Oracle Java CAPS Adapter for DB2 Tutorials

The Oracle Java CAPS Adapter for DB2handles the communication details necessary to send and receive data between these the Java CAPS environment and the DB2 Universal Database, and can apply business logic defined within the collaboration rules or business processes to perform data identification, manipulation, and transformation operations.

The Oracle Java CAPS Adapter for DB2 Tutorial provides two sample projects:

- prjDB2_BPEL Sample Project: Demonstrates how to create a Oracle Java CAPS Business Process Manager project that uses the DB2 Adapter. The prjDB2_BPEL sample project uses input files to pass data into business process. There are four business processes that demonstrate the Insert, Update, Delete, and Select operations, and one process to demonstrate a Prepared Statement. Results are written out to an output file.
- prjDB2_JCD Sample Project: Demonstrates how to create a Java Collaboration Definition (JCD)-based project that uses the DB2 Adapter. The prjDB2_JCD sample project uses input files to pass data into Collaborations. There are four Collaborations that demonstrate the Insert, Update, Delete, and Table Select operations, and one Collaboration to demonstrate a Prepared Statement. Results are written out to an output file.

It is assumed that you are already familiar with Oracle Java CAPS Enterprise Service Bus Suite terminology and concepts.

Note – You can download the Sample Project files from http://java.net/projects/javacaps-samples/pages/Home.

What You Need to Know

The following topics contain introductory and conceptual information for the Oracle Java CAPS Adapter for DB2 Tutorial.

- "About the Oracle Java CAPS Adapter for DB2 Sample Projects" on page 7
- "About the Oracle Java CAPS Business Process Manager Project" on page 9

"About the Java Collaboration Definition Sample Project" on page 10

What You Need to Do

The following topics contain the step-by-step instructions for importing and building the Oracle Java CAPS Adapter for DB2 sample projects.

- "Importing Non-JBI Based Sample Projects" on page 10
- "Running the SQL Script" on page 12

What You Need to Do for the Java Collaboration Definition Project

The following topics contain the step-by-step instructions for importing and building the Oracle Java CAPS Adapter for DB2 Java Collaboration Definition Project (JCD) sample project.

- "Creating the Java Collaboration Definition-Based Project for the Oracle Java CAPS Adapter for DB2" on page 12
 - "Creating a New Project" on page 13
 - "Creating the OTDs" on page 13
 - "Creating the Collaboration Definitions (Java)" on page 17
 - "Using the Java Collaboration Editor to create Business Rules" on page 18
 - "Creating the Connectivity Maps" on page 44
 - "Creating an Environment" on page 47
 - "Configuring the Adapter Properties" on page 47
 - "Creating the Deployment Profile" on page 51
 - "Building and Deploying the Project" on page 53
 - "Running the Project" on page 54

What You Need to Do for the BPEL Project

The following topics contain the step-by-step instructions for importing and building the Oracle Java CAPS Adapter for DB2 BPEL Project sample project.

- "Creating the BPEL-Based Project for the Oracle Java CAPS Adapter for DB2" on page 55
 - "Creating a New Project" on page 13
 - "Creating the OTDs" on page 13
 - "Creating the Business Processes" on page 55
 - "Using Business Process Designer to Create Business Rules" on page 61
 - "Creating the Connectivity Maps" on page 44
 - "Creating an Environment" on page 47
 - "Configuring the Adapter Properties" on page 47
 - "Creating the Deployment Profile" on page 51
 - "Building and Deploying the Project" on page 53
 - "Running the Project" on page 54

About the Oracle Java CAPS Adapter for DB2 Sample Projects

Topics covered in this section include:

- "Sample Input Trigger Files and Output Files" on page 7
- "Sample Project Data" on page 8
- "Operations Used in the DB2 Sample Projects" on page 8

The Oracle Java CAPS Adapter for DB2 Sample Project Zip file contains two sample Projects, one that is Java Collaboration Definition (JCD)-based, and one that uses the Oracle Java CAPS Business Process Manager (BPM).

Both the prjDB2 JCD and prjDB2 BPEL sample projects demonstrate how to:

- Select employee records from a database using a prepared statement.
- Select employee records from the db_employee table.
- Insert employee records into the db_employee table.
- Update an employee record in the db_employee table.
- Delete an employee record from the db_employee table.

Sample Input Trigger Files and Output Files

In addition to the sample projects, the DB2.zip file also includes six sample input trigger files and ten sample output files

Sample input files

- TriggerInsert.in.~in (for JCD projects only)
- TriggerBpInsert.in.~in (for BPM projects only)
- TriggerDelete.in.~in
- TriggerUpdate.in.~in
- TriggerPsSelect.in.~in
- TriggerTableSelect.in.~in

Sample output JCD files

- JCD_Insert_output().dat
- JCD_Delete_output().dat
- JCD_Update_output().dat
- JCD_PsSelect_output().dat
- JCD_TableSelect_output().dat

Sample output BPM files

- BPEL_Insert_output().dat
- BPEL_Delete_output().dat
- BPEL_Update_output().dat

- BPEL_TableSelect_output().dat
- BPEL_PsSelect_output().dat

Sample Project Data

Data used for the sample projects are contained within a table called db_employee. The table has three columns, as follows:

 TABLE 1
 Sample Project Data - db_employee Table

| Column Name | Data Type | Data Length |
|-------------|-----------|-------------|
| emp_no | INTEGER | 10 |
| last_name | VARCHAR | 30 |
| first_name | VARCHAR | 30 |
| rate | FLOAT | 15 |
| last_update | TIMESTAMP | 19 |

Note – DB2 databases do not accept table data with columns that include Boolean data types. For example, an DB2 server expects a literal "T" or "F" for True or False Boolean values, and does not accept Java primitive Boolean True or False values.

Operations Used in the DB2 Sample Projects

The following database operations are used in both the Java Collaboration Definition-based and Business Process Manager sample projects:

- Delete
- Insert
- Select Table
- Select Prepared Statement
- Update

About the Oracle Java CAPS Business Process Manager Project

The prjDB2_BPEL sample project uses input files to pass data into business process. There are four business processes that demonstrate the Insert, Update, Delete, and Select operations, and one process to demonstrate a Prepared Statement. Results are written out to an output file.

This section contains the following topics

- "Associating Business Process Manager Operators" on page 9
- "Deploying JCD-Based Operations in the Business Process Manager" on page 9

Associating Business Process Manager Operators

You can associate a Oracle Java CAPS Business Process Manager Business Process Activity with the Oracle Java CAPS Adapter for DB2 both during the system design phase and during runtime.

To make this association:

- 1. Select the desired receive or write operation under the adapter in the NetBeans Projects window.
- Drag the operation onto the Business Process Editor canvas.
 The operation automatically changes to an Activity with an icon identifying the component that is the basis for the Activity.

The operator automatically changes to an Activity with an icon identifying the component that is the basis for the Activity.

At run time, the Oracle Java CAPS Business Process Manager engine invokes each step in the order defined in the Business Process. Using the engine's Web Services interface, the Activity invokes the Oracle Java CAPS Adapter for Batch.

Deploying JCD-Based Operations in the Business Process Manager

You can deploy a Java Collaboration Definition-based component as an Activity in a Oracle Java CAPS Business Process Manager Business Process. Once you associate the desired component with an Activity, Oracle Java CAPS Business Process Manager invokes it using a Web Services interface. Oracle Java CAPS Enterprise Service Bus components that can interface with Oracle Java CAPS Business Process Manager include the following:

- Java Messaging Service (JMS)
- Object Type Definitions (OTDs)

- Adapters
- Collaborations

Using the NetBeans IDE and Oracle Java CAPS Business Process Manager, you can add an Activity to a Business Process, then associate that Activity with Oracle Java CAPS Enterprise Service Bus component, for example, an adapter. Then, when Oracle Java CAPS Business Process Manager runs the Business Process, it automatically invokes that component using its Web Services interface.

About the Java Collaboration Definition Sample Project

The prjDB2_JCD sample Project uses input files to pass data into Collaborations. There are four Collaborations that demonstrate the Insert, Update, Delete, and Table Select operations, and one Collaboration to demonstrate a Prepared Statement. Results are written out to an output file.

Assigning Operations in a Java Collaboration Definition-Based Project

Database operations are listed as methods in the JCD.

Perform the following steps to access these methods:

- 1. Create a Collaboration that contains an OTD using DB2.
- 2. Right-click the OTD listed in your Collaboration and then select Method to Call from the popup menu.
- Browse to and select a method to call.

Importing Non-JBI Based Sample Projects

Sample projects are available for implementation and product training. You can import the sample project files from the Java CAPS sample web site at http://java.net/projects/javacaps-samples/pages/Home.

Note – If you do not already have one, you might need to create an Oracle account to access the samples.

▼ To Import a Non-JBI Based Sample Project

Before You Begin

Make sure that the repository is running and that all necessary SAR files and components have been loaded. Save all unsaved work before proceeding.

1 Open your browser and navigate to the above URL.

- 2 On the Database Adapters tab, click Adapter for DB2 Connect next to the red arrow.
 - The File Download dialog box appears.
- 3 Click Save, and the select a temporary local directory to save the file to.
- 4 Navigate to the temporary directory and extract db2_connect.zip.
- 5 Start NetBeans IDE and connect to the running repository:
 - a. Select Tools o CAPS Repository o Connect.
 - b. Supply or accept values: login name, password, etc.
 - c. Click Connect.
- 6 From the NetBeans toolbar, select Tools \to CAPS Repository \to Import Project. The Import Manager appears.
- 7 In the Import Manager dialog box, browse to the location of the sample project archive file you extracted earlier, and select the ZIP file for the project you want to import.
- 8 In the Destination Project field, select As Top-Level.
- 9 When the sample project has successfully imported, click Close.
- 10 Click Import. The new project appears in the Projects window.
- **Next Steps** After you Import a project, there are several steps required to configure, deploy, and run the project.

See the following sections for directions to complete your imported project:

- "Configuring the Adapter Properties" on page 47
- "Creating the Deployment Profile" on page 51
- "Building and Deploying the Project" on page 53
- "Running the Project" on page 54

Running the SQL Script

The data used for both the Java Collaboration Definition-based and Business Process Manager sample projects are contained within a table called db_employee. You create this table by running the SQL statement DB2_Sample_script.sql, that is included in the sample Project. Note that you must use a database tool to run the script.

The SQL statement designed for the sample projects, is as follows:

```
drop table db_employee
go
create table db_employee (
   EMP_NO int,
   LAST_NAME varchar(30),
   FIRST_NAME varchar(30),
   RATE float,
   LAST_UPDATE datetime)
go
```

The sample Projects provided with the Oracle Java CAPS Adapter for DB2 use input files to pass predefined data or conditions into the Collaboration or Business Process, which then transform the database contents, and deliver the ResultSet.

Creating the Java Collaboration Definition-Based Project for the Oracle Java CAPS Adapter for DB2

The Java Collaboration Definition (JCD)-based project uses Business Rules defined within Java Collaborations that rely on Object Type Definitions. This section provides step-by-step instructions for manually creating the prjDB2_JCD sample Project.

The following steps are required to create the project:

- "Creating a New Project" on page 13
- "Creating the OTDs" on page 13
- "Creating the Collaboration Definitions (Java)" on page 17
- "Using the Java Collaboration Editor to create Business Rules" on page 18
- "Creating the Connectivity Maps" on page 44
- "Creating an Environment" on page 47
- "Configuring the Adapter Properties" on page 47
- "Creating the Deployment Profile" on page 51
- "Building and Deploying the Project" on page 53
- "Running the Project" on page 54

Creating a New Project

First, you create a new project in the NetBeans IDE

Create a Project

- 1 Start the NetBeans IDE
- 2 Click the New Project icon, or select File → New Project to initiate the New Project wizard.
- 3 In Step 1 of the Wizard, select CAPS → ESB from the Categories column, CAPS Repository-Based Project from the Projects column, and click Next.
- 4 In Step 2 of the Wizard, specify your project name (for this project, use prjDB2_JCD), and click Finish.

Next Steps For your next step, see "Creating the OTDs" on page 13.

Creating the OTDs

The Database OTD Wizard generates Object Type Definitions (OTDs) by connecting to external data sources and creating corresponding OTDs. The sample project requires three OTDs to interact with the DB2 Adapter.

These OTDs are:

- DB2 Database OTD
- Inbound DTD OTD
- Outbound DTD OTD

The sample project ZIP file includes DTDs used to create the inbound and outbound DTD OTDs.

▼ Create the DB2 Database OTD

1 Right-click your new Project in the Project window, and select New \to Object Type Definition from the popup menu.

The New Object Type Definition Wizard appears.

In Step 1 of the wizard, select the wizard type. In this case, select DB2 Database as the wizard type. Click Next. 3 In Step 2 of the wizard, specify the database connection information.

The connection information fields are:

- Host name
- Port
- Database
- User name
- Password

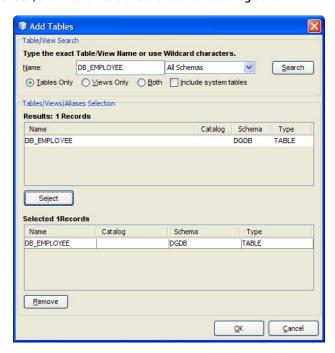

Once you have entered the correct information in the connection fields, click Next.

- 4 In Step 3 of the wizard, select the types of database object you want to include in your project For this example, select the following:
 - Tables/Views/Aliases
 - Prepared Statements

Click Next.

In Step 4 of the wizard, select the table for the project. Click Add. The Add Tables dialog box appears.

6 From the Add Tables dialog box, search for or enter the name of the database. For this example, use the DB_EMPLOYEE table. When the database appears in the Results selection frame, click Select, and click OK to close the Add Table dialog box.

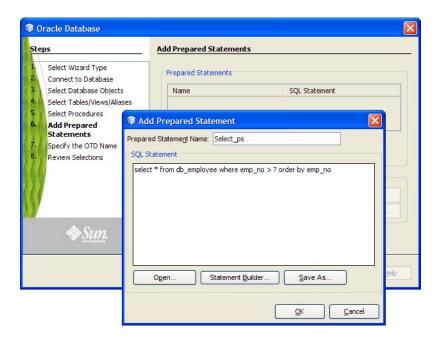

7 Click Next. The wizard proceeds to Step 6, Add Prepared Statements. Click Add.

The Add Prepared Statement dialog box appears.

8 In the Add Prepared Statements dialog box, enter Select_ps as the Prepared Statement Name, and enter the following as the SQL Statement:

```
select * from db_employee where emp_no > ? order by emp_no
```

Note – In this example, the SQL statement includes the ? placeholder for input. This placeholder represents the Where Clause.

- 9 Click OK to close the Add Prepared Statement dialog box, and then click Next.
- 10 In Step 7 of the wizard, enter a name for the OTD. In this example, use otdDB2. Click Next.
- 11 In Step 8 of the wizard, review your settings, then click Finish to create the OTD.

▼ Create the Inbound and Outbound DTD OTDs

- 1 To create the inbound DTD OTD, right-click your project in the NetBeans Projects window, and select New → Object Type Definition from the popup menu.
 - The New Object Type Definition Wizard appears.
- 2 Select DTD as the wizard type, and click Next.
- 3 Browse to and select the otdInputDTD. dtd file that was extracted with the sample project. Click Select, and click Next.

- 4 In Step 3 of the wizard, select the otdInputDTD_DBemployees document element, and click Next.
- 5 In Step 4 of the wizard, accept the default option settings, and click Finish.

The new OTD, otdInputDTD_DBemployees, now appears under your project's otdALL node, in the Projects window.

6 To create the otdOutputDTD_DBemployees OTD, repeat steps 1–5 above, substituting otdOutputDTD.dtd for the DTD in step 3.

When you're finished, the project's otdALL folder now contains three OTDs: otdDB2, otdInputDTD DBemployees, and otdOutputDTD DBemployees.

Next Steps For your next step, see:

- "Creating the Collaboration Definitions (Java)" on page 17 if you are creating the prjDB2_JCD Project.
- "Creating the Business Processes" on page 55 if you are creating the prjDB2_BPEL Project.

Creating the Collaboration Definitions (Java)

The sample project uses five Java Collaboration Definitions. Once these Collaborations are created you can write the Business Rules for each using the Collaboration Editor.

▼ Create the Java Collaborations

- 1 Right-click your new Project in the Project window, and select New → Collaboration Definition (Java) from the popup menu.
 - The Collaboration Definition Wizard (Java) appears.
- 2 Enter the name of the Collaboration (for this Collaboration enter jcdDelete) and click Next.
- In Step 2 of the wizard, double-click CAPS Components Library \to Adapters \to File \to FileClient \to receive to add the File Adapter's receive web service operation. Click Next.
- 4 In Step 3 of the wizard, double-click prjDB2_JCD → otdALL → otdDB2. The otdDB2 OTD is added to the Selected OTDs field.
- 5 Click the Up One Level button to return to Projects level, then select CAPS Components Library

 → Adapters → File → FileClient to add the File Adapter's FileClient OTD to the
 Collaboration.

- 6 Click Finish. The new Collaboration is added to your project's jcdALL node, in the Projects window.
- 7 Create the other four Collaborations using the Collaboration Definition Wizard, similar to the way you created the jcdDelete Collaboration, but using the following parameters:

| Collaboration Names | Web Service Operation to Implement | Selected OTDs |
|--|--|--|
| Adap | receive (CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient \rightarrow receive) | ${ m otdDB2~(prjDB2_JCD} ightarrow { m otdALL} ightarrow { m otdDB2})$ |
| | | |
| | | |
| jcdPsSelect | $\begin{array}{c} \text{receive (CAPS Components Library} \rightarrow \\ \text{Adapters} \rightarrow \text{File} \rightarrow \text{FileClient} \rightarrow \\ \text{receive)} \end{array}$ | otdDB2 (prjDB2_JCD $ ightarrow$ otdALL $ ightarrow$ otdDB2) |
| | | otdOutputDTD_DBemployees (prjDB2_JCD → otdALL → otdOutputDTD_DBemployees) |
| | | |
| jcdTableSelect | jcdTableSelect receive (CAPS Components Library $ ightarrow$ | $otdDB2 \; (prjDB2_JCD \rightarrow otdALL \rightarrow otdDB2)$ |
| Adapters $ ightarrow$ File $ ightarrow$ FileClient $ ightarrow$ receive) | otdOutputDTD_DBemployees (prjDB2_JCD → otdALL → otdOutputDTD_DBemployees) | |
| | | |
| , , , , , , , , , , , , , , , , , , , | receive (CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient \rightarrow receive) | $otdDB2 \; (prjDB2_JCD \rightarrow otdALL \rightarrow otdDB2)$ |
| | | |

Next Steps

For your next step, see "Using the Java Collaboration Editor to create Business Rules" on page 18.

Using the Java Collaboration Editor to create Business Rules

The prjDB2_JCD Project uses five Java Collaborations you created previously. To complete the Collaborations, use the Java Collaboration Editor's Business Rules Designer to create the business rules.

The Java Collaboration Editor also allows you to enter Java code to create business rules. The Java Source code is provided at the end of each Collaboration section, and can be copied into the Collaboration Editor's Java Source Editor to create the Collaboration.

This section contains the following topics:

- "Creating the Business Rules for the jcdDelete Collaboration" on page 19
- "Creating the Business Rules for the jcdInsert Collaboration" on page 23
- "Creating the Business Rules for the jcdPsSelect Collaboration" on page 31
- "Creating the Business Rules for the jcdTableSelect Collaboration" on page 33
- "Creating the Business Rules for the jcdUpdate Collaboration" on page 39

Creating the Business Rules for the jcdDelete Collaboration

The jcdDelete Collaboration implements the Input Web Service Operation to read the TriggerDelete.in file and then delete the record emp_no = 500. The Collaboration also writes a message to JCD_Delete_output1.dat to confirm a deleted record.

Note – The where clause in the business rule reads the trigger value as a placeholder for input. This permits you to modify the query to select a specific record. Also note that all records are selected from the database when the TriggerDelete.in file is empty.

Create the jcdDelete Collaboration Business Rules

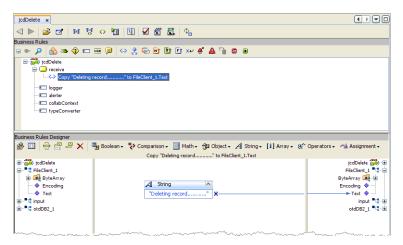

1 From the Project window, double-click the jcdDelete Collaboration under your project's jcdALL node.

The Java Collaboration Editor opens to the jcdDelete Collaboration.

- 2 Create the Copy "Deleting record....." to FileClient_1.Text rule.
 - a. From the Business Rules Designer toolbar's String menu, select Literal String.
 A String method box is added to the Business Rules Designer canvas.
 - b. Double-click the value field of the *String* method box and enter Deleting record...... as the value.

c. Map the output node of the String method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer. To do this, click on the output node of the String method box, and drag your cursor to the Textnode, under FileClient_1 in the right pane of the Business Rules Designer.

A visible link now connects the output node of the *String* method box and the Text node. The Business Rules tree now displays the new rule: Copy "Deleting record....." to FileClient 1.Text.

- 3 Create the FileClient 1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose
 Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The *write* method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

- 4 Create the otdDB2 1.Db employee.delete(input.Text) rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click Db_employee under the otdDB2_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

Select delete(StringsWhere) from the method selection window.

The *delete* method box appears in the Business Rules Designer canvas, and a link connects the Db_employee node in the left pane of the Business Rules Designer to the Db_employee input node of the *delete* method box.

d. Map Text under the input node in the left pane of the Business Rules Designer, to the sWhere (String) input node of the *delete* method box.

- 5 Create the Copy "Delete Done." to FileClient 1.Text rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. From the Business Rules Designer toolbar's String menu, select Literal String.

A String method box is added to the Business Rules Designer canvas.

- c. Double-click the value field of the String method box and enter Delete Done as the value.
- d. Map the output node of the String method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.

- 6 Create the FileClient_1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

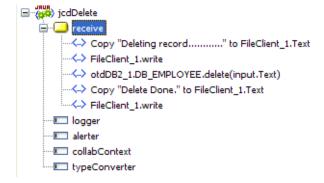

The method selection window appears.

c. Select and double-click write() from the method selection window.

The write method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

7 Click Save All to save your current changes.

The completed jcdDelete Collaboration definition appears as follows:

jcdDelete Collaboration Java Code

The completed Java source code for the jcdDelete Collaboration appears as follows:

```
package prjDB2_JCDjcdALL;

public class jcdDelete
{
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public com.stc.codegen.util.CollaborationContext collabContext;
    public com.stc.codegen.util.TypeConverter typeConverter;
    public void receive( com.stc.connector.appconn.file.FileTextMessage input, com.stc.connector.appconn.file.FileApplication FileClient_1, otdDB2.OtdDB2OTD otdDB2_1 )
```

```
throws Throwable
{
    FileClient_1.setText( "Deleting record......" );
    FileClient_1.write();
    otdDB2_1.getDB_EMPLOYEE().delete( input.getText() );
    FileClient_1.setText( "Delete Done." );
    FileClient_1.write();
}
```

Note – The above code has been wrapped for display purposes.

Creating the Business Rules for the jcdInsert Collaboration

The jcdInsert Collaboration implements the Input Web Service Operation to read the TriggerInsert.in. file. It then unmarshals data from the input data into the otdInputDTD_DBEmployees OTD, calls the otdDB2 OTD, and inserts records into the database via a For Loop. The Collaboration also writes a message to JCD_Insert_output1.dat to confirm an inserted record.

Create the jcdInsert Collaboration Business Rules

1 From the Project window, double-click the jcdInsert Collaboration under your project's jcdALL node.

The Java Collaboration Editor opens to the jcdInsert Collaboration.

- 2 Create the Copy "Inserting records in to db_employee table....." to FileClient_1.Text rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - From the Business Rules Designer toolbar's String menu, select Literal String.
 A String method box is added to the Business Rules Designer canvas.
 - c. Double-click the value field of the String method box and enter Inserting records in to db_employee table..... as the value.
 - d. Map the output node of the String method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.

- 3 Create the FileClient 1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The *write* method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

- 4 Create the otdInputDTD_DB_Employee_1.unmarshalFromString(input.Text) rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click otdInputDTD_DB_Employee_1 in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select unmarshalFromString(String in) from the method selection window.

The *unmarshalFromString* method box appears in the Business Rules Designer canvas, and a link connects the otdInputDTD_DB_Employee_1 node in the left pane of the Business Rules Designer to the Db employee input node of the *unmarshalFromString* method box.

d. Map Text under the input node in the left pane of the Business Rules Designer, to the in (String) input node of the unmarshalFromString method box.

- 5 Create the otdDB2 1.Db employee.insert rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.

b. Right-click Db_employee under the otdDB2_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

Select insert() from the method selection window.

The *insert* method box appears in the Business Rules Designer canvas, and a link connects the db_employee node in the left pane of the Business Rules Designer to the Db_employee input node of the *insert* method box.

- 6 Create the For Loop: i1 is less than count of otdInputDTD DB Employee 1.X sequence Arule.
 - Click the For Loop icon on the Business Rules toolbar to add a For Loop to the Business Rules tree.
 - b. Right-click counter initialization node under the For Loop, and select Local Variable from the popup menu.

The Create Variable dialog box appears.

c. In the Create Variable dialog box, enter i1 as the name and select Primitive: int as the type, and click OK.

The i1 variable is added to the Business Rules Designer.

- d. Select condition: ? under the For Loop on the Business Rules tree.
- Right-click i1 variable node in the left pane of the Business Rules Designer, and choose
 Select method to call from the popup menu.
- f. Select Less Than from the method selection window.

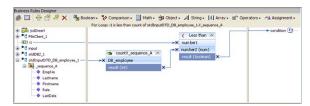

The *Less Than* method box appears in the Business Rules Designer canvas, and a link connects the i1 variable node in the left pane of the Business Rules Designer to the number1 input node of the *i1* method box.

- g. Right-click otdInputDTD_DB_Employee_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.
- h. Select countX_sequence_A() from the method selection window.

The <code>countX_sequence_A</code> method box appears in the Business Rules Designer canvas, and a link connects the <code>otdInputDTD_DB_Employee_1</code> node in the left pane of the Business Rules Designer to the <code>Db_Employee</code> input node of the <code>countX_sequence_A</code> method box.

i. Map the result (int) output node of the countX_sequence_A method box, to the number2 (num) input node of the Less Than method box.

j. Map the result (boolean) output node of the Less Than method box, to the For Loop condition node in the right pane of the Business Rules Designer.

- 7 Create the Copy i1 + 1 to i1 rule beneath the For Loop \rightarrow Steps node.
 - Select the Steps node under the For Loop and click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Right-click the ilvariable node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

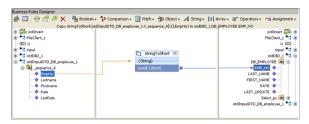

c. Select Add from the method selection window.

The *Add* method box appears in the Business Rules Designer canvas, and a link connects the i1 node in the left pane of the Business Rules Designer to the value1 input node of the *insert* method box.

- d. Double-click the value2 field and enter 1 as the value.
- e. Map the result output node of the Add method box, to the il variable node in the right pane of the Business Rules Designer.
- 8 Create the Copy stringToShort(otdInputDTD_DB_employee_1.X_sequence_A[i1].EmpNo) to otdDB2_1.DB_EMPLOYEE.EMP_NO rule beneath the For Loop → rules node.
 - a. Select the rules node under the For Loop in the Business Rules tree, and click the rule icon on the Business Rules toolbar to add a new rule.

b. Map the EmpNo node, under otdInputDTD_DB_employee_1 \rightarrow sequence_A in the left pane of the Business Rules Designer, to EMP_NO node, under otdDB2_1 otdDB2_1 \rightarrow DB EMPLOYEE in the right pane of the Business Rules Designer.

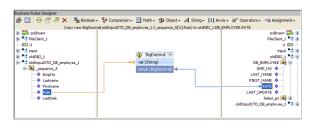

The Business Rules Designer adds the necessary code for stringToShort type conversion.

- 9 Create the Copy otdInputDTD_DB_employee_1.X_sequence_A[i1].Lastname to otdDB2 1.DB EMPLOYEE.LAST NAME rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Map the Lastname node, under otdInputDTD_DB_employee_1 → sequence_A in the left pane of the Business Rules Designer, to the LAST_NAME node, under otdDB2_1 otdDB2_1 → DB EMPLOYEE in the right pane of the Business Rules Designer.
- 10 Create the Copy otdInputDTD_DB_employee_1.X_sequence_A[i1].Firstname to otdDB2 1.DB EMPLOYEE.FIRST NAME rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Map the Firstname node, under otdInputDTD_DB_employee_1 → sequence_A in the left pane of the Business Rules Designer, to theFIRST_NAME node, under otdDB2_1 otdDB2_1 → DB_EMPLOYEE in the right pane of the Business Rules Designer.
- 11 Create the Copy new BigDecimal(otdInputDTD_DB_employee_1.X_sequence_A[i1].Rate) to otdDB2 1.DB EMPLOYEE.RATE rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. From the Business Rules Designer toolbar, click the Class Browser button.
 - c. From the Class Browser dialog box, select BigDecimal as the class, and select the BidDecimal (String val) constructor as the method. Click Select

A BigDecimal method box appears in the Business Rules Designer Canvas.

- d. Map the Rate node, under otdInputDTD_DB_employee_1 → sequence_A in the left pane of the Business Rules Designer, to the val (String) input node of the BigDecimal method box.
- e. Map the result (BigDecimal) output node of the BigDecimal method box to the RATE node, under otdDB2_1 otdDB2_1 → DB_EMPLOYEE in the right pane of the Business Rules Designer.

- 12 Create the Copy Date.valueOf(otdInputDTD_DB_employee_1.X_sequence_A[i1].LastDate) to otdDB2_1.DB_EMPLOYEE.LAST_UPDATE rule under the last rule.
 - a. From the Business Rules Designer toolbar, click the Class Browser button.
 - b. From the Class Browser dialog box, select Date as the class, and select the valueOf (String s) as the method. Click Select
 - A Date.valueOf method box appears in the Business Rules Designer Canvas.
 - c. Map the LastDate node, under otdInputDTD_DB_employee_1 → sequence_A in the left pane of the Business Rules Designer, to the s (String) input node of the Date.valueOf method box.
 - d. Map the result (Date) output node of the Date.valueOf method box to the LAST_UPDATE node, under otdDB2_1 otdDB2_1 → DB_EMPLOYEE in the right pane of the Business Rules Designer.
- 13 Create the otdDB2 1.DB EMPLOYEE.insertRow rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - Right-click DB_EMPLOYEE under the otdDB2_1 node in the left pane of the Business Rules
 Designer, and choose Select method to call from the popup menu.
 - The method selection window appears.

c. SelectinsertRow() from the method selection window.

The *insertRow* method box appears in the Business Rules Designer canvas, and a link connects the DB_EMPLOYEE node in the left pane of the Business Rules Designer to the DB_EMPLOYEE input node of the *insertRow* method box.

- 14 Create the Copy "Insert Done." to FileClient_1.Text rule under the completed For LOOP.
 - a. From the Business Rules tree, select the For Loop, then click the rule icon on the Business Rules toolbar to add a new rule.

A new rule is added to the main trunk of the Business Rules tree.

- b. From the Business Rules Designer toolbar's String menu, select Literal String.

 A *String* method box is added to the Business Rules Designer canvas.
- c. Double-click the value field of the String method box and enter Insert Done. as the value.
- d. Map the output node of the *String* method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.
- 15 Create the FileClient_1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose
 Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The *write* method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

16 Click Save All to save your current changes.

The completed Collaboration definition appears as follows:

```
| Copy and the control of the contro
```

jcdInsert Collaboration Java Code

The completed Java source code for the jcdInsert Collaboration appears as follows:

```
package prjDB2 JCDjcdALL;
public class jcdInsert
   public com.stc.codegen.logger.Logger logger;
   public com.stc.codegen.alerter.Alerter alerter:
   public com.stc.codegen.util.CollaborationContext collabContext;
   public com.stc.codegen.util.TypeConverter typeConverter;
  public void receive( com.stc.connector.appconn.file.FileTextMessage input,
com.stc.connector.appconn.file.FileApplication FileClient 1, dtd.otdInputDTD630345798
.DB employee otdInputDTD DB employee 1, otdDB2.OtdDB2OTD otdDB2 1 )
       throws Throwable
       FileClient 1.setText( "Inserting records in to db employee table....." );
       FileClient 1.write();
       otdInputDTD DB employee 1.unmarshalFromString( input.getText() );
       otdDB2 1.getDB EMPLOYEE().insert();
       for (int i1 = 0; i1 < otdInputDTD DB employee 1.countX sequence A(); i1 += 1) {
           otdDB2 1.getDB EMPLOYEE().setEMP NO( typeConverter.stringToShort(
otdInputDTD DB employee 1.getX sequence A( i1 ).getEmpNo(), "#", false, 0 ) );
           otdDB2 1.getDB EMPLOYEE().setLAST NAME( otdInputDTD DB employee 1.
getX_sequence_A( i1 ).getLastname() );
           otdDB2_1.getDB_EMPLOYEE().setFIRST_NAME( otdInputDTD_DB_employee_1.
getX sequence A( i1 ).getFirstname() );
           otdDB2 1.getDB EMPLOYEE().setRATE( new java.math.BigDecimal(
otdInputDTD_DB_employee_1.getX_sequence_A( i1 ).getRate() ) );
           otdDB2_1.getDB_EMPLOYEE().setLAST_UPDATE( java.sql.Date.valueOf(
otdInputDTD DB employee 1.getX sequence A( i1 ).getLastDate() ) );
           otdDB2 1.getDB EMPLOYEE().insertRow();
```

```
}
FileClient_1.setText( "Insert Done." );
FileClient_1.write();
}
```

Note - The above code has been wrapped for display purposes.

Creating the Business Rules for the jcdPsSelect Collaboration

The jcdPsSelect Collaboration implements the Input Web Service Operation to read the TriggerPsSelect.in file. It then copies the database resultset (as noted in the prepared statement query) into the otdInputDTD_DBEmployee OTD and selects all available records from the database. The Collaboration also writes a message to JCD_PsSelect_output1.dat to confirm when records are selected, or when no records are available.

Using the Collaboration Editor's Java Source Editor

To create the third Java Collaboration, jcdPsSelect, we will use the Java Source Editor. The Java Source Editor allows you to write your business rules in the editor, or copy code into the Collaboration Editor that you have written with another tool.

jcdPsSelect Collaboration Java Code

The completed Java source code for the jcdPsSelect Collaboration appears as follows:

```
FileClient 1.write();
      otdDB2 1.getSelect ps().setParam1( typeConverter.
stringToShort( "0", "#", false, 0 ) );
      otdDB2 1.getSelect ps().executeQuery();
       if (otdDB2 1.getSelect ps().resultsAvailable()) {
          while (otdDB2 1.getSelect ps().get$Select psResults().next()) {
               otdOutputDTD DB employee 1.setEmpNo( typeConverter.shortToString
( otdDB2 1.getSelect ps().get$Select psResults().getEMP NO(), "#", false, "" ) );
               otdOutputDTD DB employee 1.setLastname( otdDB2 1.getSelect ps().
get$Select psResults().getLAST NAME() );
               otdOutputDTD DB employee 1.setFirstname( otdDB2 1.getSelect ps().
get$Select_psResults().getFIRST_NAME() );
               otdOutputDTD DB employee 1.setRate( otdDB2 1.getSelect ps().
get$Select psResults().getRATE().toString() );
               otdOutputDTD DB employee 1.setLastDate( typeConverter.
dateToString( otdDB2 1.getSelect ps().get$Select psResults().
getLAST UPDATE(), "yyyy-MM-dd hh:mm:ss", false, "" ) );
               FileClient 1.setText( otdOutputDTD DB employee 1.marshalToString() );
               FileClient 1.write();
      } else {
          FileClient 1.setText( "No record found!" );
          FileClient 1.write();
      FileClient 1.setText( "Select Done." );
      FileClient 1.write();
   }
}
```

Note – The above code has been wrapped for display purposes.

Create the jcdPsSelect Collaboration Business Rules

1 From the Project window, double-click the jcdPsSelect Collaboration under your project's jcdALL node.

The Java Collaboration Editor opens to the jcdPsSelect Collaboration.

2 From the Collaboration Editor toolbar, select the Source Code Mode button.

The Collaboration displays the Business Rules window and the Java Source Editor window.

3 Copy the code above and paste it into the Java Source Editor, replacing the current code. The above code was wrapped in 10 places for display purposes. Correct the wrapped lines of code (the wrapped lines contain no left margin) by placing your cursor at the beginning of the line and hitting backspace (or the equivalent) 4 Once you have corrected the code, click the Commit changes button on the Java Source Editor toolbar.

If the code contains any errors they will be listed for you in the Validation window at the bottom of the NetBeans IDE. Correct these errors if necessary, and click the Commit changes button again.

- 5 Expand the business rules in the Business Rules window to see the completed Collaboration. Click the Advanced Mode button in the Collaboration Editor toolbar to open the Business Rules Designer window. Double click on a line of code in the Java Source Editor, and that rule is displayed graphically in the Business Rule Designer.
- 6 Click Save All to save your current changes.

The completed Collaboration definition appears as follows:

Creating the Business Rules for the jcdTableSelect Collaboration

The jcdTableSelect Collaboration implements the Input Web Service Operation to read the TriggerTableSelect.in file. It then copies the database resultset into the otdInputDTD_DBEmployee OTD and selects all available records from the database that meet the criteria emp_no = 100. The Collaboration also writes a message to JCD_TableSelect_output1.dat to confirm when records are selected, or when no records are available.

Note – The where clause in the business rule reads the trigger value as a placeholder for input. This permits you to modify the query to select a specific record. Also note that all records are selected from the database when the TriggerTableSelect.in file is empty.

Create the jcdTableSelect Collaboration Business Rules

You can create the jcdTableSelect Java Collaboration business rules by following the steps below, or by copying the "jcdTableSelect Collaboration Java Code" on page 38 into the Collaboration Editor's Java Source Editor as described in "Using the Collaboration Editor's Java Source Editor" on page 31.

1 From the Project window, double-click the jcdTableSelect Collaboration under your project's jcdALL node.

The Java Collaboration Editor opens to the jcdTableSelect Collaboration.

- 2 Create the Copy "Selectiong records from db_employee table via Table Select....." to FileClient_1.Text rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. From the Business Rules Designer toolbar's String menu, select Literal String.

 A String method box is added to the Business Rules Designer canvas.
 - c. Double-click the value field of the *String* method box and enter Selectiong records from db_employee table via Table Select..... as the value.
 - d. Map the output node of the *String* method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.
- 3 Create the FileClient_1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose
 Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The *write* method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

- 4 Create the otdInputDTD DB Employee 1.unmarshalFromString(input.Text) rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.

b. Right-click DB_EMPLOYEE under otdDB2_1 in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select select(String where) from the method selection window.

The *select* method box appears in the Business Rules Designer canvas, and a link connects the DB_EMPLOYEE node in the left pane of the Business Rules Designer to the DB_EMPLOYEE input node of the *select* method box.

- d. Map Text under the input node in the left pane of the Business Rules Designer, to the where (String) input node of the select method box.
- 5 Add a While statement and create the condition: otdDB2_1.DB_EMPLOYEE.next rule.
 - Click the While icon on the Business Rules toolbar to add a While statement to the Business Rules tree.
 - b. Right-click DB_EMPLOYEE under otdDB2_1 in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select next () from the method selection window.

The *next* method box appears in the Business Rules Designer canvas, and a link connects the DB_EMPLOYEE node in the left pane of the Business Rules Designer to the DB_EMPLOYEE input node of the *next* method box.

- d. Map the result (boolean) output node of the *next* method box, to the While condition in the right pane of the Business Rules Designer.
- 6 Create the Copy shortToString(otdDB2_1.DB_EMPLOYEE.EMP_NO) to otdOutputDTD_DB_employee_1.EmpNo rule beneath the While → rules node.
 - a. Select the rules node under the While statement on the Business Rules tree, and click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Map the EmpNo node, under otdDB2_1 → DB_EMPLOYEE in the left pane of the Business Rules Designer, to Emp_No node, under otdOutputDTD_DB_employee_1 in the right pane of the Business Rules Designer.

The Business Rules Designer adds the necessary code for shortToString type conversion.

- 7 Create the Copy otdDB2_1.DB_EMPLOYEE.LAST_NAME to otdOutputDTD DB employee 1.Lastname rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Map the LAST_NAME node, under otdDB2_1 → DB_EMPLOYEE in the left pane of the Business Rules Designer, to the Lastname node, under otdOutputDTD_DB_employee_1 in the right pane of the Business Rules Designer.
- 8 Create the Copy otdDB2_1.DB_EMPLOYEE.FIRST_NAME to otdOutputDTD DB employee 1.Firstname rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Map the FIRST_NAME node, under otdDB2_1 → DB_EMPLOYEE in the left pane of the Business Rules Designer, to the Firstname node, under otdOutputDTD_DB_employee_1 in the right pane of the Business Rules Designer.
- 9 Create the Copy otdDB2_1.DB_EMPLOYEE.RATE.toString to otdOutputDTD_DB_employee_1.Rate rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Right-click the RATEnode, under otdDB2 $_1 \rightarrow$ DB $_1 \rightarrow$ DB $_2 \rightarrow$ DB $_3 \rightarrow$ DB $_4 \rightarrow$

The method selection window appears.

c. Select toString() from the method selection window.

The *toString* method box appears in the Business Rules Designer canvas, and a link connects the RATE node in the left pane of the Business Rules Designer to the BigDecimal input node of the *toString* method box.

- d. Map the result (String) output node of the toString method box to the Rate node, under otdOutputDTD DB employee 1 in the right pane of the Business Rules Designer.
- 10 Create the Copy dateToString(otdDB2_1.DB_EMPLOYEE.LAST_UPDATE) to otdOutputDTD_DB_employee_1.LastDate rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Map the LAST_UPDATE node, under otdDB2_1 → DB_EMPLOYEE in the left pane of the Business Rules Designer, to LastDate node, under otdOutputDTD_DB_employee_1 in the right pane of the Business Rules Designer.

The Business Rules Designer adds the necessary code for dateToString type conversion.

- 11 Create the Copy otdOutputDTD_DB_employee_1.marshalToString to FileClient_1.Text rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Right-click otdOutputDTD_DB_employee_1 in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select marshalToString() from the method selection window.

The *marshalToString* method box appears in the Business Rules Designer canvas, and a link connects otdOutputDTD_DB_employee_1 in the left pane of the Business Rules Designer to the DB employee input node of the *marshalToString* method box.

- d. Map the result (String) output node of the marshalToString method box to the Text node, under FileClient_1 in the right pane of the Business Rules Designer.
- 12 Create the FileClient 1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose
 Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The write method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

- 13 Create the Copy "Table Select Done." to FileClient_1.Text rule.
 - a. From the Business Rules tree, select the While statement, then click the rule icon on the Business Rules toolbar to add a new rule.

A new rule is added to the main trunk of the Business Rules tree.

From the Business Rules Designer toolbar's String menu, select Literal String.

A *String* method box is added to the Business Rules Designer canvas.

- c. Double-click the value field of the String method box and enter Table Select Done. as the value.
- d. Map the output node of the *String* method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.

- 14 Create the FileClient_1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The write method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

15 Click Save All to save your current changes.

The completed jcdTableSelect Collaboration definition appears as follows:

```
receive
     Copy "Selectiong records from db_employee table via Table Select......." to FileClient_1.Text

  }
}
```

Note - The above code has been wrapped for display purposes.

Creating the Business Rules for the jcdUpdate Collaboration

The jcdUpdate Collaboration implements the Input Web Service Operation to read the TriggerUpdate.in. file and then update the record emp_no = 300. The Collaboration also writes a message to JCD_Update_output1.dat to confirm an updated record.

Note – The where clause in the business rule reads the trigger value as a placeholder for input. This permits you to modify the query to select a specific record. Also note that all records are selected from the database when the TriggerTableSelect.in file is empty.

Create the jcdUpdate Collaboration Business Rules

You can create the jcdTableSelect Java Collaboration business rules by following the steps below, or by copying the "jcdUpdate Collaboration Java Code" on page 43 into the Collaboration Editor's Java Source Editor as described in "Using the Collaboration Editor's Java Source Editor" on page 31.

1 From the Project window, double-click the jcdUpdate Collaboration under your project's jcdALL node.

The Java Collaboration Editor opens to the jcdUpdate Collaboration.

- 2 Create the Copy "Updating the Rate and Last_update fields .. " to FileClient_1.Text rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. From the Business Rules Designer toolbar's String menu, select Literal String.

A *String* method box is added to the Business Rules Designer canvas.

- c. Double-click the value field of the *String* method box and enter Updating the Rate and Last update fields . . as the value.
- d. Map the output node of the *String* method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.
- 3 Create the FileClient_1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select and double-click write() from the method selection window.

The *write* method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

- 4 Create the otdDB2 1.DB EMPLOYEE.update(input.Text) rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click DB_EMPLOYEE under otdDB2_1 in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select update(String sWhere) from the method selection window.

The *update* method box appears in the Business Rules Designer canvas, and a link connects the DB_EMPLOYEE node in the left pane of the Business Rules Designer to the DB_EMPLOYEE input node of the *update* method box.

- d. Map Text under the input node in the left pane of the Business Rules Designer, to the sWhere (String) input node of the *update* method box.
- 5 Add a While statement and create the condition: otdDB2_1.DB_EMPLOYEE.next rule.
 - Click the While icon on the Business Rules toolbar to add a While statement to the Business Rules tree.
 - b. Right-click DB_EMPLOYEE under otdDB2_1 in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select next() from the method selection window.

The *next* method box appears in the Business Rules Designer canvas, and a link connects the DB_EMPLOYEE node in the left pane of the Business Rules Designer to the DB_EMPLOYEE input node of the *next* method box.

- d. Map the result (boolean) output node of the *next* method box, to the While condition in the right pane of the Business Rules Designer.
- 6 Create the Copy new BigDecimal("22.2") to otdDB2_1.DB_EMPLOYEE.RATE rule beneath the While → rules node.
 - a. Select the rules node under the While statement on the Business Rules tree, and click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Right—click RATE node, under otdDB2_1 \rightarrow DB_EMPLOYEE in the right pane of the Business Rules Designer, and select Browse this type from the popup menu.

The Class Browser appears. with BigDecimal selected as the class.

c. From the ClassBrowser, select BigDecimal as the class, select theBigDecimal(String val) constructor as the method, and click Select.

The *BigDecimal* method box appears.

d. Double-click the val (String) field of the *BigDecimal* method box and enter 22.2 as the value.

- e. Map the result (BigDecimal) output node of the *BigDecimal* method box to the RATE node, under otdDB2 1 → DB EMPLOYEE in the right pane of the Business Rules Designer.
- 7 Create the Copy Date.valueOf("2006-06-06") to otdDB2_1.DB_EMPLOYEE.LAST_UPDATE rule under the last rule.
 - Click the rule icon on the Business Rules toolbar to add a new rule under your last rule.
 - b. From the Business Rules Designer toolbar, click the Class Browser button.
 - c. From the ClassBrowser, select Date as the class, select thevalueOf (Strings) method, and click Select.

The *Date.valueOf* method box appears.

- d. Double-click the s (String) field of the Date.valueOf method box and enter today's date as the value.
- e. Map the result (Date) output node of the Date.valueOf method box to the LAST_UPDATE node, under otdDB2_1 → DB_EMPLOYEE in the right pane of the Business Rules Designer.
- 8 Create the otdDB2 1.DB EMPLOYEE.updateRow rule under the last rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule.
 - b. Right-click DB_EMPLOYEE in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

The method selection window appears.

c. Select updateRow() from the method selection window.

The *updateRow* method box appears in the Business Rules Designer canvas, and a link connects the DB_EMPLOYEE node in the left pane of the Business Rules Designer to the DB_EMPLOYEE input node of the *updateRow* method box.

- 9 Create the Copy "Update Done." to FileClient_1.Text rule.
 - a. From the Business Rules tree, select the While statement, then click the rule icon on the Business Rules toolbar to add a new rule.

A new rule is added to the main trunk of the Business Rules tree.

- b. From the Business Rules Designer toolbar's String menu, select Literal String.
 - A *String* method box is added to the Business Rules Designer canvas.
- c. Double-click the value field of the String method box and enter Update Done. as the value.

- d. Map the output node of the String method box, to Text, under FileClient_1 in the right pane of the Business Rules Designer.
- 10 Create the FileClient 1.write rule.
 - a. Click the rule icon on the Business Rules toolbar to add a new rule in the Business Rules pane.
 - b. Right-click the FileClient_1 node in the left pane of the Business Rules Designer, and choose Select method to call from the popup menu.

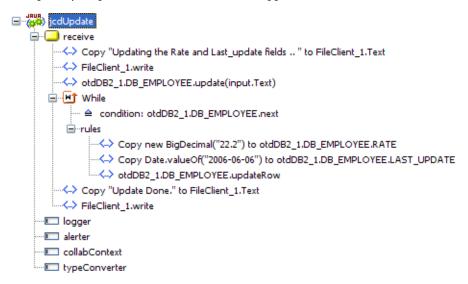

The method selection window appears.

c. Select and double-click write() from the method selection window.

The write method box appears in the Business Rules Designer canvas. The FileClient 1.write rule is added to the Business Rules tree.

11 Click Save All to save your current changes.

The completed jcdUpdate Collaboration definition appears as follows:

jcdUpdate Collaboration Java Code

The completed Java source code for the jcdUpdate Collaboration appears as follows:

```
package prjDB2_JCDjcdALL;
public class jcdUpdate
{
```

```
public com.stc.codegen.logger.Logger logger;
   public com.stc.codegen.alerter.Alerter alerter;
   public com.stc.codegen.util.CollaborationContext collabContext;
   public com.stc.codegen.util.TypeConverter typeConverter;
   public void receive( com.stc.connector.appconn.file.FileTextMessage input, com.stc.
connector.appconn.file.FileApplication FileClient 1, otdDB2.OtdDB2OTD otdDB2 1 )
       throws Throwable
       FileClient 1.setText( "Updating the Rate and Last update fields .. " );
       FileClient 1.write();
       otdDB2 1.getDB EMPLOYEE().update( input.getText() );
       while (otdDB2_1.getDB_EMPLOYEE().next()) {
           otdDB2 1.getDB EMPLOYEE().setRATE( new java.math.BigDecimal( "22.2" ) );
otdDB2_1.getDB_EMPLOYEE().setLAST_UPDATE( java.sql.Date.
valueOf( "2006-06-06" ) );
           otdDB2_1.getDB_EMPLOYEE().updateRow();
       FileClient 1.setText( "Update Done." );
       FileClient 1.write();
   }
}
```

Note – The above code has been wrapped for display purposes.

Next Steps

For your next step, see "Creating the Connectivity Maps" on page 44.

Creating the Connectivity Maps

Connectivity Maps provide the canvas for assembling and configuring a Project's components. The Oracle Java CAPS Adapter for DB2 Projects use five Connectivity Maps, one for each Collaboration.

Creating a Connectivity Map involves three processes:

- Adding Connectivity Maps to a Project
- Populating the Connectivity map with the required components
- Binding the Connectivity Map Collaboration or BPEL Process to the External Applications

The Connectivity Map Designer includes a Connectivity Map Generator. The Connectivity Map Generator can read the Collaboration Definition or Business Process, and can automatically populate the Connectivity map with the necessary components, and bind the components. We will use the Connectivity Map Generator for this sample project.

This section contains the following topics:

- "Adding Connectivity Maps to a Project" on page 45
- "Populating and Binding the Connectivity Maps using the Connectivity Map Generator" on page 45

Adding Connectivity Maps to a Project

The DB2 Project uses five Connectivity Maps.

Add the Connectivity Maps to the Project

1 From the NetBeans IDE Projects window, right-click your project and select New → Connectivity Map from the popup menu.

The new Connectivity Map appears and adds a node on the Project tree labeled CMap1.

- 2 Rename the new Connectivity Map to cmDelete.
- 3 Repeat this process to create the other four Connectivity Maps for your project substituting the following names:
 - cmInsert
 - cmPsSelect
 - cmTableSelect
 - cmUpdate

Populating and Binding the Connectivity Maps using the Connectivity Map Generator

In a Connectivity Map, Adapters are associated with External Applications. For example, to establish a connection to an external DB2 server, you must first select the DB2External Application to use in the Connectivity Map. Along with the External Applications, Connectivity Maps also contain Services, Queues, Topics, Web Service External Applications, and so forth. Once the Connectivity Map contains the Collaboration or Business Process and the other components, you can bind the components to create the appropriate connections.

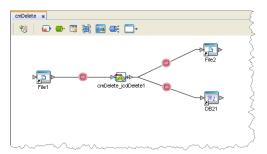

This process can be done manually by dragging the necessary components to the Connectivity Map canvas and binding the components, or you can use the Connectivity Map Generator. The connectivity Map Generator uses the information contained in the Java Collaboration Definition or Business Process, and assembles the Connectivity Map automatically.

Note – The following steps walk you through populating the Connectivity Maps for the prjDB2_JCD Project. These steps are the same for the prjDB2_BPEL Project. Simply substitute the appropriate Business Processes with the corresponding Java Collaborations, such as *bpDelete* for *jcdDelete*.

▼ Populate the Connectivity Maps using the Connectivity Map Generator.

- 1 From the Project tree, double-click the cmDelete node to open the cmDelete Connectivity Map.
- 2 Drag the jcdDelete Java Collaboration onto the Connectivity Map canvas.
- 3 From the Connectivity Map toolbar, click the Connectivity Map Generation button.

The Connectivity Map Generator assembles the Connectivity Map.

In the Connectivity Map, the nodes in the connections between the Collaboration and the External Applications represent the application adapters. The adapters are highlighted in red in the new Connectivity Map to indicate that the Connectivity Map properties have not been set.

- 4 Save your current changes and click the X on the cmDelete tab to close the cmDelete Connectivity Map.
- 5 Repeat these steps to populate and bind the other four Connectivity Maps as follows:
 - Generate the cmInsert using the jcdInsert Collaboration
 - Generate the cmPsSelect using the jcdPsSelect Collaboration
 - Generate the cmTableSelect using the jcdTableSelect Collaboration
 - Generate the cmUpdate using the jcdUpdate Collaboration

Next Steps For your next step, see "Creating an Environment" on page 47.

Creating an Environment

Environments include the External Systems, Logical Hosts, Application Servers, and Message Servers used by a project and contain the configuration information for these components.

▼ Create the Environment

- 1 From the NetBeans IDE Services window, right-click Caps Environment and select New Environment from the popup menu. Rename the new Environment to envDB2Proj.
 - A new environment is added to the Services tree.
- 2 Rename the new Environment to envDB2Proj.
- 3 Right-click envDB2Proj and select New \rightarrow DB2 External System. Name the DB2 External System esDB2.
- 4 Right-click envDB2Proj and select New \to File External System. Name the File External System esFileClient.
- 5 Right-click envDB2Proj and select New → Logical Host. LogicalHost1 is added to the Services tree.
- 6 Right-click LogicalHost1 and select New → Sun Java System Application Server.

 A new Application Server is added to the tree under LogicalHost1.
- 7 Save your changes.

Next Steps For your next step, see "Configuring the Adapter Properties" on page 47.

Configuring the Adapter Properties

The DB2 sample Project contains several Adapters, each represented in the Connectivity Maps as a node between an External Application and a Service. The Adapters facilitate the communication and movement of data between external applications and the Oracle Java CAPS Enterprise Service Bus system. These Adapters must be configured for your system.

Adapter properties must be configured in both the Connectivity Maps and the Environment.

- "Configuring the Connectivity Map Properties" on page 48
- "Configuring the Environment Properties" on page 49

Configuring the Connectivity Map Properties

Connectivity Map properties are configured from each of the Connectivity Maps. These properties are specific to each of the configured Adapters, unlike the Environment properties which contain common properties for each Adapter type.

Configure the Connectivity Map Properties

Open a Connectivity Map, and double-click the adapter to open the Properties Editor to that adapter's property sheet. For example, open the cmDelete Connectivity Map and double-click the inbound File Adapter (the node between the File1 External Application and the cmDelete_jcdDelete1 service).

The Properties Editor open to the selected Adapter's property sheet.

- 2 From the Properties Editor, edit the values of the appropriate properties for your system.
- 3 Once you are done editing the property values for that Adapter, click OK to save the current properties.
- 4 Repeat this procedure to edit all of your Connectivity Map properties.

File 1 Inbound Adapter Properties

Enter the following values for the File1 Adapters.

| Connectivity Map | Property Name | Required Value |
|------------------|-----------------|-----------------------|
| cmDelete | Input file name | TriggerDelete.in |
| cmInsert | Input file name | TriggerBpInsert.in |
| cmPsSelect | Input file name | TriggerPsSelect.in |
| cmTableSelect | Input file name | TriggerTableSelect.in |
| cmUpdate | Input file name | TriggerUpdate.in |

File2 Outbound Adapter Properties

Enter the following values for the outbound File2 Adapters.

| Connectivity Map | Property Name | Required Value |
|------------------|------------------|--|
| cmDelete | Output file name | JCD_Delete_output%d.dat (for JCD Sample) |
| | | BPEL_Delete_output%d.dat (for BPEL Sample) |

| Connectivity Map | Property Name | Required Value |
|------------------|------------------|--|
| cmInsert | Output file name | JCD_Insert_output%d.dat (for JCD Sample) |
| | | BPEL_Insert_output%d.dat (for BPEL Sample) |
| cmPsSelect | Output file name | JCD_PsSelect_output%d.dat (JCD Sample) |
| | | BPEL_PsSelect_output%d.dat (for BPEL Sample) |
| cmTableSelect | Output file name | JCD_TableSelect_output%d.dat.in (for JCD Sample) |
| | | BPEL_TableSelect_output%d.dat.in (for BPEL Sample) |
| cmUpdate | Output file name | JCD_Update_output%d.dat (for JCD Sample) |
| | | BPEL_Update_output%d.dat (for BPEL Sample) |

DB21 Outbound Adapter Properties

When you double-click the DB21 Outbound Adapter, the Adapter Connections dialog box appears. Choose an Adapter connection for your project (for this sample select Outbound DB2 Adapter). When the Properties Editor for the DB21 Outbound Adapter opens, click OK to save the default settings.

Configuring the Environment Properties

Environment properties are configured from the Services tree of the NetBeans IDE Services window.

Configure the Environment Properties

- 1 From the Services tree in the NetBeans IDE Services window, expand the CAPS Environments → envDB2Proj nodes
- 2 Double-click an Adapter to open the Properties Editor to the Adapter's Environment properties sheet.
- 3 Edit the property values for your system. Once you are done, click OK to save the current properties.
- 4 Repeat this procedure to edit all of your Environment properties.

File Adapter Environment Properties

Enter the following values for the File Adapters.

| Section | Property Name | Required Value |
|--|---------------|--|
| Configuration → Inbound File Adapter → Parameter Settings | Directory | Enter the directory that contains the input files (trigger files included in the sample Project). Trigger files: TriggerDelete.in.~in TriggerInsert.in.~in TriggerPsSelect.in.~in TriggerTableSelect.in.~in TriggerUpdate.in.~in |
| Configuration → Outbound File Adapter → Parameter Settings | Directory | Enter the directory where output files are written. For the JCD sample Project, the output files are: JCD_Delete_output1.dat JCD_Insert_output1.dat JCD_PsSelect_output1.dat JCD_TableSelect_output1.dat JCD_Update_output1.dat For the BPEL sample Project, the output files are: BPEL_Delete_output1.dat BPEL_Insert_output1.dat BPEL_TableSelect_output1.da BPEL_TableSelect_output1.dat BPEL_TableSelect_output1.dat BPEL_Update_output1.dat |
| | | |

DB2 Adapter Environment Properties

Enter the following values for the outbound DB2 Adapters.

| Section | Property Name | Required Value |
|---|---|---|
| Configuration → Outbound DB2 Adapter → JDBC Connector settings. | PortNumber | Enter the port number where the server is listening for requests. |
| | ServerName | Enter the host name of the database server being used. |
| | DatabaseName | Enter the name of the particular database that is being used on the server. |
| | User | Enter the user account name for the database. |
| | | |
| Password | Enter the user account password for the database. | |

What's the Next Step?

For your next step, see "Creating the Deployment Profile" on page 51.

Creating the Deployment Profile

A Deployment Profile is used to assign Collaborations or Business Processes and message destinations to the GlassFish Application Server and message server. Deployment Profiles are created using the Deployment Editor.

Create the Deployment Profile

- 1 From the NetBeans IDE Projects window, right-click the project and select New \rightarrow Deployment Profile from the popup menu.
- 2 Enter a name for the Deployment Profile (dpDB2JCD for the JCD project, or dpDB2BPEL for the BPEL project). Click OK.

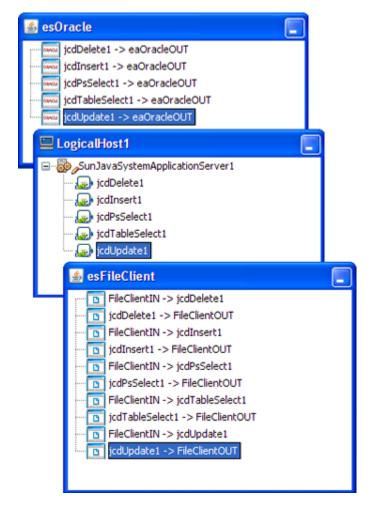

The Deployment Editor opens.

3 From the Deployment Editor, click the Automap button.

The Project's components are automatically mapped to their respective system windows.

Note – If any of your Project components do not successfully map to an external system, open each of your Adapter's configuration properties (Connectivity Map and Environment) and click OK to close and save the current configuration, then click Automap again.

The image below displays the Deployment Profile for the JCD sample Project.

4 Save your project.

Next Steps For your next step, see "Building and Deploying the Project" on page 53.

Building and Deploying the Project

The Build process compiles and validates the Project's Java files and creates the project EAR file.

This section contains the following topics:

- "Building the Project" on page 53
- "Deploying the Project from NetBeans" on page 53

Building the Project

You can build the project from the NetBeans IDE or from the Command Line. For this example we are building the project from the Java CAPS Deployment Editor in NetBeans. For more information on building a project, see "Building an Application File" in *Deploying Oracle Java CAPS Projects*.

▼ Build the Project

- 1 From the Projects window, double-click your project's Deployment file.
 - The Deployment Editor opens to your project.
- 2 From the Deployment Editor toolbar, click the Build button.
- 3 If there are any validation errors, they are displayed in the Validation window at the bottom of the NetBeans IDE. If there are any errors, make corrections to the project, save the project, and click the Build button again.
- 4 When the build succeeds, save your project.

Deploying the Project from NetBeans

You can deploy a Java CAPS project to the GlassFish Application Server using NetBeans IDE, Admin Console, Enterprise Manager, or the Command Line. For more information on deploying projects see *Deploying Oracle Java CAPS Projects*.

For this example we will deploy the project from the Java CAPS Deployment Editor in NetBeans.

Note – When you deploy your project from the NetBeans IDE, you cannot specify a server instance. Therefore, if the domain has multiple server instances, the application is deployed to all of the instances.

Deploy the Project

- Open your project in the Deployment Editor.
- 2 Ensure that the application server is running.
- 3 In the toolbar of the Deployment Profile Editor, click Deploy.

Next Steps For your next step, see "Running the Project" on page 54.

Running the Project

When the project is running, the File Adapter polls the directory every five seconds for the input file name, as defined in the inbound File Adapter properties. The Java Collaboration or Business Process then transforms the data, and the File Adapter sends the output to an output file, as defined in the outbound File Adapter properties. See "About the Oracle Java CAPS Adapter for DB2 Sample Projects" on page 7 for more details on the types of output files used in this sample Project.

Run the project

1 Rename one of the trigger files included with the sample, from filename. Net to filename.in in the target file, to run the corresponding operation. For example, rename TriggerDelete.in.~in to TriggerDelete.in to run the delete file operation.

The Where Clause defined in the business rule recognizes the trigger as a placeholder for input, allowing a set condition, such as $emp_no = 100$, to determine the type of output data.

You can modify the following input files to view different output.

- TriggerTableSelect.in
- TriggerDelete.in
- TriggerUpdate.in

Having no content in these files causes the operation to read all records.

Verify the output data by viewing the sample output files. The output files may change depending on the number of times you execute the sample Project, the input file, and also the content of your database table.

Creating the BPEL-Based Project for the Oracle Java CAPS Adapter for DB2

The BPEL-based project uses Business Processes that rely on Business Process Execution Language (BPEL). This section provides step-by-step instructions for manually creating the prjDB2_BPEL sample Project.

The following steps are required to create the project:

- "Creating a New Project" on page 13
- "Creating the OTDs" on page 13
- "Creating the Business Processes" on page 55
- "Using Business Process Designer to Create Business Rules" on page 61
- "Creating the Connectivity Maps" on page 44
- "Creating an Environment" on page 47
- "Configuring the Adapter Properties" on page 47
- "Creating the Deployment Profile" on page 51
- "Building and Deploying the Project" on page 53
- "Running the Project" on page 54

Next Steps

For your next step, see "Creating a New Project" on page 13.

Creating the Business Processes

The business process flow contains all the BPEL elements that make up a business process.

This section walks you through creating the project's five business processes:

- "Create the bpDelete Business Process" on page 55
- "Create the bpInsert Business Process" on page 56
- "Create the bpPsSelect Business Process" on page 58
- "Create the bpTableSelect Business Process" on page 60
- "Create the bpUpdate Business Process" on page 60

Create the bpDelete Business Process

1 From the Projects window, right-click your new project and select New \rightarrow Business Process from the shortcut menu.

The Business Process Designer opens and Business Process 1 is added to the Project tree.

2 Rename BusinessProcess1 to bpDelete.

- 3 From the Projects window, expand CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient. Select and drag the FileClient. receive activity from the project tree to the Business Process Designer canvas.
- 4 As in step 3, drag the FileClient.write activity from the CAPS Components Library → Adapters → File → FileClient directory to the Business Process Designer canvas, and then drag another FileClient.write activity to the canvas, so that you have two FileClient.write activities in your BPEL process.
- From the Projects window, expand prjDB2_BPEL → otdALL → otdDB2. Select and drag the otdDB2.DB_EMPLOYEEDelete activity from the project tree to the Business Process Designer canvas.
- 6 Connect the activities in the bpDelete BPEL canvas by dragging your cursor from the output node of one activity to the input node of the next activity, as follows: (See image below for details)
 - Start → FileClient.receive
 - FileClient.receive → FileClient.write
 - FileClient.write → otdDB2.DB EMPLOYEEDelete
 - otdDB2.DB_EMPLOYEEDelete → FileClient.write
 - FileClient.write → End

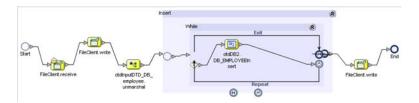

7 Click Save All to save the latest changes to your project.

Create the bpInsert Business Process

- 1 From the Projects window, right-click your new project and select New → Business Process from the shortcut menu.
- 2 Rename your new business process to bplnsert.
- 3 From the Projects window, expand CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient. Select and drag the FileClient. receive activity from the project tree to the Business Process Designer canvas.

- 4 As in step 3, drag the FileClient.write activity from the CAPS Components Library → Adapters → File → FileClient directory to the Business Process Designer canvas, and then drag another FileClient.write activity to the canvas, so that you have two FileClient.write activities in your BPEL process.
- 5 From the Projects window, expand prjDB2_BPEL → otdALL → otdInputDTD_DB_employee. Select and drag the unmarshal activity from the project tree to the Business Process Designer canvas.
- 6 Connect the following activities:
 - Start → FileClient.receive
 - FileClient.receive → FileClient.write
 - FileClient.write → otdInputDTD_DB_employee.unmarshal
- 7 Create the Insert Scope with a While statement.
 - From the Business Process Designer toolbar, select a Scope element and drag it to the canvas. Double-click the Scope element to expand the element.
 - b. Rename the Scope element to Insert.
 - c. From the Business Process Designer toolbar, select a While element and drag it into the expanded Scope element box on the canvas. Double-click the While element to expand the element.
 - d. From the Projects window, expand prjDB2_BPEL → otdALL → otdDB2. Select and drag the otdDB2.DB_EMPLOYEEInsert activity from the project tree into the expanded While element box on the Business Process Designer canvas.
 - e. Connect the following elements: (See image below for details)
 - otdInputDTD_DB_employee.unmarshal → Scope element input node
 - Scope element input node → While element input node
 - While element input node → otdDB2.DB_EMPLOYEEInsert
 - otdDB2.DB_EMPLOYEEInsert → While element output node
 - While element output node → Scope element output node
 - Scope element output node \rightarrow FileClient.write
 - FileClient.write → End

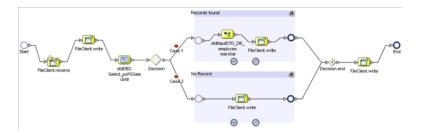

8 Click Save All to save the latest changes to your project.

Create the bpPsSelect Business Process

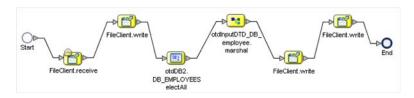

- 1 From the Projects window, right-click your new project and select New → Business Process from the shortcut menu.
- 2 Rename your new business process to bpPsSelect.
- 3 Add the following activities to the bpPsSelect Business Process canvas.
 - FileClient.Receive (CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient)
 - FileClient.Write
 - FileClient.Write
 - Select_psPSSelectAll (prjDB2_BPEL \rightarrow otdALL \rightarrow otdDB2)
- 4 Connect the following activities:
 - Start → FileClient.receive
 - FileClient.receive → FileClient.write
 - FileClient.write → otdDB2.Select_psPSSelectAll
- 5 Create the Decision.
 - a. From the Business Process Designer toolbar, select a Branching Activity → Decision element and drag it to the canvas. This adds a Decision and Decision.end element to the canvas.
 - b. From the Business Process Designer toolbar, select a Scope element and drag it to the canvas. Double-click the Scope element to expand the element.
 - c. Rename the Scope element to Records found.
 - d. From the Projects window, expand prjDB2_BPEL → otdALL → otdInputDTD_DB_employee. Select and drag the marshal activity from the project tree into the expanded Records found element box on the Business Process Designer canvas.

- e. From the Projects window, select and drag the FileClient.write activity from the project tree into the expanded Records found element box on the Business Process Designer canvas.
- f. Connect the following elements: (See image below for details)
 - otdDB2.Select_psPSSelectAll → Decision element input node
 - Decision element → Records found input node
 - Records element input node → otdInputDTD_DB_employee.marshal
 - otdInputDTD_DB_employee.marshal → FileClient.write
 - FileClient.write → Records found element output node
 - Records found element output node → Decision.end
- g. From the Business Process Designer toolbar, select another Scope element and drag it to the canvas. Double-click the Scope element to expand the element.
- h. Rename the Scope element to No Record.
- From the Projects window, select and drag the FileClient.write activity from the project tree into the expanded No Record element box on the Business Process Designer canvas.
- j. Connect the following elements: (See image below for details)
 - otdDB2.Select_psPSSelectAll → Decision element input node
 - Decision element → No Record input node
 - No Record input node → FileClient.write
 - FileClient.write → No Record element output node
 - No Record element output node → Decision.end
- 6 Connect the following elements:
 - Decision.end → FileClient.write
 - FileClient.write → End

Create the bpTableSelect Business Process

- 1 From the Projects window, right-click your new project and select New → Business Process from the shortcut menu.
- 2 Rename your new business process to bpTableSelect.
- 3 Add the following activities to the bpTableSelect Business Process canvas.
 - FileClient.Receive (CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient)
 - FileClient.Write
 - FileClient.Write
 - FileClient.Write
 - DB_EMPLOYEESelectAll (prjDB2_BPEL \rightarrow otdALL \rightarrow otdDB2)
 - marshal (prjDB2_BPEL → otdALL → otdInputDTD_DB_employee)
- 4 Connect the following activities: (See image below for details)
 - Start \rightarrow FileClient.receive
 - FileClient.receive → FileClient.write
 - FileClient.write → otdDB2.DB_EMPLOYEESelectAll
 - otdDB2.DB_EMPLOYEESelectAll → otdInputDTD_DB_employee.marshal
 - otdInputDTD_DB_employee.marshal \rightarrow FileClient.write
 - FileClient.write → FileClient.write
 - FileClient.write → End

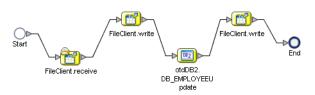

Create the bpUpdate Business Process

- 1 From the Projects window, right-click your new project and select New → Business Process from the shortcut menu.
- 2 Rename your new business process to bpUpdate.
- 3 Add the following activities to the bpTableSelect Business Process canvas.
 - FileClient.Receive (CAPS Components Library \rightarrow Adapters \rightarrow File \rightarrow FileClient)
 - FileClient.Write

- FileClient.Write
- DB_EMPLOYEEUpdate (prjDB2_BPEL \rightarrow otdALL \rightarrow otdDB2)

4 Connect the following activities: (See image below for details)

- Start → FileClient.receive
- FileClient.receive → FileClient.write
- FileClient.write → otdDB2.DB_EMPLOYEEUpdate
- otdDB2.DB_EMPLOYEEUpdate → FileClient.write
- FileClient.write \rightarrow End

5 Save your project.

Next Steps For your next step, see "Using Business Process Designer to Create Business Rules" on page 61.

Using Business Process Designer to Create Business Rules

Business Rules, created between the Business Process Activities, allow you to configure the relationships between the input and output Attributes of the Activities using the Business Process Designer's Business Rule Designer.

This section walks you through creating the project's five business processes:

- "Creating the bpDelete Business Rules" on page 61
- "Creating the bpInsert Business Rules" on page 63
- "Creating the bpPsSelect Business Rules" on page 68
- "Creating the bpTableSelect Business Rules" on page 71
- "Creating the bpUpdate Business Rules" on page 73

Creating the bpDelete Business Rules

The bpDelete business process describes how to delete a record in the DB2 database using the Business Process Designer.

Create the bpDelete Business Rules

- 1 Double-click bpDelete in the Projects window to open the Business Process Designer to the bpDelete Business Process.
- 2 Create the bpDelete FileClient.receive → FileClient.write rule.
 - a. Right-click the link between FileClient.receive and FileClient.write and select Add Business Rule from the popup menu.

A Business Rule icon is add to the link.

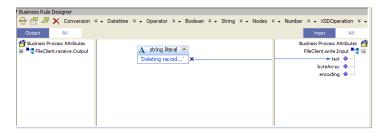

b. Double-click the Business Rule icon.

The Business Rule Designer opens to the new Business Rule.

c. From the Business Rule Designer toolbar String menu, select string literal.

A *string literal* method box is added to the Business Rule Designer canvas.

- d. Double-click the string literal method box value field, and enter Deleting record... as the value.
- e. Map the Deleting record... output node of the string literal method box, to text under FileClient.write.Input in the Input pane (right pane) of the Business Rule Designer. To do this, click on the Deleting record... output node of the string literal method box, and drag your cursor to the text node under FileClient.write.Input in the Input pane of the Business Rule Designer.

- 3 Create the bpDelete FileClient.write → otdDB2.DB_EMPLOYEEDelete rule.
 - a. Add a Business Rule to the link between FileClient.write and otdDB2.DB EMPLOYEEDelete and double-click the new Business Rule icon.

The Business Rule Designer opens to the new Business Rule.

b. Map text under FileClient.receive.Output in the Output pane of the Business Rule Designer, to whereClause under otdDB2.DB_EMPLOYEEDelete.Input → input in the Input pane of the Business Rule Designer.

A visible link now connects the two nodes in the Business Rule Designer.

- 4 Create the otdDB2.DB_EMPLOYEEDelete \rightarrow bpDelete FileClient.write rule.
 - a. Add a Business Rule to the link between otdDB2.DB_EMPLOYEEDelete and bpDelete FileClient.write and double-click the new Business Rule icon.

The Business Rule Designer opens to the new Business Rule.

- b. From the Business Rule Designer toolbar String menu, select string literal.

 A string literal method box is added to the Business Rule Designer canvas.
- c. Double-click the string literal method box value field, and enter Delete done.. as the value.
- d. Map the Delete done.. output node of the string literal method box, to text under FileClient.write.Input1 in the Input pane of the Business Rule Designer.
- 5 Save your project.

Creating the bpInsert Business Rules

The bpInsert Business Process implements the Input Operation to read the TriggerInsert.in. file. It then unmarshals data from the input data into the otdInputDTD_DBEmployees OTD, calls the otdDB2, and inserts records into the database, and writes a message to confirm an inserted record.

Create the bpInsert Business Rules

1 Double-click bpInsert in the Projects window to open the Business Process Designer to the bpInsert Business Process.

- 2 Create the bpInsert FileClient.receive → FileClient.write rule.
 - Add a Business Rule to the link between FileClient.receive and FileClient.write and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. From the Business Rule Designer toolbar String menu, select string literal.
 - c. Enter Inserting records into db_employee table..as the String value in the string literal method box.
 - d. Map the Inserting records into db_employee table.. output node of the string literal method box, to text under FileClient.write.input in the Input pane (right pane) of the Business Rule Designer.
- 3 Create the bpDelete FileClient.write \rightarrow otdInputDTD DB employee.unmarshal rule.
 - a. Add a Business Rule to the link between FileClient.write and otdInputDTD_DB_employee.unmarshal and double-click the new Business Rule icon.

 The Business Rule Designer opens to the new Business Rule.
 - b. Map text under FileClient.receive.Output in the Output pane of the Business Rule Designer, to contents under otdInputDTD_DB_employee.unmarshal.Input in the Input pane of the Business Rule Designer.
- 4 Create the otdInputDTD DB employee.unmarshal \rightarrow Insert (Scope) element rule.
 - a. Add a Business Rule to the link between otdInputDTD_DB_employee.unmarshal and the Insert (Scope) element and double-click the new Business Rule icon.

The Business Rule Designer opens to the new Business Rule.

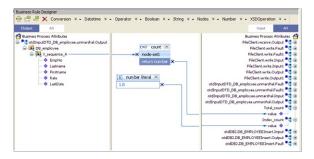

b. From the Business Rule Designer toolbar Nodes menu, select count.

A *count* method box is added to the Business Rule Designer canvas.

- c. Map the X_sequence_A under otdInputDTD_DB_employee.unmarshal.Output → DB_employee in the Output pane of the Business Rule Designer, to the node-set1 input node of the count method box.
- d. Map the return number output node of the *count* method box, to value under Total_count in the Input pane of the Business Rule Designer.
- e. From the Business Rule Designer toolbar Number menu, select number literal.

A *number literal* method box is added to the Business Rule Designer canvas.

- f. Double-click the number literal method box value field, and enter 1.0 as the value.
- g. Map the 1.0 output node of the *number literal* method box, to value under Index_count in the Input pane of the Business Rule Designer.

5 Create the

X_sequence_A[number(getContainerData('Index_count'.'value'.'/value'))] predicate for the DTD.

a. Right-click otdInputDTD_DB_employee.unmarshal.Output \to DB_employee \to x_sequence_A, and select New Predicate from the popup menu.

The Predicate window appears

b. From the Predicate window's Number menu, select number.

A *number* method box is added to the Predicate window canvas.

- c. Map value under Index_count in the Business Process Attributes pane of the Predicate window, to the object1? input node of the *number* method box.
- d. Map the Return Number output node of the *number* method box, to Result in the right pane of the Predicate window.
- e. Click OK.

The X_sequence_A[number(getContainerData('Index_count'.'value'.'/value'))] predicate is added to the Output pane of the Business Rule Designer under otdInputDTD DB employee.unmarshal.Output → DB employee.

- 6 Create the While \rightarrow otdDB2.DB_EMPLOYEEInsert rule.
 - a. Add a Business Rule to the link between While input node and the otdDB2.DB EMPLOYEEInsert and double-click the new Business Rule icon.
 - b. From the Business Rule Designer toolbar Number menu, select Settings.

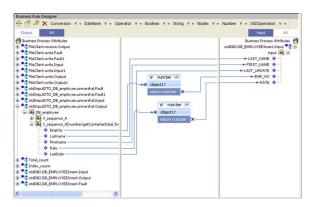

The Method Pallette appears.

- c. From the Method Palette, click the Number tab and select the number option. Click Close.
 The number option is added to the Number menu.
- d. From the Business Rule Designer toolbar Number menu, select number.

A *number* method box is added to the canvas.

- e. Map EmpNo under otdInputDTD_DB_employee.unmarshal.Output → DB_employee → X_sequence_A[number(getContainerData´('Index_count'.'value'.'/value'))] in the Output pane of the Business Rule Designer, to the object1? input node of the number method box.
- f. Map the return number output node of the number method box, to EMP_NO under otdDB2.DB_EMPLOYEEInsert.Input → input in the Input pane of the Business Rule Designer.
- g. From the Business Rule Designer toolbar Number menu, select number to add another number method box.
- h. Map Rate under otdInputDTD_DB_employee.unmarshal.Output → DB_employee → X_sequence_A[number(getContainerData´('Index_count'.'value'.'/value'))] in the Output pane of the Business Rule Designer, to the object1? input node of the number method box.
- i. Map the return number output node of the number method box, to RATE under otdDB2.DB_EMPLOYEEInsert.Input → input in the Input pane of the Business Rule Designer.
- j. Map Lastname under otdInputDTD_DB_employee.unmarshal.Output → DB_employee → X_sequence_A[number(getContainerData´('Index_count'.'value'.'/value'))] in the Output pane of the Business Rule Designer, to LAST_NAME under otdDB2.DB_EMPLOYEEInsert.Input → input in the Input pane of the Business Rule Designer.
- k. Map Firstname under otdInputDTD_DB_employee.unmarshal.Output → DB_employee → X_sequence_A[number(getContainerData´('Index_count'.'value'.'/value'))] in the Output pane of the Business Rule Designer, to FIRST_NAME under otdDB2.DB_EMPLOYEEInsert.Input → input in the Input pane of the Business Rule Designer.

I. Map LastDate under otdInputDTD_DB_employee.unmarshal.Output → DB_employee → X_sequence_A[number(getContainerData´('Index_count'.'value'.'/value'))] in the Output pane of the Business Rule Designer, to LAST_UPDATE under otdDB2.DB_EMPLOYEEInsert.Input → input in the Input pane of the Business Rule Designer.

- 7 Create the otdDB2.DB EMPLOYEEInsert \rightarrow While rule.
 - a. Add a Business Rule to the link between the otdDB2.DB_EMPLOYEEInsert activity and the While output node and double-click the new Business Rule icon.
 - b. From the Business Rule Designer toolbar Operator menu, select addition.
 A addition method box is added to the canvas.
 - c. Map value under Index_count in the Output pane of the Business Rule Designer, to the number1 input node of the *addition* method box.
 - d. Double-click the number 2 field of the addition method box and enter a value of 1.0
 - e. Map the return number output node of the *addition* method box, to value under Index-count in the Input pane of the Business Rule Designer.
- 8 Create the Insert → FileClient.write rule.
 - Add a Business Rule to the link between the Insert output node and FileClient.write and double-click the new Business Rule icon.
 - From the Business Rule Designer toolbar String menu, select string literal.
 - c. Enter Insert Done as the String value.

d. Map the Insert Done output node of the string literal method box, to text under FileClient.write.Input1 in the Input pane of the Business Rule Designer.

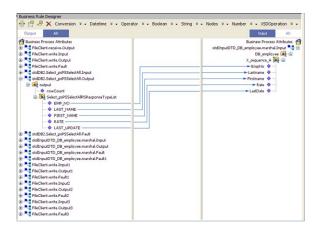

Creating the bpPsSelect Business Rules

The bpPsSelect business process describes how to use a Prepared Statement query to select all records in the DB2 database via the Business Process Designer.

Create the bpPsSelect Business Rules

- 1 Double-click bpPsSelect in the Projects window to open the Business Process Designer to the bpPsSelect Business Process.
- 2 Create the bpPsSelect FileClient.receive → FileClient.write rule.
 - a. Add a Business Rule to the link between FileClient.receive and FileClient.write and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. From the Business Rule Designer toolbar String menu, select string literal.
 - c. Enter Selecting record(s) from db_employee table via Prepared Statement select...as the String value in the string literal method box.
 - d. Map the Selecting record(s) from db_employee table via Prepared Statement select... output node of the string literal method box, to text under FileClient.write.input in the Input pane (right pane) of the Business Rule Designer.
- 3 Create the FileClient.write ightarrow otdDB2.Select_psPSSelectAll rule.
 - a. Add a Business Rule to the link between FileClient.write and otdDB2.Select_psPSSelectAll and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. From the Business Rule Designer toolbar Number menu, select number literal.
 - c. Enter 0.0 as the number value.
 - d. Map the 0.0 output node of the number literal method box, to EMP_NO under otdDB2.Select_psPSSelectAll.Input → input in the Input pane of the Business Rule Designer.

- 4 Create the Records found → otdInputDTD_DBemployees.marshal rule in Case 1 of the Decision branching activity.
 - a. Add a Business Rule to the link between the Records found input node and otdInputDTD_DBemployees.marshal and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Map nodes under otdDB2.Select_psPSSelectAll.Output → output → Select_psPSSelectAllPSResponseTypeList in the Output pane of the Business Rule Designer, to the corresponding nodes under otdInputDTD_DBemployees.marshal.Input → DBemployees → X_sequence_A in the Input pane of the Business Rule Designer, as follows:
 - EMP NO \rightarrow EmpNo
 - LAST NAME \rightarrow Lastname
 - FIRST NAME \rightarrow Firstname
 - RATE \rightarrow Rate
 - LAST_UPDATE → LastDate

- 5 Create the otdInputDTD_DBemployees.marshal → FileClient.write rule in Case 1 of the Decision branching activity.
 - a. Add a Business Rule to the link between otdInputDTD_DBemployees.marshaland FileClient.write within the Records found element, and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Map contents under otdInputDTD_DBemployee.marshal.Output, in the Output pane of the Business Rule Designer, to text under FileClient.write.Input3 in the Input pane of the Business Rule Designer.

- 6 Create the Norecord → FileClient.write rule in Case 2 of the Decision branching activity.
 - a. Add a Business Rule to the link between No record input node and FileClient.write within the Records found element, and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. From the Business Rule Designer toolbar String menu, select string literal.
 - c. Enter Records Not Found as the String value in the string literal method box.
 - d. Map the Records Not Found output node of the *string literal* method box, to text under FileClient.write.Input2 in the Input pane (right pane) of the Business Rule Designer.
- 7 Create the Decision Gate Properties for the Decision Case 1 and Case 2.
 - a. Double-click the red Case 1 icon between Decision input node and Records found input node.

The Decision Gate Properties Editor appears.

- b. From the Decision Gate Properties Editor toolbar Operator menu, select Settings.

 The Method Pallette appears.
- c. From the Method Palette, click the Operator tab and select the greater than option (for Case 1) and select the Lesser or equal option (for case 2). Click Close.

The new options are added to the Operator menu.

- d. From the Decision Gate Properties Editor toolbar Operator menu, select greater than.

 The greater than method box is added to the editor's canvas.
- e. Map rowCount under otdDB2.Select_psPSSelectAll.Output → output in the left pane of the Decision Gate Properties Editor, to the number1 input node of the *greater than* method box.
- f. Double-click the number 2 field of the greater than method box, and change the value to 0.0.
- g. Map 00 output node of the *greater than* method box, to the Result node in the right pane of the Decision Gate Properties Editor.
- h. From the Order of Execution field, select Case 2.
- i. From the Decision Gate Properties Editor toolbar Operator menu, select lessor or equal. The *lessor or equal* method box is added to the editor's canvas.

- j. Map rowCount under otdDB2.Select_psPSSelectAll.Output → output in the left pane of the Decision Gate Properties Editor, to the number1 input node of the lessor or equal method box.
- k. Double-click the number 2 field of the lessor or equal method box, and change the value to 0.0.
- I. Map 00 output node of the *lessor or equal* method box, to the Result node in the right pane of the Decision Gate Properties Editor.
- m. Click OK to close the Decision Gate Properties Editor.

The Case 1 and 2 icons change from red to green to indicate that the properties have been set.

- 8 Create the Decision.end \rightarrow FileClient.write rule.
 - a. Add a Business Rule to the link between the Decision . end element and FileClient.write, and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. From the Business Rule Designer toolbar String menu, select string literal.
 - c. Enter Select Done as the String value in the string literal method box.
 - d. Map the Select Done output node of the *string literal* method box, to text under FileClient.write.Input3 in the Input pane of the Business Rule Designer.
- 9 Save your project.

Creating the bpTableSelect Business Rules

The bpTableSelect business process describes how to select all records the DB2 database using the Business Process Designer.

Note – The where clause in the business rule reads the trigger value as a placeholder for input. This permits you to modify the query to select a specific record. Also note that all records are selected from the database when the TriggerTableSelect.in file is empty.

Create the bpTableSelect Business Rules

1 Double-click bpTableSelect in the Projects window to open the Business Process Designer to the bpTableSelect Business Process.

- 2 Create the bpTableSelect FileClient.receive → FileClient.write rule.
 - a. Add a Business Rule to the link between FileClient.receive and FileClient.write and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Create a string literal and enter Selecting record(s) from db_employee table via table select...as the String value.
 - c. Map the Selecting record(s) from db_employee table via table select... output node of the string literal method box, to text under FileClient.write.input in the Input pane (right pane) of the Business Rule Designer.
- 3 Create the FileClient.write \rightarrow otdDB2.DB_EMPLOYEESelectAll rule.
 - a. Add a Business Rule to the link between FileClient.write and otdDB2.DB_EMPLOYEESelectAll and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Map text under FileClient.receive.Output in the Output pane of the Business Rule Designer, to the whereClause under otdDB2.DB_EMPLOYEESelectAll.Input in the Input pane.
- 4 Create the otdDB2.DB_EMPLOYEESelectAll \rightarrow otdInputDTD_DBemployees.marshal rule.
 - a. Add a Business Rule to the link between otdDB2.DB_EMPLOYEESelectAll and otdInputDTD_DBemployees.marshal and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Map nodes under otdDB2.Select_psPSSelectAll.Output → output → DB_EMPLOYEESelectAllTableResponseTypeList in the Output pane of the Business Rule Designer, to the corresponding nodes under otdInputDTD_DBemployees.marshal.Input → DBemployees → X_sequence_A in the Input pane of the Business Rule Designer, as follows:
 - $EMP_NO \rightarrow EmpNo$
 - LAST NAME \rightarrow Lastname
 - FIRST NAME \rightarrow Firstname
 - RATE \rightarrow Rate
 - LAST_UPDATE → LastDate
- 5 Create the otdInputDTD DBemployees.marshal → FileClient.write rule.
 - a. Add a Business Rule to the link between otdInputDTD_DBemployees.marshal and FileClient.write, and double-click the new Business Rule icon to open the Business Rule Designer.

- b. Map text under otdInputDTD_DBemployees.marshal.Output in the Output pane of the Business Rule Designer, to text under FileClient.write.Input1 in the Input pane.
- 6 Create the FileClient.write → FileClient.write rule.
 - a. Add a Business Rule to the link between FileClient.write element and FileClient.write, and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Create a string literal and enter TableSelect Done...as the String value.
 - c. Map the TableSelect Done... output node of the string literal method box, to text under FileClient.write.input2 in the Input pane (right pane) of the Business Rule Designer.

Creating the bpUpdate Business Rules

The bpTableSelect business process describes how to select all records the DB2 database using the Business Process Designer.

Note – The where clause in the business rule reads the trigger value as a placeholder for input. This permits you to modify the query to select a specific record. Also note that all records are selected from the database when the TriggerTableSelect.in file is empty.

Create the bpUpdate Business Rules

- 1 Double-click bpUpdate in the Projects window to open the Business Process Designer to the bpUpdate Business Process.
- 2 Create the bpUpdate FileClient.receive → FileClient.write rule.
 - Add a Business Rule to the link between FileClient.receive and FileClient.write and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Create a string literal and enter Update the Rate and Last_update fields...as the String value.
 - c. Map the Update the Rate and Last_update fields... output node of the string literal method box, to text under FileClient.write.input in the Input pane (right pane) of the Business Rule Designer.

- 3 Create the FileClient.write \rightarrow otdDB2.DB EMPLOYEEUpdate rule.
 - a. Add a Business Rule to the link between FileClient.write and otdDB2.DB_EMPLOYEEUpdate and double-click the new Business Rule icon to open the Business Rule Designer.
 - b. Create a string literal and enter 2008-10-21 as the String value.
 - c. Map the 2008-10-21 output node of the string literal method box, to LAST_UPDATE under otdDB2.DB_EMPLOYEEUpdate.Input → insert in the Input pane (right pane) of the Business Rule Designer.
 - d. Create another string literal and enter 23.0as the String value.
 - e. Map the 23.0 output node of the string literal method box, to RATE under otdDB2.DB_EMPLOYEEUpdate.Input → insert in the Input pane (right pane) of the Business Rule Designer.
 - f. Map the text under FileClient.receive.Output1 in the Output pane of the Business Rule Designer, to whereClause under otdDB2.DB_EMPLOYEEUpdate.Input → insert in the Input pane (right pane) of the Business Rule Designer.
- 4 Create the otdDB2.DB_EMPLOYEEUpdate → FileClient.write rule.
 - a. Create a string literal and enter Update Doneas the String value.
 - b. Map the Update Done output node of the string literal method box, to text under FileClient.write.Input1 in the Input pane of the Business Rule Designer.
- 5 Save your Project.

Next Steps For your next step, see "Creating the Connectivity Maps" on page 44.
