

Oracle® Enterprise Manager Ops Center

Configuring and Managing File System Storage Libraries Guide

12c Release 1 (12.1.0.0.0)

E27329-01

April 2012

This guide provides an end-to-end example for how to use Oracle Enterprise Manager Ops Center.

Introduction

A storage library stores all the metadata for virtualization hosts and their virtual hosts, as well as the data that is the output of their operations. A virtualization host such as a global zone or a control domain relies on a storage library. In most cases, virtualization hosts are in a server pool, so each virtualization host uses the storage library associated with the server pool.

A storage library can use block storage or file system storage. When it uses a file system, the storage library can use a file system on the Enterprise Controller's system or a file system on an external storage device that is an NFS mount point. The file system on the Enterprise Controller is called a local file system and the file system on the NFS mount point is called a share.

A Sun ZFS Storage Appliance is unified storage, that is, it is capable of both file system storage and block storage. In this document, the Sun ZFS Storage Appliance is an NFS mount point and its shares are used for file system storage.

As a storage administrator, you create storage libraries to support server pools. These instructions create a NAS storage library, backed by a share on the Sun ZFS Storage Appliance.

See [Related Articles and Resources](#) for links to related information and articles.

What You Will Need

You will need the following to set up and use this type of NAS storage library:

- A Sun ZFS Storage Appliance that is a managed asset in Oracle Enterprise Manager Ops Center.
- You must have the role of Storage Admin to create storage libraries.

Hardware and Software Configuration

The Sun ZFS Storage Appliance must be configured to be an NFS mount point and have available NAS shares. To learn how to set up an NFS server and client, see [Storage Management](#).

Configuring a Storage Library on a NAS Share

These are the tasks for setting up a NAS storage library:

1. [Identify the NAS Share](#)
2. [Creating a NAS Storage Library](#)

After you create the storage library, you associate the storage library with a server pool or virtualization host.

Identify the NAS Share

The NAS share is a file system on a NAS storage device. You can view the shares on a storage appliance from the Oracle Enterprise Manager Ops Center user interface.

1. Expand Assets in the Navigation pane.
2. In the group drop-down list, click the Storage group to see all types of storage devices.
3. Click on a Sun ZFS Storage Appliance.
4. Click the Storage Shares tab.

Name	Export Point (NFS)	Resource Name (CIFS)	Use Access Based Enumeration (CIFS)	NFS Enabled	CIFS Enabled	Used Space (GB)	Share Mode (NFS)	No SUID (NFS)	Anon User Mapping (NFS)
DVM/FS_befo...	/export/FS_be...		false	true	false	0.000	none	false	
DVM/pool1	/export/pool1		false	true	false	0.000	none	false	
DVM/pool2	/export/pool2		false	true	false	0.441	none	false	
DVM/repo1	/export/repo1		false	true	false	58.917	none	false	
DVM/repo2	/export/repo2		false	true	false	0.143	none	false	
DVM/sigal1	/export/sigal1		false	true	false	0.142	none	false	
DVM/sigal2	/export/sigal2		false	true	false	0.000	none	false	
DVM/sigal3	/export/sigal3		false	true	false	0.000	none	false	
DVM/sigal4	/export/sigal4		false	true	false	0.142	none	false	

5. View the shares and identify one with capacity to support a server pool.

Creating a NAS Storage Library

After you have identified the physical storage for the storage library, you create the storage library in Oracle Enterprise Manager Ops Center.

1. Expand Libraries in the Navigation pane.
2. In Storage Libraries, click File System Storage.
3. Click New NAS Storage in the Actions pane.

Oracle Enterprise Manager Ops Center - Create New NAS Library

New NAS Library

Library Name:

Library Description:

Server Pool Association: **Select the server pool you want to be associated with this library. Use Ctrl+Click and Shift+Click to select multiple server pools.**

Name	Description
NORM-VirtPool-0	
NORM-VirtPool-1	

Select the type of service:

Exported share on a managed asset

Select a storage asset and then select the share that provides storage.

Asset:

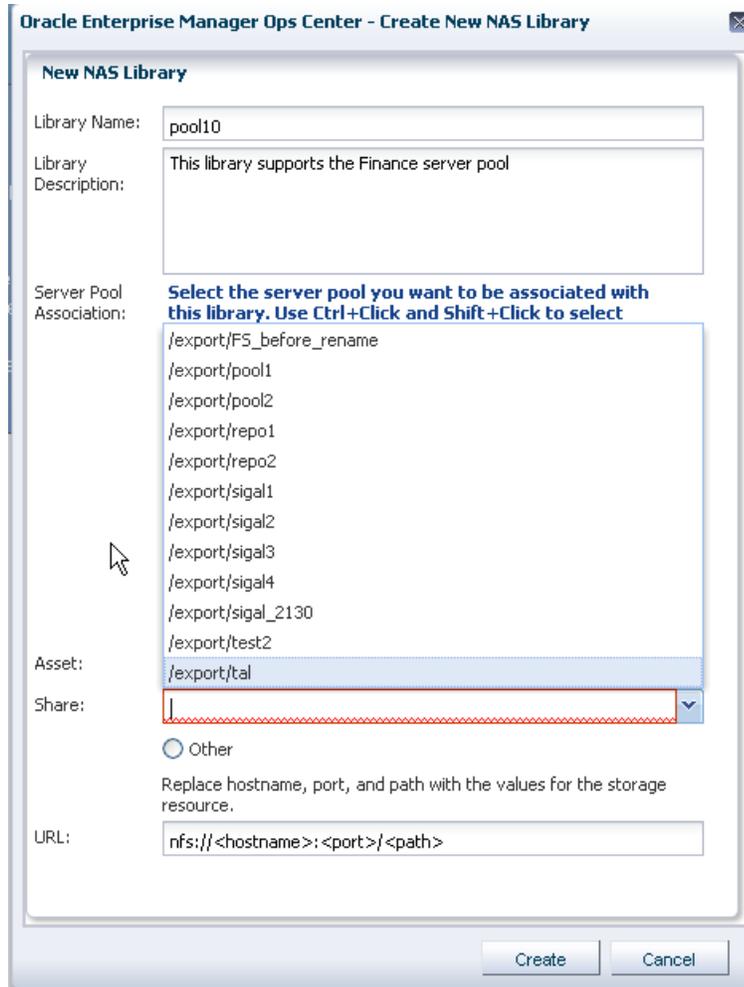

Share:

Other

Replace hostname, port, and path with the values for the storage resource.

URL:

4. Enter a name for the library and a description. For example, identify how the new library will be used.
5. At this point, you could associate a server pool with the new storage library, if the server pool exists and you know the server pool will use the storage library. In these instructions, the storage library is created for use by any server pool, so do not select a server pool.
6. For the type of service, accept the default option, Exported share on a managed asset. The alternative option is to enter the URL for the NFS server, but these instructions are for the specific share on the Sun ZFS Storage Appliance.
7. Click the Asset drop-down list to see the available storage devices. Select the same Sun ZFS Storage Appliance as you did in the previous procedure.
8. Click on the Share drop-down list to see the available shares for the Sun ZFS Storage Appliance. Select the share you identified in the previous procedure.

9. Click the Create button to create the storage library.

When the job is completed, you can see the new storage library in the Libraries section of the Navigation pane in the Filesystem Storage section.

What's Next

The new storage library is not associated with any server pool or virtualization host. Select a server pool or virtualization host and then use the Associate Libraries action.

The storage library is available for any virtualization host or server pool, but because the storage library is not mounted, Oracle Enterprise Manager Ops Center has limited information about it. The Summary tab reports the size as -2 MB and the state as UNKNOWN. After the storage library is associated with a virtualization host or server pool, the storage is mounted so more information can be displayed. The size of the storage library is accurate and all actions for the library are enabled.
