Oracle® Solaris Cluster Data Service for SAP
MaxDB Guide
This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS. Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are “commercial computer software” pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Ce logiciel et la documentation qui l’accompagne sont protégés par les lois sur la propriété intellectuelle. Ils sont concédés sous licence et soumis à des restrictions d’utilisation et de divulgation. Sauf disposition de votre contrat de licence ou de la loi, vous ne pouvez pas copier, reproduire, traduire, diffuser, modifier, breveter, transmettre, distribuer, exposer, exécuter, publier ou afficher le logiciel, même partiellement, sous quelque forme et par quelque procédé que ce soit. Par ailleurs, il est interdit de procéder à toute ingénierie inverse du logiciel, de le désassembler ou de le décompiler, excepté à des fins d’interopérabilité avec des logiciels tiers ou tel que prescrit par la loi.

Les informations fournies dans ce document sont susceptibles de modification sans préavis. Par ailleurs, Oracle Corporation ne garantit pas qu’elles soient exemptes d’erreurs et vous invite, le cas échéant, à lui en faire part par écrit.

Si ce logiciel, ou la documentation qui l’accompagne, est concédé sous licence au Gouvernement des États-Unis, ou à toute entité qui délivre la licence de ce logiciel ou l’utilise pour le compte du Gouvernement des États-Unis, la notification suivante s’applique:

U.S. GOVERNMENT END USERS. Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are “commercial computer software” pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. Preface

*Oracle Solaris Cluster Data Service for SAP MaxDB Guide* explains how to install and configure Oracle Solaris Cluster data services.

**Note** – This Oracle Solaris Cluster release supports systems that use the SPARC and x86 families of processor architectures. In this document, “x86” refers to the larger family of x86 compatible products. Information in this document pertains to all platforms unless otherwise specified.

This document is intended for system administrators with extensive knowledge of Oracle software and hardware. Do not use this document as a planning or presales guide. Before reading this document, you should have already determined your system requirements and purchased the appropriate equipment and software.

The instructions in this book assume knowledge of the Oracle Solaris Operating System and expertise with the volume-manager software that is used with Oracle Solaris Cluster software.

Bash is the default shell for Oracle Solaris 11. Machine names shown with the Bash shell prompt are displayed for clarity.

**Using UNIX Commands**

This document contains information about commands that are specific to installing and configuring Oracle Solaris Cluster data services. The document does not contain comprehensive information about basic UNIX commands and procedures, such as shutting down the system, booting the system, and configuring devices. Information about basic UNIX commands and procedures is available from the following sources:

- Online documentation for the Oracle Solaris Operating System
- Oracle Solaris Operating System man pages
- Other software documentation that you received with your system
Typographic Conventions

The following table describes the typographic conventions that are used in this book.

**TABLE P–1  Typographic Conventions**

<table>
<thead>
<tr>
<th>Typeface</th>
<th>Description</th>
<th>Example</th>

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.
Getting Help

If you have problems installing or using Oracle Solaris Cluster, contact your service provider and provide the following information.

- Your name and email address (if available)
- Your company name, address, and phone number
- The model number and serial number of your systems
- The release number of the operating environment (for example, Oracle Solaris 11)
- The release number of Oracle Solaris Cluster (for example, Oracle Solaris Cluster 4.1)

Use the following commands to gather information about your system for your service provider.

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>prtconf -v</code></td>
<td>Displays the size of the system memory and reports information about peripheral devices</td>
</tr>
<tr>
<td><code>psrinfo -v</code></td>
<td>Displays information about processors</td>
</tr>
<tr>
<td><code>pkg list</code></td>
<td>Reports which packages are installed</td>
</tr>
<tr>
<td><code>prtdiag -v</code></td>
<td>Displays system diagnostic information</td>
</tr>
<tr>
<td><code>/usr/cluster/bin/clnode show-rev -v</code></td>
<td>Displays Oracle Solaris Cluster release and package version information for each node</td>
</tr>
</tbody>
</table>

Also have available the contents of the `/var/adm/messages` file.
This chapter explains how to install and configure HA for SAP MaxDB. From version 7.5, SAP DB is distributed under the name MaxDB for MySQL (MaxDB). In this book, all versions of this database are referred to as MaxDB.

This chapter contains the following sections.

- "HA for SAP MaxDB Overview" on page 9
- "Overview of the Installation and Configuration Process for HA for SAP MaxDB" on page 10
- "Planning the HA for SAP MaxDB Installation and Configuration" on page 11
- "Installing and Configuring SAP MaxDB" on page 16
- "Verifying the SAP MaxDB Installation and Configuration" on page 19
- "Installing the HA for SAP MaxDB Package" on page 21
- "Configuring the HASToragePlus Resource Type to Work With HA for SAP MaxDB" on page 22
- "Registering and Configuring HA for SAP MaxDB" on page 23
- "Tuning the HA for SAP MaxDB Fault Monitors" on page 30
- "Verifying the HA for SAP MaxDB Installation and Configuration" on page 33

HA for SAP MaxDB Overview

To eliminate single points of failure in an SAP MaxDB system, HA for SAP MaxDB provides the following features:

- Fault monitoring and automatic failover for the SAP MaxDB application. You must configure HA for SAP MaxDB as a failover data service.
- Fault monitoring and automatic restart for SAP xserver. You must configure SAP xserver as a multiple master data service.

For conceptual information about failover data services and multiple master data services, see the Oracle Solaris Cluster Concepts Guide.
Each component of SAP MaxDB has data service that protects the component when the component is configured in Oracle Solaris Cluster. See the following table.

**Note** – The files that are associated with the SUNW.sap_xserver resource type are supplied with the Oracle Solaris Cluster HA for SAP liveCache data service. The Oracle Solaris Cluster HA for SAP liveCache data service is installed when you install HA for SAP MaxDB data service.

Planning the HA for SAP MaxDB Installation and Configuration

This section contains the information that you need to plan your HA for SAP MaxDB installation and configuration.

Note – Before you begin, consult your SAP MaxDB documentation for configuration restrictions and requirements that are not imposed by Oracle Solaris Cluster software. For information about restrictions that the Oracle Solaris Cluster software imposes, see the Oracle Solaris Cluster documentation.

Configuration Requirements

The configuration requirements in this section apply only to HA for SAP MaxDB.
Caution – If your data service configuration does not conform to these requirements, the data service configuration might not be supported.

For requirements that apply to all data services, see “Configuration Guidelines for Oracle Solaris Cluster Data Services” in Oracle Solaris Cluster Data Services Planning and Administration Guide.

SAP MaxDB Software Version Requirements
Use SAP MaxDB versions 7.8.2.26, 7.9.7.10, or compatible versions.

HA for SAP MaxDB Configuration Requirements
Configure HA for SAP MaxDB as a failover data service. You cannot configure HA for SAP MaxDB either as a scalable data service or as a multiple master data service. For more information, see the following sections:
- “How to Enable SAP MaxDB to Run in a Cluster” on page 18
- “How to Register and Configure a SAP MaxDB Resource” on page 27

SAP xserver Configuration Requirements
To enable client applications to access HA for SAP MaxDB, you must use SAP xserver. Configure SAP xserver as a multiple master data service. Do not configure SAP xserver as a failover data service.

Configure SAP xserver so that SAP xserver starts on all nodes to which the SAP MaxDB resource can fail over. To implement this configuration, ensure that the node list of the SAP xserver resource group contains all nodes that are in the node list of the SAP MaxDB resource group. For more information, see “How to Register and Configure an SAP xserver Resource” on page 25.

Supported Configurations of This Data Service
The HA for SAP MaxDB data service supports configurations that conform to the requirements in “Configuration Requirements” on page 11.

If you plan to use SAP MaxDB with other highly available SAP MaxDB applications, you must also configure the Oracle Solaris Cluster data services for those applications. For more information, see the following table.
The examples that follow show these supported configurations of HA for SAP MaxDB:

- Two-node cluster configuration
- Four-node cluster configuration with SAP NetWeaver
- Four-node cluster configuration with SAP NetWeaver and SAP liveCache

**Note** – HA for SAP MaxDB might support additional configurations. However, you must contact your Oracle service provider for information about additional configurations.

**EXAMPLE 1–1  Two-Node Configuration**

This example shows a two-node configuration in which a client application accesses the SAP MaxDB resource through the SAP xserver resource. The characteristics of this configuration are as follows:

- The SAP MaxDB resource is configured as a failover data service.
- The SAP xserver resource is configured as a multiple master data service.

**EXAMPLE 1–2  Four-Node Configuration With SAP NetWeaver**

This example shows a four-node configuration in which SAP MaxDB is used with SAP NetWeaver. This configuration uses multiple Advanced Planner & Optimizer (APO) application servers. The characteristics of this configuration are as follows:

- The SAP MaxDB APO Central Instance (CI) resource is configured as a failover data service.
- The SAP MaxDB resource is configured as a failover data service.
- The SAP xserver resource is configured as a multiple master data service.
- APO application server (APP) resources are configured as multiple master data services.
EXAMPLE 1–3  Four-Node Configuration With SAP NetWeaver and SAP liveCache

This example shows a four-node configuration in which SAP MaxDB is used with SAP NetWeaver and SAP liveCache. This configuration uses multiple APO application servers. The characteristics of this configuration are as follows:

- The SAP MaxDB APO CI resource is configured as a failover data service.
- The SAP MaxDB resource is configured as a failover data service.
- The SAP xserver resource is configured as a multiple master data service.
- APP resources are configured as multiple master data services.
- The SAP liveCache resource is configured as a failover data service.

Configuration Considerations

The configuration considerations in the subsections that follow affect the installation and configuration of HA for SAP MaxDB.

Device Group for the SAP MaxDB Application

Ensure that you create a device group for the SAP MaxDB application as follows:

- Install SAP MaxDB on its own global device group. For more information, see “Installing and Configuring SAP MaxDB” on page 16. This separate global device group for SAP MaxDB ensures that the SAP MaxDB resource can depend on the HAStoragePlus resource only for SAP MaxDB.
Create an HAStoragePlus resource for the global device group on which SAP MaxDB is installed. For more information, see “Configuring the HAStoragePlus Resource Type to Work With HA for SAP MaxDB” on page 22.

Ensure that the resource for SAP MaxDB depends on the HAStoragePlus resource for the global device group on which SAP MaxDB is installed. For more information, see “Registering and Configuring HA for SAP MaxDB” on page 23.

**Dependencies of the SAP MaxDB Application on SAP xserver**

Configure SAP MaxDB so that SAP MaxDB starts only on a node where SAP xserver is running. To implement this configuration, configure resources and resource groups as follows:

- Ensure that the resource for SAP MaxDB depends on the resource for SAP xserver.
- Create on the SAP MaxDB resource group a strong positive affinity for the SAP xserver resource group.

For more information, see “Registering and Configuring HA for SAP MaxDB” on page 23.

**Administration of SAP xserver by a User Other Than Root**

You might be required to administer SAP xserver as a user other than root. In this situation, you must create and define that user as follows:

- You must create that user on all cluster nodes or zones that master SAP xserver.
- You must define that user when you register and configure HA for SAP MaxDB. For more information, see “Registering and Configuring HA for SAP MaxDB” on page 23.

**Configuration Planning Questions**

Answer the questions in this section to plan the installation and configuration of HA for SAP MaxDB.

- Which resource group will you use for the SAP MaxDB application resource and for the logical host name for the SAP MaxDB resource?
  
  Use the answer to this question when you perform the procedure “How to Enable SAP MaxDB to Run in a Cluster” on page 18.

- What is the logical host name for the SAP MaxDB resource? Clients access the data service through this logical host name.
  
  Use the answer to this question when you perform the following procedures:
  - “How to Install and Configure SAP MaxDB” on page 16
  - “How to Enable SAP MaxDB to Run in a Cluster” on page 18
  - Where will the system configuration files reside?
See Oracle Solaris Cluster Data Services Planning and Administration Guide for the advantages and disadvantages of using the local file system instead of the cluster file system.

Installing and Configuring SAP MaxDB

To enable HA for SAP MaxDB to make SAP MaxDB highly available, additional installation and configuration operations are required. These operations supplement the standard installation and standard configuration of SAP MaxDB.

During a standard installation, SAP MaxDB is installed with a physical hostname. To enable SAP MaxDB to run in a cluster, you must modify SAP MaxDB to use a logical hostname.

For information about the standard installation and standard configuration of SAP MaxDB, see the following documentation:

- If you are using SAP MaxDB with SAP NetWeaver, see the SAP NetWeaver documentation for information about how to install and configure SAP NetWeaver with SAP MaxDB.
- If you are using SAP MaxDB independently of SAP NetWeaver, see the SAP MaxDB documentation.

▼ How to Install and Configure SAP MaxDB

1. On one node of the cluster, install the SAP MaxDB software.
   Ensure that you install SAP MaxDB on its own global device group.

2. Perform a standard configuration of SAP MaxDB.

3. Create the .XUSER.62 file in the home directory of the operating system user who administers the SAP MaxDB instance.
   a. Create a plain text file that contains information about the database user who administers the SAP MaxDB database instance.
      For information about the content of this file, see the SAP MaxDB documentation. For the name of the server on which the database is running, specify the logical host name for the SAP MaxDB resource that you specified in “Configuration Planning Questions” on page 15.
      For an example of the content of this file, see Example 1–4.

   b. As SAP MaxDB admin user, generate the .XUSER.62 file from the plain text file that you created in Step a.
      Use the SAP MaxDB command xuser for this purpose.
      # xuser -b user-info-file
4 Copy the `/usr/spool/sql` directory and its contents from the node on which you installed SAP MaxDB to all nodes where resources for SAP MaxDB and SAP xserver will run.

To ensure that the same owner owns the directory and its contents on all nodes, use the `tar(1)` command and the `ssh(1)`.

```
# tar cfB - /usr/spool/sql | ssh destination "cd /;tar xfB -"
```

`destination` specifies the node to which you are copying the `/usr/spool/sql` directory and its contents.

The following example shows a plain text file that contains information about a database user who administers an SAP MaxDB instance.

5 Distribute `/etc/opt/sdb` on all nodes to run SAP MaxDB.

Copy the `/etc/opt/sdb` directory and its contents from the node on which you installed SAP MaxDB to all nodes where resources for SAP MaxDB and SAP xserver will run.

To ensure that the same owner owns the directory and its contents on all nodes, use the `tar(1)` command and the `ssh(1)`.

```
# tar cfB - /etc/opt/sdb | ssh destination "cd /;tar xfB -"
```

`destination` specifies the node to which you are copying the `/etc/opt/sdb` directory and its contents.

Example 1–4 Information About a Database User Who Administers a SAP MaxDB Instance

```
DEFAULT
dbm
dbm
TST
srvr-1
  blank line
  blank line
-1
-1
  blank line
```

This example specifies the following information about a database user who administers an SAP MaxDB instance:

- The user key that is used to address this combination of XUSER data is named DEFAULT.
- The username and password of the database user are dbm.
- The name of the SAP MaxDB instance is TST.
- The logical host name for the SAP MaxDB resource is srvr-1.
- No structured query language (SQL) mode is specified.
- The default time-out value of the SAP MaxDB instance is used.
- The default isolation level of the SAP MaxDB instance is used.

For more information, see the SAP MaxDB documentation.

### How to Enable SAP MaxDB to Run in a Cluster

1. Create a failover resource group to contain the SAP MaxDB application resources and the logical host name for the SAP MaxDB resource.
   Use the resource group that you identified when you answered the questions in “Configuration Planning Questions” on page 15.

   ```shell
   # clresourcegroup create -n node-list sapdb-rg
   sapdb-rg
   ```

   Specifies that the resource group that you are creating is named `sapdb-rg`.

2. Ensure that all network resources that you intend to you use are added to your name service database.

3. Add a logical host name resource to the failover resource group that you created in **Step 1**.

   ```shell
   # clreslogicalhostname create -g sapdb-rg \ 
   -h sapdb-logical-hostname sapdb-logical-hostname
   -g sapdb-rg
   ```

   Specifies that the logical host name’s database resource is to be added to the failover resource group that you created in **Step 1**.

   ```shell
   -h
   ```

   Specifies the host name list. You must use this option either when more than one logical host needs to be associated with the new SAP MaxDB resource or when the IP alias logical host does not have the same name as the SAP MaxDB resource itself. SAP MaxDB is the resource for the `sapdb-logical-hostname` that you specified in “Configuration Planning Questions” on page 15.

   ```shell
   sapdb-logical-hostname
   ```

   Specifies the logical host name of the server on which the database is running. This host name must be the logical host name for the SAP MaxDB resource that you specified in “Configuration Planning Questions” on page 15.

**Note** – If you require a fully qualified hostname, you must specify the fully qualified name with the `-h` option and you cannot use the fully qualified form in the resource name.
4 **Enable the resource group that you created in Step 1.**

```
# clresourcegroup online -emM sapdb-rg
```

- `emM` Enables the resource group `sapdb-rg` created in Step 1 and moves it to the MANAGED state.

**Example 1–5 Enabling SAP MaxDB to Run in a Cluster**

This example shows the sequence of commands that are required to enable SAP MaxDB to run in a cluster. The commands are run on only one cluster node.

1. The following command creates a failover resource group to contain the SAP MaxDB application resources and the logical host name for the SAP MaxDB resource. The resource group is named `sapdbrg`. The `sapdbrg` resource group can be brought online on all cluster nodes or zones.

   ```
   # clresourcegroup create sapdbrg
   ```

2. The following command adds a logical host name resource to the `sapdbrg` resource group. The logical host name of the server on which the database is running is `srvr-1`. When the `sapdbrg` resource group is brought online, an attempt is made for each node to discover a network interface on the subnet that the host name list identifies.

   ```
   # clreslogicalhostname create -g sapdbrg -h srvr-1 -d sapdblr
   ```

   **Note** – If you require a fully qualified hostname, you must specify the fully qualified name with the `-h` option and you cannot use the fully qualified form in the resource name.

3. The following command moves the `sapdbrg` resource group to the MANAGED state, brings the resource group online, and monitors the resources in the resource group.

   ```
   # clresourcegroup online -emM sapdbrg
   ```

---

**Verifying the SAP MaxDB Installation and Configuration**

Before you install the HA for SAP MaxDB packages, verify that the SAP MaxDB software is correctly installed and configured to run in a cluster. This verification does not verify that the SAP MaxDB application is highly available because the HA for SAP MaxDB data service is not yet installed.
How to Verify SAP MaxDB Installation and Configuration on Each Node

Perform this procedure on each node or zone that can master the SAP MaxDB resource group.

1. Assume a root role to a node or zone that can master the SAP MaxDB resource group.

2. Switch the SAP MaxDB resource group to the node that you logged in to in Step 1.
   
   ```
   # cresourcegroup switch -n node sapdb-rg
   ```
   
   - `-n node` Specifies the node to which the SAP MaxDB resource group is to be switched
   - `sapdb-rg` Specifies that the SAP MaxDB resource group `sapdb-rg` is to be switched to another node

3. Confirm that the SAP MaxDB database can be started and be stopped.
   
   a. Become the OS user who administers the SAP MaxDB database.
      
      ```
      # su - os-sapdb-adm-user
      ```
      
      `-o-sapdb-adm-user` Specifies the UNIX user identity of the OS user who administers the SAP MaxDB database. This user's home directory contains the `.XUSER.62` file that was created during the installation and configuration of SAP MaxDB. For more information, see "Installing and Configuring SAP MaxDB" on page 16. You specify this user when you set the `DB_User` extension property as explained in "How to Register and Configure a SAP MaxDB Resource" on page 27.

   b. Start the SAP xserver.
      
      ```
      $ x_server start
      ```

   c. Manually start the SAP MaxDB database instance on the node that you logged in to in Step 1.
      
      ```
      $ dbmcli -U sapdb-adm-key db_online
      ```
      
      `-U sapdb-adm-key` Specifies that the `dbmcli` command is run with the user key of the database user who administers the SAP MaxDB instance. This user key is created during the installation and configuration of SAP MaxDB. For more information, see "Installing and Configuring SAP MaxDB" on page 16. You specify this user key when you set the `User_Key` extension property as explained in "How to Register and Configure a SAP MaxDB Resource" on page 27.

   d. Confirm that the SAP MaxDB database instance is started.
Installing the HA for SAP MaxDB Package

If you did not install the HA for SAP MaxDB package during your initial Oracle Solaris Cluster installation, perform this procedure to install the package.

How to Install the HA for SAP MaxDB Package

Perform this procedure on each cluster node where you want the HA for SAP MaxDB software to run.

1 On the cluster node where you are installing the data service package, assume the root role.

2 Ensure that the solaris and ha-cluster publishers are valid.

```
# pkg publisher

<table>
<thead>
<tr>
<th>PUBLISHER</th>
<th>TYPE</th>
<th>STATUS</th>
<th>URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>solaris</td>
<td>origin</td>
<td>online</td>
<td>solaris-repository</td>
</tr>
<tr>
<td>ha-cluster</td>
<td>origin</td>
<td>online</td>
<td>ha-cluster-repository</td>
</tr>
</tbody>
</table>
```

For information about setting the solaris publisher, see "Set the Publisher Origin to the File Repository URI" in Copying and Creating Oracle Solaris 11.1 Package Repositories.

3 Install the HA for SAP MaxDB software package.

```
# pkg install ha-cluster/data-service/sapdb
```

4 Verify that the package installed successfully.

```
$ pkg info ha-cluster/data-service/sapdb
```

Installation is successful if output shows that State is Installed.

5 Perform any necessary updates to the Oracle Solaris Cluster software.

For instructions on updating single or multiple packages, see Chapter 11, "Updating Your Software," in Oracle Solaris Cluster System Administration Guide.

e. Manually stop the SAP MaxDB database instance.

```
$ dbmcli -U sapdb-adm-key db_offline
- U sapdb-adm-key  Specifies that the dbmcli command is run with the user key that you used for starting the database in Step c
```

f. Confirm that the SAP MaxDB database instance is stopped.
Configuring the HAStoragePlus Resource Type to Work With HA for SAP MaxDB

For maximum availability of the SAP MaxDB database, resources that HA for SAP MaxDB requires must be available before the SAP MaxDB database instance is started. An example of such a resource is the file system where programs and libraries for the SAP MaxDB runtime environment reside. To ensure that these resources are available, configure the HAStoragePlus resource type to work with HA for SAP MaxDB.

For information about the relationship between resource groups and disk device groups, see “Relationship Between Resource Groups and Device Groups” in Oracle Solaris Cluster Data Services Planning and Administration Guide.

Configuring the HAStoragePlus resource type to work with HA for SAP MaxDB involves the following operation:

- Registering and configuring an HAStoragePlus resource

▼ How to Register and Configure an HAStoragePlus Resource

Perform this procedure on any one cluster node.

1. **Register the SUNW.HAStoragePlus resource type.**
   
   ```
   # cresource type register SUNW.HAStoragePlus
   ```

2. **Create an HAStoragePlus resource for the global device group on which SAP MaxDB is installed.**
   Create this resource in the SAP MaxDB resource group. This resource must perform an affinity switchover for all global devices that are defined for this resource.

   ```
   # cresource create -d -g sapdb-rg \
   -t SUNW.HAStoragePlus -p filesystemmountpoints=mountpoint-list \
   -p globaldevicepaths=sapdb-device-group \
   -p affinityon=TRUE  hsp-resource \
   -d
   ```
   - Specified that a new resource is to be created in a disabled state.
   - `g sapdb-rg`
     - Specifies that the resource is to be added to the SAP MaxDB resource group.
   - `t SUNW.HAStoragePlus`
     - Specifies that the resource is an instance of the SUNW.HAStoragePlus resource type.
   - `p filesystemmountpoints=mountpoint-list`
     - Specifies a list of valid mount points for the file system.
Creating an HAStoragePlus Resource

```
# clresource create -g sapdbrg \
  -t SUNW.HAStoragePlus -p filesystemmountpoints=/global/sapdbdata \ 
  -p globaldevicepaths=sapdbdg -p affinityon=TRUE hsprs
```

This example shows the creation of a SUNW.HAStoragePlus resource that has the following characteristics:

- The resource is named hsprs.
- The resource is a member of a resource group that is named sapdbrg. The creation of this resource group is shown in Example 1–5.
- The resource is an instance of the SUNW.HAStoragePlus resource type. The registration of this resource type is not shown in this example.
- The mount point for the file system is /global/sapdbdata.
- The SAP MaxDB software is installed on a global device group that is named sapdbdg.
- The hsprs resource performs an affinity switchover for all global devices that are defined for this resource.

Next Steps  Go to "Registering and Configuring HA for SAP MaxDB" on page 23.

Registering and Configuring HA for SAP MaxDB

To enable HA for SAP MaxDB to make SAP MaxDB highly available, configure Oracle Solaris Cluster data services as follows:

- Configure SAP xsServer as a multiple master data service.
- Configure HA for SAP MaxDB as a failover data service.

Before you perform this procedure, ensure that the HA for SAP MaxDB data service packages are installed.
Caution – One SAP xserver serves multiple SAP MaxDB instances and, if SAP liveCache is used, multiple SAP liveCache instances in the cluster. Therefore, do not configure more than one SAP xserver resource on the same cluster. If more than one SAP xserver resource runs on the same cluster, conflicts between the SAP xserver resources occur. These conflicts cause all SAP xserver resources to become unavailable. If you attempt to start the SAP xserver a second time, the attempt fails. The error message Address already in use is also displayed.

Setting HA for SAP MaxDB Extension Properties

The sections that follow contain instructions for registering and configuring resources. These instructions explain how to set only extension properties that HA for SAP MaxDB requires you to set. For information about all HA for SAP MaxDB extension properties, see Appendix A, “HA for SAP MaxDB Extension Properties.” You can update some extension properties dynamically. You can update other properties, however, only when you create or disable a resource. The Tunable entry indicates when you can update a property.

To set an extension property of a resource, include the following option to modify the resource:

\[-p \text{property}=value\]

\[-p\text{ property}\] Identifies the extension property that you are setting

\[value\] Specifies the value to which you are setting the extension property

You can also use the procedures in Chapter 2, “Administering Data Service Resources,” in Oracle Solaris Cluster Data Services Planning and Administration Guide to configure resources after the resources are created.

Administering SAP xserver as a User Other Than Root

You might be required to administer SAP xserver as a user other than root. In this situation, you must create and define that user as follows:

- You must create that user on all cluster nodes or zones that master SAP xserver.
- You must define that user when you register and configure an SAP xserver resource. To define the user who administers SAP xserver, set the $Xserver_User extension property when you create an SAP xserver resource. For more information about the $Xserver_User extension property, see "SUNW.sap_xserver Extension Properties" on page 40.
How to Register and Configure an SAP xserver Resource

1. Assume a root role on a cluster node.

2. Register the SUNW.sap_xserver resource type.
   
   ```
   # clresourcetype register SUNW.sap_xserver
   ```

3. Create a scalable resource group for the SAP xserver resource.
   
   Configure SAP xserver so that SAP xserver starts on all nodes to which the SAP MaxDB resource can fail over. To implement this configuration, ensure that the node list of the SAP xserver resource group contains all nodes that are in the node list of the SAP MaxDB resource group. This resource group is created when the procedure “How to Enable SAP MaxDB to Run in a Cluster” on page 18 is performed.

   ```
   # clresourcegroup create \
   -p Maximum_primaries=nodes-in-sapdb-rg \
   -p Desired_primaries=nodes-in-sapdb-rg xserver-rg \
   -p Maximum_primaries=nodes-in-sapdb-rg 
   ```

   Specifies the maximum number of nodes on which the SAP xserver resource can start. This number is equal to the number of nodes that are in the node list of the SAP MaxDB resource group. You must specify the same number as the value of the Desired_primaries property.

   ```
   -p Desired_primaries=nodes-in-sapdb-rg
   ```

   Specifies the desired number of nodes on which the SAP xserver resource can start. This number is equal to the number of nodes that are in the node list of the SAP MaxDB resource group. You must specify the same number as the value of the Maximum_primaries property.

   ```
   xserver-rg
   ```

   Specifies that the resource group that you are creating is named xserver-rg.

4. Add the HASStoragePlus resource to the SAP xserver resource group.

   ```
   # clresource create -g xserver-rg \ 
   -t SUNW.HASStoragePlus \ 
   -p filesystemmountpoints=mountpoints \ 
   -p affinityon=false xserver-storage-resource \
   -g xserver-rg
   ```

   Specifies that the resource that you are creating is added to the resource group xserver-rg.

   ```
   -t SUNW.HASStoragePlus
   ```

   Specifies that the resource type of the resource you are creating is SUNW.HASStoragePlus.

   ```
   -p filesystemmountpoints=mountpoint, ...
   ```

   Specifies the mount points for the resource group you are creating.
-p affinityon=false
Indicates that the SAP xserver resource does not have to be colocated with the device group.

xserver-storage-resource
Specifies that the resource that you are creating is named xserver-storage-resource.

For more details on how to set up an HAStragePlus resource, see “Enabling Highly Available Local File Systems” in Oracle Solaris Cluster Data Services Planning and Administration Guide.

5 Create an SAP xserver resource in the resource group that you created in Step 3.

# clresource create -d -g xserver-rg \
-t SUNW.sap_xserver \
-p resource_dependencies_offline_restart=storage-resource \
-p resource_dependencies=rest-of-the-tree \
-g xserver-rg
Specifies that the resource is to be added to the resource group that you created in Step 3

-t SUNW.sap_xserver
Specifies that the resource is an instance of the SUNW.sap_xserver resource type

-p resource_dependencies_offline_restart=storage-resource
Sets a resource dependency between storage-resource and the HAStragePlus resource we created in Step 4.

storage-resource
Specifies that the resource that you are creating is named storage-resource.

6 Enable the resource group that you created in Step 3.

# clresourcegroup online -emM xserver-rg
-emM Enables the resource group and moves it to the MANAGED state.

xserver-rg Specifies the name of the resource group.

Example 1–7 Configuring a SUNW.sap_xserver Resource

This example shows the sequence of commands that are required to configure an SAP xserver resource. The commands are run on only one cluster node.

1. The following command creates a multiple master resource group to contain an SAP xserver resource for a four-node cluster. The resource group is named xsrvrg. The xsrvrg resource group can be brought online on all cluster nodes.

# clresourcegroup create \
-p Maximum_primaries=4 \
-p Desired_primaries=4 xsrvrg

2. The following command adds the HAStragePlus resource to the SAP xserver resource group. The xserver-storage-resource is called xsstorrs and the mount point, mtp1.
3. The following command creates an SAP xserver resource that is named xsrvrrs in the xsrvrrg resource group. The SAP xserver resource is an instance of the SUNW.sap_xserver resource type. The registration of this resource type is not shown in this example.

   # clresource create -d -g xsrvrrg -t SUNW.sap_xserver -p resource_dependencies_offline_restart=storage-resource -p resource_dependencies=rest-of-the-tree

4. The following command moves the xsrvrrg resource group to the MANAGED state and brings the resource group online.

   # clresourcegroup online -emM xsrvrrg

### How to Register and Configure a SAP MaxDB Resource

1. Register the SUNW.sapdb resource type.
   
   # clresourcetype register SUNW.sapdb

2. Create a SAP MaxDB resource in the SAP MaxDB resource group.

   Ensure that the SAP MaxDB resource depends on the following resources:
   - The HAStoragePlus resource for the global device group on which SAP MaxDB is installed.
   - The SAP xserver resource.

   When you create this resource, specify the following information about the SAP MaxDB database instance. This information is created when SAP MaxDB is installed and configured as explained in “Installing and Configuring SAP MaxDB” on page 16.
   - The name of the SAP MaxDB database.
   - The UNIX user identity of the OS user who administers the SAP MaxDB database instance.
   - The user key of the database user who administers the SAP MaxDB database instance.

   # clresource create -d -g sapdb-rg -t SUNW.sapdb -p DB_Name=db-name -p DB_User=os-sapdb-adm-user -p User_Key=sapdb-adm-key -p resource_dependencies_offline_restart=storage-resource -p resource_dependencies=rest-of-the-tree -d

   Specifies that the resource that you are creating is not immediately enabled.
-g sapdb-rg
   Specifies that the resource is to be added to the SAP MaxDB resource group.

-t SUNW.sapdb
   Specifies that the resource is an instance of the SUNW.sapdb resource type.

-p DB_Name=\(db-name\)
   Specifies the name of the SAP MaxDB database instance in uppercase.

-p DB_User=os-sapdb-adm-user
   Specifies the UNIX user identity of the OS user who administers the SAP MaxDB database.
   This user’s home directory contains the .XUSER.62 file that was created during the
   installation and configuration of SAP MaxDB. For more information, see “Installing and
   Configuring SAP MaxDB” on page 16.

-p User_Key=sapdb-adm-key
   Specifies the user key of the database user who administers the SAP MaxDB database
   instance. This user key is created during the installation and configuration of SAP MaxDB.
   For more information, see “Installing and Configuring SAP MaxDB” on page 16.

-p resource_dependencies_offline_restart=storage-resource
   Specifies that the SAP MaxDB resource depends on the following resource.
   ■ The HAStoragePlus resource for the global device group on which SAP MaxDB is
   installed.

sapdb-rg
   Specifies that the resource that you are creating is named sapdb-rg.

3 Ensure that the SAP MaxDB resource group is brought online only on a node or zone where
the SAP xserver resource group is online.
To meet this requirement, create on the SAP MaxDB resource group a strong positive affinity
for the SAP xserver resource group.

# clresourcegroup set -p rg_affinities=++xserver-rg sapdb-rg
-p rg_affinities=++xserver-rg
   Specifies that the SAP MaxDB resource group declares a strong positive affinity for the SAP
   xserver resource group.

sapdb-rg
   Specifies that the SAP MaxDB resource group is to be modified.

4 Enable the SAP MaxDB resource group.
# clresourcegroup online -emM sapdb-rg
   Enables the SAP MaxDB resource group and moves it to the MANAGED state.

sapdb-rg
   Specifies the name of the SAP MaxDB resource group to be brought online.
Consider configuring your cluster to prevent noncritical resource groups from being brought online on the same node or zone as the SAP MaxDB resource group.

You might plan to run lower-priority services on a node to which the SAP MaxDB resource can fail over. In this situation, consider using resource group affinities to shut down the noncritical services when the SAP MaxDB resource fails over to the node.

To specify this behavior, declare on the resource group for each noncritical service a strong negative affinity for the SAP MaxDB resource group.

```
# clresourcegroup set -p rg_affinities=-- sapdb-rg noncritical-rg
```

Sets the resource group property to the specified value.

```
noncritical-rg
```

Specifies the name of the noncritical resource group.

---

**Example 1–8 Creating a SUNW.sapdb Resource**

```
# clresource create -d -g sapdbrg -t SUNW.sapdb \
-p DB_Name=TST -p DB_User=dbadmin \
-p User_Key=DEFAULT -p resource_dependencies_offline_restart=hsprs,xsrvrrs sapdbrs
```

This example shows the creation of a SUNW.sapdb resource that has the following characteristics:

- The resource is named sapdbrs.
- The resource is a member of a resource group that is named sapdbrg. The creation of this resource group is shown in Example 1–5.
- The resource is an instance of the SUNW.sapdb resource type. The registration of this resource type is not shown in this example.
- The SAP MaxDB database instance that is associated with this resource is named TST.
- The UNIX user identity of the OS user who administers the SAP MaxDB database is dbadmin.
- The user key of the database user who administers the SAP MaxDB database is DEFAULT.
- The SAP MaxDB resource depends on the following resources:
  - An HASToragePlus resource that is named hsprs. The creation of the hsprs resource is shown in Example 1–6.
  - A SUNW.sap_xserver resource that is named xsrvrrs. The creation of the xsrvrrs resource is shown in Example 1–7.
Fault monitoring for the HA for SAP MaxDB data service is provided by the following fault monitors:

- The SAP MaxDB fault monitor
- The SAP xserver fault monitor

Each fault monitor is contained in a resource whose resource type is shown in the following table.

<table>
<thead>
<tr>
<th>Fault Monitor</th>
<th>Resource Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP MaxDB</td>
<td>SUNW.sapdb</td>
</tr>
<tr>
<td>SAP xserver</td>
<td>SUNW.sap_xserver</td>
</tr>
</tbody>
</table>

System properties and extension properties of these resources control the behavior of the fault monitors. The default values of these properties determine the preset behavior of the fault monitors. The preset behavior should be suitable for most Oracle Solaris Cluster installations. Therefore, you should tune the HA for SAP MaxDB fault monitors only if you need to modify this preset behavior.

Tuning the HA for SAP MaxDB fault monitors involves the following tasks:

- Setting the interval between fault monitor probes
- Setting the timeout for fault monitor probes
- Defining the criteria for persistent faults
- Specifying the failover behavior of a resource

For more information, see “Tuning Fault Monitors for Oracle Solaris Cluster Data Services” in Oracle Solaris Cluster Data Services Planning and Administration Guide. Information about the HA for SAP MaxDB fault monitors that you need to perform these tasks is provided in the subsections that follow.

HA for SAP MaxDB also enables you to control how the fault monitor responds if the SAP MaxDB parent kernel process is not running. For more information, see “Forcing the SAP MaxDB Database Instance to Be Restarted if the Parent Kernel Process Is Terminated” on page 32.

Tune the HA for SAP MaxDB fault monitors when you register and configure HA for SAP MaxDB. For more information, see “Registering and Configuring HA for SAP MaxDB” on page 23.
Factors That Affect the Interval Between Fault Monitor Probes

To determine whether SAP xserver and the SAP MaxDB database instance are operating correctly, the HA for SAP MaxDB fault monitors probe these resources periodically. The optimum interval between fault monitor probes depends on the time that is required to respond to a fault in a resource. This time depends on how the complexity of the resource affects the time that is required for operations such as restarting the resource.

For example, SAP xserver is a much simpler resource and can be restarted much quicker than SAP MaxDB. Therefore, the optimum interval between fault monitor probes of SAP xserver is shorter than the optimum interval between probes of SAP MaxDB.

Operations by the HA for SAP MaxDB Fault Monitors During a Probe

The optimum timeout for fault monitor probes depends on the operations that a fault monitor performs to probe the resource.

Operations by the SAP MaxDB Fault Monitor During a Probe

During a probe, the SAP MaxDB fault monitor performs the following operations:

1. The SAP MaxDB fault monitor determines whether the SAP MaxDB database instance is online.
2. If the SAP MaxDB database instance is online, the SAP MaxDB fault monitor determines whether the parent kernel process of the SAP MaxDB database instance is running. You can control how the fault monitor responds if the parent kernel process is not running. For more information, see “Forcing the SAP MaxDB Database Instance to Be Restarted if the Parent Kernel Process Is Terminated” on page 32.
3. The SAP MaxDB fault monitor determines whether SAP xserver is available. This fault monitoring supplements the fault monitoring that the SAP xserver fault monitor provides.

Operations by the SAP xserver Fault Monitor During a Probe

During a probe, the SAP xserver fault monitor determines whether SAP xserver is available.

Faults Detected by the HA for SAP MaxDB Fault Monitors

Faults that each HA for SAP MaxDB fault monitor detects are described in the subsections that follow.
Faults Detected by the SAP MaxDB Fault Monitor

The SAP MaxDB fault monitor detects the following faults in SAP MaxDB:

- A status of the SAP MaxDB database instance that is not ONLINE, for example, OFFLINE or ADMIN
- Unexpected termination of the parent kernel process of the SAP MaxDB database instance

The SAP MaxDB fault monitor also detects the unavailability of SAP xserver. This fault monitoring supplements the fault monitoring that the SAP xserver fault monitor provides.

Note – If the SAP MaxDB fault monitor detects that SAP xserver is unavailable twice within the retry interval, the SAP MaxDB fault monitor restarts SAP MaxDB. By restarting SAP MaxDB, the fault monitor ensures that the SAP MaxDB database fails over to another node when SAP xserver is persistently unavailable.

Faults Detected by the SAP xserver Fault Monitor

The SAP xserver fault monitor detects following faults:

- **Unavailability of SAP xserver.** Unavailability of SAP xserver is also detected by the SAP MaxDB fault monitor.
- **Persistent system errors.** A persistent system error is a system error that occurs four times within the retry interval. If a persistent system error occurs, the fault monitor restarts SAP xserver.

Recovery Actions in Response to Detected Faults

To minimize the disruption that transient faults in a resource cause, a fault monitor restarts the resource in response to such faults. For persistent faults, more disruptive action than restarting the resource is required:

- For the SAP MaxDB resource, the fault monitor fails over the resource to another node. The SAP MaxDB resource is a failover resource.
- For the SAP xserver resource, the fault monitor takes the resource offline. The SAP xserver is a multiple master resource.

Forcing the SAP MaxDB Database Instance to Be Restarted if the Parent Kernel Process Is Terminated

By default, unexpected termination of the parent kernel process does not cause the SAP MaxDB fault monitor to restart the SAP MaxDB database instance. The SAP MaxDB database instance can continue to function without the parent kernel process. Restarting the SAP MaxDB database instance in this situation might cause unnecessary unavailability of the SAP MaxDB
database instance. Therefore, you should force the SAP MaxDB database instance to be restarted only if you require a feature that the parent kernel process provides. An example of such a feature is maintaining the integrity of the log history.

To force the SAP MaxDB database instance to be restarted if the parent kernel process is terminated, set the `Restart_if_Parent_Terminated` extension property of the `SUNW.sapdb` resource to `True`.

### Verifying the HA for SAP MaxDB Installation and Configuration

After you install, register, and configure HA for SAP MaxDB, verify the HA for SAP MaxDB installation and configuration. Verifying the HA for SAP MaxDB installation and configuration determines if the HA for SAP MaxDB data service makes the SAP MaxDB application highly available.

Verifying the HA for SAP MaxDB installation involves verifying the operation of the following fault monitors:

- The SAP MaxDB fault monitor
- The SAP xserver fault monitor

### How to Verify the Operation of the SAP MaxDB Fault Monitor

Perform this procedure on each node where SAP MaxDB can run.

1. **Assume a root role to a node or zone that can master the SAP MaxDB resource group.**

2. **Switch the SAP MaxDB resource group to the node or zone that you logged in to in Step 1.**
   ```
   # clresourcegroup switch -n node sapdb-rg
   
   node       Specifies the node to which the SAP MaxDB resource group is to be switched
   sapdb-rg   Specifies the name of the SAP MaxDB resource group is to be switched to another node
   ```

3. **Abnormally terminate SAP MaxDB.**
   
   a. **Determine the process identities of all kernel processes for the SAP MaxDB database instance that you are running.**
      ```
      # ps -ef | grep kernel | grep db-name
      
      db-name   Specifies the name of the SAP MaxDB database instance in uppercase
      ```
b. Kill all kernel processes for the SAP MaxDB database instance that you are running.

```
# kill -9 sapdb-kernel-pid
```

`sapdb-kernel-pid` Specifies the process identities of the SAP MaxDB kernel processes that you determined in Step a.

4 Confirm that the HA for SAP MaxDB fault monitor performs the appropriate operation from the following list:

- Restarting the SAP MaxDB resource
- Failing over the SAP MaxDB resource to another node

The expected behavior of the fault monitor depends on the failure history of the resource and the value of the Failover_enabled extension property. For more information, see the following sections:

- “Tuning the HA for SAP MaxDB Fault Monitors” on page 30
- “SUNW.sapdb Extension Properties” on page 37

5 Terminate SAP MaxDB normally.

a. Become the OS user who administers the SAP MaxDB database.

```
# su - os-sapdb-adm-user
```

`os-sapdb-adm-user` Specifies the UNIX user identity of the OS user who administers the SAP MaxDB database. This user's home directory contains the .XUSER.62 file that was created during the installation and configuration of SAP MaxDB. For more information, see “Installing and Configuring SAP MaxDB” on page 16. You specify this user when you set the DB_User extension property as explained in “How to Register and Configure a SAP MaxDB Resource” on page 27.

b. Manually stop the SAP MaxDB database instance.

```
# dbmcli -U sapdb-adm-key db_offline
```

`-U sapdb-adm-key` Specifies that the dbmcli command is run with the user key of the database user who administers the SAP MaxDB database. This user key is created during the installation and configuration of SAP MaxDB. For more information, see “Installing and Configuring SAP MaxDB” on page 16. You specify this user key when you set the User_Key extension property as explained in “How to Register and Configure a SAP MaxDB Resource” on page 27.

6 Confirm that the HA for SAP MaxDB fault monitor performs the appropriate operation from the following list:

- Restarting the SAP MaxDB resource
Failing over the SAP MaxDB resource to another node

The expected behavior of the fault monitor depends on the failure history of the resource and the value of the Failover_enabled extension property. For more information, see the following sections:

- “Tuning the HA for SAP MaxDB Fault Monitors” on page 30
- “SUNW.sapdb Extension Properties” on page 37

How to Verify the Operation of the SAP xserver Fault Monitor

Perform this procedure on each node that can master SAP xserver.

1. Log in to a node or zone that can master SAP xserver.

2. Abnormally terminate SAP xserver.
   a. Determine the process identities of all SAP xserver processes.
      # ps -ef | grep xserver
   b. Kill all SAP xserver processes.
      # kill -9 xserver-pid
      xserver-pid Specifies the process identities of the SAP xserver processes that you determined in Step a

3. Confirm that the SAP xserver fault monitor restarts the SAP xserver resource.

4. Terminate SAP xserver normally.
   a. Become the OS user who administers SAP xserver.
      # su - os-sapxsvr-adm-user
      os-sapxsvr-adm-user Specifies the UNIX user identity of the OS user who administers SAP xserver. By default, this user is root. You can specify this user by setting the Xserver_User extension property. For more information, see "SUNW.sap_xserver Extension Properties" on page 40.
   b. Manually stop the SAP xserver.
      # x_server stop

5. Confirm that the SAP xserver fault monitor restarts the SAP xserver resource.
Extension properties for HA for SAP MaxDB resource types are described in the following sections.

- "SUNW.sapdb Extension Properties" on page 37
- "SUNW.sap_xserver Extension Properties" on page 40

For details about system-defined properties, see the r_properties(5) man page and the rg_properties(5) man page.

**SUNW.sapdb Extension Properties**

The SUNW.sapdb resource type represents the SAP MaxDB application in a Oracle Solaris Cluster configuration. The extension properties of this resource type are as follows:

- **dbmcli_Start_Option**
  The option that is passed to the dbmcli command to start the SAP MaxDB database instance.
  - **Data type**: String
  - **Default**: db_online
  - **Range**: Not applicable
  - **Tunable**: When disabled

- **DB_Name**
  The name of the SAP MaxDB database instance in uppercase. This name is created when SAP MaxDB is installed and configured as explained in "Installing and Configuring SAP MaxDB" on page 16.
  - **Data type**: String
  - **Default**: No default defined
  - **Range**: Not applicable
### Tunable When disabled

**DB_User**
The UNIX user identity of the operating system (OS) user who administers the SAP MaxDB database instance. This user's home directory contains the `.XUSER.62` file that was created during the installation and configuration of SAP MaxDB. For more information, see “Installing and Configuring SAP MaxDB” on page 16.

<table>
<thead>
<tr>

<tr>
<td>Default</td>
<td>No default defined</td>
</tr>
<tr>
<td>Range</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Tunable</td>
<td>When disabled</td>
</tr>
</tbody>
</table>

**Failover_enabled**
Specifies whether the fault monitor fails over the SAP MaxDB resource if the number of attempts to restart exceeds `Retry_count` within the time that `Retry_interval` specifies. The possible values of this extension property are as follows:

- **True** – Specifies that the fault monitor fails over the SAP MaxDB resource
- **False** – Specifies that the fault monitor does *not* fail over the SAP MaxDB resource

<table>
<thead>
<tr>
<th>Data type</th>
<th>Boolean</th>

</thead>
<tbody>
<tr>
<td>Default</td>
<td>True</td>
</tr>
<tr>
<td>Range</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Tunable</td>
<td>Any time</td>
</tr>
</tbody>
</table>

**Independent_Program_Path**
The full path to the directory that contains the following programs and libraries for the SAP MaxDB application:

- Programs that are independent of the database software version
- Libraries for the client runtime environment

HA for SAP MaxDB determines the path to the `dbmcli` command from the value of this property. The `dbmcli` command resides in the `bin` subdirectory of the directory that this property specifies.

<table>
<thead>
<tr>
<th>Data type</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td><code>/sapdb/programs</code></td>
</tr>
<tr>
<td>Range</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Tunable</td>
<td>When disabled</td>
</tr>
</tbody>
</table>
Monitor_retry_count
The maximum number of restarts by the process monitor facility (PMF) that are allowed for the fault monitor.

- **Data type**: Integer
- **Default**: 4
- **Range**: No range defined
- **Tunable**: Any time

Monitor_retry_interval
The period of time in minutes during which the PMF counts restarts of the fault monitor.

- **Data type**: Integer
- **Default**: 2
- **Range**: No range defined
- **Tunable**: Any time

Pid_Dir_Path
The full path to the directory under which files that store the process identities of SAP MaxDB kernel processes are created. The process identities of SAP MaxDB kernel processes are stored in the following files:

- `pid-dir/ppid/db-name`
- `pid-dir/pid/db-name`

The replaceable items in these file paths are as follows:

- `pid-dir` is the directory that the `Pid_Dir_Path` extension property specifies
- `db-name` is the name of the SAP MaxDB database instance that the `DB_Name` extension property specifies

- **Data type**: String
- **Default**: `/var/spool/sql`
- **Range**: Not applicable
- **Tunable**: When disabled

Probe_timeout
The timeout value in seconds that the fault monitor uses to probe an SAP MaxDB database instance.

- **Data type**: Integer
- **Default**: 90
- **Range**: 30–99,999
**Tunable Anytime**

**Restart_if_Parent_Terminated**
Determined whether the fault monitor restarts the SAP MaxDB database instance if the parent kernel process is terminated. The possible values of this extension property are as follows:

- **True** – Specifies that the fault monitor restarts the SAP MaxDB database instance if the parent kernel process is terminated
- **False** – Specifies that the fault monitor does *not* restart the SAP MaxDB database instance if the parent kernel process is terminated

**Data type** Boolean

**Default** False

**Range** Not applicable

**Tunable** Anytime

**User_Key**
The user key of the database user who administers the SAP MaxDB database instance. This user key is created when SAP MaxDB is installed and configured as explained in "Installing and Configuring SAP MaxDB" on page 16.

**Data type** String

**Default** No default defined

**Range** Not applicable

**Tunable** When disabled

---

**SUNW.sap_xserver Extension Properties**

The **SUNW.sap_xserver** resource type represents SAP xserver in a Oracle Solaris Cluster configuration. The extension properties of this resource type are as follows:

**Confdir_List**
The full path to the directory that contains the SAP MaxDB software and SAP MaxDB database instance.

**Data type** String

**Default** /sapdb

**Range** Not applicable

**Tunable** At creation
Independent_Program_Path
The full path to the directory that contains the following programs and libraries for SAP xserver:
- Programs that are independent of the database software version
- Libraries for the client runtime environment

HA for SAP MaxDB determines the path to the x_server command from the value of this property. The x_server command resides in the bin subdirectory of the directory that this property specifies.

Data type: String
Default: No default defined
Range: Not applicable
Tunable: When disabled
Introduced in release: 3.1 4/04

Monitor_retry_count
The maximum number of restarts by the PMF that are allowed for the fault monitor.

Data type: Integer
Default: 4
Range: No range defined
Tunable: Any time

Monitor_retry_interval
The period of time in minutes during which the PMF counts restarts of the fault monitor.

Data type: Integer
Default: 2
Range: No range defined
Tunable: Any time

Probe_timeout
The timeout value in seconds for fault monitor probes.

Data type: Integer
Default: 120
Range: No range defined
Tunable: Any time
### Soft_Stop_Pct
The percentage of the Stop method timeout that is used to stop SAP xserver by using the SAP MaxDB utility x_server stop. If this timeout is exceeded, the SIGKILL signal is used to stop all SAP xserver processes.

- **Data type**: Integer
- **Default**: 50
- **Range**: 1–100
- **Tunable**: When disabled

### Xserver_User
The UNIX user identity of the OS user who administers SAP xserver.

- **Data type**: String
- **Default**: root
- **Range**: Not applicable
- **Tunable**: At creation
