License Restrictions Warranty/Consequential Damages Disclaimer

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

Warranty Disclaimer

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

Restricted Rights Notice

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS

Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle America, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

Hazardous Applications Notice

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Trademark Notice

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. Upgrading to Java CAPS 6.3

The topics listed here provide information about upgrading to the Java Composite Application Platform Suite (Java CAPS) Release 6.3.

What You Need to Know

- [“Overview of Upgrading to Java CAPS 6.3” on page 5](#)

What You Need to Do

- [“Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3” on page 6](#)
- [“Upgrading From Release 6.x to Release 6.3” on page 12](#)

Reference Material

- *[Planning for Oracle Java CAPS 6.3 Installation](#)*
- *[Using the Oracle Java CAPS 6.3 Installation GUI](#)*
- *[Using the Oracle Java CAPS 6.3 Installation CLI](#)*

Overview of Upgrading to Java CAPS 6.3

The process of upgrading from 5.x releases to 6.x releases is different from the previous upgrading process. Beginning with Release 6, you no longer perform an in-place installation. Instead, install Java CAPS 6.x in a new directory, and then import your Projects from previous releases.

Here are the basic steps for upgrading from 5.x releases of Java CAPS to release 6.3:

- Install Java CAPS in a new directory
- Export your Projects and Environments from an earlier release of Java CAPS 5.1.0–5.1.3 or Integrated Composite Application Network Suite (ICAN Suite) 5.0.5
- Import your Projects and Environments into release 6.3 using the NetBeans IDE Import Manager

- Update your runtime components, and then build and deploy the Projects

To upgrade from 6x releases of Java CAPS, you can either perform the above steps, or you can upgrade the existing Repository and use it with the new Java CAPS 6.3 installation. Performing the upgrade in this way, you do not need to export and import any Projects; you will just continue to use the existing Repository.

Note – Components from 5.x versions of Java CAPS or ICAN are not compatible with Release 6.3 components. For example, you cannot use a 5.1.3 Enterprise Designer to connect to a Release 6.3 Repository or vice versa.

Perform the procedure below related to the version from which you are upgrading:

- [“Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3” on page 6](#)
- [“Upgrading From Release 6.x to Release 6.3” on page 12](#)

Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3

The process to upgrade from release 5.0.5 and earlier to release 6.3 has changed considerably. With release 5.1.3 and earlier, you performed an in-place installation. Now, you install Java CAPS 6.3 into a new directory, export 5.1.3 and earlier Projects and Environments and then import them into release 6.3 using the NetBeans IDE.

There are two ways to export your old Projects and Environments and create an external file:

- Use Enterprise Designer's export function
- Use a command-line script

Perform the following steps to upgrade from a 5.x release of Java CAPS to release 6.3.

- [“Exporting and Importing Projects and Environments” on page 7](#)
- [“Completing the Upgrade From Java CAPS 5.x” on page 12](#)

Tip – These steps include installing Java CAPS. See one of the following topics for complete instructions on how to install:

- [Using the Oracle Java CAPS 6.3 Installation GUI](#)
- [Using the Oracle Java CAPS 6.3 Installation CLI](#)

Before beginning an installation, ensure that you are familiar with the contents of [Planning for Oracle Java CAPS 6.3 Installation](#).

Note that a default Java CAPS installation does not install the complete set of products that were installed in previous versions. You might need to manually install some additional components, such as Adapters or other add-ons.

Exporting and Importing Projects and Environments

Perform one of the following procedures to export existing Projects and import them into the new Java CAPS environment.

- [“To Use Enterprise Designer to Export Projects and Environments” on page 7](#)
- [“To Use a Command Line to Export Projects and Environments” on page 9](#)

Tip – When exporting a Project, note the following:

- The exported Project may have references to elements that are in other Projects. A list of such references is generated during the export process.
 - Project deployment profiles are not exported, because they have references to both Project and Environment elements that are not required at the Project level.
-

▼ **To Use Enterprise Designer to Export Projects and Environments**

Before You Begin Before beginning the process of exporting Projects and Environments from prior releases of Java CAPS 5.1.0–5.1.3 or ICAN Suite 5.0.5, it is recommended that you acquaint yourself with the steps to complete the task in the appropriate version of the *eGate Integrator User's Guide*.

1 Install Java CAPS 6.3.

See the notes under [“Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3” on page 6](#) for links to more information.

2 If you are using any components that are not included in the default installation, reinstall them now.

This includes certain adapters and add-ons, certain core components like Oracle Java CAPS Master Index, and so on.

Tip – You can view a list of installed products for Java CAPS 6.3 on the Suite Uploader, which can be accessed from a web browser if the Repository is started. The URL is `http://host-name:port-number..` The default port number is 12000.

3 Export a Project or Environment from releases 5.0.5 through 5.1.3 using Enterprise Designer and create an external file to import into Release 6.3.

Record the settings for your Projects and Environments before exporting them. You will need this information when you reset the properties.

a. From the Repository or Project context menu, select Export Project to display the Export Manager dialog.

Note – If you do not have any existing Environments in your Repository, the Environment panes are empty.

b. Highlight the desired Projects or Environments in the displayed lists.

c. Click the appropriate Arrow button to transfer the highlighted items to the Selected Projects or Selected Environments panes.

d. When the desired Project appears in the Selected Projects pane, click Browse.

The Save As dialog box appears. A file name is already defined by adding the ZIP extension to the Project name.

Note – You can change the export file name.

e. To enter the file name click Save As.

The Export Manager dialog box reappears.

f. Select the export destination and then click Export to export the Project file.

This process may take a few minutes. The Export Status message box appears after the file has been exported successfully.

g. To close the message box click OK.

4 Import the Java CAPS Project or Environment into the NetBeans IDE.

a. Start the NetBeans IDE.

b. On the menu bar, select Tools, point to CAPS Repository, and then select Import Project.

A warning dialog box appears with a reminder to save any unsaved changes.

- c. Click **No** if you need to save or check in any changes; otherwise, click **Yes** to continue with the process.
The Import Manager dialog box appears.
- d. In the **From ZIP file** field, browse to the location of the export ZIP file you created and then select the file.
- e. If you want the Project to appear as top level in the Projects pane in the NetBeans IDE, select **As Top-Level** under the **Destination Project** field drop down list.
- f. When you have made all your selections on the Import Manager dialog box, click **Import**.
- g. When the **Import Status** message appears, click **OK**.
- h. Wait until the **Repository** completes refreshing, and then close the **Import Manager** dialog box.
The Project appears in the Projects Window.

▼ To Use a Command Line to Export Projects and Environments

Before You Begin

You can export a Project, an Environment, or a Project and an Environment using a command-line script. Before beginning the process of exporting Projects and Environments from prior releases of Java CAPS 5.1.0–5.1.3 or ICAN Suite 5.0.5, it is recommended that you acquaint yourself with the steps to complete the task in the appropriate *eGate Integrator User's Guide*.

Location of Script File

```
JavaCAPS_install_dir\repository\util\exportProject.bat
```

or

```
JavaCAPS_install_dir/repository/util/exportProject.sh
```

Command Syntax

```
exportProject username password branch_name export_file project_name environment_name
```

where:

- *branch_name* is the name of the Repository branch to contain the Project or Environment you are exporting.
- *export_file* is the name and path for the archive file to contain the Project or Environment you are exporting.
- *project_name* is the name of the Project you are exporting. You can export multiple Projects by listing them one after another, separated by a plus sign (+). If you do not export a Project, leave this parameter as an empty string ("").

- *environment_name* is the name of the Environment you are exporting. You can export multiple Environments by listing them one after another, separated by a plus sign (+). If you do not export an Environment, leave this parameter as an empty string ("").

Note – The *project_name* and *environment_name* variables assume that the objects reside in the same repository directory as the script file you are using.

Caution – Project names should not include special characters such as a comma (,), single quote ('), or double quote ("). If any of these characters are used, you must escape them when using the `exportProject` command-line tool.

1 Install Java CAPS 6.

See the notes under [“Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3”](#) on page 6 for links to more information.

2 If you are using any components that are not included in the default installation, reinstall them now.

This includes certain adapters and add-ons, certain core components like Oracle Java CAPS Master Index, and so on.

Tip – You can view a list of installed products for Java CAPS 6.3 on the Suite Uploader, which can be accessed from a web browser if the Repository is started. The URL is `http://host-name:port-number..` The default port number is 12000.

3 Export a Project using the export script.

a. Open a command prompt.

b. Navigate to `JavaCAPS_install_dir\repository\util`.

c. Enter the following command:

```
exportProject username password branch_name export_file project_name  
environment_name
```

For example, to save the Project `myProject` to the file `c:\project1export.zip` with the default login, the command would be similar to the following:

```
exportProject admin adminadmin C:\JavaCAPS5\project1export.zip myProject.
```

4 Import the Java CAPS Project or Environment into the NetBeans IDE.

a. Start the NetBeans IDE.

- b. **On the menu bar, select Tools, point to CAPS Repository, and then select Import Project.**

A warning dialog box appears with a reminder to save any unsaved changes.

- c. **Click No if you need to save or check in any changes; otherwise, click Yes to continue with the process.**

The Import Manager dialog box appears.

- d. **In the From ZIP file field, browse to the location of the export ZIP file you created and then select the file.**

- e. **If you want the Project to appear as top level in the Projects pane in the NetBeans IDE, select As Top-Level under the Destination Project field drop down list.**

- f. **When you have made all your selections on the Import Manager dialog box, click Import.**

- g. **When the Import Status message appears, click OK.**

- h. **Wait until the Repository completes refreshing, and then close the Import Manager dialog box.**

The Project appears in the Projects Window.

Note – When importing a Project, note that:

- Existing Projects are not affected by an imported Project.
- During import, if a Project with the same name as the Project being imported already exists in the target Repository, an error message informs you that the existing file will not be overwritten.
- References are validated during import.
- Project deployment objects are not imported.

-
- 5 **After you import a Project or Environment, verify the configuration properties defined in the Connectivity Map and the Environment.**

Caution – Due to configuration changes from version 5.0.x, certain properties might be reset to their default value. Specifically, you should verify file names and directories defined for Adapters, but other properties might have changed as well. For Projects containing MSMQ Adapters, be sure to verify both sets of properties because some properties were changed and new properties were added since version 5.1.3.

-
- 6 **Continue to [“Completing the Upgrade From Java CAPS 5.x” on page 12.](#)**

Completing the Upgrade From Java CAPS 5.x

Once you have imported all previous Projects and Environment into Java CAPS 6.3, you need to recompile and in some cases reconfigure the Projects.

▼ To Complete the Upgrade

- 1 Complete the steps under [“Exporting and Importing Projects and Environments” on page 7](#).

Caution – Be sure to verify the Adapter properties in the Connectivity Maps and Environments.

- 2 Recreate any connection pools using the GlassFish Admin Console.
- 3 Redefine any required security attributes using the GlassFish Admin Console.
- 4 Reinstall the required plugins in Enterprise Manager.
- 5 If you are migrating a JMS-based Project and are using the same Environment as before, you need to update the JMS URL defined in the Environment. The new default URL is `stcms://localhost:18007`.
- 6 Build and deploy all migrated Projects.

Upgrading From Release 6.x to Release 6.3

You can upgrade from previous release 6 versions by using the import and export method described in [“Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3” on page 6](#), or you can perform side-by-side upgrade that allows you to continue to use your existing Repository by applying a patch to update the components. When you have completed the side-by-side upgrade, you will have two Java CAPS environments and will use the Java CAPS 6.3 components to connect to your Repository from the previous environment.

No matter which method you use, the runtime application must be manually rebuilt and redeployed to the new application server after the runtime upgrade is complete. This is described in [“Completing the Upgrade From Java CAPS 6.x” on page 14](#).

To upgrade from an earlier Release 6 version, perform the following steps:

- [“Upgrading the Repository” on page 13](#) (side-by-side method) OR [“Upgrading From Release 5.0.5 - 5.1.3 to Release 6.3” on page 6](#) (export and import method)
- [“Completing the Upgrade From Java CAPS 6.x” on page 14](#)

Upgrading the Repository

This topic describes the side-by-side method of upgrading the Repository. In addition to installing the latest version of Java CAPS, you will also install a patch to the previous version's Repository so you can continue using it in the new Java CAPS installation.

Tip – See one of the following topics for complete instructions on how to install Java CAPS:

- [Using the Oracle Java CAPS 6.3 Installation GUI](#)
- [Using the Oracle Java CAPS 6.3 Installation CLI](#)

Before beginning an installation, ensure that you are familiar with the contents of [Planning for Oracle Java CAPS 6.3 Installation](#).

▼ To Upgrade the Repository

- 1 Perform a complete backup of your existing Java CAPS Repository, domains, and the `caps-patch` directory.
- 2 Install Java CAPS 6.3 in a separate directory with the following guidelines:
 - Use the same Repository name for the new Repository as for the existing Repository that you are upgrading.
 - Use the same port numbers for the new installation as you did for the existing Java CAPS environment.
- 3 Rename the new Repository to `repository_63`.
- 4 Copy the `caps-patch` directory from the Java CAPS 6.3 environment into the old Java CAPS directory.

Note – This step will replace the `caps-patch` directory in the old Java CAPS environment.

- 5 Copy the file named `patches_m1.zip` from the `patches` directory of your installation media to a temporary local directory.
- 6 Extract the ZIP file to the temporary directory (maintaining the directory structure).
- 7 Navigate to `TempDir/patches_m1/patches/`.
You should see a file name `6836560-01-REP.zip`.

- 8 Install the Repository patch by running the following command. Use the `caps-patch-install` command from the old Repository's `caps-patch/util/bin` directory.**

```
caps-patch-install -verbose -repuser user -reppwd password -patch  
temp-dir/6836560-01-REP.zip
```

where *temp-dir* is the location where you copied 6836560-01-REP.zip.

Note – The patch installer takes additional optional parameters. For more information about the syntax, see “[Java CAPS 6.3 Patch Management Tools](#)” in *Installing Patches for Oracle Java CAPS*.

This updates the Repository in the older Java CAPS environment.

- 9 If you are using LDAP prefixes, open the file `JavaCAPSHome/repository/repository/startserver.bat` (or `startserver.sh`), where `JavaCAPSHome` is the Java CAPS R6 or R6U1 home directory. Add the following to the `JAVA_OPTS` section of the file:**

```
-Dorg.apache.catalina.realm.JNDIRealm.ROLE_PREFIX=prefix
```

where *prefix* is the full LDAP prefix to use; for example, com.sun.java.

Note – LDAP prefixes are a new features of the LDAP Adapter in this release. Prefixes are similar to suffixes, except they are prepended instead of appended to a user or group name to form the distinguished name (DN).

- 10 Start the Repository you just updated (in the old Java CAPS environment) and launch the Java CAPS 6.3 NetBeans IDE.**
- 11 Connect to the updated Repository from the NetBeans IDE.**

You might need to modify the Repository connection information and CAPS Project location to connect to the correct Repository.
- 12 Open the existing Repository-based Projects in the Projects window to verify that you are connecting correctly to the updated Repository.**
- 13 Continue to “[Completing the Upgrade From Java CAPS 6.x](#)” on page 14.**

Completing the Upgrade From Java CAPS 6.x

Once you have imported all previous Projects and Environment into Java CAPS 6.3 or have updated the previous Repository, you need to redeploy and in some cases reconfigure the Projects. Runtime components need to be recreated as well.

▼ To Complete the Upgrade

- 1 Complete the steps under [“Upgrading the Repository” on page 13](#).
- 2 **Recreate any runtime artifacts using the GlassFish Admin Console for Java CAPS 6.3.**
This could include any connection pools, security attributes, application configurations, application variables, and so on.
- 3 **Reinstall the required plugins in Enterprise Manager.**
- 4 **Open any JBI Projects in NetBeans Project window.**
- 5 **Build and deploy all Repository and JBI Projects to the new GlassFish server installed with Java CAPS 6.3.**
