This document contains important release information about Oracle’s Sun Storage 2500-M2 Arrays managed by Sun Storage Common Array Manager (CAM), Version 6.9.0. Read this document so that you are aware of issues or requirements that can affect the installation and operation of the array.

The release notes consist of the following sections:

- “What’s New for This Release” on page 2
- “Product Overview” on page 2
- “About the Management Software” on page 3
- “Downloading Patches and Updates” on page 3
- “System Requirements” on page 4
- “Device Mapper Multipath (DMMP) for the Linux Operating System” on page 13
- “Restrictions and Known Issues” on page 21
- “Related Documentation” on page 27
- “Documentation, Support, and Training” on page 28
What’s New for This Release

Firmware version 7.80.xx.x delivered with CAM 6.9 adds these features to Sun Storage 2500-M2 arrays:

- Expanded features:
  - Support for 96 drives (7 expansion trays)
  - Performance Enhancer (increases performance of the base controller)
- Data Services support:
  - Snapshot license (up to 128 snapshots per array, 8 per volume) with Snapshot Rollback
  - Volume Copy license (up to 255 per array)
  - Storage Domains license (up to 32 per array)
- Data host support for:
  - Oracle Linux 6.0, 5.6, 5.5 Fibre Channel
  - Oracle Unbreakable Linux
  - Oracle VM 2.2.2 (2540-M2 only)
  - RedHat Linux 6.0, 5.6, 5.5 (2530-M2 and 2540-M2)
  - SuSe Linux 11.1, 10.4, 10 SP3
  - Windows 2003 SP2 R2 clustered and non-clustered
  - Windows Server 2008 R2 SP1 clustered and non-clustered
- Sun Storage Common Array Manager enhancements (as described in the CAM Release Notes)

Product Overview

The Sun Storage 2500-M2 Arrays are a family of storage products that provide high-capacity, high-reliability storage in a compact configuration. The controller tray, with two controller modules, provides the interface between a data host and the disk drives. Three array models are offered:

- The Sun Storage 2540-M2 array provides a Fibre Channel (FC) connection between the data host and the controller tray at 8 Gbit/sec.
- The Sun Storage 2530-M2 array provides a Serial Attached SCSI (SAS) connection between the data host and the controller tray at 6 Gbit/sec.
The Sun Storage 2501-M2 array expansion tray provides additional storage via SAS interface at 6 Gbit/sec. It is connected to either of the above controller tray models.

The Sun Storage 2500-M2 Arrays are modular and rack-mountable in industry-standard cabinets. The arrays are scalable from a single controller tray configuration to a maximum configuration of one controller tray and three expansion trays. The maximum configuration creates a storage array configuration with a total of 48 drives attached behind the controllers.

Use the latest version of Sun Storage Common Array Manager to manage the arrays. See “About the Management Software” on page 3 for more information.

---

### About the Management Software

Oracle’s Sun Storage Common Array Manager (CAM) software is a key component for the initial configuration and operation of Sun Storage 2500-M2 Arrays hardware. It is installed on a management host cabled to the array via out-of-band Ethernet. Note: In-band management is also supported.

To download CAM, follow the procedure in the section “Downloading Patches and Updates” on page 3. Then, review the latest Sun Storage Common Array Manager Quick Start Guide and Sun Storage Common Array Manager Installation and Setup Guide to begin installation. CAM documentation can be found here:

---

### Downloading Patches and Updates

To download patches and updates from My Oracle Support, including the CAM management software, follow this procedure.

1. **Sign in to My Oracle Support:**
   
   [https://support.oracle.com](https://support.oracle.com)

2. **At the top of the page, click the Patches & Updates tab.**

3. **Search for software and patches in one of two ways:**
   
   - If you have a patch number:
a. Under the Patch Search section, click the Search tab.

b. In the Patch Name or Number field, enter the patch number. For example, 10272123 or 141474-01.

c. Click Search.

■ If you do not have a patch number:

a. Under the Patch Search section, click the Search tab, and then click the Product or Family (Advanced Search) link.

b. Check Include all products in a family.

c. In the Product field, start typing the product name. For example, “Sun Storage Common Array Manager (CAM)”.

   Select the product name when it appears.

d. In the Release field, expand the product name, check the release and patches you want to download, and then click Close.

e. Click Search.

4. Select the patch you want to download.

5. Click ReadMe for a patch description and installation instructions.

6. Click Download for a single patch, or Add to Plan to download a group of patches.

---

System Requirements

The software and hardware products that have been tested and qualified to work with Sun Storage 2500-M2 Arrays are described in the following sections. Sun Storage 2500-M2 Arrays require Sun Storage Common Array Manager, Version 6.8.0 (or higher) software.

■ “Firmware Requirements” on page 5
■ “Supported Disk Drives and Tray Capacity” on page 5
■ “Array Expansion Module Support” on page 5
■ “Data Host Requirements” on page 6
Firmware Requirements

The Sun Storage 2500-M2 Arrays firmware version 07.80.xx.xx (or higher) is installed on the array controllers prior to shipment and is also delivered with Sun Storage Common Array Manager (CAM), Version 6.9.0.

Firmware is bundled with the CAM software download package. To download CAM, follow the procedure in “Downloading Patches and Updates” on page 3.

Supported Disk Drives and Tray Capacity

TABLE 1 lists the disk capacity, form factor, spindle speed, interface type, interface speed, and tray capacity for supported SAS disk drives for the Sun Storage 2500-M2 arrays.

<table>
<thead>
<tr>
<th>Drive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS-2, 300G15K</td>
<td>300-Gbyte 3.5” 15K-RPM SAS-2 drives</td>
</tr>
<tr>
<td></td>
<td>(6 Gbits/sec); 3600 Gbytes per tray</td>
</tr>
<tr>
<td>SAS-2, 600G15K</td>
<td>600-Gbyte 3.5” 15K-RPM SAS-2 drives</td>
</tr>
<tr>
<td></td>
<td>(6 Gbits/sec); 7200 Gbytes per tray</td>
</tr>
</tbody>
</table>

Array Expansion Module Support

The Sun Storage 2530-M2 and 2540-M2 arrays can be expanded by adding Sun Storage 2501-M2 array expansion trays. To add capacity to an array, refer to the following Service Advisor procedures:

- Adding Expansion Trays
- Upgrade Firmware

Caution – To add trays with existing stored data, contact My Oracle Support for assistance to avoid data loss.

<table>

</table>
Data Host Requirements

- “Multipathing Software” on page 6
- “Supported Host Bus Adaptors (HBAs)” on page 8
- “Supported FC and Multilayer Switches” on page 12

Multipathing Software

TABLE 3 and TABLE 4 provide a summary of the data host requirements for the Sun Storage 2500-M2 Arrays. You must install multipathing software on each data host that communicates with the Sun Storage 2500-M2 Arrays. For additional information on multipathing software, see the following:

- Sun StorageTek RDAC Multipath Failover Driver Installation Guide For Linux OS
- “Device Mapper Multipath (DMMP) for the Linux Operating System” on page 13

Note – Download RDAC multipathing drivers from My Oracle Support at https://support.oracle.com using keyword “RDAC” or “MPP”. See “Downloading Patches and Updates” on page 3 for more information.

Note – Single path data connections are not recommended. For more information, see “Single Path Data Connections” on page 21.

Supported Host Bus Adaptors (HBAs)

- HBAs must be ordered separately from Oracle or its respective manufacturers.
- To obtain the latest HBA firmware:
  - For Fibre Channel HBAs, download firmware from My Oracle Support using keyword “HBA”. For download instructions, see “Downloading Patches and Updates” on page 3.
  - For SAS HBAs, go to http://wwwlsi.com/support/sun/
- You must install multipathing software before you install any OS patches.
- Download OS updates from the web site of the OS company.

The following tables list supported HBAs by interface type and operating system:
- TABLE 5: Supported Fibre Channel HBAs for Solaris Data Host Platforms
- TABLE 6: Supported Fibre Channel HBAs for Linux Data Host Platforms
- TABLE 7: Supported Fibre Channel HBAs for Windows Data Host Platforms
- TABLE 8: Supported SAS HBAs for Solaris and Linux Data Host Platforms

Supported FC and Multilayer Switches

The following FC fabric and multilayer switches are compatible for connecting data hosts and the Sun Storage 2540-M2 array. See the release notes for your switch hardware for firmware support information.

- Brocade SilkWorm 200E/300/4100/4900/5000/5100/5300/7500/48000/DCX
- Cisco 9124/9134/9216/9216i/9222i/9506/9509/9513
- QLogic SANBox 5602/9000
Device Mapper Multipath (DMMP) for the Linux Operating System

Device Mapper (DM) is a generic framework for block devices provided by the Linux operating system. It supports concatenation, striping, snapshots, mirroring, and multipathing. The multipath function is provided by the combination of the kernel modules and user space tools.

The DMMP is supported on SUSE Linux Enterprise Server (SLES) Version 11 and 11.1. The SLES installation must have components at or above the version levels shown in the following table before you install the DMMP.

<table>
<thead>
<tr>

</tbody>
</table>

To update a component, download the appropriate package from the Novell website at http://download.novell.com/patch/finder. The Novell publication, SUSE Linux Enterprise Server 11 Installation and Administration Guide, describes how to install and upgrade the operating system.

Device Mapper Features

- Provides a single block device node for a multipathed logical unit
- Ensures that I/O is re-routed to available paths during a path failure
- Ensures that the failed paths are revalidated as soon as possible
- Configures the multipaths to maximize performance
- Reconfigures the multipaths automatically when events occur
- Provides DMMP features support to newly added logical unit
- Provides device name persistency for DMMP devices under /dev/mapper/
- Configures multipaths automatically at an early stage of rebooting to permit the OS to install and reboot on a multipathed logical unit
Known Limitations and Issues of the Device Mapper

- When storage is configured with AVT mode, delays in device discovery might occur. Delays in device discovery might result in long delays when the operating system boots.

- In certain error conditions with `no_path_retry` or `queue_if_no_path` feature set, applications might hang forever. To overcome these conditions, you must enter the following command to all the affected multipath devices: `dmsetup message device 0 "fail_if_no_path"`, where `device` is the multipath device name (for example, `mpath2`; do not specify the path).

- An I/O hang might occur when a volume is unmapped without first deleting the DM device. **Note:** This limitation applies to only the SUSE 11 OS.

- Stale entries might not be noticed in multipath `-ll` output if the volumes are unmapped or deleted without first deleting the DM device and its underlying paths. **Note:** This limitation applies to only the SUSE 11 OS.

- Currently, the `mode select` command is issued synchronously for each LUN. With large LUN configurations, slower failovers for DM multipath devices might occur if there is any delay in completing of the `mode select` command. **Note:** This limitation applies to only the SUSE 11 OS.

- If the `scsi_dh_rdac` module is not included in initrd, slower device discovery might occur, and the syslog might get populated with buffer I/O error messages.

- If the storage vendor and model are not included in `scsi_dh_rdac` device handler, slower device discovery might be seen, and the syslog might get populated with buffer I/O error messages.

- Use of the DMMP and RDAC failover solutions together on the same host is not supported. Use only one solution at a time.

Installing the Device Mapper Multi-Path

1. Use the media supplied by your operating system vendor to install SLES 11.

2. Install the errata kernel 2.6.27.29-0.1.
   
   Refer to the *SUSE Linux Enterprise Server 11 Installation and Administration Guide* for the installation procedure.

3. To boot up to 2.6.27.29-0.1 kernel, reboot your system.

4. On the command line, enter `rpm -qa |grep device-mapper`, and check the system output to see if the correct level of the device mapper component is installed.
   - If the correct level of the device mapper component is installed – Go to Step 5.
If the correct level of the device mapper component is not installed, install the correct level of the device mapper component or update the existing component. Then, go to Step 5.

5. On the command line, enter `rpm -qa |grep multipath-tools` and check the system output to see if the correct level of the multipath tools is installed.
   - If the correct level of the multipath tools is installed, go to Step 6.
   - If the correct level of the multipath tools is not installed, install the correct level of the multipath tools or update the existing multipath tools. Then, go to Step 6.

6. Update the configuration file `/etc/multipath.conf`.
   See “Setting Up the multipath.conf File” on page 15 for detailed information about the `/etc/multipath.conf` file.

7. On the command line, enter `chkconfig multipathd on`.
   This command enables multipathd daemon when the system boots.

8. Edit the `/etc/sysconfig/kernel` file to add directive `scsi_dh_rdac` to the `INITRD_MODULES` section of the file.

10. Update the boot loader to point to the new `initrd` image, and reboot the host with the new `initrd` image.

Setting Up the multipath.conf File

The `multipath.conf` file is the configuration file for the multipath daemon, multipath. The `multipath.conf` file overwrites the built-in configuration table for multipath. Any line in the file whose first non-white-space character is # is considered a comment line. Empty lines are ignored.

Installing the Device Mapper Multi-Path for SLES 11.1

All of the components required for DMMP are included in SUSE Linux Enterprise Server (SLES) version 11.1 installation media. However, users might need to select the specific component based on the storage hardware type. By default, DMMP is disabled in SLES. You must follow the following steps to enable DMMP components on the host.
1. **On the command line, type** `chkconfig multipath on.`
   The multipathd daemon is enabled with the system starts again.

2. **Edit the** `/etc/sysconfig/kernel` **file to add the directive** `scsi_dh_rdac` **to the** `INITRD_MODULES` **section of the file.**

3. Create a new initrd image using the following command to include `scsi_dh_rdac` into ram disk:
   ```
   mkinitrd -i /boot/initrd-r -rdac -k /boot/vmlinuz
   ```

4. Update the boot leader to point to the new initrd image, and reboot the host with the new initrd image.

**Copy and Rename the Sample File**

Copy and rename the sample file located at
`/usr/share/doc/packages/multipath-tools/multipath.conf.synthetic` to `etc/multipath.conf`. Configuration changes are now accomplished by editing the new `/etc/multipath.conf` file. All entries for multipath devices are commented out initially. The configuration file is divided into five sections:

- **defaults** – Specifies all default values.
- **blacklist** – All devices are blacklisted for new installations. The default blacklist is listed in the commented-out section of the `/etc/multipath.conf` file. Blacklist the device mapper multipath by WWID if you do not want to use this functionality.
- **blacklist_exceptions** – Specifies any exceptions to the items specified in the section blacklist
- **devices** – Lists all multipath devices with their matching vendor and product values
- **multipaths** – Lists the multipath device with their matching WWID values

**Determine the Attributes of a MultiPath Device**

To determine the attributes of a multipath device, check the multipaths section of the `/etc/multipath.conf` file, then the devices section, then the defaults section. The model settings used for multipath devices are listed for each storage array and include matching vendor and product values. Add matching storage vendor and product values for each type of volume used in your storage array.

For each UTM LUN mapped to the host, include an entry in the blacklist section of the `/etc/multipath.conf` file. The entries should follow the pattern of the following example.
blacklist {
  device {
    vendor "***
    product "Universal Xport"
  }
}

The following examples show the devices section from the /etc/multipath.conf file. Be sure the vendor ID and the product ID for the Sun Storage 2500-M2 arrays are set as shown in the following examples:

For 2530-M2

devices {
  device {
    vendor "SUN"
    product "LCSM100_S"
    path_grouping_policy group_by_prio
    prio rdac
    getuid_callout "/lib/udev/scsi_id -g -u -d /dev/%n"
    polling_interval 5
    path_checker rdac
    path_selector "round-robin 0"
    hardware_handler "1 rdac"
    failback immediate
    features "2 pg_init_retries 50"
    no_path_retry 30
    rr_min_io 100
  }
}

For 2540-M2

devices {
  device {
    vendor "SUN"
    product "LCSM100_F"
    path_grouping_policy group_by_prio
    prio rdac
    getuid_callout "/lib/udev/scsi_id -g -u -d /dev/%n"
    polling_interval 5
    path_checker rdac
    path_selector "round-robin 0"
    hardware_handler "1 rdac"
    failback immediate
    features "2 pg_init_retries 50"
    no_path_retry 30
  }
}
The following table explains the attributes and values in the devices section of the /etc/multipath.conf file.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Parameter Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path_grouping_policy</td>
<td>group_by_prio</td>
<td>The path grouping policy to be applied to this specific vendor and product storage.</td>
</tr>
<tr>
<td>prio</td>
<td>rdac</td>
<td>The program and arguments to determine the path priority routine. The specified routine should return a numeric value specifying the relative priority of this path. Higher numbers have a higher priority.</td>
</tr>
<tr>
<td>getuid_callout</td>
<td>&quot;/lib/udev/scsi_id -g -u -d /dev/%n&quot;</td>
<td>The program and arguments to call out to obtain a unique path identifier.</td>
</tr>
<tr>
<td>polling_interval</td>
<td>5</td>
<td>The interval between two path checks, in seconds.</td>
</tr>
<tr>
<td>path_checker</td>
<td>rdac</td>
<td>The method used to determine the state of the path.</td>
</tr>
<tr>
<td>path_selector</td>
<td>&quot;round-robin 0&quot;</td>
<td>The path selector algorithm to use when there is more than one path in a path group.</td>
</tr>
<tr>
<td>hardware_handler</td>
<td>&quot;1 rdac&quot;</td>
<td>The hardware handler to use for handling device-specific knowledge.</td>
</tr>
<tr>
<td>failback</td>
<td>10</td>
<td>A parameter to tell the daemon how to manage path group failback. In this example, the parameter is set to 10 seconds, so failback occurs 10 seconds after a device comes online. To disable the failback, set this parameter to manual. Set it to immediate to force failback to occur immediately.</td>
</tr>
</tbody>
</table>
Using the Device Mapper Devices

Multipath devices are created under /dev/ directory with the prefix dm-. These devices are the same as any other block devices on the host. To list all of the multipath devices, run the multipath -ll command. The following example shows system output from the multipath -ll command for one of the multipath devices.

```
mpathp (3600a0b80005ab177000017544a8d6b92) dm-0 LSI,INF-01-00
[size=5.0G][features=3 queue_if_no_path
pg_init_retries 50][hwhandler=1 rdac][rw]
\_ round-robin 0 [prio=6][active] \_ 5:0:0:0
sdc  8:32   [active][ready] \_
round-robin 0 [prio=1][enabled] \_ 4:0:0:0    sdb  8:16
[active][ghost]
```
In this example, the multipath device node for this device is `/dev/mapper/mpathp` and `/dev/dm-0`. The following table lists some basic options and parameters for the multipath command.

**TABLE 13**  Options and Parameters for the `multipath` Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>multipath -h</code></td>
<td>Prints usage information</td>
</tr>
<tr>
<td><code>multipath -ll</code></td>
<td>Shows the current multipath topology from all available information (sysfs, the device mapper, path checkers, and so on)</td>
</tr>
<tr>
<td><code>multipath -f map</code></td>
<td>Flushes the multipath device map specified by the map option, if the map is unused</td>
</tr>
<tr>
<td><code>multipath -F</code></td>
<td>Flushes all unused multipath device maps</td>
</tr>
</tbody>
</table>

**Troubleshooting the Device Mapper**

**TABLE 14**  Troubleshooting the Device Mapper

<table>
<thead>
<tr>
<th>Situation</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the multipath daemon, <code>multipathd</code>, running?</td>
<td>At the command prompt, enter the command: <code>/etc/init.d/multipathd status</code>.</td>
</tr>
<tr>
<td>Why are no devices listed when you run the <code>multipath -ll</code> command?</td>
<td>At the command prompt, enter the command: <code>#cat /proc/scsi/scsi</code>.</td>
</tr>
<tr>
<td></td>
<td>The system output displays all of the devices that are already discovered.</td>
</tr>
<tr>
<td></td>
<td>Verify that the <code>multipath.conf</code> file has been updated with proper settings.</td>
</tr>
</tbody>
</table>
Restrictions and Known Issues

The following are restrictions and known issues applicable to this product release.

■ “Restrictions” on page 21
■ “Controller Issues” on page 22
■ “OS Issues” on page 23

Restrictions

Single Path Data Connections

In a single path data connection, a group of heterogeneous servers is connected to an array through a single connection. Although this connection is technically possible, there is no redundancy, and a connection failure will result in loss of access to the array.

Caution – Because of the single point of failure, single path data connections are not recommended.

SAS Host Ports on the Sun Storage 2540-M2

Although SAS host ports are physically present on the Sun Storage 2540-M2 array controller tray, they are not for use, not supported, and are capped at the factory. FIGURE 1 shows the location of these ports. The Sun Storage 2540-M2 only supports Fibre Channel host connectivity.

FIGURE 1  SAS Host Ports on the 2540-M2
SAS-2 Phase 5++ HBA Unable to Boot from Attached 2530-M2 Volume

Bug 7042226 – SAS-2 HBA device booting is not supported using Phase 5++ HBA firmware. This restriction will be lifted with the Phase 10 HBA firmware.

Controller Issues

I/O Errors Occur During Controller Firmware Download

Configuration:
- Red Hat Enterprise Linux (RHEL) version 6 with kernel 2.6.32 only.
- PowerPC
- Emulex 10N9824 HBA
- Device Mapper Multipath (DMMP) failover driver
- Sun Storage 2500-M2 controller tray
- Sun Storage 6180 controller tray

Note – This problem does not occur in RHEL version 6.0 with kernel 2.6.33.

Problem or Restriction: An I/O error occurs during an online controller firmware upgrade.

Workaround: To avoid this problem, quiesce the host I/O before performing controller firmware upgrades. To recover from this problem, make sure that the host reports that it has optimal paths available to the storage array controllers, and then resume I/O.

2500-M2 Controller Firmware Panics during Firmware Download

Configuration:
- Sun Storage 2500-M2 controller tray
- Controller firmware version 7.77
- Environmental services monitor (ESM/IOM)

Problem or Restriction: This problem occurs when a firmware download to the controller causes the controller to panic and reboot.
Workaround: Stop all I/O to the array before initiating the firmware download. Once the download is initiated, the controller automatically reboots, recovering the system.

Caution – To avoid potential data loss, stop all I/O to the array before initiating the firmware download.

OS Issues

Linux RDAC 09.03.0C02.0453 - Make Install Dependencies

Configuration:
- Red Hat Enterprise Linux (RHEL) or Oracle Linux version 5.5 or 5.6
- RDAC driver version 09.03.0C02.0453

Bug 7042297 – Before running a “make” on the RDAC driver, the following kernel packages are required:
- kernel-2.6.18-194.el5
- kernel-devel-2.6.18-194.el5.x86_64.rpm
- kernel-headers-2.6.18-194.el5.x86_64.rpm
- glibc-headers-2.5-49.x86_64.rpm
- glibc-devel-2.5-49.x86_64.rpm
- libgomp-4.4.0-6.el5.x86_64.rpm
- gcc-4.1.2-48.el5.x86_64.rpm

RHEL6 DMMP Excessive Log Messages

Bug 7034078 – When booting a Red Hat Enterprise Linux 6.0 host mapped to volumes on a Sun Storage 2500-M2 array in a multipath configuration using DMMP, it is possible to receive excessive messages similar to the following:
- multipathd: dm-2: add map (uevent)
- multipathd: dm-2: devmap already registered

Workaround – This is normal behavior on RHEL 6.0.
Oracle Linux 6 Boots With Messages

**Bugs 7038184, 7028670, 7028672** – When booting an Oracle Linux 6.0 host mapped to volumes on Sun Storage 2500-M2 and 6780 arrays, it is possible to receive one of these messages:

“FIXME driver has no support for subenclosures (1)”
“FIXME driver has no support for subenclosures (3)”
“Failed to bind enclosure -19”

**Workaround** – This is a cosmetic issue with no impact to the I/O path. There is no workaround.

Log Events Using SLES 11.1 With smartd Monitoring Enabled

**Bug 7014293** – When a SLES 11.1 host with smartd monitoring enabled is mapped to volumes on either a Sun Storage 2500-M2 or 6780 array, it is possible to receive “IO FAILURE” and “Illegal Request ASC/ASCQ” log events.

**Workaround** – Either disable smartd monitoring or disregard the messages. This is an issue with the host OS.

Cluster Startup Fails When Devices Are in a Unit Attention State

**Configuration:**
- Red Hat Enterprise Linux (RHEL) version 6.0 with Native Cluster
- Device Mapper Multipath (DMMP) failover driver

**Problem or Restriction:** This problem occurs when the DMMP failover driver is used with the RHEL version 6.0 OS. If you try to set up a Red Hat cluster with the DMMP failover driver, cluster startup might fail during the unfencing stage, where each host registers itself with the SCSI devices. The devices are in a Unit Attention state, which causes the SCSI registration command issued by the host during startup to fail. When the cluster manager (`cman`) service starts, the logs show that the nodes failed to unfence themselves, which causes the cluster startup to fail.

**Workaround:** To avoid this problem, do not use the DMMP failover driver with RHEL version 6.0. To recover from this problem, open a terminal window, and run:

```bash
sg_turs -n 5 <device>
```

where `<device>` is a SCSI device that is virtualized by the DMMP failover driver. Run this command on every `/dev/sd` device that the DMMP failover driver manages. It issues a Test Unit Ready command to clear the Unit Attention state and allow node registration on the device to succeed.
Node Unfencing Fails when Automatically Generated Host Keys Are Used during a Red Hat Cluster Suite Services Startup

**Operating System:** Red Hat Enterprise Linux 6 with Native Cluster

**Problem or Restriction:** This problem occurs the first time a cluster is set up when the cluster.conf file does not have manually defined host keys. When the cluster.conf file was first defined to set up a cluster with SCSI reservation fencing, the cluster services were started on the nodes. With SCSI reservation fencing, the hosts try to generate and register a key on the clustered devices as part of the cluster manager’s startup. The cluster manager service (cman) fails to start, and the key cannot be zero error message appears in the host log.

**Workaround:** To avoid this problem, use only power fencing. Do not use SCSI reservation fencing. To recover from this problem, change to manually defined host keys, and restart the cluster services.

Red Hat Cluster Suite Services with GFS2 Mounts Cannot Transfer Between Nodes when the Client Mounts with NFSv4

**Operating System:** Red Hat Enterprise Linux 6 Native Cluster

**Problem or Restriction:** This problem occurs during an attempt to transfer a cluster service manually when a client is connected using NFSv4. The Global File System (GFS) 2 mount points failed to unmount, which caused the Red Hat Cluster Suite Services to go to the Failed state. The mount point, and all other mount points exported from the same virtual IP address, becomes inaccessible.

**Workaround:** To avoid this problem, configure the cluster nodes to not allow mount requests from NFS version 4 (NFSv4) clients. To recover from this problem, restart the failed service on the node that previously owned it.

Host Aborts I/O Operations

**Operating System:** Red Hat Enterprise Linux version 6.0

**Problem or Restriction:** This problem occurs during an online controller firmware upgrade. The controller is not responding quickly enough to a host read or write to satisfy the host. After 30 seconds, the host sends a command to abort the I/O. The I/O aborts, and then starts again successfully.

**Workaround:** Quiesce the host I/O before performing the controller firmware upgrade. To recover from this problem, either reset the server, or wait until the host returns an I/O error.
Host Attempts to Abort I/O Indefinitely

Operating System: Red Hat Enterprise Linux version 6.0 with kernel 2.6.32.

Red Hat Bugzilla Number: 620391

Note – This problem does not occur in Red Hat Enterprise Linux version 6.0 with kernel 2.6.33.

Problem or Restriction: This problem occurs under situations of heavy stress when storage arrays take longer than expected to return the status of a read or write. The storage array must be sufficiently stressed that the controller response is more than 30 seconds, at which time a command is issued to abort if no response is received. The abort will be retried indefinitely even when the abort is successful. The application either times out or hangs indefinitely on the read or write that is being aborted. The messages file reports the aborts, and resets might occur on the LUN, the host, or the bus.

Factors effecting controller response include Remote Volume Mirroring, the controller state, the number of attached hosts, and the total throughput.

Workaround: To recover from this problem, reset the power on the server.
