# Preface

This manual provides information about the error messages you may encounter when installing and using Oracle Fusion Middleware components. It augments the message texts by providing additional cause and action information. For more information on error messages in Oracle Application Server, browse the documentation on the Oracle Technology Network (OTN) at <http://www.oracle.com/technology/products/ias/index.html>.

## Audience

This manual is intended for anyone who uses Oracle Fusion Middleware and requires more information about an error message encountered in the product.

## Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at <http://www.oracle.com/accessibility/>.

### Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

### Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

### Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/support/contact.html> or visit <http://www.oracle.com/accessibility/support.html> if you are hearing impaired.

# Conventions

The following text conventions are used in this document:

<b>boldface</b>	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.

**Impact:** Data

**BDSS-20013: Failed to update metadata to the BDSS hub-record. \tSource Connector user = {0} \tSource PIM Connector Name = {1} \tSource PIM Record Identifier = {2}.**

**Cause:** This error occurs when the Sync-Engine is unable to persist updated metadata to the BDSS database for a particular BDSS hub-record. In particular, this error occurs when the Sync-Engine catches an exception when invoking method `SyncConfig::getHubRecordForPimRecord`. This error could indicate corrupt metadata for a particular BDSS hub-record, or perhaps a network or database failure, or a problem with the SyncConfig component.

**Action:** Check that the database is accessible. Perhaps try restarting the BDSS hub. If corrupt metadata is suspected, then try removing all metadata for a user and perform initial synchronization for a user.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20014: Failed to update the error code for a record.**

**Cause:** The Sync-Engine cannot find a hub record for the specified PIM record identifier and Connector. This problem is unexpected and should not occur under normal operating conditions. This error message signifies that either hub metadata is missing or incorrect, or there was some other problem - such as a database access error. The Sync-Engine detects this error by means of an Exception thrown from SyncConfig method `getHubRecordForPimRecord`.

**Action:** Examine the log for evidence of exception text that will give more specific information as to the cause of the problem. Ensure that all infrastructure, such as the database and network, are working correctly. Ensure that all configuration is correct. Ensure that metadata is not corrupt for the specified user, Connector user and PIM Connector Name and PIM Record identifier. If the problem is due to hub metadata corruption for a given user then try clearing that user hub metadata and perform first-time synchronization for the user.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20015: Failed to find an BDSS PIM metadata record for BDSS master hub record ID = {0}**

**Cause:** This error message is logged when a PIM metadata record could not be found for the specified hub user ID, hub record ID and Connector. In particular, the Sync-Engine logs this message when it detects an exception from method `SyncConfig::getPimRecordForHubRecord`. This problem could be due to corrupt metadata (e.g. the PIM metadata record is actually missing) or some other cause.

---

**Action:** Examine the log for the exception text that should give a better clue as to the underlying cause of the error. Ensure that all infrastructure, such as the database and network, are working correctly. Ensure that all configuration is correct. Ensure that hub metadata is not corrupt for the logged hub record ID. If the problem is due to hub metadata corruption for a given user then try clearing that user hub metadata and perform first-time synchronization for the user.

**Level:** 1

**Type:** NOTIFICATION

**Impact:** Other

**BDSS-20019: BDSS queue message receiver timeout expired. Queue message not received.**

**Cause:** This error indicates that the Sync-Engine ExtractResponseTimeout occurred because the Sync-Engine did not receive an ExtractResponse for which it was waiting. In particular, this error represents a failure to receive an

---

ExtractResponse via a queue message in a timely fashion. The Sync-Engine uses the ExtractResponseTimeout as a time-trigger to determine when a connector has become unresponsive. In such a case, the Sync-Engine has determined that it will not receive an ExtractResponse in a timely fashion and thus takes recovery action to abort the synchronization. This problem could be caused when a connector does not correctly send an ExtractResponse to the Sync-Engine. Alternatively, the ExtractResponse was sufficiently large, or network latency slow enough, that the timeout occurred before the ExtractResponse could be properly transferred to the Sync-Engine from a connector.

**Action:** Ensure that all connectors are properly working and can successfully send ExtractResponse objects to the Sync-Engine. Ensure that the Sync-Engine machine is not overloaded and can handle receiving ExtractResponse objects efficiently. Ensure that the amount of data transferred via an ExtractResponse is not too large, or the network latency too slow, to trigger the ExtractResponseTimeout. If necessary, increase the ExtractResponseTimeout timeout value. Determine whether an http webservice timeout is occurring when a connector sends an ExtractResponse to the Sync-Engine.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20020: Received queue message that is an unexpected message class type. Expecting class type ObjectMessage. {0}.**

**Cause:** This error indicates that the Sync-Engine has received a queue message with an unexpected Java class type. This error suggests a communication protocol failure within the Sync-Engine.

**Action:** Ensure the BDSS product is installed and configured correctly and ensure that a rogue producer is not sending messages to the BDSS message queue.

**Cause:** The Sync-Engine has detected an invalid hub-user in the UsersArray. The Sync-Engine cannot synchronize an invalid hub user. In particular, a string array element is null, instead of specifying a valid hub user.

**Action:** Ensure that the array of users sent to the Sync-Engine has a valid hub user for each element in the array.

**Level:** 1

**Impact:** Data

**BDSS-20024: Invalid Hub User ID detected in an element of UsersArray.**

**Cause:** The Sync-Engine has detected an invalid hub-user in the UsersArray. The Sync-Engine cannot synchronize an invalid hub user. In particular, a valid string array element has been detected, but the string is empty and does not specify a hub user.

**BDSS-20027: Synchronization cannot start because the Hub user ID provided is either null or an empty string.**

**Cause:** The Hub user id provided is either null or an empty string.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20028: Invalid ExtractResponse detected. The ExtractResponse sent by a connector indicates that it contains delete events but the delete events do not exist.**

**Cause:** This error occurs when the Sync-Engine detects that an ExtractResponse specifies a true value for member ExtractResponse.ExtractResponseData.hasDeletes and yet specifies a null value for

---

member `ExtractResponse.ExtractResponseData.deleteRecordIdArray`. Thus, the `ExtractResponse` object is corrupt and cannot be processed.

**Action:** Fix the connector that is providing the invalid `ExtractResponse`.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20029: Invalid ExtractResponse detected. The ExtractResponse sent by a connector contains a null delete record ID.**

**Cause:** This error is logged when the Sync-Engine detects a null array element in member `ExtractResponse.ExtractResponseData.deleteRecordIdArray` when a valid delete record ID is expected.

**Action:** Fix the connector that is providing the invalid `ExtractResponse`.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20030: An ExtractResponse indicates that upserts exist but they do not.**

**Cause:** This error occurs when the Sync-Engine determines that an `ExtractResponse` should contain upsert records when it does not. In particular, the member `ExtractResponse.ExtractResponseData.hasUpserts` is true but `upsertRecordArray` in `ExtractResponse.ExtractResponseData.upsertRecordArray` is invalid.

**Action:** Fix the connector that is providing the invalid `ExtractResponse`.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20035: Cannot find a PIM connector endpoint for the current user and Connector {0}**

**Cause:** The Sync-Engine queried all connector URLs for a particular Connector using connector interface method `getPimServerEndPoint`. However, none of the connector instances provided a connector endpoint for a particular Connector user.

**Action:** See the log entry to identify the Connector and the corresponding hub user ID for this error. Ensure that the Connector user is configured in the PIM, that BDSS configuration is correct, that all connector instance URLs are properly configured, and that the connector instance can successfully return the endpoint for the Connector and user for which this problem occurs.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20040: An error occurred while pushing create, update or delete changes to Connector {0} for hub domain {1}.**

**Cause:** This is a generic high-level error message indicating that an error occurred while pushing create, update, or delete events to the specified Connector and hub domain.

---

**Action:** Examine this message in the log to find the pertinent Connector and hub domain. Examine the log for the underlying error that is expected to have been logged prior to this error message. Take appropriate action once the underlying error has been identified.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20041: The BDSS Engine will continue to push record changes to the next PIM if any are available.**

**Cause:** The text of this informational message is a supplement to the text of message SYNCENG\_PUSH\_TO\_PIM\_ERROR. This message text is logged only when the Sync-Engine has changes to additional PIMs that can be propagated for the same hub domain.

**Action:** No action is necessary that is specific to this message. Instead, see the action text for error message SYNCENG\_PUSH\_TO\_PIM\_ERROR.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20043: Unexpected or failure result code detected in an ExtractResponse.**

**ExtractResponse Result Code = {0}. ExtractResponse Error Description = {1}**

**Cause:** An ExtractResultCode value of either PARTIAL\_EXTRACT\_COMPLETED\_OK or PARTIAL\_EXTRACT\_COMPLETED\_NOTOK has been detected in an ExtractResponse received from a connector. An ExtractResponse, with either of these ExtractResultCode values, is considered nonviable for synchronization by the Sync-Engine. Thus, the Sync-Engine cannot perform synchronization with the corresponding ExtractResponse.

**Action:** Examine the connector, PIM server and configuration corresponding to the failed ExtractResponse. Fix the problem with this connector-related error.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20044: Unknown failure code detected in an ExtractResponse.**

**ExtractResponse Result Code = {0}. ExtractResponse Error Description = {1}**

**Cause:** The Sync-Engine detects an unknown ExtractResultCode value in an ExtractResponse received from a connector.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20045: Unknown Connector detected when retrieving an extract response.**

**Cause:** The Sync-Engine recognizes only two Connectors - one for Exchange and the other for Webcenter. The Connector, received in an ExtractResponse from a connector, is not recognized by the Sync-Engine.

---

**Action:** Examine the log entry for this message to obtain the Connector retrieved from the problematic ExtractResponse. Examine the connector, PIM server and configuration corresponding to the problematic ExtractResponse. **BPM-36335: Fact not found in the rule engine working memory, rule session execution failed.**

**Cause:** The rule session {0} failed because an instance of the fact {1} could not be found in the working memory of the rule session.

**Action:** This is most likely a rule modeling error. The decision service interaction expects the fact instance to exist in the working memory of the rule session. **Action:** This is most likely due to a rule modeling issue. Make sure that the fact of the given type is asserted only once. One common issue is that the rule conditions are not mutually exclusive and as a result of that more than one rule action is executed. In case the rule action has a assert new statement of the given fact type then multiple fact instances are created in the rule session working memory and the decision service is not able to identify the one that should be returned as the result of the decision service interaction. **DMS-57003: Failed to process the wrapped DMS execution context {0} sent by {1} (user-agent: {2}) when requesting the resource {3}.**

**Cause:** By scrutinizing the incoming HTTP request DMS has attempted to detect and, if appropriate, make use of a wrapped execution context. That process has failed. This should not affect the processing of the servlet handling the request, but the ability to correlate the processing of this request with others to which it may related will have been adversely affected. A DMS execution context is an object that contains context information about the piece of work being performed at a particular moment in time. The type of context information carried by the DMS execution context may include the URL of the http request, the unique correlation key (ECID) assigned to that piece of work, etc - information that is useful for tracking requests though the system. The execution context does not carry user names, passwords or general application parameters. The DMS execution context should not be confused with application specific context objects, such as ADF-context or Faces-context, which are vital to the accurate execution of the application concerned.

**Action:** Contact Oracle Support Services.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57004: Failed to initialize the DMS trace to be associated with DMS execution context {0}, that itself is associated with a request of resource {1}.**

**Cause:** A problem has occurred in the initialization of the trace system for this request. This should not affect the processing of the servlet handling the request but will be a problem if the trace (aggregate, debug or triggered) data was of value to the system's administrator.

**Action:** If the trace of this request was important, and has been affected by this error, then contact Oracle Support Services

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57005: Failed to terminate the DMS trace associated with DMS execution context {0}, that itself is associated with a request of resource {1}.**

**Cause:** A problem has occurred in the finalization of the trace system for this request. This should not affect the processing of the servlet handling the request but will be a problem if the trace (aggregate, debug or triggered) data was of value to the system's administrator.

**Action:** If the trace of this request was important, and has been affected by this error, then contact Oracle Support Services

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57006: Failed to deactivate the DMS execution context, {0}, associated with a request of resource {1}.**

---

**Cause:** A problem has occurred in the termination of the DMS execution context in place during the processing of the HTTP request. This should not affect the servlet handling the request, but may result in an invalid execution context being in place for the processing of future requests and possibly prevent accurate trace data from being gathered.

**Action:** Contact Oracle Support Services.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57007: Failed to url-decode a wrapped execution context ({0}) due to a problem in the decoding process itself: {1}**

**Cause:** A problem has occurred while trying to url-decode a wrapped execution context found as a url-parameter. The consequence is that the execution context being passed from client to server can not be used. A failure in the DMS execution context feature does not generally result in a complete failure of the system or application making use of it, but it can result in misleading trace output or misleading correlation keys (ECID) in log messages: generally only the administrator will be aware of such changes in the behavior of an affected application.

**Action:** Determine if there is any code in the system that integrates with the Oracle DMS Context API (java package oracle.dms.context) but was not produced by Oracle. If there is no such code then contact Oracle Support Services. Otherwise scrutinize and test the non-Oracle code, and if necessary contact Oracle Support Services.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57008: The execution context put in place at the start of the request, {0}, is not the execution context in place at the end of the request, {1}. The request is as follows: {2}**

**Cause:** When enabled to do so DMS associates an execution context with the resources (typically a thread) assigned to process an incoming request. In this case the context that DMS assigned at the start of the processing is not the one in place at the end of the processing. At some point during the processing the context has been changed. This could result in the loss of the ability to correlate the work performed across the complete request lifecycle for this request. A failure in the DMS execution context feature does not generally result in a complete failure of the system or application making use of it, but it can result in misleading trace output or misleading correlation keys (ECID) in log messages: generally only the administrator will be aware of such changes in the behavior of an affected application.

**Action:** Determine if there is any code in the system that integrates with the Oracle DMS Context API (java package oracle.dms.context) but was not produced by Oracle. If there is no such code then contact Oracle Support Services. Otherwise scrutinize and test the non-Oracle code, and if necessary contact Oracle Support Services.

**Level:** 1

**Type:** WARNING

---

**Impact:** Other

**DMS-57009: An error prevented selection of an appropriate execution context implementation for this environment - the feature will be disabled.**

**Cause:** At the point of initialization DMS needs to determine the environment in which it is operating in order to select the most appropriate implementation of the execution context feature. An unexpected error has occurred during that process. The DMS execution context feature will be disabled.

**Action:** Review the error to see if it can be resolved and then restart the server.

**Level:** 1

**Type:** ERROR

**Impact:** Other

**DMS-58002: Could not create trace output directory ({0}) - Disabling {1} traces.**

**Cause:** An attempt to create a file system directory, into which trace files were to be written, has failed. Consequently no trace information can be saved and therefore, to save unnecessary burden on the system, trace information will not be collected.

**Action:** Check that the system user that owns the process has permissions to create such a directory. Check that the system has sufficient disk space to create a new directory.

**Level:** 1

**Type:** WARNING

**Impact:** Files

**DMS-58005: ignoring exception: {0}**

**Cause:** An unanticipated problem has occurred for which the runtime code can not take automatic remedial action.

**Action:** Refer to the base exception to see if there is a problem with the system that can be addressed (e.g. run low in disk space, run out of memory, etc).

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58006: Problem encountered while removing old files from trace output directories.**

**Cause:** DMS was attempting to remove old files from the trace output directories but for some reason (see base exception) has failed.

**Action:** The system is unlikely to fail as a consequence of this error, but disk space will be used that would otherwise have been released. Refer to the base exception to see if the problem can be addressed, and consider deleting unrequired files manually (DMS no longer needs these old files so any or all of them can be removed).

**Level:** 1

**Type:** WARNING

**Impact:** Files

**DMS-58007: Problem encountered when closing file and associated streams.**

---

**Cause:** As part of the termination of a normal read or write operation on a file the file could not be closed.

**Action:** If a file can not be properly closed then the operating system's file-handle associated with that file may not be properly released. An operating system can manage only a finite number of file-handles and if they are not released then new file-handles can not be created. One consequence of a depletion of file-handles is that file input/output on the machine concerned may be forced to come to a stop. It is more likely, however, that this is a one-off problem and that Java will tidy up the file-handle internally. This type of problem suggests a problem with either the JVM, the operating system or the state of the machine on which they are running. Review the base exception to see if the issue can be resolved (e.g. memory issues, disk space issues, file access issues, etc.). In order to understand the scale of the problem continue to monitor the system for similar or related issues. If necessary stop and start the product to fully reinitialize the JVM on which it runs.

**DMS-58008: error writing trace data to disk**

**Cause:** DMS has failed to create or use the objects required to write trace output to disk. The output intended to be written will be discarded.

**Action:** This type of problem suggests a problem with either the JVM, the operating system or the state of the machine on which they are running. Review the base exception to see if the issue can be resolved (e.g. memory issues, disk space issues, file access issues, etc.). In order to understand the scale of the problem continue to monitor the system for similar or related issues. If necessary stop and start the product to fully reinitialize the JVM on which it runs.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58013: Problem encountered aggregating trace: {0}.**

**Cause:** DMS has failed to perform the aggregation process on the trace data collected during the handling of this particular task or servlet request. A DMS trace is composed of a series of DMS trace events that represent an operation performed within DMS. Examples of trace events are: a sensor update, the start and end of an HTTP request. An aggregate trace is the result of aggregating trace data for tasks (typically HTTP requests) associated with the same URI. Failure to perform the aggregation processing for this task will mean that the summary data for the URI concerned will not be accurate.

**Action:** Review exception details and the log for any seemingly related messages. If the problem has come from the JVM itself: This type of problem suggests a problem with either the JVM, the operating system or the state of the machine on which they are running. Review the base exception to see if the issue can be resolved (e.g. memory issues, disk space issues, file access issues, etc.). In order to understand the scale of the problem continue to monitor the system for similar or related issues. If necessary stop and start the product to fully reinitialize the JVM on which it runs. Otherwise the problem is with the code written to run on the JVM: Determine if there is any code in the system that that integrates with the Oracle DMS Trace API (java package oracle.dms.trace) but was not produced by

**DMS-58014: Failed to handle REQUEST\_BEGIN for {0}. The trace will not be aggregated.**

**Cause:** DMS did not find the trace event that marks the start of the series of trace events to be associated with an HTTP request. Without that particular trace event DMS can not be sure that the set of collected trace events will accurately represent the actions performed during that HTTP request and consequently will not process them further. Failure to perform the aggregation processing for this task will mean that the summary data for the URI concerned will not be accurate.

**Action:** Review exception details and the log for any seemingly related messages. Failure to perform the aggregation processing for this task will mean that the summary data for the URI concerned will not be accurate.

**Action:** Determine if there is any code in the system that that integrates with the Oracle DMS Trace API (java package oracle.dms.trace) but was not produced by Oracle. If there is no such code then contact Oracle Support Services. Otherwise scrutinize and test the non-Oracle code in order to isolate the problem.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58017: The maximum number of allowed aggregates has already been reached. Traces referring to URLs not already being aggregated will not contribute to aggregate information.**

**Cause:** In order to prevent too much memory being consumed by the DMS trace system the current request will not be added to the aggregate trace set because the maximum number of URIs for which trace data will be aggregated has already been reached. A DMS trace is composed of a series of DMS trace events that represent an operation performed within DMS. Examples of trace events are: a sensor update, the start and end of an HTTP request. An aggregate trace is the result of aggregating trace data for tasks (typically HTTP requests) associated with the same URI.

**Action:** If aggregate trace information is not required for this request there is no action required. Otherwise please review the value of the system property oracle.dms.trace.maxAggregates.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58018: Cannot delete old trace file: {0}.**

**Cause:** An attempt to delete a file system file has failed (the deletion attempt was intended to keep files organized and their number manageable). The system is unlikely to fail as a consequence of this error, but disk space will be used that would otherwise have been released.

**Action:** This type of problem suggests a problem with either the JVM, the operating system or the state of the machine on which they are running. Review the base exception to see if the issue can be resolved (e.g. memory issues, disk space issues, file access issues, etc.). In order to understand the scale of the problem continue to monitor the system for similar or related issues. If necessary stop and start the product to fully reinitialize the JVM on which it runs.

**Level:** 1

**Type:** WARNING

**Impact:** Files

**DMS-58019: Cannot generate aggregate trace data because the trace system failed initialization.**

**Cause:** (See message)

**Action:** Review the log files for reports of other problems relating to initialization failure. Where possible correct those other problems and restart the system. Failure of the trace subsystem should not affect the ability of the system to execute, but will prevent traces from being produced.

**DMS-58025: cannot instantiate class {0} for destination with id = {1}**

**Cause:** A Destination could not be created at runtime.

**Action:** Check that the Destination has been configured correctly.

**Level:** 1

**Type:** WARNING

**Impact:** Configuration

**DMS-58026: cannot not set property {0} on an instance of class {1} for destination with id = {2}**

**Cause:** The configuration of a destination specified one or more properties to be set on the destination before the destination was used. A problem was encountered trying to set the property listed in the message the precise details of which are also shown in the message.

**Action:** Verify that the property exists on the class being instantiated as the destination, and that the value is legal for that property.

**Level:** 1

**Type:** WARNING

**Impact:** Configuration

**DMS-58028: will not associate filter {0} and destination {1} - one or both are null or have null IDs.**

**Cause:** (See message)

**Action:** Check the configuration of the filter and destination, and search the log file for other messages that may report problems creating instances of the filter or destination.

**Level:** 1

**Type:** WARNING

**Impact:** Configuration

**DMS-58033: Can not associate a destination, id={0}, with a filter, id={1} if the filter declares that it will not pass any events.**

**Cause:** An instance of a filter should declare the set of event types in which it has an interest. In this particular case the set is empty and thus the filter is apparently interested in no events at all. Such a filter serves no sensible purpose and therefore will be ignored.

**Action:** Check the log file for other error relating to this filter to see if there were problems in its construction. Also verify the configuration of the filter and its associated destination (some filters are created implicitly to cooperate with a destination, so the configuration may only specify details of the destination).

**DMS-58035: The required JRockit Flight Recorder classes can not be found. The JFRDestination can not function without them.**

**Cause:** The JRockit Flight Recorder classes are only available on Oracle JRockit.

**Action:** Check that the system is running using JRockit or disable the JFRDestination declared within dms\_config.xml

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58040: The JRockit FlightRecorder class is declaring that it is not the JRockit native implementation and thus DMS can not use it.**

**Cause:** DMS only makes use of the JRockit FlightRecorder implementation that is native to JRockit. The FlightRecorder class available to DMS is apparently not a native implementation and will therefore not be used by DMS.

**Action:** This situation will not affect the runtime operation of the system, but in order to avoid the message being reported again either switch to using the JRockit JVM or remove eventRoutes from dms\_config.xml that involve the JFRDestination.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58041: The JRockit FlightRecorder class is declaring that it is not active and so DMS can not use it.**

**Cause:** DMS can only make use of the JRockit FlightRecorder class if it is active. The FlightRecorder class is declaring that it is not active and therefore DMS will not make use of it.

**Action:** This situation will not affect the runtime operation of the system, but in order to avoid the message being reported again either switch to using the JRockit JVM or remove eventRoutes from dms\_config.xml that involve the JFRDestination.
