_charset

Copyright 1997-2010 the PHP Documentation Group.

- mysql_set_charset

  Sets the client character set

Description

```
 bool mysql_set_charset(string charset,
                        resource link_identifier);
```

Sets the default character set for the current connection.

Parameters

charset	A valid character set name.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns TRUE on success or FALSE on failure.

Notes

> **Note**
>
> This function requires MySQL 5.0.7 or later.

> **Note**
>
> This is the preferred way to change the charset. Using mysql_query to execute SET NAMES .. is not recommended.

See Also

mysql_client_encoding
List of character sets that MySQL supports

20.10.1.4.45. mysql_stat

Copyright 1997-2010 the PHP Documentation Group.

- mysql_stat

  Get current system status

Description

```
string mysql_stat(resource link_identifier);
```

mysql_stat returns the current server status.

Parameters

link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns a string with the status for uptime, threads, queries, open tables, flush tables and queries per second. For a complete list of other status variables, you have to use the SHOW STATUS SQL command. If *link_identifier* is invalid, NULL is returned.

Examples

Example 20.64. mysql_stat example

```
<?php
$link   = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$status = explode('  ', mysql_stat($link));
print_r($status);
?>
```

The above example will output something similar to:

```
Array
(
    [0] => Uptime: 5380
    [1] => Threads: 2
    [2] => Questions: 1321299
    [3] => Slow queries: 0
    [4] => Opens: 26
    [5] => Flush tables: 1
    [6] => Open tables: 17
    [7] => Queries per second avg: 245.595
)
```

Example 20.65. Alternative `mysql_stat` example

```
<?php
$link   = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$result = mysql_query('SHOW STATUS', $link);
while ($row = mysql_fetch_assoc($result)) {
    echo $row['Variable_name'] . ' = ' . $row['Value'] . "\n";
}
?>
```

The above example will output something similar to:

```
back_log = 50
basedir = /usr/local/
bdb_cache_size = 8388600
bdb_log_buffer_size = 32768
bdb_home = /var/db/mysql/
bdb_max_lock = 10000
bdb_logdir =
bdb_shared_data = OFF
bdb_tmpdir = /var/tmp/
...
```

See Also

`mysql_get_server_info`
`mysql_list_processes`

20.10.1.4.46. `mysql_tablename`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_tablename`

  Get table name of field

Description

```
  string mysql_tablename(resource result,
                         int i);
```

Retrieves the table name from a *`result`*.

This function deprecated. It is preferable to use `mysql_query` to issue a SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

`result`	A result pointer resource that's returned from `mysql_list_tables`.
`i`	The integer index (row/table number)

Return Values

The name of the table on success or `FALSE` on failure.

Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

Examples

Example 20.66. `mysql_tablename` example

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password");
$result = mysql_list_tables("mydb");
$num_rows = mysql_num_rows($result);
for ($i = 0; $i < $num_rows; $i++) {
    echo "Table: ", mysql_tablename($result, $i), "\n";
}

mysql_free_result($result);
?>
```

Notes

> **Note**
>
> The `mysql_num_rows` function may be used to determine the number of tables in the result pointer.

`mysql_db_name`

20.10.1.4.47. `mysql_thread_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_thread_id`

  Return the current thread ID

Description

```
int mysql_thread_id(resource link_identifier);
```

Retrieves the current thread ID. If the connection is lost, and a reconnect with `mysql_ping` is executed, the thread ID will change. This means only retrieve the thread ID when needed.

Parameters

`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The thread ID on success or `FALSE` on failure.

Examples

Example 20.67. `mysql_thread_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$thread_id = mysql_thread_id($link);
if ($thread_id){
    printf("current thread id is %d\n", $thread_id);
}
?>
```

The above example will output something similar to:

```
current thread id is 73
```

See Also

`mysql_ping`
`mysql_list_processes`

20.10.1.4.48. `mysql_unbuffered_query`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_unbuffered_query`

  Send an SQL query to MySQL without fetching and buffering the result rows.

Description

```
resource mysql_unbuffered_query(string query,
                                resource link_identifier);
```

`mysql_unbuffered_query` sends the SQL query *`query`* to MySQL without automatically fetching and buffering the result rows as `mysql_query` does. This saves a considerable amount of memory with SQL queries that produce large result sets, and you can start working on the result set immediately after the first row has been retrieved as you don't have to wait until the complete SQL query has been performed. To use `mysql_unbuffered_query` while multiple database connections are open, you must specify the optional parameter *`link_identifier`* to identify which connection you want to use.

Parameters

`query`	The SQL query to execute. Data inside the query should be properly escaped.
`link_identifier`	The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE or EXPLAIN statements, `mysql_unbuffered_query` returns a resource on success, or `FALSE` on error.

For other type of SQL statements, UPDATE, DELETE, DROP, etc, `mysql_unbuffered_query` returns `TRUE` on success or `FALSE` on error.

Notes

> **Note**
>
> The benefits of `mysql_unbuffered_query` come at a cost: you cannot use `mysql_num_rows` and `mysql_data_seek` on a result set returned from `mysql_unbuffered_query`. You also have to fetch all result rows from an unbuffered SQL query before you can send a new SQL query to MySQL.

All examples in the `mysqli` documentation use the world database from Sun Microsystems, Inc. The world database can be found at http://downloads.mysql.com/docs/world.sql.gz

20.10.2.2. Overview

Copyright 1997-2010 the PHP Documentation Group.

This section provides an introduction to the options available to you when developing a PHP application that needs to interact with a MySQL database.

What is an API?

An Application Programming Interface, or API, defines the classes, methods, functions and variables that your application will need to call in order to carry out its desired task. In the case of PHP applications that need to communicate with databases the necessary APIs are usually exposed via PHP extensions.

APIs can be procedural or object-oriented. With a procedural API you call functions to carry out tasks, with the object-oriented API you instantiate classes and then call methods on the resulting objects. Of the two the latter is usually the preferred interface, as it is more modern and leads to better organised code.

When writing PHP applications that need to connect to the MySQL server there are several API options available. This document discusses what is available and how to select the best solution for your application.

What is a Connector?

In the MySQL documentation, the term *connector* refers to a piece of software that allows your application to connect to the MySQL database server. MySQL provides connectors for a variety of languages, including PHP.

If your PHP application needs to communicate with a database server you will need to write PHP code to perform such activities as connecting to the database server, querying the database and other database-related functions. Software is required to provide the API that your PHP application will use, and also handle the communication between your application and the database server, possibly using other intermediate libraries where necessary. This software is known generically as a connector, as it allows your application to *connect* to a database server.

What is a Driver?

A driver is a piece of software designed to communicate with a specific type of database server. The driver may also call a library, such as the MySQL Client Library or the MySQL Native Driver. These libraries implement the low-level protocol used to communicate with the MySQL database server.

By way of an example, the PHP Data Objects (PDO) database abstraction layer may use one of several database-specific drivers. One of the drivers it has available is the PDO MYSQL driver, which allows it to interface with the MySQL server.

Sometimes people use the terms connector and driver interchangeably, this can be confusing. In the MySQL-related documentation the term “driver” is reserved for software that provides the database-specific part of a connector package.

What is an Extension?

In the PHP documentation you will come across another term - *extension*. The PHP code consists of a core, with optional extensions to the core functionality. PHP's MySQL-related extensions, such as the `mysqli` extension, and the `mysql` extension, are implemented using the PHP extension framework.

An extension typically exposes an API to the PHP programmer, to allow its facilities to be used programmatically. However, some extensions which use the PHP extension framework do not expose an API to the PHP programmer.

The PDO MySQL driver extension, for example, does not expose an API to the PHP programmer, but provides an interface to the PDO layer above it.

The terms API and extension should not be taken to mean the same thing, as an extension may not necessarily expose an API to the programmer.

What are the main PHP API offerings for using MySQL?

There are three main API options when considering connecting to a MySQL database server:

- PHP's MySQL Extension
- PHP's mysqli Extension

- PHP Data Objects (PDO)

Each has its own advantages and disadvantages. The following discussion aims to give a brief introduction to the key aspects of each API.

What is PHP's MySQL Extension?

This is the original extension designed to allow you to develop PHP applications that interact with a MySQL database. The `mysql` extension provides a procedural interface and is intended for use only with MySQL versions older than 4.1.3. This extension can be used with versions of MySQL 4.1.3 or newer, but not all of the latest MySQL server features will be available.

> **Note**
>
> If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use the `mysqli` extension instead.

The `mysql` extension source code is located in the PHP extension directory `ext/mysql`.

For further information on the `mysql` extension, see Section 20.10.1, “MySQL”.

What is PHP's mysqli Extension?

The `mysqli` extension, or as it is sometimes known, the MySQL *improved* extension, was developed to take advantage of new features found in MySQL systems versions 4.1.3 and newer. The `mysqli` extension is included with PHP versions 5 and later.

The `mysqli` extension has a number of benefits, the key enhancements over the `mysql` extension being:

- Object-oriented interface
- Support for Prepared Statements
- Support for Multiple Statements
- Support for Transactions
- Enhanced debugging capabilities
- Embedded server support

> **Note**
>
> If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use this extension.

As well as the object-oriented interface the extension also provides a procedural interface.

The `mysqli` extension is built using the PHP extension framework, its source code is located in the directory `ext/mysqli`.

For further information on the `mysqli` extension, see Section 20.10.2, “MySQL Improved Extension (`Mysqli`)”.

What is PDO?

PHP Data Objects, or PDO, is a database abstraction layer specifically for PHP applications. PDO provides a consistent API for your PHP application regardless of the type of database server your application will connect to. In theory, if you are using the PDO API, you could switch the database server you used, from say Firebird to MySQL, and only need to make minor changes to your PHP code.

Other examples of database abstraction layers include JDBC for Java applications and DBI for Perl.

While PDO has its advantages, such as a clean, simple, portable API, its main disadvantage is that it doesn't allow you to use all of the advanced features that are available in the latest versions of MySQL server. For example, PDO does not allow you to use MySQL's support for Multiple Statements.

PDO is implemented using the PHP extension framework, its source code is located in the directory `ext/pdo`.

For further information on PDO, see the Section 20.10.4, “MySQL Functions (PDO_MYSQL)”.

What is the PDO MYSQL driver?

The PDO MYSQL driver is not an API as such, at least from the PHP programmer's perspective. In fact the PDO MYSQL driver sits in the layer below PDO itself and provides MySQL-specific functionality. The programmer still calls the PDO API, but PDO uses the PDO MYSQL driver to carry out communication with the MySQL server.

The PDO MYSQL driver is one of several available PDO drivers. Other PDO drivers available include those for the Firebird and PostgreSQL database servers.

The PDO MYSQL driver is implemented using the PHP extension framework. Its source code is located in the directory `ext/pdo_mysql`. It does not expose an API to the PHP programmer.

For further information on the PDO MYSQL driver, see Section 20.10.4, “MySQL Functions (PDO_MYSQL)”.

What is PHP's MySQL Native Driver?

In order to communicate with the MySQL database server the `mysql` extension, `mysqli` and the PDO MYSQL driver each use a low-level library that implements the required protocol. In the past, the only available library was the MySQL Client Library, otherwise known as `libmysql`.

However, the interface presented by `libmysql` was not optimized for communication with PHP applications, as `libmysql` was originally designed with C applications in mind. For this reason the MySQL Native Driver, `mysqlnd`, was developed as an alternative to `libmysql` for PHP applications.

The `mysql` extension, the `mysqli` extension and the PDO MySQL driver can each be individually configured to use either `libmysql` or `mysqlnd`. As `mysqlnd` is designed specifically to be utilised in the PHP system it has numerous memory and speed enhancements over `libmysql`. You are strongly encouraged to take advantage of these improvements.

> **Note**
>
> The MySQL Native Driver can only be used with MySQL server versions 4.1.3 and later.

The MySQL Native Driver is implemented using the PHP extension framework. The source code is located in `ext/mysqlnd`. It does not expose an API to the PHP programmer.

Comparison of Features

The following table compares the functionality of the three main methods of connecting to MySQL from PHP:

	PHP's mysqli Extension	**PDO (Using PDO MySQL Driver and MySQL Native Driver)**	**PHP's MySQL Extension**
PHP version introduced	5.0	5.0	Prior to 3.0
Included with PHP 5.x	yes	yes	Yes
MySQL development status	Active development	Active development as of PHP 5.3	Maintenance only
Recommended by MySQL for new projects	Yes - preferred option	Yes	No
API supports Charsets	Yes	Yes	No
API supports server-side Prepared Statements	Yes	Yes	No
API supports client-side Prepared Statements	No	Yes	No
API supports Stored Procedures	Yes	Yes	No
API supports Multiple Statements	Yes	Most	No
Supports all MySQL 4.1+ functionality	Yes	Most	No

20.10.2.3. Installing/Configuring

Copyright 1997-2010 the PHP Documentation Group.

20.10.2.3.1. Requirements

Copyright 1997-2010 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with support for the mysqli extension.

> **Note**
>
> The mysqli extension is designed to work with MySQL version 4.1.13 or newer, or 5.0.7 or newer. For previous versions, please see the MySQL extension documentation.

20.10.2.3.2. Installation

Copyright 1997-2010 the PHP Documentation Group.

As of PHP 5.0, MySQL support is no longer enabled by default with the standard PHP distributions. This means PHP needs to be explicitly configured to take advantage of the MySQL extensions.

The common Unix distributions include binary versions of PHP that can be installed. Although these binary versions are typically built with support for MySQL extensions enabled, the extension libraries themselves may need to be installed using an additional package. Check the package manager than comes with your chosen distribution for availability.

Unless your Unix distribution comes with a binary package of PHP with the `mysqli` extension available, you will need to build PHP from source code. Building PHP from source allows you to specify the MySQL extensions you want to use, as well as your choice of client library for each extension.

To ensure that the `mysqli` extension for PHP is enabled, you will need to configure the PHP source code to use `mysqli`. This is achieved by running the `configure` script with the option `--with-mysqli=mysql_config_path/mysql_config`, prior to building PHP. This will enable `mysqli` and it will use the MySQL Client Library (libmysql) to communicate with the MySQL Server.

> **Note**
>
> The `mysql_config_path` represents the location of the `mysql_config` program that comes with MySQL Server.

With versions of PHP 5.3 and newer, you can alternatively use the new MySQL Native Driver with `mysqli`. This gives a number of benefits over using libmysql.

To use MySQL Native Driver with `mysqli` you need to configure the PHP source code using the `--with-mysqli=mysqlnd` option, prior to building PHP.

This is the recommended option, as using the MySQL Native Driver results in improved performance and gives access to features not available when using the MySQL Client Library. Refer to What is PHP's MySQL Native Driver? for a brief overview of the advantages of MySQL Native Driver.

Note that it is possible to freely mix MySQL extensions and client libraries. For example, it is possible to enable the MySQL extension to use the MySQL Client Library (libmysql), while configuring the `mysqli` extension to use the MySQL Native Driver. However, all permutations of extension and client library are possible.

The following example builds the MySQL extension to use the MySQL Client Library, and the `mysqli` and PDO MYSQL extensions to use the MySQL Native Driver:

20.10.2.3.2.1. Installation on Windows Systems

Copyright 1997-2010 the PHP Documentation Group.

On Windows, PHP is most commonly installed using the binary installer. Once PHP has been installed, some configuration is required to enable `mysqli` and specify the client library you want it to use.

As mentioned earlier, the `mysqli` extension is not enabled by default, so the `php_mysqli.dll` DLL must be enabled inside of

`php.ini`. In order to do this you need to find the `php.ini` file (typically located in `c:\php`), and make sure you remove the comment (semi-colon) from the start of the line `extension=php_mysqli.dll`, in the section marked `[PHP_MYSQLI]`.

Also, if you want to use the MySQL Client Library with `mysqli`, you need to make sure PHP can access the client library file. The MySQL Client Library is included as a file named `libmysql.dll` in the Windows PHP distribution. This file needs to be available in the Windows system's `PATH` environment variable, so that it can be successfully loaded. See the FAQ titled "How do I add my PHP directory to the PATH on Windows" for information on how to do this. Copying `libmysql.dll` to the Windows system directory (typically `c:\Windows\system`) also works, as the system directory is by default in the system's `PATH`. However, this practice is strongly discouraged.

On Windows, for PHP versions 5.3 and newer, the `mysqli` extension uses the MySQL Native Driver by default. This means you don't need to worry about configuring access to `libmysql.dll`, you just need to make sure the extension is enabled in the `php.ini` file.

As with enabling any PHP extension (such as `php_mysqli.dll`), the PHP directive extension_dir should be set to the directory where the PHP extensions are located. See also the Manual Windows Installation Instructions. An example `extension_dir` value for PHP 5 is `c:\php\ext`.

> **Note**
>
> If when starting the web server an error similar to the following occurs: `"Unable to load dynamic library './php_mysqli.dll'"`, this is because `php_mysqli.dll` and/or `libmysql.dll` cannot be found by the system.

20.10.2.3.3. Runtime Configuration

Copyright 1997-2010 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 20.7. MySQLi Configuration Options

Name	Default	Changeable	Changelog
mysqli.allow_persistent	"1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
mysqli.max_persistent	"-1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
mysqli.max_links	"-1"	PHP_INI_SYSTEM	Available since PHP 5.0.0.
mysqli.default_port	"3306"	PHP_INI_ALL	Available since PHP 5.0.0.
mysqli.default_socket	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
mysqli.default_host	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
mysqli.default_user	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
mysqli.default_pw	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
mysqli.reconnect	"0"	PHP_INI_SYSTEM	Available since PHP 4.3.5.
mysqli.allow_local_infile	"1"	PHP_INI_SYSTEM	Available since PHP 5.2.4.
mysqli.cache_size	"2000"	PHP_INI_SYSTEM	Available since PHP 5.3.0.

For further details and definitions of the above PHP_INI_* constants, see the chapter on configuration changes.

Here's a short explanation of the configuration directives.

`mysqli.allow_persistent` integer
: Enable the ability to create persistent connections using `mysqli_connect`.

`mysqli.max_persistent` integer
: Maximum of persistent connections that can be made. Set to 0 for unlimited.

`mysqli.max_links` integer
: The maximum number of MySQL connections per process.

`mysqli.default_port` integer
: The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the `MYSQL_TCP_PORT` environment variable, the `mysql-tcp` entry in `/etc/services` or the compile-time `MYSQL_PORT` constant, in that order. Win32 will only use the `MYSQL_PORT` constant.

mysqli.default_socket string	The default socket name to use when connecting to a local database server if no other socket name is specified.
mysqli.default_host string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in safe mode.
mysqli.default_user string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in safe mode.
mysqli.default_pw string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in safe mode.
mysqli.reconnect integer	Automatically reconnect if the connection was lost.
mysqli.allow_local_infil *mysqli.cache_size* integer	Available only with mysqlnd.

20.10.2.3.4. Resource Types

Copyright 1997-2010 the PHP Documentation Group.

This extension has no resource types defined.

20.10.2.4. The mysqli Extension and Persistent Connections

Copyright 1997-2010 the PHP Documentation Group.

Persistent connection support was introduced in PHP 5.3 for the `mysqli` extension. Support was already present in PDO MYSQL and ext/mysql. The idea behind persistent connections is that a connection between a client process and a database can be reused by a client process, rather than being created and destroyed multiple times. This reduces the overhead of creating fresh connections every time one is required, as unused connections are cached and ready to be reused.

Unlike the mysql extension, mysqli does not provide a separate function for opening persistent connections. To open a persistent connection you must prepend `p:` to the hostname when connecting.

The problem with persistent connections is that they can be left in unpredictable states by clients. For example, a table lock might be activated before a client terminates unexpectedly. A new client process reusing this persistent connection will get the connection “as is”. Any cleanup would need to be done by the new client process before it could make good use of the persistent connection, increasing the burden on the programmer.

The persistent connection of the `mysqli` extension however provides built-in cleanup handling code. The cleanup carried out by `mysqli` includes:

- Rollback active transactions
- Close and drop temporary tables
- Unlock tables
- Reset session variables
- Close prepared statements (always happens with PHP)
- Close handler
- Release locks acquired with `GET_LOCK`

This ensures that persistent connections are in a clean state on return from the connection pool, before the client process uses them.

The `mysqli` extension does this cleanup by automatically calling the C-API function `mysql_change_user()`.

The automatic cleanup feature has advantages and disadvantages though. The advantage is that the programmer no longer needs to worry about adding cleanup code, as it is called automatically. However, the disadvantage is that the code could *potentially* be a little

slower, as the code to perform the cleanup needs to run each time a connection is returned from the connection pool.

It is possible to switch off the automatic cleanup code, by compiling PHP with `MYSQLI_NO_CHANGE_USER_ON_PCONNECT` defined.

> **Note**
>
> The `mysqli` extension supports persistent connections when using either MySQL Native Driver or MySQL Client Library.

20.10.2.5. Predefined Constants

Copyright 1997-2010 the PHP Documentation Group.

`MYSQLI_READ_DEFAULT_GROUP`	Read options from the named group from `my.cnf` or the file specified with `MYSQLI_READ_DEFAULT_FILE`
`MYSQLI_READ_DEFAULT_FILE`	Read options from the named option file instead of from `my.cnf`
`MYSQLI_OPT_CONNECT_TIMEOUT`	Connect timeout in seconds
`MYSQLI_OPT_LOCAL_INFILE`	Enables command `LOAD LOCAL INFILE`
`MYSQLI_INIT_COMMAND`	Command to execute when connecting to MySQL server. Will automatically be re-executed when reconnecting.
`MYSQLI_CLIENT_SSL`	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the MySQL client library
`MYSQLI_CLIENT_COMPRESS`	Use compression protocol
`MYSQLI_CLIENT_INTERACTIVE`	Allow `interactive_timeout` seconds (instead of `wait_timeout` seconds) of inactivity before closing the connection. The client's session `wait_timeout` variable will be set to the value of the session `interactive_timeout` variable.
`MYSQLI_CLIENT_IGNORE_SPACE`	Allow spaces after function names. Makes all functions names reserved words.
`MYSQLI_CLIENT_NO_SCHEMA`	Don't allow the `db_name.tbl_name.col_name` syntax.
`MYSQLI_CLIENT_MULTI_QUERIES`	Allows multiple semicolon-delimited queries in a single `mysqli_query` call.
`MYSQLI_STORE_RESULT`	For using buffered resultsets
`MYSQLI_USE_RESULT`	For using unbuffered resultsets
`MYSQLI_ASSOC`	Columns are returned into the array having the fieldname as the array index.
`MYSQLI_NUM`	Columns are returned into the array having an enumerated index.
`MYSQLI_BOTH`	Columns are returned into the array having both a numerical index and the fieldname as the associative index.
`MYSQLI_NOT_NULL_FLAG`	Indicates that a field is defined as `NOT NULL`
`MYSQLI_PRI_KEY_FLAG`	Field is part of a primary index
`MYSQLI_UNIQUE_KEY_FLAG`	Field is part of a unique index.
`MYSQLI_MULTIPLE_KEY_FLAG`	Field is part of an index.
`MYSQLI_BLOB_FLAG`	Field is defined as `BLOB`
`MYSQLI_UNSIGNED_FLAG`	Field is defined as `UNSIGNED`
`MYSQLI_ZEROFILL_FLAG`	Field is defined as `ZEROFILL`

MYSQLI_AUTO_INCREMENT_FLAG	Field is defined as AUTO_INCREMENT
MYSQLI_TIMESTAMP_FLAG	Field is defined as TIMESTAMP
MYSQLI_SET_FLAG	Field is defined as SET
MYSQLI_NUM_FLAG	Field is defined as NUMERIC
MYSQLI_PART_KEY_FLAG	Field is part of an multi-index
MYSQLI_GROUP_FLAG	Field is part of GROUP BY
MYSQLI_TYPE_DECIMAL	Field is defined as DECIMAL
MYSQLI_TYPE_NEWDECIMAL	Precision math DECIMAL or NUMERIC field (MySQL 5.0.3 and up)
MYSQLI_TYPE_BIT	Field is defined as BIT (MySQL 5.0.3 and up)
MYSQLI_TYPE_TINY	Field is defined as TINYINT
MYSQLI_TYPE_SHORT	Field is defined as SMALLINT
MYSQLI_TYPE_LONG	Field is defined as INT
MYSQLI_TYPE_FLOAT	Field is defined as FLOAT
MYSQLI_TYPE_DOUBLE	Field is defined as DOUBLE
MYSQLI_TYPE_NULL	Field is defined as DEFAULT NULL
MYSQLI_TYPE_TIMESTAMP	Field is defined as TIMESTAMP
MYSQLI_TYPE_LONGLONG	Field is defined as BIGINT
MYSQLI_TYPE_INT24	Field is defined as MEDIUMINT
MYSQLI_TYPE_DATE	Field is defined as DATE
MYSQLI_TYPE_TIME	Field is defined as TIME
MYSQLI_TYPE_DATETIME	Field is defined as DATETIME
MYSQLI_TYPE_YEAR	Field is defined as YEAR
MYSQLI_TYPE_NEWDATE	Field is defined as DATE
MYSQLI_TYPE_INTERVAL	Field is defined as INTERVAL
MYSQLI_TYPE_ENUM	Field is defined as ENUM
MYSQLI_TYPE_SET	Field is defined as SET
MYSQLI_TYPE_TINY_BLOB	Field is defined as TINYBLOB
MYSQLI_TYPE_MEDIUM_BLOB	Field is defined as MEDIUMBLOB
MYSQLI_TYPE_LONG_BLOB	Field is defined as LONGBLOB
MYSQLI_TYPE_BLOB	Field is defined as BLOB
MYSQLI_TYPE_VAR_STRING	Field is defined as VARCHAR
MYSQLI_TYPE_STRING	Field is defined as STRING
MYSQLI_TYPE_CHAR	Field is defined as CHAR
MYSQLI_TYPE_GEOMETRY	Field is defined as GEOMETRY

MYSQLI_NEED_DATA	More data available for bind variable
MYSQLI_NO_DATA	No more data available for bind variable
MYSQLI_DATA_TRUNCATED	Data truncation occurred. Available since PHP 5.1.0 and MySQL 5.0.5.
MYSQLI_ENUM_FLAG	Field is defined as ENUM. Available since PHP 5.3.0.
MYSQLI_CURSOR_TYPE_FOR_U PDATE	
MYSQLI_CURSOR_TYPE_NO_CU RSOR	
MYSQLI_CURSOR_TYPE_READ_ ONLY	
MYSQLI_CURSOR_TYPE_SCROL LABLE	
MYSQLI_STMT_ATTR_CURSOR_ TYPE	
MYSQLI_STMT_ATTR_PREFETC H_ROWS	
MYSQLI_STMT_ATTR_UPDATE_ MAX_LENGTH	
MYSQLI_SET_CHARSET_NAME	

20.10.2.6. The MySQLi Extension Function Summary

Copyright 1997-2010 the PHP Documentation Group.

MySQLi Class			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
Properties			
$mysqli->affected_rows	mysqli_affected_rows	N/A	Gets the number of affected rows in a previous MySQL operation
$mysqli->client_info	mysqli_get_client_info	N/A	Returns the MySQL client version as a string
$mysqli->client_version	mysqli_get_client_version	N/A	Returns MySQL client version info as an integer
$mysqli->connect_errno	mysqli_connect_errno	N/A	Returns the error code from last connect call
$mysqli->connect_error	mysqli_connect_error	N/A	Returns a string description of the last connect error
$mysqli->errno	mysqli_errno	N/A	Returns the error code for the most recent function call
$mysqli->error	mysqli_error	N/A	Returns a string description of the last error
$mysqli->field_count	mysqli_field_count	N/A	Returns the number of columns for the most recent query
$mysqli->host_info	mysqli_get_host_info	N/A	Returns a string representing the type of connection used
$mysqli->protocol_version	mysqli_get_proto_info	N/A	Returns the version of the MySQL protocol used
$mysqli->server_info	mysqli_get_server_info	N/A	Returns the version of the MySQL server
$mysqli->server_version	mysqli_get_server_version	N/A	Returns the version of the MySQL server as an integer
$mysqli->info	mysqli_info	N/A	Retrieves information about the most recently executed query
$mysqli->insert_id	mysqli_insert_id	N/A	Returns the auto generated id used in the last query
$mysqli->sqlstate	mysqli_sqlstate	N/A	Returns the SQLSTATE error from previous MySQL operation
$mysqli->warning_count	mysqli_warning_count	N/A	Returns the number of warnings from the last query for the given

MySQLi Class			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
			link
Methods			
mysqli->autocommit	mysqli_autocommit	N/A	Turns on or off auto-commiting database modifications
mysqli->change_user	mysqli_change_user	N/A	Changes the user of the specified database connection
mysqli->character_set_name, mysqli->client_encoding	mysqli_character_set_name	mysqli_client_encoding	Returns the default character set for the database connection
mysqli->close	mysqli_close	N/A	Closes a previously opened database connection
mysqli->commit	mysqli_commit	N/A	Commits the current transaction
mysqli::__construct	mysqli_connect	N/A	Open a new connection to the MySQL server [Note: static (i.e. class) method]
mysqli->debug	mysqli_debug	N/A	Performs debugging operations
mysqli->dump_debug_info	mysqli_dump_debug_info	N/A	Dump debugging information into the log
mysqli->get_charset	mysqli_get_charset	N/A	Returns a character set object
mysqli->get_connection_stats	mysqli_get_connection_stats	N/A	Returns client connection statistics. Available only with mysqlnd.
mysqli->get_client_info	mysqli_get_client_info	N/A	Returns the MySQL client version as a string
mysqli->get_client_stats	mysqli_get_client_stats	N/A	Returns client per-process statistics. Available only with mysqlnd.
mysqli->get_cache_stats	mysqli_get_cache_stats	N/A	Returns client Zval cache statistics. Available only with mysqlnd.
mysqli->get_server_info	mysqli_get_server_info	N/A	NOT DOCUMENTED
mysqli->get_warnings	mysqli_get_warnings	N/A	NOT DOCUMENTED
mysqli::init	mysqli_init	N/A	Initializes MySQLi and returns a resource for use with mysqli_real_connect. [Not called on an object, as it returns a $mysqli object.]
mysqli->kill	mysqli_kill	N/A	Asks the server to kill a MySQL thread
mysqli->more_results	mysqli_more_results	N/A	Check if there are any more query results from a multi query
mysqli->multi_query	mysqli_multi_query	N/A	Performs a query on the database
mysqli->next_result	mysqli_next_result	N/A	Prepare next result from multi_query
mysqli->options	mysqli_options	mysqli_set_opt	Set options
mysqli->ping	mysqli_ping	N/A	Pings a server connection, or tries to reconnect if the connection has gone down
mysqli->prepare	mysqli_prepare	N/A	Prepare a SQL statement for ex-

MySQLi Class			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
			ecution
mysqli->query	mysqli_query	N/A	Performs a query on the database
mysqli->real_connect	mysqli_real_connect	N/A	Opens a connection to a mysql server
mysqli->real_escape_string, mysqli->escape_string	mysqli_real_escape_string	mysqli_escape_string	Escapes special characters in a string for use in a SQL statement, taking into account the current charset of the connection
mysqli->real_query	mysqli_real_query	N/A	Execute an SQL query
mysqli->rollback	mysqli_rollback	N/A	Rolls back current transaction
mysqli->select_db	mysqli_select_db	N/A	Selects the default database for database queries
mysqli->set_charset	mysqli_set_charset	N/A	Sets the default client character set
mysqli->set_local_infile_default	mysqli_set_local_infile_default	N/A	Unsets user defined handler for load local infile command
mysqli->set_local_infile_handler	mysqli_set_local_infile_handler	N/A	Set callback function for LOAD DATA LOCAL INFILE command
mysqli->ssl_set	mysqli_ssl_set	N/A	Used for establishing secure connections using SSL
mysqli->stat	mysqli_stat	N/A	Gets the current system status
mysqli->stmt_init	mysqli_stmt_init	N/A	Initializes a statement and returns an object for use with mysqli_stmt_prepare
mysqli->store_result	mysqli_store_result	N/A	Transfers a result set from the last query
mysqli->thread_id	mysqli_thread_id	N/A	Returns the thread ID for the current connection
mysqli->thread_safe	mysqli_thread_safe	N/A	Returns whether thread safety is given or not
mysqli->use_result	mysqli_use_result	N/A	Initiate a result set retrieval

MySQL_STMT			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
Properties			
$mysqli_stmt->affected_rows	mysqli_stmt_affected_rows	N/A	Returns the total number of rows changed, deleted, or inserted by the last executed statement
$mysqli_stmt->errno	mysqli_stmt_errno	N/A	Returns the error code for the most recent statement call
$mysqli_stmt->error	mysqli_stmt_error	N/A	Returns a string description for last statement error
$mysqli_stmt->field_count	mysqli_stmt_field_count	N/A	Returns the number of field in the given statement - not documented
$mysqli_stmt->insert_id	mysqli_stmt_insert_id	N/A	Get the ID generated from the previous INSERT operation

MySQL_STMT			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
$mysqli_stmt->num_rows	mysqli_stmt_num_rows	N/A	Return the number of rows in statements result set
$mysqli_stmt->param_count	mysqli_stmt_param_count	mysqli_param_count	Returns the number of parameter for the given statement
$mysqli_stmt->sqlstate	mysqli_stmt_sqlstate	N/A	Returns SQLSTATE error from previous statement operation
Methods			
mysqli_stmt->attr_get	mysqli_stmt_attr_get	N/A	Used to get the current value of a statement attribute
mysqli_stmt->attr_set	mysqli_stmt_attr_set	N/A	Used to modify the behavior of a prepared statement
mysqli_stmt->bind_param	mysqli_stmt_bind_param	mysqli_bind_param	Binds variables to a prepared statement as parameters
mysqli_stmt->bind_result	mysqli_stmt_bind_result	mysqli_bind_result	Binds variables to a prepared statement for result storage
mysqli_stmt->close	mysqli_stmt_close	N/A	Closes a prepared statement
mysqli_stmt->data_seek	mysqli_stmt_data_seek	N/A	Seeks to an arbitrary row in statement result set
mysqli_stmt->execute	mysqli_stmt_execute	mysqli_execute	Executes a prepared Query
mysqli_stmt->fetch	mysqli_stmt_fetch	mysqli_fetch	Fetch results from a prepared statement into the bound variables
mysqli_stmt->free_result	mysqli_stmt_free_result	N/A	Frees stored result memory for the given statement handle
$mysqli_stmt->get_result()	mysqli_stmt_get_result	N/A	NOT DOCUMENTED Available only with mysqlnd.
mysqli_stmt->get_warnings	mysqli_stmt_get_warnings	N/A	NOT DOCUMENTED
$mysqli_stmt->more_results()	mysqli_stmt_more_results()	N/A	NOT DOCUMENTED Available only with mysqlnd.
$mysqli_stmt->next_result()	mysqli_stmt_next_result()	N/A	NOT DOCUMENTED Available only with mysqlnd.
mysqli_stmt->num_rows	mysqli_stmt_num_rows	N/A	See also property $mysqli_stmt->num_rows
mysqli_stmt->prepare	mysqli_stmt_prepare	N/A	Prepare a SQL statement for execution
mysqli_stmt->reset	mysqli_stmt_reset	N/A	Resets a prepared statement
mysqli_stmt->result_metadata	mysqli_stmt_result_metadata	mysqli_get_metadata	Returns result set metadata from a prepared statement
mysqli_stmt->send_long_data	mysqli_stmt_send_long_data	mysqli_send_long_data	Send data in blocks
mysqli_stmt->store_result	mysqli_stmt_store_result	N/A	Transfers a result set from a prepared statement

MySQLi_RESULT			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
Properties			
$mysqli_result->current_field	mysqli_field_tell	N/A	Get current field offset of a result pointer

MySQLi_RESULT			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
$mysqli_result->field_count	mysqli_num_fields	N/A	Get the number of fields in a result
$mysqli_result->lengths	mysqli_fetch_lengths	N/A	Returns the lengths of the columns of the current row in the result set
$mysqli_result->num_rows	mysqli_num_rows	N/A	Gets the number of rows in a result
Methods			
mysqli_result->data_seek	mysqli_data_seek	N/A	Adjusts the result pointer to an arbitary row in the result
mysqli_result->fetch_all	mysqli_fetch_all	N/A	Fetches all result rows and returns the result set as an associative array, a numeric array, or both. Available only with mysqlnd.
mysqli_result->fetch_array	mysqli_fetch_array	N/A	Fetch a result row as an associative, a numeric array, or both
mysqli_result->fetch_assoc	mysqli_fetch_assoc	N/A	Fetch a result row as an associative array
mysqli_result->fetch_field_direct	mysqli_fetch_field_direct	N/A	Fetch meta-data for a single field
mysqli_result->fetch_field	mysqli_fetch_field	N/A	Returns the next field in the result set
mysqli_result->fetch_fields	mysqli_fetch_fields	N/A	Returns an array of objects representing the fields in a result set
mysqli_result->fetch_object	mysqli_fetch_object	N/A	Returns the current row of a result set as an object
mysqli_result->fetch_row	mysqli_fetch_row	N/A	Get a result row as an enumerated array
mysqli_result->field_seek	mysqli_field_seek	N/A	Set result pointer to a specified field offset
mysqli_result->free, mysqli_result->close, mysqli_result->free_result	mysqli_free_result	N/A	Frees the memory associated with a result

MySQL_Driver			
OOP Interface	**Procedural Interface**	**Alias (Do not use)**	**Description**
Properties			
N/A			
Methods			
mysqli_driver->embedded_server_end	mysqli_embedded_server_end	N/A	NOT DOCUMENTED
mysqli_driver->embedded_server_start	mysqli_embedded_server_start	N/A	NOT DOCUMENTED

Note

Alias functions are provided for backward compatibility purposes only. Do not use them in new projects.

20.10.2.7. The MySQLi class (MySQLi)

Copyright 1997-2010 the PHP Documentation Group.

Represents a connection between PHP and a MySQL database.

```
 MySQLi {
 MySQLi

20.10.2.7.1. mysqli->affected_rows, mysqli_affected_rows

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->affected_rows`

  `mysqli_affected_rows`

  Gets the number of affected rows in a previous MySQL operation

Description

Object oriented style (property):

```
 mysqli {
  int affected_rows ;
}
```

Procedural style:

```
  int mysqli_affected_rows(mysqli link);
```

Returns the number of rows affected by the last `INSERT`, `UPDATE`, `REPLACE` or `DELETE` query.

For SELECT statements `mysqli_affected_rows` works like `mysqli_num_rows`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records where updated for an UPDATE statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error.

> **Note**
>
> If the number of affected rows is greater than maximal int value, the number of affected rows will be returned as a string.

Examples

Example 20.68. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
/* Insert rows */
$mysqli->query("CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", $mysqli->affected_rows);

$mysqli->query("ALTER TABLE Language ADD Status int default 0");

/* update rows */
$mysqli->query("UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", $mysqli->affected_rows);

/* delete rows */
$mysqli->query("DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", $mysqli->affected_rows);

/* select all rows */
$result = $mysqli->query("SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", $mysqli->affected_rows);

$result->close();

/* Delete table Language */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

Example 20.69. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}

/* Insert rows */
mysqli_query($link, "CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", mysqli_affected_rows($link));

mysqli_query($link, "ALTER TABLE Language ADD Status int default 0");

/* update rows */
mysqli_query($link, "UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", mysqli_affected_rows($link));

/* delete rows */
mysqli_query($link, "DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", mysqli_affected_rows($link));

/* select all rows */
$result = mysqli_query($link, "SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", mysqli_affected_rows($link));

mysqli_free_result($result);

/* Delete table Language */
mysqli_query($link, "DROP TABLE Language");

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Affected rows (INSERT): 984
Affected rows (UPDATE): 168
Affected rows (DELETE): 815
Affected rows (SELECT): 169
```

20.10.2.7.2. `mysqli::autocommit`, `mysqli_autocommit`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::autocommit`

  `mysqli_autocommit`

  Turns on or off auto-commiting database modifications

Description

Object oriented style (method)

```
bool mysqli::autocommit(bool mode);
```

Procedural style:

```
bool mysqli_autocommit(mysqli link,
                       bool mode);
```

Turns on or off auto-commit mode on queries for the database connection.

To determine the current state of autocommit use the SQL command `SELECT @@autocommit`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`mode`	Whether to turn on auto-commit or not.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

> **Note**
>
> This function doesn't work with non transactional table types (like MyISAM or ISAM).

Examples

Example 20.70. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* turn autocommit on */
$mysqli->autocommit(TRUE);
```

```
if ($result = $mysqli->query("SELECT @@autocommit")) {
    $row = $result->fetch_row();
    printf("Autocommit is %s\n", $row[0]);
    $result->free();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.71. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}

/* turn autocommit on */
mysqli_autocommit($link, TRUE);

if ($result = mysqli_query($link, "SELECT @@autocommit")) {
    $row = mysqli_fetch_row($result);
    printf("Autocommit is %s\n", $row[0]);
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Autocommit is 1
```

See Also

`mysqli_commit`
`mysqli_rollback`

20.10.2.7.3. `mysqli::change_user`, `mysqli_change_user`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::change_user`

  `mysqli_change_user`

  Changes the user of the specified database connection

Description

Object oriented style (method):

```
  bool mysqli::change_user(string user,
                           string password,
```

```
                            string database);
```

Procedural style:

```
  bool mysqli_change_user(mysqli link,
                          string user,
                          string password,
                          string database);
```

Changes the user of the specified database connection and sets the current database.

In order to successfully change users a valid *`username`* and *`password`* parameters must be provided and that user must have sufficient permissions to access the desired database. If for any reason authorization fails, the current user authentication will remain.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`user`	The MySQL user name.
`password`	The MySQL password.
`database`	The database to change to. If desired, the `NULL` value may be passed resulting in only changing the user and not selecting a database. To select a database in this case use the `mysqli_select_db` function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

> **Note**
>
> Using this command will always cause the current database connection to behave as if was a completely new database connection, regardless of if the operation was completed successfully. This reset includes performing a rollback on any active transactions, closing all temporary tables, and unlocking all locked tables.

Examples

Example 20.72. Object oriented style

```
<?php

/* connect database test */
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
$mysqli->query("SET @a:=1");

/* reset all and select a new database */
$mysqli->change_user("my_user", "my_password", "world");

if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database: %s\n", $row[0]);
    $result->close();
}

if ($result = $mysqli->query("SELECT @a")) {
    $row = $result->fetch_row();
```

```
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.73. Procedural style

```
<?php
/* connect database test */
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
mysqli_query($link, "SET @a:=1");

/* reset all and select a new database */
mysqli_change_user($link, "my_user", "my_password", "world");

if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database: %s\n", $row[0]);
    mysqli_free_result($result);
}

if ($result = mysqli_query($link, "SELECT @a")) {
    $row = mysqli_fetch_row($result);
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Default database: world
Value of variable a is NULL
```

20.10.2.7.4. `mysqli::character_set_name`, `mysqli_character_set_name`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::character_set_name`

mysqli_character_set_name

Returns the default character set for the database connection

Description

Object oriented style (method):

```
  string mysqli::character_set_name();
```

Procedural style:

```
  string mysqli_character_set_name(mysqli link);
```

Returns the current character set for the database connection.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

The default character set for the current connection

Examples

Example 20.74. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = $mysqli->character_set_name();
printf ("Current character set is %s\n", $charset);

$mysqli->close();
?>
```

Example 20.75. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = mysqli_character_set_name($link);
printf ("Current character set is %s\n",$charset);

/* close connection */
```

```
mysqli_close($link);
?>
```

The above example will output:

```
Current character set is latin1_swedish_ci
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->client_info`

  `mysqli_get_client_info`

  Returns the MySQL client version as a string

Description

Object oriented style (property):

```
 mysqli {

  string client_info ;

}
```

Procedural style:

```
  string mysqli_get_client_info(mysqli link);
```

Returns a string that represents the MySQL client library version.

Return Values

A string that represents the MySQL client library version

Examples

Example 20.76. mysqli_get_client_info

```
<?php

/* We don't need a connection to determine
   the version of mysql client library */

printf("Client library version: %s\n", mysqli_get_client_info());
?>
```

See Also

`mysqli_get_client_version`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->client_version`

  `mysqli_get_client_version`

  Get MySQL client info

Description

Object oriented style (property):

```
 mysqli {

  int client_version ;

}
```

Procedural style:

```
  int mysqli_get_client_version(mysqli link);
```

Returns client version number as an integer.

Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exits.

Examples

Example 20.77. mysqli_get_client_version

```
<?php

/* We don't need a connection to determine
   the version of mysql client library */

printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

20.10.2.7.7. `mysqli::close`, `mysqli_close`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::close`

  `mysqli_close`

  Closes a previously opened database connection

Description

Object oriented style (method):

```
bool mysqli::close();
```

Procedural style:

```
bool mysqli_close(mysqli link);
```

Closes a previously opened database connection.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_connect`.

See Also

`mysqli_connect`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::commit`

  `mysqli_commit`

  Commits the current transaction

Description

Object oriented style (method)

```
bool mysqli::commit();
```

Procedural style:

```
bool mysqli_commit(mysqli link);
```

Commits the current transaction for the database connection.

Parameters

link	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.78. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE Language LIKE CountryLanguage");

/* set autocommit to off */
$mysqli->autocommit(FALSE);

/* Insert some values */
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
$mysqli->commit();

/* drop table */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

Example 20.79. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* set autocommit to off */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE Language LIKE CountryLanguage");

/* Insert some values */
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
mysqli_commit($link);

/* close connection */
mysqli_close($link);
?>
```

`mysqli_autocommit`
`mysqli_rollback`

20.10.2.7.9. `mysqli->connect_errno`, `mysqli_connect_errno`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->connect_errno`

  `mysqli_connect_errno`

  Returns the error code from last connect call

Description

```
 mysqli {

  string connect_errno ;

}
```

```
  int mysqli_connect_errno();
```

Returns the last error code number from the last call to `mysqli_connect`.

> **Note**
>
> Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file `Docs/mysqld_error.txt`.

Return Values

An error code value for the last call to `mysqli_connect`, if it failed. zero means no error occurred.

Examples

Example 20.80. Object oriented style

```
<?php
$mysqli = @new mysqli('localhost', 'fake_user', 'my_password', 'my_db');

if ($mysqli->connect_errno) {
    die('Connect Error: ' . $mysqli->connect_errno);
}
?>
```

Example 20.81. Procedural style

```
<?php
$link = @mysqli_connect('localhost', 'fake_user', 'my_password', 'my_db');

if (!$link) {
    die('Connect Error: ' . mysqli_connect_errno());
```

```
}
?>
```

The above example will output:

```
Connect Error: 1045
```

See Also

mysqli_connect
mysqli_connect_error
mysqli_errno
mysqli_error
mysqli_sqlstate

20.10.2.7.10. mysqli->connect_error, mysqli_connect_error

Copyright 1997-2010 the PHP Documentation Group.

- mysqli->connect_error

  mysqli_connect_error

  Returns a string description of the last connect error

Description

```
 mysqli {

  string connect_error ;

}
```

```
  string mysqli_connect_error();
```

Returns the last error message string from the last call to mysqli_connect.

Return Values

A string that describes the error. NULL is returned if no error occurred.

Examples

Example 20.82. Object oriented style

```
<?php
$mysqli = @new mysqli('localhost', 'fake_user', 'my_password', 'my_db');

// Works as of PHP 5.2.9 and 5.3.0.
if ($mysqli->connect_error) {
    die('Connect Error: ' . $mysqli->connect_error);
}
?>
```

Example 20.83. Procedural style

```
<?php
$link = @mysqli_connect('localhost', 'fake_user', 'my_password', 'my_db');

if (!$link) {
    die('Connect Error: ' . mysqli_connect_error());
}
?>
```

The above example will output:

```
Connect Error: Access denied for user 'fake_user'@'localhost' (using password: YES)
```

Notes

> **Warning**
>
> The mysqli->connect_error property only works properly as of PHP versions 5.2.9 and 5.3.0. Use the `mysqli_connect_error` function if compatibility with earlier PHP versions is required.

20.10.2.7.11. `mysqli::__construct`, `mysqli_connect`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::__construct`

  `mysqli_connect`

  Open a new connection to the MySQL server

Description

Object oriented style (constructor):

```
 mysqli::__construct(string host= =ini_get("mysqli.default_host"),
                     string username= =ini_get("mysqli.default_user"),
                     string passwd= =ini_get("mysqli.default_pw"),
                     string dbname= "",
                     int port= =ini_get("mysqli.default_port"),
                     string socket= =ini_get("mysqli.default_socket"));
```

Procedural style

```
 mysqli mysqli_connect(string host= =ini_get("mysqli.default_host"),
                       string username= =ini_get("mysqli.default_user"),
                       string passwd= =ini_get("mysqli.default_pw"),
                       string dbname= "",
                       int port= =ini_get("mysqli.default_port"),
```

```
                        string socket= =ini_get("mysqli.default_socket"));
```

Opens a connection to the MySQL Server running on.

Parameters

host	Can be either a host name or an IP address. Passing the NULL value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol. Prepending host by p: opens a persistent connection. mysqli_change_user is automatically called on connections opened from the connection pool.
username	The MySQL user name.
passwd	If not provided or NULL , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
dbname	If provided will specify the default database to be used when performing queries.
port	Specifies the port number to attempt to connect to the MySQL server.
socket	Specifies the socket or named pipe that should be used.

> **Note**
>
> Specifying the *socket* parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the *host* parameter.

Return Values

Returns an object which represents the connection to a MySQL Server.

Changelog

Version	Description
5.3.0	Added the ability of persistent connections.

Examples

Example 20.84. Object oriented style

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'my_db');

/*
 * This is the "official" OO way to do it,
 * BUT $connect_error was broken until PHP 5.2.9 and 5.3.0.
 */
if ($mysqli->connect_error) {
    die('Connect Error (' . $mysqli->connect_errno . ') '
            . $mysqli->connect_error);
}

/*
 * Use this instead of $connect_error if you need to ensure
 * compatibility with PHP versions prior to 5.2.9 and 5.3.0.
 */
if (mysqli_connect_error()) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
            . mysqli_connect_error());
}
```

```
echo 'Success... ' . $mysqli->host_info . "\n";

$mysqli->close();
?>
```

Example 20.85. Object oriented style when extending mysqli class

```
<?php

class foo_mysqli extends mysqli {
    public function __construct($host, $user, $pass, $db) {
        parent::__construct($host, $user, $pass, $db);

        if (mysqli_connect_error()) {
            die('Connect Error (' . mysqli_connect_errno() . ') '
                    . mysqli_connect_error());
        }
    }
}

$db = new foo_mysqli('localhost', 'my_user', 'my_password', 'my_db');

echo 'Success... ' . $db->host_info . "\n";

$db->close();
?>
```

Example 20.86. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'my_db');

if (!$link) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
            . mysqli_connect_error());
}

echo 'Success... ' . mysqli_get_host_info($link) . "\n";

mysqli_close($link);
?>
```

The above example will output:

```
Success... MySQL host info: localhost via TCP/IP
```

Notes

> **Note**
>
> OO syntax only: If a connection fails an object is still returned. To check if the connection failed then use either the `mysqli_connect_error` function or the mysqli->connect_error property like in the examples above.

> **Note**
>
> If it is necessary to set options, such as the connection timeout, `mysqli_real_connect` must be used instead.

> **Note**
>
> Calling the constructor with no parameters is the same as calling `mysqli_init`.

> **Note**
>
> Error "Can't create TCP/IP socket (10106)" usually means that the variables_order configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

20.10.2.7.12. `mysqli::debug`, `mysqli_debug`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::debug`

  `mysqli_debug`

  Performs debugging operations

Description

Object oriented style (method):

```
bool mysqli::debug(string message);
```

Procedural style:

```
bool mysqli_debug(string message);
```

Performs debugging operations using the Fred Fish debugging library.

Parameters

`message`	A string representing the debugging operation to perform

Return Values

Returns `TRUE` .

Notes

> **Note**
>
> To use the `mysqli_debug` function you must compile the MySQL client library to support debugging.

Examples

Example 20.87. Generating a Trace File

```
<?php

/* Create a trace file in '/tmp/client.trace' on the local (client) machine: */
mysqli_debug("d:t:o,/tmp/client.trace");

?>
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::dump_debug_info`

  `mysqli_dump_debug_info`

  Dump debugging information into the log

Description

Object oriented style (method):

```
  bool mysqli::dump_debug_info();
```

Procedural style:

```
  bool mysqli_dump_debug_info(mysqli link);
```

This function is designed to be executed by an user with the SUPER privilege and is used to dump debugging information into the log for the MySQL Server relating to the connection.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_debug`

20.10.2.7.14. `mysqli->errno`, `mysqli_errno`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->errno`

  `mysqli_errno`

Returns the error code for the most recent function call

Description

Object oriented style (property):

```
 mysqli {

  int errno ;

}
```

Procedural style:

```
  int mysqli_errno(mysqli link);
```

Returns the last error code for the most recent MySQLi function call that can succeed or fail.

Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file `Docs/mysqld_error.txt`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An error code value for the last call, if it failed. zero means no error occurred.

Examples

Example 20.88. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$mysqli->query("SET a=1")) {
    printf("Errorcode: %d\n", $mysqli->errno);
}

/* close connection */
$mysqli->close();
?>
```

Example 20.89. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
if (!mysqli_query($link, "SET a=1")) {
    printf("Errorcode: %d\n", mysqli_errno($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Errorcode: 1193
```

- `mysqli->error`

  `mysqli_error`

  Returns a string description of the last error

Description

Object oriented style (property):

```
 mysqli {

  string error ;

}
```

Procedural style:

```
  string mysqli_error(mysqli link);
```

Returns the last error message for the most recent MySQLi function call that can succeed or fail.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 20.90. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$mysqli->query("SET a=1")) {
    printf("Errormessage: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

Example 20.91. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errormessage: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Errormessage: Unknown system variable 'a'
```

20.10.2.7.16. `mysqli->field_count`, `mysqli_field_count`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->field_count`

mysqli_field_count

Returns the number of columns for the most recent query

Description

Object oriented style (property):

```
 mysqli_result {

  int field_count ;

}
```

Procedural style:

```
  int mysqli_field_count(mysqli link);
```

Returns the number of columns for the most recent query on the connection represented by the *link* parameter. This function can be useful when using the mysqli_store_result function to determine if the query should have produced a non-empty result set or not without knowing the nature of the query.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

An integer representing the number of fields in a result set.

Examples

Example 20.92. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query( "DROP TABLE IF EXISTS friends");
$mysqli->query( "CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query( "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$mysqli->real_query("SELECT * FROM friends");

if ($mysqli->field_count) {
    /* this was a select/show or describe query */
    $result = $mysqli->store_result();

    /* process resultset */
    $row = $result->fetch_row();

    /* free resultset */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.93. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

mysqli_real_query($link, "SELECT * FROM friends");

if (mysqli_field_count($link)) {
    /* this was a select/show or describe query */
    $result = mysqli_store_result($link);

    /* process resultset */
    $row = mysqli_fetch_row($result);

    /* free resultset */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

20.10.2.7.17. `mysqli::get_charset`, `mysqli_get_charset`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_charset`

  `mysqli_get_charset`

  Returns a character set object

Description

```
  object mysqli::get_charset();
```

```
  object mysqli_get_charset(mysqli link);
```

Returns a character set object providing several properties of the current active character set.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The function returns a character set object with the following properties:

`charset`	Character set name
`collation`	Collation name
`dir`	Directory the charset description was fetched from (?) or "" for built-in character sets
`min_length`	Minimum character length in bytes
`max_length`	Maximum character length in bytes
`number`	Internal character set number

state	Character set status (?)

Examples

Example 20.94. Object oriented style

```
<?php
  $db = mysqli_init();
  $db->real_connect("localhost","root","","test");
  var_dump($db->get_charset());
?>
```

Example 20.95. Procedural style

```
<?php
  $db = mysqli_init();
  mysqli_real_connect($db, "localhost","root","","test");
  var_dump($db->get_charset());
?>
```

The above example will output:

```
object(stdClass)#2 (7) {
  ["charset"]=>
  string(6) "latin1"
  ["collation"]=>
  string(17) "latin1_swedish_ci"
  ["dir"]=>
  string(0) ""
  ["min_length"]=>
  int(1)
  ["max_length"]=>
  int(1)
  ["number"]=>
  int(8)
  ["state"]=>
  int(801)
}
```

20.10.2.7.18. `mysqli->get_client_info`, `mysqli_get_client_info`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->get_client_info`

  `mysqli_get_client_info`

  Returns the MySQL client version as a string

Description

Object oriented style (method):

```
  string mysqli::get_client_info();
```

Procedural style:

```
  string mysqli_get_client_info(mysqli link);
```

Returns a string that represents the MySQL client library version.

Return Values

A string that represents the MySQL client library version

Examples

Example 20.96. mysqli_get_client_info

```
<?php

/* We don't need a connection to determine
   the version of mysql client library */

printf("Client library version: %s\n", mysqli_get_client_info());
?>
```

See Also

`mysqli_get_client_version`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->client_version`

  `mysqli_get_client_version`

  Get MySQL client info

Description

Object oriented style (property):

```
 mysqli {

  int client_version ;

}
```

Procedural style:

```
  int mysqli_get_client_version(mysqli link);
```

Returns client version number as an integer.

Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exits.

Examples

Example 20.97. mysqli_get_client_version

```
<?php

/* We don't need a connection to determine
   the version of mysql client library */

printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

20.10.2.7.20. `mysqli::get_connection_stats`, `mysqli_get_connection_stats`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_connection_stats`

  `mysqli_get_connection_stats`

  Returns statistics about the client connection

Description

Object oriented style (method):

```
  bool mysqli::get_connection_stats();
```

Procedural style:

```
  array mysqli_get_connection_stats(mysqli link);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

Returns statistics about the client connection. Available only with mysqlnd.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns an array with connection stats if success, `FALSE` otherwise.

Examples

Example 20.98. A `mysqli_get_connection_stats` example

```
<?php
$link = mysqli_connect();
print_r(mysqli_get_connection_stats($link));
?>
```

The above example will output something similar to:

```

Stats description

20.10.2.7.21. `mysqli->host_info`, `mysqli_get_host_info`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->host_info`

  `mysqli_get_host_info`

  Returns a string representing the type of connection used

Description

Object oriented style (property):

```
 mysqli {

  string host_info ;

}
```

Procedural style:

```
  string mysqli_get_host_info(mysqli link);
```

Returns a string describing the connection represented by the *link* parameter (including the server host name).

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

A character string representing the server hostname and the connection type.

Examples

Example 20.99. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", $mysqli->host_info);

/* close connection */
$mysqli->close();
?>
```

Example 20.100. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Host info: Localhost via UNIX socket
```

See Also

`mysqli_get_proto_info`

20.10.2.7.22. `mysqli->protocol_version`, `mysqli_get_proto_info`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->protocol_version`

  `mysqli_get_proto_info`

  Returns the version of the MySQL protocol used

Description

Object oriented style (property):

```
 mysqli {
  string protocol_version ;
}
```

Procedural style:

```
  int mysqli_get_proto_info(mysqli link);
```

Returns an integer representing the MySQL protocol version used by the connection represented by the *`link`* parameter.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns an integer representing the protocol version.

Examples

Example 20.101. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", $mysqli->protocol_version);
```

```
/* close connection */
$mysqli->close();
?>
```

Example 20.102. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", mysqli_get_proto_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Protocol version: 10
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->server_info`

  `mysqli_get_server_info`

  Returns the version of the MySQL server

Description

Object oriented style (property):

```
 mysqli {

  string server_info ;

}
```

Procedural style:

```
  string mysqli_get_server_info(mysqli link);
```

Returns a string representing the version of the MySQL server that the MySQLi extension is connected to.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

A character string representing the server version.

Examples

Example 20.103. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", $mysqli->server_info);

/* close connection */
$mysqli->close();
?>
```

Example 20.104. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", mysqli_get_server_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Server version: 4.1.2-alpha-debug
```

mysqli_get_client_info

mysqli_get_client_version
mysqli_get_server_version

20.10.2.7.24. mysqli->server_version, mysqli_get_server_version

Copyright 1997-2010 the PHP Documentation Group.

- mysqli->server_version

  mysqli_get_server_version

  Returns the version of the MySQL server as an integer

Description

Object oriented style (property):

```
 mysqli {

  int server_version ;

}
```

Procedural style:

```
  int mysqli_get_server_version(mysqli link);
```

The mysqli_get_server_version function returns the version of the server connected to (represented by the *link* parameter) as an integer.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

An integer representing the server version.

The form of this version number is main_version * 10000 + minor_version * 100 + sub_version (i.e. version 4.1.0 is 40100).

Examples

Example 20.105. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", $mysqli->server_version);

/* close connection */
$mysqli->close();
?>
```

Example 20.106. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", mysqli_get_server_version($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Server version: 40102
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_warnings`

  `mysqli_get_warnings`

  Get result of SHOW WARNINGS

Description

```
  mysqli_warnings mysqli::get_warnings();
```

```
  mysqli_warnings mysqli_get_warnings(mysqli link);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

20.10.2.7.26. `mysqli->info`, `mysqli_info`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->info`

  `mysqli_info`

Retrieves information about the most recently executed query

Description

Object oriented style (property)

```
 mysqli {

  string info ;

}
```

Procedural style:

```
  string mysqli_info(mysqli link);
```

The `mysqli_info` function returns a string providing information about the last query executed. The nature of this string is provided below:

Table 20.8. Possible mysqli_info return values

Query type	Example result string
INSERT INTO...SELECT...	Records: 100 Duplicates: 0 Warnings: 0
INSERT INTO...VALUES (...),(...),(...)	Records: 3 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...	Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE ...	Records: 3 Duplicates: 0 Warnings: 0
UPDATE ...	Rows matched: 40 Changed: 40 Warnings: 0

> **Note**
>
> Queries which do not fall into one of the above formats are not supported. In these situations, `mysqli_info` will return an empty string.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A character string representing additional information about the most recently executed query.

Examples

Example 20.107. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
$mysqli->query("INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
```

```
printf("%s\n", $mysqli->info);

/* close connection */
$mysqli->close();
?>
```

Example 20.108. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
mysqli_query($link, "INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", mysqli_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Records: 150  Duplicates: 0  Warnings: 0
```

20.10.2.7.27. `mysqli::init`, `mysqli_init`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::init`

  `mysqli_init`

  Initializes MySQLi and returns a resource for use with mysqli_real_connect()

Description

Object oriented style (method):

```
  mysqli mysqli::init();
```

Procedural style:

```
  mysqli mysqli_init();
```

Allocates or initializes a MYSQL object suitable for `mysqli_options` and `mysqli_real_connect`.

> **Note**
>
> Any subsequent calls to any mysqli function (except `mysqli_options`) will fail until `mysqli_real_connect` was called.

Return Values

Returns an object.

Examples

See `mysqli_real_connect`.

`mysqli_options`
`mysqli_close`
`mysqli_real_connect`
`mysqli_connect`

20.10.2.7.28. `mysqli->insert_id`, `mysqli_insert_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->insert_id`

  `mysqli_insert_id`

  Returns the auto generated id used in the last query

Description

Object oriented style (property):

```
 mysqli {
  mixed insert_id ;
}
```

Procedural style:

```
  mixed mysqli_insert_id(mysqli link);
```

The `mysqli_insert_id` function returns the ID generated by a query on a table with a column having the AUTO_INCREMENT attribute. If the last query wasn't an INSERT or UPDATE statement or if the modified table does not have a column with the AUTO_INCREMENT attribute, this function will return zero.

> **Note**
>
> Performing an INSERT or UPDATE statement using the LAST_INSERT_ID() function will also modify the value returned by the `mysqli_insert_id` function.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The value of the AUTO_INCREMENT field that was updated by the previous query. Returns zero if there was no previous query on the connection or if the query did not update an AUTO_INCREMENT value.

> **Note**
>
> If the number is greater than maximal int value, mysqli_insert_id will return a string.

Examples

Example 20.109. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
$mysqli->query($query);

printf ("New Record has id %d.\n", $mysqli->insert_id);

/* drop table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>
```

Example 20.110. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
mysqli_query($link, $query);

printf ("New Record has id %d.\n", mysqli_insert_id($link));

/* drop table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
New Record has id 1.
```

20.10.2.7.29. `mysqli::kill`, `mysqli_kill`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::kill`

  `mysqli_kill`

  Asks the server to kill a MySQL thread

Description

Object oriented style (method)

```
bool mysqli::kill(int processid);
```

Procedural style:

```
bool mysqli_kill(mysqli link,
                 int processid);
```

This function is used to ask the server to kill a MySQL thread specified by the *`processid`* parameter. This value must be retrieved by calling the `mysqli_thread_id` function.

To stop a running query you should use the SQL command `KILL QUERY processid`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.111. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>
```

Example 20.112. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit;
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

`mysqli_thread_id`

20.10.2.7.30. `mysqli::more_results`, `mysqli_more_results`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::more_results`

  `mysqli_more_results`

  Check if there are any more query results from a multi query

Description

```
  bool mysqli::more_results();
```

```
  bool mysqli_more_results(mysqli link);
```

Indicates if one or more result sets are available from a previous call to `mysqli_multi_query`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_multi_query`.

See Also

`mysqli_multi_query`
`mysqli_next_result`
`mysqli_store_result`
`mysqli_use_result`

20.10.2.7.31. `mysqli::multi_query`, `mysqli_multi_query`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::multi_query`

  `mysqli_multi_query`

  Performs a query on the database

Description

Object oriented style (method):

```
bool mysqli::multi_query(string query);
```

Procedural style:

```
bool mysqli_multi_query(mysqli link,
                        string query);
```

Executes one or multiple queries which are concatenated by a semicolon.

To retrieve the resultset from the first query you can use `mysqli_use_result` or `mysqli_store_result`. All subsequent query results can be processed using `mysqli_more_results` and `mysqli_next_result`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`query`	The query, as a string. Data inside the query should be properly escaped.

Return Values

Returns `FALSE` if the first statement failed. To retrieve subsequent errors from other statements you have to call `mysqli_next_result` first.

Examples

Example 20.113. Object oriented style

```
```

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query  = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->store_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->free();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----------------\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 20.114. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query  = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_store_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----------------\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output something similar to:

```
my_user@localhost
-----------------
Amersfoort
```

```
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

`mysqli_more_results`

20.10.2.7.32. `mysqli::next_result`, `mysqli_next_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::next_result`

  `mysqli_next_result`

  Prepare next result from multi_query

Description

```
bool mysqli::next_result();
```

```
bool mysqli_next_result(mysqli link);
```

Prepares next result set from a previous call to `mysqli_multi_query` which can be retrieved by `mysqli_store_result` or `mysqli_use_result`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_multi_query`.

20.10.2.7.33. `mysqli::options`, `mysqli_options`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::options`

`mysqli_options`

Set options

Description

Object oriented style (method)

```
bool mysqli::options(int option,
                     mixed value);
```

Procedural style:

```
bool mysqli_options(mysqli link,
                    int option,
                    mixed value);
```

Used to set extra connect options and affect behavior for a connection.

This function may be called multiple times to set several options.

`mysqli_options` should be called after `mysqli_init` and before `mysqli_real_connect`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`option`	The option that you want to set. It can be one of the following values:

Table 20.9. Valid options

Name	Description
`MYSQLI_OPT_CONNECT_TIMEOUT`	connection timeout in seconds (supported on Windows with TCP/IP since PHP 5.3.1)
`MYSQLI_OPT_LOCAL_INFILE`	enable/disable use of `LOAD LOCAL INFILE`
`MYSQLI_INIT_COMMAND`	command to execute after when connecting to MySQL server
`MYSQLI_READ_DEFAULT_FILE`	Read options from named option file instead of `my.cnf`
`MYSQLI_READ_DEFAULT_GROUP`	Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE` .

`value`	The value for the option.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_real_connect`.

See Also

`mysqli_init`
`mysqli_real_connect`

20.10.2.7.34. `mysqli::ping`, `mysqli_ping`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::ping`

  `mysqli_ping`

  Pings a server connection, or tries to reconnect if the connection has gone down

Description

Object oriented style (method):

```
bool mysqli::ping();
```

Procedural style:

```
bool mysqli_ping(mysqli link);
```

Checks whether the connection to the server is working. If it has gone down, and global option mysqli.reconnect is enabled an automatic reconnection is attempted.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.115. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if ($mysqli->ping()) {
    printf ("Our connection is ok!\n");
} else {
    printf ("Error: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

Example 20.116. Procedural style

```
<?php
```

```
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if (mysqli_ping($link)) {
    printf ("Our connection is ok!\n");
} else {
    printf ("Error: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

Our connection is ok!
```

20.10.2.7.35. `mysqli::poll`, `mysqli_poll`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::poll`

  `mysqli_poll`

  Poll connections

Description

```
  public int mysqli::poll(array read,
                          array error,
                          array reject,
                          int sec,
                          int usec);
```

```
  int mysqli_poll(array read,
                  array error,
                  array reject,
                  int sec,
                  int usec);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

Poll connections. Available only with mysqlnd.

Parameters

read *error* *reject* *sec*	Number of seconds to wait, must be non-negative.

usec	Number of microseconds to wait, must be non-negative.

Return Values

Returns number of ready connections in success, FALSE otherwise.

Examples

Example 20.117. A mysqli_poll example

```
<?php
$link1 = mysqli_connect();
$link1->query("SELECT 'test'", MYSQLI_ASYNC);
$all_links = array($link1);
$processed = 0;
do {
    $links = $errors = $reject = array();
    foreach ($all_links as $link) {
        $links[] = $errors[] = $reject[] = $link;
    }
    if (!mysqli_poll($links, $errors, $reject, 1)) {
        continue;
    }
    foreach ($links as $link) {
        if ($result = $link->reap_async_query()) {
            print_r($result->fetch_row());
            mysqli_free_result($result);
            $processed++;
        }
    }
} while ($processed < count($all_links));
?>
```

The above example will output:

```
Array
(
    [0] => test
)
```

See Also

20.10.2.7.36. mysqli::prepare, mysqli_prepare

Copyright 1997-2010 the PHP Documentation Group.

- mysqli::prepare

  mysqli_prepare

  Prepare a SQL statement for execution

Description

Object oriented style (method)

```
  mysqli_stmt mysqli::prepare(string query);
```

Procedure style:

```
  mysqli_stmt mysqli_prepare(mysqli link,
                             string query);
```

Prepares the SQL query, and returns a statement handle to be used for further operations on the statement. The query must consist of a single SQL statement.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

link	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
query	The query, as a string.

> **Note**
>
> You should not add a terminating semicolon or `\g` to the statement.

This parameter can include one or more parameter markers in the SQL statement by embedding question mark (`?`) characters at the appropriate positions.

> **Note**
>
> The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value.
>
> However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a `SELECT` statement, or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. It's not allowed to compare marker with `NULL` by `? IS NULL` too. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

`mysqli_prepare` returns a statement object or `FALSE` if an error occurred.

Examples

Example 20.118. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = $mysqli->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);
```

```
    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.119. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = mysqli_prepare($link, "SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Amersfoort is in district Utrecht
```

mysqli_stmt_close

20.10.2.7.37. mysqli::query, mysqli_query

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::query`

  `mysqli_query`

  Performs a query on the database

Description

Object oriented style (method):

```
mixed mysqli::query(string query,
                    int resultmode);
```

Procedural style:

```
mixed mysqli_query(mysqli link,
                   string query,
                   int resultmode);
```

Performs a *`query`* against the database.

Functionally, using this function is identical to calling `mysqli_real_query` followed either by `mysqli_use_result` or `mysqli_store_result`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`query`	The query string. Data inside the query should be properly escaped.
`resultmode`	Either the constant `MYSQLI_USE_RESULT` or `MYSQLI_STORE_RESULT` depending on the desired behavior. By default, `MYSQLI_STORE_RESULT` is used. If you use `MYSQLI_USE_RESULT` all subsequent calls will return error `Commands out of sync` unless you call `mysqli_free_result` With `MYSQLI_ASYNC` (available with mysqlnd), it is possible to perform query asynchronously. `mysqli_poll` is then used to get results from such queries.

Return Values

Returns `FALSE` on failure. For successful `SELECT, SHOW, DESCRIBE` or `EXPLAIN` queries `mysqli_query` will return a result object. For other successful queries `mysqli_query` will return `TRUE` .

Changelog

Version	Description
5.3.0	Added the ability of async queries.

Examples

Example 20.120. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if ($mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = $mysqli->query("SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", $result->num_rows);

    /* free result set */
    $result->close();
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = $mysqli->query("SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
       server until result set was closed. All calls will return an
       'out of sync' error */
    if (!$mysqli->query("SET @a:='this will not work'")) {
        printf("Error: %s\n", $mysqli->error);
    }
    $result->close();
}

$mysqli->close();
?>
```

Example 20.121. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if (mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = mysqli_query($link, "SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", mysqli_num_rows($result));

    /* free result set */
    mysqli_free_result($result);
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = mysqli_query($link, "SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
       server until result set was closed. All calls will return an
       'out of sync' error */
    if (!mysqli_query($link, "SET @a:='this will not work'")) {
        printf("Error: %s\n", mysqli_error($link));
    }
    mysqli_free_result($result);
}

mysqli_close($link);
?>
```

The above example will output:

```
Table myCity successfully created.
Select returned 10 rows.
Error: Commands out of sync;  You can't run this command now
```

20.10.2.7.38. `mysqli::real_connect`, `mysqli_real_connect`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::real_connect`

  `mysqli_real_connect`

  Opens a connection to a mysql server

Description

Object oriented style (method)

```
bool mysqli::real_connect(string host,
                          string username,
                          string passwd,
                          string dbname,
                          int port,
                          string socket,
                          int flags);
```

Procedural style

```
bool mysqli_real_connect(mysqli link,
                         string host,
                         string username,
                         string passwd,
                         string dbname,
                         int port,
                         string socket,
                         int flags);
```

Establish a connection to a MySQL database engine.

This function differs from `mysqli_connect`:

- `mysqli_real_connect` needs a valid object which has to be created by function `mysqli_init`.
- With the `mysqli_options` function you can set various options for connection.
- There is a *`flags`* parameter.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

host	Can be either a host name or an IP address. Passing the NULL value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
username	The MySQL user name.
passwd	If provided or NULL , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
dbname	If provided will specify the default database to be used when performing queries.
port	Specifies the port number to attempt to connect to the MySQL server.
socket	Specifies the socket or named pipe that should be used.

Note

Specifying the *socket* parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the *host* parameter.

flags With the parameter *flags* you can set different connection options:

Table 20.10. Supported flags

Name	Description
MYSQLI_CLIENT_COMPRESS	Use compression protocol
MYSQLI_CLIENT_FOUND_ROWS	return number of matched rows, not the number of affected rows
MYSQLI_CLIENT_IGNORE_SPACE	Allow spaces after function names. Makes all function names reserved words.
MYSQLI_CLIENT_INTERACTIVE	Allow interactive_timeout seconds (instead of wait_timeout seconds) of inactivity before closing the connection
MYSQLI_CLIENT_SSL	Use SSL (encryption)

Note

For security reasons the MULTI_STATEMENT flag is not supported in PHP. If you want to execute multiple queries use the mysqli_multi_query function.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.122. Object oriented style

```
<?php

$mysqli = mysqli_init();
if (!$mysqli) {
    die('mysqli_init failed');
}

if (!$mysqli->options(MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
    die('Setting MYSQLI_INIT_COMMAND failed');
}

if (!$mysqli->options(MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
    die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}
```

```
if (!$mysqli->real_connect('localhost', 'my_user', 'my_password', 'my_db')) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
            . mysqli_connect_error());
}

echo 'Success... ' . $mysqli->host_info . "\n";

$mysqli->close();
?>
```

Example 20.123. Object oriented style when extending mysqli class

```
<?php

class foo_mysqli extends mysqli {
    public function __construct($host, $user, $pass, $db) {
        parent::init();

        if (!parent::options(MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
            die('Setting MYSQLI_INIT_COMMAND failed');
        }

        if (!parent::options(MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
            die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
        }

        if (!parent::real_connect($host, $user, $pass, $db)) {
            die('Connect Error (' . mysqli_connect_errno() . ') '
                    . mysqli_connect_error());
        }
    }
}

$db = new foo_mysqli('localhost', 'my_user', 'my_password', 'my_db');

echo 'Success... ' . $db->host_info . "\n";

$db->close();
?>
```

Example 20.124. Procedural style

```
<?php

$link = mysqli_init();
if (!$link) {
    die('mysqli_init failed');
}

if (!mysqli_options($link, MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
    die('Setting MYSQLI_INIT_COMMAND failed');
}

if (!mysqli_options($link, MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
    die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}

if (!mysqli_real_connect($link, 'localhost', 'my_user', 'my_password', 'my_db')) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
            . mysqli_connect_error());
}

echo 'Success... ' . mysqli_get_host_info($link) . "\n";

mysqli_close($link);
?>
```

The above example will output:

```
Success... MySQL host info: localhost via TCP/IP
```

20.10.2.7.39. mysqli::real_escape_string, mysqli_real_escape_string

Copyright 1997-2010 the PHP Documentation Group.

- mysqli::real_escape_string

  mysqli_real_escape_string

  Escapes special characters in a string for use in a SQL statement, taking into account the current charset of the connection

Description

Object oriented style (both methods are equivalent):

```
  string mysqli::escape_string(string escapestr);
```

```
  string mysqli::real_escape_string(string escapestr);
```

Procedural style:

```
  string mysqli_real_escape_string(mysqli link,
                                   string escapestr);
```

This function is used to create a legal SQL string that you can use in an SQL statement. The given string is encoded to an escaped SQL string, taking into account the current character set of the connection.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
escapestr	The string to be escaped. Characters encoded are NUL (ASCII 0), \n, \r, \, ', ", and Control-Z.

Return Values

Returns an escaped string.

Examples

Example 20.125. Object oriented style

```
<?php
```

```
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!$mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", $mysqli->sqlstate);
}

$city = $mysqli->real_escape_string($city);

/* this query with escaped $city will work */
if ($mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", $mysqli->affected_rows);
}

$mysqli->close();
?>
```

Example 20.126. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", mysqli_sqlstate($link));
}

$city = mysqli_real_escape_string($link, $city);

/* this query with escaped $city will work */
if (mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", mysqli_affected_rows($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Error: 42000
1 Row inserted.
```

`mysqli_character_set_name`

20.10.2.7.40. mysqli::real_query, mysqli_real_query

Copyright 1997-2010 the PHP Documentation Group.

- mysqli::real_query

  mysqli_real_query

  Execute an SQL query

Description

Object oriented style (method):

```
bool mysqli::real_query(string query);
```

Procedural style

```
bool mysqli_real_query(mysqli link,
                       string query);
```

Executes a single query against the database whose result can then be retrieved or stored using the mysqli_store_result or mysqli_use_result functions.

In order to determine if a given query should return a result set or not, see mysqli_field_count.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
query	The query, as a string. Data inside the query should be properly escaped.

Return Values

Returns TRUE on success or FALSE on failure.

See Also

mysqli_query
mysqli_store_result
mysqli_use_result

20.10.2.7.41. mysqli::reap_async_query, mysqli_reap_async_query

Copyright 1997-2010 the PHP Documentation Group.

- mysqli::reap_async_query

  mysqli_reap_async_query

  Get result from async query

Description

```
public mysqli_result mysqli::reap_async_query();
```

```
mysqli_result mysqli_reap_async_query(mysql link);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

Get result from async query. Available only with mysqlnd.

Parameters

link	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `mysqli_result` in success, `FALSE` otherwise.

See Also

`mysqli_poll`

20.10.2.7.42. `mysqli::rollback`, `mysqli_rollback`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::rollback`

  `mysqli_rollback`

  Rolls back current transaction

Description

Object oriented style (method):

```
bool mysqli::rollback();
```

Procedural style:

```
bool mysqli_rollback(mysqli link);
```

Rollbacks the current transaction for the database.

Parameters

link	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.127. Object oriented style

```
<?php
```

```
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
$mysqli->autocommit(FALSE);

$mysqli->query("CREATE TABLE myCity LIKE City");
$mysqli->query("ALTER TABLE myCity Type=InnoDB");
$mysqli->query("INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
$mysqli->commit();

/* delete all rows */
$mysqli->query("DELETE FROM myCity");

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Rollback */
$mysqli->rollback();

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Drop table myCity */
$mysqli->query("DROP TABLE myCity");

$mysqli->close();
?>
```

Example 20.128. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE myCity LIKE City");
mysqli_query($link, "ALTER TABLE myCity Type=InnoDB");
mysqli_query($link, "INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
mysqli_commit($link);

/* delete all rows */
mysqli_query($link, "DELETE FROM myCity");

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Rollback */
mysqli_rollback($link);

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
```

```
    /* Free result */
    mysqli_free_result($result);
}

/* Drop table myCity */
mysqli_query($link, "DROP TABLE myCity");

mysqli_close($link);
?>
```

The above example will output:

```
0 rows in table myCity.
50 rows in table myCity (after rollback).
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::select_db`

  `mysqli_select_db`

  Selects the default database for database queries

Description

Object oriented style (method):

```
  bool mysqli::select_db(string dbname);
```

Procedural style:

```
  bool mysqli_select_db(mysqli link,
                        string dbname);
```

Selects the default database to be used when performing queries against the database connection.

> **Note**
>
> This function should only be used to change the default database for the connection. You can select the default database with 4th parameter in `mysqli_connect`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`dbname`	The database name.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.129. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

/* change db to world db */
$mysqli->select_db("world");

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

$mysqli->close();
?>
```

Example 20.130. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

/* change db to world db */
mysqli_select_db($link, "world");

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

mysqli_close($link);
?>
```

The above example will output:

```

```

```
Default database is test.
Default database is world.
```

See Also

`mysqli_connect`
`mysqli_real_connect`

20.10.2.7.44. `mysqli::set_charset`, `mysqli_set_charset`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_charset`

  `mysqli_set_charset`

  Sets the default client character set

Description

Object oriented style (method):

```
  bool mysqli::set_charset(string charset);
```

Procedural style:

```
  bool mysqli_set_charset(mysqli link,
                          string charset);
```

Sets the default character set to be used when sending data from and to the database server.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`charset`	The charset to be set as default.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

> **Note**
>
> To use this function on a Windows platform you need MySQL client library version 4.1.11 or above (for MySQL 5.0 you need 5.0.6 or above).

> **Note**
>
> This is the preferred way to change the charset. Using `mysqli::query` to execute `SET NAMES ..` is not recommended.

Examples

Example 20.131. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!$mysqli->set_charset("utf8")) {
    printf("Error loading character set utf8: %s\n", $mysqli->error);
} else {
    printf("Current character set: %s\n", $mysqli->character_set_name());
}

$mysqli->close();
?>
```

Example 20.132. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'test');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!mysqli_set_charset($link, "utf8")) {
    printf("Error loading character set utf8: %s\n", mysqli_error($link));
} else {
    printf("Current character set: %s\n", mysqli_character_set_name($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Current character set: utf8
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_local_infile_default`

`mysqli_set_local_infile_default`

Unsets user defined handler for load local infile command

Description

```
void mysqli_set_local_infile_default(mysqli link);
```

Deactivates a `LOAD DATA INFILE LOCAL` handler previously set with `mysqli_set_local_infile_handler`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

No value is returned.

Examples

See `mysqli_set_local_infile_handler` examples

See Also

`mysqli_set_local_infile_handler`

20.10.2.7.46. `mysqli::set_local_infile_handler`, `mysqli_set_local_infile_handler`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_local_infile_handler`

  `mysqli_set_local_infile_handler`

  Set callback function for LOAD DATA LOCAL INFILE command

Description

```
bool mysqli_set_local_infile_handler(mysqli link,
                                     callback read_func);
```

Object oriented style (method)

```
mysqli {

 bool set_local_infile_handler(mysqli link,
                               callback read_func);

}
```

Set callback function for LOAD DATA LOCAL INFILE command

The callbacks task is to read input from the file specified in the `LOAD DATA LOCAL INFILE` and to reformat it into the format understood by `LOAD DATA INFILE`.

The returned data needs to match the format specified in the `LOAD DATA`

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
read_func	A callback function or object method taking the following parameters:
stream	A PHP stream associated with the SQL commands INFILE
&buffer	A string buffer to store the rewritten input into
buflen	The maximum number of characters to be stored in the buffer
&errormsg	If an error occurs you can store an error message in here

The callback function should return the number of characters stored in the *buffer* or a negative value if an error occurred.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.133. Object oriented style

```
<?php
  $db = mysqli_init();
  $db->real_connect("localhost","root","","test");

  function callme($stream, &$buffer, $buflen, &$errmsg)
  {
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",", "\t", $buffer));

    return strlen($buffer);
  }

  echo "Input:\n";

  $db->set_local_infile_handler("callme");
  $db->query("LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
  $db->set_local_infile_default();

  $res = $db->query("SELECT * FROM t1");

  echo "\nResult:\n";
  while ($row = $res->fetch_assoc()) {
    echo join(",", $row)."\n";
  }
?>
```

Example 20.134. Procedural style

```
<?php
  $db = mysqli_init();
  mysqli_real_connect($db, "localhost","root","","test");

  function callme($stream, &$buffer, $buflen, &$errmsg)
  {
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
```

```
    $buffer = strtoupper(str_replace(",", "\t", $buffer));

    return strlen($buffer);
  }

  echo "Input:\n";

  mysqli_set_local_infile_handler($db, "callme");
  mysqli_query($db, "LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
  mysqli_set_local_infile_default($db);

  $res = mysqli_query($db, "SELECT * FROM t1");

  echo "\nResult:\n";
  while ($row = mysqli_fetch_assoc($res)) {
    echo join(",", $row)."\n";
  }
?>
```

The above example will output:

```

Input:
23,foo
42,bar

Output:
23,FOO
42,BAR
```

See Also

`mysqli_set_local_infile_default`

20.10.2.7.47. `mysqli->sqlstate`, `mysqli_sqlstate`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->sqlstate`

  `mysqli_sqlstate`

  Returns the SQLSTATE error from previous MySQL operation

Description

Object oriented style (property):

```
 mysqli {

  string sqlstate ;

}
```

Procedural style:

```
  string mysqli_sqlstate(mysqli link);
```

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see http://dev.mysql.com/doc/mysql/en/error-handling.html.

> **Note**
>
> Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for unmapped errors.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means no error.

Examples

Example 20.135. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!$mysqli->query("CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", $mysqli->sqlstate);
}

$mysqli->close();
?>
```

Example 20.136. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!mysqli_query($link, "CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", mysqli_sqlstate($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Error - SQLSTATE 42S01.
```

See Also

`mysqli_errno`
`mysqli_error`

20.10.2.7.48. `mysqli::ssl_set`, `mysqli_ssl_set`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::ssl_set`

  `mysqli_ssl_set`

  Used for establishing secure connections using SSL

Description

Object oriented style (method):

```
bool mysqli::ssl_set(string key,
                     string cert,
                     string ca,
                     string capath,
                     string cipher);
```

Procedural style:

```
bool mysqli_ssl_set(mysqli link,
                    string key,
                    string cert,
                    string ca,
                    string capath,
                    string cipher);
```

Used for establishing secure connections using SSL. It must be called before `mysqli_real_connect`. This function does nothing unless OpenSSL support is enabled.

Note that MySQL Native Driver does not support SSL, so calling this function when using MySQL Native Driver will result in an error. MySQL Native Driver is enabled by default on Microsoft Windows from PHP version 5.3 onwards.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
`key`	The path name to the key file.
`cert`	The path name to the certificate file.
`ca`	The path name to the certificate authority file.
`capath`	The pathname to a directory that contains trusted SSL CA certificates in PEM format.
`cipher`	A list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`

Return Values

This function always returns `TRUE` value. If SSL setup is incorrect `mysqli_real_connect` will return an error when you attempt to connect.

- mysqli::stat

  mysqli_stat

  Gets the current system status

Description

Object oriented style (method):

```
  string mysqli::stat();
```

Procedural style:

```
  string mysqli_stat(mysqli link);
```

mysqli_stat returns a string containing information similar to that provided by the 'mysqladmin status' command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

A string describing the server status. FALSE if an error occurred.

Examples

Example 20.137. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("System status: %s\n", $mysqli->stat());

$mysqli->close();
?>
```

Example 20.138. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
```

```
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("System status: %s\n", mysqli_stat($link));

mysqli_close($link);
?>
```

The above example will output:

```
System status: Uptime: 272  Threads: 1  Questions: 5340  Slow queries: 0
Opens: 13  Flush tables: 1  Open tables: 0  Queries per second avg: 19.632
Memory in use: 8496K  Max memory used: 8560K
```

See Also

`mysqli_get_server_info`

20.10.2.7.50. `mysqli::stmt_init`, `mysqli_stmt_init`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::stmt_init`

  `mysqli_stmt_init`

  Initializes a statement and returns an object for use with mysqli_stmt_prepare

Description

Object oriented style (property):

```
 mysqli {

  mysqli_stmt stmt_init();

}
```

Procedural style :

```
  mysqli_stmt mysqli_stmt_init(mysqli link);
```

Allocates and initializes a statement object suitable for `mysqli_stmt_prepare`.

> **Note**
>
> Any subsequent calls to any mysqli_stmt function will fail until `mysqli_stmt_prepare` was called.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns an object.

See Also

`mysqli_stmt_prepare`

20.10.2.7.51. `mysqli::store_result`, `mysqli_store_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::store_result`

  `mysqli_store_result`

  Transfers a result set from the last query

Description

Object oriented style (method):

```
mysqli_result mysqli::store_result();
```

Procedural style:

```
mysqli_result mysqli_store_result(mysqli link);
```

Transfers the result set from the last query on the database connection represented by the *`link`* parameter to be used with the `mysqli_data_seek` function.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a buffered result object or `FALSE` if an error occurred.

> **Note**
>
> `mysqli_store_result` returns `FALSE` in case the query didn't return a result set (if the query was, for example an INSERT statement). This function also returns `FALSE` if the reading of the result set failed. You can check if you have got an error by checking if `mysqli_error` doesn't return an empty string, if `mysqli_errno` returns a non zero value, or if `mysqli_field_count` returns a non zero value. Also possible reason for this function returning `FALSE` after successful call to `mysqli_query` can be too large result set (memory for it cannot be allocated). If `mysqli_field_count` returns a non-zero value, the statement should have produced a non-empty result set.

Notes

> **Note**
>
> Although it is always good practice to free the memory used by the result of a query using the `mysqli_free_result` function, when transferring large result sets using the `mysqli_store_result` this becomes particularly important.

Examples

See `mysqli_multi_query`.

`mysqli_real_query`
`mysqli_use_result`

20.10.2.7.52. `mysqli::thread_id`, `mysqli_thread_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::thread_id`

  `mysqli_thread_id`

  Returns the thread ID for the current connection

Description

Object oriented style (property):

```
 mysqli {

  int thread_id ;

}
```

Procedural style:

```
  int mysqli_thread_id(mysqli link);
```

The `mysqli_thread_id` function returns the thread ID for the current connection which can then be killed using the `mysqli_kill` function. If the connection is lost and you reconnect with `mysqli_ping`, the thread ID will be other. Therefore you should get the thread ID only when you need it.

> **Note**
>
> The thread ID is assigned on a connection-by-connection basis. Hence, if the connection is broken and then re-established a new thread ID will be assigned.
>
> To kill a running query you can use the SQL command `KILL QUERY processid`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns the Thread ID for the current connection.

Examples

Example 20.139. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>
```

Example 20.140. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit;
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

`mysqli_kill`

20.10.2.7.53. `mysqli::thread_safe`, `mysqli_thread_safe`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::thread_safe`

  `mysqli_thread_safe`

  Returns whether thread safety is given or not

Description

Procedural style:

```
bool mysqli_thread_safe();
```

Tells whether the client library is compiled as thread-safe.

Return Values

`TRUE` if the client library is thread-safe, otherwise `FALSE` .

20.10.2.7.54. `mysqli::use_result`, `mysqli_use_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::use_result`

  `mysqli_use_result`

  Initiate a result set retrieval

Description

Object oriented style (method):

```
mysqli_result mysqli::use_result();
```

Procedural style:

```
mysqli_result mysqli_use_result(mysqli link);
```

Used to initiate the retrieval of a result set from the last query executed using the `mysqli_real_query` function on the database connection.

Either this or the `mysqli_store_result` function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

> **Note**
>
> The `mysqli_use_result` function does not transfer the entire result set from the database and hence cannot be used functions such as `mysqli_data_seek` to move to a particular row within the set. To use this functionality, the result set must be stored using `mysqli_store_result`. One should not use `mysqli_use_result` if a lot of processing on the client side is performed, since this will tie up the server and prevent other threads from updating any tables from which the data is being fetched.

Return Values

Returns an unbuffered result object or `FALSE` if an error occurred.

Examples

Example 20.141. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
$query  = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->use_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->close();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----------------\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 20.142. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query  = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_use_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----------------\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
my_user@localhost
-----------------
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

20.10.2.7.55. `mysqli::warning_count`, `mysqli_warning_count`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::warning_count`

  `mysqli_warning_count`

  Returns the number of warnings from the last query for the given link

Description

Object oriented style (property):

```
 mysqli {

  int warning_count ;

}
```

Procedural style:

```
  int mysqli_warning_count(mysqli link);
```

Returns the number of warnings from the last query in the connection.

> **Note**
>
> For retrieving warning messages you can use the SQL command `SHOW WARNINGS [limit row_count]`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Number of warnings or zero if there are no warnings.

Examples

Example 20.143. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* a remarkable city in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
        'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogogoch')";

$mysqli->query($query);
```

```
if ($mysqli->warning_count) {
    if ($result = $mysqli->query("SHOW WARNINGS")) {
        $row = $result->fetch_row();
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        $result->close();
    }
}

/* close connection */
$mysqli->close();
?>
```

Example 20.144. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* a remarkable long city name in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
        'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogogoch')";

mysqli_query($link, $query);

if (mysqli_warning_count($link)) {
    if ($result = mysqli_query($link, "SHOW WARNINGS")) {
        $row = mysqli_fetch_row($result);
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        mysqli_free_result($result);
    }
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Warning (1264): Data truncated for column 'Name' at row 1
```

}
```

20.10.2.8.1. `mysqli_stmt->affected_rows`, `mysqli_stmt_affected_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt->affected_rows`

  `mysqli_stmt_affected_rows`

  Returns the total number of rows changed, deleted, or inserted by the last executed statement

Description

Object oriented style (property):

```
 mysqli_stmt {
  int affected_rows ;
}
```

Procedural style :

```
  int mysqli_stmt_affected_rows(mysqli_stmt stmt);
```

Returns the number of rows affected by `INSERT`, `UPDATE`, or `DELETE` query.

This function only works with queries which update a table. In order to get the number of rows from a SELECT query, use `mysqli_stmt_num_rows` instead.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records where updated for an UPDATE/DELETE statement, no rows matched the WHERE clause in the query or that no query has yet been executed. -1 indicates that the query has returned an error. NULL indicates an invalid argument was supplied to the function.

> **Note**
>
> If the number of affected rows is greater than maximal PHP int value, the number of affected rows will be returned as a string value.

Examples

Example 20.145. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
$mysqli->query("CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = $mysqli->prepare($query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    $stmt->bind_param("s", $code);

    /* execute statement */
    $stmt->execute();

    printf("rows inserted: %d\n", $stmt->affected_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.146. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
mysqli_query($link, "CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = mysqli_prepare($link, $query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    mysqli_stmt_bind_param($stmt, "s", $code);

    /* execute statement */
    mysqli_stmt_execute($stmt);

    printf("rows inserted: %d\n", mysqli_stmt_affected_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
rows inserted: 17
```

See Also

`mysqli_stmt_num_rows`
`mysqli_prepare`

20.10.2.8.2. `mysqli_stmt::attr_get`, `mysqli_stmt_attr_get`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::attr_get`

  `mysqli_stmt_attr_get`

  Used to get the current value of a statement attribute

Description

Object oriented style (method):

```
int mysqli_stmt::attr_get(int attr);
```

Procedural style:

```
int mysqli_stmt_attr_get(mysqli_stmt stmt,
                         int attr);
```

Gets the current value of a statement attribute.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`attr`	The attribute that you want to get.

Return Values

Returns `FALSE` if the attribute is not found, otherwise returns the value of the attribute.

20.10.2.8.3. `mysqli_stmt::attr_set`, `mysqli_stmt_attr_set`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::attr_set`

  `mysqli_stmt_attr_set`

  Used to modify the behavior of a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::attr_set(int attr,
                           int mode);
```

Procedural style:

```
bool mysqli_stmt_attr_set(mysqli_stmt stmt,
                          int attr,
                          int mode);
```

Used to modify the behavior of a prepared statement. This function may be called multiple times to set several attributes.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

attr The attribute that you want to set. It can have one of the following values:

Table 20.11. Attribute values

Character	Description
MYSQLI_STMT_ATTR_UPDATE_MAX_LENGTH	If set to 1, causes `mysqli_stmt_store_result` to update the metadata `MYSQL_FIELD->max_length` value.
MYSQLI_STMT_ATTR_CURSOR_TYPE	Type of cursor to open for statement when `mysqli_stmt_execute` is invoked. *mode* can be `MYSQLI_CURSOR_TYPE_NO_CURSOR` (the default) or `MYSQLI_CURSOR_TYPE_READ_ONLY`.
MYSQLI_STMT_ATTR_PREFETCH_ROWS	Number of rows to fetch from server at a time when using a cursor. *mode* can be in the range from 1 to the maximum value of unsigned long. The default is 1.

If you use the `MYSQLI_STMT_ATTR_CURSOR_TYPE` option with `MYSQLI_CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysqli_stmt_execute`. If there is already an open cursor from a previous `mysqli_stmt_execute` call, it closes the cursor before opening a new one. `mysqli_stmt_reset` also closes any open cursor before preparing the statement for re-execution. `mysqli_stmt_free_result` closes any open cursor.

If you open a cursor for a prepared statement, `mysqli_stmt_store_result` is unnecessary.

mode The value to assign to the attribute.

20.10.2.8.4. `mysqli_stmt::bind_param`, `mysqli_stmt_bind_param`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::bind_param`

  `mysqli_stmt_bind_param`

  Binds variables to a prepared statement as parameters

Description

Object oriented style (method):

```
bool mysqli_stmt::bind_param(string types,
```

```
                              mixed var1,
                              mixed ...);
```

Procedural style:

```
 bool mysqli_stmt_bind_param(mysqli_stmt stmt,
                             string types,
                             mixed var1,
                             mixed ...);
```

Bind variables for the parameter markers in the SQL statement that was passed to `mysqli_prepare`.

> **Note**
>
> If data size of a variable exceeds max. allowed packet size (max_allowed_packet), you have to specify `b` in *`types`* and use `mysqli_stmt_send_long_data` to send the data in packets.

> **Note**
>
> Care must be taken when using `mysqli_stmt_bind_param` in conjunction with `call_user_func_array`. Note that `mysqli_stmt_bind_param` requires parameters to be passed by reference, whereas `call_user_func_array` can accept as a parameter a list of variables that can represent references or values.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

`types` A string that contains one or more characters which specify the types for the corresponding bind variables:

Table 20.12. Type specification chars

Character	Description
i	corresponding variable has type integer
d	corresponding variable has type double
s	corresponding variable has type string
b	corresponding variable is a blob and will be sent in packets

`var1` The number of variables and length of string *`types`* must match the parameters in the statement.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.147. Object oriented style

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = $mysqli->prepare("INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
$stmt->bind_param('sssd', $code, $language, $official, $percent);

$code = 'DEU';
```

```
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
$stmt->execute();

printf("%d Row inserted.\n", $stmt->affected_rows);

/* close statement and connection */
$stmt->close();

/* Clean up table CountryLanguage */
$mysqli->query("DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", $mysqli->affected_rows);

/* close connection */
$mysqli->close();
?>
```

Example 20.148. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = mysqli_prepare($link, "INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
mysqli_stmt_bind_param($stmt, 'sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
mysqli_stmt_execute($stmt);

printf("%d Row inserted.\n", mysqli_stmt_affected_rows($stmt));

/* close statement and connection */
mysqli_stmt_close($stmt);

/* Clean up table CountryLanguage */
mysqli_query($link, "DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", mysqli_affected_rows($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
1 Row inserted.
1 Row deleted.
```

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_stmt::bind_result

  mysqli_stmt_bind_result

  Binds variables to a prepared statement for result storage

Description

Object oriented style (method):

```
  bool mysqli_stmt::bind_result(mixed var1,
                                mixed ...);
```

Procedural style:

```
  bool mysqli_stmt_bind_result(mysqli_stmt stmt,
                               mixed var1,
                               mixed ...);
```

Binds columns in the result set to variables.

When mysqli_stmt_fetch is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified variables *var1, ...*.

> **Note**
>
> Note that all columns must be bound after mysqli_stmt_execute and prior to calling mysqli_stmt_fetch. Depending on column types bound variables can silently change to the corresponding PHP type.
>
> A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time mysqli_stmt_fetch is called.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.
var1	The variable to be bound.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.149. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
/* prepare statement */
if ($stmt = $mysqli->prepare("SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    $stmt->execute();

    /* bind variables to prepared statement */
    $stmt->bind_result($col1, $col2);

    /* fetch values */
    while ($stmt->fetch()) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    $stmt->close();
}
/* close connection */
$mysqli->close();

?>
```

Example 20.150. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = mysqli_prepare($link, "SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    mysqli_stmt_execute($stmt);

    /* bind variables to prepared statement */
    mysqli_stmt_bind_result($stmt, $col1, $col2);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
AFG Afghanistan
ALB Albania
DZA Algeria
ASM American Samoa
AND Andorra
```

20.10.2.8.6. mysqli_stmt::close, mysqli_stmt_close

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_stmt::close

  mysqli_stmt_close

  Closes a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::close();
```

Procedural style:

```
bool mysqli_stmt_close(mysqli_stmt stmt);
```

Closes a prepared statement. mysqli_stmt_close also deallocates the statement handle. If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns TRUE on success or FALSE on failure.

See Also

mysqli_prepare

20.10.2.8.7. mysqli_stmt::data_seek, mysqli_stmt_data_seek

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_stmt::data_seek

  mysqli_stmt_data_seek

  Seeks to an arbitrary row in statement result set

Description

Object oriented style (method):

```
void mysqli_stmt::data_seek(int offset);
```

Procedural style:

```
  void mysqli_stmt_data_seek(mysqli_stmt stmt,
                             int offset);
```

Seeks to an arbitrary result pointer in the statement result set.

`mysqli_stmt_store_result` must be called prior to `mysqli_stmt_data_seek`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`offset`	Must be between zero and the total number of rows minus one (0.. `mysqli_stmt_num_rows` - 1).

Return Values

No value is returned.

Examples

Example 20.151. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* store result */
    $stmt->store_result();

    /* seek to row no. 400 */
    $stmt->data_seek(399);

    /* fetch values */
    $stmt->fetch();

    printf ("City: %s  Countrycode: %s\n", $name, $code);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.152. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
```

```
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* store result */
    mysqli_stmt_store_result($stmt);

    /* seek to row no. 400 */
    mysqli_stmt_data_seek($stmt, 399);

    /* fetch values */
    mysqli_stmt_fetch($stmt);

    printf ("City: %s  Countrycode: %s\n", $name, $code);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
City: Benin City  Countrycode: NGA
```

See Also

`mysqli_prepare`

20.10.2.8.8. `mysqli_stmt->errno`, `mysqli_stmt_errno`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt->errno`

  `mysqli_stmt_errno`

  Returns the error code for the most recent statement call

Description

Object oriented style (property):

```
 mysqli_stmt {

  int errno ;

}
```

Procedural style :

```
  int mysqli_stmt_errno(mysqli_stmt stmt);
```

Returns the error code for the most recently invoked statement function that can succeed or fail.

Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file `Docs/mysqld_error.txt`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An error code value. Zero means no error occurred.

Examples

Example 20.153. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %d.\n", $stmt->errno);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.154. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {
```

```
    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %d.\n", mysqli_stmt_errno($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: 1146.
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt->error`

  `mysqli_stmt_error`

  Returns a string description for last statement error

Description

Object oriented style (property):

```
 mysqli_stmt {

  string error ;

}
```

Procedural style:

```
  string mysqli_stmt_error(mysqli_stmt stmt);
```

Returns a containing the error message for the most recently invoked statement function that can succeed or fail.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 20.155. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->error);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.156. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_error($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: Table 'world.myCountry' doesn't exist.
```

See Also

`mysqli_stmt_errno`
`mysqli_stmt_sqlstate`

20.10.2.8.10. `mysqli_stmt::execute`, `mysqli_stmt_execute`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::execute`

  `mysqli_stmt_execute`

  Executes a prepared Query

Description

Object oriented style (method):

```
  bool mysqli_stmt::execute();
```

Procedural style:

```
  bool mysqli_stmt_execute(mysqli_stmt stmt);
```

Executes a query that has been previously prepared using the `mysqli_prepare` function. When executed any parameter markers which exist will automatically be replaced with the appropriate data.

If the statement is `UPDATE`, `DELETE`, or `INSERT`, the total number of affected rows can be determined by using the `mysqli_stmt_affected_rows` function. Likewise, if the query yields a result set the `mysqli_stmt_fetch` function is used.

> **Note**
>
> When using `mysqli_stmt_execute`, the `mysqli_stmt_fetch` function must be used to fetch the data prior to performing any additional queries.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.157. Object oriented style

```
<?php
```

```
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?,?,?)";
$stmt = $mysqli->prepare($query);

$stmt->bind_param("sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
$stmt->execute();

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
$stmt->execute();

/* close statement */
$stmt->close();

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = $mysqli->query($query)) {
    while ($row = $result->fetch_row()) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    $result->close();
}

/* remove table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>
```

Example 20.158. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?,?,?)";
$stmt = mysqli_prepare($link, $query);

mysqli_stmt_bind_param($stmt, "sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
mysqli_stmt_execute($stmt);

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
```

```
mysqli_stmt_execute($stmt);

/* close statement */
mysqli_stmt_close($stmt);

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = mysqli_query($link, $query)) {
    while ($row = mysqli_fetch_row($result)) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    mysqli_free_result($result);
}

/* remove table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Stuttgart (DEU,Baden-Wuerttemberg)
Bordeaux (FRA,Aquitaine)
```

20.10.2.8.11. `mysqli_stmt::fetch`, `mysqli_stmt_fetch`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::fetch`

  `mysqli_stmt_fetch`

  Fetch results from a prepared statement into the bound variables

Description

Object oriented style (method):

```
  bool mysqli_stmt::fetch();
```

Procedural style:

```
  bool mysqli_stmt_fetch(mysqli_stmt stmt);
```

Fetch the result from a prepared statement into the variables bound by `mysqli_stmt_bind_result`.

> **Note**
>
> Note that all columns must be bound by the application before calling `mysqli_stmt_fetch`.

> **Note**

Data are transferred unbuffered without calling `mysqli_stmt_store_result` which can decrease performance (but reduces memory cost).

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Table 20.13. Return Values

Value	Description
`TRUE`	Success. Data has been fetched
`FALSE`	Error occurred
`NULL`	No more rows/data exists or data truncation occurred

Examples

Example 20.159. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {

    /* execute statement */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* fetch values */
    while ($stmt->fetch()) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.160. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";
```

```
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute statement */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)
```

  `mysqli_stmt_free_result`

  Frees stored result memory for the given statement handle

Description

Object oriented style (method):

```
void mysqli_stmt::free_result();
```

Procedural style:

```
void mysqli_stmt_free_result(mysqli_stmt stmt);
```

Frees the result memory associated with the statement, which was allocated by `mysqli_stmt_store_result`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

No value is returned.

20.10.2.8.16. `mysqli_stmt::num_rows`, `mysqli_stmt_num_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::num_rows`

  `mysqli_stmt_num_rows`

  Return the number of rows in statements result set

Description

Object oriented style (property):

```
 mysqli_stmt {
  int num_rows ;
}
```

Procedural style :

```
  int mysqli_stmt_num_rows(mysqli_stmt stmt);
```

Returns the number of rows in the result set. The use of `mysqli_stmt_num_rows` depends on whether or not you used `mysqli_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysqli_stmt_store_result`, `mysqli_stmt_num_rows` may be called immediately.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer representing the number of rows in result set.

Examples

Example 20.161. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.162. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Number of rows: 20.
```

20.10.2.8.17. mysqli_stmt->param_count, mysqli_stmt_param_count

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_stmt->param_count

  mysqli_stmt_param_count

  Returns the number of parameter for the given statement

Description

Object oriented style (property):

```
 mysqli_stmt {

  int param_count ;

}
```

Procedural style:

```
  int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns an integer representing the number of parameters.

Examples

Example 20.163. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = $stmt->param_count;
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    $stmt->close();
```

```
}

/* close connection */
$mysqli->close();
?>
```

Example 20.164. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = mysqli_stmt_param_count($stmt);
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

Statement has 2 markers.
```

See Also

`mysqli_prepare`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::prepare`

  `mysqli_stmt_prepare`

  Prepare a SQL statement for execution

Description

Object oriented style (method)

```
  mixed mysqli_stmt::prepare(string query);
```

Procedure style:

```
  bool mysqli_stmt_prepare(mysqli_stmt stmt,
```

```
                            string query);
```

Prepares the SQL query pointed to by the null-terminated string query.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`query`	The query, as a string. It must consist of a single SQL statement. You can include one or more parameter markers in the SQL statement by embedding question mark (`?`) characters at the appropriate positions.

> **Note**
>
> You should not add a terminating semicolon or `\g` to the statement.

> **Note**
>
> The markers are legal only in certain places in SQL statements. For example, they are allowed in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value.
>
> However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a SELECT statement), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.165. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt =  $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);
```

```
    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.166. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if (mysqli_stmt_prepare($stmt, 'SELECT District FROM City WHERE Name=?')) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Amersfoort is in district Utrecht
```

20.10.2.8.19. `mysqli_stmt::reset`, `mysqli_stmt_reset`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::reset`

  `mysqli_stmt_reset`

Resets a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::reset();
```

Procedural style:

```
bool mysqli_stmt_reset(mysqli_stmt stmt);
```

Resets a prepared statement on client and server to state after prepare.

It resets the statement on the server, data sent using `mysqli_stmt_send_long_data`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To prepare a statement with another query use function `mysqli_stmt_prepare`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

20.10.2.8.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::result_metadata`

  `mysqli_stmt_result_metadata`

  Returns result set metadata from a prepared statement

Description

Object oriented style (method):

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style:

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to `mysqli_prepare` is one that produces a result set, `mysqli_stmt_result_metadata` returns the result object that can be used to process the meta information such as total number of fields and individual field information.

> **Note**
>
> This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata,

such as:

- mysqli_num_fields
- mysqli_fetch_field
- mysqli_fetch_field_direct
- mysqli_fetch_fields
- mysqli_field_count
- mysqli_field_seek
- mysqli_field_tell
- mysqli_free_result

The result set structure should be freed when you are done with it, which you can do by passing it to mysqli_free_result

Note

The result set returned by mysqli_stmt_result_metadata contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with mysqli_stmt_fetch.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns a result object or FALSE if an error occurred.

Examples

Example 20.167. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query("DROP TABLE IF EXISTS friends");
$mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = $mysqli->prepare("SELECT id, name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 20.168. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

See Also

`mysqli_prepare`
`mysqli_free_result`

20.10.2.8.21. `mysqli_stmt::send_long_data`, `mysqli_stmt_send_long_data`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::send_long_data`

  `mysqli_stmt_send_long_data`

  Send data in blocks

Description

Object oriented style (method)

```
  bool mysqli_stmt::send_long_data(int param_nr,
                                   string data);
```

Procedural style:

```
  bool mysqli_stmt_send_long_data(mysqli_stmt stmt,
                                  int param_nr,
                                  string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of `max_allowed_packet`. This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.
param_nr	Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.
data	A string containing data to be sent.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.169. Object oriented style

```
<?php
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?)");
$null = NULL;
$stmt->bind_param("b", $null);
$fp = fopen("messages.txt", "r");
while (!feof($fp)) {
    $stmt->send_long_data(0, fread($fp, 8192));
}
fclose($fp);
$stmt->execute();
?>
```

mysqli_prepare
mysqli_stmt_bind_param

20.10.2.8.22. mysqli_stmt::sqlstate, mysqli_stmt_sqlstate

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_stmt::sqlstate

  mysqli_stmt_sqlstate

  Returns SQLSTATE error from previous statement operation

Description

Object oriented style (property):

```
 mysqli_stmt {

  string sqlstate ;

}
```

Procedural style:

```
  string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see http://dev.mysql.com/doc/mysql/en/error-handling.html.

Parameters

stmt Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

Notes

> **Note**
>
> Note that not all MySQL errors are yet mapped to SQLSTATE's. The value HY000 (general error) is used for unmapped errors.

Examples

Example 20.170. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->sqlstate);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.171. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
```

```
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: 42S02.
```

20.10.2.8.23. `mysqli_stmt::store_result`, `mysqli_stmt_store_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::store_result`

  `mysqli_stmt_store_result`

  Transfers a result set from a prepared statement

Description

Object oriented style (method):

```
  bool mysqli_stmt::store_result();
```

Procedural style:

```
  bool mysqli_stmt_store_result(mysqli_stmt stmt);
```

You must call `mysqli_stmt_store_result` for every query that successfully produces a result set (`SELECT, SHOW, DESCRIBE, EXPLAIN`), and only if you want to buffer the complete result set by the client, so that the subsequent `mysqli_stmt_fetch` call returns buffered data.

> **Note**
>
> It is unnecessary to call `mysqli_stmt_store_result` for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if `mysqli_stmt_result_metadata` returns NULL.

Parameters

stmt Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.172. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* free result */
    $stmt->free_result();

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.173. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* free result */
    mysqli_stmt_free_result($stmt);

    /* close statement */
    mysqli_stmt_close($stmt);
}
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Number of rows: 20.
```

Represents the result set obtained from a query against the database.

```
 MySQLi_Result {
 MySQLi_Result

      Properties

  int current_field ;

  int field_count ;

  array lengths ;

  int num_rows ;

Methods

  int mysqli_field_tell(mysqli_result result);

  bool mysqli_result::data_seek(int offset);

  mixed mysqli_result::fetch_all(int resulttype= =MYSQLI_NUM);

  mixed mysqli_result::fetch_array(int resulttype= =MYSQLI_BOTH);

  array mysqli_result::fetch_assoc();

  object mysqli_result::fetch_field_direct(int fieldnr);

  object mysqli_result::fetch_field();

  array mysqli_result::fetch_fields();

  object mysqli_result::fetch_object(string class_name,
                                     array params);
```

```
  mixed mysqli_result::fetch_row();

  int mysqli_num_fields(mysqli_result result);

  bool mysqli_result::field_seek(int fieldnr);

  void mysqli_result::free();

  array mysqli_fetch_lengths(mysqli_result result);

  int mysqli_num_rows(mysqli_result result);
}
```

20.10.2.9.1. `mysqli_result->current_field`, `mysqli_field_tell`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->current_field`

  `mysqli_field_tell`

  Get current field offset of a result pointer

Description

Object oriented style (property):

```
 mysqli_result {
  int current_field ;
}
```

Procedural style:

```
  int mysqli_field_tell(mysqli_result result);
```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns current offset of field cursor.

Examples

Example 20.174. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
```

```
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        /* get fieldpointer offset */
        $currentfield = $result->current_field;

        printf("Column %d:\n", $currentfield);
        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.175. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        /* get fieldpointer offset */
        $currentfield = mysqli_field_tell($result);

        printf("Column %d:\n", $currentfield);
        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Column 1:
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254
```

```
Column 2:
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

mysqli_field_seek

20.10.2.9.2. mysqli_result::data_seek, mysqli_data_seek

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_result::data_seek

  mysqli_data_seek

  Adjusts the result pointer to an arbitary row in the result

Description

Object oriented style (method):

```
  bool mysqli_result::data_seek(int offset);
```

Procedural style:

```
  bool mysqli_data_seek(mysqli_result result,
                        int offset);
```

The mysqli_data_seek function seeks to an arbitrary result pointer specified by the *offset* in the result set.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
offset	The field offset. Must be between zero and the total number of rows minus one (0..mysqli_num_rows - 1).

Return Values

Returns TRUE on success or FALSE on failure.

Notes

> **Note**
>
> This function can only be used with buffered results attained from the use of the mysqli_store_result or mysqli_query functions.

Examples

Example 20.176. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query( $query)) {

    /* seek to row no. 400 */
    $result->data_seek(399);

    /* fetch row */
    $row = $result->fetch_row();

    printf ("City: %s  Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.177. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";

if ($result = mysqli_query($link, $query)) {

    /* seek to row no. 400 */
    mysqli_data_seek($result, 399);

    /* fetch row */
    $row = mysqli_fetch_row($result);

    printf ("City: %s  Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
City: Benin City  Countrycode: NGA
```

mysqli_fetch_object
mysqli_query
mysqli_num_rows

20.10.2.9.3. mysqli_result::fetch_all, mysqli_fetch_all

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_result::fetch_all

  mysqli_fetch_all

  Fetches all result rows as an associative array, a numeric array, or both

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_all(int resulttype= =MYSQLI_NUM);
```

Procedural style:

```
mixed mysqli_fetch_all(mysqli_result result,
                       int resulttype= =MYSQLI_NUM);
```

mysqli_fetch_all fetches all result rows and returns the result set as an associative array, a numeric array, or both.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
resulttype	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants MYSQLI_ASSOC , MYSQLI_NUM , or MYSQLI_BOTH .

Return Values

Returns an array of associative or numeric arrays holding result rows.

MySQL Native Driver Only

Available only with mysqlnd.

As mysqli_fetch_all returns all the rows as an array in a single step, it may consume more memory than some similar functions such as mysqli_fetch_array, which only returns one row at a time from the result set. Further, if you need to iterate over the result set, you will need a looping construct that will further impact performance. For these reasons mysqli_fetch_all should only be used in those situations where the fetched result set will be sent to another layer for processing.

See Also

mysqli_fetch_array
mysqli_query

20.10.2.9.4. mysqli_result::fetch_array, mysqli_fetch_array

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_result::fetch_array

  mysqli_fetch_array

  Fetch a result row as an associative, a numeric array, or both

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_array(int resulttype= =MYSQLI_BOTH);
```

Procedural style:

```
mixed mysqli_fetch_array(mysqli_result result,
                         int resulttype= =MYSQLI_BOTH);
```

Returns an array that corresponds to the fetched row or NULL if there are no more rows for the resultset represented by the *result* parameter.

mysqli_fetch_array is an extended version of the mysqli_fetch_row function. In addition to storing the data in the numeric indices of the result array, the mysqli_fetch_array function can also store the data in associative indices, using the field names of the result set as keys.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP NULL value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data. In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
resulttype	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants MYSQLI_ASSOC , MYSQLI_NUM , or MYSQLI_BOTH . By using the MYSQLI_ASSOC constant this function will behave identically to the mysqli_fetch_assoc, while MYSQLI_NUM will behave identically to the mysqli_fetch_row function. The final option MYSQLI_BOTH will create a single array with the attributes of both.

Return Values

Returns an array of strings that corresponds to the fetched row or NULL if there are no more rows in resultset.

Examples

Example 20.178. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 20.179. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Kabul (AFG)
Qandahar (AFG)
Herat (AFG)
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_assoc`

  `mysqli_fetch_assoc`

  Fetch a result row as an associative array

Description

Object oriented style (method):

```
array mysqli_result::fetch_assoc();
```

Procedural style:

```
array mysqli_fetch_assoc(mysqli_result result);
```

Returns an associative array that corresponds to the fetched row or `NULL` if there are no more rows.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP `NULL` value.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or `NULL` if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysqli_fetch_row` or add alias names.

Examples

Example 20.180. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch associative array */
    while ($row = $result->fetch_assoc()) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.181. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_assoc($result)) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

mysqli_data_seek

20.10.2.9.6. mysqli_result::fetch_field_direct, mysqli_fetch_field_direct

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_result::fetch_field_direct

  mysqli_fetch_field_direct

  Fetch meta-data for a single field

Description

Object oriented style (method):

```
object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style:

```
object mysqli_fetch_field_direct(mysqli_result result,
                                 int fieldnr);
```

Returns an object which contains field definition information from the specified result set.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
fieldnr	The field number. This value must be in the range from 0 to number of fields - 1.

Return Values

Returns an object which contains field definition information or FALSE if no field information for specified fieldnr is available.

Table 20.14. Object attributes

Attribute	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.182. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = $result->fetch_field_direct(1);

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.183. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = mysqli_fetch_field_direct($result, 1);

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

- `mysqli_result::fetch_field`

  `mysqli_fetch_field`

  Returns the next field in the result set

Description

Object oriented style (method):

```
object mysqli_result::fetch_field();
```

Procedural style:

```
object mysqli_fetch_field(mysqli_result result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an object which contains field definition information or `FALSE` if no field information is available.

Table 20.15. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.

Property	Description
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.184. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.185. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

20.10.2.9.8. mysqli_result::fetch_fields, mysqli_fetch_fields

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_result::fetch_fields

  mysqli_fetch_fields

  Returns an array of objects representing the fields in a result set

Description

Object oriented style (method):

```
array mysqli_result::fetch_fields();
```

Procedural Style:

```
array mysqli_fetch_fields(mysqli_result result);
```

This function serves an identical purpose to the mysqli_fetch_field function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.

Return Values

Returns an array of objects which contains field definition information or FALSE if no field information is available.

Table 20.16. Object properties

Property	Description
name	The name of the column

Property	Description
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.186. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    $finfo = $result->fetch_fields();

    foreach ($finfo as $val) {
        printf("Name:     %s\n", $val->name);
        printf("Table:    %s\n", $val->table);
        printf("max. Len: %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.187. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all columns */
    $finfo = mysqli_fetch_fields($result);

    foreach ($finfo as $val) {
        printf("Name:     %s\n", $val->name);
```

```
        printf("Table:    %s\n", $val->table);
        printf("max. Len: %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_object`

  `mysqli_fetch_object`

  Returns the current row of a result set as an object

Description

Object oriented style (method):

```
  object mysqli_result::fetch_object(string class_name,
                                     array params);
```

Procedural style:

```
  object mysqli_fetch_object(mysqli_result result,
                             string class_name,
                             array params);
```

The `mysqli_fetch_object` will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
class_name	The name of the class to instantiate, set the properties of and return. If not specified, a stdClass object is returned.
params	An optional array of parameters to pass to the constructor for *class_name* objects.

Return Values

Returns an object with string properties that corresponds to the fetched row or NULL if there are no more rows in resultset.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP NULL value.

Changelog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 20.188. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch object array */
    while ($obj = $result->fetch_object()) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.189. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
```

```
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($obj = mysqli_fetch_object($result)) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_row`

  `mysqli_fetch_row`

  Get a result row as an enumerated array

Description

Object oriented style (method):

```
  mixed mysqli_result::fetch_row();
```

Procedural style:

```
  mixed mysqli_fetch_row(mysqli_result result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or `NULL` if there are no more rows.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.

Return Values

mysqli_fetch_row returns an array of strings that corresponds to the fetched row or NULL if there are no more rows in result set.

> **Note**
>
> This function sets NULL fields to the PHP NULL value.

Examples

Example 20.190. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch object array */
    while ($row = $result->fetch_row()) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.191. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_row($result)) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
```

```
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

20.10.2.9.11. `mysqli_result->field_count`, `mysqli_num_fields`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->field_count`

  `mysqli_num_fields`

  Get the number of fields in a result

Description

Object oriented style (property):

```
 mysqli_result {

  int field_count ;

}
```

Procedural style:

```
  int mysqli_num_fields(mysqli_result result);
```

Returns the number of fields from specified result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

The number of fields from a result set.

Examples

Example 20.192. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = $result->field_count;

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.193. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = mysqli_num_fields($result);

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Result set has 5 fields.
```

`mysqli_fetch_field`

20.10.2.9.12. `mysqli_result::field_seek`, `mysqli_field_seek`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::field_seek`

  `mysqli_field_seek`

  Set result pointer to a specified field offset

Description

Object oriented style (method):

```
  bool mysqli_result::field_seek(int fieldnr);
```

Procedural style:

```
  bool mysqli_field_seek(mysqli_result result,
                         int fieldnr);
```

Sets the field cursor to the given offset. The next call to `mysqli_fetch_field` will retrieve the field definition of the column associated with that offset.

> **Note**
>
> To seek to the beginning of a row, pass an offset value of zero.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.
`fieldnr`	The field number. This value must be in the range from `0` to `number of fields - 1`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.194. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for 2nd column */
    $result->field_seek(1);
    $finfo = $result->fetch_field();

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n\n", $finfo->type);

    $result->close();
```

```
}

/* close connection */
$mysqli->close();
?>
```

Example 20.195. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for 2nd column */
    mysqli_field_seek($result, 1);
    $finfo = mysqli_fetch_field($result);

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

See Also

`mysqli_fetch_field`

20.10.2.9.13. `mysqli_result::free`, `mysqli_free_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::free`

  `mysqli_free_result`

  Frees the memory associated with a result

Description

Object oriented style (all methods are equivalent):

```
  void mysqli_result::free();

  void mysqli_result::close();

  void mysqli_result::free_result();
```

Procedural style:

```
  void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

> **Note**
>
> You should always free your result with `mysqli_free_result`, when your result object is not needed anymore.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

No value is returned.

See Also

`mysqli_query`
`mysqli_stmt_store_result`

`mysqli_use_result`

20.10.2.9.14. `mysqli_result->lengths`, `mysqli_fetch_lengths`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->lengths`

  `mysqli_fetch_lengths`

  Returns the lengths of the columns of the current row in the result set

Description

Object oriented style (property):

```
 mysqli_result {
  array lengths ;
}
```

Procedural style:

```
  array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

An array of integers representing the size of each column (not including any terminating null characters). `FALSE` if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns `FALSE` if you call it before calling mysqli_fetch_row/array/object or after retrieving all rows in the result.

Examples

Example 20.196. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = $mysqli->query($query)) {

    $row = $result->fetch_row();

    /* display column lengths */
    foreach ($result->lengths as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.197. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = mysqli_query($link, $query)) {

    $row = mysqli_fetch_row($result);

    /* display column lengths */
    foreach (mysqli_fetch_lengths($result) as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    mysqli_free_result($result);
}
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Field  1 has Length  3
Field  2 has Length  5
Field  3 has Length 13
Field  4 has Length  9
Field  5 has Length  6
Field  6 has Length  1
Field  7 has Length  6
Field  8 has Length  4
Field  9 has Length  6
Field 10 has Length  6
Field 11 has Length  5
Field 12 has Length 44
Field 13 has Length  7
Field 14 has Length  3
Field 15 has Length  2
```

20.10.2.9.15. `mysqli_result->num_rows`, `mysqli_num_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->num_rows`

  `mysqli_num_rows`

  Gets the number of rows in a result

Description

Object oriented style (property):

```
 mysqli_result {

  int num_rows ;

}
```

Procedural style:

```
  int mysqli_num_rows(mysqli_result result);
```

Returns the number of rows in the result set.

The use of `mysqli_num_rows` depends on whether you use buffered or unbuffered result sets. In case you use unbuffered resultsets `mysqli_num_rows` will not return the correct number of rows until all the rows in the result have been retrieved.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns number of rows in the result set.

> **Note**
>
> If the number of rows is greater than maximal int value, the number will be returned as a string.

Examples

Example 20.198. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = $result->num_rows;

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.199. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = mysqli_num_rows($result);

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Result set has 239 rows.
```

20.10.2.10. The MySQLi_Driver class (`MySQLi_Driver`)

Copyright 1997-2010 the PHP Documentation Group.

MySQLi Driver.

```
 MySQLi_Driver {
 MySQLi_Driver

      Properties

  public readonly string client_info ;

  public readonly string client_version ;

  public readonly string driver_version ;

  public readonly string embedded ;

  public bool reconnect ;

  public int report_mode ;

Methods

  void mysqli_driver::embedded_server_end();

  bool mysqli_driver::embedded_server_start(bool start,
                                            array arguments,
                                            array groups);

}
```

`client_info`	The Client API header version
`client_version`	The Client version
`driver_version`	The MySQLi Driver version
`embedded`	Wether MySQLi Embedded support is enabled
`reconnect`	Allow or prevent reconnect (see the mysqli.reconnect INI directive)
`report_mode`	Set to `MYSQLI_REPORT_OFF` , `MYSQLI_REPORT_ALL` or any combination of `MYSQLI_REPORT_STRICT` (throw Exceptions for errors), `MYSQLI_REPORT_ERROR` (report errors) and `MYSQLI_REPORT_INDEX` (errors regarding indexes).

20.10.2.12.12. mysqli_get_cache_stats

Copyright 1997-2010 the PHP Documentation Group.

- mysqli_get_cache_stats

  Returns client Zval cache statistics

Description

```
array mysqli_get_cache_stats();
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

Returns client Zval cache statistics. Available only with mysqlnd.

Parameters

Return Values

Returns an array with client Zval cache stats if success, FALSE otherwise.

Examples

Example 20.200. A `mysqli_get_cache_stats` example

```
<?php
$link = mysqli_connect();
print_r(mysqli_get_cache_stats());
?>
```

The above example will output something similar to:

```

Returns client per-process statistics. Available only with mysqlnd.

Parameters

Return Values

Returns an array with client stats if success, `FALSE` otherwise.

Examples

Example 20.201. A `mysqli_get_client_stats` example

```
<?php
$link = mysqli_connect();
print_r(mysqli_get_client_stats());
?>
```

The above example will output something similar to:

```
Array
(
    [bytes_sent] => 43

20.10.2.12.17. `mysqli_report`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_report`

  Enables or disables internal report functions

Description

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from mysqli function calls or queries which don't use an index (or use a bad index).

Parameters

`flags`

Table 20.17. Supported flags

Name	Description
`MYSQLI_REPORT_OFF`	Turns reporting off
`MYSQLI_REPORT_ERROR`	Report errors from mysqli function calls
`MYSQLI_REPORT_STRICT`	Report warnings from mysqli function calls
`MYSQLI_REPORT_INDEX`	Report if no index or bad index was used in a query
`MYSQLI_REPORT_ALL`	Set all options (report all)

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.202. Object oriented style

```
<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a warning */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_rpl_query_type`

  `mysqli->rpl_query_type`

  Returns RPL query type

Description

Procedural style:

```
  int mysqli_rpl_query_type(mysqli link,
                            string query);
```

Object oriented style (method)

```
 mysqli {

  int rpl_query_type(string query);

}
```

Returns `MYSQLI_RPL_MASTER` , `MYSQLI_RPL_SLAVE` or `MYSQLI_RPL_ADMIN` depending on a query type. `INSERT`, `UPDATE` and similar are *master* queries, `SELECT` is *slave*, and `FLUSH`, `REPAIR` and similar are *admin*.

20.10.3. MySQL Native Driver (`Mysqlnd`)

Copyright 1997-2010 the PHP Documentation Group.

This section of the manual provides an overview of the MySQL Native Driver.

20.10.3.1. Overview

Copyright 1997-2010 the PHP Documentation Group.

MySQL Native Driver is a replacement for the MySQL Client Library (libmysql). MySQL Native Driver is part of the official PHP sources as of PHP 5.3.0.

The MySQL database extensions MySQL extension, `mysqli` and PDO MYSQL all communicate with the MySQL server. In the past, this was done by the extension using the services provided by the MySQL Client Library. The extensions were compiled against the MySQL Client Library in order to use its client-server protocol.

With MySQL Native Driver there is now an alternative, as the MySQL database extensions can be compiled to use MySQL Native Driver instead of the MySQL Client Library.

MySQL Native Driver is written in C as a PHP extension.

What it is not

Although MySQL Native Driver is written as a PHP extension, it is important to note that it does not provide a new API to the PHP programmer. The programmer APIs for MySQL database connectivity are provided by the MySQL extension, `mysqli` and PDO MYSQL. These extensions can now use the services of MySQL Native Driver to communicate with the MySQL Server. Therefore, you should not think of MySQL Native Driver as an API.

Why use it?

Using the MySQL Native Driver offers a number of advantages over using the MySQL Client Library.

The older MySQL Client Library was written by MySQL AB (now Sun Microsystems, Inc.) and so was released under the MySQL license. This ultimately led to MySQL support being disabled by default in PHP. However, the MySQL Native Driver has been developed as part of the PHP project, and is therefore released under the PHP license. This removes licensing issues that have been problematic in the past.

Also, in the past, you needed to build the MySQL database extensions against a copy of the MySQL Client Library. This typically meant you needed to have MySQL installed on a machine where you were building the PHP source code. Also, when your PHP application was running, the MySQL database extensions would call down to the MySQL Client library file at run time, so the file needed to be installed on your system. With MySQL Native Driver that is no longer the case as it is included as part of the standard distribution. So you do not need MySQL installed in order to build PHP or run PHP database applications.

Because MySQL Native Driver is written as a PHP extension, it is tightly coupled to the workings of PHP. This leads to gains in efficiency, especially when it comes to memory usage, as the driver uses the PHP memory management system. It also supports the PHP memory limit. Using MySQL Native Driver leads to comparable or better performance than using MySQL Client Library, it always ensures the most efficient use of memory. One example of the memory efficiency is the fact that when using the MySQL Client Library, each row is stored in memory twice, whereas with the MySQL Native Driver each row is only stored once in memory.

Special features

MySQL Native Driver also provides some special features not available when the MySQL database extensions use MySQL Client Library. These special features are listed below:

- Improved persistent connections
- The special function `mysqli_fetch_all`
- Performance statistics calls: `mysqli_get_cache_stats`, `mysqli_get_client_stats`, `mysqli_get_connection_stats`

The performance statistics facility can prove to be very useful in identifying performance bottlenecks.

MySQL Native Driver also allows for persistent connections when used with the `mysqli` extension.

SSL Support

Currently, MySQL Native Driver does not support SSL. This means that `mysqli_ssl_set` will generate an error if called while using MySQL Native Driver.

Compressed Protocol Support

As of PHP 5.3.2 MySQL Native Driver supports the compressed client server protocol. MySQL Native Driver did not support this in 5.3.0 and 5.3.1. Extensions such as `ext/mysql`, `ext/mysqli`, `PDO_MYSQL`, that are configured to use MySQL Native Driver, can also take advantage of this feature.

20.10.3.2. Installation

Copyright 1997-2010 the PHP Documentation Group.

Installation on Unix

By default the MySQL database extensions are configured to use MySQL Client Library. In order to use the MySQL Native Driver, PHP needs to be built specifying that the MySQL database extensions are compiled with MySQL Native Driver support. This is done through configuration options prior to building the PHP source code.

For example, to build the MySQL extension, `mysqli` and PDO MYSQL using the MySQL Native Driver, the following command would be given:

Installation on Windows

In the official PHP distributions from 5.3 onwards, MySQL Native Driver is enabled by default, so no additional configuration is required to use it. All MySQL database extensions will use MySQL Native Driver in this case.

20.10.3.3. Configuration

Copyright 1997-2010 the PHP Documentation Group.

Configuration File (php.ini) Settings

In PHP 5.3 the following `php.ini` settings are available for the MySQL Native Driver:

`mysqlnd.collect_statistics`

type:boolean, default:"1", changeable:PHP_INI_SYSTEM

Available since 5.3.0

Enables the collection of various client statistics which can be accessed through `mysqli_get_client_stats()`, `mysqli_get_connection_stats()`, `mysqli_get_cache_stats()` and are shown in `mysqlnd` section of the output of the `phpinfo()` function as well.

When enabled the following statistics will be collected:

bytes_sent, bytes_received, packets_sent, packets_received, protocol_overhead_in, protocol_overhead_out, bytes_received_ok_packet, bytes_received_eof_packet, bytes_received_rset_header_packet, bytes_received_rset_field_meta_packet, bytes_received_rset_row_packet, bytes_received_prepare_response_packet, bytes_received_change_user_packet, packets_sent_command, packets_received_ok, packets_received_eof, packets_received_rset_header, packets_received_rset_field_meta, packets_received_rset_row, packets_received_prepare_response, packets_received_change_user, result_set_queries, non_result_set_queries, no_index_used, bad_index_used, slow_queries, buffered_sets, unbuffered_sets, ps_buffered_sets, ps_unbuffered_sets, flushed_normal_sets, flushed_ps_sets, ps_prepared_never_executed, ps_prepared_once_executed, rows_fetched_from_server_normal, rows_fetched_from_server_ps, rows_buffered_from_client_normal, rows_buffered_from_client_ps, rows_fetched_from_client_normal_buffered, rows_fetched_from_client_normal_unbuffered, rows_fetched_from_client_ps_buffered, rows_fetched_from_client_ps_unbuffered, rows_fetched_from_client_ps_cursor, rows_skipped_normal, rows_skipped_ps, copy_on_write_saved, copy_on_write_performed, command_buffer_too_small, connect_success, connect_failure

`mysqlnd.collect_memory_statistics`

type:boolean, default:"0", changeable:PHP_INI_SYSTEM

Available since 5.3.0

Enable the collection of various memory statistics which can be accessed through `mysqli_get_client_stats()`, `mysqli_get_connection_stats()`, `mysqli_get_cache_stats()` and are shown in `mysqlnd` section of the output of the `phpinfo()` function as well.

When enabled the following statistics will be collected:

TBD

20.10.3.4. Persistent Connections

Copyright 1997-2010 the PHP Documentation Group.

Using Persistent Connections

The MySQL database extensions do not support persistent connections when used with the MySQL Client Library. However, they do when using MySQL Native Driver. When creating a connection the hostname is prepended with “p:”. This is demonstrated by the following code snippet, which creates a new connection using `mysqli`:

20.10.3.5. Statistics

Copyright 1997-2010 the PHP Documentation Group.

Using Statistical Data

MySQL Native Driver contains support for gathering statistics on the communication between the client and the server. The statistics gathered are of three main types:

- Client statistics
- Connection statistics
- Zval cache statistics

If you are using the `mysqli` extension, these statistics can be obtained through three API calls:

- `mysqli_get_client_stats`
- `mysqli_get_connection_stats`
- `mysqli_get_cache_stats`

> **Note**
>
> Statistics are aggregated among all extensions that use MySQL Native Driver. For example, when compiling both `ext/mysql` and `ext/mysqli` against MySQL Native Driver, both function calls of `ext/mysql` and `ext/mysqli` will change the statistics. There is no way to find out how much a certain API call of any extension that has been compiled against MySQL Native Driver has impacted a certain statistic. You can configure the PDO MySQL Driver, `ext/mysql` and `ext/mysqli` to optionally use the MySQL Native Driver. When doing so, all three extensions will change the statistics.

Accessing Client Statistics

To access client statistics, you need to call `mysqli_get_client_stats`. The function call does not require any parameters.

The function returns an associative array that contains the name of the statistic as the key and the statistical data as the value.

Client statistics can also be accessed by calling the `phpinfo` function.

Accessing Connection Statistics

To access connection statistics call `mysqli_get_connection_stats`. This takes the database connection handle as the parameter.

The function returns an associative array that contains the name of the statistic as the key and the statistical data as the value.

Accessing Zval Cache Statistics

The MySQL Native Driver also collects statistics from its internal Zval cache. These statistics can be accessed by calling `mysqli_get_cache_stats`.

The Zval cache statistics obtained may lead to a tweaking of `php.ini` settings related to the Zval cache, resulting in better performance.

Buffered and Unbuffered Result Sets

Result sets can be buffered or unbuffered. Using default settings, `ext/mysql` and `ext/mysqli` work with buffered result sets for normal (non prepared statement) queries. Buffered result sets are cached on the client. After the query execution all results are fetched from the MySQL Server and stored in a cache on the client. The big advantage of buffered result sets is that they allow the server to free all resources allocated to a result set, once the results have been fetched by the client.

Unbuffered result sets on the other hand are kept much longer on the server. If you want to reduce memory consumption on the client, but increase load on the server, use unbuffered results. If you experience a high server load and the figures for unbuffered result sets are high, you should consider moving the load to the clients. Clients typically scale better than servers. “Load” does not only refer to memory buffers - the server also needs to keep other resources open, for example file handles and threads, before a result set can be freed.

Prepared Statements use unbuffered result sets by default. However, you can use `mysqli_stmt_store_result` to enable buffered result sets.

Statistics returned by MySQL Native Driver

The following tables show a list of statistics returned by the `mysqli_get_client_stats`, `mysqli_get_connection_stats` and `mysqli_get_cache_stats` functions.

Network

Statistic	Scope	Description	Notes
`bytes_sent`	Connection	Number of bytes sent from PHP to the MySQL server	Can be used to check the efficiency of the compression protocol
`bytes_received`	Connection	Number of bytes received from MySQL server	Can be used to check the efficiency of the compression protocol
`packets_sent`	Connection	Number of MySQL Client Server protocol packets sent	Used for debugging Client Server protocol implementation
`packets_received`	Connection	Number of MySQL Client Server protocol packets received	Used for debugging Client Server protocol implementation
`protocol_overhead_in`	Connection	MySQL Client Server protocol overhead in bytes for incoming traffic. Currently only the Packet Header (4 bytes) is considered as overhead. protocol_overhead_in = packets_received * 4	Used for debugging Client Server protocol implementation
`protocol_overhead_out`	Connection	MySQL Client Server protocol overhead in bytes for outgoing traffic. Currently only the Packet Header (4 bytes) is considered as overhead. pro-	Used for debugging Client Server protocol implementation

Statistic	Scope	Description	Notes
		tocol_overhead_out = packets_sent * 4	
bytes_received_ok_packet	Connection	Total size of bytes of MySQL Client Server protocol OK packets received. OK packets can contain a status message. The length of the status message can vary and thus the size of an OK packet is not fixed.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_ok	Connection	Number of MySQL Client Server protocol OK packets received.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_eof_packet	Connection	Total size in bytes of MySQL Client Server protocol EOF packets received. EOF can vary in size depending on the server version. Also, EOF can transport an error message.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_eof	Connection	Number of MySQL Client Server protocol EOF packets. Like with other packet statistics the number of packets will be increased even if PHP does not receive the expected packet but, for example, an error message.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_rset_header_packet	Connection	Total size in bytes of MySQL Client Server protocol result set header packets. The size of the packets varies depending on the payload (LOAD LOCAL INFILE, INSERT, UPDATE, SELECT, error message).	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_rset_header	Connection	Number of MySQL Client Server protocol result set header packets.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_rset_field_meta_packet	Connection	Total size in bytes of MySQL Client Server protocol result set meta data (field information) packets. Of course the size varies with the fields in the result set. The packet may also transport an error or an EOF packet in case of COM_LIST_FIELDS.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_rset_field_meta	Connection	Number of MySQL Client Server protocol result set meta data (field information) packets.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_rset_row_packet	Connection	Total size in bytes of MySQL Client Server protocol result set row data packets. The packet may also transport an error or an EOF packet. You can reverse engineer the number of error and	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).

Statistic	Scope	Description	Notes
		EOF packets by substracting `rows_fetched_from_server_normal` and `rows_fetched_from_server_ps` from `bytes_received_rset_row_packet`.	
`packets_received_rset_row`	Connection	Number of MySQL Client Server protocol result set row data packets and their total size in bytes.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
`bytes_received_prepare_response_packet`	Connection	Total size in bytes of MySQL Client Server protocol OK for Prepared Statement Initialization packets (prepared statement init packets). The packet may also transport an error. The packet size depends on the MySQL version: 9 bytes with MySQL 4.1 and 12 bytes from MySQL 5.0 on. There is no safe way to know how many errors happened. You may be able to guess that an error has occurred if, for example, you always connect to MySQL 5.0 or newer and, `bytes_received_prepare_response_packet` != `packets_received_prepare_response` * 12. See also `ps_prepared_never_executed`, `ps_prepared_once_executed`.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
`packets_received_prepare_response`	Connection	Number of MySQL Client Server protocol OK for Prepared Statement Initialization packets (prepared statement init packets).	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
`bytes_received_change_user_packet`	Connection	Total size in bytes of MySQL Client Server protocol COM_CHANGE_USER packets. The packet may also transport an error or EOF.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
`packets_received_change_user`	Connection	Number of MySQL Client Server protocol COM_CHANGE_USER packets	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
`packets_sent_command`	Connection	Number of MySQL Client Server protocol commands sent from PHP to MySQL. There is no way to know which specific	Only useful for debugging CS protocol implementation.

Statistic	Scope	Description	Notes
		commands and how many of them have been sent. At its best you can use it to check if PHP has sent any commands to MySQL to know if you can consider to disable MySQL support in your PHP binary. There is also no way to reverse engineer the number of errors that may have occurred while sending data to MySQL. The only error recoded is command_buffer_too_small (see below).	

Result Set

Statistic	Scope	Description	Notes
`result_set_queries`	Connection	Number of queries that have generated a result set. Examples of queries that generate a result set: `SELECT`, `SHOW`. The statistic will not be incremented if there is an error reading the result set header packet from the line.	You may use it an an indirect measure for the number of queries PHP has sent to MySQL, for example, to identify a client that causes a high database load.
`non_result_set_queries`	Connection	Number of queries that did not generate a result set. Examples of queries that do not generate a result set: `INSERT`, `UPDATE`, `LOAD DATA`, `SHOW`. The statistic will not be incremented if there is an error reading the result set header packet from the line.	You may use it an an indirect measure for the number of queries PHP has sent to MySQL, for example, to identify a client that causes a high database load.
`no_index_used`	Connection	Number of queries that have generated a result set but did not use an index (see also mysqld start option –log-queries-not-using-indexes). If you want these queries to be reported you can use mysqli_report(MYSQLI_REPORT_INDEX) to make ext/mysqli throw an exception. If you prefer a warning instead of an exception use mysqli_report(MYSQLI_REPORT_INDEX ^ MYSQLI_REPORT_STRICT).	
`bad_index_used`	Connection	Number of queries that have generated a result set and did not use a good index (see also mysqld start option –log-slow-queries).	If you want these queries to be reported you can use mysqli_report(MYSQLI_REPORT_INDEX) to make ext/mysqli throw an exception. If you prefer a warning instead of an exception use mysqli_report(MYSQLI_REPORT_INDEX ^ MYSQLI_REPORT_STRICT)

Statistic	Scope	Description	Notes
`slow_queries`	Connection	SQL statements that took more than `long_query_time` seconds to execute and required at least `min_examined_row_limit` rows to be examined.	Not reported through `mysqli_report`
`buffered_sets`	Connection	Number of buffered result sets returned by “normal” queries. “Normal” means “not prepared statement” in the following notes.	Examples of API calls that will buffer result sets on the client: `mysql_query`, `mysqli_query`, `mysqli_store_result`,

Statistic	Scope	Description	Notes
			. Buffering result sets on the client ensures that server resources are freed as soon as possible and it makes result set scrolling easier. The downside is the additional memory consumption on the client for buffering data. Note that mysqlnd (unlike the MySQL Client Library) respects the PHP memory limit because it uses PHP internal memory management functions to allocate memory. This is also the reason why `memory_get_usage` reports a higer memory consumption when using mysqlnd instead of the MySQL Client Library. `memory_get_usage` does not measure the memory consumption of the MySQL Client Library at all because the MySQL Client Library does not use PHP internal memory management functions monitored by the function!
`unbuffered_sets`	Connection	Number of unbuffered result sets returned by normal (non prepared statement) queries.	Examples of API calls that will not buffer result sets on the client: `mysqli_use_result`
`ps_buffered_sets`	Connection	Number of buffered result sets returned by prepared statements. By default prepared statements are unbuffered.	Examples of API calls that will not buffer result sets on the client: `mysqli_stmt_store_result`
`ps_unbuffered_sets`	Connection	Number of unbuffered result sets returned by prepared statements.	By default prepared statements are unbuffered.
`flushed_normal_sets`	Connection	Number of result sets from normal (non prepared statement) queries with unread data which have been flushed silently for you. Flushing happens only with unbuffered result sets.	Unbuffered result sets must be fetched completely before a new query can be run on the connection otherwise MySQL will throw an error. If the application does not fetch all rows from an unbuffered result set, mysqlnd does implicitly fetch the result set to clear the line. See also `rows_skipped_normal`, `rows_skipped_ps`. Some possible causes for an implicit flush: • Faulty client application • Client stopped reading after it found what it was looking for but has made MySQL calculate more records than needed • Client application has

Statistic	Scope	Description	Notes
			stopped unexpectedly
`flushed_ps_sets`	Connection	Number of result sets from prepared statements with unread data which have been flushed silently for you. Flushing happens only with unbuffered result sets.	Unbuffered result sets must be fetched completely before a new query can be run on the connection otherwise MySQL will throw an error. If the application does not fetch all rows from an unbuffered result set, mysqlnd does implicitly fetch the result set to clear the line. See also `rows_skipped_normal`, `rows_skipped_ps`. Some possible causes for an implicit flush: • Faulty client application • Client stopped reading after it found what it was looking for but has made MySQL calculate more records than needed • Client application has stopped unexpectedly
`ps_prepared_never_executed`	Connection	Number of statements prepared but never executed.	Prepared statements occupy server resources. You should not prepare a statement if you do not plan to execute it.
`ps_prepared_once_executed`	Connection	Number of prepared statements executed only one.	One of the ideas behind prepared statements is that the same query gets executed over and over again (with different parameters) and some parsing and other preparation work can be saved, if statement execution is split up in separate prepare and execute stages. The idea is to prepare once and “cache” results, for example, the parse tree to be reused during multiple statement executions. If you execute a prepared statement only once the two stage processing can be inefficient compared to “normal” queries because all the caching means extra work and it takes (limited) server resources to hold the cached information. Consequently, prepared statements that are executed only once may cause performance hurts.
`rows_fetched_from_server_normal`, `rows_fetched_from_server_ps`	Connection	Total number of result set rows successfully fetched from MySQL regardless if the client application has consumed them	See also `packets_received_rset_row`

Statistic	Scope	Description	Notes
		or not. Some of the rows may not have been fetched by the client application but have been flushed implicitly.	
`rows_buffered_from_client_normal`, `rows_buffered_from_client_ps`	Connection	Total number of succesfully buffered rows originating from a "normal" query or a prepared statement. This is the number of rows that have been fetched from MySQL and buffered on client. Note that there are two distinct statistics on rows that have been buffered (MySQL to mysqlnd internal buffer) and buffered rows that have been fetched by the client application (mysqlnd internal buffer to client application). If the number of buffered rows is higher than the number of fetched buffered rows it can mean that the client application runs queries that cause larger result sets than needed resulting in rows not read by the client.	Examples of queries that will buffer results: `mysqli_query`, `mysqli_store_result`
`rows_fetched_from_client_normal_buffered`, `rows_fetched_from_client_ps_buffered`	Connection	Total number of rows fetched by the client from a buffered result set created by a normal query or a prepared statement.	
`rows_fetched_from_client_normal_unbuffered`, `rows_fetched_from_client_ps_unbuffered`	Connection	Total number of rows fetched by the client from a unbuffered result set created by a "normal" query or a prepared statement.	
`rows_fetched_from_client_ps_cursor`	Connection	Total number of rows fetch by the client from a cursor created by a prepared statement.	
`rows_skipped_normal`, `rows_skipped_ps`	Connection	Reserved for future use (currently not supported)	
`copy_on_write_saved`, `copy_on_write_performed`	Process	With mysqlnd, variables returned by the extensions point into mysqlnd internal network result buffers. If you do not change the variables, fetched data will be kept only once in memory. If you change the variables, mysqlnd has to perform a copy-on-write to protect the internal network result buffers from being changed. With the MySQL Client Library you always hold fetched data twice in memory. Once in the internal MySQL Client Library buffers and once in the variables returned by the extensions. In theory mysqlnd can save up to 40% memory. However, note that the memory saving cannot be measured using `memory_get_usage`.	

Statistic	Scope	Description	Notes
explicit_free_result, implicit_free_result	Connection, Process (only during prepared statement cleanup)	Total number of freed result sets.	The free is always considered explicit but for result sets created by an init command, for example, mysqli_options(MYSQLI_INIT_COMMAND , ...)
proto_text_fetched_null, proto_text_fetched_bit, proto_text_fetched_tinyint proto_text_fetched_short, proto_text_fetched_int24, proto_text_fetched_int proto_text_fetched_bigint, proto_text_fetched_decimal, proto_text_fetched_float proto_text_fetched_double, proto_text_fetched_date, proto_text_fetched_year proto_text_fetched_time, proto_text_fetched_datetime, proto_text_fetched_timestamp proto_text_fetched_string, proto_text_fetched_blob, proto_text_fetched_enum proto_text_fetched_set, proto_text_fetched_geometry, proto_text_fetched_other	Connection	Total number of columns of a certain type fetched from a normal query (MySQL text protocol).	Mapping from C API / MySQL meta data type to statistics name: • MYSQL_TYPE_NULL - proto_text_fetched_null • MYSQL_TYPE_BIT - proto_text_fetched_bit • MYSQL_TYPE_TINY - proto_text_fetched_tinyint • MYSQL_TYPE_SHORT - proto_text_fetched_short • MYSQL_TYPE_INT24 - proto_text_fetched_int24 • MYSQL_TYPE_LONG - proto_text_fetched_int • MYSQL_TYPE_LONGLONG - proto_text_fetched_bigint • MYSQL_TYPE_DECIMAL, MYSQL_TYPE_NEWDECIMAL - proto_text_fetched_decimal • MYSQL_TYPE_FLOAT - proto_text_fetched_float • MYSQL_TYPE_DOUBLE - proto_text_fetched_double • MYSQL_TYPE_DATE, MYSQL_TYPE_NEWDATE - proto_text_fetched_date • MYSQL_TYPE_YEAR - proto_text_fetched_year • MYSQL_TYPE_TIME - proto_text_fetched_time • MYSQL_TYPE_DATETIME - proto_text_fetched_datetime • MYSQL_TYPE_TIMESTAMP - proto_text_fetched_timestamp • MYSQL_TYPE_STRING, MYSQL_TYPE_VARSTRIN

Statistic	Scope	Description	Notes
			`G`, `MYSQL_TYPE_VARCHAR` - proto_text_fetched_string • `MYSQL_TYPE_TINY_BLOB`, `MYSQL_TYPE_MEDIUM_BLOB`, `MYSQL_TYPE_LONG_BLOB`, `MYSQL_TYPE_BLOB` - proto_text_fetched_blob • `MYSQL_TYPE_ENUM` - proto_text_fetched_enum • `MYSQL_TYPE_SET` - proto_text_fetched_set • `MYSQL_TYPE_GEOMETRY` - proto_text_fetched_geometry • Any `MYSQL_TYPE_*` not listed before (there should be none) - proto_text_fetched_other Note that the MYSQL_*-type constants may not be associated with the very same SQL column types in every version of MySQL.
`proto_binary_fetched_null`, `proto_binary_fetched_bit`, `proto_binary_fetched_tinyint` `proto_binary_fetched_short`, `proto_binary_fetched_int24`, `proto_binary_fetched_int`, `proto_binary_fetched_bigint`, `proto_binary_fetched_decimal`, `proto_binary_fetched_float`, `proto_binary_fetched_double`, `proto_binary_fetched_date`, `proto_binary_fetched_year`, `proto_binary_fetched_time`, `proto_binary_fetched_datetime`,	Connection	Total number of columns of a certain type fetched from a prepared statement (MySQL binary protocol).	For type mapping see `proto_text_*` above.

Statistic	Scope	Description	Notes
`proto_binary_fetched_timestamp`, `proto_binary_fetched_string`, `proto_binary_fetched_blob`, `proto_binary_fetched_enum`, `proto_binary_fetched_set`, `proto_binary_fetched_geometry`, `proto_binary_fetched_other`			

Connection

Statistic	Scope	Description	Notes
`connect_success`, `connect_failure`	Connection	Total number of successful / failed connection attempt.	Reused connections and all other kinds of connections are included.
`reconnect`	Process	Total number of (real_)connect attempts made on an already opened connection handle.	The code sequence `$link = new mysqli(...); $link->real_connect(...)` will cause a reconnect. But `$link = new mysqli(...); $link->connect(...)` will not because `$link->connect(...)` will explicitly close the existing connection before a new connection is established.
`pconnect_success`	Connection	Total number of successful persistent connection attempts.	Note that `connect_success` holds the sum of successful persistent and non-persistent connection attempts. The number of successful non-persistent connection attempts is `connect_success` - `pconnect_success`.
`active_connections`	Connection	Total number of active persistent and non-persistent connections.	
`active_persistent_connections`	Connection	Total number of active persistent connections.	The total number of active non-persistent connections is `active_connections` - `active_persistent_connections`.
`explicit_close`	Connection	Total number of explicitly closed connections (ext/mysqli only).	Examples of code snippets that cause an explicit close : `$link = new mysqli(...); $link->close` `$link = new mysqli(...); $link->conne`
`implicit_close`	Connection	Total number of implicitly closed connections (ext/mysqli only).	Examples of code snippets that cause an implicit close :

Statistic	Scope	Description	Notes
			• `$link = new mysqli(...); $link->real_connect(...)` • `unset($link)` • Persistent connection: pooled connection has been created with real_connect and there may be unknown options set - close implicitly to avoid returning a connection with unknown options • Persistent connection: ping/change_user fails and ext/mysqli closes the connection • end of script execution: close connections that have not been closed by the user
`disconnect_close`	Connection	Connection failures indicated by the C API call `mysql_real_connect` during an attempt to establish a connection.	It is called `disconnect_close` because the connection handle passed to the C API call will be closed.
`in_middle_of_command_close`	Process	A connection has been closed in the middle of a command execution (outstanding result sets not fetched, after sending a query and before retrieving an answer, while fetching data, while transferring data with LOAD DATA).	Unless you use asynchronous queries this should only happen if your script stops unexpectedly and PHP shuts down the connections for you.
`init_command_executed_count`	Connection	Total number of init command executions, for example, `mysqli_options(MYSQLI_INIT_COMMAND , ...)`.	The number of successful executions is `init_command_executed_count` - `init_command_failed_count`.
`init_command_failed_count`	Connection	Total number of failed init commands.	

COM_* Commands

Statistic	Scope	Description	Notes
`com_quit`, `com_init_db`, `com_query`, `com_field_list`, `com_create_db`, `com_drop_db`, `com_refresh`, `com_shutdown`, `com_statistics`, `com_process_info`, `com_connect`, `com_process_kill`,	Connection	Total number of attempts to send a certain COM_* command from PHP to MySQL.	The statistics are incremented after checking the line and immediately before sending the corresponding MySQL client server protocol packet. If mysqlnd fails to send the packet over the wire the statistics will not be decremented. In case of a failure mysqlnd emits a PHP warning “Error while sending

Statistic	Scope	Description	Notes
com_debug, com_ping, com_time, com_delayed_insert, com_change_user, com_binlog_dump, com_table_dump, com_connect_out, com_register_slave, com_stmt_prepare, com_stmt_execute, com_stmt_send_long_data, com_stmt_close, com_stmt_reset, com_stmt_set_option, com_stmt_fetch, com_daemon			%s packet. PID=%d." Usage examples: • Check if PHP sends certain commands to MySQL, for example, check if a client sends COM_PROCESS_KILL • Calculate the average number of prepared statement executions by comparing COM_EXECUTE with COM_PREPARE • Check if PHP has run any non-prepared SQL statements by checking if COM_QUERY is zero • Identify PHP scripts that run an excessive number of SQL statements by checking COM_QUERY and COM_EXECUTE

Miscellaneous

Statistic	Scope	Description	Notes
explicit_stmt_close, implicit_stmt_close	Process	Total number of close prepared statements.	A close is always considered explicit but for a failed prepare.
mem_emalloc_count, mem_emalloc_ammount, mem_ecalloc_count, mem_ecalloc_ammount, mem_erealloc_count, mem_erealloc_ammount, mem_efree_count, mem_malloc_count, mem_malloc_ammount, mem_calloc_count, mem_calloc_ammount, mem_realloc_count, mem_realloc_ammount, mem_free_count	Process	Memory management calls.	Development only.
com_command_buffer_too_small	Connection	Number of network command buffer extensions while sending commands from PHP to MySQL.	mysqlnd allocates an internal command/network buffer of mysqlnd.net_cmd_buffer_size (php.ini) bytes for every connection. If a MySQL Client Server protocol command, for example, COM_QUERY (normal query), does not fit into the buffer, mysqlnd will grow the buffer to what is needed for sending the

Statistic	Scope	Description	Notes
			command. Whenever the buffer gets extended for one connection `com-mand_buffer_too_small` will be incremented by one. If mysqlnd has to grow the buf-fer beyond its initial size of `mysqlnd.net_cmd_buffer_size` (`php.ini`) bytes for al-most every connection, you should consider to increase the default size to avoid re-allocations. The default buffer size is 2048 bytes in PHP 5.3.0. In future versions the default will be 4kB or larger. The default can changed either through the `php.ini` setting `mysqlnd.net_cmd_buffer_size` or using `mysqli_options(MYSQLI_OPT_NET_CMD_BUFFER_SIZE, int size)`. It is recommended to set the buf-fer size to no less than 4096 bytes because mysqlnd also uses it when reading certain commu-nication packet from MySQL. In PHP 5.3.0, mysqlnd will not grow the buffer if MySQL sends a packet that is larger than the current size of the buffer. As a consequence mysqlnd is unable to decode the packet and the cli-ent application will get an error. There are only two situations when the packet can be larger than the 2048 bytes default of `mysqlnd.net_cmd_buffer_size` in PHP 5.3.0: the packet transports a very long error mes-sage or the packet holds column meta data from `COM_LIST_FIELD` (`mysql_list_fields`) and the meta data comes from a string column with a very long default value (>1900 bytes). No bug report on this exists - it should happen rarely. As of PHP 5.3.2 mysqlnd does not allow setting buffers smaller than 4096 bytes.
`connection_reused`			

20.10.3.6. Notes

Copyright 1997-2010 the PHP Documentation Group.

This section provides a collection of miscellaneous notes on MySQL Native Driver usage.

- In the case where you pass a statement to `mysqli_query` that is longer than `max_allowed_packet` of the server, the returned error codes are different depending on whether you are using MySQL Native Driver (`mysqlnd`) or MySQL Client Library (`libmysql`). The behavior is as follows:
  - `mysqlnd` on Linux returns an error code of 1153. The error message means “got a packet bigger than `max_allowed_packet` bytes”.
  - `mysqlnd` on Windows returns an error code 2006. This error message means “server has gone away”.
  - `libmysql` on all platforms returns an error code 2006. This error message means “server has gone away”.

  The same thing happens with `mysqli_stmt_prepare`.

20.10.4. MySQL Functions (PDO_MYSQL)

Copyright 1997-2010 the PHP Documentation Group.

PDO_MYSQL is a driver that implements the PHP Data Objects (PDO) interface to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

> **Warning**
>
> Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using driver-specific attributes with another driver may result in unexpected behaviour. `PDO::getAttribute` may be used to obtain the `PDO_ATTR_DRIVER_NAME` attribute to check the driver, if your code can run against multiple drivers.

`PDO::MYSQL_ATTR_USE_BUFFERED_QUERY` (integer)
: If this attribute is set to `TRUE` on a `PDOStatement`, the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use `PDOStatement::fetchAll` instead.

Example 20.203. Forcing queries to be buffered in mysql

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead");
}
?>
```

`PDO::MYSQL_ATTR_LOCAL_INFILE` (integer)
: Enable `LOAD LOCAL INFILE`.

`PDO::MYSQL_ATTR_INIT_COMMAND` (integer)
: Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.

`PDO::MYSQL_ATTR_READ_DEFAULT_FILE` (integer)	Read options from the named option file instead of from `my.cnf`. This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
`PDO::MYSQL_ATTR_READ_DEFAULT_GROUP` (integer)	Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE` . This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
`PDO::MYSQL_ATTR_MAX_BUFFER_SIZE` (integer)	Maximum buffer size. Defaults to 1 MiB.
`PDO::MYSQL_ATTR_DIRECT_QUERY` (integer)	Perform direct queries, don't use prepared statements.

20.10.4.1. `PDO_MYSQL DSN`

Copyright 1997-2010 the PHP Documentation Group.

- `PDO_MYSQL DSN`

  Connecting to MySQL databases

Description

The PDO_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix	The DSN prefix is **`mysql:`**.
`host`	The hostname on which the database server resides.
`port`	The port number where the database server is listening.
`dbname`	The name of the database.
`unix_socket`	The MySQL Unix socket (shouldn't be used with `host` or `port`).

Examples

Example 20.204. PDO_MYSQL DSN examples

The following example shows a PDO_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

20.10.5. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysqli` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql`/`mysqli` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysqli` extensions shipped with the PHP sources. See

Section 20.10, “MySQL PHP API”.

20.10.6. Common Problems with MySQL and PHP

- `Error: Maximum Execution Time Exceeded`: This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- `Fatal error: Call to unsupported or undefined function mysql_connect() in ...`: This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- `Error: Undefined reference to 'uncompress'`: This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- `Error: Client does not support authentication protocol`: This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See Section B.5.2.4, “`Client does not support authentication protocol`”, for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: http://www.coggeshall.org/oss/mysql2i.

20.10.7. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

   ```
   ./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
   ```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

   ```
   EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
   -lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm
   -lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
   ```

   Remove all duplicates, so that the line looks like this (all on one line):

   ```
   EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
   -lxml2
   ```

3. Build and install PHP:

   ```
   make
   make install
   ```

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about the mysqli extension in the Knowledge Base articles found at mysqli. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.11. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD::mysql` module.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl DBI support are given in Section 2.15, “Perl Installation Notes”.

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

  You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, http://dbi.perl.org/. That site hosts a general DBI mailing list. Oracle Corporation hosts a list specifically about `DBD::mysql`; see Section 1.6.1, “MySQL Mailing Lists”.

- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, http://dbi.perl.org/.

  For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is http://www.kitebird.com/mysql-perl/.

20.12. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at http://tangentsoft.net/mysql++/doc.

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about using C++ with the MySQL API in the MySQL Knowledge Base. articles found at C++. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.13. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about using Python with the MySQL API in the MySQL Knowledge Base articles found at Python. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.14. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the `libmysql` API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see Ruby Programming Language.

For information on installing and using the MySQL/Ruby API, see Section 20.14.1, “The MySQL/Ruby API”.

For information on installing and using the Ruby/MySQL API, see Section 20.14.2, “The Ruby/MySQL API”.

20.14.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

20.14.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

20.15. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.

20.16. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

Chapter 21. Extending MySQL

21.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in Section 2.10.3, "Installing from the Development Source Tree". If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see Section 1.6.1, "MySQL Mailing Lists". Many MySQL developers at Oracle Corporation are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

21.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

  For information about tuning the parameters that control thread resources, see Section 7.5.7, "How MySQL Uses Threads for Client Connections".
- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See Section 13.6.3, "`InnoDB` Startup Options and System Variables".
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every *`val`* seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See Section 12.2.5.2, "`INSERT DELAYED` Syntax".
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See Section 18.4.1, "Event Scheduler Overview".

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

> **MySQL Enterprise**
> For expert advice on thread management, subscribe to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

21.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at http://dev.mysql.com/doc/.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.7, "How to Report Bugs or Problems".

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See Section 1.6.1, "MySQL Mailing Lists". This list does not accept attachments, so you should FTP all the relevant files to: ftp://ftp.mysql.com/pub/mysql/upload/

21.2. The MySQL Plugin API

MySQL 5.1 and up supports a plugin API that allows for creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, full-text parser plugins, storage-engines and server extensions. In MySQL 5.4, the storage engines can be included in the server as plugins.

Full-text parser plugins can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins. This table is created as part of the MySQL installation process. If you are upgrading from a version of MySQL older than 5.1, you should run the `mysql_upgrade` command to create this table. See Section 4.4.7, "`mysql_upgrade` — Check Tables for MySQL Upgrade".

21.2.1. Plugin API Characteristics

The plugin API has these characteristics:

- All plugins have several things in common.

  Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or via the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

Although some aspects of the plugin API are common to all types of plugins, the API also allows for type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.

- Plugins can expose information to users.

  A plugin can implement system and status variables that are available via the `SHOW VARIABLES` and `SHOW STATUS` statements.

- The plugin API includes versioning information.

  The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

  There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

  A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs allowed libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

21.2.2. Plugin API Components

The plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=`*`path`* option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see Section 12.4.3.1, “Installing and Uninstalling Plugins”.

Source files (the locations indicate where the files are found in MySQL source distributions):

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.
- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process. If you are upgrading from a version of MySQL older than 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see Section 4.4.7, "`mysql_upgrade` — Check Tables for MySQL Upgrade").

21.2.3. Types of Plugins

The plugin API allows for creation of several types of plugins. This section provides an overview of some of them.

21.2.3.1. Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see Section 13.4, "Overview of MySQL Storage Engine Architecture".

For more information on how the Plugin API can be used to write storage engines, see MySQL Internals: Custom Engine.

21.2.3.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, "parsing" means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in Section 11.9, "Full-Text Search Functions". These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

  One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text "case-sensitive" to consist of two words "case" and "sensitive," whereas an application might need to treat the text as a single word.
- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_xxx` system variables and the stopword list.

  One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from nonplaintext input (the front end role),

and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see Section 21.2.5.1, “Writing Full-Text Parser Plugins”.

21.2.4. Plugin Data Structures and Functions

Every plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the given type needs to do. The plugin interface also enables plugins to expose status and system variables.

21.2.4.1. General Plugin Data Structures and Functions

Every plugin must have a general descriptor that provides information to the plugin API. The structure of the general descriptor is the same for all plugin types. This descriptor is defined by the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
  int type;            /* the plugin type (a MYSQL_XXX_PLUGIN value)   */
  void *info;          /* pointer to type-specific plugin descriptor   */
  const char *name;    /* plugin name                                  */
  const char *author;  /* plugin author (for SHOW PLUGINS)             */
  const char *descr;   /* general descriptive text (for SHOW PLUGINS ) */
  int license;         /* the plugin license (PLUGIN_LICENSE_XXX)      */
  int (*init)(void *);  /* the function to invoke when plugin is loaded */
  int (*deinit)(void *);/* the function to invoke when plugin is unloaded */
  unsigned int version; /* plugin version (for SHOW PLUGINS)           */
  struct st_mysql_show_var *status_vars;
  struct st_mysql_sys_var **system_vars;
  void * __reserved1;   /* reserved for dependency checking            */
};
```

The `st_mysql_plugin` descriptor structure members should be filled in as follows:

- `type`

  The plugin type. This must be one of the plugin-type values from `plugin.h`:

  ```
  /*
    The allowable types of plugins
  */
  #define MYSQL_UDF_PLUGIN              0  /* User-defined function        */
  #define MYSQL_STORAGE_ENGINE_PLUGIN   1  /* Storage Engine               */
  #define MYSQL_FTPARSER_PLUGIN         2  /* Full-text parser plugin      */
  #define MYSQL_DAEMON_PLUGIN           3  /* The daemon/raw plugin type */
  #define MYSQL_INFORMATION_SCHEMA_PLUGIN  4  /* The I_S plugin type */
  ...
  ```

For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`

  A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. Each type-specific descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. See Section 21.2.4.2, "Type-Specific Plugin Data Structures and Functions".

- `name`

  A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

- `author`

  A string naming the plugin author. This can be whatever you like.

- `desc`

  A string that provides a general description of the plugin. This can be whatever you like.

- `license`

  The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- `init`

  A once-only initialization function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes no arguments. It returns zero for success and nonzero for failure. If no `init` function is needed for a plugin, it can be specified as 0.

- `deinit`

  A once-only deinitialization function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and nonzero for failure. If no `deinit` function is needed for a plugin, it can be specified as 0.

- `version`

  The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0x`*`MMNN`*, where *`MM`* and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- `status_vars`

  A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

  The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures that describe status variables. See Section 21.2.4.3, "Plugin Status and System Variables".

- `system_vars`

  A pointer to a structure for system variables associated with the plugin, or 0 if there are no such variables. These options and system variables can be used to help initialize variables within the plugin.

  The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures that describe sytem variables. See Section 21.2.4.3, "Plugin Status and System Variables".

- `__reserved1`

  A placeholder for the future. Currently, it should be set to `NULL`.

The `init` and `deinit` functions in the general plugin descriptor are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

21.2.4.2. Type-Specific Plugin Data Structures and Functions

Each type of plugin has its own type-specific structures and functions. The primary structure is the type-specific plugin descriptor. This is pointed to by the `info` member of the `st_mysql_plugin` general plugin descriptor, but has a structure determined by the requirements of the plugin type.

For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. The type-specific descriptor commonly includes callback functions and other information needed by the server to invoke the plugin properly.

21.2.4.2.1. Full-Text Parser Plugin Data Structures and Functions

The following discussion describes the full-text parser type-specific plugin descriptor.

For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
  int interface_version;
  int (*parse)(MYSQL_FTPARSER_PARAM *param);
  int (*init)(MYSQL_FTPARSER_PARAM *param);
  int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions. The version is specified using a symbol of the form `MYSQL_`*`xxx`*`_INTERFACE_VERSION` (such as (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
  int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
  int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
  void *ftparser_state;
```

```
  void *mysql_ftparam;
  struct charset_info_st *cs;
  char *doc;
  int length;
  int flags;
  enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- `mysql_parse`

  A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_parse(param, ...);
  ```

  A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`

  A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_add_word(param, ...);
  ```

- `ftparser_state`

  This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`

  This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`

  A pointer to information about the character set of the text, or 0 if no information is available.

- `doc`

  A pointer to the text to be parsed.

- `length`

  The length of the text to be parsed, in bytes.

- `flags`

  Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

  This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`

  The parsing mode. This value will be one of the folowing constants:

- `MYSQL_FTPARSER_SIMPLE_MODE`

  Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

- `MYSQL_FTPARSER_WITH_STOPWORDS`

  Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`

  Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens via the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
  enum enum_ft_token_type type;
  int yesno;
  int weight_adjust;
  bool wasign;
  bool trunc;
  /* These are parser state and must be removed. */
  byte prev;
  byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`

  The token type. This should be one of values shown in the following table.

Type	Meaning
`FT_TOKEN_EOF`	End of data
`FT_TOKEN_WORD`	A regular word
`FT_TOKEN_LEFT_PAREN`	The beginning of a group or subexpression
`FT_TOKEN_RIGHT_PAREN`	The end of a group or subexpression
`FT_TOKEN_STOPWORD`	A stopword

- `yesno`

  Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- `weight_adjust`

  A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at Section 11.9.2, “Boolean Full-Text Searches”, that use the < and > operators illustrate how weighting works.

- `wasign`

  The sign of the weighting factor. A negative value acts like the ~ boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

  Whether matching should be done as if the boolean-mode `*` truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

21.2.4.3. Plugin Status and System Variables

The plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
  const char *name;
  char *value;
  enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the allowable status variable `type` values and what the corresponding variable should be.

Type	Meaning
`SHOW_BOOL`	Pointer to a boolean variable
`SHOW_INT`	Pointer to an integer variable
`SHOW_LONG`	Pointer to a long integer variable
`SHOW_LONGLONG`	Pointer to a longlong integer variable
`SHOW_CHAR`	A string
`SHOW_CHAR_PTR`	Pointer to a string
`SHOW_ARRAY`	Pointer to another `st_mysql_show_var` array
`SHOW_FUNC`	Pointer to a function
`SHOW_DOUBLE`	Pointer to a double

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                    struct st_mysql_show_var *out,
                                    char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```
struct st_mysql_sys_var {
 int flags;
 const char *name, *comment;
 int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
 void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- `name`: An unquoted identifier for the system variable.
- `varname`: The identifier for the static variable. Where not available, it is the same as the `name` field.
- `opt`: Additional use flags for the system variable. Supported flags are shown in the following table.

Flag	Description
`PLUGIN_VAR_READONLY`	The system variable is read only
`PLUGIN_VAR_NOSYSVAR`	The system variable is not user visible at runtime
`PLUGIN_VAR_NOCMDOPT`	The system variable is not configurable from the command line
`PLUGIN_VAR_NOCMDARG`	No argument is required at the command line (typically used for boolean variables)
`PLUGIN_VAR_RQCMDARG`	An argument is required at the command line (this is the default)
`PLUGIN_VAR_OPCMDARG`	An argument is optional at the command line
`PLUGIN_VAR_MEMALLOC`	Used for string variables; indicates that memory is to be allocated for storage of the string

- `comment`: A descriptive comment to be displayed in the server help message. `NULL` if this variable is to be hidden.
- `check`: The check function, `NULL` for default.
- `update`: The update function, `NULL` for default.
- `default`: The variable default value.
- `minimum`: The variable minimum value.
- `maximum`: The variable maximum value.
- `blocksize`: The variable block size. When the value is set, it is rounded to the nearest multiple of `blocksize`.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()` accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
                        PLUGIN_VAR_RQCMDARG, "foo comment",
                        NULL, NULL, 0, 0, INT_MAX, 0);
 ...
   SYSVAR(foo_var)= value;
   value= SYSVAR(foo_var);
   my_foo= value;
   value= my_foo;
```

Session variables may be accessed only via the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
                         PLUGIN_VAR_NOCMDARG, "flag comment",
                         NULL, NULL, FALSE);
 ...
   if (THDVAR(thd, some_flag))
   {
     do_something();
     THDVAR(thd, some_flag)= FALSE;
   }
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[]= {
  MYSQL_SYSVAR(my_foo),
```

```
  MYSQL_SYSVAR(some_flag),
  NULL
};
mysql_declare_plugin(fooplug)
{
  MYSQL_..._PLUGIN,
  &plugin_data,
  "fooplug",
  "foo author",
  "This does foo!",
  PLUGIN_LICENSE_GPL,
  foo_init,
  foo_fini,
  0x0001,
  NULL,
  my_plugin_vars,
  NULL
}
mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `my_bool`, which is a 1-byte boolean. (0 = FALSE, 1 = TRUE)

  ```
  MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
  ```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

  ```
  MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
  ```

- Integer system variables, of which there are several varieties.

  - An `int` system variable, which is typically a 4-byte signed word.

    ```
    MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
                     minimum, maximum, blocksize)
    ```

  - An `unsigned int` system variable, which is typically a 4-byte unsigned word.

    ```
    MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
                      minimum, maximum, blocksize)
    ```

  - A `long` system variable, which is typically either a 4- or 8-byte signed word.

    ```
    MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
                      minimum, maximum, blocksize)
    ```

  - An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

    ```
    MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default,
                       minimum, maximum, blocksize)
    ```

  - A `long long` system variable, which is typically an 8-byte signed word.

    ```
    MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
                          default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
                          default, minimum, maximum, blocksize)
    ```

  - An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

    ```
    MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,
                           default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
                           default, minimum, maximum, blocksize)
    ```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the `typelib`, starting from 0.

```
MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
                  default, typelib)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the `typelib`.

```
MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
                 default, typelib)
```

Internally, all mutable and plugin system variables are stored in a `HASH`.

Display of the server command-line help text is handled by compiling a `DYNAMIC_ARRAY` of all variables relevent to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the `argv` by the `handle_option()` function (`my_getopt.c`); in effect, it is consumed.

The processing of command-line options is performed during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at `mysqld` initialization time and configuration options can be set at the command line or within `my.cnf`.

Plugins should consider the `thd` parameter to be read only.

21.2.5. Writing Plugins

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see Section 2.10.2, “Typical `configure` Options”, and Section 2.10.4, “Dealing with Problems Compiling MySQL”.

This section provides a step-by-step guide to creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters. For example plugin source code, see the `plugin/fulltext` directory of MySQL source distributions.

Each plugin library has the following contents:

- A general plugin descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library. The framework for this descriptor is supplied by referring to macros that expand to provide the API version automatically.
- Each general plugin descriptor contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The general plugin descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains an API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

- The plugin library contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of MySQL source distributions. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-5.4` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-5.4/plugin/fulltext/* fulltext_plugin
```

If you are copying files from a Bazaar source tree, `cp` will display an error message about the `SCCS` directory, which you can ignore.

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

   ```
   shell> cd fulltext_plugin
   ```

2. The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

   ```
   #include <stdlib.h>
   #include <ctype.h>
   #include <mysql/plugin.h>
   ```

3. Set up the general plugin descriptor for the plugin library file.

   Every plugin library must include a general descriptor that must define two symbols:

   - `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
   - `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

   If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

   The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

   ```
   mysql_declare_plugin(name)
    ... one or more plugin declarations here ...
   mysql_declare_plugin_end;
   ```

   For example, the general plugin descriptor for a library that contains a single plugin named `simple_parser` looks like this:

   ```
   mysql_declare_plugin(ftexample)
   {
     MYSQL_FTPARSER_PLUGIN,      /* type                            */
     &simple_parser_descriptor,  /* descriptor                      */
     "simple_parser",            /* name                            */
     "Oracle Corporation",       /* author                          */
     "Simple Full-Text Parser",  /* description                     */
     PLUGIN_LICENSE_GPL,         /* plugin license                  */
     simple_parser_plugin_init,  /* init function (when loaded)     */
     simple_parser_plugin_deinit,/* deinit function (when unloaded) */
     0x0001,                     /* version                         */
     simple_status,              /* status variables                */
     simple_system_variables,    /* system variables                */
     NULL
   }
   mysql_declare_plugin_end;
   ```

   For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being

legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)          \
int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION;                         \
int PSIZE= sizeof(struct st_mysql_plugin);                           \
struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)          \
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);  \
struct st_mysql_plugin _mysql_plugin_declarations_[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
                builtin_ ## NAME ## _plugin_interface_version, \
                builtin_ ## NAME ## _sizeof_struct_st_plugin, \
                builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0}}
```

Note

Those declarations define the `_mysql_plugin_interface_version_` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you must provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):

```
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION;
int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin _mysql_plugin_declarations_[]= {
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL
}
  ,{0,0,0,0,0,0,0,0,0,0,0,0}}
};
```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). If you write a C++ plugin, one C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is allowable in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL
}
mysql_declare_plugin_end;
```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  simple_parser_name,         /* name                            */
  simple_parser_author,       /* author                          */
  simple_parser_description,  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL
}
mysql_declare_plugin_end;
```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
  const char *name;
  const char *author;
  const char *description;
} plugin_info;

plugin_info parser_info = {
  "simple_parser",
  "Oracle Corporation",
  "Simple Full-Text Parser"
};

mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  parser_info.name,           /* name                            */
  parser_info.author,         /* author                          */
  parser_info.description,    /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL
}
mysql_declare_plugin_end;
```

4. Set up the type-specific plugin descriptor.

   Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

   ```
   static struct st_mysql_ftparser simple_parser_descriptor=
   {
     MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
     simple_parser_parse,              /* parsing function       */
     simple_parser_init,               /* parser init function   */
     simple_parser_deinit              /* parser deinit function */
   };
   ```

5. Set up the plugin interface functions.

   The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void)
{
  return(0);
}

static int simple_parser_plugin_deinit(void)
{
  return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
  return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
  return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
  char *end, *start, *docend= param->doc + param->length;

  for (end= start= param->doc;; end++)
  {
    if (end == docend)
    {
      if (end > start)
        add_word(param, start, end - start);
      break;
    }
    else if (isspace(*end))
    {
      if (end > start)
        add_word(param, start, end - start);
      start= end + 1;
    }
  }
  return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
  MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
    { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };

  param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in Section 21.2.4.2.1, “Full-Text Parser Plugin Data Structures and Functions”.

6. Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;
```

```
struct st_mysql_show_var simple_status[]=
{
  {"static", (char *)"just a static text", SHOW_CHAR},
  {"called", (char *)&number_of_calls,     SHOW_LONG},
  {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+----------------------+--------------------+
| Variable_name        | Value              |
+----------------------+--------------------+
| simple_parser_static | just a static text |
| simple_parser_called | 0                  |
+----------------------+--------------------+
```

7. Compile the plugin library as a shared library and install it in the plugin directory.

   Note

   As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

   The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The file name might have a different extension on your system.)

   To use the autotools, you'll need to make a few changes to the configuration files at this point to enable the plugin to be compiled and installed. Assume that your MySQL distribution is installed at a base directory of `/usr/local/mysql` and that its header files are located in the `include` directory under the base directory.

   Edit `Makefile.am`, which should look something like this:

```
#Makefile.am example for a plugin

pkgplugindir=$(libdir)/mysql/plugin
INCLUDES= -I$(top_builddir)/include -I$(top_srcdir)/include
#noinst_LTLIBRARIES= mypluglib.la
pkgplugin_LTLIBRARIES= mypluglib.la
mypluglib_la_SOURCES= plugin_example.c
mypluglib_la_LDFLAGS= -module -rpath $(pkgplugindir)
mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
```

   The `mypluglib_la_CFLAGS` line takes care of passing the `-DMYSQL_DYNAMIC_PLUGIN` flag to the compilation command.

   Adjust the `INCLUDES` line to specify the path name to the installed MySQL header files. Edit it to look like this:

```
INCLUDES= -I/usr/local/mysql/include
```

   Make sure that the `noinst_LTLIBRARIES` line is commented out or remove it. Make sure that the `pkglib_LTLIBRARIES` line is not commented out; it enables the `make install` command.

   Set up the files needed for the `configure` command, invoke it, and run `make`:

```
shell> autoreconf --force --install --symlink
shell> ./configure --prefix=/usr/local/mysql
shell> make
```

   The `--prefix` option to `configure` indicates the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+---------------+------------------+
| Variable_name | Value            |
+---------------+------------------+
| base          | /usr/local/mysql |
```

```
+--------------+-----------------+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+---------------+---------------------------------+
| Variable_name | Value                           |
+---------------+---------------------------------+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin |
+---------------+---------------------------------+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions allow it to be executed by the server.

8. Register the plugin with the server.

   The `INSTALL PLUGIN` statement causes the server to register the plugin in the `mysql.plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `mysql.plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+---------------+-----------------+
| name          | dl              |
+---------------+-----------------+
| simple_parser | libmypluglib.so |
+---------------+-----------------+
1 row in set (0.00 sec)
```

   For additional information about plugin loading, see Section 12.4.3.1, “Installing and Uninstalling Plugins”.

9. Try the plugin.

   Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
    ->   FULLTEXT (c) WITH PARSER simple_parser);
Query OK, 0 rows affected (0.01 sec)
```

   Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
    ->   ('latin1_general_cs is a case-sensitive collation'),
    ->   ('I\'d like a case of oranges'),
    ->   ('this is sensitive information'),
    ->   ('another row'),
    ->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0

mysql> SELECT c FROM t;
+-----------------------------------------------+
| c                                             |
+-----------------------------------------------+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges                    |
| this is sensitive information                 |
| another row                                   |
| yet another row                               |
+-----------------------------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-------------------------+
| MATCH(c) AGAINST('case') |
+-------------------------+
|                       0 |
```

```
|          1.2968142032623 |
|                         0 |
|                         0 |
|                         0 |
+--------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+------------------------------+
| MATCH(c) AGAINST('sensitive') |
+------------------------------+
|                            0 |
|                            0 |
|               1.3253291845322 |
|                            0 |
|                            0 |
+------------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----------------------------------+
| MATCH(c) AGAINST('case-sensitive') |
+-----------------------------------+
|                    1.3109166622162 |
|                                  0 |
|                                  0 |
|                                  0 |
+-----------------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+--------------------------+
| MATCH(c) AGAINST('I\'d') |
+--------------------------+
|                         0 |
|          1.2968142032623 |
|                         0 |
|                         0 |
|                         0 |
+--------------------------+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

21.2.5.1. Writing Full-Text Parser Plugins

A plugin that requires those elements must be compiled against MySQL source for which the value of `MYSQL_AUDIT_INTERFACE_VERSION`, the type-specific interface version, is `0x0200` or greater.

A full-text parser plugin can be used to replace or modify the built-in full-text parser. The procedure described in Section 21.2.5, “Writing Plugins”, demonstrates how to write such a plugin.

21.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 12.4.3.2, “`CREATE FUNCTION` Syntax”.
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See Section 18.2, “Using Stored Routines (Procedures and Functions)”.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the

server, you don't need to do that.

- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See Section 8.2.4, "Function Name Parsing and Resolution", for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

21.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

21.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.10.2, "Typical `configure` Options", and Section 2.10.4, "Dealing with Problems Compiling MySQL".

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `--with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `--with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name "xxx" is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

> **Note**
>
> When using C++ you can encapsulate your C functions within:
>
> ```
> extern "C" { ... }
> ```

This will ensure that your C++ function names remain readble in the completed UDF.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

  The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
`STRING`	`char *`
`INTEGER`	`long long`
`REAL`	`double`

  It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

  The initialization function for `xxx()`. It can be used for the following purposes:

  - To check the number of arguments to `XXX()`.
  - To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
  - To allocate any memory required by the main function.
  - To specify the maximum length of the result.
  - To specify (for `REAL` functions) the maximum number of decimal places in the result.
  - To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

  The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.

3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

21.3.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 21.3.2, "Adding a New User-Defined Function", describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);

void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

  `xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

  For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number

of decimals allowed for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is 31 for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

  The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

  If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

  A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

  ```
  initid->ptr = allocated_memory;
  ```

  In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

  `xxx_init()` should set `const_item` to `1` if `xxx()` always returns the same value and to `0` otherwise.

21.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. Section 21.3.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

- `xxx_reset()`

  This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

  ```
  void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
                 char *is_null, char *error);
  ```

  `xxx_reset()` is not needed or used in MySQL 5.4, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

  This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

  ```
  void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
  ```

  `is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

  If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.4.

- `xxx_add()`

  This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See Section 21.3.2.1, "UDF Calling Sequences for Simple Functions".

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See Section 21.3.2.4, "UDF Return Values and Error Handling".

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See Section 21.3.2.3, "UDF Argument Processing".

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

21.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

  The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message,"XXX() requires two arguments");
    return 1;
}
```

  For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count` – 1.

- `enum Item_result *arg_type`

  A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

  To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message,"XXX() requires a string and an integer");
    return 1;
}
```

  Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` val-

ues.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

  `args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

  For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

  If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

  - An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
  - For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

    ```
    long long int_val;
    int_val = *((long long*) args->args[i]);
    ```

  - For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

    ```
    double    real_val;
    real_val = *((double*) args->args[i]);
    ```

  - For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
  - `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

  For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

  For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

  `args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

  The `attribute_lengths` array indicates the length of each argument name.

21.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function via the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

21.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in MySQL source distributions.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a host name.
- `reverse_lookup()` returns the host name for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the Bazaar source repository for MySQL 5.4. See Section 2.10.3, “Installing from the Development Source Tree”.
2. You must obtain the CMake build utility from http://www.cmake.org. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` (`CMakeLists.txt`) with these contents:

   ```
   PROJECT(udf_example)

   # Path for MySQL include directory
   INCLUDE_DIRECTORIES("c:/mysql/include")

   ADD_DEFINITIONS("-DHAVE_DLOPEN")
   ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
   TARGET_LINK_LIBRARIES(udf_example wsock32)
   ```

5. Create the VC project and solution files:

   ```
   cmake -G "<Generator>"
   ```

   Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION reverse_lookup
    ->        RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE AGGREGATE FUNCTION avgcost
    ->        RETURNS REAL SONAME 'udf_example.dll';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

21.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

21.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave serv-

er also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:

   - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.

   - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

   ```
   static Native_func_registry func_array[]
   ```

   You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.

4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

   ```
   double   Item_func_newname::val()
   longlong Item_func_newname::val_int()
   String  *Item_func_newname::Str(String *str)
   ```

   If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

   ```
   current_thd->lex->safe_to_cache_query=0;
   ```

   A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

   ```
   void Item_func_newname::fix_length_and_dec()
   ```

   This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)

- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.

- All current string functions try to avoid allocating any memory unless absolutely necessary!

21.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

21.4.1. `PROCEDURE ANALYSE`

`ANALYSE([max_elements[,max_memory]])`

`ANALYSE()` is defined in the `sql/sql_analyse.cc` source file, which serves as an example of how to create a procedure for use with the `PROCEDURE` clause of `SELECT` statements. `ANALYSE()` is built in and is available by default; other procedures can be created using the format demonstrated in the source file.

`ANALYSE()` examines the result from a query and returns an analysis of the results that suggests optimal data types for each column that may help reduce table sizes. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- *`max_elements`* (default 256) is the maximum number of distinct values that `ANALYSE()` notices per column. This is used by `ANALYSE()` to check whether the optimal data type should be of type `ENUM`; if there are more than *`max_elements`* distinct values, then `ENUM` is not a suggested type.
- *`max_memory`* (default 8192) is the maximum amount of memory that `ANALYSE()` should allocate per column while trying to find all distinct values.

21.4.2. Writing a Procedure

You can find information about procedures by examining the following source files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

See also Writing a Procedure at MySQL Forge.

21.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See Section 2.1.1, “Operating Systems Supported by MySQL Community Server”. If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (http://www.mysql.com/), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, `<Xavier.Leroy@inria.fr>`.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See `mit-pthreads/README` and Programming POSIX Threads (http://www.humanfactor.com/pthreads/).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at http://www.mit.edu/afs/sipb/project/pthreads/ and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See Section 2.10.5, “MIT-pthreads Notes”.

It is also possible to use another user level thread package named FSU Pthreads (see http://moss.csc.ncsu.edu/~mueller/pthreads/). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are Sun Studio, HP-UX `aCC`, IBM AIX `xlC_r`), Intel `ecc/icc`. With previous versions on the respective platforms, we also used Irix `cc` and Compaq `cxx`.

> **Important**
>
> If you are trying to build MySQL 5.4 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see Bug#21875.)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See Section 2.10.3, “Installing from the Development Source Tree”.

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See Section 21.5.1, “Debugging a MySQL Server”.

> **Note**
>
> Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

21.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it "hangs," you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.13, "Operating System-Specific Notes".

21.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
   -fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
   --with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something "unexpected," an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See Section 1.6.1, "MySQL Mailing Lists". If you believe that you have found a bug, please use the instructions at Section 1.7, "How to Report Bugs or Problems".

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

21.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the

`mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big**! If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to ftp://ftp.mysql.com/pub/mysql/upload/ so that a MySQL developer can take a look at it.

The trace file is made with the **DBUG** package by Fred Fish. See Section 21.5.3, “The DBUG Package”.

21.5.1.3. Using `pdb` to create a Windows crashdump

Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see Microsoft Knowledge Base Article 121366. For more information on the debugging options available, see Debugging Tools for Windows.

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with WinDbg, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

   ```
   C:\> drwtsn32 -i
   ```

2. Set the **Log File Path** to the directory where you want to store trace files.
3. Make sure **Dump All Thread Contexts** and **Append To Existing Log File**.
4. Uncheck **Dump Symbol Table**, **Visual Notification**, **Sound Notification** and **Create Crash Dump File**.
5. Set the **Number of Instructions** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can be very large.

21.5.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb` 5.1 because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections` + 1. In most cases just using `--thread_cache_size=5'` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb>   backtrace full
gdb>   quit
```

See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download gdb 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug mysqld:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

21.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See Section 5.2.2, “The Error Log”. To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See Section 21.5.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
```

```
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

   ```
   0x9da402
   0x6648e9
   0x7f1a5af000f0
   0x7f1a5a10f0f2
   0x7412cb
   0x688354
   0x688494
   0x67a170
   0x67f0ad
   0x67fdf8
   0x6811b6
   0x66e05e
   ```

2. Make a symbol file for the `mysqld` server:

   ```
   shell> nm -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If `mysqld` is not linked statically, use the following command instead:

   ```
   shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

   ```
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
   ```

   If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

   ```
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
   ```

   This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See Section 1.7, "How to Report Bugs or Problems".

21.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See Chapter 5, *MySQL Server Administration*.

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See Section 5.2.3, "The General Query Log". When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as *`host_name`*`.log` In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See Section 12.8.2, "`EXPLAIN` Syntax".

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See Section 5.2.5, "The Slow Query Log".

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see Chapter 5, *MySQL Server Administration*), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at http://lists.mysql.com/, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.2, "Server Command Options".

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

21.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/`*`table`*`.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See Section 5.2.3, "The General Query Log", and Section 5.2.4, "The Binary Log".
- When you have gotten a crashed table, stop the `mysqld server`.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.

- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to ftp://ftp.mysql.com/pub/mysql/upload/ and report it in our bugs database using the instructions given in Section 1.7, "How to Report Bugs or Problems". (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center https://support.mysql.com/ to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

21.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See Section 2.10.2, "Typical `configure` Options".

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.7, "How to Report Bugs or Problems".

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

21.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See Section 21.5.1.2, "Creating Trace Files".

This section summaries the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional "`,`" and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
`d`	Enable output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only

	for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
D	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, -#D,20 specifies a delay of two seconds.
f	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate d or t flags must still be given; this flag only limits their actions if they are enabled.
F	Identify the source file name for each line of debug or trace output.
i	Identify the process with the PID or thread ID for each line of debug or trace output.
g	Enable profiling. Create a file called dbugmon.out containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
L	Identify the source file line number for each line of debug or trace output.
n	Print the current function nesting depth for each line of debug or trace output.
N	Number each line of debug output.
o	Redirect the debugger output stream to the specified file. The default output is stderr.
O	Like o, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
p	Limit debugger actions to specified processes. A process must be identified with the DBUG_PROCESS macro and match one in the list for debugger actions to occur.
P	Print the current process name for each line of debug or trace output.
r	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
S	Do function _sanity(_file_,_line_) at each debugged function until _sanity() returns something that differs from 0. (Mostly used with safemalloc to find memory leaks)
t	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the -# is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:O,\\mysqld.trace
```

In MySQL, common tags to print (with the d option) are enter, exit, error, warning, info, and loop.

21.5.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See mysys/my_pthread.c for more info.

At least the following should be changed:

pthread_get_specific should use one argument. sigwait should take two arguments. A lot of functions (at least pthread_cond_wait, pthread_cond_timedwait()) should return the error code on error. Now they return -1 and set errno.

Another problem is that user-level threads use the ALRM signal and this aborts a lot of functions (read, write, open...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed mysys/thr_alarm.c to wait between alarms with pthread_cond_timedwait(), but this aborts with error EINTR. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.
- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```
Main thread: 1
Thread 0 (5) started
Thread: 5  Waiting
process_alarm
Thread 1 (6) started
Thread: 6  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 1 (1) sec
Thread: 6  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 2 (2) sec
Thread: 6  Simulation of no alarm needed
Thread: 6  Slept for 0 (3) sec
Thread: 6  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 4 (4) sec
Thread: 6  Waiting
process_alarm
thread_alarm
Thread: 5  Slept for 10 (10) sec
Thread: 5  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 5 (5) sec
Thread: 6  Waiting
process_alarm
process_alarm

...
thread_alarm
Thread: 5  Slept for 0 (1) sec
end
```

21.5.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all nonthread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it is quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting.

Thread switching is somewhat expensive.

- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really “thread aware.”

Appendix A. MySQL 5.4 Frequently Asked Questions

A.1. MySQL 5.4 FAQ: General

Questions

- 23.1.1: Which version of MySQL is production-ready (GA)?
- 23.1.2: Can MySQL 5.4 do subqueries?
- 23.1.3: Can MySQL 5.4 perform multiple-table inserts, updates, and deletes?
- 23.1.4: Does MySQL 5.4 have a Query Cache? Does it work on Server, Instance or Database?
- 23.1.5: Does MySQL 5.4 have Sequences?
- 23.1.6: Does MySQL 5.4 have a `NOW()` function with fractions of seconds?
- 23.1.7: Does MySQL 5.4 work with multi-core processors?
- 23.1.8: Why do I see multiple processes for `mysqld`?
- 23.1.9: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?
- 23.1.10: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- 23.1.11: Can MySQL 5.4 perform ACID transactions?

Questions and Answers

23.1.1: Which version of MySQL is production-ready (GA)?

Currently, both MySQL 5.0 and MySQL 5.1 are supported for production use.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

MySQL 5.4 was a development series. Work on this series has ceased.

Development work on MySQL 5.5 has started; currently, MySQL 5.5 is in beta status.

Development work on MySQL 6.0 has started; currently, MySQL 6.0 is in alpha status.

23.1.2: Can MySQL 5.4 do subqueries?

Yes. See Section 12.2.9, “Subquery Syntax”.

23.1.3: Can MySQL 5.4 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see Section 12.2.11, “`UPDATE` Syntax”; for that required to perform multiple-table deletes, see Section 12.2.2, “`DELETE` Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See Section 18.3, “Using Triggers”.

23.1.4: Does MySQL 5.4 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See Section 7.5.5, “The MySQL Query Cache”.

23.1.5: Does MySQL 5.4 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.4 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

23.1.6: Does MySQL 5.4 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See Section 10.3.2, “The TIME Type”.

23.1.7: Does MySQL 5.4 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

23.1.8: Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

23.1.9: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?

This is currently under development for a future MySQL release.

23.1.10: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in `InnoDB` has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

23.1.11: Can MySQL 5.4 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

A.2. MySQL 5.4 FAQ: Storage Engines

Questions

- 23.2.1: Are there any new storage engines in MySQL 5.4?
- 23.2.2: Have any storage engines been removed in MySQL 5.4?
- 23.2.3: What are the unique benefits of the `ARCHIVE` storage engine?
- 23.2.4: Do the new features in MySQL 5.4 apply to all storage engines?
- 23.2.5: Where can I obtain complete documentation for MySQL storage engines?

Questions and Answers

23.2.1: Are there any new storage engines in MySQL 5.4?

No, but the `InnoDB Plugin` is the built-in version of the `InnoDB` storage engine.

23.2.2: Have any storage engines been removed in MySQL 5.4?

No.

23.2.3: What are the unique benefits of the `ARCHIVE` storage engine?

The `ARCHIVE` storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See Section 13.12, "The `ARCHIVE` Storage Engine", for details.

23.2.4: Do the new features in MySQL 5.4 apply to all storage engines?

The general new features such as views, stored procedures, triggers, `INFORMATION_SCHEMA`, precision math (`DECIMAL` column type), and the `BIT` column type, apply to all storage engines. There are also additions and changes for specific storage engines.

23.2.5: Where can I obtain complete documentation for MySQL storage engines?

See Chapter 13, *Storage Engines*. That chapter contains information about all MySQL storage engines except for the `NDB` storage engine used for MySQL Cluster; `NDB` is covered in MySQL Cluster NDB 6.X/7.X.

A.3. MySQL 5.4 FAQ: Server SQL Mode

Questions

- 23.3.1: Is the mode dependent on the database or connection?
- 23.3.2: What is the default server SQL mode when My SQL 5.4 is installed?
- 23.3.3: Does strict mode impact performance?
- 23.3.4: Can the rules for strict mode be extended?
- 23.3.5: How do you determine the server SQL mode?
- 23.3.6: How many server SQL modes are there?
- 23.3.7: What are server SQL modes?

Questions and Answers

23.3.1: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

23.3.2: What is the default server SQL mode when My SQL 5.4 is installed?

By default, no special modes are enabled. See Section 5.1.7, "Server SQL Modes", for information about all available modes and MySQL's default behavior.

23.3.3: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However—if you do require it—strict mode can provide such validation.

23.3.4: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See Section 5.1.7, "Server SQL Modes", for more information.

23.3.5: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

23.3.6: How many server SQL modes are there?

Each mode can be independently switched on and off. See Section 5.1.7, “Server SQL Modes”, for a complete list of available modes.

23.3.7: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see Section 5.1.7, “Server SQL Modes”.

A.4. MySQL 5.4 FAQ: Stored Procedures and Functions

Questions

- 23.4.1: Do stored procedures have a statement for raising application errors?
- 23.4.2: How do you manage stored routines?
- 23.4.3: Can a stored procedure call a trigger?
- 23.4.4: Where can I find documentation for MySQL stored procedures and stored functions?
- 23.4.5: Can I return a cursor as an `OUT` parameter from a stored procedure?
- 23.4.6: Can MySQL 5.4 stored routines return result sets?
- 23.4.7: What is being done to correct the aforementioned limitations?
- 23.4.8: How are actions that take place inside stored procedures and functions replicated?
- 23.4.9: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?
- 23.4.10: Is `WITH RECOMPILE` supported for stored procedures?
- 23.4.11: Can I print out a variable's value within a stored routine for debugging purposes?
- 23.4.12: Are there special security requirements for using stored procedures and functions together with replication?
- 23.4.13: What limitations exist for replicating stored procedure and function actions?
- 23.4.14: Where can I find the ANSI SQL 2003 specification for stored procedures?
- 23.4.15: Is it possible to group stored procedures or stored functions into packages?
- 23.4.16: Is there a way to view all stored procedures and stored functions in a given database?
- 23.4.17: Do MySQL 5.4 stored procedures and functions work with replication?
- 23.4.18: Can I pass an array as input to a stored procedure?
- 23.4.19: Can a stored procedure access tables?
- 23.4.20: Are stored procedures and functions created on a master server replicated to a slave?
- 23.4.21: Can I pass a cursor as an `IN` parameter to a stored procedure?
- 23.4.22: Can a stored procedure call another stored procedure?
- 23.4.23: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- 23.4.24: Where are stored procedures stored?
- 23.4.25: Is there a discussion forum for MySQL stored procedures?
- 23.4.26: Does MySQL 5.4 support stored procedures and functions?

- 23.4.27: Do stored procedures provide exception handling?
- 23.4.28: Can I commit or roll back transactions inside a stored procedure?

Questions and Answers

23.4.1: Do stored procedures have a statement for raising application errors?

Not in MySQL 5.4. The SQL standard `SIGNAL` and `RESIGNAL` statements are implemented in MySQL 5.5.

23.4.2: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see Section 19.14, "The `INFORMATION_SCHEMA ROUTINES` Table").

23.4.3: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

23.4.4: Where can I find documentation for MySQL stored procedures and stored functions?

See Section 18.2, "Using Stored Routines (Procedures and Functions)".

23.4.5: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.4, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See Section 12.2.8, "`SELECT` Syntax".

23.4.6: Can MySQL 5.4 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

23.4.7: What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, "smart" form of replication "knows" whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see Section 16.1.2, "Replication Formats".

23.4.8: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

23.4.9: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.4.

23.4.10: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.4.

23.4.11: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work.

This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

23.4.12: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

23.4.13: What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

23.4.14: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including coverage of stored procedures.

23.4.15: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.4.

23.4.16: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *`dbname`*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
    FROM INFORMATION_SCHEMA.ROUTINES
    WHERE ROUTINE_SCHEMA='dbname';
```

For more information, see Section 19.14, “The `INFORMATION_SCHEMA ROUTINES` Table”.

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See Section 12.4.5.11, “`SHOW CREATE PROCEDURE` Syntax”, for more information.

23.4.17: Do MySQL 5.4 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in Section 18.7, “Binary Logging of Stored Programs”.

23.4.18: Can I pass an array as input to a stored procedure?

Not in MySQL 5.4.

23.4.19: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

23.4.20: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

23.4.21: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.4, cursors are available inside stored procedures only.

23.4.22: Can a stored procedure call another stored procedure?

Yes.

23.4.23: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

23.4.24: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See Section 12.4.5.11, "`SHOW CREATE PROCEDURE` Syntax", for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database—see Section 19.14, "The `INFORMATION_SCHEMA ROUTINES` Table", for information about this table.

23.4.25: Is there a discussion forum for MySQL stored procedures?

Yes. See http://forums.mysql.com/list.php?98.

23.4.26: Does MySQL 5.4 support stored procedures and functions?

Yes. MySQL 5.4 supports two types of stored routines—stored procedures and stored functions.

23.4.27: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See Section 12.7.4.2, "`DECLARE` for Handlers", for details.

23.4.28: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

A.5. MySQL 5.4 FAQ: Triggers

Questions

- 23.5.1: How are actions carried out through triggers on a master replicated to a slave?
- 23.5.2: Can a trigger call a stored procedure?
- 23.5.3: Do triggers work with replication?
- 23.5.4: Is it possible for a trigger to update tables on a remote server?
- 23.5.5: How are triggers managed in MySQL?
- 23.5.6: Can triggers access tables?
- 23.5.7: Where are triggers stored?
- 23.5.8: Are there any default triggers?
- 23.5.9: Where can I find the documentation for MySQL 5.4 triggers?
- 23.5.10: Is there a discussion forum for MySQL Triggers?

- 23.5.11: Is there a way to view all triggers in a given database?
- 23.5.12: Does MySQL 5.4 have statement-level or row-level triggers?
- 23.5.13: Can triggers call an external application through a UDF?

Questions and Answers

23.5.1: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and—in addition—the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see Section 16.4.1.28, “Replication and Triggers”.

23.5.2: Can a trigger call a stored procedure?

Yes.

23.5.3: Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see Section 16.4.1.28, “Replication and Triggers”.

23.5.4: Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See Section 13.11, “The `FEDERATED` Storage Engine”).

23.5.5: How are triggers managed in MySQL?

In MySQL 5.4, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See Section 12.1.15, "`CREATE TRIGGER` Syntax", and Section 12.1.24, "`DROP TRIGGER` Syntax", for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See Section 19.16, "The `INFORMATION_SCHEMA TRIGGERS` Table".

23.5.6: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

23.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

23.5.8: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

23.5.9: Where can I find the documentation for MySQL 5.4 triggers?

See Section 18.3, "Using Triggers".

23.5.10: Is there a discussion forum for MySQL Triggers?

Yes. It is available at http://forums.mysql.com/list.php?99.

23.5.11: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
    FROM INFORMATION_SCHEMA.TRIGGERS
    WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see Section 19.16, "The `INFORMATION_SCHEMA TRIGGERS` Table".

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See Section 12.4.5.39, "`SHOW TRIGGERS` Syntax".

23.5.12: Does MySQL 5.4 have statement-level or row-level triggers?

In MySQL 5.4, all triggers are `FOR EACH ROW`—that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.4 does not support triggers using `FOR EACH STATEMENT`.

23.5.13: Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: http://forge.mysql.com/projects/project.php?id=211

A.6. MySQL 5.4 FAQ: Views

Questions

- 23.6.1: Does MySQL 5.4 have table snapshots?
- 23.6.2: Does MySQL 5.4 have materialized views?
- 23.6.3: What happens to a view if an underlying table is dropped or renamed?
- 23.6.4: Is there a discussion forum for MySQL Views?

- 23.6.5: Where can I find documentation covering MySQL Views?
- 23.6.6: Can you insert into views that are based on joins?

Questions and Answers

23.6.1: Does MySQL 5.4 have table snapshots?

No.

23.6.2: Does MySQL 5.4 have materialized views?

No.

23.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See Section 12.4.2.3, "`CHECK TABLE` Syntax".)

23.6.4: Is there a discussion forum for MySQL Views?

Yes. See http://forums.mysql.com/list.php?100

23.6.5: Where can I find documentation covering MySQL Views?

See Section 18.5, "Using Views".

23.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7. MySQL 5.4 FAQ: `INFORMATION_SCHEMA`

Questions

- 23.7.1: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- 23.7.2: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- 23.7.3: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?
- 23.7.4: Is there a discussion forum for `INFORMATION_SCHEMA`?
- 23.7.5: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Questions and Answers

23.7.1: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

23.7.2: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See Chapter 19, *`INFORMATION_SCHEMA` Tables*

23.7.3: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data*.

23.7.4: Is there a discussion forum for `INFORMATION_SCHEMA`?

See http://forums.mysql.com/list.php?101.

23.7.5: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

A.8. MySQL 5.4 FAQ: Migration

Questions

- 23.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.4?
- 23.8.2: How has storage engine (table type) support changed in MySQL 5.4 from previous versions?

Questions and Answers

23.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.4?

For detailed upgrade information, see Section 2.12.1, “Upgrading MySQL”. Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble—if you encounter problems during the upgrade, their origin will be easier to identify, either by you or—if you have a MySQL Enterprise subscription—by MySQL support.

23.8.2: How has storage engine (table type) support changed in MySQL 5.4 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table *`tblname`* from `ISAM` to `MyISAM`, simply issue a statement such as this one:

  ```
  ALTER TABLE tblname ENGINE=MYISAM;
  ```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.
- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

A.9. MySQL 5.4 FAQ: Security

Questions

- 23.9.1: Does MySQL 5.4 have built-in authentication against LDAP directories?
- 23.9.2: Does MySQL 5.4 have native support for SSL?
- 23.9.3: Where can I find documentation that addresses security issues for MySQL?
- 23.9.4: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?
- 23.9.5: Does MySQL 5.4 include support for Roles Based Access Control (RBAC)?

Questions and Answers

23.9.1: Does MySQL 5.4 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

23.9.2: Does MySQL 5.4 have native support for SSL?

Most 5.4 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See Section 5.5.6, “Using SSL for Secure Connections”.

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see Section 5.5.7, “Connecting to MySQL Remotely from Windows with SSH”.

23.9.3: Where can I find documentation that addresses security issues for MySQL?

The best place to start is Section 5.3, “General Security Issues”.

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- Section 5.3.1, “General Security Guidelines”.
- Section 5.3.3, “Making MySQL Secure Against Attackers”.
- Section B.5.4.1, “How to Reset the Root Password”.
- Section 5.3.6, “How to Run MySQL as a Normal User”.
- Section 21.3.2.6, “User-Defined Function Security Precautions”.
- Section 5.3.4, “Security-Related `mysqld` Options”.
- Section 5.3.5, “Security Issues with `LOAD DATA LOCAL`”.
- Section 2.11, “Post-Installation Setup and Testing”.
- Section 5.5.6.1, “Basic SSL Concepts”.

MySQL Enterprise
The MySQL Enterprise Monitor enforces best practices for maximizing the security of your servers. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

23.9.4: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.4 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See Section 5.5.6, “Using SSL for Secure Connections”, for a complete listing of supported and unsupported platforms.

23.9.5: Does MySQL 5.4 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

A.10. MySQL 5.4 FAQ: MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the `NDBCLUSTER` storage engine.

Questions

- 23.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?

Questions and Answers

23.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?

MySQL Cluster is not supported in MySQL Server 5.4 releases. Instead, MySQL Cluster is released as a separate product, available as MySQL Cluster NDB 6.3 and MySQL Cluster NDB 7.0. You should use one of these for new deployments, and plan to upgrade to one of them if you are using a previous version of MySQL with clustering support. For an overview of improvements in MySQL Cluster NDB 6.2 and 6.3, see MySQL Cluster Development in MySQL Cluster NDB 6.3, and MySQL Cluster Development in MySQL Cluster NDB 7.0.

For answers to frequently asked questions about MySQL Cluster, see MySQL 5.1 FAQ: MySQL Cluster. For detailed information about deploying and using MySQL Cluster, see MySQL Cluster NDB 6.X/7.X.

A.11. MySQL 5.4 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- 23.11.1: Why do I get `DATA TRUNCATED` error messages?
- 23.11.2: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?
- 23.11.3: What should I do if I want to convert SJIS `81CA` to `cp932`?
- 23.11.4: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- 23.11.5: Why do Japanese character set conversions fail?
- 23.11.6: How do I know whether character *X* is available in all character sets?
- 23.11.7: What problems should I be aware of when working with the Big5 Chinese character set?
- 23.11.8: How does MySQL represent the Yen (`¥`) sign?
- 23.11.9: Why don't CJK strings sort correctly in Unicode? (I)
- 23.11.10: Shouldn't it be “CJKV”?
- 23.11.11: What CJK character sets are available in MySQL?
- 23.11.12: Do MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?
- 23.11.13: Why are my supplementary characters rejected by MySQL?
- 23.11.14: Why don't CJK strings sort correctly in Unicode? (II)
- 23.11.15: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- 23.11.16: Where can I get help with CJK and related issues in MySQL?
- 23.11.17: Does MySQL allow CJK characters to be used in database and table names?
- 23.11.18: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- 23.11.19: I've upgraded to MySQL 5.4. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- 23.11.20: Of what issues should I be aware when working with Korean character sets in MySQL?

Questions and Answers

23.11.1: Why do I get `DATA TRUNCATED` error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
    -> (ucs2 CHAR(3) CHARACTER SET ucs2,
    -> gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character 汃 in both columns.

```
mysql> INSERT INTO ch VALUES ('A汃B','A汃B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS;
+---------+------+-------------------------------------------+
| Level   | Code | Message                                   |
+---------+------+-------------------------------------------+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1 |
+---------+------+-------------------------------------------+
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-------+--------------+--------+-------------+
| ucs2  | HEX(ucs2)    | gb2312 | HEX(gb2312) |
+-------+--------------+--------+-------------+
| A汃B | 00416C4C0042 | A?B    | 413F42      |
+-------+--------------+--------+-------------+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it is a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.

2. The 汃 character isn't in the `gb2312` character set. We described that problem earlier.

3. Admittedly the message is misleading. We didn't “truncate” in this case, we replaced with a question mark. We've had a complaint about this message (See Bug#9337). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.

4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1`.

23.11.2: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check Section 20.1.4, “Connector/ODBC Configuration”. If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
              & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See Section 20.2.5.1, “Connecting to MySQL Using Connector/NET”, for more information.

If you are using PHP, try this:

```
<?php
  $link = mysql_connect($host, $usr, $pwd);
```

```
  mysql_select_db($db);

  if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
  mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
  $link = new mysqli($host, $usr, $pwd, $db);

  if( mysqli_connect_errno() )
  {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
  }

  $link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see Section 20.3.4.4, “Using Character Sets and Unicode”.

23.11.3: What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`. We are considering a change to this behavior.

23.11.4: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

  Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

  People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or—better—yet by using this statement:

  ```
  SELECT character_set_name, collation_name
      FROM information_schema.columns
      WHERE table_schema = your_database_name
          AND table_name = your_table_name
          AND column_name = your_column_name;
  ```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

  You can obtain this information for a column `column_name` in the table `table_name` using the following query:

  ```
  SELECT HEX(column_name)
  FROM table_name;
  ```

  `3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible—that is, when you select `literal` (or `_introducer hexadecimal-value`), you obtain `literal` as a result.*

For example, the Japanese *Katakana* character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ペ' AS `ペ`;         /* or SELECT _ucs2 0x30da; */
```

If the result is not also ペ, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ペ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

  Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

  To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.03 sec)
```

  These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

  Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

  If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

  Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

  It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

23.11.5: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations—that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F

Character Name	ucs2	sjis	cp932	ujis	eucjpms
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”)—this is what is always used when the conversion cannot be performed.

23.11.6: How do I know whether character *X* is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
             (ucs2 CHAR(1) character set ucs2,
              utf8 CHAR(1) character set utf8,
              big5 CHAR(1) character set big5,
              cp932 CHAR(1) character set cp932,
              eucjpms CHAR(1) character set eucjpms,
              euckr CHAR(1) character set euckr,
              gb2312 CHAR(1) character set gb2312,
              gbk CHAR(1) character set gbk,
              sjis CHAR(1) character set sjis,
              ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
              big5=ucs2,
              cp932=ucs2,
              eucjpms=ucs2,
              euckr=ucs2,
```

```
              gb2312=ucs2,
              gbk=ucs2,
              sjis=ucs2,
              ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//
```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (http://www.unicode.org/Public/UNIDATA/UnicodeData.txt), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+------+--------+------+-------+---------+-------+--------+------+------+------+
| ucs2 | utf8   | big5 | cp932 | eucjpms | euckr | gb2312 | gbk  | sjis | ujis |
+------+--------+------+-------+---------+-------+--------+------+------+------+
| 30DA | E3839A | C772 | 8379  | A5DA    | ABDA  | A5DA   | A5DA | 8379 | A5DA |
+------+--------+------+-------+---------+-------+--------+------+------+------+
1 row in set (0.04 sec)
```

Since none of the column values is `3F`—that is, the question mark character (`?`)—we know that every conversion worked.

23.11.7: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of Bug#12476). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+------+
| big5 |
+------+
| 嫺   |
+------+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug#13577 to be of interest.

23.11.8: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\`—also known as a backslash), and others treat it as a yen sign (`¥`).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, *`5C` is always the reverse solidus (`\`)*.

23.11.9: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt. This is not the first table you will find by navigating from the `unicode.org` home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we

are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in Bug#16526, illustrated as follows:

```
mysql< CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2  Duplicates: 0  Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+------+
| s1   |
+------+
| が   |
| か   |
+------+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+------+-----------------------------+
| s1   | HEX(CONVERT(s1 USING ucs2)) |
+------+-----------------------------+
| が   | 304C                        |
| か   | 304B                        |
+------+-----------------------------+
2 rows in set (0.03 sec)
```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B  ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C  ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QQCM
```

The official Unicode names (following the "#" mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting が and か correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct "according to Unicode" isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA`/`GA` are distinguishable for ordering purposes.

23.11.10: Shouldn't it be "CJKV"?

No. The term "CJKV" (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

Bug#4745 is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

23.11.11: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eucjpms` character set was not supported prior to MySQL 5.0.3 (see Changes in MySQL 5.0.3). However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
    -> FROM INFORMATION_SCHEMA.CHARACTER_SETS
    -> WHERE DESCRIPTION LIKE '%Chinese%'
    -> OR DESCRIPTION LIKE '%Japanese%'
    -> OR DESCRIPTION LIKE '%Korean%'
    -> ORDER BY CHARACTER_SET_NAME;
+--------------------+----------------------------+
| CHARACTER_SET_NAME | DESCRIPTION                |
+--------------------+----------------------------+
| big5               | Big5 Traditional Chinese   |
| cp932              | SJIS for Windows Japanese  |
| eucjpms            | UJIS for Windows Japanese  |
| euckr              | EUC-KR Korean              |
| gb2312             | GB2312 Simplified Chinese  |
| gbk                | GBK Simplified Chinese     |
| sjis               | Shift-JIS Japanese         |
| ujis               | EUC-JP Japanese            |
+--------------------+----------------------------+
```

```
8 rows in set (0.01 sec)
```

(See Section 19.9, "The INFORMATION_SCHEMA CHARACTER_SETS Table", for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`—but eventually they try to insert a rarer Chinese character and it doesn't work. (See Bug#16072 for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: gb2312
- MySQL's `gbk` is in reality "Microsoft code page 936". This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`. For a listing of the differences, see http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h.
- For a listing of `gbk`/Unicode mappings, see http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT.
- For MySQL's listing of `gbk` characters, see gbk.

23.11.12: Do MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

23.11.13: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters—that is, characters which need more than 3 bytes—for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in Bug#12600, which we rejected as "not a bug". With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the "bad" characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

23.11.14: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see Section A.11, "MySQL 5.4 FAQ: MySQL Chinese, Japanese, and Korean Character Sets"), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
******************** 1. row ******************
Table: t
Create Table: CREATE TABLE `t` (
`s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
    -> FROM INFORMATION_SCHEMA.COLUMNS
    -> WHERE COLUMN_NAME = 's1'
    -> AND TABLE_NAME = 't';
+-------------+--------------------+-----------------+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME  |
+-------------+--------------------+-----------------+
| s1          | ucs2               | ucs2_general_ci |
+-------------+--------------------+-----------------+
1 row in set (0.01 sec)
```

(See Section 19.3, “The INFORMATION_SCHEMA COLUMNS Table”, for more information.)

You can see that the collation is ucs2_general_ci instead of ucs2_unicode_ci. The reason why this is so can be found using SHOW CHARSET, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+---------+---------------+-------------------+--------+
| Charset | Description   | Default collation | Maxlen |
+---------+---------------+-------------------+--------+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   |      2 |
+---------+---------------+-------------------+--------+
1 row in set (0.00 sec)
```

For ucs2 and utf8, the default collation is “general”. To specify a Unicode collation, use COLLATE ucs2_unicode_ci.

23.11.15: Why do some LIKE and FULLTEXT searches with CJK characters fail?

There is a very simple problem with LIKE searches on BINARY and BLOB columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in utf8, A requires one byte but ぺ requires three bytes, as shown here:

```
+------------------------+--------------------------+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 'ぺ') |
+------------------------+--------------------------+
|                      1 |                        3 |
+------------------------+--------------------------+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as LIKE '_A%' fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For FULLTEXT searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary—the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

23.11.16: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at http://dev.mysql.com/user-groups/.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

  ```
  Tel: +81(0)3-5326-3133
  Fax: +81(0)3-5326-3001
  Email: dsaito@mysql.com
  ```

- View feature requests relating to character set issues at http://tinyurl.com/y6xcuf.
- Visit the MySQL Character Sets, Collation, Unicode Forum. We are also in the process of adding foreign-language forums at http://forums.mysql.com/.

23.11.17: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named 楮 on a server whose operating system does not support CJK in directory names, MySQL creates a directory named @0w@00a5@00ae. which is just a fancy way of encoding E6A5AE—that is, the Unicode hexadecimal representation for the 楮 character. However, if you run a SHOW DATABASES statement, you can see that the database is listed as 楮.

23.11.18: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at http://dev.mysql.com/doc/. The Japanese trans-

lation of the MySQL 4.1 manual can be downloaded from http://dev.mysql.com/doc/.

23.11.19: I've upgraded to MySQL 5.4. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single "global" character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a "handshake", as described in Section 9.1.4, "Connection Character Sets and Collations":

> When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use—however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | latin1                                 |
| character_set_connection | latin1                                 |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | latin1                                 |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

23.11.20: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `WON SIGN`(₩). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
    ->     CONVERT('₩' USING euckr) AS euckr,
    ->     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-------+----------+
| euckr | hexeuckr |
+-------+----------+
| ?     | 3F       |
+-------+----------+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: euckr.

A.12. MySQL 5.4 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- Section 20.9.10, “Common Questions and Problems When Using the C API”
- Section 20.10.6, “Common Problems with MySQL and PHP”
- Section 20.1.7, “Connector/ODBC Notes and Tips”
- Section 20.2.5, “Connector/NET Programming”
- Section 20.3.5, “Connector/J Notes and Tips”
- Section 20.4.6, “Connector/MXJ Notes and Tips”

A.13. MySQL 5.4 FAQ: Replication

For answers to common queries and question regarding Replication within MySQL, see Section 16.4.4, “Replication FAQ”.

A.14. MySQL 5.4 FAQ: MySQL, DRBD, and Heartbeat

A.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- 23.14.1.1: How is DRBD licensed?
- 23.14.1.2: Where can I download DRBD?
- 23.14.1.3: If I find a bug in DRBD, to whom do I submit the issue?
- 23.14.1.4: What are “Block Devices”?
- 23.14.1.5: What is DRBD?
- 23.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Questions and Answers

23.14.1.1: How is DRBD licensed?

DRBD is licensed under the GPL.

23.14.1.2: Where can I download DRBD?

Please see http://www.drbd.org/download/packages/.

23.14.1.3: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see http://lists.linbit.com/.

23.14.1.4: What are "Block Devices"?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

23.14.1.5: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by LINBIT.

23.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit http://mysql.com/drbd/.

A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- 23.14.2.1: Where can I download Linux Heartbeat?
- 23.14.2.2: How is Linux Heartbeat licensed?
- 23.14.2.3: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

23.14.2.1: Where can I download Linux Heartbeat?

Please see http://linux-ha.org/download/index.html.

23.14.2.2: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

23.14.2.3: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to http://www.linux-ha.org/ClusterResourceManager/BugReports.

A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- 23.14.3.1: How long does a failover take?
- 23.14.3.2: How long does it take to resynchronize data after a failure?
- 23.14.3.3: Are there any situations where you shouldn't use DRBD?

- 23.14.3.4: Where can I find more information on sample architectures?
- 23.14.3.5: Is an Active/Active option available for MySQL with DRBD?
- 23.14.3.6: Are there any limitations to DRBD?
- 23.14.3.7: What MySQL storage engines are supported with DRBD?

Questions and Answers

23.14.3.1: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

23.14.3.2: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

23.14.3.3: Are there any situations where you shouldn't use DRBD?

See When Not To Use DRBD.

23.14.3.4: Where can I find more information on sample architectures?

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see DRBD User's Guide.

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see DRBD User's Guide.

23.14.3.5: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

23.14.3.6: Are there any limitations to DRBD?

See DRBD limitations (or are they?).

23.14.3.7: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- 23.14.4.1: What is the difference between MySQL Replication and DRBD?
- 23.14.4.2: How can I combine MySQL Replication scale-out with DRBD?
- 23.14.4.3: What is the difference between MySQL Cluster and DRBD?

Questions and Answers

23.14.4.1: What is the difference between MySQL Replication and DRBD?

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates

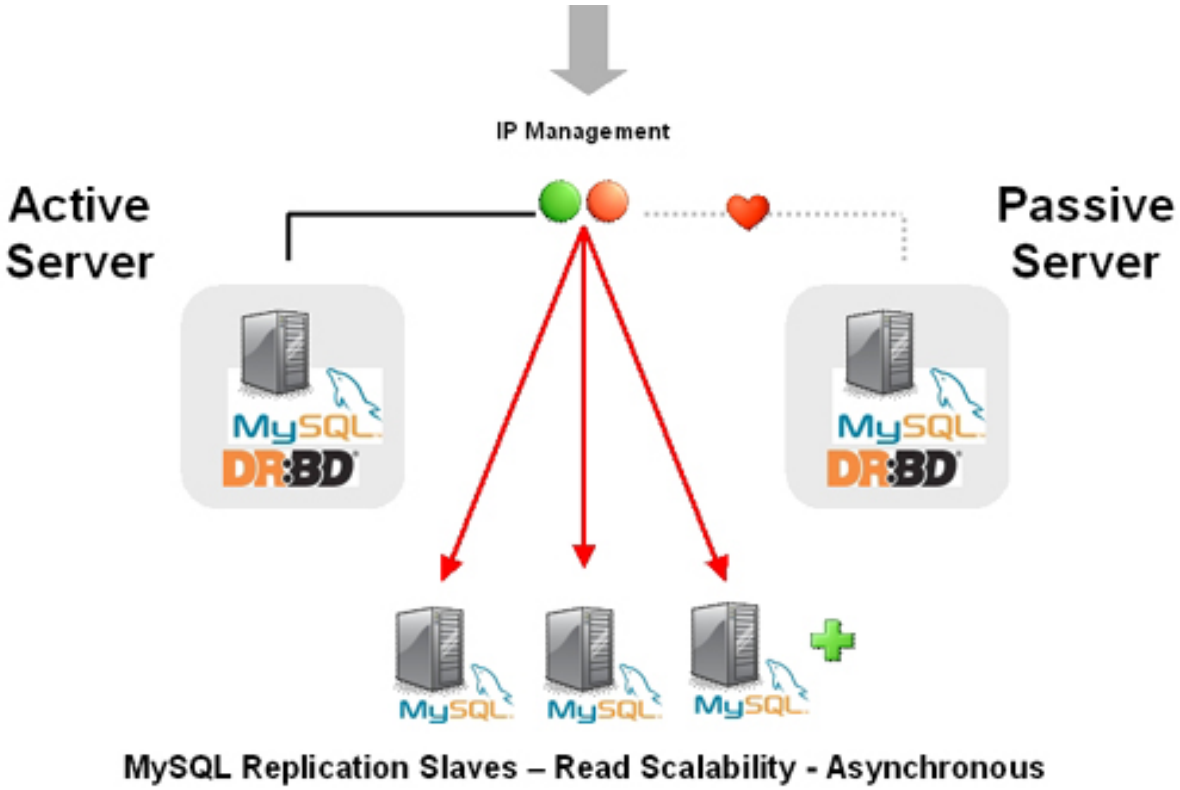
MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, Chapter 14, *High Availability and Scalability*.

23.14.4.2: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL "read-slaves" off of the Active-Master MySQL Server. Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure A.1. Active-Master MySQL Server



23.14.4.3: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the "stack", at the disk I/O level. For a comparison of various high availability features between these two options, please refer to Chapter 14, *High Availability and Scalability*.

A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- 23.14.5.1: Can XFS be used with DRBD?

Questions and Answers

23.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- 23.14.6.1: Can I use DRBD on top of LVM?
- 23.14.6.2: Can I use LVM on top of DRBD?
- 23.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

23.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

23.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your distribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

23.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

A.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- 23.14.7.1: Can I use DRBD with Xen and/or KVM?
- 23.14.7.2: Can I use DRBD with OpenVZ?

Questions and Answers

23.14.7.1: Can I use DRBD with Xen and/or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (http://www.linbit.com).

23.14.7.2: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

A.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- 23.14.8.1: Does DRBD do mutual node authentication?
- 23.14.8.2: Can I encrypt/compress the exchanged data?

Questions and Answers

23.14.8.1: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

23.14.8.2: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

A.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- 23.14.9.1: What other packages besides DRBD are required?
- 23.14.9.2: How many machines are required to set up DRBD?
- 23.14.9.3: Does DRBD only run on Linux?

Questions and Answers

23.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for `glibc` and your favorite shell. When compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison

- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

23.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

23.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

A.14.10. DBRD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- 23.14.10.1: Where can I get more information about MySQL for DRBD?
- 23.14.10.2: Does MySQL offer professional consulting to help with designing a DRBD system?
- 23.14.10.3: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- 23.14.10.4: Are pre-built binaries or RPMs available?
- 23.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?
- 23.14.10.6: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Questions and Answers

23.14.10.1: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: http://www.mysql.com/products/enterprise/drbd.html.

23.14.10.2: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: http://www.mysql.com/consulting/packaged/scaleout.html.

23.14.10.3: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

For MySQL-specific DRBD documentation, see Section 14.1, “Using MySQL with DRBD”.

For general DRBD documentation, see DRBD User's Guide.

23.14.10.4: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: http://mysql.com/products/enterprise/features.html.

23.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, http://forums.mysql.com/list.php?144.

23.14.10.6: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: http://mysql.com/products/enterprise/features.html.

For the list of supported Linux distributions, please see: http://www.mysql.com/support/supportedplatforms/enterprise.html.

> **Note**
>
> DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HPUX, AIX, FreeBSD, or other non-Linux platforms.

Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

> **MySQL Enterprise**
> The MySQL Enterprise Monitor provides a "Virtual DBA" to assist with problem solving. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

B.1. Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in Section B.2, "Types of Error Values". These errors are returned from the server side; see Section B.3, "Server Error Codes and Messages".
- Errors can occur on the client side, usually involving problems communicating with the server; see Section B.4, "Client Error Codes and Messages".
- SQL statement warning and error information is available via the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` and `error_count` system variables provide counts of the number of warnings and errors.
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an `InnoDB` table fails.
- The `perror` program provides information from the command line about error numbers. See Section 4.8.1, "`perror` — Explain Error Codes".

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to `InnoDB`, see Section 13.6.12, "`InnoDB` Error Handling".

B.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, `'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, you can access the MySQL error code, the SQLSTATE value, and the message string using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in Section 20.9, "MySQL C API".

The first two characters of an SQLSTATE value indicate the error class:

- `'00'` indicates success.
- `'01'` indicates a warning.
- `'02'` indicates “not found.” These values are relevant only within the context of cursors and are used to control what happens when a cursor reaches the end of a data set.
- Other values indicate an exception.

B.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (`1146`). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped errors.
- A message string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at http://dev.mysql.com/doc/.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ername.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `1000` SQLSTATE: `HY000` (`ER_HASHCHK`)

  Message: hashchk
- Error: `1001` SQLSTATE: `HY000` (`ER_NISAMCHK`)

  Message: isamchk
- Error: `1002` SQLSTATE: `HY000` (`ER_NO`)

  Message: NO
- Error: `1003` SQLSTATE: `HY000` (`ER_YES`)

  Message: YES
- Error: `1004` SQLSTATE: `HY000` (`ER_CANT_CREATE_FILE`)

  Message: Can't create file '%s' (errno: %d)

- Error: 1005 SQLSTATE: HY000 (ER_CANT_CREATE_TABLE)

  Message: Can't create table '%s' (errno: %d)
- Error: 1006 SQLSTATE: HY000 (ER_CANT_CREATE_DB)

  Message: Can't create database '%s' (errno: %d)
- Error: 1007 SQLSTATE: HY000 (ER_DB_CREATE_EXISTS)

  Message: Can't create database '%s'; database exists
- Error: 1008 SQLSTATE: HY000 (ER_DB_DROP_EXISTS)

  Message: Can't drop database '%s'; database doesn't exist
- Error: 1009 SQLSTATE: HY000 (ER_DB_DROP_DELETE)

  Message: Error dropping database (can't delete '%s', errno: %d)
- Error: 1010 SQLSTATE: HY000 (ER_DB_DROP_RMDIR)

  Message: Error dropping database (can't rmdir '%s', errno: %d)
- Error: 1011 SQLSTATE: HY000 (ER_CANT_DELETE_FILE)

  Message: Error on delete of '%s' (errno: %d)
- Error: 1012 SQLSTATE: HY000 (ER_CANT_FIND_SYSTEM_REC)

  Message: Can't read record in system table
- Error: 1013 SQLSTATE: HY000 (ER_CANT_GET_STAT)

  Message: Can't get status of '%s' (errno: %d)
- Error: 1014 SQLSTATE: HY000 (ER_CANT_GET_WD)

  Message: Can't get working directory (errno: %d)
- Error: 1015 SQLSTATE: HY000 (ER_CANT_LOCK)

  Message: Can't lock file (errno: %d)
- Error: 1016 SQLSTATE: HY000 (ER_CANT_OPEN_FILE)

  Message: Can't open file: '%s' (errno: %d)
- Error: 1017 SQLSTATE: HY000 (ER_FILE_NOT_FOUND)

  Message: Can't find file: '%s' (errno: %d)
- Error: 1018 SQLSTATE: HY000 (ER_CANT_READ_DIR)

  Message: Can't read dir of '%s' (errno: %d)
- Error: 1019 SQLSTATE: HY000 (ER_CANT_SET_WD)

  Message: Can't change dir to '%s' (errno: %d)
- Error: 1020 SQLSTATE: HY000 (ER_CHECKREAD)

  Message: Record has changed since last read in table '%s'
- Error: 1021 SQLSTATE: HY000 (ER_DISK_FULL)

  Message: Disk full (%s); waiting for someone to free some space...

- Error: 1022 SQLSTATE: 23000 (ER_DUP_KEY)

  Message: Can't write; duplicate key in table '%s'

- Error: 1023 SQLSTATE: HY000 (ER_ERROR_ON_CLOSE)

  Message: Error on close of '%s' (errno: %d)

- Error: 1024 SQLSTATE: HY000 (ER_ERROR_ON_READ)

  Message: Error reading file '%s' (errno: %d)

- Error: 1025 SQLSTATE: HY000 (ER_ERROR_ON_RENAME)

  Message: Error on rename of '%s' to '%s' (errno: %d)

- Error: 1026 SQLSTATE: HY000 (ER_ERROR_ON_WRITE)

  Message: Error writing file '%s' (errno: %d)

- Error: 1027 SQLSTATE: HY000 (ER_FILE_USED)

  Message: '%s' is locked against change

- Error: 1028 SQLSTATE: HY000 (ER_FILSORT_ABORT)

  Message: Sort aborted

- Error: 1029 SQLSTATE: HY000 (ER_FORM_NOT_FOUND)

  Message: View '%s' doesn't exist for '%s'

- Error: 1030 SQLSTATE: HY000 (ER_GET_ERRNO)

  Message: Got error %d from storage engine

- Error: 1031 SQLSTATE: HY000 (ER_ILLEGAL_HA)

  Message: Table storage engine for '%s' doesn't have this option

- Error: 1032 SQLSTATE: HY000 (ER_KEY_NOT_FOUND)

  Message: Can't find record in '%s'

- Error: 1033 SQLSTATE: HY000 (ER_NOT_FORM_FILE)

  Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER_NOT_KEYFILE)

  Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER_OLD_KEYFILE)

  Message: Old key file for table '%s'; repair it!

- Error: 1036 SQLSTATE: HY000 (ER_OPEN_AS_READONLY)

  Message: Table '%s' is read only

- Error: 1037 SQLSTATE: HY001 (ER_OUTOFMEMORY)

  Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 (ER_OUT_OF_SORTMEMORY)

  Message: Out of sort memory; increase server sort buffer size

- Error: 1039 SQLSTATE: HY000 (ER_UNEXPECTED_EOF)

  Message: Unexpected EOF found when reading file '%s' (errno: %d)

- Error: 1040 SQLSTATE: 08004 (ER_CON_COUNT_ERROR)

  Message: Too many connections

- Error: 1041 SQLSTATE: HY000 (ER_OUT_OF_RESOURCES)

  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 (ER_BAD_HOST_ERROR)

  Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 (ER_HANDSHAKE_ERROR)

  Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 (ER_DBACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 (ER_ACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' (using password: %s)

- Error: 1046 SQLSTATE: 3D000 (ER_NO_DB_ERROR)

  Message: No database selected

- Error: 1047 SQLSTATE: 08S01 (ER_UNKNOWN_COM_ERROR)

  Message: Unknown command

- Error: 1048 SQLSTATE: 23000 (ER_BAD_NULL_ERROR)

  Message: Column '%s' cannot be null

- Error: 1049 SQLSTATE: 42000 (ER_BAD_DB_ERROR)

  Message: Unknown database '%s'

- Error: 1050 SQLSTATE: 42S01 (ER_TABLE_EXISTS_ERROR)

  Message: Table '%s' already exists

- Error: 1051 SQLSTATE: 42S02 (ER_BAD_TABLE_ERROR)

  Message: Unknown table '%s'

- Error: 1052 SQLSTATE: 23000 (ER_NON_UNIQ_ERROR)

  Message: Column '%s' in %s is ambiguous

- Error: 1053 SQLSTATE: 08S01 (ER_SERVER_SHUTDOWN)

  Message: Server shutdown in progress

- Error: 1054 SQLSTATE: 42S22 (ER_BAD_FIELD_ERROR)

  Message: Unknown column '%s' in '%s'

- Error: 1055 SQLSTATE: 42000 (ER_WRONG_FIELD_WITH_GROUP)

Message: '%s' isn't in GROUP BY

- Error: 1056 SQLSTATE: 42000 (ER_WRONG_GROUP_FIELD)

  Message: Can't group on '%s'

- Error: 1057 SQLSTATE: 42000 (ER_WRONG_SUM_SELECT)

  Message: Statement has sum functions and columns in same statement

- Error: 1058 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT)

  Message: Column count doesn't match value count

- Error: 1059 SQLSTATE: 42000 (ER_TOO_LONG_IDENT)

  Message: Identifier name '%s' is too long

- Error: 1060 SQLSTATE: 42S21 (ER_DUP_FIELDNAME)

  Message: Duplicate column name '%s'

- Error: 1061 SQLSTATE: 42000 (ER_DUP_KEYNAME)

  Message: Duplicate key name '%s'

- Error: 1062 SQLSTATE: 23000 (ER_DUP_ENTRY)

  Message: Duplicate entry '%s' for key %d

- Error: 1063 SQLSTATE: 42000 (ER_WRONG_FIELD_SPEC)

  Message: Incorrect column specifier for column '%s'

- Error: 1064 SQLSTATE: 42000 (ER_PARSE_ERROR)

  Message: %s near '%s' at line %d

- Error: 1065 SQLSTATE: 42000 (ER_EMPTY_QUERY)

  Message: Query was empty

- Error: 1066 SQLSTATE: 42000 (ER_NONUNIQ_TABLE)

  Message: Not unique table/alias: '%s'

- Error: 1067 SQLSTATE: 42000 (ER_INVALID_DEFAULT)

  Message: Invalid default value for '%s'

- Error: 1068 SQLSTATE: 42000 (ER_MULTIPLE_PRI_KEY)

  Message: Multiple primary key defined

- Error: 1069 SQLSTATE: 42000 (ER_TOO_MANY_KEYS)

  Message: Too many keys specified; max %d keys allowed

- Error: 1070 SQLSTATE: 42000 (ER_TOO_MANY_KEY_PARTS)

  Message: Too many key parts specified; max %d parts allowed

- Error: 1071 SQLSTATE: 42000 (ER_TOO_LONG_KEY)

  Message: Specified key was too long; max key length is %d bytes

- Error: 1072 SQLSTATE: 42000 (ER_KEY_COLUMN_DOES_NOT_EXITS)

  Message: Key column '%s' doesn't exist in table

- Error: 1073 SQLSTATE: 42000 (ER_BLOB_USED_AS_KEY)

  Message: BLOB column '%s' can't be used in key specification with the used table type

- Error: 1074 SQLSTATE: 42000 (ER_TOO_BIG_FIELDLENGTH)

  Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead

- Error: 1075 SQLSTATE: 42000 (ER_WRONG_AUTO_KEY)

  Message: Incorrect table definition; there can be only one auto column and it must be defined as a key

- Error: 1076 SQLSTATE: HY000 (ER_READY)

  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

- Error: 1077 SQLSTATE: HY000 (ER_NORMAL_SHUTDOWN)

  Message: %s: Normal shutdown

- Error: 1078 SQLSTATE: HY000 (ER_GOT_SIGNAL)

  Message: %s: Got signal %d. Aborting!

- Error: 1079 SQLSTATE: HY000 (ER_SHUTDOWN_COMPLETE)

  Message: %s: Shutdown complete

- Error: 1080 SQLSTATE: 08S01 (ER_FORCING_CLOSE)

  Message: %s: Forcing close of thread %ld user: '%s'

- Error: 1081 SQLSTATE: 08S01 (ER_IPSOCK_ERROR)

  Message: Can't create IP socket

- Error: 1082 SQLSTATE: 42S12 (ER_NO_SUCH_INDEX)

  Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table

- Error: 1083 SQLSTATE: 42000 (ER_WRONG_FIELD_TERMINATORS)

  Message: Field separator argument is not what is expected; check the manual

- Error: 1084 SQLSTATE: 42000 (ER_BLOBS_AND_NO_TERMINATED)

  Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'

- Error: 1085 SQLSTATE: HY000 (ER_TEXTFILE_NOT_READABLE)

  Message: The file '%s' must be in the database directory or be readable by all

- Error: 1086 SQLSTATE: HY000 (ER_FILE_EXISTS_ERROR)

  Message: File '%s' already exists

- Error: 1087 SQLSTATE: HY000 (ER_LOAD_INFO)

  Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld

- Error: 1088 SQLSTATE: HY000 (ER_ALTER_INFO)

  Message: Records: %ld Duplicates: %ld

- Error: 1089 SQLSTATE: HY000 (ER_WRONG_SUB_KEY)

  Message: Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys

- Error: 1090 SQLSTATE: 42000 (ER_CANT_REMOVE_ALL_FIELDS)

  Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead

- Error: 1091 SQLSTATE: 42000 (ER_CANT_DROP_FIELD_OR_KEY)

  Message: Can't DROP '%s'; check that column/key exists

- Error: 1092 SQLSTATE: HY000 (ER_INSERT_INFO)

  Message: Records: %ld Duplicates: %ld Warnings: %ld

- Error: 1093 SQLSTATE: HY000 (ER_UPDATE_TABLE_USED)

  Message: You can't specify target table '%s' for update in FROM clause

- Error: 1094 SQLSTATE: HY000 (ER_NO_SUCH_THREAD)

  Message: Unknown thread id: %lu

- Error: 1095 SQLSTATE: HY000 (ER_KILL_DENIED_ERROR)

  Message: You are not owner of thread %lu

- Error: 1096 SQLSTATE: HY000 (ER_NO_TABLES_USED)

  Message: No tables used

- Error: 1097 SQLSTATE: HY000 (ER_TOO_BIG_SET)

  Message: Too many strings for column %s and SET

- Error: 1098 SQLSTATE: HY000 (ER_NO_UNIQUE_LOGFILE)

  Message: Can't generate a unique log-filename %s.(1-999)

- Error: 1099 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED_FOR_WRITE)

  Message: Table '%s' was locked with a READ lock and can't be updated

- Error: 1100 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED)

  Message: Table '%s' was not locked with LOCK TABLES

- Error: 1101 SQLSTATE: 42000 (ER_BLOB_CANT_HAVE_DEFAULT)

  Message: BLOB/TEXT column '%s' can't have a default value

- Error: 1102 SQLSTATE: 42000 (ER_WRONG_DB_NAME)

  Message: Incorrect database name '%s'

- Error: 1103 SQLSTATE: 42000 (ER_WRONG_TABLE_NAME)

  Message: Incorrect table name '%s'

- Error: 1104 SQLSTATE: 42000 (ER_TOO_BIG_SELECT)

  Message: The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET SQL_MAX_JOIN_SIZE=# if the SELECT is okay

- Error: 1105 SQLSTATE: HY000 (ER_UNKNOWN_ERROR)

Message: Unknown error

- Error: 1106 SQLSTATE: 42000 (ER_UNKNOWN_PROCEDURE)

  Message: Unknown procedure '%s'

- Error: 1107 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_PROCEDURE)

  Message: Incorrect parameter count to procedure '%s'

- Error: 1108 SQLSTATE: HY000 (ER_WRONG_PARAMETERS_TO_PROCEDURE)

  Message: Incorrect parameters to procedure '%s'

- Error: 1109 SQLSTATE: 42S02 (ER_UNKNOWN_TABLE)

  Message: Unknown table '%s' in %s

- Error: 1110 SQLSTATE: 42000 (ER_FIELD_SPECIFIED_TWICE)

  Message: Column '%s' specified twice

- Error: 1111 SQLSTATE: HY000 (ER_INVALID_GROUP_FUNC_USE)

  Message: Invalid use of group function

- Error: 1112 SQLSTATE: 42000 (ER_UNSUPPORTED_EXTENSION)

  Message: Table '%s' uses an extension that doesn't exist in this MySQL version

- Error: 1113 SQLSTATE: 42000 (ER_TABLE_MUST_HAVE_COLUMNS)

  Message: A table must have at least 1 column

- Error: 1114 SQLSTATE: HY000 (ER_RECORD_FILE_FULL)

  Message: The table '%s' is full

- Error: 1115 SQLSTATE: 42000 (ER_UNKNOWN_CHARACTER_SET)

  Message: Unknown character set: '%s'

- Error: 1116 SQLSTATE: HY000 (ER_TOO_MANY_TABLES)

  Message: Too many tables; MySQL can only use %d tables in a join

- Error: 1117 SQLSTATE: HY000 (ER_TOO_MANY_FIELDS)

  Message: Too many columns

- Error: 1118 SQLSTATE: 42000 (ER_TOO_BIG_ROWSIZE)

  Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs

- Error: 1119 SQLSTATE: HY000 (ER_STACK_OVERRUN)

  Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld -O thread_stack=#' to specify a bigger stack if needed

- Error: 1120 SQLSTATE: 42000 (ER_WRONG_OUTER_JOIN)

  Message: Cross dependency found in OUTER JOIN; examine your ON conditions

- Error: 1121 SQLSTATE: 42000 (ER_NULL_COLUMN_IN_INDEX)

  Message: Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler

- Error: 1122 SQLSTATE: HY000 (ER_CANT_FIND_UDF)

  Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER_CANT_INITIALIZE_UDF)

  Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER_UDF_NO_PATHS)

  Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER_UDF_EXISTS)

  Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER_CANT_OPEN_LIBRARY)

  Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER_CANT_FIND_DL_ENTRY)

  Message: Can't find symbol '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER_FUNCTION_NOT_DEFINED)

  Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER_HOST_IS_BLOCKED)

  Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER_HOST_NOT_PRIVILEGED)

  Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER_PASSWORD_ANONYMOUS_USER)

  Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER_PASSWORD_NOT_ALLOWED)

  Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER_PASSWORD_NO_MATCH)

  Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER_UPDATE_INFO)

  Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER_CANT_CREATE_THREAD)

  Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT_ON_ROW)

  Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER_CANT_REOPEN_TABLE)

  Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 22004 (ER_INVALID_USE_OF_NULL)

Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER_REGEXP_ERROR)

  Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS)

  Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER_NONEXISTING_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER_TABLEACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER_COLUMNACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER_ILLEGAL_GRANT_FOR_TABLE)

  Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER_GRANT_WRONG_HOST_OR_USER)

  Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER_NO_SUCH_TABLE)

  Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER_NONEXISTING_TABLE_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER_NOT_ALLOWED_COMMAND)

  Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER_SYNTAX_ERROR)

  Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1150 SQLSTATE: HY000 (ER_DELAYED_CANT_CHANGE_LOCK)

  Message: Delayed insert thread couldn't get requested lock for table %s

- Error: 1151 SQLSTATE: HY000 (ER_TOO_MANY_DELAYED_THREADS)

  Message: Too many delayed threads in use

- Error: 1152 SQLSTATE: 08S01 (ER_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- Error: 1153 SQLSTATE: 08S01 (ER_NET_PACKET_TOO_LARGE)

  Message: Got a packet bigger than 'max_allowed_packet' bytes

- Error: 1154 SQLSTATE: 08S01 (ER_NET_READ_ERROR_FROM_PIPE)

Message: Got a read error from the connection pipe

- Error: 1155 SQLSTATE: 08S01 (ER_NET_FCNTL_ERROR)

  Message: Got an error from fcntl()

- Error: 1156 SQLSTATE: 08S01 (ER_NET_PACKETS_OUT_OF_ORDER)

  Message: Got packets out of order

- Error: 1157 SQLSTATE: 08S01 (ER_NET_UNCOMPRESS_ERROR)

  Message: Couldn't uncompress communication packet

- Error: 1158 SQLSTATE: 08S01 (ER_NET_READ_ERROR)

  Message: Got an error reading communication packets

- Error: 1159 SQLSTATE: 08S01 (ER_NET_READ_INTERRUPTED)

  Message: Got timeout reading communication packets

- Error: 1160 SQLSTATE: 08S01 (ER_NET_ERROR_ON_WRITE)

  Message: Got an error writing communication packets

- Error: 1161 SQLSTATE: 08S01 (ER_NET_WRITE_INTERRUPTED)

  Message: Got timeout writing communication packets

- Error: 1162 SQLSTATE: 42000 (ER_TOO_LONG_STRING)

  Message: Result string is longer than 'max_allowed_packet' bytes

- Error: 1163 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_BLOB)

  Message: The used table type doesn't support BLOB/TEXT columns

- Error: 1164 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_AUTO_INCREMENT)

  Message: The used table type doesn't support AUTO_INCREMENT columns

- Error: 1165 SQLSTATE: HY000 (ER_DELAYED_INSERT_TABLE_LOCKED)

  Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES

- Error: 1166 SQLSTATE: 42000 (ER_WRONG_COLUMN_NAME)

  Message: Incorrect column name '%s'

- Error: 1167 SQLSTATE: 42000 (ER_WRONG_KEY_COLUMN)

  Message: The used storage engine can't index column '%s'

- Error: 1168 SQLSTATE: HY000 (ER_WRONG_MRG_TABLE)

  Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist

- Error: 1169 SQLSTATE: 23000 (ER_DUP_UNIQUE)

  Message: Can't write, because of unique constraint, to table '%s'

- Error: 1170 SQLSTATE: 42000 (ER_BLOB_KEY_WITHOUT_LENGTH)

  Message: BLOB/TEXT column '%s' used in key specification without a key length

- Error: 1171 SQLSTATE: 42000 (ER_PRIMARY_CANT_HAVE_NULL)

  Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead
- Error: 1172 SQLSTATE: 42000 (ER_TOO_MANY_ROWS)

  Message: Result consisted of more than one row
- Error: 1173 SQLSTATE: 42000 (ER_REQUIRES_PRIMARY_KEY)

  Message: This table type requires a primary key
- Error: 1174 SQLSTATE: HY000 (ER_NO_RAID_COMPILED)

  Message: This version of MySQL is not compiled with RAID support
- Error: 1175 SQLSTATE: HY000 (ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE)

  Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column
- Error: 1176 SQLSTATE: 42000 (ER_KEY_DOES_NOT_EXITS)

  Message: Key '%s' doesn't exist in table '%s'
- Error: 1177 SQLSTATE: 42000 (ER_CHECK_NO_SUCH_TABLE)

  Message: Can't open table
- Error: 1178 SQLSTATE: 42000 (ER_CHECK_NOT_IMPLEMENTED)

  Message: The storage engine for the table doesn't support %s
- Error: 1179 SQLSTATE: 25000 (ER_CANT_DO_THIS_DURING_AN_TRANSACTION)

  Message: You are not allowed to execute this command in a transaction
- Error: 1180 SQLSTATE: HY000 (ER_ERROR_DURING_COMMIT)

- Error: 1182 SQLSTATE: HY000 (ER_ERROR_DURING_FLUSH_LOGS)

  Message: Got error %d during FLUSH_LOGS
- Error: 1183 SQLSTATE: HY000 (ER_ERROR_DURING_CHECKPOINT)

  Message: Got error %d during CHECKPOINT
- Error: 1184 SQLSTATE: 08S01 (ER_NEW_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)
- Error: 1185 SQLSTATE: HY000 (ER_DUMP_NOT_IMPLEMENTED)

  Message: The storage engine for the table does not support binary table dump
- Error: 1186 SQLSTATE: HY000 (ER_FLUSH_MASTER_BINLOG_CLOSED)

  Message: Binlog closed, cannot RESET MASTER
- Error: 1187 SQLSTATE: HY000 (ER_INDEX_REBUILD)

  Message: Failed rebuilding the index of dumped table '%s'

- Error: 1188 SQLSTATE: HY000 (ER_MASTER)

  Message: Error from master: '%s'

- Error: 1189 SQLSTATE: 08S01 (ER_MASTER_NET_READ)

  Message: Net error reading from master

- Error: 1190 SQLSTATE: 08S01 (ER_MASTER_NET_WRITE)

  Message: Net error writing to master

- Error: 1191 SQLSTATE: HY000 (ER_FT_MATCHING_KEY_NOT_FOUND)

  Message: Can't find FULLTEXT index matching the column list

- Error: 1192 SQLSTATE: HY000 (ER_LOCK_OR_ACTIVE_TRANSACTION)

  Message: Can't execute the given command because you have active locked tables or an active transaction

- Error: 1193 SQLSTATE: HY000 (ER_UNKNOWN_SYSTEM_VARIABLE)

  Message: Unknown system variable '%s'

- Error: 1194 SQLSTATE: HY000 (ER_CRASHED_ON_USAGE)

  Message: Table '%s' is marked as crashed and should be repaired

- Error: 1195 SQLSTATE: HY000 (ER_CRASHED_ON_REPAIR)

  Message: Table '%s' is marked as crashed and last (automatic?) repair failed

- Error: 1196 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK)

  Message: Some non-transactional changed tables couldn't be rolled back

- Error: 1197 SQLSTATE: HY000 (ER_TRANS_CACHE_FULL)

  Message: Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again

- Error: 1198 SQLSTATE: HY000 (ER_SLAVE_MUST_STOP)

  Message: This operation cannot be performed with a running slave; run STOP SLAVE first

- Error: 1199 SQLSTATE: HY000 (ER_SLAVE_NOT_RUNNING)

  Message: This operation requires a running slave; configure slave and do START SLAVE

- Error: 1200 SQLSTATE: HY000 (ER_BAD_SLAVE)

  Message: The server is not configured as slave; fix in config file or with CHANGE MASTER TO

- Error: 1201 SQLSTATE: HY000 (ER_MASTER_INFO)

  Message: Could not initialize master info structure; more error messages can be found in the MySQL error log

- Error: 1202 SQLSTATE: HY000 (ER_SLAVE_THREAD)

  Message: Could not create slave thread; check system resources

- Error: 1203 SQLSTATE: 42000 (ER_TOO_MANY_USER_CONNECTIONS)

  Message: User %s already has more than 'max_user_connections' active connections

- Error: 1204 SQLSTATE: HY000 (ER_SET_CONSTANTS_ONLY)

Message: You may only use constant expressions with SET

- Error: 1205 SQLSTATE: HY000 (ER_LOCK_WAIT_TIMEOUT)

  Message: Lock wait timeout exceeded; try restarting transaction

- Error: 1206 SQLSTATE: HY000 (ER_LOCK_TABLE_FULL)

  Message: The total number of locks exceeds the lock table size

- Error: 1207 SQLSTATE: 25000 (ER_READ_ONLY_TRANSACTION)

  Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction

- Error: 1208 SQLSTATE: HY000 (ER_DROP_DB_WITH_READ_LOCK)

  Message: DROP DATABASE not allowed while thread is holding global read lock

- Error: 1209 SQLSTATE: HY000 (ER_CREATE_DB_WITH_READ_LOCK)

  Message: CREATE DATABASE not allowed while thread is holding global read lock

- Error: 1210 SQLSTATE: HY000 (ER_WRONG_ARGUMENTS)

  Message: Incorrect arguments to %s

- Error: 1211 SQLSTATE: 42000 (ER_NO_PERMISSION_TO_CREATE_USER)

  Message: '%s'@'%s' is not allowed to create new users

- Error: 1212 SQLSTATE: HY000 (ER_UNION_TABLES_IN_DIFFERENT_DIR)

  Message: Incorrect table definition; all MERGE tables must be in the same database

- Error: 1213 SQLSTATE: 40001 (ER_LOCK_DEADLOCK)

  Message: Deadlock found when trying to get lock; try restarting transaction

- Error: 1214 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_FT)

  Message: The used table type doesn't support FULLTEXT indexes

- Error: 1215 SQLSTATE: HY000 (ER_CANNOT_ADD_FOREIGN)

  Message: Cannot add foreign key constraint

- Error: 1216 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW)

  Message: Cannot add or update a child row: a foreign key constraint fails

- Error: 1217 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED)

  Message: Cannot delete or update a parent row: a foreign key constraint fails

- Error: 1218 SQLSTATE: 08S01 (ER_CONNECT_TO_MASTER)

  Message: Error connecting to master: %s

- Error: 1219 SQLSTATE: HY000 (ER_QUERY_ON_MASTER)

  Message: Error running query on master: %s

- Error: 1220 SQLSTATE: HY000 (ER_ERROR_WHEN_EXECUTING_COMMAND)

  Message: Error when executing command %s: %s

- Error: 1221 SQLSTATE: HY000 (ER_WRONG_USAGE)

  Message: Incorrect usage of %s and %s
- Error: 1222 SQLSTATE: 21000 (ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT)

  Message: The used SELECT statements have a different number of columns
- Error: 1223 SQLSTATE: HY000 (ER_CANT_UPDATE_WITH_READLOCK)

  Message: Can't execute the query because you have a conflicting read lock
- Error: 1224 SQLSTATE: HY000 (ER_MIXING_NOT_ALLOWED)

  Message: Mixing of transactional and non-transactional tables is disabled
- Error: 1225 SQLSTATE: HY000 (ER_DUP_ARGUMENT)

  Message: Option '%s' used twice in statement
- Error: 1226 SQLSTATE: 42000 (ER_USER_LIMIT_REACHED)

  Message: User '%s' has exceeded the '%s' resource (current value: %ld)
- Error: 1227 SQLSTATE: 42000 (ER_SPECIFIC_ACCESS_DENIED_ERROR)

  Message: Access denied; you need the %s privilege for this operation
- Error: 1228 SQLSTATE: HY000 (ER_LOCAL_VARIABLE)

  Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL
- Error: 1229 SQLSTATE: HY000 (ER_GLOBAL_VARIABLE)

  Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL
- Error: 1230 SQLSTATE: 42000 (ER_NO_DEFAULT)

  Message: Variable '%s' doesn't have a default value
- Error: 1231 SQLSTATE: 42000 (ER_WRONG_VALUE_FOR_VAR)

  Message: Variable '%s' can't be set to the value of '%s'
- Error: 1232 SQLSTATE: 42000 (ER_WRONG_TYPE_FOR_VAR)

  Message: Incorrect argument type to variable '%s'
- Error: 1233 SQLSTATE: HY000 (ER_VAR_CANT_BE_READ)

  Message: Variable '%s' can only be set, not read
- Error: 1234 SQLSTATE: 42000 (ER_CANT_USE_OPTION_HERE)

  Message: Incorrect usage/placement of '%s'
- Error: 1235 SQLSTATE: 42000 (ER_NOT_SUPPORTED_YET)

  Message: This version of MySQL doesn't yet support '%s'
- Error: 1236 SQLSTATE: HY000 (ER_MASTER_FATAL_ERROR_READING_BINLOG)

  Message: Got fatal error %d: '%s' from master when reading data from binary log
- Error: 1237 SQLSTATE: HY000 (ER_SLAVE_IGNORED_TABLE)

  Message: Slave SQL thread ignored the query because of replicate-*-table rules

- Error: 1238 SQLSTATE: HY000 (ER_INCORRECT_GLOBAL_LOCAL_VAR)

  Message: Variable '%s' is a %s variable
- Error: 1239 SQLSTATE: 42000 (ER_WRONG_FK_DEF)

  Message: Incorrect foreign key definition for '%s': %s
- Error: 1240 SQLSTATE: HY000 (ER_KEY_REF_DO_NOT_MATCH_TABLE_REF)

  Message: Key reference and table reference don't match
- Error: 1241 SQLSTATE: 21000 (ER_OPERAND_COLUMNS)

  Message: Operand should contain %d column(s)
- Error: 1242 SQLSTATE: 21000 (ER_SUBQUERY_NO_1_ROW)

  Message: Subquery returns more than 1 row
- Error: 1243 SQLSTATE: HY000 (ER_UNKNOWN_STMT_HANDLER)

  Message: Unknown prepared statement handler (%.*s) given to %s
- Error: 1244 SQLSTATE: HY000 (ER_CORRUPT_HELP_DB)

  Message: Help database is corrupt or does not exist
- Error: 1245 SQLSTATE: HY000 (ER_CYCLIC_REFERENCE)

  Message: Cyclic reference on subqueries
- Error: 1246 SQLSTATE: HY000 (ER_AUTO_CONVERT)

  Message: Converting column '%s' from %s to %s
- Error: 1247 SQLSTATE: 42S22 (ER_ILLEGAL_REFERENCE)

  Message: Reference '%s' not supported (%s)
- Error: 1248 SQLSTATE: 42000 (ER_DERIVED_MUST_HAVE_ALIAS)

  Message: Every derived table must have its own alias
- Error: 1249 SQLSTATE: 01000 (ER_SELECT_REDUCED)

  Message: Select %u was reduced during optimization
- Error: 1250 SQLSTATE: 42000 (ER_TABLENAME_NOT_ALLOWED_HERE)

  Message: Table '%s' from one of the SELECTs cannot be used in %s
- Error: 1251 SQLSTATE: 08004 (ER_NOT_SUPPORTED_AUTH_MODE)

  Message: Client does not support authentication protocol requested by server; consider upgrading MySQL client
- Error: 1252 SQLSTATE: 42000 (ER_SPATIAL_CANT_HAVE_NULL)

  Message: All parts of a SPATIAL index must be NOT NULL
- Error: 1253 SQLSTATE: 42000 (ER_COLLATION_CHARSET_MISMATCH)

  Message: COLLATION '%s' is not valid for CHARACTER SET '%s'
- Error: 1254 SQLSTATE: HY000 (ER_SLAVE_WAS_RUNNING)

  Message: Slave is already running

- Error: 1255 SQLSTATE: HY000 (ER_SLAVE_WAS_NOT_RUNNING)

  Message: Slave already has been stopped
- Error: 1256 SQLSTATE: HY000 (ER_TOO_BIG_FOR_UNCOMPRESS)

  Message: Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)
- Error: 1257 SQLSTATE: HY000 (ER_ZLIB_Z_MEM_ERROR)

  Message: ZLIB: Not enough memory
- Error: 1258 SQLSTATE: HY000 (ER_ZLIB_Z_BUF_ERROR)

  Message: ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)
- Error: 1259 SQLSTATE: HY000 (ER_ZLIB_Z_DATA_ERROR)

  Message: ZLIB: Input data corrupted
- Error: 1260 SQLSTATE: HY000 (ER_CUT_VALUE_GROUP_CONCAT)

  Message: %d line(s) were cut by GROUP_CONCAT()
- Error: 1261 SQLSTATE: 01000 (ER_WARN_TOO_FEW_RECORDS)

  Message: Row %ld doesn't contain data for all columns
- Error: 1262 SQLSTATE: 01000 (ER_WARN_TOO_MANY_RECORDS)

  Message: Row %ld was truncated; it contained more data than there were input columns
- Error: 1263 SQLSTATE: 22004 (ER_WARN_NULL_TO_NOTNULL)

  Message: Column set to default value; NULL supplied to NOT NULL column '%s' at row %ld
- Error: 1264 SQLSTATE: 22003 (ER_WARN_DATA_OUT_OF_RANGE)

  Message: Out of range value for column '%s' at row %ld
- Error: 1265 SQLSTATE: 01000 (WARN_DATA_TRUNCATED)

  Message: Data truncated for column '%s' at row %ld
- Error: 1266 SQLSTATE: HY000 (ER_WARN_USING_OTHER_HANDLER)

  Message: Using storage engine %s for table '%s'
- Error: 1267 SQLSTATE: HY000 (ER_CANT_AGGREGATE_2COLLATIONS)

- Error: 1339 SQLSTATE: 20000 (ER_SP_CASE_NOT_FOUND)

  Message: Case not found for CASE statement
- Error: 1340 SQLSTATE: HY000 (ER_FPARSER_TOO_BIG_FILE)

  Message: Configuration file '%s' is too big
- Error: 1341 SQLSTATE: HY000 (ER_FPARSER_BAD_HEADER)

  Message: Malformed file type header in file '%s'
- Error: 1342 SQLSTATE: HY000 (ER_FPARSER_EOF_IN_COMMENT)

  Message: Unexpected end of file while parsing comment '%s'
- Error: 1343 SQLSTATE: HY000 (ER_FPARSER_ERROR_IN_PARAMETER)

  Message: Error while parsing parameter '%s' (line: '%s')
- Error: 1344 SQLSTATE: HY000 (ER_FPARSER_EOF_IN_UNKNOWN_PARAMETER)

  Message: Unexpected end of file while skipping unknown parameter '%s'
- Error: 1345 SQLSTATE: HY000 (ER_VIEW_NO_EXPLAIN)

  Message: EXPLAIN/SHOW can not be issued; lacking privileges for underlying table
- Error: 1346 SQLSTATE: HY000 (ER_FRM_UNKNOWN_TYPE)

  Message: File '%s' has unknown type '%s' in its header
- Error: 1347 SQLSTATE: HY000 (ER_WRONG_OBJECT)

  Message: '%s.%s' is not %s
- Error: 1348 SQLSTATE: HY000 (ER_NONUPDATEABLE_COLUMN)

  Message: Column '%s' is not updatable
- Error: 1349 SQLSTATE: HY000 (ER_VIEW_SELECT_DERIVED)

  Message: View's SELECT contains a subquery in the FROM clause
- Error: 1350 SQLSTATE: HY000 (ER_VIEW_SELECT_CLAUSE)

  Message: View's SELECT contains a '%s' clause
- Error: 1351 SQLSTATE: HY000 (ER_VIEW_SELECT_VARIABLE)

  Message: View's SELECT contains a variable or parameter
- Error: 1352 SQLSTATE: HY000 (ER_VIEW_SELECT_TMPTABLE)

  Message: View's SELECT refers to a temporary table '%s'
- Error: 1353 SQLSTATE: HY000 (ER_VIEW_WRONG_LIST)

  Message: View's SELECT and view's field list have different column counts
- Error: 1354 SQLSTATE: HY000 (ER_WARN_VIEW_MERGE)

  Message: View merge algorithm can't be used here for now (assumed undefined algorithm)

- Error: 1355 SQLSTATE: HY000 (ER_WARN_VIEW_WITHOUT_KEY)

  Message: View being updated does not have complete key of underlying table in it

- Error: 1356 SQLSTATE: HY000 (ER_VIEW_INVALID)

  Message: View '%s.%s' references invalid table(s) or column(s) or function(s) or definer/invoker of view lack rights to use them

- Error: 1357 SQLSTATE: HY000 (ER_SP_NO_DROP_SP)

  Message: Can't drop or alter a %s from within another stored routine

- Error: 1358 SQLSTATE: HY000 (ER_SP_GOTO_IN_HNDLR)

  Message: GOTO is not allowed in a stored procedure handler

- Error: 1359 SQLSTATE: HY000 (ER_TRG_ALREADY_EXISTS)

  Message: Trigger already exists

- Error: 1360 SQLSTATE: HY000 (ER_TRG_DOES_NOT_EXIST)

  Message: Trigger does not exist

- Error: 1361 SQLSTATE: HY000 (ER_TRG_ON_VIEW_OR_TEMP_TABLE)

  Message: Trigger's '%s' is view or temporary table

- Error: 1362 SQLSTATE: HY000 (ER_TRG_CANT_CHANGE_ROW)

  Message: Updating of %s row is not allowed in %strigger

- Error: 1363 SQLSTATE: HY000 (ER_TRG_NO_SUCH_ROW_IN_TRG)

  Message: There is no %s row in %s trigger

- Error: 1364 SQLSTATE: HY000 (ER_NO_DEFAULT_FOR_FIELD)

  Message: Field '%s' doesn't have a default value

- Error: 1365 SQLSTATE: 22012 (ER_DIVISION_BY_ZERO)

  Message: Division by 0

- Error: 1366 SQLSTATE: HY000 (ER_TRUNCATED_WRONG_VALUE_FOR_FIELD)

  Message: Incorrect %s value: '%s' for column '%s' at row %ld

- Error: 1367 SQLSTATE: 22007 (ER_ILLEGAL_VALUE_FOR_TYPE)

  Message: Illegal %s '%s' value found during parsing

- Error: 1368 SQLSTATE: HY000 (ER_VIEW_NONUPD_CHECK)

  Message: CHECK OPTION on non-updatable view '%s.%s'

- Error: 1369 SQLSTATE: HY000 (ER_VIEW_CHECK_FAILED)

  Message: CHECK OPTION failed '%s.%s'

- Error: 1370 SQLSTATE: 42000 (ER_PROCACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for routine '%s'

- Error: 1371 SQLSTATE: HY000 (ER_RELAY_LOG_FAIL)

  Message: Failed purging old relay logs: %s

- Error: 1372 SQLSTATE: HY000 (ER_PASSWD_LENGTH)

  Message: Password hash should be a %d-digit hexadecimal number
- Error: 1373 SQLSTATE: HY000 (ER_UNKNOWN_TARGET_BINLOG)

  Message: Target log not found in binlog index
- Error: 1374 SQLSTATE: HY000 (ER_IO_ERR_LOG_INDEX_READ)

  Message: I/O error reading log index file
- Error: 1375 SQLSTATE: HY000 (ER_BINLOG_PURGE_PROHIBITED)

  Message: Server configuration does not permit binlog purge
- Error: 1376 SQLSTATE: HY000 (ER_FSEEK_FAIL)

  Message: Failed on fseek()
- Error: 1377 SQLSTATE: HY000 (ER_BINLOG_PURGE_FATAL_ERR)

  Message: Fatal error during log purge
- Error: 1378 SQLSTATE: HY000 (ER_LOG_IN_USE)

  Message: A purgeable log is in use, will not purge
- Error: 1379 SQLSTATE: HY000 (ER_LOG_PURGE_UNKNOWN_ERR)

  Message: Unknown error during log purge
- Error: 1380 SQLSTATE: HY000 (ER_RELAY_LOG_INIT)

  Message: Failed initializing relay log position: %s
- Error: 1381 SQLSTATE: HY000 (ER_NO_BINARY_LOGGING)

  Message: You are not using binary logging
- Error: 1382 SQLSTATE: HY000 (ER_RESERVED_SYNTAX)

  Message: The '%s' syntax is reserved for purposes internal to the MySQL server
- Error: 1383 SQLSTATE: HY000 (ER_WSAS_FAILED)

  Message: WSAStartup Failed
- Error: 1384 SQLSTATE: HY000 (ER_DIFF_GROUPS_PROC)

  Message: Can't handle procedures with different groups yet
- Error: 1385 SQLSTATE: HY000 (ER_NO_GROUP_FOR_PROC)

  Message: Select must have a group with this procedure
- Error: 1386 SQLSTATE: HY000 (ER_ORDER_WITH_PROC)

  Message: Can't use ORDER clause with this procedure
- Error: 1387 SQLSTATE: HY000 (ER_LOGGING_PROHIBIT_CHANGING_OF)

  Message: Binary logging and replication forbid changing the global server %s
- Error: 1388 SQLSTATE: HY000 (ER_NO_FILE_MAPPING)

  Message: Can't map file: %s, errno: %d

- Error: 1389 SQLSTATE: HY000 (ER_WRONG_MAGIC)

  Message: Wrong magic in %s
- Error: 1390 SQLSTATE: HY000 (ER_PS_MANY_PARAM)

  Message: Prepared statement contains too many placeholders
- Error: 1391 SQLSTATE: HY000 (ER_KEY_PART_0)

  Message: Key part '%s' length cannot be 0
- Error: 1392 SQLSTATE: HY000 (ER_VIEW_CHECKSUM)

  Message: View text checksum failed
- Error: 1393 SQLSTATE: HY000 (ER_VIEW_MULTIUPDATE)

  Message: Can not modify more than one base table through a join view '%s.%s'
- Error: 1394 SQLSTATE: HY000 (ER_VIEW_NO_INSERT_FIELD_LIST)

  Message: Can not insert into join view '%s.%s' without fields list
- Error: 1395 SQLSTATE: HY000 (ER_VIEW_DELETE_MERGE_VIEW)

  Message: Can not delete from join view '%s.%s'
- Error: 1396 SQLSTATE: HY000 (ER_CANNOT_USER)

  Message: Operation %s failed for %s
- Error: 1397 SQLSTATE: XAE04 (ER_XAER_NOTA)

  Message: XAER_NOTA: Unknown XID
- Error: 1398 SQLSTATE: XAE05 (ER_XAER_INVAL)

  Message: XAER_INVAL: Invalid arguments (or unsupported command)
- Error: 1399 SQLSTATE: XAE07 (ER_XAER_RMFAIL)

  Message: XAER_RMFAIL: The command cannot be executed when global transaction is in the %s state
- Error: 1400 SQLSTATE: XAE09 (ER_XAER_OUTSIDE)

  Message: XAER_OUTSIDE: Some work is done outside global transaction
- Error: 1401 SQLSTATE: XAE03 (ER_XAER_RMERR)

  Message: XAER_RMERR: Fatal error occurred in the transaction branch - check your data for consistency
- Error: 1402 SQLSTATE: XA100 (ER_XA_RBROLLBACK)

  Message: XA_RBROLLBACK: Transaction branch was rolled back
- Error: 1403 SQLSTATE: 42000 (ER_NONEXISTING_PROC_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on routine '%s'
- Error: 1404 SQLSTATE: HY000 (ER_PROC_AUTO_GRANT_FAIL)

  Message: Failed to grant EXECUTE and ALTER ROUTINE privileges
- Error: 1405 SQLSTATE: HY000 (ER_PROC_AUTO_REVOKE_FAIL)

  Message: Failed to revoke all privileges to dropped routine

- Error: 1406 SQLSTATE: 22001 (ER_DATA_TOO_LONG)

  Message: Data too long for column '%s' at row %ld

- Error: 1407 SQLSTATE: 42000 (ER_SP_BAD_SQLSTATE)

  Message: Bad SQLSTATE: '%s'

- Error: 1408 SQLSTATE: HY000 (ER_STARTUP)

  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d %s

- Error: 1409 SQLSTATE: HY000 (ER_LOAD_FROM_FIXED_SIZE_ROWS_TO_VAR)

  Message: Can't load value from file with fixed size rows to variable

- Error: 1410 SQLSTATE: 42000 (ER_CANT_CREATE_USER_WITH_GRANT)

  Message: You are not allowed to create a user with GRANT

- Error: 1411 SQLSTATE: HY000 (ER_WRONG_VALUE_FOR_TYPE)

  Message: Incorrect %s value: '%s' for function %s

- Error: 1412 SQLSTATE: HY000 (ER_TABLE_DEF_CHANGED)

  Message: Table definition has changed, please retry transaction

- Error: 1413 SQLSTATE: 42000 (ER_SP_DUP_HANDLER)

  Message: Duplicate handler declared in the same block

- Error: 1414 SQLSTATE: 42000 (ER_SP_NOT_VAR_ARG)

  Message: OUT or INOUT argument %d for routine %s is not a variable or NEW pseudo-variable in BEFORE trigger

- Error: 1415 SQLSTATE: 0A000 (ER_SP_NO_RETSET)

  Message: Not allowed to return a result set from a %s

- Error: 1416 SQLSTATE: 22003 (ER_CANT_CREATE_GEOMETRY_OBJECT)

  Message: Cannot get geometry object from data you send to the GEOMETRY field

- Error: 1417 SQLSTATE: HY000 (ER_FAILED_ROUTINE_BREAK_BINLOG)

  Message: A routine failed and has neither NO SQL nor READS SQL DATA in its declaration and binary logging is enabled; if non-transactional tables were updated, the binary log will miss their changes

- Error: 1418 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_ROUTINE)

  Message: This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error: 1419 SQLSTATE: HY000 (ER_BINLOG_CREATE_ROUTINE_NEED_SUPER)

  Message: You do not have the SUPER privilege and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error: 1420 SQLSTATE: HY000 (ER_EXEC_STMT_WITH_OPEN_CURSOR)

  Message: You can't execute a prepared statement which has an open cursor associated with it. Reset the statement to re-execute it.

- Error: 1421 SQLSTATE: HY000 (ER_STMT_HAS_NO_OPEN_CURSOR)

  Message: The statement (%lu) has no open cursor.

- Error: 1422 SQLSTATE: HY000 (ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG)

  Message: Explicit or implicit commit is not allowed in stored function or trigger.

- Error: 1423 SQLSTATE: HY000 (ER_NO_DEFAULT_FOR_VIEW_FIELD)

  Message: Field of view '%s.%s' underlying table doesn't have a default value

- Error: 1424 SQLSTATE: HY000 (ER_SP_NO_RECURSION)

  Message: Recursive stored functions and triggers are not allowed.

- Error: 1425 SQLSTATE: 42000 (ER_TOO_BIG_SCALE)

  Message: Too big scale %d specified for column '%s'. Maximum is %lu.

- Error: 1426 SQLSTATE: 42000 (ER_TOO_BIG_PRECISION)

  Message: Too big precision %d specified for column '%s'. Maximum is %lu.

- Error: 1427 SQLSTATE: 42000 (ER_M_BIGGER_THAN_D)

  Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').

- Error: 1428 SQLSTATE: HY000 (ER_WRONG_LOCK_OF_SYSTEM_TABLE)

  Message: You can't combine write-locking of system tables with other tables or lock types

- Error: 1429 SQLSTATE: HY000 (ER_CONNECT_TO_FOREIGN_DATA_SOURCE)

  Message: Unable to connect to foreign data source: %s

- Error: 1430 SQLSTATE: HY000 (ER_QUERY_ON_FOREIGN_DATA_SOURCE)

  Message: There was a problem processing the query on the foreign data source. Data source error: %s

- Error: 1431 SQLSTATE: HY000 (ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST)

  Message: The foreign data source you are trying to reference does not exist. Data source error: %s

- Error: 1432 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE)

  Message: Can't create federated table. The data source connection string '%s' is not in the correct format

- Error: 1433 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID)

  Message: The data source connection string '%s' is not in the correct format

- Error: 1434 SQLSTATE: HY000 (ER_CANT_CREATE_FEDERATED_TABLE)

  Message: Can't create federated table. Foreign data src error: %s

- Error: 1435 SQLSTATE: HY000 (ER_TRG_IN_WRONG_SCHEMA)

  Message: Trigger in wrong schema

- Error: 1436 SQLSTATE: HY000 (ER_STACK_OVERRUN_NEED_MORE)

  Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld -O thread_stack=#' to specify a bigger stack.

- Error: 1437 SQLSTATE: 42000 (ER_TOO_LONG_BODY)

  Message: Routine body for '%s' is too long

- Error: 1438 SQLSTATE: HY000 (ER_WARN_CANT_DROP_DEFAULT_KEYCACHE)

Message: Cannot drop default keycache

- Error: 1439 SQLSTATE: 42000 (ER_TOO_BIG_DISPLAYWIDTH)

  Message: Display width out of range for column '%s' (max = %lu)

- Error: 1440 SQLSTATE: XAE08 (ER_XAER_DUPID)

  Message: XAER_DUPID: The XID already exists

- Error: 1441 SQLSTATE: 22008 (ER_DATETIME_FUNCTION_OVERFLOW)

  Message: Datetime function: %s field overflow

- Error: 1442 SQLSTATE: HY000 (ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG)

  Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.

- Error: 1443 SQLSTATE: HY000 (ER_VIEW_PREVENT_UPDATE)

  Message: The definition of table '%s' prevents operation %s on table '%s'.

- Error: 1444 SQLSTATE: HY000 (ER_PS_NO_RECURSION)

  Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error: 1445 SQLSTATE: HY000 (ER_SP_CANT_SET_AUTOCOMMIT)

  Message: Not allowed to set autocommit from a stored function or trigger

- Error: 1446 SQLSTATE: HY000 (ER_MALFORMED_DEFINER)

  Message: Definer is not fully qualified

- Error: 1447 SQLSTATE: HY000 (ER_VIEW_FRM_NO_USER)

  Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!

- Error: 1448 SQLSTATE: HY000 (ER_VIEW_OTHER_USER)

  Message: You need the SUPER privilege for creation view with '%s'@'%s' definer

- Error: 1449 SQLSTATE: HY000 (ER_NO_SUCH_USER)

  Message: The user specified as a definer ('%s'@'%s') does not exist

- Error: 1450 SQLSTATE: HY000 (ER_FORBID_SCHEMA_CHANGE)

  Message: Changing schema from '%s' to '%s' is not allowed.

- Error: 1451 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED_2)

  Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)

- Error: 1452 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW_2)

  Message: Cannot add or update a child row: a foreign key constraint fails (%s)

- Error: 1453 SQLSTATE: 42000 (ER_SP_BAD_VAR_SHADOW)

  Message: Variable '%s' must be quoted with `...`, or renamed

- Error: 1454 SQLSTATE: HY000 (ER_TRG_NO_DEFINER)

Message: No definer attribute for trigger '%s'.'%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.

- Error: 1455 SQLSTATE: HY000 (ER_OLD_FILE_FORMAT)

  Message: '%s' has an old format, you should re-create the '%s' object(s)

- Error: 1456 SQLSTATE: HY000 (ER_SP_RECURSION_LIMIT)

  Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s

- Error: 1457 SQLSTATE: HY000 (ER_SP_PROC_TABLE_CORRUPT)

  Message: Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)

- Error: 1458 SQLSTATE: 42000 (ER_SP_WRONG_NAME)

  Message: Incorrect routine name '%s'

- Error: 1459 SQLSTATE: HY000 (ER_TABLE_NEEDS_UPGRADE)

  Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!

- Error: 1460 SQLSTATE: 42000 (ER_SP_NO_AGGREGATE)

  Message: AGGREGATE is not supported for stored functions

- Error: 1461 SQLSTATE: 42000 (ER_MAX_PREPARED_STMT_COUNT_REACHED)

  Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)

- Error: 1462 SQLSTATE: HY000 (ER_VIEW_RECURSIVE)

  Message: `%s`.`%s` contains view recursion

- Error: 1463 SQLSTATE: 42000 (ER_NON_GROUPING_FIELD_USED)

  Message: non-grouping field '%s' is used in %s clause

- Error: 1464 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_SPKEYS)

  Message: The used table type doesn't support SPATIAL indexes

- Error: 1465 SQLSTATE: HY000 (ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA)

  Message: Triggers can not be created on system tables

- Error: 1466 SQLSTATE: HY000 (ER_REMOVED_SPACES)

  Message: Leading spaces are removed from name '%s'

- Error: 1467 SQLSTATE: HY000 (ER_AUTOINC_READ_FAILED)

  Message: Failed to read auto-increment value from storage engine

- Error: 1468 SQLSTATE: HY000 (ER_USERNAME)

  Message: user name

- Error: 1469 SQLSTATE: HY000 (ER_HOSTNAME)

  Message: host name

- Error: 1470 SQLSTATE: HY000 (ER_WRONG_STRING_LENGTH)

  Message: String '%s' is too long for %s (should be no longer than %d)

- Error: 1471 SQLSTATE: HY000 (ER_NON_INSERTABLE_TABLE)

  Message: The target table %s of the %s is not insertable-into

- Error: 1472 SQLSTATE: HY000 (ER_ADMIN_WRONG_MRG_TABLE)

  Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist

- Error: 1473 SQLSTATE: HY000 (ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT)

  Message: Too high level of nesting for select

- Error: 1474 SQLSTATE: HY000 (ER_NAME_BECOMES_EMPTY)

  Message: Name '%s' has become ''

- Error: 1475 SQLSTATE: HY000 (ER_AMBIGUOUS_FIELD_TERM)

  Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

- Error: 1476 SQLSTATE: HY000 (ER_FOREIGN_SERVER_EXISTS)

  Message: The foreign server, %s, you are trying to create already exists.

- Error: 1477 SQLSTATE: HY000 (ER_FOREIGN_SERVER_DOESNT_EXIST)

  Message: The foreign server name you are trying to reference does not exist. Data source error: %s

- Error: 1478 SQLSTATE: HY000 (ER_ILLEGAL_HA_CREATE_OPTION)

  Message: Table storage engine '%s' does not support the create option '%s'

- Error: 1479 SQLSTATE: HY000 (ER_PARTITION_REQUIRES_VALUES_ERROR)

  Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition

- Error: 1480 SQLSTATE: HY000 (ER_PARTITION_WRONG_VALUES_ERROR)

  Message: Only %s PARTITIONING can use VALUES %s in partition definition

- Error: 1481 SQLSTATE: HY000 (ER_PARTITION_MAXVALUE_ERROR)

  Message: MAXVALUE can only be used in last partition definition

- Error: 1482 SQLSTATE: HY000 (ER_PARTITION_SUBPARTITION_ERROR)

  Message: Subpartitions can only be hash partitions and by key

- Error: 1483 SQLSTATE: HY000 (ER_PARTITION_SUBPART_MIX_ERROR)

  Message: Must define subpartitions on all partitions if on one partition

- Error: 1484 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_PART_ERROR)

  Message: Wrong number of partitions defined, mismatch with previous setting

- Error: 1485 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_SUBPART_ERROR)

  Message: Wrong number of subpartitions defined, mismatch with previous setting

- Error: 1486 SQLSTATE: HY000 (ER_CONST_EXPR_IN_PARTITION_FUNC_ERROR)

  Message: Constant/Random expression in (sub)partitioning function is not allowed

- Error: 1487 SQLSTATE: HY000 (ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR)

Message: Expression in RANGE/LIST VALUES must be constant

- Error: 1488 SQLSTATE: HY000 (ER_FIELD_NOT_FOUND_PART_ERROR)

  Message: Field in list of fields for partition function not found in table

- Error: 1489 SQLSTATE: HY000 (ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR)

  Message: List of fields is only allowed in KEY partitions

- Error: 1490 SQLSTATE: HY000 (ER_INCONSISTENT_PARTITION_INFO_ERROR)

  Message: The partition info in the frm file is not consistent with what can be written into the frm file

- Error: 1491 SQLSTATE: HY000 (ER_PARTITION_FUNC_NOT_ALLOWED_ERROR)

  Message: The %s function returns the wrong type

- Error: 1492 SQLSTATE: HY000 (ER_PARTITIONS_MUST_BE_DEFINED_ERROR)

  Message: For %s partitions each partition must be defined

- Error: 1493 SQLSTATE: HY000 (ER_RANGE_NOT_INCREASING_ERROR)

  Message: VALUES LESS THAN value must be strictly increasing for each partition

- Error: 1494 SQLSTATE: HY000 (ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR)

  Message: VALUES value must be of same type as partition function

- Error: 1495 SQLSTATE: HY000 (ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR)

  Message: Multiple definition of same constant in list partitioning

- Error: 1496 SQLSTATE: HY000 (ER_PARTITION_ENTRY_ERROR)

  Message: Partitioning can not be used stand-alone in query

- Error: 1497 SQLSTATE: HY000 (ER_MIX_HANDLER_ERROR)

  Message: The mix of handlers in the partitions is not allowed in this version of MySQL

- Error: 1498 SQLSTATE: HY000 (ER_PARTITION_NOT_DEFINED_ERROR)

  Message: For the partitioned engine it is necessary to define all %s

- Error: 1499 SQLSTATE: HY000 (ER_TOO_MANY_PARTITIONS_ERROR)

  Message: Too many partitions (including subpartitions) were defined

- Error: 1500 SQLSTATE: HY000 (ER_SUBPARTITION_ERROR)

  Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning

- Error: 1501 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLER_FILE)

  Message: Failed to create specific handler file

- Error: 1502 SQLSTATE: HY000 (ER_BLOB_FIELD_IN_PART_FUNC_ERROR)

  Message: A BLOB field is not allowed in partition function

- Error: 1503 SQLSTATE: HY000 (ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF)

  Message: A %s must include all columns in the table's partitioning function

- Error: 1504 SQLSTATE: HY000 (ER_NO_PARTS_ERROR)

  Message: Number of %s = 0 is not an allowed value
- Error: 1505 SQLSTATE: HY000 (ER_PARTITION_MGMT_ON_NONPARTITIONED)

  Message: Partition management on a not partitioned table is not possible
- Error: 1506 SQLSTATE: HY000 (ER_FOREIGN_KEY_ON_PARTITIONED)

  Message: Foreign key clause is not yet supported in conjunction with partitioning
- Error: 1507 SQLSTATE: HY000 (ER_DROP_PARTITION_NON_EXISTENT)

  Message: Error in list of partitions to %s
- Error: 1508 SQLSTATE: HY000 (ER_DROP_LAST_PARTITION)

  Message: Cannot remove all partitions, use DROP TABLE instead
- Error: 1509 SQLSTATE: HY000 (ER_COALESCE_ONLY_ON_HASH_PARTITION)

  Message: COALESCE PARTITION can only be used on HASH/KEY partitions
- Error: 1510 SQLSTATE: HY000 (ER_REORG_HASH_ONLY_ON_SAME_NO)

  Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers
- Error: 1511 SQLSTATE: HY000 (ER_REORG_NO_PARAM_ERROR)

  Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONs
- Error: 1512 SQLSTATE: HY000 (ER_ONLY_ON_RANGE_LIST_PARTITION)

  Message: %s PARTITION can only be used on RANGE/LIST partitions
- Error: 1513 SQLSTATE: HY000 (ER_ADD_PARTITION_SUBPART_ERROR)

  Message: Trying to Add partition(s) with wrong number of subpartitions
- Error: 1514 SQLSTATE: HY000 (ER_ADD_PARTITION_NO_NEW_PARTITION)

  Message: At least one partition must be added
- Error: 1515 SQLSTATE: HY000 (ER_COALESCE_PARTITION_NO_PARTITION)

  Message: At least one partition must be coalesced
- Error: 1516 SQLSTATE: HY000 (ER_REORG_PARTITION_NOT_EXIST)

  Message: More partitions to reorganize than there are partitions
- Error: 1517 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION)

  Message: Duplicate partition name %s
- Error: 1518 SQLSTATE: HY000 (ER_NO_BINLOG_ERROR)

  Message: It is not allowed to shut off binlog on this command
- Error: 1519 SQLSTATE: HY000 (ER_CONSECUTIVE_REORG_PARTITIONS)

  Message: When reorganizing a set of partitions they must be in consecutive order
- Error: 1520 SQLSTATE: HY000 (ER_REORG_OUTSIDE_RANGE)

  Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range

- Error: 1521 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_FAILURE)

  Message: Partition function not supported in this version for this handler

- Error: 1522 SQLSTATE: HY000 (ER_PART_STATE_ERROR)

  Message: Partition state cannot be defined from CREATE/ALTER TABLE

- Error: 1523 SQLSTATE: HY000 (ER_LIMITED_PART_RANGE)

  Message: The %s handler only supports 32 bit integers in VALUES

- Error: 1524 SQLSTATE: HY000 (ER_PLUGIN_IS_NOT_LOADED)

  Message: Plugin '%s' is not loaded

- Error: 1525 SQLSTATE: HY000 (ER_WRONG_VALUE)

  Message: Incorrect %s value: '%s'

- Error: 1526 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE)

  Message: Table has no partition for value %s

- Error: 1527 SQLSTATE: HY000 (ER_FILEGROUP_OPTION_ONLY_ONCE)

  Message: It is not allowed to specify %s more than once

- Error: 1528 SQLSTATE: HY000 (ER_CREATE_FILEGROUP_FAILED)

  Message: Failed to create %s

- Error: 1529 SQLSTATE: HY000 (ER_DROP_FILEGROUP_FAILED)

  Message: Failed to drop %s

- Error: 1530 SQLSTATE: HY000 (ER_TABLESPACE_AUTO_EXTEND_ERROR)

  Message: The handler doesn't support autoextend of tablespaces

- Error: 1531 SQLSTATE: HY000 (ER_WRONG_SIZE_NUMBER)

  Message: A size parameter was incorrectly specified, either number or on the form 10M

- Error: 1532 SQLSTATE: HY000 (ER_SIZE_OVERFLOW_ERROR)

  Message: The size number was correct but we don't allow the digit part to be more than 2 billion

- Error: 1533 SQLSTATE: HY000 (ER_ALTER_FILEGROUP_FAILED)

  Message: Failed to alter: %s

- Error: 1534 SQLSTATE: HY000 (ER_BINLOG_ROW_LOGGING_FAILED)

  Message: Writing one row to the row-based binary log failed

- Error: 1535 SQLSTATE: HY000 (ER_BINLOG_ROW_WRONG_TABLE_DEF)

  Message: Table definition on master and slave does not match: %s

- Error: 1536 SQLSTATE: HY000 (ER_BINLOG_ROW_RBR_TO_SBR)

  Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events

- Error: 1537 SQLSTATE: HY000 (ER_EVENT_ALREADY_EXISTS)

Message: Event '%s' already exists

- Error: 1538 SQLSTATE: HY000 (ER_EVENT_STORE_FAILED)

  Message: Failed to store event %s. Error code %d from storage engine.

- Error: 1539 SQLSTATE: HY000 (ER_EVENT_DOES_NOT_EXIST)

  Message: Unknown event '%s'

- Error: 1540 SQLSTATE: HY000 (ER_EVENT_CANT_ALTER)

  Message: Failed to alter event '%s'

- Error: 1541 SQLSTATE: HY000 (ER_EVENT_DROP_FAILED)

  Message: Failed to drop %s

- Error: 1542 SQLSTATE: HY000 (ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG)

  Message: INTERVAL is either not positive or too big

- Error: 1543 SQLSTATE: HY000 (ER_EVENT_ENDS_BEFORE_STARTS)

  Message: ENDS is either invalid or before STARTS

- Error: 1544 SQLSTATE: HY000 (ER_EVENT_EXEC_TIME_IN_THE_PAST)

  Message: Event execution time is in the past. Event has been disabled

- Error: 1545 SQLSTATE: HY000 (ER_EVENT_OPEN_TABLE_FAILED)

  Message: Failed to open mysql.event

- Error: 1546 SQLSTATE: HY000 (ER_EVENT_NEITHER_M_EXPR_NOR_M_AT)

  Message: No datetime expression provided

- Error: 1547 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_CORRUPTED)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted

- Error: 1548 SQLSTATE: HY000 (ER_CANNOT_LOAD_FROM_TABLE)

  Message: Cannot load from mysql.%s. The table is probably corrupted

- Error: 1549 SQLSTATE: HY000 (ER_EVENT_CANNOT_DELETE)

  Message: Failed to delete the event from mysql.event

- Error: 1550 SQLSTATE: HY000 (ER_EVENT_COMPILE_ERROR)

  Message: Error during compilation of event's body

- Error: 1551 SQLSTATE: HY000 (ER_EVENT_SAME_NAME)

  Message: Same old and new event name

- Error: 1552 SQLSTATE: HY000 (ER_EVENT_DATA_TOO_LONG)

  Message: Data for column '%s' too long

- Error: 1553 SQLSTATE: HY000 (ER_DROP_INDEX_FK)

  Message: Cannot drop index '%s': needed in a foreign key constraint

- Error: 1554 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX_WITH_VER)

  Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead

- Error: 1555 SQLSTATE: HY000 (ER_CANT_WRITE_LOCK_LOG_TABLE)

  Message: You can't write-lock a log table. Only read access is possible

- Error: 1556 SQLSTATE: HY000 (ER_CANT_LOCK_LOG_TABLE)

  Message: You can't use locks with log tables.

- Error: 1557 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY)

  Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

- Error: 1558 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

- Error: 1559 SQLSTATE: HY000 (ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR)

  Message: Cannot switch out of the row-based binary log format when the session has open temporary tables

- Error: 1560 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT)

  Message: Cannot change the binary logging format inside a stored function or trigger

- Error: 1561 SQLSTATE: HY000 (ER_NDB_CANT_SWITCH_BINLOG_FORMAT)

  Message: The NDB cluster engine does not support changing the binlog format on the fly yet

- Error: 1562 SQLSTATE: HY000 (ER_PARTITION_NO_TEMPORARY)

  Message: Cannot create temporary table with partitions

- Error: 1563 SQLSTATE: HY000 (ER_PARTITION_CONST_DOMAIN_ERROR)

  Message: Partition constant is out of partition function domain

- Error: 1564 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_IS_NOT_ALLOWED)

  Message: This partition function is not allowed

- Error: 1565 SQLSTATE: HY000 (ER_DDL_LOG_ERROR)

  Message: Error in DDL log

- Error: 1566 SQLSTATE: HY000 (ER_NULL_IN_VALUES_LESS_THAN)

  Message: Not allowed to use NULL value in VALUES LESS THAN

- Error: 1567 SQLSTATE: HY000 (ER_WRONG_PARTITION_NAME)

  Message: Incorrect partition name

- Error: 1568 SQLSTATE: 25001 (ER_CANT_CHANGE_TX_ISOLATION)

  Message: Transaction isolation level can't be changed while a transaction is in progress

- Error: 1569 SQLSTATE: HY000 (ER_DUP_ENTRY_AUTOINCREMENT_CASE)

  Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'

- Error: 1570 SQLSTATE: HY000 (ER_EVENT_MODIFY_QUEUE_ERROR)

Message: Internal scheduler error %d

- Error: 1571 SQLSTATE: HY000 (ER_EVENT_SET_VAR_ERROR)

  Message: Error during starting/stopping of the scheduler. Error code %u

- Error: 1572 SQLSTATE: HY000 (ER_PARTITION_MERGE_ERROR)

  Message: Engine cannot be used in partitioned tables

- Error: 1573 SQLSTATE: HY000 (ER_CANT_ACTIVATE_LOG)

  Message: Cannot activate '%s' log

- Error: 1574 SQLSTATE: HY000 (ER_RBR_NOT_AVAILABLE)

  Message: The server was not built with row-based replication

- Error: 1575 SQLSTATE: HY000 (ER_BASE64_DECODE_ERROR)

  Message: Decoding of base64 string failed

- Error: 1576 SQLSTATE: HY000 (ER_EVENT_RECURSION_FORBIDDEN)

  Message: Recursion of EVENT DDL statements is forbidden when body is present

- Error: 1577 SQLSTATE: HY000 (ER_EVENTS_DB_ERROR)

  Message: Cannot proceed because system tables used by Event Scheduler were found damaged at server start

- Error: 1578 SQLSTATE: HY000 (ER_ONLY_INTEGERS_ALLOWED)

  Message: Only integers allowed as number here

- Error: 1579 SQLSTATE: HY000 (ER_UNSUPORTED_LOG_ENGINE)

  Message: This storage engine cannot be used for log tables"

- Error: 1580 SQLSTATE: HY000 (ER_BAD_LOG_STATEMENT)

  Message: You cannot '%s' a log table if logging is enabled

- Error: 1581 SQLSTATE: HY000 (ER_CANT_RENAME_LOG_TABLE)

  Message: Cannot rename '%s'. When logging enabled, rename to/from log table must rename two tables: the log table to an archive table and another table back to '%s'

- Error: 1582 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_NATIVE_FCT)

  Message: Incorrect parameter count in the call to native function '%s'

- Error: 1583 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_NATIVE_FCT)

  Message: Incorrect parameters in the call to native function '%s'

- Error: 1584 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_STORED_FCT)

  Message: Incorrect parameters in the call to stored function '%s'

- Error: 1585 SQLSTATE: HY000 (ER_NATIVE_FCT_NAME_COLLISION)

  Message: This function '%s' has the same name as a native function

- Error: 1586 SQLSTATE: 23000 (ER_DUP_ENTRY_WITH_KEY_NAME)

  Message: Duplicate entry '%s' for key '%s'

- Error: 1587 SQLSTATE: HY000 (ER_BINLOG_PURGE_EMFILE)

  Message: Too many files opened, please execute the command again

- Error: 1588 SQLSTATE: HY000 (ER_EVENT_CANNOT_CREATE_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1589 SQLSTATE: HY000 (ER_EVENT_CANNOT_ALTER_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1590 SQLSTATE: HY000 (ER_SLAVE_INCIDENT)

  Message: The incident %s occured on the master. Message: %s

- Error: 1591 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE_SILENT)

  Message: Table has no partition for some existing values

- Error: 1592 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_STATEMENT)

  Message: Statement may not be safe to log in statement format.

- Error: 1593 SQLSTATE: HY000 (ER_SLAVE_FATAL_ERROR)

  Message: Fatal error: %s

- Error: 1594 SQLSTATE: HY000 (ER_SLAVE_RELAY_LOG_READ_FAILURE)

  Message: Relay log read failure: %s

- Error: 1595 SQLSTATE: HY000 (ER_SLAVE_RELAY_LOG_WRITE_FAILURE)

  Message: Relay log write failure: %s

- Error: 1596 SQLSTATE: HY000 (ER_SLAVE_CREATE_EVENT_FAILURE)

  Message: Failed to create %s

- Error: 1597 SQLSTATE: HY000 (ER_SLAVE_MASTER_COM_FAILURE)

  Message: Master command %s failed: %s

- Error: 1598 SQLSTATE: HY000 (ER_BINLOG_LOGGING_IMPOSSIBLE)

  Message: Binary logging not possible. Message: %s

- Error: 1599 SQLSTATE: HY000 (ER_VIEW_NO_CREATION_CTX)

  Message: View `%s`.`%s` has no creation context

- Error: 1600 SQLSTATE: HY000 (ER_VIEW_INVALID_CREATION_CTX)

  Message: Creation context of view `%s`.`%s' is invalid

- Error: 1601 SQLSTATE: HY000 (ER_SR_INVALID_CREATION_CTX)

  Message: Creation context of stored routine `%s`.`%s` is invalid

- Error: 1602 SQLSTATE: HY000 (ER_TRG_CORRUPTED_FILE)

  Message: Corrupted TRG file for table `%s`.`%s`

- Error: 1603 SQLSTATE: HY000 (ER_TRG_NO_CREATION_CTX)

Message: Triggers for table `%s`.`%s` have no creation context

- Error: 1604 SQLSTATE: HY000 (ER_TRG_INVALID_CREATION_CTX)

  Message: Trigger creation context of table `%s`.`%s` is invalid

- Error: 1605 SQLSTATE: HY000 (ER_EVENT_INVALID_CREATION_CTX)

  Message: Creation context of event `%s`.`%s` is invalid

- Error: 1606 SQLSTATE: HY000 (ER_TRG_CANT_OPEN_TABLE)

  Message: Cannot open table for trigger `%s`.`%s`

- Error: 1607 SQLSTATE: HY000 (ER_CANT_CREATE_SROUTINE)

  Message: Cannot create stored routine `%s`. Check warnings

- Error: 1608 SQLSTATE: HY000 (ER_SLAVE_AMBIGOUS_EXEC_MODE)

  Message: Ambiguous slave modes combination. %s

- Error: 1609 SQLSTATE: HY000 (ER_NO_FORMAT_DESCRIPTION_EVENT_BEFORE_BINLOG_STATEMENT)

  Message: The BINLOG statement of type `%s` was not preceded by a format description BINLOG statement.

- Error: 1610 SQLSTATE: HY000 (ER_SLAVE_CORRUPT_EVENT)

  Message: Corrupted replication event was detected

- Error: 1611 SQLSTATE: HY000 (ER_LOAD_DATA_INVALID_COLUMN)

  Message: Invalid column reference (%s) in LOAD DATA

- Error: 1612 SQLSTATE: HY000 (ER_LOG_PURGE_NO_FILE)

  Message: Being purged log %s was not found

- Error: 1613 SQLSTATE: XA106 (ER_XA_RBTIMEOUT)

  Message: XA_RBTIMEOUT: Transaction branch was rolled back: took too long

- Error: 1614 SQLSTATE: XA102 (ER_XA_RBDEADLOCK)

  Message: XA_RBDEADLOCK: Transaction branch was rolled back: deadlock was detected

- Error: 1615 SQLSTATE: HY000 (ER_NEED_REPREPARE)

  Message: Prepared statement needs to be re-prepared

- Error: 1616 SQLSTATE: HY000 (ER_DELAYED_NOT_SUPPORTED)

  Message: DELAYED option not supported for table '%s'

- Error: 1617 SQLSTATE: HY000 (WARN_NO_MASTER_INFO)

  Message: The master info structure does not exist

- Error: 1618 SQLSTATE: HY000 (WARN_OPTION_IGNORED)

  Message: <%s> option ignored

- Error: 1619 SQLSTATE: HY000 (WARN_PLUGIN_DELETE_BUILTIN)

  Message: Built-in plugins cannot be deleted

- Error: 1620 SQLSTATE: HY000 (WARN_PLUGIN_BUSY)

  Message: Plugin is busy and will be uninstalled on shutdown
- Error: 1621 SQLSTATE: HY000 (ER_VARIABLE_IS_READONLY)

  Message: %s variable '%s' is read-only. Use SET %s to assign the value
- Error: 1622 SQLSTATE: HY000 (ER_WARN_ENGINE_TRANSACTION_ROLLBACK)

  Message: Storage engine %s does not support rollback for this statement. Transaction rolled back and must be restarted
- Error: 1623 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_FAILURE)

  Message: Unexpected master's heartbeat data: %s
- Error: 1624 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE)

  Message: The requested value for the heartbeat period %s %s
- Error: 1625 SQLSTATE: HY000 (ER_NDB_REPLICATION_SCHEMA_ERROR)

  Message: Bad schema for mysql.ndb_replication table. Message: %s
- Error: 1626 SQLSTATE: HY000 (ER_CONFLICT_FN_PARSE_ERROR)

  Message: Error in parsing conflict function. Message: %s
- Error: 1627 SQLSTATE: HY000 (ER_EXCEPTIONS_WRITE_ERROR)

  Message: Write to exceptions table failed. Message: %s"
- Error: 1628 SQLSTATE: HY000 (ER_TOO_LONG_TABLE_COMMENT)

  Message: Comment for table '%s' is too long (max = %lu)
- Error: 1629 SQLSTATE: HY000 (ER_TOO_LONG_FIELD_COMMENT)

  Message: Comment for field '%s' is too long (max = %lu)
- Error: 1630 SQLSTATE: 42000 (ER_FUNC_INEXISTENT_NAME_COLLISION)

  Message: FUNCTION %s does not exist. Check the 'Function Name Parsing and Resolution' section in the Reference Manual
- Error: 1631 SQLSTATE: HY000 (ER_DATABASE_NAME)

  Message: Database
- Error: 1632 SQLSTATE: HY000 (ER_TABLE_NAME)

  Message: Table
- Error: 1633 SQLSTATE: HY000 (ER_PARTITION_NAME)

  Message: Partition
- Error: 1634 SQLSTATE: HY000 (ER_SUBPARTITION_NAME)

  Message: Subpartition
- Error: 1635 SQLSTATE: HY000 (ER_TEMPORARY_NAME)

  Message: Temporary
- Error: 1636 SQLSTATE: HY000 (ER_RENAMED_NAME)

  Message: Renamed

- Error: 1637 SQLSTATE: HY000 (ER_TOO_MANY_CONCURRENT_TRXS)

  Message: Too many active concurrent transactions

- Error: 1638 SQLSTATE: HY000 (WARN_NON_ASCII_SEPARATOR_NOT_IMPLEMENTED)

  Message: Non-ASCII separator arguments are not fully supported

B.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the include/errmsg.h MySQL source file.
- The Message values correspond to the error messages that are listed in the libmysql/errmsg.c file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 (CR_UNKNOWN_ERROR)

  Message: Unknown MySQL error

- Error: 2001 (CR_SOCKET_CREATE_ERROR)

  Message: Can't create UNIX socket (%d)

- Error: 2002 (CR_CONNECTION_ERROR)

  Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: 2003 (CR_CONN_HOST_ERROR)

  Message: Can't connect to MySQL server on '%s' (%d)

- Error: 2004 (CR_IPSOCK_ERROR)

  Message: Can't create TCP/IP socket (%d)

- Error: 2005 (CR_UNKNOWN_HOST)

  Message: Unknown MySQL server host '%s' (%d)

- Error: 2006 (CR_SERVER_GONE_ERROR)

  Message: MySQL server has gone away

- Error: 2007 (CR_VERSION_ERROR)

  Message: Protocol mismatch; server version = %d, client version = %d

- Error: 2008 (CR_OUT_OF_MEMORY)

  Message: MySQL client ran out of memory

- Error: 2009 (CR_WRONG_HOST_INFO)

  Message: Wrong host info

- Error: 2010 (CR_LOCALHOST_CONNECTION)

  Message: Localhost via UNIX socket

- Error: 2011 (CR_TCP_CONNECTION)

  Message: %s via TCP/IP

- Error: 2012 (CR_SERVER_HANDSHAKE_ERR)

  Message: Error in server handshake

- Error: 2013 (CR_SERVER_LOST)

  Message: Lost connection to MySQL server during query

- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)

  Message: Commands out of sync; you can't run this command now

- Error: 2015 (CR_NAMEDPIPE_CONNECTION)

  Message: Named pipe: %s

- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)

  Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)

  Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)

  Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR_CANT_READ_CHARSET)

  Message: Can't initialize character set %s (path: %s)

- Error: 2020 (CR_NET_PACKET_TOO_LARGE)

  Message: Got packet bigger than 'max_allowed_packet' bytes

- Error: 2021 (CR_EMBEDDED_CONNECTION)

  Message: Embedded server

- Error: 2022 (CR_PROBE_SLAVE_STATUS)

  Message: Error on SHOW SLAVE STATUS:

- Error: 2023 (CR_PROBE_SLAVE_HOSTS)

  Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 (CR_PROBE_SLAVE_CONNECT)

  Message: Error connecting to slave:

- Error: 2025 (CR_PROBE_MASTER_CONNECT)

  Message: Error connecting to master:

- Error: 2026 (CR_SSL_CONNECTION_ERROR)

  Message: SSL connection error

- Error: 2027 (CR_MALFORMED_PACKET)

  Message: Malformed packet

- Error: 2028 (CR_WRONG_LICENSE)

  Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR_NULL_POINTER)

  Message: Invalid use of null pointer

- Error: 2030 (CR_NO_PREPARE_STMT)

  Message: Statement not prepared

- Error: 2031 (CR_PARAMS_NOT_BOUND)

  Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR_DATA_TRUNCATED)

  Message: Data truncated

- Error: 2033 (CR_NO_PARAMETERS_EXISTS)

  Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

  Message: Invalid parameter number

- Error: 2035 (CR_INVALID_BUFFER_USE)

  Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

  Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

  Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

  Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

  Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)

  Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)

  Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)

  Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)

  Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)

  Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)

  Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)

  Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)

  Message: Wrong or unknown protocol

- Error: 2048 (CR_INVALID_CONN_HANDLE)

  Message: Invalid connection handle

- Error: 2049 (CR_SECURE_AUTH)

  Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: 2050 (CR_FETCH_CANCELED)

  Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: 2051 (CR_NO_DATA)

  Message: Attempt to read column without prior row fetch

- Error: 2052 (CR_NO_STMT_METADATA)

  Message: Prepared statement contains no metadata

- Error: 2053 (CR_NO_RESULT_SET)

  Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED)

  Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED)

  Message: Lost connection to MySQL server at '%s', system error: %d

- Error: 2056 (CR_STMT_CLOSED)

  Message: Statement closed indirectly because of a preceeding %s() call

- Error: 2057 (CR_NEW_STMT_METADATA)

  Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, rebind the result set columns, and execute the statement again

B.5. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.5.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard

disk) or kernel problem:

- The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
- The mouse pointer doesn't move.
- The machine doesn't answer to a remote machine's pings.
- Other programs that are not related to MySQL don't behave correctly.
- Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See Section 5.2, “MySQL Server Logs”.
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.7, “How to Report Bugs or Problems”.

B.5.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.5.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See Section 5.4, “The MySQL Access Privilege System”, and Section 5.4.7, “Causes of Access-Denied Errors”.

B.5.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on '`*`server`*`' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.11.2.3, “Starting and Troubleshooting the MySQL Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: Section B.5.2.2.1, “`Connection to MySQL Server Failing on Windows`”.
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses

the MIT-pthreads package. See Section 2.1.1, “Operating Systems Supported by MySQL Community Server”. However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the host name explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See Section B.5.4.5, “How to Protect or Change the MySQL Unix Socket File”.

- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

  ```
  shell> netstat -ln | grep mysql
  ```

  See Section B.5.4.5, “How to Protect or Change the MySQL Unix Socket File”.

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.

- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)

- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

B.5.2.2.1. `Connection to MySQL Server Failing on Windows`

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been allowed for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could via the Internet with its comparatively large distances and latencies.

Windows allows ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of WIn-

dows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista and Server 2008: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: http://support.microsoft.com/kb/256986/EN-US/.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

   ```
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
   ```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534
   ```

   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
   Value: 30
   ```

   This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.5.2.3. `Lost connection to MySQL server`

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a

very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

B.5.2.4. Client does not support authentication protocol

MySQL 5.4 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

  ```
  mysql> SET PASSWORD FOR
      -> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
  ```

  Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

  ```
  mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
      -> WHERE Host = 'some_host' AND User = 'some_user';
  mysql> FLUSH PRIVILEGES;
  ```

  Substitute the password you want to use for “*newpwd*” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:

  1. Start `mysqld` with the `--old-passwords` option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

     ```
     mysql> SELECT Host, User, Password FROM mysql.user
         -> WHERE LENGTH(Password) > 16;
     ```

     For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

  > **Note**
  >
  > In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for "MySQL, Improved"; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see http://php.net/mysqli.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our MySQL with PHP forum.

For additional background on password hashing and authentication, see Section 5.3.2.3, “Password Hashing in MySQL”.

B.5.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.5.2.6. `Host 'host_name' is blocked`

If you get the following error, it means that `mysqld` has received many connect requests from the host `'host_name'` that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See Section 5.1.4, “Server System Variables”.

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.5.2.7. `Too many connections`

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

> **MySQL Enterprise**
> Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable to avoid failed connection attempts. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 12.4.5.31, “`SHOW PROCESSLIST` Syntax”.

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding. Windows is limited to (open tables × 2 + open connections) < 2048 due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` may be necessary. Also see Section 2.13.1.4, “Linux Post-Installation Notes”, for how to raise the operating system limit on how many handles can be used by MySQL.

B.5.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.5.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
`CR_SERVER_GONE_ERROR`	The client couldn't send a question to the server.
`CR_SERVER_LOST`	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See Section 5.1.4, “Server System Variables”.

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

  The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

  The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.
- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section B.5.2.10, “`Packet too large`”.

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

  You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

  Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.
- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See Section 5.2.2, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See MySQL Internals: Porting.
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.2.3, “The General Query Log”.)

See also Section B.5.2.11, “Communication Errors and Aborted Connections”, and Section 1.7, “How to Report Bugs or Problems”.

B.5.2.10. `Packet too large`

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.4 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.5.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See Section 5.2.2, “The Error Log”. If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23  Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See Section 5.1.4, “Server System Variables”.
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See Section 5.1.4, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

> **MySQL Enterprise**
> For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connects` status variable. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See Section B.5.2.10, “`Packet too large`”.

See also Section B.5.2.9, “`MySQL server has gone away`”.

B.5.2.12. `The table is full`

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB
NetWare w/NSS file system	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get `MyISAM` tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The `InnoDB` storage engine maintains `InnoDB` tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

  If you are using `InnoDB` tables and run out of room in the `InnoDB` tablespace. In this case, the solution is to extend the `InnoDB` tablespace. See Section 13.6.5, “Adding, Removing, or Resizing `InnoDB` Data and Log Files”.
- You are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is allowed by the internal pointer size. `MyISAM` allows data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum allowable size of 65,536TB ($256^7 - 1$ bytes).

If you need a MyISAM table that is larger than the default limit and your operating system supports large files, the CREATE TABLE statement supports AVG_ROW_LENGTH and MAX_ROWS options. See Section 12.1.14, “CREATE TABLE Syntax”. The server uses these options to determine how large a table to allow.

If the pointer size is too small for an existing table, you can change the options with ALTER TABLE to increase a table's maximum allowable size. See Section 12.1.6, “ALTER TABLE Syntax”.

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify AVG_ROW_LENGTH only for tables with BLOB or TEXT columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for MyISAM tables, set the myisam_data_pointer_size, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the MAX_ROWS option. The value of myisam_data_pointer_size can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use myisamchk -dv /path/to/table-index-file. See Section 12.4.5, “SHOW Syntax”, or Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”.

Other ways to work around file-size limits for MyISAM tables are as follows:

- If your large table is read only, you can use myisampack to compress it. myisampack usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. myisampack also can merge multiple tables into a single table. See Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”.
- MySQL includes a MERGE library that allows you to handle a collection of MyISAM tables that have identical structure as a single MERGE table. See Section 13.8, “The MERGE Storage Engine”.

- You are using the MEMORY (HEAP) storage engine; in this case you need to increase the value of the max_heap_table_size system variable. See Section 5.1.4, “Server System Variables”.

B.5.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start mysqld with the --tmpdir option or to add the option to the [mysqld] section of your option file. For example, to specify a directory of C:\temp, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The C:\temp directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.3.3, “Using Option Files”.

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the tmpdir directory.

Check also the error code that you get with perror. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system and/or directory used for storing data files is

write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.5.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.5.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

`Found wrong password for user '`*`some_user`*`'@'`*`some_host`*`'; ignoring user`

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
    -> WHERE User='some_user' AND Host='some_host';
```

B.5.2.16. Table '*tbl_name*' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 12.4.5, “SHOW Syntax”.

B.5.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to re-compile the client by running `configure` with the `--with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See Section 2.10.2, "Typical `configure` Options".

  All standard MySQL binaries are compiled with `--with-extra-charsets=complex`, which enables support for all multi-byte character sets. See Section 2.10.2, "Typical `configure` Options".

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

  In this case, you need to use one of the following methods to solve the problem:

  - Recompile the client with support for the character set. See Section 2.10.2, "Typical `configure` Options".
  - Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
  - Copy the character definition files to the path where the client expects them to be.

B.5.2.18. `'FILE' NOT FOUND` and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code  23:  File table overflow
shell> perror 24
OS error code  24:  Too many open files
shell> perror 11
OS error code  11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See Section 5.1.4, "Server System Variables". The easiest way to set these values is to add an option to your option file. See Section 4.2.3.3, "Using Option Files". If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the "#" character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a "hard" limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

> **Note**
>
> If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.5.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also Section 5.1.2, "Server Command Options", and Section 21.5.1.7, "Making a Test Case If You Experience Table Corruption".

B.5.3. Installation-Related Issues

B.5.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See Section 2.10, “MySQL Installation Using a Source Distribution”.

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

B.5.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See Section 2.14, “Environment Variables”.

B.5.4. Administration-Related Issues

B.5.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning passwords, see Section 2.11.3, “Securing the Initial MySQL Accounts”.

If you know the `root` password, but want to change it, see Section 12.4.1.6, “`SET PASSWORD` Syntax”.

If you set a `root` password previously, but have forgotten it, you can set a new password. The following sections provide instructions for Windows and Unix systems, as well as generic instructions that apply to any system.

> **MySQL Enterprise**
> For expert advice on security-related issues, subscribe to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

B.5.4.1.1. Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for all MySQL `root` accounts:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the START menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.
3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.
4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the START menu, select Run, then enter `cmd` as the command to be run.
6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

   ```
   C:\> C:\mysql\bin\mysqld --init-file=C:\\mysql-init.txt
   ```

   If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

   The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

   You can also add the `--console` option to the command if you want server output to appear in the console window rather than in

a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.4\bin\mysqld.exe"
        --defaults-file="C:\\Program Files\\MySQL\\MySQL Server 5.4\\my.ini"
        --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the START menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

B.5.4.1.2. Resetting the Root Password: Unix Systems

On Unix, use the following procedure to reset the password for all MySQL `root` accounts. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the `mysqld` server runs as (for example, `mysql`).

2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

   You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

   ```
   shell> kill `cat /mysql-data-directory/host_name.pid`
   ```

   Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.

5. Start the MySQL server with the special `--init-file` option:

   ```
   shell> mysqld_safe --init-file=/home/me/mysql-init &
   ```

   The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

B.5.4.1.3. Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions for Windows and Unix systems. Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges.

2. Connect to the `mysqld` server with this command:

   ```
   shell> mysql
   ```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

   ```
   mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
       -> WHERE User='root';
   mysql> FLUSH PRIVILEGES;
   ```

   The `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option).

B.5.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See Section 5.2.2, “The Error Log”.

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See MySQL Internals: Porting. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See Chapter 5, *MySQL Server Administration*.
- Start `mysqld` with the general query log enabled (see Section 5.2.3, "The General Query Log"). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.2.3, "The General Query Log". If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See Section 1.7, "How to Report Bugs or Problems".
- Try to make a test case that we can use to repeat the problem. See MySQL Internals: Porting.
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See Section 21.1.2, "MySQL Test Suite". They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See MySQL Internals: Porting.
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:

  1. Start `mysqld` from `gdb` (or another debugger). See MySQL Internals: Porting.
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

     ```
     backtrace
     info local
     up
     info local
     up
     info local
     ```

     With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where *`N`* is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See Section 1.7, "How to Report Bugs or Problems". Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

  The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

B.5.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

MySQL Enterprise
For early notification of possible problems with your MySQL configuration, subscribe to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

B.5.4.4. Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, Netware and OS2, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.4, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“`:`”) on Unix and semicolon characters (“`;`”) on Windows, NetWare, and OS/2.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

MySQL Enterprise
Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

B.5.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

  ```
  [mysqld]
  socket=/path/to/socket

  [client]
  socket=/path/to/socket
  ```

  See Section 4.2.3.3, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See Section 2.10.2, “Typical `configure` Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.5.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 2.14, “Environment Variables”.

You can set the time zone for the server with the `--timezone=`*`timezone_name`* option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

B.5.5. Query-Related Issues

B.5.5.1. Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=, >, =, <, <=`, sorting, and grouping) are based on each character's “sort value.” Characters with the same sort value are treated as the same character. For example, if “`e`” and “`é`” have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with *`col_name`* `LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See Section 12.1.14, “CREATE TABLE Syntax”.

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
    ->     @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0 |
+-----------+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-------------------------------------+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+--------------+
| @s = 'mysql' |
```

```
+-------------+
|           0 |
+-------------+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-------------------------------------------------------------+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-------------------------------------------------------------+
|                                                           1 |
+-------------------------------------------------------------+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
+----------------------+
| utf8_general_ci      |
+----------------------+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-------------------------+----------------------+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-------------------------+----------------------+
| binary                  | binary               |
+-------------------------+----------------------+
```

B.5.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When using a `'0000-00-00'` date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');
```

```
mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store `'0000-00-00'` as a "dummy date." This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a `0` is stored in the `DATE` column, which is retrieved as `'0000-00-00'`. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by IGNORE), you should set `sql_mode` to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

B.5.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `''`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as "phone number is not known" and the meaning of the second can be regarded as "the person is known to have no phone, and thus no phone number."

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Section 3.3.4.6, "Working with `NULL` Values", for additional information and examples.

You can add an index on a column that can have NULL values if you are using the MyISAM, InnoDB, or MEMORY storage engine. Otherwise, you must declare an indexed column NOT NULL, and you cannot insert NULL into the column.

When reading data with LOAD DATA INFILE, empty or missing columns are updated with ''. If you want a NULL value in a column, you should use \N in the data file. The literal word "NULL" may also be used under some circumstances. See Section 12.2.6, "LOAD DATA INFILE Syntax".

When using DISTINCT, GROUP BY, or ORDER BY, all NULL values are regarded as equal.

When using ORDER BY, NULL values are presented first, or last if you specify DESC to sort in descending order.

Aggregate (summary) functions such as COUNT(), MIN(), and SUM() ignore NULL values. The exception to this is COUNT(*), which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-NULL values in the age column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles NULL values specially. If you insert NULL into a TIMESTAMP column, the current date and time is inserted. If you insert NULL into an integer or floating-point column that has the AUTO_INCREMENT attribute, the next number in the sequence is inserted.

B.5.5.4. Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in GROUP BY, ORDER BY, or HAVING clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a WHERE clause. This restriction is imposed because when the WHERE clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The WHERE clause determines which rows should be included in the GROUP BY clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the GROUP BY.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column id, referenced using the alias `a`:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string 'a' and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

B.5.5.5. Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a ROLLBACK, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the ROLLBACK statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See Section 12.4.5.37, “SHOW TABLE STATUS Syntax”, and Section 12.4.5.12, “SHOW CREATE TABLE Syntax”.

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See Section 12.4.5.17, “SHOW ENGINES Syntax”, and Section 12.4.5.40, “SHOW VARIABLES Syntax”.

> **MySQL Enterprise**
> Ensure that your data is adequately protected by subscribing to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

B.5.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.5.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See Section 12.8.2, “EXPLAIN Syntax”.
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See Section B.5.5.8, “Problems with Floating-Point Values”.
6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

   Verify that the test file demonstrates the problem by executing these commands:

   ```
   shell> mysqladmin create test2
   shell> mysql test2 < query.sql
   ```

Attach the test file to a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

B.5.5.8. Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
    -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
    -> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
    -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
    -> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
    -> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
    -> FROM t1 GROUP BY i HAVING a <> b;

+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    1 |  21.4 | 21.4 |
|    2 |  76.8 | 76.8 |
|    3 |   7.4 |  7.4 |
|    4 |  15.4 | 15.4 |
|    5 |   7.2 |  7.2 |
|    6 | -51.4 |    0 |
+------+-------+------+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    6 | -51.4 |    0 |
+------+-------+------+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+------+------+------+
| i    | a    | b    |
+------+------+------+
|    1 | 21.4 | 21.4 |
|    2 | 76.8 | 76.8 |
|    3 |  7.4 |  7.4 |
|    4 | 15.4 | 15.4 |
|    5 |  7.2 |  7.2 |
+------+------+------+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. Other others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

B.5.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

  ```
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  ```

  `EXPLAIN` is discussed in more detail in Section 12.8.2, “`EXPLAIN` Syntax”.

- Use `ANALYZE TABLE` *`tbl_name`* to update the key distributions for the scanned table. See Section 12.4.2.1, “`ANALYZE TABLE` Syntax”.

- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

  ```
  SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
  WHERE t1.col_name=t2.col_name;
  ```

  `USE INDEX` and `IGNORE INDEX` may also be useful. See Section 12.2.8.2, “Index Hint Syntax”.

- Global and table-level `STRAIGHT_JOIN`. See Section 12.2.8, “`SELECT` Syntax”.

- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Section 5.1.4, “Server System Variables”.

B.5.7. Table Definition-Related Issues

B.5.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-`*`xxx`* or `B-`*`xxx`* lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.5.7.2. `TEMPORARY` Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

  Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

  This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See Section 16.4.1, “Replication Features and Issues”, for more information.

B.5.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in Section 2.13, “Operating System-Specific Notes”, and MySQL Internals: Porting.

B.5.8.1. Open Issues in MySQL

The following problems are also known and fixing them is also a high priority:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).

- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` statement before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` statement wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and 2^{64}–1) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

  It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

  For example:

  - `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
  - `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
  - `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

  If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

  For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

  A query is optimized differently on the master and slave only if:

  - The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
  - MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
  - The master and slave run different MySQL versions, and the optimizer code differs between these versions.

  This problem may also affect database restoration using `mysqlbinlog|mysql`.

  The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order.

  In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options

such as `--log-bin=old_host_name-bin` if you change your host name to something else. Another option is to rename the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binary log file names there as well). See Section 5.1.2, “Server Command Options”.

- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See Section 4.6.7, “`mysqlbinlog` — Utility for Processing Binary Log Files”.
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “_” or “%” with `ESCAPE` in `LIKE ... ESCAPE`.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See Section 2.10.5, “MIT-pthreads Notes”.
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to *`host_name`*`.err` instead of *`host_name`*`.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by `2`, **not** `1`:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

  An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
       WHERE userid = 9 ORDER BY id DESC;
```

  and

```
SELECT DISTINCT band_downloads.mp3id
       FROM band_downloads,band_mp3
       WHERE band_downloads.userid = 9
       AND band_mp3.id = band_downloads.mp3id
       ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

Appendix C. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.4, which is currently MySQL 5.4.3. We offer a version of the Manual for each series of MySQL releases (5.0, 5.1, and so forth). For information about changes in another release series of the MySQL database software, see the corresponding version of this Manual.

We update this section as we add new features in the 5.4 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (http://dev.mysql.com/downloads/), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

C.1. Changes in Release 5.4.x (Development)

An overview of features added in MySQL 5.4 can be found here: Section 1.5, "What Is New in MySQL 5.4". For a full list of changes, please refer to the changelog sections for individual 5.4 releases.

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.1 to MySQL 5.4, see Section 2.12.1.1, "Upgrading from MySQL 5.1 to 5.4".

C.1.1. Changes in MySQL 5.4.3 (06 October 2009)

Functionality added or changed:

- **Incompatible Change**: If you upgrade to MySQL 5.4.3 from an earlier 5.4 release, the server may fail to start due to changes in the default values of `innodb_log_files_in_group` and `innodb_log_file_size`, which differ from those in earlier 5.4 releases. You should discard the old `InnoDB` log files and let MySQL 5.4.3 create new ones. It is necessary to shut down your current server cleanly so that no outstanding transaction information remains in the log. The procedure to use depends on the value of `innodb_fast_shutdown` used in your current server:

  - If `innodb_fast_shutdown` is not set to 2: Stop your current MySQL server and make sure that it shuts down without errors (to ensure that there is no information for outstanding transactions in the log). Copy the old log files into a safe place in case something went wrong during the shutdown and you need them to recover the tablespace. Delete the old log files and edit `my.cnf` if necessary to specify the desired log file configuration. Then upgrade to MySQL 5.4.3 and start the new server. `mysqld` sees that no `InnoDB` log files exist at startup and creates new ones.

  - If `innodb_fast_shutdown` is set to 2: Shut down your current server, set `innodb_fast_shutdown` to 1, and restart the server. The server should be allowed to recover. Then you should shut down the server again and follow the procedure described in the preceding item to change `InnoDB` log file size. Set `innodb_fast_shutdown` back to 2 and start the MySQL 5.4.3 server.

- **Incompatible Change**: The following list indicates `InnoDB` configuration changes in MySQL 5.4.3, compared to previous versions of MySQL 5.4. For a description of cumulative changes in MySQL 5.4 compared to MySQL 5.1, see Section 1.5, "What Is New in MySQL 5.4".

  The default value of these system variables was changed:

Variable	Change in default value
`innodb_autoextend_increment`	From 64MB to 8MB
`innodb_buffer_pool_size`	From 1GB to 128MB
`innodb_log_buffer_size`	From 16MB to 8MB
`innodb_log_file_size`	From 128MB to 5MB
`innodb_log_files_in_group`	From 3 to 2

Variable	Change in default value
innodb_read_io_threads	From 8 to 4
innodb_write_io_threads	From 8 to 4

These default value changes in most cases revert changes made in earlier MySQL 5.4 releases. The result is that the defaults are more similar to those in MySQL 5.1.

- On Linux (and perhaps other systems), the performance of MySQL Server can be improved by using a different malloc() implementation, developed by Google and called tcmalloc. The gain is noticeable with a higher number of simultaneous users. MySQL 5.4.1 was linked against this library, which improved performance but imposed some restrictions. As a result of these restrictions, MySQL 5.4.3 uses a different approach:

  - The server is linked against the default malloc() provided by the respective platform.

  - Binary distributions for Linux include libtcmalloc_minimal.so (a shared library that can be linked against at runtime) in pkglibdir (that is, the same directory within the package where server plugins and similar object files are located). The version of tcmalloc included with MySQL 5.4.3 comes from google-perftools 1.4.

    If you want to try tcmalloc but are using a binary distribution for a non-Linux platform or a source distribution, you can install Google's tcmalloc. Some distributions provide it in a google-perftools package or with a similar name, or you can download it from Google at http://code.google.com/p/google-perftools/ and compile it yourself.

  - mysqld_safe now supports a --malloc-lib option that enables administrators to specify that mysqld should use tcmalloc.

  The --malloc-lib option works by modifying the LD_PRELOAD environment value to affect dynamic linking to enable the loader to find the memory-allocation library when mysqld runs:

  - If the option is not given, or is given without a value (--malloc-lib=), LD_PRELOAD is not modified and no attempt is made to use tcmalloc.

  - If the option is given as --malloc-lib=tcmalloc, mysqld_safe looks for a tcmalloc library in /usr/lib and then in the MySQL pkglibdir location (for example, /usr/local/mysql/lib or whatever is appropriate). If tmalloc is found, its path name is added to the beginning of the LD_PRELOAD value for mysqld. If tcmalloc is not found, mysqld_safe aborts with an error.

  - If the option is given as --malloc-lib=*/path/to/some/library*, that full path is added to the beginning of the LD_PRELOAD value. If the full path points to a nonexistent or unreadable file, mysqld_safe aborts with an error.

  - For cases where mysqld_safe adds a path name to LD_PRELOAD, it adds the path to the beginning of any existing value the variable already has.

  As a result of the preceding changes, Linux users can use the libtcmalloc_minimal.so now included in binary packages by adding these lines to the my.cnf file:

  ```
  [mysqld_safe]
  malloc-lib=tcmalloc
  ```

  Those lines also suffice for users on any platform who have installed a tcmalloc package in /usr/lib. To use a specific tcmalloc library, specify its full path name. Example:

  ```
  [mysqld_safe]
  malloc-lib=/opt/lib/libtcmalloc_minimal.so
  ```

  (Bug#47549)

Bugs fixed:

- **Performance**: For MyISAM tables with bulk_insert_buffer_size values larger than 256KB, the performance of bulk insert operations such as multiple-row INSERT and INSERT ... SELECT operations has been improved greatly when up to a hundred

rows are inserted at the same time. (Bug#44723)

- **Partitioning**: **Replication**: Attempting to replicate an `INSERT ... SELECT` statement on a partitioned table using row-based replication caused the slave to crash. (Bug#44108)

- **Partitioning**: When reorganizing partitions, not all affected subpartitions were removed prior to renaming. One way in which the issue was visible was that attempting to reorganize two partitions into a single partition having the same name as one of the original partitions could lead to a crash of the server. (Bug#47029)

  See also Bug#45961, Bug#43729.

- **Partitioning**: An `INSERT ... SELECT` statement on an empty partition of a partitioned table failed with `ERROR 1030 (HY000): Got error 124 from storage engine`. This issue also caused queries run against a partitioned table while a `LOAD DATA CONCURRENT INFILE` statement was in progress to fail with the same error. (Bug#46639)

  See also Bug#35845, Bug#44657, Bug#45840.

- **Partitioning**: An online or fast `ALTER TABLE` of a partitioned table could leave behind temporary files in the database directory. (Bug#46483)

- **Partitioning**: A partitioned table having a `TIMESTAMP` column with a default value of `CURRENT_TIMESTAMP` and this column was not defined using an `ON UPDATE` option, an `ALTER TABLE ... REORGANIZE PARTITION` statement on the table caused the `TIMESTAMP` column value to be set to `CURRENT_TIMESTAMP` regardless. (Bug#46478)

- **Partitioning**: Partition pruning did not always work correctly when the table's partitioning key used the `TO_DAYS()` function. (Bug#46362)

- **Partitioning**: Inserting negative values into an `AUTO_INCREMENT` column of a partitioned table could lead to apparently unrelated errors or a crash of the server. (Bug#45823)

- **Partitioning**: Attempting to access a partitioned table when partitioning support was disabled in a MySQL server binary that had been compiled with partitioning support caused the server to crash. (Bug#39893)

- **Partitioning**: Unnecessary calls were made in the server code for performing bulk inserts on partitions for which no inserts needed to be made. (Bug#35845)

  See also Bug#35843.

- **Partitioning**: The use of `TO_DAYS()` in the partitioning expression led to selection failures when the column having the date value contained invalid dates. This occurred because the function returns `NULL` in such cases, and the partition containing NULL values was pruned away. For example, this problem occurred if `'2001-02-00'` was inserted into a `DATE` column of such a table, and a subsequent query on this table used `WHERE date_col < '2001-02-00'`—while `'2001-01-01'` is less than `'2001-02-00'`, `TO_DAYS('2001-02-00')` evaluates as `NULL`, and so the row containing `'2001-01-01'` was not returned. Now, for tables using `RANGE` or `LIST` partitioning and having `TO_DAYS()` in the partitioning expression, the `NULL` partition is also scanned instead of being ignored.

  The fix for this issue also corrects misbehavior such that a query of the form `SELECT * FROM table WHERE date_col < date_val` on a table partitioned by `RANGE` or `LIST` was handled as though the server SQL mode included `ALLOW_INVALID_DATES` even if this was not actually part of the server SQL mode at the time the query was issued. (Bug#20577)

  See also Bug#18198, Bug#32021, Bug#46362.

- **Replication**: Performing a multi-row update of the `AUTO_INCREMENT` column of a transactional table could result in an inconsistency between master and slave when there was a trigger on the transactional table that updated a nontransactional table. When such an update failed on the master, no rows were updated on the master, but some rows could (erroneously) be updated on the slave. (Bug#46864)

- **Replication**: When using the `--replicate-rewrite-db` option and the database referenced by this option on the master was the current database when the connection to the slave was closed, any temporary tables existing in this database were not properly dropped. (Bug#46861)

- **Replication**: When a statement that changed both transactional and nontransactional tables failed, the transactional changes were automatically rolled back on the master but the slave ignored the error and did not roll them back, thus leading to inconsistencies between master and slave.

  This issue is fixed by automatically rolling back a statement that fails on the slave; however, the transaction is not rolled back unless

a corresponding ROLLBACK statement is found in the relay log file. (Bug#46130)

See also Bug#33864.

- **Replication**: When using row-based replication, importing a dump made with mysqldump and replicating a row with an AUTO_INCREMENT column set to 0, with NO_AUTO_VALUE_ON_ZERO active on the master, the row was inserted successfully on the master; however any setting for NO_AUTO_VALUE_ON_ZERO was ignored on the slave. When the AUTO_INCREMENT column was incremented, this caused replication to fail on the slave due to a duplicate key error. In some cases it could also cause the slave to crash. (Bug#45999)

- **Replication**: When slave_transaction_retries is set, a statement that replicates, but is then rolled back due to a deadlock on the slave, should be retried. However, in certain cases, replication was stopped with error 1213 (DEADLOCK FOUND WHEN TRYING TO GET LOCK; TRY RESTARTING TRANSACTION) instead, even when this variable was set. (Bug#45694)

- **Replication**: The binary logging behavior (and thus, the replication behavior) of CREATE DATABASE IF NOT EXISTS, CREATE TABLE IF NOT EXISTS, and CREATE EVENT IF NOT EXISTS was not consistent among these statements, nor with that of DROP DATABASE IF EXISTS, DROP TABLE IF EXISTS, and DROP EVENT IF EXISTS: A DROP ... IF EXISTS statement is always logged even if the database object named in the statement does not exist. However, of the CREATE ... IF NOT EXISTS statements, only the CREATE EVENT IF NOT EXISTS statement was logged when the database object named in the statement already existed.

  Now, every CREATE ... IF NOT EXISTS statement is written to the binary log (and thus replicated), whether the database object named in the statement exists or not. For more information, see Section 16.4.1.3, "Replication of CREATE ... IF NOT EXISTS Statements".

  Exception. Replication and logging of CREATE TABLE IF NOT EXISTS ... SELECT continues to be handled according to existing rules. See Section 16.4.1.4, "Replication of CREATE TABLE ... SELECT Statements", for more information.

  (Bug#45574)

- **Replication**: When using statement-based replication, database-level character sets were not always honored by the replication SQL thread. This could cause data inserted on the master using LOAD DATA to be replicated using the wrong character set.

  > **Note**
  >
  > This was not an issue when using row-based replication.

  (Bug#45516)

- **Replication**: In some cases, a STOP SLAVE statement could cause the replication slave to crash. This issue was specific to MySQL on Windows or Macintosh platforms. (Bug#45238, Bug#45242, Bug#45243, Bug#46013, Bug#46014, Bug#46030)

  See also Bug#40796.

- **Replication**: Creating a scheduled event whose DEFINER clause was either set to CURRENT_USER or not set explicitly caused the master and the slave to become inconsistent. This issue stems from the fact that, in both cases, the DEFINER is set to the CURRENT_USER of the current thread. (On the master, the CURRENT_USER is the mysqld user; on the slave, the CURRENT_USER is empty.)

  This behavior has been modified as follows:

  - If CURRENT_USER is used as the DEFINER, it is replaced with the *value* of CURRENT_USER before the CREATE EVENT statement is written to the binary log.
  - If the definer is not set explicitly, a DEFINER clause using the value of CURRENT_USER is added to the CREATE EVENT statement before it is written to the binary log.

  (Bug#44331)

  See also Bug#42217.

- **Replication**: When using the statement-based logging format, the only possible safe combination of transactional and nontransactional statements within the same transaction is to perform any updates on nontransactional tables (such as MyISAM tables) first, before updating any transactional tables (such as those using the InnoDB storage engine). This is due to the fact that, although a modification made to a nontransactional table is immediately visible to other connections, the update is not immediately written to

the binary log, which can lead to inconsistencies between master and slave. (Other combinations may hide a causal dependency, thus making it impossible to write statements updating nontransactional tables to the binary log in the correct order.)

However, in some cases, this situation was not handled properly, and the determination whether a given statement was safe or not under these conditions was not always correct. In particular, a multi-table update that affected both transactional and nontransactional tables or a statement modifying data in a nontransactional table having a trigger that operated on a transactional table (or the reverse) was not determined to be unsafe when it should have been.

With this fix, the following determinations regarding replication safety are made when combining updates to transactional and nontransactional tables within the same transaction in statement-based logging mode:

1. Any statement modifying data in a nontransactional table within a given transaction is considered safe if it is issued prior to any data modification statement accessing a transactional table within the same transaction.

2. A statement that updates transactional tables only is always considered safe.

3. A statement affecting both transactional and nontransactional tables within a transaction is always considered unsafe. It is not necessary that both tables be modified for this to be true; for example, a statement such as `INSERT INTO innodb_table SELECT * FROM myisam_table` is also considered unsafe.

Note

The current fix is valid only when using statement-based logging mode; we plan to address similar issues occurring when using the `MIXED` or `ROW` format in a future MySQL release.

(Bug#28976)

- The `ARCHIVE` storage engine lost records during a bulk insert. (Bug#46961)
- `CONCAT_WS()` could return incorrect results due to an argument buffer also being used as a result buffer. (Bug#46815)
- Stack overflow checking did not account for the size of the structure stored in the heap. (Bug#46807)
- The server crashed when re-using outer column references in correlated subqueries when the enclosing query used a temp table. (Bug#46791)
- The server could crash for queries with the following elements: 1. An “impossible where” in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-level `WHERE` sargable predicate; (Bug#46749)
- Assertion failure could result from repeated execution of a stored procedure containing an incorrect query with a subselect. (Bug#46629)
- `CREATE TABLE ... SELECT` could cause assertion failure if a table already existed with the same name and contained an `AUTO_INCREMENT` column. (Bug#46616)
- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. (Bug#46614)
- In queries for which the loose index scan access method was chosen, using a condition of the form `col_name` rather than the equivalent `col_name <> 0` caused an assertion failure. (Bug#46607)
- The server ignored the setting of `sync_frm` for `CREATE TABLE ... LIKE`. (Bug#46591)
- `TRUNCATE TABLE` for a table that was opened with `HANDLER` did not close the handler and left it in an inconsistent state that could lead to a server crash. Now `TRUNCATE TABLE` for a table closes all open handlers for the table. (Bug#46456)
- An attempt to create a table with the same name as an existing view could cause a server crash. (Bug#46384)
- A parser problem prevented properly stripping backquotes from an argument to a user-defined function (UDF). If the UDF was in an `ORDER BY` clause, its name would not be properly resolved against an alias with the same name in the select list. (Bug#46259)
- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. (Bug#46184)

  See also Bug#48293.

- Certain `SELECT` statements containing `DISTINCT`, `GROUP BY`, and `HAVING` clauses could hang in an infinite loop. (Bug#46159)

- Killing a query that was performing a sort could result in a memory leak. (Bug#45962)
- A Valgrind error when opening the `init_file` file was corrected. (Bug#45894)
- `CREATE TEMPORARY TABLE` failed for `InnoDB` tables on systems with case-insensitive file systems when `lower_case_table_names = 2` and the pathname of the temporary file directory contained uppercase characters. (Bug#45638)
- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. (Bug#45261)

  See also Bug#48370.
- When re-installing MySQL on Windows on a server that has a data directory from a previous MySQL installation, the installer would fail to identify the existence of the installation and the password configured for the `root` user. (Bug#45200)
- Debug builds of the server on Windows crashed in debugging code. (Bug#45118)
- The default value of `innodb_buffer_pool_size` was set to 1GB in MySQL 5.4.0. This was too large for many installations, so the default has been lowered to 128MB. (Bug#44408)
- `SHOW ERRORS` returned an empty result set after an attempt to drop a nonexistent table. (Bug#42364)
- A test for stack growth failed on some platforms, leading to server crashes. (Bug#42213)
- A buffer overflow could occur during handling of `IS NULL` ranges. (Bug#37044)
- `mysqladmin --wait ping` crashed on Windows systems. (Bug#35132)
- `myisamchk` performed parameter value casting at startup that generated unnecessary warning messages. (Bug#33785)
- When using the `ARCHIVE` storage engine, `SHOW TABLE STATUS` displayed incorrect information for `Max_data_length`, `Data_length` and `Avg_row_length`. (Bug#29203)

C.1.2. Changes in MySQL 5.4.2 (01 September 2009)

InnoDB Notes:

- As of MySQL 5.4.2, the `InnoDB Plugin` is included in MySQL 5.4 releases. The version of the `InnoDB Plugin` in this release is 1.0.4 and is considered of Beta quality. It becomes the built-in version of `InnoDB` in MySQL Server, replacing the version previously included as the built-in `InnoDB` engine.

  A number of performance and scalability enhancements were made to the previous built-in version of `InnoDB` in MySQL 5.4.0 and 5.4.1. `InnoDB Plugin` also provides improvements in these areas, and in addition offers new features and capabilities for flexibility and ease of use. Among these features are enhanced reliability, “Fast index creation,” table and index compression, file format management, new `INFORMATION_SCHEMA` tables, capacity tuning, multiple background I/O threads, and group commit.

  For information about these features, see InnoDB Plugin 1.0 for MySQL 5.1 User’s Guide. For general information about using `InnoDB` in MySQL, see Section 13.6, “The `InnoDB` Storage Engine”.

  Due to inclusion of `InnoDB Plugin`, a number of `InnoDB` configuration changes were made, as described later in this section.

Functionality added or changed:

- **Incompatible Change**: The inclusion of `InnoDB Plugin` as the built-in version of `InnoDB` in MySQL Server results in an incompatibility for upgrades from MySQL 5.1. `InnoDB Plugin` is available in MySQL 5.1 as of 5.1.38, but it is an optional storage engine that must be enabled explicitly using two server options:

```
[mysqld]
ignore-builtin-innodb
plugin-load=innodb=ha_innodb_plugin.so
```

If you were using `InnoDB Plugin` in MySQL 5.1 by means of those options, you must remove them after an upgrade to 5.4 or the server will fail to start.

- **Incompatible Change**: If you upgrade to MySQL 5.4.2 from MySQL 5.1, the server may fail to start due to `InnoDB` log file configuration changes. MySQL 5.4 increases the default value of `innodb_log_files_in_group` from 2 to 3. It also increases the default value of `innodb_log_file_size` from 5MB to 128MB. (MySQL 5.4.0 increased the minimum value of `innodb_log_file_size` from 1MB to 32MB, but this has been reverted to 1MB in 5.4.2.)

  For an upgrade to MySQL 5.4.2, you should discard the old `InnoDB` log files and let MySQL 5.4.2 create new ones. It is necessary to shut down your current server cleanly so that no outstanding transaction information remains in the log. The procedure to use depends on the value of `innodb_fast_shutdown` used in your current server:

  - If `innodb_fast_shutdown` is not set to 2: Stop your current MySQL server and make sure that it shuts down without errors (to ensure that there is no information for outstanding transactions in the log). Copy the old log files into a safe place in case something went wrong during the shutdown and you need them to recover the tablespace. Delete the old log files and edit `my.cnf` if necessary to specify the desired log file configuration. Then upgrade to MySQL 5.4.2 and start the new server. `mysqld` sees that no `InnoDB` log files exist at startup and creates new ones.

  - If `innodb_fast_shutdown` is set to 2: Shut down your current server, set `innodb_fast_shutdown` to 1, and restart the server. The server should be allowed to recover. Then you should shut down the server again and follow the procedure described in the preceding item to change `InnoDB` log file size. Set `innodb_fast_shutdown` back to 2 and start the MySQL 5.4.2 server.

- **Incompatible Change**: The following list indicates `InnoDB` configuration changes in MySQL 5.4.2, compared to previous versions of MySQL 5.4. For a description of cumulative changes in MySQL 5.4 compared to MySQL 5.1, see Section 1.5, “What Is New in MySQL 5.4”.

  These system variables were added:

  - `innodb_adaptive_flushing`: Controls adaptive flushing of dirty pages.
  - `innodb_change_buffering`: Controls insert buffering.
  - `innodb_file_format`: The format for new `InnoDB` tables.
  - `innodb_file_format_check`: Whether to perform file format compatibility checking.
  - `innodb_read_ahead_threshold`: Controls sensitivity of linear read-ahead.
  - `innodb_replication_delay`: The replication thread delay (in ms) on a slave server if `innodb_thread_concurrency` is reached.
  - `innodb_spin_wait_delay`: Maximum delay between polls for a spin lock.
  - `innodb_stats_sample_pages`: How many index pages to sample for statistics calculations.
  - `innodb_strict_mode`: Whether `InnoDB` returns errors rather than warnings for certain exceptional conditions (analogous to strict SQL mode).
  - `innodb_use_sys_malloc`: Whether `InnoDB` uses the OS (system) or its own memory allocator.
  - `innodb_version`: The current version of `InnoDB`.

  More information about the new system variables can be found at InnoDB Plugin 1.0 for MySQL 5.1 User’s Guide.

  These system variables have been made dynamic and can be modified at runtime:

  - `innodb_adaptive_hash_index` (global value)
  - `innodb_file_per_table` (global value)
  - `innodb_io_capacity` (global value)
  - `innodb_lock_wait_timeout` (global and session values)

These system variables were removed, along with the functionality that they represented:

- `innodb_extra_dirty_writes`
- `innodb_max_merged_io`
- `innodb_thread_concurrency_timer_based`

The minimum value of these system variables was changed:

Variable	Change in minimum value
`innodb_additional_mem_pool_size`	From 2MB to 512KB
`innodb_buffer_pool_size`	From 64MB to 5MB
`innodb_log_buffer_size`	From 2MB to 256KB
`innodb_log_file_size`	From 32MB to 1MB

These minimum value changes in most cases revert changes made in MySQL 5.4.0.

The default value of this system variable was changed:

Variable	Change in default value
`innodb_sync_spin_loops`	From 20 to 30

These status variables were renamed or removed:

- `Innodb_have_sync_atomic`: renamed to `Innodb_have_atomic_builtins`
- `Innodb_heap_enabled`: Removed
- `Innodb_wake_ups`: Removed

- **Important Change**: **Replication**: Previously, incident log events were represented as comments in the output from `mysqlbinlog`, making them effectively silent when playing back the binlog.

  (An incident log event represents an incident that could cause the contents of the database to change without that event being recorded in the binary log.)

  This meant that, if the SQL were applied to a server, it could potentially lead to the master and the slave having different data. To make it possible to handle incident log events without breaking applications that expect the previous behavior, the nonsense statement `RELOAD DATABASE` is added to the SQL output for that incident log event, which causes an error.

  To use this functionality currently requires hand editing of the dump file and handling of each case on an individual basis by a database administrator before applying the output to a server. (Bug#44442)

- **Replication**: With statement-based logging (SBL), repeatedly calling statements that are unsafe for SBL caused a warning message to be written to the error log for each statement, and there was no way to disable this behavior. Now the server logs messages about statements that are unsafe for statement-based logging only if the `log_warnings` variable is greater than 0. (Bug#46265)

- The undocumented `TRANSACTIONAL` and `PAGE_CHECKSUM` keywords were removed from the grammar. (Bug#45829)

- The minimum value for `table_open_cache` was increased from 64 to 400. (Bug#45475)

- `mysql_upgrade` now displays a message indicating the connection parameters it uses when invoking `mysqlcheck`. (Bug#44638)

- Previously, `mysqldump` would not dump the `INFORMATION_SCHEMA` database and ignored it if it was named on the command line. Now, `mysqldump` will dump `INFORMATION_SCHEMA` if it is named on the command line. Currently, this requires that the `--skip-lock-tables` (or `--skip-opt`) option be given. (Bug#33762)

- Previously, `SELECT ... INTO OUTFILE` dumped column values without character set conversion, which could produce data

files that cannot be imported without error if different columns used different character sets. A consequence of this is that `mysqldump` ignored the `--default-character-set` option if the `--tab` option was given (which causes `SELECT ... INTO OUTFILE` to be used to dump data.)

`INTO OUTFILE` now can be followed by a `CHARACTER SET` clause indicating the character set to which dumped values should be converted. Also, `mysqldump` adds a `CHARACTER SET` clause to the `SELECT ... INTO OUTFILE` statement used to dump data, so that `--default-character-set` is no longer ignored if `--tab` is given.

Other changes are that `SELECT ... INTO OUTFILE` enforces that `ENCLOSED BY` and `ESCAPED BY` arguments must be a single character, and `SELECT ... INTO OUTFILE` and `LOAD DATA INFILE` produce warnings if non-ASCII field or line separators are specified. (Bug#30946)

- The maximum value for `max_binlog_cache_size` has been increased from $2^{32} - 1$ to $2^{64} - 1$ (even on 32-bit platforms), which enables transactions 4GB and larger to be performed when binary logging is enabled. (Bug#10206)
- Pluggable storage engines now can be built for Windows.
- On Linux, the performance of MySQL Server can be improved by using a different `malloc()` implementation, developed by Google and called `tcmalloc`. The gain is noticeable with a higher number of simultaneous users. MySQL 5.4.1 was linked against this library, which improved performance but imposed some restrictions. As a result of these restrictions, MySQL 5.4.2 uses a different approach:
  - The server is linked against the default `malloc()` provided by the respective platform.
  - The user or administrator can install Google's `tcmalloc` if desired. Some distributions provide it in a `google-perftools` package or with a similar name, or you can download it from Google at http://code.google.com/p/google-perftools/.
  - If the MySQL server is then started with an environment variable setting like this (with the correct path name) the server will use `tcmalloc` with no other change needed:

    ```
    LD_PRELOAD=/your/local/path/to/libtcmalloc_minimal.so
    ```

    The MySQL team is considering whether to modify the start script `mysqld_safe` so that it will check whether `tcmalloc` is installed and set the variable if that shared library is found.

    Feedback about this possible change is welcome!
- The MySQL `euckr` character set now can store extended codes [81...FE][41..5A,61..7A,81..FE], which makes `euckr` compatible with the Microsoft `cp949` character set.
- The `optimizer_switch` system variable is now available to control optimizations that can be switched on and off. See Section 7.2.18, “Using `optimizer_switch` to Control the Optimizer”.

Bugs fixed:

- **Performance**: With `InnoDB` tables, MySQL used a less-selective secondary index to avoid a filesort even if a prefix of the primary key was much more selective.

  The fix for this problem might cause other queries to run more slowly. (Bug#45828)
- **Performance**: `InnoDB` uses random numbers to generate dives into indexes for calculating index cardinality. However, under certain conditions, the algorithm did not generate random numbers, so `ANALYZE TABLE` did not update cardinality estimates properly. A new algorithm has been introduced with better randomization properties. (Bug#43660)
- **Performance**: The table cache lock (`LOCK_open`) is now an adaptive mutex, which should improve performance in workloads where this lock is heavily contended. (Bug#43435)
- **Partitioning**: **Security Fix**: Accessing a table having user-defined partitioning when the server SQL mode included `ONLY_FULL_GROUP_BY` caused the MySQL server to crash. For example, the following sequence of statements crashed the server:

  ```
  DROP TABLE IF EXISTS t1;
  SET SESSION SQL_MODE='ONLY_FULL_GROUP_BY';
  ```

```
CREATE TABLE t1 (id INT, KEY(id))
    PARTITION BY HASH(id) PARTITIONS 2;
```

(Bug#45807)

- **Security Fix**: The `strxnmov()` library function could write a null byte after the end of the destination buffer. (Bug#44834)
- **Security Fix**: Four potential format string vulnerabilities were fixed (discovered by the Veracode code analysis). (Bug#44166)
- **Incompatible Change**: The server can load plugins under the control of startup options. For example, many storage engines can be built in pluggable form and loaded when the server starts. In the following descriptions, *`plugin_name`* stands for a plugin name such as `innodb`.

  Previously, plugin options were handled like other boolean options (see Section 4.2.3.2, “Program Option Modifiers”). That is, any of these options enabled the plugin:

  ```
  --plugin_name
  --plugin_name=1
  --enable-plugin_name
  ```

  And these options disabled the plugin:

  ```
  --plugin_name=0
  --disable-plugin_name
  --skip-plugin_name
  ```

  However, use of a boolean option for plugin loading did not provide control over what to do if the plugin failed to start properly: Should the server exit, or start with the plugin disabled? The actual behavior has been that the server starts with the plugin disabled, which can be problematic. For example, if `InnoDB` fails to start, existing `InnoDB` tables become inaccessible, and attempts to create new `InnoDB` tables result in tables that use the default storage engine unless the `NO_ENGINE_SUBSTITUTION` SQL mode has been enabled to cause an error to occur instead.

  Now, there is a change in the options used to control plugin loading, such that they have a tristate format:

  - *`--plugin_name`*`=OFF`

    Do not enable the plugin.

  - *`--plugin_name`*`[=ON]`

    Enable the plugin. If plugin initialization fails, start the server anyway, but with the plugin disabled. Specifying the option as *`--plugin_name`* without a value also enables the plugin.

  - *`--plugin_name`*`=FORCE`

    Enable the plugin. If plugin initialization fails, do not start the server. In other words, force the server to run with the plugin or not at all.

  The values `OFF`, `ON`, and `FORCE` are not case sensitive.

  Suppose that `CSV` and `InnoDB` have been built as pluggable storage engines and that you want the server to load them at startup, subject to these conditions: The server is allowed to run if `CSV` initialization fails, but must require that `InnoDB` initialization succeed. To accomplish that, use these lines in an option file:

  ```
  [mysqld]
  csv=ON
  innodb=FORCE
  ```

  This change is incompatible with the previous implementation if you used options of the form *`--plugin_name`*`=0` or *`--plugin_name`*`=1`, which should be changed to *`--plugin_name`*`=OFF` or *`--plugin_name`*`=ON`, respectively.

  `--enable-`*`plugin_name`* is still supported and is the same as *`--plugin_name`*`=ON`. `--disable-`*`plugin_name`* and `--skip-`*`plugin_name`* are still supported and are the same as *`--plugin_name`*`=OFF`. (Bug#19027)

  See also Bug#45336.

- **Important Change**: **Replication**: `BEGIN`, `COMMIT`, and `ROLLBACK` statements are no longer affected by `--replicate-do-db` or `--replicate-ignore-db` rules. (Bug#43263)

- **Important Change**: **Replication**: The transactional behavior of `STOP SLAVE` has changed. Formerly, it took effect immediately, even inside a transaction; now, it waits until the current replication event group (if any) has finished executing, or until the user issues a `KILL QUERY` or `KILL CONNECTION` statement.

  This was done in order to solve the problem encountered when replication was stopped while a nontransactional slave was replicating a transaction on the master. (It was impossible to roll back a mixed-engines transaction when one of the engines was nontransactional, which meant that the slave could not safely re-apply any transaction that had been interrupted by `STOP SLAVE`.) (Bug#319, Bug#38205)

  See also Bug#43217.

- **Partitioning**: Attempting to create a table using an invalid or inconsistent subpartition definition caused the server to crash. An example of such a statement is shown here:

  ```
  CREATE TABLE t2 (s1 INT, s2 INT)
  PARTITION BY LIST (s1) SUBPARTITION BY HASH (s2) SUBPARTITIONS 1
  (
      PARTITION p1 VALUES IN (1),
      PARTITION p2 VALUES IN (2) (SUBPARTITION p3)
  );
  ```

  (Bug#46354)

- **Partitioning**: A failed `RENAME TABLE` operation on a table with user-defined partitioning left the table in an unusable state, due to only some of the table files having been renamed. (Bug#30102)

- **Replication**: When a statement that changes a nontransactional table failed, the transactional cache was flushed, causing a mismatch between the execution and logging histories. Now we avoid flushing the transactional cache unless a `COMMIT` or `ROLLBACK` is issued. (Bug#46129)

- **Replication**: For replication of a stored procedure that uses the `gbk` character set, the result on the master and slave differed. (Bug#45485)

- **Replication**: The internal function `purge_relay_logs()` did not propagate an error occurring in another internal function `count_relay_log_space()`. (Bug#44115)

- **Replication**: Large transactions and statements could corrupt the binary log if the size of the cache (as set by `max_binlog_cache_size`) was not large enough to store the changes.

  Now, for transactions that do not fit into the cache, the statement is not logged, and the statement generates an error instead.

  For nontransactional changes that do not fit into the cache, the statement is also not logged—an incident event is logged after committing or rolling back any pending transaction, and the statement then raises an error.

  > **Note**
  >
  > If a failure occurs before the incident event is written the binary log, the slave does not stop, and the master does not report any errors.

  (Bug#43929)

  See also Bug#37148.

- **Replication**: When using the `MIXED` logging format, after creating a temporary table and performing an update that switched the logging format to `ROW`, the format switch persisted following the update. This prevented any subsequent DDL statements on temporary tables from being written to the binary log until the temporary table was dropped. (Bug#43046)

  See also Bug#40013.

  This regression was introduced by Bug#20499.

- **Replication**: Statements using `LIMIT` generated spurious `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT` warnings in the error log, causing the log to grow rapidly in size. (Bug#42851)

See also Bug#46265, Bug#42415.

This regression was introduced by Bug#34768.

- **Replication**: When using row-based logging, the length of an event for which the field metadata exceeded 255 bytes in size was incorrectly calculated. This could lead to corruption of the binary log, or cause the server to hang. (Bug#42749)

  See also Bug#44548, Bug#44672, Bug#44752.

- **Replication**: The warning `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`, issued in situations when it cannot be determined that a statement or other database event can be written reliably to the binary log using the statement-based format, has been changed to `STATEMENT MAY NOT BE SAFE TO LOG IN STATEMENT FORMAT`. (Bug#42415)

- **Replication**: The `Query_log_event` used by replication to transfer a query to the slave has been refactored. `Query_log_event` also stores and sends the error code resulting from the execution since it, in some cases, is necessary to execute the statement on the slave as well, which should result in the same error code. The `Query_log_event` constructor previously worked out for itself the error code using a complex routine, the result of which was often set aside within the constructor itself. This was also involved with at least 2 known bugs relating to invalid errors, and taken as a clear sign that the constructor was not well-designed and needed to be re-written. (Bug#41948)

  See also Bug#37145.

- **Replication**: When replicating many temporary tables and inserts into those tables, executing `STOP SLAVE` followed by `START SLAVE` could cause the server to crash. This appeared to be caused by temporary tables preserving outdated thread references after the restart. (Bug#41725)

- **Replication**: If the `--log-bin-trust-function-creators` option is not enabled, `CREATE FUNCTION` requires one of the modifiers `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA`. When using statement-based mode, the execution of a stored function should follow the same rules; however, only functions defined with `DETERMINISTIC` could actually be executed. In addition, the wrong error was generated (**`ER_BINLOG_ROW_RBR_TO_SBR`** instead of **`ER_BINLOG_UNSAFE_ROUTINE`**).

  Now execution of stored functions is compatible with creation in this regard; when a stored function without one of the modifiers above is executed in `STATEMENT` mode, the correct error is raised, and functions defined using `NO SQL`, `READS SQL DATA`, or both (that is, without using `DETERMINISTIC`) can be excuted. (Bug#41166)

- **Replication**: When reading a binary log that was in use by a master or that had not been properly closed (possibly due to a crash), the following message was printed: `WARNING: THIS BINLOG WAS NOT CLOSED PROPERLY. MOST PROBABLY MYSQLD CRASHED WRITING IT`. This message did not take into account the possibility that the file was merely in use by the master, which caused some users concern who were not aware that this could happen.

  To make this clear, the original message has been replaced with `WARNING: THIS BINLOG IS EITHER IS USE OR WAS NOT CLOSED PROPERLY`. (Bug#34687)

- `open_binary_frm()` performed a version test incorrectly, resulting in Valgrind errors. (Bug#46652)

- Concurrent `INSERT INTO ... SELECT` statements for an `InnoDB` table could cause an `AUTO_INCREMENT` assertion failure. (Bug#46650)

- Incorrect index optimization could lead to incorrect results or server crashes. (Bug#46454)

- The server printed warnings at startup about adjusting the value of the `max_join_size` system variable. (These were harmless, but might be seen by users as significant.) (Bug#46385)

- `mysql` did not handle backspace properly for multi-byte characters. This has been fixed now if `mysql` is linked with the `readline` library. It is not fixed if `mysql` is linked with `libedit`, which does not contain the necessary support for multi-byte character sets. (Bug#46310)

- For `InnoDB` tables, an unnecessary table rebuild for `ALTER TABLE` could sometimes occur if `ROW_FORMAT` was specified. (Bug#46160)

- The server crashed if evaluation of `GROUP_CONCAT(... ORDER BY)` required allocation of a sort buffer but allocation failed. (Bug#46080)

- An optimization that moved an item from a subquery to an outer query could cause a server crash. (Bug#46051)

- Several Valgrind warnings were corrected. (Bug#46003, Bug#46034, Bug#46042)
- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. (Bug#45998)
- When creating tables using the `IBMDB2I` storage engine with the `ibmdb2i_create_index_option` option set to 1, creating an `IBMDB2I` table with a primary key should produce an additional index that uses EBCDIC hexadecimal sorting, but this index was not created. (Bug#45983)
- The server crashed for attempts to use `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` with a view defined using a join. (Bug#45806)
- Some collations were causing `IBMDB2I` to report inaccurate key range estimations to the optimizer for `LIKE` clauses that select substrings. This can be seen by running `EXPLAIN`. This problem primarily affects multi-byte and unicode character sets. (Bug#45803)
- The MySQL Server crashed when performing a `REPLACE` into a `MERGE` table if there was a duplicate. (Bug#45800)
- Inserting data into a table using the `macce` character set with the `IBMDB2I` storage engine would fail. (Bug#45793)
- For problems reading SSL files during SSL initialization, the server wrote error messages to `stderr` rather than to the error log. (Bug#45770)
- There was a race condition when changing `innodb_commit_concurrency` at runtime to the value `DEFAULT`. (Bug#45749)

  See also Bug#42101.
- Performing an empty XA transaction caused the server to crash for the next XA transaction. (Bug#45548)
- The vendor name change from MySQL AB to Sun Microsystems, Inc. in RPM packages was not handled gracefully when upgrading MySQL using an RPM package. (Bug#45534)
- `SHOW CREATE TRIGGER` requires the `TRIGGER` privilege but was not checking privileges. (Bug#45412)
- An assertion failure could occur if `InnoDB` tried to unlock a record when the clustered index record was unknown. (Bug#45357)
- Linker failures with `libmysqld` on VC++ 2008 were fixed. (Bug#45326)
- If `autocommit` was enabled, `InnoDB` did not roll back `DELETE` or `UPDATE` statements if the statement was killed. (Bug#45309)
- Compiler warnings on Mac OS X were fixed. (Bug#45286)
- The optimizer mishandled “impossible range” conditions and returned empty results due to an uninitialized variable. (Bug#45266)
- Use of `DECIMAL` constants with more than 65 digits in `CREATE TABLE ... SELECT` statements led to spurious errors or assertion failures. (Bug#45262)
- The `mysql` client could misinterpret some character sequences as commands under some circumstances. (Bug#45236)
- Running a `SELECT` query over an `IBMDB2I` table using the `cp1250` character set would produce an error

  ```
  ibmdb2i error 2027: Error converting single-byte sort sequence to UCS-2
  ```

  (Bug#45197)
- Use of `CONVERT()` with an empty `SET` value could cause an assertion failure. (Bug#45168)
- Use of `ROUND()` on a `LONGTEXT` or `LONGBLOB` column of a derived table could cause a server crash. (Bug#45152)
- A problem of compiler register misallocation on 32-bit Linux was corrected. (Bug#45131)
- `DROP USER` could fail to drop all privileges for an account if the `PAD_CHAR_TO_FULL_LENGTH` SQL mode was enabled. (Bug#45100)
- `InnoDB` recovery could hang due to redo logging of doublewrite buffer pages. (Bug#45097)
- Invalid memory reads could occur using the compressed client/server protocol. (Bug#45031)

- Invalid input could cause invalid memory reads by the parser. (Bug#45010)
- `GROUP BY` on a `constant` (single-row) `InnoDB` table joined to other tables caused a server crash. (Bug#44886)
- `ALTER TABLE` on a view crashed the server. (Bug#44860)
- When using partitioning with the `IBMDB2I` storage engine, the engine could report that a valid character set was not supported. (Bug#44856)
- Running queries on tables with the `IBMDB2I` storage engine using the `utf8` character would fail when using the 64-bit version of MySQL. (Bug#44811)
- Index Merge followed by a filesort could result in a server crash if `sort_buffer_size` was not large enough for all sort keys. (Bug#44810)

  See also Bug#40974.
- `UNCOMPRESSED_LENGTH()` returned a garbage result when passed a string shorter than 5 bytes. Now `UNCOMPRESSED_LENGTH()` returns `NULL` and generates a warning. (Bug#44796)
- Several Valgrind warnings were silenced. (Bug#44774, Bug#44792)
- Selecting `RAND(N)` function where *`N`* is a column of a `constant` table (table with a single row) failed with a `SIGFPE` signal. (Bug#44768)
- The `PASSWORD()` and `OLD_PASSWORD()` functions could read memory outside of an internal buffer when used with `BLOB` arguments. (Bug#44767)
- Conversion of a string to a different character set could use the same buffer for input and output, leading to incorrect results or warnings. (Bug#44743, Bug#44766)
- When reading binary data, the concatenation function for geometry data collections did not rigorously check for available data, leading to invalid reads and server crashes. (Bug#44684)
- Some deprecation warning messages indicated feature removal in MySQL 5.2 rather than MySQL 6.0. (Bug#44676)
- Code that optimized a read-only XA transaction failed to reset the XID once the transaction was no longer active. (Bug#44672)
- During incorporation of a Google patch to `SHOW ENGINE INNODB STATUS` in MySQL 5.4.0, the `TRANSACTIONS` section of the output was inadvertently omitted. This section has been restored. (Bug#44671)
- A Valgrind warning related to transaction processing was silenced. (Bug#44664)
- If an error occurred during the creation of a table (for example, the table already existed) having an `AUTO_INCREMENT` column and a `BEFORE` trigger that used the `INSERT ... SELECT` construct, an internal flag was not reset properly. This led to a crash the next time the table was opened again. (Bug#44653)
- Some files in an AIX `tar` file distribution unpacked with incorrect permissions. (Bug#44647)
- When creating tables using the `IBMDB2I` storage engine, the `RCDFMT` (record format) that would be applied to the corresponding files within the IBM i would be set according to the table name. During whole table operations, the name could get modified to a value inconsistent with the table name. In addition, the record format would be inconsistent compared to the file content. The `IBMDB2I` storage engine now adds an explicit `RCDFMT` clause to the `CREATE TABLE` statement passed down to the DB2 storage engine layer. (Bug#44610)
- Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. (Bug#44495)
- `innochecksum` could incorrectly determine the input file name from the arguments. (Bug#44484)
- The `my-innodb-heavy-4G.cnf` sample option file contained a setting for the no longer existing `innodb_file_io_threads` system variable. This has been replaced with settings for the `innodb_write_io_threads` and `innodb_read_io_threads` system variables with which `innodb_file_io_threads` has been replaced. (Bug#44470)
- Creating a new instance after previously removing an instance would fail to complete the installation properly because the security settings could not be applied correctly. (Bug#44428)

- Incorrect time was reported at the end of `mysqldump` output. (Bug#44424)
- `mysqlslap` ignored the `--csv` option if it was given without an argument. (Bug#44412)
- Caching of `GROUP BY` expressions could lead to mismatches between compile-time and runtime calculations and cause a server crash. (Bug#44399)
- A deprecation warning message tested for an incorrect version number and caused an assertion failure. (Bug#44394)
- Lettercase conversion in multibyte `cp932` or `sjis` character sequences could produce incorrect results. (Bug#44352)
- Assertion failure could occur for duplicate-key errors in `INSERT INTO ... SELECT` statements. (Bug#44306)
- Incomplete cleanup of `JOIN_TAB::select` during the filesort of rows for a `GROUP BY` clause inside a subquery caused a server crash. (Bug#44290)
- Trying to use an unsupported character set on an `IBMDB2I` table would produce DB2 error 2501 or 2511. The error has been updated to produce Error 2504 (Character set is unsupported). (Bug#44232)
- For `InnoDB` tables with `ROW_FORMAT = REDUNDANT`, `CHAR` columns should be fixed-length and allow in-place updates. However, they were treated as variable-length if they contained `utf8` data or `NULL`, preventing in-place updates. (Bug#44032)
- `InnoDB` use of `SELECT MAX(autoinc_column)` could cause a crash when MySQL data dictionaries went out of sync. (Bug#44030)
- In some circumstances, when a table is created with the `IBMDB2I` engine, the `CREATE TABLE` statement will return successfully but the table will not exist. (Bug#44022)
- On 64-bit Windows systems, `myisamchk` did not handle `key_buffer_size` values larger than 4GB. (Bug#43940)
- For user-defined `utf8` collations, attempts to store values too long for a column could cause a server crash. (Bug#43827)
- Invalidation of query cache entries due to table modifications could cause threads to hang inside the query cache with state “freeing items”. (Bug#43758)
- `EXPLAIN EXTENDED` could crash for `UNION` queries in which the last `SELECT` was not parenthesized and included an `ORDER BY` clause. (Bug#43612)
- Enabling the event scheduler from within the file specified by `--init-file` caused a server crash. (Bug#43587)
- Multiple-table updates for `InnoDB` tables could produce unexpected results. (Bug#43580)
- The server did not always check the return value of calls to the `hash_init()` function. (Bug#43572)
- If the client lost the connection to the MySQL server after `mysql_stmt_prepare()`, the first call to `mysql_stmt_execute()` returned an error (as expected) but consecutive calls to `mysql_stmt_execute()` or `mysql_stmt_close()` crashed the client. (Bug#43560)
- For `InnoDB` tables, overflow in an `AUTO_INCREMENT` column could cause a server crash. (Bug#43203)
- For `DELETE` statements with `ORDER BY var`, where `var` was a global system variable with a `NULL` value, the server could crash. (Bug#42778)
- `configure.in` contained references to literal instances of `nm` and `libc`, rather than to variables parameterized for the proper values on the current platform. (Bug#42721)
- For `InnoDB` tables, spurious duplicate-key errors could occur when inserting into an `AUTO_INCREMENT` column. (Bug#42714)
- `mysqladmin --count=X --sleep=Y` incorrectly delayed `Y` seconds after the last iteration before exiting. (Bug#42639)
- `configure.in` did not properly check for the `pthread_setschedprio()` function. (Bug#42599)
- For `InnoDB` tables, inserting into floating-point `AUTO_INCREMENT` columns failed. (Bug#42400)
- Builds linked against OpenSSL had a memory leak in association with use of X509 certificates. (Bug#42158)

- There was a race condition when changing `innodb_commit_concurrency` at runtime from zero to nonzero or from nonzero to zero. Now this variable cannot be changed at runtime from zero to nonzero or vice versa. The value can still be changed from one nonzero value to another. (Bug#42101)

  See also Bug#45749.

- `SELECT ... INTO @var` could produce values different from `SELECT ...` without the `INTO` clause. (Bug#42009)

- `mysql_zap` did not work on Mac OS X. (Bug#41883)

- A workaround for a Sun Studio bug was instituted. (Bug#41710)

- A crash occurred due to a race condition between the merge table and `table_cache` evictions.

  Trying to get some variables.
  Some pointers may be invalid and cause the dump to abort...
  ```

  (Bug#41212)

- Shared-memory connections did not work in Vista if `mysqld` was started from the command line. (Bug#41190)

- For queries with a sufficient number of subqueries in the `FROM` clause of this form:

  ```
  SELECT * FROM (SELECT 1) AS t1,
                (SELECT 2) AS t2,
                (SELECT 3) AS t3, ...
  ```

  The query failed with a `Too high level of nesting for select` error, as though the query had this form:

  ```
  SELECT * FROM (SELECT 1 FROM (SELECT 2 FROM (SELECT 3 FROM ...
  ```

  (Bug#41156)

- For views created with a column list clause, column aliases were not substituted when selecting through the view using a `HAVING` clause. (Bug#40825)

- Some `UPDATE` statements that affected no rows returned a rows-affected count of one. (Bug#40565)

- `mysqladmin` did not have enough space allocated for tracking all variables when using `--vertical` or `--relative` with `extended-status`. (Bug#40395)

- Partitioning a log table caused a server crash. (Bug#40281)

- When using quick access methods to search for rows in `UPDATE` and `DELETE` statements, there was no check whether a fatal error had already been sent to the client while evaluating the quick condition. Consequently, a false OK (following the error) was sent to the client, causing the error to be incorrectly transformed into a warning. (Bug#40113)

- A multiple-table `DELETE` involving a table self-join could cause a server crash. (Bug#39918)

- Creating an `InnoDB` table with a comment containing a `'#'` character caused foreign key constraints to be omitted. (Bug#39793)

- `ALTER TABLE` neglected to preserve `ROW_FORMAT` information from the original table, which could cause subsequent `ALTER TABLE` and `OPTIMIZE TABLE` statements to lose the row format for `InnoDB` tables. (Bug#39200)

- The `mysql` option `--ignore-spaces` was nonfunctional. (Bug#39101)
- The functions listed in Section 11.17.4.2.3, “Creating Geometry Values Using MySQL-Specific Functions”, previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values.

  The functions listed in Section 11.17.4.2.2, “Creating Geometry Values Using WKB Functions”, previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. (Bug#38990)
- `SHOW PROCESSLIST` could access freed memory of a stored procedure run in a concurrent session. (Bug#38816)
- During installation on Windows, the MySQL Instance Configuration Wizard window could be opened at a size too small to be usable. (Bug#38723)
- `make_binary_distribution` did not always generate correct distribution names. (Bug#37808)
- The server crashed when executing a prepared statement containing a duplicated `MATCH()` function call in the select list and `ORDER BY` clause; for example, `SELECT MATCH(a) AGAINST('test') FROM t1 ORDER BY MATCH(a) AGAINST('test')`. (Bug#37740)
- The output of `mysqldump --tab` for views included a `DROP TABLE` statement without the `IF EXISTS` qualifier. (Bug#37377)
- If a query was such as to produce the error `1054 Unknown column '...' in 'field list'`, using `EXPLAIN EXTENDED` with the query could cause a server crash. (Bug#37362)
- In the `mysql` client, if the server connection was lost during repeated `status` commands, the client would fail to detect this and command output would be inconsistent. (Bug#37274)
- In the `mysql` client, using a default character set of `binary` caused internal commands such as `DELIMITER` to become case sensitive. (Bug#37268)
- A Valgrind error during subquery execution was corrected. (Bug#36995)
- When invoked to start multiple server instances, `mysqld_multi` sometimes would fail to start them all due to not changing location into the base directory for each instance. (Bug#36654)
- `mysql_upgrade` silently ignored the `--basedir` and `--datadir` options, which it accepts for backward compatibility. Now it prints a warning. (Bug#36558)
- For `InnoDB` tables, poor cardinality statistics could result in poor query execution plans. (Bug#36513)
- `mysqldump --tab` dumped triggers to `stdout` rather than to the `.sql` file for the corresponding table. (Bug#34861)
- If the `MYSQL_HISTFILE` environment variable was set to `/dev/null`, the `mysql` client overwrote the `/dev/null` device file as a normal file. (Bug#34224)
- Rows written to the slow query log could have an indeterminate `Rows_examined` value due to improper initialization. (Bug#34002)
- `mysqld_safe` mishandled certain parameters if they contained spaces. (Bug#33685)
- `mysqlimport` was not always compiled correctly to enable thread support, which is required for the `--use-threads` option. (Bug#32991)
- `mysqladmin kill` did not work for thread IDs larger than 32 bits. (Bug#32457)
- `mysqlcheck` failed to fix table names when the `--fix-table-names` and `--all-in-1` options were both specified. (Bug#31821)
- If the MySQL server was killed without the PID file being removed, attempts to stop the server with `mysql.server stop` waited 900 seconds before giving up. (Bug#31785)
- When performing an installation on Windows using the GUI installer, the installer would fail to wait long enough during installation for the MySQL service to be installed, which would cause the installation to fail and may cause security settings, such as the `root` password to not be applied correctly. (Bug#30525)

- `mysql` included extra spaces at the end of some result set lines. (Bug#29622)
- Several client programs failed to interpret `--skip-password` as “send no password.” (Bug#28479)
- The `mysql` client inconsistently handled NUL bytes in column data in various output formats. (Bug#28203)
- `mysqlimport` did not correctly quote and escape table identifiers and file names. (Bug#28071)
- Output from `mysql --html` did not encode the `<`, `>`, or `&` characters. (Bug#27884)
- If the `mysql` client was built with the `readline` library and the `.inputrc` file mapped `Space` to the `magic-space` function, it became impossible to enter spaces. (Bug#27439)
- `mysql_convert_table_format` did not prevent conversion of tables to `MEMORY` or `BLACKHOLE` tables, which could result in data loss. (Bug#27149)
- Renaming a column that appeared in a foreign key definition did not update the foreign key definition with the new column name. (Bug#21704)
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. (Bug#18828)

  See also Bug#46672.

C.1.3. Changes in MySQL 5.4.1 (22 June 2009)

Release availability:

- This release does not differ from 5.4.0 except that binary distributions are available for all MySQL-supported platforms, including Windows binaries with scalability improvements enabled. We expect that the scalability improvements will also benefit users of 64-bit Mac OS X and FreeBSD as well as 64-bit Linux/Solaris/SPARC, and potentially also users of 32-bit versions of these platforms.

C.1.4. Changes in MySQL 5.4.0 (05 April 2009 Beta)

Release availability:

- MySQL 5.4 is based on MySQL 5.1 but includes small, high-impact changes to enhance scalability and performance in MySQL Server. For details, see Section 1.5, “What Is New in MySQL 5.4”.

  Binary MySQL 5.4.0 distributions are available as 64-bit builds for Solaris 10-x86_64, Solaris10-SPARC, and Linux x86_64-glibc23.

  If you use a source distribution, the `BUILD/build_mccge.sh` script can be used to configure and build MySQL 5.4.0. Run this script with the `--help` option to see the available options.

Functionality added or changed:

- **Incompatible Change**: The following `InnoDB` system variable changes were made:
  - `innodb_file_io_threads`: Removed (replaced by `innodb_read_io_threads` and `innodb_write_io_threads`).

    If you upgrade from MySQL 5.1 from MySQL 5.4 and previously explicitly set `innodb_file_io_threads` at server startup, you must change your configuration. `innodb_read_io_threads` and `innodb_write_io_threads` can be used instead.
  - `innodb_read_io_threads` and `innodb_write_io_threads`: Default changed from 1 to 8.

- `innodb_buffer_pool_size`: Default increased from 8 MB to 1GB. Minimum increased from 1MB to 64MB.
- `innodb_additional_mem_pool_size`: Default increased from 1MB to 8MB. Minimum increased from 512KB to 2MB.
- `innodb_max_dirty_pages_pct`: Default decreased from 90 to 75. Maximum decreased from 100 to 99 to never allow a completely dirty buffer pool.
- `innodb_log_buffer_size`: Default increased from 1MB to 16MB. Minimum increased from 256KB to 2MB.
- `innodb_log_file_size`: Default increased from 5MB to 128MB. Minimum increased from 1MB to 32MB.
- `innodb_log_files_in_group`: Default increased from 2 to 3.
- `innodb_io_capacity`: Default increased from 100 to 200.
- `innodb_autoextend_increment`: Default increased from 8MB to 64MB.

(Bug#42607, Bug#42608)

- **Incompatible Change**: If you upgrade to MySQL 5.4.0 from MySQL 5.1, the server may fail to start due to `InnoDB` log file configuration changes. MySQL 5.4.0 increases the default value of `innodb_log_files_in_group` from 2 to 3. It also increases the default value of `innodb_log_file_size` from 5MB to 128MB and the minimum value of `innodb_log_file_size` from 1MB to 32MB.

  For an upgrade, it is necessary to account for these changes. To do so, discard the old `InnoDB` log files and let MySQL 5.4.0 create new ones. It is necessary to shut down your current server cleanly so that no outstanding transaction information remains in the log. The procedure to use depends on the value of `innodb_fast_shutdown` used in your current server:

  - If `innodb_fast_shutdown` is not set to 2: Stop your current MySQL server and make sure that it shuts down without errors (to ensure that there is no information for outstanding transactions in the log). Copy the old log files into a safe place in case something went wrong during the shutdown and you need them to recover the tablespace. Delete the old log files and edit `my.cnf` if necessary to specify the desired log file configuration. Then upgrade to MySQL 5.4.0 and start the new server. `mysqld` sees that no `InnoDB` log files exist at startup and creates new ones.
  - If `innodb_fast_shutdown` is set to 2: Shut down your current server, set `innodb_fast_shutdown` to 1, and restart the server. The server should be allowed to recover. Then you should shut down the server again and follow the procedure described in the preceding item to change `InnoDB` log file size. Set `innodb_fast_shutdown` back to 2 and start the MySQL 5.4.0 server.

- The Instance Manager (`mysqlmanager`) has been discontinued and is no longer provided in MySQL releases.

Bugs fixed:

- **Performance**: The server unnecessarily acquired a query cache mutex even with the query cache disabled, resulting in a small performance decrement which could show up as threads often in state “invalidating query cache entries (table)”, particularly on a replication slave with row-based replication. Now if the server is started with `query_cache_type` set to 0, it does not acquire the query cache mutex. This has the implication that the query cache cannot be enabled at runtime. (Bug#38551)
- **Important Change**: When using the MySQL Instance Configuration Wizard with a configuration where you already have an existing installation with a custom `datadir`, the wizard could reset the data to the default data directory. When performing an upgrade installation in this situation, you must re-specify your custom settings, including the `datadir`, to ensure that your configuration file is not reset to the default values. (Bug#37534)
- **Important Change**: Uninstalling MySQL using the MySQL installer on Windows would delete the `my.ini` file. The file is no longer deleted. In addition, when a new installation is conducted, any existing cofiguration file will be renamed to `myDATE-TIME.ini.bak` during configuration. (Bug#36493)
- **Important Change**: When installing MySQL on Windows, it was possible to install multiple editions (Complete, and Essential, for example) of the same version of MySQL, leading to two separate entries in the installed packages which were impossible to isolate. This could lead to problems with installation and uninstallation. The MySQL installer on Windows no longers allow multiple installations of the same version of MySQL on a single machine. (Bug#4217)
- The MySQL Instance Configuration Wizard would fail to start correctly on Windows Vista. (Bug#42386)

- When running the MySQL Instance Configuration Wizard in command-line only mode, the service name would be ignored (effectively creating all instances with the default `MySQL` service name), irrespective of the name specified on the command line. However, the wizard would attempt to start the service with the specified name, and would fail. (Bug#38379)
- When using the MySQL MSI Installer on Windows and selecting BACK after a choosing Repair, you would be returned to the Fresh Install section of the installer. You are now correctly returned to the Install, Repair, Modify screen. (Bug#37294)

C.2. MySQL Enterprise Monitor Change History

This appendix lists the changes to the MySQL Enterprise Monitor, beginning with the most recent release. Each release section covers added or changed functionality, bug fixes, and known issues, if applicable. All bug fixes are referenced by bug number and include a link to the bug database. Bugs are listed in order of resolution. To find a bug quickly, search by bug number.

C.2.1. Changes in MySQL Enterprise Monitor 2.1.2 (26 May 2010)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.1.1.

Bugs fixed:

- **Security Fix**: A number of cross-site request forging issues have been identified and resolved. (Bug#52888, Bug#52910, Bug#52905, Bug#52897)
- MySQL Enterprise Service Manager would crash during initial startup on Solaris SPARC 64-bit. (Bug#53751)
- The MySQL Enterprise Monitor Agent could report data using an old timestamp, or report information for a server that the MySQL Enterprise Monitor Agent can no longer connect to due to a permissions change. (Bug#52839)
- The dialog box during installation of MySQL Enterprise Service Manager has been updated to make the process of installing MySQL Enterprise Service Manager when using an existing MySQL server. (Bug#52839)
- Scheduling a rule against an instance, and then deleting that instance, would retain the instance within MySQL Enterprise Dashboard, identified as `Unknown`. (Bug#51095)
- Deleting a server within MySQL Enterprise Dashboard could cause a `foreign key constraint` error. (Bug#50927)
- Deleting a server that had purged all its monitoring data, but still have query analyzer information, would fail. (Bug#50916)
- The SSL certificates supplied with MySQL Enterprise Service Manager have been updated.

  The certificate shipped with MySQL Enterprise Service Manager is an example certificate that expires after 1 year and that folks should create their own and back it up between MEM service manager updates. For more information on updating the certificate, see Section 15.12.4, “Creating a new SSL KeyStore”. (Bug#50694)
- Clicking on a link to a support issue within the dashboard is now configured to open the issue within a new window. (Bug#50651)
- Monitoring of a server that had `INFORMATION_SCHEMA`, and a large number of schemas and/or tables could upset the gathering of monitoring data. (Bug#47947)
- If you specify an invalid backend proxy address to MySQL Enterprise Monitor Agent, the agent would fail silently. (Bug#46927)
- Installation on certain platforms could fail during the generation of a UUID because of a lack of privileges. A separate UUID generation tool, `agent-generate-uuid` is now used to create the UUID. (Bug#46370)
- If a customer was using their own SSL certificate, they entered that information in the `server.xml` file. However, running the upgrade installer caused `server.xml`, and any custom certificates, to be replaced. (Bug#44525)
- Starting the agent could lead to an error regarding the `ssh-keygen` tool and a missing library (`libcrypto`). (Bug#43125)

C.2.2. Changes in MySQL Enterprise Monitor 2.1.1 (10th February 2010)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.1.0.

Functionality added or changed:

- The smallest purge log time interval that could be set in the Dashboard was one week. MySQL Enterprise Monitor was changed to allow setting the smallest purge log time interval to one day. (Bug#46822)
- Certain heat chart rules cannot be unscheduled or disabled, this is because they are required for correct operation of MySQL Enterprise Monitor. Should an attempt be made to unschedule or disable one of these heat chart rules, a suitable message is now displayed, explaining this requirement. (Bug#46535)
- If you are monitoring one instance of MySQL server `mysqld` and then upgrade that MySQL server, the correct version of the MySQL server is not displayed in the Dashboard. The agent will now perform a re-synchronization of the inventory if it identifies that the server has gone away and that the monitored MySQL has been upgraded. (Bug#38409)

Bugs fixed:

- The MySQL Enterprise Monitor Agent could fail to reconnect to a monitored MySQL instance if the agent was started while the MySQL instance was unavailable. (Bug#50797)
- When installing MySQL Enterprise Monitor Agent on a Linux operating system using the SELinux security environment, the installation would fail if the `allow_execstack` option had been enabled. (Bug#50515)
- It was possible to updated an existing email notification list with two email addresses in the destination without a required comma between the addresses. Addresses are now validated during the editing phase to ensure that this does not occur. (Bug#50161)
- The agent could not be installed on Mac OS X Snow Leopard (10.6) due to an incompatibility in the XML libraries used. (Bug#50126)
- Deleting users within MySQL Enterprise Service Manager could lead to errors in the repository database that would affect further operations involving the deleted user. (Bug#49896)
- When creating a new instance by copying an existing agent configuration, it is possible to create an orphaned agent. The recommended advice is to `TRUNCATE` the `mysql.inventory` table. However, doing this could lead to additional errors and an exception when the scheduled data updates on the now orphaned agent are executed. (Bug#49882)
- Monitoring a MySQL 4.0 server would fail because MySQL 4.0 did not support table-level character set support. (Bug#49082)
- The agent installer for Solaris on x64 would fail due to a library linker issue duing the post-installation phase of the installer. (Bug#48336)
- Support has been added for SNMPv2 traps in addition to the existing SNMPv1 traps. You can configure the version to use for SNMP traps, see ??? [1424].

  In addition, support has also been added to send SNMP notifications to two hosts in place of just one host. Notifications are sent to both hosts simultaneously. (Bug#47686, Bug#48955)
- Support issues can have a Severity from S1 through S4, but can also have a value of “NS” meaning “No Severity Set”. MySQL Enterprise Monitor was not able to parse this, which resulted in errors such as the following:

  ```
  2009-09-23 13:53:51,812 ERROR [em-worker-pool-thread-6:monitor.support.DevSpPoller] error
  consuming successful response
  java.lang.IllegalArgumentException: No enum const class
  com.mysql.etools.monitor.support.SpIssue$Severity.NS
          at java.lang.Enum.valueOf(Enum.java:196)
  ...
  ```

  (Bug#47562)
- The pagination of errors within MySQL Enterprise Dashboard for MySQL Enterprise Service Manager logging made it difficult to identify the true source of the error. (Bug#47464)
- An additional link has been added to the **Configure What's New** page to link to the relevant documentation. (Bug#47256)
- MySQL Enterprise Monitor would fail to install on Miracle Linux4. (Bug#47209)

- Some strings in the **WHAT'S NEW** tab of MySQL Enterprise Dashboard had not been translated from English to Japanese. (Bug#47203)
- The diagnostic report file has been updated so that the filename of the report includes the timestamp when the report was generated. (Bug#47164)
- When the **CONFIGURING AND TROUBLESHOOTING THIS FEED** link was clicked it opened the help screen in the current browser window, rather than in a new window.

  The link can be found on the **WHAT'S NEW** tab, at the bottom of the **IMPORTANT PRODUCT-RELATED ANNOUNCEMENTS** section, in the **WELCOME TO THE "WHAT'S NEW?" LIVE FEED!** sub-section. (Bug#47145)
- The links for further information on the **WHAT'S NEW** feed were invalid. (Bug#47133)
- When the Help link was clicked in the Dashboard, the following script error was generated:

  ```
  row:   32
  char:  5
  error: object expected
  code:  0
  URL:   http://xxx.yyy.com:38080/Help.action
  ```

  This only happened when using Internet Explorer. (Bug#47065)
- The times used for queries in Query Analyzer would not match the time set for the user's timezone and browser setting. (Bug#47040)
- The date format in the **CONFIGURE WHAT'S NEW** popup on the **WHAT'S NEW?** tab did not reflect the locale set in the **USER PREFERENCES** page. (Bug#46901)
- Two links in the Agent installer were incorrect.

  The link https://enterprise.mysql.com/docs/monitor/2.0/en/mem-install.html#mem-agent-rights should have pointed to https://enterprise.mysql.com/docs/monitor/2.1/en/mem-install.html#mem-agent-rights. Also, the link https://enterprise.mysql.com/docs/monitor/2.1/en/mem-query-analysis.html should have pointed to https://enterprise.mysql.com/docs/monitor/2.1/en/mem-query-analyzer.html. (Bug#46812)
- The `REPLACE` and `CALL` statments did not show a rows graph within the statement popup graph tab. (Bug#46796)
- When updating your scription after the subscription has expired, the ability to update your advisor bundle was not available. (Bug#46700)
- The task message for a given server within the agent would be logged at the incorrect level. Messages are now logged at the message level. (Bug#46681)
- Pressing cancel on a popup would cause a page reload, instead of just closing the popup window. (Bug#46604)
- The cry for help email included a stack trace, however it was displayed on a single line without any line breaks. (Bug#46458)
- If the **LAST** link was clicked on the Infrastructure logs page, the following error was generated:

  ```
  Error Message
  fromIndex(400) > toIndex(31)
  ```

  (Bug#46229)
- When using MySQL Enterprise Monitor Agent, if the current configured time went backwards (for example during time correction), then the MySQL Enterprise Monitor Agent would stop reporting data and induce a high load on the machine running MySQL Enterprise Monitor Agent (Bug#46052)
- The Windows installers for MySQL Enterprise Service Manager did not include 64-bit versions of the various binary tools. (Bug#45682)
- The agent could get into a state where it loop through the resynchronization of the core data, without reporting information to the service manager, causing gaps in the data. (Bug#45382)

- The IP address of the agent host on FreeBSD 7 systems would not be reported correctly. (Bug#45079)

C.2.3. Changes in MySQL Enterprise Monitor 2.1.0 (8th September 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.6.

Functionality added or changed:

- **Incompatible Change**: The default proxy port used to relay queries when using the Query Analyzer has been changed from port 4040 to 6446.
- The Agent did not write its version number to the log on startup or shutdown.

  The information is now available by setting log level "MESSAGE" in the Dashboard. It is also available when running the Agent from the command line with the command `mysql-monitor-agent --version`. The Agent also now logs its version number on startup if the log level is set to "CRITICAL". (Bug#45884)
- The Agent did not have a configurable response size.

  The response size was hard coded to 65K. However, with large inventories, the customer might need to use a larger response size.

  The Agent command line option `--agent-max-response-size` was added which will set the maximum size (in bytes) of the response the agent will send to the Service Manager. The default is 65536. (Bug#45571)
- If the Service Manager lost connection to the repository server, it would shut down after 50 attempts to reconnect or if it was unable to reconnect within 180 seconds. This behavior has now been made configurable through parameters in the `config.properties` file. The parameters are:

  - `mysql.max_connect_retries` - default is 50.
  - `mysql.max_connect_timeout_msec` - default is 180 seconds.

  (Bug#45471)
- There was no way to force the Agent to resynch with the Service Manager. A link has now been added. The link can be found on the **SETTINGS**, **MANAGE SERVERS** page - click the context menu next to a server, the menu now contains a **REFRESH** item. (Bug#45461)
- When the Agent debug log was examined, it was found to contain XML returned by the Service Manager that did not contain carriage returns. This made the data difficult to read by a human. The Service Manager has been changed to return formatted XML. (Bug#45460)
- The version of Enterprise Monitor was not logged on startup.

  Enterprise Monitor was changed to log the Monitor and Advisor version number on startup. See also Bug#45884. (Bug#45459)
- The ability to customize the text of the email sent for an event was added. The URL to the event can now be added to the email, so that the administrator does not have to search for the action that triggered the email. (Bug#44383)
- In large installations it can be desirable to locate the repository MySQL Server and the Tomcat server on difference computers to reduce load. However, the script `mysqlmonitorctl.sh` assumed these were running on the same server.

  The script was therefore changed to accommodate the above requirement.

  The `mysqlmonitorctl.sh` script now checks for a new configuration file called `mysqlmonitorctl.conf`. This configuration file is located in a new directory, `etc/defaults`, relative to the install directory. The configuration file contains 2 variables:

  - START_MYSQL=yes
  - START_TOMCAT=yes

  The script will then start/stop the MySQL Server and Tomcat accordingly. Defaults for both variables in the file are set to "yes". The update installers will not overwrite this file. (Bug#44379)

- When Replication was configured to use SSL for encrypting the transfer of the binary log, even though replication worked and the dashboard displayed the replication group correctly, the agent still logged the following message (repeatedly):

```
2009-04-06 16:12:00: (critical) job_collect_mysql.c:698: [mysql] (master-uuid)
mysql_real_connect(hostname:port replication:...) to the slave's master
failed: Access denied for user 'replication'@'hostname' (using password: YES) (1045)
```

  (Bug#44200)

- It was not possible to keep logs for a specific period of more than 52 weeks. The value for purging logs could be set in **SETTINGS**, **GLOBAL SETTINGS** to values ranging from “Never” to “52 Weeks” using the drop down list boxes.

  The interface has now been changed to additionally offer periods of 18 months and 24 months. (Bug#43793)

- Events used a GMT timestamp for the event time within email notifications, rather than the local time for the server generating the event.

  MySQL Enterprise Monitor has been changed so that it displays the time using the server's locale and GMT. (Bug#43739)

- MySQL Enterprise Monitor did not include a graph to show `max_used_connections` versus `max_connections`.

  This has now been included with the Silver level advisor bundle. (Bug#43583)

- A rule has been added named “Server Restarted” to signal a server restart. This has been added as a Heat Chart advisor to the Silver level advisor bundle. The rule has the following options:

```
Expression: (%Uptime% < THRESHOLD)

Critical Alert: 600
Warning Alert: 600
Info Alert: 600

Variable: %Uptime%

Data Item: mysql.status:Uptime

Instance: local

Default frequency: 5 minutes
```

  (Bug#43243)

- In the Enterprise Dashboard, it was possible to change the last remaining user with a manager role to having an agent role. This led to a problem whereby when attempting to subsequently login to the Dashboard, this caused redirection to the `setup.action` page which presents the Create Administrator facility. However, there was no CONTINUE button on this page, so it was not possible to create the administrative account.

  The Dashboard has now been changed so that the currently logged in user is not able to change their role. (Bug#42436)

- Certain alerts were misleadingly labelled as CRITICAL, and caused people to change settings unnecessarily, thereby adversely affecting their system performace and functionality.

  MySQL Enterprise Monitor was changed as follows:

  Heat Chart Advisor

  - MyISAM Key Cache Has Sub-Optimal Hit Rate. Critical threshold removed, Warning set to 75 and Info set to 85.
  - Query Cache Has Sub-Optimal Hit Rate. Critical threshold removed, Warning set to 40 and Info set to 50.
  - Temporary Tables To Disk Ratio Excessive. Critical threshold removed, others left unchanged.

  Memory Usage Advisor

  - InnoDB Buffer Cache Has Sub-Optimal Hit Rate. Critical threshold removed, others left unchanged.
  - Key Buffer Size May Not Be Optimal For Key Cache. Critical threshold removed, others left unchanged.
  - Key Buffer Size May Not Be Optimal For System RAM. Critical threshold removed, others left unchanged.

- Table Cache Not Optimal. Critical threshold removed, Warning set to 60 and Info set to 40.
- Thread Cache Size May Not Be Optimal. Critical threshold removed, Warning set to 75 and Info set to 85.

Performance Advisor

- Binary Log Usage Exceeding Disk Cache Memory Limits. Critical threshold removed, Warning set to 50 and Info set to 70.
- Excessive Disk Temporary Table Usage Detected. Critical threshold removed, others left unchanged.
- InnoDB Buffer Pool Writes May Be Performance Bottleneck. Critical threshold removed, Warning set to 99 and Info set to 99.5.
- InnoDB Log Waits May Be Performance Bottleneck. Critical threshold removed, Warning set to 1 and Info set to 0.5.

(Bug#42089)

- In the Enterprise Dashboard, the **MONITOR** page did not have detailed server meta information. For example, the hostname, datadir, socket and port information were not displayed.

  The interface has now been changed to include the following. Hostname, datadir, socket, and port information has been added to the server meta information on the monitor page. The port and datadir information has been added to the **SETTINGS**, **MANAGE SERVERS** page. Socket and datadir information has been added to the edit server popup. (Bug#40787)

- When running multiple instances of the Enterprise Dashboard it could be difficult to determine which instance is currently being logged into.

  This was fixed by adding a name for the server on the login page. The name defaults to the hostname but may be changed in the **SETTINGS** page. (Bug#40642)

- The agent should be able to run as a non-`root` user. However, the startup scripts always started it as `root`.

  The agent chassis now has a new option `--user` to drop privileges after being started as `root`. Note, this does not work when not started as superuser, nor on Windows.

  A new dialog box has also been added to the agent installer. The dialog has the following text: “The agent does not need to run with `root` user privileges. The agent will switch to the user account provided below when started by the `root` user.”

  The dialog also has a text field to allow the entry of the user account.

  A new parameter was also added to the `mysql-monitor-agent.ini` file. The parameter has the format `user=xxx`, where xxx is the user account to be used. (Bug#33778)

- The Advisor rule “InnoDB Redo Logs Not Sized Correctly” has been renamed to “InnoDB Transaction Logs Not Sized Correctly”. The rule's Problem Description and Advice text have also been updated accordingly. (Bug#33528)

- You can now configure an individual notification group to be used when sending critical email alerts. You can configure this by selecting the administration checkbox when configuring an individual notification group. For more information, see Section 15.5.5, “Manage Notification Groups”. (Bug#30974)

- The Event Log now tracks both the **CURRENT** and **WORST** states for individual events.

- To enable communication by MySQL Enterprise Service Manager with the MySQL Enterprise website, you can now configure an HTTP Proxy to be used when accessing the Internet. For more information, see Section 15.5.1, “Global Settings”.

- The MySQL Enterprise Dashboard now includes a What's New page that incorporates information automatically from the MySQL Enterprise and MySQL Support websites. For more information, see Section 15.6, “The What's New Page”.

Bugs fixed:

- The installer for MySQL Enterprise Monitor Agent on Linux 64-bit using glibc-2.3 would fail before the installation had completed properly. (Bug#50289)

- The alert for “Connection Usage Excessive” recommended raising `max_connections`. However, if the users raised

`max_connections` based only on the advice of the alert, they could potentially exhaust all RAM and SWAP.

This alert should have made the proviso that `max_connections` be increased only if sufficient free RAM is available to support the additional connections. The alert should also have recommended checking that all connections are correctly closed, and suggest lowering the `wait_timeout` or `interactive_timeout` settings. (Bug#46921)

- The “Slow Query Log Not Enabled” rule was missing a <value> tag in the <thresholdList> block. This caused a stack trace to be generated when the Service Manager started. (Bug#46899)

- Table lock contention rules had inconsistent thresholds.

  The rule `lock_contention_excessive` (part of the Basic subscription) contained the following expression:

  ```
  (%Uptime% > 10800) && (((%Table_locks_waited% /
  (%Table_locks_immediate% + %Table_locks_waited%)) * 100) > THRESHOLD)
  ```

  This used thresholds of 1/3/5 (for Info/Warning/Critical).

  However, in the rule `table_lock_contention_excessive` (part of the Platinum subscription), the same expression existed but with different thresholds:

  ```
  (%Uptime% > 10800) && (((%Table_locks_waited% /
  (%Table_locks_immediate% + %Table_locks_waited%)) * 100) > THRESHOLD)
  ```

  In this case the thresholds were 30/60/95. (Bug#46768)

- MySQL Enterprise Monitor 2.1 advisors for Windows suggested using `innodb_flush_method=unbuffered`, which is an undocumented value. Only documented values should have been recommended. (Bug#46709)

- When deleting a server within MySQL Enterprise Dashboard where there was a lot of historical data and/or a large number of instances being monitored, the deletion process could take some time and affect the loading of all pages within MySQL Enterprise Dashboard The process should no longer affect the performance UI. (Bug#46632)

- The rule names and other content on the **RULES** page could be displayed without the necessary formatting and translation. (Bug#46608)

- You would get a Java `NullPointerException` message if you omitted to select a server before using **ADD SERVER TO GROUP** to add a new server to an existing group. (Bug#46593)

- Initial setup and registration of MySQL Enterprise Monitor could fail on Mac OS X when communicating with the MySQL Enterprise website. (Bug#46571)

- The MySQL Enterprise Service Manager would send one email from each agent when agents were no longer able to write information to the repository. You now get one email containing a list of the affected agents. (Bug#46460)

- The error message shown in the orange dialog when a Rule could not be scheduled showed the Rule's resource key instead of its name. For example:

  ```
  U0146 Unable to schedule rule "binary_logging_is_limited.name" due to
  "mysql.MasterStatus.Binlog_Ignore_DB" data not being collected from server
  "net-dev2:13306". It may be an unsupported collection for that server.
  ```

  (Bug#46442)

- The length of the MySQL Enterprise Monitor related cookie information caused the web browser to fail with errors such as the following (from Safari 4):

  ```
  Bad Request

  Your browser sent a request that this server could not understand.
  Size of a request header field exceeds server limit.

  Cookie: __utma=183337658.3685800196369993700.1241092024.1248080652.1248188601.199;
  __utmc=183337658; __utmz=183337658.1247859315.194.26.ut......
  ```

(Bug#46348)

- The values reported for the `os.mem.swap_page_out` and `os.mem.swap_page_in` could be identified incorrectly as delta, instead of absolute, values. (Bug#46326)
- When upgrading an agent that uses SSL to connect to MySQL Enterprise Service Manager using a non-standard SSL port (i.e. not 18443), the upgrade would change the SSL port back to the default value. (Bug#46253)
- When upgrading MySQL Enterprise Service Manager any custom properties set within `config.properties` would be lost. Changes are now retained during an upgrade. (Bug#46252)
- When installing MySQL Enterprise Service Manager the disk space requirements could be calcualted incorrectly, which would cause the remainder of the installation to fail. (Bug#46251)
- Installation of MySQL Enterprise Monitor Agent on Solaris 8 or Solaris 9 using the SPARC platform could fail if the latest patches of the SUNW UTF-8 and iconv libraries were not available. This prevented the installer from operating correctly, although the agent would work correctly. The installer for the agent has now been updated to avoid this issue. (Bug#46235)
- In the Enterprise Dashboard, the query summary information popup on the BrowseQueries page forced a page reload after any hide. This affected both the user pressing the hide button, as well as the links on the **EXAMPLE** and **EXPLAIN** tabs that caused the query summary information popup to be hidden, and the Query Analyzer config popup to be shown instead. (Bug#46230)
- The Agent had a memory leak. The memory consumption increased by 35MB every five minutes. (Bug#46222)
- The MySQL server embedded with MySQL Enterprise Service Manager has been updated to MySQL 5.1.37. (Bug#46214)
- After a Service Manager upgrade, if there were migration errors, the message “Upgrade Status: there were errors in migration (details)” was displayed on the **SETTINGS**, **MANAGE SERVERS** page. When the details link was clicked the yellow “An Error Occurred” popup was briefly displayed before disappearing, making it impossible to determine the details of the error. (Bug#46181)
- When installing a new Advisor JAR, the contents could overwrite localizations in your current installation. (Bug#46169)
- The threshold information in email alerts listed the thresholds in a seemingly random order, for example:

```
Thresholds
Warning : 1024
Info : 512
Critical : 10240

Thresholds
Info : 70
Critical : 5
Warning : 40

Thresholds
Critical : 75
Warning : 85
Info : 95
```

(Bug#46143)

- In the Enterprise Dashboard, the check boxes within the **CONFIGURE WHAT'S NEW** panel did not function correctly. When deselecting a check box the accompanying text did not become de-emphasized (“grayed out”) as expected, but only changed when another check box was selected. Further, when the checkbox was subsequently selected, the text did not become emphasized until another check box was selected or deselected. This problem was limited to Internet Explorer 8. (Bug#46104)
- In the Enterprise Dashboard, selecting all three checkboxes in the **CONFIGURE QUERY ANALYZER** panel generated an error:

```
The interval “00:00:00,500” could not be parsed. Intervals must be in hh:mm:ss.msec
format.
```

The error was due to the default value of **AUTO-EXPLAIN THRESHOLD** containing a “,” rather than a “.” character. (Bug#46102)

- The MySQL Enterprise Monitor Agent could return a null value for a valid result set, resulting in incorrect results when using Query Analyzer. (Bug#46095)
- The Rule “Non-Authorized User Has Server Admin Privileges” in the “Security” Advisor checked for the following:

```
Create_user_priv = 'Y'
File_priv = 'Y'
Lock_tables_priv = 'Y'
Reload_priv = 'Y'
Shutdown_priv = 'Y'
Super_priv = 'Y
```

However, it did not include a check for the condition:

```
Process_priv = 'Y'
```

(Bug#46071)

- The Query Analyzer Statement Popup history graphs were inconsistent with the other graphs. In particular:
  - The series colors were not consistent with other graphs.
  - The graph image was right aligned, but the title was left aligned. When the popup was expanded, unnecessary space was located on the left.
  - The Y axis did not have a Range Label.

  (Bug#46066)
- In the Enterprise Dashboard, if a Notification Group was created, and also set to be the “MEM Admin” for cry for help emails, the MEM Admin column showed as "false" in the table overview when the group was saved. However, if the group was then edited and the flag added again, the MEM Admin status was saved. (Bug#46038)
- Links in emails generated from the Query Analyzer were not linking to the Query Analyzer tab correctly. (Bug#46036)
- When a query was clicked on the Query Analyzer page, the Explain Query tab displayed a potentially incorrect value for the Auto-Explain Threshold. The Threshold can actually be set to a user configurable value in Configure Query Analyzer, but the popup text did not reflect the currently set value, instead displaying a hard-coded default value. (Bug#46035)
- The Rule “Server Includes A Root User Account” in the “Security” Advisor had a Recommended Action:

  ```
  UPDATE user SET user = 'new_name' WHERE user = 'root'; FLUSH PRIVILEGES;
  ```

  However, three other rules triggered in the case where “user” was not “root” but had administrative grants. This caused the following alerts to be generated:
  - Non-Authorized User Has DB, Table, Or Index Privileges On All Databases
  - Non-Authorized User Has GRANT Privileges On All Databases
  - Non-Authorized User Has Server Admin Privileges

  (Bug#46023)
- In the Enterprise Dashboard, on the **SETTINGS**, **MANAGE SERVERS** page, the menu item **CONFIGURE QUERY ANALYZER** generated an unhandled error message if clicked when using the Silver level subscription. Query Analyzer is not available at this subscription level, and the menu option to configure the analyzer should not be shown on this page. (Bug#46016)
- If the Agent and monitored server had time settings that were out of sync the Enterprise Dashboard reported the server as “down”. (Bug#45937)
- On the **WHAT'S NEW?** page of the Enterprise Dashboard, multiple messages were generated for the same error. This cluttered the user interface. (Bug#45927)
- In the Enterprise Dashboard, when using the Safari web browser, the graph selection displayed on the **QUERY ANALYZER** tab was sometimes drawn outside the plot area. (Bug#45926)
- The Enterprise Monitor log was flooded with ERROR/WARN messages when the Service Manager was retrying for a `mysqld` connection:

  ```
  2009-07-02 16:52:23,440  WARN [http-18080-4:com.mysql.sql] java.lang.Exception: MySQL
  ```

```
server not running or accepting connections, retrying  30 times or 46 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:24,455  WARN [Purger:com.mysql.sql] java.lang.Exception: MySQL server not
running or accepting connections, retrying  46 times or 151 seconds, whichever expires
first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:25,471  WARN [http-18080-5:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying  28 times or 34 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:26,377  WARN [http-18080-9:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying  33 times or 64 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
```

(Bug#45924)

- In the Enterprise Dashboard the icon file for `event.status.closed` was missing. The problem manifested differently in different browsers. In Internet Explorer 8 the UI cell was empty and no text was displayed. In Firefox 3 the text “event.status.closed” was displayed in the cell. (Bug#45872)

- If the system time zone was different from that set in the Enterprise Dashboard, then there was inconsistency in the way times were displayed on the Query Analyzer page. Some times were displayed in the time zone of the system and some were displayed using the Dashboard time zone setting. (Bug#45858)

- In Enterprise Dashboard, when a range on the graph in the **GRAPHS** tab was selected, the following error message was displayed:

```
Error Message

(Bug#45836)

- If both the **VIEW README** and **LAUNCH MONITOR IN BROWSER** check boxes were selected on the last screen of the Monitor installer, the Dashboard was not brought up in a browser until after the window displaying the “readme” information was closed. (Bug#45795)

- The Agent did not report all the rows from an explain plan where the plan had more than one row. The Dashboard would display in-

formation for the first row, but subsequent rows would display NULL. (Bug#45791)

- Custom collections did not override standard collections.

  If a custom collection file was defined, and collections specified which were the same as the defaults but with some extensions, the custom collection did not appear to be processed and so did not override the default collection. (Bug#45755)

- When the Service Manager was restarted, or if the Service Manager was turned off for a brief period, and then turned back on, some graphs, such as Database Activity, showed an erroneous spike in traffic. (Bug#45688)

- Cry for help emails were not sent for events such as the monitored server running out of connections or disk space. In the past these had been sent for any error code < 1026. (Bug#45667)

- If custom collection files were created for the Agent, and references added to the `agent-item-files` variable within the `mysql-monitor-agent.ini` file, on upgrade the following problems occurred:

  1. The `agent-item-files` variable was overwritten, thereby removing the custom entry.

  2. The custom files were deleted, if they were contained in the `share/` directory.

  (Bug#45655)

- In the Enterprise Dashboard, when closing single or multiple Events the following exception was generated:

```
Could not execute JDBC batch update
org.hibernate.exception.SQLStateConverter.convert(SQLStateConverter.java:71)
```

  (Bug#45627)

- In the Enterprise Dashboard, the icon displayed for each server on the SETTINGS, MANAGE SERVERS page was incorrectly located. This resulted in fewer servers being displayed per page. (Bug#45564)

- In Enterprise Dashboard, when clicking on **CONFIGURE WHAT'S NEW** in the **WHAT'S NEW?** tab, an error occurred. This only happened when using Internet Explorer 8. (Bug#45478)

- After the initial server installation a user may select OpenSSL native integration with Tomcat. This will modify the `apache-tomcat/lib` directory. However, subsequently running an upgrade installer overwrote the `apache-tomcat/lib` directory which had been modified during the OpenSSL native integration. (Bug#45432)

- The query `SELECT * FROM 23lk4kj234;` was reported incorrectly in the Query Analyzer. (Bug#45431)

- When an event was closed a “SUCCESS” SNMP trap was sent, rather than a “CLOSED” SNMP trap. (Bug#45376)

- When MySQL Enterprise Monitor 1.3 was upgraded directly to 2.1, and having requested SSL in the upgrade dialog, SSL did not work in the upgraded Monitor. (Bug#45339)

- When an event was closed, the row in the event table where the event entry was located had its checkbox disabled, even though the event now in that row was open. This happened regardless of whether the CLOSE button, or the **CLOSE** link were used to close the event. (Bug#45250)

- The Notifications list in the Schedules or Edit Schedules popups listed the Notification Groups targets in the order in which they were created, not alphabetical order. (Bug#45169)

- A small memory leak occurred in the agent when a connection attempt to the dashboard failed. This represented a problem if the agent was unable to connect to the dashboard for a long period of time, as each failure to connect would leak some more memory. (Bug#45164)

- When disabling Query Analyzer while the two sub-options remain enabled for an individual agent, the analyzer, explain and other options would be logged by the agent as critical errors. Now, only the disabling of Query Analyzer is logged as a critical error. The Example Query and Example Explain options are reported as info errors. (Bug#45041)

- The Agent attempted to obtain the Query Analyzer configuration before the Monitor server has created it. This resulted in the Agent generating the following critical error in the log:

```
2009-05-21 15:59:42: (critical) network-io.c:255: successfully reconnected to dashboard at
http://agent:merlin@127.0.0.1:18080/heartbeat
2009-05-21 15:59:47: (critical) agent_mysqld.c:641: successfully connected to database at
```

```

```

(Bug#45016)

- If a migration from 1.3 to 2.0 was initiated and a new server created during the migration, but then deleted before migration was finished, the new server delete operation failed with an Null Pointer Exception (NPE). (Bug#44991)

- If you have the environment variable `http_proxy` set within your environment, when connections from MySQL Enterprise Monitor Agent could be redirected to an external site, instead of sending them to the configured MySQL Enterprise Service Manager. You can disable this behavior by adding the contents of the `agent-mgmt-hostname` configuration option for MySQL Enterprise Monitor Agent to the `no_proxy` variable. (Bug#44893)

- The regular expression used to parse the adaptive hash index section of `SHOW INNODB STATUS` for the cell size/used and node size did not function correctly for versions of monitored server greater than 5.1.28. This was because the section of the expression dealing with “cells used” was removed as part of Bug#36941. (Bug#44853)

- The Rule “InnoDB Buffer Cache Hit Rate Not Optimal” in the “Memory Usage” Advisor did not contain an uptime check. This resulted in premature firing of an info event. (Bug#44770)

- Any `JAVA_OPTS` configuration changes made in the `catalina.sh` file, such as `-Xmx`, `-Xms`, were overwritten when the upgrade installer was run. These values were used for customizing larger installations. (Bug#44740)

- In the Advisor “Administration” the Rule “InnoDB Redo Logs Not Sized Correctly” did not fire correctly. The rule contained the expression:

  ```
  (%have_innodb% == "YES") && ((%innodb_log_file_size% * %innodb_log_files_in_group%) <
  LEAST(1073741824, (%innodb_buffer_pool_size% / 2)))
  ```

  This was incorrect and needed to be changed to:

  ```
  (%have_innodb% == "YES") && ((%innodb_log_file_size% * %innodb_log_files_in_group%) <=
  LEAST(1073741824, (%innodb_buffer_pool_size% / 2)))
  ```

  (Bug#44734)

- If the Service Manager was set up to use an HTTP proxy, all traffic attempted to go through the proxy, including the connection to the `mysqld` server running the repository. (Bug#44729)

- The recommendation for the rule `Table Cache Not Optimal` says:

  ```
  Recommended Action
  SET GLOBAL table_cache = (64 + 16);
  ```

  But an error was generated on executing that query:

  ```
  mysql> SET GLOBAL table_cache = (64 + 16);
  ERROR 1193 (HY000): Unknown system variable 'table_cache'

  mysql> select version();
  +------------+
  | version()  |
  +------------+
  | 5.1.31-log |
  +------------+
  ```

```
1 row in set (0.01 sec)
```

(Bug#44602)

- In Enterprise Dashboard, clicking on a query listed on the Query Analyzer page resulted in a delay of around 28 seconds before the popup was displayed. (Bug#44601)

- The frequency shown on the **ADVANCED** tab of an **EVENT** popup was the default frequency for a rule and not the frequency actually scheduled. (Bug#44591)

- Any changes made to the `config.properties` file, were overwritten by the upgrade installer. (Bug#44526)

- If a customer was using their own SSL certificate, they entered that information in the `server.xml` file. However, running the upgrade installer caused `server.xml`, and any custom certificates, to be replaced. (Bug#44525)

- If you edited the `server.xml` file inside the `tomcat/conf/` folder, and changed the Tomcat port, running the upgrade installer did not show you the new port number, but the one you used at the installation time.

  It also did not remember that you had enabled SSL. (Bug#44444)

- Editing an Advisor and selecting the **USE SNMP TRAPS** checkbox led to confusing behavior. Advisors appeared to be incorrectly enabled or disabled. (Bug#44387)

- The Agent failed to correctly determine the state of the monitored server if the `thread-id`, extracted from the client-server protocol, is greater than 2^32. In the case with a `thread-id` greater than 2^32, the agent incorrectly determined that it was monitoring a remote server. High values of `thread-id` occur when the monitored server has many connections, or if it has been running for an extended period of time. (Bug#44168)

- The Mac OS X version of the Service Manager uses the system JRE. The system JRE loads the libraries located in `/Library/Java/Extensions`. As libraries in the extensions directory take precedence over other libraries, this caused conflicts when user extension libraries were installed there, as these would be used by the JRE when running Service Manager, instead of the shipped libraries. This happened when Java-related products were installed such as Connector/J, Spring, and Hibernate.

  This fix stops user-installed extension libraries from being used when the JRE runs the Service Manager, thus giving a “pristine” environment with no library collisions. (Bug#44157)

- The **WHAT'S NEW** tab can no longer be hidden, as it now provides important information and updates about MySQL and MySQL Enterprise Monitor. (Bug#44107)

- In the Enterprise Dashboard, when the frequency for a rule was changed in ADVISORS, MANAGE RULES, EDIT, incorrect thresholds were saved, leading to erroneous alerts. (Bug#44102)

- MySQL Enterprise Monitor installation sometimes failed, generating the following error:

```
Installing

Innitializing User accounts. (4/6)

Error running /opt/mysql/enterprise/monitor/mysql/bin/mysql
--defaults-file=/opt/mysql/enterprise/monitor/mysql/my.cnf -S
/opt/mysql/enterprise/monitor/mysql/tmp/mysql.sock -u root -D mysql -e "update user set
Password = PASSWORD('service_manager') where User = 'root'; update user set User =
'service_manager' where User = 'root';delete from user where User = '';flush privileges;"
: ERROR 2002 (HY000): Can't connect to local MySQL server through socket
'/opt/mysql/enterprise/monitor/mysql/tmp/mysql.sock' (2)
```

  After displaying this error, the MySQL Enterprise Monitor installer reported that it had “completed”, but the message displayed contained an error message string:

```
Report2.SetInstallerVariable.errorsOnSQLStatementsText
```

  (Bug#44038)

- In the Enterprise Dashboard, in the **QUERY ANALYZER** tab, the monitored parameter was not handled correctly during collapse and expansion of the graph. For example, if the graph was monitoring CPU Utilization, and then collapsed and the parameter changed to Database Activity, the monitored parameter reverted to CPU Utilization when the graph was expanded again. (Bug#44029)

- The upgrade installer overwrote any custom settings stored in `WEB-INF/config.properties`. For example it set the database host back to `localhost`. (Bug#44003)

- Accessing the Query Analyzer tab caused a full table scan to take place on the MySQL Enterprise Monitor database. (Bug#43989)

- Some SNMP managers could not detect “Application Error” SNMP notifications.

  This happened because some SNMP managers do not follow the protocol correctly. Some use the `DisplayString` length of 255 as the maximum `OctetString`, but this is in fact unlimited in SMIv1 and 64k in SMIv2.

  To work around this issue it is possible to override the correct behavior to allow non-comformant SNMP Managers to detect all messages. This is achieved by overriding the `OctetString` maximum size by setting a MySQL Enterprise Monitor server property. This is done by entering SQL such as the following:

  ```
  INSERT INTO map_entries VALUES (1,'2048','snmp.octetstring');
  ```

  In this example the value 2048 will be the maximum SNMP `OctetString` size that would sent in any SNMP traps. After setting this property the server will need to be restarted. Note that the value used may need adjusting depending on the behavior of the SNMP manager. (Bug#43970)

- When updating an Agent from 2.0 to 2.1 the `mysql-monitor-agent.ini` was incorrectly updated.

  This happened if the Agent was configured to use SSL to connect to the Enterprise Dashboard, on a port other than 18443. The update installer caused any value specified for the port to be changed to 18443. This did not happen if the Agent was not using SSL. (Bug#43900)

- The Enterprise Dashboard was running abnormally slowly. Clicking on a tab in the Dashboard, or selecting a server from the server tree resulted in a delay of approximately one minute before the results were displayed. (Bug#43866)

- The Agent failed on Linux 32-bit systems with the following error:

  ```
  2009-03-24 16:01:09: (debug) chassis.c:1091: current RLIMIT_NOFILE = 4398046512128 (hard:
  577792033385921489)
  2009-03-24 16:01:09: (debug) chassis.c:1095: trying to set new RLIMIT_NOFILE =
  4398046519296 (hard: 577792033385921489)
  2009-03-24 16:01:09: (critical) chassis.c:1097: could not raise RLIMIT_NOFILE to 8192,
  Invalid argument (22). Current limit still 13811918798715880448.
  2009-03-24 16:01:09: (message) MySQL Monitor Agent 2.0.5.7153 started.
  ```

  This happened with the following environment:

  ```
  $ ./mysql-monitor-agent -V
   mysql-proxy 0.7.0
   glib2: 2.16.3
   libevent: 1.4.6-stable
   proxy: 0.7.0
   monitor: 0.7.0
   MySQL Monitor Agent(agent): 2.0.5.7153
   admin: 0.7.0

  $ cat /etc/redhat-release
   Red Hat Enterprise Linux ES release 3 (Taroon Update 5)

  $ uname -a
   Linux xxxx 2.4.21-32.0.1.ELsmp #1 SMP Tue May 17 17:52:23 EDT 2005 i686 i686 i386
  GNU/Linux
  ```

  The same error also occurred on CentOS 5.2 32-bit systems. (Bug#43821)

- The Replication Group was renamed back to its default name after a new topology was discovered. (Bug#43816)

- A new topology was not discovered after the previous replication group was renamed. (Bug#43815)

- On Unix systems, executing the command:

  ```
  ./mysqlmonitorctl.sh stop
  ```

  did not make sure that `mysqld` was shutdown before finishing.

  This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME:       /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

(Bug#43803)

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. (Bug#43773)
- The SNMP trap source IP was always set to 127.0.0.1. (Bug#43738)
- The advisor “Replication - Slave Has Login Accounts With Inappropriate Privileges” contained inappropriate advice information.

  The advice message generated was:

  ```
  Server: slave-01
  Time: 2009-03-17 12:00:04 GMT
  Advisor: Replication - Slave Has Login Accounts With Inappropriate Privileges

  Problem Description
  Altering and dropping tables on a slave can break replication. Unless the slave also hosts
  non-replicated tables, there is no need for accounts with these privileges.

  Advice
  Revoke the global ALTER and DROP privileges from the following accounts on server slave-01
  unless they are absolutely necessary:

  user_1@localhost,
  user_2@localhost

  Recommended Action
  REVOKE ALTER, DROP ON *.* FROM user_name@host_name;
  FLUSH PRIVILEGES;
  ```

  However, the problems with this advice were:

  1. The server was configured `read_only` so it would not be possible to `DROP` or `ALTER` tables unless the user had `SUPER` privilege.
  2. MySQL grants were replicated from the master and therefore appeared on the slave. Also, `read_only` ensured the slave could not be changed.

  (Bug#43701)

- In Enterprise Dashboard, if on the **MONITOR** page the **CONFIGURE GRAPHS** link was clicked, no changes made, and then the SAVE button clicked, then the following error was generated:

  ```
  U0023 You must provide a non-zero interval
  ```

  (Bug#43682)

- The installer exited with a return code `0`, even if an error was detected and reported to the user during the installation.

  ```
  .../mysqlmonitor-2.1.0.1015-linux-x86-64bit-installer.bin --mode unattended --installdir
  /data0/merlin/monitoring/2.1.0.1015/host/38080 --tomcatport 38080 --tomcatshutdownport

  ```

(Bug#43676)

- The Connections graph did not include information from the Thread Cache graph. Connections and Thread Cache were available as separate graphs but it was difficult to compare them. (Bug#43584)

- If it was desired to look at MySQL Enterprise Monitor graphs for time spans of over 24 hours, you had to change from Interval to From/To mode, and specify a fixed From and To period. This was inconvenient compared to simply specifying a greater interval. (Bug#43564)

- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. (Bug#43551)

- When a trailing space, or tab character, was added at the end of a parameter in the `config.properties` file, MySQL Enterprise Monitor failed to start and generated the following errors in log:

```
ERROR [Thread-1:org.springframework.web.context.ContextLoader] Context initialization
failed
...
Caused by: java.sql.SQLException: Illegal connection port value '13306'
...
```

  Resolving the problem required detailed log analysis because the configuration file did not show any apparent problems. (Bug#43540)

- The MySQL Enterprise Monitor installer failed to install correctly due to insufficient disk space, even though the installer calculated there was suffcient disk space for the installation. This was due to the installer having out of date information regarding disk space requirements. (Bug#43538)

- After removing enough servers to bring the host count back down to the number covered in the subscription, the Subscription Warnings reflected the new number. However, the warning message displayed:

```
You are currently monitoring 1 host, however your subscription covers only 1. Your
subscription needs to be updated to cover at least 0 additional hosts.
```

  Instead of displaying:

```
Your subscription is up-to-date
You have no warnings at this time.
```

  The former message resulted in confusion. (Bug#43163)

- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

  This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. (Bug#42997)

- In the Enterprise Dashboard it is only possible to delete monitored servers if they are stopped. Monitored servers can be deleted in **Settings**, **Manage Servers**. However, if after stopping the Agent, the Dashboard was not refreshed and the agent was started again, an error was generated saying that the agent was running and could therefore not be deleted. Although correct, this was confusing as the Dashboard showed the Agent as stopped but the delete operation error message showed the Agent as running. (Bug#42983)

- Heat Chart rules could not be disabled or unscheduled. (Bug#42932)

- There were four columns added to the `SHOW SLAVE STATUS` query in MySQL Server 5.1: `Last_IO_Errno`, `Last_IO_Error`, `Last_SQL_Errno`, and `Last_SQL_Error`.

  However, these were not displayed within the Replication tab. (Bug#42811)

- Agent IP address was not included in SNMP traps. It was also not possible to set these Agent IP addresses through a configuration, which would have been useful for situations where the Agent could not determine the monitored server IP address, such as when virtual IP addresses were used. (Bug#42703)

- The Agent would not reconnect to a monitored database if it was started when the monitored server was down. The agent log contained the following error:

  ```
  Can't connect to MySQL server on '127.0.0.1' (0) (mysql-errno = 2003)
  ```

  The agent only sent OS data to the Dashboard. Further, when the monitored server was later started, no attempts to reconnect were logged.

  The problem could be worked around by restarting the agent when the monitored server was running again. (Bug#42581)

- The installer used to upgrade from version 1.3 corrupted passwords containing the "?" character. (Bug#42452)

- Sun multi-core processors caused all cores to be reported on the meta information page.

  The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. (Bug#42355)

- The username field for new users was populated by the last username used.

  When creating a new user for the second time in Dashboard, the previously created username appeared in the dialog. (Bug#42314)

- The Agent shut down if the wrong username/password was given in the Service Manager. This happened on a fresh installation, when running the Service Manager through the Proxy. When COMPLETE was clicked to finish the installation the error "Cannot open conection" was displayed. The Agent log also contained the following errors:

  ```
  2009-01-20 15:54:16: (critical) <-- received HTTP-status: 401 (failed) for
  'http://agent:mysql@127.0.0.1:8080/Monitor2/heartbeat': password are wrong
  2009-01-20 15:54:16: (critical) shutting down normally

  2009-01-20 15:54:19: (critical) <-- received HTTP-status: 401 (failed) for
  'http://agent:mysql@127.0.0.1:8080/Monitor2/heartbeat': password are wrong
  2009-01-20 15:54:19: (critical) shutting down normally
  ```

  (Bug#42228)

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

  ```
  innodb_autoextend_increment = 50M
  ```

  This generated the error:

  ```
  16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
  adjusted to 1000
  ```

  This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

  The value in the configuration file should be:

  ```
  innodb_autoextend_increment = 50
  ```

  (Bug#42096)

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)

- Using a long interval for the long data collection purging (such as 6 weeks), and a short interval for the query analysis purging (such as 1 week) caused the Query Analyzer purge `EXPLAIN` for the `INSERT` ... `SELECT` into the `temp_dc_ng_*_now` table to perform a full scan on the `dc_ng_*_now.end_time` index. For example:

  ```
  explain SELECT instance_attribute_id, end_time, end_time  FROM dc_ng_long_now JOIN
  inventory_instance_attributes USING  (instance_attribute_id) JOIN inventory_instances
  USING (instance_id) WHERE  dc_ng_long_now.end_time <= 1230814870074 AND
  dc_ng_long_now.instance_attribute_id AND type_id in (8, 9, 7, 6) ORDER BY
  dc_ng_long_now.end_time ASC LIMIT 10000\G
  *************************** 1. row ***************************
             id: 1
    select_type: SIMPLE
  ```

```
        table: dc_ng_long_now
         type: range
possible_keys: PRIMARY,end_time
          key: end_time
      key_len: 8
          ref: NULL
         rows: 8205369
        Extra: Using where; Using index
*************************** 2. row ***************************
           id: 1
  select_type: SIMPLE
        table: inventory_instance_attributes
         type: eq_ref
possible_keys: PRIMARY,instance_id
          key: PRIMARY
      key_len: 4
          ref: mem.dc_ng_long_now.instance_attribute_id
         rows: 1
        Extra:
*************************** 3. row ***************************
           id: 1
  select_type: SIMPLE
        table: inventory_instances
         type: eq_ref
possible_keys: PRIMARY,FKD4320F5BBDD9C29B
          key: PRIMARY
      key_len: 4
          ref: mem.inventory_instance_attributes.instance_id
         rows: 1
        Extra: Using where
3 rows in set (0.55 sec)
```

(Bug#42061)

- `OM_REFRESH` was not supported by MySQL Proxy, it caused an `abort()`.

```
shell>  ./mysql-proxy --proxy-backend-addresses=192.168.250.3:3306
network-mysqld-proxy.c.3524: COM_(0x07) is not handled

```

(Bug#41991)

- The MySQL Enterprise Monitor file `my.cnf` specified an initial size of 500M for the central tablespace. However, `innodb_file_per_table` was used as well, resulting in approximately 500M of space being potentially wasted. (Bug#41967)

- It was not possible to change any settings related to Query Analyzer unless at least one MySQL server was already being monitored. (Bug#41875)

- The advisor “User Has Rights To Database That Does Not Exist” generated erroneous alerts.

  If a database was created with an “_” character in the name, and then user privileges granted to this database using the escaped character sequence “_” to prevent wildcards, then the advisor generates an error stating there is no database for the privilege.

  For example, if the following is carried out on the monitored server:

  ```
  CREATE DATABASE test_foo;
  GRANT SELECT ON `test\_foo`.* to testuser@'localhost' identified by 'test';
  ```

  then the advisor warns that these users have rights to a database that does not exist:

  ```
  ''@'%' on DB test_%,
  'test'@'localhost' on DB test_foo,
  ```

```
'testuser'@'localhost' on DB test_foo
```

(Bug#41717)

- In the Enterprise Dashboard, when a new server group was clicked in the main tab an error message was generated. On checking the Monitor log there were many error messages related to lock timeouts and having to retry transactions. This problem occurred after enabling purging of the Repository. (Bug#41461)

- Running the Service Manager on Mac OS X and monitoring two servers with two agents for at least 16 hours caused the Java process to use 2.08 GB of memory. (Bug#41438)

- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

  ```
  U0002 You must log in to access the requested resource
  ```

  (Bug#41384)

- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. (Bug#41361)

- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. (Bug#41312)

- Data in the agent resource usage graphs (CPU, RAM) stopped after a full install of a new agent monitoring the same database was carried out. Usage history was available across agent versions for all graphs except the agent resource usage graphs. (Bug#41249)

- Graphs were incorrect for data that did not change. The graphs appeared as if no data had been gathered.

  The Hit Ratios graph had gaps in it where there had not been any activity on the parameters being monitored. For instance, if MyISAM tables were not used, then no Key Cache hit ratio series was plotted, even though the variables were still being collected. (Bug#41232)

- The generic Linux IA64 glibc2.3 Agent installer was missing from the build. (Bug#41224)

- When creating a new Database Administrator user in FireFox 2 the following error message was generated:

  ```
  U0002 You must log in to access the requested resource.
  ```

  This occurred in a new installation using the default administrator account. No Query Analysis permissions were given. However, the operation worked correctly using the Safari web browser. (Bug#41032)

- The Enterprise Dashboard displayed a blank entry for **DISK SPACE** in the Meta Info area. This happened on Open Solaris 2008.05. This problem only occurred when using the ZFS file system. (Bug#40907)

- The configuration for Query Analyzer that sets the default for all servers (using the **MAKE THIS THE DEFAULT FOR ALL NEW SERVERS** checkbox) could still applied even when the dialog box was canceled. (Bug#40828)

- The **MANAGE SERVERS** page did not refresh in a manner consistent with other pages. This meant that changes to configuration made by others would not be reflected on the page. Also, changes in the status of the servers were not displayed automatically. (Bug#40792)

- The agent installer for HP-UX 11.11 would fail to execute correctly. (Bug#40568, Bug#40566, Bug#37508)

- The graphs for Thread Cache, Connections and Temporary Tables contained incorrect Japanese translations on their Y axis. The Japanese displayed “total connection time (min)” when it should have displayed something else. For example, the Thread Cache graph should have displayed “total/min”. (Bug#40413)

- If the MySQL Enterprise Monitor Agent was unable to execute an `EXPLAIN` on a query, it would report an empty SQL query. The agent will now report the query hash value, which can be used to identify the original query by examining the repository. (Bug#40353)

- The agent installer for Solaris 8 x86 32-bit was missing. (Bug#40248)

- Even though Query Analysis was disabled through the user interface, the queries that go through the agent were still being collected.

When Query Analysis was turned back on in the user interface, those queries were then displayed. (Bug#40032)

- The Enterprise Dashboard did not display OS data if the Agent was changed from remote to local monitoring. (Bug#39954)
- The agent crashed if `ssh-keygen` was not present and if a wireless card was being used instead of an Ethernet card.

  This only affected Unix based systems, it did not affect Microsoft Windows. (Bug#39938)
- On Mac OS X when a server had more than 4GB RAM available the memory advisor was still triggered. This appeared to be due to an overflowing value. (Bug#39757)
- The Agent received a critical error but did not terminate as expected. The critical error generated was:

  ```
  2008-09-23 09:35:02: (critical) agent_mysqld.c:139: mysql_real_query() failed: Can't find
  file: './mysql/inventory.frm' (errno: 13) (errno=1017)
  ```

  (Bug#39603)
- Alerts sent from MySQL Enterprise Monitor used the GMT timezone, for example:

  ```
  Time: 2008-09-17 19:41:08 GMT
  ```

  That was not convenient for users, as their timezones may not have been GMT. (Bug#39504)
- The Agent running on AIX 5.3 did not report CPU data or RAM size, causing the Enterprise Dashboard to crash with a Null Pointer Exception. (Bug#38001)
- The MySQL Enterprise Monitor upgrade installer replaced the `my.cnf` file. This resulted in the loss of any changes that had been made to the configuration file. (Bug#36528)
- In the Enterprise Dashboard, on the **GRAPHS** page, the interface for selecting time intervals was not convenient, and it required multiple clicks to select the desired interval.

  This was fixed by adding a selection of pre-determined time intervals. (Bug#34556)
- Auto-generated replication group names were not translated into Japanese. (Bug#32155)
- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. (Bug#32069)
- The Enterprise Dashboard could communicate with https://enterprise.mysql.com using the customer username and password to download the license key and advisor bundle. However, it could not make use of a proxy to do so. This was a problem as many corporate firewalls required the use of a proxy for all HTTP and HTTPS traffic.

  The work around of having to manually download license keys and advisor bundles by hand was inconvenient. (Bug#31507)
- The agent log does not include a specific note of when the monitoring by the agent was started. An entry `AgentMonitoringService started` is now added to the log. (Bug#30609)
- When the Agent was started as a service on Windows for the first time, the name in the Task Manager window was `MYSQL~1.EXE`. This occurred whether the Agent was started from within the installer or from the Start Menu.

  If the service was restarted, the Agent's name changed to the correct value, `mysql-service-agent.exe`. (Bug#30166)
- When configuring a graph, setting a to date to a value prior to the from date, or the from date to a value after the to date will not automatically switch the dates when UPDATE is pressed. (Bug#28473)
- In the Enterprise Dashboard, the user interface allowed you to close an already closed event. This happened if multiple instances of the **EVENTS** tab were created. It was possible to close an event with resolution notes in one instance, and then close the same event again with a different set of resolution notes in the other instance. However, on review, the resolution notes and event closure time stamp recorded, were those of the first closure. (Bug#24107)
- When upgrading a monitored server, the information and configuration of the server would not be updated, leading to rules not being executed or applied correctly. Server's are now re-inventoried according to the specified schedule. For more information, see Remote Server Inventory Schedule. (Bug#24068)

- The Dynamic Link Library (DLL) `libxml2.dll` did not contain version resources. This meant version information was not available to be displayed when the file was examined in Windows Explorer. (Bug#23948)
- It was not possible to rename a notification group. (Bug#22962)
- Failures by MySQL Enterprise Service Manager to send warning emails are now reported both in the logs and in the MySQL Enterprise Dashboard within the **PRODUCT INFO** section of the **SETTINGS** page. For more information, see Section 15.5.7, "The Product Information Screen". (Bug#20478)

C.3. MySQL Connector/ODBC (MyODBC) Change History

C.3.1. Changes in MySQL Connector/ODBC 5.1.7 (Not yet released)

Functionality added or changed:

- MySQL Connector/ODBC has been changed to support the `CLIENT_INTERACTIVE` flag. (Bug#48603)

Bugs fixed:

- The `SQLColumns` function returned the incorrect transfer octet length and display size for `DECIMAL` type. (Bug#53235)
- MySQL Connector/ODBC manually added a `LIMIT` clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the `LIMIT` clause. (Bug#49726)
- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug#49029)
- Bulk upload operations did not work for queries that used parameters. (Bug#48310)
- Describing a view or table caused SQLPrepare to prefetch table data. For large tables this created an intolerable performance hit. (Bug#46411)
- If an application was invoked by the root user, `SQLDriverConnect()` was not able to use the username and password in the connection string to connect to the database. (Bug#45378)
- Calling `SQLColAttribute` on a date column did not set `SQL_DESC_DATETIME_INTERVAL_CODE`. `SQLColAttribute` returned `SQL_SUCCESS` but the integer passed in was not set to `SQL_CODE_DATE`. (Bug#44576)
- Conversions for many types were missing from the file `driver/info.c`. (Bug#43855)
- The `SQLTables()` function required approximately two to four minutes to return the list of 400 tables in a database. The `SHOW TABLE STATUS` query used by `SQLTables()` was extremely slow for InnoDB tables with a large number of rows because the query was calculating the approximate number of rows in each table. Further, the results could not be cached due to non-deterministic nature of the result set (the row count was re-calculated every time), impacting performance further. (Bug#43664)
- `SQLDescribeCol` returned incorrect column definitions for `SQLTables` result. (Bug#37621)
- When opening `ADO.Recordset` from Microsoft Access 2003, a run-time error occurred:

  ```
  ErrNo: -2147467259 ErrMessage: Data provider or other service returned an E_FAIL status.
  ```

  (Bug#36996)
- `SQLPrimaryKeysW` returned mangled strings for table name, column name and primary key name. (Bug#36441)
- On Windows, the SOCKET parameter to the DSN was used as the named pipe name to connect to. This was not exposed in the Windows setup GUI. (Bug#34477)
- MySQL Connector/ODBC returned a value of zero for a column with a non-zero value. This happened when the column had a datatype of `BIT`, and any numeric type was used in `SQLBindCol`. (Bug#32821)
- Option for handling bad dates was not available in the GUI. (Bug#30539)

C.3.2. Changes in MySQL Connector/ODBC 5.1.6 (09 November 2009)

Functionality added or changed:

- In the MySQL Data Source Configuration dialog, an excessive number of tabs were required to navigate to selection of a database. MySQL Connector/ODBC has been changed to make the tab order more practical, thereby allowing faster configuration of a Data Source. (Bug#42905)

Bugs fixed:

- An error randomly occurred on Windows 2003 Servers (German language Version) serving classic ASP scripts on IIS6 MDAC version 2.8 SP2 on Windows 2003 SP2. The application connected to MySQL Server 5.0.44-log with a charset of UTF-8 Unicode (utf8). The MySQL server was running on Gentoo Linux.

  The script error occurred sporadically on the following line of code:

  ```
  SET my_conn = Server.CreateObject("ADODB.Connection")
  my_conn.Open ConnString  <- ERROR
  ```

  The connection was either a DSN or the explicit connection string:

  ```
  Driver={MySQL ODBC 5.1 Driver};SERVER=abc.abc.abc.abc;DATABASE=dbname;UID=uidname;PWD=pwdname;PORT=3306;OPTION=67108864
  ```

  The error occurred on connections established using either a DNS or a connection string.

  When IISState and Debug Diagnostic Tool 1.0.0.152 was used to analyse the code, the following crash analysis was generated:

  ```
  MYODBC5!UTF16TOUTF32+6In 4640-1242788336.dmp the assembly instruction at
  myodbc5!utf16toutf32+6 in C:\Programme\MySQL\Connector ODBC 5.1\myodbc5.dll from MySQL AB
  has caused an access violation exception (0xC0000005) when trying to read from memory
  location 0x194dd000 on thread 33
  ```

  (Bug#44971)

- MySQL Connector/ODBC overwrote the query log. MySQL Connector/ODBC was changed to append the log, rather than overwrite it. (Bug#44965)

- MySQL Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. (Bug#42120)

- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. (Bug#41946)

- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. (Bug#41942)

- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. (Bug#41256)

- When a column of type `DECIMAL` containing `NULL` was accessed, MySQL Connector/ODBC returned a 0 rather than a `NULL`. (Bug#41081)

- In Access 97, when linking a table containing a `LONGTEXT` or `TEXT` field to a MySQL Connector/ODBC DSN, the fields were shown as `TEXT(255)` in the table structure. Data was therefore truncated to 255 characters. (Bug#40932)

- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

  ```
  SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
  ```

  (Bug#40316)

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the re-

cord set was updated with the `Update` method. (Bug#39961)

- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. (Bug#39957)
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

```
[MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
```

  The fix causes MyODBC to return an error message instead of crashing. (Bug#39831)
- Binding `SQL_C_BIT` to an `INTEGER` column did not work.

  The `sql_get_data()` function only worked correctly for `BOOLEAN` columns that corresponded to `SQL_C_BIT` buffers. (Bug#39644)
- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. (Bug#39561)
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug#39560)
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “SERVER= localhost” instead of “SERVER=localhost” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
```

  (Bug#39085)
- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. (Bug#38949)
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid nonnull string. (Bug#37649)
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug#37278)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug#36071)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug#30626)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

  (Bug#29955)
- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

  When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

  (Bug#26950)
- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`.

`#DELETE` appeared instead of the correct values. (Bug#17679)

C.3.3. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. (Bug#37342)
- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. (Bug#37254)
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. (Bug#36293)
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. (Bug#36275)
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. (Bug#36203)
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. (Bug#36069)

C.3.4. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. (Bug#35920)
- The driver installer could not create a new DSN if many other drivers were already installed. (Bug#35776)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. (Bug#33910)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)

C.3.5. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change**: You must uninstall previous 5.1.x editions of MySQL Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. (Bug#34672)
- Installation of MySQL Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. (Bug#34522)
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. (Bug#34429)
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. (Bug#34271)
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. (Bug#33918)
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the MySQL Connector/ODBC driver. (Bug#33825)
- MySQL Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. (Bug#33808)
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. (Bug#24535)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)

C.3.6. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- Explicit descriptors are implemented. (Bug#32064)
- A full implementation of SQLForeignKeys based on the information available from INFORMATION_SCHEMA in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.

- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which allows more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. (Bug#33897)
- Within the GUI interface, when connecting to a MySQL server on a nonstandard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. (Bug#33822)
- Specifying a nonexistent database name within the GUI dialog would result in an empty list, not an error. (Bug#33615)
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. (Bug#33388)
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. (Bug#33130)
- Retrieving data from a `BLOB` column would fail within `SQLGetData`when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. (Bug#32684)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. (Bug#28617)
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. (Bug#19923)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug#12805, Bug#30890)
- Dynamic cursors on statements with parameters were not supported. (Bug#11846)
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. (Bug#10128)
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. (Bug#6157)

C.3.7. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from Connector/ODBC 3.51.21 and 3.51.22.

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- **Incompatible Change**: Replaced myodbc3i (now myodbc-installer) with MySQL Connector/ODBC 5.0 version.
- **Incompatible Change**: Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change**: Disallow `SET NAMES` in initial statement and in executed statements.
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. (Bug#32685)
- Added MSI installer for Windows 64-bit. (Bug#31510)
- Implemented support for `SQLCancel()`. (Bug#15601)
- Added support for `SQL_NUMERIC_STRUCT`. (Bug#3028, Bug#24920)
- Removed nonthreadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of MySQL Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug#32596)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug#32161)
- ADO was unable to open record set using dynamic cursor. (Bug#32014)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug#31720)
- Memory usage would increase considerably. (Bug#31115)
- SQL statements are limited to 64KB. (Bug#30983, Bug#30984)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug#29765)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug#29239)

- ADO Not possible to update a client side cursor. (Bug#27961)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug#26985)
- MySQL Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug#16178)
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

C.3.8. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

C.3.9. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

> **Note**
>
> Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1.

Bugs fixed:

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. (Bug#27896)
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. (Bug#20127)

C.3.10. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. (Bug#25316)
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. (Bug#25263)
- Transaction support has been added and tested. (Bug#25045)
- Internal function, `my_setpos_delete_ignore()` could cause a crash. (Bug#22796)
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.
- Fixed the binding of certain integer types.

C.3.11. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. (Bug#24876)
- Added initial unicode support in data and metadata. (Bug#24837)
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. (Bug#24485)
- Added loose handling of retrieving some diagnostic data. (Bug#15782)
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. (Bug#24675)
- String query parameters are new escaped correctly. (Bug#19078)

C.3.12. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as SQL_NUMBERIC_STRUCT.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested via `SQLColAttribute`/`SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for SQLDriverConnect.
- ODBC v2 behavior in driver now supports ODBC v3 date/time types (since DriverManager maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed SQLGetData to clear the NULL indicator correctly during multiple calls.

C.3.13. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn’t available.
- Made distinction between `CHAR`/`BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Allow SQLDescribeCol to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed hanlding of numeric pointers in SQLColAttribute.

- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by SQLGetDiagRec.

C.3.14. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- SQLBindParameter now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

C.3.15. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations, and notes on this release

- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.
- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

C.3.16. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

C.3.17. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - `SQLBindParameter`
  - `SQLBindCol`

C.3.18. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

C.3.19. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - `SQLAllocHandle`
  - `SQLCloseCursor`
  - `SQLColAttribute`
  - `SQLColumns`
  - `SQLConnect`
  - `SQLCopyDesc`
  - `SQLDisconnect`
  - `SQLExecDirect`
  - `SQLExecute`
  - `SQLFetch`
  - `SQLFreeHandle`
  - `SQLFreeStmt`
  - `SQLGetConnectAttr`
  - `SQLGetData`

- SQLGetDescField
- SQLGetDescRec
- SQLGetDiagField
- SQLGetDiagRec
- SQLGetEnvAttr
- SQLGetFunctions
- SQLGetStmtAttr
- SQLGetTypeInfo
- SQLNumResultCols
- SQLPrepare
- SQLRowcount
- SQLTables

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- SQLSetConnectAttr
- SQLSetDescField
- SQLSetDescRec
- SQLSetEnvAttr
- SQLSetStmtAttr

C.3.20. Changes in MySQL Connector/ODBC 3.51.28 (Not yet released)

Bugs fixed:

- SQLColAttribute(...SQL_DESC_CASE_SENSITIVE...) returned SQL_FALSE for binary types and SQL_TRUE for the rest. It should have returned SQL_TRUE for binary types, and SQL_FALSE for the rest. (Bug#54212)
- SQLColAttribute for SQL_DESC_OCTET_LENGTH returned length including terminating null byte. It should not have included the null byte. (Bug#54206)
- If NO_BACKSLASH_ESCAPES mode was used on a server, escaping binary data led to server query parsing errors. (Bug#49029)
- Inserting a new record using SQLSetPos did not correspond to the database name specified in the SELECT statement when querying tables from databases other than the current one.

  SQLSetPos attempted to do the INSERT in the current database, but finished with a SQL_ERROR result and “Table does not exist” message from MySQL Server. (Bug#41946)
- No result record was returned for SQLGetTypeInfo for the TIMESTAMP data type. An application would receive the result return code 100 (SQL_NO_DATA_FOUND). (Bug#30626)
- Microsoft Access was not able to read BIGINT values properly from a table with just two columns of type BIGINT and VARCHAR. #DELETE appeared instead of the correct values. (Bug#17679)

C.3.21. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. (Bug#40407)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

  (Bug#29955)

C.3.22. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. (Bug#29402)

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. (Bug#30770)
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. (Bug#24131)

C.3.23. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug#12805, Bug#30890)

C.3.24. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement**: Accessing a parameer with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stropped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug#34575)
- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- When using ADO, the count of parameters in a query would always return zero. (Bug#33298)
- Using tables with a single quote or other nonstandard characters in the table or column names through ODBC would fail. (Bug#32989)
- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug#32864)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug#32420)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug#31959)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

  > **Note**
  >
  > ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

  (Bug#31495)
- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug#31220)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug#29871)
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug#27351)
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug#27158)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)
- With some connections to MySQL databases using MySQL Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug#16653)

C.3.25. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- MySQL Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. (Bug#32727)
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. (Bug#32587)
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. (Bug#32366)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. (Bug#3780)

C.3.26. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

  This regression was introduced by Bug#10491.

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. (Bug#32294)
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. (Bug#32253)
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. (Bug#32171)
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. (Bug#30958)
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. (Bug#13776)

C.3.27. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. (Bug#31246)
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. (Bug#31055)
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. (Bug#31009)
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). (Bug#30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug#30568)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug#30499)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1).

Bug#29871)

- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column allowed `NULL` values. This was dur to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug#26108)
- MySQL Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. MySQL Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug#3456)

C.3.28. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug#30840)
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. (Bug#30774)
- The wrong column size was returned for binary data. (Bug#30547)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug#30520)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug#14639)
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

C.3.29. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see Section C.3.30, “Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)”.

Functionality added or changed:

- Because of Bug#10491 in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

C.3.30. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change**: The `FLAG_DEBUG` option was removed.

- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the mysql database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. (Bug#28662)
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the MySQL Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would bge installed local to the user, not globally. (Bug#15326, Bug#10444)
- MySQL Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or **ALLOW MULTIPLE STATEMENTS** within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. (Bug#7445)
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. (Bug#6741)
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns . (Bug#9927) (Bug#30081)
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. (Bug#29964)
- Getting table metadata (through the `SQLColumns()` would fail, returning a bad table definition to calling applications. (Bug#29888)
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug#28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug#27862)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug#19345)
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug#14414)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug#14407)
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in SQLColumns() was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires

it.

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

C.3.31. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. (Bug#9498, Bug#6667)
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling SQLGetData() if value is null. Now returns SQL_ERROR w/state 22002.
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. (Bug#29709)
- MySQL Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. (Bug#28316)
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. (Bug#27315)
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug#26934)
- For a stored procedure that returns multiple result sets, MySQL Connector/ODBC returned only the first result set. (Bug#16817)
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug#16224)
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. (Bug#13766)

- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug#10563)
- When inserting a large `BLOB` field, MySQL Connector/ODBC would crash due to a memory allocation error. (Bug#10562)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug#9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained nonalphanumeric characters. (Bug#8860)
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

C.3.32. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- MySQL Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. (Bug#12918)

Bugs fixed:

- Calls to SQLNativeSql() could cause stack corruption due to an incorrect pointer cast. (Bug#28758)
- Using curors on results sets with multi-column keys could select the wrong value. (Bug#28255)
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. (Bug#27723)
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. (Bug#27544)
- SQLTables() did not distinguish tables from views. (Bug#23031)
- Data in `TEXT` columns would fail to be read correctly. (Bug#16917)
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. (Bug#16235)
- SQL_WVARCHAR and SQL_WLONGVARCHAR parameters were not properly quoted and escaped. (Bug#16235)
- Using `BETWEEN` with date values, the wrong results could be returned. (Bug#15773)
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. (Bug#4657)
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

C.3.33. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- MySQL Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. (Bug#27591)
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. (Bug#27589)
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. (Bug#27220)
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. (Bug#24306)
- Using `SQLProcedures` does not return the database name within the returned resultset. (Bug#23033)
- The `SQLTransact()` function did not support an empty connection handle. (Bug#21588)
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. (Bug#7912)
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. (Bug#5853)
- MySQL Connector/ODBC would return too many foreign key results when accessing tables with similar names. (Bug#4518)

C.3.34. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. (Bug#19823)
- Added auto is null option to MySQL Connector/ODBC option parameters. (Bug#10910)
- Added auto-reconnect option to MySQL Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. (Bug#26024)
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. (Bug#25846)
- MySQL Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. (Bug#22446)
- Using MySQL Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. (Bug#20547)
- Using `DataAdapter`, MySQL Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). (Bug#20459)
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. (Bug#20208)
- The ODBC driver name and version number were incorrectly reported by the driver. (Bug#19740)
- A string format exception would be raised when using iODBC, MySQL Connector/ODBC and the embedded MySQL server. (Bug#16535)
- The `SQLDriverConnect()` ODBC method did not work with recent MySQL Connector/ODBC releases. (Bug#12393)

C.3.35. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

C.3.36. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. (Bug#15635)
- File DSNs could not be saved. (Bug#12019)
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. (Bug#9539)

C.3.37. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. (Bug#8198)
- `SQLGetTypoInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. (Bug#8138)

C.4. MySQL Connector/NET Change History

C.4.1. Changes in MySQL Connector/NET Version 6.3.x

C.4.1.1. Changes in MySQL Connector/NET 6.3.3 (Not yet released beta)

First Beta release. Fixes bugs since 6.3.2.

Bugs fixed:

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

(Bug#53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug#53357)

- The MySQL Connector/NET installation failed due to `machine.config` files not being present in configuration folders.

  MySQL Connector/NET has been changed to skip over configuration folders that do not contain a `machine.config` file. (Bug#52352)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug#49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)

C.4.1.2. Changes in MySQL Connector/NET 6.3.2 (24th May 2010 beta)

First Beta release. Fixes bugs since 6.3.1.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- MySQL Connector/NET generated an exception when used to read a `TEXT` column containing more than 32767 bytes. (Bug#54040)

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)

- The procedure cache affected the MySQL Connector/NET performance, reducing it by around 65%. This was due to unnecessary

calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug#52475)

- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

(Bug#51610)

- MySQL Connector/NET 6.3.1 failed to install. (Bug#51407, Bug#51604)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)

C.4.1.3. Changes in MySQL Connector/NET 6.3.1 (2nd March 2010 alpha)

Fixes bugs since 6.3.0.

Functionality added or changed:

- Connector/NET was not compatible with Visual Studio wizards that used square brackets to delimit symbols.

  Connector/NET has been changed to include a new connection string option `Sql Server mode` that supports use of square brackets to delimit symbols. (Bug#35852)

Bugs fixed:

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

(Bug#51209)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database.

Bug#50123)

- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

C.4.1.4. Changes in MySQL Connector/NET 6.3.0 (16th February 2010 alpha)

First alpha release of 6.3.

Functionality added or changed:

- Nested transaction scopes were not supported. MySQL Connector/NET now implements nested transaction scopes. A per-thread stack of scopes is maintained, which is necessary in order to handle nested scopes with the `RequiresNew` or `Suppress` options. (Bug#45098)

- Support for MySQL Server 4.1 has been removed from MySQL Connector/NET starting with version 6.3.0. The connector will now throw an exception if you try to connect to a server of version less than 5.0.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)

C.4.2. Changes in MySQL Connector/NET Version 6.2.x

C.4.2.1. Changes in MySQL Connector/NET 6.2.4 (Not yet released GA)

This release fixes bugs since 6.2.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)

Bugs fixed:

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug#53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug#53357)

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)
- The procedure cache affected the MySQL Connector/NET performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug#52475)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)
- Periodically the session provider threw an `SqlNullValueException` exception. When this happened, the row within the `my_aspnet_Sessions` table had `locked` always set to '1'. The locked status never changed back to '0' and the user experienced the exception on every page, until their browser was closed and reopened (recreating a new sessionID), or the `locked` value was manually changed to '0'. (Bug#52175)
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug#49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)

C.4.2.2. Changes in MySQL Connector/NET 6.2.3 (10th April 2010 GA)

This release fixes bugs since 6.2.2.

Functionality added or changed:

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

(Bug#51610)

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

(Bug#51209)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

(Bug#50344)

- When using the Compact Framework the following exception occurred when attempting to connect to a MySQL Server:

```
System.InvalidOperationException was unhandled
  Message="Timeouts are not supported on this stream."
```

  (Bug#50321)

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)

- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)

- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)

- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug#49794)

- A `FormatException` was generated when an empty string was returned from a stored function. (Bug#49642)

- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug#45277)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

C.4.2.3. Changes in MySQL Connector/NET 6.2.2 (22nd December 2009 GA)

First GA release of 6.2. This release fixes bugs since 6.2.1.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)

- MySQL Connector/NET generated an invalid operation exception during a transaction rollback:

```
System.InvalidOperationException: Connection must be valid and open to rollback
transaction
   at MySql.Data.MySqlClient.MySqlTransaction.Rollback()
   at MySql.Data.MySqlClient.MySqlConnection.CloseFully()
   at
MySql.Data.MySqlClient.MySqlPromotableTransaction.System.Transactions.IPromotableSinglePhaseNotification.Rollback(Singl
singlePhaseEnlistment)
...
```

(Bug#35330)

- Connection objects were not garbage collected when not in use. (Bug#31996)

C.4.2.4. Changes in MySQL Connector/NET 6.2.1 (16th November 2009 beta)

This release fixes bugs since 6.2.0.

Functionality added or changed:

- The `MySqlParameter` class now has a property named `PossibleValues`. This property is NULL unless the parameter is created by `MySqlCommandBuilder.DeriveParameters`. Further, it will be NULL unless the parameter is of type enum or set - in this case it will be a list of strings that are the possible values for the column. This feature is designed as an aid to the developer. (Bug#48586)

- Prior to MySQL Connector/NET 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds.

  MySQL Connector/NET 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations.

  Further details on this can be found in the relevant Microsoft documentation.

- Starting with MySQL Connector/NET 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

  Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool.

- MySQL Connector/NET now supports the processing of certificates when connecting to an SSL-enabled MySQL Server. For further information see the connection string option SSL Mode in the section Section 20.2.6, “Connector/NET Connection String Options Reference” and the tutorial Section 20.2.4.7, “Tutorial: Using SSL with MySQL Connector/NET”.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

  ```
  MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
  ```

  MySQL Connector/NET was changed so that it was possible to do:

  ```
  MySqlCommand clone = comm.Clone();
  ```

  (Bug#48460)

- When used, the `Encrypt` connection string option caused a “Keyword not supported” exception to be generated.

This option is in fact obsolete, and the option SSL Mode should be used instead. Although the `Encrypt` option has been fixed so that it does not generate an exception, it will be removed completely in version 6.4. (Bug#48290)

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug#48271)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- MySQL Connector/NET session support did not work with MySQL Server versions prior to 5.0, as the Session Provider used a call to `TIMESTAMPDIFF`, which was not available on servers prior to 5.0. (Bug#47219)

C.4.2.5. Changes in MySQL Connector/NET 6.2.0 (21st October 2009 alpha)

The first alpha release of 6.2.

Bugs fixed:

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

(Bug#47928)

- The Session Provider created invalid “session expires” on a random basis.

This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug#47815)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

(Bug#47048)

C.4.3. Changes in MySQL Connector/NET Version 6.1.x

C.4.3.1. Changes in MySQL Connector/NET 6.1.5 (Not yet released GA)

This release fixes bugs since 6.1.4.

Bugs fixed:

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug#53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug#53357)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug#49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)

C.4.3.2. Changes in MySQL Connector/NET 6.1.4 (28th April 2010 GA)

This release fixes bugs since 6.1.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be

recognized. (Bug#52562)

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)
- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug#51610)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

  ```
  InvalidOperationException : The CommandText property has not been properly initialized.
  ```

  (Bug#50344)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug#49794)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug#49642)
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug#45277)
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

C.4.3.3. Changes in MySQL Connector/NET 6.1.3 (16th November 2009 GA)

This release fixes bugs since 6.1.2.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/NET was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

(Bug#48460)

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug#48271)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
```

```
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

(Bug#48101)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- For some character sets such as UTF-8, a `CHAR` column would sometimes be incorrectly interpreted as a `GUID` by MySQL Connector/NET.

  MySQL Connector/NET was changed so that a column would only be interpreted as a `GUID` if it had a character length of 36, as opposed to a byte length of 36. (Bug#47985)

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

  ```
  Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
  ```

  (Bug#47928)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug#47815)

- Attempting to build MySQL Connector/NET 6.1 `MySQL.Data` from source code on Windows failed with the following error:

  ```
  ...\clones\6.1\MySql.Data\Provider\Source\NativeDriver.cs(519,29): error CS0122:
  'MySql.Data.MySqlClient.MySqlPacket.MySqlPacket()' is inaccessible due to its protection level
  ```

  (Bug#47354)

- When tables were auto created for the Session State Provider they were set to use the MySQL Server's default collation, rather than the default collation set for the containing database. (Bug#47332)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

  ```
  /home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
  Unsupported or unrecognized project:
  '/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
  ```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

  ```
  /home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
  error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
  override but no suitable property found to override
  ```

  (Bug#47048)

C.4.3.4. Changes in MySQL Connector/NET 6.1.2 (8th September 2009 GA)

This is the first GA release of 6.1.

Bugs fixed:

- The MySQL Connector/NET Session State Provider truncated session data to 64KB, due to its column types being set to `BLOB`. (Bug#47339)
- MySQL Connector/NET generated the following exception when using the Session State provider:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'MINUTEWHERE SessionId =
'dtmgga55x35oi255nrfrxe45' AND ApplicationId = 1 AND Loc' at line 1
Description: An unhandled exception occurred during the execution of the current web
request. Please review the stack trace for more information about the error and where it
originated in the code.

Exception Details: MySql.Data.MySqlClient.MySqlException: You have an error in your SQL
syntax; check the manual that corresponds to your MySQL server version for the right
syntax to use near 'MINUTEWHERE SessionId = 'dtmgga55x35oi255nrfrxe45' AND ApplicationId =
1 AND Loc' at line 1
```

  (Bug#46939)
- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
        string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

  This was due to the fact that the encoding field had not been initialized correctly. (Bug#46844)
- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug#44985)
- MySQL Connector/NET did not time out correctly. The command timeout was set to 30 secs, but MySQL Connector/NET hung for several hours. (Bug#43761)

C.4.3.5. Changes in MySQL Connector/NET 6.1.1 (20 August 2009 beta)

This is the first Beta release of 6.1.

Bugs fixed:

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug#46620)
- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------

        The requested feature is not implemented.
        Description: HTTP 500. Error processing request.

        Stack Trace:

        System.NotImplementedException: The requested feature is not implemented.
        at MySql.Data.MySqlClient.MySqlConnection.EnlistTransaction
        (System.Transactions.Transaction transaction) [0x00000]
        at MySql.Data.MySqlClient.MySqlConnection.Open () [0x00000]
        at MySql.Web.Profile.MySQLProfileProvider.SetPropertyValues
        (System.Configuration.SettingsContext context,
        System.Configuration.SettingsPropertyValueCollection collection) [0x00000]
```

```
------------------------------------------------------------------------------
Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

(Bug#46375)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug#46311)
- MySQL Connector/NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug#46308)
- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug#46270)

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25
bytesC#
MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(System.Data.CommandBeha
vior behavior = SequentialAccess) Line 405 + 0xb bytesC#
MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteDbDataReader(System.Data.Comma
ndBehavior behavior = SequentialAccess) Line 884 + 0xb bytesC#
System.Data.dll!System.Data.Common.DbCommand.System.Data.IDbCommand.ExecuteReader(System
.Data.CommandBehavior behavior) + 0xb bytes
System.Data.dll!System.Data.Common.DbDataAdapter.FillInternal(System.Data.DataSet
dataset = {System.Data.DataSet}, System.Data.DataTable[] datatables = null, int
startRecord = 0, int maxRecords = 0, string srcTable = "Table", System.Data.IDbCommand
command = {MySql.Data.MySqlClient.MySqlCommand}, System.Data.CommandBehavior behavior) +
0x83 bytes
System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet, int
startRecord, int maxRecords, string srcTable, System.Data.IDbCommand command,
System.Data.CommandBehavior behavior) + 0x120 bytes
System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug#46205, Bug#46359, Bug#41953)
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
  SystemArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

(Bug#46100)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
        TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. (Bug#45723)

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```
        There is a problem with this Windows Installer package. A DLL required for this
        install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. (Bug#45474)

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

(Bug#45457)

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
        The value given is not an instance of type 'Edm.Int32'
```

(Bug#45077)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug#44455)
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug#43736)
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug#43678)
- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

```
        $ nant -buildfile:Client.build
```

  The following error occurred:

```
        BUILD FAILED

        Error loading buildfile.
        Encoding name 'Windows-1252' not supported.
        Parameter name: name
```

  (Bug#42411)

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. (Bug#42110)
- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug#40684)

- Calling a Stored Procedure with an output parameter through MySQL Connector/NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug#36027)

C.4.3.6. Changes in MySQL Connector/NET 6.1.0 (15 July 2009 alpha)

This is the first Alpha release of 6.1.

Functionality added or changed:

- Changed GUID type - The backend representation of a guid type has been changed to be CHAR(36). This is so you can use the server UUID() function to populate a GUID table. UUID generates a 36 character string. Developers of older applications can add `old guids=true` to the connection string and the old BINARY(16) type will be used instead.
- Support for native output parameters - This is supported when connected to a server that supports native output parameters. This includes servers as of 5.5.3 and 6.0.8.
- Session State Provider - This allows you to store the state of your website in a MySQL server.
- Website Configuration Dialog - This is a new wizard that is activated by clicking a button on the toolbar at the top of the Visual Studio Solution Explorer. It works in conjunction with the ASP.Net administration pages, making it easier to activate and set advanced options for the different MySQL web providers included.

C.4.4. Changes in MySQL Connector/NET Version 6.0.x

C.4.4.1. Changes in MySQL Connector/NET 6.0.7 (Not yet released)

Fixes bugs since 6.0.6.

Bugs fixed:

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug#53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug#53357)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug#49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)

C.4.4.2. Changes in MySQL Connector/NET 6.0.6 (28 April 2010)

Fixes bugs since 6.0.5.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)

- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)

- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)

- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

  (Bug#51610)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)

- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

  ```
  InvalidOperationException : The CommandText property has not been properly initialized.
  ```

  (Bug#50344)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug#49794)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug#49642)
- When adding a data set in Visual Studio 2008, the following error was generated:

  ```
  Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
  ```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

  ```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
  ```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug#45277)
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

C.4.4.3. Changes in MySQL Connector/NET 6.0.5 (12 November 2009)

This is a new release, fixing recently discovered bugs.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/NET was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

  (Bug#48460)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

  Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

  (Bug#48101)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

  (Bug#47048)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
        string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

  This was due to the fact that the encoding field had not been initialized correctly. (Bug#46844)

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug#46620)

- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

--------------------------------------------------------------------------------

(Bug#46375)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug#46311)
- MySQL Connector/NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug#46308)
- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug#46270)

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```

System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug#46205, Bug#46359, Bug#41953)

- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
       SystemArgumentException: DataGridViewComboBoxCell value is not valid.
     To replace this default dialog please handle the DataError Event.
```

  (Bug#46100)

- In MySQL Connector/NET 6.0.4 using `GetProcData` generated an error because the `parameters` data table was only created if MySQL Server was at least version 6.0.6, or if the `UseProcedureBodies` connection string option was set to true.

  Also the `DeriveParameters` command generated a null reference exception. This was because the `parameters` data table, which was null, was used in a `for each` loop. (Bug#45952)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
       TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

  This resulted in the data being unsorted. (Bug#45723)

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug#45699)

- Adding the `Allow Batch=False` option to the connection string caused MySQL Connector/NET to generate the error:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
     server version for the right syntax to use near 'SET character_set_results=NULL' at line 1
```

  (Bug#45502)

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```
       There is a problem with this Windows Installer package. A DLL required for this
       install to complete could not be run. Contact your support personnel or package vendor.
```

  When OK was clicked to acknowledge the error the installer exited. (Bug#45474)

- A MySQL Connector/NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug#45463)

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

  (Bug#45457)

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
       The value given is not an instance of type 'Edm.Int32'
```

  (Bug#45077)

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug#44985)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug#44455)

- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug#43736)

- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug#43678)

- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

  ```
  $ nant -buildfile:Client.build
  ```

  The following error occurred:

  ```
  BUILD FAILED

  Error loading buildfile.
  Encoding name 'Windows-1252' not supported.
  Parameter name: name
  ```

  (Bug#42411)

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

  ```
  Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
        has no constructors defined MysqlTest
        Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
        likely culprit is 'COMPILE'.
  ```

  (Bug#42261)

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. (Bug#42110)

- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug#40684)

- MySQL Connector/NET generated the following exception:

  ```
  System.NullReferenceException: Object reference not set to an instance of an object.
        bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
        bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
        bei System.Threading.ExecutionContext.runTryCode(Object userData)
        bei
        System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
        code, CleanupCode backoutCode, Object userData)
        bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
  ```

  (Bug#40005)

- Calling a Stored Procedure with an output parameter through MySQL Connector/NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug#36027)

- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

  ```
  Connection must be valid and open
  ```

(Bug#34657)

C.4.4.4. Changes in MySQL Connector/NET 6.0.4 (16 June 2009)

This is the first post-GA release, fixing recently discovered bugs.

Bugs fixed:

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection via TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

  ```
  Only one usage of each socket address (protocol/network address/port) is normally
        permitted IP ADDRESS/PORT.
  ```

  However, MySQL Connector/NET masked this socket exception and displayed an exception with the following text:

  ```
  Unable to connect to any of the specified MySQL hosts.
  ```

  (Bug#45021)

- A SQL query string containing an escaped backslash caused an exception to be generated:

  ```
  Index and length must refer to a location within the string.
        Parameter name: length
        at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
        fAlwaysCopy)
        at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
        at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
        MySqlParameterCollection parameters, MySqlPacket packet)
        at MySql.Data.MySqlClient.Statement.BindParameters()
        at MySql.Data.MySqlClient.PreparableStatement.Execute()
        at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior be□havior)
        at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
  ```

  (Bug#44960)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/NET from source. (Bug#44822)

- The Data Set editor generated an error when attempts were made to modify insert, update or delete commands:

  ```
  Error in WHERE clause near '@'.
        Unable to parse query text.
  ```

  (Bug#44512)

- The DataReader in MySQL Connector/NET 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. (Bug#44507)

- When creating a new DataSet the following error was generated:

  ```
  Failed to open a connection to database.
        Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
  ```

  (Bug#44460)

- The MySQL Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)

- MySQL Connector/NET was missing the capability to validate the server's certificate when using encryption. This made it possible to conduct a man-in-the-middle attack against the connection, which defeated the security provided by SSL. (Bug#38700)

C.4.4.5. Changes in MySQL Connector/NET 6.0.3 (28 April 2009)

First GA release.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

  The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

  ```
  INSERT INTO anytable SET Text='test--test';
  ```

  The tokenizer incorrectly interpreted the value as containing a comment.

  ```
  UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
        ID=4711;'
  ```

  A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

  ```
  Fatal error encountered during command execution.
        EXCEPTION: MySqlException - Parameter '?'' must be defined.
  ```

  (Bug#44318)

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

  When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when REFERENCES, ADD REFERENCE was selected. (Bug#44141)

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

  When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. (Bug#44123)

C.4.4.6. Changes in MySQL Connector/NET 6.0.2 (07 April 2009 beta)

This is a new development release, fixing recently discovered bugs.

Bugs fixed:

- MySQL Connector/NET 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

  The following error message was generated:

  ```
  .NET Framework Data Provider for MySQL: The data provider object factory service was not
        found.
  ```

  (Bug#44064)

C.4.4.7. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. (Bug#43574)
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. (Bug#43480)

C.4.4.8. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug#42801)

C.4.5. Changes in MySQL Connector/NET Version 5.3.x

C.4.5.1. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-chema="true"`. (Bug#39072)
- The MySQL Connector/NET installer program ended prematurely without reporting the specific error. (Bug#39019)
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException` . (Bug#38939)
- Possible overflow in `MySqlPacket.ReadLong()`. (Bug#36997)
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. (Bug#36836)

C.4.6. Changes in MySQL Connector/NET Version 5.2.x

C.4.6.1. Changes in MySQL Connector/NET 5.2.8 (Not yet released)

Bugs fixed:

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

  Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

  (Bug#48101)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug#46620)

- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)

- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------

        The requested feature is not implemented.
        Description: HTTP 500. Error processing request.

        Stack Trace:

        System.NotImplementedException: The requested feature is not implemented.

        Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

  (Bug#46375)

- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
        connection.GetSchema("Columns", ...);
```

  The exception generated was:

```
        'connection.GetSchema("Columns")' threw an exception of type
        'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
        base{"Input string was not in a correct format.Couldn't store <'Select'> in
        NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
        {System.ArgumentException}
```

  (Bug#46270)

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
        MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
        ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#

```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug#46205, Bug#46359, Bug#41953)
- If the application slept for longer than the specified `net_write_timeout`, and then resumed `Read` operations on a connection, then the application failed silently. (Bug#45978)
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug#43678)
- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

  ```
        $ nant -buildfile:Client.build
  ```

  The following error occurred:

  ```
        BUILD FAILED

        Error loading buildfile.
        Encoding name 'Windows-1252' not supported.
        Parameter name: name
  ```

  (Bug#42411)
- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. (Bug#42110)
- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

  ```
  Connection must be valid and open
  ```

  (Bug#34657)

C.4.6.2. Changes in MySQL Connector/NET 5.2.7 (15 July 2009)

Bugs fixed:

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug#45699)
- A MySQL Connector/NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

This was due to a bug in Mono. MySQL Connector/NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug#45463)

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection via TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

  ```
  Only one usage of each socket address (protocol/network address/port) is normally
        permitted IP ADDRESS/PORT.
  ```

  However, MySQL Connector/NET masked this socket exception and displayed an exception with the following text:

  ```
  Unable to connect to any of the specified MySQL hosts.
  ```

  (Bug#45021)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/NET from source. (Bug#44822)

- The MySQL Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

  ```
  Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
        has no constructors defined MysqlTest
        Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
        likely culprit is 'COMPILE'.
  ```

  (Bug#42261)

- MySQL Connector/NET generated the following exception:

  ```
  System.NullReferenceException: Object reference not set to an instance of an object.
        bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
        bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
        bei System.Threading.ExecutionContext.runTryCode(Object userData)
        bei
        System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
        code, CleanupCode backoutCode, Object userData)
        bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
  ```

  (Bug#40005)

- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

  ```
  The method or operation is not implemented
  ```

  (Bug#39409)

C.4.6.3. Changes in MySQL Connector/NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows in-

stead of found rows. (Bug#44194)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)

- `GetSchema("MetaDataCollections")` should have returned a table with a column named “NumberOfRestrictions” not “NumberOfRestriction”.

  This can be confirmed by referencing the Microsoft Documentation. (Bug#43990)

- Requests sent to the MySQL Connector/NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. (Bug#43553)

- When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. (Bug#43332)

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug#42801)

- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

  The generated query was, for example:

  ```
  SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
        FROM my_aspnet_Membership WHERE userId=13
  ```

  Note that `applicationId` is not used. (Bug#42574)

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named “lastUpdatdDate” ('e' is missing) instead of the correct “lastUpdatedDate”. (Bug#41654)

- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. (Bug#41452)

- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. (Bug#41408)

- If a `Stored Procedure` contained spaces in its parameter list, and was then called from MySQL Connector/NET, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

  The exception generated was:

  ```
          Parameter '0' not found in the collection.
  ```

  (Bug#41034)

- The `DATETIME` format contained an erroneous space. (Bug#41021)

- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

The exception generated was:

```
The profile default provider was not found.
```

Note that the exception stated: 'the profile **default provider**...', even though a different name was explicitly requested. (Bug#40871)

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

  However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. (Bug#40139)

C.4.6.4. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

  ```
  "Package Load Failure

  Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
  Version=5.2.4, Culture=neutral, PublicKeyTopen=null' has failed to load properly (GUID =
  {79A115C9-B133-4891-9E7B-242509DAD272}).  Please contact the package vendor for
  assistance.  Application restart is recommended, due to possible environment corruption.
  Would you like to disable loading the package in the future?  You may use
  'devenve/resetskippkgs' to re-enable package loading."
  ```

  (Bug#40726)

C.4.6.5. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. (Bug#40571)
- When working with stored procedures MySQL Connector/NET generated an exception `Unknown "table parameters" in information_schema`. (Bug#40382)
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. (Bug#40231)
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted "Pooling=True" to "pooling=True".

  If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug#40091)
- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained "??" instead of the correct national character symbols. (Bug#40076)
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)

- After the `ConnectionString` property was initialized via the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. (Bug#39728)
- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug#39330)
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug#39294)
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. (Bug#39275)
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

  Also, if **TableAdapter** was right-clicked and then Add, Query, Use Existing Stored Procedures selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug#39252)
- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. (Bug#39072)
- MySQL Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. (Bug#38895)

C.4.6.6. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `Connection-State.Closed` event. (Bug#38119)
- Changed how the procedure schema collection is retrieved. If the connection string contains "`use procedure bodies=true`" then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains "`use procedure bodies=false`", then the Information Schema collection is queried. (Bug#36694)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug#36694)
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug#36205)

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug#38721)
- MySQL Connector/NET uninstaller did not clean up all installed files. (Bug#38534)
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- The provider did not silently create the user if the user did not exist. (Bug#38243)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

```
        host=localhost;database=test;uid=*****;pwd=*****;
      connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
        host=localhost;database=test;uid=*****;pwd=*****;
        connect timeout=25;auto enlist=false;pooling=false;
        Allow User Variables=True;Allow User Variables=False;
      Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug#37469)
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug#37239)
- The `autogenerateschema` option produced tables with incorrect collations. (Bug#36444)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

C.4.6.7. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated '?' is the preferred parameter marker. (Bug#37349)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- Tables with `GEOMETRY` field types would return an unknown datatype exception. (Bug#36081)
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. (Bug#36000)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. (Bug#35336)
- An error would be raised when calling `GetPassword()` with a `NULL` value. (Bug#35332)
- When retreiving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. (Bug#35041)
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. (Bug#34941)
- When creating a new stored procedured, the new parameter code which allows the use of the `@` symbol would interfere with the specification of a `DEFINER`. (Bug#34940)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)
- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. (Bug#34001)

- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug#31338)
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

C.4.6.8. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. (Bug#34792)
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. (Bug#34699)
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to MySQL Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. (Bug#34674)
- A number issues were identified in the case, connection and scema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. (Bug#34495)
- When using web providers, the MySQL Connector/NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the memvership provider list. (Bug#34451)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug#34448)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug#34359)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug#34338)
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

C.4.6.9. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug#34052)
- Added support for `DbDataAdapter` `UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added ClearPool and ClearAllPools features.

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug#34220)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/NET does not handle multiple connections within the same transac-

tion scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug#34204)

- The status of connections reported through the state change handler was not being updated correctly. (Bug#34082)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug#34000)
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug#33909)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)

C.4.7. Changes in MySQL Connector/NET Version 5.1.x

C.4.7.1. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)

- The `DATETIME` format contained an erroneous space. (Bug#41021)
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted "Pooling=True" to "pooling=True".

  If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug#40091)

- MySQL Connector/NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
      bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
      bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
      bei System.Threading.ExecutionContext.runTryCode(Object userData)
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
```

```
      ContextCallback callback, Object state)
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

(Bug#40005)

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- Calling `MySqlDataAdapter.FillSchema` on a `SELECT` statement that referred to a table that did not exist left the connection in a bad state. After this call, all `SELECT` statements returned an empty result set. If the `SELECT` statement referred to a table that did exist then everything worked as expected. (Bug#30518)

C.4.7.2. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
        host=localhost;database=test;uid=*****;pwd=*****;
      connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
        host=localhost;database=test;uid=*****;pwd=*****;
        connect timeout=25;auto enlist=false;pooling=false;
        Allow User Variables=True;Allow User Variables=False;
      Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug#37955)

- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. (Bug#37406)
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. (Bug#37398)
- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not allow columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. (Bug#37350)
- `SemaphoreFullException` is generated when application is closed. (Bug#36688)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

C.4.7.3. Changes in MySQL Connector/NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrival = true` and `RequireQuestionAndAnswer = false`. (Bug#36159)
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. (Bug#36157)
- Tables with `GEOMETRY` field types would return an unknown datatype exception. (Bug#36081)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug#34448)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug#34359)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug#34338)
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug#31338)

C.4.7.4. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug#34052)

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug#34220)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug#34204)
- The status of connections reported through the state change handler was not being updated correctly. (Bug#34082)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug#34000)
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug#33909)
- MySQL Connector/NET would fail to compile properly with `nant`. (Bug#33508)

- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. (Bug#33347)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)

C.4.7.5. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDataTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- MySQL Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. (Bug#31703)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Trying to use a connection that was not open could return an ambiguous and misleading error message. (Bug#31262)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)` were not returned as boolean fields. (Bug#27959)
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. (Bug#27958)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

C.4.7.6. Changes in MySQL Connector/NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- The Saudi Hijri calendar was not supported. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug#29476)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug#29236)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug#29235)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug#29123)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug#29098)
- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug#28709)

C.4.7.7. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. (Bug#28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug#28648)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. (Bug#28536)
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug#28437)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug#28204)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug#26347)

C.4.7.8. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Installation of the MySQL Connector/NET on Windows would fail if VisualStudio had not already been installed. (Bug#28260)
- MySQL Connector/NET would look for the wrong table when executing `User.IsRole()`. (Bug#28251)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- `DATETIME` fields from versions of MySQL bgefore 4.1 would be incorrectly parsed, resulting in a exception. (Bug#23342)
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

C.4.7.9. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

C.4.8. Changes in MySQL Connector/NET Version 5.0.x

C.4.8.1. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

```
        host=localhost;database=test;uid=*****;pwd=*****;
      connect timeout=25; auto enlist=false;pooling=false;
```

  The connection string after closing `MySqlDataReader`:

```
        host=localhost;database=test;uid=*****;pwd=*****;
        connect timeout=25;auto enlist=false;pooling=false;
        Allow User Variables=True;Allow User Variables=False;
      Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)

C.4.8.2. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDataTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

C.4.8.3. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

> **Note**
>
> This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)

- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- Fixed bug where MySQL Connector/NET was hand building some date time patterns rather than using the patterns provided under CultureInfo. This caused problems with some calendars that do not support the same ranges as Gregorian.. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug#29123)
- Log messages would be truncated to 300 bytes. (Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. ExecuteReader had to be changed to check for this.

C.4.8.4. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug#26754)

- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug#26472)
- The `characterset` property would not be identified during a connection (also affected Visual Studion Plugin). (Bug#26147, Bug#27240)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug#25947)
- `DATETIME` fields from versions of MySQL bgefore 4.1 would be incorrectly parsed, resulting in a exception. (Bug#23342)

C.4.8.5. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `DESCRIBE ...` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug#27221)
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug#27187)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- Exception thrown when using large values in `UInt64` parameters. (Bug#27093)
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/NET 5.0.5. (Bug#26960)

C.4.8.6. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with DeriveParameters now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug#26660)
- MySQL Connector/NET would fail to install under Windows Vista. (Bug#26430)
- Opening a connection would be slow due to host name lookup. (Bug#26152)

- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug#25950)
- Registry would be incorrectly populated with installation locations. (Bug#25928)
- Times with negative values would be returned incorrectly. (Bug#25912)
- Returned data types of a `DataTypes` collection do not contain the right correctl CLR Datatype. (Bug#25907)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug#25906)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug#25569)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug#25458)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)
- MySQL Connector/NET would not compile properly when used with Mono 1.2. (Bug#24263)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

C.4.8.7. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

C.4.8.8. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented useg the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from storaed procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns` `GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.

- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The ShapZipLib library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message (Bug#25178)
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. (Bug#25033)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. (Bug#23687)
- Nested transactions (which are unsupported)do not raise an error or warning. (Bug#22400)

C.4.8.9. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the numbver of procedures that are cacheds by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. (Bug#23758)
- Column names with accented characters were not parsed properly causing malformed column names in result sets. (Bug#23657)
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. (Bug#23538)
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. (Bug#23268)
- During installation, an antivirus error message would be raised (indicating a malicious script problem). (Bug#23245)

- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/NET 5.0.2 must be installed. (Bug#23071)
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied`. (Bug#22882)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug#18186)
- MySQL Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. (Bug#16126)

C.4.8.10. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

Bugs fixed:

- MySQL Connector/NET on a Tukish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug#22042)
- The `MySqlexception` class is now derived from the `DbException` class. (Bug#21874)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521)
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. (Bug#18391)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

C.4.8.11. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implemention of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.

- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. (Bug#6214)

C.4.9. Changes in MySQL Connector/NET Version 1.0.x

C.4.9.1. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. (Bug#33682)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

C.4.9.2. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)

- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)

C.4.9.3. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the numbver of procedures that are cacheds by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug#25912)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- Additional text added to error message. (Bug#25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug#24565)

- Stored procedure executions are not thread safe. (Bug#23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug#23862)
- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. (Bug#23758)
- Nested transactions do not raise an error or warning. (Bug#22400)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

C.4.9.4. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- MySQL Connector/NET on a Tukish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- The # would not be accepted within column/table names, even though it was valid. (Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- The DiscoverParameters function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)
- When running a query that included a date comparison, a DateReader error would be raised. (Bug#19481)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. (Bug#18391)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- CHAR type added to MySqlDbType. (Bug#17749)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug#17736)
- The CommandBuilder ignored Unsigned flag at Parameter creation. (Bug#17375)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `datetime` field with a null value. (Bug#16884)
- Unsigned data types were not properly supported. (Bug#16788)

- The connection string parser did not allow single or double quotation marks in the password. (Bug#16659)
- The `MySqlDateTime` class did not contain constructors. (Bug#15112)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug#15077)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

C.4.9.5. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- Added support for the `cp932` character set. (Bug#13806)
- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug#13753)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug#13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug#13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug#13541)

C.4.9.6. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- MySQL Connector/NET 1.0.5 could not connect on Mono. (Bug#13345)
- Serializing a parameter failed if the first value passed in was `NULL`. (Bug#13276)
- Field names that contained the following characters caused errors: `()%<>/` (Bug#13036)
- The `nant` build sequence had problems. (Bug#12978)
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. (Bug#12835)

C.4.9.7. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- MySQL Connector/NET could not connect to MySQL 4.1.14. (Bug#12771)
- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last host in the list. (Bug#12628)
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug#12551, Bug#8724)
- The `cp1250` character set was not supported. (Bug#11621)
- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug#11542)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug#11490)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug#11450)
- MySQL Connector/NET interpreted the new decimal data type as a byte array. (Bug#11294)
- Added support to call a stored function from MySQL Connector/NET. (Bug#10644)
- Connection could fail when .NET thread pool had no available worker threads. (Bug#10637)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug#10281)
- Decimal parameters caused syntax errors. (Bug#10152, Bug#11550, Bug#10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug#9722)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug#8382)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug#7951)
- MySQL Connector/NET could not work properly with certain regional settings. (WL#8228)

C.4.9.8. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug#7755)
- Quote character \222 not quoted in `EscapeString`. (Bug#7724)
- GetBytes is working no more. (Bug#7704)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug#7612)
- Clone method bug in `MySqlCommand`. (Bug#7478)
- Problem with Multiple resultsets. (Bug#7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug#7345)
- `MySqlCommand.Connection` returns an IDbConnection. (Bug#7258)
- Calling prepare causing exception. (Bug#7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.

- Fixed problem that causes named pipes to not work with some blob functionality.

C.4.9.9. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters (Bug#7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug#7132)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug#7032)
- Exception stack trace lost when re-throwing exceptions. (Bug#6983)
- Errors in parsing stored procedure parameters. (Bug#6902)
- InvalidCast when using `DATE_ADD`-function. (Bug#6879)
- Int64 Support in `MySqlCommand` Parameters. (Bug#6863)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug#6831)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRange` exception. (Bug#6770)
- Integer "out" parameter from stored procedure returned as string. (Bug#6668)
- An Open Connection has been Closed by the Host System. (Bug#6634)
- Fixed Invalid character set index: 200. (Bug#6547)
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create START MENU items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

C.4.9.10. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed (Bug#6649)
- Fixed Charset-map for UCS-2 (Bug#6541)
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset (Bug#6429)
- Fixed double type handling in MySqlParameter(string parameterName, object value) (Bug#6428)
- Fixed Installation directory ignored using custom installation (Bug#6329)

- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ (Bug#6322)
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

C.4.9.11. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) (Bug#6230)
- Fixed GetBoolean returns wrong values (Bug#6227)
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters (Bug#6217)
- Fixed NET Connector source missing resx files (Bug#6216)
- Fixed System.OverflowException when using YEAR datatype (Bug#6036)
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found (Bug#6006)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) (Bug#5900)
- Fixed missing Reference in DbType setter (Bug#5897)
- Fixed Parsing the ';' char (Bug#5876)
- Fixed DBNull Values causing problems with retrieving/updating queries. (Bug#5798)
- IsNullable error (Bug#5796)
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value (Bug#5621)
- Fixed construtor initialize problems in MySqlCommand() (Bug#5613)
- Fixed Yet Another "object reference not set to an instance of an object" (Bug#5496)
- Fixed Can't display Chinese correctly (Bug#5288)
- Fixed MySqlDataReader and 'show tables from ...' behavior (Bug#5256)
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed Bug#5458 Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed Bug#5388 DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected

- Fixed Bug#5602 Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed Bug#5392 MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed Bug#5474 cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed Bug#5469 Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

C.4.9.12. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. (Bug#3889)
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

C.4.10. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.

- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.
- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug#5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug#5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug#4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug#4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new .Types types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver (Bug#4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug#4505)

- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. (Bug#4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. (Bug#4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting maxPacketSize to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. (Bug#4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug#4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. (Bug#4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug#4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug#3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug#3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.

- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug#3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdatper` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

C.4.11. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.

- Changed `ConnectionString` and added attributes to allow it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is alive.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to allow values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitly (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

C.4.12. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.

- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

C.4.13. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`.

(Thanks Miguel)

- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match SqlClient (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split SQL code (thanks everyone!).

C.4.14. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).

- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

C.4.15. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).

- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQLDbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only allows characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from Field.cs. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

C.4.16. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.

- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using DBNull.Value instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an auto_insert field is not present.
- Field now uses typeof keyword to return `System.Types` (performance).

C.4.17. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

C.4.18. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

C.4.19. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

C.5. MySQL Visual Studio Plugin Change History

> **Note**
>
> As of Connector/NET 5.1.2 (14 June 2007), the Visual Studion Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see Section C.4, “MySQL Connector/NET Change History”.

C.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

C.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

C.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

C.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

C.6. MySQL Connector/J Change History

C.6.1. Changes in MySQL Connector/J 5.1.x

C.6.1.1. Changes in MySQL Connector/J 5.1.13 (24 June 2010)

Fixes bugs found since release 5.1.12.

Functionality added or changed:

- Connector/J did not support `utf8mb4` for servers 5.5.2 and newer.

Connector/J now auto-detects servers configured with `character_set_server=utf8mb4` or treats the Java encoding `utf-8` passed via `characterEncoding=...` as `utf8mb4` in the `SET NAMES=` calls it makes when establishing the connection. (Bug#54175)

Bugs fixed:

- The method `unSafeStatementInterceptors()` contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. (Bug#53041)
- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. (Bug#52534)
- Logic in implementations of `LoadBalancingConnectionProxy` and `LoadBalanceStrategy` behaved differently as to which `SQLException`s trigger failover to a new host. The former looked at the first two characters of the SQLState:

  ```
  if (sqlState.startsWith("08"))
  ...
  ```

  The latter used a different test:

  ```
  if (sqlEx instanceof CommunicationsException
    || "08S01".equals(sqlEx.getSQLState())) {
  ...
  ```

  This meant it was possible for a new `Connection` object to throw an `Exception` when the first selected host was unavailable. This happened because `MySqlIO.createNewIO()` could throw an `SQLException` with a `SQLState` of “08001”, which did not trigger the “try another host” logic in the `LoadBalanceStrategy` implementations, so an `Exception` was thrown after having only attempted connecting to a single host. (Bug#52231)
- In the file `DatabaseMetadata.java`, the function `private void getCallStmtParameterTypes` failed if the parameter was defined over more than one line by using the '\n' character. (Bug#52167)
- The catalog parameter, `PARAM_CAT`, was not correctly processed when calling for metadata with `getMetaData()` on stored procedures. This was because `PARAM_CAT` was hardcoded in the code to `NULL`. In the case where `nullcatalogmeanscurrent` was `true`, which is its default value, a crash did not occur, but the meta data returned was for the stored procedures from the catalog currently attached to. If, however, `nullcatalogmeanscurrent` was set to `false` then a crash resulted.

  Connector/J has been changed so that when `NULL` is passed as `PARAM_CAT` it will not crash when `nullcatalogmeanscurrent` is `false`, but rather iterate all catalogs in search of stored procedures. This means that `PARAM_CAT` is no longer hardcoded to `NULL` (see Bug#51904). (Bug#51912)
- A load balanced `Connection` object with multiple open underlying physical connections rebalanced on `commit()`, `rollback()`, or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with “/* ping */”, to ensure they remained alive. This meant that calls to `Connection.commit()` could throw a `SQLException`. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. (Bug#51783)
- The `rollback()` method could fail to rethrow a `SQLException` if the server became unavailable during a rollback. The errant code only rethrew when `ignoreNonTxTables` was true and the exception did not have the error code 1196, `SQLError.ER_WARNING_NOT_COMPLETE_ROLLBACK`. (Bug#51776)
- When the `allowMultiQueries` connection string option was set to `true`, a call to `Statement.executeBatch()` scanned the query for escape codes, even though `setEscapeProcessing(false)` had been called previously. (Bug#51704)
- When a `StatementInterceptor` was used and an alternate `ResultSet` was returned from `preProcess()`, the original statement was still executed. (Bug#51666)
- Objects created by `ConnectionImpl`, such as prepared statements, hold a reference to the `ConnectionImpl` that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the `PreparedStatement`. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. (Bug#51643)

- `jdbc:mysql:loadbalance://` would connect to the same host, even though `loadBalanceStrategy` was set to a value of `random`, and multiple hosts were specified. (Bug#51266)
- An unexpected exception when trying to register `OUT` parameters in `CallableStatement`.

  Sometimes Connector/J was not able to register `OUT` parameters for `CallableStatements`. (Bug#43576)

C.6.1.2. Changes in MySQL Connector/J 5.1.12 (18 February 2010)

Fixes bugs found since release 5.1.11.

Bugs fixed:

- The catalog parameter was ignored in the `DatabaseMetaData.getProcedure()` method. It returned all procedures in all databases. (Bug#51022)
- A call to `DatabaseMetaData.getDriverVersion()` returned the revision as `mysql-connector-java-5.1.11 ( Revision: ${svn.Revision} )`. The variable `${svn.Revision}` was not replaced by the SVN revision number. (Bug#50288)

C.6.1.3. Changes in MySQL Connector/J 5.1.11 (21 January 2010)

Fixes bugs found since release 5.1.10.

Functionality added or changed:

- Replication connections, those with URLs that start with jdbc:mysql:replication, now use a jdbc:mysql:loadbalance connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklistTimeout` and `loadBalanceStrategy` in order to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. (Bug#49537)

Bugs fixed:

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. (Bug#50288)
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multibyte character set. (Bug#49745)
- For pooled connections, Connector/J did not process the session variable `time_zone` when set via the URL, resulting in incorrect timestamp values being stored. (Bug#49700)
- The `ExceptionInterceptor` class did not provide a `Connection` context. (Bug#49607)
- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. (Bug#48605)
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource
Caused by: java.lang.ClassCastException: $Proxy0
   at
com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2
 at com.mysql.jdbc.jdbc2.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

  (Bug#48486)

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. (Bug#48442)

- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for "VALUES " (with trailing space). However, valid MySQL syntax allows for `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES
(1);

INSERT INTO tbl VALUES(1);
```

  Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. (Bug#48172)

- A PermGen memory leaked was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. (Bug#36565)

- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

  (Bug#32525)

C.6.1.4. Changes in MySQL Connector/J 5.1.10 (23 September 2009)

Fixes bugs found since release 5.1.9.

Bugs fixed:

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. (Bug#47494)

C.6.1.5. Changes in MySQL Connector/J 5.1.9 (21 September 2009)

Bugs fixed:

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalTxToPhysicalConnection=true`, there is a static map (XIDS_TO_PHYSICAL_CONNECTIONS) that tracks the Xid with the XAConnection, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. (Bug#46925)

- When using the ON DUPLICATE KEY UPDATE functionality together with the rewriteBatchedStatements option set to true, an exception was generated when trying to execute the prepared statement:

```
INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
```

  The exception generated was:

```
java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is
2).
        at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
......
Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters,
which is 2).
        at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:1055)
        at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:956)
        at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:926)

        at com.mysql.jdbc.PreparedStatement.setInternal(PreparedStatement.java:3641)
        at
```

```
com.mysql.jdbc.PreparedStatement.setBytesNoEscapeNoQuotes(PreparedStatement.java:3391)
        at
com.mysql.jdbc.PreparedStatement.setOneBatchedParameterSet(PreparedStatement.java:4203)
        at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1759)
        at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1441)
        at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
        ... 16 more
```

(Bug#46788)

- When Connector/J encountered an error condition that caused it to create a `CommunicationsException`, it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

```
The last packet successfully received from the server was 1,249,932,468,916 milliseconds
ago.  The last packet sent successfully to the server was 0 milliseconds ago.
```

(Bug#46637)

- The `getSuperTypes` method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be `TYPE_CAT` and that of the second column `TYPE_SCHEM`. The method however returned the names as `TABLE_CAT` and `TABLE_SCHEM` for first and second column respectively. (Bug#44508)

- SQLException for data truncation error gave the error code as 0 instead of 1265. (Bug#44324)

- Calling `ResultSet.deleteRow()` on a table with a primary key of type `BINARY(8)` silently failed to delete the row, but only in some repeatable cases. The generated `DELETE` statement generated corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. (Bug#43759)

- Accessing result set columns by name after the result set had been closed resulted in a NullPointerException instead of a SQLException. (Bug#41484)

- `QueryTimeout` did not work for batch statements waiting on a locked table.

  When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. (Bug#34555)

- The `parseURL` method in class `com.mysql.jdbc.Driver` did not work as expected. When given a URL such as "jdbc:mysql://www.mysql.com:12345/my_database" to parse, the property `PORT_PROPERTY_KEY` was found to be `null` and the `HOST_PROPERTY_KEY` property was found to be "www.mysql.com:12345".

  > **Note**
  >
  > Connector/J has been fixed so that it will now always fill in the `PORT` property (using 3306 if not specified), and the `HOST` property (using `localhost` if not specified) when `parseURL()` is called. The driver also parses a list of hosts into `HOST.n` and `PORT.n` properties as well as adding a property `NUM_HOSTS` for the number of hosts it has found. If a list of hosts is passed to the driver, `HOST` and `PORT` will be set to the values given by `HOST.1` and `PORT.1` respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

  (Bug#32216)

- Attempting to delete rows using `ResultSet.deleteRow()` did not delete rows correctly. (Bug#27431)

- The `setDate` method silently ignored the Calendar parameter. The code was implemented as follows:

```
public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {
   setDate(parameterIndex, x);
}
```

From reviewing the code it was apparent that the Calendar parameter `cal` was ignored. (Bug#23584)

C.6.1.6. Changes in MySQL Connector/J 5.1.8 (16 July 2009)

Bugs fixed:

- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```
SQLError.createLinkFailureMessageBasedOnHeuristics(
(ConnectionImpl) this.conn,
System.currentTimeMillis() - 1000,
System.currentTimeMillis() - 2000,
e,
false);
```

  returned the following string:

```
The last packet successfully received from the server
was 2 milliseconds ago. The last packet sent successfully to the
server was 1 milliseconds ago.
```

  (Bug#45419)

- Calling `Connection.serverPrepareStatement()` variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely `TYPE_SCROLL_SENSITIVE`. (Bug#45171)

- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug#44869)

- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44868)

- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

  This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug#44867)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44865)

- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44863)

- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44862)

- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

  In the `CommunicationsException` code:

```
private boolean streamingResultSetInPlay = false;

public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
long lastPacketReceivedTimeMs, Exception underlyingException) {

this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
      lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
      this.streamingResultSetInPlay);
```

  `streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
    exceptionMessageBuf.append(
    Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
} else {
...
```

  (Bug#44588)

- The `SQLError.createLinkFailureMessageBasedOnHeuristics()` method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

  Information about when the last packet was successfully received should be provided in all cases. (Bug#44587)

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug#44056)

- Using `useInformationSchema` with `DatabaseMetaData.getExportedKeys()` generated the following exception:

```
com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
'REFERENCED_TABLE_NAME' in where clause is ambiguous
...
at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)
at com.mysql.jdbc.PreparedStatement.executeQuery(PreparedStatement.java:1923)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
DatabaseMetaDataUsingInfoSchema.java:50)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
DatabaseMetaDataUsingInfoSchema.java:603)
```

  (Bug#43714)

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

  `LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

  With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug#43421)

- The method `Statement.getGeneratedKeys()` did not return values for `UNSIGNED BIGINTS` with values greater than `Long.MAX_VALUE`.

  Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return BigIntegers for the result set returned from `getGeneratedKeys()`, it will only return them if the value is greater than `Long.MAX_VALUE`. If your application needs this consistency, it will need to check the class of the return value from `.getObject()` on the ResultSet returned by `Statement.getGeneratedKeys()` and if it is not a BigInteger, create one based on the `java.lang.Long` that is returned. (Bug#43196)

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug#43071)

- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug#43070)

- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

```
java.lang.StringIndexOutOfBoundsException: String index out of range: -1
at java.lang.String.substring(String.java:1938)
at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1524)
```

  (Bug#42253)

- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
 at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
 at java.util.HashMap$KeyIterator.next(Unknown Source)
 at
com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
 at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)
 at
com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
 at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
```

(Bug#42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug#41730)

- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recognized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

  For example, consider the following statement:

  ```
  String sql = "-- Customer's zip code will be fixed\n" +
    "update address set zip_code = 99999\n" +
    "where not regexp '^[0-9]{5}([[.-.]])?([0-9]{4})?$'";
  ```

  When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

  ```
  -- Customer's zip code will be fixed
  update address set zip_code = '99999'
  where not regexp '^[0-9]([[.-.]])?([0-9])?$'
  ```

  (Bug#41566)

- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

  > **Note**
  >
  > The performance regression in `indexOfIgnoreCaseRespectMarker()`has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

  (Bug#41532)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

  ```
  java.lang.NullPointerException
  at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
  at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)
  at org.apache.commons.dbcp.DelegatingResultSet.getShort(DelegatingResultSet.java:219)
  at com.zimbra.cs.db.DbVolume.constructVolume(DbVolume.java:297)
  at com.zimbra.cs.db.DbVolume.get(DbVolume.java:197)
  at com.zimbra.cs.db.DbVolume.create(DbVolume.java:95)
  at com.zimbra.cs.store.Volume.create(Volume.java:227)
  at com.zimbra.cs.store.Volume.create(Volume.java:189)
  at com.zimbra.cs.service.admin.CreateVolume.handle(CreateVolume.java:48)
  at com.zimbra.soap.SoapEngine.dispatchRequest(SoapEngine.java:428)
  at com.zimbra.soap.SoapEngine.dispatch(SoapEngine.java:285)
  ```

  (Bug#41484)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

  ```
  PreparedStatement ps = connection.prepareStatement("INSERT INTO table
    values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);
  ```

  (Bug#41448)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

  ```
  Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
  falling back to sane default of {2}
  ```

  This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not

have been generated. (Bug#41416)

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

  However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. (Bug#41269)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug#41161)

- Error message strings contained variable values that were not expanded. For example:

  ```
  Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},
  falling back to sane default of {2}
  ```

  (Bug#40772)

- When using `rewriteBatchedStatements=true` with:

  ```
  INSERT INTO table_name_values (...) VALUES (...)
  ```

  Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

  ```
  testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an
  error in your SQL syntax; check the manual that corresponds to your MySQL server version
  for the right syntax to use near 'values (2,'toto',2),(id,data, ordr) values
  (3,'toto',3),(id,data, ordr) values (' at line 1
  at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1495)
  at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1097)
  at testsuite.simple.TestBug40439.testBug40439(TestBug40439.java:42)
  at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
  at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39)
  at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25)
  at testsuite.simple.TestBug40439.main(TestBug40439.java:57)
  ```

  (Bug#40439)

- A statement interceptor received the incorrect parameters when used with a batched statement. (Bug#39426)

- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[]` for following:

  ```
  SELECT TRIM(rowid) FROM tbl
  ```

  Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

  The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[]` was returned.

  Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. (Bug#38387)

C.6.1.7. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug#42309)

- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug#40031)

- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug#39962)

- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug#39956)

- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug#39911)

- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

  There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

  ```
  int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue();
  ```

  This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug#39784)

- When configuring the Java Replication Driver the last slave specified was never used. (Bug#39611)

- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug#39352)

- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug#38782)

- Connector/J threw the following exception when using a read-only connection:

  ```
  java.sql.SQLException: Connection is read-only. Queries leading to data
  modification are not allowed.
  ```

  (Bug#38747)

- Connector/J was unable to connect when using a non-`latin1` password. (Bug#37570)

- The `useOldAliasMetadataBehavior` connection property was ignored. (Bug#35753)

- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug#35170)

- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug#34185)

- The `loadBalance bestResponseTime` blacklists did not have a global state. (Bug#33861)

C.6.1.8. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the resul sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` paramaters. (Bug#33678)

- XAConnections and datasources have been updated to the JDBC-4.0 standard.

- The profiler event handling has been made extensible via the `profilerEventHandler` connection property.

- Add the `verifyServerCertificate` propery. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug#36830)
- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. (Bug#36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug#35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug#35666)
- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug#35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug#35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug#35489)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

  ```
  java.sql.SQLException: java.lang.NumberFormatException: For input string:
  ```

  followed by the text of the stored function starting after the argument list. (Bug#35199)
- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

  ```
  SELECT column AS aliasName from table
  ```

  (Bug#35150)
- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from ConnectionProperties are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug#34937)
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). (Bug#34913)
- `RowDataStatic` does't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug#34762)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug#34703)
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. (Bug#34677)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug#34518)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug#34194)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug#34093)
- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug#33823)

- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug#33734)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug#33594)
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug#33162)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

  We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

  We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name via the `loadBalanceStrategy` configuration property. (Bug#32877)
- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

  Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

  This bug fix also fixes Bug#15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) (Bug#32577, Bug#15604)
- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug#32246)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug#32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBounds` exception when setting the last parameter to null. (Bug#31823)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug#31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug#31192)
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug#31053)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug#30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug#20491)
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

C.6.1.9. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than 5 * stddev of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp( cal.getTimeInMillis() );
ps.setTimestamp( N, t, cal );
```

(Bug#15604)

C.6.1.10. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

C.6.1.11. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. (Bug#29853)
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the

form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.

- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.

- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.

- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).

- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).

- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` via the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.

- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.

- Errors encountered during `Statement`/`PreparedStatement`/`CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

  If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

  If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

  Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT`/`REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:

  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

    This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

    If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

  - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

    This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

  Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs` The regex must follow the patterns used for the `java.util.regex`package. The default is to exclude no columns, and include all columns.

  Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to

utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in PreparedStatmentWrapper delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from sub-queries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all paramters as "IN" paramters but allow callers to call registerOutParameter() on them without throwing an exception. (Bug#28689)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

C.6.1.12. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

C.6.1.13. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change**: Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

  For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

  We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

  `Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.

- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).

- Externalized the descriptions of connection properties.

- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.

- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.

- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.

- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

  Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

  `StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.

- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be rewritten in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

C.6.1.14. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

> **Note**
>
> The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

  > **Note**
  >
  > This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the SQLState class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR`/`NVARCHAR` types.
- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's SQLXML interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

  To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

  - `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
  - `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- New feature—driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

  The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

  This functionality is only available when using Java-6 or newer.
- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

C.6.2. Changes in MySQL Connector/J 5.0.x

C.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

  If the driver gives up, it will throw the last-received `SQLException`. (Bug#31053)
- `setObject(int, Object, int, int)` delegate in PreparedStatmentWrapper delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all paramters as "IN" paramters but allow callers to call registerOutParameter() on them without throwing an exception. (Bug#28689)
- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- `UNSIGNED` types not reported via `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

  This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly via `DBMD.getColumns()`. (Bug#27916)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)

- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug#27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

C.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
- Give more information in EOFExceptions thrown out of MysqlIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and autoReconnect to `true`.
- `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes ResultSetMetadata.isCaseSensitive() much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to allow tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
  - `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling setFetchSize() on a Statement or ResultSet) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.

- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

  > **Note**
  >
  > If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. (Bug#29605)
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. (Bug#28956)
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. (Bug#28851)
- PreparedStatement.getMetaData() for statements containing leading one-line comments is not returned correctly.

  As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. (Bug#28469)

C.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

  If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

  Therefore, for this to work (at all), you must use transactions, even if only reading data.

  Physical connections to the given hosts will not be created until needed.

  The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

  There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

  - `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
  - `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.

- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining

characters with space (for ANSI compliance).

- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

  This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

  > **Note**
  >
  > This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

  When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.

- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a ReplicationConnection (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

  In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.

- Driver will now use `INSERT INTO ... VALUES (DEFAULT)`form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()`(which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

  This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). (Bug#28085)

- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. (Bug#27655)

- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). (Bug#27655)
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

  If the comments happen to contain parameter markers (`?`), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

  > **Note**
  >
  > The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

  (Bug#27400)
- `ResultSet.get*()` with a column index < 1 returns misleading error message. (Bug#27317)
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug#27317)
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug#26959)
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug#26789)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug#26592)
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug#26173)
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug#25715)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug#25624)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug#25545)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug#25517)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug#25328)

C.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string:

  ```
  useServerPrepStmts=true
  ```

  The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable via `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat java.util.Date as a java.sql.Timestamp because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedState.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting

`useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)

- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug#21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underyling exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSet-`

`Metadata=true` was used.

- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a HashMap. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, TreeMaps are about half as fast wall-clock time as a HashMap, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).

- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

C.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- DBMD.getColumns() does not return expected COLUMN_SIZE for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimitters to be consistent with the ODBC driver. (Bug#22613)

- Added new _ci collations to CharsetMapping - utf8_unicode_ci not working. (Bug#22456)

- Driver was using milliseconds for Statement.setQueryTimeout() when specification says argument is to be in seconds. (Bug#22359)

- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug#22297)

- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)

- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug#22024)

- When using information_schema for metadata, COLUMN_SIZE for getColumns() is not clamped to range of java.lang.Integer as is the case when not using information_schema, thus leading to a truncation exception that isn't present when not using information_schema. (Bug#21544)

- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column (")" exceptions. (Bug#21379)

- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.

- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.

- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.

- Driver now supports `{call sp}` (without "()" if procedure has no arguments).

C.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug#20650)

- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug#20650)

C.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the "scanning" nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug#20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug#20242)
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug#20242)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. (Bug#20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug#19169)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` systtem variable to the character set that is used for error messages. (Bug#18086)
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug#17401)

C.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

C.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...`. (Bug#14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug#14729)
- When fix for Bug#14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug#14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug#14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to Bug#14972). (Bug#14729)
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug#14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `''`, `(int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.) (Bug#14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug#14729)

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug#14729)
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

C.6.3. Changes in MySQL Connector/J 3.1.x

C.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)

C.6.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for continueBatchOnError property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause NullPointerExceptions when it is required to check this property. (Bug#22290)
- Fixed Bug#18258 - DatabaseMetaData.getTables(), columns() with bad catalog parameter threw exception rather than return empty result set (as required by spec). (Bug#22290)
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'. (Bug#22290)
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down. (Bug#22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug#22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR. (Bug#21207)
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). (Bug#21207)
- ResultSet.getSomeInteger() doesn't work for BIT(>1). (Bug#21062)
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, " or ""). (Bug#20888)
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug#20687)
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Bug#20485)
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. (Bug#20479)
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. (Bug#20306)
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. (Bug#19993)
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. (Bug#19993)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug#19726)
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. (Bug#18880)
- Fixed memory leak with profileSQL=true. (Bug#16987)
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. (Bug#16791)

C.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- `Fixed PreparedStatement.setObject(int, Object, int)` doesn't respect scale of BigDecimals. (Bug#19615)
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug#19282)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT type`. (Bug#19282)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug#19282)

- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug#18740)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug#18554)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug#18496)
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. (Bug#18041)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug#18041)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug#17898)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug#17587)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug#17587)
- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. (Bug#17587)
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. (Bug#17450)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug#17099)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug#16841)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug#15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug#15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug#15570)
- No "dos" character set in MySQL > 4.1.0. (Bug#15544)
- `INOUT` parameter does not store `IN` value. (Bug#15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). (Bug#15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug#14938)
- Exception thrown for new decimal type when using updatable result sets. (Bug#14609)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . (Bug#13601)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug#13469)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

  If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug#13469)

- LogFactory now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger". (Bug#13469)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug#11874)

C.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug#15141)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065)
- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePStmtStreams` to `true` (also included in the 3-0-Compat configuration “bundle”). (Bug#15024)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug#14972)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug#14938)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug#14909)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug#14815)
- `storesMixedCaseIdentifiers()` returns `false` (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug#14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug#14562)
- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=1` (on server):
  - `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`

    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`

    (Bug#14562)

- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
    - If `lower_case_table_names=0` (on server):
        - `storesLowerCaseIdentifiers()` returns `false`
        - `storesLowerCaseQuotedIdentifiers()` returns `false`
        - `storesMixedCaseIdentifiers()` returns `true`
        - `storesMixedCaseQuotedIdentifiers()` returns `true`
        - `storesUpperCaseIdentifiers()` returns `false`
        - `storesUpperCaseQuotedIdentifiers()` returns `true`
    - If `lower_case_table_names=1` (on server):
        - `storesLowerCaseIdentifiers()` returns `true`
        - `storesLowerCaseQuotedIdentifiers()` returns `true`
        - `storesMixedCaseIdentifiers()` returns `false`
        - `storesMixedCaseQuotedIdentifiers()` returns `false`
        - `storesUpperCaseIdentifiers()` returns `false`
        - `storesUpperCaseQuotedIdentifiers()` returns `true`

    (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
- Extraneous sleep on `autoReconnect`. (Bug#13775)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)

- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT`/`INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

C.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now allows you to specify variables that start with the "`@`" sign. (Bug#13453)
- URL configuration parameters don't allow "`&`" or "`=`" in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html).

  If the "`%`" character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of "`%`" when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY`/`VARBINARY` and related types. (Bug#13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
- Tokenizer for `=` in URL properties was causing `sessionVariables=....` to be parameterized incorrectly. (Bug#12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
- `getExportedKeys()` (Bug#12541)
- Specifying a catalog works as stated in the API docs. (Bug#12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)

- `getIndexInfo()` (Bug#12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug#12541)
- `getImportedKeys()` (Bug#12541)
- Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug#12541)
- `getCrossReference()` (Bug#12541)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug#12541)
- `getColumns()` (Bug#12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

  The `catalog` argument in all of these methods now behaves in the following way:
  - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
  - Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
  - Specifying a catalog works as stated in the API docs.
  - Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

  (Bug#12541)
- `getBestRowIdentifier()` (Bug#12541)
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug#12541)
- `getTables()` (Bug#12541)
- `getPrimaryKeys()` (Bug#12541)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug#12417)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug#12229)
- Properties shared between master and slave with replication connection. (Bug#12218)
- Geometry types not handled with server-side prepared statements. (Bug#12104)

- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug#11976)
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug#11879)
- `Pstmt.setObject(...., Types.BOOLEAN)` throws exception. (Bug#11798)
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug#11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug#11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug#11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT`/`OUTPUT` parameters as well as `INPUT` parameters. (Bug#11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers where within the range of the positive signed type. (Bug#11663)
- Moved source code to Subversion repository. (Bug#11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)
- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug#11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotation marks. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

C.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implemention of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.

- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

C.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug#11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug#11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug#11360)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug#11115)
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality (Bug#11115)
- `maxPerformance`: Maximum performance without being reckless (Bug#11115)
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can (Bug#11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug#11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
  - `maxPerformance`: Maximum performance without being reckless
  - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality

  (Bug#11115)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug#10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug#10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug#10850)
- 0-length streams not sent to server when using server-side prepared statements. (Bug#10850)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug#10850)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug#10496)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug#10496)

- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug#10496)
- The datatype returned for `TINYINT(1)` columns when `tinyInt1isBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyInt1isBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug#10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORT`s. (Bug#10485)
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug#10155)
- Double quotation marks not recognized when parsing client-side prepared statements. (Bug#10155)
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions. (Bug#10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug#10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug#10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug#10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug#10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

C.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)

- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
- Should accept `null` for name patterns in DBMD (meaning "`%`"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug#9704)
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:

  1. Log4j, if it is available,
  2. Then JDK1.4 logging,
  3. Then fallback to our `STDERR` logging.

  (Bug#9704)
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug#9704)
- Stored procedures with `DECIMAL` parameters with storage specifications that contained "`,`" in them would fail. (Bug#9682)
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug#9682)
- Added support for the c3p0 connection pool's (http://c3p0.sf.net/) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClass-Name` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug#9320)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug#9320)
- `Connection.canHandleAsPreparedStatement()` now makes "best effort" to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug#9320)
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug#9320)
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug#9319)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug#9319)
- A continuation of Bug#8868, where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug#9236)
- Cannot use `UTF-8` for characterSetResults configuration property. (Bug#9206)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug#9040)
- `ServerPreparedStatements` now correctly "stream" `BLOB`/`CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug#8868)
- `DATE_FORMAT()` queries returned as `BLOB`s from `getObject()`. (Bug#8868)

- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug#8868)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug#8868)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug#8868)
- Check for empty strings (`''`) when converting `CHAR`/`VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug#8803)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug#8800)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

C.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatements` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug#7952)

- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over statement.close() or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Choose correct "direction" to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(...., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for "boolean" `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

C.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

C.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all "padding" zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)

- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for nonnumerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql_stmt_execute()”. (Bug#5235)
- Handle case when string representation of timestamp contains trailing “`.`” with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

C.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundExceptions`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)

- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retreiving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for “pseudo” bit type). (Bug#5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.wasNull()` does not work for primatives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes via `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's “standard” description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug#4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug#4482)

C.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug#4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). (Bug#4119)
- Added packet debuging code (see the `enablePacketDebug` property documentation). (Bug#4119)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug#4119)
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

C.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug#3804)
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540)
- `getProcedures()` does not return any procedures in result set. (Bug#3539)
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1. (Bug#3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug#3146)
- Cleaned up detection of server properties. (Bug#3146)
- Correctly detect initial character set for servers >= 4.1.0. (Bug#3146)
- Support placeholder for parameter metadata for server >= 4.1.2. (Bug#3146)
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered “slow.”
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

C.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)

- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606)
- Fixed charset conversion issue in `getTables()`. (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData`. `getProcedures()` and `getProcedure-Columns()`. (Bug#2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate`/`TimeCreate()` when unpacking results from server-side prepared statements. (Bug#2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. (Bug#1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month descrepencies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug#1673)
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug#1673)
- Fixed sending of queries larger than 16M. (Bug#1673)
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug#1673)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug#1673)
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug#1673)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug#1673)
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug#1673)
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.

- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions >= 5.0.0
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Support "old" `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

C.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

C.6.4. Changes in MySQL Connector/J 3.0.x

C.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server Bug#9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug#8812)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug#8629)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later. (Bug#8629)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including "aliases" `Windows-31J`, `CP934`, `MS932`. (Bug#8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug#8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug#7686)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug#7601)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7601)
- Escape sequence {fn convert(..., type)} now supports ODBC-style types that are prepended by `SQL_`. (Bug#7601)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug#7081)
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug#7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug#7081)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7061)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- Adding `CP943` to aliases for `sjis`. (Bug#6549, Bug#7607)
- `Timestamp`/`Time` conversion goes in the wrong "direction" when `useTimeZone=true` and server time zone differs from client time zone. (Bug#5874)

C.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1)` -> `BIT`/`Boolean` conversion configurable via `tinyInt1isBit` property (default `true` to be JDBC compliant out of the box). (Bug#5664)

- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug#5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. (Bug#5664)
- Only set `character_set_results` during connection establishment if server version >= 4.1.1. (Bug#5664)
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of "original" table and column names.
- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

C.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug#5069)
- Parse new time zone variables from 4.1.x servers. (Bug#5069)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022)
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880)
- "Production" is now "GA" (General Availability) in naming scheme of distributions. (Bug#4860, Bug#4138)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that "like" types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4860, Bug#4138)
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742)
- Added FLOSS license exemption. (Bug#4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug#4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

  > **Warning**
  >
  > This required a change to the `SocketFactory` `connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

  (Bug#4334)
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed

and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug#4334)

- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)

C.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

C.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873)
- Using a `MySQLDatasource` without server name fails. (Bug#3848)

C.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. (Bug#3570)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557)
- Not specifying database in URL caused `MalformedURL` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug#3554)
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse). (Bug#3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug#3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug#3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug#3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)
- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets. (Bug#2670)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. . (Bug#2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug#2670)

- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers >= 4.1.2. (Bug#2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL >= 4.1.0. (Bug#2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column. (Bug#2670)
- Only set `character_set_results` for MySQL >= 4.1.0. (Bug#2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . (Bug#103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Backported "change user" and "reset server state" functionality from 3.1 branch, to allow clients of `MysqlConnection-PoolDataSource` to reset server state on `getConnection()` on a pooled connection.

C.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSet-MetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSet-MetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue http://developer.java.sun.com/developer/bugParade/bugs/4401235.html) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on`/`off` or `1`, `2`, `3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` *or* `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

C.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepSt-mtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD`

`DATA LOCAL INFILE`). (Bug#2006)

- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in SQLError to report deadlocks with SQLStates of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for SQLStates. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBounds` when parameter number == number of parameters + 1. (Bug#1958)
- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence {fn convert ... }. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR`/`VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug#1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBounds` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug#1534)

- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511)

C.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. (Bug#1247)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any oustanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug#1247)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug#1247)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug#1247)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug#1246)
- Optimized `CLOB.setChracterStream()`. (Bug#1131)
- Fixed `CLOB.truncate()`. (Bug#1130)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug#1099)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble`/`setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug#884)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in nonescaped input. (Bug#879)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time. (Bug#879)
- Issue exception on `ResultSet.get`*`XXX`*`()` on empty result set (wasn't caught in some cases). (Bug#848)
- Don't hide messages from exceptions thrown in I/O layers. (Bug#848)
- Fixed regression in large split-packet handling. (Bug#848)
- Better diagnostic error messages in exceptions for “streaming” result sets. (Bug#848)
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug#688)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug#688)
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug#688)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug#688)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug#688)
- Fix `UpdatableResultSet` to return values for `get`*`XXX`*`()` when on insert row. (Bug#675)
- Support `InnoDB` contraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug#664, Bug#517)

- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug#664, Bug#517)
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug#496)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

C.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug#378)
- Fix problem detecting server character set in some cases. (Bug#378)
- Allow multiple calls to `Statement.close()`. (Bug#378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug#378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. . (Bug#378)
- Fix row data decoding error when using *very* large packets. (Bug#378)
- Optimized row data decoding. (Bug#378)
- Issue exception when operating on an already closed prepared statement. (Bug#378)
- Optimized usage of `EscapeProcessor`. (Bug#378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

C.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.

- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of 0x5c (`'\'`) character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

C.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return `""` when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

C.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.

- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBounds` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.

C.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

C.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement`/`PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `testsuite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be nonstatic.
- Use nonaliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.

- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

C.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See `README` for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.

- `PreparedStatement` now honors stream lengths in setBinary/Ascii/Character Stream() unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

C.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatemtent.setClob()`, `PreparedStatement.setObject(Clob)`.
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.

C.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see `README`) Thanks to Doron.
- Testsuite now uses Junit (which you can get from http://www.junit.org.
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see `README`).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see `README` for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements via controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me `<mark@mysql.com>`.
- Performance enchancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

C.6.5. Changes in MySQL Connector/J 2.0.x

C.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See `README` for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, "`"`" will be used as an identifier quote character, otherwise "`'`" will be used.

C.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

C.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect auto_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

C.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

C.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

C.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

C.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource`/`ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

C.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Captialize type names when `captializeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- PreparedStatement.setDouble() now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- PreparedStatement.setBoolean() will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

C.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

C.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has +/-Inf/inf support.

- `getObject()` on `ResultSet` correctly does `TINYINT`->`Byte` and `SMALLINT`->`Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT`/`BLOB`.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

C.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of -/+INF for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

C.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

C.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

C.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to ResultSet for insertRow() - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.

- Fixed ResultSet to return correct row numbers
- Statement.getUpdateCount() now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

C.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to specified to connect. (Thanks to Christian Motschke)

C.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotation marks.

C.6.7. Changes in MySQL Connector/J 1.2.x and lower

C.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

C.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

C.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

C.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidriectonally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.

- Fixes to getDriverPropertyInfo().

C.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

C.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

C.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

C.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

C.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

C.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that allows executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate()s on one Statement, be sure to clearWarnings() every so often to save memory.

C.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccess error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

C.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

C.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`
  - `getColumns()`
  - `getCatalogs()`

C.7. MySQL Connector/MXJ Change History

C.7.1. Changes in MySQL Connector/MXJ 5.0.11 (24th November 2009)

Functionality added or changed:

- The embedded MySQL binaries have been updated to MySQL 5.1.40 for GPL releases and MySQL 5.1.40 for Commercial releases.
- The contents of the directory used for bootstrapping the MySQL databases is now configurable by using the `windows-share-dir-jar` property. You should supply the name of a jar containing the files you want to use.
- The embedded Aspect/J class has been removed.
- The default timeout for the kill delay within the embedded test suite has been increased from 10 to 30 seconds.

Bugs fixed:

- On startup Connector/MXJ generated an exception on Windows 7:

```
Exception in thread “Thread-3” java.util.MissingResourceException?: Resource
‘5-0-51a/Windows_7-x86/mysqld-nt.exe’ not found
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:133)
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:107)
at com.mysql.management.util.Streams$1.inner(Streams.java:149) at
com.mysql.management.util.Exceptions$VoidBlock?.exec(Exceptions.java:128)
at com.mysql.management.util.Streams.createFileFromResource(Streams.java:162)
at com.mysql.management.MysqldResource?.makeMysqld(MysqldResource?.java:533)
at com.mysql.management.MysqldResource?.deployFiles(MysqldResource?.java:518)
at com.mysql.management.MysqldResource?.exec(MysqldResource?.java:495)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:216)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:166)
```

  The default `platform-map.properties` file, which maps platforms to the supplied binary bundles, has been updated with additional platforms, including Windows 7, Windows Server 2008, `amd64` and `sparcv9` for Solaris, and Mac OS X 64-bit. (Bug#48298)

C.7.2. Changes in MySQL Connector/MXJ 5.0.10 (Never released)

This was an internal only release.

Functionality added or changed:

- The embedded MySQL has been updated to the MySQL 5.1 series. The embedded MySQL binaries have been updated to MySQL 5.1.33 for GPL releases and MySQL 5.1.34 for Commercial releases.
- The MySQL binary for Windows targets has been updated to be configurable through the `windows-mysqld-command` property. This is to handle the move in MySQL 5.1.33 from `mysqld-nt.exe` to `mysqld.exe`. The default value is `mysqld.exe`.

C.7.3. Changes in MySQL Connector/MXJ 5.0.9 (19 August 2008)

Functionality added or changed:

- The port used in the `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` port is no longer hard coded. Instead, the code uses the `x-mxj_test_port` property a default value of `3336`
- The utility used to kill MySQL on Windows (`kill.exe`) has been configured to be loaded from the `kill.exe` property, instead of being hard-coded. The corresponding timeout, `KILL_DELAY` has also been moved to the properties file and defaults to 5 minutes.
- The embedded MySQL binaries have been updated to MySQL 5.0.51a for GPL releases and MySQL 5.0.54 for Commercial releases.
- The timeout for kill operations in the embedded test suite has been set to a default of 10 seconds.

C.7.4. Changes in MySQL Connector/MXJ 5.0.8 (06 August 2007)

Functionality added or changed:

- The embedded documentation has been updated so that it now points to the main MySQL documentation pages in the MySQL reference manual.
- The embedded MySQL binaries have been updated to MySQL 5.0.45 for GPL releases and MySQL 5.0.46 for Commercial releases.

C.7.5. Changes in MySQL Connector/MXJ 5.0.7 (27 May 2007)

Functionality added or changed:

- Updated the jar filename to be consistent with the Connector/J jar filename. Files are now formatted as `mysql-connector-mxj-`*`mxj-version`*.
- The `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExammple` have been updated to include an example of initializing the user/password and creating an initial database. The `InitializePasswordExample` example class has now been removed.
- The `PatchedStandardSocketFactory` class has been removed, because it fixed an issue in Connector/J that was corrected in Connector/J 5.0.6.
- The embedded MySQL binaries have been updated to MySQL 5.0.41 for GPL releases and MySQL 5.0.42 for Commercial releases.

Bugs fixed:

- Added a null-check to deal with class loaders where `getClassLoader()` returns null.

C.7.6. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preperation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connetor/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.

- Removed obsolete `InitializePasswordExample`

C.7.7. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in mysql_kill; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: MySQL Forums (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml`: `usage` now slightly more verbose; some reformatting.
- Now incoporates Reggie Bernett's `SafeTerminateProcess` and only calls the unsafe TerminateProcess as a final last resort.
- New windows `kill.exe` fixes a bug where mysqld was being force terminated. Issue reported by bruno haleblian and others, see: MySQL Forums.
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrats that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to mysqld.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

C.7.8. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. (Bug#24004)
- Updated `build.xml` to build to handle with different gpl and commercial mysld version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

C.7.9. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

C.7.10. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18

- Made tests more robust be deleting the /tmp/test-c.mxj directory before running tests.
- ServerLauncherSocketFactory.shutdown API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- MysqldResource now tied to dataDir as well as basedir (API CHANGE)
- moved PID file into datadir
- ServerLauncherSocketFactory.shutdown now works across JVMs.
- extracted splitLines(String) to Str utility class
- ServerLauncherSocketFactory.shutdown(port) no longer throws, only reports to System.err
- ServerLauncherSocketFactory now treats URL parameters in the form of `&server.foo=null` as `serverOption-Map.put("foo", null)`
- ServerLauncherSocketFactory.shutdown API change: now takes 2 File parameters (basedir, datadir)

C.7.11. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

C.7.12. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed HelpOptionsParser's need to reference a MysqldResource.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with Str).
- Minor refactorings for type casting and exception handling.

C.8. MySQL Connector/C++ Change History

C.8.1. Changes in MySQL Connector/C++ 1.1.x

C.8.1.1. Changes in MySQL Connector/CPP 1.1.0 (Note yet released GA)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

Functionality added or changed:

- **Incompatible Change**: API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses

`boost::variant`. Code such as:

```
sql::ConnectPropertyVal tmp;
tmp.str.val=passwd.c_str();
tmp.str.len=passwd.length();
connection_properties["password"] = tmp;
```

Should be changed to:

```
connection_properties["password"] = sql::ConnectPropertyVal(passwd);
```

- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use boost::scoped_array. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.
- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use CMake for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was allowed. The same options are avalable for `Connection::setClientOption()`.

Bugs fixed:

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. (Bug#45846)
- CMake generated an error if configuring an out of source build, that is when CMake not called from the source root directory. (Bug#45843)
- Using Prepared Statements caused corruption of the heap. (Bug#45048)
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. (Bug#44931)
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. (Bug#44931)
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.
- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.

C.8.2. Changes in MySQL Connector/C++ 1.0.x

C.8.2.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality added or changed:

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

```
connection->getMetaData->getSchema();
```

This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

Bugs fixed:

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

C.8.2.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

Functionality added or changed:

- An installer was added for the Windows operating system.
- Minimum CMake version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which allows control of the `INFORMATION_SCHEMA` for meta data.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.
- Introduced `ResultSetMetaData::isZerofill()`, which is not in the JDBC specification.

Bugs fixed:

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

C.8.2.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

Functionality added or changed:

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with bzip2.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the meta data functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

Bugs fixed:

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.
- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

C.8.2.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

Functionality added or changed:

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs fixed:

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed a bug in `getString()`. `getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

C.8.2.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

Functionality added or changed:

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked in order to evaluate the error type.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:

    `mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

    `mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

    However, you can make your application fully abstract by using the generic interface rather than these two headers.
- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

  ```
  examples/connect tcp://host:port user pass database
  ```

  or

  ```
  examples/connect unix:///path/to/mysql.sock user pass database
  ```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.

- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

C.9. MySQL Proxy Change History

C.9.1. Changes in MySQL Proxy 0.8.1 (Not yet released)

Functionality added or changed:

- `network_address_set_address()->network_address_set_address_ip()` called `gethostbyname()` which was not reentrant. This meant that an mt-plugin needed to guard all calls to `network_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. (Bug#49099)
- The hard-limit was fixed for the case where the fdlimit was set. (Bug#48120)
- Allow interception of LOAD DATA and SHOW ERROR commands.
- An unused `network_mysqld_com_query_result_track_state()` state was deprecated.
- `chassis_set_fdlimit()` was deprecated in favor of `chassis_fdlimit_set()`.
- Shutdown hooks were added to free the global memory of third party libraries such as `openssl`.
- `con->in_load_data_local` has been removed.

Bugs fixed:

- The admin plugin had an undocumented default value for `--admin-password`. (Bug#53429)
- Use of LOAD DATA LOCAL INFILE caused the connection between the client and MySQL Proxy to abort. (Bug#51864)
- When using the MySQL Proxy, if the backend MySQL server went down, and then the clock on the MySQL Proxy host went back in time (for example, during daylight savings time adjustments), the MySQL Proxy would stop sending queries to the configured backend. (Bug#50806)
- Proxy returned an error message with a non-standard SQLState when all backends were down:

  ```
  "#07000(proxy) all backends are down"
  ```

  This caused issues for clients with "retry" logic, as they did not have the facility to handle these "custom" SQL States. (Bug#45417)
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have now been updated.

C.9.2. Changes in MySQL Proxy 0.8.0 (21 Jan 2010)

Bugs fixed:

- A memory leak could occur in MySQL Proxy if MySQL v4.0 or earlier clients connected to the proxy. (Bug#50993)
- `mysql-proxy` would cause a segmentation fault if a connection was made from a client using the MySQL protocol 4.0 or earlier. (Bug#48641)
- MySQL Proxy would load a configuration file with unsafe permissions, which could allow password information to be exposed through the configuration file. MySQL Proxy now refuses to load a file with unsafe permissions. (Bug#47589)
- The supplied script `ro-balance.lua` had not been updated to use the `resultset_is_needed` and updated `proxy.connection.dst.name` structure. (Bug#47349, Bug#45408)
- The line numbers provided in stack traces would be out by one line. (Bug#47348)
- The supplied script `active-transactions.lua` had not been updated to use the new `resultset_is_needed` flag. (Bug#47345)
- When submitting an address on the command line using `--proxy-backend-addresses`, the option would accept more than one address as an argument to the option. You should specify one `--proxy-backend-addresses` for each backend address. (Bug#47273)
- MySQL Proxy would return the wrong version string internally from the `proxy.PROXY_VERSION` constant. (Bug#45996)
- MySQL Proxy could stop accepting network packets if a large number of packets were sent to the proxy. The listen queue has been extended to allow a larger backlog. (Bug#45878, Bug#43278)
- Due to a memory leak, memory usage for each uniqute connection to the proxy would increase, leading to very high consumption. (Bug#45272)
- MySQL Proxy would fail to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. (Bug#45167)

  See also Bug#25371.
- The supplied script `rw-splitting.lua` had not been updated to use the new `resultset_is_needed` flag or updated `proxy.connections` structure. (Bug#43424, Bug#42841, Bug#46141)
- Logging to `syslog` with the `use-log-syslog` option did not work. (Bug#36431)
- It was possible for the MySQL Proxy to incorrectly insert null values into the returned result set, even though non-null values were returned in the original query. (Bug#35729)
- MySQL Proxy would raise an error when processing query packets larger than 16MB in size. (Bug#35202)

C.9.3. Changes in MySQL Proxy 0.7.2 (30 June 2009)

Bugs fixed:

- When using MySQL Proxy on Windows, the required modules may not be found properly during initialization. The core code has now been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. (Bug#45833)

C.9.4. Changes in MySQL Proxy 0.7.1 (15 May 2009)

Bugs fixed:

- Due to a memory leak, memory usage for each uniqute connection to the proxy would increase, leading to very high consumption. (Bug#45272)
- The port number reported in `proxy.connection.client.address` would be reported incorrectly. (Bug#43313)
- Result sets with more than 250 fields could cause MySQL Proxy to crash. (Bug#43078)

- MySQL Proxy would be unable to increase it's own maximum number of open files accorindg to the applied limit, if the limit was less than 8192. When set to debug level, MySQL Proxy will now report the open files limits and when the limits have been updated. (Bug#42783)
- When connecting to a MySQL 4.0 server, the proxy would crash. You are now provided with an error message. (Bug#38601)
- When using the `rw-splitting.lua` script you could get an error when talking to the backend server:

```
2008-07-28 18:00:30: (critical) (read_query) [string
"/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
expected, got userdata)
```

  This would lead to the proxy closing the connection to the configured MySQL backend. (Bug#38419)
- When using MySQL Proxy with multiple backends, the failure of one backend would cause proxy to disconnect all backends and stop routing requests. (Bug#34793)

C.9.5. Changes in MySQL Proxy 0.7.0 (Never Released)

Functionality added or changed:

- Support for using a configuration file, in addition to the command-line options, has been added. You can specify the file to use by using the `--defaults-file` command line option. See Section 14.6.3, “MySQL Proxy Configuration Options”. (Bug#30206)
- A number of the internal structures used during developing Lua scripts for work with MySQL proxy have been updated and harmonised to make their meaning and contents easier to use and consistent across multiple locations.
  - The address information has been updated so that instead of a combined `ip:port` structure that you had to parse to extract the individual informaiton, you can now access that information directly. For example, instead of structures providing a single item `.address`, you now have items, `name` (the combined `ip:port`) and `address` (the IP address) and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of the connections.

    Some familiar strucgtures have been updated to acommodate this information:

    - `proxy.connection.client.address` is `proxy.connection.client.src.name`
    - `proxy.connection.server.address` is `proxy.connection.server.dst.name`
  - `proxy.backends` is now in `proxy.global.backends` The `.address` field of each backend is a address-object as described above. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
  - The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

    In read_handshake() you access the informaiton through the global `proxy.connction` table:

0.6	0.7
`auth.thread_id`	`proxy.connection.server.thread_id`
`auth.mysqld_version`	`proxy.connection.server.mysqld_version`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`
`auth.scramble`	`proxy.connection.server.scramble_buffer`

    In `read_auth()` you can use the following:

0.6	0.7
`auth.username`	`proxy.connection.client.username`
`auth.password`	`proxy.connection.client.scrambled_password`

0.6	0.7
auth.default_db	proxy.connection.client.default_db
auth.server_addr	proxy.connection.server.dst.name
auth.client_addr	proxy.connection.client.src.name

- In the function proxy.queries:append() a 3rd parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the resultset in the read_query_result() hook, you have to set the result-set_is_needed flag:

  ```
  proxy.queries:append( 1, ..., { resultset_is_needed = true } )
  ```

  For more information, see proxy.queries [1328].

- proxy.backends is now in proxy.global.backends.

Bugs fixed:

- **Security Enhancement**: Accessing mysql-proxy using a client or backend with a MySQL protocol less than MySQL 5.0 would result in mysql-proxy aborting with an assertion. This is because mysql-proxy only supports MySQL Protocol 5.0 or higher. The proxy will now report a fault. (Bug#31419)
- MySQL Proxy would be configured with the LUA_PATH and LUA_CPATHn directory locations according to the build, not execution, host. In addition, during installation, certain Lua source files could be installed into the incorrect locations. (Bug#44877, Bug#44497)
- Using mysql-proxy with very large return datasets from queries, with or without manipulate of the dataset within the Lua engine could cause a crash. (Bug#39332)
- If a submitted packet was smaller than expected by the protocol, MySQL Proxy would terminate. (Bug#36743)
- When using mysql-proxy in a master-master replication scenario, a failure in one of the replication masters would fail to be identified by the proxy and connections would not be redirected to the other master. (Bug#35295)

C.9.6. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write-errors
- Fixed sending fake server-greetings in connect_server().
- Fixed error handling for socket functions on Windows.
- Added new features to run-tests.lua.

C.9.7. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the rw-splitting.lua example script, connecting a second user to the proxy returns an error message. (Bug#30867)
- Added support in read_query_result() to overwrite the result-set.

- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. (Bug#29764)
- Fixed assertion on result-packets like `[ field-len | fields | EOF | ERR ]`. (Bug#29732)
- Fixed assertion at login with empty password + empty default db. (Bug#29719)
- Fixed assertion at `COM_SHUTDOWN`. (Bug#29719)
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.
- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()`ion.
- Fixed len-encoding on `proxy.resulsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.
- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

C.9.8. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the INSTALL file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.

- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when mysql.h isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing COM_STMT_*.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when a error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

C.9.9. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake`/`autoconf` support.
- Added `cmake` support.

Appendix D. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

D.1. Restrictions on Stored Routines, Triggers, and Events

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of these restrictions apply to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Implication: You cannot use dynamic SQL within stored functions or triggers (where you construct dynamically statements as strings and then execute them).

  In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See Section 12.6, “SQL Syntax for Prepared Statements”, for a list of statements supported as prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in Section 18.2, “Using Stored Routines (Procedures and Functions)”.
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. Begin a transaction in this context with `START TRANSACTION` instead.

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to allow them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO *var_list*` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO *var_list*` or by using a cursor and `FETCH` statements. See Section 12.7.3.3, “`SELECT ... INTO` Statement”.
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: '*tbl_name*'` error occurs, even if the references occur in different statements within the function.
- A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log even for statement-based binary logging. See Section 18.7, “Binary Logging of Stored Programs”.

Although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that variables take precedence over table columns is nonstandard.

Use of stored routines can cause replication problems. This issue is discussed further in Section 18.7, “Binary Logging of Stored Programs”.

`INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 5.5, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

The `--replicate-wild-do-table=`*`db_name.tbl_name`* option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

There are no stored routine debugging facilities.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. This does not apply when using statement-based replication. For more information, see Section 16.4.1.28, “Replication and Triggers”.
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, this means that you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug#16409, Bug#18896)
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug#16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug#16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically disallowed by the Event Scheduler. (Bug#16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are disallowed. (See Bug#22830 for more information.)
- Generally speaking, statements which are not permitted in stored routines or in SQL prepared statements are also not allowed in the body of an event. For more information, see Section 12.6, “SQL Syntax for Prepared Statements”.

D.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API via the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

D.3. Restrictions on Subqueries

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return *`M`* and *`N`* rows, respectively, the execution time becomes on the order of O(*`M`*×*`N`*), rather than O(*`M`*+*`N`*) as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

  ```
  DELETE FROM t WHERE ... (SELECT ... FROM t ...);
  UPDATE t ... WHERE col = (SELECT ... FROM t ...);
  {INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
  ```

  Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

  ```
  UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
  ```

  Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:

  - For *`expr`* `IN (`*`subquery`*`)`, *`expr`* can be an *`n`*-tuple (specified via row constructor syntax) and the subquery can return rows of *`n`*-tuples.

  - For *`expr op`* `{ALL|ANY|SOME} (`*`subquery`*`)`, *`expr`* must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

  In other words, for a subquery that returns rows of *`n`*-tuples, this is supported:

  ```
  (val_1, ..., val_n) IN (subquery)
  ```

  But this is not supported:

  ```
  (val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
  ```

  The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.

- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

  ```
  mysql> SELECT * FROM t1
      ->   WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
  ERROR 1235 (42000): This version of MySQL doesn't yet support
   'LIMIT & IN/ALL/ANY/SOME subquery'
  ```

- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more

efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- MySQL allows a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is nonstandard (not allowed by the SQL standard). In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a,ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.

- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.

- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
         AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

  - It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on

`t1`.

- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.

- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

  In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

  Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

D.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.

- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See Section D.3, “Restrictions on Subqueries”.

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the EXECUTE statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have UNION in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the WHERE clause. Some views that have subqueries in the SELECT list may be updatable.
- You cannot use UPDATE to update more than one underlying table of a view that is defined as a join.
- You cannot use DELETE to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the CREATE VIEW and SELECT privileges), that user will be unable to call SHOW CREATE VIEW on that object unless the user is also granted the SHOW VIEW privilege.

That shortcoming can lead to problems backing up a database with mysqldump, which may fail due to insufficient privileges. This problem is described in Bug#22062.

The workaround to the problem is for the administrator to manually grant the SHOW VIEW privilege to users who are granted CREATE VIEW, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is disallowed.

SHOW CREATE VIEW displays view definitions using an AS *alias_name* clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in CREATE VIEW statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of SHOW CREATE VIEW fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with mysqldump cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is the modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with DROP VIEW and CREATE VIEW, or replace the definition with CREATE OR REPLACE VIEW.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its CREATE VIEW statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

D.5. Restrictions on XA Transactions

XA transaction support is limited to the InnoDB storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for InnoDB.

For XA START, the JOIN and RESUME clauses are not supported.

For XA END, the SUSPEND [FOR MIGRATE] clause is not supported.

The requirement that the *bqual* part of the *xid* value be different for each XA transaction within a global transaction is a limitation of

the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

D.6. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not allowed in identifiers.
- The `ucs2` character sets has the following restrictions:
  - It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 9.1.4, “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.
  - `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

D.7. Limits in MySQL

This section lists current limits in MySQL 5.4.

D.7.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

D.7.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

  The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate 255 × 3 = 765 bytes per value. Consequently, a table cannot contain more than 65,535 / 765 = 85 such columns.

  Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

  `BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

  Declaring columns `NULL` can reduce the maximum number of columns allowed. `NULL` columns require additional space in the row

to record whether their values are NULL.

For MyISAM tables, each NULL column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

delete_flag is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. *delete_flag* is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for InnoDB tables, for which storage size is no different for NULL columns than for NOT NULL columns.

The following statement to create table t1 succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
    -> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table t2 fails because the columns are NULL and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
    -> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an .frm file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

  ```
  if (info_length+(ulong) create_fields.elements*FCOMP+288+
      n_length+int_length+com_length > 65535L || int_count > 255)
  ```

  The portion of the information stored in the .frm file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

  The relevant factors in the expression are:

  - info_length is space needed for “screens.” This is related to MySQL's Unireg heritage.
  - create_fields.elements is the number of columns.
  - FCOMP is 17.
  - n_length is the total length of all column names, including one byte per name as a separator.
  - int_length is related to the list of values for ENUM and SET columns.
  - com_length is the total length of column and table comments.

  Thus, using long column names can reduce the maximum number of columns, as can the inclusion of ENUM or SET columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:

  - InnoDB allows no more than 1000 columns.
  - InnoDB restricts row size to something less than half a database page (approximately 8000 bytes), not including VARBINARY, VARCHAR, BLOB, or TEXT columns.
  - Different InnoDB storage formats (COMPRESSED, REDUNDANT) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

D.7.3. Windows Platform Limitations

The following limitations apply only to the Windows platform:

- The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due not to Windows but to C runtime library compatibility functions used to open files on Windows that use the POSIX compatibility layer.

  This limitation will also cause problems if you try to set `open_files_limit` to a value greater than the 2048 file limit.

- On Windows 32-bit platforms it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

  Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more then 2GB, use a 64-bit version of Windows.

- When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

aborted clients, Section B.5.2.11, "Communication Errors and Aborted Connections"
aborted connection, Section B.5.2.11, "Communication Errors and Aborted Connections"
access control, Section 5.4.4, "Access Control, Stage 1: Connection Verification"
access denied errors, Section B.5.2.1, "Access denied"
access privileges, Section 5.4, "The MySQL Access Privilege System"
account names, Section 5.4.3, "Specifying Account Names"
account privileges
  adding, Section 5.5.2, "Adding User Accounts"
accounts
  anonymous user, Section 2.11.3, "Securing the Initial MySQL Accounts"
  root, Section 2.11.3, "Securing the Initial MySQL Accounts"
add-drop-database option
  mysqldump, Description
add-drop-table option
  mysqldump, Description
add-locks option
  mysqldump, Description
adding
  character sets, Section 9.3, "Adding a New Character Set"
  native functions, Section 21.3.3, "Adding a New Native Function"
  new account privileges, Section 5.5.2, "Adding User Accounts"
  new functions, Section 21.3, "Adding New Functions to MySQL"
  new user privileges, Section 5.5.2, "Adding User Accounts"
  new users, Section 2.10.1, "Source Installation Overview", Section 2.9, "Installing MySQL from tar.gz Packages on Other Unix-Like Systems"
  procedures, Section 21.4, "Adding New Procedures to MySQL"
  user-defined functions, Section 21.3.2, "Adding a New User-Defined Function"
addition (+), Section 11.6.1, "Arithmetic Operators"
addtodest option
  mysqlhotcopy, Description
administration
  server, Section 4.5.2, "mysqladmin — Client for Administering a MySQL Server"
administrative programs, Section 4.1, "Overview of MySQL Programs"
age
  calculating, Section 3.3.4.5, "Date Calculations"
alias names
  case sensitivity, Section 8.2.2, "Identifier Case Sensitivity"
aliases
  for expressions, Section 11.16.3, "GROUP BY and HAVING with Hidden Columns"
  for tables, Section 12.2.8, "SELECT Syntax"
  in GROUP BY clauses, Section 11.16.3, "GROUP BY and HAVING with Hidden Columns"
  names, Section 8.2, "Schema Object Names"
  on expressions, Section 12.2.8, "SELECT Syntax"
all-databases option
  mysqlcheck, Description
  mysqldump, Description
all-in-1 option
  mysqlcheck, Description
all-tablespaces option
  mysqldump, Description
allocating local table
  thread state, Section 7.5.6.3, "Delayed-Insert Thread States"
allow-keywords option
  mysqldump, Description
allow-suspicious-udfs option
  mysqld, Section 5.1.2, "Server Command Options", Section 5.3.4, "Security-Related mysqld Options"
allowold option
  mysqlhotcopy, Description
altering
  database, Section 12.1.1, "ALTER DATABASE Syntax"
  schema, Section 12.1.1, "ALTER DATABASE Syntax"
analyze option
  myisamchk, Section 4.6.3.4, "Other myisamchk Options"
  mysqlcheck, Description
anonymous user, Section 5.4.5, "Access Control, Stage 2: Request Verification", Section 5.4.4, "Access Control, Stage 1: Connection Verification", Section 2.11.3, "Securing the Initial MySQL Accounts"
ansi option
  mysqld, Section 5.1.2, "Server Command Options"
ansi_mode system variable, Section 5.1.4, "Server System Variables"
apply-slave-statements option
  mysqldump, Description
arbitrator, Section A.10, "MySQL 5.4 FAQ: MySQL Cluster"
argument processing, Section 21.3.2.3, "UDF Argument Processing"
arithmetic expressions, Section 11.6.1, "Arithmetic Operators"
arithmetic functions, Section 11.12, "Bit Functions"
attackers
  security against, Section 5.3.3, "Making MySQL Secure Against Attackers"
attribute demotion
  replication, Section 16.4.1.6.2, "Replication of Columns Having Different Data Types"
attribute promotion
  replication, Section 16.4.1.6.2, "Replication of Columns Having Different Data Types"
auto-generate-sql option
  mysqlslap, Description
auto-generate-sql-add-autoincrement option
  mysqlslap, Description

auto-generate-sql-execute-number option
mysqlslap, Description
auto-generate-sql-guid-primary option
mysqlslap, Description
auto-generate-sql-load-type option
mysqlslap, Description
auto-generate-sql-secondary-indexes option
mysqlslap, Description
auto-generate-sql-select-columns option
mysqlslap, Description
auto-generate-sql-unique-query-number option
mysqlslap, Description
auto-generate-sql-unique-write-number option
mysqlslap, Description
auto-generate-sql-write-number option
mysqlslap, Description
auto-rehash option
mysql, Section 4.5.1.1, "mysql Options"
auto-repair option
mysqlcheck, Description
auto-vertical-output option
mysql, Section 4.5.1.1, "mysql Options"
auto_increment_increment system variable, Section 16.1.3.2, "Replication Master Options and Variables"
auto_increment_offset system variable, Section 16.1.3.2, "Replication Master Options and Variables"
autoclose option
mysqld_safe, Description
autocommit session variable, Section 5.1.4, "Server System Variables"
automatic_sp_privileges system variable, Section 5.1.4, "Server System Variables"

B

BACKUP TABLE, Section 12.4.2.2, "BACKUP TABLE Syntax"
BDB storage engine, Chapter 13, *Storage Engines*
BDB tables, Section 1.8.5.3, "Transactions and Atomic Operations"
BEGIN, Section 12.3.1, "START TRANSACTION, COMMIT, and ROLLBACK Syntax"
XA transactions, Section 12.3.7.1, "XA Transaction SQL Syntax"
BENCHMARK(), Section 11.14, "Information Functions"

  Rpl_status, Section 5.1.6, “Server Status Variables”
status variables, Section 12.4.5.36, “`SHOW STATUS` Syntax”, Section 5.1.6, “Server Status Variables”
stop-datetime option
  mysqlbinlog, Description
stop-position option
  mysqlbinlog, Description
stopping
  the server, Section 2.11.2.2, “Starting and Stopping MySQL Automatically”
stopword list
  user-defined, Section 11.9.6, “Fine-Tuning MySQL Full-Text Search”
storage engine
  ARCHIVE, Section 13.12, “The `ARCHIVE` Storage Engine”
storage engines
  choosing, Chapter 13, *Storage Engines*
storage requirements
  data type, Section 10.5, “Data Type Storage Requirements”
storage space
  minimizing, Section 7.4.1, “Make Your Data as Small as Possible”
storage_engine system variable, Section 5.1.4, “Server System Variables”
stored functions, Section 18.2, “Using Stored Routines (Procedures and Functions)”
  and INSERT DELAYED, Section 12.2.5, “`INSERT` Syntax”
stored procedures, Section 18.2, “Using Stored Routines (Procedures and Functions)”
stored programs, Chapter 18, *Stored Programs and Views*
stored routine

restrictions, Section D.1, “Restrictions on Stored Routines, Triggers, and Events”
stored routines
LAST_INSERT_ID(), Section 18.2.4, “Stored Procedures, Functions, Triggers, and LAST_INSERT_ID()”
and replication, Section 16.4.1.8, “Replication of Invoked Features”
metadata, Section 18.2.3, “Stored Routine Metadata”
storing result in query cache
thread state, Section 7.5.6.4, “Query Cache Thread States”
storing row into queue
thread state, Section 7.5.6.3, “Delayed-Insert Thread States”
strict SQL mode, Section 5.1.7, “Server SQL Modes”
string collating, Section 9.3.2, “String Collating Support”
string comparison functions, Section 11.5.1, “String Comparison Functions”
string comparisons
case sensitivity, Section 11.5.1, “String Comparison Functions”
string concatenation, Section 8.1.1, “Strings”, Section 11.5, “String Functions”
string functions, Section 11.5, “String Functions”
string literal introducer, Section 8.1.1, “Strings”, Section 9.1.3.5, “Character String Literal Character Set and Collation”
string replacement
replace utility, Section 4.8.2, “replace — A String-Replacement Utility”
string types, Section 10.4, “String Types”
strings
defined, Section 8.1.1, “Strings”
escape sequences, Section 8.1.1, “Strings”
nondelimited, Section 10.3.1, “The DATETIME, DATE, and TIMESTAMP Types”
striping
defined, Section 7.6, “Disk Issues”
subpartitioning, Section 17.2.5, “Subpartitioning”
subpartitions, Section 17.2.5, “Subpartitioning”
known issues, Section 17.5, “Restrictions and Limitations on Partitioning”
subqueries, Section 12.2.9, “Subquery Syntax”
correlated, Section 12.2.9.7, “Correlated Subqueries”
errors, Section 12.2.9.9, “Subquery Errors”
rewriting as joins, Section 12.2.9.11, “Rewriting Subqueries as Joins”
with ALL, Section 12.2.9.4, “Subqueries with ALL”
with ANY, IN, SOME, Section 12.2.9.3, “Subqueries with ANY, IN, or SOME”
with EXISTS, Section 12.2.9.6, “Subqueries with EXISTS or NOT EXISTS”
with NOT EXISTS, Section 12.2.9.6, “Subqueries with EXISTS or NOT EXISTS”

mysqlanalyze
Description

mysqlbinlog

Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”
Section 4.6.7.1, “mysqlbinlog Hex Dump Format”
Section 4.6.7.2, “mysqlbinlog Row Event Display”
Section 12.4.6.1, “BINLOG Syntax”
Section 12.4.4, “SET Syntax”
Section 12.4.5.3, “SHOW BINLOG EVENTS Syntax”
Section 12.5.2.7, “START SLAVE Syntax”
Section 13.6.6, “Backing Up and Recovering an InnoDB Database”
Description
Section 16.2.3.1, “Evaluation of Database-Level Replication and Binary Logging Options”
Section 16.4.6, “How to Report Replication Bugs or Problems”
Section 11.15, “Miscellaneous Functions”
Section 1.5, “What Is New in MySQL 5.4”
Section B.5.8.1, “Open Issues in MySQL”
Section 4.1, “Overview of MySQL Programs”
Section 6.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”
Section 6.5.2, “Point-in-Time Recovery Using Event Positions”
Section 6.5.1, “Point-in-Time Recovery Using Event Times”
Section 16.4.1.31, “Replication and Variables”
Section 5.2.4, “The Binary Log”
Section 16.2.2.1, “The Slave Relay Log”
Section 6.3.2, “Using Backups for Recovery”

mysqlbinlog --database=test

Description

mysqlbinlog binary-log-file | mysql

Section 21.5.1.7, “Making a Test Case If You Experience Table Corruption”

mysqlbinlog --database=db2

Description

mysqlbinlog --database=test

Description

mysqlbinlog [options] log_file ...

Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”

mysqlbinlog|mysql

Section B.5.8.1, “Open Issues in MySQL”

mysqlbug

Section 4.4.3, “mysqlbug — Generate Bug Report”
Description
Section 1.7, “How to Report Bugs or Problems”

mysqlc

Section 2.3.12, “Testing The MySQL Installation”

mysqlcheck

Section 4.5.3, “mysqlcheck — A Table Maintenance Program”
Section 12.1.1, “ALTER DATABASE Syntax”
Section 6.6, “MyISAM Table Maintenance and Crash Recovery”
Description
Description
Description
Section 8.2.3, “Mapping of Identifiers to File Names”
Section 4.1, “Overview of MySQL Programs”
Section 2.12.4, “Rebuilding or Repairing Tables or Indexes”
Section 17.5, “Restrictions and Limitations on Partitioning”
Section 13.5, “The MyISAM Storage Engine”
Section 2.12.1.1, “Upgrading from MySQL 5.1 to 5.4”

mysqlcheck --all-databases --analyze

Section 5.1.4, “Server System Variables”

mysqlcheck --check-upgrade

Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”

mysqlcheck --check-upgrade

Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”

mysqlcheck --repair

Section 2.12.4, “Rebuilding or Repairing Tables or Indexes”

mysqlcheck [options] [db_name [tbl_name ...]]

Section 4.5.3, “mysqlcheck — A Table Maintenance Program”

mysqld

Section 4.6.3.2, “myisamchk Check Options”
Section 4.6.3.1, “myisamchk General Options”
Section 4.3.1, “mysqld — The MySQL Server”
Section B.5.2.18, “'FILE' NOT FOUND and Similar Errors”
Section 12.4.2.4, “CHECKSUM TABLE Syntax”
Section 12.4.3.2, “CREATE FUNCTION Syntax”
Section 12.1.16, “CREATE VIEW Syntax”
Section B.5.2.2, “Can't connect to [local] MySQL server”
Section B.5.2.13, “Can't create/write to file”
Section B.5.2.17, “Can't initialize character set”
Section B.5.2.4, “Client does not support authentication protocol”
Section 12.4.6.3, “FLUSH Syntax”
Section B.5.2.6, “Host 'host_name' is blocked”
Section 12.2.5.2, “INSERT DELAYED Syntax”
Section B.5.2.15, “Ignoring user”
Section 13.6.2, “InnoDB Configuration”
Section 13.6.13.3, “InnoDB General Troubleshooting”
Section 13.6.3, “InnoDB Startup Options and System Variables”
Section 12.4.6.4, “KILL Syntax”
Section 12.2.6, “LOAD DATA INFILE Syntax”
Section 13.5.1, “MyISAM Startup Options”
Section B.5.2.9, “MySQL server has gone away”
Section 12.4.2.5, “OPTIMIZE TABLE Syntax”
Section B.5.2.10, “Packet too large”
Section 12.2.8, “SELECT Syntax”
Section 12.3.6, “SET TRANSACTION Syntax”
Section 13.6.13.2, “SHOW ENGINE INNODB STATUS and the InnoDB Monitors”
Section 12.4.5.16, “SHOW ENGINE Syntax”

Section 12.4.5.40, “SHOW VARIABLES Syntax”
Section B.5.2.12, “The table is full”
Section B.5.2.7, “Too many connections”
Section 20.9.3.1, “mysql_affected_rows()”
Section 20.9.3.49, “mysql_options()”
Section 21.3, “Adding New Functions to MySQL”
Section 21.3.2, “Adding a New User-Defined Function”
Section 13.6.5, “Adding, Removing, or Resizing InnoDB Data and Log Files”
Section 2.13.5.6, “Alpha-DEC-OSF/1 Notes”
Section 2.13.5.5, “Alpha-DEC-UNIX Notes (Tru64)”
Section 2.13.4.5, “BSD/OS Version 3.x Notes”
Section 2.13.4.6, “BSD/OS Version 4.x Notes”
Section 13.6.6, “Backing Up and Recovering an InnoDB Database”
Section 16.1.3.4, “Binary Log Options and Variables”
Section 5.2.4.1, “Binary Logging Formats”
Section 2.10.6.1, “Building MySQL from Source Using CMake and Visual Studio”
Section 11.10, “Cast Functions and Operators”
Section 5.4.7, “Causes of Access-Denied Errors”
Section 2.1.2.2, “Choosing a Distribution Format”
Section 8.5, “Comment Syntax”
Section B.5.2.11, “Communication Errors and Aborted Connections”
Section 21.5.1.1, “Compiling MySQL for Debugging”
Section 21.3.2.5, “Compiling and Installing User-Defined Functions”
Section 13.6.4.3.2, “Configurable InnoDB Auto-Increment Locking”
Section 13.5.4.1, “Corrupted MyISAM Tables”
Section 21.5.1.2, “Creating Trace Files”
Section 13.6.2.3, “Creating the InnoDB Tablespace”
Section 13.6.2.4, “Dealing with InnoDB Initialization Problems”

Section 9.1.3.1, “Server Character Set and Collation”
Section 12.3.3, “Statements That Cause an Implicit Commit”

CREATE DATABASE IF NOT EXISTS

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

CREATE EVENT

Section 12.1.2, “ALTER EVENT Syntax”
Section 12.1.9, “CREATE EVENT Syntax”
Section 12.4.5.9, “SHOW CREATE EVENT Syntax”
Section 18.7, “Binary Logging of Stored Programs”
Section 16.4.1.8, “Replication of Invoked Features”
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 19.20, “The INFORMATION_SCHEMA EVENTS Table”

CREATE EVENT IF NOT EXISTS

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

CREATE FUNCTION

Section 12.1.3, “ALTER FUNCTION Syntax”
Section 12.4.3.2, “CREATE FUNCTION Syntax”
Section 12.1.10, “CREATE FUNCTION Syntax”
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”
Section 12.4.3.3, “DROP FUNCTION Syntax”
Section 21.3, “Adding New Functions to MySQL”
Section 18.7, “Binary Logging of Stored Programs”
Section 21.3.2.5, “Compiling and Installing User-Defined Functions”
Description
Section 8.2.4, “Function Name Parsing and Resolution”
Section 16.4.1.8, “Replication of Invoked Features”
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 18.2.1, “Stored Routine Syntax”
Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”
Section 2.12.1, “Upgrading MySQL”
Section 2.12.1.1, “Upgrading from MySQL 5.1 to 5.4”
Section 21.3.2.6, “User-Defined Function Security Precautions”

CREATE INDEX

Section 12.1.6, “ALTER TABLE Syntax”
Section 12.1.11, “CREATE INDEX Syntax”
Section 13.6.4.4, “FOREIGN KEY Constraints”
Section 11.17.6.1, “Creating Spatial Indexes”
Section 11.9, “Full-Text Search Functions”
Section 12.6, “SQL Syntax for Prepared Statements”
Section 5.1.4, “Server System Variables”
Section 12.3.3, “Statements That Cause an Implicit Commit”

CREATE LOGFILE GROUP

Description

CREATE OR REPLACE VIEW

Section 12.1.7, “ALTER VIEW Syntax”
Section 12.1.16, “CREATE VIEW Syntax”
Section D.4, “Restrictions on Views”

CREATE PROCEDURE

Section 12.1.4, “ALTER PROCEDURE Syntax”
Section 12.2.1, “CALL Syntax”
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”
Section 18.7, “Binary Logging of Stored Programs”
Description
Section 16.4.1.8, “Replication of Invoked Features”
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 18.2.1, “Stored Routine Syntax”

CREATE SCHEMA

Section 12.1.8, “CREATE DATABASE Syntax”

CREATE SERVER

Section 12.1.5, “ALTER SERVER Syntax”
Section 12.1.13, “CREATE SERVER Syntax”
Section 13.11.3, “FEDERATED Storage Engine Notes and Tips”
