Replacing an ESM/IOM CRU in the CSM200 Drive Module

Use the following procedure to replace an environmental services monitor (ESM/IOM) CRU in the CSM200 drive module. Gather antistatic protection and a replacement ESM/IOM for this procedure.

IMPORTANT Trays in the storage array can be connected to the standard AC power source or the optional DC power source (–48 VDC). For DC-powered trays, you must disconnect the two-pole 20-amp circuit breaker before turning off any power switches. If the CSM200 drive module is connected to the 6580/6780 controller module, the DC power option is not available for either tray.

ATTENTION Possible hardware damage – To prevent electrostatic discharge damage to the tray, use proper antistatic protection when handling tray components.

- 1 If possible, use the storage management software to create, save, and print a new storage array profile.
- 2 Did the Recovery Guru direct you to replace a failed ESM/IOM?
 - **Yes** – Go to step 3.
 - **No** – Run the Recovery Guru to identify the failed component, and go to step 3.
- 3 Put on antistatic protection.
- 4 If applicable, turn off the audible alarm by pressing the Alarm Mute button on the front of the drive module.
- 5 Unpack the new ESM/IOM, and verify that it is the same type of ESM/IOM as the one you are replacing. If it is not, contact your Sun Customer Care Center representative.
- 6 Stop all I/O activity to the drive module.
- 7 Check the ESM/IOM Fault LEDs to locate the failed ESM/IOM. If a fault is detected, the amber ESM/IOM Fault LED is on.
- 8 Determine whether the blue ESM/IOM Service Action Allowed LED is on. Do not remove the ESM/IOM if the blue LED is off.
- 9 Label the cables that are attached to the ESM/IOM that you are replacing so that you can connect them correctly later.

- 10** To turn off the power to the drive module with the failed ESM/IOM, choose one of these actions:
- **The drive module is connected to the standard AC power source** – Go to step 20.
 - **The drive module is connected to the optional DC power source** – Go to step 11.

WARNING (W12) Risk of electrical shock – This unit has more than one power source. To remove all power from the unit, all DC MAINS must be disconnected by removing all power connectors (item 4 below) from the power supplies.

- 1 Supply (Negative), Brown Wire, –48 VDC
- 2 Return (Positive), Blue Wire
- 3 Ground, Green and Yellow Wire
- 4 DC Power Connector

CAUTION (C05) Electrical grounding hazard – This equipment is designed to permit the connection of the DC supply circuit to the earthing conductor at the equipment.

- 11** Disconnect the two-pole 20-amp DC circuit breaker.
- 12** Turn off both of the DC Power switches on all DC-powered trays in the storage array.

ATTENTION Potential degraded performance – To prevent degraded performance, do not twist, fold, pinch, or step on fiber-optic cables. Do not bend the fiber-optic cables tighter than a 5-cm (2-in.) radius.

- 13 Disconnect the host interface cables and any SFP transceivers from the failed ESM/IOM in the DC-powered drive module (Figure 1).

Figure 1 Removing and Replacing an SFP Transceiver

- 1 Fiber-Optic Cable
- 2 SFP Transceiver
- 3 ESM/IOM Bypass LED
- 4 Host Interface Connector
- 5 ESM/IOM Service Action Required LED
- 6 ESM/IOM CRU

- 14 To remove the failed ESM/IOM in the DC-powered drive module, pull up and out on the latch (Figure 2).

Figure 2 Removing and Replacing an ESM/IOM

- 1 Latch

- 15 Slide the new ESM/IOM in the DC-powered drive module into the empty slot, and close the latch.
- 16 Reconnect the SFP transceivers and the host interface cables to the new ESM/IOM in the DC-powered drive module.
- 17 Connect the two-pole 20-amp DC circuit breaker.

- 18 Turn on both of the Power switches on all of the DC-powered drive modules in the storage array, and wait for the drives to spin up.
- 19 Turn on both of the Power switches on the DC-powered array module in the storage array, and go to step 26.
- 20 Turn off both AC Power switches on the AC-powered drive module with the failed ESM/IOM.

ATTENTION Potential degraded performance – To prevent degraded performance, do not twist, fold, pinch, or step on fiber-optic cables. Do not bend the fiber-optic cables tighter than a 5-cm (2-in.) radius.

- 21 Disconnect the host interface cables and any SFP transceivers from the failed ESM/IOM in the AC-powered drive module.
- 22 To remove the failed ESM/IOM in the AC-powered drive module, pull up and out on the latch (Figure 2 on page 3).
- 23 Slide the new ESM/IOM in the AC-powered drive module into the empty slot, and close the latch.
- 24 Reconnect the SFP transceivers and the host interface cables to the new ESM/IOM in the AC-powered drive module.
- 25 Turn on the AC Power switches on the new ESM/IOM in the AC-powered drive module, and wait for the drives to spin up.
- 26 Based on the status of the LEDs, choose one of these actions:
 - **One or more green LEDs are on and the ESM/IOM Service Action Required LED is off** – Go to step 28.
 - **All green LEDs are off or the ESM/IOM Service Action Required LED is on** – Verify that the ESM/IOM is installed correctly and that all host interface cables are secure. If the ESM/IOM is not installed correctly, reinstall the ESM/IOM (starting with step 10), and go to step 28.
- 27 Did reinstalling the ESM/IOM correct the problem?
 - **Yes** – Go to step 28.
 - **No** – If the problem is not resolved, contact your Sun Customer Care Center representative.
- 28 Complete any remaining Recovery Guru procedures, if needed.
- 29 Using the LEDs and the storage management software, check the status of all of the trays in the storage array.

30 Does any component have a Needs Attention status?

- **Yes** – Click the **Recovery Guru** toolbar button in the Array Management Window, and complete the recovery procedure. If the problem is not resolved, contact your Sun Customer Care Center representative.
- **No** – Go to step [31](#).

31 Remove the antistatic protection.

32 Create, save, and print a new storage array profile.
