This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

This software and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

# Contents

|                                   |            |
|-----------------------------------|------------|
| <b>Preface .....</b>              | <b>xix</b> |
| Audience.....                     | xix        |
| Documentation Accessibility ..... | xix        |
| Related Documents .....           | xix        |
| Conventions .....                 | xx         |

## **Part I Monitoring and Managing Targets**

### **1 Discovering Targets**

|       |   |     |
|-------|---|-----|
| 1.1   | Configuring Automatic Discovery .....                                       | 1-1 |
| 1.1.1 | Configuring Automatic Discovery of Un-Managed Host Machines Using IP Scan.. | 1-2 |
| 1.1.2 | Configuring Automatic Discovery of Targets On Managed Hosts.....            | 1-3 |
| 1.1.3 | Checking For and Promoting Discovered Targets.....                          | 1-5 |
| 1.2   | Manually Adding Targets.....  | 1-6 |
| 1.2.1 | Manually Adding Host Targets.....   | 1-7 |
| 1.2.2 | Manually Adding Non-Host Targets.....                                       | 1-7 |

### **2 Using Incident Management**

|         |   |      |
|---------|---|------|
| 2.1     | Events, Incidents, and Problems.....                | 2-1  |
| 2.1.1   | Event Management.....                               | 2-1  |
| 2.1.2   | Incident Management .....                           | 2-1  |
| 2.1.3   | Problem Management.....                             | 2-2  |
| 2.1.4   | Summing Up .....                                    | 2-2  |
| 2.1.5   | Working with Events, Incidents, and Problems.....   | 2-3  |
| 2.2     | Key Concepts: Events, Incidents, and Problems ..... | 2-4  |
| 2.2.1   | Events .....  | 2-4  |
| 2.2.2   | Incidents .....                                     | 2-7  |
| 2.2.2.1 | Working with Incidents.....                         | 2-7  |
| 2.2.2.2 | Incident Composed of a Single Event.....            | 2-10 |
| 2.2.2.3 | Incident Composed of Multiple Events .....          | 2-10 |
| 2.2.2.4 | How are Incidents Created?.....                     | 2-11 |
| 2.2.3   | Problems.....                                       | 2-11 |
| 2.2.4   | Rule Sets .....                                     | 2-12 |
| 2.2.4.1 | Out-of-Box Rule Sets .....                          | 2-13 |
| 2.2.4.2 | Rule Set Types.....                                 | 2-14 |

|         |  |      |
|---------|--|------|
| 2.2.4.3 | Rules .....  | 2-14 |
| 2.2.5   | Incident Manager .....   | 2-19 |
| 2.2.5.1 | Views .....  | 2-20 |
| 2.3     | Setting Up Your Incident Management Environment .....  | 2-20 |
| 2.3.1   | Setting Up Your Monitoring Infrastructure.....   | 2-21 |
| 2.3.1.1 | Rule Set Development.....  | 2-21 |
| 2.3.2   | Setting Up Notifications .....   | 2-24 |
| 2.3.3   | Setting Up Administrators and Privileges .....   | 2-25 |
| 2.3.4   | Setting Up Rule Sets .....   | 2-28 |
| 2.3.4.1 | Creating a Rule Set .....  | 2-28 |
| 2.3.4.2 | Creating a Rule to Create an Incident.....   | 2-28 |
| 2.3.4.3 | Creating a Rule to Manage Escalation of Incidents .....  | 2-29 |
| 2.3.4.4 | Creating a Rule to Escalate a Problem.....   | 2-31 |
| 2.3.4.5 | Subscribing to a Rule .....  | 2-32 |
| 2.3.4.6 | Receiving E-mail for Private Rules .....   | 2-32 |
| 2.4     | Working with Incidents .....   | 2-33 |
| 2.4.1   | Finding What Needs to be Worked On .....   | 2-34 |
| 2.4.2   | Setting Up Custom Views .....  | 2-37 |
| 2.4.3   | Responding and Working on a Simple Incident .....  | 2-38 |
| 2.4.4   | Searching My Oracle Support Knowledge .....  | 2-39 |
| 2.4.5   | Open Service Request (Problems-only) .....   | 2-39 |
| 2.4.6   | Suppressing Incidents and Problems .....   | 2-39 |
| 2.4.7   | Managing Workload Distribution of Incidents .....  | 2-40 |
| 2.4.8   | Reviewing Events on a Periodic Basis .....   | 2-40 |
| 2.4.8.1 | Creating an Incident Manually.....   | 2-41 |
| 2.5     | Advanced Topics.....   | 2-41 |
| 2.5.1   | Defining Custom Incident Statuses.....   | 2-41 |
| 2.5.2   | Clearing Stateless Alerts for Metric Alert Event Types.....                                      | 2-42 |
| 2.5.3   | User-reported Events .....   | 2-43 |
| 2.5.3.1 | Format .....   | 2-43 |
| 2.5.3.2 | Options.....   | 2-43 |
| 2.5.3.3 | Examples.....  | 2-44 |
| 2.5.4   | Additional Rule Applications .....   | 2-45 |
| 2.5.4.1 | Setting Up a Rule to Send Different Notifications for Different Severity States of an Event 2-45 |      |
| 2.5.4.2 | Creating a Rule to Notify Different Administrators Based on the Event Type                       | 2-46 |
| 2.5.4.3 | Creating a Rule to Create a Ticket for Incidents .....   | 2-47 |
| 2.5.5   | Event Prioritization .....   | 2-48 |
| 2.6     | Moving from Enterprise Manager 10/11g to 12c.....  | 2-49 |

### 3 Notifications

|         |   |     |
|---------|---|-----|
| 3.1     | Setting Up Notifications.....                   | 3-1 |
| 3.1.1   | Setting Up a Mail Server for Notifications..... | 3-2 |
| 3.1.1.1 | Setting Up Repeat Notifications .....           | 3-3 |
| 3.1.2   | Setting Up E-mail for Yourself.....             | 3-5 |
| 3.1.2.1 | Defining E-mail Addresses .....                 | 3-5 |
| 3.1.2.2 | Setting Up a Notification Schedule.....         | 3-9 |

|         |  |      |
|---------|--|------|
| 3.1.2.3 | Subscribe to Receive E-mail for Incident Rules.....                        | 3-9  |
| 3.1.3   | Setting Up E-mail for Other Administrators .....                           | 3-10 |
| 3.1.4   | E-mail Customization.....  | 3-11 |
| 3.1.4.1 | E-mail Customization Reference .....                                       | 3-12 |
| 3.2     | Extending Notification Beyond E-mail.....                                  | 3-16 |
| 3.2.1   | Custom Notification Methods Using Scripts and SNMP Traps .....             | 3-17 |
| 3.2.1.1 | Adding a Notification Method based on an OS Command or Script.....         | 3-17 |
| 3.2.1.2 | Adding a Notification Method Based on a PL/SQL Procedure.....              | 3-33 |
| 3.2.1.3 | Adding a Notification Method Based on an SNMP Trap.....                    | 3-47 |
| 3.3     | Passing Corrective Action Status Change Information.....                   | 3-49 |
| 3.3.1   | Passing Corrective Action Execution Status to an OS Command or Script..... | 3-49 |
| 3.3.2   | Passing Corrective Action Execution Status to a PLSQL Procedure.....       | 3-50 |
| 3.4     | Passing Job Execution Status Information.....                              | 3-51 |
| 3.4.1   | Passing Job Execution Status to a PL/SQL Procedure.....                    | 3-51 |
| 3.4.2   | Passing Job Execution Status to an OS Command or Script.....               | 3-53 |
| 3.5     | Passing User-Defined Target Properties to Notification Methods .....       | 3-54 |
| 3.6     | Management Information Base (MIB).....                                     | 3-55 |
| 3.6.1   | About MIBs.....  | 3-55 |
| 3.6.2   | Reading the MIB Variable Descriptions .....                                | 3-55 |
| 3.6.2.1 | Variable Name .....  | 3-55 |
| 3.6.2.2 | MIB Definition.....  | 3-56 |
| 3.7     | Troubleshooting Notifications .....  | 3-56 |
| 3.7.1   | General Setup .....  | 3-56 |
| 3.7.2   | Notification System Errors .....   | 3-57 |
| 3.7.3   | Notification System Trace Messages.....                                    | 3-57 |
| 3.7.4   | E-mail Errors.....   | 3-59 |
| 3.7.5   | OS Command Errors .....  | 3-59 |
| 3.7.6   | SNMP Trap Errors .....   | 3-59 |
| 3.7.7   | PL/SQL Errors .....  | 3-60 |

## 4 Managing with Groups

|       |  |     |
|-------|--|-----|
| 4.1   | Introduction to Groups .....   | 4-1 |
| 4.2   | Managing Groups.....   | 4-2 |
| 4.2.1 | Using the Groups Page .....  | 4-2 |
| 4.2.2 | About the Group Home Page .....                                      | 4-2 |
| 4.2.3 | About the Group Charts Page.....                                     | 4-4 |
| 4.2.4 | About the Group Members Page.....                                    | 4-4 |
| 4.2.5 | Viewing Group Status History .....                                   | 4-4 |
| 4.2.6 | About the System Dashboard .....                                     | 4-4 |
| 4.3   | About Out-of-Box Reports.....  | 4-5 |
| 4.4   | About Redundancy Systems .....                                       | 4-6 |
| 4.5   | About Privilege Propagating Groups .....                             | 4-6 |
| 4.5.1 | Creating Privilege Propagating Groups.....                           | 4-7 |
| 4.5.2 | Using the Group Administration Privilege .....                       | 4-7 |
| 4.5.3 | Adding Members to Privilege Propagating Groups .....                 | 4-7 |
| 4.5.4 | Converting Conventional Groups to Privilege Propagating Groups ..... | 4-8 |

## 5 Administration Groups

|         |   |      |
|---------|---|------|
| 5.1     | What is an Administration Group? .....                            | 5-1  |
| 5.1.1   | Developing an Administration Group .....                          | 5-3  |
| 5.2     | Planning.....   | 5-3  |
| 5.3     | Implementing Administration Groups and Template Collections.....  | 5-8  |
| 5.3.1   | Creating an Administration Group.....                             | 5-9  |
| 5.3.1.1 | Accessing the Administration Group Home Page .....                | 5-9  |
| 5.3.1.2 | Defining a Hierarchy.....   | 5-10 |
| 5.3.1.3 | Defining Template Collections .....                               | 5-13 |
| 5.3.1.4 | Associating Template Collections with Administration Groups ..... | 5-16 |
| 5.4     | Removing Administration Groups.....                               | 5-22 |

## 6 Metric Extensions

|        |   |      |
|--------|---|------|
| 6.1    | What are Metric Extensions? .....   | 6-1  |
| 6.2    | Metric Extension Lifecycle.....   | 6-3  |
| 6.3    | Working with Metric Extensions .....  | 6-6  |
| 6.3.1  | Administrator Privilege Requirements .....  | 6-6  |
| 6.3.2  | Granting Create Metric Extension Privilege .....  | 6-7  |
| 6.3.3  | Creating a New Metric Extension .....   | 6-7  |
| 6.3.4  | Creating a New Metric Extension (Create Like) .....                                       | 6-9  |
| 6.3.5  | Editing a Metric Extension .....  | 6-10 |
| 6.3.6  | Creating the Next Version of an Existing Metric Extension.....                            | 6-10 |
| 6.3.7  | Importing a Metric Extension .....  | 6-11 |
| 6.3.8  | Exporting a Metric Extension.....   | 6-12 |
| 6.3.9  | Deleting a Metric Extension .....   | 6-12 |
| 6.3.10 | Granting Edit/Full Access to Metric Extensions .....                                      | 6-12 |
| 6.3.11 | Deploying Metric Extensions to a Group of Targets .....                                   | 6-13 |
| 6.3.12 | Updating Older Versions of Metric Extensions Already deployed to a Group of Targets ..... | 6-13 |
| 6.4    | Adapters .....  | 6-14 |
| 6.4.1  | OS Command Adapter - Single Column.....   | 6-14 |
| 6.4.2  | OS Command Adapter- Multiple Values.....  | 6-17 |
| 6.4.3  | OS Command Adapter - Multiple Columns.....  | 6-18 |
| 6.4.4  | SQL Adapter .....   | 6-19 |
| 6.4.5  | SNMP (Simple Network Management Protocol) Adapter .....                                   | 6-20 |
| 6.4.6  | JMX Adapter .....   | 6-21 |
| 6.5    | Converting User-defined Metrics to Metric Extensions .....                                | 6-22 |
| 6.5.1  | Overview .....  | 6-22 |
| 6.5.2  | Commands.....   | 6-23 |
| 6.6    | Metric Extension Command Line Verbs.....  | 6-26 |

## 7 Utilizing the Job System and Corrective Actions

|       |   |     |
|-------|---|-----|
| 7.1   | Job System Purpose and Overview .....           | 7-1 |
| 7.1.1 | What Are Job Executions and Job Runs?.....      | 7-2 |
| 7.1.2 | Operations on Job Executions and Job Runs ..... | 7-2 |
| 7.2   | Preliminary Considerations.....                 | 7-3 |

|         |  |      |
|---------|--|------|
| 7.2.1   | Creating Scripts .....                                   | 7-3  |
| 7.2.2   | Sharing Job Responsibilities .....                       | 7-4  |
| 7.2.3   | Submitting Jobs for Groups .....                         | 7-4  |
| 7.3     | Creating Jobs .....                                      | 7-4  |
| 7.3.1   | Selecting a Job Type .....                               | 7-4  |
| 7.3.2   | Creating an OS Command Job .....                         | 7-5  |
| 7.3.2.1 | Specifying a Single Operation .....                      | 7-10 |
| 7.3.2.2 | Specifying a Script .....                                | 7-10 |
| 7.3.2.3 | Access Level Rules .....                                 | 7-12 |
| 7.3.3   | Creating a SQL Script Job .....                          | 7-12 |
| 7.3.3.1 | Specifying Targets .....                                 | 7-12 |
| 7.3.3.2 | Specifying Options for the Parameters Page .....         | 7-12 |
| 7.3.3.3 | Specifying Host and Database Credentials .....           | 7-13 |
| 7.3.3.4 | Returning Error Codes from SQL Script Jobs .....         | 7-14 |
| 7.3.4   | Creating a Multi-task Job .....                          | 7-14 |
| 7.3.4.1 | Job Capabilities .....                                   | 7-15 |
| 7.3.4.2 | Specifying Targets for a Multi-task Job .....            | 7-15 |
| 7.3.4.3 | Adding Tasks to the Job .....                            | 7-15 |
| 7.4     | Analyzing Job Activity .....                             | 7-16 |
| 7.5     | Generating Job Event Criteria .....                      | 7-16 |
| 7.5.1   | Enabling Events For Job Status and Targetless Jobs ..... | 7-17 |
| 7.5.2   | Adding Targets To Generate Events For Job Status .....   | 7-18 |
| 7.6     | Creating Event Rules For Job Status Change .....         | 7-18 |
| 7.6.1   | Creating Job Status Change Event Rules For Jobs .....    | 7-18 |
| 7.6.2   | Creating Job Status Change Event Rules For Targets ..... | 7-21 |
| 7.7     | Creating Corrective Actions .....                        | 7-24 |
| 7.7.1   | Providing Credentials .....                              | 7-25 |
| 7.7.2   | Creating Corrective Actions for Metrics .....            | 7-25 |
| 7.7.3   | Creating a Library Corrective Action .....               | 7-26 |
| 7.7.4   | Specifying Access to Corrective Actions .....            | 7-27 |
| 7.7.4.1 | Defining or Modifying Access .....                       | 7-27 |
| 7.7.4.2 | Access Level Rules .....                                 | 7-27 |
| 7.7.5   | Setting Up Notifications for Corrective Actions .....    | 7-28 |
| 7.7.6   | Providing Agent-side Response Actions .....              | 7-29 |
| 7.7.6.1 | Specifying Commands and Scripts .....                    | 7-29 |
| 7.7.6.2 | Using Target Properties in Commands .....                | 7-29 |
| 7.7.6.3 | Using Advanced Capabilities .....                        | 7-30 |

## 8 Configuring Software Library

|       |  |     |
|-------|--|-----|
| 8.1   | Overview of Software Library .....                   | 8-1 |
| 8.2   | Users, Roles, and Privileges .....                   | 8-3 |
| 8.3   | Software Library Storage .....                       | 8-4 |
| 8.3.1 | Upload File Locations .....                          | 8-6 |
| 8.3.2 | Referenced File Location .....                       | 8-7 |
| 8.4   | Prerequisites for Configuring Software Library ..... | 8-8 |
| 8.5   | Configuring Software Library Storage Location .....  | 8-8 |
| 8.5.1 | Configuring an OMS Shared Filesystem Location .....  | 8-8 |

|         |  |      |
|---------|--|------|
| 8.5.2   | Configuring an OMS Agent Filesystem Location .....         | 8-9  |
| 8.5.3   | Configuring a Referenced File Location .....               | 8-10 |
| 8.6     | Configuring Software Library on a Multi-OMS System .....   | 8-11 |
| 8.7     | Using Software Library Entities.....                       | 8-12 |
| 8.8     | Tasks Performed Using the Software Library Home Page ..... | 8-13 |
| 8.8.1   | Organizing Entities.....                                   | 8-13 |
| 8.8.2   | Creating Entities.....                                     | 8-13 |
| 8.8.2.1 | Creating Generic Components .....                          | 8-14 |
| 8.8.2.2 | Creating Directives .....                                  | 8-16 |
| 8.8.3   | Customizing Entities .....                                 | 8-18 |
| 8.8.4   | Managing Entities .....                                    | 8-18 |
| 8.8.4.1 | Granting or Revoking Privileges .....                      | 8-19 |
| 8.8.4.2 | Moving Entities .....                                      | 8-19 |
| 8.8.4.3 | Changing Entity Maturity .....                             | 8-20 |
| 8.8.4.4 | Adding Notes to Entities .....                             | 8-20 |
| 8.8.4.5 | Adding Attachments to Entities .....                       | 8-20 |
| 8.8.4.6 | Viewing, Editing, and Deleting Entities .....              | 8-21 |
| 8.8.4.7 | Searching Entities .....                                   | 8-21 |
| 8.8.4.8 | Exporting Entities .....                                   | 8-22 |
| 8.8.4.9 | Importing Entities.....                                    | 8-23 |
| 8.9     | Maintaining Software Library .....                         | 8-23 |
| 8.9.1   | Periodic Maintenance Tasks.....                            | 8-24 |
| 8.9.2   | Re-Importing Oracle Owned Entity Files.....                | 8-24 |
| 8.9.3   | Deleting Software Library Storage Location.....            | 8-24 |
| 8.9.4   | Purging Deleted Entity Files .....                         | 8-25 |
| 8.9.5   | Backing Up Software Library.....                           | 8-25 |

## Part II Security

### 9 Configuring Security

|         |   |      |
|---------|---|------|
| 9.1     | About Oracle Enterprise Manager Security .....                              | 9-1  |
| 9.2     | Enterprise Manager Authentication.....                                      | 9-2  |
| 9.2.1   | Repository-Based Authentication .....                                       | 9-3  |
| 9.2.2   | Oracle Access Manager Single Sign-On .....                                  | 9-4  |
| 9.2.3   | Single Sign-On Based Authentication.....                                    | 9-5  |
| 9.2.3.1 | Registering Enterprise Manager as a Partner Application.....                | 9-5  |
| 9.2.3.2 | Removing Single Sign-On Configuration .....                                 | 9-6  |
| 9.2.3.3 | Registering Single Sign-On Users as Enterprise Manager Administrators ..... | 9-7  |
| 9.2.3.4 | Bypassing the Single Sign-On Logon Page .....                               | 9-9  |
| 9.2.3.5 | Restoring the Default Authentication Method.....                            | 9-9  |
| 9.2.4   | Enterprise User Security Based Authentication .....                         | 9-10 |
| 9.2.4.1 | Registering Enterprise Users as Enterprise Manager Users.....               | 9-11 |
| 9.2.5   | Oracle Internet Directory (OID).....  | 9-12 |
| 9.2.6   | Microsoft Active Directory Based Authentication.....                        | 9-13 |
| 9.2.6.1 | Configuring WebLogic Server Authentication .....                            | 9-14 |
| 9.2.6.2 | Manage Active Directory Users with External Roles .....                     | 9-17 |
| 9.2.6.3 | Password Management for Active Directory Users .....                        | 9-17 |

|         |  |      |
|---------|--|------|
| 9.2.6.4 | Remove Active Directory Users .....  | 9-17 |
| 9.2.6.5 | Remove Active Directory Authentication.....  | 9-17 |
| 9.3     | Enterprise Manager Authorization .....   | 9-17 |
| 9.3.1   | Authentication Scheme .....  | 9-18 |
| 9.3.2   | Classes of Users.....  | 9-18 |
| 9.3.3   | Privileges and Roles .....   | 9-19 |
| 9.3.3.1 | Granting Privileges.....   | 9-21 |
| 9.4     | Configuring Secure Communication (SSL) for Cloud Control .....   | 9-31 |
| 9.4.1   | About Enterprise Manager Framework Security .....  | 9-31 |
| 9.4.2   | Enabling Security for the Oracle Management Service.....   | 9-32 |
| 9.4.2.1 | Creating a New Certificate Authority .....   | 9-34 |
| 9.4.2.2 | Viewing the Security Status and OMS Port Information .....   | 9-35 |
| 9.4.2.3 | Configuring Transparent Layer Security .....   | 9-36 |
| 9.4.3   | Securing the Oracle Management Agent .....   | 9-37 |
| 9.4.4   | Enabling Security with Multiple Management Service Installations.....                                  | 9-38 |
| 9.4.5   | Restricting HTTP Access to the Management Service .....  | 9-39 |
| 9.4.6   | Managing Agent Registration Passwords.....   | 9-40 |
| 9.4.6.1 | Using the Cloud Control Console to Manage Agent Registration Passwords..                               | 9-41 |
| 9.4.6.2 | Using emctl to Add a New Agent Registration Password .....   | 9-41 |
| 9.4.7   | Configuring the OMS with Server Load Balance.....  | 9-42 |
| 9.4.8   | Enabling Security for the Management Repository Database .....   | 9-42 |
| 9.4.8.1 | About Oracle Advanced Security and the sqlnet.ora Configuration File .....                             | 9-43 |
| 9.4.8.2 | Configuring the Management Service to Connect to a Secure Management<br>Repository Database 9-43       |      |
| 9.4.8.3 | Enabling Oracle Advanced Security for the Management Repository.....                                   | 9-45 |
| 9.4.8.4 | Enabling Security for a Management Agent Monitoring a Secure Management<br>Repository or Database 9-45 |      |
| 9.4.9   | Configuring Third Party Certificates .....   | 9-45 |
| 9.4.9.1 | Configuring Third Party Certificate for HTTPS Upload Virtual Host .....                                | 9-46 |
| 9.4.9.2 | Configuring Third Party Certificate for HTTPS Console Virtual Host .....                               | 9-47 |
| 9.5     | Accessing Managed Targets .....  | 9-47 |
| 9.5.1   | Credential Subsystem.....  | 9-47 |
| 9.5.1.1 | <b>Named Credential</b> .....  | 9-47 |
| 9.5.1.2 | Job Credentials .....  | 9-49 |
| 9.5.1.3 | Monitoring Credentials .....   | 9-50 |
| 9.5.1.4 | Collection Credentials.....  | 9-50 |
| 9.5.1.5 | Preferred Credentials .....  | 9-51 |
| 9.5.1.6 | Managing Credentials Using EM CLI .....  | 9-51 |
| 9.5.2   | Setting Up SSH Key-based Host Authentication .....   | 9-52 |
| 9.5.3   | Pluggable Authentication Modules (PAM) Support for Hosts.....  | 9-54 |
| 9.5.3.1 | Configuring PAM for RHEL4 Users.....   | 9-54 |
| 9.5.3.2 | Configuring PAM for AIX Users.....   | 9-55 |
| 9.5.4   | Sudo and PowerBroker Support.....  | 9-55 |
| 9.5.4.1 | Creating a Privilege Delegation Setting .....  | 9-56 |
| 9.6     | Cryptographic Support .....  | 9-57 |
| 9.6.1   | Configuring the emkey .....  | 9-57 |
| 9.6.2   | emctl Commands .....   | 9-58 |

|         |   |      |
|---------|---|------|
| 9.6.2.1 | emctl status emkey .....  | 9-58 |
| 9.6.2.2 | emctl config emkey -copy_to_credstore.....                          | 9-59 |
| 9.6.2.3 | emctl config emkey -copy_to_repos .....                             | 9-59 |
| 9.6.2.4 | emctl config emkey -copy_to_file_from_credstore.....                | 9-59 |
| 9.6.2.5 | emctl config emkey -copy_to_file_from_repos .....                   | 9-59 |
| 9.6.2.6 | emctl config emkey -copy_to_credstore_from_file.....                | 9-60 |
| 9.6.2.7 | emctl config emkey -copy_to_repos_from_file .....                   | 9-60 |
| 9.6.2.8 | emctl config emkey -remove_from_repos .....                         | 9-60 |
| 9.6.3   | Install and Upgrade Scenarios .....                                 | 9-60 |
| 9.6.3.1 | Installing the Management Repository .....                          | 9-61 |
| 9.6.3.2 | Installing the First Oracle Management Service .....                | 9-61 |
| 9.6.3.3 | Upgrading from 10.2 or 11.1 to 12.1.....                            | 9-61 |
| 9.6.3.4 | Recreating the Management Repository .....                          | 9-61 |
| 9.7     | Setting Up the Auditing System for Enterprise Manager.....          | 9-61 |
| 9.7.1   | Configuring the Enterprise Manager Audit System.....                | 9-62 |
| 9.7.2   | Configuring the Audit Data Export Service .....                     | 9-62 |
| 9.7.3   | Updating the Audit Settings .....                                   | 9-62 |
| 9.7.4   | Searching the Audit Data .....                                      | 9-63 |
| 9.7.5   | List of Operations Audited.....                                     | 9-65 |
| 9.8     | Additional Security Considerations.....                             | 9-70 |
| 9.8.1   | Changing the SYSMAN and MGMT_VIEW Passwords.....                    | 9-70 |
| 9.8.1.1 | Changing the SYSMAN User Password .....                             | 9-70 |
| 9.8.1.2 | Changing the MGMT_VIEW User Password.....                           | 9-71 |
| 9.8.2   | Responding to Browser-Specific Security Certificate Alerts .....    | 9-72 |
| 9.8.2.1 | Responding to the Internet Explorer Security Alert Dialog Box ..... | 9-72 |
| 9.8.2.2 | Responding to Mozilla Firefox New Site Certificate Dialog Box ..... | 9-75 |
| 9.8.3   | Configuring Beacons to Monitor Web Applications Over HTTPS.....     | 9-77 |
| 9.8.4   | Patching Oracle Homes When the User is Locked .....                 | 9-79 |
| 9.8.5   | Cloning Oracle Homes.....   | 9-79 |

## Part III Generating Reports

### 10 Using Information Publisher

|        |   |      |
|--------|---|------|
| 10.1   | About Information Publisher .....       | 10-1 |
| 10.2   | Out-of-Box Report Definitions .....     | 10-2 |
| 10.3   | Custom Reports.....                     | 10-2 |
| 10.3.1 | Creating Custom Reports .....           | 10-2 |
| 10.3.2 | Report Parameters .....                 | 10-3 |
| 10.3.3 | Report Elements .....                   | 10-3 |
| 10.4   | Scheduling Reports.....                 | 10-3 |
| 10.4.1 | Flexible Schedules.....                 | 10-3 |
| 10.4.2 | Storing and Purging Report Copies ..... | 10-4 |
| 10.4.3 | E-mailing Reports .....                 | 10-4 |
| 10.5   | Sharing Reports .....                   | 10-4 |

## Part IV Accessing Enterprise Manager via Mobile Devices

## **11 Cloud Control Mobile**

|        |  |      |
|--------|--|------|
| 11.1   | Reviewing System Requirements .....                  | 11-1 |
| 11.2   | Performing Initial Setup .....                       | 11-1 |
| 11.3   | Connecting the First Time .....                      | 11-2 |
| 11.4   | Encountering the Login Screen .....                  | 11-2 |
| 11.5   | Managing Settings .....                              | 11-3 |
| 11.6   | Using Cloud Control Mobile in Incident Manager ..... | 11-4 |
| 11.7   | Working in Cloud Control Mobile .....                | 11-6 |
| 11.7.1 | Viewing Incidents and Problems .....                 | 11-6 |
| 11.7.2 | Changing Views .....                                 | 11-7 |
| 11.7.3 | Performing Actions .....                             | 11-8 |
| 11.8   | Learning Tips and Tricks .....                       | 11-8 |

## **Part V Administering Cloud Control**

### **12 Personalizing Cloud Control**

|      |  |      |
|------|--|------|
| 12.1 | Personalizing a Cloud Control Page ..... | 12-1 |
| 12.2 | Customizing a Region .....               | 12-2 |
| 12.3 | Setting Your Homepage .....              | 12-3 |

### **13 Maintaining Enterprise Manager**

|        |  |       |
|--------|--|-------|
| 13.1   | Overview: Managing the Manager .....                 | 13-1  |
| 13.2   | Management Services and Repository .....             | 13-2  |
| 13.3   | Viewing Enterprise Manager Topology and Charts ..... | 13-4  |
| 13.4   | Viewing Enterprise Manager Services .....            | 13-6  |
| 13.5   | Controlling and Configuring Management Agents .....  | 13-7  |
| 13.5.1 | Management Agent Home Page .....                     | 13-7  |
| 13.5.2 | Controlling a Single Agent .....                     | 13-8  |
| 13.5.3 | Configuring Single Management Agents .....           | 13-9  |
| 13.5.4 | Controlling Multiple Management Agents .....         | 13-9  |
| 13.5.5 | Configuring Multiple Agents .....                    | 13-11 |

### **14 Updating Cloud Control**

|        |   |      |
|--------|---|------|
| 14.1   | Using Self Update .....                               | 14-1 |
| 14.1.1 | What Can Be Updated? .....                            | 14-1 |
| 14.2   | Setting Up Self Update .....                          | 14-2 |
| 14.2.1 | Setting Up Enterprise Manager Self Update Mode .....  | 14-2 |
| 14.2.2 | Assigning Self Update Privileges to Users .....       | 14-2 |
| 14.2.3 | Setting Up the Software Library .....                 | 14-3 |
| 14.2.4 | Setting Up the EM CLI Utility (Optional) .....        | 14-3 |
| 14.3   | Applying an Update .....                              | 14-3 |
| 14.3.1 | Applying an Update in Online Mode .....               | 14-4 |
| 14.3.2 | Applying an Update in Offline Mode .....              | 14-5 |
| 14.4   | Accessing Informational Updates .....                 | 14-5 |
| 14.5   | Acquiring or Updating Management Agent Software ..... | 14-6 |

|        |   |      |
|--------|---|------|
| 14.5.1 | Acquiring Management Agent Software in Online Mode .....  | 14-7 |
| 14.5.2 | Acquiring Management Agent Software in Offline Mode ..... | 14-7 |

## 15 Using Plug-Ins

|          |  |       |
|----------|--|-------|
| 15.1     | Getting Started.....   | 15-1  |
| 15.2     | Introduction to Plug-Ins.....  | 15-2  |
| 15.2.1   | Overview of Plug-Ins .....   | 15-2  |
| 15.2.2   | Understanding How Enterprise Manager Uses Plug-Ins to Discover, Monitor, and Manage Targets 15-3 |       |
| 15.2.3   | Understanding the Different Components of Plug-Ins.....  | 15-3  |
| 15.2.4   | Differentiating Plug-In Releases from Enterprise Manager Platform Releases.....                  | 15-4  |
| 15.2.5   | Differentiating Plug-In Version from Plug-In Revision .....                                      | 15-5  |
| 15.2.6   | Tracking the Plug-Ins Released So Far .....  | 15-5  |
| 15.2.6.1 | Viewing Plug-In Certification Matrix on My Oracle Support .....                                  | 15-5  |
| 15.2.6.2 | Viewing Plug-Ins Available for Download on Oracle Technology Network...                          | 15-6  |
| 15.2.7   | Understanding Default Plug-Ins Deployed with Enterprise Manager.....                             | 15-7  |
| 15.2.8   | Understanding Plug-In Homes.....   | 15-7  |
| 15.3     | Deploying Plug-Ins.....  | 15-8  |
| 15.3.1   | Before You Begin.....  | 15-8  |
| 15.3.2   | Deploying Plug-Ins While Installing Enterprise Manager .....                                     | 15-9  |
| 15.3.3   | Deploying Plug-Ins After Installing Enterprise Manager.....                                      | 15-10 |

| 15.3.3.2 | Checking the Availability of Plug-Ins .....  | 15-11 |
| 15.3.3.3 | Downloading Plug-Ins.....  | 15-11 |
| 15.3.3.4 | Deploying Plug-Ins to Oracle Management Service .....  | 15-14 |
| 15.3.4   | Deploying Plug-Ins While Installing Oracle Management Agent.....                                 | 15-15 |
| 15.3.5   | Monitoring the Deployment Status of Plug-Ins .....   | 15-16 |
| 15.3.6   | Monitoring the Deployment Status of Plug-Ins that Require Down Time .....                        | 15-16 |
| 15.4     | Discovering Targets After Deploying Plug-Ins .....   | 15-16 |
| 15.4.1   | Discovering Unmanaged Hosts in Enterprise Manager .....  | 15-16 |
| 15.4.2   | Configuring Automatic Discovery of Targets on Managed Hosts.....                                 | 15-17 |
| 15.4.3   | Checking For and Promoting Discovered Targets.....   | 15-17 |
| 15.5     | Viewing and Administering Installed Plug-Ins .....   | 15-18 |
| 15.5.1   | Viewing Installed Plug-Ins .....   | 15-18 |
| 15.5.2   | Identifying Plug-In ID.....  | 15-19 |
| 15.5.3   | Identifying the Plug-In Version.....   | 15-20 |
| 15.5.4   | Identifying Plug-In Revision.....  | 15-20 |
| 15.5.5   | Viewing Targets and Operating Systems Certified for Deployed Plug-Ins.....                       | 15-21 |
| 15.5.6   | Identifying the Oracle Management Service on Which a Plug-In Is Deployed.....                    | 15-21 |
| 15.5.7   | Identifying the Oracle Management Agent on Which a Plug-In Is Deployed .....                     | 15-21 |
| 15.6     | Cloning Plug-Ins While Cloning Oracle Management Service .....                                   | 15-21 |
| 15.7     | Upgrading Plug-Ins .....   | 15-22 |
| 15.7.1   | Upgrading Across Plug-In Versions .....  | 15-22 |
| 15.7.1.1 | Upgrading Across Plug-In Versions Deployed to Oracle Management Service .....                    | 15-22 |
| 15.7.1.2 | Upgrading Across Plug-In Versions Deployed to Oracle Management Agent .....                      | 15-22 |

|        |  |       |
|--------|--|-------|
| 15.7.2 | Upgrading Across Plug-In Revisions within a Plug-In Version..... | 15-23 |
| 15.8   | Undeploying Plug-Ins .....                                       | 15-23 |
| 15.8.1 | Undeploying Plug-Ins from Oracle Management Agent .....          | 15-24 |
| 15.8.2 | Undeploying Plug-Ins from Oracle Management Service.....         | 15-24 |
| 15.9   | Using EM CLI to Deploy, Track, and Undeploy Plug-Ins .....       | 15-24 |
| 15.10  | Troubleshooting Plug-In Deployment Issues .....                  | 15-25 |

## **16 Patching Enterprise Manager**

|          |   |       |
|----------|---|-------|
| 16.1     | Overview .....                                    | 16-1  |
| 16.2     | Patching OMS and Management Repository .....      | 16-2  |
| 16.2.1   | OMS Patches.....                                  | 16-2  |
| 16.2.2   | Repository Patches .....                          | 16-2  |
| 16.2.3   | Applying OMS and Repository Patches.....          | 16-2  |
| 16.3     | Patching Enterprise Manager Agents .....          | 16-3  |
| 16.3.1   | Management Agent Patches.....                     | 16-3  |
| 16.3.1.1 | Patches and Updates Versus My Oracle Support..... | 16-4  |
| 16.3.2   | Automated Agent Patching.....                     | 16-4  |
| 16.3.2.1 | Accessing Patches and Updates .....               | 16-5  |
| 16.3.2.2 | Viewing Patch Recommendations .....               | 16-5  |
| 16.3.2.3 | Searching Patches .....                           | 16-6  |
| 16.3.2.4 | Applying Management Agent Patches .....           | 16-7  |
| 16.3.2.5 | Verifying the Applied Agent Patches.....          | 16-12 |
| 16.3.2.6 | Validating Agent Patch Errors.....                | 16-12 |
| 16.3.2.7 | Deinstalling the Applied Agent Patches .....      | 16-13 |
| 16.3.3   | Manual Agent Patching .....                       | 16-13 |

## **17 Starting and Stopping Enterprise Manager Components**

|          |   |       |
|----------|---|-------|
| 17.1     | Controlling the Oracle Management Agent.....  | 17-1  |
| 17.1.1   | Starting, Stopping, and Checking the Status of the Management Agent on UNIX .....         | 17-1  |
| 17.1.2   | Starting and Stopping the Management Agent on Windows .....                               | 17-3  |
| 17.1.3   | Checking the Status of the Management Agent on Windows .....                              | 17-3  |
| 17.1.4   | Troubleshooting Management Agent Startup Errors.....                                      | 17-4  |
| 17.1.4.1 | Management Agent starts up but is not ready.....  | 17-4  |
| 17.1.4.2 | Management Agent fails to start because of time zone mismatch between agent and OMS ..... | 17-4  |
| 17.1.4.3 | Agent fails to start due to possible port conflict .....                                  | 17-4  |
| 17.1.4.4 | Agent secure/unsecure fails .....   | 17-5  |
| 17.2     | Controlling the Oracle Management Service.....  | 17-5  |
| 17.2.1   | Controlling the Management Service on UNIX .....  | 17-5  |
| 17.2.2   | Controlling the Management Service on Windows.....  | 17-6  |
| 17.2.3   | Troubleshooting Oracle Management Service Startup Errors .....                            | 17-6  |
| 17.3     | Guidelines for Starting Multiple Enterprise Manager Components on a Single Host..         | 17-7  |
| 17.4     | Starting and Stopping Oracle Enterprise Manager 12c Cloud Control .....                   | 17-8  |
| 17.4.1   | Starting Cloud Control and All Its Components .....                                       | 17-8  |
| 17.4.2   | Stopping Cloud Control and All Its Components .....                                       | 17-9  |
| 17.5     | Additional Management Agent Commands .....  | 17-10 |

|        |   |       |
|--------|---|-------|
| 17.5.1 | Uploading and Reloading Data to the Management Repository ..... | 17-10 |
| 17.5.2 | Specifying New Target Monitoring Credentials .....              | 17-10 |
| 17.5.3 | Listing the Targets on a Managed Host.....                      | 17-11 |
| 17.5.4 | Controlling Blackouts.....                                      | 17-11 |
| 17.5.5 | Changing the Management Agent Time Zone.....                    | 17-14 |
| 17.5.6 | Reevaluating Metric Collections.....                            | 17-14 |
| 17.6   | emctl Commands .....  | 17-16 |
| 17.7   | Using emctl.log File .....                                      | 17-22 |

## **18 Locating and Configuring Enterprise Manager Log Files**

|          |  |       |
|----------|--|-------|
| 18.1     | Managing Log Files .....   | 18-1  |
| 18.1.1   | Viewing Log Files and Their Messages .....   | 18-3  |
| 18.1.2   | Searching Log Files.....   | 18-3  |
| 18.1.2.1 | Searching Log Files: Basic Searches .....  | 18-3  |
| 18.1.2.2 | Searching Log Files: Advanced Searches .....   | 18-4  |
| 18.1.3   | Downloading Log Files.....   | 18-5  |
| 18.2     | Locating Management Agent Log and Trace Files .....  | 18-6  |
| 18.2.1   | About the Management Agent Log and Trace Files.....  | 18-6  |
| 18.2.1.1 | Structure of Agent Log Files .....   | 18-7  |
| 18.2.2   | Locating the Management Agent Log and Trace Files.....                                       | 18-7  |
| 18.2.3   | Setting Oracle Management Agent Log Levels.....  | 18-7  |
| 18.2.3.1 | Setting gcagent.log .....  | 18-8  |
| 18.2.3.2 | Setting gcagent_error.log.....   | 18-8  |
| 18.2.3.3 | Setting the Log Level for Individual Classes and Packages.....                               | 18-8  |
| 18.2.3.4 | Setting gcagent_mdu.log.....   | 18-9  |
| 18.2.3.5 | Setting the TRACE Level.....   | 18-11 |
| 18.3     | Locating and Configuring Oracle Management Service Log and Trace Files .....                 | 18-11 |
| 18.3.1   | About the Oracle Management Service Log and Trace Files .....                                | 18-11 |
| 18.3.2   | Locating Oracle Management Service Log and Trace Files.....                                  | 18-12 |
| 18.3.3   | Controlling the Size and Number of Oracle Management Service Log and Trace Files...<br>18-12 |       |
| 18.3.4   | Controlling the Contents of the Oracle Management Service Trace File .....                   | 18-13 |
| 18.3.5   | Controlling the Oracle WebLogic Server and Oracle HTTP Server Log Files .....                | 18-14 |

## **Part VI Configuring Enterprise Manager for High Availability**

### **19 High Availability Solutions**

|        |  |      |
|--------|--|------|
| 19.1   | Latest High Availability Information.....  | 19-1 |
| 19.2   | Defining High Availability .....           | 19-2 |
| 19.2.1 | Levels of High Availability .....          | 19-2 |
| 19.3   | Comparing Availability Levels.....         | 19-3 |
| 19.4   | Implementing High Availability Levels..... | 19-4 |

### **20 Setting Up High Availability**

|      |  |      |
|------|--|------|
| 20.1 | Installation Best Practices for Enterprise Manager High Availability ..... | 20-1 |
|------|--|------|

|          |  |       |
|----------|--|-------|
| 20.1.1   | Configuring the Management Agent to Automatically Start on Boot and Restart on Failure                                     | 20-1  |
| 20.1.2   | Configuring Restart for the Management Agent .....   | 20-1  |
| 20.1.3   | Installing the Management Agent Software on Redundant Storage .....  | 20-2  |
| 20.2     | Installation Best Practices for Enterprise Manager Management Repository High Availability                                 | 20-2  |
| 20.3     | Configuring a Standby Database for the Management Repository .....   | 20-3  |
| 20.4     | Configuring Management Service to RAC Management Repository Communication  | 20-4  |
| 20.5     | Configuring the First Management Service for High Availability .....   | 20-5  |
| 20.5.1   | Management Service Install Location .....  | 20-5  |
| 20.6     | Configuring the Cloud Control OMS in an Active/Passive Environment for High Availability Failover Using Virtual Host Names | 20-6  |
| 20.6.1   | Overview and Requirements .....  | 20-6  |
| 20.6.2   | Installation and Configuration .....   | 20-6  |
| 20.6.3   | Setting Up the Virtual Host Name/Virtual IP Address .....  | 20-7  |
| 20.6.4   | Setting Up Shared Storage.....   | 20-7  |
| 20.6.5   | Setting Up the Environment .....   | 20-7  |
| 20.6.6   | Synchronizing Operating System IDs.....  | 20-8  |
| 20.6.7   | Setting Up Shared Inventory.....   | 20-8  |
| 20.6.8   | Installing the Software .....  | 20-8  |
| 20.6.9   | Starting Up Services .....   | 20-9  |
| 20.7     | Configuring the Software Library .....   | 20-9  |
| 20.8     | Configuring a Load Balancer .....  | 20-9  |
| 20.8.1   | SLB Setup .....  | 20-10 |
| 20.8.2   | Enterprise Manager Side Setup .....  | 20-12 |
| 20.9     | Configuring Standby Management Services on a Standby Site.....   | 20-13 |
| 20.9.1   | Installing the First Standby Management Service .....  | 20-13 |
| 20.9.2   | Installing the First Standby Management Service (Silent Mode) .....  | 20-15 |
| 20.9.3   | Installing Additional Standby Management Services.....   | 20-17 |
| 20.9.4   | Installing Additional Standby Management Services (Silent Mode).....   | 20-19 |
| 20.9.5   | Validating Your Installation and Complete the Setup .....  | 20-21 |
| 20.9.5.1 | Keeping the Standby Site in Sync.....  | 20-21 |

## 21 Backing Up Enterprise Manager

|      |                                       |      |
|------|---------------------------------------|------|
| 21.1 | Backing Up Your Deployment.....       | 21-1 |
| 21.2 | Management Repository Backup.....     | 21-1 |
| 21.3 | Oracle Management Service Backup..... | 21-2 |
| 21.4 | Management Agent Backup .....         | 21-3 |

## 22 Enterprise Manager Outages

|          |   |      |
|----------|---|------|
| 22.1     | Recovery of Failed Enterprise Manager Components..... | 22-1 |
| 22.1.1   | Repository Recovery .....                             | 22-1 |
| 22.1.2   | Recovery Scenarios .....                              | 22-3 |
| 22.1.2.1 | Full Recovery on the Same Host .....                  | 22-3 |
| 22.1.2.2 | Incomplete Recovery on the Same Host.....             | 22-3 |
| 22.1.2.3 | Full Recovery on a Different Host.....                | 22-4 |
| 22.1.2.4 | Incomplete Recovery on a Different Host.....          | 22-4 |

|          |   |       |
|----------|---|-------|
| 22.1.3   | Recovering the OMS.....   | 22-5  |
| 22.1.4   | OMS Recovery Scenarios.....   | 22-6  |
| 22.1.4.1 | Single OMS, No Server Load Balancer (SLB), OMS Restored on the same Host.....   | 22-6  |
| 22.1.4.2 | Single OMS, No SLB, OMS Restored on a Different Host.....   | 22-8  |
| 22.1.4.3 | Single OMS, No SLB, OMS Restored on a Different Host using the Original Hostname  | 22-9  |
| 22.1.4.4 | Multiple OMS, Server Load Balancer, Primary OMS Recovered on the Same Host..  | 22-11 |
| 22.1.4.5 | Multiple OMS, Server Load Balancer configured, Primary OMS Recovered on a Different Host  | 22-13 |
| 22.1.4.6 | Multiple OMS, SLB configured, additional OMS recovered on same or different host  | 22-15 |
| 22.1.5   | Recovering Management Agents .....  | 22-15 |
| 22.1.6   | Management Agent Recovery Scenarios.....  | 22-16 |
| 22.1.6.1 | Management Agent Reinstall Using the Same Port .....  | 22-16 |
| 22.1.6.2 | Management Agent Restore from Filesystem Backup .....   | 22-16 |
| 22.2     | Recovering from a Simultaneous OMS-Management Repository Failure .....  | 22-17 |
| 22.2.1   | Collapsed Configuration: Incomplete Management Repository Recovery, Primary OMS on the Same Host  | 22-17 |
| 22.2.2   | Distributed Configuration: Incomplete Management Repository Recovery, Primary OMS and additional OMS on Different Hosts, SLB Configured | 22-17 |
| 22.3     | Switching Over or Failing Over to Standby Enterprise Manager Configurations .....   | 22-18 |
| 22.3.1   | Switchover .....  | 22-18 |
| 22.3.2   | Failover.....   | 22-20 |
| 22.3.3   | Automatic Failover to the Standby Site in a Level 4 MAA Configuration.....  | 22-22 |

## Part VII Engineered Systems Management

### 23 Discovering and Managing Exadata Targets and Systems

|        |   |       |
|--------|---|-------|
| 23.1   | Automatically Discovering an Oracle Database Machine .....    | 23-2  |
| 23.2   | Viewing the Topology of an Existing DB Machine Target .....   | 23-4  |
| 23.3   | Drilling Down to Individual Targets .....                     | 23-4  |
| 23.4   | Viewing Critical Hardware Information for the DB Machine..... | 23-5  |
| 23.5   | Viewing DB Machine Alerts.....                                | 23-5  |
| 23.6   | Adding Exadata Components Manually.....                       | 23-5  |
| 23.7   | About Oracle Exadata Storage Server.....                      | 23-6  |
| 23.7.1 | Using Exadata As a Cloud Control Target.....                  | 23-6  |
| 23.7.2 | Performing Administration Tasks on Exadata Cells .....        | 23-7  |
| 23.7.3 | Performing Administration Tasks on Infiniband Networks .....  | 23-8  |
| 23.7.4 | Launching the IORM Performance Page.....                      | 23-8  |
| 23.7.5 | Viewing an Exadata Cell Configuration.....                    | 23-9  |
| 23.7.6 | Managing a Single I/O Resource Management Allocation.....     | 23-9  |
| 23.7.7 | Accessing Oracle Support Workbench for Exadata Cell.....      | 23-10 |
| 23.7.8 | Changing the IORM Mode and Updating the IORM Objective .....  | 23-10 |

## **24 Using Oracle Exalogic Elastic Cloud**

|      |  |      |
|------|--|------|
| 24.1 | Using the Exalogic Elastic Cloud Discovery Wizard.....                       | 24-1 |
| 24.2 | Displaying and Using the Exalogic Elastic Cloud Home Page and Dashboard..... | 24-2 |
| 24.3 | Viewing Application Deployments in Exalogic Elastic Cloud Targets .....      | 24-3 |
| 24.4 | Viewing WebLogic Domains in Exalogic Elastic Cloud Targets .....             | 24-3 |
| 24.5 | Viewing Coherence Clusters in Exalogic Elastic Cloud Targets.....            | 24-4 |
| 24.6 | Viewing Hosts in Exalogic Elastic Cloud Targets.....                         | 24-5 |

## **Index**

---

---

# Preface

This guide describes how to set up a Private Cloud, manage and deploy virtualization targets with Oracle Enterprise Manager 12c Release 1.

The preface covers the following:

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

## Audience

This document is intended for cloud administrators who want to setup and manage the cloud infrastructure. It is also intended for administrators and users of the Self Service Portal.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website  
<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

### Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

# Discovering Targets

Oracle components that are managed and monitored by Cloud Control, such as an Oracle Database or an Oracle WebLogic Server domain, are known as “managed targets”.

Before a target can be managed, a Management Agent must first be installed on the host machine the target is running on. The target itself must then be assigned to a Management Agent, thereby promoting it to managed target status.

Cloud Control offers two modes for installing Management Agents to monitor and manage potential targets: Manually or using automatic target discovery.

The manual process is exactly that: You explicitly add a specific host or Oracle component as a target to bring under management.

In automatic discovery, you create an Enterprise Manager job that searches host machines for possible targets on a regularly-scheduled basis. A key benefit is that as new Oracle components are added to your infrastructure, they can be found and brought under management.

See the following sections for more information about discovering and adding new targets:

- [Configuring Automatic Discovery](#)
- [Manually Adding Targets](#)

## 1.1 Configuring Automatic Discovery

Automatic discovery refers to the process of scanning host machines for Oracle components that can be managed and monitored by Enterprise Manager Cloud Control. You can decide upon a schedule for discovery, the target types to be discovered and the hosts to scan for targets. Discovered targets can then be promoted to managed target status, enabling Enterprise Manager to manage the targets.

Once automatic discovery has been configured, you can check the Auto Discovery Results page on a periodic basis to see what new targets have been discovered.

See the following sections for instructions on using the various self-discovery options:

- [Configuring Automatic Discovery of Un-Managed Host Machines Using IP Scan](#)
- [Configuring Automatic Discovery of Targets On Managed Hosts](#)
- [Checking For and Promoting Discovered Targets](#)

### 1.1.1 Configuring Automatic Discovery of Un-Managed Host Machines Using IP Scan

In automatic host discovery, a single Management Agent is tasked to scan the entire network based on IP address ranges that you specify. It then returns a list of “un-managed” host machines - that is, host machines that do not yet have a Management Agent installed - with a list of ports in use that match the ranges you specified. The name of the service using each port is also returned.

By looking at the list of services and ports, you should be able to determine what types of Oracle components have been discovered. For example, if a host is returned with port 7001 in use, you can assume that this port is associated with an Oracle WebLogic Server domain that can be promoted to managed target status.

The next step is to deploy Management Agents to the hosts you want to promote to managed status. Once a Management Agent is deployed to the host, any Oracle components running on the host will be discovered and reported as potential targets. These components can then be promoted to managed target status, enabling them to be managed and monitored by Cloud Control.

To be most effective, automatic discovery should ideally be run by a network administrator with an overview of what Oracle components are running on what ports.

Note that because the network will be scanned, the Sudo Privilege Delegation must be set on the Management Agent host that will perform the scan. Typically you will use the Management Agent installed by default on the Oracle Management Service host that Cloud Control is running, which means you can set this privilege on the Cloud Control machine. Privileges are managed via the Manage Privilege Delegation Settings page, which is accessed by selecting **Security**, then **Privilege Delegation** from the **Setup** menu. For more information on privileges, see [Chapter 9, "Configuring Security"](#).

To discover and configure hosts using IP scan, follow these steps:

1. Log into Enterprise Manager Cloud Control.
2. From the **Setup** menu, select **Add Target**, then select **Configure Auto Discovery**.
3. Click the **Configure** icon in the Hosts and Virtual Server Discovery Using IP Scan in the Configure Auto Discovery table.
4. Click **Create**. You will not create the discover job. By default, the Name field will be populated with a title including that date and time the job was created. Note that you can edit the discovery jobs and schedule discovery to run immediately or later.
5. Click **Add**. You will now select the Management Agent that will perform the network scan. You can select the Management Agent that is installed by default on the Oracle Management Service host, or can select another Agent if desired.

Note that because the entire network will be scanned, the Sudo Privilege Delegation must be set on the Management Agent host that will perform the scan.

6. Select the agent in the IP Ranges for scan table, and enter the IP ranges to scan. You can specify any or even all of the following:
  - One or more absolute hostnames, each separated by a space; for example:  
host1.example.com host3.example.com
  - One or more IP addresses, each separated by a space

- A range of addresses; for example: 10.0.0-255.1-250. Note that IP addresses and IP ranges must be separated by a comma; for example: 10.0.0-255.1-250
- Classless Inter-Domain Routing (CIDR) notations; for example: 128.16.10.0/24

Separate each value with a space; for example:

```
host1.example.com 192.168.0.1 128.16.10.0/24
10.0.0-255.1-250,254
```

7. A default list of ports to scan within the IP ranges you specified is listed in the Configure Ports table. These are default ports typically used by the listed Oracle components.  
  
To modify the port values for a component, select the component in the table and change the values accordingly. Up to 10 ports and/or port ranges can be specified.
8. If you want to add more component ports to the list, click **Add**. Enter the name of the service to include, and specify the port(s) or port range to scan.
9. Click **Save and Submit IP Scan** when finished. The Job Details panel now opens. This is where you can specify:
  - The schedule at which the discovery job will run. Note that you can start the job immediately.
  - The credentials set on the Management Agent that will perform the scan.  
  
As noted, the Sudo Privilege Delegation must be set on the Management Agent host that will perform the scan. The named credential that will be used must be configured to run as root.
10. After the discovery job executes, you can check for discovered hosts that may contain potential targets. You can do this two ways:
  - Select the job in the Host Discovery page, then click **View Discovered Targets**;
  - or:
  - From the **Setup** menu, select **Add Target**, then select **Auto Discovery Results**.
11. Click the **Host Targets** tab. All discovered hosts are listed, with the open ports and identifiable service names shown. Based on your understanding of the Oracle components deployed on your network, you should be able to determine the types of potential targets that have been discovered.
12. Select a host in the table, then click **Promote** to promote the host to managed target status. The Add Host Targets wizard opens. You will use this wizard to install a Management Agent on the host.  
  
For instructions on installing a Management Agent, see "Installing Oracle Management Agent" in the *Enterprise Manager Cloud Control Basic Installation Guide*.
13. After the Management Agent has been successfully installed on the host, targets running on the host will be discovered as potential targets. See [Section 1.1.3, "Checking For and Promoting Discovered Targets"](#) for details on promoting targets.

## 1.1.2 Configuring Automatic Discovery of Targets On Managed Hosts

By default, automatic discovery of new Oracle targets on hosts that are already managed targets - that is, host machines that have a Management Agent installed - is

pre-configured to run on each host. Automatic target discovery is the most efficient way to discover potential targets on managed hosts, as Cloud Control can search one or more hosts for multiple types of targets at the same time.

Automatic discovery is enabled for all supported target types by default except for Oracle Fusion Middleware, which requires that a search parameter be provided.

The automatic discovery configuration is defined within a "discovery module", which you can modify to suit your requirements. You can schedule discovery to run on all hosts in the discovery module at the same interval, or can configure separate schedules for each host.

To configure automatic discovery on one or more managed hosts, follow these steps:

1. Login into Enterprise Manager Cloud Control.
2. From the **Setup** menu, select **Add Target**, then select **Configure Auto Discovery**.
3. Click the **Configure** icon in the **Multiple Target-type Discovery on Single Host** row in the Discovery table.
4. Expand **Search**, then enter the hostname for the host you want to check for targets in the Agent Host Name field. The host must have a Management Agent installed on it.
5. Click **Search**. The host will be added to the table below.
6. Select the host in the table and click **Configure**.
7. Set the schedule at which the discovery job will be run, in days. This schedule will be applied to all selected hosts. By default the job will run every 24 hours.
8. Select the Oracle component types you want to search the host for. Note that you must supply search parameters for some target types. To specify a parameter, select the target type in the Discovery Module column and click **Edit Parameters**.
  - Oracle Cluster and High Availability Service: No parameters required
  - Oracle Database, Listener and Automatic Storage Management: Specify the path to the Clusterware Home.
  - Oracle Home Discovery: No parameters required.
  - Oracle Secure Backup: No parameters required.
  - Oracle Fusion Middleware: Specify \* (the "star" character) to search all Middleware Homes, or specify the path to one or more Middleware Homes on the host, each separated by a comma.
9. Click **OK** when finished. The host has been added to the discovery module.
10. Repeat these steps for each additional host you want to add to the discovery module.
11. Click **Run Discovery Now** to discover targets immediately.

Note that the discovery job will also run at the scheduled daily interval.

12. Once targets have been discovered, you can promote them to managed status. See [Section 1.1.3, "Checking For and Promoting Discovered Targets"](#) for details on promoting targets.

### 1.1.3 Checking For and Promoting Discovered Targets

Once automatic discovery has been configured, you should check the Auto Discovery Results page on a regular basis to see what targets have been discovered. You can then promote targets to managed status.

To promote discovered targets to managed status, follow these steps:

1. Log in into Enterprise Manager.
2. After the discovery job executes, you can check for discovered hosts that may contain potential targets. You can do this two ways:
  - Select the job in the Host Discovery page, then click **View Discovered Targets**; or
  - From the **Setup** menu, select **Add Target**, then select **Auto Discovery Results**.
3. Select a target to promote, then click **Promote**. A wizard specific to the target type you are promoting opens. Supply the required values.
4. Click the **Non-Host Targets**. You can choose one or several targets to promote.
5. Note that you can optionally click **Ignore** for a discovered target, essentially marking it to be processed at a later time.

Ignored targets will be displayed in the Ignored Targets tab, and will remain in Cloud Control as un-managed targets until you decide to either promote or remove them.

6. Check the target type home page to verify that the target is promoted as an Enterprise Manager target. Once a target is successfully promoted, the Management Agent installed on the target host will begin collecting metric data on the target.

---

**Note:**

- When you promote a discovered target to managed status, the plug-in required for the target is automatically deployed to the Management Agent, which monitors the host where the target has been discovered. For the plug-in to be deployed, the Management Agent must be secure. Therefore, before promoting the discovered targets to managed status, ensure that the Management Agent is secure. You can always unsecure it after the discovered target is promoted to managed status, that is, after the required plug-in is deployed.

To verify the secure status of a Management Agent, and to secure it if required, use any one of the following methods:

- From the **Setup** menu, click **Agents**. Click the required Management Agent. Verify whether the Management Agent is secure. If it is not secure, from the **Agent** menu, click **Secure** to secure it.

- Run the following command to verify if the Management Agent is secure:

```
<EMSTATE>/bin/emctl status agent
```

If the Management Agent is secure, the Management Agent URL displayed in the output of the previous command is an HTTPS URL. However, if the Management Agent URL displayed is an HTTP URL, secure the Management Agent by running the following command:

```
<EMSTATE>/bin/emctl secure agent
```

- Enterprise Manager does not support simultaneous promotion of multiple targets. Additionally, multiple selection of database targets has been disabled to avoid a user selecting RAC databases across clusters. This is similar to the user-guided discovery feature where a user cannot discover targets across a cluster in the same session.
- 

## 1.2 Manually Adding Targets

In addition to automatic discovery, Cloud Control allows you to manually add hosts as well as a wide variety of Oracle software and components as managed targets. When you add a target manually, you do not need to go through the process of discovery by adding the target directly. Discovering targets in this way eliminates the need to consume resources on the agent to perform discovery when it is not needed.

You must be able to specify the properties of a target to be managed and create an Enterprise Manager managed target.

Not all target types can be manually added. During registration with the discovery framework, the target type owner indicates whether a target type can be manually added or not.

See the following sections for instructions:

- [Manually Adding Host Targets](#)
- [Manually Adding Non-Host Targets](#)

### 1.2.1 Manually Adding Host Targets

A wizard guides you through the process of manually deploying a Management Agent to a new host target.

For instructions on installing a Management Agent, see "Installing Oracle Management Agent" in the *Enterprise Manager Cloud Control Basic Installation Guide*.

### 1.2.2 Manually Adding Non-Host Targets

A configuration page or wizard based on target type metadata listing all the instance properties required to manage target is displayed.

You can specify a name for the target and provide the required configuration information.

To add targets manually to Enterprise Manager, follow these steps:

1. Log in into Enterprise Manager.
2. From the **Setup**, select **Add Target**, then select **Add Targets Manually** from the drop-down menus. Enterprise Manager displays the Add Targets Manually page.
3. Under the Add Targets Manually page, go to the Add Targets Manually sub-section and choose an option:
  - **Add Non-Host Targets Using Guided Process**  
Choose one of the target types to add, such as **Oracle Cluster and High Availability Service**, **Oracle Database Machine**, or **WebLogic Domain Discovery**. This process will also add related targets.
  - **Add Non-Host Targets by Specifying Target Monitoring Properties**  
Choose one of the target types to add, such as **Fusion J2EE Application**, **Applications Utilities**, or **Supplier Portal**.
4. After you select the target type, you will follow a wizard specific to the target type to add the target.

Upon confirmation, the target becomes a managed target in Enterprise Manager. Enterprise Manager simply accepts the information, performs validation of the supplied data where possible and starts monitoring the target.

---

**Note:** When you manually add a non-host target to Enterprise Manager, the plug-in required for the target is automatically deployed to the Management Agent, which monitors the host where the non-host target exists. For the plug-in to be deployed, the Management Agent must be secure. Therefore, before manually adding a non-host target to Enterprise Manager, ensure that the Management Agent is secure. You can always unsecure it after the target is added to Enterprise Manager, that is, after the required plug-in is deployed.

To verify the secure status of a Management Agent, and to secure it if required, use any one of the following methods:

- From the **Setup** menu, click **Agents**. Click the required Management Agent. Verify whether the Management Agent is secure. If it is not secure, from the **Agent** menu, click **Secure** to secure it.
- Run the following command to verify if the Management Agent is secure:

```
<EMSTATE>/bin/emctl status agent
```

If the Management Agent is secure, the Management Agent URL displayed in the output of the previous command is an HTTPS URL. However, if the Management Agent URL displayed is an HTTP URL, secure the Management Agent by running the following command:

```
<EMSTATE>/bin/emctl secure agent
```

---

# Using Incident Management

Incident management allows you to monitor and resolve service disruptions quickly and efficiently.

This chapter covers the following:

- [Events, Incidents, and Problems](#)
- [Key Concepts: Events, Incidents, and Problems](#)
- [Setting Up Your Incident Management Environment](#)
- [Working with Incidents](#)
- [Advanced Topics](#)
- [Moving from Enterprise Manager 10/11g to 12c](#)

## 2.1 Events, Incidents, and Problems

Enterprise Manager Cloud Control 12c greatly expands target monitoring and management capability beyond previous releases by focusing on what is important from a broader management perspective rather than the discrete events that may point to the same underlying issue. Enterprise Manager exposes three levels of management granularity that when combined, provide complete monitoring/management coverage of your environment.

### 2.1.1 Event Management

Intuitively, you monitor for specific events in your monitored environment. An event is a significant occurrence on a managed target that typically indicates something has occurred outside normal operating conditions--they provide a uniform way to indicate that something of interest has occurred in an environment managed by Enterprise Manager.

### 2.1.2 Incident Management

You monitor and manage your Enterprise Manager environment via incidents and not discrete events (even though an incident can conceivably consist of a single event). Of all events raised within your managed environment, there is likely only a subset that you need to act on because they impact your business applications (such as a target down event). However, managing by incident also allows you to address more complex situations where the subset of events you are interested in are related and may indicate a higher level issue needs to be addressed as a single issue and not as individual events: A cluster of events by themselves may indicate a minor administrative issue, but when viewed together may signify a larger problem that can

potentially consist of events from multiple domains/layers of your monitored infrastructure.

For example, you are monitoring a host. If you want to monitor 'load' being placed on one or more hosts you might be interested in events such as CPU utilization, memory utilization, and swap utilization exceeding acceptable metric thresholds. Individually, these events may or may not indicate an issue with the host, but together, these events form an incident indicating extreme load is being placed on a monitored host.

Incidents represent the larger service disruptions that may impact your business instead of discrete events. Managing by incidents, therefore, allows you to monitor for complex operational issues that may affect multiple domains that may impact your business. These incidents typically need to be tracked, assigned to appropriate personnel, and resolved as quickly as possible. You can effectively implement a centralized monitoring that consolidates monitoring information and more effectively allocate resource across your ecosystem to resolve or prevent issues from occurring. The end result is better implementation of your business processes that in turn lead to better performance of your IT resources.

### 2.1.3 Problem Management

Problem management involves the functionality that helps track the underlying root causes of incidents. Once the immediate service disruptions represented by incidents are resolved, you can then progress to understanding and resolving the underlying root cause of the issue.

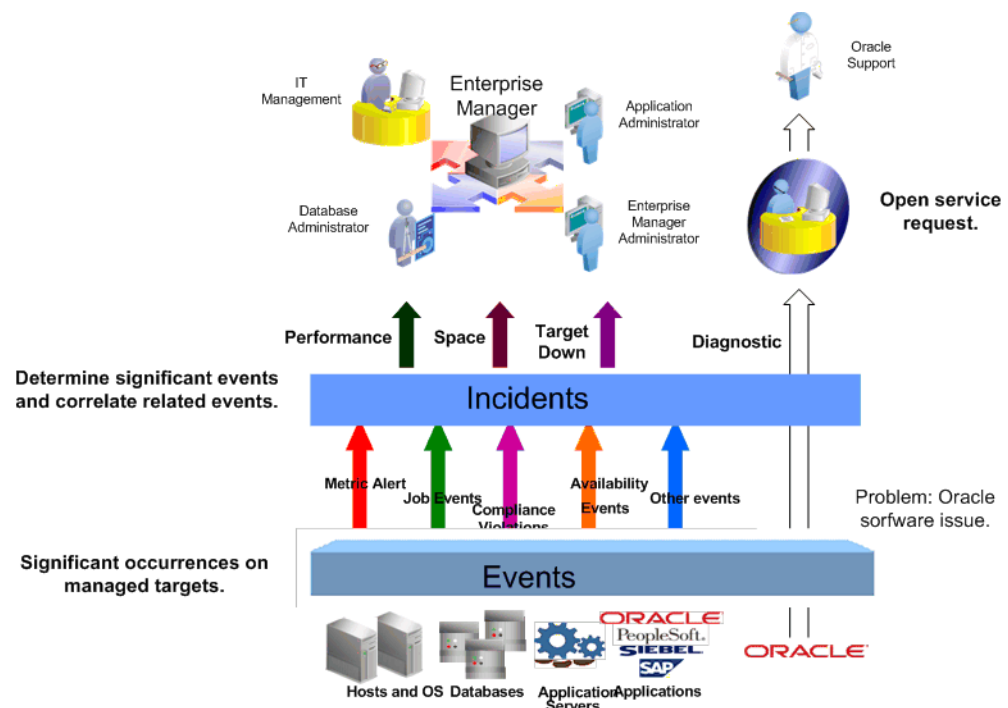

For the current release, problems pertain to the diagnostic incidents and problems stored in Automatic Diagnostic Repository (ADR), which are automatically raised by Oracle software when it encounters critical errors in the software. When problems are raised for Oracle software, Oracle has determined that the recommended recourse is to open a Service Request (SR), send support the diagnostic logs, and eventually provide a solution from Oracle. A problem represents the underlying root cause of a set of incidents. Enterprise Manager provides features to track and manage the lifecycle of a problem.

### 2.1.4 Summing Up

- **Event:** A significant occurrence of interest on a target that has been detected by Enterprise Manager.  
Goal: Ensure that your environment is monitored.
- **Incident:** A set of significant events or combination of related events that pertain to the same issue.  
Goal: Ensure that service disruptions are either avoided or resolved quickly.
- **Problems:** The underlying root cause of incidents. Currently, this represents critical errors in Oracle software that represents the underlying root cause of diagnostic incidents.  
Goal: Ensure underlying root causes of issues are resolved to avoid future occurrence of issues.

Events, incidents, and problems work in concert to allow you to manage your complete IT ecosystem both effectively and efficiently. The following illustration summarizes how they work within your managed environment.

**Figure 2–1 Event/Incident/Problem Flow**

The following sections delve into events, incidents, and problems in more detail.

### 2.1.5 Working with Events, Incidents, and Problems

Effectively managing your environment via events, incidents, and problems involves planning, setup, implementation, and finally usage. Ultimately, the goal is to manage your environment through a series of incidents that address the critical IT components of your organization that affect corporate operations and ultimately profitability.

This chapter covers operational specifics about Enterprise Manager's incident management feature. However, as part of the larger Enterprise Manager core framework, other areas of the monitoring infrastructure are involved. The following topics link off to appropriate areas of this chapter as well as other areas of Enterprise Manager documentation.

- **Setting Up Your Incident Management Environment**
  - Setting Up Your Monitoring Infrastructure
  - Setting Up Notifications
  - Setting Up Administrators and Privileges
  - Setting Up Rule Sets

  - [Additional Rule Applications](#)
  - [Event Prioritization](#)
- [Moving from Enterprise Manager 10/11g to 12c](#)

## 2.2 Key Concepts: Events, Incidents, and Problems

As discussed previously, Enterprise Manager Cloud Control 12c lets you focus on what is important from a broader monitoring/management perspective via events, incidents, and problems. This section covers these concepts in greater detail.

### 2.2.1 Events

An event is a significant occurrence on a managed target that typically indicates something has occurred outside normal operating conditions. Examples of events include: database target down, performance threshold violation, unapproved change in application configuration files, or job failure. An event can also be raised to signal successful operations or a job successfully completed.

Existing Enterprise Manager customers may be familiar with metric alerts and metric collection errors. For Enterprise Manager 12c, metric alerts are a type of event, one of many different event types. The notion of an event unifies the different exception conditions that are detected by Enterprise Manager, such as monitoring issues or compliance issues, into a common concept. It is backed by a consistent and uniform set of event management capabilities that can indicate something of interest has occurred in a datacenter managed by Enterprise Manager.

All events have the following attributes:

**Table 2–1 Event Attributes**

| Attribute                            | Description   |
|--------------------------------------|---|
| Type                                 | Type of event that is being reported. All events of a specific type share the same set of attributes that describe the exact nature of the problem. For example, Metric Alert, Compliance Standard Score Violation, or Job Status Change.     |
| Severity                             | Event severity. For example, Fatal, Warning, or Critical.   |
| Internal Name                        | An internal name that describes the nature of the event and can be used to search for events. For example, you can search for all <i>tablespacePctUsed</i> events.  |
| Entity on which the event is raised. | An event can be raised on a target, a non-target source object (such as a job) or be related to a target and a non-target source object. Note: This attribute is important when determining what privileges are required to manage the event. |

**Table 2–1 (Cont.) Event Attributes**

| Attribute     | Description   |
|---------------|---|
| Message       | Informational text associated with the event.   |
| Reported Date | Time the event was reported.  |
| Category      | Functional or operational classification for an event.<br>Available Categories: <ul style="list-style-type: none"> <li>■ Availability</li> <li>■ Business</li> <li>■ Capacity</li> <li>■ Configuration</li> <li>■ Diagnostics</li> <li>■ Error</li> <li>■ Fault</li> <li>■ Jobs</li> <li>■ Load</li> <li>■ Performance</li> <li>■ Security</li> </ul> |

### Event Types

The *type* of an event defines the structure and payload of an event and provides the details of the condition it is describing. For example, a metric alert raised by threshold violation has a specific payload whereas a job state change has a different structure. As shown in the following table, the range of events types greatly expands Enterprise Manager's monitoring flexibility.

| Event Type              | Description   |
|-------------------------|---|
| Target Availability     | The Target Availability Event represents a target's availability status (Example: Up, Down, Agent Unreachable, or Blackout).  |
| Metric Alert            | A metric alert event is generated when an alert occurs for a metric on a specific target (Example: CPU utilization for a host target) or metric on a target and object combination (Example: Space usage on a specific tablespace of a database target).  |
| Metric Evaluation Error | A metric evaluation error is generated when the collection for a specific metric group fails for a target.  |
| Job Status Change       | All changes to the status of an Enterprise Manager job are treated as events, and these events are made available via the Job Status Change event class.<br><br><b>Note:</b> A prerequisite to creating Incident Rules, is to enable the relevant job status and add required targets to job event generation criteria. To change this criteria, from the <b>Setup</b> menu, select <b>Incidents</b> , and then <b>Job Events</b> . |

| Event Type                                   | Description  |
|--|--|
| Compliance Standard Rule Violation           | Events are generated for compliance standard rule violations. Each event corresponds to a violation of a compliance rule on a specific target.   |
| Compliance Standard Score Violation          | Events are generated for compliance standard score violations. An event is generated when the compliance score for a compliance standard on a specific target falls below predefined thresholds. |
| High Availability                            | High Availability events are generated for database availability operations (shutdown and startup), database backups and Data Guard operations (switchover, failover, and other state changes).  |
| Service Level Agreement Alert                | These events are generated when a service level or service level objective is violated for a service. occurs for a Service Level Agreement or a Service Level Objective.                         |
| User-reported                                | These events are created by end-users.   |
| Application Dependency and Performance Alert | Alerts are raised by the Application Dependency and Performance (ADP) monitoring when metrics related to a J2EE application or component have crossed some thresholds.                           |
| JVM Diagnostics Threshold Violation          | A JVM Diagnostics event is raised when a JVM metric exceeds its threshold value on a Java Virtual Machine target.  |

### Event Severity

The severity of an event indicates the criticality of a specific issue. The following table shows the various event severity levels along with the associated icon.

| Icon  | Severity | Description   |
|---|----------|---|
|  | Fatal    | Corresponding service is no longer available. For example, a monitored target is down (target down event). A Fatal severity is the highest level severity and only applies to the Target Availability event type. |
|  | Critical | Immediate action is required in a particular area. The area is either not functional or indicative of imminent problems.  |
|  | Warning  | Attention is required in a particular area, but the area is still functional.   |
|  | Advisory | While the particular area does not require immediate attention, caution is recommended regarding the area's current state. This severity can be used, for example, to report Oracle best practice violations.     |
|  | Clear    | Conditions that raised the event have been resolved.  |

| Icon  | Severity      | Description   |
|---|---------------|---|
|  | Informational | <p>A specific condition has just occurred but does not require any remedial action.</p> <p>Events with an informational severity:</p> <ul style="list-style-type: none"> <li>do not appear in the incident management UI.</li> <li>cannot create incidents.</li> <li>are not stored within Enterprise Manager.</li> </ul> |

## 2.2.2 Incidents

While events indicate issues requiring attention in your managed environment, it is more efficient to work on a collective subset of related events as a single unit of work--you can work on different events representing the same issue or you can work on one incident containing multiple space-related events. For example, you have multiple space events from various targets that indicate you are running low on space. Instead of managing numerous discrete events, you can more efficiently manage a smaller set of incidents.

An incident is a significant event or set of related significant events that need to be managed because it can potentially impact your business applications. These incidents typically need to be tracked, assigned to appropriate personnel, and resolved as quickly as possible. You perform these incident management operations through Incident Manager, an intuitive UI within Enterprise Manager.

Incident Manager provides you with a central location from which to view, manage, diagnose and resolve incidents as well as identify, resolve and eliminate the root cause of disruptions. See [Section 2.2.5, "Incident Manager"](#) for more information about this UI.

### 2.2.2.1 Working with Incidents

When an incident is created, Enterprise Manager makes available a rich set of incident management workflow features that let you to manage and track the incident through its complete lifecycle.

- Assign incident ownership.
- Track the incident resolution status.
- Set incident priority.
- Set incident escalation level.
- Ability to provide a manual summary.
- Ability to add user comments.
- Ability to suppress/unsuppress
- Ability to manually clear the incident.
- Ability to create a ticket manually.

All incident management/tracking operations are carried out from Incident Manager. Creation of incidents for events, assignment of incidents to administrators, setting priority, sending notifications and other actions can be automated using (incident) rules.

**Incident Status**

The lifecycle of an incident within an organization is typically determined by two pieces of information: The current resolution state of the incident (Incident Status) and how important it is to resolve the incident relative to other incidents (Priority). As key incident attributes, the following options are available:

- New
- Work in Progress
- Closed
- Resolved

You can define additional statuses if the default options are not adequate. In addition, you can change labels using the Enterprise Manager Command Line Interface (EM CLI). See **Advanced Topics** for more information.

**Priority**

By changing the priority, you can escalate the incident and perform operations such as assigning it to a specific IT operator or notifying upper-management. The following priority options are available:

- None
- Low
- Medium
- High
- Very High
- Urgent

Priority is often based on simple business rules determined by the business impact and the urgency of resolution.

**Incident Attributes**

Every incident possesses attributes that provide information as identification, status for tracking, and ownership. The following table lists available incident attributes.

| Incident Attribute | Definition  |
|--------------------|---|
| Escalated          | <p>Escalation level signifying a escalation to raise the level of attention on the incident from your organization's IT or management hierarchy.</p> <p>Available escalation levels:</p> <ul style="list-style-type: none"><li>■ None (Not escalated)</li><li>■ Level 1 through Level 5</li></ul> |

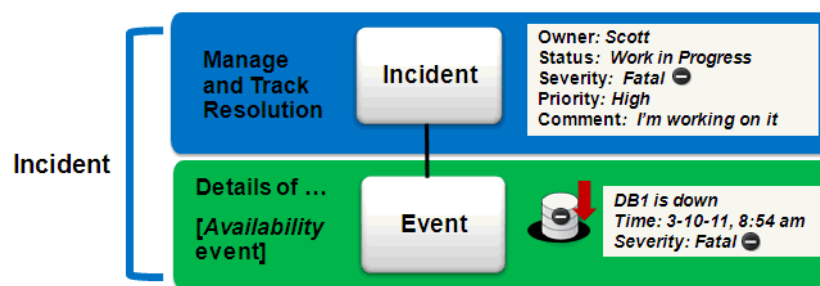

| Incident Attribute | Definition   |
|--------------------|--|
| Category           | <p>Operational or organizational classification for an incident. Incidents (and events) can have multiple categories.</p> <p>Categories for all events within an incident are aggregated.</p> <p>Available Categories:</p> <ul style="list-style-type: none"> <li>■ Availability</li> <li>■ Business</li> <li>■ Capacity</li> <li>■ Configuration</li> <li>■ Diagnostics</li> <li>■ Error</li> <li>■ Fault</li> <li>■ Jobs</li> <li>■ Load</li> <li>■ Performance</li> <li>■ Security</li> </ul> |
| Summary            | An intuitive message indicating what the incident is about. By default, the incident summary is pulled from the message of the last event of the incident, however, this message can be changed to a fixed summary by any administrator working on the incident.   |
| Incident Created   | Date and time the incident was created.  |
| Last Updated       | Date and time the incident was last updated or when the incident was closed.   |
| Severity           | Severity is based on the worst severity of the events in the incident. For example, Fatal, Warning, or Critical.   |
| Source             | Source entities of the incident.   |
| Priority           | <p>Priority Values</p> <ul style="list-style-type: none"> <li>■ None (Default)</li> <li>■ Low</li> <li>■ Medium</li> <li>■ High</li> <li>■ Very High</li> <li>■ Urgent</li> </ul>  |
| Status             | <p>Incident Status.</p> <ul style="list-style-type: none"> <li>■ New (Default)</li> <li>■ Work in Progress</li> <li>■ Closed (Terminal state when the incident is closed.)</li> <li>■ Resolved</li> </ul> <p>You can define additional statuses if the default options are not adequate. In addition, you can change labels using the Enterprise Manager Command Line Interface (EM CLI).</p>  |
| Comment            | Annotations added by an administrator to communicate analysis information or actions taken to resolve the incident.  |
| Owner              | Administrator/user currently working on the incident.  |

| Incident Attribute | Definition   |
|--------------------|--|
| Acknowledged       | <p>Indicates that a user has accepted ownership of an incident or problem. Available options: Yes or No.</p> <p>When an incident is acknowledged, it will be implicitly assigned to the user who acknowledged it. When a user assigns an incident to himself, it is considered 'acknowledged'. Once acknowledged, an incident cannot be unacknowledged, but can be assigned to another user. Acknowledging an incident stops any repeat notifications for that incident.</p> |

### 2.2.2.2 Incident Composed of a Single Event

The simplest incident is composed of a single event. In the following example, you are concerned whenever any production target is down. You can create an incident for the target down event which is raised by Enterprise Manager if it detects the monitored target is down. Once the incident is created, you will have available all incident management functionality required to track and manage its resolution.

**Figure 2–2 Incident with a Single Event**

The figure shows how both the incident and event attributes are used to help you manage the incident. From the figure, we see that the database DB1 has gone down and an event of Fatal severity has been raised. When the event is newly generated, there is no ownership or status. An incident is opened that can be updated manually or by automated rules to set owners, status, as well as other attributes. In the example, the owner/administrator Scott is currently working to resolve the issue.

The incident severity is currently Fatal as the incident inherits the worst severity of all the events within incident. In this case there is only one event associated with the incident so the severity is Fatal.

### 2.2.2.3 Incident Composed of Multiple Events

Situations of interest may involve more than a single event. It is an incident's ability to contain multiple events that allows you to monitor and manage complex and more meaningful issues.

---

**Note:** Multi-event incidents are not automatically generated. An administrator must manually create them.

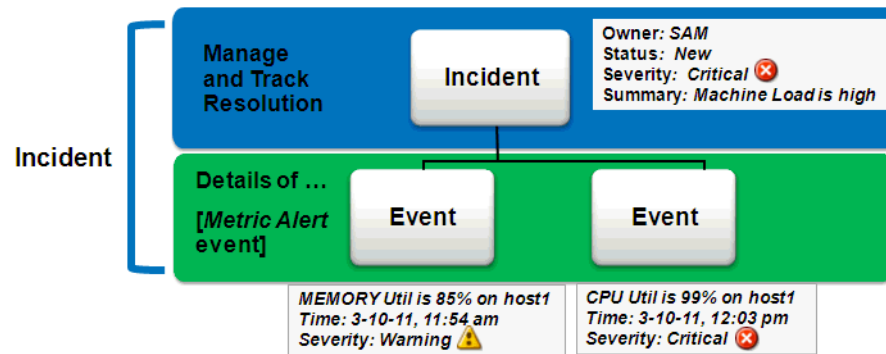

---

For example, if a monitored system is running out of space, separate multiple events such as *tablespace full* and *filesystem full* may be raised. Both, however, are related to

running out of space. Another machine resource monitoring example might be the simultaneous raising of CPU utilization, memory utilization, and swap utilization events. Together, these events form an incident indicating extreme load is being placed on a monitored host. The following figure illustrates this example.

**Figure 2–3 Incident with Multiple Events**

Incidents inherit the worst severity of all the events within incident. The incident summary indicates why this incident should be of interest, in this case, "Machine Load is high". This message is an intuitive indicator for all administrators looking at this incident. By default, the incident summary is pulled from the message of the last event of the incident, however, this message can be changed by any administrator working on the incident.

Because administrators are interested in overall machine load, administrator Sam has manually created an incident for these two metric events because they are related—together these events represent a host overload situation. An administrator needs to take action because memory is filling up and consumed CPU resource is too high. In its current state, this condition will impact any applications running on the host.

#### 2.2.2.4 How are Incidents Created?

Incidents are most commonly created automatically through rules and rule sets—user-defined instructions that tell Incident Manager how to handle specific events when they occur. As shown in the preceding examples, incidents can also be created manually. Once an incident is raised, its severity is inherited from the worst severity of all events within the incident. The latest event *Message*, by default, becomes the *Incident Summary*.

### 2.2.3 Problems

For Enterprise Manager 12c, problems focus on the diagnostic incidents and problem diagnostic incidents/problems stored in Advanced Diagnostic Repository (ADR), which are automatically raised by Oracle software when it encounters critical errors in the software. A problem, therefore, represents the root cause of all the Oracle software incidents. For these diagnostic incidents, in order to address root cause, a problem is created that represents the root cause of these diagnostic incidents. A problem is identified by a *problem key* which uniquely identifies the particular error in software. Each occurrence of this error results in a diagnostic incident which is then associated with the problem object.

When a problem is raised for Oracle software, Oracle has determined that the recommended recourse is to open a service request (SR), send support the diagnostic logs, and eventually provide a solution from Oracle. As an incident, Enterprise Manager makes available all tracking, diagnostic, and reporting functions for problem management. Whenever you view all open incidents and problems, whether you are using Incident Manager, or in context of a target/group home page, you can easily determine what issues are actually affecting your monitored target.

To manage problems, you can use Support Workbench to package the diagnostic details gathered in ADR and open SR. Users should then manage the problems in Incident Manager. Access to Support Workbench functionality is available through Incident Manager (**Guided Resolution** area) in context of the problem.

## 2.2.4 Rule Sets

Incident rules and rule sets automate actions related to events, incidents and problems. They can automate the creation of incidents based on important events, perform notification actions such as sending e-mail or opening helpdesk tickets, or perform operations to manage the incident workflow lifecycle such as changing incident ownership, priority, or escalation level.

With previous versions of Enterprise Manager, you used notification rules to choose the individual targets and conditions for which you want to perform actions or receive notifications (send e-mail, page, open a helpdesk ticket) from Enterprise Manager. For Enterprise Manager 12c, the concept and function of notification rules has been replaced with incident rules and rule sets.

- **Rules:** A rule instructs Enterprise Manager to take specific actions when incidents, events, or problems occur, such as performing notifications. Beyond notifications, rules can also instruct Enterprise Manager to perform specific actions, such as creating incidents, updating incidents and problems. The actions can also be conditional in nature. For example, a rule action can be defined to page a user when an incident severity is critical or just send e-mail if it is warning.
- **Rule Set:** An incident ruleset is a collection of rules that apply to a common set of objects such as targets (hosts, databases, groups), jobs, metric extensions, or self updates and take appropriate actions to automate the business processes underlying event, incident and problem management.

Operationally, individual rules within a rule set are executed in a specified order as are the rule sets themselves. Rule sets are executed in a specified order. By default, the execution order for both rules and rule sets is the order in which they are created, but they can be reordered from the Incident Rules UI.

The following figure shows typical rule set structure and how the individual rules are applied to a heterogeneous group of targets.

**Figure 2–4 Rule Set Application****Example:**

- Group **PROD-GROUP** consists of hosts, databases, WebLogic servers
- Create one ruleset for group **PROD-GROUP**

**RULE SET**

Rule Set: *Rule Set for PROD-GROUP*  
 Applies to: *PROD-GROUP*  
 Type: *Enterprise*

**RULE#1: Target down rule**

**Criteria:** *DB and WLS down availability event*  
**Action:** *Create incident, Set Priority = High*

**RULE#2: Email and Pager rule**

**Criteria:** *All Incidents with severity= Fatal, Critical or Warning*  
**Action#1:** *If severity = Warning, email*  
**Action#2:** *If severity = Fatal or Critical, page*

The graphic illustrates a situation where all rules pertaining to a group of targets can be put into a single rule set (this is also a best practice). In the above example, a group named *PROD-GROUP* consists of hosts, databases, and WebLogic servers exists as part of a company's managed environment. A single rule set is created to manage the group.

In addition to the actual rules contained within a rule set, a rule set possesses the following attributes:

- **Name:** A descriptive name for the rule set.
- **Description:** Brief description stating the purpose of the rule set.
- **Applies To:** Object to which all rules in the rule set apply: Valid rule set objects are targets, jobs, metric extensions, and self update.
- **Owner:** The Enterprise Manager user who created the rule set. Rule set owners have the ability to update or delete the rule set and the rules in the rule set.
- **Enabled:** Whether or not the rule set is actively being applied.
- **Type:** Enterprise or Private. See "[Rule Set Types](#)" on page 2-14

**2.2.4.1 Out-of-Box Rule Sets**

Enterprise Manager provides out-of-box rule sets for incident creation, event clearing based on typical scenarios. Out-of-box rule sets cannot be edited or deleted. As a best practice, you should create your own copies of out-of-box rule sets and then subscribe to the rule set copies rather than subscribing directly to the out-of-box rule sets. Changes to out-of-box rule set definitions and the actions they perform can be made by Oracle at any time and will be applied during patching or software upgrade.

Regular Enterprise Manager administrators are allowed to perform the following operations on rule sets:

- Subscribe
- Unsubscribe

---

---

**Note:** Even though administrators can subscribe to a rule set, they will only receive notification from the targets for which they have at least the View Target privilege.

---

---

Enterprise Manager Super Administrators have the added ability to reorder the rule sets. Enterprise rule sets are evaluated sequentially. For example, when a new event, incident, or problem arises, the first rule set in the list is checked to see if any of its member rules apply and appropriate actions specified in those rules are taken. The second rule is then checked to see if its rules apply and so on. Private rule sets are only evaluated once all enterprise rule set evaluations are complete and in no particular order.

---

---

**Important:** Use caution when reordering rule sets as their order defines the event, incident, and problem handling workflow. Reordering rule sets without fully understanding the impact on your system can result in unintended actions being taken on incoming events, incidents, and problems.

---

---

#### 2.2.4.2 Rule Set Types

There are two types of Rule Sets:

- **Enterprise:** Used to implement all operational practices within your IT organization. All supported actions are available for this type of rule set. However, because this type of rule set can perform all actions, there are restrictions as to who can create an enterprise rule set.

In order to create or edit an enterprise rule set, an administrator must have been granted the *Create Enterprise Rule Set* privilege on the *Enterprise Rule Set* resource. However, if the rule set owner loses the *Create Enterprise Rule Set* system privilege at some future time, he can still edit or delete the rule set. Super Administrators can edit or delete any rule set.

If the originator of the rule set wants other administrators to edit the rule set, he will need to share access in order to work collaboratively by adding co-authors. Enterprise rule sets are visible to all administrators.

- **Private:** Used when an administrator wants to be notified about something he is monitoring but not as a standard business practice. The only action a private rule set can perform is to send e-mail to the rule set owner. Any administrator can create a private rule set regardless of whether they have been granted the *Create Enterprise Rule Set* resource privilege. Oracle recommends that private rule sets be used only in rare or exceptional situations.

---

---

**Important:** When a rule set performs actions, the privileges of the rule set creator are used. For example, a rule set owner/creator must have at least View Target privilege in order to receive notifications and at least Manage Target Events privilege in order to update the incident.

---

---

#### 2.2.4.3 Rules

Rules are instructions within a rule set that automate actions on incoming events or incidents or problems. Because rules operate on *incoming* incidents/events/problems,

if you create a new rule, it will not act retroactively on incidents/events/problems that have already occurred.

Every rule is composed of two parts:

- **Criteria:** The events/incidents/problems on which the rule applies.
- **Action(s):** The ordered set of one or more operations on the specified events, incidents, or problems. Each action can be executed based on additional conditions.

The following table shows how rule criteria and actions determine rule application. In this rule operation example there are three rules which take actions on selected events and incidents. Within a ruleset, rules are executed in a specified order. The rule execution order can be changed at any time. By default, rules are executed in the order they are created.

**Table 2–2 Rule Operation**

| Rule Name | Execution Order | Criteria  | Action                 |                           |
|-----------|-----------------|---|------------------------|---------------------------|
|           |                 |   | Condition              | Actions                   |
| Rule 1    | First           | CPU Util(%), Tablespace Used(%) metric alert events of warning or critical severity |                        | Create incident.          |
| Rule 2    | Second          | Incidents of warning or critical severity   | If severity = critical | Notify by page            |
|           |                 |   | If severity =warning   | Notify by e-mail          |
| Rule 3    | Third           | Incidents are unacknowledged for more than six hours                                |                        | Set escalation level to 1 |

In the rule operation example, *Rule 1* applies to two metric alert events: *CPU Utilization* and *Tablespace Used*. Whenever these events reach either Warning or Critical severity threshold levels, an incident is created.

When the incident severity level (the incident severity is inherited from the worst event severity) reaches Warning, *Rule 2* is applied according to its first condition and Enterprise Manager sends an e-mail to the administrator. If the incident severity level reaches Critical, *Rule 2*'s second condition is applied and Enterprise Manager sends a page to the administrator.

If the incident remains open for more than six hours, *Rule 3* applies and the incident escalation level is increased from None to Level 1.

**2.2.4.3.1 Rule Application** Each rule within a rule set applies to an event, incident OR problem. For each of these, you can choose rule application criteria such as:

- Apply the rule to incoming events or updated events only
- Apply the rule to critical events only.

Rules are applied to events, incidents, and problems according to criteria selected at the time of rule creation (or update). The following situations illustrate the methodology used to apply rules.

- If one of the rules creates an new incident in response to an incoming event, Enterprise Manager finishes matching the event to any further rules/rule sets.

Once completed, Enterprise Manager then matches the newly created incident to all the rule sets from the beginning to see if any incident-specific rules match.

- If an incoming event is already associated with an incident (for example, a *Warning* event creates an incident and then a *Critical* event is generated for the same issue), Enterprise Manager applies all the matching rules to the event and then matches all rules to the incident.
- If, while applying a rule to an incident, changes are made to the incident (change priority, for example), Enterprise Manager stops rule application at that point and then re-applies the rules to the incident from the beginning. The conditional action that updated the incident will not be matched again in the same rule application cycle.

#### 2.2.4.3.2 Rule Criteria

The following tables list selectable criteria for each type.

**Table 2–3 Rule Criteria: Events**

| Criteria                         | Description   |
|----------------------------------|---|
| Type                             | Rule applies to a specific event type.  |
| Severity                         | Rule applies to a specific event severity.  |
| Category                         | Rule applies to a specific event category.  |
| Target type                      | Rule applies to a specific target type.   |
| Target Lifecycle Status          | Rule applies to a specific lifecycle status for a target. Lifecycle status is a target property that specifies a target's operational status.   |
| Associated with incident         | Typically, events are associated with incidents through rules. Specify Yes or No.   |
| Event name                       | Rule applies to events with a specific name. The specified name can either be an exact match or a pattern match.  |
| Root cause analysis result       | Upon completion of Root Cause Analysis (RCA) event, the rule applies to the event that is marked either as root cause or symptom. Alternatively, the rule can act on an RCA event when it is no longer a symptom. |
| Associated incident acknowledged | Rule applies to an event that is associated with a specific incident when that incident is acknowledged by an administrator. Specify Yes or No.   |
| Total occurrence count           | For duplicated events, the rule is applied when the total number of event occurrences reaches a specified number.   |
| Comment added                    | Rule applies to events where an administrator adds a comment.   |

For incidents, a rule can apply to all new and/or updated incidents, or newly created incidents that match specific criteria shown in the following table.

**Table 2–4 Rule Criteria: Incidents**

| Criteria                         | Description  |
|----------------------------------|--|
| Rules that created the incidence | Rule applies to incidents raised by a specific rule. |
| Category                         | Rule applies to a specific incident category.        |
| Target Type                      | Rule applies to a specific target type.              |

**Table 2–4 (Cont.) Rule Criteria: Incidents**

| Criteria                        | Description  |
|---------------------------------|--|
| Target Lifecycle Status         | Rule applies to a specific lifecycle status for a target. Lifecycle status is a target property that specifies a target's operational status.              |
| Severity                        | Rule applies to a specific incident severity.  |
| Acknowledged                    | Rule applies if the incident has been acknowledged by an administrator. Specify Yes or No.   |
| Owner                           | Rule applies for a specified incident owner.   |
| Priority                        | Rule applies when incident priority matches a selected priority.   |
| Status                          | Rule applies when the incident status matches a selected incident status.  |
| Escalation Level                | Rule applies when the incident escalation level matches the selected level. Available escalation levels: None, Level 1, Level 2, Level 3, Level 4, Level 5 |
| Associated with Ticket          | Rule applies when the incident is associated with a helpdesk ticket. Specify Yes or No.  |
| Associated with Service Request | Rule applies when the incident is associated with a service request. Specify Yes or No.  |
| Diagnostic Incident             | Rule applies when the incident is a diagnostic incident. Specify Yes or No.  |
| Unassigned                      | Rule applies if the newly raised incident does not have an owner.  |
| Comment Added                   | Rule applies if an administrator adds a comment to the incident.   |

For problems, a rule can apply to all new and/or updated problems, or newly created problems that match specific criteria shown in the following table.

**Table 2–5 Rule Criteria: Problems**

| Criteria                | Description  |
|-------------------------|--|
| Problem key             | Each problem has a problem key, which is a text string that describes the problem. It includes an error code (such as ORA 600) and in some cases, one or more error parameters.<br><br>Rule can apply to a specific problem key or a key matching a specific pattern (using a wildcard character). |
| Category                | Rule applies to a specific problem category.   |
| Target Type             | Rule applies to a specific target type.  |
| Target Lifecycle Status | Rule applies to a specific lifecycle status for a target. Lifecycle status is a target property that specifies a target's operational status.  |
| Acknowledged            | Rule applies when the problem is acknowledged.   |
| Owner                   | Rule applies for a specified problem owner.  |
| Priority                | Rule applies when problem priority matches a selected priority.  |
| Status                  | Rule applies when the problems matches a specific status.  |

**Table 2–5 (Cont.) Rule Criteria: Problems**

| Criteria                        | Description   |
|---------------------------------|---|
| Escalation Level                | Rule applies when the problem escalation level matches the selected level. Available escalation levels: None, Level 1, Level 2, Level 3, Level 4, Level 5                 |
| Incident Count                  | Rule applies when the number of incidents related to the problem reaches the specified count limit. The problem owner and the Operations manager are notified via e-mail. |
| Associated with Service Request | Rule applies if the incoming problem is has an associated Service Request. Specify Yes or No.   |
| Associated with Bug             | Rule applies if the incoming problem is has an associated bug. Specify Yes or No.   |
| Unassigned                      | Rule applies if the newly raised incident does not have an owner.   |
| Comment Added                   | Rule applies if an administrator adds a comment to the problem.   |

**2.2.4.3.3 Rule Actions** For each rule, Enterprise Manager allows you to define specific actions.

Some examples of the types of actions that a rule set can perform are:

- Create an incident based on an event.
- Perform notification actions such as sending an e-mail or generating a helpdesk ticket.
- Perform actions to manage incident workflow notification via e-mail/PL/SQL methods/ SNMP traps. For example, if a target down event occurs, create an incident and e-mail administrator Joe about the incident. If the incident is still open after two days, set the escalation level to one and e-mail Joe's manager.

The following table summarizes available actions for each rule application.

**Table 2–6 Available Rule Actions**

| Action                  | Event | Incident | Problem |
|-------------------------|-------|----------|---------|
| E-mail                  | Yes   | Yes      | Yes     |
| Page                    | Yes   | Yes      | Yes     |
| Advanced Notifications  |       |          |         |
| Send SNMP Trap          | Yes   | No       | No      |
| Run OS Command          | Yes   | Yes      | Yes     |
| Run PL/SQL Procedure    | Yes   | Yes      | Yes     |
| Create an Incident      | Yes   | No       | No      |
| Set Workflow Attributes | Yes   | Yes      | Yes     |

Note: Within an event rule, the workflow attributes of the associated incident can also be updated.

**Table 2–6 (Cont.) Available Rule Actions**

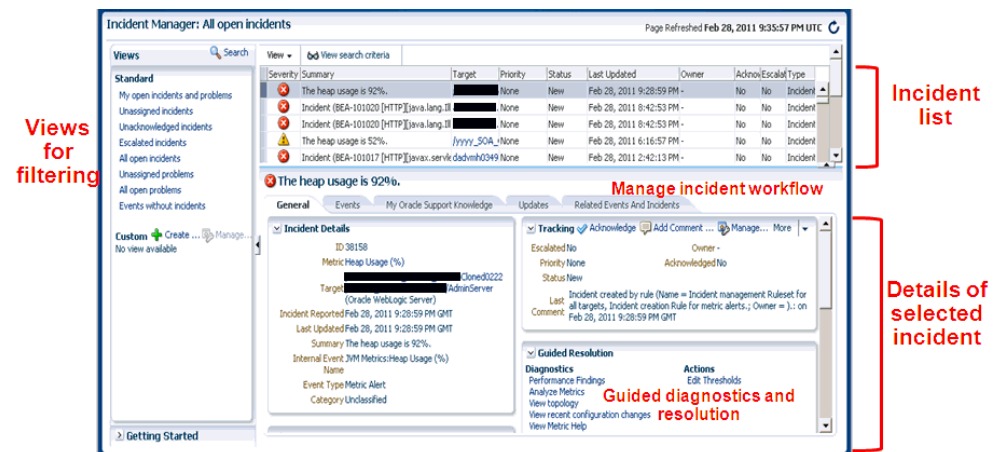

| Action                   | Event | Incident | Problem |
|--------------------------|-------|----------|---------|
| Create a Helpdesk Ticket | Yes   | Yes      | No      |

Note: Action performed indirectly by first creating an incident and then creating a ticket for the incident.

## 2.2.5 Incident Manager

Incident Manager provides, in one location, the ability to search, view, manage, and resolve incidents and problems impacting your environment. Use Incident Manager to perform the following tasks:

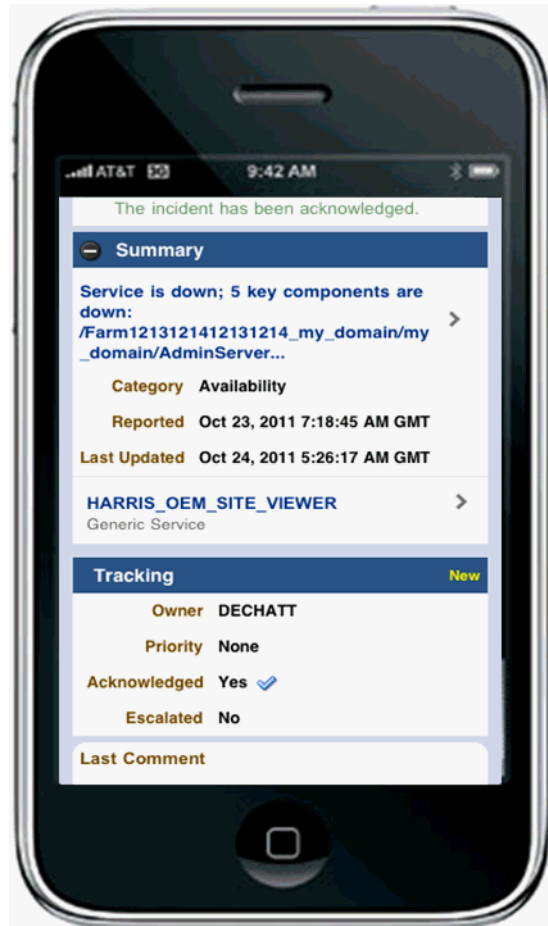

- Filter incidents, problems, and events by using custom views
- Respond and work on an incident
- Manage incident lifecycle including assigning, acknowledging, tracking its status, prioritization, and escalation
- Access (in context) My Oracle Support knowledge base articles and other Oracle documentation to help resolve the incident.
- Access direct in-context diagnostic/action links to relevant Enterprise Manager functionality allowing you to quickly diagnose or resolve the incident.

**Figure 2–5 incident Manager**

For example, you have an open incident. You can use Incident Manager to track its ownership, its resolution status, set the priority and, if necessary, add annotations to the incident to share information with others when working in a collaborative environment. In addition, you have direct access to pertinent information from MOS and links to other areas of Enterprise Manager that will help you resolve issues quickly. By drilling down on an open incident, you can access this information and modify it accordingly.

Also available is the mobile application Cloud Control Mobile, which lets you manage incidents and problems on the go using any iDevice to remotely connect to Enterprise Manager.

**Figure 2–6 Cloud Control Mobile**

For more information about this mobile application, see [Chapter 11, "Cloud Control Mobile"](#)

### 2.2.5.1 Views

Views let you work efficiently with incidents by allowing you to categorize and focus on only those incidents of interest. A view is a set of search criteria for filtering incidents and problems in the system. Incident Manager provides a set of predefined *standard* views that cover the most common event, incident, and problem search scenarios. In addition, Incident Manager also allows you to create your own custom views. Custom views cannot be shared with other users. For instructions on creating custom views, see [Setting Up Custom Views](#).

## 2.3 Setting Up Your Incident Management Environment

Before you can monitor and manage your environment using incidents, you must ensure that your monitoring environment is properly configured. Proper configuration consists of the following:

- [Setting Up Your Monitoring Infrastructure](#)
- [Setting Up Notifications](#)
- [Setting Up Administrators and Privileges](#)

## 2.3.1 Setting Up Your Monitoring Infrastructure

The first step in setting up your monitoring infrastructure is to determine which conditions need to be monitored and hence are the source of events. To prevent an inordinate number of extraneous events from being generated, thus reducing system and administrator overhead, you need to determine what is of interest to you and enable monitoring based on your requirements. You can leverage Enterprise Manager features such as Administrations Groups to automatically apply management settings such as monitoring settings or compliance standards when new targets are added to your monitored environment. This greatly simplifies the task of ensuring that events are raised only for those conditions in which you are interested. For more information, see [Chapter 5, "Administration Groups"](#).

**Example:** You want to ensure that the database containing your human resource information is available round the clock. One condition you are monitoring for is whether that database target is up or down. If it goes down, you want the appropriate person to be notified and have them resolve the problem as quickly as possible. Other conditions that you may want to monitor include performance threshold violations, any changes in application configuration files, or job failures. Working with events, you are monitoring and managing individual targets and issues directly related to those targets. For example, you monitor for individual database availability, individual host threshold violations such as CPU and I/O load, or perhaps the performance of a Web service.

In general, if you are primarily interested in availability and some key performance related metrics, you should use default monitoring templates and other template features to ensure the only those specific metrics are collected and events are raised only for those metrics.

**Job Events:** The status of a job can change throughout its lifecycle - from the time it is submitted to the time it has executed. For each of these job statuses, events can be raised to notify administrators of the status of the job.

As a general rule, events should be generated only for job status values that require administration attention. These job status values include Action Required and Problem status values such as Failed or Stopped. However, in order to avoid overloading the system with unnecessary events, job events are not enabled for any target by default. Hence, if you would like to generate events for jobs, you must

1. Set the appropriate job status. You can use the default settings or modify them as required.
2. Specify the set of targets for which you would like job-related events to be generated.

You can perform these operations from the *Job Event Generation Criteria* page. From the **Setup** menu, choose **Incidents** and then **Job Events**.

### 2.3.1.1 Rule Set Development

Before creating incident rules/rule sets, the first step is to strategically determine when incidents should be created based on the business requirements of your organization. Important questions to consider are:

1. What events should create incidents? Which service disruptions need to be tracked and resolved by IT administrators?
2. Which administrators should be notified for incoming events or incidents?
3. Are any of the events or incidents being forwarded to external systems (such as a helpdesk ticketing system) ?

Once the exact business requirements are understood, you translate those into enterprise rule sets. Adhering to the following guidelines will result in efficient use of system resource as well as operational efficiency.

- For rule sets that operate on targets (for example, hosts and databases), use groups to consolidate targets into a smaller number of monitoring entities for the rule set. Groups should be composed of targets that have similar monitoring requirements including incident management and response.
- All the rules that apply to the same groups of targets should be consolidated into one rule set. You can create multiple rules that apply to the targets in the rule set. You can create rules for events specific to an event class, rules that apply to events of a specific event class and target type, or rules that apply to incidents on these targets.
- Leverage the execution order of rules within the rule set. Rule sets and rules within a rule set are executed in sequential order. Therefore, ensure that rules and rulesets are sequenced with that in mind.

When creating a new rule, you are given a choice as to what object the rule will apply— events, incidents or problems. Use the following rule usage guidelines to help guide your selection.

**Table 2–7 Rule Usage Guidelines**

| Rule Usage         | Application  |
|--------------------|--|
| Rules on Event     | <p>To create incidents for the events managed in Enterprise Manager.</p> <p>To send notifications on events.</p> <p>To create tickets for incidents managed by helpdesk analysts , you want to create an incident for an event, then create a ticket for the incident.</p> <p>Send events to third-party management systems.</p> |
| Rules on Incidents | <p>Automate management of incident workflow operations (assign owner, set priority, escalation levels..) and send notifications</p> <p>Create tickets based on incident conditions. For example, create a ticket if the incident is escalated to level 2.</p>  |
| Rules on Problems  | <p>Automate management of problem workflow operations (assign owner, set priority, escalation levels..) and send notifications</p>   |

### Rule Set Example

The following example illustrates many of the implementation guidelines just discussed. All targets have been consolidated into a single group, all rules that apply to group members are part of the same rule set, and the execution order of the rules has been set. In this example, the rule set applies to a group (Production Group G) that consists of the following targets:

- DB1 (database)
- Host1 (host)

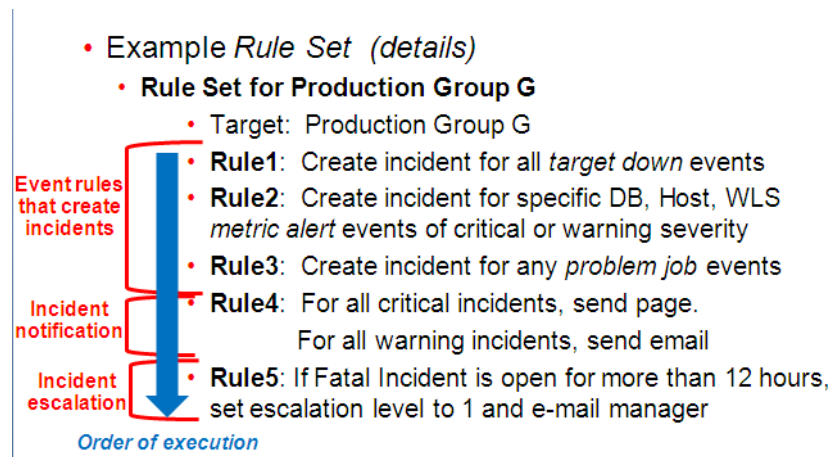

- WLS1 (WebLogic Server)

All rules in the rule set perform three types of actions: incident creation, notification, and escalation.

- **Example Rule Set:**

- Rule set applies to target: Group target G
- Rules in the *rule set*:
  1. Rule(s) to create incidents for specified events
  2. Rule(s) that send notifications on the incidents
  3. Rule(s) that escalate incidents based on some condition (e.g. length of time incident is open)

In a more detailed view of the rule set, we can see how the guidelines have been followed.

In this detailed view, there are five rules that apply to all group members. The execution sequence of the rules (rule 1 - rule 5) has been leveraged to correspond to the three types of rule actions in the rule set: Rules 1-3

- Rules 1-3: Incident Creation
- Rule 4: Notification
- Rule 5: Escalation

By synchronizing rule execution order with the progression of rule action categories, execution efficiency is achieved. As shown in this example, by using conditional actions that take different actions for the same set of events based on severity, it is easier to change the event selection criteria in the future without having to change multiple rules. **Note:** This assumes that the action requirements for all incidents (from rules 1 - 3) are the same.

The following table illustrates explicit rule set operation for this example.

**Table 2–8 Example Rule Set for Production Group G**

| Rule Name                                   | Execution Order | Criteria   | Action                                      |                                 |
|---|-----------------|--|---|---------------------------------|
|   |                 |  | Condition                                   | Actions                         |
| Rule Set: Targets within Production Group G |                 |  |   |                                 |
| Rule 1                                      | First           | DB1 goes down .<br>Host1 goes down.<br>WLS1 goes down.   |   | Create incident.                |
| Rule 2                                      | Second          | <b>DB1</b><br>Tablespace Full (%)<br>Note: The warning and critical thresholds are defined in Metric and Policy settings, not from the rules UI.<br><b>Host1</b><br>CPU Utilization (%)<br><b>WLS1</b><br>Heap Usage (%) | If severity=Warning<br>If severity=Critical | Create incident.                |
| Rule 3                                      | Third           | Event generated for problem job status changes for DB1, Host1, and WLS1.   |   | Create incident.                |
| Rule 4                                      | Fourth          | All incidents for Production Group G   | Severity=Warning<br>Severity=Critical       | Send e-mail<br>Send page        |
| Rule 5                                      | Fifth           | Incident remains open for more than 12 days.   | Status=Fatal                                | Increase escalation level to 1. |

**2.3.1.1.1 Before Using Rules** Before you use rules, ensure the following prerequisites have been set up:

- User's Enterprise Manager account has notification preferences (e-mail and schedule). This is required not just for the administrator who is creating/editing a rule, but also for any user who is being notified as a result of the rule action.
- If you decide to use connectors, tickets, or advanced notifications, you need to configure them before using them in the actions page.
- Ensure that the SMTP gateway has been properly configured to send e-mail notifications.
- User's Enterprise Manager account has been granted the appropriate privileges to manage incidents from his managed system.

## 2.3.2 Setting Up Notifications

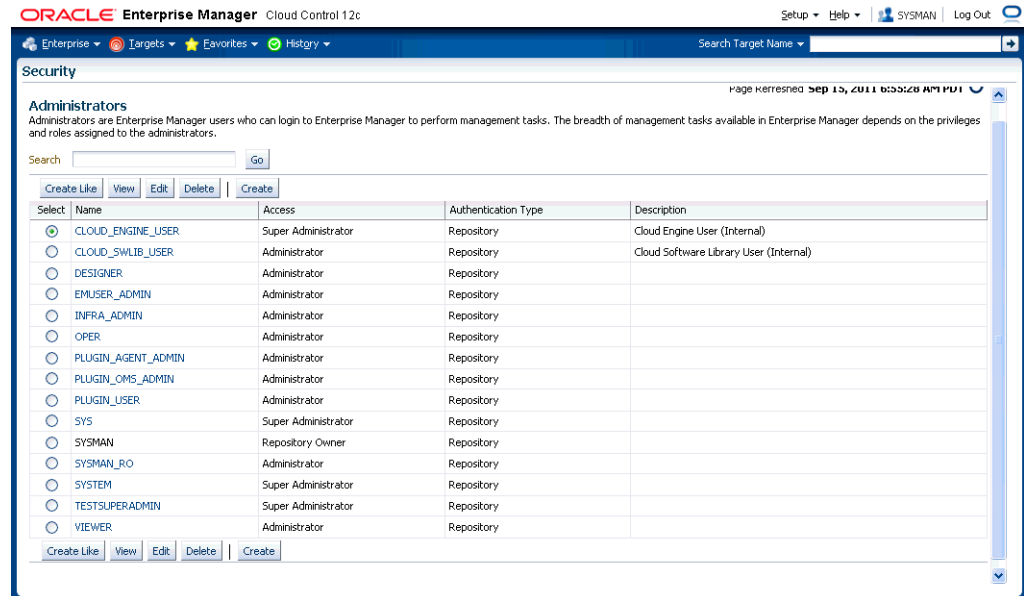

After determining which events should be raised for your monitoring environment, you need to establish a comprehensive notification infrastructure for your enterprise by configuring Enterprise Manager to send out e-mail and or pages, setting up e-mail addresses for administrators and tagging them as e-mail/paging. In addition, depending on the needs of your organization, notification setup may involve configuring advanced notification methods such as OS scripts, PL/SQL procedures, or

SNMP traps. For detailed information and setup instructions for Enterprise Manager notifications, see [Chapter 3, "Notifications"](#).

### 2.3.3 Setting Up Administrators and Privileges

This step involves defining the appropriate administrators (which includes assigning the proper privileges for security) and then setting up notification assignments based on their defined roles and domain ownership within your organization.

To perform user account administration, click **Setup** on the Enterprise Manager home page, select **Security**, then select **Administrators** to access the Administrators page.

There are two types of administrators typically involved in incident management.

- **Business Rules Architect/Analyst:** Administrator who has a deep understanding of how the business works and translates this knowledge to operational rules. Once these rules have been deployed, the business architect uses their knowledge of the dynamic organization to keep these rules up-to-date.

In order to create or edit an enterprise rule set, the business architect/analyst must have been granted the *Create Enterprise Rule Set* privilege on the *Enterprise Rule Set* resource. The architect/analyst can share ownership of the rule sets with other administrators who may or may not have the *Create Enterprise Ruleset* privilege but are responsible for managing a specific ruleset.

- **IT Operator/Manager:** The IT manager is responsible for day-to-day management of incident assignment. The IT operator is assigned the incidents and is responsible for their resolution.

#### Privileges Required for Enterprise Rule Sets

As the owner of the rule set, an administrator can perform the following:

- Update or delete the rule set, and add, modify, or delete the rules in the rule set.

- Assign co-authors of the rule set. Co-authors can edit the rule set the same as the author. However, they cannot delete rule sets nor can they add additional co-authors.
- When a rule action is to update an event, incident, or problem (for example, change priority or clear an event), the action succeeds only if the owner has the privilege to take that action on the respective event, incident, or problem.
- Additionally, user must be granted privilege to create an enterprise rule set.

If an incident or problem rule has an update action (for example, change priority), it will take the action only if the owner of the respective rule set has manage privilege on the matching incident or problem.

To grant privileges, from the **Setup** menu on the Enterprise Manager home page, select **Security**, then select **Administrators** to access the Administrators page. Select an administrator from the list, then click **Edit** to access the Administrator properties wizard as shown in the following graphic.

ORACLE Enterprise Manager Cloud Control 12c

Properties Roles Target Privileges **Resource Privileges** Review

Edit Administrator EMUSER\_ADMIN: Resource Privileges

Cancel Back Step 4 of 5 Next Review

For each of the resource types in the list below, identify specific privileges to be explicitly granted on "all resources" level or individual resources to grant

| Resource Type                        | Description  | Privilege Grants Applicable to all Resources | Number of Resources with Privilege Grants | Manage Privilege Grants |
|--------------------------------------|--|--|---|-------------------------|
| Access                               | Defines the access to different application in Enterprise Manager Cloud Control  | -  | NA  |                         |
| Application Replay Entities          | Application Replay Entities include captures, replay tasks, and replays.   | -  | NA  |                         |
| Backup Configurations                | Security Class for System Backup/Recovery Manager.   | -  | -   |                         |
| Change Plan Security Class           | Security behavior for Change Plans   | -  | -   |                         |
| Chargeback and Consolidation         | Extends Enterprise Manager Feature to allow Chargeback and Consolidation of Targets based on configuration and resource usage  | -  | -   |                         |
| Cloud Policy                         | Defines access privileges for Cloud Policies   | -  | -   |                         |
| Cloud Policy Group                   | Defines access privileges for Cloud Policy Groups  | -  | -   |                         |
| Cloud Self Service Portal            | Defines the access privileges and roles for Cloud Self Service Portal.   | -  | NA  |                         |
| Compliance Framework                 | Compliance Framework provides capability to define/customize/manage compliance frameworks, and compliance standards/rules and evaluate compliance of targets/systems with regards to business best practices for configuration/security/storage etc. | -  | NA  |                         |
| Custom Configurations                | Custom Configurations allow extending target configuration collections   | -  | NA  |                         |
| Deployment Procedure                 | Deployment procedures are customizable orchestration routines for various Provisioning and Patching tasks  | -  | -   |                         |

| EM Plug-in                           | Manage the access control for Enterprise Manager plug-ins  | -  | NA  |                         |
| Enterprise Manager High Availability | Enterprise Manager High Availability Administration allows to add additional management service through deployment procedure.  | -  | NA  |                         |
| Enterprise Rule Set                  | Collection of rules that apply to Enterprise Manager elements, for example, targets and job. Individual rules can be used to send notifications, create incidents, update incidents, and other incident-management related actions.                  | -  | -   |                         |

## Granting User Privileges for Events, Incidents and Problems

In order to work with incidents, all relevant Enterprise Manager administrator accounts must be granted the appropriate privileges to manage incidents. Privileges for events, incidents, and problems are determined according to the following rules:

- Privileges on events are calculated based on the privilege on the underlying source objects. For example, the user will have VIEW privilege on an event if he can view the target for the event.
- Privileges on an incident are calculated based on the privileges on the events in the incident.
- Similarly, problem privileges are calculated based on privileges on underlying incidents.

Users are granted privileges for events, incidents, and problems in the following situations.

**For events, two privileges are defined in the system:**

- The *View Event* privilege allows you to view an event and add comments to the event.
- The *Manage Event* privilege allows you to take update actions on an event such as closing an event, creating an incident for an event, and creating a ticket for an event. You can also associate an event with an incident.

---

**Important:** Incident privilege is inherited from the underlying events.

---

If an event is raised on a target alone (the majority of event types are raised on targets such as metric alerts, availability events or service level agreement), you will need the following privileges:

- *View on target* to view the event.
- *Manage Target Events* to manage the event.

Note: This is a sub-privilege of Operator.

If an event is raised on both a target and a job, you will need the following privileges:

- *View on target* and *View on the job* to view the event.
- *View on target* and *Full on the job* to manage the event.

If the event is raised on a job alone, you will need the following privileges:

- *View on the job* to view the event.
- *Full on the job* to manage the event.

If an event is raised on a metric extension, you will need *View* privilege on the metric extension to view the event. Because events raised on metric extensions are informational (and do not appear in Incident Manager) event management privileges do not apply in this situation.

If an event is raised on a Self-update, only system privilege is required. Self-update events are strictly informational.

**For incidents, two privileges are defined in the system:**

- The *View Incident* privilege allows you to view an incident, and add comments to the incident.
- The *Manage Incident* privilege allows you to take update actions on an incident. The update actions supported for an incident includes incident assignment and prioritization, resolution management, manually closing events, and creating tickets for incidents.

If an incident consists of a single event, you can view the incident if you can view the event and manage the incident if you can manage the event.

If an incident consists of more than one event, you can view the incident if you can view at least one event and manage incident if you can manage at least one of the events.

**For problems, two privileges are defined:**

- The View Problem privilege allows you to view a problem and add comments to the problem.
- The Manage Problem privilege allows you to take update actions on the problem. The update actions supported for a problem include problem assignment and prioritization, resolution management, and manually closing the problem.

In Enterprise Manager 12c, problems are always related to a single target. So View Problem if View on target and Manage Problem if *manage\_target\_events* on targets as that implicitly grants manage on event which grants manage on incident within the problem.

## 2.3.4 Setting Up Rule Sets

Rule sets automate actions in response to incoming events, incidents and problems or updates to them. This section covers the most common tasks and examples.

- [Creating a Rule Set](#)
- [Creating a Rule to Create an Incident](#)
- [Creating a Rule to Manage Escalation of Incidents](#)
- [Creating a Rule to Escalate a Problem](#)
- [Subscribing to a Rule](#)
- [Receiving E-mail for Private Rules](#)

### 2.3.4.1 Creating a Rule Set

In general, to create a rule set, perform the following steps:

1. From the **Setup** menu, select **Incidents** then select **Incident Rules**.
2. On the Incident Rules - All Enterprise Rules page, edit the existing rule set or create a new rule set. For new rule sets, you will need to first select the targets to which the rules apply. Rules are created in the context of a rule set.  
**Note:** In the case where there is no existing rule set, create a rule set by clicking Create Rule Set... You then create the rule as part of creating the rule set.
3. In the Rules tab of the Edit Rule Set page, click **Create...** and select the type of rule to create (Event, Incident, Problem) on the Select Type of Rule to Create page. Click **Continue**.
4. In the Create New Rule wizard, provide the required information.
5. Once you have finished defining the rule, click **Continue** to add the rule to the rule set. Click **Save** to save the changes made to the rule set.

### 2.3.4.2 Creating a Rule to Create an Incident

To create a rule that creates an incident, perform the following steps:

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. Determine whether there is an existing rule set that contains a rule that manages the event. In the **Incident Rules** page, use the Search option to find the events for the target and the associated rule set. You can search by target name or the group target name to which this target belongs to locate the rule sets that manage the targets.

**Note:** In the case where there is no existing rule set, create a rule set by clicking **Create Rule Set...** You then create the rule as part of creating the rule set.

3. Select the rule set that will contain the new rule. Click **Edit...** In the Rules tab of the Edit Rule Set page,

1. Click **Create ...**
2. Select "Incoming events and updates to events"
3. Click **Continue**.

Provide the rule details using the Create New Rule wizard.

- a. Select the Event Type the rule will apply to, for example, Metric Alert. (Metric Alert is available for rule sets of the type Targets.) **Note:** Only one event type can be selected in a single rule and, once selected, it cannot be changed when editing a rule.

You can then specify metric alerts by selecting **Specific Metrics**. The table for selecting metric alerts displays. Click the **+Add** button to launch the metric selector. On the Select Specific Metric Alert page, select the target type, for example, Database Instance. A list of relevant metrics display. Select the ones in which you are interested. Click **OK**.

You also have the option to select the severity and corrective action status.

- b. Once you have provided the initial information, click **Next**. Click **+Add** to add the actions to occur when the event is triggered. One of the actions is to **Create Incident**.

As part of creating an incident, you can assign the incident to a particular user, set the priority, and create a ticket. Once you have added all the conditional actions, click **Continue**.

- c. After you have provided all the information on the Add Actions page, click **Next** to specify the name and description for the rule. Once on the Review page, verify that all the information is correct. Click **Back** to make corrections; click **Continue** to return to the Edit (Create) Rule Set page.
- d. Click **Save** to ensure that the changes to the rule set and rules are saved to the database.

4. Test the rule by generating a metric alert event on the metrics chosen in the previous steps.

### 2.3.4.3 Creating a Rule to Manage Escalation of Incidents

To create a rule to manage incident escalation, perform the following steps:

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. Determine whether there is an existing rule set that contains a rule that manages the incident. You can add it to any of your existing rule sets on incidents.  
**Note:** In the case where there is no existing rule set, create a rule set by clicking **Create Rule Set...** You then create the rule as part of creating the rule set.
3. Select the rule set that will contain the new rule. Click **Edit...** in the Rules tab of the Edit Rule Set page, and then:
  1. Click **Create ...**
  2. Select "Newly created incidents or updates to incidents"
  3. Click **Continue**.
4. For demonstration purposes, the escalation is in regards to a production database.

As per the organization's policy, the DBA manager is notified for escalation level 1 incidents where a fatal incident is open for 48 hours. Similarly, the DBA director is paged if the incident has been escalated to level 2, the severity is fatal and it has been open for 72 hours. If the fatal incident is still open after 96 hours, then it is escalated to level 3 and the operations VP is notified.

Provide the rule details using the Create New Rule wizard.

- a. To set up the rule to apply to all newly created incidents or when the incident is updated with *fatal* severity, select the **Specific Incidents** option and add the condition *Severity is Fatal*.
- b. In the **Conditions for Actions** region located on the Add Actions page, select **Only execute the actions if specified conditions match**.

Select **Incident has been open for some time and is in a particular state (select time and optional expressions)**.

Select the time to be 48 hours and Status is not resolved or closed.

- c. In the **Notification** region, type the name of the administrator to be notified by e-mail or page. Click **Continue** to save the current set of conditions and actions.

- d. Repeat steps b and c to page the DBA director (Time in this state is 72 hours, Status is Not Resolved or Closed). If open for more than 96 hours, set escalation level to 3, page Operations VP.
  - e. After reviewing added actions sets, click **Next**.
  - f. Click **Next** to go to the Summary screen. Review the summary information and click **Continue** to save the rule.
5. Review the sequence of existing enterprise rules and position the newly created rule in the sequence.

In Edit Rule Set page, click on the **desired rule from the Rules** table and select **Reorder Rules** from the **Actions** menu to reorder rules within the rule set, then click **Save** to save the rule sequence changes.

### Example Scenario

To facilitate the incident escalation process, the administration manager creates a rule to escalate unresolved incidents based on their age:

- To level 1 if the incident is open for 30 minutes
- To level 2 if the incident is open for 1 hour
- To level 3 if the incident is open for 90 minutes

As per the organization's policy, the DBA manager is notified for escalation level 1. Similarly, the DBA director and operations VP are paged for incidents escalated to levels "2" and "3" respectively.

Accordingly, the administration manager inputs the above logic and the respective Enterprise Manager administrator IDs in a separate rule to achieve the above notification requirement. Enterprise Manager administrator IDs represents the respective users with required target privileges and notification preferences (that is, e-mail addresses and schedule).

#### 2.3.4.4 Creating a Rule to Escalate a Problem

In an organization, whenever an unresolved problem has more than 20 occurrences of associated incidents, the problem should be auto-assigned to the appropriate administrator based on target type of the target on which the problem has been raised.

Accordingly, a problem rule is created to observe the count of incidents attached to the problem and notify the appropriate administrator handling that specific target type.

The problem owner and the Operations manager are notified by e-mail.

To create a rule to escalate a problem, perform the following steps:

1. Navigate to the Incident Rules page.

From the **Setup** menu, select **Incidents**, then select **Incident Rules**.

2. On the Incident Rules - All Enterprise Rules page, either create a new rule set (click **Create Rule Set...**) or edit an existing rule set (highlight the rule set and click **Edit...**). Rules are created in the context of a rule set.

**Note:** In the case where there is no existing rule set, create a rule set by clicking **Create Rule Set...** You then create the rule as part of creating the rule set.

3. In the Rules section of the Edit Rule Set page, select **Create...**
4. From the **Select Type of Rule to Create** dialog, **Select Newly created problems or updates to problems** and click **Continue**.
5. On the Create New Rule page, select **Specific problems** and add the following criteria:

The Attribute Name is **Incident Count**, the Operator is **Greater than or equals** and the Values is **20**. Click **Next**.

6. In the Conditions for Actions region on the Add Actions page select **Always execute the action**. As the actions to take when the rule matches the condition:
  - In the Notifications region, send e-mail to the owner of the problem and to the Operations Manager.
  - In the Update Problem region, enter the e-mail address of the appropriate administrator in the **Assign to** field.

Click **Continue**.

7. Review the rules summary. Make corrections as needed. Click **Continue** to return to Edit Rule Set page and then click **Save** to save the rule set.

#### 2.3.4.5 Subscribing to a Rule

A DBA is aware that incidents owned by him will be escalated when not resolved in 48 hours. The DBA wants to be notified when the rule escalates the Incident. The DBA can subscribe to the Rule, which escalates the Incident and will be notified whenever the rule escalates the Incident.

Before you set up a notification subscription, ensure there exists a rule that escalates High Priority Incidents for databases that have not been resolved in 48 hours

Perform the following steps:

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. On the Incident Rules - All Enterprise Rules page, click on the rule set containing incident escalation rule in question and click **Edit...** Rules are created in the context of a rule set.

**Note:** In the case where there is no existing rule set, create a rule set by clicking **Create Rule Set...** You then create the rule as part of creating the rule set.

3. In the Rules section of the Edit Rule Set page, highlight the escalation rule and click **Edit...**
4. Navigate to the Add Actions page.
5. Select the action that escalates the incident and click **Edit...**
6. In the Notifications section, add the DBA to the **E-mail cc** list.
7. Click **Continue** and then navigate back to the **Edit Rule Set** page and click **Save**.

As a result of the edit to the enterprise rule, when an incident stays unresolved for 48 hours, the rule marks it to escalation level 1. An e-mail is sent out to the DBA notifying him about the escalation of the incident.

**Alternate Rule Set Subscription Method:** From the Incident Rules - All Enterprise Rules page, select the rule in incident rules table. From the **Actions** menu, select **E-mail** and then **Subscribe me** (or **Subscribe administrator...**).

#### 2.3.4.6 Receiving E-mail for Private Rules

A DBA has setup a backup job on the database that he is administering. As part of the job, the DBA has subscribed to e-mail notification for "completed" job status. Before you create the rule, ensure that the DBA has the requisite privileges to create jobs. See [Chapter 7, "Utilizing the Job System and Corrective Actions"](#) for job privilege requirements.

Perform the following steps:

1. Navigate to the Rules page.  
From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. On the Incident Rules - All Enterprise Rules page, either edit an existing rule set (highlight the rule set and click **Edit...**) or create a new rule set.  
**Note:** The rule set must be defined as a Private rule set.
3. In the Rules tab of the Edit Rule Set page, select **Create...** and select **Incoming events and updates to events**. Click **Continue**.

4. On the Select Events page, select **Job Status Change** as the Event Type. Select the job in which you are interested either by selecting a specific job or selecting a job by providing a pattern, for example, Backup Management.

Add additional criteria by adding an attribute: Target Type as Database Instance.

5. Add conditional actions: Event matches the following criteria (Severity is Informational) and E-mail Me for notifications.
6. Review the rules summary. Make corrections as needed. Click **Save**.
7. Create a database backup job and subscribe for e-mail notification when the job completes.

When the job completes, Enterprise Manager publishes the informational event for "Job Complete" state of the job. The newly created rule is considered 'matching' against the incoming job events and e-mail will be sent to the DBA.

The DBA receives the e-mail and clicks the link to access the details section in Enterprise Manager console for the event.

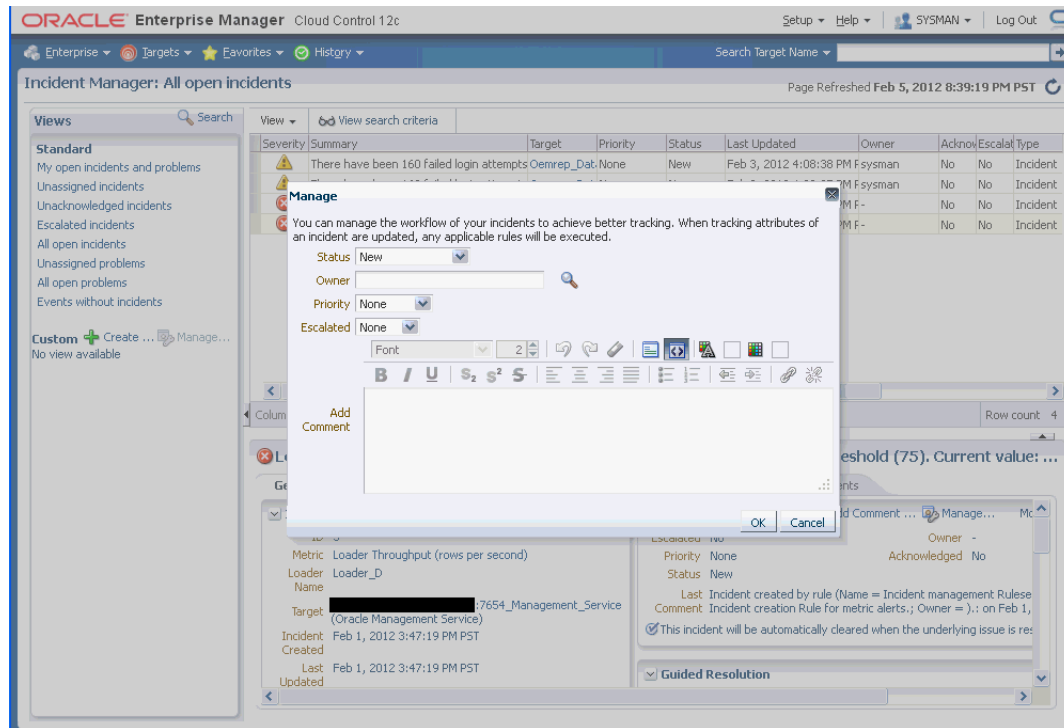

## 2.4 Working with Incidents

Data centers follow operational practices that enable them to manage events and incidents by business priority and in a collaborative manner. Enterprise Manager provides the following features to enable this management and automation:

- Send notifications to the appropriate administrators.
- Create incidents and rules.
- Assigning initial ownership of an incident and perhaps transferring ownership based on shift assignments or expertise.
- Tracking its resolution status.
- Assigning priorities based on the component affected and nature of the incident.
- Escalating incidents.
- Accessing My Oracle Support knowledge articles.
- Opening Oracle Service Requests to request assistance with issues with Oracle software (Problems).

You can update resolution information for an incident by performing the following:

1. In the **All Open Incidents** view, select the incident.
2. In the resulting Details page, click the **General** tab, then click **Manage**. The **Manage** dialog displays.

You can then adjust the priority, escalate the incident, and assign it to a specific IT operator.

Working with incidents involves the following stages:

1. [Finding What Needs to be Worked On](#)
2. [Setting Up Custom Views](#)
3. [Responding and Working on a Simple Incident](#)
4. [Managing Workload Distribution of Incidents](#)
5. [Creating an Incident Manually](#)

## 2.4.1 Finding What Needs to be Worked On

Enterprise Manager provides multiple access points that allow you to find out what needs to be worked on. The primary focal point for incident management is the Incident Manager console, however Enterprise Manager also provides other methods of notification. The most common way to be notified that you have an issue that needs to be addressed is by e-mail. However, incident information can also be found in the following areas:

## Target Homepages

The screenshot shows the Oracle Enterprise Manager interface for a target named **asmdb.us.oracle.com**. The top navigation bar includes links for Enterprise, Targets, Favorites, and History. The main content area is divided into several sections:

- Summary:** Displays key metrics such as Up Time (17 days, 17 hrs), Version (11.2.0.3.0), Load (0.00 average active sessions), Total Sessions (71), Last Backup (Mar 5, 2012 6:14:20 AM), Available Space (0.13 GB), and Total SGA (999.51 MB).
- Diagnostics:** Shows ADDM Findings (0) and Incidents (0).
- Incidents and Problems:** A table listing various issues:
 

| Summary              | Target | Sev | Status | Escalation level | Type     | Time since last update |
|----------------------|--------|-----|--------|------------------|----------|------------------------|
| Problem: ORA 600 [4: |        |     | New    | -                | Problem  | 7 days 7 hours         |
| Problem: ORA 603     |        |     | New    | -                | Problem  | 7 days 7 hours         |
| Compliance score 51% |        |     | New    | -                | Incident | 21 days 4 hours        |
- Compliance Summary:** A section for compliance standards, currently showing "No data to display".
- Performance:** Links to SQL Monitor - Last Hour and Resources.

## Incident Manager (in context of a system or target)

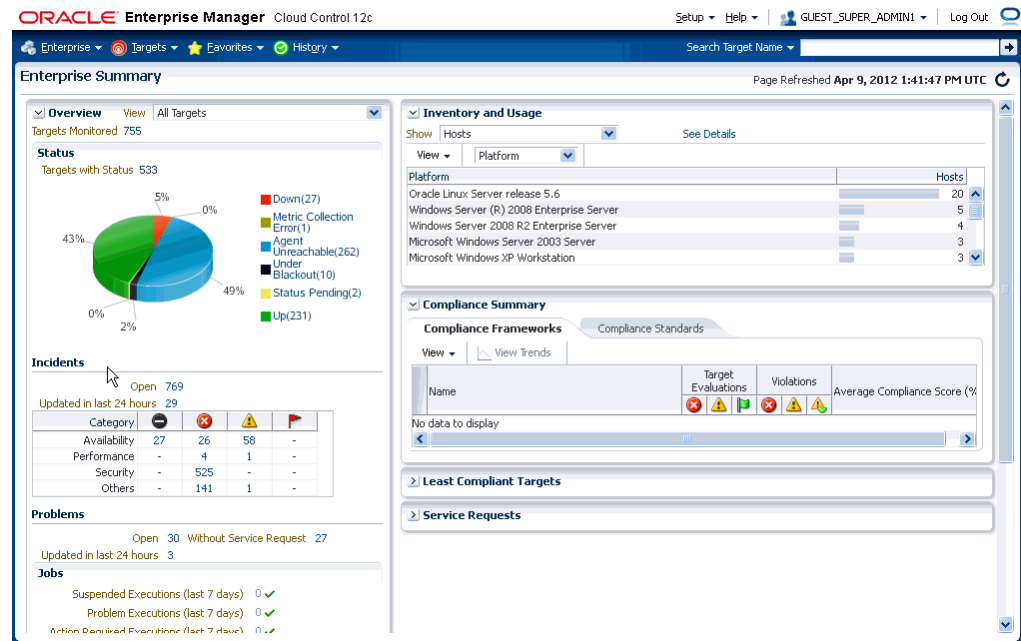

The screenshot displays the Oracle Enterprise Manager Incident Manager interface. The top navigation bar is consistent with the previous screenshot. The main content area is titled "Incident Manager" and includes a search bar and a "View search criteria" button. The left sidebar shows a tree view of incident categories: Standard (My open incidents and problems, Unassigned incidents, Unacknowledged incidents, Escalated incidents, All open incidents, Unassigned problems, All open problems, Events without incidents) and Custom (test, banana).

The main table lists incidents with columns: Severity, Summary, Target, Priority, Status, Last Updated, Owner, Ackno/Esca, and Type. The first incident is "Agent is Unreachable (REASON = unable to connect to the agent at https://.../1830/...)". Below the table, the "Incident Details" section for ID 6057 shows:

- Availability status:** Agent Unreachable
- Target:** banana (Database Instance)
- Incident Created:** Apr 4, 2012 10:21:31 AM MDT
- Last:** Apr 9, 2012 6:56:09 AM MDT

The "Tracking" section shows the incident's status: Escalated (No), Priority (None), Status (New), and Acknowledged (No). A comment states: "This incident will be automatically cleared when the underlying issue is resolved."

## Enterprise Manager Console

### 2.4.2 Setting Up Custom Views

Incident Manager also allows you to define custom views to help you gain quick access to the incidents and problems on which you need to focus. For example, you may define a view to display all critical database incidents that you own. By specifying and saving view preferences to display only those incident attributes that you are interested in Enterprise Manager will show only the list of matching incidents.

You can then search the incidents for only the ones with specific attributes, such as priority 1. The view allows easy access to pertinent incidents for daily triage. Accordingly, you can save the search criteria as a filter named "All priority 1 incidents for my targets". The view becomes available in the UI for immediate use and will be available anytime you log in to access the specific incidents. The last view you used will be the default view used on your next login.

---

**Note:** The view you create is specific to your Enterprise Manager account and cannot currently be shared with other administrators.

---

Perform the following steps:

1. Navigate to the Incident Manager page.  
From the **Enterprise** menu on the Enterprise Manager home page, select **Monitoring**, then select **Incident Manager**.
2. In the **Views** region located on the left, click **Search**.
  - a. In the **Search** region, search for Incidents using the **Type** list and select **Incidents**.
  - b. In the **Criteria** region, choose all the criteria that are appropriate. To add fields to the criteria, click **Add Fields...** and select the appropriate fields.

- c. After you have provided the appropriate criteria, click **Get Results**.  
Validate that the list of incidents match what you are looking for. If not, change the search criteria as needed.
- d. To view all the columns associated with this table, in the **View** menu, select **Columns**, then select **Show All**.
- e. Click the **Create View...** button.
- f. Enter the view name.
- g. Click **OK** to save the view.

### 2.4.3 Responding and Working on a Simple Incident

The following steps take you through one possible incident management scenario.

1. Navigate to Incident Manager.  
From the **Enterprise** menu on the Enterprise Manager home page, select **Monitoring**, then select **Incident Manager**.
2. Use a view to filter the list of incidents. For example, you should use **My Open Incidents and Problems** view to see incidents and problems assigned to you. You can then sort the list by priority.
3. To work on an incident, select the incident. In the **General** tab, click **Acknowledge** to indicate that you are working on this incident, and to stop receiving repeat notifications for the incident.

In addition to the acknowledging the incident, you can perform other incident management operations such as:

- Adding a comment.
- Managing the incident.
- Editing the summary.
- Manually creating a ticket.
- Suppressing/unsuppressing the incident.
- Clearing the incident.

Be aware that as you are working on an individual incident, new incidents might be coming in. Update the list of incidents by clicking the **Refresh** icon.

4. If the solution for the incident is unknown, use one or all of the following methods made available in the Incident page:
  - Use the **Guided Resolution** region and access any recommendations, diagnostic and resolution links available.
  - Check My Oracle Support Knowledge base for known solutions for the incident.
  - Study related incidents available through the Related Events and Incidents tab.
5. Once the solution is known and can be resolved right away, resolve the incident by using tools provided by the system, if possible.
6. In most cases, once the underlying cause has been fixed, the incident is cleared in the next evaluation cycle. However, in cases like log-based incidents, clear the incident.

Alternatively, you can work with incidents for a specific target from that target's home page. From the *target* menu, select **Monitoring** and then select **Incident Manager** to access incidents for that target (or group).

## 2.4.4 Searching My Oracle Support Knowledge

To access My Oracle Support Knowledge base entries from within Incident Manager, perform the following steps:

1. Navigate to Incident Manager.

From the **Enterprise** menu on the Enterprise Manager home page, select **Monitoring**, then select **Incident Manager**.

2. Select one of the standard views. Choose the appropriate incident or problem in the View table.
3. In the resulting details region, click **My Oracle Support Knowledge**.

If your My Oracle Support (MOS) login credentials have been saved as MOS Preferred Credentials, you do not need to log in manually. If not, you will need to sign in to My Oracle Support. To save your MOS login information as Preferred Credentials.

Setting MOS Preferred Credentials: From the **Setup** menu, select **Security** and then **Preferred Credentials**. From the My Oracle Support Preferred Credentials region, click **Set MOS Credentials**.

4. On the My Oracle Support page, click the **Knowledge** tab to browse the knowledge base.

From this page, in addition to accessing formal Oracle documentation, you can also change the search string in to look for additional knowledge base entries.

## 2.4.5 Open Service Request (Problems-only)

There are times when you may need assistance from Oracle Support to resolve a *problem*. This procedure is not relevant for incidents or events.

To submit a service request (SR), perform the following steps:

1. Navigate to Incident Manager.

From the **Enterprise** menu on the Enterprise Manager home page, select **Monitoring**, then select **Incident Manager**.

2. Use one of the views to find the problem or search for it or use one of your custom views. Select the appropriate problem from table.
3. Click on the **Support Workbench: Package Diagnostic** link.
4. Complete the workflow for opening an SR. Upon completing the workflow, a draft SR will have been created.
5. Sign in to My Oracle Support if you are not already signed in.
6. On the My Oracle Support page, click the **Service Requests** tab.
7. Click **Create SR** button.

## 2.4.6 Suppressing Incidents and Problems

There are times when it is convenient to hide an incident or problem from the list in the All Open Incidents page or the All Open Problems page. For example, you need to

defer work on the incident until a future date (for example, until maintenance window). In order to avoid having it appear in the UI, you want to temporarily hide or suppress the incident until a future date. In order to find a suppressed incident, you must explicitly search for the incident using either the *Show all* or the *Only show suppressed* search option. In order to unhide a suppressed incident or problem, it must be manually unsuppressed.

To suppress an incident or problem:

1. Navigate to Incident Manager.  
From the **Enterprise** menu on the Enterprise Manager home page, select **Monitoring**, then select **Incident Manager**.
2. Select either the All Open Incidents view or the All Open Problems view. Choose the appropriate incident or problem. Click the **General** tab.
3. In the resulting details region, click **More**, then select **Suppress**.
4. On the resulting Suppress pop-up, choose the appropriate suppression type. Add a comment if desired.
5. Click **OK**.

## 2.4.7 Managing Workload Distribution of Incidents

Incident Manager enables you to manage incidents and problems to be addressed by your team

Perform the following tasks:

1. Navigate to Incident Manager.  
From the **Enterprise** menu on the Enterprise Manager home page, select **Monitoring**, then select **Incident Manager**.
2. Use the standard or custom views to identify the incidents for which your team is responsible. You may want to focus on unassigned and unacknowledged incidents and problems.
3. Review the list of incidents. This includes: determining person assigned to the incident, checking its status, progress made, and actions taken by the incident owner.
4. Add comments, change priority, reassign the incident as needed by clicking on the Manage button in the Incident Details region.

### Example Scenario

The DBA manager uses Incident Manager to view all the incidents owned by his team. He ensures all of them are correctly assigned; if not, he reassigns and prioritizes them appropriately. He monitors the escalated events for their status and progress, adds comments as needed for the owner of the incident. In the console, he can view how long each of the incidents has been open. He also reviews the list of unassigned incidents and assigns them appropriately.

## 2.4.8 Reviewing Events on a Periodic Basis

Oracle recommends managing via incidents in order to focus on important events or groups of related events. Due to the variety and sheer number of events that can be generated, it is possible that not all important events will be covered by incidents. To

help you find these important yet untreated events, Enterprise Manager provides the **Events without incidents** standard view.

Perform the following steps:

1. From the **Enterprise** menu, select **Monitoring**, then select **Incident Manager**.
2. In the Views region, click **Events without incidents**.
3. Select the desired event in the table. The event details display.
4. In the details area, choose **More** and then either **Create Incident** or **Add Event to Incident**.

### Example Scenario

During the initial phase of Enterprise Manager uptake, every day the DBA manager reviews the events for the databases his team is responsible for and filters them to view only the ones which are not tracked by ticket or incident. He browses such events to ensure that none of them requires incidents to track the issue. If he feels that one such event requires an incident to track the issue, he creates an incident directly for this event.

#### 2.4.8.1 Creating an Incident Manually

If an event of interest occurs that is not covered by any rule and you want to convert that event to an incident, perform the following:

1. Using an available view, find the event of interest.
2. Select the event in the table.
3. From the **More...** drop-down menu, choose **Create Incident...**
4. Enter the incident details and click **OK**.
5. Should you decide to work on the incident, set yourself as owner of the incident and update status to *Work in Progress*.

### Example Scenario

As per the operations policy, the DBA manager has setup rules to create incidents for all critical issues for his databases. The remainder of the issues are triaged at the event level by one of the DBAs.

One of the DBA receives e-mail for an "SQL Response" event (not associated with an incident) on the production database. He accesses the details of the event by clicking on the link in the e-mail. He reviews the details of the event. This is an issue that needs to be tracked and resolved, so he opens an incident to track the resolution of the issue. He marks the status of the incident as "Work in progress".

## 2.5 Advanced Topics

The following sections discuss incident/event management features relating advanced applications or operational areas.

### 2.5.1 Defining Custom Incident Statuses

As discussed in ["Working with Incidents"](#) on page 2-33, one of the primary incident workflow attributes is *status*. For most conditions, these predefined status attributes will suffice. However, the uniqueness of your monitoring and management environment may require an incident workflow requiring specialized incident states.

To address this need, you can define custom states using the *modify\_resolution\_state* EM CLI verb.

```
emcli modify_resolution_state
    -label="old label of the state to be changed"
    -new_label="New label for display"
    -position="New display position"
    [-applies_to=BOTH]
[ ] indicates that the parameter is optional
```

This verb modifies an existing resolution state that describes the state of incidents or problems. Only Super Administrators can execute this command. You need to specify the updated label as well as the updated position. The position can be between 2 and 98, and cannot be in use by another resolution state.

You can optionally indicate that the state should apply to both incidents and problems. A success message is reported if the command is successful. An error message is reported if the change fails.

## 2.5.2 Clearing Stateless Alerts for Metric Alert Event Types

For *metric alert* event types, an event (metric alert) is raised based on the metric threshold values. These metric alert events are called *stateful* alerts. For those metric alert events that are not tied to the state of a monitored system (for example, *snapshot too old*, or *resumable session suspended*), these alerts are called stateless alerts. Because stateless alerts are not cleared automatically, they need to be cleared manually. You can perform a bulk purge of stateless alerts using the *clear\_stateless\_alerts* EM CLI verb.

*clear\_stateless\_alerts* clears the stateless alerts associated with the specified target. The clearing must be manually performed as the Management Agent does not automatically clear stateless alerts. To find the metric internal name associated with a stateless alert, use the EM CLI *get\_metrics\_for\_stateless\_alerts* verb.

### Format

```
emcli clear_stateless_alerts -older_than=number_in_days -target_type=target_type
    -target_name=target_name [-include_members] [-metric_internal_name=target_type_
metric:metric_column] [-unacknowledged_only] [-ignore_notifications]
    [-preview]
```

[ ] indicates that the parameter is optional

### Options

- **older\_than**  
Specify the age of the alert in days. (Specify 0 for currently open stateless alerts.)
- **target\_type**  
Internal target type identifier, such as host, oracle\_database, and emrep.
- **target\_name**  
Name of the target.
- **include\_members**  
Applicable for composite targets to examine alerts belonging to members as well.
- **metric\_internal\_name**  
Metric to be cleaned up. Use the *get\_metrics\_for\_stateless\_alerts* verb to see a complete list of supported metrics for a given target type.

- **unacknowledged\_only**  
Only clear alerts if they are not acknowledged.
- **ignore\_notifications**  
Use this option if you do not want to send notifications for the cleared alerts. This may reduce the notification sub-system load.
- **ignore\_notifications**  
Use this option if you do not want to send notifications for the cleared alerts. This may reduce the notification sub-system load.
- **preview**  
Shows the number of alerts to be cleared on the target(s).

### Example

The following example clears alerts generated from the database alert log over a week old. In this example, no notifications are sent when the alerts are cleared.

```
emcli clear_stateless_alerts -older_than=7 -target_type=oracle_database -target_name=database -metric_internal_name=oracle_database:alertLog:genericErrStack -ignore_notifications
```

## 2.5.3 User-reported Events

Users may create (publish) events manually using the EM CLI verb *publish\_event*. A User-reported event is published as an event of the "User-reported event" class. Only users with Manage Target privilege can publish these events for a target. An error message is reported if the publish fails.

After an event is published with a severity other than CLEAR (see below), end-users with appropriate privileges can manually clear the event from the UI, or they can publish a new event using a severity level of CLEAR and the same details to report clearing of the underlying situation.

### 2.5.3.1 Format

```
emcli publish_event
  -target_name="Target name"
  -target_type="Target type internal name"
  -message="Message for the event"
  -severity="Severity level"
  -name="event name"
  [-key="sub component name"
   -context="name1=value1;name2=value2;.."
   -separator=context="alt. pair separator"
   -subseparator=context="alt. name-value separator"]
```

[ ] indicates that the parameter is optional

### 2.5.3.2 Options

- **target\_name**  
Target name.
- **target\_type**  
Target type name.
- **message**

Message to associate for the event. The message cannot exceed 4000 characters.

- **severity**

Numeric severity level to associate for the event. The supported values for severity level are as follows:

"CLEAR"  
"MINOR\_WARNING"  
"WARNING"  
"CRITICAL"  
"FATAL"

- **name**

Name of the event to publish. The event name cannot exceed 128 characters.

This is indicative of the nature of the event. Examples include "Disk Used Percentage," "Process Down," "Number of Queues," and so on. The name must be repeated and identical when reporting different severities for the same sequence of events. This should not have any identifying information about a specific event; for example, "Process xyz is down." To identify any specific components within a target that the event is about, see the key option below.

- **key**

Name of the sub-component within a target this event is related to. Examples include a disk name on a host, name of a tablespace, and so forth. The key cannot exceed 256 characters.

- **context**

Additional context that can be published for a given event. This is a series of strings of format name:value separated by a semi-colon. For example, it might be useful to report the percentage size of a disk when reporting space issues on the disk. You can override the default separator ":" by using the sub-separator option, and the pair separator ";" by using the separator option.

The context names cannot exceed 256 characters, and the values cannot exceed 4000 characters.

- **separator**

Set to override the default ";" separator. You typically use this option when the name or the value contains ";". Using "=" is not supported for this option.

- **subseparator**

Set to override the default ":" separator between the name-value pairs. You typically use this option when the name or value contains ":". Using "=" is not supported for this option.

### 2.5.3.3 Examples

#### Example 1

The following example publishes a warning event for "my acme target" indicating that a HDD restore failed, and the failure related to a component called the "Finance DB machine" on this target.

```
emcli publish_event -target_name="my acme target" -target_type="oracle_acme"
-name="HDD restore failed" -key="Finance DB machine" -message="HDD restoration
failed due to corrupt disk" -severity=WARNING
```

**Example 2**

The following example publishes a minor warning event for "my acme target" indicating that a HDD restore failed, and the failure related to a component called the "Finance DB machine" on this target. It specifies additional context indicating the related disk size and name using the default separators. Note the escaping of the \ in the disk name using an additional "\\".

```
emcli publish_event -target_name="my acme target" -target_type="oracle_acme"
-name="HDD restore failed" -key="Finance DB machine" -message="HDD restoration
failed due to corrupt disk" -severity=MINOR_WARNING -context="disk
size":800GB\;"disk name":\\uddo0111245
```

**Example 3**

The following example publishes a critical event for "my acme target" indicating that a HDD restore failed, and the failure related to a component called the "Finance DB machine" on this target. It specifies additional context indicating the related disk size and name. It uses alternate separators, because the name of the disk includes the ":" default separator.

```
emcli publish_event -target_name="my acme target" -target_type="oracle_acme"
-name="HDD restore failed" -key="Finance DB machine" -message="HDD restoration
failed due to corrupt disk" -severity=CRITICAL -context="disk size"^800GB\;"disk
name"^\\sdd1245:2 -subseparator=context=^
```

## 2.5.4 Additional Rule Applications

Rules can be set up to perform more complicated tasks beyond straightforward notifications. The following tasks illustrate additional rule capabilities.

- [Setting Up a Rule to Send Different Notifications for Different Severity States of an Event](#)
- [Creating a Rule to Notify Different Administrators Based on the Event Type](#)
- [Creating a Rule to Create a Ticket for Incidents](#)

### 2.5.4.1 Setting Up a Rule to Send Different Notifications for Different Severity States of an Event

Before you perform this task, ensure the DBA has set appropriate thresholds for the metric so that a critical metric alert is generated as expected.

Consider the following example:

The Administration Manager sets up a rule to page the specific DBA when a critical metric alert event occurs for a database in a production database group and to e-mail the DBA when a warning metric alert event occurs for the same targets. This task occurs when a new group of databases is deployed and DBAs request to create appropriate rules to manage such databases.

Perform the following tasks to set appropriate thresholds:

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. On the Incident Rules - All Enterprise Rules page, highlight a rule set and click **Edit...** (Rules are created in the context of a rule set. If there is no existing rule set to manage the newly added target, create a rule set.)
3. In the Edit Rule Set page, locate the Rules section. Click **Create...**

4. From the Select Type of Rule to Create dialog, choose **Incoming events and updates to events**. Click **Continue**.
5. Provide the rule details as follows:
  - a. For Type, select **Metric Alerts** as the Type.
  - b. In the criteria section, select **Severity**. From the drop-down list, check and **Critical** and **Warning** as the selected values. Click **Next**.
  - c. On the Add Actions page, click **+Add**.  
In the Create Incident section, check the **Create Incident** option. Click **Continue**. The Add Action page displays with the new rule. Click **Next**.
  - d. Specify a name for the rule and a description. Click **Next**.
  - e. On the Review page, ensure your settings are correct and click **Continue**. A message appears informing you that the rule has been successfully created. Click **OK** to dismiss the message.  
Next, you need to create a rule to perform the notification actions.
6. From the Rules section on the Edit Rules page, click **Create**.
7. Select **Newly created incidents or updates to incidents** as the rule type and click **Continue**.
8. Check **Specific Incidents**.
9. Check **Severity** and from the drop-down option selector, check **Critical** and **Warning**. Click **Next**.
10. On the Add Actions page, click **Add**. The Conditional Actions page displays.
11. In the **Conditions for actions** section, choose **Only execute the actions if specified conditions match**.
12. From the **Incident matches the following criteria** list, choose **Severity** and then **Critical** from the drop-down option selector.
13. In the **Notifications** section, enter the DBA in the **Page** field. Click **Continue**. The Add Actions page displays.
14. Click **Add** to create a new action for the Warning severity.
15. In the **Conditions for actions** section, choose **Only execute the actions if specified conditions match**.
16. From the **Incident matches the following criteria** list, choose **Severity** and then **Warning** from the drop-down option selector.
17. In the **Notifications** section, enter the DBA in the **E-mail to** field. Click **Continue**. The Add Actions page displays with the two conditional actions. Click **Next**.
18. Specify a rule name and description. Click **Next**.
19. On the Review page, ensure your rules have been defined correctly and click **Continue**. The Edit Rule Set page displays.
20. Click **Save** to save your newly defined rules.

#### 2.5.4.2 Creating a Rule to Notify Different Administrators Based on the Event Type

As per operations policy for production databases, the incidents that relate to application issues should go to the application DBAs and the incidents that relate to system parameters should go to the system DBAs. Accordingly, the respective

incidents will be assigned to the appropriate DBAs and they should be notified by way of e-mail.

Before you set up rules, ensure the following prerequisites are met:

- DBA has setup appropriate thresholds for the metric so that critical metric alert is generated as expected.
- Rule has been setup to create incident for all such events.
- Respective notification setup is complete, for example, global SMTP gateway, e-mail address, and schedule for individual DBAs.

Perform the following steps:

1. Navigate to the Incident Rules page.  
From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. Search the list of enterprise rules matching the events from the production database.
3. On the Incident Rules - All Enterprise Rules page, highlight a rule set and click **Edit...** (Rules are created in the context of a rule set. If there is no existing rule set , create a rule set.)
4. From the Edit Rule Set page (Rules tab), select the rule which creates the incidents for the metric alert events for the database. Click **Edit**
5. From the Select Events page, click **Next**.
6. From the Add Actions page, click **+Add**. The Add Conditional Actions page displays.
7. In the Notifications area, enter the e-mail address of the DBA you want to be notified for this specific event type and click **Continue** to add the action. Enterprise Manager returns you to the Add Actions page.
8. Click **Next**.
9. On the Specify Name and Description page, enter an intuitive rule name and a brief description.
10. Click **Next**.
11. On the Review page, review the **Applies to**, **Actions** and **General** information for correctness .
12. Click **Continue** to create the rule.
13. Create/Edit additional rules to handle alternate additional administrator notifications according to event type.
14. Review the rules summary and make corrections as needed. Click **Save** to save your rule set changes.

### 2.5.4.3 Creating a Rule to Create a Ticket for Incidents

If your IT process requires a helpdesk ticket be created to resolve incidents, then you can use the helpdesk connector to associate the incident with a helpdesk ticket and have Enterprise Manager automatically open a ticket when the incident is created. Communication between Incident Manager and your helpdesk system is bidirectional, thus allowing you to check the changing status of the ticket from within Incident Manager. Enterprise Manager also allows you to link out to a Web-based third-part console directly from the ticket so that you can launch the console in context directly from the ticket.

For example, according to the operations policy of an organization, all critical incidents from a production database should be tracked by way of Remedy tickets. A rule is set up to create a Remedy ticket when a critical incident occurs for the database. When such an incident occurs, the ticket is generated by the rule, the incident is associated with the ticket, and the operation is logged for future reference to the updates of the incident. While viewing the details of the incident, the DBA can view the ticket ID and, using the attached URL link, access the Remedy to get the details about the ticket.

Before you perform this task, ensure the following prerequisites are met:

- Monitoring support has been set up.
- Remedy ticketing connector has been configured.

Perform the following steps:

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. On the Incident Rules - All Enterprise Rules page, select the appropriate rule set and click **Edit...** (Rules are created in the context of a rule set. If there is no applicable rule set, create a new rule set.)
3. Select the appropriate rule that covers the incident conditions for which tickets should be generated and click **Edit...**
4. Click **Next** to proceed to the **Add Actions** page.
5. Click **+Add** to access the **Add Conditional Actions** page.
  - a. Specify that a ticket should be generated for incidents covered by the rule.
  - b. Specify the ticket template to be used.
6. Click **Continue** to return to the Add actions page.
7. On the Add Actions page, click **Next**.
8. On the Review page, click **Continue**.
9. On the Specify Name and Description page, click **Next**.
10. On the Review page, click **Continue**. A message displays indicating that the rule has been successfully modified. Click **OK** to close the message.
11. Repeat steps 3 through 10 until all appropriate rules have been edited.
12. Click **Save** to save your changes to the rule set.

## 2.5.5 Event Prioritization

When working in a large enterprise it is conceivable that when systems are under heavy load, a large number of incidents and events may be generated. All of these need to be processed in a timely and efficient manner in accordance with your business priorities. An effective prioritization scheme is needed to determine which events/incidents should be resolved first.

In order to determine which event/incidents are high priority, Enterprise Manager uses a prioritization protocol based on two incident/event attributes: Lifecycle Status of the target and the Incident/Event Type. Lifecycle Status is a target property that specifies a target's operational status. You can set/view a target's Lifecycle Status from the UI (from a target's **Target Setup** menu, select **Properties**). You can set target Lifecycle Status properties across multiple targets simultaneously by using the Enterprise Manager Command Line Interface (EM CLI) `set_target_property_value` verb.

A target's Lifecycle Status is set when it is added to Enterprise Manager for monitoring. At that time, you determine where in the prioritization hierarchy that target belongs—the highest level being "mission critical" and the lowest being "development."

#### Target Lifecycle Status

- Mission Critical (highest priority)
- Production
- Stage
- Test
- Development (lowest priority)

#### Incident/Event Type

- Availability events (highest priority)
- Non-informational events.
- Informational events

## 2.6 Moving from Enterprise Manager 10/11g to 12c

Enterprise Manager 12c incident management functionality leverages your existing pre-12c monitoring setup out-of-box. Migration is seamless and transparent. For example, if your Enterprise Manager 10/11g monitoring system sends you e-mails based on specific monitoring conditions, you will continue to receive those e-mails without interruption. To take advantage of 12c features, however, you may need to perform additional migration tasks.

---

**Important:** Alerts that were generated pre-12c will still be available. For example, critical metric alerts will be available as critical incidents.

---

#### Rules

When you migrate to Enterprise Manager 12c, all of your existing notification rules are automatically converted to rules. Technically, they are converted to event rules first with incidents automatically being created for each event rule.

In general, event rules allow you to define which events should become incidents. However, they also allow you to take advantage of the Enterprise Manager's increased monitoring flexibility.

For more information on rule migration, see the following documents:

- Appendix A, "Overview of Notification in Enterprise Manager Cloud Control" section "Migrating Notification Rules to Rule Sets" in the *Enterprise Manager Cloud Control Upgrade Guide*.
- Chapter 29 "Updating Rules" in the *Enterprise Manager Cloud Control Upgrade Guide*.

#### Privilege Requirements

The *Create Enterprise Rule Set* resource privilege is now required in order to edit/create enterprise rule sets and rules contained within. The exception to this is migrated notification rules. When pre-12c notification rules are migrated to event rules, the

original notification rule owners will still be able to edit their own rules without having been granted the Create Enterprise Rule Set resource privilege. However, they must be granted the *Create Enterprise Rule Set* resource privilege if they wish to create new rules. Enterprise Manager Super Administrators, by default, can edit and create rule sets.

---

## Notifications

The notification system allows you to notify Enterprise Manager administrators when specific incidents, events, or problems arise.

---

**Note:** This chapter assumes that you are familiar with incident management. For information about monitoring and managing your IT infrastructure via incident management, see [Chapter 2, "Using Incident Management"](#).

---

As an integral part of the management framework, notifications can also perform actions such as executing operating system commands (including scripts) and PL/SQL procedures when specific incidents, events, or problems occur. This capability allows you to automate IT practices. For example, if an incident (such as monitoring of the operational (up/down) status of a database) arises, you may want the notification system to automatically open an in-house trouble-ticket using an OS script so that the appropriate IT staff can respond in a timely manner.

By using Simple Network Management Protocol (SNMP) traps, the Enterprise Manager notification system also allows you to send traps to SNMP-enabled third-party applications such as HP OpenView for events published in Enterprise Manager. Some administrators may want to send third-party applications a notification when a certain metric has exceeded a threshold.

This chapter covers the following:

- [Setting Up Notifications](#)
- [Extending Notification Beyond E-mail](#)
- [Passing Corrective Action Status Change Information](#)
- [Passing Job Execution Status Information](#)
- [Passing User-Defined Target Properties to Notification Methods](#)
- [Management Information Base \(MIB\)](#)
- [Troubleshooting Notifications](#)

### 3.1 Setting Up Notifications

All Enterprise Manager administrators can set up e-mail notifications for themselves. Super Administrators also have the ability to set up notifications for other Enterprise Manager administrators.

### 3.1.1 Setting Up a Mail Server for Notifications

Before Enterprise Manager can send e-mail notifications, you must first specify the Outgoing Mail (SMTP) servers to be used by the notification system. Once set, you can then define e-mail notifications for yourself or, if you have Super Administrator privileges, other Enterprise Manager administrators.

You specify the Outgoing Mail (SMTP) server on the Notification Methods page ([Figure 3-1](#)). To display the Notification Methods page, from the **Setup** menu, select **Notifications**, then select **Notification Methods**.

---

**Note:** You must have Super Administrator privileges in order to set up SMTP servers.

---

Specify one or more outgoing mail server names, the mail server authentication credentials (User Name, Password, and Confirm Password), if required, the name you want to appear as the sender of the notification messages, and the e-mail address you want to use to send your e-mail notifications. This address, called the Sender's Mail Address, must be a valid address on each mail server that you specify. A message will be sent to this e-mail address if any problem is encountered during the sending of an e-mail notification. [Example 3-1](#) shows sample notification method entries.

#### **Example 3-1 Mail Server Settings**

- **Outgoing Mail (SMTP) Server** - smtp01.example.com:587, smtp02.example.com
- **User Name** - myadmin
- **Password** - \*\*\*\*\*
- **Confirm Password** - \*\*\*\*\*
- **Identify Sender As** - Enterprise Manager
- **Sender's E-mail Address** - mgmt\_rep@example.com
- **Use Secure Connection** - *No*: E-mail is not encrypted. *SSL*: E-mail is encrypted using the Secure Sockets Layer protocol. *TLS, if available*: E-mail is encrypted using the Transport Layer Security protocol if the mail server supports TLS. If the server does not support TLS, the e-mail is automatically sent as plain text.

Figure 3–1 Defining a Mail Server

**Setup**

Enterprise Manager requires the following information to send e-mail notifications by means of Incident Rules. When specifying multiple SMTP servers, separate each server by a comma or space. Revert Apply Test Mail Servers

**Outgoing Mail (SMTP) Server**

Use the format SERVER:PORT (Example: SMTP1:587). Port 25 is used if no port is specified for the server. (Example: SMTP1, MyServer:587).

**User Name**

Specify user name if your SMTP server requires authentication.

**Password**

Specify the authentication password. The name and password will be used for all SMTP servers.

**Confirm Password**

**Identify Sender As**

**Sender's E-mail Address**

**Use Secure Connection** ☒ No ☐ TLS, if available ☐ SSL

**Scripts and SNMP Traps**

Before Enterprise Manager can send notifications by means of OS commands, PL/SQL procedures, or SNMP traps, they must first be defined as Notification Methods. Administrators can then use these methods in Incident Rules.

Add OS Command Go

| Name                           | Type | Support Repeat Notifications |
|--------------------------------|------|------------------------------|
| No notification methods found. |      |                              |

**TIP** Remember to create Incident Rules in order to send notifications by means of these methods.

**Repeat Notifications**

Repeat notifications allow you to be notified repeatedly about the same events, incidents or problems. Once enabled, you will still need to choose the repeat notification option in each Incident Rule that will use it. If you disable repeat notifications on this page, all repeat notifications will stop.

☐ Send Repeat Notifications

Repeat Frequency (minutes)

Maximum Repeat Notifications

---

**Note:** The e-mail address you specify on this page is not the e-mail address to which the notification is sent. You will have to specify the e-mail address (where notifications will be sent) from the Password and E-mail page. From the **Setup** menu, choose **MyPreferences** and then **Enterprise Manager Password & E-mail**.

---

After configuring the e-mail server, click **Test Mail Servers** to verify your e-mail setup. You should verify that an e-mail message was received by the e-mail account specified in the **Sender's E-mail Address** field.

Defining multiple mail servers will improve the reliability of e-mail notification delivery. E-mail notifications will be delivered if at least one e-mail server is up. The notification load is balanced across multiple e-mail servers by the OMS, which switches through them (servers are allocated according to availability) after 20 e-mails have been sent. Switching is controlled by the *em.notification.emails\_per\_connection* emoms property.

### 3.1.1.1 Setting Up Repeat Notifications

Repeat notifications allow administrators to be notified repeatedly until an incident is either acknowledged or the number of **Maximum Repeat Notifications** has been reached. Enterprise Manager supports repeat notification for all notification methods

(e-mail, OS command, PL/SQL procedure, and SNMP trap). To enable this feature for a notification method, select the **Send Repeat Notifications** option. In addition to setting the maximum number of repeat notifications, you can also set the time interval at which the notifications are sent.

---

**Important:** For Oracle database versions 10 and higher, it is recommend that no modification be made to *aq\_tm\_processes* init.ora parameter. If, however, this parameter must be modified, its value should be at least one for repeat notification functionality. If the Enterprise Manager Repository database version is 9.2, the *aq\_tm\_processes* init.ora parameter must be set to at least one to enable repeat notification functionality.

---

### Repeat Notifications for Incident Rules

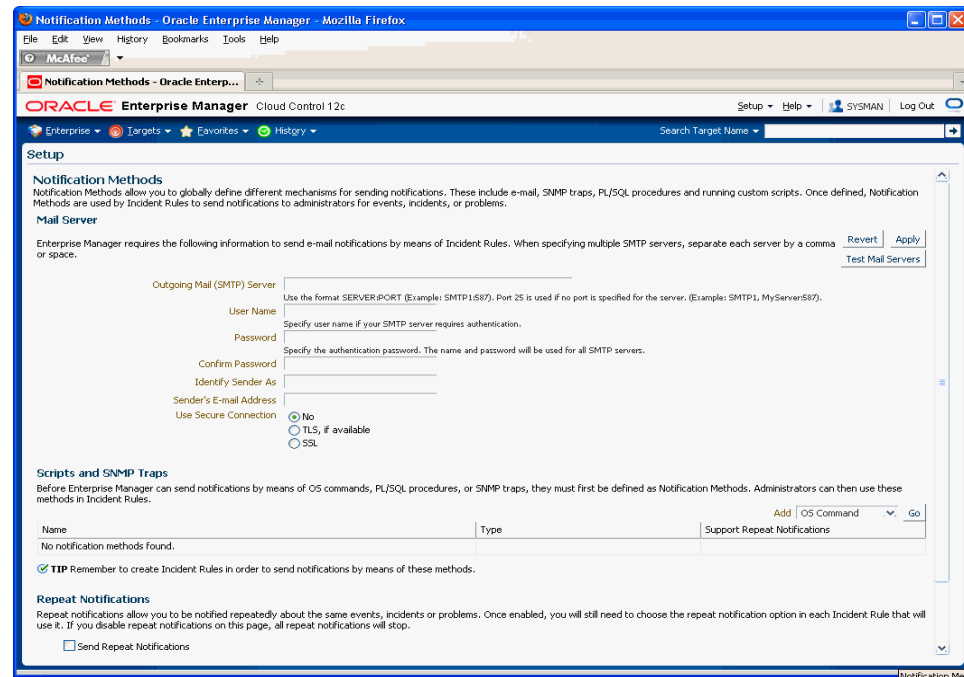

Setting repeat notifications globally at the notification method level may not be provide sufficient flexibility. For example, you may want to have different repeat notification settings based on event type. Enterprise Manager accomplishes this by allowing you to set repeat notifications for individual incident rule sets or individual rules within a rule set. Repeat notifications set at the rule level take precedence over those defined at the notification method level.

---

**Important:** Repeat notifications for rules will only be sent if the **Send Repeat Notifications** option is enabled in the Notification Methods page.

---

For PL/SQL, OS command, and SNMP trap notification methods, you must enable each method to support repeat notifications. You can select **Supports Repeat Notifications** option when adding a new notification method or by editing an existing method.

**Figure 3–2 Enabling Repeat Notification for an OS Command Notification Method**

### 3.1.2 Setting Up E-mail for Yourself

If you want to receive notifications by e-mail, you will need to specify your e-mail address(s) in the Password & E-mail page (from the Setup menu, select **MyPreferences**, then select **Enterprise Manager Password & E-mail**). In addition to defining notification e-mail addresses, you associate the notification message format (long, short, pager) to be used for your e-mail address.

Setting up e-mail involves three steps:

**Step 1: Define e-mail addresses.**

**Step 2: Set up a Notification Schedule.**

**Step 3: Subscribe to incident rules in order to receive e-mails.**

#### 3.1.2.1 Defining E-mail Addresses

An e-mail address can have up to 128 characters. There is no upper limit with the number of e-mail addresses.

To add an e-mail address:

1. From the **Setup** menu, select **MyPreferences**, then select **Enterprise Manager Password & E-mail**.
2. Click **Add Another Row** to create a new e-mail entry field in the **E-mail Addresses** table.
3. Specify the e-mail associated with your Enterprise Manager account. All e-mail notifications you receive from Enterprise Manager will be sent to the e-mail addresses you specify.

For example, `user1@oracle.com`

Select the *E-mail Type* (message format) for your e-mail address. *E-mail (Long)* sends a HTML formatted e-mail that contains detailed information. [Example 3-2](#) shows a typical notification that uses the long format.

*E-mail (Short)* and *Pager(Short)* ([Example 3-3](#)) send a concise, text e-mail that is limited to a configurable number of characters, thereby allowing the e-mail be received as an SMS message or page. The content of the message can be sent entirely in the subject, entirely in the body or split across the subject and body.

For example, in the last case, the subject could contain the severity type (for example, Critical) and the target name. The body could contain the time the severity occurred and the severity message. Since the message length is limited, some of this information may be truncated. If truncation has occurred there will be an ellipsis end of the message. *Pager(Short)* addresses are used for supporting the paging feature in incident rules. Note that the incident rules allow the rule author to designate some users to receive a page for critical issues.

4. Click **Apply** to save your e-mail address.

#### **Example 3-2 Long E-mail Notification for Metric Alerts**

```
Target type=Host
Target name=machine6140830.example.com
Message=Filesystem / has 54.39% available space, fallen below warning (60) or
critical (30) threshold.
Severity=Warning
Event reported time=Apr 28, 2011 2:33:55 PM PDT
Event Type=Metric Alert
Event name=Filesystems:Filesystem Space Available (%)
Metric Group=Filesystems
Metric=Filesystem Space Available (%)
Metric value=54.39
Key Value=/
Key Column 1=Mount Point
Rule Name=NotifRuleSet1,Event rule1
Rule Owner=SYSMAN
```

#### **Example 3-3 Short E-mail Notification for Alerts**

```
Subject is :
EM:Unreachable Start:myhost
Body is :
Nov 16, 2006 2:02:19 PM EST:Agent is Unreachable (REASON = Connection refused)
but the host is UP
```

#### **More about E-mail(Short) and Pager(Short) Formats**

Enterprise Manager does not directly support message services such as paging or SMS, but instead relies on external gateways to, for example, perform the conversion from e-mail to page. Beginning with Enterprise Manager 12c, the notification system allows you to tag e-mail addresses explicitly as 'page' or 'e-mail'. Explicit system differentiation between these two notification methods allows you to take advantage of the multiple action capability of incident rules. For example, the e-mail versus page distinction is required in order to send you an e-mail if an event severity is 'warning' or page you if the severity is 'critical'. To support this capability, a Pager format has been made available that sends an abbreviated version of the short format e-mail.

EMOMS properties can be used for controlling the size and format of the short e-mail. The following table lists emoms properties for Notification System.

**Table 3–1 EMOMS Properties for Notifications**

| Property Name                            | Default    |  |
|--|------------|--|
|  | Value      | Description  |
| em.notification.emails_per_minute        | 250        | Email delivery limits per minute. The Notification system uses this value to throttle number of Email delivery per minutes. Customer should set the value lower if doesn't want to over flow the Email server, or set the value higher if the Email server can handle high volume of Emails. |
| em.notification.cmds_per_minute          |            | OS Command delivery limits per minute. The Notification system uses this value to throttle number of OS Command delivery per minutes.  |
| em.notification.os_cmd_timeout           | 30         | OS Command delivery timeout in seconds. This value indicates how long to allow OS process to execute the OS Command delivery. Set this value higher if the OS command script requires longer time to complete execution.   |
| em.notification.plsql_per_minute         | 250        | PL/SQL delivery limits per minute. The Notification system uses this value to throttle number of PL/SQL delivery per minutes.  |
| em.notification.java_per_minute          | 500        | JAVA delivery limits per minute. The Notification system uses this value to throttle number of Java delivery per minutes.  |
| em.notification.ticket_per_minute        | 250        | Ticket delivery limits per minute. The Notification system uses this value to throttle number of Ticket delivery per minutes.  |
| em.notification.traps_per_minute         | 250        | SNMP delivery limits per minute. The Notification system uses this value to control the number of SNMP Trap per minutes.   |
| em.notification.locale.plsql             | OMS Locale | This property specifies the Locale delivered by advanced PL/SQL notification. The customer can define this property to overwrite the default Locale where the OMS is installed.  |
| em.notification.locale.email             | OMS Locale | This property specifies the Locale delivered by Email. Customer can define this property to overwrite the default Locale where the OMS is installed.   |
| em.notification.locale.osmcd             | OMS Locale | This property specifies the Locale delivered by OS Command. Customer can define this property to overwrite the default Locale where the OMS is installed.  |
| em.notification.locale.snmp              | OMS Locale | This property specifies the Locale delivered by SNMP trap. Customer can define this property to overwrite the default Locale where the OMS is installed.   |
| em.notification.oscmd.max_env_var_length | 512        | The maximum length of OS Common environment variable value.  |
| em.notification.snmp.max_oid_length      | 2560       | The maximum length of SNMP OID value.  |

**Table 3–1 (Cont.) EMOMS Properties for Notifications**

| Property Name                                   | Default  |   |
|---|--|---|
|   | Value  | Description   |
| em.notification.min_delivery_threads            | 6  | The minimum number of active threads in the thread pool initially and number of active threads are running when system is in low activities. Setting the value higher will use more system resources, but will deliver more notifications.                      |
| em.notification.max_delivery_threads            | 24   | The maximum number of active threads in the thread pool when the system is in the high activities. This value should greater than em.notification.min_delivery_threads. Setting the value higher will use more system resources and deliver more notifications. |
| em.notification.short_format_length             | >=1<br>(155)                                     | The size limit of the total number of characters in short email format. The customer should modify this property value to fit their Email or Pager limit content size.  |
| em.notification.snmp_packet_length              | >=1<br>(5120)                                    | The maximum size of SNMP Protocol Data unit.  |
| em.notification.email_content_transfer_encoding | 8-bit,<br>7-bit(QP),<br>7-bit(BASE64)<br>(8-bit) | The character set that can encode the Email. Oracle supports three character sets : 8-bit, 7-bit(QP), and 7-bit(BASE64).  |
| em.notification.emails_per_connection           | >=1 (20)   | The maximum number of emails delivered to same email gateway before switching to the next available email gateway (assumes customers have configured multiple email gateways). This property is used for email gateway load balance.                            |
| em.notification.short_format                    | both,<br>subject,<br>body<br>(both)              | Use short format on both subject and body, subject only, or body only..   |

You must establish the maximum size your device can support and whether the message is sent in subject, body or both.

You can modify the EMOMS properties by using the Enterprise Manager command line control `emctl get/set/delete/list property` command.

#### Get Property Command

```
emctl get [-sysman_pwd "sysman password"]-name em.notification.short_format_length
```

#### Set Property Command

```
emctl set property -name em.notification.short_format_length -value 155
```

#### Emoms Properties Entries for a Short E-mail Format

```
emctl set property -name em.notification.short_format_length -value 155
emctl set property -name em.notification.short_format -value both
```

### 3.1.2.2 Setting Up a Notification Schedule

Once you have defined your e-mail notification addresses, you will need to define a notification schedule. For example, if your e-mail addresses are user1@oracle.com, user2@oracle.com, user3@oracle.com, you can choose to use one or more of these e-mail addresses for each time period in your notification schedule.

---

**Note:** When you enter e-mail addresses for the first time, a 24x7 weekly notification schedule is set automatically. You can then review and modify the schedule to suit your monitoring needs.

---

A notification schedule is a repeating schedule used to specify your on-call schedule—the days and time periods and e-mail addresses that should be used by Enterprise Manager to send notifications to you. Each administrator has exactly one notification schedule. When a notification needs to be sent to an administrator, Enterprise Manager consults that administrator's notification schedule to determine the e-mail address to be used. Depending on whether you are Super Administrator or a regular Enterprise Manager administrator, the process of defining a notification schedule differs slightly.

**If you are a regular Enterprise Manager administrator and are defining your own notification schedule:**

1. From **Setup** menu, select **Notifications**, then select **My Notification Schedule**.
2. Follow the directions on the Notification Schedule page to specify when you want to receive e-mails.

### 3.1.2.3 Subscribe to Receive E-mail for Incident Rules

An incident rule is a user-defined rule that specifies the criteria by which notifications should be sent for specific events that make up the incident. An incident rule set, as the name implies, consists of one or more rules associated with the same incident.

When creating an incident rule, you specify criteria such as the targets you are interested in, the types of events to which you want the rule to apply. Specifically, for a given rule, you can specify the criteria you are interested in and the notification methods (such as e-mail) that should be used for sending these notifications. For example, you can set up a rule that when any database goes down or any database backup job fails, e-mail should be sent and the "log trouble ticket" notification method should be called. Or you can define another rule such that when the CPU or Memory Utilization of any host reach critical severities, SNMP traps should be sent to another management console.

Notification flexibility is further enhanced by the fact that with a single rule, you can perform multiple actions based on specific conditions. Example: When monitoring a condition such as machine memory utilization, for an incident severity of 'warning' (memory utilization at 80%), send the administrator an e-mail, if the severity is 'critical' (memory utilization at 99%), page the administrator immediately.

You can subscribe to a rule you have already created.

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. On the Incident Rules page, select the desired rule.
3. From the **Actions** menu, select **Notifications**, then select **Basic Notifications**.

### Out-of-Box Incident Rules

Enterprise Manager comes with two incident rule sets that cover the most common monitoring conditions, they are:

- Incident Management Ruleset for All Targets
- Event Management Ruleset for Self Update

If the conditions defined in the out-of-box incident rules meet your requirements, you can simply subscribe to receive e-mail notifications for the conditions defined in the rule using the subscribe procedure shown in the previous section.

### Creating Your Own Incident Rules

You can define your own custom rules. The following procedure documents the process of incident rule creation for non-Super Administrators.

To create your own incident rule:

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.  
The Incident Rules page displays. From this page you can create a new rule set, to which you can add new rules. Alternatively, if you have the requisite permissions, you can add new rules to existing
2. Click **Create Rule Set...**  
The create rule set page displays.
3. Specify the **Name**, **Description**, and the **Targets** to which the rules set should apply.
4. Click the **Rules** tab, then click **Create**.
5. Choose the incoming incident, event or problem to which you want the rule to apply. See "[Setting Up Rule Sets](#)" for more information.
6. Click **Continue**.  
Enterprise Manager displays the Create Incident Rule pages. Enter the requisite information on each page to create your incident rule.
7. Follow the wizard instructions to create your rule.  
Once you have completed defining your rule, the wizard returns you to the create rule set page.
8. Click **Save** to save the incident rule set.

### 3.1.3 Setting Up E-mail for Other Administrators

If you have Super Administrator privileges, you can set up e-mail notifications for other Enterprise Manager administrators. To set up e-mail notifications for other Enterprise Manager administrators, you need to:

#### Step 1: Ensure Each Administrator Account has an Associated E-mail Address

Each administrator to which you want to send e-mail notifications must have a valid e-mail address.

1. From the **Setup** menu, select **Security** and then **Administrators**.
2. For each administrator, define an e-mail address. This sets up a 24x7 notification schedule for this user that uses all the e-mail addresses specified.

Enterprise Manager also allows you to specify an administrator address when editing an administrator's notification schedule.

### Step 2: Define Administrators' Notification Schedules

Once you have defined e-mail notification addresses for each administrator, you will need to define their respective notification schedules. Although a default 24x7 notification schedule is created when you specify an e-mail address for the first time, you should review and edit the notification schedule as needed.

1. From the **Setup** menu, select **Notifications**, then select **Notification Schedule**.

From the vertical navigation bar, click Schedules (under Notification). The Notification Schedule page appears.

2. Specify the administrator who's notification schedule you wish to edit and click **Change**.
3. Click **Edit Schedule Definition**. The Edit Schedule Definition: Time Period page appears. If necessary, modify the rotation schedule.
4. Click **Continue**. The Edit Schedule Definition: E-mail Addresses page appears.
5. Follow the directions on the Edit Schedule Definition: E-mail Addresses page to modify the notification schedule.
6. Click **Finish** when you are done.
7. Repeat steps three through seven for each administrator.

### Step 3: Assign Incident Rules to Administrators

With the notification schedules set, you now need to assign the appropriate incident rules for each designated administrator.

1. From the **Setup** menu, select **Incidents**, then select **Incident Rules**.
2. Select the desired **Ruleset** and click **Edit**.
3. Click on the **Rules** tab, select the desired rule and click **Edit**.
4. Click **Add Actions**, select desired action and click **Edit**.
5. Enter the **Administrator** name on either **E-mail To** or **E-mail Cc** field in the **Basic Notification** region.
6. Click **Continue**, click **Next**, click **Next**, click **Continue**, and finally click **Save**.

## 3.1.4 E-mail Customization

Enterprise Manager allows Super Administrators to customize global e-mail notifications for the following types: All events, incidents, problems, and specific event types installed. You can alter the default behavior for all events by customizing *Default Event Email Template*. In addition, you can further customize the behavior for a specific event type by customizing the template for the event type. For instance, you can customize the *Metric Alert Events* template for the metric alert event type. Using predefined building blocks (called attributes and labels) contained within a simple script, Super Administrators can customize alert e-mails by selecting from a wide variety of information content.

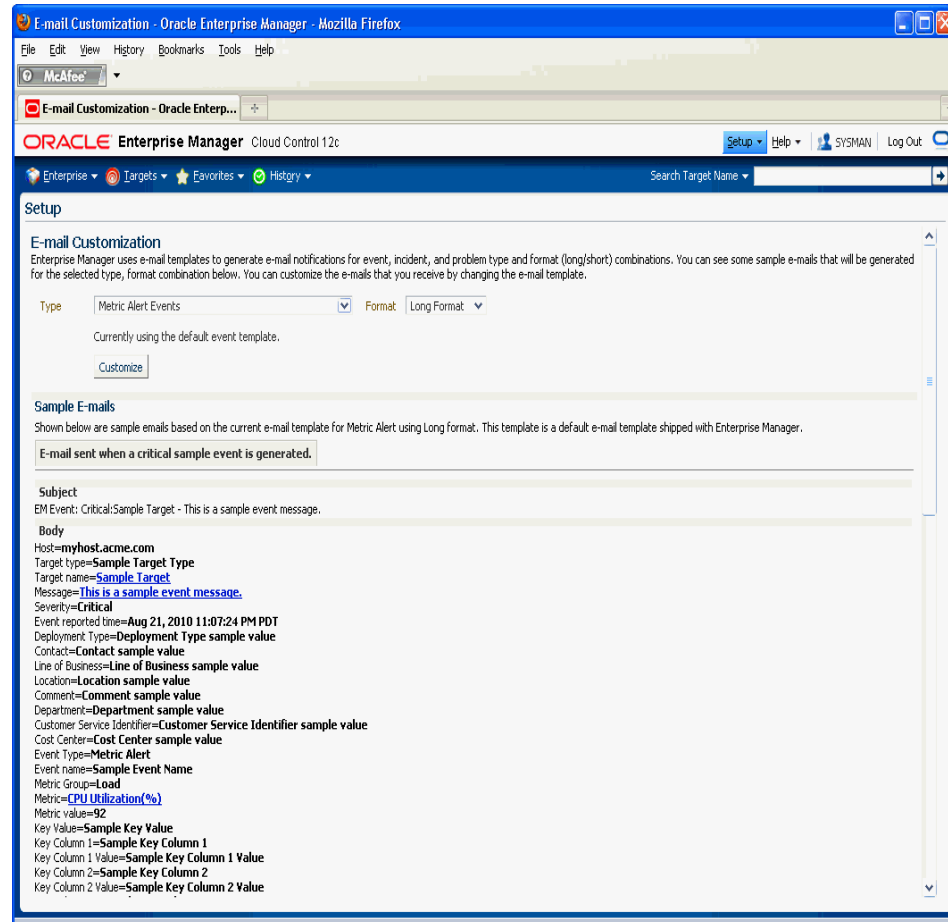

To customize an e-mail:

1. From the **Setup** menu, select **Notifications**, then select **Customize Email Formats**.
2. Choose the **Type** and **Format**.

3. Click **Customize**. The Customize E-mail Template page displays.

From the Customize E-mail Template page, you can modify the content of the e-mail template Enterprise Manager uses to generate e-mail notifications. Extensive information on script formatting, syntax, and options is available from the Edit E-mail Template page via imbedded assistance and online help.

**Figure 3–3 E-mail Customization**

### 3.1.4.1 E-mail Customization Reference

The following reference summarizes the semantics and component syntax of the pseudo-language used to define e-mails. The pseudo-language provides you with a simple, yet flexible way to customize e-mail notifications. The following is a summary of pseudo-language conventions/limitations:

- You can add comments (or any free-form text) using separate lines beginning with "--" or at end of lines.
- You can use attributes.
- You can use IF & ELSE & ENDIF control structures. You can also use multiple conditions using "AND" or "OR". Nested IF statements are not supported.
- You can insert spaces for formatting purposes. Spaces at the beginning of a line will be ignored in the actual e-mail. To insert spaces at the beginning of a line, use the [SP] attribute.

- Use "/" to escape and "[" or "]" if you want to add attribute names, operators, or IF clauses to the actual e-mail.
- HTML is not supported.

### Reserved Words and Operators

The following table lists all reserved words and operators used when modifying e-mail scripts.

**Table 3–2 Reserved Words and Operators**

| Reserved Word/Operator | Description   |
|------------------------|---|
| IF, ELSIF, ENDIF, ELSE | Used in IF-ELSE constructs.   |
| AND, OR                | Boolean operators – used in IF-ELSE constructs only.  |
| NULL                   | To check NULL value for attributes - used in IF-ELSE constructs only.   |
|                        | Pipe operator – used to show the first non-NULL value in a list of attributes.<br><br>For example:<br><code>METRIC_NAME   SEVERITY</code>                             |
| EQ, NEQ                | Equal and Not-Equal operators – applicable to NULL, STRING and NUMERIC values.  |
| /                      | Escape character – used to escape reserved words and operators. Escape characters signify that what follows the escape character takes an alternative interpretation. |
| [, ]                   | Delimiters used to demarcate attribute names and IF clauses.  |

### Syntax Elements

#### Literal Text

You can specify any text as part of the e-mail content. The text will be displayed in the e-mail and will not be translated if the Oracle Management Services (OMS) language setting is changed. For example, 'my Oracle Home' appears as 'my Oracle Home' in the generated e-mail.

#### Predefined Attributes

Predefined attributes/labels will be substituted with actual values in a specific context. To specify a predefined attribute/label, use the following syntax:

```
[ PREDEFINED_ATTR ]
```

Attribute names can be in either UPPER or LOWER case. The parsing process is case-insensitive.

A pair of square brackets is used to distinguish predefined attributes from literal text. For example, for a job e-mail notification, the actual job name will be substituted for `[EXECUTION_STATUS]`. For a metric alert notification, the actual metric column name will be substituted for `[METRIC_COLUMN]`.

You can use the escape character "/" to specify words and not have them interpreted as predefined labels/attributes. For example, `"/[NEW/]"` will not be considered as the predefined attribute `[NEW]` when parsed.

**Operators**

EQ, NEQ – for text and numeric values

NULL- for text and numeric values

GT, LT, GE, LE – for numeric values

**Control Structures**

The following table lists acceptable script control structures.

**Table 3–3 Control Structures**

| Control Structure | Description   |
|-------------------|---|
| Pipe " "          | <p>Two or more attributes can be separated by ' ' character. For example,</p> <p>[METRIC_NAME   SEVERITY]</p> <p>In this example, only the applicable attribute within the current alert context will be used (replaced by the actual value) in the e-mail. If more than one attributes are applicable, only the left-most attribute is used.</p> |

**Table 3–3 (Cont.) Control Structures**

| Control Structure | Description   |
|-------------------|---|
| IF                | <p>Allows you to make a block of text conditional. Only one level of IF and ELSIF is supported. Nested IF constructs are not supported.</p> <p>All attributes can be used in IF or ELSIF evaluation using EQ/NEQ operators on NULL values. Other operators are allowed for "SEVERITY" and "REPEAT_COUNT" only.</p> <p>Inside the IF block, the values need to be contained within quotation marks "". Enterprise Manager will extract the attribute name and its value based on the position of "EQ" and other key words such as "and", "or". For example,</p> <pre>[IF REPEAT_COUNT EQ "1" AND SEVERITY EQ "CRITICAL" THEN]</pre> <p>The statement above will be true when the attributes of the alert match the following condition:</p> <ul style="list-style-type: none"> <li>■ Attribute Name: REPEAT_COUNT</li> <li>■ Attribute Value: 1</li> <li>■ Attribute Name: SEVERITY</li> <li>■ Attribute Value: CRITICAL</li> </ul> <p>Example IF Block:</p> <pre>[IF EXECUTION_STATUS NEQ NULL]     [JOB_NAME_LABEL] = [EXECUTION_STATUS]     [JOB_OWNER_LABEL] = [JOB_OWNER] [ENDIF]</pre> <pre>[IF SEVERITY_CODE EQ CRITICAL ]     [METRIC_NAME_LABEL] = [METRIC_GROUP]     [METRIC_VALUE_LABEL] = [METRIC_VALUE]     [TARGET_NAME_LABEL] = [TARGET_NAME]     [KEY_VALUES] [ENDIF]</pre> <p>Example IF and ELSEIF Block:</p> <pre>[IF SEVERITY_CODE EQ CRITICAL]     statement1  [ELSIF SEVERITY_CODE EQ WARNING]     statement2  [ELSIF SEVERITY_CODE EQ CLEAR]     statement3  [ELSE]     statement4  [ENDIF]</pre> |

**Comments**

You can add comments to your script by prefacing a single line of text with two hyphens "--". For example,

```
-- Code added on 8/3/2009
[IF REPEAT_COUNT NEQ NULL]
. . .
```

Comments may also be placed at the end of a line of text.

```
[IF SEVERITY_SHORT EQ W] -- for Warning alert
```

### HTML Tags in Customization Content

Use of HTML tags is not supported.

When Enterprise Manager parses the e-mail script, it will convert the "<" and ">" characters of HTML tags into encoded format (&lt; and &gt;). This ensures that the HTML tag is not treated as HTML by the destination system.

### Examples

E-mail customization template scripts support three main operators.

- Comparison operators: EQ/NEQ/GT/LT/GE/LE
- Logic operators: AND/OR
- Pipeline operator: |

## 3.2 Extending Notification Beyond E-mail

Notification Methods are the mechanisms by which notifications are sent. Enterprise Manager Super Administrators can set up e-mail notifications by configuring the 'e-mail' notification method. Most likely this would already have been set up as part of the Oracle Management Service installation.

Enterprise Manager Super Administrators can also define other custom notification methods. For example, event notifications may need to be forwarded to a 3rd party trouble-ticketing system. Assuming APIs to the third-party trouble-ticketing system are available, a custom notification method can be created to call a custom OS script that has the appropriate APIs. The custom notification method can be named in a user-friendly fashion, for example, "Log trouble ticket". Once the custom method is defined, whenever an administrator needs to send alerts to the trouble-ticketing system, he simply needs to invoke the now globally available notification method called "Log trouble ticket".

Custom notification methods can be defined based on any custom OS script, any custom PL/SQL procedure, or by sending SNMP traps. A fourth type of notification method (Java Callback) exists to support Oracle internal functionality and cannot be created or edited by Enterprise Manager administrators.

Only Super Administrators can define OS Command, PL/SQL, and SNMP Trap notification methods. However, any Enterprise Manager administrator can add these notification methods (once defined by the Super Administrator) as actions to their incident rules.

Through the Notification Methods page, you can:

- Set up the outgoing mail servers if you plan to send e-mail notifications through incident rules
- Create other custom notification methods using OS and PL/SQL scripts and SNMP traps.
- Set global repeat notifications.

### 3.2.1 Custom Notification Methods Using Scripts and SNMP Traps

You can create other custom notification methods based on OS scripts, PL/SQL procedures, or SNMP traps. Any administrator can then use these methods in incident rules.

The length of the SNMP OID value is limited to 2560 bytes by default. Configure emoms property `em.notification.snmp.max_oid_length` to change the default limit.

For Enterprise Manager 12c, SNMP traps are delivered for event notifications only. SNMP trap notifications are not supported for incidents or problems.

---

**Note:** SNMP advanced notification methods defined using previous versions of Enterprise Manager (pre-12c) will continue to function without modification. Traps will conform to the older Enterprise Manager MIB definition.

---

#### 3.2.1.1 Adding a Notification Method based on an OS Command or Script

Notification system invokes the custom script when an incident rule matches the OS Command advanced notification action. Custom script receives notifications for matching events, incidents and problem through environment variables.

The length of any environment variable's value is limited to 512 characters by default. Configure emoms property named `em.notification.oscmd.max_env_var_length` for changing the default limit.

---

**Note:** Notification methods based on OS commands must be configured by an administrator with Super Administrator privileges.

---

#### Step 1: Define your OS command or script.

You can specify an OS command or script that will be called by the notification system when an incident rule matches the OS Command advanced notification action. You can use incident, event, or problem context information, corrective action execution status and job execution status within the body of the script. Passing this contextual information to OS commands/scripts allows you to customize automated responses specific event conditions. For example, if an OS script opens a trouble ticket for an in-house support trouble ticket system, you will want to pass severity levels (critical, warning, and so on) to the script to open a trouble ticket with the appropriate details and escalate the problem. For more information on passing specific types of information to OS Command or Scripts, see:

- ["Passing Event, Incident, Problem Information to an OS Command or Script"](#) on page 3-19
- ["Passing Corrective Action Execution Status to an OS Command or Script"](#) on page 3-49
- ["Passing Job Execution Status to an OS Command or Script"](#) on page 3-50

#### Step 2: Deploy the script on each Management Service host.

You must deploy the OS Command or Script on each Management Service host machine that connects to the Management Repository. The OS Command is run as the user who started the Management Service.

The OS Command or Script should be deployed on the same location on each Management Service host machine. The OS Command should be an absolute path, for example, `/u1/bin/logSeverity.sh`. The command is run by the user who started the Management Service. If an error is encountered during the running of the OS Command, the Notification System can be instructed to retry the sending of the notification to the OS Command by returning an exit code of 100. The procedure is initially retried after one minute, then two minutes, then three minutes and so on, until the notification is a day old, at which point it will be purged.

[Example 3-4](#) shows the parameter in `emoms.properties` that controls how long the OS Command can execute without being killed by the Management Service. This is to prevent OS Commands from running for an inordinate length of time and blocking the delivery of other notifications. By default the command is allowed to run for 30 seconds before it is killed. The `em.notification.os_cmd_timeout` `emoms` property can be configured to change the default timeout value.

**Example 3-4 Changing the `em.notification.os_cmd_timeout` EMOMS Property**

```
emctl set property -name em.notification.os_cmd_timeout value 30
```

**Step 3: Register your OS Command or Script as a new Notification Method.**

Add this OS command as a notification method that can be called in incident rules. Log in as a Super Administrator. From the **Setup** menu, select **Notifications**, then select **Notification Methods**. From this page, you can define a new notification based on the 'OS Command' type. See ["Adding a Notification Method based on an OS Command or Script"](#).

The following information is required for each OS command notification method:

- Name
- Description
  - Both Name and Description should be clear and intuitive so that the function of the method is clear to other administrators.
- OS Command

You must enter the full path of the OS command or script in the OS command field (for example, `/u1/bin/myscript.sh`). For environments with multiple Management Services, the path must be exactly the same on each machine that has a Management Service. Command line parameters can be included after the full path (for example, `/u1/bin/myscript.sh arg1 arg2`).

[Example 3-5](#) shows information required for the notification method.

**Example 3-5 OS Command Notification Method**

```
Name Trouble Ticketing
Description Notification method to log trouble ticket for a severity occurrence
OS Command /private/mozart/bin/logTicket.sh
```

---

**Note:** There can be more than one OS Command configured per system.

---

**Step 4: Assign the notification method to an instance rule.**

You can edit an existing rule (or create a new instance rule), then go to the Methods page. From the **Setup** menu, choose **Incidents** and then **Incident Rules**. The Incident Rules page provides access to all available rule sets.

### Passing Event, Incident, Problem Information to an OS Command or Script

The notification system passes information to an OS script or executable using system environment variables.

Conventions used to access environmental variables vary depending on the operating system:

- UNIX: \$ENV\_VARIABLE
- Windows: %ENV\_VARIABLE%

The notification system sets the following environment variables before calling the script. The script can then use any or all of these variables within the logic of the script.

### Environment Variables Common to Event, Incident and Problem

**Table 3–4 Generic Environment Variables**

| Environment Variable | Description   |
|----------------------|---|
| NOTIF_TYPE           | Type of notification and possible values<br>NOTIF_NORMAL,<br>NOTIF_RETRY,<br>NOTIF_DURATION,<br>NOTIF_REPEAT,<br>NOTIF_CA,<br>NOTIF_RCA |
| REPEAT_COUNT         | How many times the notification has been sent out before this notification.   |
| RULESET_NAME         | The name of the ruleset that triggered this notification.   |
| RULE_NAME            | The name of the rule that triggered this notification.  |
| RULE_OWNER           | The owner of the ruleset that triggered this notification.  |
| MESSAGE              | The message of the event, incident, or problem.   |
| MESSAGE_URL          | EM console URL for this message.  |

**Table 3–5 Category-Related Environment Variables**

| Environment Variable | Description  |
|----------------------|--|
| CATEGORIES_COUNT     | Number of categories in this notification. This value is equal to 1 if one category is associated with event, incident or problem. It is equal to 0 if no category associated with event, incident or problem. |
| CATEGORY_CODES_COUNT | Number of category codes in this notification.   |
| CATEGORY_n           | Category is translated based on locale defined in OMS server. Valid values for the suffix "_n" are between 1.. \$CATEGORIES_COUNT  |
| CATEGORY_CODE_n      | Codes for the categories. Valid values for the suffix "_n" are between 1..\$CATEGORY_CODES_COUNT   |

The following lists the common environment variables for User Defined Target Properties. They will be populated under the following cases: (a) When an event has a related target, (b) When an incident or a problem have single event source and have a related target.

**Table 3–6 User-Defined Target Property Environment Variables**

| Environment Variable     | Description      |
|--------------------------|------------------|
| ORCL_GTP_COMMENT         | Comment          |
| ORCL_GTP_CONTACT         | Contact          |
| ORCL_GTP_COST_CENTER     | Cost Center      |
| ORCL_GTP_DEPARTMENT      | Department       |
| ORCL_GTP_DEPLOYMENT_TYPE | Deployment type  |
| ORCL_GTP_LINE_OF_BUS     | Line of Business |
| ORCL_GTP_LOCATION        | Location         |

### Event Notification-Specific Environment Variables

**Table 3–7 Event Notification-Specific Environment Variables**

| Environment Variable   | Description  |
|------------------------|--|
| EVENT_NAME             | Event Name.  |
| EVENT_REPORTED_TIME    | Event reported date.   |
| EVENT_SOURCE_COUNT     | Number of Sources associated with this event.  |
| EVENT_TYPE             | Event type.  |
| EVENT_OCCURRENCE_TIME  | Event occurrence time.   |
| EVENT_TYPE_ATTRS       | The list of event type specific attributes.  |
| EVENT_CONTEXT_ATTRS    | Event context data.  |
| LAST_UPDATED_TIME      | Last updated time  |
| SEQUENCE_ID            | Event sequence global unique identifier.   |
| SEVERITY               | Severity of event, it is translated.   |
| SEVERITY_CODE          | Code for event severity. Possible values are the following.<br>FATAL, CRITICAL, WARNING, MINOR_WARNING, INFORMATIONAL, and CLEAR |
| ACTION_MSG             | Message describing the action to take for resolving the event.   |
| TOTAL_OCCURRENCE_COUNT | Total number of duplicate occurrences  |
| SEQUENCE_ID            | Event sequence ID  |
| RCA_DETAILS            | If RCA is associated with this events.   |

The following tables lists the environment variables for the incident associated with an event. They are populated when the event is associated with an incident.

**Table 3–8 Associated Incident Environment Variables**

| Environment Variable                 | Description   |
|--------------------------------------|---|
| ASSOC_INCIDENT_ACKNOWLEDGED_BY_OWNER | Set to yes, if associated incident was acknowledged by owner  |
| ASSOC_INCIDENT_ACKNOWLEDGED_DETAILS  | The details of associated incident acknowledgement. For example:<br>No - if not acknowledged<br>Yes By userName - if acknowledged |
| ASSOC_INCIDENT_STATUS                | Associated Incident Status  |
| ASSOC_INCIDENT_ID                    | Associated Incident ID  |
| ASSOC_INCIDENT_PRIORITY              | Associated Incident priority. Supported value are Urgent, Very High, High, Medium, Low, None.                                     |
| ASSOC_INCIDENT_OWNER                 | Associated Incident Owner if it is existed.   |
| ASSOC_INCIDENT_ESCALATION_LEVEL      | Escalation level of the associated incident has a value between 0 to 5.   |

Following lists the common environment variables related to the Source Object. They are populated when \$SOURCE\_OBJ\_TYPE is not TARGET.

**Table 3–9 Source Object-Related Environment Variables**

| Environment Variable | Description   |
|----------------------|---|
| SOURCE_OBJ_TYPE      | Type of the Source object. For example, JOB, TEMPLATE.  |
| SOURCE_OBJ_NAME      | Source Object Name.   |
| SOURCE_OBJ_NAME_URL  | Source's event console URL.   |
| SOURCE_OBJ_SUB_TYPE  | Sub-type of the Source object. For example, it provides the underlying job type for job status change events. |
| SOURCE_OBJ_OWNER     | Owner of the Source object.   |

Following lists the common environment variables for the target, associated with the given issue. They are populated when the issue is related to a target.

**Table 3–10 Target-Related Environment Variables**

| Environment Variable | Description  |
|----------------------|--|
| TARGET_NAME          | Name of Target   |
| TARGET_TYPE          | Type of Target   |
| TARGET_OWNER         | Owner of Target  |
| HOST_NAME            | The name of the host on which the target is deployed upon. |
| TARGET_URL           | Target's Enterprise Manager Console URL.                   |

**Table 3–10 (Cont.) Target-Related Environment Variables**

| Environment Variable    | Description   |
|-------------------------|---|
| TARGET_LIFECYCLE_STATUS | Life Cycle Status of the target. Possible values: Production, Mission Critical, Stage, Test, and Development.<br>It is null if not defined. |
| TARGET_VERSION          | Target Version of the target  |

Events are classified into multiple types. For example, the merte\_alert event type is used for modeling metric alerts. Following SQL query lists the environment variables corresponding to the event type specific attributes.

```

Select event_class as event_type, upper(name) as env_var_name
from em_event_class_attrs
where notif_order != 0
and event_class is not null
union
select event_class as event_type, upper(name) || '_NLS' as env_var_name
from em_event_class_attrs
where notif_order != 0
and event_class is not null
and is_translated = 1
order by event_type, env_var_name;

```

There is environment variable payload specific to each event type which can be accessed from the OS scripts. The following tables list notification attributes for the most critical event types.

**Table 3–11 Environment variables specific to Metric Alert event type**

| Environment Variable   | Description  |
|------------------------|--|
| COLL_NAME              | The name of the collection collecting the metric.                        |
| COLL_NAME_NLS          | The translated name of the collection collecting the metric              |
| KEY_COLUMN_X           | Internal name of Key Column X where X is a number between 1 and 7.       |
| KEY_COLUMN_X_NLS       | Translated name of Key Column X where X is a number between 1 and 7.     |
| KEY_COLUMN_X_VALUE     | Value of Key Column X where X is a number between 1 and 7.               |
| KEY_VALUE              | Monitored object for the metric corresponding to the Metric Alert event. |
| METRIC_COLUMN          | The name of the metric column  |
| METRIC_COLUMN_NLS      | The translated name of the metric column.                                |
| METRIC_DESCRIPTION     | Brief description of the metric.   |
| METRIC_DESCRIPTION_NLS | Translated brief description of the metric.                              |
| METRIC_GROUP           | The name of the metric.  |
| METRIC_GROUP_NLS       | The translated name of the metric  |
| NUM_KEYS               | The number of key metric columns in the metric.                          |
| SEVERITY_GUID          | The GUID of the severity record associated with this metric alert.       |

**Table 3–11 (Cont.) Environment variables specific to Metric Alert event type**

| Environment Variable | Description                                   |
|----------------------|---|
| VALUE                | Value of the metric when the event triggered. |

**Table 3–12 Environment variables specific to Target Availability event type**

| Environment Variable | Description   |
|----------------------|---|
| AVAIL_SEVERITY       | The transition severity that resulted in that status of the target to change to the current availability status.. |
| AVAIL_SUB_STATE      | The sub-status of a target for the current status.  |
| CYCLE_GUID           | The GUID of the first severity record in this availability cycle.   |
| METRIC_GUID          | Metric GUID of response metric.   |
| SEVERITY_GUID        | The GUID of the severity record associated with this availability status.   |
| TARGET_STATUS        | The current availability status of the target.  |
| TARGET_STATUS-NLS    | The translated current availability status of the target.   |

**Table 3–13 Environment variables specific to Job Status Change event type**

| Environment Variable | Description                                 |
|----------------------|---|
| EXECUTION_ID         | Unique ID of the job execution..            |
| EXECUTION_LOG        | The job output of the last step executed.   |
| EXECUTION_STATUS     | The internal status of the job execution.   |
| EXECUTION_STATUS-NLS | The translated status of the job execution. |
| EXEC_STATUS_CODE     | Execution status code of job execution.     |
| STATE_CHANGE_GUID    | Unique ID of last status change             |

You can use SQL queries to list the deployed event types in your deployment and the payload specific to each one of them. The following SQL can be used to list all internal event type names which are registered in the Enterprise Manager.

```
select class_name as event_type_name from em_event_class;
```

Following SQL lists environment variables specific to metric\_alert event type.

```
select env_var_name
  from
    ( Select event_class as event_type, upper(name) as env_var_name
      from em_event_class_attrs
     where notif_order != 0
       and event_class is not null
     union
      select event_class as event_type, upper(name) || '_NLS' as env_var_name
      from em_event_class_attrs
     where notif_order != 0
       and event_class is not null
       and is_translated = 1)
```

```
where event_type = 'metric_alert';
```

You can also obtain the description of notification attributes specific to an event type directly from the Enterprise Manager console:

1. From the **Setup** menu, select **Notifications**, then select **Customize Email Formats**.
2. Select the event type.
3. Click **Customize**.
4. Click **Show Predefined Attributes**.

Environment variables, ending with the suffix `_NLS`, provide the translated value for given attribute. For example, `METRIC_COLUMN_NLS` environment variable will provide the translated value for the `metric_column` attribute. Translated values will be in the locale of the OMS.

### Environment Variables Specific to Incident Notifications

**Table 3–14** *Incident-Specific Environment Variables*

| Environment Variable           | Description  |
|--------------------------------|--|
| SEVERITY                       | Incident Severity, it is translated. Possible Values: Fatal, Critical, Warning, Informational, Clear                           |
| SEVERITY_CODE                  | Code for Severity.<br><br>Possible values are the<br>FATAL, CRITICAL, WARNING, MINOR_WARNING,<br>INFORMATIONAL, and CLEAR      |
| INCIDENT_REPORTED_TIME         | Incident reported time   |
| INCIDENT_ACKNOWLEDGED_BY_OWNER | Set yes, if incident is acknowledged by owner.   |
| INCIDENT_ID                    | Incident ID  |
| INCIDENT_OWNER                 | Incident Owner   |
| ASSOC_EVENT_COUNT              | The number events associated with this incident.   |
| INCIDENT_STATUS                | Incident status. There are two internal fixed resolution status.<br>NEW<br>CLOSED<br><br>Users can define additional statuses. |
| ESCALATED                      | Is Incident escalated  |
| ESCALATED_LEVEL                | The escalated level of incident.   |
| PRIORITY                       | Incident priority. It is the translated priority name. Possible Values: Urgent, Very High, High, Medium, Low, None             |

**Table 3–14 (Cont.) Incident-Specific Environment Variables**

| Environment Variable | Description   |
|----------------------|---|
| PRIOTITY_CODE        | Incident priority code<br>It is the internal value defined in EM.<br>PRIORITY_URGENT<br>PRIORITY_VERY_HIGH<br>PRIORITY_HIGH<br>PRIORITY_MEDIUM<br>PRIORITY_LOW<br>PRIORITY_NONE |
| TICKET_STATUS        | Status of external ticket, if it exists.  |
| TICKET_ID            | ID of external ticket, if it exists.  |
| LAST_UPDATED_TIME    | Incident last update time   |

Following lists the associated problem's environment variables, when the incident is associated with a problem.

**Table 3–15 Associated Problem Environment Variables**

| Environment Variable                | Description  |
|-------------------------------------|--|
| ASSOC_PROBLEM_ACKNOWLEDGED_BY_OWNER | Set to yes, if this problem was acknowledged by owner                  |
| ASSOC_PROBLEM_STATUS                | Associated Problem Status  |
| ASSOC_PROBLEM_ID                    | Associated Problem ID  |
| ASSOC_PROBLEM_PRIORITY              | Associated Problem priority  |
| ASSOC_PROBLEM_OWNER                 | Associated Problem Owner if it is existed.                             |
| ASSOC_PROBLEM_ESCALATION_LEVEL      | Escalation level of the associated Problem has a value between 0 to 5. |

### Environment Variables Specific to Problem Notifications

**Table 3–16 Problem-Specific Environment Variables**

| Environment Variable  | Description  |
|-----------------------|--|
| SEVERITY              | Problem Severity, it is translated.  |
| SEVERITY_CODE         | Code for Severity.<br>Possible values are :<br>FATAL, CRITICAL, WARNING, MINOR_WARNING, INFORMATIONAL, and CLEAR |
| PROBLEM_REPORTED_TIME | Problem reported time.   |

**Table 3–16 (Cont.) Problem-Specific Environment Variables**

| <b>Environment Variable</b>   | <b>Description</b>  |
|-------------------------------|---|
| PROBLEM_ACKNOWLEDGED_BY_OWNER | Set yes, if problem is acknowledged by owner.   |
| PROBLEM_ID                    | Problem ID  |
| PROBLEM_KEY                   | Problem Key   |
| PROBLEM_OWNER                 | Problem Owner   |
| ASSOC_INCIDENT_COUNT          | The number incident associated with this problem..  |
| PROBLEM_STATUS                | Incident status. They are<br>STATUS_NEW<br>STATUS_CLOSED<br>Any other user defined status.  |
| ESCALATED                     | Is Incident escalated. Yes if it is escalated, otherwise No.  |
| ESCALATED_LEVEL               | The escalated level of incident.  |
| PRIORITY                      | Incident priority. It is the translated priority name..   |
| PRIOTITY_CODE                 | Incident priority code<br>It is the internal value defined in Enterprise Manager.<br>PRIORITY_URGENT<br>PRIORITY_VERY_HIGH<br>PRIORITY_HIGH<br>PRIORITY_MEDIUM<br>PRIORITY_LOW<br>PRIORITY_NONE |
| LAST_UPDATED_TIME             | Last updated time   |
| SR_ID                         | Oracle Service Request Id, if it exists.  |
| BUD_ID                        | Oracle Bug ID, if an associated bug exists.   |

### **Environment Variables Common to Incident and Problem Notifications**

An incident or problem may be associated with multiple event sources. An event source can be a Target, a Source Object, or both.

#### **3.2.1.1.1 Environment Variables Related to Event Sources**

Number of event sources will be set in EVENT\_SOURCE\_COUNT environment variable. Using the EVENT\_SOURCE\_COUNT information, a script can be written to loop through the relevant environment variables to fetch the information about multiple event sources. Environment variables for all event sources are prefixed with EVENT\_SOURCE\_. Environment variables for source objects are suffixed with SOURCE\_<attribute\_name> . For example, EVENT\_SOURCE\_1\_SOURCE\_TYPE provides the source object type of first event source. Environment variables for a target are suffixed with TARGET\_<attribute\_name>. For example, EVENT\_SOURCE\_1\_TARGET\_NAME provides the target name of first event source.

The following table lists the environment variables for source object of x-th Event Source.

**Table 3–17 Source Object of the  $x$ -th Event Source**

| Environment Variable               | Description                      |
|------------------------------------|----------------------------------|
| EVENT_SOURCE_ $x$ _SOURCE_GUID     | Source Object GUID.              |
| EVENT_SOURCE_ $x$ _SOURCE_TYPE     | Source Object Type               |
| EVENT_SOURCE_ $x$ _SOURCE_NAME     | Source Object Name.              |
| EVENT_SOURCE_ $x$ _SOURCE_OWNER    | Source Object Owner.             |
| EVENT_SOURCE_ $x$ _SOURCE_SUB_TYPE | Source Object Sub-Type.          |
| EVENT_SOURCE_ $x$ _SOURCE_URL      | Source Object URL to EM console. |

The following table lists the environment variables for target of  $x$ th Event Source.

**Table 3–18 Target of  $x$ -th Event Source**

| Environment Variable                        | Description               |
|---|---------------------------|
| EVENT_SOURCE_ $x$ _TARGET_GUID              | Target GUID               |
| EVENT_SOURCE_ $x$ _TARGET_NAME              | Target name               |
| EVENT_SOURCE_ $x$ _TARGET_OWNER             | Target Owner              |
| EVENT_SOURCE_ $x$ _TARGET_VERSION           | Target version            |
| EVENT_SOURCE_ $x$ _TARGET_LIFE_CYCLE_STATUS | Target life cycle status  |
| EVENT_SOURCE_ $x$ _TARGET_TYPE              | Target Type               |
| EVENT_SOURCE_ $x$ _HOST_NAME                | Target Host Name          |
| EVENT_SOURCE_ $x$ _TARGET_URL               | Target URL to EM Console. |

### 3.2.1.1.2 Script Examples

The sample OS script shown in [Example 3–6](#) appends environment variable entries to a log file. In this example, the script logs a severity occurrence to a file server. If the file server is unreachable then an exit code of 100 is returned to force the Oracle Management Service Notification System to retry the notification

#### **Example 3–6 Sample OS Command Script**

```
#!/bin/ksh

LOG_FILE=/net/myhost/logs/event.log
if test -f $LOG_FILE
then
```

```
echo $TARGET_NAME $MESSAGE $EVENT_REPORTED_TIME >> $LOG_FILE
else
    exit 100
fi
```

[Example 3-7](#) shows an OS script that logs alert information for both incidents and events to the file 'oscmdNotify.log'. The file is saved to the /net/myhost/logs directory.

### **Example 3-7 Alert Logging Scripts**

```
#!/bin/sh
#
LOG_FILE=/net/myhost/logs/oscmdNotify.log

echo '-----' >> $LOG_FILE

echo 'issue_type=' $ISSUE_TYPE >> $LOG_FILE
echo 'notif_type=' $NOTIF_TYPE >> $LOG_FILE

```

[Example 3-8](#) shows a script that sends an alert to an HP OpenView console from Enterprise Manager Cloud Control. When a metric alert is triggered, the Enterprise Manager Cloud Control displays the alert. The HP OpenView script is then called, invoking `opcmsg` and forwarding the information to the HP OpenView management server.

**Example 3–8 HP OpenView Script**

```
/opt/OV/bin/OpC/opcmsh severity="$SEVERITY" app=OEM msg_grp=Oracle msg_
text="$MESSAGE" object="$TARGET_NAME"
```

**3.2.1.1.3 Migrating pre-12c OS Command Scripts** This section describes how to map pre-12c OS Command notification shell environment variables to 12c OS Command shell environment variables.

Please note that Policy Violations are no longer supported beginning with the 12c release.

**Migrating Metric Alert Event Types**

Following table is the mapping for the OS Command shell environment variables when the event\_type is metric\_alert.

**Table 3–19 pre-12c/12c metric\_alert Environment Variable Mapping**

| Pre-12c Environment Variable | Corresponding 12c Environment Variables  |
|------------------------------|--|
| ACKNOWLEDGED                 | ASSOC_INCIDENT_ACKNOWLEDGED_BY_OWNER     |
| ACKNOWLEDGED_BY              | ASSOC_INCIDENT_OWNER                     |
| CYCLE_GUID                   | CYCLE_GUID                               |
| HOST                         | HOST_NAME                                |
| KEY_VALUE                    | Note: See detail description below.      |
| KEY_VALUE_NAME               | Note: See detail description below       |
| MESSAGE                      | MESSAGE                                  |
| METRIC                       | METRIC_COLUMN                            |
| NOTIF_TYPE                   | NOTIF_TYPE; use the map in section 2.3.5 |
| REPEAT_COUNT                 | REPEAT_COUNT                             |
| RULE_NAME                    | RULESET_NAME                             |
| RULE_OWNER                   | RULE_OWNER                               |
| SEVERITY                     | SEVERITY                                 |
| TARGET_NAME                  | TAGER_NAME                               |
| TARGET_TYPE                  | TARGET_TYPE                              |
| TIMESTAMP                    | EVENT_REPORTED_TIME                      |
| VIOLATION_CONTEXT            | EVENT_CONTEXT_ATTRS                      |
| VIOLATION_GUID               | SEVERITY_GUID                            |
| POLICY_RULE                  | No mapping, obsolete in NG release.      |

To get KEY\_VALUE\_NAME and KEY\_VALUE from NG, perform the following steps.

- If \$NUM\_KEYS variable is null, then \$KEY\_VALUE\_NAME and \$KEY\_VALUE are null.
- If \$NUM\_KEYS equals 1
  - KEY\_VALUE\_NAME=\$KEY\_COLUMN\_1
  - KEY\_VALUE=\$KEY\_VALUE\_1\_VALUE

- If \$NUM\_KEYS is greater than 1

```
KEY_VALUE_NAME="$KEY_COLUMN_1;$KEY_COLUMN_2;...;KEY_
COLUMN_x"
```

```
KEY_VALUE="$KEY_COLUMN_1_VALUE;$KEY_COLUMN_2_VALUE;...;KEY_
COLUMN_x_VALUE "
```

Where x is the value of \$NUM\_KEYS and ";" is the separator.

### Migrating Target Availability Event Types

Following table is the mapping for the OS Command shell environment variables when the event\_type is 'target\_availability'.

**Table 3–20 pre-12c/12c target\_availability Environment Variable Mappings**

| Pre-12c Environment Variable | Corresponding 12c Environment Variables  |
|------------------------------|--|
| TARGET_NAME                  | TARGET_NAME                              |
| TARGET_TYPE                  | TARGET_TYPE                              |
| METRIC                       | Status                                   |
| CYCLE_GUID                   | CYCLE_GUID                               |
| VIOLATION_CONTEXT            | EVENT_CONTEXT_ATTRS                      |
| SEVERITY                     | TARGET_STATUS                            |
| HOST                         | HOST_NAME                                |
| MESSAGE                      | MESSAGE                                  |
| NOTIF_TYPE                   | NOTIF_TYPE; use the map in section 2.3.5 |
| TIMESTAMP                    | EVENT_REPORTED_TIME                      |
| RULE_NAME                    | RULESET_NAME                             |
| RULE_OWNER                   | RULE_OWNER                               |
| REPEAT_COUNT                 | REPEAT_COUNT                             |
| KEY_VALUE                    | ""                                       |
| KEY_VALUE_NAME               | ""                                       |

### Migrating Job Status Change Event Types

Following table is the mapping for the OS Command shell environment variables when the event\_type is 'job\_status\_change'.

**Table 3–21 pre-12c/12c job\_status\_change Environment Variable Mappings**

| Pre-12c Environment Variable | Corresponding 12c Environment Variables      |
|------------------------------|--|
| JOB_NAME                     | SOURCE_OBJ_NAME                              |
| JOB_OWNER                    | SOURCE_OBJ_OWNER                             |
| JOB_TYPE                     | SOURCE_OBJ_SUB_TYPE                          |
| JOB_STATUS                   | EXECUTION_STATUS                             |
| NUM_TARGETS                  | 1 if \$ TARGET_NAME is not null, 0 otherwise |
| TARGET_NAME1                 | TARGET_NAME                                  |

**Table 3–21 (Cont.) pre-12c/12c job\_status\_change Environment Variable Mappings**

| <b>Pre-12c Environment Variable</b> | <b>Corresponding 12c Environment Variables</b> |
|-------------------------------------|--|
| TARGET_TYPE1                        | TARGET_TYPE                                    |
| TIMESTAMP                           | EVENT_REPORTED_TIME                            |
| RULE_NAME                           | RULESET_NAME                                   |
| RULE_OWNER                          | RULE_OWNER                                     |

**Migrating Corrective Action-Related OS Scripts**

Refer to section "Migrating Metric Alert Event Types" for mapping the following environment variables while receiving notifications for corrective actions.

KEY\_VALUE

KEY\_VALUE\_NAME

METRIC

METRIC\_VALUE

RULE\_NAME

RULE\_OWNER

SEVERITY

TIMESTAMP

VIOLATION\_CONTEXT

Use the map below for mapping other environment variables.

**Table 3–22 pre-12c/12c Corrective Action Environment Variable Mappings**

| <b>Pre-12c Environment Variable</b> | <b>Corresponding 12c Environment Variables</b> |
|-------------------------------------|--|
| NUM_TARGETS                         | 1  |
| TARGET_NAME1                        | TAGER_NAME                                     |
| TARGET_TYPE1                        | TARGET_TYPE                                    |
| JOB_NAME                            | CA_JOB_NAME                                    |
| JOB_OWNER                           | CA_JOB_OWNER                                   |
| JOB_STATUS                          | CA_JOB_STATUS                                  |
| JOB_TYPE                            | CA_JOB_TYPE                                    |

**Notification Type Mapping****Table 3–23 pre-12c/12c notif\_type Mappings**

| <b>notif_type (12c)</b> | <b>notif_type (Pre-12c)</b> |
|-------------------------|-----------------------------|
| NOTIF_NORMAL            | 1                           |
| NOTIF_REPEAT            | 4                           |
| NOTIF_DURATION          | 9                           |
| NOTIF_RETRY             | 2                           |

### 3.2.1.2 Adding a Notification Method Based on a PL/SQL Procedure

A user-defined PL/SQL procedure can receive notifications for matching events, incidents and problem.

---

---

**Note:** PL/SQL procedures used with pre-12c versions of Enterprise Manager will continue to work without modification. However, you should update the procedures to use the new signatures.

---

---

Complete the following four steps to define a notification method based on a PL/SQL procedure.

#### Step 1: Define the PL/SQL procedure.

The procedure must have one of the following signatures depending on the type of notification that will be received.

For Events:

```
PROCEDURE event_proc(event_msg IN gc$notif_event_msg)
```

For Incidents:

```
PROCEDURE incident_proc(incident_msg IN gc$notif_incident_msg)
```

For Problems:

```
PROCEDURE problem_proc(problem_msg IN gc$notif_problem_msg)
```

---

---

**Note:** The notification method based on a PL/SQL procedure must be configured by an administrator with Super Administrator privileges before a user can select it while creating/editing a incident rule.

---

---

For more information on passing specific types of information to scripts or PL/SQL procedures, see the following sections:

["Passing Information to a PL/SQL Procedure"](#) on page 3-34

["Passing Corrective Action Status Change Information"](#) on page 3-49

["Passing Job Execution Status Information"](#) on page 3-51

#### Step 2: Create the PL/SQL procedure on the Management Repository.

Create the PL/SQL procedure on the repository database using one of the following procedure specifications:

```
PROCEDURE event_proc(event_msg IN gc$notif_event_msg)
```

```
PROCEDURE incident_proc(incident_msg IN gc$notif_incident_msg)
```

```
PROCEDURE problem_proc(problem_msg IN gc$notif_problem_msg)
```

The PL/SQL procedure must be created on the repository database using the database account of the repository owner (such as SYSMAN)

If an error is encountered during the running of the procedure, the Notification System can be instructed to retry the sending of the notification to the procedure by raising a user-defined exception that uses the error code -20000. The procedure initially retried

after one minute, then two minutes, then three minutes and so on, until the notification is a day old, at which point it will be purged.

### **Step 3: Register your PL/SQL procedure as a new notification method.**

Log in as a Super Administrator. From the **Setup** menu, choose **Notifications** and then **Notification Methods** to access the Notification Methods page. From this page, you can define a new notification based on 'PL/SQL Procedure'. See [Section 3.2.1.2, "Adding a Notification Method Based on a PL/SQL Procedure"](#).

Make sure to use a fully qualified name that includes the schema owner, package name and procedure name. The procedure will be executed by the repository owner and so the repository owner must have execute permission on the procedure.

Create a notification method based on your PL/SQL procedure. The following information is required when defining the method:

- Name
- Description
- PL/SQL Procedure

You must enter a fully qualified procedure name (for example, OWNER.PKGNAME.PROCNAME) and ensure that the owner of the Management Repository has execute privilege on the procedure.

An example of the required information is shown in [Example 3–9](#).

#### **Example 3–9 PL/SQL Procedure Required Information**

```
Name Open trouble ticket
Description Notification method to open a trouble ticket in the event
PLSQL Procedure ticket_sys.ticket_ops.open_ticket
```

### **Step 4: Assign the notification method to an incident rule.**

You can edit an existing rule (or create a new incident rule). From the **Setup** menu, select **Incidents** and then select **Incident Rules**. The Incident Rules page displays. From here, you can add an action to a rule specifying the new PL/SQL procedure found under **Advanced Notification Method**.

There can be more than one PL/SQL-based method configured for your Enterprise Manager environment.

Information about how incident, event, and problem information is passed to the PLSQL procedure is covered in the next section.

### **Passing Information to a PL/SQL Procedure**

Passing event, incident, and problem information (payload) to PL/SQL procedures allows you to customize automated responses to these conditions. All 3 types of notification payloads have a common element - gc\$notif\_msg\_info. It provides generic information that applies to all types of notifications. In addition, each of the 3 payloads have one specific element that provides the payload specific to the given issue type.

#### **gc\$notif\_event\_msg (payload for event notifications)**

gc\$notif\_event\_msg contains two objects - event payload object and message information object.

**Table 3–24 Event Notification Payload**

| Attribute     | Datatype                | Additional Information  |
|---------------|-------------------------|---|
| event_payload | gc\$notif_event_payload | Event notification payload. See gc\$notif_event_payload type definition for detail. |
| msg_info      | gc\$notif_msg_info      | Notification message. See gc\$notif_msg_info definition for detail.                 |

**gc\$notif\_incident\_msg (payload for incident notifications)**

gc\$notif\_incident\_msg type contains two objects - incident payload and message information. This object represents the delivery payload for Incident notification message, contains all data associated with Incident notification, and can be accessed by user's custom PL/SQL procedures.

**Table 3–25 Incident Notification Payload**

| Attribute        | Datatype                   | Additional Information  |
|------------------|----------------------------|---|
| incident_payload | gc\$notif_incident_payload | Incident notification payload. See gc\$notif_incident_payload type definition for detail.   |
| msg_info         | gc\$notif_msg_info         | Envelope level notification information. See gc\$notif_msg_info type definition for detail. |

**gc\$notif\_problem\_msg (payload for problem notifications)**

This object represents the delivery payload for Problem notification message, contains all data associated with problem notification, and can be accessed by a user's custom PL/SQL procedures.

**Table 3–26 Problem Notification Payload**

| Attribute       | Datatype                  | Additional Information  |
|-----------------|---------------------------|---|
| problem_payload | gc\$notif_problem_payload | Problem notification payload. See gc\$notif_problem_payload type definition for detail. |
| msg_info        | gc\$notif_msg_info        | Notification message. See gc\$notif_msg_info type definition for detail.                |

**gc\$notif\_msg\_info (common for event/incident/problem payloads)**

This object contains the generic notification information including notification\_type, rule set and rule name, etc. for Event, Incident or Problem delivery payload.

**Table 3–27 Event, Incident, Problem Common Payload**

| Attribute         | Datatype       | Description   |
|-------------------|----------------|---|
| notification_type | VARCHAR2(32)   | Type of notification, can be one of the following values.<br><br>GC\$NOTIFICATION.NOTIF_NORMAL<br>GC\$NOTIFICATION.NOTIF_RETRY<br>GC\$NOTIFICATION.NOTIF_REPEAT<br>GC\$NOTIFICATION.NOTIF_DURATION<br>GC\$NOTIFICATION.NOTIF_CA<br>GC\$NOTIFICATION.NOTIF_RCA |
| repeat_count      | NUMBER         | Repeat notification count   |
| ruleset_name      | VARCHAR2(256)  | Name of the rule set that triggered the notification  |
| rule_name         | VARCHAR2(256)  | Name of the rule that triggered the notification  |
| rule_owner        | VARCHAR2(256)  | EM User who owns the rule set   |
| message           | VARCHAR2(4000) | Message about event/incident/problem.   |
| message_url       | VARCHAR2(4000) | Link to the Enterprise Manager console page that provides the details of the event/incident/problem.  |

**gc\$notif\_event\_payload (payload specific to event notifications)**

This object represents the payload specific to event notifications.

**Table 3–28 Common Payloads for Events, Incidents, and Problems**

| Attribute           | Datatype                        | Additional Information  |
|---------------------|---------------------------------|---|
| event_instance_guid | RAW(16)                         | Event instance global unique identifier.  |
| event_sequence_guid | RAW(16)                         | Event sequence global unique identifier.  |
| Target              | gc\$notif_target                | Related Target Information object. See gc\$notif_target type definition for detail.                       |
| Source              | gc\$notif_source                | Related Source Information object, that is not a target. See gc\$notif_source type definition for detail. |
| event_attrs         | gc\$notif_event_attr_array      | The list of event specified attributes. See gc\$notif_event_attr type definition for detail.              |
| corrective_action   | gc\$notif_corrective_action_job | Corrective action information, optionally populated when corrective action job execution has completed.   |
| event_type          | VARCHAR2(20)                    | Event type - example: Metric Alert.   |
| event_name          | VARCHAR2(512)                   | Event name.   |
| event_msg           | VARCHAR2(4000)                  | Event message.  |
| reported_date       | DATE                            | Event reported date.  |
| Occurrence_date     | DATE                            | Event occurrence date.  |
| Severity            | VARCHAR2(128)                   | Event Severity. It is the translated severity name.   |
| severity_code       | VARCHAR2(32)                    | Event Severity code. It is the internal severity name used in Enterprise Manager.                         |

**Table 3–28 (Cont.) Common Payloads for Events, Incidents, and Problems**

| Attribute          | Datatype                      | Additional Information   |
|--------------------|-------------------------------|--|
| assoc_incident     | gc\$notif_issue_summary       | Summary of associated incident. It is populated if the event is associated with an incident. See gc\$notif_issue_summary type definition for detail        |
| action_msg         | VARCHAR2(4000)                | Message describing the action to take for resolving the event.   |
| rca_detail         | VARCHAR2(4000)                | Root cause analysis detail. The size of RCA details output is limited to 4000 characters long.   |
| event_context_data | gc\$notif_event_context_array | Event context data. See gc\$notif_event_context type definition for detail.  |
| categories         | gc\$category_string_array     | List of categories that the event belongs to. Category is translated based on locale defined in OMS server. Notification system sends up to 10 categories. |
| category_codes     | gc\$category_string_array     | Codes for the categories. The size of array is up to 10.   |

**gc\$notif\_incident\_payload (payload specific to incident notifications)**

It contains the incident specific attributes, associated problem and ticket information.

**Table 3–29 Incident Notification Payloads**

| Attribute         | Datatype                | Additional Information   |
|-------------------|-------------------------|--|
| incident_attrs    | gc\$notif_issue_attrs   | Incident specific attributes. See gc\$notif_issue_attrs type definition for detail.                              |
| assoc_event_count | NUMBER                  | The total number of events associated with this incident.  |
| ticket_status     | VARCHAR2(64)            | The status of external Ticket, if it exists.   |
| ticket_id         | VARCHAR2(128)           | The ID of external Ticket, if it exists.   |
| ticket_url        | VARCHAR2(4000)          | The URL for external Ticket, if it exists.   |
| assoc_problem     | gc\$notif_issue_summary | Summary of the problem, if it has an associated problem. See gc\$notif_issue_summary type definition for detail. |

**gc\$notif\_problem\_payload (payload specific to problems)**

It contains problem specific attributes, key, Service Request(SR) and Bug information.

**Table 3–30 Problem Payload**

| Attribute            | Datatype              | Additional Information   |
|----------------------|-----------------------|--|
| problem_attrs        | gc\$notif_issue_attrs | Problem specific attributes. See gc\$notif_issue_attrs type definition for detail. |
| problem_key          | VARCHAR2(850)         | Problem key if it is generated.  |
| assoc_incident_count | NUMBER                | Number of incidents associated with this problem.                                  |
| sr_id                | VARCHAR2(64)          | Oracle Service Request Id, if it exists.   |
| sr_url               | VARCHAR2(4000)        | URL for Oracle Service Request, if it exists.                                      |

**Table 3–30 (Cont.) Problem Payload**

| Attribute | Datatype     | Additional Information                      |
|-----------|--------------|---|
| bug_id    | VARCHAR2(64) | Oracle Bug ID, if an associated bug exists. |

**gc\$notif\_issue\_attr (payload common to incidents and problems)**

It provides common details for incident and problem. It contains details such as id, severity, priority, status, categories, acknowledged by owner, and source information associated with.

**Table 3–31 Payload Common to Incidents and Problems**

| Attribute             | Datatype      | Additional Information   |
|-----------------------|---------------|--|
| Id                    | NUMBER(16)    | ID of the incident or problem.   |
| Severity              | VARCHAR2(128) | Issue Severity. It is the translated.  |
| severity_code         | VARCHAR2(32)  | Issue Severity Code. The possible values are defined in descending order of severity:<br>GC\$EVENT.FATAL<br>GC\$EVENT.CRITICAL<br>GC\$EVENT.WARNING<br>GC\$EVENT.MINOR_WARNING<br>GC\$EVENT.INFORMATIONAL<br>GC\$EVENT.CLEAR   |
| priority              | VARCHAR2(128) | Issue Priority. It is the translated priority name.  |
| priority_code         | VARCHAR2(32)  | Issue Priority. It is the internal value defined in EM. The possible values are defined in descending order of priority:<br>GC\$EVENT.PRIORITY_URGENT<br>GC\$EVENT.PRIORITY_VERY_HIGH<br>GC\$EVENT.PRIORITY_HIGH<br>GC\$EVENT.PRIORITY_MEDIUM<br>GC\$EVENT.PRIORITY_LOW<br>GC\$EVENT.PRIORITY_NONE |
| status                | VARCHAR2(32)  | Status of Issue. The possible values are<br>GC\$EVENT.STATUS_NEW<br>GC\$EVENT.STATUS_CLOSED<br>Any other user defined status.  |
| escalation_level      | NUMBER(1)     | Escalation level of the issue, has a value between 0 to 5.   |
| owner                 | VARCHAR(256)  | Issue Owner. Set to NULL if no owner exists.   |
| acknowledged_by_owner | NUMBER(1)     | Set to 1, if this issue was acknowledged by owner.   |
| creation_date         | DATE          | Issue creation date.   |
| closed_date           | DATE          | Issue closed date, null if not closed.   |

**Table 3–31 (Cont.) Payload Common to Incidents and Problems**

| Attribute         | Datatype                    | Additional Information   |
|-------------------|-----------------------------|--|
| categories        | gc\$category_string_array   | List of categories that the event belongs to. Category is translated based on locale defined in OMS server. Notification system sends up to 10 categories. |
| category_codes    | gc\$category_string_array   | Codes for the categories. Notification system sends up to 10 category codes.   |
| source_info_arr   | gc\$notif_source_info_array | Array of source information associated with this issue. See \$gcnotif_source_info type definition for detail.  |
| last_modified_by  | VARCHAR2(256)               | Last modified by user.   |
| last_updated_date | DATE                        | Last updated date.   |

**gc\$notif\_issue\_summary (common to event and incident payloads)**

This object represents the associated incident summary in Event payload, or associated problem summary in Incident payload, respectively.

**Table 3–32 Payload**

| Attribute     | Datatype      | Additional Information   |
|---------------|---------------|--|
| id            | NUMBER        | Issue Id, either Incident Id or Problem Id.  |
| severity      | VARCHAR(128)  | The severity level of an issue. It is translated severity name.  |
| severity_code | VARCHAR2(32)  | Issue Severity Code, has one of the following values.<br>GC\$EVENT.FATAL<br>GC\$EVENT.CRITICAL<br>GC\$EVENT.WARNING<br>GC\$EVENT.MINOR_WARNING<br>GC\$EVENT.INFORMATIONAL<br>GC\$EVENT.CLEAR                                 |
| priority      | VARCHAR2(128) | Current priority. It is the translated priority name.  |
| priority_code | VARCHAR2(32)  | Issue priority code, has one of the following values. GC\$EVENT.PRIORITY_URGENT<br>GC\$EVENT.PRIORITY_VERY_HIGH<br>GC\$EVENT.PRIORITY_HIGH<br>GC\$EVENT.PRIORITY_MEDIUM<br>GC\$EVENT.PRIORITY_LOW<br>GC\$EVENT.PRIORITY_NONE |
| status        | VARCHAR2(64)  | Status of issue. The possible values are<br>GC\$EVENT.STATUS_NEW<br>GC\$EVENT.STATUS_CLOSED<br>GC\$EVENT.WIP (work in progress)<br>GC\$EVENT.RESOLVED<br>any other user defined status                                       |

**Table 3–32 (Cont.) Payload**

| Attribute             | Datatype      | Additional Information                               |
|-----------------------|---------------|--|
| escalation_level      | VARCHAR2(2)   | Issue escalation level range from 0 to 5, default 0. |
| owner                 | VARCHAR2(256) | Issue Owner. Set to NULL if no owner exists.         |
| acknowledged_by_owner | NUMBER(1)     | Set to 1, if this issue was acknowledged by owner.   |

**gc\$category\_string\_array**

gc\$category\_string\_array is an array of string containing the categories which event, incident or problem is associated with. The notification system delivers up to 10 categories.

**gc\$notif\_event\_context\_array**

gc\$notif\_event\_context\_array provides information about the additional diagnostic data that was captured at event detection time. Note that notification system delivers up to 200 elements from the captured event context.

```
CREATE OR REPLACE TYPE gc$notif_event_context_array AS VARRAY(200) OF
gc$notif_event_context;
```

**gc\$notif\_event\_context**

This object represents the detail of event context data which is additional contextual information that is captured by the source system at the point of event generation that could be useful for diagnosis. The context for an event should consist of set of keys and values along with data type (Number or String only).

**Table 3–33 Event Context Type**

| Attribute    | Datatype       | Additional Information  |
|--------------|----------------|---|
| Name         | VARCHAR2(256)  | The event context name.   |
| Type         | NUMBER(1)      | The data type of the value, which is stored<br>(0) - for numeric data<br>(1) - for string data. |
| Value        | NUMBER         | The numerical value.  |
| string_value | VARCHAR2(4000) | The string value.   |

**gc\$notif\_corrective\_action\_job**

This object provides information about the execution of a corrective action job. Note that the corrective actions are supported for metric alert and target availability events only.

**Table 3–34 Corrective Action Job-Specific Attributes**

| Attribute | Datatype      | Additional Information  |
|-----------|---------------|---|
| job_guid  | RAW(16)       | Corrective Action Job global unique identifier.   |
| job_name  | VARCHAR2(128) | The value will be the name of the Corrective Action. It applies to Metric Alert and Target Availability Events. |
| job_owner | VARCHAR2(256) | Corrective action job owner.  |

**Table 3–34 (Cont.) Corrective Action Job-Specific Attributes**

| Attribute             | Datatype       | Additional Information  |
|-----------------------|----------------|---|
| job_type              | VARCHAR2(256)  | Corrective action job type.   |
| job_status            | VARCHAR2(64)   | Corrective action job execution status.   |
| job_status_code       | NUMBER         | Corrective action job execution status code. It is the internal value defined in EM.                                    |
| job_step_output       | VARCHAR2(4000) | The value will be the text output from the Corrective Action execution. This will be truncated to last 4000 characters. |
| job_execution_guid    | RAW(16)        | Corrective Action Job execution global unique identifier.   |
| job_state_change_guid | RAW(16)        | Corrective Action Job change global unique identifier.  |
| occurred_date         | DATE           | Corrective action job occurred date.  |

**gc\$notif\_source\_info\_array**

It is used providing access to the multiple sources that an incident or a problem could be related to. NOTE: The notification system delivers up to 200 sources associated with an incident or a problem.

CREATE OR REPLACE TYPE gc\$notif\_source\_info\_array AS VARRAY(200) OF gc\$notif\_source\_info;

**gc\$notif\_source\_info**

Notification Source Information which is used for referencing Source information containing either target or source, or both.

**Table 3–35 Source Information Type**

| Attribute | Datatype         | Additional Information   |
|-----------|------------------|--|
| target    | gc\$notif_target | It is populated when the event is related to a target. See gc\$notif_target type definition for detail.              |
| Source    | gc\$notif_source | It is populated when the event is related to a (non-target) source. See gc\$notif_source type definition for detail. |

**gc\$notif\_source**

Source object is used for referencing source objects other than a job target.

**Table 3–36 Payload**

| Attribute       | Datatype      | Additional Information   |
|-----------------|---------------|--|
| source_guid     | RAW(16)       | Source's global unique identifier.   |
| source_type     | VARCHAR2(120) | Type of the Source object, e.g., TARGET, JOB, TEMPLATE, etc.   |
| source_name     | VARCHAR2(256) | Source Object Name.  |
| source_owner    | VARCHAR2(256) | Owner of the Source object.  |
| source_sub_type | VARCHAR2(256) | Sub-type of the Source object, for example, within the TARGET these would be the target types like Host, Database etc. |

**Table 3–36 (Cont.) Payload**

| Attribute  | Datatype       | Additional Information      |
|------------|----------------|-----------------------------|
| source_url | VARCHAR2(4000) | Source's event console URL. |

**gc\$notif\_target**

Target information object is used for providing target information.

**Table 3–37 Target Information**

| Attribute               | Datatype             | Additional Information   |
|-------------------------|----------------------|--|
| target_guid             | RAW(16)              | Target's global unique identifier.   |
| target_name             | VARCHAR2(256)        | Name of target.  |
| target_owner            | VARCHAR2(256)        | Owner of target.   |
| target_lifecycle_status | VARCHAR2(1024)       | Life Cycle Status of the target.   |
| target_version          | VARCHAR2(64)         | Target Version of the target.  |
| target_type             | VARCHAR2(128)        | Type of a target.  |
| target_timezone         | VARCHAR2(64)         | Target's regional time zone.   |
| host_name               | VARCHAR2(256)        | The name of the host on which the target is deployed upon.   |
| target_url              | VARCHAR2(4000)       | Target's EM Console url.   |
| udtp_array              | gc\$notif_udtp_array | The list of user defined target properties. It is populated for events that are associated with a target. It is populated for incidents and problems, when they are associated with a single source (gc\$notif_source_info). |

**gc\$notif\_udtp\_array**

It is array of gc\$notif\_udtp type and size is up to 20.

```
CREATE OR REPLACE TYPE gc$notif_udtp_array AS VARRAY(20) OF gc$notif_udtp;
```

**gc\$notif\_udtp**

User defined Target Properties (UDTP) is used for referencing User defined target properties. UDTP should consist of set of property key name and property value.

**Table 3–38 Payload**

| Attribute | Datatype       | Additional Information |
|-----------|----------------|------------------------|
| name      | VARCHAR2(64),  | The name of property.  |
| value     | VARCHAR2(1024) | Property value.        |
| label     | VARCHAR(256)   | Property label.        |
| nls_id    | VARCHAR(64)    | Property nls id        |

**gc\$notif\_event\_attr\_array**

Array of gc\$notif\_event\_attr is used for referencing Event specific attributes, and its size is up to 35.

```
CREATE OR REPLACE TYPE gc$notif_event_attr_array AS VARRAY(35) OF gc$notif_event_attr;
```

**gc\$notif\_event\_attr**

It is used for referencing Event type specific attributes.

**Table 3–39 Event Attribute Type**

| Attribute | Datatype       | Additional Information                              |
|-----------|----------------|---|
| name      | VARCHAR2(64)   | The internal name of event type specific attribute. |
| value     | VARCHAR2(4000) | value.  |
| nls_value | VARCHAR2(4000) | Translated value for the attribute.                 |

**3.2.1.2.1 Migrating Pre-12c PL/SQL Advanced Notification Methods**

Pre-12c notifications map to event notifications in Enterprise Manager 12c. Event types `metric_alert`, `target_availability` and `job_status_alert` correspond to the pre-12c notification functionality. Note that policy violations functionality is removed for this release.

This section describes the mapping between Enterprise Manager 12c PL/SQL notification payload to the pre-12c PL/SQL notification payload. You can use this information for updating the existing pre-12c PL/SQL user callback procedures to use the 12c PL/SQL notification payload.

Please note that Policy Violations are no longer supported in the 12c release.

**Mapping for MGMT\_NOTIFY\_SEVERITY**

*When event type is metric\_alert*

Use the following map when `gc$notif_event_payload.event_type='metric_alert'`.

**Table 3–40 Metric Alert Mapping**

| MGMT_NOTIFY_SEVERITY | 12c Notification Payload   |
|----------------------|--|
| TARGET_NAME          | <code>gc\$notif_target.target_name</code>  |
| TARGET_TYPE          | <code>gc\$notif_target.target_type</code>  |
| TIMEZONE             | <code>gc\$notif_target.target_timezone</code>  |
| HOST_NAME            | <code>gc\$notif_target.host_name</code>  |
| MERTIC_NAME          | <code>gc\$notif_event_attr.value</code> where its name='metric_group' in <code>gc\$notif_event_attr_array</code> .       |
| METRIC_DESCRIPTION   | <code>gc\$notif_event_attr.value</code> where its name='metric_description' in <code>gc\$notif_event_attr_array</code> . |
| METRIC_COLUMN        | <code>gc\$notif_event_attr.value</code> where its name='metric_column' in <code>gc\$notif_event_attr_array</code> .      |
| METRIC_VALUE         | <code>gc\$notif_event_attr.value</code> where its name='value' in <code>gc\$notif_event_attr_array</code> .              |

**Table 3–40 (Cont.) Metric Alert Mapping**

| <b>MGMT_NOTIFY_SEVERITY</b> | <b>12c Notification Payload</b>  |
|-----------------------------|--|
| KEY_VALUE                   | It is applied for multiple keys based metric when value of gc\$notif_event_attr.name='num_keys' is not null and is greater than 0 in gc\$notif_event_attr_array.<br>See detail descriptions below. |
| KEY_VALUE_NAME              | It is applied for multiple keys based metric when value of gc\$notif_event_attr.name='num_keys' is not null and is greater than 0 in gc\$notif_event_attr_array.<br>See detail descriptions below. |
| KEY_VALUE_GUID              | gc\$notif_event_attr.value where its name='key_value' in gc\$notif_event_attr_array.   |
| CTXT_LIST                   | gc\$notif_event_context_array  |
| COLLECTION_TIMESTAMP        | gc\$notif_event_payload.reported_date  |
| SEVERITY_CODE               | Derive from gc\$notif_event_payload.severity_code, see section 1.2.1.1.2 for the mapping over the value.   |
| MESSAGE                     | gc\$notif_msg_info.message   |
| SEVERITY_GUID               | gc\$notif_event_attr.value where its name='severity_guid' in gc\$notif_event_attr_array.   |
| METRIC_GUID                 | gc\$notif_event_attr.value where its name='metric_guid_id' in gc\$notif_event_attr_array.  |
| TARGET_GUID                 | gc\$notif_target.target_guid   |
| RULE_OWNER                  | gc\$notif_msg_info.rule_owner  |
| RULE_NAME                   | gc\$notif_msg_info.ruleset_name  |

The following example shows you how to obtain similar pre-12c KEY\_VALUE and KEY\_VALUE\_NAME from an Enterprise Manager 12c notification payload.

First, check its gc\$notif\_event\_attr.value where its name='num\_keys' in gc\$notif\_event\_attr\_array.

If it is null or its value is equal to 0, then KEY\_VALUE and KEY\_VALUE\_NAME are null for this event.

If it is not null and value is equal to 1, then it is single key metric.

*KEY\_VALUE\_NAME= value of gc\$notif\_event\_attr where name='key\_column\_1' in gc\$notif\_event\_attr\_array.*

*KEY\_VALUE = value of gc\$notif\_event\_attr where name='key\_value' in gc\$notif\_event\_attr\_array.*

For example: METRIC= Filesystem Space Available (%) num\_key=1

KEY\_VALUE\_NAME= Mount Point

KEY\_VALUE= /

If it is not null and value is greater than 1, then it multiple keys metric.

KEY\_VALUE\_NAME = value of gc\$notif\_event\_attr where name='key\_column\_1' + ";" +

value of gc\$notif\_event\_attr where name='key\_column\_2' + ";" +

.... (up to where name='key\_column\_num\_key')

KEY\_VALUE = value of gc\$notif\_event\_attr where name='key\_column\_1\_value' + ";" +

value of gc\$notif\_event\_attr where name='key\_column\_2\_value' + ";" +

.... (up to where name='key\_column\_num\_key\_value')

The ";" is separator between names or values.

For example: METRIC= Program's Max CPU Utilization (%) which num\_key=2

KEY\_VALUE\_NAME= Program Name;Owner

KEY\_VALUE= loadcpu;userId

**Severity Code mapping from 12c to pre-12c when the event type is metric\_alert**

**Table 3–41 Severity Code Mapping**

| 12c Severity Code             | Pre-12c Severity Code              |
|-------------------------------|------------------------------------|
| GC_EVENT_RECEIVER.FATAL 32    | MGMT_GLOBAL.G_SEVERITY_CRITICAL 25 |
| GC_EVENT_RECEIVER.CRITICAL 16 | MGMT_GLOBAL.G_SEVERITY_CRITICAL 25 |
| GC_EVENT_RECEIVER.WARNING 8   | MGMT_GLOBAL.G_SEVERITY_WARNING 20  |
| GC_EVENT_RECEIVER.CLEAR 0     | MGMT_GLOBAL.G_SEVERITY_CLEAR 15    |

*When event type is target\_availability*

Use the following map when gc\$notif\_event\_payload.event\_type='target\_availability'.

**Table 3–42 Target Availability Mapping**

| MGMT_NOTIFY_SEVERITY | 12c Notification Payload   |
|----------------------|--|
| TARGET_NAME          | gc\$notif_target.target_name   |
| TARGET_TYPE          | gc\$notif_target.target_type   |
| TIMEZONE             | gc\$notif_target.target_timezone   |
| HOST_NAME            | gc\$notif_target.host_name   |
| MERTIC_NAME          | Use fixed value "Response".  |
| METRIC_DESCRIPTION   | NULL   |
| METRIC_COLUMN        | Use fixed value "Status".  |
| METRIC_VALUE         | gc\$notif_event_attr.value where its name='target_status' in gc\$notif_event_attr array. |
| KEY_VALUE            | NULL   |
| KEY_VALUE_NAME       | NULL   |
| KEY_VALUE_GUID       | NULL   |

**Table 3–42 (Cont.) Target Availability Mapping**

| <b>MGMT_NOTIFY_SEVERITY</b> | <b>12c Notification Payload</b>   |
|-----------------------------|---|
| CTXT_LIST                   | gc\$notif_event_context_array   |
| COLLECTION_TIMESTAMP        | gc\$notif_event_payload.reported_date   |
| SEVERITY_CODE               | gc\$notif_event_attr.value where its name='avail_severity' in gc\$notif_event_attr_array. |
| MESSAGE                     | gc\$notif_msg_info.message  |
| SEVERITY_GUID               | gc\$notif_event_attr.value where its name='severity_guid' in gc\$notif_event_attr_array.  |
| METRIC_GUID                 | gc\$notif_event_attr.value where its name='metric_guid_id' in gc\$notif_event_attr_array. |
| TARGET_GUID                 | gc\$notif_target.target_guid  |
| RULE_OWNER                  | gc\$notif_msg_info.rule_owner   |
| RULE_NAME                   | gc\$notif_msg_info.ruleset_name   |

**Mapping for MGMT\_NOTIFY\_JOB**

Use the following map when gc\$notif\_event\_payload.event\_type=job\_status\_change'.

**Table 3–43 Job Status Change Mapping**

| <b>MGMT_NOTIFY_JOB</b> | <b>12c Notification Payload</b>  |
|------------------------|--|
| JOB_NAME               | gc\$notif_source.source_name   |
| JOB_OWNER              | gc\$notif_source.source_owner  |
| JOB_TYPE               | gc\$notif_source.source_sub_type   |
| JOB_STATUS             | gc\$notif_event_attr.value where its name='execution_status_code' in gc\$notif_event_attr_array. |
| STATE_CHANGE_GUID      | gc\$notif_event_attr.value where its name='state_change_guid' in gc\$notif_event_attr_array.     |
| JOB_GUID               | gc\$notif_source.source_guid   |
| EXECUTION_ID           | gc\$notif_event_attr.value where its name='execution_id' in gc\$notif_event_attr_array.          |
| TARGETS                | gc\$notif_target.target_name, gc\$notif_target.target_type                                       |
| RULE_OWNER             | gc\$notif_msg_info.rule_owner  |
| RULE_NAME              | gc\$notif_msg_info.ruleset_name  |
| OCCURRED_DATE          | gc\$notif_event_payload.reported_date  |

**Mapping for MGMT\_NOTIFY\_CORRECTIVE\_ACTION**

Note that corrective action related payload is populated when gc\$notif\_msg\_info.notification\_type is set to NOTIF\_CA.

For mapping the following attributes, use the mapping information provided for MGMT\_NOTIFY\_SEVERITY object [Table 3–40, "Metric Alert Mapping"](#)

MERTIC\_NAME  
 METRIC\_COLUMN  
 METRIC\_VALUE  
 KEY\_VALUE  
 KEY\_VALUE\_NAME  
 KEY\_VALUE\_GUID  
 CTEXT\_LIST  
 RULE\_OWNER  
 RULE\_NAME  
 OCCURRED\_DATE

For mapping the job related attributes in MGMT\_NOTIFY\_CORRECTIVE\_ACTION object, use the following map.

**Table 3-44 Corrective Action Mapping**

| MGMT_NOTIFY_CORRECTIVE_ACTION | 12c Notification Payload   |
|-------------------------------|--|
| JOB_NAME                      | gc\$ notif_corrective_action.job.job_name  |
| JOB_OWNER                     | gc\$ notif_corrective_action.job.job_owner   |
| JOB_TYPE                      | gc\$ notif_corrective_action.job.job_type  |
| JOB_STATUS                    | gc\$ notif_corrective_action.job.status_code   |
| STATE_CHANGE_GUID             | gc\$ notif_corrective_action.job.job_state_change_guid   |
| JOB_GUID                      | gc\$ notif_corrective_action.job.job_guid  |
| EXECUTION_ID                  | gc\$ notif_corrective_action.job.job_execution_guid  |
| OCCURRED_DATE                 | gc\$ notif_corrective_action.job.occurred_date   |
| TARGETS                       | There can be at most one target. Use the values from gc\$notif_target.target_name, gc\$notif_target.target_type for the associated target. |

### 3.2.1.3 Adding a Notification Method Based on an SNMP Trap

Enterprise Manager supports integration with third-party management tools through the SNMP. For example, you can use SNMP to notify a third-party application that a selected metric has exceeded its threshold.

The trap is an SNMP Version 1 trap and is described by the MIB definition shown at the end of this chapter. See "[Management Information Base \(MIB\)](#)".

For more comprehensive configuration information, see the documentation specific to your platform; SNMP configuration differs from platform to platform.

---

**Note:** Notification methods based on SNMP traps must be configured by an administrator with Super Administrator privileges before any user can then choose to select one or more of these SNMP trap methods while creating/editing a incident rule.

---

**Step 1: Define a new notification method based on an SNMP trap.**

Log in to Enterprise Manager as a Super Administrator. From the **Setup** menu, select **Notifications** and then select **Notification Method** to access the Notification Methods page. From this page you can add a new method based on an SNMP trap.

You must provide the name of the host (machine) on which the SNMP master agent is running and other details as shown in the following example. In [Example 3–10](#), the SNMP host will receive your SNMP traps.

**Example 3–10 SNMP Trap Required Information**

Name HP OpenView Console  
Description Notification method to send trap to HP OpenView console  
SNMP Trap Host Name machine1.oracle.com  
SNMP Host Port 162  
SNMP Community public  
This SNMP host will receive your SNMP traps.

---

**Note:** A Test Trap button exists for you to test your setup.

---

Metric severity information will be passed as a series of variables in the SNMP trap.

An example SNMP Trap is shown in [Example 3–11](#). Each piece of information is sent as a variable embedded in the SNMP Trap.

**Example 3–11 SNMP Trap**

```
*****V1 TRAP***[3]*****
Community : public

```

### Step 2: Assign the notification method to a rule.

You can edit an existing rule (or create a new incident rule), then add an action to the rule that subscribes to the advanced notification method.

## 3.3 Passing Corrective Action Status Change Information

Passing corrective action status change attributes (such as new status, job name, job type, or rule owner) to PL/SQL procedures or OS commands/scripts allows you to customize automated responses to status changes. For example, you may want to call an OS script to open a trouble ticket for an in-house support trouble ticket system if a critical corrective action fails to run. In this case, you will want to pass status (for example, Problems or Aborted) to the script to open a trouble ticket and escalate the problem.

### 3.3.1 Passing Corrective Action Execution Status to an OS Command or Script

The notification system passes information to an OS script or executable via system environment variables. Conventions used to access environmental variables vary depending on the operating system:

- UNIX: \$ENV\_VARIABLE
- MS Windows: %ENV\_VARIABLE%

The notification system sets the following environment variables before calling the script. The notification system will set the environment variable \$NOTIF\_TYPE = NOTIF\_CA for Corrective Action Execution. The script can then use any or all of these variables within the logic of the script.

Following table lists the environment variables for corrective action, they are populated when a corrective action is completed for an event.

**Table 3–45 Corrective Action Environment Variables**

| Environment Variable | Description   |
|----------------------|---|
| CA_JOB_STATUS        | Corrective action job execution status.                                 |
| CA_JOB_NAME          | Name of the Corrective Action.  |
| CA_JOB_OWNER         | Owner of Corrective Action.   |
| CA_JOB_STEP_OUTPUT   | The value will be the text output from the Corrective Action execution. |
| CA_JOB_TYPE          | Corrective Action Job type  |

### 3.3.2 Passing Corrective Action Execution Status to a PLSQL Procedure

The notification system passes corrective action status change information to PL/SQL procedure - PROCEDURE p(event\_msg IN gc\$notif\_event\_msg). The instance gc\$notif\_corrective\_action\_job object is defined in event\_msg.event\_payload.corrective\_action if event\_msg.msg\_info.notification\_type is equal to GC\$NOTIFICATIONNOTIF\_CA. When a corrective action executes, the notification system calls the PL/SQL procedure associated with the incident rule and passes the populated object to the procedure. The procedure is then able to access the fields of the object that has been passed to it. See [Table 3–34, "Corrective Action Job-Specific Attributes"](#) for details.

The following status codes are possible values for the job\_status field of the MGMT\_NOTIFY\_CORRECTIVE\_ACTION object.

**Table 3–46 Corrective Action Status Codes**

| Name                      | Datatype  | Value |
|---------------------------|-----------|-------|
| SCHEDULED_STATUS          | NUMBER(2) | 1     |
| EXECUTING_STATUS          | NUMBER(2) | 2     |
| ABORTED_STATUS            | NUMBER(2) | 3     |
| FAILED_STATUS             | NUMBER(2) | 4     |
| COMPLETED_STATUS          | NUMBER(2) | 5     |
| SUSPENDED_STATUS          | NUMBER(2) | 6     |
| AGENTDOWN_STATUS          | NUMBER(2) | 7     |
| STOPPED_STATUS            | NUMBER(2) | 8     |
| SUSPENDED_LOCK_STATUS     | NUMBER(2) | 9     |
| SUSPENDED_EVENT_STATUS    | NUMBER(2) | 10    |
| SUSPENDED_BLACKOUT_STATUS | NUMBER(2) | 11    |
| STOP_PENDING_STATUS       | NUMBER(2) | 12    |
| SUSPEND_PENDING_STATUS    | NUMBER(2) | 13    |
| INACTIVE_STATUS           | NUMBER(2) | 14    |
| QUEUED_STATUS             | NUMBER(2) | 15    |
| FAILED_RETRIED_STATUS     | NUMBER(2) | 16    |
| WAITING_STATUS            | NUMBER(2) | 17    |

**Table 3–46 (Cont.) Corrective Action Status Codes**

| Name              | Datatype  | Value |
|-------------------|-----------|-------|
| SKIPPED_STATUS    | NUMBER(2) | 18    |
| REASSIGNED_STATUS | NUMBER(2) | 20    |

## 3.4 Passing Job Execution Status Information

Passing job status change attributes (such as new status, job name, job type, or rule owner) to PL/SQL procedures or OS commands/scripts allows you to customize automated responses to status changes. For example, you may want to call an OS script to open a trouble ticket for an in-house support trouble ticket system if a critical job fails to run. In this case you will want to pass status (for example, Problems or Aborted) to the script to open a trouble ticket and escalate the problem. The job execution status information is one of event type - job\_status\_change event, and its content is in OS command and PL/SQL payload as described in [Section 3.2.1.1, "Adding a Notification Method based on an OS Command or Script"](#) and [Section 3.2.1.2, "Adding a Notification Method Based on a PL/SQL Procedure"](#).

### 3.4.1 Passing Job Execution Status to a PL/SQL Procedure

The notification system passes job status change information to a PL/SQL procedure via the event\_msg.event\_payload object where event\_type is equal to job\_status\_change. An instance of this object is created for every status change. When a job changes status, the notification system calls the PL/SQL p(event\_msg IN gc\$notif\_event\_msg) procedure associated with the incident rule and passes the populated object to the procedure. The procedure is then able to access the fields of the event\_msg.event\_payload object that has been passed to it.

[Table 3–47](#) lists all corrective action status change attributes that can be passed:

**Table 3–47 Job Status Attributes**

| Attribute  | Datatype      | Additional Information               |
|--|---------------|--------------------------------------|
| event_msg.event_payload.source.source_name   | VARCHAR2(128) | The job name.                        |
| event_msg.event_payload.source.source_owner  | VARCHAR2(256) | The owner of the job.                |
| event_msg.event_payload.source.source_sub_type   | VARCHAR2(32)  | The type of the job.                 |
| event_msg.event_payload.event_attrs(i).value where event_attrs(i).name='execution_status'  | NUMBER        | The new status of the job.           |
| event_msg.event_payload.event_attrs(i).value where event_attrs(i).name='state_change_guid' | RAW(16)       | The GUID of the state change record. |

**Table 3–47 (Cont.) Job Status Attributes**

| Attribute  | Datatype         | Additional Information   |
|--|------------------|--|
| event_msg.event_payload.source.source_guid   | RAW(16)          | The unique id of the job.  |
| event_msg.target.event_payload.event_attrs(i).value where event_attrs(i).name='execution_id' | RAW(16)          | The unique id of the execution.  |
| event_msg.event_payload.target   | gc\$notif_target | Target Information object..  |
| event_msg.msg_info.rule_owner  | VARCHAR2(64)     | The name of the notification rule that cause the notification to be sent.  |
| event_msg.msg_info.rule_name   | VARCHAR2(132)    | The owner of the notification rule that cause the notification to be sent. |
| event_msg.event_payload.reported_date  | DATE             | The time and date when the status change happened.                         |

When a job status change occurs for the job, the notification system creates an instance of the event\_msg.event\_payload.event\_attrs(i).value where event\_attrs(i).name='execution\_status' object and populates it with values from the status change. The following status codes have been defined as constants in the MGMT\_JOBS package and can be used to determine the type of status in the job\_status field of the event\_msg.event\_payload.event\_attrs(i).value where event\_attrs(i).name='execution\_status' object.

**Table 3–48 Job Status Codes**

| Name                      | Datatype  | Value |
|---------------------------|-----------|-------|
| SCHEDULED_STATUS          | NUMBER(2) | 1     |
| EXECUTING_STATUS          | NUMBER(2) | 2     |
| ABORTED_STATUS            | NUMBER(2) | 3     |
| FAILED_STATUS             | NUMBER(2) | 4     |
| COMPLETED_STATUS          | NUMBER(2) | 5     |
| SUSPENDED_STATUS          | NUMBER(2) | 6     |
| AGENTDOWN_STATUS          | NUMBER(2) | 7     |
| STOPPED_STATUS            | NUMBER(2) | 8     |
| SUSPENDED_LOCK_STATUS     | NUMBER(2) | 9     |
| SUSPENDED_EVENT_STATUS    | NUMBER(2) | 10    |
| SUSPENDED_BLACKOUT_STATUS | NUMBER(2) | 11    |
| STOP_PENDING_STATUS       | NUMBER(2) | 12    |
| SUSPEND_PENDING_STATUS    | NUMBER(2) | 13    |
| INACTIVE_STATUS           | NUMBER(2) | 14    |
| QUEUED_STATUS             | NUMBER(2) | 15    |
| FAILED_RETRIED_STATUS     | NUMBER(2) | 16    |
| WAITING_STATUS            | NUMBER(2) | 17    |

**Table 3–48 (Cont.) Job Status Codes**

| Name              | Datatype  | Value |
|-------------------|-----------|-------|
| SKIPPED_STATUS    | NUMBER(2) | 18    |
| REASSIGNED_STATUS | NUMBER(2) | 20    |

**Example 3–12 PL/SQL Procedure Using a Status Code (Job)**

```

CREATE TABLE job_log (jobid RAW(16), status_code NUMBER(2), occurred DATE);

CREATE OR REPLACE PROCEDURE LOG_JOB_STATUS_CHANGE(event_msg IN GC$NOTIF_EVENT_MSG)
IS
    l_attrs gc$notif_event_attr_array;
    exec_status_code NUMBER(2) := NULL;
    occurred_date DATE := NULL;
    job_guid RAW(16) := NULL;

BEGIN
    IF event_msg.event_payload.event_type = 'job_status_change'
    THEN
        l_attrs := event_msg.event_payload.event_attrs;
        IF l_attrs IS NOT NULL
        THEN
            FOR i IN 1..l_attrs.COUNT
            LOOP
                IF l_attrs(i).name = 'exec_status_code'
                THEN
                    exec_status_code := TO_NUMBER(l_attrs(i).value);
                END IF;
            END LOOP;
        END IF;

        occurred_date := event_msg.event_payload.reported_date;
        job_guid := event_msg.event_payload.source.source_guid;
        -- Log all jobs' status
        BEGIN
            INSERT INTO job_log (jobid, status_code, occurred)
            VALUES (job_guid, exec_status_code, occurred_date);
        EXCEPTION
        WHEN OTHERS
        THEN
            -- If there are any problems then get the notification retried
            RAISE_APPLICATION_ERROR(-20000, 'Please retry');
        END;
        COMMIT;

    ELSE
        null; -- it is not a job_status_change event, ignore
    END IF;
END LOG_JOB_STATUS_CHANGE;
/

```

**3.4.2 Passing Job Execution Status to an OS Command or Script**

The notification system passes job execution status information to an OS script or executable via system environment variables. Conventions used to access environmental variables vary depending on the operating system:

- UNIX: \$ENV\_VARIABLE

- MS Windows: %ENV\_VARIABLE%

The notification system sets the following environment variables before calling the script. The script can then use any or all of these variables within the logic of the script.

**Table 3–49 Environment Variables**

| Environment Variable | Description  |
|----------------------|--|
| SOURCE_OBJ_NAME      | The name of the job.   |
| SOURCE_OBJ_OWNE      | The owner of the job.  |
| SOURCE_OBJ_SUB_TYPE  | The type of job.   |
| EXEC_STATUS_CODE     | The job status.  |
| EVENT_REPORTED_TIME  | Time when the severity occurred.   |
| TARGET_NAME          | The name of the target.  |
| TARGET_TYPE          | The type of the target.  |
| RULE_NAME            | Name of the notification rule that resulted in the severity.                 |
| RULE_OWNER           | Name of the Enterprise Manager administrator who owns the notification rule. |

## 3.5 Passing User-Defined Target Properties to Notification Methods

Enterprise Manager allows you to define target properties (accessed from the target home page) that can be used to store environmental or usage context information specific to that target. Target property values are passed to custom notification methods where they can be processed using conditional logic or simply passed as additional alert information to third-party devices, such as ticketing systems. By default, Enterprise Manager passes all defined target properties to notification methods.

**Note:** Target properties are not passed to notification methods when short e-mail format is used.

**Figure 3–4 Host Target Properties**

ORACLE Enterprise Manager Cloud Control 12c

Host: dadvmn0630.us.oracle.com > Monitoring Configuration

Monitoring Configuration

Cancel OK

**Properties**

| Name   | Value                    |
|--|--------------------------|
| SNMP Community String (Default: public)                          | <input type="text"/>     |
| SNMP Hostname  | <input type="text"/>     |
| SNMP Timeout (Default: 10 seconds)                               | <input type="text"/>     |
| Host Username for WBEM Access                                    | <input type="text"/>     |
| Host Password for WBEM Access                                    | <input type="password"/> |
| Port number for WBEM Access Default: 5988                        | <input type="text"/>     |
| Disk Activity Metrics Collection Max Rows Upload(>0) Default:16  | <input type="text"/>     |
| Monitor Loopback Filesystems (true/false) Default:false          | <input type="text"/>     |
| Use pseudo-memory for Swap utilization (true/false) Default:true | <input type="text"/>     |

**Monitoring**

Oracle has automatically enabled monitoring for this target's availability and performance, so no further monitoring configuration is necessary. You can edit the metric thresholds from the target's homepage.

Cancel OK

## 3.6 Management Information Base (MIB)

Enterprise Manager Cloud Control can send SNMP Traps to third-party, SNMP-enabled applications. Details of the trap contents can be obtained from the management information base (MIB) variables. The following sections discuss Enterprise Manager MIB variables in detail.

### 3.6.1 About MIBs

A MIB is a text file, written in ASN.1 notation, which describes the variables containing the information that SNMP can access. The variables described in a MIB, which are also called MIB objects, are the items that can be monitored using SNMP. There is one MIB for each element being monitored. Each monolithic or subagent consults its respective MIB in order to learn the variables it can retrieve and their characteristics. The encapsulation of this information in the MIB is what enables master agents to register new subagents dynamically — everything the master agent needs to know about the subagent is contained in its MIB. The management framework and management applications also consult these MIBs for the same purpose. MIBs can be either standard (also called public) or proprietary (also called private or vendor).

The actual values of the variables are not part of the MIB, but are retrieved through a platform-dependent process called "instrumentation". The concept of the MIB is very important because all SNMP communications refer to one or more MIB objects. What is transmitted to the framework is, essentially, MIB variables and their current values.

### 3.6.2 Reading the MIB Variable Descriptions

This section covers the format used to describe MIB variables. Note that the STATUS element of SNMP MIB definition, Version 1, is not included in these MIB variable descriptions. Since Oracle has implemented all MIB variables as CURRENT, this value does not vary.

#### 3.6.2.1 Variable Name

##### **Syntax**

Maps to the SYNTAX element of SNMP MIB definition, Version 1.

##### **Max-Access**

Maps to the MAX-ACCESS element of SNMP MIB definition, Version 1.

##### **Status**

Maps to the STATUS element of SNMP MIB definition, Version 1.

##### **Explanation**

Describes the function, use and precise derivation of the variable. (For example, a variable might be derived from a particular configuration file parameter or performance table field.) When appropriate, incorporates the DESCRIPTION part of the MIB definition, Version 1.

##### **Typical Range**

Describes the typical, rather than theoretical, range of the variable. For example, while integer values for many MIB variables can theoretically range up to 4294967295, a typical range in an actual installation will vary to a lesser extent. On the other hand, some variable values for a large database can actually exceed this "theoretical" limit (a "wraparound"). Specifying that a variable value typically ranges from 0 to 1,000 or

1,000 to 3 billion will help the third-party developer to develop the most useful graphical display for the variable.

#### **Significance**

Describes the significance of the variable when monitoring a typical installation. Alternative ratings are Very Important, Important, Less Important, or Not Normally Used. Clearly, the DBA will want to monitor some variables more closely than others. However, which variables fall into this category can vary from installation to installation, depending on the application, the size of the database, and on the DBA's objectives. Nevertheless, assessing a variable's significance relative to the other variables in the MIB can help third-party developers focus their efforts on those variables of most interest to the most DBAs.

#### **Related Variables**

Lists other variables in this MIB, or other MIBs implemented by Oracle, that relate in some way to this variable. For example, the value of this variable might derive from that of another MIB variable. Or perhaps the value of this variable varies inversely to that of another variable. Knowing this information, third-party developers can develop useful graphic displays of related MIB variables.

#### **Suggested Presentation**

Suggests how this variable can be presented most usefully to the DBA using the management application: as a simple value, as a gauge, or as an alarm, for example.

#### **3.6.2.2 MIB Definition**

You can find the SNMP MIB file at the following location:

*OMS\_HOME/network/doc/omstrap.v1*

The file *omstrap.v1* is the OMS MIB.

## **3.7 Troubleshooting Notifications**

To function properly, the notification system relies on various components of Enterprise Manager and your IT infrastructure. For this reason, there can be many causes of notification failure. The following guidelines and suggestions can help you isolate potential problems with the notification system.

### **3.7.1 General Setup**

The first step in diagnosing notification issues is to ensure that you have properly configured and defined your notification environment.

#### **OS Command, PL/SQL and SNMP Trap Notifications**

Make sure all OS Command, PLSQL and SNMP Trap Notification Methods are valid by clicking the Test button. This will send a test notification and show any problems the OMS has in contacting the method. Make sure that your method was called, for example, if the OS Command notification is supposed to write information to a log file, check that it has written information to its log file.

#### **E-mail Notifications**

- Make sure an e-mail gateway is set up under the Notification Methods page of Setup. The Sender's e-mail address should be valid. Clicking the Test button will send an e-mail to the Sender's e-mail address. Make sure this e-mail is received. Note that the Test button ignores any Notification Schedule.

- Make sure an e-mail address is set up. Clicking the Test button will send an e-mail to specified address and you should make sure this e-mail is received. Note that the Test button ignores any Notification Schedule.
- Make sure an e-mail schedule is defined. No e-mails will be sent unless a Notification Schedule has been defined.
- Make sure a incident rule is defined that matches the states you are interested and make sure e-mail and notification methods are assigned to the rule.

### 3.7.2 Notification System Errors

For any alerts involving problems with notifications, check the following for notification errors.

- Any serious errors in the Notification System are logged as system errors in the MGMT\_SYSTEM\_ERROR\_LOG table. From the **Setup** menu, select **Management Services and Repository** to view these errors.
- Check for any delivery errors. You can view them from Incident Manager. From the **Enterprise** menu, select **Monitoring**, then select **Incident Manager**. The details will give the reason why the notification was not delivered. Delivery errors are stored in MGMT\_NOTIFICATION\_LOG with the DELIVERED column set to 'N'.
- Severities will not be displayed in the Enterprise Manager console if no metric values have been loaded for the metric associated with the severity.

### 3.7.3 Notification System Trace Messages

The Notification System can produce trace messages in sysman/log/emoms.trc file.

Tracing is configured by setting the *log4j.em.notification* property flag using the `emctl set property` command. You can set the trace level to INFO, WARN, DEBUG. For example,

```
./emctl set property -sysman_pwd your_sysman_password -name log4j.em.notification -value DEBUG
```

Trace messages contain the string "em.notification". If you are working in a UNIX environment, you can search for messages in the emoms.trc and emoms\_pbs.trc files using the `grep` command. For example,

```
grep em.notification emoms.trc emoms_pbs.trc
```

#### What to look for in the trace file.

The following entries in the emoms.trc file are relevant to notifications.

#### Normal Startup Messages

When the OMS starts, you should see these types of messages.

```
2011-08-17 13:50:29,458 [EventInitializer] INFO em.notification init.167 - Short
format maximum length is 155

### 3.7.4 E-mail Errors

#### The SMTP gateway is not set up correctly:

Failed to send e-mail to my.admin@oracle.com: For e-mail notifications to be sent, your Super Administrator must configure an Outgoing Mail (SMTP) Server within Enterprise Manager. (SYSMAN, myrule)

#### Invalid host name:

Failed to connect to gateway: badhost.oracle.com: Sending failed;  
nested exception is:  
javax.mail.MessagingException: Unknown SMTP host: badhost.example.com;

#### Invalid e-mail address:

Failed to connect to gateway: rgmemeasmtpt.oraclecorp.com: Sending failed;  
nested exception is:  
javax.mail.MessagingException: 550 5.7.1 <smpemailtest\_ie@example.com>... Access denied

Always use the Test button to make sure the e-mail gateway configuration is valid. Check that an e-mail is received at the sender's e-mail address

### 3.7.5 OS Command Errors

When attempting to execute an OS command or script, the following errors may occur. Use the Test button to make sure OS Command configuration is valid. If there are any errors, they will appear in the console.

#### Invalid path or no read permissions on file:

Could not find /bin/myscript (machineb10.oracle.com\_Management\_Service) (SYSMAN, myrule )

#### No execute permission on executable:

Error calling /bin/myscript: java.io.IOException: /bin/myscript: cannot execute (machineb10.oracle.com\_Management\_Service) (SYSMAN, myrule )

#### Timeout because OS Command ran too long:

Timeout occurred running /bin/myscript (machineb10.oracle.com\_Management\_Service) (SYSMAN, myrule )

Any errors such as out of memory or too many processes running on OMS machine will be logged as appropriate.

Always use the Test button to make sure OS Command configuration is valid.

### 3.7.6 SNMP Trap Errors

Use the Test button to make sure SNMP Trap configuration is valid.

Other possible SNMP trap problems include: invalid host name, port, or community for a machine running an SNMP Console.

### 3.7.7 PL/SQL Errors

When attempting to execute an PL/SQL procedure, the following errors may occur. Use the Test button to make sure the procedure is valid. If there are any errors, they will appear in the console.

**Procedure name is invalid or is not fully qualified. Example: SCOTT.PKG.PROC**

Error calling PL/SQL procedure `plsql_proc`: ORA-06576: not a valid function or procedure name (SYSMAN, myrule)

**Procedure is not the correct signature. Example: PROCEDURE event\_proc(s IN GC\$NOTIF\_EVENT\_MSG)**

Error calling PL/SQL procedure `plsql_proc`: ORA-06553: PLS-306: wrong number or types of arguments in call to 'PLSQL\_PROC' (SYSMAN, myrule)

**Procedure has bug and is raising an exception.**

Error calling PL/SQL procedure `plsql_proc`: ORA-06531: Reference to uninitialized collection (SYSMAN, myrule)

Care should be taken to avoid leaking cursors in your PL/SQL. Any exception due to this condition will result in delivery failure with the message being displayed in the Details section of the alert in the Cloud Control console.

Always use the Test button to make sure the PL/SQL configuration is valid.

---

## Managing with Groups

This chapter introduces the concept of group management and contains the following sections:

- [Introduction to Groups](#)
- [Managing Groups](#)
- [About Out-of-Box Reports](#)
- [About Redundancy Systems](#)
- [About Privilege Propagating Groups](#)

### 4.1 Introduction to Groups

Today's IT operations can be responsible for managing a great number of components, such as databases, application servers, hosts, or other components, which can be time consuming and impossible to manage individually. The Enterprise Manager Cloud Control group management system lets you combine components (called targets in Enterprise Manager) into logical sets, called groups. This enables you to organize, manage, and effectively monitor the potentially large number of targets in your enterprise.

Enterprise Manager Groups can include:

- Targets of the same type, such as:
  - All hosts in your data center
  - All of your production databases
- Targets of different types, such as:
  - The database, application server, listener, and host that are used in your application environment
  - Targets operating within a particular data center region

---

**Note:** An Enterprise Manager "System," used specifically to group the components on which a service runs, is a special kind of Enterprise Manager group. Many of the functions and capabilities for groups and systems are similar.

---

Typically you can gather together targets that you want to manage as a group. If you use the target properties (for example, *Line of Business* or *Deployment Type*) to put operational information about your targets in Enterprise Manager, you can use these

properties when creating groups to locate targets. For example, you could search for all databases of *Deployment Type = Production* and belonging to *Line of Business 'HCM'*. You can also create a group hierarchy and use nested groups.

## 4.2 Managing Groups

By combining targets in a group, Enterprise Manager offers a wealth of management features that enable you to efficiently manage these targets as one group. Using the Group pages, you can:

- View a summary status of the targets within the group.
- Monitor outstanding alerts and incidents for the group collectively, rather than individually.
- Monitor the overall performance of the group.
- Perform administrative tasks, such as scheduling jobs for the entire group, or blacking out the group for maintenance periods.

You can also customize the console to provide direct access to group management pages.

### 4.2.1 Using the Groups Page

When you choose Groups from the Targets menu on the Enterprise Manager menu bar, the Groups page appears. From the page you can view the currently available groups and perform the following tasks:

- View a list of all the defined groups.
- Search for existing groups and save search criteria for future searches.
- View a roll-up of the outstanding alerts and incidents for members in a group.
- Create administration groups, associate template collections, and disassociate template collections
- Add groups or privilege propagating groups, remove groups, and change the configuration of currently defined groups.
- Drill down from a specific group to collectively monitor and manage its member targets.

Redundancy systems and special high availability groups are not accessed from this Groups page. You can access them from the All Targets page.

### 4.2.2 About the Group Home Page

The Group Home page enables you to quickly view key information about members of a group, eliminating the need to navigate to individual member targets to check on availability and performance. You can view the entire group on a single screen and drill down to obtain further details. The rolled up numbers include alerts and incidents for all members including those in nested groups. The Group Home page provides the following sections:

- A General section that shows the Owner, Group Type, and Privilege Propagation status.
- A Status section that shows how many member targets are in up, down, and unknown states. For nested groups, this segment shows how many targets are in up, down, and unknown states across all its sub-groups. The status roll up count is

based on the unique member targets across all sub-groups. Consequently, even if a target appears more than once in sub-groups, it is counted only once in status roll ups. Click member names to go to the member Status page.

- An Overview of Incidents and Problems section that displays the number of outstanding critical, warning, and error alerts associated with the current group. For nested groups, this segment shows how many targets are in an alert state across all its sub-groups.

The rolled up information is shown for all the member targets regardless of their status. The status roll up count is based on the unique member targets across all sub-groups. Consequently, even if a target appears more than once in sub-groups, its alerts are counted only once in alert roll ups.

Click the number in the Problems column to go to the Incident Manager page to search, view, and manage exceptions and issues in your environment. By using Incident Manager, you can track outstanding incidents and problems.

- A Compliance Summary section that shows how many of your group members do not comply with Enterprise Manager policy rules. Non-compliant members are indicated with the number of critical, warning, and informational incidents along the Average Compliance Score (as a percentage) for each compliance rule. You can click the Members tab to see the Member Targets and their types along with any violations and an average score for each member target.

The numbers include the group-level incidents (if any group-level policy is defined), as well as group members violations. The rolled-up information for all policy categories, including security, is shown for all the member targets regardless of their status.

- A Job Activity section that displays the status for jobs that have started within the previous 7 days. The embedded table shows you the number of executions submitted to the group or any group members listed by status type, such as Problem Executions, Suspended Executions, and so on.
- A Blackouts section that allows you to create blackout periods and view the status of existing blackouts. The table displays the Scheduled and Active blackouts for each group or group member. Click Create to define primary blackout identification information and assign targets to be blacked out.
- A Patch Recommendations section that shows the total number of Oracle critical patch advisories (including one or more critical patches) that are applicable to your enterprise, and the number of Oracle homes in your enterprise to which those patches should be applied. You can view the information by Classification or by Target Type.

Click the Current number link to go to the Group Critical Patch Advisories page. If your Oracle MetaLink Credentials are not configured, click Not Configured to go to the Patching Setup page. After you configure this page, Enterprise Manager collects information about Oracle critical patch advisories that are relevant to your enterprise.

- An Inventory and Usage section where you can view inventory summaries for deployments such as hosts, database installations, and fusion middleware installations on an enterprise basis or for specific targets. You can select an option such as Platform or Version to roll up inventory. Optionally, you can click See Details to navigate to the Inventory and Usage Details page where you can perform more detailed tasks such as viewing trends in inventory counts charted across a time line, revising selections to refresh chart and details based on new selections, or export deployment and details tables to CSV files.

- A Configuration Changes for Last 7 Days section that displays the number for configuration changes and Relationship changes incurred over the previous 7 days. Configuration history is a log of changes to a target, such as a group or beacon, recorded over a period of time. The recorded history includes changes both to configurations and to relationships. Relationships are the associations that exist among managed entities. You can click the number of changes in either column to view more detailed information about the change.

### 4.2.3 About the Group Charts Page

The Group Charts page enables you to monitor the collective performance of the group. Out-of-box performance charts are provided based on the type of members in the group. For example, when databases are part of the group, a Wait Time (%) chart is provided that shows the top databases with the highest wait time percentage values. You can view this performance information over the last 24 hours, last 7 days, or last 31 days. You can also add your own custom charts to the page.

You can access the Charts page by choosing Charts from the Monitoring sub-menu of the Group menu.

### 4.2.4 About the Group Members Page

The Group Members page summarizes information about the member targets in the group. It includes information on their current availability status, roll-up of open alerts and incidents, and key performance metrics based on the type of targets in the group.

You can visually assess availability and relative performance across all member targets. You can sort on any of the columns to rank members by a certain criterion (for example, database targets in order of decreasing wait time percentage). Default key performance metrics are displayed based on the targets you select, but you can customize these to include additional metrics that are important for managing your group.

### 4.2.5 Viewing Group Status History

You can use the Group Status History page to view the historical availability of a member during a specified time period, view the current status of all group members, or access the home pages for members.

Bar graphs provide a historical presentation of the availability of group members during a time period you select from the View Data drop-down list. The color-coded graphs can show statuses of Up, Down, Under Blackout, Agent Down, Metric Collection Error, and Status Pending. You can select time periods of 24 hours, 7 days, or 31 days.

To view the current status of a member, you can click a Status icon to go to the Availability page, which shows the member's current and past availability status within the last 24 hours, 7 days, or 31 days. Click a member Name to go to the member's Home page. You can use this page as a starting point when evaluating the performance of the selected member.

You can access the Group Status History page by choosing Status History from the Monitoring section of the Group menu.

### 4.2.6 About the System Dashboard

The System Dashboard enables you to pro-actively monitor the status and alerts in the group as they occur. The color-coded interface is designed to highlight problem areas

using the universal colors of alarm—targets that are down are highlighted in red, metrics in critical severity are shown as red dots, metrics in warning severity are shown as yellow dots, and metrics operating within normal boundary conditions are shown as green dots.

Using these colors, you can easily spot the problem areas for any target and drill down for details as needed. An alert table is also included to provide a summary for all open alerts in the group. The alerts in the table are presented in reverse chronological order to show the most recent alerts first, but you can also click any column in the table to change the sort order.

The Dashboard allows you to drill down for more detailed information. You can click the following items in the Dashboard for more information:

- A target name to access the target home page
- A group or system name to access the System Dashboard
- Status icon corresponding to specific metric columns to access the metric detail page
- Alerts icon for a group to access the Alerts page for that aggregate object
- Status icon for a metric with key values to access the metric page with a list of all key values
- Status icon for a metric with a specific key value to access the metric detail page with the specified key
- Dashboard header to access the group home page
- Status icon for down, critical or warning alerts to access the Alerts page
- Alerts messages to access the metric detail page containing the alert history for the target

Click **Customize** to access the Edit Group pages. By default, Enterprise Manager takes you to the Edit Group Dashboard page where you can change the target display and data refresh frequency. However, you can also modify any other group properties that affect the content of the System Dashboard. Columns that appear in the Dashboard target area mirror the columns that appear in the Edit Group Columns page. To display additional columns, click Modify on the Edit Group Columns page and add the desired metric columns.

In the "Group by Target Type" mode, the Dashboard displays information of the targets based on the specific target types present in the group or system. The statuses and alerts displayed are rolled up for the targets in that specific target type.

Columns that appear in the Dashboard target area mirror the columns that appear in the Edit Group Columns page. To display additional columns, click Modify on the Edit Group Columns page and add the desired metric columns.

If you minimize the dashboard window, pertinent alert information associated with the group or system is still displayed in the Microsoft Windows toolbar. For example, (#1 X3 !5) denotes there is 1 Target Down Alert, 3 Critical Alerts and 5 Warning Alerts associated with this group or system.

## 4.3 About Out-of-Box Reports

Enterprise Manager provides several out-of-box reports for groups as part of the reporting framework, called Information Publisher. These reports display important administrative information, such as hardware and operating system summaries across

all hosts within a group, and monitoring information, such as outstanding alerts and incidents for a group.

You can access these reports from the **Information Publisher Reports** menu item on the Groups menu.

**See Also:** [Chapter 10, "Using Information Publisher"](#)

## 4.4 About Redundancy Systems

A redundancy system is a group that contains members of the same type that function collectively as a unit. A type of redundancy system functions like a single logical target that supports a status (availability) metric. A redundancy system is considered up (available) if at least one of the member targets is up.

You can create and administer a redundancy system from the All Targets page. Redundancy systems support all group management features previously discussed.

When you define the Redundancy System, you must choose the member type for the members in the Redundancy System.

You can define the options for how availability of the redundancy system is calculated by selecting either Number or Percentage:

- **Number** - When you choose Number, you can specify either the number of member targets that should be up in order for the group to be considered up, or the number of member targets that should be down in order for the system to be considered down.
- **Percentage** - When you choose Percentage, you can specify either the minimum percentage of member targets that must be up in order for the system to be considered up, or the minimum percentage of member targets that are down in order to consider the system to be down. If you choose Percentage, the required number of member targets will be rounded off to the next integer. For example if you define the Percentage as 50% and the total number of member targets is 5, then the value used for calculating the availability will be 3.

Do not use redundancy systems if the group you want to model is an Oracle Real Application Clusters database, host cluster, HTTP server high availability group, or OC4J high availability group. Instead, you can use the following specialized target types for this purpose:

- Cluster
- Cluster Database
- HTTP HA Group
- OC4J HA Group

## 4.5 About Privilege Propagating Groups

Privilege propagating groups enable administrators to grant privileges to other administrators in a manner in which new administrators get the same privileges as its member targets. For example, granting *operator* privilege on a group to an Administrator grants him the *operator* privilege on its member targets and also to any members that will be added in the future. Privilege propagating groups can contain individual targets or other privilege propagating groups.

Privileges on the group can be granted to an Enterprise Manager user or a role. Use a role if the privileges you want to grant are to be granted to a group of Enterprise Manager users.

For example, suppose you create a large privilege propagating group and grant a privilege to a role which is then granted to administrators. If new targets are later added to the privilege propagating group, then the administrators receive the privileges on the target automatically. Additionally, when a new administrator is hired, you only need to grant the role to the administrator for the administrator to receive all the privileges on the targets automatically.

### 4.5.1 Creating Privilege Propagating Groups

The privilege propagating group creation function is a privileged activity. The privilege propagating group feature contains two privileges:

- **Create Privilege Propagating Group**  
This privileged activity allows the administrators to create the privilege propagating groups. Administrators with this privilege can create propagating groups and delegate the group administration activity to other users.
- **Group Administration**  
This privilege can be granted to administrators on specific group targets and is used to delegate the group administration activities to other administrators. It is granted to both conventional and privilege propagating groups.

### 4.5.2 Using the Group Administration Privilege

The Group Administration Privilege is available for both Privilege Propagating Groups and conventional groups. If you are granted this privilege, you can grant access to the group to other Enterprise Manager users without having to be the SuperAdministrator to grant the privilege.

### 4.5.3 Adding Members to Privilege Propagating Groups

The target privileges granted on a propagating group are propagated to member targets. The administrator grants target objects scoped to another administrator, and the grantee maintains the same privileges on member targets. The propagating groups maintain the following features:

- The administrator with a Create Privilege Propagating Group privilege will be able to create a propagating group
- To add a target as a member of a propagating group, the administrator must have *Full* target privileges on the target

You can add any non-aggregated target as the member of a privilege propagating group. For aggregated targets in Cloud Control version 12c, cluster and RAC databases and other propagating groups can be added as members (cluster and RAC databases must be added via the *EM CLI* verb). There is no support for this through the Enterprise Manager interface in version 10.2.0.5. Cloud Control version 12c, however, supports more aggregated target types, such as redundancy systems, systems and services. These, along with cluster and RAC databases, can be added in version 12c via the Cloud Control console.

If you are not the group creator, you must have at least the *Full* target privilege on the group to add a target to the group.

## 4.5.4 Converting Conventional Groups to Privilege Propagating Groups

In Enterprise Manager release 12c you can convert conventional groups to privilege propagating groups (and vice-versa) through the use of the specified EM CLI verb. Two new parameters have been added in the *modify\_group* EM CLI verb:

- *privilege\_propagation*  
This parameter is used to modify the privilege propagation behavior of the group. The possible value of this parameter is either true or false.
- *drop\_existing\_grants*  
This parameter indicates whether existing privilege grants on that group are to be revoked at the time of converting a group from privilege propagation to normal (or vice versa). The possible values of this parameter are yes or no. The default value of this parameter is yes.

These same enhancements have been implemented on the following EM CLI verbs: *modify\_system*, *modify\_redundancy\_group*, and *modify\_aggregate\_service*.

The EM CLI verb is listed below:

```
emcli modify_group
-name="name"
[-type=<group>]
[-add_targets="name1:type1;name2:type2;..."...]
[-delete_targets="name1:type1;name2:type2;..."...]
[-privilege_propagation = true/false]
[-drop_existing_grants = Yes/No]
```

For more information about this verb and other EM CLI verbs, see the *EM CLI Reference Manual*.

---

## Administration Groups

Administration Groups greatly simplify the process of setting up targets for management in Enterprise Manager by automating the application of management settings such as monitoring settings or compliance standards. Typically, these settings are manually applied to individual target, or perhaps semi-automatically using custom scripts. However, by defining Administration Groups, Enterprise Manager uses specific target properties to direct the target to the appropriate Administration Group and then automatically apply the requisite monitoring and management settings. This level of automation simplifies the target setup process and also enables a datacenter to easily scale as new targets are added to Enterprise Manager for management.

This chapter covers the following topics:

- [What is an Administration Group?](#)
- [Planning](#)
- [Implementing Administration Groups and Template Collections](#)
- [Removing Administration Groups](#)

### 5.1 What is an Administration Group?

Administration groups are a special type of group used to fully automate application of monitoring and other management settings targets upon joining the group. When a target is added to the group, Enterprise Manager applies these settings using a Template Collection consisting of Monitoring Templates, compliance standards, and cloud policies. This completely eliminates the need for administrator intervention. The following illustration demonstrates the typical Administration Group workflow:

### Auto-Applying Monitoring Settings to Targets through Administration Groups and Template Collections

#### Step 1.

The Administrator sets the target property Lifecycle Status to "Production".

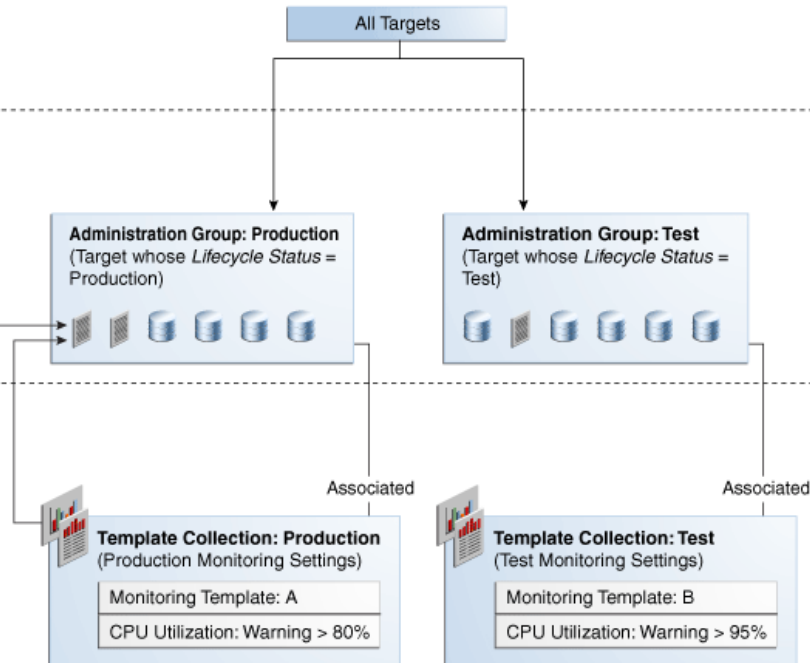

#### Step 2.

Enterprise Manager adds the target to the Administration Group.

#### Step 3.

Enterprise Manager applies the monitoring template to the target.

The first step involves setting a target's Lifecycle Status property when a target is first added to Enterprise Manager for monitoring. At that time, you determine where in the prioritization hierarchy that target belongs; the highest level being "mission critical" and the lowest being "development."

Target Lifecycle Status prioritization consists of the following levels:

- Mission Critical (highest priority)
- Production
- Stage
- Test
- Development (lowest priority)

As shown in step two of the illustration, once Lifecycle Status is set, Enterprise Manager uses it to determine which Administration Group the target belongs.

In order to prevent different monitoring settings to be applied to the same target, Administration Groups were designed to be mutually exclusive with other Administration Groups in terms of group membership. Administration groups can also be used for hierarchically classifying targets in an organization. For example, in the previous illustration, you have an Administration Group hierarchy consisting of two subgroups: *Production* targets and *Test* targets, with each subgroup having its own Template Collections. In this example, the Production group inherits monitoring settings from Monitoring Template A while targets in the Test subgroup inherit monitoring settings from Monitoring Template B.

### 5.1.1 Developing an Administration Group

In order to create an Administration Group, you must have both *Full Any Target* and *Create Privilege Propagating Group* target privileges.

Developing an Administration Group is performed in two phases:

- **Planning**
  - Plan your Administration Group hierarchy by creating a group hierarchy based on how you manage your targets.
  - Plan the management settings associated with the Administration Groups in the hierarchy.
    - \* Management settings: Monitoring settings, Compliance standard settings, Cloud policy settings
    - \* For Monitoring settings, you can have additional metric settings or override metric settings lower in your hierarchy
    - \* For Compliance standards or Cloud policies, additional rules/policies lower in the hierarchy are additive
- **Implementation**
  - Enter the group hierarchy definition and management settings in Enterprise Manager.
    - \* Create the Administration Group hierarchy.
    - \* Create the Monitoring Templates, compliance standards, cloud policies and add these to Template Collections.
    - \* Associate Template Collections with Administration Groups.
    - \* Add targets to the Administration Group by assigning the appropriate values to the target properties such that Enterprise Manager automatically adds them to the appropriate Administration Group.

## 5.2 Planning

As with any management decision, the key to effective implementation is planning and preparation. The same holds true for Administration Groups.

### Step 1: Plan Your Group Hierarchy

You can only have one Administration Group hierarchy in your Enterprise Manager deployment, thus ensuring that Administration Group member targets can only directly belong to one Administration Group. This prevents monitoring conflicts from occurring as a result of having a target join multiple Administration Groups with different associated monitoring settings.

To define the hierarchy, you start with the highest (root) level consisting of all targets that have been added to Enterprise Manager. On the next level of the hierarchy, you organize the targets into groups such that all targets that are monitored and managed in the same way are part of the same group.

The attributes used to define Administration Group membership criteria are based on *target properties*, which are attributes of every target that specify operational information and within the organization. For example, *location*, *line of business* to which it belongs, and *lifecycle status*. Target properties that can be used in the creation of Administration Groups are:

- Lifecycle Status

---

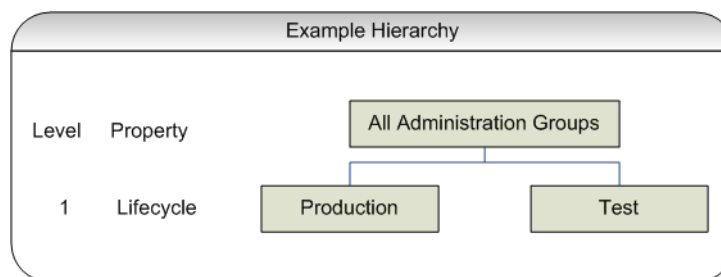

**Note:** Lifecycle Status target property is of particular importance when creating Administration Groups as it denotes a target's operational status. Lifecycle Status can be any of the following: Mission Critical, Production, Staging, Test, or Development.

---

- Location
- Line of Business
- Department
- Cost Center
- Contact
- Target Version
- Customer Support Identifier

You cannot manually add targets to an Administration Group. Instead, you set the target properties of the target (prospective group member) to match the membership criteria defined for the Administration Group. Once the target properties are set, Enterprise Manager automatically adds the target to the appropriate Administration Group.

In the following illustration, two Administration Groups are created, *Production* and *Test*, because monitoring settings for production targets will differ from the monitoring settings for test targets.

In this example, the group membership criteria are based on the *Lifecycle Status* target property. Targets whose *Lifecycle Status* is 'Production' join the Production group and targets whose *Lifecycle Status* is 'Test' join the Test group. For this reason, *Lifecycle Status* is the target property that determines the first level in the Administration Group hierarchy, and each value of the Lifecycle Status property determines the membership criteria of each Administration Group in the first level.

Additional levels in the Administration Group hierarchy can be added based on other target properties. Typically, additional levels are added if there are additional monitoring (or management) settings that need to be applied and these could be different for different subsets of targets in the Administration Group. For example, in the *Production* group, there could be additional monitoring settings for targets in *Finance* line of business that are different from targets in *Sales* line of business. In this case, an additional level based on *Line of Business* target property level would be added.

The end result of this hierarchy planning exercise is summarized in the following table.

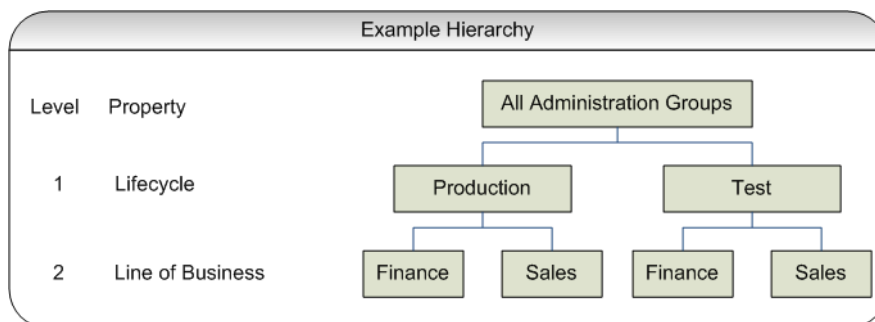

| Tree Root Level | Level 1 Target Property<br>Lifecycle Status | Level 2 Target Property<br>Line of Business |
|-----------------|---|---|
| All Targets     | Production or Mission Critical              | Finance                                     |
|                 |   | Sales                                       |
|                 | Staging, Test, or Development               | Finance                                     |
|                 |   | Sales                                       |

Each cell of the table represents a group. The values in each cell represent the values of the target property that define membership criteria for the group.

It is possible to have the group membership criteria be based on more than one target property value. In that case, any target whose target property matches any of the values will be added to the group. For example, in the case of the Production group, if the *Lifecycle Status* of a target is either *Production* or *Mission Critical*, then it will be added to the Production group.

It is also important to remember that group membership criteria is cumulative. For example, for the *Finance* group under *Production or Mission Critical* group, a target must have its *Lifecycle Status* set to *Production or Mission Critical* **AND** its *Line of Business* set to *Finance* before it can join the group.

For this planning example, the resulting Administration Group hierarchy would appear as shown in the following graphic.

It is important to note that a target can become part of hierarchy if and only if its property values match criteria at both the levels. A target possessing matching values for *lifecycle status* cannot become member of the Administration Group at the first level.

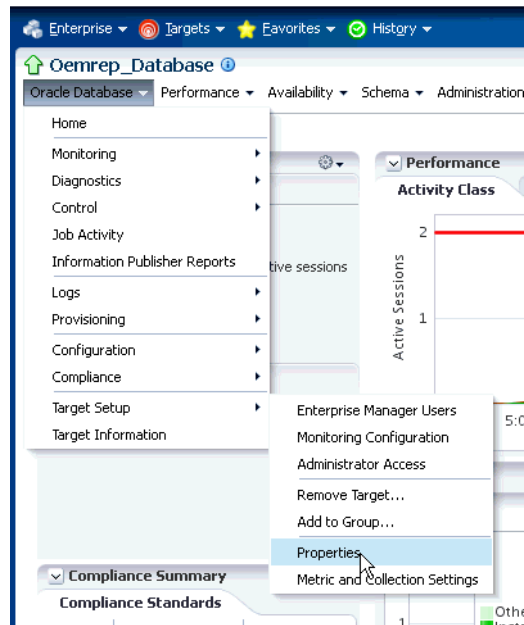

## Step 2: Assign Target Properties

After establishing the desired Administration Group hierarchy, you must make sure properties are set correctly for each target to ensure they join the correct Administration Group. Using target properties, Enterprise Manager automatically places targets into the appropriate Administration Group without user intervention. You can set target properties at the same time you add targets to Enterprise Manager (either using the Enterprise Manager console or using the EM CLI verb `add_target`). For targets that have already been added to Enterprise Manager, you can

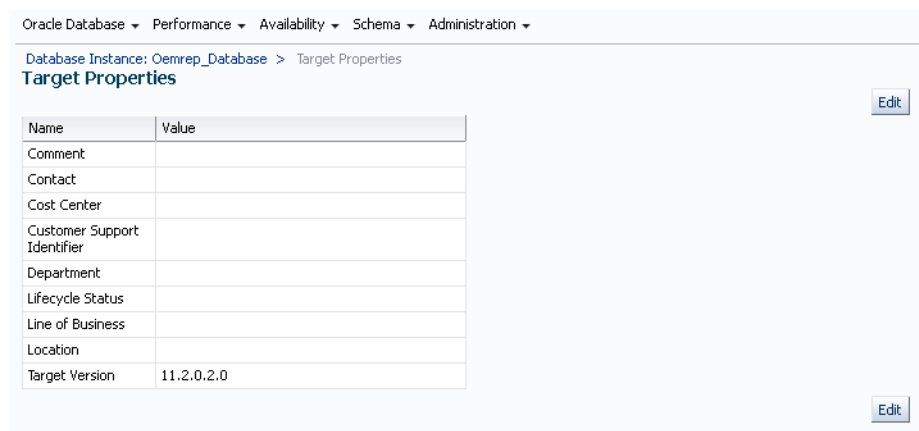

also set the target properties via the console or using EM CLI. The benefit of setting the target properties prior to the creation of the Administration Group hierarchy is that once the group hierarchy is created, the targets whose properties are set will automatically join their appropriate Administration Groups. However, target properties can be set after the Administration Group hierarchy is created.

For small numbers of targets, you can change target properties directly from the Enterprise Manager console.

1. From an Enterprise Manager target's option menu, select **Target Setup**, then select **Properties**.

2. On the **Target Properties** page, click **Edit** to change the property values.

3. Once you have set the target properties, click **OK**.

For large numbers of targets, it is best to use the Enterprise Manager Command Line Interface (EM CLI) `set_target_property_value` verb to perform a mass update. For more information about this EM CLI verb, see the Enterprise Manager Command Line Interface guide.

At any time, you can use the **All Targets** page to view properties across all targets. To view target properties:

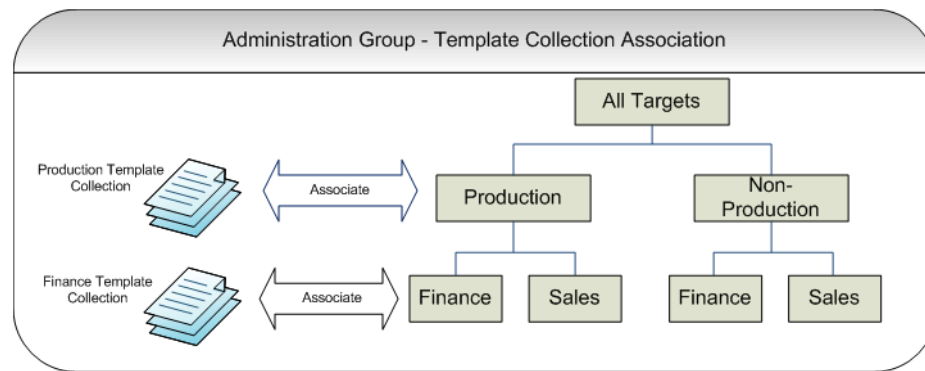

1. From the **Targets** menu, select **All Targets** to display the All Targets page.
2. From the **View** menu, select **Columns**, then select **Show All**.
3. Alternatively, if you are interested in specific target properties, choose **Columns** and then select **Show More Columns** to display column selector, as shown in following graphic.

### Step 3: Prepare for Creating Template Collections

Template collections contain the monitoring settings and other management settings that are meant to be applied to targets as they join the Administration Group. Monitoring settings for targets are defined in Monitoring Templates. Monitoring templates are defined on a per target type basis, so you will need to create Monitoring Templates for each of the different target types in your Administration Group. You will most likely create multiple Monitoring Templates to define the appropriate monitoring settings for an Administration Group. For example, you might create a database Monitoring Template containing the metric settings for your production databases and a separate Monitoring Template containing the settings for your non-production databases. Other management settings that can be added to a Template Collection include Compliance Standards and Cloud Policies. Ensure all of these entities that you want to add to your Template Collection are correctly defined in Enterprise Manager before adding them to Template Collections.

If you have an Administration Group hierarchy defined with more than two levels, such as the hierarchy shown in the following figure, it is important to understand how management settings are applied to the targets in the Administration Group.

Each group in the Administration Group hierarchy can be associated with a Template Collection (containing Monitoring Templates, compliance standards, and cloud policies). If you associate a Template Collection containing monitoring settings with the *Production* group, then the monitoring settings will apply to the *Finance* and *Sales* subgroup under *Production*. If the *Finance* group under *Production* has additional monitoring settings, then you can create a Monitoring Template with only those additional monitoring settings. (Later, this Monitoring Template should be added to another Template Collection and associated with the *Finance* group). The monitoring settings from the *Finance Template Collection* will be logically combined with the monitoring settings from the *Production Template Collection*. In case there are duplicate metric settings in both Template Collections, then the metric settings from the *Finance Template Collection* takes precedence and will be applied to the targets in the *Finance* group. This precedence rule only applies to the case of metric settings. In the case of compliance standard rules and cloud policies, even if there are duplicate compliance standard rules and cloud policies in both Template Collections, they will be all applied to the targets in the *Finance* group.

Once you have completed all the planning and preparation steps, you are ready to begin creating an Administration Group.

### 5.3 Implementing Administration Groups and Template Collections

With the preparatory work complete, you are ready to begin the four step process of creating an Administration Group hierarchy and Template Collections. The Administration Group user interface is organized to guide you through the creation process, with each tab containing the requisite operations to perform each step.

This process involves:

1. Creating the Administration Group hierarchy.
2. Creating Template Collections.
3. Associating Template Collections to Administration Group.
4. Synchronizing the targets with the selected items.

The following graphic shows a completed Administration Group hierarchy with associated Template Collections. It illustrates how Enterprise Manager uses this to automate the application of target monitoring settings.

#### Auto-Applying Monitoring Settings to Targets through Administration Groups and Template Collections

##### Step 1.

The Administrator sets the target property Lifecycle Status to "Production".

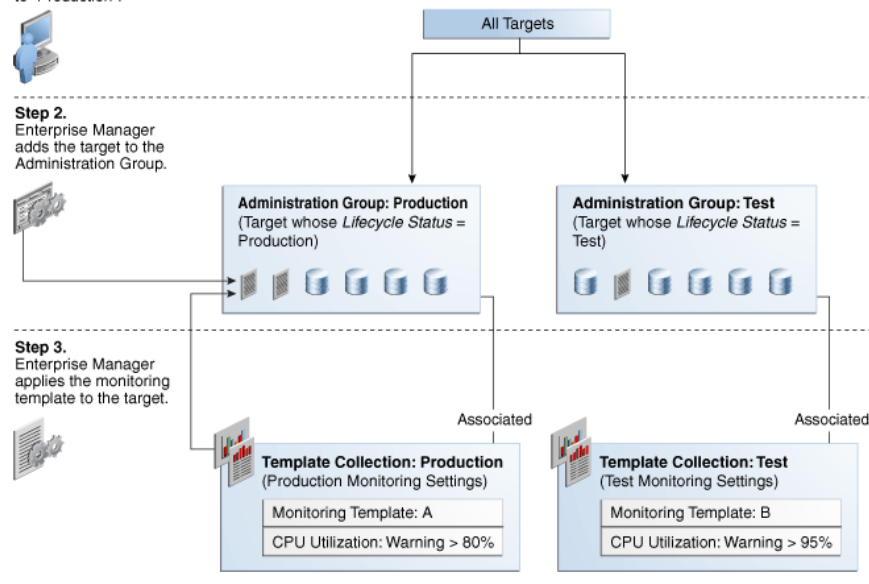

##### Step 2.

Enterprise Manager adds the target to the Administration Group.

##### Step 3.

Enterprise Manager applies the monitoring template to the target.

### 5.3.1 Creating an Administration Group

The following four primary tasks summarize the Administration Group creation process. These tasks are conveniently arranged in sequence via tabbed pages.

---

**Important:** In order to create an Administration Group, you must have both **Full Any Target** and **Create Privilege Propagating Group** target privileges.

---

**Task 1: Access the Administration Group and Template Collections page.**

**Task 2: Define the hierarchy.**

From the **Hierarchy** tab, you define the Administration Group hierarchy that matches the way you manage your targets. See [Section 5.3.1.2, "Defining a Hierarchy"](#).

**Task 3: Define the Template Collections.**

From the **Template Collections** tab, you define the monitoring and management settings you want applied to targets. See [Section 5.3.1.3, "Defining Template Collections"](#).

**Task 4: Associate the Template Collections with the Administration Groups**

From the **Associations** tab, you tie the monitoring and management settings to the appropriate Administration Group. See [Section 5.3.1.4, "Associating Template Collections with Administration Groups"](#).

#### 5.3.1.1 Accessing the Administration Group Home Page

All Administration Group operations are performed from the Administration Groups home page.

From the **Setup** menu, select **Add Target** and then select **Administration Groups**. The Administration Groups homepage displays.

Administration Groups and Template Collections

Page Refreshed Jan 21, 2012 7:40:27 PM PST

**Getting Started** Hierarchy Template Collections Associations

**Step 1: Design Your Grid's Hierarchy**

Administration Groups are a special type of group used to fully automate the application of management settings (monitoring settings, compliance standards, and cloud policies) to targets upon joining the group. When a target is added to the group, Enterprise Manager automatically applies management settings associated with the group to the newly added target. You define target management settings in a template collection. Any updates to the template collection are automatically applied to all targets in the Administration Group. Administration Groups and associated Template Collections need only be set up once.

A target can belong to at most one Administration Group. This prevents any conflicts occurring as a result of joining multiple Administration Groups with potentially different monitoring settings. To ensure a target belongs to only one Administration Group, only a single Administration Group hierarchy can be created and a target can join only one group in the hierarchy. Each Administration Group in the hierarchy is defined by membership criteria formed using global target properties and a target is added to the group only if it meets the group's membership criteria. Normal Groups, Generic Systems, Generic Services and Non Privilege Propagating Aggregates cannot become member of Administration Groups.

First, design a way to organize your targets so they make a logical hierarchy of your organization. The hierarchy shown at the bottom is one example. Properties you can use to manage your hierarchy are global target properties like Contact, Lifecycle Status, Location, Line of Business, Department, etc.

**Order Matters!** The order of the properties that make up your hierarchy matters. It determines the order that template collections are applied to groups in the hierarchy. Settings from template collections at the lowest level of the hierarchy override settings from the template collections at higher levels.

In the example at the bottom, a setting at the "Line of Business" level would override that same setting at the "Location" level, which in turn overrides that setting at the "Lifecycle Status" level. It works exactly like CSS inheritance.

**Example hierarchy**

| Level | Property           |
|-------|--------------------|
| 1     | Lifecycle =        |
| 2     | Location =         |
| 3     | Line of Business = |

The hierarchy diagram shows:

- Level 1: All Admin Groups (Production, Staging)
- Level 2: Austin, Bangalore (under both Production and Staging)
- Level 3: HR, Sales (under both Austin and Bangalore)

**Step 2: Assign Properties to Targets**

Next you need to make sure all of the targets in your organization have the correct property values associated. You can use the "All Targets" page to view state of each property across all targets in your grid.

For small numbers of targets, you can change target properties directly from the Enterprise Manager console. For large numbers of targets, it is best to use EMCLI (see `set_target_property_value` verb).

**All Targets**

**Step 3: Prepare for Creating Template Collections**

Template Collections are sets of Monitoring Templates, Compliance Standards and/or Cloud Policies that are applied to targets. So before you create Template Collections, prepare these items so that you can add them to your Template Collections.

**Step 4: Manage Administration Groups and Template Collections**

Setup the Administration Groups Hierarchy

Create Template Collections

Associate Template Collections to Administration Groups

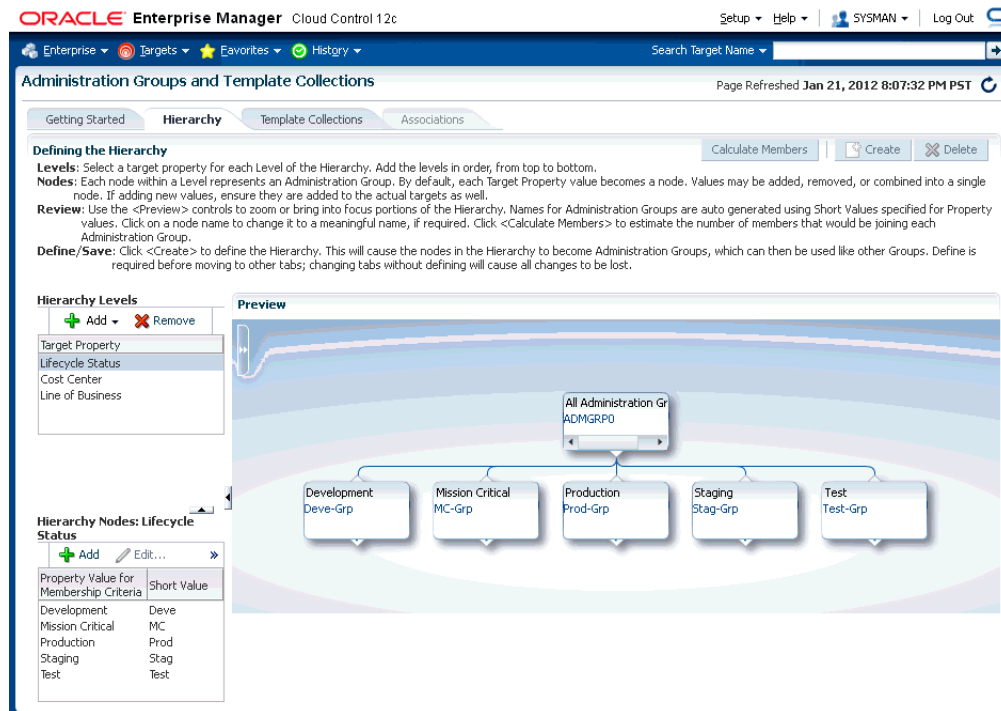

Synchronize the targets with the selected items

Read the relevant information on the **Getting Started** page. The information contained in this page summarizes the steps outlined in this chapter. For your convenience, links are provided that take you to appropriate Administration Group functions, as well as the Enterprise Manager **All Targets** page where you can view target properties.

### 5.3.1.2 Defining a Hierarchy

On this page you define the Administration Group hierarchy that reflects the organizational hierarchy you planned earlier and which target properties are associated with a particular hierarchy level.

On the left side of the page are two tables: Hierarchy Levels and Hierarchy Nodes.

The **Hierarchy Levels** table allows you to add the target properties that define Administration Group hierarchy. The **Hierarchy Nodes** table allows you to define the values associated with the target properties in the **Hierarchy Levels** table. When you select a target property, the related property values are made available in the **Hierarchy Nodes** table, where you can add/remove/merge/split the values. In the **Hierarchy Nodes** table, each row corresponds to a single Administration Group.

### Adding a Hierarchy Level

1. On the **Administration Group** page, click the **Hierarchy** tab.
2. From the **Hierarchy Levels** table, click **Add** and choose one of the available target properties. Repeat this step until you have added all target properties of interest.
3. Click on one of the newly added target properties in the **Hierarchy Levels** list. The membership values for property are displayed in the **Hierarchy Nodes** table.

Enterprise Manager finds all existing values of the target property across all targets and displays them in the **Hierarchy Nodes** table. For some target properties, such as Lifecycle Status, predefined property values already exist and are automatically displayed in the **Hierarchy Nodes** table. However, property values that are not yet available, will need to be added.

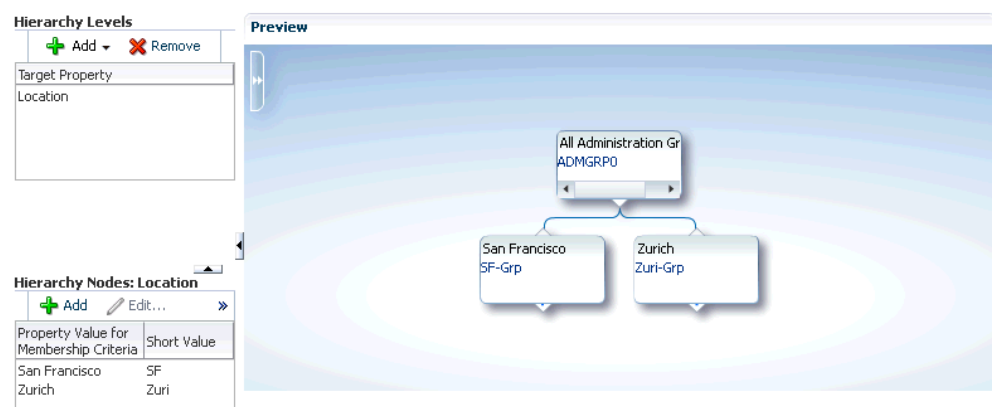

The next step shows you how to add property values.

4. From the **Hierarchy Nodes** table, click **Add**. The associated property value add dialog containing existing values from various targets displays. Add the requisite value(s). Multiple values can be specified using a comma separated list. For example, to add multiple locations such as San Francisco and Zurich, add the **Location** target property to the **Hierarchy Level** table. Select **Location** and then click **Add** in the **Hierarchy Nodes** table. The **Values for Hierarchy Nodes** dialog displays. Enter "San Francisco,Zurich" as shown in the following graphic.

Note: You cannot specify additional values for properties with predefined values (such as *Lifecycle Status*) or read-only properties (such as *Target Version*). Also, you cannot specify more than 25 property values (the **Hierarchy Nodes** table can have only 25 rows). If more than 25 property values need to be accommodated, values can be merged.

Click **OK**. The two locations "San Francisco" and "Zurich" appear as nodes in the **Preview** pane as shown in the following graphic.

Sometimes it is useful to treat multiple property values as one. For example, if a combination of values is needed, such as *Production* or *Mission Critical* for the *Lifecycle Status* property, they need to be merged (combined into a single node).

To merge property values:

1. Select a target property from the list of chosen properties in the **Hierarchy Levels** table. The associated property values are displayed.
2. Select two or more property values by holding down the *Shift* key and clicking on the desired values.
3. Click **Merge**. If **Merge** is not visible, click **Overflow** on the **Hierarchy Nodes** table.
5. Continue adding hierarchy levels until the group hierarchy is complete. The **Preview** pane dynamically displays any changes you make to your Administration Group hierarchy.

6. Click **Create** to define the hierarchy.

**IMPORTANT:** Review and define the complete hierarchy before clicking **Create**. Once the Administration Group hierarchy is created, you cannot add additional levels to the hierarchy without deleting and recreating the entire hierarchy.

Once your Administration Group hierarchy has been created, the only change you can make is to add/remove group membership criteria property values, which equates to creating/deleting additional Administration Groups for a given level. Using the previous example, if in addition to San Francisco and Zurich you add more locations, say New York and Bangalore, you can click **Add** in the **Hierarchy Node** table to add additional locations, as shown in the following graphic.

Click **Update** to save your changes.

### 5.3.1.3 Defining Template Collections

A Template Collection is an assemblage of monitoring/management settings to be applied to targets in the Administration Group. Multiple Monitoring Templates can be added to a Template Collection that in turn is associated with an Administration Group.

However, you can only have one Monitoring Template of a particular target type in the Template Collection. The Monitoring Template should contain the complete set of metric settings for the target in the Administration Group. You should create one Monitoring Template for each type of target in the Administration Group. For example, you can have a Template Collection containing a template for database and a template for listener, but you cannot have a Template Collection containing two templates for databases. When members targets are added to an Administration Group, the template monitoring and management settings are automatically applied.

You create Template Collections when you define Administration Groups. Template collections may consist of three types of monitoring/management setting categories:

- Monitoring Templates (monitoring settings)
- Compliance Standards (compliance policy rules)
- Cloud Policies (cloud policies such as determining when to start virtual machines or scale out clusters).

When creating a Template Collection, you can use the default Monitoring Templates, compliance standards, or cloud templates supplied with Enterprise Manager or you can create your own.

To create a Template Collection:

1. Click the **Template Collections** tab. The Template Collection page displays.

2. Click **Create**.
3. In the **Name** field, specify the Template Collection name.
4. Click the Template Collection member type you want to add (Monitoring Template, Compliance Standard, Cloud Policies). The requisite definition page appears.
5. Click **Add**. A list of available template entities appears.

6. Select the desired template entities you want added to the Template Collection.
7. Click **OK**.
8. Continue adding template entities (Monitoring Template, Compliance Standard, Cloud Policies) as required.
9. Click **Save**. The newly defined collection appears in the **Template Collections Library**.
10. To create another Template Collection, click **Create** from the **Library** region and create and repeat steps two through eight. Repeat this process until you have created all required Template Collections.

---

**Note:** When editing existing Template Collections, you can back out of any changes made during the editing session by clicking **Revert**. This restores the Template Collection to its state when it was last saved.

---

### Required Privileges

To create a Template Collection, *Create Template Collection* resource privilege. To include a Monitoring Template into a Template Collection, you need at least *View* privilege on the specific Monitoring Template or *View Any Monitoring Template* privilege, which allows you to view any Monitoring Template and add it to the Template Collection. The following table summarizes privilege requirements for all Enterprise Manager operations related to Template Collection creation.

| Enterprise Manager Operation           | Minimum Privilege Requirement                         |
|--|---|
| Create Administration Group hierarchy. | Full Any Target<br>Create Privilege Propagating Group |

| Enterprise Manager Operation   | Minimum Privilege Requirement  |
|--|--|
| Create Monitoring Templates.   | No privileges required   |
| Create Template Collection.  | Create Template Collection (resource privilege)                        |
|  | VIEW on the Monitoring Template to be added to the Template Collection |
|  | or   |
|  | View any Monitoring Template (resource privilege)                      |
| Create compliance standards.   | Create Compliance Entity   |
|  | No privileges are required to view compliance standards.               |
| Create cloud policies.   | Create Any Policy  |
|  | View Cloud Policy  |
| Associate Template Collection with Administration Group.   | VIEW on the specific Template Collection.                              |
|  | OPERATOR on the group  |
| Perform on-demand synchronization.   | OPERATOR on the group or<br>MANAGE_TC_OPERATION (subset of OPERATOR)   |
| Define global synchronization schedule.  | Enterprise Manager Super Administrator privileges.                     |
| Set the value of target properties for a target (allows the target to "join" an Administration Group). | Configure Target on the specific target                                |
| Delete an Administration Group hierarchy.  | Full Any Target  |

#### 5.3.1.4 Associating Template Collections with Administration Groups

Once you have defined one or more Template Collections, you need to associate them to Administration Groups in the hierarchy. You can associate a Template Collection with one or more Administration Groups. As a rule, you should associate the Template Collection with the applicable Administration Group residing at the highest level in the hierarchy as the Template Collection will also be applied to targets joining any subgroup.

The **Associations** page displays the current Administration Group hierarchy diagram. Each Administration Group in the hierarchy can only be associated with one Template Collection.

##### Associating a Template Collection with an Administration Group

1. Click the **Template/Group Associations** tab. The Template/Group Associations page displays.

2. Select the desired Administration Group in the hierarchy.
3. Click **Associate Template Collection**. The Choose a Template Collection dialog displays.
4. Choose the desired Template Collection and click **Select**. The Template Collection details are displayed. If too much information is displayed, you can use the Zoom and Layout controls located at the upper-left corner of the hierarchy display region.

---

**Note:** All sub-nodes in the hierarchy will inherit the selected Template Collection.

---

5. Repeat steps 1-3 until Template Collections have been associated with the desired groups.

---

**Note:** The target privileges of the administrator who performs the association will be used when Enterprise Manager applies the template to the group.

---

---

**Note:** Settings from Monitoring Templates applied at lower levels in the hierarchy override settings inherited from higher levels. This does not apply to compliance standards or cloud policies.

---

### Setting the Global Synchronization Schedule

In order to apply the Template Collection/Administration Group association, you must set up a global synchronization schedule. This schedule is used to perform synchronization operations, such as applying templates to targets in Administration Groups. If no synchronization schedule is set up, then most synchronization changes will remain in pending mode. When there are any pending synchronization operations, they will be scheduled on the next available date based on the

synchronization schedule. Thus, it is important to set the synchronization schedule as there is no default setting.

To set up the synchronization schedule:

1. Click **Synchronization Schedule**. The Synchronization Schedule dialog displays.

2. Click **Edit** and then choose a date and time you want the Administration Group-Template synchronization to take place. By default, the current date and time is shown.

---

**Note:** You can specify a start date for synchronization operations and interval in days. Whenever there are any pending sync operations, then they will be scheduled on the next available date based on the this schedule.

---

3. Click **Save**.

### Synchronization Sequence of Events

The following table summarizes when template synchronization operations (such as apply operations) occur on targets in Administration Groups.

| Action  | When Synchronization Occurs  |
|---|--|
| Target is added to an Administration Group (by setting its target properties) | Immediate upon joining the Administration Group.   |
| Template collection is associated with the Administration Group.              | Targets in an Administration Group will be synchronized based on next scheduled date in global Synchronization Schedule.     |
| Changes are made to any of the templates in the Template Collection.          | Targets in an Administration Group will be synchronized based on the next scheduled date in global Synchronization Schedule. |

| Action  | When Synchronization Occurs  |
|---|--|
| Target is removed from an Administration Group (by changing its target properties).   | No change in target's monitoring settings.<br>Compliance Standards and Cloud Policies will be disassociated with the target. |
| Template collection is disassociated with Administration Group.   | No change in target's monitoring settings.<br>Compliance Standards and Cloud Policies will be disassociated with the target. |
| User performs an on-demand synchronization by clicking on the <b>Start Synchronization</b> button in the <b>Synchronization Status</b> region in the Administration Group's homepage. | Immediate synchronization operation occurs.  |

### Viewing Synchronization Status

You can check the current synchronization status for a specific Administration Group directly from the group's homepage.

1. Select an Administration Group in the hierarchy.
2. Click **Goto Group Homepage**.
3. From the **Synchronization Status** region, you can view the status of the Monitoring Template, compliance standard, and/or cloud policies synchronization (In Sync, Pending, or Failed).

The screenshot displays the Oracle Enterprise Manager interface for an Administration Group named 'Deve-Grp'. The 'Synchronization Status' section is active, showing a table with the following data:

| Name                | Synchronized Targets | Pending Targets | Failed Targets | Excluded Targets |
|---------------------|----------------------|-----------------|----------------|------------------|
| Monitoring Template | 0                    | 1               | 0              | 0                |
| Compliance Standard | 0                    | 0               | 0              | 0                |
| Cloud Policies      | 0                    | 0               | 0              | 0                |

The 'Start Synchronization' button is located below the table. The 'Last Synchronization' timestamp is 'Jan 19, 2012 6:07:20 AM GMT+00:00' and the 'Next Synchronization' is 'N/A'.

You can initiate an immediate synchronization by clicking **Start Synchronization**.

### Disassociating a Template Collection from a Group

To remove a Template Collection from an Administration Group.

1. From the hierarchy diagram, select the Administration Group with the Template Collection you wish to remove.
2. Click **Disassociate Template Collection**.

The Template Collection is immediately removed. See [Section , "Synchronization Sequence of Events"](#) for more information.

### Viewing Aggregate Settings

For any Administration Group, you can easily view what Template Collection components (Monitoring Templates, compliance standards, and/or cloud policies) are associated with individual group members.

---

**Note:** For Monitoring Templates, the settings for a target could be a union of two or more Monitoring Templates from different Template Collections.

---

1. From the hierarchy diagram, select the desired Administration Group.
2. Click **View Aggregate Settings**.

The **Aggregate Settings** page appears. This page displays all Monitoring Templates, Compliance Standards and Cloud Policies associated with the selected Administration Group (listed by target type).

### Viewing the Administration Group Homepage

Like regular groups, each Administration Group has an associated group homepage providing a comprehensive overview of group member status and/or activity such as synchronization status, job activity, or critical patch advisories. To view Administration Group homepages:

1. From the hierarchy diagram, select an Administration Group.
2. Click **Goto Group Homepage**. The homepage for that particular Administration Group displays.

Page Refreshed Jan 24, 2012 2:48:48 AM UTC

Groups allow users to monitor and manage many targets as one. Users creating Privilege Propagating Groups must have full privilege on all member targets. When privileges (e.g. View) on Privilege Propagating Group are granted by the owner to any administrator, the grantee gets the same privilege on all the member targets as well. It is possible to create regular groups that are not Privilege propagating. Administration Groups are hierarchical in nature and their membership is only through criteria defined using global target properties. All Administration Groups are Privilege Propagating.

| slc00azb.us.oracle.com:4889_Management_Service     | Oracle Management Service           | <input checked="" type="checkbox"/> |            |                  |

Columns Hidden 5

- From the **View** menu, choose the customization options to display only the desired information.

**Note:** The **Non-Privilege Propagating Aggregate** column indicates whether a target is a non-privilege propagating aggregate. This type of target cannot be added to an Administration Group, which are by design privilege propagating. For this reason, any aggregate target added to Administration Group must also be privilege propagating.

On this page, you can review the list to see if there any targets that need to be added to the Administration Group. Click on the target names shown in this page to access the target's **Edit Target Properties** page where you can change the target property values. After making the requisite changes and clicking OK, you are returned to the **Unassigned Targets** page

If so, you can set the target properties of these targets to add them to the appropriate Administration Groups. For information on changing target properties, see ["Planning"](#) on page 5-3.

- Click your browser *back* button to return to the **Administration Groups and Template Collections** homepage.

## 5.4 Removing Administration Groups

You can completely remove an Administration Group hierarchy or just individual Administration Groups from the hierarchy. Deleting an Administration Group will not delete targets or Template Collections, but it will remove associations. Any stored membership criteria is removed. When you delete an Administration Group, any stored membership criteria is removed.

To remove the entire Administration Group hierarchy:

- From the **Setup** menu, select **Add Target**, then select **Administration Groups**.
- Click on the **Hierarchy Definition** tab.

**3. Click **Delete**.**

To remove individual Administration Groups from the hierarchy:

- 1. From the **Setup** menu, choose **Add Target**, then select **Administration Groups**.**
- 2. Click on the **Hierarchy Definition** tab.**
- 3. From the **Hierarchy Levels** table, choose the target property that corresponds to the hierarchy level containing the Administration Group to be removed.**
- 4. From the **Hierarchy Nodes** table, select the Administration Group (**Property Value for Membership Criteria**) to be removed.**
- 5. Choose **Remove** from the drop-down menu.**

---

## Metric Extensions

Metric extensions provides you with the ability to extend Oracle's monitoring capabilities to monitor conditions specific to your IT environment. This provides you with a comprehensive view of your environment. Furthermore, metric extensions allow you to simplify your IT organization's operational processes by leveraging Enterprise Manager as the single central monitoring tool for your entire datacenter instead of relying on other monitoring tools to provide this supplementary monitoring.

This chapter covers the following:

- [What are Metric Extensions?](#)
- [Metric Extension Lifecycle](#)
- [Working with Metric Extensions](#)
- [Adapters](#)
- [Converting User-defined Metrics to Metric Extensions](#)
- [Metric Extension Command Line Verbs](#)

### 6.1 What are Metric Extensions?

Metric extensions also allow you to create metrics on any target type and customize metric thresholds and collections. Unlike user-defined metrics (used to extend monitoring in previous Enterprise Manager releases), metric extensions allow you to create full-fledged metrics for a multitude of target types, such as:

- Hosts
- Databases
- Fusion Applications
- IBM Websphere
- Oracle Exadata databases and storage servers
- Siebel components
- Oracle Business Intelligence components

You manage metric extensions from the Metric Extensions page. This page lists all metric extensions in addition to allowing you to create, edit, import/export, and deploy metric extensions.

The cornerstone of the metric extension is the Oracle Integration Adapter. Adapters provide a means to gather data about targets using specific protocols. Adapter availability depends on the target type your metric extension monitors.

### How Do Metric Extensions Differ from User-defined Metrics?

In previous releases of Enterprise Manager, user-defined metrics were used to extend monitoring capability in a limited fashion: user-defined metrics could be used to collect point values through execution of OS scripts and a somewhat more complex set of values (one per object) through SQL. Unlike metric extensions, user-defined metrics have several limitations:

- **Limited Integration:** If the OS or SQL user-defined metric executed custom scripts, or required atonal dependent files, the user needed to manually transfer these files to the target's file system.
- **Limited Application of Query Protocols:** OS user-defined metrics cannot model child objects of servers by returning multiple rows from a metric (this capability only exists for SQL user-defined metrics).
- **Limited Data Collection:** Full-fledged Enterprise Manager metrics can collect multiple pieces of data with a single query and reflect the associated data in alert context. In the case of user-defined metrics, multiple pieces of data can be collected by creating multiple user-defined metrics, however, it is not possible to refer to the related data when alerts are generated because they are collected separately.
- **Limited Query Protocols:** User-defined metrics can only use the "OS" and "SQL" protocols, unlike metric extensions which can use additional protocols such as SNMP and JMX.
- **Limited Target Application:** You can only create OS user-defined metrics against host targets and SQL user-defined metrics against database targets. No other target types are permitted. User-defined metrics only allow OS user-defined metrics against host targets and SQL user-defined metrics against database targets. If, for example, you want to deploy a user-defined metric against Weblogic instances in your environment, you will not be able to do so, making it

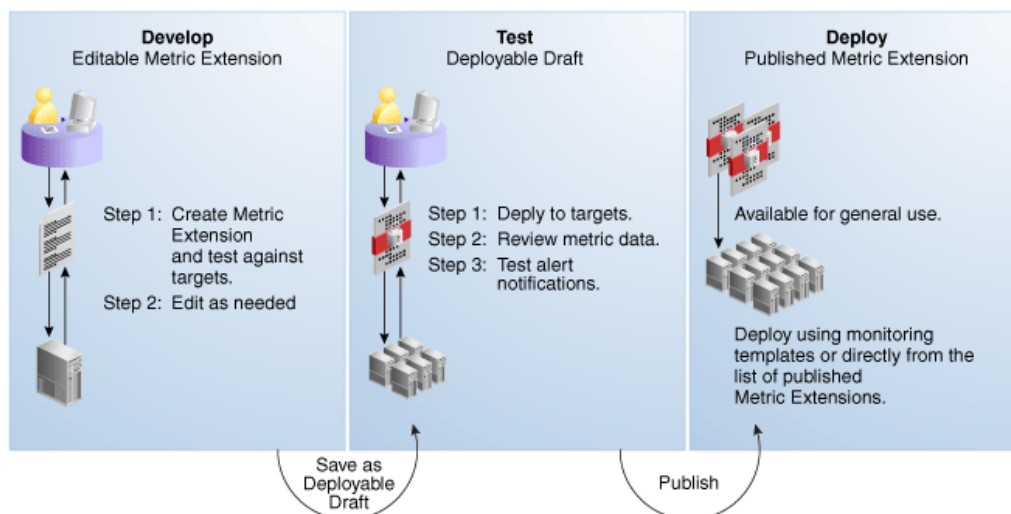

impossible to associate suspending of monitoring (blackouts) on these targets when servers are undergoing maintenance periods.

Most importantly, the primary difference between metric extensions and user-defined metrics is that, unlike user-defined metrics, metric dissensions are full-fledged metrics similar to Enterprise Manager out-of-box metrics. They are handled and exposed in all Enterprise Manager monitoring features as any Enterprise Manager-provided metric and will automatically apply to any new features introduced.

## 6.2 Metric Extension Lifecycle

Developing a metric extension involves the same three phases you would expect from any programmatic customization:

- Developing Your Metric Extension
- Testing Your Metric Extension
- Deploying and Publishing Your Metric Extension

### Developing Your Metric Extension

The first step is to define your monitoring requirements. This includes deciding the target type, what data needs to be collected, what mechanism (adapter) can be used to collect that data, and if elevated credentials are required. After making these decisions, you are ready to begin developing your metric extension. Enterprise Manager provides an intuitive user interface to guide you through the creation process.

**ORACLE Enterprise Manager Cloud Control 12c** Help

**Metric Extensions**

General Properties | Adapter | Columns | Credentials | Test | Review

**Create New : General Properties** Back Step 1 of 6 Next Finish Cancel

Specify the basic properties for the metric extension.  
The default collection can be overridden on a target instance basis in the Metric and Policies Settings page.

**General Properties**

\* Target Type: Host

\* Name:

A Metric Extension Name can only contain alpha-numeric characters, `_`, `-`, and `.` (non leading)

\* Display Name:

\* Adapter: OS Command - Multiple Columns

Tokenizes OS command output using user-specified delimiter

Description:

**Collection Schedule**

Data Collection ☐ Disabled ☒ Enabled

Collection Frequency: By Minutes

Repeat Every: 15 Minutes

Use of Metric Data: ☐ Alerting Only ☒ Alerting and Historical Trending

Upload Interval: 1 Collections

The metric extension wizard allows you to develop and refine your metric extension in a completely editable format. And more importantly, allows you to interactively test your metric extension against selected targets without having first to deploy the extension to a dedicated test environment. The **Test** page allows you to run real-time metric evaluations to ensure there are no syntactical errors in your script or metric extension definition.

**ORACLE Enterprise Manager Cloud Control 12c** Help

**Metric Extensions**

General Properties | Adapter | Columns | Credentials | Test | Review

**Edit command (ME\$ME\_Host) v1 : Test** Back Step 5 of 6 Next Finish Cancel

You can perform real-time metric evaluations here on specified test targets.  
It is recommended that you test your metric extension here first before deploying to targets. Targets that you select need to be up in order for your test to succeed.

**Test Targets**

+ Add - Remove Run Test Clear Results

| Target Name              | Target Type | Hostname                 | Current Status | Agent  |
|--------------------------|-------------|--------------------------|----------------|--|
| dadvmn0630.us.oracle.com | Host        | dadvmn0630.us.oracle.com |                | https://dadvmn0630.us.oracle.com:11852/emd/main/ |

**Test Results**

| Target Name | Error Message |
|-------------|---------------|
|-------------|---------------|

When you have completed working on your metric extension, you can click Finish to exit the wizard. The newly created metric extension appears in the Metric Extension Library where you can edit can be opened for further editing or saved as a deployable draft that can be tested against multiple targets.

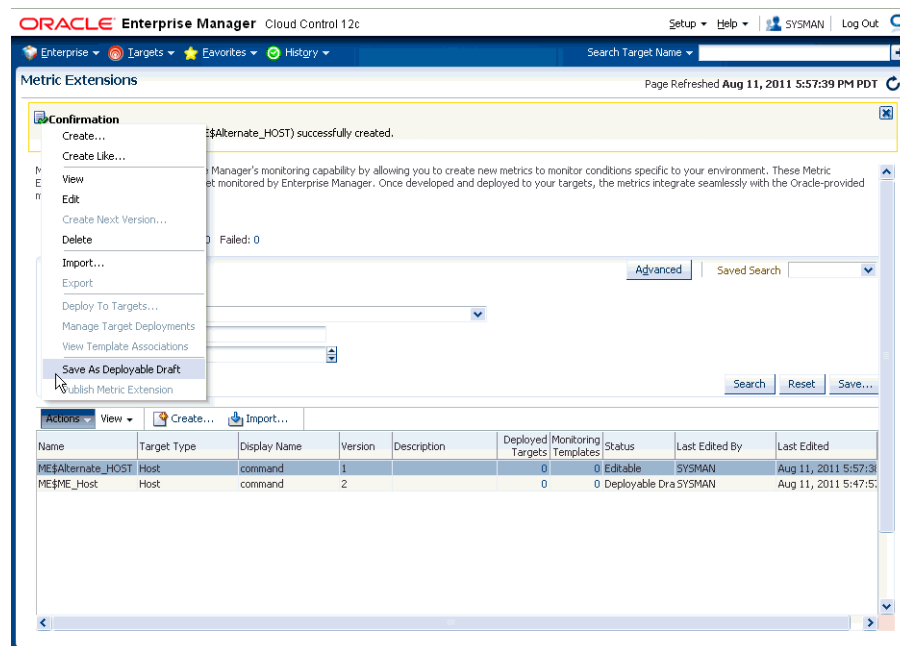

---

**Note:** You can edit a metric extension only if its status is *editable*. Once it is saved as a deployable draft, you must create a new version to implement further edits.

---

## Testing Your Metric Extension

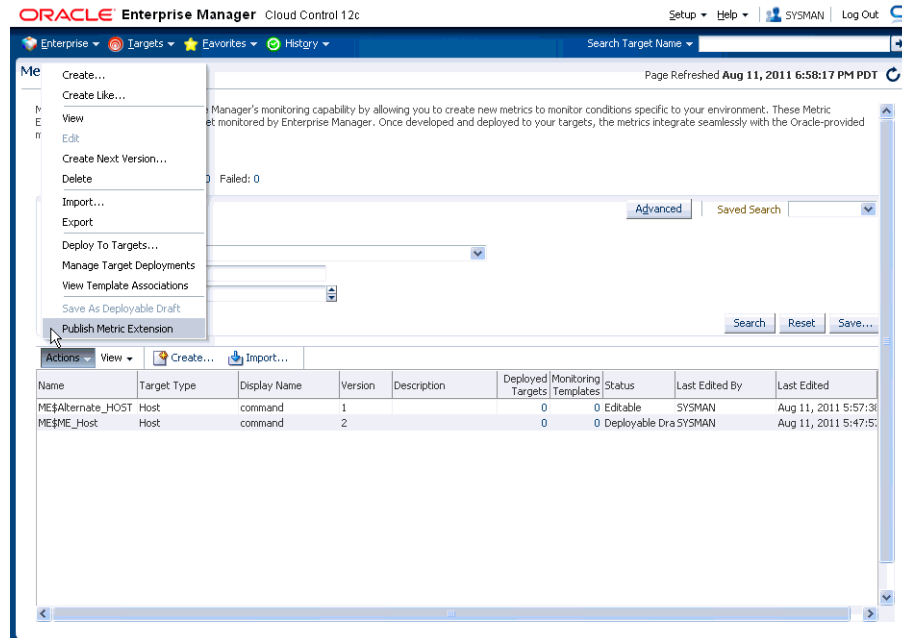

Once your metric extension returns the expected data during real-time target testing, you are ready to test its robustness and actual behavior in Enterprise Manager by deploying it against targets and start collecting data. At this point, the metric extension is still private (only the developer can deploy to targets), but is identical to Oracle out-of-box metrics behavior wise. This step involves selecting your editable metric extension in the library and generating a deployable draft.

You can now deploy the metric extension to actual targets by going through the “Deploy To Targets...” action. After target deployment, you can review the metric data returned and test alert notifications. As mentioned previously, you will not be able to edit the metric extension once a deployable draft is created: You must create a new version of the metric extension.

## Deploying Your Metric Extension

After rigorous testing through multiple metric extension versions and target deployments, your metric extension is ready for deployment to your production environment. Until this point, your metric extension is only viewable by you, the metric extension creator. To make it accessible to all Enterprise Manager administrators, it must be published.

Now that your metric extension has been made public, your metric extension can be deployed to intended production targets. If you are monitoring a small number of targets, you can select the **Deploy To Targets** menu option and add targets one at a time. For large numbers of targets, you deploy metric extensions to targets using monitoring templates. An extension is added to a monitoring template in the same way a full-fledged metric is added. The monitoring template is then deployed to the targets.

---

**Note:** You cannot add metric extensions to monitoring templates before publishing the extension. If you attempt to do so, the monitoring template page will warn you about it, and will not proceed until you remove the metric extension.

---

## 6.3 Working with Metric Extensions

Most all metric extension operations can be carried out from the Metric Extension home page. If you need to perform operations on published extensions outside of the UI, Enterprise Manager also provides EM CLI verbs to handle such operations as importing/exporting metric extensions to archive files and migrating legacy user-defined metrics to metric extensions. This section covers metric extension operations carried out from the UI.

### 6.3.1 Administrator Privilege Requirements

In order to create, edit, view, deploy or undeploy metric extensions, you must have the requisite administrator privileges. Enterprise Manager administrators must have the following privileges:

- **Create Metric Extension:** System level access that:
  - Lets administrators view and deploy metric extensions
  - Allows administrators to edit and delete extensions.

- **Edit Metric Extension:** Lets users with "Create Metric Extension" privilege edit and create next versions of a particular metric extensions. The metric extension creator has this privilege by default.

Note: This privilege must be granted on a per-metric extension basis.

- **Full Metric Extension:** In addition to the Edit Metric Extension privileges, allows deletion of a particular metric extension.

- **Manage Metrics:** Lets users deploy and un-deploy extensions on targets

Note: The Manage Metrics privilege must be granted on a per-target basis.

### 6.3.2 Granting Create Metric Extension Privilege

To grant create metric extension privileges to another administrator:

1. From the **Setup** menu, select **Security**, then select **Administrators**.
2. Choose the Administrator you would like to grant the privilege to.
3. Click **Edit**.
4. Go to the Resource Privileges tab, and click **Manage Privilege Grants** for the Metric Extension resource type.
5. Under Resource Type Privileges, click the **Create Metric Extension** check box.
6. Click **Continue**, review changes, and click **Finish** in the Review tab.

### 6.3.3 Creating a New Metric Extension

To create a new metric extension:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. Click **Create New**. Enterprise Manager will determine whether you have the Create Extension privilege and guide you through the creation process.
3. Decide on a metric extension name. Be aware that the name (and Display Name) must be unique across a target type.
4. Enter the general parameters.

The selected Adapter type defines the properties you must specify in the next step of the metric extension wizard. The following adapter types are available:

- **OS Command Adapter - Single Column**  
Executes the specified OS command and returns the command output as a single value. The metric result is a 1 row, 1 column table.
- **OS Command Adapter- Multiple Values**  
Executes the specified OS command and returns each command output line as a separate value. The metric result is a multi-row, 1 column table.
- **OS Command Adapter - Multiple Columns**  
Executes the specified OS command and parses each command output line (delimited by a user-specified string) into multiple values. The metric result is a multi-row, multi-column table.
- **SQL Adapter**  
Executes custom SQL queries or function calls against single instance databases and instances on Real Application Clusters (RAC).

- **SNMP (Simple Network Management Protocol) Adapter**  
Allow Enterprise Manager Management Agents to query SNMP agents for Management Information Base (MIB) variable information to be used as metric data.
- **JMX (Java Management Extensions) Adapter**  
Retrieves JMX attributes from JMX-enabled servers and returns these attributes as a metric table.

Refer to the Adapters section for specific information on the selected adapter needed in the Adapter page (step 2) of the wizard.

---

**Note:** Be aware that if you change the metric extension Adapter, all your previous adapter properties (in Step 2) will be cleared.

---

5. From the Columns page, add metric columns defining the data returned from the adapter. Note that the column order should match the order the adapter returns the data in.
  - **Column Type**  
A column is either a Key column, or Data column. A Key column uniquely identifies a row in the table. For example, employee ID is a unique identifier of a table of employees. A Data column is any non-unique data in a row. For example, the first and last names of an employee.
  - **Value Type**  
A value type is Number or String. This determines the alert comparison operators that are available, and how Enterprise Manager renders collection data for this metric column.
  - **Alert Thresholds**  
The Comparison Operation, Warning, and Critical fields define an alert threshold.
  - **Alert Thresholds By Key**  
The Comparison Operation, Warning Thresholds By Key, and Critical Thresholds By Key fields allow you to specify distinct alert thresholds for different rows in a table. This option becomes available if there are any Key columns defined. For example, if your metric is monitoring CPU Usage, you can specify a different alert threshold for each distinct CPU. The syntax is to specify the key column values in a comma separated list, the "=" symbol, followed by the alert threshold. Multiple thresholds for different rows can be separated by the semi-colon symbol ";". For example, if the key columns of the CPU Usage metric are `cpu_id` and `core_id`, and you want to add a warning threshold of 50% for `processor1`, `core1`, and a threshold of 60% for `processor2`, `core2`, you would specify:  
`processor1,core1=50;processor2,core2=60`
  - **Manually Clearable Alert**  
If this option is set to true, then the alert will not automatically clear when the alert threshold is no longer satisfied. For example, if your metric is counting the number of errors in the system log files, and you set an alert threshold of 50, if an alert is raised once the threshold is met, the alert will not automatically clear once the error count falls back below 50. The alert will

need to be manually cleared in the Alerts UI in the target home page or Incident Manager.

- **Number of Occurrences Before Alert**

The number of consecutive metric collections where the alert threshold is met, before an alert is raised.

- **Alert Message / Clear Message**

The message that is sent when the alert is raised / cleared. Variables that are available for use are: %columnName%, %keyValue%, %value%, %warning\_threshold%, %critical\_threshold%

You can also retrieve the value of another column by surrounding the desired column name with "%". For example, if you are creating an alert for the cpu\_usage column, you can get the value of the core\_temperature column by using %core\_temperature%. Note that the same alert / clear message is used for warning or critical alerts.

---

**Note:** Think carefully and make sure all Key columns are added, because you cannot create additional Key columns in newer versions of the metric extension. Once you click **Save As Deployable Draft**, the Key columns are final (edits to column display name, alert thresholds are still allowed). You can still add new Data columns in newer versions. Also be aware that some properties of existing Data columns cannot be changed later, including Column Type, Value Type, Comparison Operator (you can add a new operator, but not change an existing operator), and Manually Clearable Alert.

---

- **Metric Category**

The metric category this column belongs to.

6. From the Credentials page, you can override the default monitoring credentials by using custom monitoring credential sets. By default, the metric extension wizard chooses the existing credentials used by Oracle out-of-box metrics for the particular target type. For example, metric extensions will use the dbsnmp user for database targets. You have the option to override the default credentials, by creating a custom monitoring credential set through the "emcli create\_credential\_set" command. Refer to the *Enterprise Manager Command Line Interface Guide* for additional details. Some adapters may use additional credentials, refer to the Adapters section for specific information.
7. From the Test page, add available test targets.
8. Click **Run Test** to validate the metric extension. The extension is deployed to the test targets specified by the user and a real-time collection is executed. Afterwards, the metric extension is automatically undeployed. The results and any errors are added to the **Test Results** region.
9. Repeat the edit / test cycle until the metric extension returns data as expected.
10. Click **Finish**.

### 6.3.4 Creating a New Metric Extension (Create Like)

To create a new metric extension based on an existing metric extension:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.

2. From the **Metric Extensions** page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select an existing metric extension.
4. From the **Actions** menu, select **Create Like**. Enterprise Manager will determine whether you have the Create Extension privilege and guide you through the creation process.
5. Make desired modifications.
6. From the **Test** page, add available test targets.
7. Click **Run Test** to validate the metric extension. The extension is deployed to the test targets specified by the user and a real-time collection is executed. Afterwards, the metric extension is automatically undeployed. The results and any errors are added to the **Test Results** region.
8. Repeat the edit / test cycle until the metric extension returns data as expected.
9. Click **Finish**.

### 6.3.5 Editing a Metric Extension

Before editing an existing metric extension, you must have Edit privileges on the extension you are editing or be the extension creator. Note: Once a metric extension is saved as a deployable draft, it cannot be edited, you can only create a new version.

To edit an existing metric extension:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. From the **Metric Extensions** page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select the metric extension to be edited.
4. From the **Actions** menu, select **Edit**.
5. Update the metric extension as needed.
6. From the **Test** page, add available test targets.
7. Click **Run Test** to validate the metric extension. The extension is deployed to the test targets specified by the user and a real-time collection is executed. Afterwards, the metric extension is automatically undeployed. The results and any errors are added to the **Test Results** region.
8. Repeat the edit / test cycle until the metric extension returns data as expected.
9. Click **Finish**.

### 6.3.6 Creating the Next Version of an Existing Metric Extension

Before creating the next version of an existing metric extension, you must have Edit privileges on the extension you are versioning or be the extension creator.

To create next version of an existing metric extension:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.

2. From the Metric Extensions page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select the metric extension to be versioned.
4. From the **Actions** menu, select **Create Next Version**.
5. Update the metric extension as needed. The target type, and extension name cannot be edited, but all other general properties can be modified. There are also restrictions on metric columns modifications. See Note in Creating a New Metric Extension section for more details.
6. From the Test page, add available test targets.
7. Click **Run Test** to validate the metric extension. The extension is deployed to the test targets specified by the user and a real-time collection is executed. Afterwards, the metric extension is automatically undeployed. The results and any errors are added to the **Test Results** region.
8. Repeat the edit / test cycle until the metric extension returns data as expected.
9. Click **Finish**.

### 6.3.7 Importing a Metric Extension

Metric extensions can be converted to portable, self-contained packages that allow you to move the metric extension to other Enterprise Manager installations, or for storage/backup. These packages are called Metric Extension Archives (MEA) files.

MEA files are zip files containing all components that make up the metric extension: metric metadata, collections, and associated scripts/jar files. Each MEA file can contain only one metric extension. To add the metric extension back to your Enterprise Manager installation, you must import the metric extension from the MEA.

To import a metric extension from an MEA file:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. Click **Import**.
3. Browse to file location, and select the MEA file. Enterprise Manager checks if the target type and metric extension name combination is already used in the system. If not, the system will create a new metric extension. If the extension name is already in use, the system will attempt to create a new version of the existing extension using the MEA contents. This will require the MEA to contain a superset of all the existing metric extension's metric columns. You also have the option to rename the metric extension.
4. Clicking on OK creates the new metric extension or the new version of an existing metric extension.
5. From the **Actions** menu, select **Edit** to verify the entries.
6. From the **Test** page, add available test targets.
7. Click **Run Test** to validate the metric extension. The extension is deployed to the test targets specified by the user and a real-time collection is executed. Afterwards, the metric extension is automatically undeployed. The results and any errors are added to the **Test Results** region.
8. Repeat the edit / test cycle until the metric extension returns data as expected.
9. Click **Finish**.

### 6.3.8 Exporting a Metric Extension

Existing metric extensions can be package as self-contained zip files (exported) for portability and/or backup and storage.

To export an existing metric extension:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. From the **Metric Extensions** page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select the metric extension to be exported.
4. From the **Actions** menu, select **Export**. Enterprise Manager prompts you to enter the name and location of the MEA file that is to be created.
5. Enter the name and location of the package. Enterprise Manager displays the confirmation page after the export is complete. Note: You can only export the production version. Note: You can only export Deployable Draft and Published metric extension versions.
6. Confirm the export file is downloaded.

### 6.3.9 Deleting a Metric Extension

Initiating the deletion of a metric extension is simple. However, the actual deletion triggers a cascade of activity by Enterprise Manager to completely purge the metric extension from the system. This includes closing open metric alerts, and purging collected metric data (if the latest metric extension version is deleted).

Before a metric extension version can be deleted, it must be undeployed from all targets, and removed from all monitoring templates (including templates in pending apply status).

To delete a metric extension:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. From the **Metric Extensions** page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select the metric extension that is to be deleted.
4. From the **Actions** menu, select **Delete**. Enterprise Manager prompts you to confirm the deletion.
5. Confirm the deletion.

### 6.3.10 Granting Edit/Full Access to Metric Extensions

Before an Enterprise Manager administrator can be edit, or delete a metric extension created by another administrator, they must have been granted requisite access privileges. Edit privilege allows editing and creating next versions of the extension, and Full privilege allows the above operations and deletion of the extension.

To grant edit/full access to an existing metric extension to another administrator:

1. From the **Setup** menu, select **Security**, then select **Administrators**.
2. Choose the Administrator you would like to grant access to.
3. Click **Edit**.

4. Go to the Resource Privileges tab, and click **Manage Privilege Grants for the Metric Extension** resource type.
5. Under **Resource Privileges**, you can search for and add existing metric extensions. Add the metric extensions you would like to grant privileges to. This allows the user to edit and create next versions of the metric extension.
6. If you would additionally like to allow delete operations, then click the pencil icon in the **Manage Resource Privilege Grants** column, and select **Full Metric Extension** privilege in the page that shows up.
7. Click **Continue**, review changes, and click **Finish** in the review tab.

### 6.3.11 Deploying Metric Extensions to a Group of Targets

A metric extension must be deployed to a target in order for it to begin collecting data.

To deploy a metric extension to one or more targets:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. From the **Metric Extensions** page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select the metric extension that is to be deployed.
4. From the **Actions** menu, select **Manage Target Deployments**. The **Manage Target Deployments** page appears showing you on which target(s) the selected metric extension is already deployed.
5. Return to the **Metric Extensions** page.
6. Select the metric extension.
7. From the **Actions** menu, select **Deploy to Targets**. Enterprise Manager determines whether you have "Manage Target Metrics" privilege, and only those targets where you do show up in the target selector.
8. Add the targets where the metric extension is to be deployed and click Submit. Enterprise Manager submits a job deploying the metric extension to each of the targets. A single job is submitted per deployment request.
9. You are automatically redirected to the Pending Operations page, which shows a list of currently scheduled, executing, or failed metric extension deploy operations. Once the deploy operation completes, the entry is removed from the pending operations table.

### 6.3.12 Updating Older Versions of Metric Extensions Already deployed to a Group of Targets

When a newer metric extension version is published, you may want to update any older deployed instances of the metric extension.

To update old versions of the metric extension already deployed to targets:

1. From the **Enterprise** menu, select **Monitoring**, then select **Metric Extensions**.
2. From the **Metric Extensions** page, determine which extensions are accessible. The page displays the list of metric extensions along with target type, owner, production version and deployment information.
3. Select the metric extension to be upgraded.

4. From the **Actions** menu, select **Manage Target Deployments**. The **Manage Target Deployments** page appears showing a list of targets where the metric extension is already deployed.
5. Select the list of targets where the extension is to be upgraded and click **Upgrade**. Enterprise Manager submits a job for the deployment of the newest Published metric extension to the selected targets. A single job is submitted per deployment request.
6. You are automatically redirected to the Pending Operations page, which shows a list of currently scheduled, executing, or failed metric extension deploy operations. Once the deploy operation completes, the entry is removed from the pending operations table.

## 6.4 Adapters

Oracle Integration Adapters provide comprehensive, easy-to-use monitoring connectivity with a variety of target types. The adapter enables communication with an enterprise application and translates the application data to standards-compliant XML and back.

The metric extension target type determines which adapters are made available from the UI. A complete list of all adapters is shown below.

- [OS Command Adapter - Single Column](#)
- [OS Command Adapter- Multiple Values](#)
- [OS Command Adapter - Multiple Columns](#)
- [SQL Adapter](#)
- [SNMP \(Simple Network Management Protocol\) Adapter](#)
- [JMX Adapter](#)

### 6.4.1 OS Command Adapter - Single Column

Executes the specified OS command and returns the command output as a single value. The metric result is a 1 row, 1 column table.

#### Basic Properties

The complete command line will be constructed as: Command + Script + Arguments.

- **Command** - The command to execute. For example, %perlBin%/perl. The complete command line will be constructed as: Command + Script + Arguments.
- **Script** - A script to pass to the command. For example, %scriptsDir%/myscript.pl. You can upload custom files to the agent, which will be accessible under the %scriptsDir% directory.
- **Arguments** - Additional arguments to be appended to the Command.

#### Advance Properties

- **Input Properties** - Additional properties can be passed to the command through its standard input stream. This is usually used for secure content, such as username or passwords, that you don't want to be visible to other users. For example, you can add the following Input Property:

```
Name=targetName, Value=%NAME%
```

which the command can read through it's standard input stream as "STDINtargetName=<target name>".

- **Environment Variables** - Additional properties can be accessible to the command from environment variables. For example, you can add Environment Variable: Name=targetType, Value="%TYPE%", and the command can access the target type from environment variable "ENVtargetType".

### Credentials

- **Host Credentials** - The credential used to launch the OS Command.
- **Input Credentials** - Additional credentials passed to the OS Command's standard input stream.

### Example 1

Read the contents of a log file, and dump out all lines containing references to the target.

- **Approach 1** - Use the grep command, and specify the target name using %NAME% parameter.

```
Command = /bin/grep %NAME% mytrace.log
```

- **Approach 2** - Run a perl script

```
Command = %perlBin%/perl
```

```
Script = %scriptsDir%/filterLog.pl
```

Input Properties:

```
targetName = %NAME%
```

```
targetType = %TYPE%
```

#### filterLog.pl:

```
require "emd_common.pl";

my %stdinVars = get_stdinvars();
my $targetName = $stdinVars{"targetName"};
my $targetType = $stdinVars{"targetType"};
open (MYTRACE, mytrace.log);
foreach $line (<MYTRACE >)
{
    # Do line-by-line processing
}

close (MYTRACE);
```

### Example 2

Connect to a database instance from a PERL script and query the HR.JOBS sample schema table.

- **Approach 1** - Pass credentials from target type properties into using Input Properties:

```
Command = %perlBin%/perl
```

```
Script = %scriptsDir%/connectDB.pl
```

**Input Properties:**

```
EM_DB_USERNAME = %Username%
EM_DB_PASSWORD = %Password%
EM_DB_MACHINE = %MachineName%
EM_DB_PORT = %Port%
EM_DB_SID = %SID%
```

**connectDB.pl**

```
use DBI;
require "emd_common.pl";

my %stdinVars = get_stdinvars();
my $dbUsername = $stdinVars{"EM_DB_USERNAME"};
my $dbPassword = $stdinVars{"EM_DB_PASSWORD"};
my $dbMachine = $stdinVars{"EM_DB_MACHINE"};
my $dbPort = $stdinVars{"EM_DB_PORT"};
my $dbSID = $stdinVars{"EM_DB_SID"};

my $dbAddress =
"(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP) (HOST=$dbMachine) (Port=$dbPort)) (CONNECT_
DATA=(SID=$dbSID)))";

# Establish Target DB Connection
my $db = DBI->connect('dbi:Oracle:', "$dbUsername@$dbAddress", "$dbPassword",
    {PrintError => 0, RaiseError => 0, AutoCommit => 0})
    or die (filterOraError("em_error=Could not connect to
$dbUsername/$dbAddress: $DBI::errstr\n", $DBI::err));

my $query = "SELECT JOB_TITLE, MIN_SALARY FROM HR.JOBS";
my $st = $db->prepare($query);
$st->execute();

while ( my ($job_title, $min_sal) = $st->fetchrow_array() )
{
    print "$job_title|$min_sal\n";
}

$db->disconnect
    or warn "disconnect $DBI::errstr\n";

exit 0;
```

- **Approach 2 - Pass monitoring credential set using Input Credentials**

```
Command = %perlBin%/perl
Script = %scriptsDir%/connectDB.pl
```

**Input Credentials:**

```
dbCreds = MyCustomDBCreds
```

**connectDB.pl**

```
use DBI;

require "emd_common.pl";
```

```

my %stdinVars = get_stdinvars();
my $credType = getCredType("dbCred", \%stdinVars);
my %credProps = getCredProps("dbCreds", \%stdinVars);
my $dbUsername = $credProps{"DBUserName"};
my $dbPassword = $credProps{"DBPassword"};

```

### Example 3

Overriding default monitoring credentials by creating and using a custom monitoring credential set for host target.

We will only show a simple example here. Refer to the Credentials section of the Administrator's Guide for more details on creating and configuring custom monitoring credential sets.

Creating host credentials for the host target type:

```

> emcli create_credential_set -set_name=myCustomCreds -target_type=host -auth_
target_type=host -supported_cred_types=HostCreds -monitoring -description='My
Custom Credentials'

```

When you go to the Credentials page of the Metric Extension wizard, and choose to "Specify Credential Set" for Host Credentials, you will see "My Custom Credentials" show up as an option in the drop down list.

Note that this step only creates the Monitoring Credential Set for the host target type, and you need to set the credentials on each target you plan on deploying this metric extension to. You can set credentials from Enterprise Manager by going to Setup, then Security, then Monitoring Credentials. Alternatively, this can be done from the command line.

```

> emcli set_monitoring_credential -target_name=target1 -target_type=host -set_
name=myCustomCreds -cred_type=HostCreds -auth_target_type=host
-attributes='HostUserName:myusername;HostPassword:mypassword'

```

## 6.4.2 OS Command Adapter- Multiple Values

Executes the specified OS command and returns each command output line as a separate value. The metric result is a multi-row, 1 column table.

For example, if the command output is:

```

em_result=foo
em_result=bar

```

then three columns are populated with values 1,2,3 respectively.

### Basic Properties

- **Command** - The command to execute. For example, %perlBin%/perl.
- **Script** - A script to pass to the command. For example, %scriptsDir%/myscript.pl. You can upload custom files to the agent, which will be accessible under the %scriptsDir% directory.
- **Arguments** - Additional arguments to be appended to the Command.
- **Starts With** - The starting string of metric result lines.

Example: If the command output is:

```

em_result=4354
update

```

test

setting *Starts With = em\_result* specifies that only lines starting with *em\_result* will be parsed.

### Advanced Properties

- **Input Properties** - Additional properties to be passed to the command through its standard input stream. For example, you can add Input Property: Name=targetName, Value=%NAME%, which the command can read through its standard input stream as "STDINtargetName=<target name>". See usage examples in OS Command Adapter - Single Columns.
- **Environment Variables** - Additional properties can be accessible to the command from environment variables. For example, you can add Environment Variable: Name=targetType, Value="%TYPE%", and the command can access the target type from environment variable "ENVtargetType". See usage examples in OS Command Adapter - Single Columns.

### Credentials

- **Host Credentials** - The credential used to launch the OS Command. See usage examples in OS Command Adapter - Single Columns.
- **Input Credentials** - Additional credentials passed to the OS Command's standard input stream. See usage examples in OS Command Adapter - Single Columns.

## 6.4.3 OS Command Adapter - Multiple Columns

Executes the specified OS command and parses each command output line (delimited by a user-specified string) into multiple values. The metric result is a multi-row, multi-column table.

Example: If the command output is

```
em_result=1|2|3
em_result=4|5|6
```

and the Delimiter is set as "|", then there are two rows of three columns each:

**Table 6–1 Multi-Column Output**

|   |   |   |
|---|---|---|
| 1 | 2 | 3 |
| 4 | 5 | 6 |

### Basic Properties

The complete command line will be constructed as: Command + Script + Arguments

- **Command** - The command to execute. For example, %perlBin%/perl.
- **Script** - A script to pass to the command. For example, %scriptsDir%/myscript.pl. You can upload custom files to the agent, which will be accessible under the %scriptsDir% directory.
- **Arguments** - Additional arguments.
- **Delimiter** - The string used to delimit the command output.
- **Starts With** - The starting string of metric result lines.

Example: If the command output is

```
em_result=4354
foo
bar
```

setting *Starts With = em\_result* specifies that only lines starting with *em\_result* will be parsed.

- **Input Properties** - Additional properties can be passed to the command through its standard input stream. For example, you can add Input Property: *Name=targetName, Value=%NAME%*, which the command can read through its standard input stream as *STDINtargetName=<target name>*. To specify multiple Input Properties, enter each property on its own line.
- **Environment Variables** - Additional properties can be accessible to the command from environment variables. For example, you can add Environment Variable: *Name=targetType, Value="%TYPE%*, and the command can access the target type from environment variable "ENVtargetType".

### Advanced Properties

- **Input Properties** - Additional properties can be passed to the command through its standard input stream. For example, you can add Input Property: *Name=targetName, Value=%NAME%*, which the command can read through its standard input stream as *STDINtargetName=<target name>*. See usage examples in OS Command Adapter - Single Columns.
- **Environment Variables** - Additional properties can be accessible to the command from environment variables. For example, you can add Environment Variable: *Name=targetType, Value="%TYPE%*, and the command can access the target type from environment variable "ENVtargetType". See usage examples in OS Command Adapter - Single Columns.

### Credentials

- **Host Credentials** - The credential used to launch the OS Command. See usage examples in OS Command Adapter - Single Columns
- **Input Credentials** - Additional credentials passed to the OS Command's standard input stream. See usage examples in OS Command Adapter - Single Columns.

## 6.4.4 SQL Adapter

Executes custom SQL queries or function calls supported against single instance databases and instances on Real Application Clusters (RAC).

### Properties

- **SQL Query** - The SQL query to execute. Normal SQL statements should not be semi-colon terminated. For example, SQL Query = "select a.ename, (select count(\*) from emp p where p.mgr=a.empno) directs from emp a". PL/SQL statements are also supported, and if used, the "Out Parameter Position" and "Out Parameter Type" properties should be populated.
- **SQL Query File** - A SQL query file. Note that only one of "SQL Query" or "SQL Query File" should be used. For example, %scriptsDir%/myquery.sql. You can upload custom files to the agent, which will be accessible under the %scriptsDir% directory.

- **Transpose Result** - Transpose the SQL query result.
- **Bind Variables** - Declare bind variables used in normal SQL statements here. For example, if the SQL Query = "select a.ename from emp a where a.mgr = :1", then you can declare the bind variable as Name=1, Value=Bob.
- **Out Parameter Position** - The bind variable used for PL/SQL output. Only integers can be specified.

Example: If the SQL Query is

```
DECLARE
    l_output1 NUMBER;
    l_output2 NUMBER;
BEGIN
    ....
    OPEN :1 FOR
        SELECT l_output1, l_output2 FROM dual;
END;
```

you can set Out Parameter Position = 1, and Out Parameter Type = SQL\_CURSOR

- **Out Parameter Type** - The SQL type of the PL/SQL output parameter. See comment for Out Parameter Position

### Credentials

- **Database Credentials** - The credential used to connect to the database.

### Example

Overriding default monitoring credentials by creating and using a custom monitoring credential set for database target.

We will only show a simple example here. Refer to the Credentials guide of the Admin Guide for more details on creating and configuring custom monitoring credential sets.

Creating host credentials for the database target type:

```
> emcli create_credential_set -set_name=myCustomDBCreds -target_type=oracle_
database -auth_target_type=oracle_database -supported_cred_types=DBCreds
-monitoring -description='My Custom DB Credentials'
```

When you go to the Credentials page of the Metric Extension wizard, and choose to "Specify Credential Set" for Database Credentials, you will see "My Custom DB Credentials" show up as an option in the drop down list.

Note that this step only creates the Monitoring Credential Set for the host target type, and you need to set the credentials on each target you plan on deploying this metric extension to. You can set credentials from Enterprise Manager by going to **Setup**, then selecting **Security**, then selecting **Monitoring Credentials**. Alternatively, this can be performed using the Enterprise Manager Command Line Interface.

```
> emcli set_monitoring_credential -target_name=db1 -target_type=oracle_database
-set_name=myCustomDBCreds -cred_type=DBCreds -auth_target_type=oracle_database
-attributes='DBUserName:myusername;DBPassword:mypassword'
```

## 6.4.5 SNMP (Simple Network Management Protocol) Adapter

Allow Enterprise Manager Management Agents to query SNMP agents for Management Information Base (MIB) variable information to be used as metric data.

### Basic Properties

- **Object Identifiers (OIDs):** Object Identifiers uniquely identify managed objects in a MIB hierarchy. One or more OIDs can be specified. The SNMP adapter will collect data for the specified OIDs. For example, 1.3.6.1.4.1.111.4.1.7.1.1

### Advanced Properties

- **Delimiter** - The delimiter value used when specifying multiple OID values for an OID's attribute. The default value is space or \n or \t
- **Tabular Data** - Indicates whether the expected result for a metric will have multiple rows or not. Possible values are TRUE or FALSE. The default value is FALSE
- **Contains V2 Types** - Indicates whether any of the OIDs specified is of SNMPV2 data type. Possible values are TRUE or FALSE. The default value is FALSE. For example, if an OID value specified is of counter64 type, then this attribute will be set to TRUE.

## 6.4.6 JMX Adapter

Retrieves JMX attributes from JMX-enabled servers and returns these attributes as a metric table.

### Properties

- **Metric** -- The MBean ObjectName or ObjectName pattern whose attributes are to be queried. Since this is specified as metric metadata, it needs to be instance-agnostic. Instance-specific key properties (such as *servername*) on the MBean ObjectName may need to be replaced with wildcards.
- **ColumnOrder** -- A semi-colon separated list of JMX attributes in the order they need to be presented in the metric.

### Advanced Properties

- **IdentityCol** -- The MBean key property that needs to be surfaced as a column when it is not available as a JMX attribute. For example:

```
com.myCompany:Name=myName,Dept=deptName, prop1=prop1Val, prop2=prop2Val
```

In this example, setting *identityCol* as *Name;Dept* will result in two additional key columns representing Name and Dept besides the columns representing the JMX attributes specified in the *columnOrder* property.

- **AutoRowPrefix** -- Prefix used for an automatically generated row. Rows are automatically generated in situations where the MBean *ObjectName* pattern specified in metric property matches multiple MBeans and none of the JMX attributes specified in the *columnOrder* are unique for each. The *autoRowId* value specified here will be used as a prefix for the additional key column created. For example, if the metric is defined as:

```
com.myCompany:Type=CustomerOrder,* columnOrder
```

is

```
CustomerName;OrderNumber;DateShipped
```

and assuming *CustomerName;OrderNumber;Amount* may not be unique if an order is shipped in two parts, setting *autoRowId* as "ShipItem-" will populate an

additional key column for the metric for each row with ShipItem-0, ShipItem-1, ShipItem-2...ShipItem-n.

- **Metric Service** -- True/False. Indicate whether *MetricService* is enabled on a target Weblogic domain. This property would be false (unchecked) in most cases for Metric Extensions except when metrics that are exposed via the Oracle DMS MBean needs to be collected. If *MetricService* is set to true, then the basic property *metric* becomes the *MetricService* table name and the basic property *columnOrder* becomes a semicolon-separated list of column names in the *MetricService* table.

---

**Note:** Refer to the Monitoring Using Web Services and JMX chapter in the *Oracle® Enterprise Manager Extensibility Programmer's Reference* for an in-depth example of creating a JMX based Metric Extension.

---

## 6.5 Converting User-defined Metrics to Metric Extensions

For targets monitored by Enterprise Manager 12c Agents, both older user-defined metrics and metric extensions will be supported. After release 12c, only metric extensions will be supported. If you have existing user-defined metrics, it is recommended that you migrate them to metric extensions as soon as possible to prevent potential monitoring disruptions in your managed environment.

Migration of user-defined metric definitions to metric extensions is not automatic and must be initiated by an administrator. The migration process involves migrating user-defined metric metadata to metric extension metadata.

---

**Note:** Migration of collected user-defined metric historic data is not supported.

---

After the user-defined metric is migrated to the metric extension and the metric extension has been deployed successfully on the target, the user-defined metric should be either disabled or deleted. Disabling the collection of the user-defined metric will retain the metadata definition of the user-defined metric but will clear all the open alerts, remove the metric errors and prevent further collections of the user-defined metric. Deleting the user-defined metric will delete the metadata, historic data, clear open alerts and remove metric errors.

### 6.5.1 Overview

The User Defined Metric (UDM) to Metric Extension (ME) migration replaces an existing UDM with a new or existing ME. The idea behind the migration process is to consolidate UDMs with the same definition that have been created on different targets into a single ME. In addition, MEs support multiple metric columns, allowing the user to combine multiple related UDMs into a single ME.

This migration process is comprised of the following steps:

1. Identify the UDMs that need to be migrated.
2. Use the provided EM CLI commands to create or select a compatible metric extension.
3. Test and publish the metric extension.
4. Deploy the metric extension to all targets and templates where the original UDMs are located. Also update the existing notification rules to refer to the ME.

5. Delete the original UDMs. Note that the historical data and alerts from the old UDM is still accessible from the UI, but the new ME will not inherit them.

Note that the credentials being used by the UDM are NOT migrated to the newly created ME. The user interface allows a user to specify the credential set required by the metric extension. If the ME does not use the default monitoring credentials, the user will need to create a new credential set to accommodate the necessary credentials through the relevant EM CLI commands. This set will then be available in the credentials page of the metric extension wizard.

The migration process is categorized by migration sessions. Each session is responsible for migrating one or more UDMs. The process of migrating an individual session is referred to as a task. Therefore, a session is comprised of one or more tasks. In general terms, the migration involves creating a session and providing the necessary input to complete each task within that session. The status of the session and tasks is viewable throughout the workflow.

## 6.5.2 Commands

A number of EM CLI commands are responsible for completing the various steps of this process. For a more detailed explanation of the command definition, please use the 'EM CLI help <command>' option.

- **list\_unconverted\_udms** - Lists the UDMs that have yet to be migrated and not in a session
- **create\_udmmig\_session** - Creates a session to migrate one or more UDMs
- **udmmig\_summary** - Lists the migration sessions in progress
- **udmmig\_session\_details** - Provides the details of a specific session
- **udmmig\_submit\_metricpics** - Provides a mapping between the UDM and the ME in order to create a new ME or use an existing one
- **udmmig\_retry\_deploys** - Deploys the ME to the targets where the UDM is present. Note that the ME has to be in a deployable draft or published state for this command to succeed
- **udmmig\_request\_udmdelete** - Deletes the UDM and completing the migration process

### Usage Examples

The following exercise outlines a simple use case to showcase the migration

Consider a system with one host (host1) that has one host UDM (hostudm1) on it. The goal is to create a new ME (me1) that represents the UDM. The sequence of commands would be as follows

```
$ emcli list_unconverted_udms
```

| Type | Name  | Metric | UDM      |
|------|-------|--------|----------|
| host | host1 | UDM    | hostudm1 |

The command indicates that there is only one UDM that has not been migrated or in the process of migration at this stage. Now proceed with the creation of a session.

```
$ emcli create_udmmig_session -name=migration1 -desc="Convert UDMs for host
target" -udm_choice=hostudm1 -target=host:host1
```

Migration session created - session id is 1

The command creates a migration session with name migration1 and the description "convert UDMs for host target". The udm\_choice flag indicates the UDM chosen and the target flag describes the target type and the target on which the UDM resides. Migration sessions are identified by session IDs. The current session has an ID of 1.

```
$ emcli udm mig_summary
```

| ID | Name       | Description  | #Tgts | Todo | #TmpIs | Todo | IncRules |
|----|------------|--------------|-------|------|--------|------|----------|
| 1  | migration1 | Convert UDMS |       | 1/1  | 0      | -/0  | -/0      |

The command summarizes all the migrations sessions currently in progress. The name and description fields identify the session. The remaining columns outline the number of targets, templates and incident rules that contain references to the UDM that is being converted to a metric extension. The 'Todo' columns indicate the number of targets, templates and incident rules whose references to the UDM are yet to be updated. Since a migration session can be completed over a protracted period of time, the command provides an overview of the portion of the session that was been completed.

```
$ emcli list_unconverted_udms
```

There are no unconverted udms

Since the UDM is part of a migration session, it no longer shows up in the list of unconverted UDMs.

```
$ emcli udm mig_session_details -session_id=1
```

```
Name: migration1
Desc: Convert UDMs for host target
Created: <date> <time>
UDM Pick: [hostudm1]
UDMs being converted:
```

| Type | Name  | UDM      | #MC | Metric | Column | DepS | DelS |
|------|-------|----------|-----|--------|--------|------|------|
| host | host1 | hostudm1 | 0   |        |        | WAIT | WAIT |

The command provides the status of a single migration session. It lists the name of the UDM and the target type and name of the target on which the UDM resides. In addition, it also outlines the metric extensions currently in the EM instance that match the UDM. The user can elect to use one of the existing choices or create an entirely new metric extension.

The system attempts to find compatible metric extensions by matching the properties of the UDM. For example, in the case of a host UDM, the system tries to find a metric extension that has the same command, script and argument fields. In the case of a database UDM, the system attempts to match the SQL query.

Finally, the DepS column indicates whether the metric extension that was matched to the UDM has been deployed to the target on which the UDM is defined. The DelS column tells the user whether the UDM has been deleted after the metric extension has been deployed. As the user proceeds with the migration, the above table is updated

from left to right. When the delete status column is set to complete, the migration session has ended.

```
$ emcli udmnig_submit_metricpicks -session_id=1 -input_file=metric_picks:filename
```

Successfully submitted metric picks for migration session

The command instructs the Enterprise Manager instance to use an existing metric extension or create a new one to replace the UDM. The various options are presented through a file, which is filename in the above command. The contents of the file are shown below

```
"host,host1,hostudm1,N,ME$me1,Usage"
```

Each line in the file represents a mapping from n UDM to an ME. The line provides the target type, the name of the target, the name of the UDM, a flag to indicate whether the metric extension is new (N) or existing (E), the name of the metric extension (note that ME\$ must be prefixed) and the column name.

The types of UDMs supported are:

- Host (host)
- Database (oracle\_database)
- RAC (rac\_database)

A user can only specify the names of the data columns via the collection item portion of the file. A metric extension created through migration will always have two columns to represent the structure of the UDM. The first column is an index column for single column UDMs while the second column uses the column name mentioned in the file. In the case of two column UDMs, the first column of the ME is termed as the 'KEY' column and the collection name is used for the second column.

At this stage, the metric extension has been created and is visible in the metric extensions library.

```
$ emcli udmnig_session_details -session_id=1
```

Name: migration1

Desc: Convert UDMs for host target

Created: <date> <time>

UDM Pick: [hostudm1]

Udms being converted:

| Type | Name  | UDM      | #MC | Metric  | Column | DepS | DelS |
|------|-------|----------|-----|---------|--------|------|------|
| host | host1 | hostudm1 | 1   | ME\$me1 | Usage  | WAIT | WAIT |

#MC : There are 1 matches for udms in this session.

Use emcli udmnig\_list\_matches to list available matches

The session details command indicates that there is one matching metric extension for this UDM (the value of the MC column is 1) and that metric extension is named as ME\$me1. At this stage, we are ready to test the metric extension through the library page. Once the testing is complete and the user is satisfied with the metric extension that has been created, it is ready to be deployed. In order to deploy, the metric extension has to be minimally saved as a deployable draft.

```
$ emcli udmnig_retry_deploys -session_id=1 -input_file=metric_tasks:filename2
```

Metric Deployments successfully submitted

Note that the system will trigger a job to automatically deploy the metric extension to all targets where the UDM was present once the metric extension is published. If the user is interested in manually controlling the operation, the above command will perform the necessary steps. The command is similar to the `submit_metricpicks` option in that a file with the UDM to target mapping is provided. It is referred to by `filename2` above. The contents of the file are as follows

```
"host,host1,hostudm1"
```

Each line in the file is a mapping from the UDM to the targets type and target on which it resides. Once the command is executed, jobs to deploy the metric extensions to various targets have been launched and can be tracked through the user interface.

```
$ emcli udm mig_request_udmdelete -session_id=1 -input_file=metric_tasks:demo_tasks
```

```
Udm deletes successfully submitted
```

The final command deletes the UDMs that were migrated to metric extensions. Note that this command might partially finish based on how many of the deployments were completed when the command was run.

```
$ emcli udm mig_session_details -session_id=1
```

```
Name: migration1
```

```
Desc: Convert UDMs for host target
```

```
Created: <date> <time>
```

```
Completed: <date> <time>
```

```
UDM Pick: [hostudm1]
```

```
Udms being converted:
```

| Type | Name  | UDM      | #MC | Metric  | Column | DepS | DelS |
|------|-------|----------|-----|---------|--------|------|------|
| host | host1 | hostudm1 | 1   | ME\$me1 | Usage  | COMP | COMP |

```
#MC : There are 1 matches for udms in this session.
```

```
Use emcli udm mig_list_matches to list available matches
```

The session details command shows that the migration process is indeed complete.

## 6.6 Metric Extension Command Line Verbs

Metric extensions can be manipulated outside the UI via the Enterprise Manager Command Line Interface (EM CLI). Two categories of verbs are available:

### ■ Metric Extension Verbs

- *export\_metric\_extension*: Export a metric extension to an archive file
- *get\_unused\_metric\_extensions*: Get a list of unused metric extensions.
- *import\_metric\_extension*: Import a metric extension archive file.
- *publish\_metric\_extension*: Publish a metric extension for use by all administrators.
- *save\_metric\_extension\_draft*: Save a deployable draft of a metric extension.

### ■ User-defined Metric Migration Verbs

- *abort\_udmmig\_session*: Abort (partially) user-defined metric migration session.
- *analyze\_unconverted\_udms*: Analyze the unconverted user-defined metrics.

- *create\_udmmig\_session*: Create a user-defined metric migration session.
- *list\_unconverted\_udms*: List the user-defined metrics that are not yet in a migration session.
- *udmmig\_list\_matches*: List the matching metrics per user-defined metric in a specific user-defined metric migration session.
- *udmmig\_request\_udmdelete*: Request deletion of user-defined metrics from targets.
- *udmmig\_retry\_deploys*: Retry deployment of metric extensions to targets.
- *udmmig\_session\_details*: Retrieve the details of a specific user-defined metric migration session.
- *udmmig\_submit\_metricpicks*: Select the metrics to replace user-defined metrics in a session.
- *udmmig\_summary*: Summarize the status of all user-defined metric migration sessions.
- *udmmig\_update\_incrules*: Update user-defined metric incident rules to include replacement metric references.

## Metric Extension Verbs

```
emcli export_metric_extension
  -file_name=<name of the metric extension archive>
  -target_type=<target type of the metric extension>
  -name=<name of the metric extension>
  -version=<version of the metric extension>
```

### Description:

Export a metric extension archive file.

### Options:

```
-file_name=<file name>
  The name of the metric extension archive file to export into.
-target_type=<target type>
  Target type of the metric extension.
-name=<name>
  Name of the metric extension.
-version=<version>
  Version of the metric extension to be exported.
```

```
emcli get_unused_metric_extensions
```

### Description:

Get a list of metric extensions that are deployed to agents but not attached to any targets.

```
emcli import_metric_extension
  -file_name=<name of the metric extension archive>
  -rename_as=<name of the metric extension to import as>
```

### Description:

Import a metric extension archive file.

### Options:

```
-file_name=<file name>
```

The name of the metric extension archive file to be imported.

-rename\_as=<metric extension name>

Import the metric extension using the specified name, replacing the name given in the archive.

emcli publish\_metric\_extension

-target\_type=<target type of the metric extension>

-name=<name of the metric extension>

-version=<version of the metric extension>

Description:

Publish a metric extension for use by all administrators.  
The metric extension must currently be a deployable draft.

Options:

-target\_type=<target type>

Target type of the metric extension.

-name=<name>

Name of the metric extension.

-version=<version>

Version of the metric extension to be published.

emcli save\_metric\_extension\_draft

-target\_type=<target type of the metric extension>

-name=<name of the metric extension>

-version=<version of the metric extension>

Description:

Save a deployable draft of a metric extension. The metric extension must currently be in editable state. Once saved as draft, the metric extension will no longer be editable.

Options:

-target\_type=<target type>

Target type of the metric extension.

-name=<name>

Name of the metric extension.

-version=<version>

Version of the metric extension to be saved to draft.

## User-Defined Metric Verbs

emcli abort\_udmmig\_session

-session\_id=<sessionId>

[-input\_file=specific\_tasks:<complete path to file>]

Description:

Abort the migration of user-defined metrics to MEs in a session

Options:

-session\_id=<id of the session>

Specify the id that was returned at time of session created,  
or from the output of udmig\_summary

[-input\_file=specific\_tasks:<complete file path>]

This optional parameter points at a file name that contains a  
target, user-defined metric,  
one per line in the following format:

<targetType>,<targetName>,<collection name>  
 Use targetType=Template to indicate a template  
 Use \* for collection name to abort all user-defined metrics for a target

```
emcli analyze_unconverted_udms [-session_id=<sessionId>]
```

Description:

Analyze user-defined metrics and list unique user-defined metrics, any possible matches, and templates that can apply these matching metric extensions

Options:

-session\_id=<id of a session to be reanalyzed>  
 Not specifying a session id causes the creation of a analysis session that contains all unconverted user-defined metrics. You can specify this session id in future invocations to get fresh analysis.

```
emcli create_udmmig_session
```

```
-name=<name of the session>
-desc=<description of the session>
[-udm_choice=<specific udm to convert>]*
{-target=<type:name of the target to migrate> }*
| {-input_file=targetList:<complete path to file>};      {-template=<name of
the template to update> }*
| {-input_file=templateList:<complete path to file>}
[-allUdms]
```

Description:

Creates a session to migrate user-defined metrics to metric extensions for targets.

Options:

-name=<session name>  
 The name of the migration session to be created.  
 -desc=<session session description>  
 A description of the migration session to be created.  
 -udm\_choice=<udm name>  
 If the session should migrate specific user-defined metrics, specify them  
 Otherwise, all user-defined metrics will be migrated  
 -target=<type:name of target to migrate>  
 The type:name of the target to be updated.  
 Multiple values may be specified.  
 -input\_file=targetList:<complete file path>  
 This takes a file name that contains a list of targets,  
 one per line in the following format:  
 <targetType>:<targetName>  
 -template=<name of template to migrate>  
 The name of the template to update. Multiple values may be specified  
 -input\_file=templateList:<complete file path>  
 This takes a file name that contains a list of templates,  
 one name per line  
 -allUdms  
 This forces the session to contain all user-defined metrics from targets and  
 templates (default behavior just picks those not in a session)

```
emcli list_unconverted_udms [-templates_only]
```

Description:

Get the list of all user-defined metrics that are not yet in a migration

session

Options:

-templates\_only

Only lists unconverted user-defined metrics in templates.

emcli udmig\_list\_matches

-session\_id=<sessionId>

Description:

Lists the matching metrics per user-defined metric in a migration session

Options:

-session\_id=<id of the session>

Specify the id that was returned at time of session created,  
or from the output of udmig\_summary

emcli udmig\_request\_udmdelete

-session\_id=<sessionId>

-input\_file=metric\_tasks:<complete path to file>

Description:

Delete the user-defined metrics that have been replaced by Metric Extensions

Options:

-session\_id=<id of the session>

Specify the id that was returned at time of session created,  
or from the output of udmig\_summary

-input\_file=metric\_tasks:<complete file path>

This takes a file name that contains a target, user-defined metric,  
one per line in the following format:  
<targetType>,<targetName>,<collection name>

emcli udmig\_retry\_deploys

-session\_id=<sessionId>

-input\_file=metric\_tasks:<complete path to file>

Description:

Retry the deployment of metric extensions to a target

Options:

-session\_id=<id of the session>

Specify the id that was returned at time of session created,  
or from the output of udmig\_summary

-input\_file=metric\_tasks:<complete file path>

This takes a file name that contains a target, user-defined metric,  
one per line in the following format:  
<targetType>,<targetName>,<collection name>

emcli udmig\_submit\_metricpicks

-session\_id=<sessionId>

-input\_file=metric\_picks:<complete path to file>

Description:

Supply the metric picks to use to replace user-defined metrics per target in a session

## Options:

```
-session_id=<id of the session>
  Specify the id that was returned at time of session created,
  or from the output of udmig_summary
-input_file=metric_picks:<complete file path>
  This takes a file name that contains a target, user-defined metric, metric
pick,
  one per line in the following format:
  <targetType>,<targetName>,<collection name>,[N/E],<metric>,<column>
  using N if a new metric should be created or E if an existing
  metric is referenced.
```

```
emcli udmig_summary
  [-showAll]
```

## Description:

Gets the summary details of all migration sessions in progress

## Options:

```
-showAll
  This prints out all sessions including those that are complete.
  By default, only in-progress sessions are listed.
```

```
emcli udmig_update_incrules
  -session_id=<sessionId>
  -input_file=udm_inc_rules:<complete path to file>
```

## Description:

Update Incident Rules that reference user-defined metrics with a reference to replacing metric extension.

## Options:

```
-session_id=<id of the session>
  Specify the id that was returned at time of session created,
  or from the output of udmig_summary
-input_file=udm_inc_rules:<complete file path>
  This takes a file name that contains rule, user-defined metric, metric,
  one per line in the following format:
  <ruleset id>,<rule id>,<udm name>,<metric name>
```

---

## Utilizing the Job System and Corrective Actions

Today's IT environments have many sets of components, so it is beneficial to minimize the time needed to support these IT components and eliminate the human error associated with component maintenance. The Enterprise Manager Cloud Control Job System can automate routine administrative tasks and synchronize components in your environment so you can manage them more efficiently.

This chapter facilitates your usage of the Job System by presenting instructional information in the following sections:

- [Job System Purpose and Overview](#)
- [Preliminary Considerations](#)
- [Creating Jobs](#)
- [Analyzing Job Activity](#)
- [Generating Job Event Criteria](#)
- [Creating Event Rules For Job Status Change](#)
- [Creating Corrective Actions](#)

### 7.1 Job System Purpose and Overview

The Enterprise Manager Job System serves these purposes:

- Automates many administrative tasks; for example: backup, cloning, and patching
- Enables you to create your own jobs using your own custom OS and SQL scripts
- Enables you to create your own multi-task jobs comprised of multiple tasks

A job is a unit of work that you define to automate commonly-run tasks. Scheduling flexibility is one of the advantages of jobs. You can schedule a job to start immediately or start at a later date and time. You can also run the job once or at a specific interval, such as three times every month.

The Job Activity page ([Figure 7-1](#)) is the hub of the Job System. From this page, you can:

- Search for existing job runs and job executions filtered by name, owner, status, scheduled start, job type, target type, and target name
- Create a job
- View or edit the job definition

- Create like, copy to library, suspend, resume, stop, and delete a job
- View results, edit, create like, suspend, resume, retry, stop, and delete a job run or execution

**Figure 7-1 Job Activity Page**

Besides accessing the Job Activity page from the Enterprise menu, you can also access this page from any Database or Cluster Database property page (Home, Performance, Availability, and so forth) by selecting Job Activity from the Oracle Database menu. When you access this page from these alternate locations, rather than showing the entire list of jobs, the Job Activity page shows a subset of the jobs associated with the particular target.

### 7.1.1 What Are Job Executions and Job Runs?

Job executions are usually associated with one target, such as a patch job on a particular database. When a job is run against multiple targets, each execution may execute on one target.

Job executions are not always a one-to-one mapping to a target. Some executions have multiple targets, such as comparing hosts. A few jobs have no target.

When you submit a job to many targets, it would be tedious to examine the status of each execution of the job against each target. For example, suppose you run a backup job against several databases. A typical question would be: Were all the backup jobs successful, and if not, which jobs failed? If this backup job runs every week, you would want to know which backups were successful and those that failed each week.

With the Job System, you can easily get these answers by viewing the *job run*. A job run is the summary of all job executions of a job that ran on a particular scheduled date. For example, if you have a job scheduled for March 5th, you will have a March 5 job run. The job table that shows the job run provides a roll-up of the status of the executions, such as Succeeded, Failed, or Error.

### 7.1.2 Operations on Job Executions and Job Runs

Besides supporting the standard job operations of create, edit, create like, and delete, the Job System enables you to:

- **Suspend jobs** —

You can suspend individual executions or entire jobs. For example, you may need to suspend a job if a needed resource was unavailable, or the job needs to be postponed.

If a job is scheduled to repeat but is suspended past the scheduled repeat time, the execution of this job would be marked "Skipped."

- **Resume jobs** —

After you suspend a job, any scheduled executions do not occur until you decide to resume the job.

- **Retry failed executions** —

When analyzing individual executions or entire jobs, it is useful to retry a failed execution after you determine the cause of the problem. This alleviates the need to create a new job for that failed execution. When you use the Retry operation in the Job System, Enterprise Manager provides links from the failed execution to the retried execution and vice versa, should it become useful to retroactively examine the causes of the failed executions. Only the most recent retry is shown in the Job Run page.

With regard to job runs, the Job System enables you to:

- **Delete old job runs**
- **Stop job runs**
- **Retry job runs**

**See Also:** For more information on job executions and runs, refer to Enterprise Manager Cloud Control online help.

## 7.2 Preliminary Considerations

Before proceeding to the procedural information presented in [Section 7.3, "Creating Jobs"](#) on page 7-4, it is advisable to read the topics presented in the sections below:

- [Creating Scripts](#)
- [Sharing Job Responsibilities](#)
- [Submitting Jobs for Groups](#)

### 7.2.1 Creating Scripts

Besides predefined job tasks, you can define your own job tasks by writing code to be included in OS and SQL scripts. The advantages of using these scripts include:

- When defining these jobs, you can use target properties.
- When defining these jobs, you can use the job library, which enables you to share the job and make updates as issues arise. However, you need to resubmit modified library jobs for them to take effect.
- You can submit the jobs against multiple targets.
- You can submit the jobs against a group. The job automatically keeps up with changes to group membership.
- For host command jobs, you can submit to a cluster.
- For SQL jobs, you can submit to a Real Application Cluster.

## 7.2.2 Sharing Job Responsibilities

To allow you to share job responsibilities, the Job System provides job privileges. These job privileges allow you to share the job with other administrators. Using privileges, you can:

- Grant access to the administrators who need to see the results of the job.
- Grant Full access to the administrators who may need to edit the job definition or control the job execution (suspend, resume, stop).

You can grant these privileges on an as-needed basis.

## 7.2.3 Submitting Jobs for Groups

Besides submitting jobs to individual targets, you can submit jobs against a group of targets. Any job that you submit to a group is automatically extended to all of its member targets that match the target type of the job, and accounts for the membership of the group as it changes.

For example, if a Human Resources job is submitted to the Payroll group, then a new host is added to this group, the host automatically becomes part of future Human Resources job runs. For instance, for a daily repeating job scheduled for 10:00 a.m. today, if you add a target before that time, the new target would be part of the job run. However, if you add a target after that time today, the target would not be part of today's run, but would be part of the next run. Additionally, if the Payroll group is comprised of diverse targets (for example: databases, hosts, and application servers), the job only runs against applicable targets in the group.

By accessing the Group Home page, you can analyze the job activity for that group.

**See Also:** [Chapter 4, "Managing with Groups"](#)

## 7.3 Creating Jobs

Your first task in creating a job from the Job Activity page is to choose a job type, which the next section, [Selecting a Job Type](#), explains. The most typical job types are OS command jobs, script jobs, and multi-task jobs, which are explained in these subsequent sections:

- [Creating an OS Command Job](#)
- [Creating a SQL Script Job](#)
- [Creating a Multi-task Job](#)

### 7.3.1 Selecting a Job Type

Using the Job System, you can create a job by selecting one of the job types from the Create Job drop-down in the Job Activity page. The most commonly used types are as follows:

- **OS Command** — Runs an operating system command or script.
- **SQL Script** — Runs a user-defined SQL or PL/SQL script.
- **Multi-Task** — Use to specify primary characteristics for multi-task jobs or corrective actions. Multi-task jobs enable you to create composite jobs by defining tasks, with each task functioning as an independent job. You edit and define tasks similarly to a regular job.

### Blocked Agents Job Type

A blocked Agent is a condition where the Oracle Management Server (OMS) rejects all heartbeat or upload requests from the blocked Agent. Therefore, a blocked Agent cannot upload any alerts or metric data to the OMS. However, blocked Agents continue to collect monitoring data.

On a blocked Agent, the OMS “ignores” requests from the blocked Agent, thereby reducing the workload on the OMS. For example, by using this feature for an Agent that fails to upload properly, you can block the Agent until you can resolve the upload issue.

An Agent can become blocked under the following circumstances:

- The system detects that the Agent is no longer sending the correct state. This can occur after a failed recovery, or when users have corrupted state files. The OMS can detect some of the corruptions, and when it finds one, it blocks the Agent until the problem has been resolved.
- A superuser has blocked an Agent to prevent a "rogue" Agent from flooding the system with errors and bad data.

When an Agent is blocked for a long period of time and the Agent is kept running, it eventually must stop monitoring, because it will run out of local disc space to store all of the results. However, this is not an issue, because the "state" of the Agent was corrupt anyway. Therefore, unless corrective actions were taken, the Agent should remain blocked so that no data then penetrates the system.

## 7.3.2 Creating an OS Command Job

Use this type of job to run an operating system command or script. Tasks and their dependent steps for creating an OS command are discussed below.

### Task 1 Initiate Job Creation

1. From the Enterprise menu, select **Jobs**, then Job Activity.
2. Select **OS Command** from the Create Job drop-down, then click **Go**. The **General property page** of the Create OS Command Job page appears.

### Task 2 Specify General Job Information

Perform these steps on the General property page:

1. Provide a required Name for the job, then select a Target Type from the drop-down.

After you have selected a target of a particular type for the job, only targets of that same type can be added to the job. If you change target types, the targets you have populated in the Targets table disappear, as well as parameters and credentials for the job.

If you specify a composite as the target for this job, the job executes only against targets in the composite that are of the selected target type. For example, if you specify a target type of host and a group as the target, the job only executes against the hosts in the group, even if there are other non-host targets in the group.

2. Click **Add**, then select one or more targets from the Search and Select: Targets pop-up window. The targets now appear in the Targets table.
3. Click the **Parameters** property page link.

### Task 3 Specify Parameters

Perform these steps on the Parameters property page:

1. Select either **Single Operation** or **Script** from the Command Type drop-down.  
The command or script you specify executes against each target specified in the target list for the job. The Management Agent executes it for each of these targets.  
Depending on your objectives, you can choose one of the following options:
  - Single Operation to run a specific command
  - Script to run an OS script and optionally provide an interpreter, which processes the script; for example, %perlbin%/perl or /bin/sh.Sometimes, a single command line is insufficient to specify the commands to run, and you may not want to install and update a script on all hosts. In this case, you can use the Script option to specify the script text as part of the job.
2. Based on your objectives, follow the instructions in [Section 7.3.2.1, "Specifying a Single Operation"](#) or [Section 7.3.2.2, "Specifying a Script"](#).
3. Click the **Credentials** property page link.

### Task 4 Specify Credentials - (optional)

You do not need to provide input on this page if you want to use the system default of using preferred credentials.

On the Credentials property page, you can specify the credentials that you want the Oracle Management Service to use when it runs the OS Command job against target hosts. The job can use either the job submitter's preferred credentials for hosts, or you can specify other credentials to override the preferred credentials.

You do not need to provide input on this page if you have already set preferred credentials.

- **To use preferred credentials:**
  1. Select the **Preferred Credential** radio button, which is the default selection.  
If the target for the OS Command job is a host or host group, the preferred host credentials are used. You specify these on the Database Preferred Credentials page, and they are different from the host credentials for the host on which the database resides.
  2. Select either **Normal Host Credentials** or **Privileged Host Credentials** from the Host Credentials drop-down.  
You specify these separately on the Preferred Credentials page, which you can access by selecting **Security** from the **Setup** menu, then **Preferred Credentials**. The Preferred Credentials page appears, where you can click the Manage Preferred Credentials button to set credentials.
- **To use named credentials:**
  1. Select the **Named Credential** radio button to override database or host preferred credentials.  
The drop-down list is a prepopulated credential set with values saved with names. These are not linked to targets, and you can use them to provide credential and authentication information to tasks.
- **To use other credentials:**

1. Select the **New Credential** radio button to override previously defined preferred credentials.

Note that override credentials apply to all targets.

2. Optionally select Sudo or PowerBroker as the run privilege.

Sudo enables you to authorize certain users (or groups of users) to run some (or all) commands as root while logging all commands and arguments.

PowerBroker provides access control, manageability, and auditing of all types of privileged accounts.

If you provide Sudo or PowerBroker details, they must be applicable to all targets. It is assumed that Sudo or PowerBroker settings are already applied on all the hosts on which this job is to run.

See your Super Administrator about setting up these features if they are not currently enabled.

**Tip:** For information on using Sudo, see the Sudo Manual at:

<http://www.sudo.ws/sudo/man/1.7.4p6/sudo.man.html>

For information on using PowerBroker, see the PowerBroker Desktops User Guide at:

[http://www.ubm-global.com/docs/powerbroker/PBWD\\_User\\_Guide\\_V5%200.pdf](http://www.ubm-global.com/docs/powerbroker/PBWD_User_Guide_V5%200.pdf)

### Task 5 Schedule the Job - (optional)

You do not need to provide input on this page if you want to proceed with the system default of running the job immediately after you submit it.

1. Select the type of schedule:

- **One Time (Immediately)**

If you do not set a schedule before submitting a job, Enterprise Manager executes the job immediately with an indefinite grace period. You may want to run the job immediately, but specify a definite grace period in case the job is unable to start for various reasons, such as a blackout, for instance.

A grace period is a period of time that defines the maximum permissible delay when attempting to start a scheduled job. If the job system cannot start the execution within a time period equal to the scheduled time plus grace period, it sets the job status to Skipped.

- **One Time (Later)**

- Setting up a custom schedule:

You can set up a custom schedule to execute the job at a designated time in the future. When you set the Time Zone for your schedule, the job runs simultaneously on all targets when this time zone reaches the start time you specify. If you select each target's time zone, the job runs at the scheduled time using the time zone of the managed targets. The time zone you select is used consistently when displaying date and time information about the job, such as on the Job Activity page, Job Run page, and Job Execution page.

For example, if you have targets in the Western United States (US Pacific Time) and Eastern United States (US Eastern Time), and you specify a schedule where Time Zone = US Pacific Time and Start Time = 5:00 p.m., the job runs simultaneously at 5:00 p.m. against the targets in the Western

United States and at 8:00 p.m. against the targets in the Eastern United States. If you specify 5:00 p.m. in the Agent time zone, the executions do not run concurrently. The EST target would run 3 hours earlier.

- Specifying the Grace Period:

The grace period controls the latest start time for the job in case the job is delayed. A job might not start for many reasons, but the most common reasons are that the Agent was down or there was a blackout. By default, jobs are scheduled with indefinite grace periods.

A job can start any time before the grace period expires. For example, a job scheduled for 1 p.m. with a grace period of 1 hour can start any time before 2 p.m., but if it has not started by 2 p.m., it is designated as skipped.

- **Repeating**

- Defining the repeat interval:

Specify the Frequency Type (time unit) and Repeat Every (repeat interval) parameters to define your job's repeat interval. The Repeat Until options are as follows:

Note that both the end date and time determine the last execution. For example, for a job that runs daily at 6 p.m., where...

Start Time is June 1, 2010 at 6 p.m.

End Time is June 30, 2010 at 4 a.m.

... the last execution runs on June 29, not June 30, since the June 30 end time occurs before the daily time of the job.

- Specifying the Grace Period:

The grace period controls the latest start time for the job in case the job is delayed. A job might not start for many reasons, but the most common reasons are that the Agent was down or there was a blackout. By default, jobs are scheduled with indefinite grace periods.

If the job starts on time, the grace period is ignored. For example, a job scheduled for 1 p.m. with a grace period of 1 hour can start any time before 2 p.m., but if it has not started by 2 p.m., it is designated as skipped.

2. Click the **Access** property page link.

### **Task 6 Specify Who Can Access the Job - (optional)**

You do not need to provide input on this page if you want to proceed with the system default of not sharing the job. The table shows the access that administrators and roles have to the job. Only the job owner (or Super Administrator) can make changes on the Job Access page.

1. Change access levels for administrators and roles, or remove administrators and roles. Your ability to make changes depends on your function.

If you are a job owner, you can:

- Change the access of an administrator or role by choosing the Full or View access privilege in the Access Level column in the table.
- Remove all access to the job for an administrator or role by clicking the icon in the Remove column for the administrator or role. All administrators with Super Administrator privileges have the View access privilege to a job. If you

choose to provide access privileges to a role, you can only provide the View access privilege to the role, not the Full access privilege.

If you are a Super Administrator, you can:

- Grant View access to other Enterprise Manager administrators or roles.
- Revoke all administrator access privileges.

---

**Note:** Neither the owner nor a super user can revoke View access from a super user. All super users have View access.

---

For more information on access levels, see [Section 7.3.2.3, "Access Level Rules"](#).

2. Click **Add** to add administrators and roles. The Create Job Add Administrators and Roles page appears.
  - a. Specify a **Name** and **Type** in the Search section and click **Go**. If you just click Go without specifying a Name or Type, all administrators and roles in the Management Repository appear in the table.
 

The value you specify in the Name field is not case-sensitive. You can specify either \* or % as a wildcard character at any location in a string (the wildcard character is implicitly added to the end of any string). For example, if you specify %na in the Name field, names such as ANA, ANA2, and CHRISTINA may be returned as search results in the Results section.
  - b. Select one or more administrators or roles in the Results section, then click **Select** to grant them access to the job. Enterprise Manager returns to the Create Job Access page or the Edit Job Access page, where you can modify the access of administrators and roles.
3. Define a notification rule.

You can use the Notification system (rule creation) to easily associate specific jobs with a notification rule. The Cloud Control Notification system enables you to define a notification rule that sends e-mail to the job owner when a job enters one of these chosen states:

- Scheduled
- Running
- Suspended
- Succeeded
- Problems
- Action Required

---

**Note:** Before you can specify notifications, you need to set up your email account and notification preferences. See [Chapter 3, "Notifications"](#) for this information.

---

## Task 7 Conclude Job Creation

At this point, you can either submit the job for execution or save it to the job library.

- **Submitting the job —**

Click **Submit** to send the active job to the job system for execution, and then view the job's execution status on the main Job Activity page. If you are creating a library job, Submit saves the job to the library and returns you to the main Job Library page where you can edit or create other library jobs.

If you submit a job that has problems, such as missing parameters or credentials, an error appears and you will need to correct these issues before submitting an active job. For library jobs, incomplete specifications are allowed, so no error occurs.

---

**Note:** If you click Submit without changing the access, only Super Administrators can view your job.

---

■ **Saving the job to the library —**

Click **Save to Library** to the job to the Job Library as a repository for frequently used jobs. Other administrators can then share and reuse your library job if you provide them with access privileges. Analogous to active jobs, you can grant View or Full access to specific administrators. Additionally, you can use the job library to store:

- Basic definitions of jobs, then add targets and other custom settings before submitting the job.
- Jobs for your own reuse or to share with others. You can share jobs using views or giving Full access to the jobs.
- Critical jobs for resubmitting later, or revised versions of these jobs as issues arise.

### 7.3.2.1 Specifying a Single Operation

---

**Note:** The following information applies to step 2 in [Task 3, "Specify Parameters"](#) on page 7-6.

---

Enter the full command in the **Command** field. For example:

```
/bin/df -k /private
```

Note the following points about specifying a single operation:

- You can use shell commands as part of your command. The default shell for the platform is used, which is `/bin/sh` for Linux and `cmd/c` for Windows.

```
ls -la /tmp > /tmp/foobar.out
```

- If you need to execute two consecutive shell commands, you must invoke the shell in the Command field and the commands themselves in the OS Script field. You would specify this as follows in the Command field:

```
sleep 3; ls
```

### 7.3.2.2 Specifying a Script

---

**Note:** The following information applies to step 2 in [Task 3, "Specify Parameters"](#) on page 7-6.

---

The value you specify in the OS Script field is used as stdin for the command interpreter, which defaults to `/bin/sh` on Linux and `cmd/c` on Windows. You can override this with another interpreter; for example: `%perlbin%/perl`. The shell scripts size is limited to 2 GB.

To control the maximum output size, set the `mgmt_job_output_size_limit` parameter in `MGMT_PARAMETERS` to the required limit. Values less than 10 KB and greater than 2 GB are ignored. The default output size is 10 MB.

You can run a script in several ways:

- **OS Scripts** — Specify the path name to the script in the OS Script field. For example:

**OS Script field:** `/path/to/mycommand`

**Interpreter field:**

- **List of OS Commands** — You do not need to enter anything in the Interpreter field for the following example of standard shell commands for Linux or Unix systems. The OS's default shell of `/bin/sh` or `cmd/c` will be used.

```
/usr/local/bin/myProg arg1 arg2
mkdir /home/$USER/mydir
cp /dir/to/cp/from/file.txt /home/$USER/mydir
/usr/local/bin/myProg2 /home/$USER/mydir/file.txt
```

When submitting shell-based jobs, be aware of the syntax you use and the targets you choose. This script does not succeed on NT hosts, for example.

- **Scripts Requiring an Interpreter** — Although the OS shell is invoked by default, you can bypass the shell by specifying an alternate interpreter. For example, you can run a Perl script by specifying the Perl script in the OS Script field and the location of the Perl executable in the Interpreter field:

**OS Script field:** `<Enter-Perl-script-commands-here>`

**Interpreter field:** `%perlbin%/perl`

The following example shows how to run a list of commands that rely on a certain shell syntax:

```
setenv VAR1 value1
setenv VAR2 value2
/user/local/bin/myProg $VAR1 $VAR2
```

You would need to specify `csh` as the interpreter. Depending on your system configuration, you may need to specify the following string in the Interpreter field:

`/bin/csh`

When submitting shell-based jobs, be aware of the syntax you use and the targets you choose. This script would not succeed on NT hosts, for example. However, you do have the option of running a script for a list of Windows shell commands, as shown in the following example. The default shell of `cmd/c` is used for Windows systems.

```
C:\programs\MyApp arg1 arg2
md C:\MyDir
copy C:\dir1x\copy\from\file.txt \home\%USER%\mydir
```

### 7.3.2.3 Access Level Rules

---

**Note:** The following rules apply to [Task 6, "Specify Who Can Access the Job - \(optional\)"](#) on page 7-8.

---

- Super Administrators always have View access on any job.
- The Enterprise Manager administrator who owns the job can make any access changes to the job, except revoking View from Super Administrators.
- Super Administrators with a View or Full access level on a job can grant View (but not Full) to any new user. Super Administrators can also revoke Full and View from normal users, and Full from Super Administrators.
- Normal Enterprise Manager administrators with Full access levels cannot make any access changes on the job.
- If the job owner performs a Create Like operation on a job, all access privileges for the new job are identical to the original job. If the job owner grants other administrators View or Full job access to other administrators, and any of these administrators perform a Create Like operation on the job, ALL administrators will, by default, have View access on the newly created job.

## 7.3.3 Creating a SQL Script Job

The basic process for creating a SQL script job is the same as described in [Section 7.3.2, "Creating an OS Command Job."](#) The following sections provide supplemental information specific to script jobs:

- [Specifying Targets](#)
- [Specifying Options for the Parameters Page](#)
- [Specifying Host and Database Credentials](#)
- [Returning Error Codes from SQL Script Jobs](#)

### 7.3.3.1 Specifying Targets

You can run a SQL Script job against database and cluster database target types. You select the targets to run the job against by doing the following:

1. Click **Add** in the Targets section.
2. Select the database target(s) from the pop-up.

Your selection(s) now appears in the Target table.

---

**Note:** For a cluster host or RAC database, a job runs only once for the target, regardless of the number of database instances. Consequently, a job cannot run on all nodes of a RAC cluster.

---

### 7.3.3.2 Specifying Options for the Parameters Page

In a SQL Script job, you can specify any of the following in the SQL Script field of the Parameters property page:

- Any directives supported by SQL\*Plus
- Contents of the SQL script itself

- Fully-qualified SQL script file; for example:

```
@/private/oracle/scripts/myscript.sql
```

Make sure that the script file is installed in the appropriate location on all targets.

- PL/SQL script using syntax supported by SQL\*Plus; for example, one of the following:

```
EXEC plsql_block;
```

or

```
DECLARE
    local_date DATE;
BEGIN
    SELECT SYSDATE INTO local_date FROM dual;
END;
/
```

You can use target properties in the SQL Script field, a list of which appears in the Target Properties table. Target properties are case-sensitive. You can enter optional parameters to SQL\*Plus in the Parameters field.

### 7.3.3.3 Specifying Host and Database Credentials

In the Credentials property page, you specify the host credentials and database credentials. The Management Agent uses the host credentials to launch the SQL\*Plus executable, and uses database credentials to connect to the target database and run the SQL script. The job can use either the preferred credentials for hosts and databases, or you can specify other credentials that override the preferred credentials.

- **Use Preferred Credentials —**

Select this choice if you want to use the preferred credentials for the targets for your SQL Script job. The credentials used for both host and database are those you specify in the drop-down. If you choose Normal Database Credentials, your normal database preferred credentials are used. If you choose SYSDBA Database Credentials, the SYSDBA preferred credentials are used. For both cases, the host credentials associated with the database target are used. Each time the job executes, it picks up the current values of your preferred credentials.

- **Named Credentials —**

Select this choice if you want to override the preferred credentials for all targets, then enter the named credentials you want the job to use on all targets.

Many IT organizations require that passwords be changed on regular intervals. You can change the password of any preferred credentials using this option. Jobs and corrective actions that use preferred credentials automatically pick up these new changes, because during execution, Enterprise Manager uses the current value of the credentials (both user name and password). Named credentials are also centrally managed. A change to a named credential is propagated to all jobs or corrective actions that use it.

For corrective actions, if you specify preferred credentials, Enterprise Manager uses the preferred credentials of the last Enterprise Manager user who edited the corrective action. For this reason, if a user attempts to edit the corrective action that a first user initially specified, Enterprise Manager requires this second user to specify the credentials to be used for that corrective action.

### 7.3.3.4 Returning Error Codes from SQL Script Jobs

The SQL Script job internally uses SQL\*Plus to run a user's SQL or PL/SQL script. If SQL\*Plus returns 0, the job returns a status of Succeeded. If it returns any other value, it returns a job status of Failed. By default, if a SQL script runs and encounters an error, it may still result in a job status of Succeeded, because SQL\*Plus still returned a value of 0. To make such jobs return a Failed status, you can use SQL\*Plus EXIT to return a non-zero value.

The following examples show how you can return values from your PL/SQL or SQL scripts. These, in turn, will be used as the return value of SQL\*Plus, thereby providing a way to return the appropriate job status (Succeeded or Failed). Refer to the *SQL\*Plus User's Guide and Reference* for more information about returning EXIT codes.

#### Example 1

```
WHenever SQLERROR EXIT SQL.SQLCODE
select column_does_not_exist from dual;
```

#### Example 2

```
-- SQL*Plus will NOT return an error for the next SELECT statement
SELECT COLUMN_DOES_NOT_EXIST FROM DUAL;

WHenever SQLERROR EXIT SQL.SQLCODE;
BEGIN
    -- SQL*Plus will return an error at this point
    SELECT COLUMN_DOES_NOT_EXIST FROM DUAL;
END;
/
WHenever SQLERROR CONTINUE;
```

#### Example 3

```
variable exit_code number;

BEGIN
  DECLARE
    local_empno number(5);
  BEGIN
    -- do some work which will raise exception: no_data_found
    SELECT 123 INTO local_empno FROM sys.dual WHERE 1=2;
  EXCEPTION
    WHEN no_data_found THEN
      :exit_code := 10;
    WHEN others THEN
      :exit_code := 2;
  END;
END;
/
exit :exit_code;
```

## 7.3.4 Creating a Multi-task Job

The basic process for creating a multi-task job is the same as described in [Section 7.3.2, "Creating an OS Command Job."](#) The following sections provide supplemental information specific to multi-task jobs:

- [Job Capabilities](#)
- [Specifying Targets for a Multi-task Job](#)

- [Adding Tasks to the Job](#)

#### 7.3.4.1 Job Capabilities

Multi-task jobs enable you to create complex jobs consisting of one or more distinct tasks. Because multi-task jobs can run against targets of the same or different type, they can perform ad hoc operations on one or more targets of the same or different type.

The Job System's multi-task functionality makes it easy to create extremely complex operations. You can create multi-task jobs in which all tasks run on a single target. You can also create a multi-task job consisting of several tasks, each of which has a different job type, and with each task operating on separate (and different) target types. For example:

- Task 1 (OS Command job type) performs an operation on Host 1.
- If Task 1 is successful, run Task2 (SQL Script job type) against Database 1 and Database 2.

#### 7.3.4.2 Specifying Targets for a Multi-task Job

You can run a multi-task job against any targets for which jobs are defined that can be used as tasks. Not all job types can be used as tasks.

The Target drop-down in the General page enables you to choose between running the job against the same targets for all tasks, or different targets for different tasks. Because each task of a multi-task job can be considered a complete job, when choosing the **Same targets for all tasks** option, you add all targets against which the job is to run from the General page. If you choose the **Different targets for different tasks** option, you specify the targets (and required credentials) the tasks will run against as you define each task.

After making your choice from the Target drop-down, you then select the targets to run the job against by clicking Add in the Targets section.

#### 7.3.4.3 Adding Tasks to the Job

You can use the Tasks page to:

- Add, delete, or edit tasks of various job types
- Set task condition and dependency logic
- Add task error handling

You must define at least two tasks in order to set Condition and Depends On options. Task conditions define states in which the task will be executed. Condition options include:

- **Always** — Task is executed each time the job is run.
- **On Success** — Task execution **Depends On** the successful execution of another task.
- **On Failure** — Task execution **Depends On** the execution failure of another task.

The Error Handler Task is often a "clean-up" step that can undo the partial state of the job. The Error Handler Task executes if any task of the multi-task job has an error. Errors are a more severe form of failure, usually meaning that the job system could not run the task. Failures normally indicate that the task ran, but failed. The Error Handler Task does not affect the job execution status. Use the Select Task Type page to specify the job type of the task to be used for error handling.

## 7.4 Analyzing Job Activity

After you submit jobs, the status of all job executions across all targets is automatically rolled up and available for review on the Enterprise Summary page. [Figure 7-2](#) shows the Jobs section at the bottom of the Enterprise Summary page.

**Figure 7-2 Summary of Target Jobs on the Enterprise Summary Page**

This information is particularly important when you are examining jobs that execute against hundreds or thousands of systems. You can determine the job executions that have failed. By clicking the number associated with a particular execution, you can drill down to study the details of the failed jobs.

## 7.5 Generating Job Event Criteria

The job system publishes status change events when a job changes its execution status, and these events have different severities based on the execution status.

Use the Job Event Generation Criteria page ([Figure 7-3](#)) to set up targets for job event notifications. This page enables you to decide about the jobs or targets or statuses for which you want to raise events or notifications. This ensures that users raise only useful events. Any settings you make on this page do not change the job behavior whatsoever. You can set up notifications on job events through incident rule sets.

Figure 7-3 Job Event Generation Criteria Page

**ORACLE Enterprise Manager Cloud Control 12c**

Enterprise ▾ Targets ▾ Favorites ▾ History ▾

### Job Event Generation Criteria

In Enterprise Manager, all changes to the status of a job are treated as events. You can either create incidents based on these events, and view and manage them in the Incident Manager, or use them to send notifications. It is advisable to enable events only on those targets and only for job status changes that are critical to your data center. By default, events are enabled for job status Action Required and Problems but for no targets.

#### Step 1: Events For Job Status And Targetless Jobs

Enable Events for Job Status

- ☐ All
- ☐ Scheduled
- ☐ Running
- ☒ Action Required
- ☐ Suspended
- ☐ Succeeded
- ☒ Problems

Enable Events for targetless jobs ☐ Yes ☒ No

**Tip** Only super admin can modify the above settings.

#### Step 2: Events For Targets

Add individual targets to enable events.

+ Add... ✕ Remove

| Name                               | Type |
|------------------------------------|------|
| No Targets are currently selected. |      |

**Overview**

- Super Administrator: Select the Job Status for your enterprise that are allowed to generate events. Optionally, add targets that should generate these job events.
- Any Administrator: Add targets that should generate events for the Job Status selected by the Super Admin.

You need to add targets in the target filter if you want to set automatic job event generation for these targets. The job event generation settings you make on this page apply to all users. If you do not add any targets in the target filter, no targets will be set up for automatic job event generation.

On this page, you can do the following:

- Enable events for job status and targetless jobs
- Add targets to generate events for job status

### 7.5.1 Enabling Events For Job Status and Targetless Jobs

To enable events for job status and targetless jobs, do the following:

1. Ensure that you have Super Administrator privileges to select the job status for which you want to generate events.
2. Ensure that you are an administrator with View Target privileges to add targets for which you want to generate events for the job status set by the Super Administrator.
3. Log into Cloud Control as a Super Administrator.
4. From the **Setup** menu, select **Incidents** and then select **Job Events**. The Job Event Generation Criteria Page is displayed.
5. In the Job Event Generation Criteria page, do the following:
  - a. In the Events For Job Status And Targetless Jobs section, from the **Enable Events for Job Status** check boxes, select the status for which you want to publish events. In **Enable Events for targetless jobs**, select **Yes** to create events for jobs that are not associated with any target.

- b. In the Events For Targets section, click **Add** to add targets for which you want the job events to be enabled.
6. Click **Apply**.

## 7.5.2 Adding Targets To Generate Events For Job Status

After a Super Administrator selects events for which job status will be published, administrators can add targets to generate events. To add targets to generate events for job status, do the following:

1. Ensure that you are an administrator with View Target privileges to add targets for which you want to generate events for the job status set by a Super Administrator.
2. Log into Cloud Control as an administrator.
3. From the **Setup** menu, select **Incidents** and then select **Job Events**. The Job Event Generation Criteria Page is displayed.
4. In the Job Event Generation Criteria page, do the following:
  - a. In the Events For Job Status And Targetless Jobs section, you can view the status for which events can be published. You can also see if events have been enabled for targetless job filters.
  - b. In the Events For Targets section, click **Add** to add targets for which you want the job events to be enabled. You can also remove targets for which you do not want the job events to be enabled by clicking **Remove**.

---

**Note:** Your selected settings in the Events for Targets section are global. Adding or removing targets for events also affect other Enterprise Manager users.

---

5. Click **Apply**.

## 7.6 Creating Event Rules For Job Status Change

Enterprise Manager enables you to create and apply rules to events, incidents, and problems. A rule is applied when a newly created or updated event, incident, or problem matches the conditions defined in the rule. The following sections explain how to create event rules for job status change events:

- [Creating Job Status Change Event Rules For Jobs](#)
- [Creating Job Status Change Event Rules For Targets](#)

### 7.6.1 Creating Job Status Change Event Rules For Jobs

To create job status change event rules for jobs, do the following:

1. Ensure that the relevant job status is enabled and required targets have been added to job event generation criteria.
2. Ensure that you have administrator privileges to create event rules for job status change events.
3. Log into Cloud Control as an administrator.
4. From the **Setup** menu, select **Incidents** and then **Incident Rules**. The Incident Rules Page is displayed.

5. In the Incident Rules page, click **Create Rule Set** to create rule sets for incidents.
6. Specify the **Name**, **Description**, and select **Enabled** to enable the rule set. Select **Type** as **Enterprise** if you want to set the rule for all Enterprise Manager users or **Private** if you want to set the rule for a specific user only. Select **Applies to Job**.

**Incident Rules - All Enterprise Rules**

**Create Rule Set** [Save] [Cancel]

A rule set is a collection of rules that applies to a common set of objects, for example, targets, jobs, and templates. A rule contains a set of automated actions to be taken on specific events, incidents or problems. For example, individual rules can respond to incoming or updated events, incidents, or problems, and then take actions such as sending e-mails, creating incidents, updating incidents, and creating tickets.

\* Name: Sample Job Rule Set

Description: [Text Area]

Enabled: ☒ Enabled

Owner: SYSMAN

Type: ☒ Enterprise ☐ Private

Applies To: Job

**Job** Rules

A pre-requisite to creating Incident Rules, is to enable the relevant job status and add required targets to job event generation criteria. To change this criteria, visit Setup->Incidents->Job Events.

| Name          | Type          | Owner  |
|---------------|---------------|--------|
| SAME JOB RULE | All Job Types | SYSMAN |

In the Job section, click **Add** to add jobs for which you want to create event rules.

7. In the Add Jobs dialog box, if you select **Job By Pattern**, provide **Job name like** and select the **Job Type**. Specify **Job owner like**. For **Specific jobs**, select the job. Click **OK**.
8. In the **Rules** tab, click **Create**.
9. In the Select Type of Rule to Create dialog box, select from the following choices according to the rule set you want to create:
  - **Incoming events and updates to events** to receive notification or create incidents for job rules. If you are operating on events (for example, if you want to create incidents for incoming events, such as job failed, or notify someone), choose this option.
  - **Newly created incidents or updates to incidents** receive notifications or create rules for incidents even though the events for which incidents are generated do not have associated rules. If you are operating on incidents already created or newly created (for example, you want to direct all incidents related to a group, say foo, to a particular user or escalate all incidents open for more than 3 days), choose this option.
  - **Newly created problems or updates to problems** to receive notifications or create rules for problems even though the incidents for which problems are generated do not have associated rules. This option does not apply for jobs.
10. Select **Incoming events and updates to events**, and in the Create New Rule: Select Events page, do the following:
  - **Select By Type to Job Status Change**. Select **All events of type Job Status Change** if you want to take an action for all job state change events for the selected jobs. Select **Specific events of type Job Status Change** if you only want to act on specific job states. If you have selected Specific events of type Job Status Change, select Job Status for events for which you want to create the rule.

- Set the other criteria for which you want to set the rule as displayed in the above graphic.

11. Select **Newly created incidents or updates to incidents** if you want to create rules for an incident, though the event associated with the incident does not have notification rules. In the Create New Rule: Select Incidents page, select any of the following:

- **All new incidents and updated incidents** to apply the rule to all new and updated incidents
- **All new incidents** to apply the rule to all new incidents
- **Specific incidents** and then select the criteria for the incidents

12. In the Create New Rule: Add Actions page, click **Add** to add actions to the rule.

13. In the Add Conditional Actions page, specify actions to be performed when the event matches the rule.

In the Conditions for actions section, select:

- **Always execute the actions** to execute actions regardless of event.
- **Only execute the actions if specified conditions match** to execute actions to match specific criteria.

When adding actions to events, specify the following:

- Select **Create Incident** to create an incident for the event to manage and track its resolution.

- In the Notifications section, specify recipients for notifications in the **E-mail To**, **E-mail Cc**, and **Page** fields who will receive e-mail when the event for which a condition is set occurs. If Advanced and Repeat Notifications options have been set, specify them.
- In the Clear events section, select **Clear permanently** if you want to clear an event after the issue that generated the event is resolved.
- If you have configured event connections, in the Forward to Event Connectors section, you can send the events to third-party event management systems.

When adding actions to incidents, specify the following:

- In the Notifications section, specify recipients for notifications in the **E-mail To**, **E-mail Cc**, and **Page** fields who will receive e-mail when the event for which a condition is set occurs. If Advanced and Repeat Notifications options have been set, specify them.
- In the Update Incident section, specify the details to triage incidents when they occur. Specify **Assign to**, **Set priority to**, **Set status to**, and **Escalate to** details.
- In the Create Ticket section, if a ticket device has been configured, specify details to create the ticket.

Click **Continue**.

14. In the Specify Name and Description page, specify a **Name** and **Description** for the event rule. Click **Next**.
15. In the Review page, verify the details you have selected for the event rule and click **Continue** to add this rule in the rule set.
16. On the Create Rule Set page, click **Save** to save the rule set.

## 7.6.2 Creating Job Status Change Event Rules For Targets

To create job status change event rules for targets, do the following:

1. Ensure that the relevant job status is enabled and required targets have been added to job event generation criteria.
2. Ensure that you have administrator privileges to create event rules for job status change events.
3. Log into Cloud Control as an administrator.
4. From the **Setup** menu, select **Incidents**, then **Incident Rules**. The Incident Rules Page is displayed.
5. In the Incident Rules page, click **Create Rule Set** to create rule sets for incidents.
6. Specify the **Name**, **Description**, and select **Enabled** to enable the rule set. Select Type as **Enterprise** if you want to set the rule for all Enterprise Manager users, or Private if you want to set the rule for a only specific user. Select **Applies to Targets**.

**Incident Rules - All Enterprise Rules**

**Create Rule Set** Save Cancel

A rule set is a collection of rules that applies to a common set of objects, for example, targets, jobs, and templates. A rule contains a set of automated actions to be taken on specific events, incidents or problems. For example, individual rules can respond to incoming or updated events, incidents, or problems, and then take actions such as sending e-mails, creating incidents, updating incidents, and creating tickets.

Select targets to which this rule set applies. You can exclude specific targets from the scope - e.g. all database targets except 'MyDevDB'.

☐ All targets

☐ All targets of types [Dropdown]

☒ Specific targets

Add Groups [Dropdown] + Add - Remove

| Name               | Type |
|--------------------|------|
| No target selected |      |

Excluded targets(None)

In the **Targets** tab, select one of the following:

- **All targets** to apply to all targets. In the Excluded Targets section, click **Add** to search and select the target that you want to exclude from the rule set. Click **Select**.
  - **All targets of types** to select the types of targets to which you want to apply the rule set.
  - **Specific targets** to individually specify the targets. Select to Add **Groups** or **Targets** to add groups or targets and click **Add** to search and select the targets to which you want to apply the rule set. Click **Select**. In the Excluded Targets section, click **Add** to search and select the target that you want to exclude from the rule set. Click **Select**.
7. In the **Rules** tab, click **Create**.
  8. In the Select Type of Rule to Create dialog box, select from the following choices according to the rule set you want to create:
    - **Incoming events and updates to events** to receive notifications or create incidents for job rules. If you are operating on events (for example, if you want to create incidents for incoming events, such as job failed, or notify someone), choose this option.
    - **Newly created incidents or updates to incidents** receive notifications or create rules for incidents even though the events for which incidents are generated do not have associated rules. If you are operating on incidents already created or newly created (for example, you want to direct all incidents related to a group, say foo, to a particular user or escalate all incidents open for more than 3 days), choose this option.
    - **Newly created problems or updates to problems** to receive notifications or create rules for problems even though the incidents for which problems are generated do not have associated rules. This option does not apply for jobs.
  9. Select **Incoming events and updates to events**, and in the Create New Rule: Select Events page, do the following:
    - **Select By Type to Job Status Change**. Select **All events of type Job Status Change** if you want to take an action for all job state change events for the

selected jobs. Select **Specific events of type Job Status Change** if you only want to act on specific job states. If you have selected Specific events of type Job Status Change, select Job Status for events for which you want to create the rule.

- Set the other criteria for which you want to set the rule as displayed in the above graphic.
10. Select **Newly created incidents or updates to incidents** if you want to create rules for an incident, though the event associated with the incident does not have notification rules. In the Create New Rule: Select Incidents page, select any of the following:
- **All new incidents and updated incidents** to apply the rule to all new and updated incidents.
  - **All new incidents** to apply the rule to all new incidents.
  - **Specific incidents** and then select the criteria for the incidents.

11. In the Create New Rule: Add Actions page, click **Add** to add actions to the rule.
12. In the Add Conditional Actions page, specify actions to be performed when the event matches the rule.

In the Conditions for actions section, select:

- **Always execute the actions** to execute actions regardless of event.
- **Only execute the actions if specified conditions match** to execute actions to match specific criteria.

When adding actions to events, specify the following:

- Select **Create Incident** to create an incident for the event to manage and track its resolution.
- In the Notifications section, specify recipients for notifications in the **E-mail To**, **E-mail Cc**, and **Page** fields who will receive e-mail when the event for which a condition is set occurs. If Advanced and Repeat Notifications options have been set, specify them.
- In the Clear events section, select **Clear permanently** if you want to clear an event after the issue that generated the event is resolved.
- If you have configured event connections, in the Forward to Event Connectors section, you can send the events to third-party event management systems.

When adding actions to incidents, specify the following:

- In the Notifications section, specify recipients for notifications in the **E-mail To**, **E-mail Cc**, and **Page** fields who will receive e-mail when the event for which a condition is set occurs. If Advanced and Repeat Notifications options have been set, specify them.
- In the Update Incident section, specify the details to triage incidents when they occur. Specify **Assign to**, **Set priority to**, **Set status to**, and **Escalate to** details.
- In the Create Ticket section, if a ticket device has been configured, specify the details to create the ticket.

Click **Continue**.

13. In the Specify Name and Description page, specify a **Name** and **Description** for the event rule. Click **Next**.
14. In the Review page, verify the details you have selected for the event rule and click **Continue** to add this rule in the rule set.
15. On the Create Rule Set page, click **Save** to save the rule set.

## 7.7 Creating Corrective Actions

Corrective Actions enable you to specify automated responses to metric alerts. Corrective Actions ensure that routine responses to metric alerts are automatically executed, thereby saving you time and ensuring problems are dealt with before they noticeably impact end users.

Corrective actions share many features in common with the Job System. By default, a corrective action runs on the target on which the metric alert has triggered. Alternatively, you can specify a corrective action to contain multiple tasks, with each task running on a different target. You can also receive notifications for the success or failure of corrective actions.

You define corrective actions for individual metrics for monitored targets. The following sections provide instructions on setting up corrective actions:

- [Providing Credentials](#)
- [Creating Corrective Actions for Metrics](#)
- [Creating a Library Corrective Action](#)
- [Specifying Access to Corrective Actions](#)

- [Setting Up Notifications for Corrective Actions](#)
- [Providing Agent-side Response Actions](#)

### 7.7.1 Providing Credentials

Since corrective actions are associated with a target's metric thresholds, you can define corrective actions if you have been granted OPERATOR or greater privilege on the target. You can define separate corrective actions for both Warning and Critical thresholds. Corrective actions must run using the credentials of a specific user. For this reason, whenever a corrective action is created or modified, you must specify the credentials that the modified action runs with.

### 7.7.2 Creating Corrective Actions for Metrics

For any target, the Metric and Collection Settings page shows whether corrective actions have been set for various metrics. For each metric, the Corrective Actions column shows whether Critical and/or Warning severities of corrective actions have been set.

1. From any target's home page menu, select **Monitoring**, then **Metric and Collection Settings**. The Metric and Collection Settings page appears.

**Tip:** For instance, on the home page for a host named `dadvmn0630.us.oracle.com`, you would select the Host menu, then Monitoring, then Metric and Collection Settings.

2. Click the pencil icon for a specific metric to access the Edit Advanced Settings page for the metric.
3. In the Corrective Actions section, click **Add** for the metric severity (Warning and/or Critical) for which you want to associate a corrective action.
4. Select the task type on the Add Corrective Actions page, then click **Continue**.
  - If you want to use a corrective action from the library, select **From Library** as the task type. Using a library corrective action copies the description, parameters, and credentials from the library corrective action. You must still define a name for the new corrective action. You can provide corrective action parameters if necessary.
  - If you want to create a corrective action to store in the library, see [Section 7.7.3, "Creating a Library Corrective Action."](#)
  - If you want to provide an Agent-side response action, select Agent Response Action as the task type. See [Section 7.7.6, "Providing Agent-side Response Actions"](#) for more information.
5. On the Corrective Action page, provide input for General, Parameters, and Credentials as you would similarly do when creating a job.
6. Click **Continue** to save the corrective action and return to the Edit Advanced Settings page, where your corrective action now appears.
7. *Optional:* To prevent multiple instances of a corrective action from operating simultaneously, enable the **Allow only one corrective action for this metric to run at any given time** checkbox.

This option specifies that both Critical and Warning corrective actions will not run if a severity is reported to the Oracle Management Services when an execution of either corrective action is currently running. This can occur if a corrective action

runs longer than the collection interval of the metric it corrects; the value of the metric may be oscillating back and forth across one of the thresholds (leading to multiple executions of the same corrective action), or may be rising or falling quickly past both thresholds (in which case an execution of the Warning corrective action may overlap an execution of the Critical corrective action).

If you do not select this option, multiple corrective action executions are launched under the aforementioned circumstances. It is the administrator's responsibility to ensure that the simultaneous corrective action executions do not conflict.

8. Click **Continue** when you have finished adding corrective actions to return to the Metric and Collection Settings page.

The page shows the corrective action value you have provided for the metric in the Corrective Actions column. Possible values are:

- **None** — No corrective actions have been set for this metric.
  - **Warning** — A corrective action has been set for Warning, but not Critical, alerts for this metric.
  - **Critical** — A corrective action has been set for Critical, but not Warning, alerts for this metric.
  - **Warning and Critical** — Corrective actions have been set for both Warning and Critical alerts for this metric. If an Agent-side response action is associated with the metric, the value is also Warning and Critical, since Agent-side response actions are always triggered on either Critical or Warning alert severities.
9. Continue the process from step 2 forward, then click **OK** on the Metric and Collection Settings page to save your corrective actions and return to the target page you started from in step 1.

### 7.7.3 Creating a Library Corrective Action

For corrective actions that you use repeatedly, you can define a library corrective action. After a corrective action is in the library, you can reuse the corrective action definition whenever you define a corrective action for a target metric or policy rule.

1. From the Enterprise menu, select **Monitoring**, then **Corrective Actions**. The Corrective Action Library page appears.
2. Select a job type from the **Create Library Corrective Action** drop-down, then click **Go**.
3. Define the corrective action as you would for creating a job in [Section 7.3, "Creating Jobs"](#) for General, Parameters, and Credentials. For Access, go to the following optional step.
4. *Optional:* Select **Access** to define or modify the access you want other users to have for this corrective action.

For more information, see [Section 7.7.4, "Specifying Access to Corrective Actions."](#)

5. Click **Save to Library** when you have finished. The Corrective Action Library page reappears, and your corrective action appears in the list.

You can now create another corrective action based on this one (Create Like button), edit, or delete this corrective action.

You can access this library entry whenever you define a corrective action for a metric severity by selecting From Library as the task type in the Add Corrective Actions page.

See step 4 in [Section 7.7.2, "Creating Corrective Actions for Metrics,"](#) for more information.

## 7.7.4 Specifying Access to Corrective Actions

As mentioned in the procedure above, you can determine the access to corrective actions by other users. You do not need to provide input for this page if you do not want to share the corrective action.

### 7.7.4.1 Defining or Modifying Access

The table on the Access page shows the access that administrators and roles have to the corrective action. Only the corrective action owner (or Super Administrator) can make changes on this page.

As the corrective action owner, you can do the following:

- Add other administrators and roles to the table by clicking **Add**, then selecting the appropriate type in the subsequent page that appears.
- Change the access of an administrator or role by choosing the **Full** or **View** access right in the Access Level column in the table.
- Remove all access to the corrective action for an administrator or role by clicking the icon in the **Remove** columns for this administrator or role. All administrators with Super Administrator privileges have the View access right to a corrective action.

If you choose to provide access rights to a role, you can only provide the View access right to the role, not the Full access right.

If you are a Super Administrator, you can:

- Grant View access to other Enterprise Manager administrators or roles.
- Revoke all administrator access privileges.

---

**Note:** If a new user is being created, the user should have the CREATE\_JOB privilege to create Corrective Actions.

---

### 7.7.4.2 Access Level Rules

Access level rules are as follows:

- Super Administrators always have View access for any corrective action.
- The Enterprise Manager administrator who owns the corrective action can make any access changes to the corrective action (except revoking View from Super Administrators).
- Super Administrators with a View or Full access level for a corrective action can grant View (but not Full) access to any new user. Super Administrators can also revoke Full and View access from normal users, and Full access from Super Administrators.
- Normal Enterprise Manager administrators with Full access levels cannot make any access changes on the corrective action.
- If the corrective action owner performs a Create Like operation on a corrective action, all access privileges for the new corrective action become identical to the original corrective action. If the corrective action owner grants other administrators View or Full access to other administrators, and any of these

administrators perform a Create Like operation on this corrective action, all administrators will, by default, have View access on the newly created corrective action.

### 7.7.5 Setting Up Notifications for Corrective Actions

Corrective actions are associated with metrics whose alerts trigger them. Any Enterprise Manager administrator with View or higher privileges on a target can receive notifications following the success or failure of a corrective action.

A single incident rule can contain any combination of alert and corrective action states. All metrics and targets selected by the incident rule are notified for the same alert and corrective action states. Therefore, if you want to be notified of corrective action success or failure for one metric, but only on failure for another, you need to use two incident rules. An incident rule can include corrective action states for metrics with which no corrective actions have been associated. In this case, no notifications are sent.

---

**Note:** Notifications cannot be sent for Agent-side response actions, regardless of the state of any incident rules applied to the target.

---

To create incident rules for notifications:

1. From the Setup menu, select **Incidents**, then **Incident Rules**.
2. Click **Create Rule Set**. The Create Rule Set wizard appears.
3. Provide the requisite information at the top of the Create Rule Set page, then select one of the target choices in the Targets sub-tab, supplying additional information as needed for the "All targets of types" and "Specific targets" choices.
4. Select the **Rules** sub-tab, then click **Create**.
5. In the pop-up that appears, select the default **Incoming events and update to events** choice, then click **Continue**.
6. On the Select Events page, enable the **Type** checkbox, then select **Metric Alert**.
7. Click the **Specific events of type Metric alert** radio button, then click **Add** in the table that appears.
8. In the pop-up that appears, select the Target Type, filter and select the metric, select a severity, then enable the desired corrective action status. Click **OK**.
9. From the Add Actions page, click **Add**.
10. Specify recipients in the Basic Notifications section of the Add Conditional Actions page.
11. Proceed through the final two pages of the wizard, then click **Continue**. Your new rule appears in the Create Rule Set page.
12. Click **Save** to save this rule.

After you have created one or more rule sets, you need to set up notification methods as follows:

1. From the Setup menu, select **Notifications**, then **Notification Methods**.
2. From the Notification Methods page, select **Help**, then **Enterprise Manager Help** for assistance on providing input for this page.

## 7.7.6 Providing Agent-side Response Actions

Agent-side response actions perform simple commands in response to an alert. When the metric triggers a warning or critical alert, the Management Agent automatically runs the specified command or script without requiring coordination with the Oracle Management Service (OMS). The Agent runs this command or script as the OS user who owns the Agent executable. Specific target properties can be used in the Agent response action script.

---

**Note:** Use the Agent-side Response Action page to specify a single command-line action to be executed when a Warning or Critical severity is reached for a metric. For tasks that require alert context, contain more complex logic, or require that notifications be sent on success or failure, corrective actions should be used instead of an Agent-side response action.

---

To access this page, follow steps 1 through 4 in [Section 7.7.2, "Creating Corrective Actions for Metrics."](#)

### 7.7.6.1 Specifying Commands and Scripts

You can specify a single command or execute a script. You cannot specify special shell command characters (such as > and <) as part of the response action command. If you must include these types of special characters in your response action commands, you should use them in a script, then specify the script as the response action command.

If using a script, make sure the script is installed on the host machine that has the Agent. If using shell scripts, make sure the shell is specified either in the Response Action command line:

**Script/Command:** /bin/csh myScript

... or within the body of the script itself:

**Script/Command:** myScript

... where myScript contains the following:

```
#!/bin/csh<
<rest of script>
```

### 7.7.6.2 Using Target Properties in Commands

You can use target properties in a command. Click **Show Available Target Properties** to display target properties you can use in the Script/Command field. The list of available target properties changes according to the type of target the response action is to run against.

Use Target Properties as command-line arguments to the script or command, then have the script reference these command-line arguments. For example, to use the %OracleHome% and %SID% target properties, your command might appear as follows:

```
/bin/csh MyScript %OracleHome% %SID%
```

.... and your script, MyScript, can reference these properties as command-line arguments. For example:

```
IF $1 = 'u1/bin/OracleHome' THEN...
```

Target properties are case-sensitive. For example, if you want to access the Management Agent's Perl interpreter, you can specify %perlBin%/perl <my\_perl\_script> in the Script/Command field.

### 7.7.6.3 Using Advanced Capabilities

You can get other target properties from the target's XML file in the OracleHome/sysman/admin/metadata directory, where OracleHome is the Oracle home of the Management Agent that is monitoring the target. In the XML file, look for the PROP\_LIST attribute of the DynamicProperties element to get a list of properties that are not listed in the targets.xml entry for the target.

The following example is an excerpt from the hosts.xml file:

```
<InstanceProperties>
  <DynamicProperties NAME="Config" FORMAT="ROW"
    PROP_LIST="OS;Version;OS_patchlevel;Platform;Boottime;IP_address">
    <ExecutionDescriptor>
      <GetTable NAME="_OSConfig"/>
      <GetView NAME="Config" FROM_TABLE="_OSConfig">
        <ComputeColumn NAME="osName" EXPR="Linux" IS_VALUE="TRUE"/>
        <Column NAME="osVersion"/>
        <Column NAME="osPatchLevel"/>
        <Column NAME="Platform"/>
        <Column NAME="Boottime"/>
        <Column NAME="IPAddress"/>
      </GetView>
    </ExecutionDescriptor>
  </DynamicProperties>
  <InstanceProperty NAME="Username" OPTIONAL="TRUE" CREDENTIAL="TRUE">
    <ValidIf>
      <CategoryProp NAME="OS" CHOICES="Linux"/>
    </ValidIf>
    <Display>
      <Label NLSID="host_username_iprop">Username</Label>
    </Display>
  </InstanceProperty>
  <InstanceProperty NAME="Password" OPTIONAL="TRUE" CREDENTIAL="TRUE">
    <ValidIf>
      <CategoryProp NAME="OS" CHOICES="Linux"/>
    </ValidIf>
    <Display>
      <Label NLSID="host_password_iprop">Password</Label>
    </Display>
  </InstanceProperty>
</InstanceProperties>
```

---

# Configuring Software Library

This chapter describes how to configure a new Software Library, the various users and the privileges required to access the Software Library, and finally how to maintain an existing Software Library in the Enterprise Manager Cloud Control environment.

In particular, this chapter covers the following:

- [Overview of Software Library](#)
- [Users, Roles, and Privileges](#)
- [Software Library Storage](#)
- [Prerequisites for Configuring Software Library](#)
- [Configuring Software Library Storage Location](#)
- [Configuring Software Library on a Multi-OMS System](#)
- [Using Software Library Entities](#)
- [Tasks Performed Using the Software Library Home Page](#)
- [Maintaining Software Library](#)

## 8.1 Overview of Software Library

Oracle Software Library (Software Library) is one of the core features offered by Enterprise Manager Cloud Control. Technically, it is a repository that stores software entities such as software patches, virtual appliance images, reference gold images, application software, and their associated directive scripts. In addition to storing them, it also enables you to maintain versions, maturity levels, and states of these software entities.

To access the Software Library console page, from the **Enterprise** menu, select **Provisioning and Patching**, then click **Software Library**. On the Software Library home page, as shown in [Figure 8-1](#), there are two types of folders: Oracle-owned folders (marked by a lock symbol) and User-owned folders.

Oracle-owned folders and their contents (including other subfolders and entities) ship with the product by default, and appear on the Software Library home page after Software Library is configured. User-owned folders are logical top level folders that the user creates to organize the entities that he/she intends to create.

**Figure 8–1 Software Library Console**

Software Library Page Refreshed Aug 11, 2011 7:07:32 AM PDT

Software Library maintains entities that represent software patches, virtual appliance images, reference gold images, application software and their associated directive scripts. You can pick any of the Oracle-supplied entities, customize them or create a custom one of your own. Once defined, these reusable entities can be referenced from a Deployment Procedure to automate the patching, provisioning or deployment of the associated software.

Actions View ↺ View ✎ Edit... ✕ Delete... Find Name ➔ 🔍 Search

| Name                                      | Type | Subtype | Revision | Status | Maturity | Owner  | Description  |
|---|------|---------|----------|--------|----------|--------|--|
| Software Library                          |      |         |          |        |          | ORACLE | Root Folder for Software Library entities                      |
| Application Server Provisioning Utilities |      |         |          |        |          | ORACLE | Entities belonging to AS Provisioning                          |
| Bare Metal Provisioning                   |      |         |          |        |          | ORACLE | Bare Metal Provisioning directory                              |
| BPELProvisioning                          |      |         |          |        |          | ORACLE | BPEL Provisioning Entities                                     |

| Oracle VM Server Provisioning             |      |         |          |        |          | ORACLE | Oracle VM Server Provisioning directory                        |
| OSBProvisioning                           |      |         |          |        |          | ORACLE | OSBProvisioning Entities                                       |
| Patching                                  |      |         |          |        |          | ORACLE | Patching directory   |
| Prerequisite-fixup components             |      |         |          |        |          | ORACLE | Prerequisite-fixup components Components belonging to DB Prov  |
| SoaProvisioning                           |      |         |          |        |          | ORACLE | SOA Provisioning Entities                                      |

The Software Library Page is centralized media storage for all Enterprise Manager entities. For example,

- Self Update entities like plug-ins, connectors, DB workload, and so on.
- Provisioning and Patching entities like gold images, application archives, perl/shell scripts, and so on.

#### Advantages:

- Software Library facilitates patching and provisioning tasks in both the modes, which are Online mode and Offline mode. For example, if database patches cannot be downloaded directly from *My Oracle Support*, you can download them separately and stage them in Software Library for offline deployment.
- Starting with Enterprise Manager Cloud Control 12c, Referenced File Locations are supported, which means that the Software Library allows you to leverage your organizations existing IT infrastructure (like file servers, web servers, or storage systems) to stage the files to host targets as part of a provisioning or patching activity.
- Software Library allows you to organize the entities, which basically refer to the software binaries or directive scripts in your enterprise, into logical folders for efficient management.

From the Software Library Console page, you can perform the following tasks:

- Configure Software Library Storage, see [Section 8.5, "Configuring Software Library Storage Location"](#) for more information.
- Create Software Library Entities. For example, Creating a Generic Component, Creating Directives, and so on.
- Manage Software Library Entities. For example, Viewing Entities, Editing Entities, Deleting Entities, Searching Entities, and so on.

## 8.2 Users, Roles, and Privileges

Software Library folders and entities that ship with the product, by default are viewable by all the Enterprise Manager users. Fine grained privileges provide a way to control user access to the different entities in the Software Library. Administrator by default do not have any Software Library privileges, it is for the Super Administrator, to grant access, privileges to an Administrator.

Software Library users roles can be broadly classified as:

- **Designers** are administrators who perform design time tasks like setting up Software library, migrating entities, granting privileges to the Operators, deleting entities, and so on. They can perform both the design time activities, and run-time activities that the Operator can perform. Designers in Enterprise Manager Cloud Control can be granted Super Administrator role or the `EM_PROVISIONING_DESIGNER` role which allows him to create and maintain any Software Library entity.
- **Operators** are administrators who can perform run-time activities like creating components, creating directives, and so on. Operators are typically granted roles like `EM_PROVISIONING_OPERATOR` or `EM_PATCH_OPERATOR` and so on.

Any Enterprise Manager user requires, at the very least, a view privilege on an entity for the entity to be visible on the Software Library Home page. Users will not be able to see this entity till the Super Administrator grants them at least a view privilege on the entity.

---

**Note:** All the folders and entities that ship with the product also know as the Oracle-owned entities, by default are viewable by all the Enterprise Manager users.

---

Administrator by default do not have any Software Library privileges, it is for the Super Administrator, to grant access, privileges to an Administrator. [Table 8-1](#) describes all the available Software Library privileges that can be granted to a user or role.

Users and roles can be granted privileges on specific entities by the owner of the entity or the Super Administrator. For more details, see *Oracle Enterprise Manager Administrator's Guide for Software and Server Provisioning and Patching*.

**Table 8-1 Software Library Privileges for Administrators**

| Resource Type                      | Description   |
|------------------------------------|---|
| View any Template Entity           | Ability to view any Template Entity                                   |
| Export Any Software Library Entity | Ability to export any Software entity                                 |
| Edit any Software Library Entity   | Ability to edit any Software Library entity                           |
| Manage Any Software Library Entity | Ability to create, view, edit, and delete any Software Library entity |
| Import Any Software Library Entity | Ability to import any Software Library entity                         |
| Create Any Software Library Entity | Ability to create any Software Library entity                         |
| View Any Software Library Entity   | Ability to view any Software Library entity                           |
| View Any Assembly Entity           | Ability to view any Assembly entity                                   |

**Table 8–1 (Cont.) Software Library Privileges for Administrators**

| Resource Type              | Description   |
|----------------------------|---|
| Grant Any Entity Privilege | Ability to grant view, edit, and delete privileges on any Software Library entity. This privilege is required if the user granting the privilege on any entity is not a Super Administrator or owner of the entity. |

Table 8–2 describes all the primary users of Software Library, and their associated privileges:

**Table 8–2 Roles and Privileges**

| Role                                | Software Library Privileges  |
|-------------------------------------|--|
| Super Administrator                 | All Software Library Privileges  |
| EM_PROVISIONING_DESIGNER (Designer) | Create Any Software Library Entity                                     |
| EM_PROVISIONING_OPERATOR (Operator) | View Any Software Library Entity                                       |
| EM_PATCH_OPERATOR                   | Create Any Software Library Entity<br>View Any Software Library Entity |
| EM_USER (Administrator)             | Access Enterprise Manager  |

Super Administrators have complete privileges on all the entities present in Software Library, and can exercise access control on the entities by granting one or more privileges, and later revoking the previously granted privilege to another user or role.

Designers by default are given create privileges, which allow them to create entities and manage them.

Operators by default are given view privileges, which allow them to view all the entities in Enterprise Manager Cloud Control.

Any Enterprise Manager user requires, at the very least, a view privilege on an entity for the entity to be visible on the Software Library console. The Super Administrator can choose to grant additional privileges described in Table 8–1 to the user or role. Users will not be able to see this entity till the Super Administrator grants them at least a view privilege on the entity.

## 8.3 Software Library Storage

The Software Library Administration console allows you to configure and administer Software Library. To start using the Software Library, you must add at least one upload file storage location (OMS Shared location, or OMS Agent location) on the host where the OMS is running. A storage location in Software Library represents a repository of files, these files are either uploaded by Software Library, or generated and saved by some user-owned process.

---

**Note:** If you choose to newly configure an OMS Shared Storage Location, then ensure that the file system path that you specify for the location is either a shared path or a mounted path. Doing this will ensure that this newly configured location remains accessible from any OMS host as and when they are added.

However, if you have configured the OMS Shared Storage Location on a local file system, then perform the steps listed in the [Section 8.6](#) to migrate this location to another OMS Shared Storage Location that has a shared or mounted path.

---

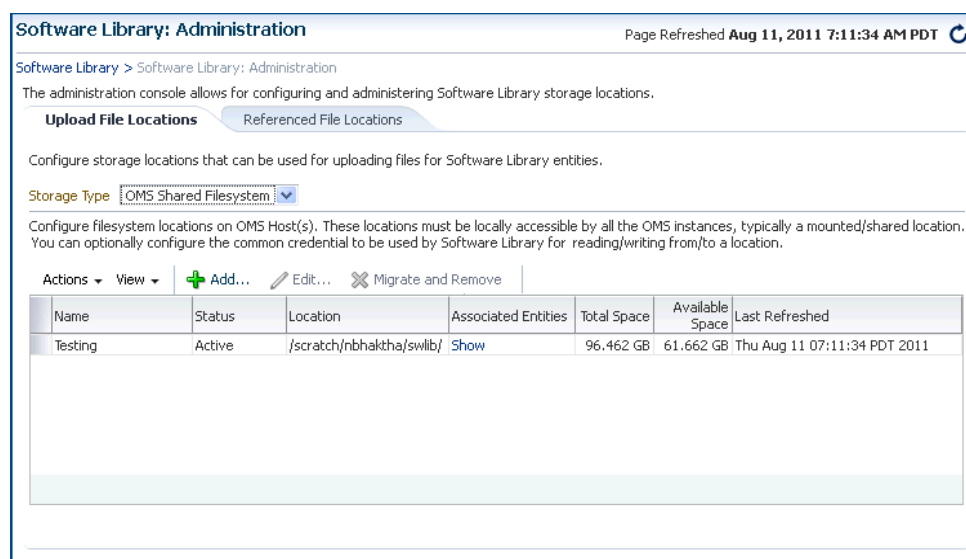

To access the administration console, log into Enterprise Manager Cloud Control with Administration access, and follow these steps:

In Cloud Control, from **Setup** menu, select **Provisioning and Patching**, and then click **Software Library**.

OR

In Cloud Control, from the **Enterprise** menu, select **Provisioning and Patching** and then, click **Software Library**. On the Software Library home page, from **Actions** menu, select **Administration**.

**Figure 8–2 Software Library Administration**

The Software Library Administration Page as shown in [Figure 8–2](#) is a GUI based screen, that enables you to create one or more storage locations to store or refer to files that are associated with an entity. To view the entities present in the storage location, click **show** on the Administration page. You can create a storage location on the OMS or the agent running on the same host as the OMS. With Enterprise Manager 12c, a new feature called Referenced File Location has been introduced, wherein Software Library entities can refer to files that are stored on another host. These locations are however read-only for Software Library, will not be used for uploading files.

The space requirements for configuring Software Library depends on the amount of space required for storing the software binaries, and its associated scripts. Understandably, this space requirement increases over a period of time as you create

more entities. Depending on the features or software required for provisioning and patching, you must decide and configure the Software Library storage space.

---

**Note:** When a storage location starts running out of space, then it is important to deactivate the configured storage location so that no new uploads can happen to this location. For more information about removing a storage location, see [Section 8.9](#)

---

The following types of storage locations are available:

- [Upload File Locations](#)
- [Referenced File Location](#)

### 8.3.1 Upload File Locations

Upload File Locations are locations configured for storing files uploaded by Software Library as part of creating or updating an entity.

---

**Note:** For Software Library to become usable, at least one upload file location must be configured. On adding the first upload file location, the default Software Library metadata for all installed plug-ins is imported from the OMS Oracle home, and a job is submitted. Ensure that you wait for this job to complete successfully, before performing other patching or provisioning operations.

---

As a prerequisite, before using Upload File Locations as storage option, you must set credentials for using an OMS Shared File System or OMS Agent File System:

- For multiple OMS environment, all the OMS hosts must have a preferred normal host credential set.

---

**Note:** When OMS instances are added, it is necessary to ensure that the configured locations are accessible from the designated host where the new OMS will be provisioned.

For an OMS that will be provisioned using the Add OMS functionality, the shared location configured as upload location should be mounted on the designated host, and verified manually.

---

- For OMS Agent File System location configuration, a credential (preferred or named) has to be specified.

Upload File Locations support two storage options:

#### OMS Shared File System

An OMS Shared File System location is required to be shared (or mounted) across all the Oracle Management Server (OMS) hosts. This option is ideal for UNIX systems.

For single OMS environments, you can configure the Software Library either on the host where the OMS is running, or in a shared location. However, in future, if you plan to expand the single OMS setup to a multiple OMS setup, then local file system path is not recommended.

For multiple OMS environments, Oracle recommends you to configure the Software Library in a non-local, shared file system path that is accessible to all Oracle Management Servers in the environment. If you are implementing multiple management servers for high availability you should also make the Software Library file system highly available. Besides accessibility and availability, it is important to ensure that there is enough space available for the storage of software binaries, and associated scripts for the entities that you want to create and store

### OMS Agent File System

An OMS Agent File System location should be accessible to the agent running on the host machine where the OMS is deployed, and is recommended for multiple OMS setup on Windows. To use this storage option, ensure that you have a preferred, or a named credential for the OMS host. Click **Change Credential** to change the associated credential to be used to access this location. Ensure that credential associated with the location is viewable by all Software Library designers, so that other designers can upload, and stage the files associated with any entity.

## 8.3.2 Referenced File Location

Referenced File Locations are locations that allow you to leverage the organization's existing IT infrastructure (like file servers, web servers, or storage systems) for sourcing software binaries and scripts. Such locations allow entities to refer to files without having to upload them explicitly to a Software Library storage.

Referenced File Locations support three storage options:

- **HTTP:** An HTTP storage location represents a base URL which acts as the source of files that can be referenced.

For example, the base URL <http://my.files.com/scripts> could be configured as an HTTP location for sourcing files such as <http://my.files.com/scripts/perl/installMyDB.pl> or <http://my.files.com/scripts/linux/stopMyDB.sh>.

- **NFS:** An NFS storage location represents an exported file system directory on a server. The server need not be an Enterprise Manager host target.

For example, the directory `/exported/scripts` is exported on server `my.file.server` could be configured as an NFS location for sourcing files such as `/exported/scripts/generic/installMyDB.pl` or `/exported/scripts/linux/stopMyDB.sh` once mounted on a target host file system.

- **Agent:** An Agent storage location is similar to the OMS Agent File System option, but can be any host monitored by an Enterprise Manager Agent. The Agent can be configured to serve the files located on that host.

For example, the directory `/u01/binaries` on the Enterprise Manager Host `my.em.file.server` could be configured as an Agent location for sourcing files such as `/u01/binaries/rpms/myCustomDB.rpm` or `/u01/binaries/templates/myTemplate.tar.gz`.

These locations require a named credential to be associated which will be used to access the files from the base location on the host through the Enterprise Manager Agent.

## 8.4 Prerequisites for Configuring Software Library

To administer the different storage types, and to configure software library, keep the following points in mind:

- Depending on the features or software required for provisioning and patching, you must decide and configure the Software Library storage space. The storage needs change based on the usage pattern.
- On UNIX systems, Oracle recommends that you configure at least one OMS Shared File System location that is accessible from all the OMS hosts.  
  
On Windows systems, Oracle recommends configuring OMS Agent File System storage.
- Each OMS host must have a preferred normal host credential set before configuring the location. For OMS Agent File System location configuration, a credential (preferred or named) has to be specified.
- You (the user configuring the Software Library) must have view privilege on all the OMS, and the agent targets running on the host machine. As per the accessibility verification, you must be able to view, and edit these newly configured locations using the credentials described in the proceeding point.
- All the credentials used while configuring the locations, must be viewable by all the Software Library designers, as this will enable the designers to upload the files to the Software Library storage. Additionally, designers can also stage the uploaded files to other hosts for provisioning or patching activities.
- To add an OMS Agent storage location, ensure that you have view privileges on the target OMS host, and the agents running on that target host.

## 8.5 Configuring Software Library Storage Location

System Administrators are responsible for configuring a storage location. Only after the storage location is configured, you can start uploading the entity files.

You can configure the Software Library in one of the following locations:

- [Configuring an OMS Shared Filesystem Location](#)
- [Configuring an OMS Agent Filesystem Location](#)
- [Configuring a Referenced File Location](#)

### 8.5.1 Configuring an OMS Shared Filesystem Location

To configure an OMS Shared File System storage location that can be used for uploading Software Library entity files, perform the following steps:

1. From the **Setup** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On Software Library: Administration page, select **OMS Shared Filesystem**.
3. To add a new OMS Shared File System, click **+Add**.
4. In the Add OMS Shared File System location dialog box, provide a unique name, and location on the OMS host, where you want to set up the upload location.

Ensure that the configured storage location is a shared location that is accessible by all the OMS instances. For a Multi OMS setup, set the Normal Preferred Credentials for all the OMS(s).

When you configure an upload location for the first time, a metadata registration job is submitted which imports all the metadata information of all the installed plug-ins from the Oracle home of the OMS.

To track the progress of the job, from **Enterprise** menu, select **Job**, and then click **Activity**. On the Job Activity Page, in the Advanced Search region, enter the name of the job, choose **Targetless** as the Target Type, and then click **Search**. Typically, the name of the job starts with `SWLIBREGISTERMETADATA_*`.

If the Import job fails, see [Section 8.9](#) for information on Re-importing metadata for Oracle-owned files.

5. Click **OK** to create a new entry for the storage location in the table, with details like **Name**, **Location**, **Host**, **Status**, and **Host Credentials**.

In addition to this, you can click **Associated Entities** to view or search the entities present in the selected upload location.

## 8.5.2 Configuring an OMS Agent Filesystem Location

To configure an OMS Agent location, perform the following steps:

1. From the **Setup** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library: Administration page, select **OMS Agent Filesystem**.
3. Click **+Add**, in the Add OMS Agent File System Location dialog box, enter the following details:

- a. In the **Name** field, enter a unique name for the storage.
- b. In the **Host** field, click the magnifier icon. From the Search and Select: Hosts dialog box, select a host where the OMS is running, and click **Select**.

For example, `xyz.acme.com`

- c. In the **Location** field, click the magnifier icon. In the Remote File Browser dialog box, click **Login As** to log into the host machine with either Preferred, Named or New credentials.

Navigate to the location on the host where you want to create the Agent File System, and click **OK**.

The selected credential is saved along with the host and selected file system path. The saved credential is used to upload files and stage the uploaded files to a host target as part of some provisioning or patching activity.

**Note:** The administrator configuring the Software Library must grant view privilege (at least) on the credential chosen to all designers uploading or staging the files to or from this location.

4. Click **OK** to create a new entry for the storage location in the table, with details like **Name**, **Location**, **Host**, **Status**, and **Host Credentials**.

In addition to this, you can click **Associated Entities** to view or search the entities present in the selected upload location.

These newly configured OMS Agent locations are now available for storing entity files.

### 8.5.3 Configuring a Referenced File Location

To configure storage location that can be used for referring to files from the Software Library entities, perform the following steps:

1. From the **Setup** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library: Administration page, click **Referenced File Locations** tab.
3. To add an HTTP location that can be accessed through a HTTP URL, select **HTTP** from the Storage Type list and click **+Add**.

In the Add HTTP Location dialog box, enter a unique name and a HTTP location for the storage that you want to reference, and click **OK**.

A new entry for the storage location is created, with details like **Name**, **Location**, and **Status**.

4. To add an NFS shared location, select **NFS** from the Storage Type list and click **+Add**.

In the Add NFS Location dialog box, do the following:

- a. Enter a unique name in the **Name** field for the storage.
- b. In **NFS server** field, provide a fully qualified domain name or the IP address of the hosted machine that has NFS services running on them.

- c. In the **Location** field, provide the shared location or directory path on the NFS server to define a storage location, then click **OK**.

A new entry for the storage location is created in the table, with details like **Name**, **Location**, and **Status**.

5. To add an Agent location that has read-only privileges set on it, select **Agent** from the Storage Type list and click **+Add**.

In the Add Agent Location dialog box, enter the following details:

- a. In the **Name** field, enter a unique name for the storage.
- b. In the **Host** field, click the magnifier icon to select a target from the list available.

For example, `xyz . company . com`

- c. In the **Location** field, click **Login As** to select the credentials and browse the previously selected host.

The credential selected, either Preferred, Named or New, is saved along with the host and selected file system path. The saved credential is used for staging the files to a host target as part of some provisioning or patching activity.

**Note:** The administrator configuring the Software Library must grant view privilege (at least) on the credential chosen to all designers uploading or staging the files to or from this location.

**Note:** When you create a new entity, these newly configured Referenced File Locations are available as storage options.

## 8.6 Configuring Software Library on a Multi-OMS System

Oracle recommends that you configure each OMS Shared Storage Location to use a shared or mounted file system path. Doing this will ensure that this newly configured location remains accessible from any OMS host as and when they are added.

If however, you have configured the OMS Shared storage location to use a local file system path, then you must migrate it to another OMS Shared Storage Location that uses a shared or mounted path. To do so, follow these steps:

1. In Cloud Control, from **Setup** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Administration page, add a new OMS Shared storage location by specifying a name (for example: NewShared), and a shared file system path.
3. On successful completion, select the location you want to migrate, (For example: OldNonShared, and click **Migrate and Remove**.

4. In the popup dialog box, select the new OMS Shared storage location (NewShared) as the destination location for the migration of files.
5. Click **Remove** to submit a job, which on successful completion deletes the storage location entry from the table.

## 8.7 Using Software Library Entities

To access the Software Library Home Page, in Cloud Control, from the **Enterprise menu**, select **Provisioning and Patching** and then, click **Software Library**. Software Library is a repository that stores certified software binaries such as software patches, virtual appliance images, reference gold images, application software and their associated directive scripts, generally referred to as *Entities*. Accesses and privileges on these entities are decided by the Super Administrators or the owner of the entity.

Entities can broadly be classified as:

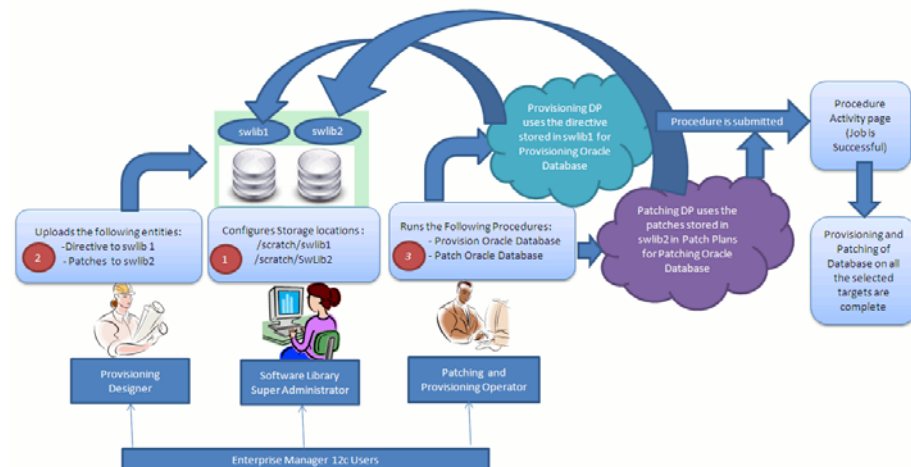

| Types                 | Description  |
|-----------------------|--|
| Oracle-owned Entities | These entities are available by default on the Software Library Home page, once the Software Library is configured. In the following graphic, all the entities that are owned by <b>Oracle</b> , qualify as Oracle-owned entities, and all the folders that appear with a lock icon against them are Oracle-owned folders like Application Server Provisioning, Bare Metal Provisioning, Cloud, and so on. |
| Custom Entities       | These entities are created by the Software Library users. In the following graphic, entities like Components, Directives, Images, Network, and so on are the User-owned entities.  |

| Name                 | Type | Subtype | Revision | Status | Maturity | Owner  | Description                                |
|----------------------|------|---------|----------|--------|----------|--------|--|
| Software Library     |      |         |          |        |          | ORACLE | Root Folder for Software Library entities  |
| Application Server F |      |         |          |        |          | ORACLE | Entities belonging to AS Provisioning      |
| Bare Metal Provision |      |         |          |        |          | ORACLE | Bare Metal Provisioning directory          |
| BPELProvisioning     |      |         |          |        |          | ORACLE | BPEL Provisioning Entities                 |
| Cloud                |      |         |          |        |          | ORACLE | Cloud                                      |
| Coherence Node Pr    |      |         |          |        |          | ORACLE | Coherence Node Provisioning Entities       |
| Common Provisionir   |      |         |          |        |          | ORACLE | Directives belonging to Common Provisionin |
| Components           |      |         |          |        |          | SYSMAN | Components Folder                          |
| Directives           |      |         |          |        |          | SYSMAN | Directives Folder                          |
| Images               |      |         |          |        |          | SYSMAN | Images Folder                              |
| Networks             |      |         |          |        |          | SYSMAN | Networks Folder                            |
| Suites               |      |         |          |        |          | SYSMAN | Suites Folder                              |

**Note:** All Oracle-owned folders (and entities) are available on the Software Library Home page by default. The Oracle-owned folders have a read-only privilege, so you cannot select these folders to create an entity. You must create a custom folder to place your entities in them.

A number of lifecycle management tasks like patching and provisioning deployment procedures make use of the entities available in Software Library to accomplish the desired goal. Here is a pictorial representation of how a Provisioning Deployment Procedure and a Patching Deployment Procedure makes use of the entities available in the Software Library:

Figure 8–3 Using Software Library Entities for Provisioning and Patching Tasks

## 8.8 Tasks Performed Using the Software Library Home Page

From the Software Library Home page, you can do the following:

- [Organizing Entities](#)
- [Creating Entities](#)
- [Customizing Entities](#)
- [Managing Entities](#)

### 8.8.1 Organizing Entities

Only designers who have the privilege to create any Software Library entity, can create folders. To create a custom folder, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, from **Actions** menu, click **Create Folder** to create a custom folder of your own.

The custom folder can contain User-owned folders, entities, and customized entities created by using the *Create Like* option.

3. In the Create Folder dialog box, enter a unique name for the folder. Also, select the parent folder in which you want to create this new custom folder and click **Save**.

For example, if the root folder is `Software Library` and you created a custom folder in it called `Cloud12gTest`, then the Parent Folder field is populated as follows: `/Software Library/Cloud12gTest`.

**Note:** Only the owner of the folder or the Super Administrator has the privilege to delete the folder, nobody else can.

### 8.8.2 Creating Entities

From the Software Library Home page, you can create the following entities:

- [Creating Generic Components](#)
- [Creating Directives](#)

### 8.8.2.1 Creating Generic Components

To create a generic component from the Software Library Home page, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select a custom folder that is not owned by Oracle.

**Note:** You cannot create a generic component in an Oracle Owned Folder. To create a custom folder, see [Section 8.8.1](#).

3. From the **Actions** menu, select **Create Entity** and click **Component**. Alternately, right click the custom folder, and from the menu, select **Create Entity** and click **Component**.
4. From the Create Entity: Component dialog box, select **Generic Component** and click **Continue**.

Enterprise Manager Cloud Control displays the Create Generic Component : Describe page.

5. On the Describe page, enter the **Name**, **Description**, and **Other Attributes** that describe the entity.

**Note:** The component name must be unique to the parent folder that it resides in. Sometime even when you enter a unique name, it may report a conflict, this is because there could be an entity with the same name in the folder that is not visible to you, as you do not have view privilege on it.

Click **+Add** to attach files that describe the entity better like readme, collateral, licensing, and so on. Ensure that the file size is less than 2 MB.

In the **Notes** field, include information related to the entity like changes being made to the entity or modification history that you want to track.

6. On the Configure page, you can customize the generic component that you are creating by adding some new properties or updating the existing properties of the component.

**Note:** Select **Shared Type** to reuse the component property. Shared Type can be stored as a template, which can be used for creating different and more complicated top level types.

To add a new property, do the following, and click **Next**:

- a. Select **Top Level Type** or **Shared Type**, and click **Add**.
- b. Enter a unique name for the property. Depending on the property type selected, enter an initial or default value for the property.
- c. To add a constraint, specify the Minimum or Maximum value for the selected property type, and click **Add Constraint**.

The Configured Constraints table lists all the constraints added. To remove a particular constraint from the property, select the property and click **Remove**.

7. On the Select Files page, you can select one or more files to be associated with the entity. Select one of the following options:
  - **Upload Files:** If you want to upload some entity files from the local file system or the agent machine to the selected destination location.

To select the destination location, in the Specify Destination section, in the **Upload Location** field, click the magnifier icon to select one of the following options:

- **OMS Shared FileSystem**
- **OMS Agent FileSystem**

The corresponding Storage Type and Location Path of the selected location is populated.

---

**Note:**

To upload the files, the status of the storage location to which the files are to be uploaded should be **Active**.

If you select OMS Agent Filesystem location, then ensure that you have the necessary privileges to access the location

---

In the Specify Source section, enter the location from where the files are being sourced, these locations can wither be local file system or a remote file system monitored by the Management Agent. Select one of the following options for File Source,;

- If you select **Local Machine**, and click **Add**, the Add File dialog box appears. Click **Browse** to select the entity file from the source location, and give a unique name , and click **OK**.

You can upload the files to any of the configured storage locations available in OMS Shared Filesystem location or OMS Agent Filesystem location

- If you select **Agent Machine**, select the name of the host machine from where you want to pick up the entity files. Click **+Add** and log into the host machine with the desired credentials. For more information about the different credential types and their setup, see *Oracle Enterprise Manager Lifecycle Management Guide*.

Once you log into the host machine, browse to the location where the files to be uploaded are present. You can upload the files to any of the configured storage locations available in OMS Shared Filesystem location or OMS Agent Filesystem location.

- **Refer Files:** If you select the **Refer Files** option, you only need to enter the source location details, since you are not technically uploading anything to the Software Library. In the Specify Source section, select from **HTTP**, **NFS**, or **Agent** Storage types, and click **OK**. The corresponding Storage Type and Location Path of the selected location is populated.

Click **+Add** to reference the entity present at the selected Referenced File Location. In the Add Referenced File dialog box, enter a relative path to the file under Base Location. Click **Stage As** to organize the file in a temporary stage location with a unique name.

For details about each of these storage options, see [Section 8.5.3](#)

8. On the Set Directives page, click **Choose Directives** to associate a component with one or more directives. Click **Next**.
9. On the Review page, review all the details, and click **Finish** to create the component and upload it on the Software Library.

### 8.8.2.2 Creating Directives

Directives are entities in the Software Library that represent a set of instructions to be performed. These are constructs used to associate scripts with software components and images. These scripts contain directions on how to interpret and process the contents of a particular component or an image.

To create a directive from a Software Library Home page, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select a custom folder that is not owned by Oracle.

**Note:** You cannot create a generic component in an Oracle Owned Folder. To create a custom folder, see [Section 8.8.1](#).

3. From **Actions** menu, select **Create Entity** and click **Directive**. Enterprise Manager Cloud Control displays the Create Entity: Directives wizard.
4. On the Describe page, enter the **Name**, **Description**, and **Other Attributes** that describe the entity.

**Note:** The component name must be unique to the parent folder that it resides in. Sometime even when you enter a unique name, and it may report a conflict, this is because there could be an entity with the same name in the folder that is not visible to you, as you do not have view privilege on it.

Click **+Add** to attach files that describe the entity better like readme, collateral, licensing, and so on. Ensure that the file size is less than 2 MB.

In the **Notes** field, include information related to the entity like changes being made to the entity or modification history that you want to track.

5. On the Configure page, specify the command line arguments that must be passed to the directive to configure it. This command provides the parameters required to execute the directive.

To add the command line arguments or parameters, click **Add**.

In the Add Command Line Arguments dialog box, enter the values in the following fields:

- **Argument Prefix**, is a switch or a constant command line argument.  
The Argument Prefix eliminates the error-prone task of manually specifying the order of the parameter executions in a given directive. This is specially useful when a directive is made of multiple parameters.  
Oracle recommends that you create command line arguments using an Argument Prefix.
- **Property Name**, is the name of the property, that must be a string value.
- **Argument Suffix**, is the text that must follow the command line property.  
Though the suffix is rarely used, it determines how the parameters must be executed, based on the suffix value.

For example, if the command line argument you want to pass is as follows:

```
./test.sh -user={username}
```

Then,

Argument Prefix is: `-user`

Property Name is: username

All the parameters added appear in the order of addition against the **Command Line** field.

To change the order of the parameter or edit any property of an existing parameter, click **Edit**.

To remove any of the parameters, click **Remove**.

In the Configuration Properties section, select either **Bash** or **Perl** as defined in the script.

Select **Run Privileged** to run the script with `root` privileges.

6. On the Select Files page, you can select one or more files to be associated with the entity. Select one of the following options:
  - **Upload Files:** If you want to upload some entity files from the local file system or the agent machine to the selected destination location.
 

To select the destination location, in the Specify Destination section, in the **Upload Location** field, click the magnifier icon to select one of the following options:

    - **OMS Shared FileSystem**
    - **OMS Agent FileSystem**

The corresponding Storage Type and Location Path of the selected location is populated.

---

---

**Note:**

To upload the files, the status of the storage location to which the files are to be uploaded should be **Active**.

If you select OMS Agent Filesystem location, then ensure that you have the necessary privileges to access the location

---

---

In the Specify Source section, enter the location from where the files are being sourced, these locations can wither be local file system or a remote file system monitored by the Management Agent. Select one of the following options for File Source,;

- If you select **Local Machine**, and click **Add**, the Add File dialog box appears. Click **Browse** to select the entity file from the source location, and give a unique name , and click **OK**.

You can upload the files to any of the configured storage locations available in OMS Shared Filesystem location or OMS Agent Filesystem location

- If you select **Agent Machine**, select the name of the host machine from where you want to pick up the entity files. Click **+Add** and log into the host machine with the desired credentials. For more information about the different credential types and their setup, see *Oracle Enterprise Manager Lifecycle Management Guide*.

Once you log into the host machine, browse to the location where the files to be uploaded are present. You can upload the files to any of the configured storage locations available in OMS Shared Filesystem location or OMS Agent Filesystem location.

- **Refer Files:** If you select the **Refer Files** option, you only need to enter the source location details, since you are not technically uploading anything to the Software Library. In the Specify Source section, select from **HTTP**, **NFS**, or **Agent** Storage types, and click OK. The corresponding Storage Type and Location Path of the selected location is populated.

Click **+Add** to reference the entity present at the selected Referenced File Location. In the Add Referenced File dialog box, enter a relative path to the file under Base Location. Click **Stage As** to organize the file in a temporary stage location with a unique name.

For details about each of these storage options, see [Section 8.5.3](#)

7. On the Review page, review all the details, and click **Finish** to create the component and upload it on the Software Library.

### 8.8.3 Customizing Entities

You cannot edit an entity present in an Oracle owned folder. However, to edit an Oracle-owned entity, you can make a copy of the entity and store it in a custom folder. Since you now have full access on the entity, you can customize the entity based on your requirement and may even choose to grant other users access to this entity.

To create a custom entity from an Oracle owned entity, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select an entity or alternately, search and select an entity.

For more information about searching for an entity, see [Section 8.8.4.7](#).

3. From **Actions** menu, select **Create Like**.
4. On the Create Like: <Entity Name> dialog box, enter a name that is unique to the parent folder and a description for the entity.

By default, the root directory Software Library is preselected in the **Parent Folder** field.

To change the parent folder and organize the entities, click **Change Parent Folder**. and select the desired folder.

5. Click **OK** to apply the changes.

The new entity appears in the Entities table, under the selected parent folder.

You as the owner have all the privileges on the entity, and can update the properties as per your requirement.

To update the properties of the entity, see [Section 8.8.4.6](#).

For more information on Oracle Owned Entities and User Owned Entities, see [Section 8.7](#).

### 8.8.4 Managing Entities

From the Software Library Home page you can perform the following maintenance tasks on the existing entities:

- [Granting or Revoking Privileges](#)
- [Moving Entities](#)

- [Changing Entity Maturity](#)
- [Adding Notes to Entities](#)
- [Adding Attachments to Entities](#)
- [Viewing, Editing, and Deleting Entities](#)
- [Searching Entities](#)
- [Exporting Entities](#)
- [Importing Entities](#)

#### 8.8.4.1 Granting or Revoking Privileges

An Enterprise Manager user requires, at the very least, a view privilege on an entity for the entity to be visible on the Software Library Home. The owner or super administrator can choose to grant additional privileges like edit (Update notion) or manage (or full) or at a later point of time, revoke the previously granted privilege.

To grant or revoke privileges, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. To grant or revoke fine-grained privileges to the other users on any entity that you own, select the custom entity and from **Actions** menu, click **Grant/Revoke Privileges**.
3. On Grant/Revoke Privileges on: <entity\_name> window, you can either grant or revoke Software Library privileges depending on the users roles and responsibilities in the organization.

**Granting Privileges:** To grant one or more new privileges, click **+Add** and search for the users. You can grant them one of the following privileges on the entity you own:

- **View Software Library Entity:** This is normally an operator privilege where the user can only view the entity on the Software Library Home. The user cannot edit or manage the entity. All the Oracle owned entities can be viewed by all Enterprise Manager users.
- **Edit Software Library Entity:** This is a designer privilege where a user has Create, Update, and Edit privileges on the entity.
- **Manage Software Library Entity:** This is a super-administrator privilege where the user has complete access on the entity. With this privilege, you can grant or revoke accesses on this entity to other users, or delete the entity.

**Revoking Privileges:** To revoke previously granted privileges, select the user and click **Remove**.

4. Click **Update** to apply the selected grants on the entity.

#### 8.8.4.2 Moving Entities

To move all the revisions of an entity from one folder to another, do the following:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select an entity or alternately, search and select an entity.

For more information about searching for an entity, see [Section 8.8.4.7](#).

3. From the **Actions** menu, click **Move Entity** and accept the confirmation.
4. From the Move Entity dialog box, select the destination folder for the entities and click **Set New Parent Folder**.

**Note:** Ensure that the source and the destination folders are not owned by Oracle, as you cannot move or edit them.

#### 8.8.4.3 Changing Entity Maturity

When an entity is created from the Enterprise Manager Home, it is present in an Untested state. It is the responsibility of a designer to test the entity, and change the maturity level based on the test result.

To manage the lifecycle and indicate the quality (maturity level) of an entity, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select an entity or alternately, search and select an entity.

For more information about searching for an entity, see [Section 8.8.4.7](#).

3. From the **Actions** menu, click **Change Maturity** to change the maturity value an entity after testing.

For example, an Oracle Database Clone component would be tested by selecting it in a deployment procedure interview flow that provisions a database. Once the entity is tested, the designer can change the maturity of the entity to either Beta or Production based on test results. Only when the entity is marked with Production level, the Operator can use it.

#### 8.8.4.4 Adding Notes to Entities

To log information about the changes or updates made to an existing entity, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select an entity or alternately, search and select an entity.

For more information about searching for an entity, see [Section 8.8.4.7](#).

3. From **Actions** menu, click **Notes** to include any important information related to the entity. You can also add notes while editing an entity.

The most recent note appears on top of the table, and the older notes appear below.

4. After updating the details, click **Finish** to submit the changes, and return to the Software Library Home page.

#### 8.8.4.5 Adding Attachments to Entities

To add or upload files that are typically documents (like README, installation, configuration) related to the software the entity represents, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.

2. On the Software Library Home page, select an entity or alternately, search and select an entity.

For more information about searching for an entity, see [Section 8.8.4.7](#).

3. From **Actions** menu, click **Attachments** to include one or more files related to the entity. These files contain some important information about the entity. You can also attach files while editing an entity.

For example, you can attach a readme file to a patch or a component, attach a test script to a directive and so on. However, you must ensure that the file size of each attachment is not more than 2 MB.

4. Click **Finish** to submit the changes, and return to the Software Library Home page.

#### 8.8.4.6 Viewing, Editing, and Deleting Entities

To view, edit, or delete the details of an entity, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, select an entity or alternately, search and select an entity.

For more information about searching for an entity, see [Section 8.8.4.7](#).

3. To manage an existing entity, select the entity and perform any of the following functions:
  - **View:** Click **View** icon on the table to view the details of an entity. You cannot update the properties of the entity from here.
  - **Edit:** Click **Edit** icon on the table to update the properties of an entity.  
If you are satisfied with the details, click **Save and Upload** to make the changes available on the Software Library Home page.
  - **Delete:** Click **Delete** icon to remove the entity from the Software Library Home page.

**Note:** By deleting an entity, the entity is no longer available for selection, viewing, or editing, and will not be displayed on the Software Library Home page. However, the entity continues to exist in the repository and the associated files, if uploaded, continue to exist in the respective disk storage. To delete the entity completely from the repository and the associated files from the file system, you must purge the deleted entities from the administration page. The purge job not only deletes the files associated with the deleted entity, but removes the deleted entities itself from the repository tables. For more information about how to purge the deleted entities from the storage location, see [Section 8.9.4](#)

#### 8.8.4.7 Searching Entities

To search for an entity, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. To search for an entity, perform one of the following operations:

- a. **Find:** On the Software Library Home page, you can search for an entity by its **Name**, **Description**, or **Type**. Select the search category, enter the desired value and then click the arrow icon.

On clicking the arrow icon, the result page displays a number of matching results, and allows you to toggle between the result rows by clicking the up and down arrows.

- b. **Search:** To perform a detailed search for an entity, click **Search**. The search option, by default, allows you to search by **Name**, **Description**, **Maturity**, **Status**, **Type**, **File Name** and **Revision** to retrieve a more granular search result.

**Note:** If you choose entities that have associated subtypes (like Components), then the page is refreshed with **Subtype** as an additional search category.

Specify appropriate values in **All** or **Any** of the search fields, and click **Search**.

To add more search parameters, in the Advanced Search section, click **Add Fields** menu and, select the desired search fields. The selected fields appear in the Advanced Search section as new search parameters. This new search feature enables you to refine your search, and drill down to the most accurate and desired search result.

To revert to the simple search view, click **Close Search**.

#### 8.8.4.8 Exporting Entities

To export selected entities, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, from the **Actions** menu, click **Export** to export entities present in the Software Library as a Provisioning Archive (PAR) file.

The PAR file can be used for recreating the entities on an Enterprise Manager with a different repository.

3. On the Export Software Library Entities page, do the following:
  - Click **+Add** to search and select an entity.
  - In **Directory Location**, enter a directory location accessible to OMS for storing the generated PAR files.
  - In **PAR File**, enter the name of the PAR file with a `.par` extension generated during export.
  - To encrypt and securely store all the secret property values of the PAR file being exported, enter a value in the **Oracle Wallet Password** field.

**Note:** Specify the same password for importing this PAR file. For more information on importing, see [Section 8.8.4.9](#).
  - Select **Exclude Associated Files**, to exclude the files, binaries, or scripts associated with an entity, from being exported.

For example, let us consider that you have a separate test and production environment and want to import only the entities that have been tested and certified in the test environment into production. The entities exported from the test system are made available as a Provisioning Archive (PAR) file. You can now

choose to import this PAR file into the production system (which is identical to the test system) and use the tested entities.

4. Click **Submit** to submit an export job. Once the job runs successfully, the selected entities from the Software Library are exported as a PAR file.

---

**Note:** Provisioning Archive Files that were exported from any Enterprise Manager version prior to 12c can not be imported into Enterprise Manager 12c.

---

#### 8.8.4.9 Importing Entities

To import PAR (Provisioning Archive) files into the Software Library or deploy them to an OMS, perform the following steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Home page, from **Actions** menu, click **Import** to import the PAR files.
3. On the Import Software Library Entities page, specify the **PAR File** to be imported.

To import the PAR file successfully, in the **Password** field, enter the same password that was set on the PAR file to secure the secret property values during export.

For example, let us consider that you have a separate test and production environment and want to import only the entities that have been tested and certified in the test environment into production. The entities exported from the test system are made available as a Provisioning Archive (PAR) file. You can now choose to import this PAR file into the production system (which is identical to the test system) and use the tested entities.

4. If a revision of the entity being imported already exists in Software Library, then you can overwrite the existing entity with a newer revision during import by selecting **Force New Revision**.

**Note:** If a revision of the entity being imported already exists in the repository, and you do not select the Force New Revision option, then import process fails.

5. Click **Submit** to submit an import job. On successful completion of the job, the PAR files are imported into the Software Library.

---

**Note:** Provisioning Archive Files that were exported from any Enterprise Manager version prior to 12c can not be imported into Enterprise Manager 12c.

---

## 8.9 Maintaining Software Library

To maintain the health and proper functionality of the Software Library, the administrator who configured the Software Library, or the Designer who has administration access on it must perform the tasks listed here.

This section includes:

- [Periodic Maintenance Tasks](#)

- [Re-Importing Oracle Owned Entity Files](#)
- [Deleting Software Library Storage Location](#)
- [Purging Deleted Entity Files](#)
- [Backing Up Software Library](#)

### 8.9.1 Periodic Maintenance Tasks

Periodically, the Administrator must perform the following tasks for proper functioning of the Software Library:

- Refresh the Software Library regularly to compute the free and used disk space.
- Purge deleted entities to conserve disk space. To do so, see [Section 8.9.4](#).
- Check accessibility of the configured Software Library locations to ensure that they are accessible.

### 8.9.2 Re-Importing Oracle Owned Entity Files

---

---

**Note:** Re-importing metadata applies only to the Oracle owned files, which means all the entity files that ship with the Enterprise Manager product by default. The metadata of User owned entity files cannot be recovered through the Re-import functionality.

---

---

Re-Importing the metadata of Oracle owned entity files is not a periodic activity. Re-import helps to recover the metadata files in one of the following situations:

- If you delete the file system location where the metadata was imported. For example, `/scratch/swlib1/`
- If the import job submitted while creating the first upload location fails.

To re-import the metadata of Oracle owned files, do the following:

1. In Cloud Control, from **Setup** menu, select **Provisioning and Patching**, and then click **Software Library**.
2. On the Software Library Administration page, in the Upload File Location tab, from **Actions** menu, select **Re-Import Metadata** option to submit a job that re-initiates the re-import process.

### 8.9.3 Deleting Software Library Storage Location

Software Library Storage Administrators have the required privileges to delete a storage location. Before removing a storage location, you are prompted to choose an alternate location where the files will be migrated. On selecting an alternate location, a migration job is submitted, and the location is marked **Inactive**. After successful migration of the entity files to the new location, the location configuration is deleted.

---

---

**Note:** To remove a location from OMS Agent File System or Referenced Agent File System storage, you must have a view privilege on the credentials for the location being removed, and the alternate location where the files are migrated.

---

---

To delete a configured storage location, perform the following steps:

1. In Cloud Control, from **Setup** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Administration page, select the storage location, and click **Migrate and Remove**.
3. In the confirmation dialog box, click **Remove** to submit a job, which on successful completion deletes the storage entry from the table.

---

**Note:** If you have only one Upload File storage location, either OMS Shared File System or OMS Agent File System, you cannot delete this location. Only if there are more than one configured storage location, the **Migrate and Remove** option is enabled. Also, the migration works only when the same storage type is being used. For example, you cannot migrate from OMS upload location to OMS Agent upload location.

---

### 8.9.4 Purging Deleted Entity Files

To purge the deleted entities from all the configured Agent Storage locations, you can run a purge job. Starting with Enterprise Manager 12c the purge job can be scheduled. To do so follow these steps:

1. In Cloud Control, from **Setup** menu, select **Provisioning and Patching**, then select **Software Library**.
2. On the Software Library Administration page, select the storage location, and from the Actions menu select **Purge**. The following dialog box appears where you can schedule the purge job:

3. Enter all the details and click OK to submit the job, on successful completion of the job all the deleted entities are removed from the storage location.

### 8.9.5 Backing Up Software Library

For information about backing up your Software Library, see [Chapter 21](#).

# Part II

---

## Security

This section contains the following chapter:

- [Configuring Security](#)

---

## Configuring Security

This chapter describes how to configure Oracle Enterprise Manager Security. Specifically, this chapter contains the following sections:

- [About Oracle Enterprise Manager Security](#)
- [Enterprise Manager Authentication](#)
- [Enterprise Manager Authorization](#)
- [Configuring Secure Communication \(SSL\) for Cloud Control](#)
- [Accessing Managed Targets](#)
- [Cryptographic Support](#)
- [Setting Up the Auditing System for Enterprise Manager](#)
- [Additional Security Considerations](#)

### 9.1 About Oracle Enterprise Manager Security

Oracle Enterprise Manager provides tools and procedures to help you ensure that you are managing your Oracle environment in a secure manner. The goals of Oracle Enterprise Manager security are:

- To ensure that only users with the proper privileges have access to critical monitoring and administrative data.

This goal is met by requiring username and password credentials before users can access the Enterprise Manager consoles and appropriate privileges for accessing the critical data.

- To ensure that all data transferred between Enterprise Manager components is transferred in a secure manner and that all data gathered by each Oracle Management Agent can be transferred only to the Oracle Management Service for which the Management Agent is configured.

This goal is met by enabling Enterprise Manager Framework Security. Enterprise Manager Framework Security automates the process of securing the Enterprise Manager components installed and configured on your network.

- To ensure that sensitive data such as credentials used to access target servers are protected.

This goal is met by Enterprise Manager's encryption support. The sensitive data is encrypted with an **emkey**. By following the best practice, even the repository owner and the SYSDBA will not be able to access the sensitive data.

- To ensure that access to managed targets is controlled through user authentication and privilege delegation.

This goal is met by configuring the Management Agent with PAM and LDAP for user authentication and using privilege delegation tools like Sudo and PowerBroker.

## 9.2 Enterprise Manager Authentication

Enterprise Manager authentication is the process of determining the validity of the user accessing Enterprise Manager. The authentication feature is available across the different interfaces such as Enterprise Manager console and Enterprise Manager Command Line Interface (EM CLI).

Enterprise Manager's authentication framework consists of pluggable authentication schemes that let you use the type of authentication protocol best suited to your environment.

---

---

**Note:** Oracle Enterprise Manager 12c relies on the WebLogic Server for external Authentication methods. For this reason, Enterprise Manager 12c can be authenticated using any authentication method supported by Oracle WebLogic Server.

---

---

The following authentication schemes are available:

- **Oracle Access Manager (OAM) SSO** - Oracle Access Manager is the Oracle Fusion Middleware single sign-on solution. The underlying identity stores will be the Enterprise Directory Identity Stores being supported by Oracle Access Manager. For more information about OAM, see *Oracle® Fusion Middleware Administrator's Guide for Oracle Access Manager 12c Release 1 (11.1.1)*.
- **Repository-Based Authentication:** This is the default authentication option. An Enterprise Manager administrator is also a repository (database) user. By using this option, you can take advantage of all the benefits that this authentication method provides like password control via password profile, enforced password complexity, password life time, and number of failed attempts allowed. During the password grace period, the administrator is prompted to change the password but when the password has expired, it must be changed. For more details, refer to [Section 9.2.1, "Repository-Based Authentication"](#).
- **SSO-Based Authentication:** The single sign-on based authentication provides strengthened and centralized user identity management across the enterprise. After you have configured Enterprise Manager to use the Oracle Application Server Single Sign-On, you can register any single sign-on user as an Enterprise Manager administrator. You can then enter your single sign-on credentials to access the Oracle Enterprise Manager console. For more details, refer to [Section 9.2.3, "Single Sign-On Based Authentication"](#).
- **Enterprise User Security Based Authentication:** The Enterprise User Security (EUS) option enables you to create and store enterprise users and roles for the Oracle database in an LDAP-compliant directory server. Once the repository is configured with EUS, you can configure Enterprise Manager to use EUS as its authentication mechanism as described in [Section 9.2.4, "Enterprise User Security Based Authentication"](#). You can register any EUS user as an Enterprise Manager administrator.

EUS helps centralize the administration of users and roles across multiple databases. If the managed databases are configured with EUS, the process of logging into these databases is simplified. When you drill down to a managed database, Enterprise Manager will attempt to connect to the database using Enterprise Manager credentials. If successful, Enterprise Manager will directly connect you to the database without displaying a logon page.

- **LDAP Authentication Options: Oracle Internet Directory and Microsoft Active Directory**
  - *Oracle Internet Directory (OID) Based Authentication* - Oracle Internet Directory is a LDAP v3 compliant directory built on the Oracle database and is fully integrated into Oracle Fusion Middleware and Oracle Applications. Thus, it is ideally suited for Oracle environments or enterprises with Oracle database expertise. When using an authentication scheme based on Oracle Internet Directory as the identity store, you can have your applications authenticate users against the OID.
  - *Microsoft Active Directory Based Authentication* - Microsoft Active Directory is a directory service that provides authentication and authorization functionality in a Windows network. When using a Microsoft Active Directory as an identity store, you can plug in this scheme to have your applications authenticate users against the Microsoft Active Directory.

## 9.2.1 Repository-Based Authentication

Enterprise Manager allows you to create and manage new administrator accounts. Each administrator account includes its own logon credentials as well as a set of roles and privileges that are assigned to the account. You can also assign a password profile to the administrator. To create, edit, or view an administrator account:

1. From the **Setup** menu, select **Security**, then select **Administrators**.
2. Click the appropriate task button on the Administrators page. The following screen is displayed:

**Figure 9–1 Create / Edit Administrator**

The screenshot displays the 'Create Administrator: Properties' form in Oracle Enterprise Manager. The form includes the following elements:

- Navigation:** 'Cancel', 'Step 1 of 5', 'Next', and 'Review' buttons at the top right.
- Fields:**
  - Name:** A text input field.
  - Password:** A text input field.
  - Confirm Password:** A text input field.
  - Password Profile:** A dropdown menu currently set to 'DEFAULT'. A 'View' link and 'Manage Profiles' button are next to it.
  - Prevent password change:** An unchecked checkbox.
  - Expire password now:** An unchecked checkbox.
  - E-mail Address:** A text input field with a note: 'Specify one or more e-mail addresses separated by a comma or space. If you are entering these for the first time, they will be used to create a default 24x7 notification schedule for this Administrator.'
  - Description:** A large text area.
- Super Administrator:** An unchecked checkbox at the bottom.
- Footer:** 'Cancel', 'Step 1 of 5', 'Next', and 'Review' buttons at the bottom right.

On this page, you can specify the type of administrator account being created and select the password profile. The password cannot be changed by the administrator if the **Prevent Password Change** checkbox is selected.

If you select the **Expire Password Now** checkbox, the password for administrator account will be set to an expired state. If the password has expired, when you log in the next time, the following screen is displayed and you are prompted to change the password.

**Figure 9–2 Password Expiry Page**

ORACLE Enterprise Manager Cloud Control 12c Help

### Change Password

Your current password has expired. Please change password first.  
To change your password, specify and confirm a new password.

Administrator ADMIN2

Current Password

New Password

Confirm New Password

Enter your current password and the new password and click **Apply**. You can now start using Enterprise Manager.

## 9.2.2 Oracle Access Manager Single Sign-On

When using an Oracle Access Manager Single Sign-On authentication scheme, the underlying identity stores will consist of Enterprise Directory Identity Stores supported by Oracle Access Manager. This section provides instructions on how to configure OAM SSO-based authentication schemes.

### Prerequisites

Oracle Access Manager is installed.

The Oracle Access Manager Single Sign-On server is configured with Oracle HTTP server, Web Gate, and the Oracle Access Manager Identity Store.

1. Run the `emctl config auth` command.

```
emctl config auth oam [-sysman_pwd <pwd>] -oid_host <host> -oid_port <port>
-oid_principal <principal> [-oid_credential <credential>]
-user_base_dn <dn> -group_base_dn <dn>
-oam_host <host> -oam_port <port> [-logout_url <url>] [-is_oam10g] [-user_dn
<dn>] [-group_dn <dn>]
```

Note: Pass `-is_oam10g` option only if the OAM version is 10g.

2. Stop each OMS.

```
emctl stop oms -all
```

3. Restart each OMS.

```
emctl start oms
```

## 9.2.3 Single Sign-On Based Authentication

If you are currently using Oracle Application Server Single Sign-On to control access and authorization for your enterprise, you can extend those capabilities to the Enterprise Manager console.

By default, Enterprise Manager displays the main logon page. However, you can configure Enterprise Manager so it uses Oracle Application Server Single Sign-On to authenticate your Enterprise Manager users. Instead of seeing the Enterprise Manager logon page, users will see the standard Oracle Application Server Single Sign-On logon page. From the logon page, administrators can use their Oracle Application Server Single Sign-On credentials to access the Oracle Enterprise Manager 12c Cloud Control console.

---

### Note:

- You can configure Enterprise Manager to use one of the default Oracle Application Server Single Sign-On or Enterprise User Security features, but not multiple.
  - When Enterprise Manager is configured to use Single Sign-On with Server Load Balancer, make sure that the correct monitoring settings have been defined. For details, refer to the chapter on *Cloud Control Common Configurations*.
- 

The following sections describe how to configure Enterprise Manager as an OracleAS Single Sign-On Partner Application:

- [Registering Enterprise Manager as a Partner Application](#)
- [Removing Single Sign-On Configuration](#)
- [Registering Single Sign-On Users as Enterprise Manager Administrators](#)
- [Bypassing the Single Sign-On Logon Page](#)

### 9.2.3.1 Registering Enterprise Manager as a Partner Application

To register Enterprise Manager as a partner application manually, follow these steps:

1. Stop all OMSs by running `emctl stop oms` on each OMS.
2. Enter the following URL to navigate to the SSO Administration page.  
`https://sso_host:sso_port/pls/orasso`
3. Log in as `orcladmin` user and click on **SSO Server Administration**.
4. Click **Administer Partner Applications** and then click **Add Partner Application**.
5. Enter the following information on the Add Partner Application page.

```
Name: <EMPartnerName>
Home URL: protocol://em_host:em_port
Success URL: protocol://em_host:em_port/osso_login_success
Logout URL: protocol://em_host:em_port/osso_logout_success
Administrator Email: user@host.com
```

**Note:** `host`, `port`, and `protocol` refer to the Enterprise Manager host, port and the protocol (`http` or `https`) used.

Note2: The `em_host`, `em_port`, `email` and Enterprise Manager Partner Name must be replaced with the appropriate values and not typed as shown in this example.

6. Go back to Administer Partner Applications page and click on the **Edit** icon for `<EMPartnerName>`.

Record the values of ID, Token, Encryption Key, Login URL, Single Sign-Off URL, Home URL and write the following in a file `osso.txt`:

```
sso_server_version= v1.2
cipher_key=<value of EncryptionKey>
site_id=<value of ID>
site_token=<value of Token>
login_url=<value of Login URL>
logout_url=<value of Single Sign-Off URL>
cancel_url=<value of Home URL>
sso_timeout_cookie_name=SSO_ID_TIMEOUT
sso_timeout_cookie_key=9E231B3C1A3A808A
```

7. Set the `ORACLE_HOME` environment variable to WebTier Oracle Home location.

```
setenv ORACLE_HOME /scratch/12c/MWHome/Oracle_WT
```

Then, run the following:

```
$ORACLE_HOME/ohs/bin/iasobf <location of osso.txt> <location
of osso.conf>
```

8. Run the following command on each OMS:

```
emctl config auth sso -ossoconf <osso.conf file loc> -dasurl <DAS URL>
[ -unsecure ] [ -sysman_pwd <pwd> ] [ -domain <domain> ] -ldap_host <ldap host> -ldap_
port <ldap port> -ldap_principal <ldap principal> [ -ldap_credential <ldap
credential> ] -user_base_dn <user base DN> -group_base_dn <group base DN>
[ -logout_url <sso logout url> ]
```

where `ldap_host`, `ldap_port`, `ldap_principal` and `ldap_credential` are the details of SSO's LDAP.

The sample output for this command is shown below:

```
Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
SSO Configuration done successfully. Please restart Admin & Managed Servers.
```

9. Run the following commands on each OMS:

```
emctl stop oms -all
emctl start oms
```

### 9.2.3.2 Removing Single Sign-On Configuration

To remove the single sign-on configuration, perform the following:

1. Run the following command on each OMS:

```
emctl config auth repos [ -sysman_pwd <pwd> ]
```

Sample command output:

```
Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Configuring Repos Authentication ... Started
Configuring Repos Authentication ... Successful
```

If you have updated files like `httpd.conf` (for example, while installing WebGate), rollback them.  
 If this is a multi-OMS environment, execute this command on remaining servers.  
 After that, restart OMS(s) using: `'emctl stop oms -all'` and `'emctl start oms'`

## 2. Bounce all OMSs by issuing the following on each OMS:

```
emctl stop oms -all
emctl start oms
```

### 9.2.3.3 Registering Single Sign-On Users as Enterprise Manager Administrators

After you have configured Enterprise Manager to use the Single Sign-On logon page, you can register any Single Sign-On user as an Enterprise Manager administrator. You can register single sign-on users using:

- Enterprise Manager Graphical User Interface
- Enterprise Manager Command Line Interface

#### 9.2.3.3.1 Registering Single Sign-On Users Using the Graphical User Interface

You can use the graphical user interface to register single sign-on users by following these steps:

##### 1. Go the Enterprise Manager Console URL.

The browser is redirected to the standard Single Sign-On Logon page.

##### 2. Enter the credentials for a valid Single Sign-On user. Note: This step requires that an SSO user is already registered with Enterprise Manager.

If no SSO user is yet registered as Enterprise Manager user, you can create them using the following procedure:

1. Log in to Enterprise Manager by connecting to Managed Server (MS) directly. For example, `https://ms_host:ms_https_port/em`.

2. Log in as a Repository user.

3. From the **Setup** menu, select **Security** then select **Administrator**

4. Create SSO users.

##### 3. Log in to Enterprise Manager as a Super Administrator.

##### 4. From the **Setup** menu, select **Security**, then select **Administrators** to display the Administrators page.

Because Enterprise Manager has been configured to use Single Sign-On, the first page in the Create Administrator wizard now offers you the option of creating an administrator either as an External User or as Repository User.

##### 5. Select **External User Identity Store** and advance to the next page in the wizard.

##### 6. Enter the name and e-mail address of the External User Identity Store user, or click the flashlight icon to search for a user name in the Oracle Internet Directory.

##### 7. Use the rest of the wizard pages to define the roles, system privileges, and other characteristics of the Enterprise Manager administrator and then click **Finish**.

Enterprise Manager displays a summary page that lists the characteristics of the administrator account.

##### 8. Click **Finish** to create the new Enterprise Manager administrator.

The External User Identity Store user is now included in the list of Enterprise Manager administrators. You can now verify the account by logging out of the Cloud Control console and logging back in using the External User Identity Store user credentials on the Single Sign-On logon page.

### 9.2.3.3.2 Registering Single Sign-On Users Using EM CLI s

You can use the following EM CLI command to create Single Sign-On users:

```
emcli create_user -name=ssouser -type=EXTERNAL_USER
```

This command creates a user with the name **ssouser** who is authenticated against the single sign-on user.

| Argument                 | Description   |
|--------------------------|---|
| -name                    | Name of the administrator.  |
| -type                    | The type of user. The default value for this parameter is EM_USER. The other possible values are: <ul style="list-style-type: none"> <li>EXTERNAL_USER: Used for single-sign-on based authentication.</li> <li>DB_EXTERNAL_USER: Used for enterprise user based security authentication.</li> </ul> |
| -password                | The password for the administrator.   |
| -roles                   | The list of roles that can be granted to this administrator.  |
| -email                   | The list of email addresses for this administrator.   |
| -privilege               | The system privileges that can be granted to the administrator. This option can be specified more than once.  |
| -profile                 | The name of the database profile. This is an optional parameter. The default profile used is DEFAULT.   |
| -desc                    | The description of the user being added.  |
| -expired                 | This parameter is used to set the password to "expired" status. This is an optional parameter and is set to False by default.   |
| -prevent_change_password | When this parameter is set to True, the user cannot change the password. This is an optional parameter and is set to False by default.  |
| -input_file              | This parameter allows the administrator to provide the values for any of these arguments in an input file. The format of value is name_of_argument:file_path_with_file_name.  |

#### Example 1

```
emcli create_user
  -name="new_admin"
  -email="first.last@oracle.com;joe.shmoe@shmoeshop.com"
  -roles="public"
  -privilege="view_job;923470234ABCD FE23018494753091111"
  -privilege="view_target;<host>.com:host"
```

This example creates an Enterprise Manager administrator named `new_admin`. This administrator has two privileges: the ability to view the job with ID `923470234ABCDFE23018494753091111` and the ability to view the target `<host>.com:host`. The administrator `new_admin` is granted the PUBLIC role.

### Example 2

```
emcli create_user
  -name="User1"
  -type="EXTERNAL_USER"
  -input_file="privilege:/home/user1/priv_file"

Contents of priv_file are:
  view_target;<host>.com:host
```

This example makes `user1` which has been created externally as an Enterprise Manager user. `user1` will have view privileges on `<host>.com:host`.

### Example 3

```
emcli create_user
  -name="User1"
  -desc="This is temp hire."
  -prevent_change_password="true"
  -profile="MGMT_ADMIN_USER_PROFILE"
```

This example sets `user1` as an Enterprise Manager user with some description. The `prevent_change_password` is set to `true` to indicate that the password cannot be changed by `user1` and the `profile` is set to `MGMT_ADMIN_USER_PROFILE`.

### Example 4

```
emcli create_user
  -name="User1"
  -desc="This is temp hire."
  -expire="true"
```

This example sets `user1` as an Enterprise Manager with some description. Since the password is set to expire immediately, when the user logs in for the first time, he is prompted to change the password.

#### 9.2.3.4 Bypassing the Single Sign-On Logon Page

If the OMS is configured with SSO or OAM or some other authentication method, you may want to by-pass the Single Sign-On or OAM authentication under certain circumstances.

To bypass the SSO logon page, connect to the following URL:

1. Connect to `https://ms_host:ms_https_port/em`  
`ms_host` & `ms_https_port` are WLS-managed server's hostname & port#. These parameters can be found in the `EM_INSTANCE_HOME/emgc.properties` file. They are listed as `EM_INSTANCE_HOST` & `MS_HTTPS_PORT` in this file.
2. Log in using a repository user's credentials.

#### 9.2.3.5 Restoring the Default Authentication Method

1. Run the following command on each OMS:

```
emctl config auth repos [-sysman_pwd <pwd>]
```

**Sample command output:**

```
Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Configuring Repos Authentication ... Started
Configuring Repos Authentication ... Successful
If you have updated files like httpd.conf (for example, while installing
WebGate), rollback them.
If this is a multi-OMS environment, execute this command on remaining servers.
After that, restart OMS(s) using: 'emctl stop oms -all' and 'emctl start oms'
```

**2. Run the following commands on each OMS:**

```
emctl stop oms -all
emctl start oms
```

## 9.2.4 Enterprise User Security Based Authentication

Enterprise User Security enables you to create and store Oracle database information as directory objects in an LDAP-compliant directory server. For example, an administrator can create and store enterprise users and roles for the Oracle database in the directory, which helps centralize the administration of users and roles across multiple databases.

**See Also:** Enterprise User Security Configuration Tasks and Troubleshooting in the *Oracle Database Advanced Security Administrator's Guide*

If you currently use Enterprise User Security for all your Oracle databases, you can extend this feature to Enterprise Manager. Configuring Enterprise Manager for use with Enterprise User Security simplifies the process of logging in to database targets you are managing with the Oracle Enterprise Manager console.

To configure Enterprise Manager for use with Enterprise User Security:

1. Ensure that you have enabled Enterprise User Security for your Oracle Management Repository database, as well as the database targets you will be managing with the Cloud Control console. Refer to *Oracle Database Advanced Security Administrator's Guide* for details.
2. Using the `emctl set property` command, set the following properties:

```
oracle.sysman.emSDK.sec.DirectoryAuthenticationType=EnterpriseUser
oracle.sysman.emSDK.sec.eus.Domain=<ClientDomainName> (For
example:mydomain.com)
oracle.sysman.emSDK.sec.eus.DASHostUrl=<das_url> (For example:
oracle.sysman.emSDK.sec.eus.DASHostUrl=http://my.dashost.com:7777 )
```

For example:

```
emctl set property -name oracle.sysman.emSDK.sec.DirectoryAuthenticationType
-value EnterpriseUser
```

3. Stop the Oracle Management Service.

**See Also:** [Controlling the Oracle Management Service](#) on page 17-5

4. Start the Management Service.

The next time you use the Oracle Enterprise Manager console to drill down to a managed database, Enterprise Manager will attempt to connect to the database using Enterprise User Security. If successful, Enterprise Manager will connect you to the database without displaying a logon page. If the attempt to use Enterprise User Security fails, Enterprise Manager will prompt you for the database credentials.

### 9.2.4.1 Registering Enterprise Users as Enterprise Manager Users

After you have configured Enterprise Manager to use Enterprise Users, you can register existing enterprise users as Enterprise Manager Users and grant them the necessary privileges so that they can manage Enterprise Manager effectively.

You can register existing enterprise users by using:

- Enterprise Manager Graphic User Interface
- Enterprise Manager Command Line Interface

#### 9.2.4.1.1 Registering Enterprise Users Using the Graphical User Interface

You can use the graphical user interface to register enterprise users by following these steps:

1. Log in to Enterprise Manager as a Super Administrator.
2. From the **Setup** menu, select **Security** then select **Administrators** to display the Administrators page. Since Enterprise Manager has been configured to use Enterprise Users, the first page of the Create Administrator wizard will provide the option to create an administrator based on a registered Oracle Internet Directory user or a normal database user.
3. Select Oracle Internet Directory and click **Continue** to go to the next page in the wizard.
4. Enter the name and e-mail address of the Oracle Internet Directory user or click the flashlight icon to search for a user name in the Oracle Internet Directory.
5. Use the rest of the wizard pages to define the roles, system privileges, and other characteristics of the Enterprise Manager administrator and then click **Finish**. Enterprise Manager displays a summary page that lists the characteristics of the administrator account.
6. Click **Finish** to create the new Enterprise Manager administrator.

The OID user is now included in the list of Enterprise Manager administrators. You can now verify the account by logging out of the Cloud Control console and logging back in using the OID user credentials on the Single Sign-On logon page.

#### 9.2.4.1.2 Registering Enterprise Users Using the Command Line Interface

To register Enterprise Users as Enterprise Manager users using EM CLI, enter the following command:

```
emcli create_user -name=eususer -type=DB_EXTERNAL_USER
```

This command registers the eususer as an Enterprise Manager user where eususer is an existing Enterprise User. For more details, refer to [Registering Single Sign-On Users Using EM CLI](#).

## 9.2.5 Oracle Internet Directory (OID)

You can implement an OID-based authentication scheme to have Enterprise Manager authenticate users against the OID.

Running the `emctl config auth oid` command on the OMS creates a WebLogic authentication provider of type `OracleInternetDirectoryAuthenticator` that uses the configuration parameter values specified by the command. Any configuration values not specified retain the default values. Tuning and modification of advanced OID configuration parameters is carried out through the WebLogic Server Administration Console and not the `emctl config auth oid` command.

### Prerequisites

Oracle Internet Directory LDAP server is set up and running.

1. Run the `emctl config auth oid` command on the OMS.

```
emctl config auth oid -ldap_host <ldap host> -ldap_port <ldap port>
                    -ldap_principal <ldap principal> [-ldap_credential <ldap credential>]
[-sysman_pwd <pwd>]
                    -user_base_dn <user base DN> -group_base_dn <group base DN>
```

where:

- `ldap_host`: LDAP host name
- `ldap_port`: LDAP port
- `ldap_principal`: The distinguished name (DN) of the LDAP user the WebLogic server should use to connect to the LDAP server.
- `ldap_credential`: Password for the user specified by `ldap_principal`.
- `user_base_dn`: The base distinguished name (DN) of the tree in the LDAP directory that contains users.
- `group_base_dn` - The base distinguished name (DN) of the tree in the LDAP directory that contains groups.

### Example:

```
emctl config auth oid -ldap_host "ldaphost" -ldap_port "3060" -ldap_principal
"cn=orcladmin" -user_base_dn "cn=users,dc=us,dc=oracle,dc=com" -group_base_dn
"cn=groups,dc=us,dc=oracle,dc=com" -ldap_credential "my_ldap_password" -sysman_
pwd "my_sysman_password"
```

2. Stop the OMS.

```
emctl stop oms -all
```

3. Restart the OMS.

```
emctl start oms
```

---

---

**Note:** For Enterprise Manager deployments consisting of multiple OMS instances, `emctl config auth oid` must be run on each OMS. Each OMS must be restarted in order for changes to take effect.

---

---

### Testing the OID Configuration

Use the WebLogic Server Administration Console (**Users and Groups** tab) to check whether the OID configuration has been successful. To navigate to this tab, select **Home/Summary of Security Realms/myrealm/Users and Groups**. From the **Users and Groups** tab, you should see users and groups showing up from the OID.

## 9.2.6 Microsoft Active Directory Based Authentication

Enterprise Manager uses the authentication capabilities provided by the Oracle WebLogic Server that is part of the OMS. If you are using Microsoft Active Directory as an identity store, you will need to configure it with the Oracle WebLogic Server which is part of the OMS. The following procedure demonstrates how to set up Enterprise Manager authentication using Microsoft Active Directory.

### Prerequisites

- Ensure Enterprise Manager Cloud Control 12c is installed and configured properly and that you can log in as a user with Super Administrator privileges.
- Ensure Microsoft Active Directory is installed and configured properly.
- Obtain the following from your Microsoft Active Directory administrator. Below is an example of a simple configuration. More complex configurations can be implemented with additional knowledge of LDAP search filters.
  - Active Directory Port
  - Active Directory Principal (User created to authenticate with Active Directory for the Oracle WebLogic Server.
  - Active Directory Principal Password
  - User Base Distinguished Name (DN)
  - Group Base DN

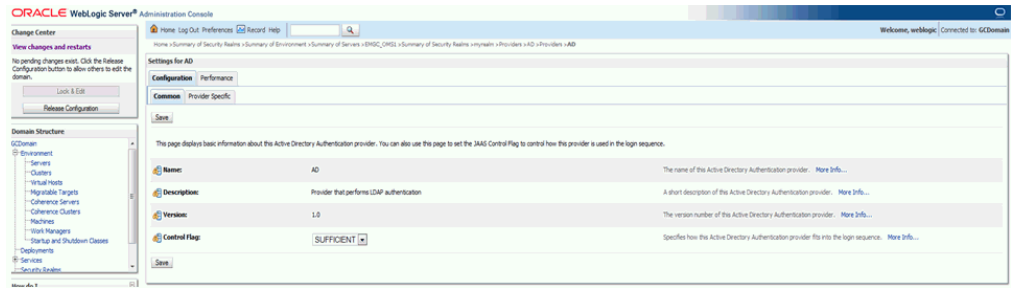

|                         |  | Example                   | Your Value             |
|-------------------------|--|---------------------------|------------------------|
| Host                    | The Active Directory host  | server.oracle.com         |                        |
| Port                    | The Active Directory Port  | 389 (LDAP) or 636 (LDAPS) |                        |
| Principal User/Password | The Principal User created in Active Directory that will be used to authenticate WebLogic Server. It must be in the Administrators group and belong to the correct Organizational Unit designated in the User base DN. Ensure the "User must change password at next logon" is not checked during setup. |                           | emgadmin/Welcom<br>e11 |

|                            | Example  | Your Value |
|----------------------------|--|------------|
| User Base DN               | The User Base Distinguished Name is the container location of valid users who will be granted access to ENTERPRISE MANAGER. Using the default Users container will allow all Active Directory Users to log in to ENTERPRISE MANAGER (though they may not have permissions to see/do anything). Using an Organizational Unit will allow you to further restrict access. |            |
| User Base Filter From Name |  |            |
| UserName Attribute:        | sAMAccountName   |            |
| User From Name Filter:     | (&(sAMAccountName=%u)(objectclass=user))   |            |

### 9.2.6.1 Configuring WebLogic Server Authentication

Use the following procedure to update

1. As the Weblogic/Enterprise Manager administrator, back up the WLS config.xml file at the following location:  
`../gc_inst/user_projects/domains/GCDomain/config/config.xml`
2. Log in to the WebLogic Administration Console as WebLogic. The WebLogic Administration Console URL can be found in the setupinfo.txt file at the following location:  
`$ORACLE_HOME/install/setupinfo.txt`
3. Under Domain Structure, click **Security Realms**.
4. Click **myrealm** and then click the **Providers** tab.
5. Click **Lock & Edit** to enable editing.
6. Click **New** to add a **Provider**.
7. Enter a **Name** for your **Provider** (for example, MS Active Directory).
8. Select **ActiveDirectoryAuthenticator** for *Type* and then click **OK**.

9. On the Providers screen, click the **New Provider** link to begin editing.
10. Set the **Control Flag** to **Sufficient** and then click **Save**.
11. Click the **Provider Specific** tab
12. In the Connection section, enter the following:

*Host:* AD Server Host

*Port:* 389 (default for LDAP, or 636 for LDAPS)

*Principal:* CN=EMGCADMIN,CN=Users,DC=Cloudcontrol,DC=local

---

**Note:** This is the User created in AD steps above and added to Administrators group. The CN/DC string must be confirmed with your Active Directory administrator.

---

*Credential:* pwd for principal

|                    |                          |  |
|--------------------|--------------------------|--|
| Host               | server.oracle.com        | The host name or IP address of the LDAP server. <a href="#">More Info...</a>   |
| Port               | 389                      | The port number on which the LDAP server is listening. <a href="#">More Info...</a>  |
| Principal          | CN=emgcadmin,OU=EA       | The distinguished name (DN) of the LDAP user that WebLogic Server should use to connect to the LDAP server. <a href="#">More Info...</a> |
| Credential         | *****                    | The credential (usually a password) used to connect to the LDAP server. <a href="#">More Info...</a>                                     |
| Confirm Credential | *****                    |  |
| SSL Enabled        | <input type="checkbox"/> | Specifies whether the SSL protocol should be used when connecting to the LDAP server. <a href="#">More Info...</a>                       |

13. In the Users section, set the **User Base DN** to the value provided by your Active Directory administrator. This is the Group or Organization Unit that will have access to Enterprise Manager. To restrict access to a specific set of users, you must use an Organization Unit.

User Base DN: cn=users,dc=Cloudcontrol,dc=local

|                   |                                   |                   |
|-------------------|-----------------------------------|-------------------|
| LDAP Control      | LDAP                              | LDAP Control      |
| LDAP Base         | OU                                | LDAP Base         |
| LDAP Scope        | Subtree                           | LDAP Scope        |
| LDAP Filter       | (cn=*)                            | LDAP Filter       |
| LDAP User Base DN | cn=users,dc=Cloudcontrol,dc=local | LDAP User Base DN |
| LDAP User Base DN | cn=users,dc=Cloudcontrol,dc=local | LDAP User Base DN |

---

**Note:** This information must be obtained from the AD Administrator.

---

14. If you want to use the Login Name instead of the Account Name (which is typically First Last) then you need to set the **User From Name Filter** and **User Name Attribute** as follows:

*User Name Attribute:* sAMAccountName

*User From Name Filter:* (&(sAMAccountName=%u)(objectclass=user))

15. In the Groups section, enter the following:

*Group Base dn:* cn=Users,dc=Cloudcontrol,dc=local

Note: This information must be obtained from the AD Administrator

16. In the General section, click **Propagate Cause For Login Exception**.

17. Click **Save**.

18. In the **Authentication Providers** section, click **Reorder** and move your new provider to the top of the list.

Authentication Providers

Click the **Lock & Edit** button in the Change Center to activate all the buttons on this page.

New Delete Reorder Showing 1 to 4 of 4 Previous Next

| <input type="checkbox"/> | Name                    | Description                                | Version |
|--------------------------|-------------------------|--|---------|
| <input type="checkbox"/> | MS Active Directory     | Provider that performs LDAP authentication | 1.0     |
| <input type="checkbox"/> | DefaultAuthenticator    | WebLogic Authentication Provider           | 1.0     |
| <input type="checkbox"/> | DefaultIdentityAsserter | WebLogic Identity Assertion provider       | 1.0     |
| <input type="checkbox"/> | EM_Repo_Authenticator   | EM Repo Authentication Provider            | 1.0     |

New Delete Reorder Showing 1 to 4 of 4 Previous Next

19. Click **Apply & Activate Changes**.

20. There are two options to provision users to Enterprise Manager. You can set a flag to auto-provision all users, or you can manually create them as external users using EM CLI.

1. To set Auto Provisioning to true, run the following:

```
$ bin/emctl set property -name "em.security.auth.autoprovisioning" -value "true"
Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
Copyright (c) 1996, 2012 Oracle Corporation. All rights reserved.
SYSMAN password:
```

The property *em.security.auth.autoprovisioning* for the OMS *server.oracle.com:4890\_Management\_Service* has been set to value true

OMS restart is required to reflect the new property value.

2. If you do not want all users created automatically, you must manually create them using the EM CLI (after restart).

```
$ bin/emcli create_user -name='TEST' -type='EXTERNAL_USER'
User "TEST" created successfully
```

21. Restart the OMS.

```
$ bin/emctl stop oms -all
$ bin/emctl start oms
```

22. The users will not show up in the Enterprise Manager Administrators UI until they have logged in once.

### 9.2.6.2 Manage Active Directory Users with External Roles

To assign a group of privileges to the LDAP users, you can create an external role with the same name as the LDAP group. Once the users are authenticated, they will inherit the permissions and privileges granted to the external role automatically.

1. Create a Group in the Active Directory and assign users to the group.
2. From the **Setup** menu, select **Security**, then select **Roles**.
3. Click **Create**.
4. Enter the name of the Active Directory group and a brief description.
5. Check the box for **External**, and then click **Next**.
6. Assign additional **Roles**, and then click **Next**.
7. Assign **target privileges**, and then click **Next**.
8. Assign **resource privileges**, and then click **Next**.
9. Review the settings and click **Finish**.

### 9.2.6.3 Password Management for Active Directory Users

Password management for Active Directory users must be handled through Active Directory. Password changes are not allowed via Enterprise Manager or WebLogic Server.

### 9.2.6.4 Remove Active Directory Users

An Active Directory user must be deleted from Enterprise Manager to remove access to Cloud Control. If the user remains in Active Directory, they should be removed from any Groups assigned privileges through External Roles to ensure they cannot log in again if auto-provisioning is enabled.

### 9.2.6.5 Remove Active Directory Authentication

Removing Active Directory authentication will remove all Active Directory user accounts from Enterprise Manager.

1. Log in to the WebLogic Server console.
2. Under **Domain Structure**, click on **Security Realms**.
3. Click **myrealm**, then click on the **Providers** tab.
4. Click **Lock & Edit** to enable editing.
5. Click the NT Authenticator provider.
6. Click **Delete**.
7. Click **Save and Activate**.
8. Restart the OMS.

## 9.3 Enterprise Manager Authorization

Giving the same level of access to all systems to all administrators is dangerous, but individually granting access to tens, hundreds, or even thousands of targets to every new member of the group is time consuming. With Enterprise Manager's administrator privileges and roles feature, this task can be performed within seconds,

instead of hours. Authorization controls the access to the secure resources managed by Enterprise Manager via system, target, and object level privileges and roles.

This section describes Enterprise Manager's Authorization model including user classes, roles, and privileges assigned to each user class. The following topics are described:

- Classes of Users
- Privileges and Roles

### 9.3.1 Authentication Scheme

An authentication scheme is the type of authentication supported by a target type. For example, a host can support a username/password-based authentication, Public Key authentication or Kerberos authentication. In fact, each target type in an enterprise may support different authentication schemes. To accommodate the many authentication schemes that can exist in a managed environment, Enterprise Manager allows you to configure the credentials for these authentication schemes as well.

### 9.3.2 Classes of Users

Oracle Enterprise Manager supports different classes of Oracle users, depending upon the environment you are managing and the context in which you are using Oracle Enterprise Manager.

The Enterprise Manager administrators you create and manage in the Cloud Control console are granted privileges and roles to log in to the Cloud Control console and to manage specific target types and to perform specific management tasks. The default super administrator for the Cloud Control Console is the SYSMAN user, which is a database user associated with the Oracle Management Repository. You define the password for the SYSMAN account during the Enterprise Manager installation procedure.

By restricting access to privileged users and providing tools to secure communications between Oracle Enterprise Manager 12c components, Enterprise Manager protects critical information in the Oracle Management Repository.

The Management Repository contains management data that Enterprise Manager uses to help you monitor the performance and availability of your entire enterprise. This data provides you with information about the types of hardware and software you have deployed, as well as the historical performance and specific characteristics of the applications, databases, applications servers, and other targets that you manage. The Management Repository also contains information about the Enterprise Manager administrators who have the privileges to access the management data.

You can create and manage Enterprise Manager administrator accounts. Each administrator account includes its own login credentials, as well as a set of roles and privileges that are assigned to the account. There are three administrator access categories:

- **Super Administrator:** Powerful Enterprise Manager administrator with full access privileges to all targets and administrator accounts within the Enterprise Manager environment. The Super Administrator, SYSMAN is created by default when Enterprise Manager is installed. The Super Administrator can create other administrator accounts.
- **Administrator:** Regular Enterprise Manager administrator.

- **Repository Owner:** Database administrator for the Management Repository. This account cannot be modified, duplicated, or deleted.

The types of management tasks that the administrator can perform and targets that he can access depends on the roles, system privileges, and target privileges that he is granted. The Super Administrator can choose to let certain administrators perform only certain management tasks, or access only certain targets, or perform certain management tasks on certain targets. In this way, the Super Administrator can divide the workload among his administrators.

### 9.3.3 Privileges and Roles

User privileges provide a basic level of security in Enterprise Manager. They are designed to control user access to data and to limit the kinds of SQL statements that users can execute. When creating a user, you grant privileges to enable the user to connect to the database, to run queries and make updates, to create schema objects, and more.

When Enterprise Manager is installed, the SYSMAN user (super administrator) is created by default. The SYSMAN Super Administrator then creates other administrator accounts for daily administration work. The SYSMAN account should only be used to perform infrequent system wide, global configuration tasks.

The Super Administrator divides workload among his administrators by filtering target access, or filtering access to management task, or both through the roles, System Privileges, and Target Privileges he grants them. For example, he can allow some administrators to view any target and to add any target in the enterprise and other administrators to only perform specific operations such as maintaining and cloning on a target for which they are responsible.

A role is a collection of Enterprise Manager resource privileges, or target privileges, or both, which you can grant to administrators or to other roles. These roles can be based upon geographic location (for example, a role for Canadian administrators to manage Canadian systems), line of business (for example, a role for administrators of the human resource systems or the sales systems), or any other model. Administrators do not want to perform the task of individually granting access to tens, hundreds, or even thousands of targets to every new member of their group.

By creating roles, an administrator needs only to assign the role that includes all the appropriate privileges to his team members instead of having to grant many individual privileges. He can divide workload among his administrators by filtering target access, or filtering access to management task, or both.

**Out-of-Box Roles:** Enterprise Manager Cloud Control 12c comes with predefined roles to manage a wide variety of resource and target types. The following table lists these roles along with their function.

**Table 9–1 Out-of-the-Box Roles**

| Roles                | Description  |
|----------------------|--|
| EM_ALL_ADMINISTRATOR | Role has privileges to perform Enterprise Manager administrative operations. It provides Full privileges on all secure resources (including targets) |
| EM_ALL_DESIGNER      | Role has privileges to design Enterprise Manager operational entities such as Monitoring Templates.  |
| EM_ALL_OPERATOR      | Role has privileges to manage Enterprise Manager operations.   |
| EM_ALL_VIEWER        | Role has privileges to view Enterprise Manager operations.   |

**Table 9–1 (Cont.) Out-of-the-Box Roles**

| <b>Roles</b>                 | <b>Description</b>  |
|------------------------------|---|
| EM_CBA_ADMIN                 | Role has privileges to manage Chargeback Objects. It provides the ability to create and view chargeback plans, chargeback consumers, assign chargeback usage, and view any CaT targets.   |
| EM_CLOUD_ADMINISTRATOR       | Enterprise Manager user for setting up and managing the infrastructure cloud. This role could be responsible for deploying the cloud infrastructure (servers, pools, zones) and infrastructure cloud operations for performance and configuration management. |
| EM_COMPLIANCE_DESIGNER       | Role has privileges for create, modify and delete compliance entities.  |
| EM_COMPLIANCE_OFFICER        | Role has privileges to view compliance framework definition and results.  |
| EM_CPA_ADMIN                 | Role to manage Consolidation Objects. It gives the capability to create and view consolidation plans, consolidation projects and view any CaT targets.  |
| EM_HOST_DISCOVERY_OPERATOR   | Role has privileges to execute host discovery   |
| EM_INFRASTRUCTURE_ADMIN      | Role has privileges to manage the Enterprise Manager infrastructure such as managing plug-in lifecycle or managing self update.   |
| EM_PATCH_ADMINISTRATOR       | Role for creating, editing, deploying, deleting and granting privileges for any patch plan.   |
| EM_PATCH_DESIGNER            | Role for creating and viewing for any patch plan  |
| EM_PATCH_OPERATOR            | Role for deploying patch plans  |
| EM_PLUGIN_AGENT_ADMIN        | Role to support plug-in lifecycle on Management Agent   |
| EM_PLUGIN_OMS_ADMIN          | Role to support plug-in lifecycle on Management Server  |
| EM_PLUGIN_USER               | Role to support view plug-in console  |
| EM_PROVISIONING_DESIGNER     | Role has privileges for provisioning designer   |
| EM_PROVISIONING_OPERATOR     | Role has privileges for provisioning operator   |
| EM_SSA_ADMINISTRATOR         | Enterprise Manager user with privilege to set up the Self Service Portal. This role can define quotas and constraints for self service users and grant them access privileges.  |
| EM_SSA_USER                  | This role grants Enterprise Manager user the privilege to access the Self Service Portal.   |
| EM_TARGET_DISCOVERY_OPERATOR | Role has privileges to execute target discovery.  |
| EM_TC_DESIGNER               | Role has privileges for creating Template Collections   |
| EM_USER                      | Role has privilege to access Enterprise Manager Application.  |
| PUBLIC                       | PUBLIC role is granted to all administrators. This role can be customized at site level to group privileges that need to be granted to all administrators.  |

**Public Role:** Enterprise Manager creates one role by default called **Public**. This role is unique in that it is automatically assigned to all new non-super administrators when they are created. By default it has no privileges assigned to it. The Public role should be used to define default privileges you expect to assign to a majority of non-super administrators you create. Privileges need not be assigned to Public initially - they can be added at any time. The role may be deleted if your enterprise does not wish to use it. If deleted, it can be added back in later if you later decide to implement it.

### 9.3.3.1 Granting Privileges

A privilege is a right to perform management actions within Enterprise Manager. Privileges can be divided into two categories:

- Target Privileges
- Resource Privileges

**Target Privileges:** These privileges allow an administrator to perform operations on a target. The Target Privileges page shows a list of targets for which privileges can be granted. Select the check box to specify the privileges that are to be granted and click **Next**.

**Table 9–2 Target Privileges Applicable to All Targets**

| Privilege Name                 | Privilege Display Name                 | Description   |
|--------------------------------|--|---|
| FULL_ANY_TARGET                | Full any Target                        | Ability to do all operations on all the targets, including delete the target  |
| PERFORM_OPERATION_AS_ANY_AGENT | Execute Command as any Agent           | Execute any OS Command as the Agent User at any Agent   |
| PUT_FILE_AS_ANY_AGENT          | Put File as any Agent                  | Put any File to any Agent's Filesystem as the Agent User  |
| PERFORM_OPERATION_ANYWHERE     | Execute Command Anywhere               | Execute any OS Command at any Agent   |
| OPERATOR_ANY_TARGET            | Operator any Target                    | Privilege to grant operator access on all targets   |
| CONNECT_ANY_VIEW_TARGET        | Connect to any viewable target         | Ability to connect and manage any of the viewable target  |
| USE_ANY_BEACON                 | Use any beacon                         | Ability to register with any Beacon   |
| EM_MONITOR                     | EM Monitor                             | Ability to view any Enterprise Manager Repository targets   |
| VIEW_ANY_TARGET                | View any Target                        | Ability to view any target  |
| GRANT_VIEW_ORACLE_VM_MANAGER   | Grant View Oracle VM Manager Privilege | Ability to grant View Oracle VM Manager privilege   |
| GRANT_VIEW_ORACLE_VM_ZONE      | Grant View Zone Privilege              | Ability to grant View Zone privilege  |
| GRANT_VIEW_ORACLE_CLOUD_ZONE   | Grant View Database Zone Privilege     | Ability to grant view privilege on Database Zone targets  |
| CREATE_PROPAGATING_GROUP       | Create Privilege Propagating Group     | Ability to create privilege propagating groups. Privileges granted on a privilege propagating group will be automatically granted on the members of the group |

**Table 9–2 (Cont.) Target Privileges Applicable to All Targets**

| Privilege Name | Privilege Display Name | Description                |
|----------------|------------------------|----------------------------|
| CREATE_TARGET  | Create Target          | Ability to create a target |

**Table 9–3 Target Privileges Applicable to Specific Targets**

| Privilege Name             | Privilege Display Name                | Description   |
|----------------------------|---------------------------------------|---|
| GROUP_ADMINISTRATION       | Group Administration                  | Ability to administer groups  |
| FULL_TARGET                | Full Target                           | Ability to do all operations on the target, including delete the target   |
| FMW_DEPLOY_APP_TARGET      | Deploy Fusion Middleware              | Ability to deploy Fusion Middleware components  |
| CONNECT_READONLY_TARGET    | Connect Target Read-only              | Ability to connect to target in read-only mode  |
| CONNECT_TARGET             | Connect Target                        | Ability to connect and manage target  |
| MANAGE_TARGET_COMPLIANCE   | Manage Target Compliance              | Ability to manage compliance of the target  |
| PERFORM_OPERATION_AS_AGENT | Execute Command as Agent              | Execute any OS Command as the Agent User  |
| PUT_FILE_AS_AGENT          | Put File as Agent                     | Put any File to the Agent's Filesystem as the Agent User  |
| MANAGE_TARGET_ALERTS       | Manage Target Events                  | Ability to clear events, re-evaluate metric alert events, create incidents, add events to incidents, and define what actions the administrator can perform on individual incidents, such as acknowledgment or escalation. |
| PERFORM_OPERATION          | Execute Command                       | Execute any OS Command  |
| CONFIGURE_TARGET           | Configure target                      | Ability to edit target properties and modify monitoring configuration   |
| MANAGE_TARGET_PATCH        | Manage Target Patch                   | Privilege to Analyze, Apply and Rollback patches on the target  |
| MANAGE_TC_OPERATION        | Manage Template Collection Operations | Ability to associate a template collection to a administration group and Sync targets with the associated template collections.   |
| MANAGE_TARGET_METRICS      | Manage Target Metrics                 | Ability to edit threshold for metric and policy setting, apply monitoring templates, and manage User Defined Metrics  |
| BLACKOUT_TARGET            | Blackout Target                       | Ability to create, edit, schedule and stop a blackout on the target   |
| OPERATOR_TARGET            | Operator Target                       | Ability to do normal administrative operations on the target, such as configure a blackout and edit the target properties   |

**Table 9–3 (Cont.) Target Privileges Applicable to Specific Targets**

| Privilege Name             | Privilege Display Name            | Description  |
|----------------------------|-----------------------------------|--|
| FMW_OPERATOR_PRIV          | Operator Fusion Middleware        | "Ability to perform operations, such as start and shutdown and view logs for Fusion Middleware targets |
| FMW_PROCESS_CONTROL_TARGET | Process Control Fusion Middleware | Ability to start or shutdown Fusion Middleware target  |
| FMW_VIEW_LOG_DATA_TARGET   | View Fusion Middleware logs       | Ability to view Fusion Middleware diagnostics data   |
| VIEW_ORACLE_CLOUD_ZONE     | View Database Zone                | Ability to view Database Zone  |
| VIEW_ORACLE_VM_MANAGER     | View Oracle VM Manager            | Ability to view Oracle VM Manager  |
| VIEW_ORACLE_VM_ZONE        | View Oracle VM Zone               | Ability to view Oracle VM Zone   |
| VIEW_TARGET                | View Target                       | Ability to view properties, inventory and monitor information about a target                           |

**Resource:** These privileges allow a user to perform operations against specific types of resources. To set Resource Privileges, from the **Setup** menu, choose **Administrators**. Select an administrator from the list and click **Edit**. The Edit Administrator wizard is displayed. Click **Next** to navigate through the wizard to see the System Privileges page. The following table lists all available resource privileges.

| Resource Type        | Display Name                     | Description   | Privileges Required to Grant |
|----------------------|----------------------------------|---|------------------------------|
| ACCESS               | Access Enterprise Manager        | Ability to access Enterprise Manager interfaces                             | ACCESS                       |
| AD4J                 | JVM Diagnostics User             | Gives capability to view the JVM Diagnostic data                            | SUPER_USER                   |
| AD4J                 | JVM Diagnostics Administrator    | Gives capability to manage all JVM Diagnostic Administrative operations     | SUPER_USER                   |
| ASREPLAY_ENTITY_MGMT | Application Replay Operator      | View, create, and edit any Application Replay entity.                       | SUPER_USER                   |
| ASREPLAY_ENTITY_MGMT | Application Replay Viewer        | View any Application Replay entity.   | SUPER_USER                   |
| BTM                  | Request Monitoring User          | Gives capability to view the Request Monitoring Data                        | SUPER_USER                   |
| BTM                  | Request Monitoring Administrator | Gives capability to manage all Request Monitoring Administrative Operations | SUPER_USER                   |

| Resource Type                | Display Name                                   | Description  | Privileges Required to Grant |
|------------------------------|--|--|------------------------------|
| CA                           | Full Corrective Action                         | Internal privilege, not for granting   |                              |
| CA                           | View Corrective Action                         | Internal privilege, not for granting   | VIEW                         |
| CCS_SECURE_CLASS             | Manage custom configurations owned by any user | Ability to create new and edit/delete Custom Configuration specification owned by any user                         |                              |
| CCS_SECURE_CLASS             | Manage custom configurations owned by the user | Ability to create new and edit/delete Custom Configuration specification owned by the user                         |                              |
| CHANGE_PLAN                  | Manage change plans                            | Create and delete Change Manager Change Plans  | FULL                         |
| CHANGE_PLAN                  | Edit change plan                               | Edit a Change Manager Change Plan  | EDIT                         |
| CHANGE_PLAN                  | View change plan                               | View a Change Manager Change Plan  | VIEW                         |
| CHARGEBACK_AND_CONSOLIDATION | Manage Chargeback Plans                        | Ability to Create and Modify Chargeback Plans.   | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | Manage Any Consolidation Plan                  | Ability to Manage any Consolidation Plans.   | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | View Chargeback and Consolidation Target       | Ability to View Chargeback and Consolidation Target.   | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | View Any Chargeback and Consolidation Target   | Ability to View Any Chargeback and Consolidation Target.   | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | Manage Chargeback and Consolidation Target     | Ability to Manage a Chargeback and Consolidation Target.   | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | Manage Any Chargeback and Consolidation Target | Ability to Add/Delete Target to Chargeback and Assign Chargeplan to Target or Add Target to Consolidation Project. | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | Setup Chargeback and Consolidation             | Ability to Setup CAT.  | SUPER_USER                   |
| CHARGEBACK_AND_CONSOLIDATION | View Any Chargeback Consumers                  | Ability to View Any Chargeback Consumers.  | SUPER_USER                   |

| Resource Type                        | Display Name                     | Description   | Privileges Required to Grant |
|--------------------------------------|----------------------------------|---|------------------------------|
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | Manage Chargeback Consumers      | Ability to Create and Modify Chargeback Consumers.        | SUPER_USER                   |
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | Assign Chargeback Usage          | Ability to Assign Chargeback Usage to Consumers.          | SUPER_USER                   |
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | Assign Chargeback Plan           | Ability to Assign Chargeback Plan to CAT Targets.         | SUPER_USER                   |
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | View Any Chargeback Plan         | Ability to view all the Chargeback Plans.                 | SUPER_USER                   |
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | View Any Consolidation Plan      | Ability to view the Consolidation Plans.                  | SUPER_USER                   |
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | View Any Consolidation Project   | Ability to View any Consolidation Project.                | SUPER_USER                   |
| CHARGEBACK_<br>AND_<br>CONSOLIDATION | Manage Any Consolidation Project | Ability to Manage any Consolidation Project.              | SUPER_USER                   |
| CLOUDPOLICY                          | Full Policy                      | Privilege required to View, Modify, Delete a Policy       | FULL                         |
| CLOUDPOLICY                          | Modify Policy                    | Ability to Modify a Policy                                | EDIT                         |
| CLOUDPOLICY                          | View Policy                      | Ability to View a Policy                                  | VIEW                         |
| CLOUDPOLICY                          | View any Policy                  | Ability to View any Policy                                | VIEW                         |
| CLOUDPOLICY                          | Create any Policy                | Ability to Create any Policy                              | CREATE                       |
| CLOUDPOLICYGRO<br>UP                 | Full Policy Group                | Privilege required to View, Modify, Delete a Policy Group | FULL                         |
| CLOUDPOLICYGRO<br>UP                 | Modify Policy Group              | Ability to Modify a Policy Group                          | EDIT                         |
| CLOUDPOLICYGRO<br>UP                 | View Policy Group                | Ability to View a Policy Group                            | VIEW                         |
| CLOUDPOLICYGRO<br>UP                 | View any Policy Group            | Ability to View any Policy Group                          | VIEW                         |
| CLOUDPOLICYGRO<br>UP                 | Create Policy Group              | Ability to Create Policy Group                            | CREATE                       |
| COMPLIANCE_<br>FWK                   | Create Compliance Entity         | Ability to create compliance framework, standard, rules   | CREATE                       |

| Resource Type     | Display Name  | Description   | Privileges Required to Grant |
|-------------------|---|---|------------------------------|
| COMPLIANCE_FWK    | Full any Compliance Entity                          | Ability to edit/delete compliance framework, standard, rules  | FULL                         |
| COMPLIANCE_FWK    | View any Compliance Framework                       | Ability to view compliance framework definition and results   | VIEW                         |

| TEMPLATECOLLECTION | View Template Collection       | Ability to view Template Collection   | VIEW                         |
| TEMPLATECOLLECTION | View any Template Collection   | Ability to view any Template Collection   | VIEW                         |
| TEMPLATECOLLECTION | Create any Template Collection | Ability to create any Template Collection   | CREATE                       |

Select the check box to select the resource privilege to be granted to the administrator and click **Next**.

## 9.4 Configuring Secure Communication (SSL) for Cloud Control

This section contains the following topics:

- [About Enterprise Manager Framework Security](#)
- [Enabling Security for the Oracle Management Service](#)
- [Securing the Oracle Management Agent](#)
- [Enabling Security with Multiple Management Service Installations](#)
- [Restricting HTTP Access to the Management Service](#)
- [Managing Agent Registration Passwords](#)
- [Configuring the OMS with Server Load Balance](#)
- [Enabling Security for the Management Repository Database](#)

### 9.4.1 About Enterprise Manager Framework Security

Enterprise Manager Framework Security provides safe and secure communication channels between the components of Enterprise Manager. For example, Framework Security provides secure connections between your Oracle Management Service and its Management Agents.

**See Also:** *Oracle Enterprise Manager Concepts* for an overview of Enterprise Manager components

Enterprise Manager Framework Security implements the following types of secure connections between the Enterprise Manager components:

- HTTPS and Public Key Infrastructure (PKI) components, including signed digital certificates, for communications between the Management Service and the Management Agents.

**See Also:** *Oracle Security Overview* for an overview of Public Key Infrastructure features, such as digital certificates and public keys

- Oracle Advanced Security for communications between the Management Service and the Management Repository.

**See Also:** *Oracle Database Advanced Security Administrator's Guide*

## 9.4.2 Enabling Security for the Oracle Management Service

To enable Enterprise Manager Framework Security for the Management Service, you use the `emctl secure oms` utility, which is located in the following subdirectory of the Management Service home directory:

```
ORACLE_HOME/bin
```

The `emctl secure oms` utility performs the following actions:

- Generates a Root Key within your Management Repository. The Root Key is used during distribution of Oracle Wallets containing unique digital certificates for your Management Agents.
- Modifies your WebTier to enable an HTTPS channel between your Management Service and Management Agents, independent from any existing HTTPS configuration that may be present in your WebTier.
- Enables your Management Service to accept requests from Management Agents using Enterprise Manager Framework Security.

To run the `emctl secure oms` utility you must first choose an Agent Registration Password. The Agent Registration password is used to validate that future installation of Oracle Management Agents are authorized to load their data into this Enterprise Manager installation.

To enable Enterprise Manager Framework Security for the Oracle Management Service:

1. Stop the Management Service, the WebTier, and the other application server components using the following command:

```
OMS_ORACLE_HOME/bin/emctl stop oms
```

2. Enter the following command:

```
OMS_ORACLE_HOME/bin/emctl secure oms
```

3. You will be prompted for the Enterprise Manager Root Password. Enter the SYSMAN password.
4. You will be prompted for the Agent Registration Password, which is the password required for any Management Agent attempting to secure with the Management Service. Specify an Agent Registration Password for the Management Service.
5. Restart the OMS.

6. After the Management Service restarts, test the secure connection to the Management Service by browsing to the following secure URL using the HTTPS protocol:

`https://hostname.domain:https_console_port/em`

Note: The Enterprise Manager console URL can be found by running the "emctl status oms -details" command.

For example:

`https://mgmthost1.acme.com:7799/em`

If the Management Service security has been enabled, your browser displays the Enterprise Manager Logon page.

#### **Example 9-1 Sample Output of the emctl secure oms Command**

```
emctl secure oms
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Securing OMS... Started.
Securing OMS... Successful
```

#### **Example 9-2 Usage of the emctl secure oms Command (II)**

```
emctl secure oms [-sysman_pwd <sysman password>] [-reg_pwd <registration
password>] [-host <hostname>] [-slb_port <slb port>] [-slb_console_port <slb
console port>] [-reset] [-console] [-lock] [-lock_console] [-secure_port <secure_
port>] [-upload_http_port <upload_http_port>] [-root_dc <root_dc>] [-root_country
<root_country>] [-root_email <root_email>] [-root_state <root_state>] [-root_loc
<root_loc>] [-root_org <root_org>] [-root_unit <root_unit>] [-wallet <wallet_loc>
-trust_certs_loc <certs_loc>] [-key_strength <strength>] [-cert_validity
<validity>] [-protocol <protocol>] [-force_newca] [-ms_hostname <Managed Server
hostname>] [-sign_alg <md5|sha1|sha256|sha384|sha512>]
```

Valid values for <protocol> are the allowed values for Apache's SSLProtocol directive

The parameters are explained below:

- `sysman_pwd` - Oracle Management Repository user password.
- `reg_pwd` - The Management Agent registration password.
- `host` - The host name to be used in the certificate used by the Oracle Management Service. You may need to use the SLB host name if there is an SLB before the Management Service.
- `reset` - A new certificate authority will be created. All the Agents and Oracle Management Services need to be resecured.
- `secure_port` - Specify this to change HTTPS Upload port on WebTier
- `upload_http_port` - Specify this to change HTTP Upload port on WebTier
- `slb_port` - This parameter is required when Server Load Balancer is used. It specifies the secure upload port configured in the Server Load Balancer.
- `slb_console_port` - This parameter is required when Server Load Balancer is used. It specifies the secure console port configured in the Server Load Balancer.
- `root_dc` - The domain component used in the root certificate. The default value is com.

- `root_country` - The country to be used in the root certificate. The default value is US.
- `root_state` - The state to be used in the root certificate. The default value is CA.
- `root_loc` - The location to be used in the root certificate. The default value is EnterpriseManager on <hostname>.
- `root_org` - The organization name to be used in the root certificate. The default value is EnterpriseManager on <hostname>.
- `root_unit` - The organizational unit to be used in the root certificate. The default value is EnterpriseManager on <hostname>.
- `root_email` - The email address to be used in the root certificate. The default value is EnterpriseManager@<hostname>.
- `wallet`: This is the location of the wallet containing the third party certificate. This parameter should be specified while configuring third party certificates.
- `trust_certs_loc` - The location of the `trusted_certs.txt` (required when third party certificates are used).
- `key_strength`: The strength of the key to be used. Valid values are 512, 1024, 2048, and 4096.
- `cert_validity`: The number of days for which the self-signed certificate is valid. The valid range is between 1 to 3650.
- `protocol`: This parameter is used to configure Oracle Management Service in TLSv1-only or SSLv3-only or mixed mode (default). Valid values are the allowed values as per **Apache's SSLProtocol** directive.

---

**Note:** The `key_strength` and `cert_validity` parameters are applicable only when the `-wallet` option is not used.

---

- `force_newca` - If specified, any Agents that are still configured with an older Certificate Authority are ignored.
- `ms_hostname` - Managed Server's hostname.
- `sign_alg` - Signature algorithm.
- `lock`: Locks the Upload
- `lock_console`: Locks the Console
- `console`: If specified, certificate is re-created for HTTPS console port as well

#### 9.4.2.1 Creating a New Certificate Authority

You may need to create a new Certificate Authority (CA) if the current CA is expiring or if you want to change the key strength. A unique identifier is assigned to each CA. For instance, the CA created during installation may have an identifier as ID 1, subsequent CAs will have the IDs 2,3, and so on. At any given time, the last created CA is active and issues certificates for OMSs and Agents.

##### **Example 9-3** Creating a New Certificate Authority

```
emctl secure createca [-sysman_pwd <pwd>] [-host <hostname>] [-key_
strength<strength>] [-cert_validity <validity>] [-root_dc <root_dc>] [-root_
country <root_country>] [-root_email <root_email>] [-root_state <root_state>]
[-root_loc <root_loc>] [-root_org <root_org>] [-root_unit <root_unit>]
```

```

Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Creating CA... Started.
Successfully created CA with ID 2

```

#### **Example 9-4 Viewing Information about a Certificate Authority**

```

emcli get_ca_info -ca_id="1;2" -details
Info about CA with ID: 1
CA is not configured
DN: CN=myhost.example.com, C=US
Serial# : 3423643907115516586
Valid From: Tue Mar 16 11:06:20 PDT 2011
Valid Till: Sat Mar 14 11:06:20 PDT 2020
Number of Agents registered with CA ID 1 is 1
myhost.mydomain.com:3872

Info about CA with ID: 2
CA is configured
DN: CN=myhost.example.com, C=US, ST=CA
Serial# : 1182646629511862286
Valid From: Fri Mar 19 05:17:15 PDT 2011
Valid Till: Tue Mar 17 05:17:15 PDT 2020
There are no Agents registered with CA ID 2

```

The WebLogic Administrator and Node Manager passwords are stored in the Administration Credentials Wallet. This is present in the `EM_INSTANCE_HOME/sysman/config/adminCredsWallet` directory. To recreate Administrator Credentials wallet, run the following command on each machine on which the Management Service is running:

```

emctl secure create_admin_creds_wallet [-admin_pwd <pwd>]
[-nodemgr_pwd <pwd>]

```

#### **9.4.2.2 Viewing the Security Status and OMS Port Information**

To view the security status and OMS port information, use the following command

##### **Example 9-5 `emctl status oms -details`**

```

> emctl status oms -details
Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Enter Enterprise Manager Root (SYSMAN) Password : *****
Console Server Host : omshost1.example.com
HTTP Console Port : 7802
HTTPS Console Port : 5416
HTTP Upload Port : 7654
HTTPS Upload Port : 4473
OMS is not configured with SLB or virtual hostname
Agent Upload is locked.
OMS Console is locked.
Active CA ID: 1
Console URL: https://omshost1.example.com:5416/em
Upload URL: https://omshost1.example.com:4473/empbs/upload

WLS Domain Information
Domain Name : EMGC_DOMAIN
Admin Server Host: omshost1.example.com

```

Managed Server Information

Managed Server Instance Name: EMGC\_OMS1

Managed Server Instance Host: omshost1.example.com

### 9.4.2.3 Configuring Transparent Layer Security

The Oracle Management Service can be configured in the following modes:

- **TLSv1-only mode:** To configure the OMS to use only TLSv1 connections, do the following:
  1. Stop the OMS by entering the following command:

```
OMS_ORACLE_HOME/bin/emctl stop oms
```
  2. Enter the following command:

```
emctl secure oms -protocol TLSv1
```
  3. Append `-Dweblogic.security.SSL.protocolVersion=TLSv1` to `JAVA_OPTIONS` in `Domain_Home/bin/startEMServer.sh/cmd`. If this property already exists, update the value to TLSv1.
  4. Restart the OMS with the following command:

```
OMS_ORACLE_HOME/bin/emctl start oms
```
- **SSLv3 Only Mode:** To configure the OMS to use SSLv3 connections only, do the following:
  1. Stop the OMS by entering the following command:

```
OMS_ORACLE_HOME/bin/emctl stop oms
```
  2. Enter the following command:

```
emctl secure oms -protocol SSLv3
```
  3. Append `-Dweblogic.security.SSL.protocolVersion=SSL3` to `JAVA_OPTIONS` in `Domain_Home/bin/startEMServer.sh` or `startEMServer.cmd` on Windows. If this property already exists, update the value to SSL3.
  4. Restart the OMS with the following command:

```
OMS_ORACLE_HOME/bin/emctl start oms
```
- **Mixed Mode:** To configure the OMS to use both SSLv3 and TLSv1 connections, do the following:
  1. Stop the OMS by entering the following command:

```
OMS_ORACLE_HOME/bin/emctl stop oms
```
  2. Enter the following command:

```
emctl secure oms
```
  3. Append `-Dweblogic.security.SSL.protocolVersion=ALL` to `JAVA_OPTIONS` in `Domain_Home/bin/startEMServer.sh`. If this property already exists, update the value to ALL.
  4. Restart the OMS with the following command:

```
OMS_ORACLE_HOME/bin/emctl start oms
```

---

**Note:** By default, the OMS is configured to use the Mixed Mode. To configure the Management Agent in TLSv1 only mode, set `allowTLSOnly=true` in the `emd.properties` file and restart the Agent.

---

### 9.4.3 Securing the Oracle Management Agent

When you install the Management Agent on a host, you must identify the Management Service that will be used by the Management Agent. To enable Enterprise Manager Framework Security for the Management Agent, use the `emctl secure agent` utility, which is located in the following directory of the Management Agent home directory:

```
AGENT_HOME/bin (UNIX)
AGENT_HOME\bin (Windows)
```

The `emctl secure agent` utility performs the following actions:

- Obtains an Oracle Wallet from the Management Service that contains a unique digital certificate for the Management Agent. This certificate is required in order for the Management Agent to conduct SSL communication with the secure Management Service.
- Obtains an Agent Key for the Management Agent that is registered with the Management Service.
- Configures the Management Agent so it is available on your network over HTTPS and so it uses the Management Service HTTPS upload URL for all its communication with the Management Service.

To enable Enterprise Manager Framework Security for the Management Agent:

1. Ensure that your Management Service and the Management Repository are up and running.
2. Change directory to the following directory:

```
AGENT_HOME/bin (UNIX)
AGENT_HOME\bin (Windows)
```

3. Stop the Management Agent:

```
emctl stop agent
```

4. Enter the following command:

```
emctl secure agent (UNIX)
emctl secure agent (Windows)
```

The `emctl secure agent` utility prompts you for the Agent Registration Password, authenticates the password against the Management Service, and reconfigures the Management Agent to use Enterprise Manager Framework Security.

[Example 9-6](#) shows sample output of the `emctl secure agent` utility.

5. Restart the Management Agent:

```
emctl start agent
```

6. Confirm that the Management Agent is secure by checking the Management Agent home page.

---

**Note:** You can also check if the Agent Management is secure by running the `emctl status agent -secure` command, or by checking the Agent and Repository URLs in the output of the `emctl status agent` command.

---

In the Management Agent home page, the **Secure Upload** field indicates whether or not Enterprise Manager Framework Security has been enabled for the Management Agent.

**Example 9-6 Sample Output of the `emctl secure agent` Utility**

```
emctl secure agent
Oracle Enterprise Manager 12c Release 1 Cloud Control.
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Securing agent... Started
Securing agent... Successful.
```

**Example 9-7 Sample Output of the `emctl status agent secure` Command**

```
emctl status agent -secure
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
Checking the security status of the Agent at location set in
/private/home/oracle/product/102/em/agent10g/sysman/config/emd.properties...
Done.
Agent is secure at HTTPS Port 3872.
Checking the security status of the OMS at
https://cloudcontrol.oraclecorp.com:4889/em/upload/... Done.
OMS is secure on HTTPS Port 4888
```

## 9.4.4 Enabling Security with Multiple Management Service Installations

Because you have already established at least one Agent Registration Password and a Root Key in your Management Repository, they must be used for your new Management Service. Your secure Management Agents can then operate against either Management Service.

All the registration passwords assigned to the current Management Repository are listed on the Registration Passwords page in the Oracle Enterprise Manager 12c Cloud Control Console.

If you install a new Management Service that uses a new Management Repository, the new Management Service is considered to be a distinct enterprise. There is no way for the new Management Service to partake in the same security trust relationship as another Management Service that uses a different Management Repository. Secure Management Agents of one Management Service will not be able to operate against the other Management Service.

## 9.4.5 Restricting HTTP Access to the Management Service

---

**Note:** The Oracle Management Service is locked (both console & upload) by default beginning with Enterprise Manager 12c.

---

It is important that only secure Management Agent installations that use the Management Service HTTPS channel are able to upload data to your Management Repository and Cloud Control console is accessible via HTTPS only.

To restrict access so Management Agents can upload data to the Management Service only over HTTPS:

1. Stop the Management Service, the WebTier, and the other application server components:

```
cd ORACLE_HOME/opmn/bin
emctl stop oms
```

2. Change directory to the following location in the Management Service home:

```
ORACLE_HOME/bin
```

3. Enter the following command to prevent Management Agents from uploading data to the Management Service over HTTP:

```
emctl secure lock -upload
```

To lock the console and prevent HTTP access to the console, enter the following command:

```
emctl secure lock -console
```

To lock both, enter either of the following commands:

```
emctl secure lock or
emctl secure lock -upload -console
```

To lock both the console access and uploads from Agents while enabling security on the Management Service, enter the following command:

```
emctl secure oms -lock [other options]
```

4. Restart the Management Service, the WebTier, and the other application server components:

```
cd ORACLE_HOME/bin
emctl start oms
```

5. Verify that you cannot access the OMS upload URL using the HTTP protocol:

For example, navigate to the following URL:

```
http://hostname.domain:4889/empbs/upload
```

You should receive an error message similar to the following:

```
Forbidden
You are not authorised to access this resource on the server.
```

6. Verify that you can access the Management Agent Upload URL using the HTTPS protocol:

For example, navigate to the following URL:

```
https://hostname.domain:4888/empbs/upload
```

You should receive the following message, which confirms the secure upload port is available to secure Management Agents:

```
Http XML File receiver
Http Recceiver Servlet active!
```

To allow the Management Service to accept uploads from unsecure Management Agents, use the following command:

```
emctl secure unlock -upload
```

---

**Note:**

- The OMS need to be stopped before running 'secure unlock', and then restarted afterwards.
- To unlock the console and allow HTTP access to the console, enter the following command:

```
emctl secure unlock -console
```

- To unlock both, enter either of the following command:

```
emctl secure unlock
emctl secure unlock -console -upload
```

---

**Example 9–8 Sample Output of the *emctl secure lock* Command**

```
emctl secure lock
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
OMS Console is locked. Access the console over HTTPS ports.
Agent Upload is locked. Agents must be secure and upload over HTTPS port.
Restart OMS
```

**Example 9–9 Sample Output of the *emctl secure unlock* Command**

```
emctl secure unlock
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
OMS Console is unlocked. HTTP ports too can be used to access console.
Agent Upload is unlocked. Unsecure Agents may upload over HTTP.
Restart OMS
```

## 9.4.6 Managing Agent Registration Passwords

Enterprise Manager uses the Agent Registration password to validate that installations of Oracle Management Agents are authorized to load their data into the Oracle Management Service.

The Agent Registration password is created during installation when security is enabled for the Oracle Management Service. You can add/edit/delete registration passwords directly from the Enterprise Manager console.

---

**Note:** If you want to avoid new Agents from being registered with the OMS, delete all registration passwords.'

---

### 9.4.6.1 Using the Cloud Control Console to Manage Agent Registration Passwords

You can use the Cloud Control Console to manage your existing registration passwords or create additional registration passwords:

1. From the **Setup** menu, select **Security**, then select **Registration Passwords**.
2. Enterprise Manager displays the Registration Passwords page (Figure 9–3). The registration password you created when you ran the `emctl secure oms` command appears in the Registration Passwords table.
3. Use the Registration Passwords page to change your registration password, create additional registration passwords, or remove registration passwords associated with the current Management Repository.

**Figure 9–3 Managing Registration Passwords in the Cloud Control Console**

When you create or edit an Agent Registration Password on the Registration Passwords page, you can determine whether the password is persistent and available for multiple Management Agents or to be used only once or for a predefined period of time.

For example, if an administrator requests to install a Management Agent on a particular host, you can create a one-time-only password that the administrator can use to install and configure one Management Agent.

On the other hand, you can create a persistent password that an administrator can use for the next two weeks before it expires and the administrator must ask for a new password.

### 9.4.6.2 Using emctl to Add a New Agent Registration Password

To add a new Agent Registration Password, use the following `emctl` command on the machine on which the Management Service has been installed:

```
emctl secure setpwd [sysman pwd] [new registration pwd]
```

The `emctl secure setpwd` command requires that you provide the password of the Enterprise Manager super administrator user, `sysman`, to authorize the addition of the Agent Registration Password.

If you change the Agent Registration Password, you must communicate the new password to other Enterprise Manager administrators who need to install new Management Agents, enable Enterprise Manager Framework Security for existing Management Agents, or install additional Management Services.

As with other security passwords, you should change the Agent Registration Password on a regular and frequent basis to prevent it from becoming too widespread.

### 9.4.7 Configuring the OMS with Server Load Balance

When you deploy a Management Service that is available behind a Server Load Balancer (SLB), special attention must be given to the DNS host name over which the Management Service will be available. Although the Management Service may run on a particular local host, for example `myhost.mycompany.com`, your Management Agents will access the Management Service using the host name that has been assigned to the Server Load Balancer. For example, `oracleoms.mycompany.com`.

As a result, when you enable Enterprise Manager Framework Security for the Management Service, it is important to ensure that the Server Load Balancer host name is embedded into the Certificate that the Management Service uses for SSL communications. To do so, enter the following commands:

This may be done by using `emctl secure oms` and specifying the host name in the with an extra `-host` parameter as follows:

- Enable security on the Management Service by entering the following command:

```
emctl secure oms -host <slb_hostname> [-slb_console_port <slb
UI port>] [-slb_port <slb upload port>] [other params]
```

Run this command on each OMS. You will need to restart each OMS after running the 'emctl secure oms' command.

- Create virtual servers and pools on the Server Load Balancer.
- Verify that the console can be accessed using the following URL:

```
https://slbhost:slb_console_port/em
```

- Re-secure the Agents with Server Load Balancer by using the following command:

```
emctl secure agent -emdWalletSrcUrl <SLB Upload or UI URL>
```

For example:

```
Agent_Home/bin/emctl secure agent -emdWalletSrcUrl
https://slbhost:slb_upload_port/em
```

### 9.4.8 Enabling Security for the Management Repository Database

This section describes how to enable Security for the Oracle Management Repository. This section includes the following topics:

- [About Oracle Advanced Security and the sqlnet.ora Configuration File](#)
- [Configuring the Management Service to Connect to a Secure Management Repository Database](#)
- [Enabling Oracle Advanced Security for the Management Repository](#)
- [Enabling Security for a Management Agent Monitoring a Secure Management Repository or Database](#)

### 9.4.8.1 About Oracle Advanced Security and the sqlnet.ora Configuration File

You enable security for the Management Repository by using Oracle Advanced Security. Oracle Advanced Security ensures the security of data transferred to and from an Oracle database.

**See Also:** *Oracle Database Advanced Security Administrator's Guide*

To enable Oracle Advanced Security for the Management Repository database, you must make modifications to the `sqlnet.ora` configuration file. The `sqlnet.ora` configuration file is used to define various database connection properties, including Oracle Advanced Security parameters.

The `sqlnet.ora` file is located in the following subdirectory of the Database home:

`ORACLE_HOME/network/admin`

After you have enabled Security for the Management Repository and the Management Services that communicate with the Management Repository, you must also configure Oracle Advanced Security for the Management Agent by modifying the `sqlnet.ora` configuration file in the Management Agent home directory.

**See Also:** ["Enabling Security for a Management Agent Monitoring a Secure Management Repository or Database"](#)

It is important that both the Management Service and the Management Repository are configured to use Oracle Advanced Security. Otherwise, errors will occur when the Management Service attempts to connect to the Management Repository. For example, the Management Service might receive the following error:

ORA-12645: Parameter does not exist

To correct this problem, be sure both the Management Service and the Management Repository are configured as described in the following sections.

---

---

**Note:** The procedures in this section describe how to manually modify the `sqlnet.ora` configuration file to enable Oracle Advanced Security. Alternatively, you can make these modifications using the administration tools described in the *Oracle Database Advanced Security Administrator's Guide*.

---

---

### 9.4.8.2 Configuring the Management Service to Connect to a Secure Management Repository Database

If you have enabled Oracle Advanced Security for the Management Service database—or if you plan to enable Oracle Advanced Security for the Management Repository database—use the following procedure to enable Oracle Advanced Security for the Management Service:

1. Stop the Management Service:

`ORACLE_HOME/bin/emctl stop oms`

2. Set Enterprise Manager operational properties by using the `emctl set property` command.

3. Restart the Management Service.

`ORACLE_HOME/bin/emctl start oms`

**Table 9–4 Oracle Advanced Security Properties in the Enterprise Manager Properties File**

| Property                                    | Description   |
|---|---|
| oracle.sysman.emRep.dbConn.enableEncryption | <p>Defines whether or not Enterprise Manager will use encryption between Management Service and Management Repository.</p> <p>Possible values are TRUE and FALSE. The default value is TRUE.</p> <p>For example:</p> <pre>oracle.sysman.emRep.dbConn.<br/>enableEncryption=true</pre>   |
| oracle.net.encryption_client                | <p>Defines the Management Service encryption requirement.</p> <p>Possible values are REJECTED, ACCEPTED, REQUESTED, and REQUIRED.</p> <p>The default value is REQUESTED. In other words, if the database supports secure connections, then the Management Service uses secure connections, otherwise the Management Service uses insecure connections.</p> <p>For example:</p> <pre>oracle.net.<br/>encryption_client=REQUESTED</pre> |
| oracle.net.encryption_types_client          | <p>Defines the different types of encryption algorithms the client supports.</p> <p>Possible values should be listed within parenthesis. The default value is ( DES40C ).</p> <p>For example:</p> <pre>oracle.net.<br/>encryption_types_client=<br/>( DES40C )</pre>  |
| oracle.net.crypto_checksum_client           | <p>Defines the Client's checksum requirements.</p> <p>Possible values are REJECTED, ACCEPTED, REQUESTED, and REQUIRED.</p> <p>The default value is REQUESTED. In other words, if the server supports checksum enabled connections, then the Management Service uses them, otherwise it uses normal connections.</p> <p>For example:</p> <pre>oracle.net.<br/>crypto_checksum_client=REQUESTED</pre>                                   |
| oracle.net.crypto_checksum_types_client     | <p>This property defines the different types of checksums algorithms the client supports.</p> <p>Possible values should be listed within parentheses. The default value is ( MD5 ).</p> <p>For example:</p> <pre>oracle.net.<br/>crypto_checksum_types_client=<br/>( MD5 )</pre>  |

### 9.4.8.3 Enabling Oracle Advanced Security for the Management Repository

To ensure your database is secure and that only encrypted data is transferred between your database server and other sources, review the security documentation available in the Oracle Database documentation library.

**See Also:** *Oracle Database Advanced Security Administrator's Guide*

The following instructions provide an example of how you can confirm that Oracle Advanced Security is enabled for your Management Repository database and its connections with the Management Service:

1. Locate the `sqlnet.ora` configuration file in the following directory of the database Oracle Home:

```
ORACLE_HOME/network/admin
```

2. Using a text editor, look for the following entries (or similar entries) in the `sqlnet.ora` file:

```
SQLNET.ENCRYPTION_SERVER = REQUESTED
SQLNET.CRYPTO_SEED = "abcdefg123456789"
```

**See Also:** "Configuring Network Data Encryption and Integrity for Oracle Servers and Clients in the *Oracle Application Server 10g Administrator's Guide*.

3. Save your changes and exit the text editor.

### 9.4.8.4 Enabling Security for a Management Agent Monitoring a Secure Management Repository or Database

After you have enabled Oracle Advanced Security for the Management Repository, you must also enable Advanced Security for the Management Agent that is monitoring the Management Repository:

1. Locate the `sqlnet.ora` configuration file in the following directory inside the home directory for the Management Agent that is monitoring the Management Repository:

```
AGENT_HOME/network/admin (UNIX)
AGENT_HOME\network\admin (Windows)
```

2. Using a text editor, add the following entry to the `sqlnet.ora` configuration file:

```
SQLNET.CRYPTO_SEED = "abcdefg123456789"
```

The `SQLNET.CRYPTO_SEED` can be any string between 10 to 70 characters.

**See Also:** "Configuring Network Data Encryption and Integrity for Oracle Servers and Clients in the *Oracle Application Server Administrator's Guide*.

3. Save your changes and exit the text editor.
4. Restart the Management Agent.

## 9.4.9 Configuring Third Party Certificates

You can configure third party certificates for:

- HTTPS Upload Virtual Host
- HTTPS Console Virtual Host

---

**Note:** Only Single Sign-On wallets are supported.

---

#### 9.4.9.1 Configuring Third Party Certificate for HTTPS Upload Virtual Host

You can configure the third party certificate for the HTTPS Upload Virtual Host in two ways:

##### Method 1

1. Create a wallet for each OMS in the Cloud.
2. While creating the wallet, specify the host name of the machine where the OMS is installed or the Load Balancer Name if the OMS is behind the Load Balancer for Common Name.
3. Write the certificates of all the Certificate Authorities in the certificate chain (like the Root Certificate Authority, Intermediate Certificate Authority) into a file named `trusted_certs.txt`.
4. Download or copy the `trusted_certs.txt` file to the host machines on which each Agent that is communicating with the OMS is running.
5. Run the `add_trust_cert` command on each Agent and then restart that Agent.

```
emctl secure add_trust_cert -trust_certs_loc <location of the trusted_certs.txt file>
```

6. Secure the OMS and restart it.

```
emctl secure oms -wallet <location of wallet> -trust_certs_loc <loc of trusted_certs.txt> [any other options]
```

##### Method 2

1. Create a wallet for each OMS in the Cloud.
2. Specify the host name of the machine where the OMS is installed or the Load Balancer Name if the OMS is behind the Server Load Balancer for Common Name (CN).
3. Write the certificates of all the Certificate Authorities in the certificate chain (like the Root Certificate Authority, Intermediate Certificate Authority) into a file named `trusted_certs.txt`.
4. Restart the OMS after it has been secured.

```
emctl secure oms -wallet <location of wallet> -trust_certs_loc <loc of trusted_certs.txt> [any other options]
```

5. Either re-secure the Agent by running the `emctl secure agent` command (should be run on all Agents) or import the trust points by running the `emctl secure add_trust_cert -trust_certs_loc <location of the trusted_certs.txt file>` command. The `-trust_certs_loc` parameter must contain the path and the filename of the `trusted_certs.txt` file.

---

**Note:** This file must only contain certificates in base64 format and no special characters or empty lines.

---

### 9.4.9.2 Configuring Third Party Certificate for HTTPS Console Virtual Host

To configure the third party certificate for HTTPS WebTier Virtual Host:

1. Create a wallet for each OMS in the Cloud. Specify the host name of the machine where the OMS is installed or the Load Balancer Name if the OMS is behind the Server Load Balancer for Common Name.
2. Run the following command on each OMS and the restart that OMS:

```
emctl secure console -wallet <location of wallet>
```

---

**Note:** Only single-sign-on wallets are supported.

---

## 9.5 Accessing Managed Targets

The following topics are discussed in this section:

- Credential Subsystem
- Pluggable Authentication Modules (PAM) Support
- Sudo and Powerbroker Support

### 9.5.1 Credential Subsystem

Credentials like user names and passwords are typically required to access targets such as databases, application servers, and hosts. Credentials are encrypted and stored in Enterprise Manager. Beginning with Enterprise Manager 12c, the credential subsystem supports, in addition to basic username-password, strong authentication schemes such as PKI, SSH-keys and Kerberos. SSH-key based host authentication, used by jobs, deployment procedures and other Enterprise Manager subsystems, is now supported.

By using appropriate credentials, you can:

- Collect metrics in the background as well as real-time
- Perform jobs such as backup, patching, and cloning
- Perform real-time target administration such as start, and stop
- Connect to My Oracle Support

Based on their usage, credentials can be classified into the following categories:

- [Named Credential](#)
- [Job Credentials](#)
- [Monitoring Credentials](#)
- [Collection Credentials](#)
- [Preferred Credentials](#)

#### 9.5.1.1 Named Credential

Credentials are stored within Enterprise Manager as "named" entities. Administrators define and store credentials within Enterprise Manager and refer to the credential by a credential name. Named credentials can be a username/password, or a public key-private key pair. An Enterprise Manager administrator can then use the named credential for performing operations like running jobs, patching and other system management tasks. For example, an administrator can store the username and

password they want to use for patching as "MyPatchingCreds". He can later submit a patching job that uses "MyPatchingCreds" to patch a production databases.

There are two categories of named credentials:

- **Global Named Credential**

A global named credential is an entity, which is not associated with any Enterprise Manager object. Global named credentials consist of the authentication scheme along with any authentication parameters. Because these are independent entities, an Enterprise Manager administrator can associate these credentials with objects at a later time.

- **Target Named Credentials**

Target named credential is an entity which are associated with individual targets at the time of creation. This entity will also contain authentication scheme along with authentication parameters for a specific target.

### **Access Control for Named Credentials**

The access control model for credentials adhere to the following rules:

- Only credential owners can grant privileges on their credential objects to other users.
- Enterprise Manager Super Administrators cannot obtain any privileges on a newly created credential until he is explicitly granted privileges on the credential object.
- Enterprise Manager administrators, regardless of privilege level, cannot see the sensitive fields such as passwords and private keys from the console UI.
- Credentials privileges cannot be assigned to a role. This eliminates back door entry by Enterprise Manager Super Administrators to grant themselves privileges on the credentials for which they do not have explicit access.
- An Enterprise Manager administrator cannot view other administrators' credentials unless an explicit grant is provided. Even Enterprise Manager Super Administrators cannot view other users' credentials.
- Any Enterprise Manager administrator can create his own credentials and have FULL privileges on the credentials owned.

Enterprise Manager Administrators will be able to grant privileges to other administrators while creating the credential or by granting the privileges when editing the credential.

All the credentials owned by an Enterprise Manager administrator will be deleted if that administrator is deleted from Enterprise Manager. Since access to shared credentials is not automatically granted to Super Administrators, re-assigning named credentials belonging to a regular Enterprise Manager administrator by a Super Administrator is not allowed.

### **Credential Privilege Levels**

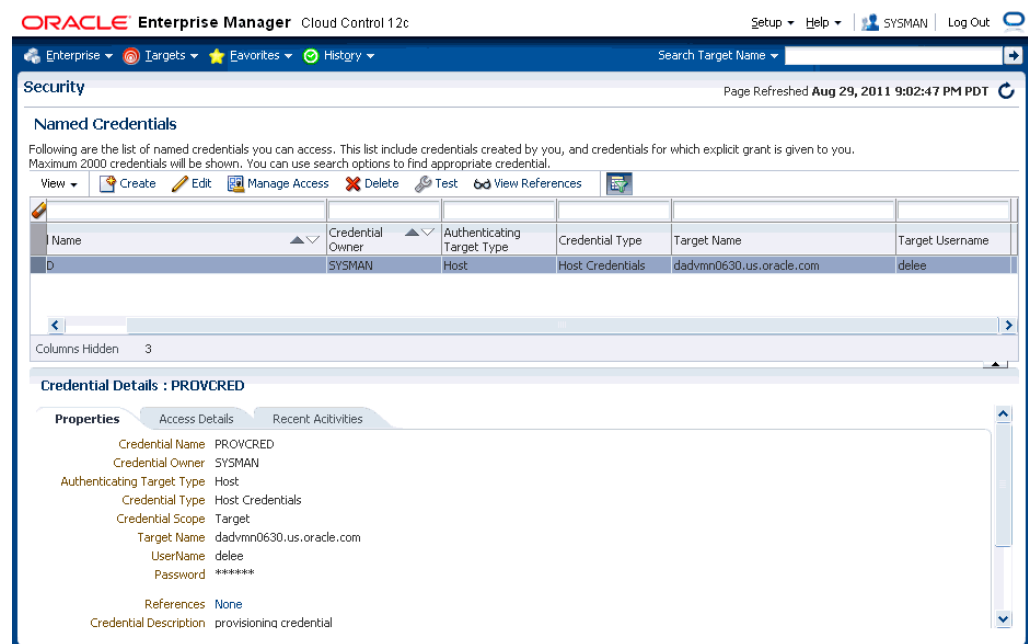

The following privilege levels are available for all credentials:

- **VIEW:** An administrator with VIEW privileges on other administrator's credentials will be able to view the structure and username of the credential. Sensitive information of the credential such as the password will never be shown. Administrators with VIEW privilege on a credential will also be able to use the credentials for running jobs, patching and other system management operations within Enterprise Manager.

- **EDIT:** Allows an Enterprise Manager administrator to change a sensitive information such as the password, or the public/private key pair of the credential. The administrator will not be able to change the Authentication Scheme of the credential. The username for the credential cannot be changed.
- **FULL:** Allows an Enterprise Manager administrator to change the credential username, sensitive information such as the password or the public/private key pair, and authentication scheme. An administrator with FULL privilege on a named credential will be able to delete the named credential.

To create or edit a named credential, from the **Setup** menu, choose **Security** and then **Named Credential**. The Named Credential page displays as shown in the following figure.

**Figure 9–4 Named Credentials Page**

From the Named Credential page, you can **Create** a new named credential, **Edit** an existing credential, **Manage Access** (grant/revoke privileges), **Delete**, **Test**, **View References**, or click the *Query by Example* icon to filter the list of named credentials.

### 9.5.1.2 Job Credentials

The job system uses the credential subsystem to retrieve the credentials required to submit a job on the targets. The administrator can define their preferred and default credentials from the **Setup** menu, choose **Security** and then **Preferred Credentials** page. As an administrator, you can perform the following when submitting a job:

- Use Preferred Credentials
- Use Named Credentials
- Create new credentials

---

**Note:** If the user chooses to use preferred credentials, these credentials will be used when the user submits the job. If the preferred credentials are not available, the default credentials will be used. If default credentials are not present, the job cannot be submitted.

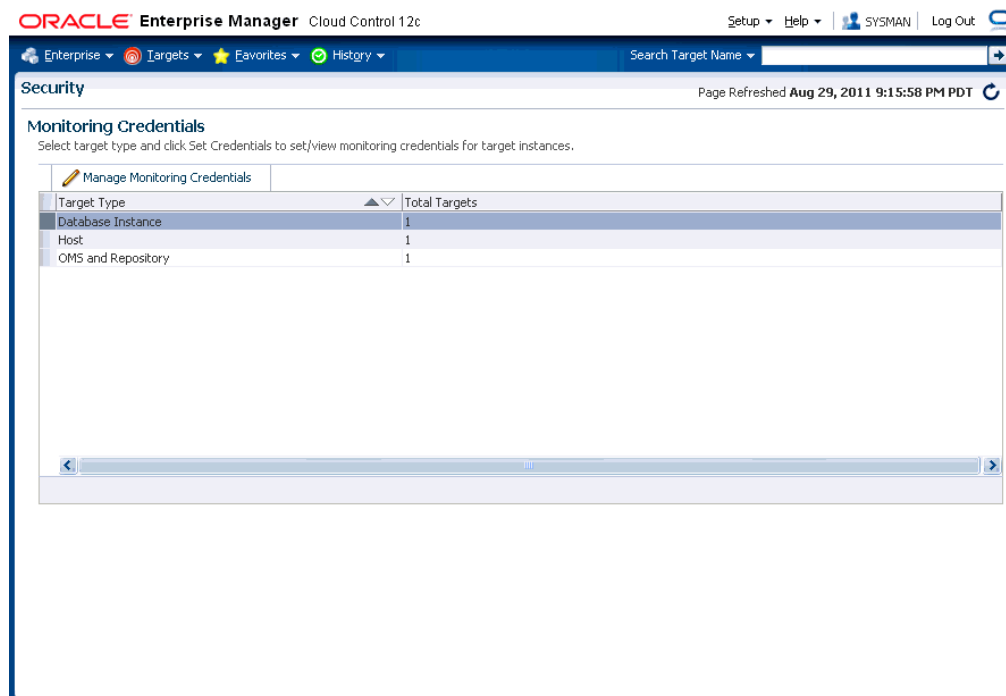

---

### 9.5.1.3 Monitoring Credentials

These credentials are used by the Management Agent to monitor certain types of targets. For example, most database monitoring involves connecting to the database, which requires a username, password, and optionally, a role. Monitoring credentials, if stored in the repository, can also be potentially used by management applications to connect directly to the target from the OMS.

To create or edit a monitoring credentials, from the **Setup** menu, choose **Security** and then **Monitoring Credentials**. The Monitoring Credentials page displays as shown in the following figure.

**Figure 9–5 Monitoring Credentials**

To modify monitoring credentials, select the desired target type and click **Manage Monitoring Credentials**. The monitoring credentials page for the selected target type displays.

### 9.5.1.4 Collection Credentials

These credentials are associated with metric extensions and older user-defined metrics.

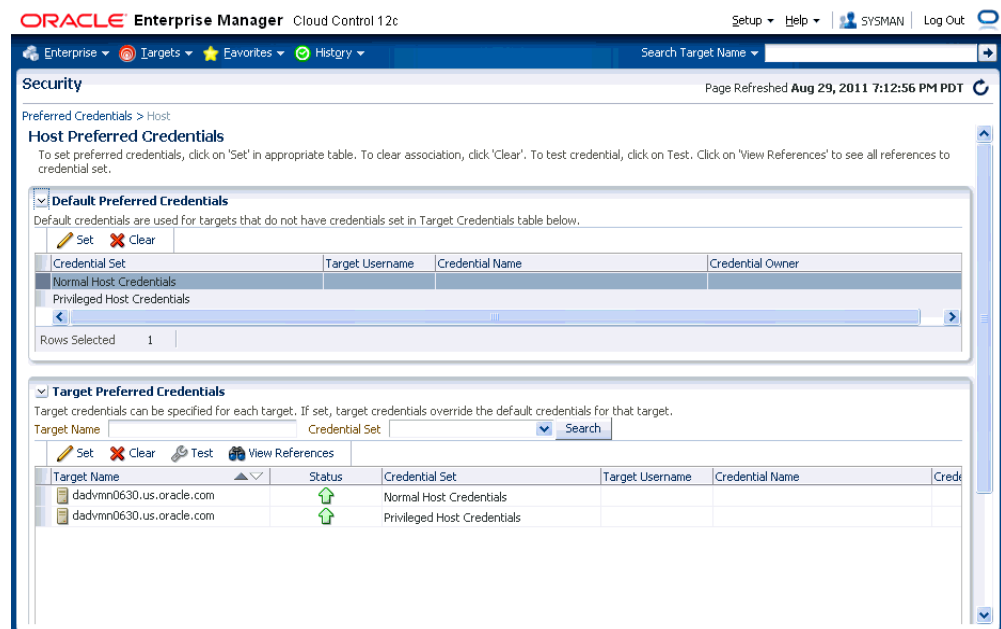

### 9.5.1.5 Preferred Credentials

Preferred credentials are used to simplify access to managed targets by storing target login credentials in the Management Repository. With preferred credentials set, users can access an Enterprise Manager target that recognizes those credentials without being prompted to log in to the target. Preferred credentials are set on a per user basis, thus ensuring the security of the managed enterprise environment.

- **Default Credentials:** Default credentials can be set for a particular target type and will be available for all the targets of the target type. It will be overridden by target preferred credentials.
- **Target Credentials:** Target credentials are preferred credentials set for a particular target. They could be used by applications such as the job system, notifications, or patching. For example, if the user chooses to use preferred credentials while submitting a job, then the preferred credentials set for the target (target credentials) will be used. If the target credentials are not present, the default credentials (for the target type) will be used. If the default credentials are not present, the job will fail. If not specified, by default, preferred credentials refer to preferred target credentials"

For example, to set the host preferred credentials, from the **Setup** menu, choose **Security** and then **Preferred Credential**. In the Preferred Credentials page, select the **Host** target type from the table and click **Manage Preferred Credentials**. The Host Preferred Credentials are displayed.

**Figure 9–6 Host Preferred Credentials**

On this page, you can set both default and explicit preferred credentials for the host target types.

### 9.5.1.6 Managing Credentials Using EM CLI

You can manage passwords using EM CLI verbs. Using EM CLI, you can:

- Change the database user password in both the target database and Enterprise Manager.

```
emcli update_db_password -change_at_target=Yes|No -change_all_reference=Yes|No
```

- Update a password which has already been changed at the host target.

```
emcli update_host_password -change_all_reference=Yes|No
```

- Set preferred credentials for given users.

```
emcli set_preferred_credential  
-set_name="set_name"  
-target_name="target_name"  
-target_type="ttype"  
-credential_name="cred_name"  
[-credential_owner ="owner"]
```

And

```
emcli set_preferred_credential  
-set_name="set_name"  
-target_name="target_name"  
-target_type="ttype"  
-credential_name="cred_name"  
[-credential_owner ="owner"]
```

For detailed descriptions of these verbs, refer to *Enterprise Manager Command Line Interface* guide.

## 9.5.2 Setting Up SSH Key-based Host Authentication

Secure Shell or SSH allows data to be exchanged over the network using a secure channel between two devices. SSH is used primarily on Linux and Unix based systems. SSH was designed as a replacement for FTP, telnet and other unsecure remote shells, which send information, notably passwords in plaintext, leaving them open for interception. The encryption used by SSH provides confidentiality and integrity of data over an insecure network. SSH also protects the system against DNS spoofing attacks. This makes SSH a better choice in production environments over telnet/FTP and other username/password based authentications.

You can configure Enterprise Manager to use SSH while performing management operations, thus allowing Enterprise Manager administrators to leverage the security features provided by SSH along with the management capabilities of Enterprise Manager. When authenticating in this mode, the Agent acts as a Java SSH client and connect to the host using the username/password provided in the credential.

Enterprise Manager allows you to store a public-private key pair for administrators and allows them to view and install the public key on the hosts. Administrators can then submit jobs/patching operations in which they specify the credential that refers to the private key to perform the operation. The OMS passes the private key to the Agent along with the commands and the command parameters. Agent invokes the Java SSH client and attempts to connect to the host using the private key. Since the host already has the public key installed, it identifies the private key and successfully authenticates the Agent's Java SSH client. The Agent can now run the commands via the SSH client on the host to perform the requested operations.

## Setup Example Session

---

**Note:** The procedure shown in this example assumes that you have a firm understanding of SSH setup procedures and user and host equivalence using public private key pair using SSH.

---

To generate, manage, or convert SSH authentication keys, you use the *SSH-keygen* utility available on UNIX systems. This utility SSH-keygen tool provides different options to create with different strengths RSA keys for SSH protocol version 1 and RSA or DSA keys for use by SSH protocol version 2.

### Example 9–10 Setting Up SSH key-based Authentication

```
$ ssh-keygen -t rsa
```

*The command options instruct the utility to generate SSH keys (RSA key pair).*

Generating public/private rsa key pair.

Enter file in which to save the key (/home/myhome/.ssh/id\_rsa):

*The path specified is the standard path to the location where SSH keys are stored (\$HOME/.ssh).*

Enter passphrase (empty for no passphrase)

Enter same passphrase again:

Your identification has been saved in /home/admin1/.ssh/id\_rsa.

Your public key has been saved in /home/admin1/.ssh/id\_rsa.pub.

The key fingerprint is:

bb:da:59:7a:fc:24:c6:9a:ee:dd:af:da:1b:1b:ed:7f admin1@myhost2170474

The ssh-key utility has now generated two files in the .ssh directory.

```
$ ls
```

```
id_rsa id_rsa.pub
```

To permit access to the host without having SSH prompt for a password, copy the public key to the `authorized_keys` file on that system.

```
$ cp id_rsa.pub authorized_keys
```

From this point, all keys listed in that file are allowed access.

Next, perform a remote logon using SSH. The system will not prompt you for a password.

```
$ ssh myhost
```

The authenticity of host 'myhost (10.229.147.184)' can't be established.

RSA key fingerprint is de:a0:2a:d5:23:f0:8a:72:98:74:2c:6f:bf:ad:5b:2b.

Are you sure you want to continue connecting (yes/no)? yes

Warning: Permanently added 'myhost,10.229.147.184' (RSA) to the list of known hosts.

Last login: Mon Aug 29 16:48:45 2011 from anotherhost.example.com

```
$
```

You are now ready to add the credential to Enterprise Manager.

1. From the **Setup** menu, select **Security**, then select **Named Credentials**.
2. On the Named Credentials page, click **Create**.
3. Select **Host** from the **Authenticating Target Type** drop-down menu.

4. Select **SSH Key Credentials** from the **Credential Type** drop-down menu as shown in the following figure.

The screenshot shows the Oracle Enterprise Manager Cloud Control 12c interface. The top navigation bar includes 'Enterprise', 'Targets', 'Favorites', and 'History'. The main content area is titled 'Security' and shows the 'Create Credential' form. The 'Credential description' field is empty. The 'Authenticating Target Type' is set to 'Host'. The 'Credential type' is set to 'SSH Key Credentials'. The 'Scope' is set to 'Target'. The 'Target type' is set to 'Host'. The 'Target Name' field is empty. The 'Credential Properties' section is expanded, showing fields for 'Username', 'SSH Private Key', and 'SSH Public Key'. Each of these fields has a 'Browse...' button next to it. The 'Run Privilege' is set to 'None'. The 'Access control' section is at the bottom, showing a table with columns 'Grantee' and 'Privilege', and a message 'No data to display'.

5. Ensure that the SSH private key/public key files have been copied to the host on which the browser is running.
6. From the **Credential Properties** region, click **Browse** for **Public Key** and **Private Key** to upload the generated public key/private key files.
7. Click **Test and Save** to verify the credentials and save them.

### 9.5.3 Pluggable Authentication Modules (PAM) Support for Hosts

Pluggable authentication modules, or PAM, is a mechanism to integrate multiple low-level authentication schemes into a high-level application programming interface (API). It allows programs that rely on authentication to be written independently of the underlying authentication scheme. By using PAM, instead of using the local password file to authenticate the user accessing the host, you can take advantage of other authentication mechanisms such as LDAP, RADIUS and Kerberos. If your host authentication is configured over PAM, the Management Agent needs to be configured accordingly to enable PAM Authentication. Refer to note 422073.1 for deployment details.

---

**Note:** The local password file (usually `/etc/passwd`) will be checked and used first. This should be synchronized with the LDAP password if it is being used. If this fails, the Management Agent will switch to the external authentication module.

---

#### 9.5.3.1 Configuring PAM for RHEL4 Users

For users on RHEL4, the PAM file configuration is as follows:

```

#%PAM-1.0
auth required pam_ldap.so
account required pam_ldap.so

```

```
password required pam_ldap.so
session required pam_ldap.so
```

For more details, see

<https://www.redhat.com/docs/manuals/enterprise/RHEL-4-Manual/ref-guide/s1-pam-format.html>

### 9.5.3.2 Configuring PAM for AIX Users

For AIX users, use the `edit/etc/pam.conf` file and add the following lines:

```
emagent auth    required      /usr/lib/security/pam_aix
emagent account required      /usr/lib/security/pam_aix
emagent password required     /usr/lib/security/pam_aix
emagent session required      /usr/lib/security/pam_aix
```

After editing the file, apply patch **5527130** and run `root.sh`

## 9.5.4 Sudo and PowerBroker Support

Privilege delegation allows a logged-in user to perform an activity with the privileges of another user. Sudo and PowerBroker are privilege delegation tools that allow a logged-in user to be assigned these privileges. Typically, the privileges that are granted to a specific user are administered centrally. For example, the `sudo` command can be used to run a script that requires root access:

```
sudo root root.sh
```

In the invocation of `sudo` in the example above, an administrator can use the `sudo` command to run a script as root provided he has been granted the appropriate privileges by the system administrator.

Enterprise Manager preferred credentials allow you to use two types of privilege delegation tools: Sudo and PowerBroker. You can use EM CLI or the Manage Privilege Delegation Settings page to set/edit privilege delegation settings for a host. See the *Enterprise Manager Command Line Interface* guide for more information on using the command line.

**Sudo:** `sudo` allows a permitted user to execute a command as the super user or another user, as specified in the `sudoers` file. If the invoking user is root or if the target user is the same as the invoking user, no password is required. Otherwise, `sudo` requires that users authenticate themselves with a password by default. Once a user has been authenticated, a timestamp is updated and the user may then use `sudo` without a password for a short period of time (5 minutes unless overridden in `sudoers`). `sudo` determines who is an authorized user by consulting the file `/etc/sudoers`. For more information, see the manual page on `sudo` (`man sudo`) on Unix. Enterprise Manager authenticates the user using `sudo`, and executes the script as `sudo`. For example, if the command to be executed is `foo -arg1 -arg2`, it will be executed as `sudo -S foo -arg1 -arg2`.

**PowerBroker:** BeyondTrust Powerbroker enables UNIX system administrators to specify the circumstances under which other people may run certain programs such as root (or other important accounts). The result is that responsibility for such actions as adding user accounts, fixing line printer queues, and so on, can be safely assigned to the appropriate people, without disclosing the root password. The full power of root is thus protected from potential misuse or abuse—for example, modifying databases or file permissions, erasing disks, or more subtle damage.

BeyondTrust PowerBroker can access existing programs as well as its own set of utilities that execute common system administration tasks. Utilities being developed to run on top of BeyondTrust PowerBroker can manage passwords, accounts, backups, line printers, file ownership or removal, rebooting, logging people out, killing their programs, deciding who can log in to where from where, and so on. They can also provide TCP/IP, Load Balancer, cron, NIS, NFS, FTP, rlogin, and accounting subsystem management. Users can work from within a restricted shell or editor to access certain programs or files as root.

See your Sudo or PowerBroker documentation for detailed setup and configuration information.

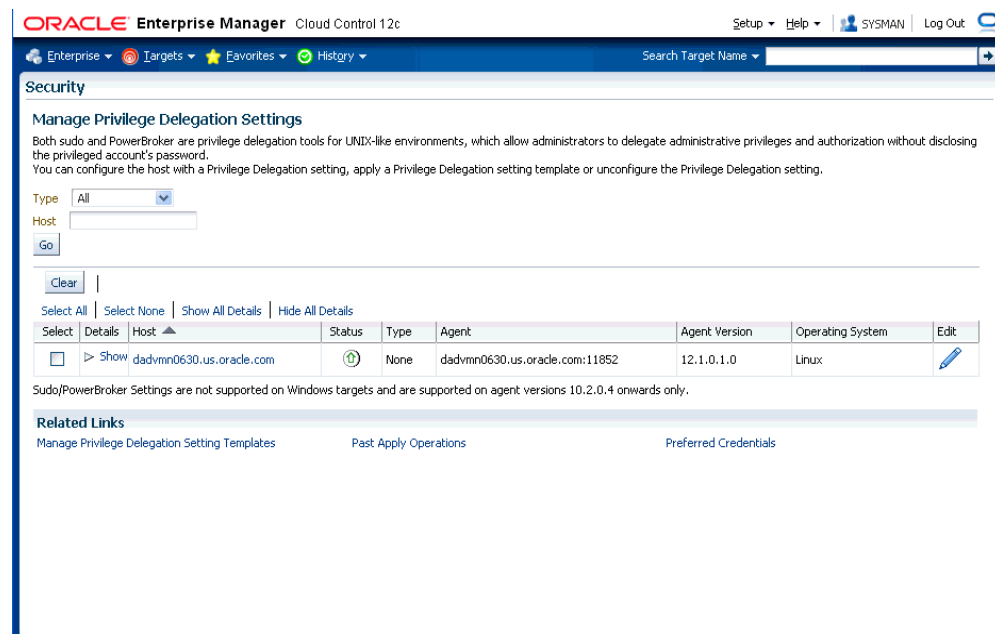

#### 9.5.4.1 Creating a Privilege Delegation Setting

Enterprise Manager allows you to create privilege delegation settings either by creating the setting directly on a host target, or by creating a Privilege Delegation Setting Template that you can apply to multiple hosts.

To create a privilege delegation setting directly on a host:

1. From the **Setup** menu, select **Security**, then select **Privilege Delegation**. The following screen is displayed:

**Figure 9–7 Manage Privilege Delegation Settings**

2. For any host target appearing in the table, click **Edit**. Enterprise Manager takes you to the Host Privilege Delegation Setting page.
3. Select a privilege delegation type (Sudo or PowerBroker).
4. Enter the privilege delegation command to be used and, in the case of PowerBroker, the optional Password Prompt.
5. Click **Update** to apply the settings to the host. The following figure shows the Host Privilege Delegation Setting window that you can use to create a PowerBroker setting.

Figure 9–8 Host Privilege Delegation Setting - PowerBroker

ORACLE Enterprise Manager Cloud Control 12c

Enterprise Targets Favorites History

Search Target Name

dadvmn0630.us.oracle.com

Host

dadvmn0630.us.oracle.com > Manage Privilege Delegation Settings

Host Privilege Delegation Setting : dadvmn0630.us.oracle.com

You can configure the host with a Privilege Delegation setting or unconfigure the Privilege Delegation setting for this host.

None Sudo **PowerBroker**

**Settings**

PowerBroker Password Prompt

Password prompt

\* PowerBroker command.

For eg. /usr/bin/pbrun -l u %RUNAS% %COMMAND%

**Parameters**

Setting properties can be used in parameters

| Name       | Description                           |
|------------|---------------------------------------|
| %COMMAND%  | PowerBroker command.                  |
| %PROFILE%  | Use this profile to run the command.  |
| %RUNAS%    | Run the command as this user.         |
| %USERNAME% | Name of the user running the command. |

Once you have created a privilege delegation setting, you must apply this setting to selected targets. This setting can be applied to one more hosts or to a composite (Group) target (the group must contain at least one host target). You can apply a Privilege Delegation setting using the Cloud Control console. From the **Setup** menu, choose **Security** and then **Privilege Delegation**.

## 9.6 Cryptographic Support

To protect the integrity of sensitive data in Enterprise Manager, a signing on verification method known as the `emkey` is used. Encryption key is the master key that is used to encrypt/decrypt sensitive data, such as passwords and preferred credentials that are stored in the Repository. The key is originally in stored in repository. It is removed from repository and copied to the Credential Store during installation of the first OMS. (the `emkey` is secured out-of-the-box). A backup is created in `OMS_ORACLE_HOME/sysman/config/emkey.ora`. It is recommended to create a backup of this file on some other machine. When starting up, OMS reads the `emkey` from Credential Store and repository. If the `emkey` is not found or is corrupted, it fails to start. By storing the key separately from Enterprise Manager schema, we ensure that the sensitive data such as Named Credentials in the Repository remain inaccessible to the schema owner and other SYSDBA users (Privileged users who can perform maintenance tasks on the database) in the Repository. Moreover, keeping the key from the schema will ensure that sensitive data remain inaccessible while Repository backups are accessed. Further, the schema owner should not have access to the OMS/Repository Oracle homes.

### 9.6.1 Configuring the `emkey`

The `emkey` is an encryption key that is used to encrypt and decrypt sensitive data in Enterprise Manager such as host passwords, database passwords and others.

---

**WARNING:** If the `emkey.ora` file is lost or corrupted, all of the encrypted data in the Management Repository becomes unusable. Maintain a backup copy of this file on another system.

---

During startup, the Oracle Management Service checks the status of the emkey. If the emkey has been properly configured, it uses it encrypting and decrypting data. If the emkey has not been configured properly, the following error message is displayed.

**Example 9–11 emctl start oms Command**

```
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
emctl start oms
Starting HTTP Server ...
Starting Oracle Management Server ...
Checking Oracle Management Server Status ...
Oracle Management Server is not functioning because of the following reason:
The Enterprise Manager Key is not configured properly. Run "emctl status emkey"
for more details.
```

## 9.6.2 emctl Commands

The emctl commands related to emkey are given below:

- emctl status emkey [-sysman\_pwd <pwd>]
- emctl config emkey -copy\_to\_credstore [-sysman\_pwd <pwd>]
- emctl config emkey -copy\_to\_repos [-sysman\_pwd <pwd>]
- emctl config emkey -remove\_from\_repos [-sysman\_pwd <pwd>]
- emctl config emkey -copy\_to\_file\_from\_credstore -admin\_host <host> -admin\_port <port> -admin\_user <username> [-admin\_pwd <pwd>] [-repos\_pwd <pwd>] -emkey\_file <emkey file>
- emctl config emkey -copy\_to\_file\_from\_repos (-repos\_host <host> -repos\_port <port> -repos\_sid <sid> | -repos\_conn\_desc <conn desc>) -repos\_user <username> [-repos\_pwd <pwd>] [-admin\_pwd <pwd>] -emkey\_file <emkey file>
- emctl config emkey -copy\_to\_credstore\_from\_file -admin\_host <host> -admin\_port <port> -admin\_user <username> [-admin\_pwd <pwd>] [-repos\_pwd <pwd>] -emkey\_file <emkey file>
- emctl config emkey -copy\_to\_repos\_from\_file (-repos\_host <host> -repos\_port <port> -repos\_sid <sid> | -repos\_conn\_desc <conn desc>) -repos\_user <username> [-repos\_pwd <pwd>] [-admin\_pwd <pwd>] -emkey\_file <emkey file>

### 9.6.2.1 emctl status emkey

This command shows the health or status of the emkey. Depending on the status of the emkey, the following messages are displayed:

- When the emkey has been correctly configured in the Credential Store, the following message is displayed.

**Example 9–12 emctl status emkey - Example 1**

```
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
The EmKey is configured properly, but is not secure. Secure the EmKey by running
"emctl config emkey -remove_from_repos"
```

- When the emkey has been correctly configured in the Credential Store and has been removed from the Management Repository, the following message is displayed.

**Example 9-13 *emctl status emkey - Example 2***

Oracle Enterprise Manager 12c Release 1 Cloud Control  
 Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.  
 The EMKey is configured properly.

- When the emkey is corrupted in the Credential Store and removed from the Management Repository, the following message is displayed.

**Example 9-14 *emctl status emkey - Example 3***

Oracle Enterprise Manager 12c Release 1 Cloud Control  
 Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.  
 The EMKey is not configured properly or is corrupted in the credential store and does not exist in the Management Repository. To correct the problem:  
 1) Get the backed up emkey.ora file.  
 2) Configure the emkey by running "emctl config emkey -copy\_to\_credstore\_from\_file"

**9.6.2.2 emctl config emkey -copy\_to\_credstore**

This command copies the emkey from the Management Repository to the Credential Store.

**Example 9-15 *Sample Output of the emctl config emkey -copy\_to\_credstore Command***

```
emctl config emkey -copy_to_credstore [-sysman_pwd <pwd>]
```

Oracle Enterprise Manager 12c Release 1 Cloud Control  
 Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.  
 The EMKey has been copied to the Credential Store.

**9.6.2.3 emctl config emkey -copy\_to\_repos**

This command copies the emkey from the Credential Store to Management Repository.

**Example 9-16 *Sample Output of the emctl config emkey -copy\_to\_repos Command***

```
emctl config emkey -copy_to_repos [-sysman_pwd <pwd>]
```

Oracle Enterprise Manager 12c Release 1 Cloud Control  
 Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.  
 The EMKey has been copied to the Management Repository. This operation will cause the EMKey to become unsecure.  
 After the required operation has been completed, secure the EMKey by running "emctl config emkey -remove\_from\_repos".

**9.6.2.4 emctl config emkey -copy\_to\_file\_from\_credstore**

This command copies the emkey from the Credential Store to a specified file.

**Example 9-17 *Sample Output of the emctl config emkey -copy\_to\_file\_from\_credstore Command***

```
emctl config emkey -copy_to_file_from_credstore -admin_host <host> -admin_port <port> -admin_user <username> [-admin_pwd <pwd>] [-repos_pwd <pwd>] -emkey_file <emkey file>
```

Oracle Enterprise Manager 12c Release 1 Cloud Control  
 Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.  
 The EMKey has been copied to file.

**9.6.2.5 emctl config emkey -copy\_to\_file\_from\_repos**

This command copies the emkey from the Management Repository to a specified file.

**Example 9–18 Sample Output of the `emctl config emkey -copy_to_file_from_repos` Command**

```
emctl config emkey -copy_to_file_from_repos (-repos_host <host> -repos_port <port>
-repos_sid <sid> | -repos_conndesc <conn desc>) -repos_user <username> [-repos_pwd
<pwd>] [-admin_pwd <pwd>] -emkey_file <emkey file>
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
The EMKey has been copied to file.
```

**9.6.2.6 `emctl config emkey -copy_to_credstore_from_file`**

This command copies the emkey from a specified file to the Credential Store.

**Example 9–19 Sample Output of the `emctl config emkey -copy_to_credstore_from_file` Command**

```
emctl config emkey -copy_to_credstore_from_file -admin_host <host> -admin_port
<port> -admin_user <username> [-admin_pwd <pwd>] [-repos_pwd <pwd>] -emkey_file
<emkey file>
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
The EMKey has been copied to the Credential Store.
```

**9.6.2.7 `emctl config emkey -copy_to_repos_from_file`**

This command copies the emkey from a specified file to the repository.

**Example 9–20 Sample Output of the `emctl config emkey -copy_to_repos_from_file` Command**

```
emctl config emkey -copy_to_repos_from_file (-repos_host <host> -repos_port <port>
-repos_sid <sid> | -repos_conndesc <conn desc>) -repos_user <username> [-repos_pwd
<pwd>] [-admin_pwd <pwd>] -emkey_file <emkey file>
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
The EMKey has been copied to the Management Repository. This operation will cause
the EMKey to become unsecure.
After the required operation has been completed, secure the EMKey by running
"emctl config emkey -remove_from_repos".
```

**9.6.2.8 `emctl config emkey -remove_from_repos`**

This command removes the emkey from the repository.

**Example 9–21 Sample Output of `emctl config emkey -remove_from_repos` Command**

```
emctl config emkey -remove_from_repos [-sysman_pwd <pwd>]
Oracle Enterprise Manager 12c Release 1 Cloud Control
Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.
The EMKey has been removed from the Management Repository.
```

---

**Note:** If the emkey is corrupted in the Credential Store, you will not be able to remove it from the Management Repository.

---

## 9.6.3 Install and Upgrade Scenarios

This section explains the install and upgrade scenarios for emkey.

### 9.6.3.1 Installing the Management Repository

A new emkey is generated as a strong random number when the Management Repository is installed.

### 9.6.3.2 Installing the First Oracle Management Service

When the Oracle Management Service is installed, the Installer copies the emkey to Credential Store and removes it from repository (emkey is secured out-of-box).

### 9.6.3.3 Upgrading from 10.2 or 11.1 to 12.1

The Management Repository is upgraded as usual. When upgrading the OMS, the omsca (OMS Configuration Assistant) copies the emkey to Credential Store and removes from repository. If the emkey is already secured before upgrade or has been removed from repository, then omsca reads the emkey from emkey.ora file present in old OMS Oracle Home and copies it to Credential Store.

---

---

**Note:** After all the Oracle Management Service have been upgraded, you can secure the emkey, that is, remove it from the Management Repository by running the following command:

```
emctl config emkey -remove_from_repos
```

---

---

### 9.6.3.4 Recreating the Management Repository

When the Management Repository is recreated, a new emkey is generated. This new key will not be in synchronization with the existing emkey in the Credential Store.

1. Copy the new emkey to Credential Store by using the `emctl config emkey -copy_to_credstore` command.
2. Take a backup by entering the `emctl config emkey -copy_to_file_from_repos` command or the `emctl config emkey -copy_to_file_from_credstore` command.
3. Secure the emkey by using the `emctl config emkey -remove_from_repos` command.

## 9.7 Setting Up the Auditing System for Enterprise Manager

All operations performed by Enterprise Manager users such as creating users, granting privileges, starting a remote job like patching or cloning, need to be audited to ensure compliance with the Sarbanes-Oxley Act of 2002 (SAS 70). This act defines standards an auditor must use to assess the contracted internal controls of a service organization. Auditing an operation enables an administrator to monitor, detect, and investigate problems and enforce enterprise wide security policies.

Irrespective of how the user has logged into Enterprise Manager, when auditing is enabled, each user action is audited and the audit details are stored in a record.

**For Enterprise Manager 12c, BASIC auditing is enabled by default**, thus creating an audit trail of credentials being created, edited, accessed, associated and deleted. Named credentials are first-class security objects on which privileges can be granted or revoked privileges. This means that multiple Enterprise Manager administrators will be able to use and modify the credential objects. Because credentials are sensitive data that can be used to perform various operations on the systems, there is a need to audit the operations on credentials.

Enterprise Manager audits all the operations performed on credentials. The auditing information includes, but is not limited to, the current username, credential name, operation performed, operation status success or failure. The audit logs contain information about the credential owner, action initiator, credential name, user name, and target name, job names along with the date time of the operation. Credential fields like password, private keys are never logged.

The following operations are audited:

- **Creating a Named Credential:** Creating new Enterprise Manager credentials will be audited.
- **Editing a Named Credential:** Editing a credential may consist of changing the username and/or the sensitive credential attributes. Credential edits may also include changing the authentication scheme for the credential.
- **Delete a Named Credential:** Deleting a credential from Enterprise Manager will be audited.
- **Associating a Named Credential:** A named credential can be set as a preferred credential for a credential set at the target level or at target type level. The named credential can also be reference directly from a job. All operations involving the setting of the named credentials as preferred credentials and using it in a job or deployment procedure will be audited.
- **Accessing a Named Credential:** Enterprise Manager subsystems request credentials from the credential store to perform various system management tasks

### 9.7.1 Configuring the Enterprise Manager Audit System

You can configure the Enterprise Manager Audit System by using the following EM CLI commands:

- `enable_audit`: Enables auditing for all user operations.
- `disable_audit`: Disables auditing for all user operations.
- `show_operations_list`: Shows a list of the user operations being audited.
- `show_audit_settings`: Shows the audit status, operation list, externalization service details, and purge period details.

### 9.7.2 Configuring the Audit Data Export Service

Audit data needs to be protected and maintained for several years. The volume of audit data may become very large and impact the performance of the system. To limit the amount of data stored in the repository, the audit data must be externalized or archived at regular intervals. The archived audit data is stored in an XML file complying with the ODL format. To externalize the audit data, the `EM_AUDIT_EXTERNALIZATION` API is used. Records of the format `<file-prefix>.NNNNN.xml`, where NNNN is a number are generated. The numbers start with 00001 and continue to 99999.

You can set up the audit externalization service for exporting audit data into the file system by using the `update_audit_setting -externalization_switch` command.

### 9.7.3 Updating the Audit Settings

The `update_audit_settings` command updates the current audit settings in the repository and restarts the Management Service.

**Example 9-22 Usage of the update\_audit\_setting command**

```
emcli update_audit_settings
-audit_switch="ENABLE/DISABLE"
-operations_to_enable="name of the operations to enable, for all oprtations
use ALL"
-operations_to_disable="name of the operations to disable, for all
oprations use ALL"
-externalization_switch="ENABLE/DISABLE"
-directory_name="directory_name (DB Directory)"
-file_prefix="file_prefix"
-file_size="file_size (Bytes)"
-data_retention_period="data_retention_period (Days)"
```

- -audit\_switch: Enables auditing across Enterprise Manager. The possible values are ENABLE/DISABLE. Default value is DISABLE.
- -operations\_to\_disable: Enables auditing for specified operations. Enter **All** to enable all operations.
- -operations\_to\_disable: Disables auditing for specified operations. Enter **All** to disable all operations.
- -externalization\_switch: Enables the audit data export service. The possible values are ENABLE/DISABLE. Default value is DISABLE.
- -directory: The database directory that is mapped to the OS directory where the export service archives the audit data files.
- -file\_prefix: The file prefix to be used by the export service to create the file in which audit data is to be stored.
- -file\_size: The size of the file on which the audit data is to be stored. The default value is 5000000 bytes.
- data\_retention\_period: The period for which the audit data is to be retained inside the repository. The default value is 365 days.

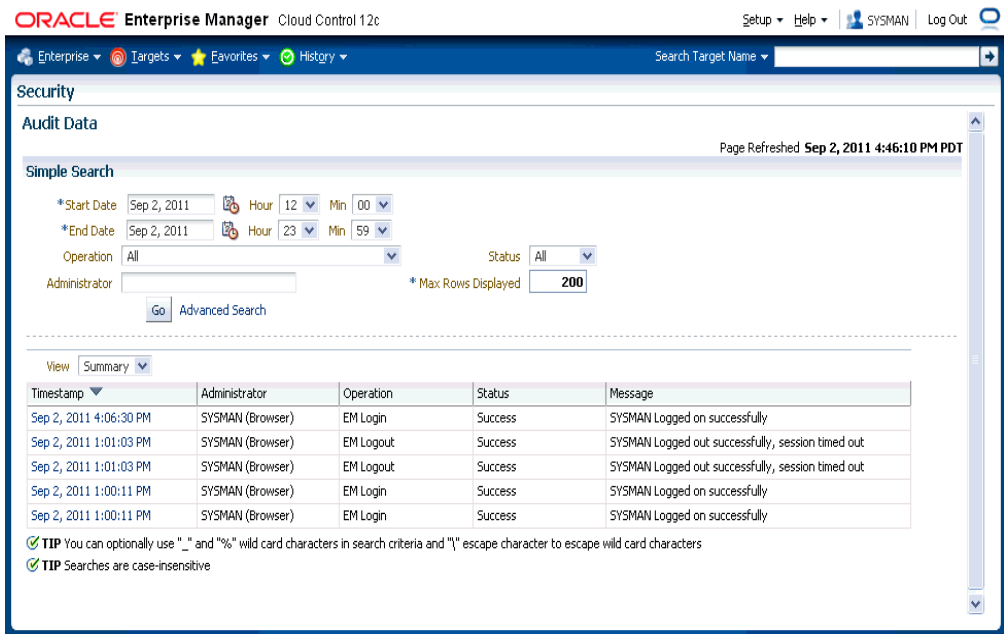

**9.7.4 Searching the Audit Data**

You can search for audit data that has been generated over a specified period. You can also search for the following:

- Audit details of a specific user operation or all user operations.
- Audit details of operations with a Success or Failure status or All operations.

From the **Setup** menu, select **Security** and then **Audit Data**. The Audit Data page is displayed. Specify the search criteria in the fields and click **Go**. The results are displayed in the Summary table.

Figure 9–9 Audit Data Search Page

To view the details of each record that meets the search criteria, select Detailed in the View drop-down list. To drill down to the full record details, click on the **Timestamp**. The Audit Record page is displayed.

Figure 9–10 Audit Record Details Page

| Field Name | Description |
|------------|-------------|
| General    |             |

| Field Name                            | Description   |
|---------------------------------------|---|
| Operation Timestamp                   | The date and time on which the operation took place.                |
| Administrator                         | The id of the administrator who has logged into Enterprise Manager. |
| Operation                             | The type of operation being audited.                                |
| Status                                | The status of the operation which can be success or failure.        |
| Message                               | A descriptive message indicating the status of the operation.       |
| Normalized Timestamp                  | This is the UTC timestamp.  |
| <b>Client Information</b>             |   |
| Session                               | This can either be the HTTP Session ID or the DBMS Session ID.      |
| IP Address                            | The IP address of the client's host machine.                        |
| Hostname                              | The name of the client's host machine.                              |
| Upstream Component Type               | The type of client, Console, Web Service, EM CLI, being used.       |
| Authentication Type                   | The nature of the session (HTTP Session, DB Session).               |
| Upstream Component Name               | The name of the client being used.                                  |
| <b>OMS Information</b>                |   |
| Hostname                              | The host name of the Oracle Management Service.                     |
| IP Address                            | The IP address of the Oracle Management Service.                    |
| Instance ID                           | The Instance ID of the Oracle Management Service.                   |
| <b>Operation Specific Information</b> |   |
| Object Name                           | The operation being performed on an object                          |

### 9.7.5 List of Operations Audited

The following table lists the names of operation and their description.

**Table 9–5 List of Operations Audited**

| Operation Name                  | Description  |
|---------------------------------|--|
| TCAUD_ADD_TEMPLATE_ENTITY       | Add entity to Template Collection                      |
| ADD_AGENT_REGISTRATION_PASSWORD | Add Registration Password                              |
| SWLIBADDLOCATION                | Configuring a new storage location in Software Library |
| ADD_CS_TARGET_ASSOC             | Add Standard-Target Association                        |
| APPLY_TEMPLATE                  | APPLY_TEMPLATE   |
| APPLY_UPDATE                    | Apply the update                                       |
| TCAUD_ASSOC_TO_AG               | Associate Template Collection to AG                    |
| ATTACH_MEXT                     | Attach Metric Extension                                |

**Table 9–5 (Cont.) List of Operations Audited**

| <b>Operation Name</b>            | <b>Description</b>   |
|----------------------------------|--|
| AUDIT_EXPORT_SETTINGS            | Audit Export Settings to externalize audit data                          |
| AUDIT_SETTINGS                   | Audit Settings to enable or Disable auditing                             |
| CHANGE_CONNECTOR_SETTINGS        | enable/disable a Connector   |
| CHANGE_PASSWORD                  | Change Password  |
| CHANGE_PREFERRED_CREDENTIAL      | change_pref_cred   |
| CONFIG_CONNECTOR                 | Configure a Connector Instance   |
| CREATE_CHANGE_MANAGEMENT_SETTING | Create the change management settings for the Real-time Monitoring rule. |
| CREATE_CONNECTOR                 | Create a Connector Instance  |
| CCS_CREATE_MD                    | Create (or import) Custom Configuration Specification                    |
| CCS_CREATE_PARSER                | Create Custom Configuration Specification Parser                         |
| CCS_CREATE_CUSTOM_TARGET_TYPE    | Create Custom Target Type  |
| CREATE_FACET                     | Create a new facet.  |
| CREATE_FACET_PARAMETER           | Create a new facet parameter.  |
| CREATE_FACET_PATTERN             | Create a new facet pattern.  |
| CREATE_CSG                       | Create Framework   |
| CREATE_MEXT                      | Create Metric Extension  |
| CREATE_TEMPLATE                  | CREATE_TEMPLATE  |
| CREATE_NAMED_CREDENTIAL          | Create Named Credential  |
| CREATE_PG_SCHED                  | Create Policy Group Schedule   |
| CREATE_CCC_RULE                  | Create a Real-time Monitoring rule.                                      |
| RES_STATE_CREATE_OP              | Resolution State created   |
| CREATE_ROLE                      | Create Role  |
| CREATE_RULE                      | Create Rule  |
| CREATE_CS                        | Create Standard  |
| TCAUD_CREATE                     | Create Template Collection   |
| CREATE_USER                      | Create User  |
| CREATE_UDP                       | Create User Defined Policy   |
| CREATE_UDPG                      | Create User Defined Policy Group   |
| DB_LOGIN                         | Audit Database user Login  |
| DB_LOGOUT                        | Audit Database user Logout   |
| DELETE_CONNECTOR                 | Delete a Connector Instance  |
| CCS_DELETE_MD                    | Delete Custom Configuration Specification                                |
| CCS_DELETE_PARSER                | Delete Custom Configuration Specification Parser                         |
| DELETE_FACET                     | Delete a facet.  |

**Table 9–5 (Cont.) List of Operations Audited**

| <b>Operation Name</b>              | <b>Description</b>                        |
|------------------------------------|---|
| DELETE_FACET_PARAMETER             | Delete a facet parameter.                 |
| DELETE_FACET_PATTERN               | Delete a facet pattern.                   |
| DELETE_CSG                         | Delete framework                          |
| DELETE_JOB                         | Delete job.                               |
| DELETE_MEXT                        | Delete Metric Extension                   |
| DELETE_TEMPLATE                    | Delete a monitoring template.             |
| DELETE_NAMED_CREDENTIAL            | Delete Named Credential                   |
| DELETE_PG_EVAL                     | Delete Policy Group Evaluation Results    |
| DELETE_PG_SCHED                    | Delete Policy Group Schedule              |
| DELETE_CCC_RULE                    | Delete a Real-time Monitoring rule.       |
| DELETE_AGENT_REGISTRATION_PASSWORD | Delete Registration Password              |
| RES_STATE_DELETE_OP                | Resolution State deleted                  |
| DELETE_ROLE                        | Drop Role                                 |
| DELETE_RULE                        | Delete Rule                               |
| SWLIBDELETEDFOLDER                 | Deleting a directory in Software Library  |
| SWLIBDELETEENTITY                  | Deleting an entity in Software Library    |
| DELETE_CS                          | Delete Standard                           |
| TCAUD_DELETE                       | Delete Template Collection                |
| DELETE_UPDATE                      | Delete the update                         |
| DELETE_USER                        | Delete User                               |
| DELETE_UDP                         | Delete User Defined Policy                |
| DELETE_UDPG                        | Delete User Defined Policy Group          |
| CCS_DEPLOY                         | Deploy Custom Configuration Specification |
| DETACH_MEXT                        | Detach Metric Extension                   |
| DISABLE_CS_TARGET_ASSOC            | Disable Standard-Target Association       |
| TCAUD_DEASSOC_FROM_AG              | Disassociate Template Collection from AG  |
| DOWNLOAD_UPDATE                    | Download an available update              |
| EDIT_CSG                           | Edit Framework                            |
| EDIT_JOB                           | edit_job                                  |
| EDIT_TEMPLATE                      | EDIT_TEMPLATE                             |
| EDIT_PG_SCHED                      | Edit Policy Group Schedule                |
| EDIT_AGENT_REGISTRATION_PASSWORD   | Edit Registration Password                |
| EDIT_RULE                          | Edit Rule                                 |
| EDIT_CS                            | Edit Standard                             |
| EDIT_CS_TARGET_ASSOC               | Edit Standard-Target Association          |
| TCAUD_EDIT                         | Edit Template Collection                  |

**Table 9–5 (Cont.) List of Operations Audited**

| <b>Operation Name</b>            | <b>Description</b>   |
|----------------------------------|--|
| EDIT_UDP                         | Edit User Defined Policy   |
| EDIT_UDPG                        | Edit User Defined Policy Group   |
| LOGIN                            | Log on   |
| LOGOUT                           | Log off  |
| ENABLE_CS_TARGET_ASSOC           | Enable Standard-Target Association                                       |
| EVALUATE_UDP                     | Evaluate User Defined Policy   |
| PERFORM_OPERATION_AS_AGENT       | Execute any OS Command as the Agent User (uncredentialed)                |
| FILE_TRANSFER                    | Transfer file  |
| GET_FILE                         | Retrieve file  |
| GET_NAMED_CREDENTIAL             | Get Named Credential   |
| GRANT_JOB_PRIVILEGE              | Grant Job Privilege  |
| GRANT_PRIVILEGE                  | Grant Privilege  |
| GRANT_ROLE                       | Grant Role   |
| GRANT_SYSTEM_PRIVILEGE           | Grant System Privilege   |
| GRANT_TARGET_PRIVILEGE           | Grant Target Privilege   |
| IMPORT_FACET                     | Import a facet.  |
| IMPORT_CSG                       | Import Framework   |
| IMPORT_CCC_RULE                  | Import a Real-time Monitoring rule.                                      |
| IMPORT_RULE                      | Import Rule  |
| IMPORT_CS                        | Import Standard  |
| IMPORT_UDP                       | Import User-defined Policy   |
| INCLUDE_ACTION_TO_MONITOR        | Include an action to monitor for the Real-time Monitoring rule.          |
| INCLUDE_FILTER_FACET             | Include a filter facet into the Real-time Monitoring rule.               |
| INCLUDE_MONITORING_FACET         | Include a monitoring facet into the Real-time Monitoring rule.           |
| JOB_OUTPUT                       | Job output obtained after job execution                                  |
| MODIFY_CHANGE_MANAGEMENT_SETTING | Modify the change management settings for the Real-time Monitoring rule. |
| MODIFY_FACET                     | Update a facet.  |
| MODIFY_FACET_CONTENT             | Update the basic facet information.                                      |
| MODIFY_FACET_PARAMETER           | Update a facet parameter.  |
| MODIFY_FACET_PATTERN             | Update a facet pattern.  |
| MODIFY_METRIC_SETTINGS           | Modify metric settings.  |
| UPDATE_NAMED_CREDENTIAL          | Update a named credential.   |
| MODIFY_POLICY_SETTINGS           | Modify Policy settings   |
| MODIFY_CCC_RULE                  | Update a Real-time Monitoring rule.                                      |

**Table 9–5 (Cont.) List of Operations Audited**

| <b>Operation Name</b>               | <b>Description</b>  |
|-------------------------------------|---|
| RES_STATE_MODIFY_OP                 | Resolution State modified   |
| MODIFY_ROLE                         | Modify Role   |
| MODIFY_USER                         | Modify User   |
| SWLIBMOVEENTITY                     | Moving all revisions of an entity in a Software Library to another directory                    |
| PUBLISH_MEXT                        | Publish Metric Extension  |
| SWLIBPURGELOCATION                  | Purging a storage location in Software Library  |
| PUT_FILE_AS_AGENT                   | Put any File to the Management Agent's filesystem as the Management Agent user (uncredentialed) |
| PUT_FILE                            | Put a file  |
| REFRESH_UPDATE                      | Refresh from Enterprise Manager store   |
| AGENT_REGISTRATION_PASSWORD_USAGE   | Registration Password Usage   |
| REMOTE_OPERATION_JOB                | Remote operation job  |
| REMOVE_ACTION_FROM_MONITOR          | Remove an action from the monitor for the Real-time Monitoring rule.                            |
| REMOVE_CHANGE_MANAGEMENT_SETTING    | Remove the change management settings for the Real-time Monitoring rule.                        |
| TCAUD_REMOVE_TEMPLATE_ENTITY        | Remove an entity from Template Collection   |
| REMOVE_FILTER_FACET                 | Remove a filter facet from the Real-time Monitoring rule.                                       |
| REMOVE_MONITORING_FACET             | Remove a monitoring facet from the Real-time Monitoring rule.                                   |
| REMOVE_PRIVILEGE_DELEGATION_SETTING | Remove a Privilege Delegation setting.  |
| SWLIBDELETELOCATION                 | Remove a storage location in the Software Library   |
| REMOVE_CS_TARGET_ASSOC              | Remove a Standard-Target association.   |
| REMOVE_UPDATE                       | Remove the update.  |
| TCAUD_RENAME                        | Rename a Template Collection  |
| AGENT_RESYNC                        | Management Agent resynchronization operation.   |
| REPOSITORY_RESYNC                   | Repository resynchronization operation  |
| RETRY_JOB                           | Retry a job.  |
| REVOKE_JOB_PRIVILEGE                | Revoke a job privilege.   |
| REVOKE_PRIVILEGE                    | Revoke a privilege.   |
| REVOKE_ROLE                         | Revoke a role.  |
| REVOKE_SYSTEM_PRIVILEGE             | Revoke a system privilege   |
| REVOKE_TARGET_PRIVILEGE             | Revoke a target privilege.  |
| SAVE_MONITORING_SETTINGS            | Save monitoring settings.   |

**Table 9–5 (Cont.) List of Operations Audited**

| Operation Name                   | Description                                    |
|----------------------------------|--|
| SET_PRIVILEGE_DELEGATION_SETTING | Set Privilege Delegation settings              |
| STOP_JOB                         | Stop a job.                                    |
| SUBMIT_JOB                       | Submit a job.                                  |
| SUBSCRIBE_UPDATE                 | Subscribe to an Update Type                    |
| SUSPEND_JOB                      | Suspend a job.                                 |
| CCS_UNDEPLOY                     | Undeploy a Custom Configuration Specification. |
| UNSUBSCRIBE_UPDATE               | Unsubscribe an Update Type.                    |
| CCS_UPDATE_MD                    | Update Custom Configuration Specification      |
| UPDATE_DB_PASSWORD               | Update database password.                      |
| INSERT_UPDATE                    | Show the update on Self-update home            |
| UPDATE_MEXT                      | Update a Metric Extension                      |
| UPDATE_PASSWORD                  | Update a password                              |

## 9.8 Additional Security Considerations

After you enable security for the Enterprise Manager components and framework, there are additional security considerations. This section provides the following topics:

- [Changing the SYSMAN and MGMT\\_VIEW Passwords](#)
- [Responding to Browser-Specific Security Certificate Alerts](#)
- [Configuring Beacons to Monitor Web Applications Over HTTPS](#)
- [Patching Oracle Homes When the User is Locked](#)
- [Cloning Oracle Homes](#)

### 9.8.1 Changing the SYSMAN and MGMT\_VIEW Passwords

This section describes the commands used to change the SYSMAN and MGMT\_VIEW passwords.

#### 9.8.1.1 Changing the SYSMAN User Password

To change the password of the SYSMAN user, you use the following command:

```
emctl config oms -change_repos_pwd [-old_pwd <old_pwd>] [-new_pwd <new_pwd>]
[-use_sys_pwd [-sys_pwd <sys_pwd>]]
```

| Parameter         | Description                          |
|-------------------|--------------------------------------|
| -change_repos_pwd | Used to change the SYSMAN password.  |
| -old_pwd          | This is the current SYSMAN password. |
| -new_pwd          | This is the new password.            |

| Parameter    | Description  |
|--------------|--|
| -use_sys_pwd | This parameter is optional and is used to connect to the database as a SYS user. Use this option if SYSMAN account on the database has expired/locked. |
| -sys_pwd     | This is the password for the SYS user.   |

1. Stop all OMS instances.

```
emctl stop oms
```

2. For each OMS, run the following command:

```
emctl config oms -change_repos_pwd'
```

3. Restart the Administration Server and all OMS instances.

```
emctl stop oms -all
```

```
emctl start oms
```

### 9.8.1.2 Changing the MGMT\_VIEW User Password

To change the password of the MGMT\_VIEW user, you use the following command:

```
emctl config oms -change_view_user_pwd [-sysman_pwd <sysman_pwd>] [-user_pwd  
<user_pwd>] [-auto_generate]
```

| Parameter             | Description  |
|-----------------------|--|
| -change_view_user_pwd | Used to change MGMT_VIEW user's password.                    |
| -sysman_pwd           | The password for the SYSMAN user.                            |
| -user_pwd             | The new password for theMGMT_VIEW user.                      |
| -auto_generate        | If this option is specified, the password is auto-generated. |

**Important:** In order to change the MGMT\_VIEW password, you must ensure that the password of the WebLogic administrative user in the credential store matches the actual password of the user SYSMAN. If the credentials do not match, the connection to the Repository Database fails and the SYSMAN password cannot be modified

1. Stop all OMS instances.

```
emctl stop oms -all
```

2. Execute the following command to update the WebLogic and nodemanager passwords in the Credential store:

```
cd <OMS_HOME>/bin
emctl secure create_admin_creds_wallet -admin_pwd <existing weblogic pwd>
-nodemgr_pwd <existing nodemanager pwd>
```

3. Log in to the Management Repository database as a DBA user and execute the following to manually modify the password of the sysman\_mds schema to the new password that will be set for the sysman user:

```
SQL> alter user sysman_mds identified by <new_pwd of sysman user>;
```

4. For **ONE** of the OMSs, run the following command to modify the SYSMAN password::

```
cd <OMS_HOME>/bin
emctl config oms -change_repos_pwd -change_in_db -old_pwd <new_pwd> -new_pwd
<new_pwd>
```

5. Restart the AdminServer and all the OMSs.

```
emctl stop oms -all
emctl start oms
```

## 9.8.2 Responding to Browser-Specific Security Certificate Alerts

This section describes how to respond to browser-specific security alert dialog boxes when you are using Enterprise Manager in a secure environment.

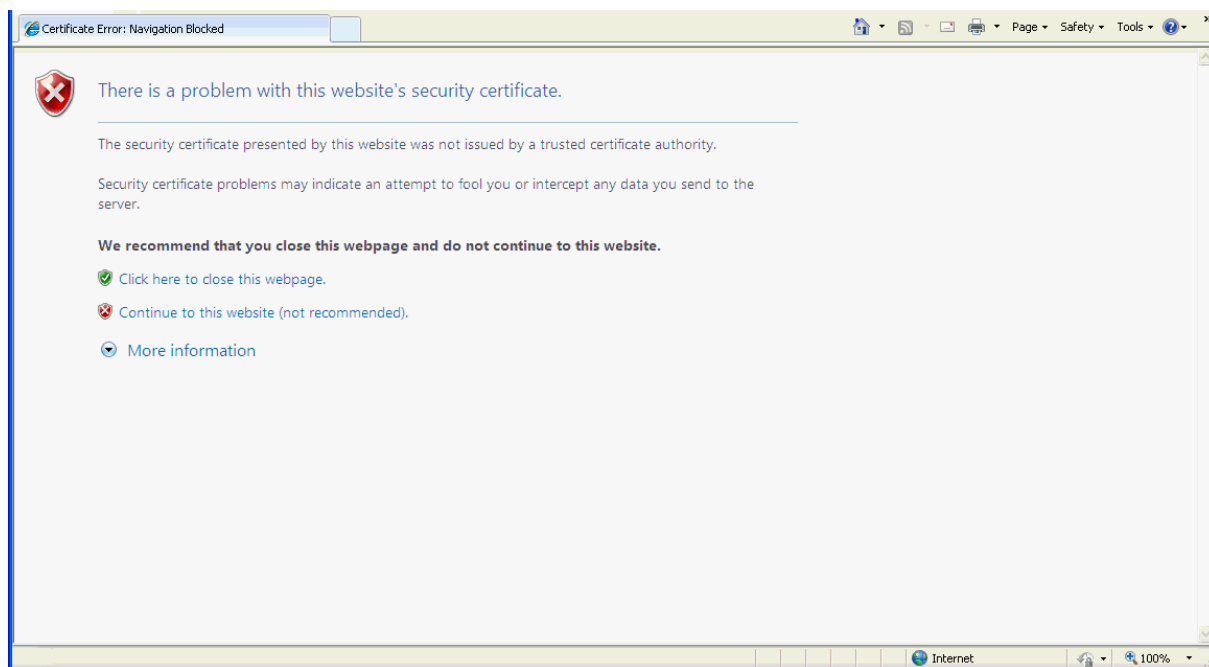

The security alert dialog boxes described in this section appear because Enterprise Manager Framework Security is enabled, but you have not secured your web tier properly.

This section contains the following topics:

- [Responding to the Internet Explorer Security Alert Dialog Box](#)
- [Responding to Mozilla Firefox New Site Certificate Dialog Box](#)

### 9.8.2.1 Responding to the Internet Explorer Security Alert Dialog Box

Security is enabled by default for the Management Service. However, if you have not enabled the more extensive security features of your web tier, you will likely receive the following warning: "There is a problem with this Web site's security certificate." This occurs when you first attempt to display the Cloud Control console using the HTTPS URL in Internet Explorer.

**Figure 9–11 Internet Explorer Security Alert**

When Internet Explorer displays the certificate warning page, use the following instructions to install the certificate and avoid viewing this page again in future Enterprise Manager sessions:

1. From the certificate warning page, click **Continue to this Web site (not recommended)**.

Internet Explorer displays a Security Warning dialog.

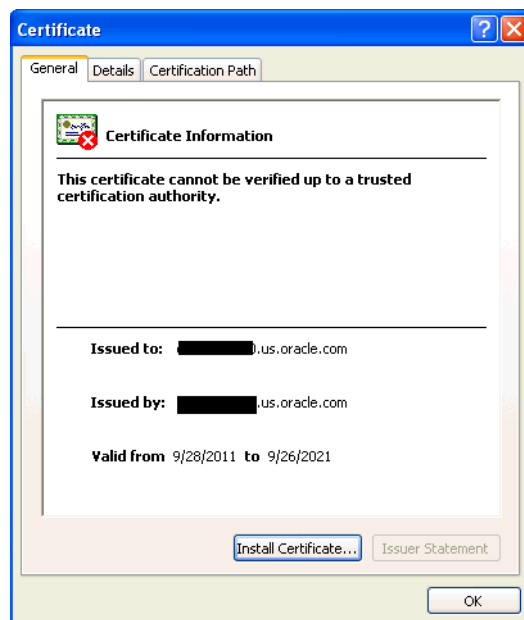

2. Click **Yes**. Internet Explorer may display a **Security Alert** dialog if you have not selected **In the future, do not show this warning**. in a previous Internet Explorer session. Click **OK** to dismiss the dialog.

3. The Enterprise Manager console logon page displays.
4. At the top of the browser, click **Certificate Error** to display the **Security Report** pop-up.

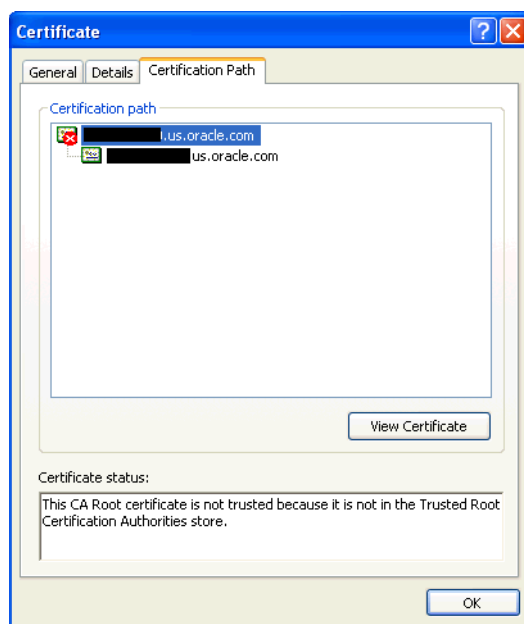

5. Click **View Certificates**. The Certificates dialog appears.

6. Click the **Certificate Path** tab and select the first entry in the list of certificates as shown in the following graphic.

7. Click **View Certificate** to display a second Certificate dialog box.
8. Click **Install Certificate** to display the Certificate Import wizard.
9. Accept the default settings in the wizard, click **Finish** when you are done.

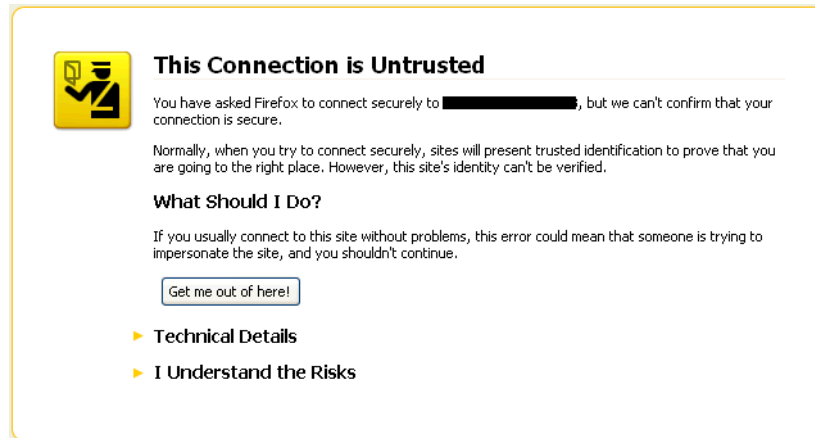

Internet Explorer displays a Security Warning asking if you want to install the certificate. Click **Yes**. Internet Explorer will display a message stating that the certificate was imported successfully.

10. Click **OK** to close each of the security dialog boxes and click **Yes** on the Security Alert dialog box to continue with your browser session.

You should no longer receive the **Security Alert** dialog box in any future connections to Enterprise Manager when you use this browser.

### 9.8.2.2 Responding to Mozilla Firefox New Site Certificate Dialog Box

Firefox will also issue a connection warning if you have not enabled its more extensive security features. When you first attempt to display the Cloud Control console using the HTTPS URL in Mozilla Firefox, you will receive a warning because the connection is untrusted.

When Firefox displays the Untrusted Connection page, use the following instructions to install the certificate and avoid viewing this page again in future Enterprise Manager sessions:

1. Review the instructions and information. Click **I Understand the Risks**. Firefox displays additional information and the opportunity to add the certificate.
2. Click **Add Exception...**. Firefox displays the **Add Security Exception** dialog.

3. Ensure that the **Permanently store this exception** option is selected.

You should no longer receive the New Site Certificate dialog box when using the current browser.

4. Click **Confirm Security Exception**. The Enterprise Manager console displays.

You will no longer receive the untrusted connection warning in any future connections to Enterprise Manager when you use this browser

### 9.8.3 Configuring Beacons to Monitor Web Applications Over HTTPS

Oracle Beacons provide application performance availability and performance monitoring. They are part of the Application Service Level Management features of Enterprise Manager.

**See Also:** "About Application Service Level Management" in the Enterprise Manager Online Help

When a Beacon is used to monitor a URL over Secure Sockets Layer (SSL) using an HTTPS URL, the Beacon must be configured to recognize the Certificate Authority that has been used by the Web site where that URL resides.

**See Also:** "The Public Key Infrastructure Approach to Security" in the *Oracle Security Overview* for an overview of Public Key Infrastructure features, such as Certificate Authorities

The Beacon software is preconfigured to recognize most commercial Certificate Authorities that are likely to be used by a secure Internet Web Site. However, you may encounter Web Sites that, although available over HTTPS, do not have a Certificate that has been signed by a commercial Certificate Authority recognized by the Beacon. The following are out-of-box certificates recognized by Beacons:

- Class 1 Public Primary Certification Authority by VeriSign, Inc.
- Class 2 Public Primary Certification Authority by VeriSign, Inc.
- Class 3 Public Primary Certification Authority by VeriSign, Inc.
- Secure Server Certification Authority by RSA Data Security, Inc.
- GTE CyberTrust Root by GTE Corporation
- GTE CyberTrust Global Root by GTE CyberTrust Solutions, Inc.
- Entrust.net Secure Server Certification Authority by Entrust.net ((c) 1999
- Entrust.net Limited, www.entrust.net/CPS incorp. by ref. (limits liab.))
- Entrust.net Certification Authority (2048) by Entrust.net ((c) 1999
- Entrust.net Limited, www.entrust.net/CPS\_2048 incorp. by ref. (limits liab.))
- Entrust.net Secure Server Certification Authority by Entrust.net ((c) 2000
- Entrust.net Limited, www.entrust.net/SSL\_CPS incorp. by ref. (limits liab.))

In those cases, for example, if you attempt to use the Test section of the Beacon Performance page to test the HTTP Response of the secure URL, the following error appears in the **Status Description** column of the Response Metrics table on the URL Test Page:

```
javax.net.ssl.SSLException: SSL handshake failed:
X509CertChainIncompleteErr--https://mgmtsys.acme.com/OracleMyPage.Home
```

**See Also:** "Using Beacons to Monitor Remote URL Availability" in the Enterprise Manager online help.

To correct this problem, you can either set the service test *Authenticate SSL Certificates* property to *No* or add the certificate authority to the list of Certificate Authorities recognized by Beacon.

**Setting the Service Test "Authenticate SSL Certifications" Property:**

1. From the **Target** menu, choose **Services**.
2. Select the desired service and click **Configure**. The Monitoring Configuration tab displays by default.
3. Click **Service Tests** and **Beacons**. The Service Tests and Beacons page displays.
4. Select the desired service test and click **Edit**. The Edit Service Test page displays.
5. In the **Transaction** region, select the desired service test.
6. Click on the **Advanced Properties** tab.
7. In the **Test Parameters** region, expand **Validation**.
8. For the **Authenticate SSL Certificates** property, choose **No** from the drop-down menu.

**Configuring the Beacon to Recognize the Certificate Authority:**

1. Obtain the Certificate of the Web Site's Certificate Authority, as follows:
  - a. In Microsoft Internet Explorer, connect to the HTTPS URL of the Web Site you are attempting to monitor.
  - b. Double-click the lock icon at the bottom of the browser screen, which indicates that you have connected to a secure Web site.

The browser displays the Certificate dialog box, which describes the Certificate used for this Web site. Other browsers offer a similar mechanism to view the Certificate detail of a Web Site.
  - c. Click the **Certificate Path** tab and select the first entry in the list of certificates.
  - d. Click **View Certificate** to display a second Certificate dialog box.
  - e. Click the **Details** tab on the Certificate window.
  - f. Click **Copy to File** to display the Certificate Manager Export wizard.
  - g. In the Certificate Manager Export wizard, select **Base64 encoded X.509 (.CER)** as the format you want to export and save the certificate to a text file with an easily-identifiable name, such as `beacon_certificate.cer`.
  - h. Open the certificate file using a text editor.

The content of the certificate file will look similar to the content shown in [Example 9-23](#).

2. Update the list of Beacon Certificate Authorities as follows:
  - a. Locate the `b64InternetCertificate.txt` file in the following directory of Agent Home of the Beacon host:

`agent_instance_home/sysman/config/`

This file contains a list of Base64 Certificates.

- b. Edit the `b64InternetCertificate.txt` file by appending the certificate text you exported using the Certificate Manager Export wizard to the end of the file.

Add only the certificate and not the peripheral text generated by the wizard. Do not include: "...base64 certificate content...", "-----BEGIN CERTIFICATE-----", or "-----END CERTIFICATE-----".

### 3. Restart the Management Agent.

After you restart the Management Agent, the Beacon detects your addition to the list of Certificate Authorities recognized by Beacon and you can successfully monitor the availability and performance of the secure Web site URL.

#### **Example 9-23 Sample Content of an Exported Certificate**

```
-----BEGIN CERTIFICATE-----
MIIDBzCCAnCgAwIBAgIQTs4NcImNY3JAs5edi/5RkTANBgkqhkiG9w0BAQQFADCB
... base64 certificate content...
-----END CERTIFICATE-----
```

## 9.8.4 Patching Oracle Homes When the User is Locked

To patch an Oracle Home used by a user "Oracle" and the user is locked:

1. Edit the default patching script and prepend `sudo` or `sudo -u` or `pbrun -u` to the default patching step. You need to set a policy (by editing the `sudoers` file) to allow the user submitting the job (who must be a valid operating system user) to be able to run `sudo` or `pbrun` without being prompted for password.

---

**Note:** You cannot patch Oracle Homes without targets. This must be done by using the Patching wizard.

---

## 9.8.5 Cloning Oracle Homes

The cloning application is wizard-driven. The source of the Oracle Home being cloned may be either an installed Oracle Home or a Software Library. Following are the steps in the cloning process:

1. If the source is an installed Oracle Home, then, after selecting the Oracle Home, a user will need to specify the Oracle Home credentials. These credentials once specified for an Oracle Home are stored in the repository. The next time a user clones the same Oracle Home, these credentials are automatically populated. Other parameters queried from the user at this point is a temporary location (on the source computer) and the list of files to be excluded from the Oracle Home. If the cloning source is a Software Library, the source Oracle Home credentials will not be queried for.
2. The user needs to specify the target location and provide the required credentials for each target location. These credentials will be the Oracle Home credentials for each of these target locations. Subsequently, if a user selects any of these cloned Oracle Homes as a source, the Oracle Home credentials are automatically populated.
3. Depending on the product being cloned, the user can view the Enterprise Manager page where query parameters required for the particular product being cloned are displayed.
4. The user can, then, view the execution of user-supplied pre-cloning and post-cloning scripts and the `root.sh` script. The `root.sh` script will always be run with `sudo` privileges, but the user has the option to decide if the pre-cloning and post-cloning scripts run with `sudo` privileges.
5. Finally, the user can schedule the cloning job at a convenient time.

For more information on cloning, refer to the Enterprise Manager Online Help.

# Part III

---

## Generating Reports

This section contains the following chapters:

- [Using Information Publisher](#)

---

## Using Information Publisher

---

Information Publisher, Enterprise Manager's reporting framework, makes information about your managed environment available to audiences across your enterprise. Strategically, reports are used to present a view of enterprise monitoring information for business intelligence purposes, but can also serve an administrative role by showing activity, resource utilization, and configuration of managed targets. IT managers can use reports to show availability of sets of managed systems. Executives can view reports on availability of applications (such as corporate email) over a period of time.

---

**Note:** The Information Publisher (IP) reporting framework is still supported for Enterprise Manager 12c, however, new report development using this framework has been deprecated for Enterprise Manager 12c.

---

The reporting framework allows you to create and publish customized reports: Intuitive HTML-based reports can be published via the Web, stored, or e-mailed to selected recipients. Information Publisher comes with a comprehensive library of predefined reports that allow you to generate reports out-of-box without additional setup and configuration.

This chapter covers the following topics:

- [About Information Publisher](#)
- [Out-of-Box Report Definitions](#)
- [Custom Reports](#)
- [Scheduling Reports](#)
- [Sharing Reports](#)

### 10.1 About Information Publisher

Information Publisher provides powerful reporting and publishing capability. Information Publisher reports present an intuitive interface to critical decision-making information stored in the Management Repository while ensuring the security of this information by taking advantage of Enterprise Manager's security and access control.

Information Publisher's intuitive user-interface allows you to create and publish reports with little effort. The key benefits of using Information Publisher are:

- Provides a framework for creating content-rich, well-formatted HTML reports based on Management Repository data.

- Out-of-box reports let you start generating reports immediately without any system configuration or setup.
- Ability to schedule automatic generation of reports and store scheduled copies and/or e-mail them to intended audiences.
- Ability for Enterprise Manager administrators to share reports with the entire business community: executives, customers, and other Enterprise Manager administrators.

Information Publisher provides you with a feature-rich framework that is your central information source for your enterprise.

## 10.2 Out-of-Box Report Definitions

The focal point of Information Publisher is the report definition. A report definition tells the reporting framework how to generate a specific report by defining report properties such as report content, user access, and scheduling of report generation.

Information Publisher comes with a comprehensive library of predefined report definitions, allowing you to generate fully formatted HTML reports presenting critical operations and business information without any additional configuration or setup. .

Generating this HTML report involved three simple steps:

**Step 1:** Click **Availability History** (Group) in the report definition list.

**Step 2:** Select the group for which you want to run the report.

**Step 3:** Click **Continue** to generate the fully-formed report.

Supplied report definitions are organized by functional category with each category covering key areas.

To access the Information Publisher home page, from the **Enterprise** menu, choose **Reports** and then **Information Publisher**.

## 10.3 Custom Reports

Although the predefined report definitions that come with Information Publisher cover the most common reporting needs, you may want to create specialized reports. If a predefined report comes close to meeting your information requirements, but not quite, you can use Information Publisher's Create Like function to create a new report definition based on one of the existing reports definitions.

### 10.3.1 Creating Custom Reports

To create custom reports:

1. Choose whether to modify an existing report definition or start from scratch. If an existing report definition closely matches your needs, it is easy to customize it by using the Create Like function.
2. Specify name, category, and sub-category. Cloud Control provides default categories and sub-categories that are used for out-of-box reports. However, you can categorize custom reports in any way you like.
3. Specify any time-period and/or target parameters. The report viewer will be prompted for these parameters while viewing the report.

4. Add reporting elements. Reporting elements are pre-defined content building blocks, that allow you to add a variety of information to your report. Some examples of reporting elements are charts, tables, and images.
5. Customize the report layout. Once you have assembled the reporting elements, you can customize the layout of the report.

### 10.3.2 Report Parameters

By declaring report parameters, you allow the user to control what data is shown in the report. There are two types of parameters: target and time-period.

Example: If you are defining a report that will be used to diagnose a problem (such as a memory consumption report), the viewer will be able to see information for their target of interest.

By specifying the time-period parameter, the viewer will be able to analyze historical data for their period of interest.

#### Analyzing Historical Data

Information Publisher allows you to view reports for a variety of time-periods:

- Last 24 Hours/ 7 Days/ 31 Days
- Previous X Days/ Weeks/ Months/ Years (calendar units)
- This Week/ This Month/ This Year (this week so far)
- Any custom date range.

### 10.3.3 Report Elements

Report elements are the building blocks of a report definition. In general, report elements take parameters to generate viewable information. For example, the Chart from SQL element takes a SQL query to extract data from the Management Repository and a parameter specifying whether to display the data in the form of a pie, bar, or line chart. Report elements let you "assemble" a custom report definition using the Information Publisher user interface.

Information Publisher provides a variety of reporting elements. Generic reporting elements allow you to display any desired information, in the form of charts, tables or images. For example, you can include your corporate Logo, with a link to your corporate Web site. Monitoring elements show monitoring information, such as availability and alerts for managed targets. Service Level Reporting elements show availability, performance, usage and achieved service levels, allowing you to track compliance with Service Level Agreements, as well as share information about achieved service levels with your customers and business executives.

## 10.4 Scheduling Reports

Enterprise manager allows you to view reports interactively and/or schedule generation of reports on a flexible schedule. For example, you might want to generate an "Inventory Snapshot" report of all of the servers in your environment every day at midnight.

### 10.4.1 Flexible Schedules

Cloud Control provides the following scheduling options:

- One-time report generation either immediately or at any point in the future
- Periodic report generation
  - Frequency: Any number of Minutes/ Hours/ Days/ Weeks/ Months/ Years
  - You can generate copies indefinitely or until a specific date in the future.

### 10.4.2 Storing and Purging Report Copies

Enterprise Manager allows you to store any number of scheduled copies for future reference.

You can delete each stored copy manually or you can set up automated purging based on either the number of stored copies or based on retention time. For example, you can have Enterprise Manager purge all reports that are more than 90 days old.

### 10.4.3 E-mailing Reports

You can choose for scheduled reports to be e-mailed to any number of recipients. You can specify reply-to address and subject of the e-mail.

## 10.5 Sharing Reports

Information Publisher facilitates easy report sharing with the entire user community. Enterprise Manager administrators can share reports with other administrators and roles. However, there may be cases when you need to share reports with non-Enterprise Manager administrators, such as customers and/or business executives. To facilitate information sharing with these users, Enterprise Manager renders a separate reporting Web site that does not require user authentication.

---

---

**Note:** To ensure that no sensitive information is compromised, only Enterprise Manager administrators with a special system privilege are allowed to publish reports to the Enterprise Manager reports Web site.

---

---

Information Publisher honors Enterprise Manager roles and privileges, ensuring that only Enterprise Manager administrators can create reports on the information they are allowed to see.

When sharing reports, administrators have an option of allowing report viewers to see the report with the owner's privileges. For example, as a system administrator you might want to share a host's performance information with a DBA using your server, but you do not want to grant the DBA any privileges on your host target. In this case, you could create a host performance report, and allow the DBA to view it with your privileges. This way, they only see the information you want them to see, without having access to the host homepage.

# Part IV

---

## Accessing Enterprise Manager via Mobile Devices

This section contains the following chapter:

- [Cloud Control Mobile](#)

---

## Cloud Control Mobile

This chapter describes how to set up and use an iDevice to remotely connect to Enterprise Manager for the purpose of managing incidents and problems in Cloud Control.

The chapter contains the following sections:

- [Reviewing System Requirements](#)
- [Performing Initial Setup](#)
- [Connecting the First Time](#)
- [Encountering the Login Screen](#)
- [Managing Settings](#)
- [Using Cloud Control Mobile in Incident Manager](#)
- [Working in Cloud Control Mobile](#)
- [Learning Tips and Tricks](#)

### 11.1 Reviewing System Requirements

Cloud Control Mobile can be deployed to the following Enterprise Manager Cloud Control 12c minimum configurations:

- A new installation of the Enterprise Manager Cloud Control 12c (12.1.0.1) patched release (released February 2012 or later)
- An existing Enterprise Manager Cloud Control 12c (12.1.0.1) installation with Bundle Patch 1 (BP1) applied

Additional requirements are as follows:

- iDevice (iPhone, iPod touch, or iPad) running iOS 4.2.x or later
- A Wi-Fi or 3G connection to a network that has access to Enterprise Manager (Cloud Control Mobile supports connections over VPN)
- An Apple account with which to download the app from the iTunes App Store

### 11.2 Performing Initial Setup

Initial setup involves the following tasks:

- Connect to a Wi-Fi or 3G network
- Install and configure VPN
- Download the Cloud Control Mobile app and sync with your iDevice
- Add a Cloud Control URL to connect to the installed Enterprise Manager

## 11.3 Connecting the First Time

When you first install the app, there is no default Enterprise Manager connection, so you must supply a Cloud Control URL. There are two ways to do this:

- Use the iDevice Settings app
- Launch the Cloud Control Mobile app

In either case, first log in to VPN if required before proceeding with the instructions below. Without the VPN connection, the login screen will not appear.

### iDevice Settings

Define a default Cloud Control URL as follows:

1. Tap the Settings icon on the Home screen.
2. Tap Cloud Control in the apps list.
3. On the Cloud Control screen, enter a name to identify the site and type the Cloud Control URL to which to connect. The URL should be of the form:

`https://www.yoursite.com/em`

4. Tap **Settings** to store the information and return to the list of apps.

You can now launch the Cloud Control Mobile app to log in.

### Initial App Launch

Define a default Cloud Control URL as follows:

1. Tap the Cloud Control Mobile icon on the Home screen.
2. On the Add Site screen, enter a name to identify the site and type the Cloud Control URL to which to connect. The URL should be of the form:

`https://www.yoursite.com/em`

Before you can type in the name field you may first have to clear the field by tapping the X at the right.

3. Tap **Done** to store the information.
4. Tap **Done** on the Sites screen. Note that you also have the option to add additional sites before exiting this screen.
5. Tap **Settings** on the Sites navigation bar to close the Sites list screen.
6. Tap **Save** on the Settings navigation bar to complete the action.

Proceed with the login.

## 11.4 Encountering the Login Screen

You encounter the login screen under the following conditions:

- After supplying a default Cloud Control URL upon initial launch
- Anytime you subsequently launch the app
- When you change the default site
- When you log out

Tap the **Settings** icon to see a list of sites or to change the default login site. See [Section 11.5, "Managing Settings"](#) for more information.

Specify your credentials and tap **Login**; the Incident Manager opens, displaying the my open incidents and problems view.

If your Enterprise Manager installation does not have a site certificate signed by a valid certificate authority, an alert overlays the login screen noting an invalid certificate. You have the option to continue with the login or change the URL to which you are trying to connect.

---

**Note:** If your installed Enterprise Manager uses single sign-on, the SSO process supplants site login. Upon completion of single sign-on, the workflow proceeds to the my open incidents and problems view.

---

## 11.5 Managing Settings

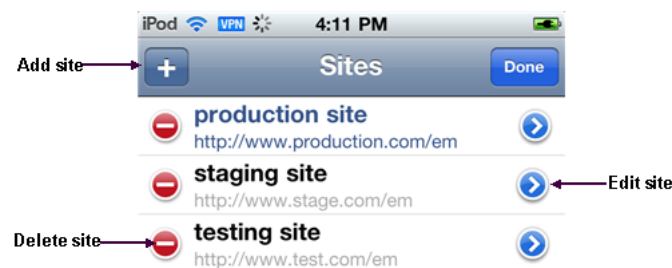

Cloud Control Mobile has its own settings interface apart from the iDevice Settings app that you use to manage all apps.

In managing Cloud Control Mobile app settings, you perform the following actions:

- Add a site
- Edit a site
- Delete a site
- Change the default site

Each action starts with the same basic steps:

1. Tap the actions icon on the right of the navigation bar.
2. Tap **Settings** in the action sheet.
3. Tap the Edit Sites table row.
4. Tap **Edit**. The Sites management screen appears:

Then proceed as described below for each individual action.

### Add a Site

1. Tap the + sign on the left of the Sites navigation bar.
2. Type a name and a URL for the site to be added.
3. Tap **Done** on the Add Site navigation bar to close the screen.
4. Tap **Done** on the Sites navigation bar to exit edit mode.
5. Tap **Settings** on the Sites navigation bar to close the Sites list screen.

6. Tap **Save** on the Settings navigation bar to complete the action.

#### **Edit a Site**

1. Tap the blue arrow to the right of the URL to be edited.
2. Change the values as appropriate.
3. Tap **Done** on the Edit Site navigation bar to close the screen.
4. Tap **Done** on the Sites navigation bar to exit edit mode.
5. Tap **Settings** on the Sites navigation bar to close the Sites list screen.
6. Tap **Save** on the Sites navigation bar to complete the action.

#### **Delete a Site**

1. Tap the red circle to the left of the URL to be deleted.
2. Tap **Delete** that appears on the right in the table row.
3. Tap **Done** on the Sites navigation bar to close the screen.
4. Tap **Settings** on the Sites navigation bar to close the Sites list screen.
5. Tap **Save** on the Settings navigation bar to complete the action.

#### **Change the Default Site**

1. Tap the site to be the new default. The check mark to the right in the table row confirms your selection.
2. Tap **Settings** to close the Sites list screen.
3. Tap **Save** to complete the action.
4. After a brief moment, the Login screen appears. Specify credentials to log in to the new site.

Note that you also can change the default site in iDevice Settings for Cloud Control.

## **11.6 Using Cloud Control Mobile in Incident Manager**

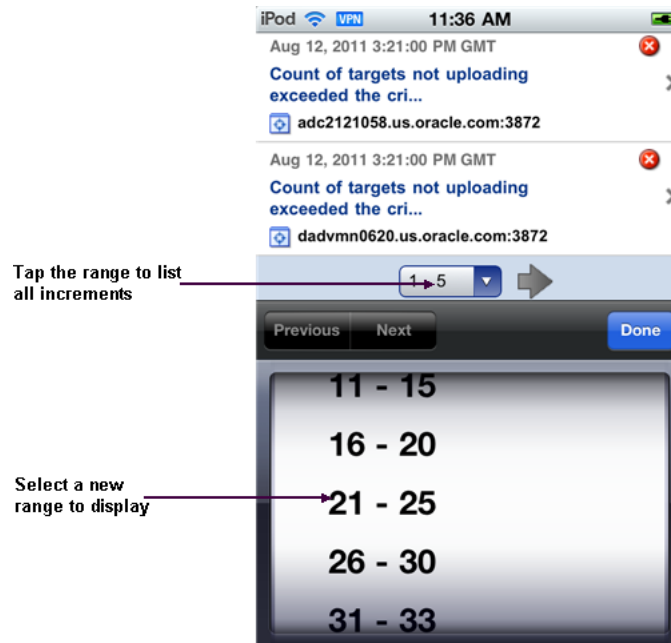

Connecting to Cloud Control remotely, you can do the following in Incident Manager:

- View your open incidents and problems; drill down to incident and problem details, including associated updates and events
- See the list of incidents for a given problem; link to these incidents and their details
- Acknowledge incidents and problems
- Manage incident and problem workflow for better tracking (change status, assign owner, escalate, and so forth)
- See who has been notified about an issue and what comments have been added by administrators

In addition, The FAQ that follows may help in understanding differences, subtleties, and nuances between the mobile app and its browser-based counterpart.

#### **How do I view more issues?**

The app displays five rows at a time. Use the next and previous controls at the bottom of the display to scroll the list. Or tap the number range itself (1 - 5) to pick from a list of increments.

#### How do I view issue details?

Simply tap the line that identifies the incident or problem. On the Details screen, you can continue to drill down to updates and events as well as expand the summary description.

#### Are the views the same in the mobile app as in the browser-based product?

Yes, except for event-related views (standard or custom), which are not available in the app. Any custom views created in the browser-based product augment the list of standard views.

#### Can I refresh the view?

Yes, just tap the refresh icon on the left of the navigation bar. When you do, the timestamp reflects the date and time of the refresh.

#### Can I view target details?

Yes, first drill down to incident details, then tap the target name to jump to target details. Tap **Incident** to return to the incident details.

#### Can I set search criteria or create a custom view?

No, you cannot set search criteria or create a custom view in the mobile app, but you can create and manage views in the browser-based product, which are then available in the mobile app.

#### Can I invoke the incident rules feature?

No, but you can receive notifications generated by incident rules on your mobile device, provided your Enterprise Manager account has the appropriate notification preferences.

#### Can I connect to My Oracle Support?

If a problem has an assigned SR number, you can click the number to view the SR details in the My Oracle Support (MOS) Mobile app.

#### Can I access guided resolution information and diagnostics?

No.

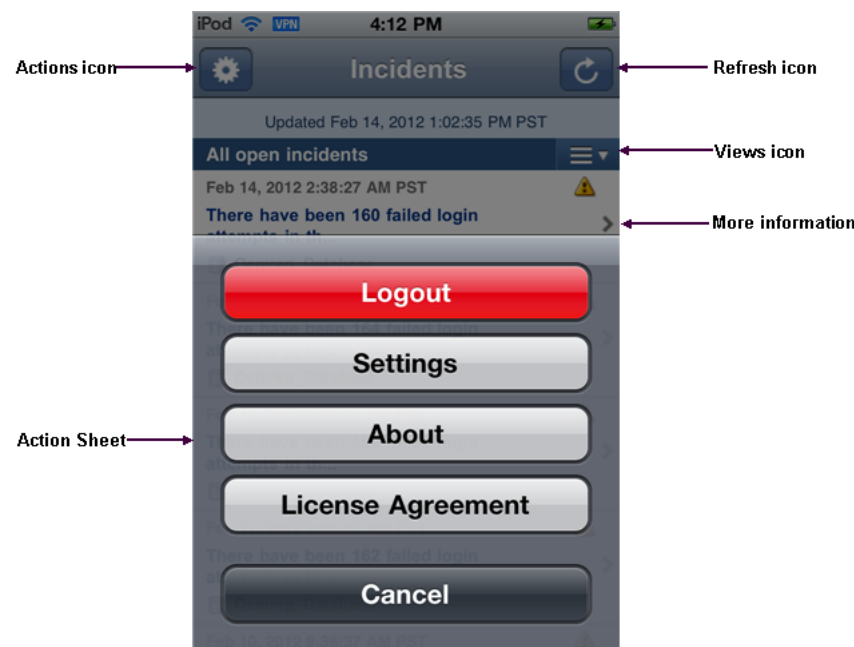

#### Do all iDevices work the same way with the mobile app?

Pretty much. The one difference you will note on an iPad is that if you tap a link to an issue or a target in an external source such as Safari or an e-mail message, Safari launches, pointing to the relevant page in the browser-based product, where you are greeted with the usual Cloud Control login screen. With the other devices, tapping a link in an external source launches the mobile app.

## 11.7 Working in Cloud Control Mobile

This section covers the following operational tasks in Cloud Control Mobile:

- [Viewing Incidents and Problems](#)
- [Changing Views](#)
- [Performing Actions](#)

### 11.7.1 Viewing Incidents and Problems

Although navigation is intuitive, the following sections offer guidance on viewing incidents and problems. As the interactions are slightly different, there is a separate section for each type of issue.

#### Viewing Incidents

Use the following guidelines as you view incidents in the list:

- An arrow on the right indicates availability of additional information.
- Tap anywhere in the incident row to drill down to incident details.

- The summary appears at the top. As summaries can be lengthy, you may need to tap the opening lines of the summary to view the complete summary. Tap **Incident** to return to incident details.
- Problem ID in incident details is a link to problem details. If you follow the link, tap **Incidents** there to return to the starting point; that is, the original list view where you first opened the incident.
- In the incident details view, target name is a link to target details. Tap **Incident** there to return to incident details.
- Tracking information appears below target name in the incident details view.
- Scroll down in incident details and tap **All Updates** to see the equivalent of the **Updates** tab in the browser-based product. Tap **Incident** there to return to incident details.
- Scroll further and tap **Event List** to see the equivalent of the **Events** tab in the browser-based product. Tap **Incident** there to return to incident details.

### Viewing Problems

Use the following guidelines as you view problems in the list:

- An arrow on the right indicates availability of additional information.
- Tap anywhere in the problem row to drill down to problem details.
- The summary appears at the top. As summaries can be lengthy, you may need to tap the opening lines of the summary to view the complete summary. Tap **Problem** to return to problem details.
- If the problem has an SR number assigned, tap the number to log in to the My Oracle Support (MOS) Mobile app using your MOS credentials. You can then view the SR details and take appropriate action. Go to the Home screen and tap the Cloud Control Mobile app icon to return to problem details.
- In the problem details view, target name is a link to target details. Tap **Problem** there to return to problem details.
- Tracking information appears below target name in the problem details view.
- Scroll down in problem details and tap **All Updates** to see the equivalent of the **Updates** tab in the browser-based product. Tap **Problem** there to return to problem details.
- Scroll further to see additional details such as first and last incident and number of incidents in which the problem has occurred.
- Scroll further and tap **Incident List** to see the equivalent of the **Incidents** tab in the browser-based product. Tap **Problem** there to return to problem details.
- Each incident summary in the list is a link to the details of the incident. If you follow the link, tap **Incidents** there to return to the starting point; that is, the original list view where you first opened the issue.

## 11.7.2 Changing Views

When you first log in, the my open incidents and problems view appears by default. You can change the view as follows:

1. Open the Views menu by tapping the views icon (three horizontal lines to the right of the current views title).

2. Tap the view you want. The check mark to the right confirms your selection.
3. Tap **Incidents** to display the new view.

### 11.7.3 Performing Actions

You can perform the following actions while viewing incident or problem details:

- Acknowledge the issue
- Manage the workflow of the issue

To acknowledge an incident or problem:

1. While viewing the details, tap **Actions**.
2. Tap **Acknowledge** in the action sheet.

A message confirms the update on the Details screen.

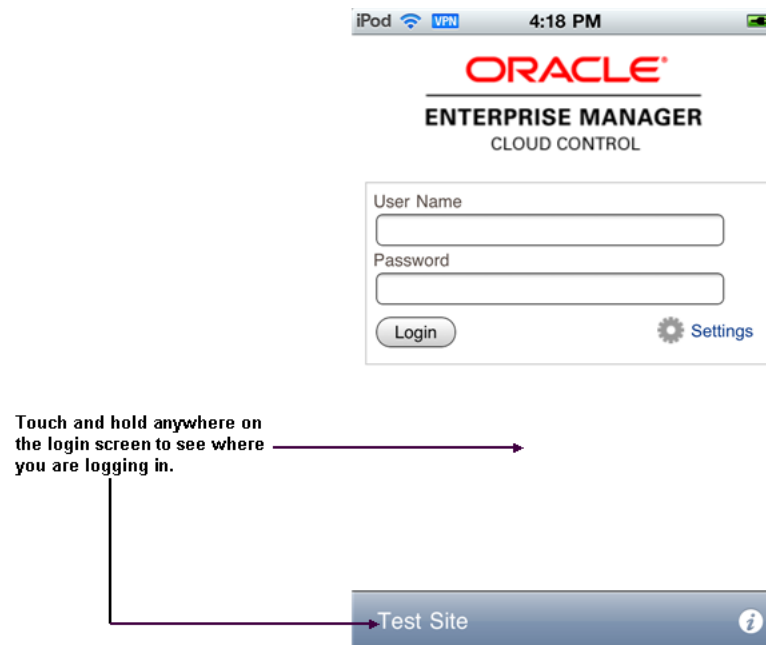

Note that the Acknowledge action may not appear in the action sheet for a variety of reasons; for example, the issue has already been acknowledged or closed, or you do not have the right permissions to acknowledge the issue.

To manage the workflow of an incident or problem for better tracking:

1. While viewing the details, tap **Actions**.
2. Tap **Manage** in the action sheet.
3. Complete the Manage dialog the same as you would in the browser-based product. The only thing missing is the ability to add styles and formatting to the comment.
4. Tap **Save** to complete the action.

## 11.8 Learning Tips and Tricks

Use a touch-and-hold gesture at any time within the app to display on the bottom of the screen the current site to which you are logged in or about to log in. If the site name is unavailable, the URL appears. With the site identity displayed, tap the information icon on the right to access the Settings screen, where you can manage your sites and change the default site. Repeat the touch-and-hold gesture to remove the site display from the bottom of the screen.

If you have logged out of the app and find that you are stuck on a page trying to return to Cloud Control Mobile, you have a couple of options to resolve the issue:

- Open [iDevice Settings](#) and change the Cloud Control default URL.
- Force quit the app and restart Cloud Control Mobile. For example, press and hold the On/Off button on top of the device until the power off slider appears, and then press the Home button until the app closes.

# Part V

---

## Administering Cloud Control

This section contains the following chapters:

- [Personalizing Cloud Control](#)
- [Maintaining Enterprise Manager](#)
- [Updating Cloud Control](#)
- [Using Plug-Ins](#)
- [Patching Enterprise Manager](#)
- [Starting and Stopping Enterprise Manager Components](#)
- [Locating and Configuring Enterprise Manager Log Files](#)

---

## Personalizing Cloud Control

You can personalize the page layout and data displayed in certain Cloud Control pages, including target home pages such as the Oracle WebLogic Server target home page. The changes you make are persisted for the currently logged in user, enabling you to create customized consoles for monitoring various target types.

Personalization support provided in the current release allows you to:

- Customize the layout of regions on a page
- Add a region to, or remove a region, from a page
- Specify what data should be displayed within each region
- Set your own homepage

Note that not all pages in Cloud Control can be personalized. The page edit mode will only be enabled for those pages or page regions that can be modified.

This chapter contains the following sections:

- [Personalizing a Cloud Control Page](#)
- [Customizing a Region](#)
- [Setting Your Homepage](#)

### 12.1 Personalizing a Cloud Control Page

Pages in Cloud Control are laid out in a columnar format. Each column contains one or more *regions*, each of which contains data rendered as a bar chart, graph or other visual component.

You can modify the layout of columns within a page, as well as select the regions to display within each column, enabling you to personalize how the data on a page is arranged and displayed.

To personalize a page:

1. Navigate to the page you want to personalize.
2. Do one of the following:
  - Select **Personalize Page** from the menu item that displays the username of the currently logged-in user, just to the left of the Log Out menu item. In [Figure 12-1](#), the menu item displays the SYSMAN user name.

**Figure 12–1 Personalize Page Menu**

- Or, click the “Personalize Page” icon on the right-hand side of the page, shown just above the “Page Refreshed” time stamp, as shown in [Figure 12–2](#).

**Figure 12–2 Personalize Page Icon**

Note that the menu item or icon will only be enabled if the page you are currently on can be personalized.

3. You are now in page edit mode. Click the **Change Layout** button. A graphical menu of column layout options opens.
4. Select the column layout you want to use.
5. Next, add a region to each column. Click the **Add Content** button for a specific column. The Resource Catalog, which contains available components used to display data, opens.
6. Select a region, then click **Add** to add it to the column. Note that you can “stack” regions on top of one another.
7. Once a region has been added to a column, you can:
  - Customize the region. See [Section 12.2, "Customizing a Region"](#) for details.
  - Click the **View Actions** icon to move the region up or down within the column.
  - Drag the region from one column to another.
8. Click **Close** to save your changes.

## 12.2 Customizing a Region

A *region* contains business data rendered as a bar chart, graph or other visual component. You can select the component to display within a specific region.

To customize a region within a page column:

1. Navigate to the page containing the region you want to customize and enable the page editing mode as described in [Section 12.1, "Personalizing a Cloud Control Page"](#).
2. Click the "ratchet" icon next to the "X" icon within a region, as shown in [Figure 12-3](#). Note that the icon will only be enabled if the region can be customized.

**Figure 12-3 Customize Region Icon**

For most resources, you will specify the target host from which to collect data.

Other configurable parameters and customization options vary between regions. When you click the icon, a dialog opens to enable you to specify parameters, such as target type, target name and metric name.

3. If at a later time you want to remove the region from the page, click the "X" icon in the region.
4. Click **Close** to save your changes.

## 12.3 Setting Your Homepage

Cloud Control allows you to choose the page that will serve as your homepage - the first page you see after logging in to Cloud Control. You can either:

- Choose your own page, such as a target homepage that you view frequently or have customized to suit your specific needs
- Select from a pre-designed homepage templates created for specific types of Cloud Control users

### Choosing Your Own Homepage

1. Navigate to the page you want to set as your homepage.
2. Select **Set Current Page As My Home** from the menu item that displays the username of the currently logged-in user, just to the left of the Log Out menu item, as shown in [Figure 12-1](#).

### Selecting a Pre-Designed Homepage

1. Select **Select My Home** from the menu item that displays the username of the currently logged-in user, just to the left of the Log Out menu item, as shown in [Figure 12-1](#).
2. Click the **Preview** button to preview a page design template you are interested in.
3. Click the **Select As My Home** button to select a template as your homepage. Once you have selected a page, you can customize it to suit your needs.

### De-selecting Your Homepage

Your homepage is saved as a “favorite” page. To de-select your current homepage:

1. From the **Favorites** menu, select **Manage Favorites**.
2. Select your homepage from the list, then click the **Remove Favorite** button.
3. Click **OK** when finished.

---

## Maintaining Enterprise Manager

Enterprise Manager provides extensive monitoring and management capabilities for various Oracle and non-Oracle products. Used to manage your heterogeneous IT infrastructure, Enterprise Manager plays an integral role in monitoring and maintaining the health of your IT resources. It is therefore essential to make sure Enterprise Manager itself is operating at peak efficiency.

To help you maintain your Enterprise Manager installation, a variety of enhanced self-monitoring and diagnostic functionality is available from the Enterprise Manager console. These functions are designed to help you understand and monitor various components of Enterprise Manager, monitor/measure the quality of services Enterprise Manager provides, diagnose failures quickly, and manage Agents more easily.

This chapter covers the following topics:

- [Overview: Managing the Manager](#)
- [Management Services and Repository](#)
- [Viewing Enterprise Manager Topology and Charts](#)
- [Viewing Enterprise Manager Services](#)
- [Controlling and Configuring Management Agents](#)

### 13.1 Overview: Managing the Manager

Although Enterprise Manager functions as a single entity to manage your IT infrastructure, in reality it is composed of multiple components working in concert to provide a complete management framework from a functional standpoint. Beginning with Enterprise Manager 12c, the functions used to ensure reliability and performance for your monitored targets can be used to maintain Enterprise Manager itself. All major components of Enterprise Manager have been grouped into a single system. A special set of services has been created (based on the system) to model Enterprise Manager functions.

#### Management Features

- Topology view that allows you to see all major components of Enterprise Manager and their current status.
- Enterprise Manager dashboard displaying the overall health of Enterprise Manager.
- Full control of the Agent directly from the Enterprise Manager console. Functions include:
  - View/edit Agent configuration properties.

- View Agent(s) configuration history and compare the results against other Agents.
- Perform Agent control operations (start/stop/secure).

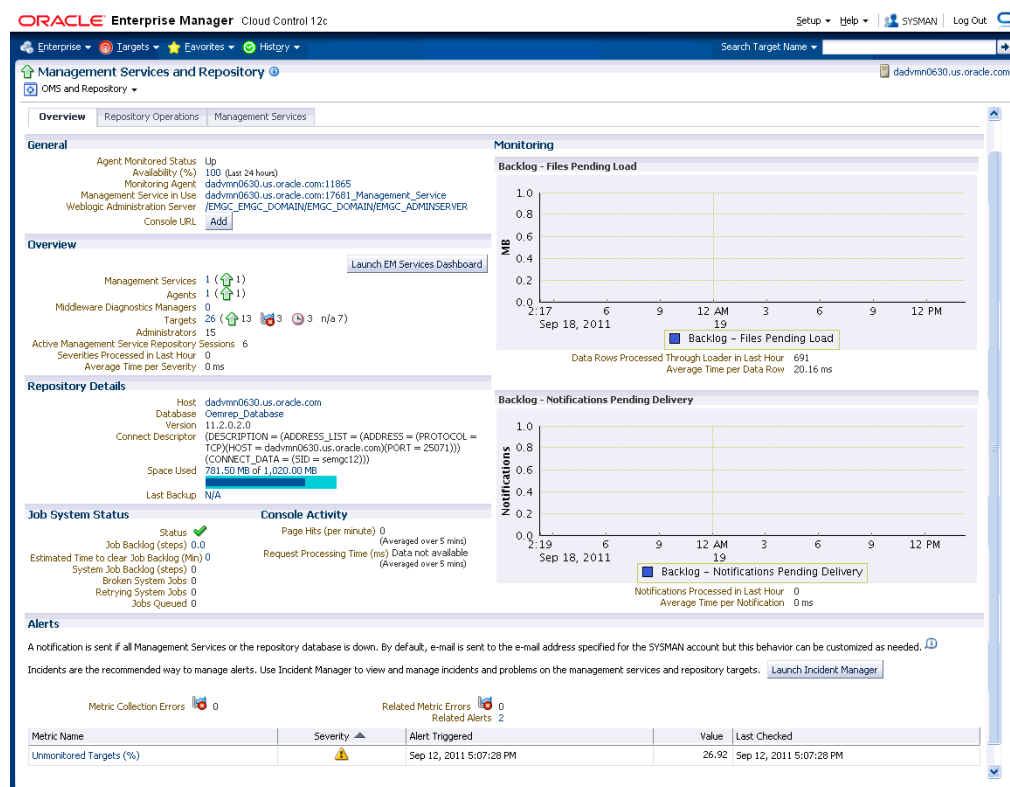

## 13.2 Management Services and Repository

The Management Services and Repository home page provides a detailed overview of the OMS and Repository.

### Accessing the Management Services and Repository Home Page

From the **Setup** menu, click **Management Services and Repository**.

**Figure 13–1 Management Services and Repository Home Page**

### Overview Page

The Overview page displays a summary of the current status of the OMS and Repository. The Overview page also provides details on the status of the Job system and the console activity and two monitoring charts that indicate the backlog in terms of the files pending and the backlog on notifications pending delivery.

Each region provides specific information on the various operational areas of the OMS and Repository.

- **General:** provides the Agent monitored status, availability and the host details of the Management Service in use, the monitoring Agent and the WebLogic administration server.

- **Overview:** Displays the number and breakdown in term of status for the OMS, Agents, targets, active OMS repository sessions and severities detected within the past hour.
- **Repository Details:** Provides physical information about the Management Repository and the host on which the database is located.
- **Alerts:** Provides details on the metric errors recorded and when an alert was triggered. In-context links to Incident Manager are also provided.

### Repository Operations Page

The Repository Operations page provides you with an overview of the status and performance of the Repository DBMS Jobs that handle part of Enterprise Manager's maintenance and monitoring functionality. These DBMS jobs run within the Management Repository and require no user input. Charts showing the **Data Upload to Repository** and the **Backlog** in Repository collection are provided. The **Scheduler Status** region provides the status of the scheduler and the number of Job Queue Processes.

**Figure 13–2 Repository Operations Page**

The **Repository Scheduler Jobs Status** region provides details of the DBMS Jobs regarding their status, throughput, processing time, the next scheduled run and the last scheduled run.

Use the Repository Operations page to view the performance of the Repository DBMS jobs. If you want more information, clicking a link brings you to a metrics detail page.

To determine how well the Management Repository is handling its share of the Enterprise Manager functionality, view the Throughput per second and Processing

Time Percent (Last Hour) columns. If the Processing Time Percent (Last Hour) is large and the Throughput is low, there may be problems in that area of management.

---

**Note:** Processing Time (%) Last Hour may exceed 100% if a job runs continuously for more than an hour. For example, if you see 125.00 in this column, it means that the job ran for 75 minutes (125 % of one hour).

---

### Management Services Page

The **Management Services** page lists the names of the Management Services and their status. When an OMS is decommissioned, status will be shown as down and delete button will be displayed, allowing you to remove the decommissioned OMS from EM.

**Figure 13–3 Management Services Page**

By clicking on the individual Management Service, you can drill down to that OMS' target home page for explicit information and status.

## 13.3 Viewing Enterprise Manager Topology and Charts

The Enterprise Manager Topology page provides a graphical representation of the Enterprise Manager infrastructure components and their association. Each node in the hierarchy displays key information about the member type, the host on which it resides, and the number of incidents, if any. The incident icons on each of the nodes expand to display a global view of current status for each node in the hierarchy.

---

**Note:** In order for the Enterprise Manager repository database to appear in the Topology page, you must first manually discover the database. Manual discovery is also required in order to have the database's metric data (Database Time (centiseconds per second)) displayed in the charts.

---

## Accessing the Enterprise Manager Topology

1. From the Setup menu, choose Management Services and Repository.
2. On the Management Services and Repository page, click on the **OMS and Repository** drop-down menu.
3. Choose **Members** and then **Topology**.

**Figure 13–4 Enterprise Manager Topology**

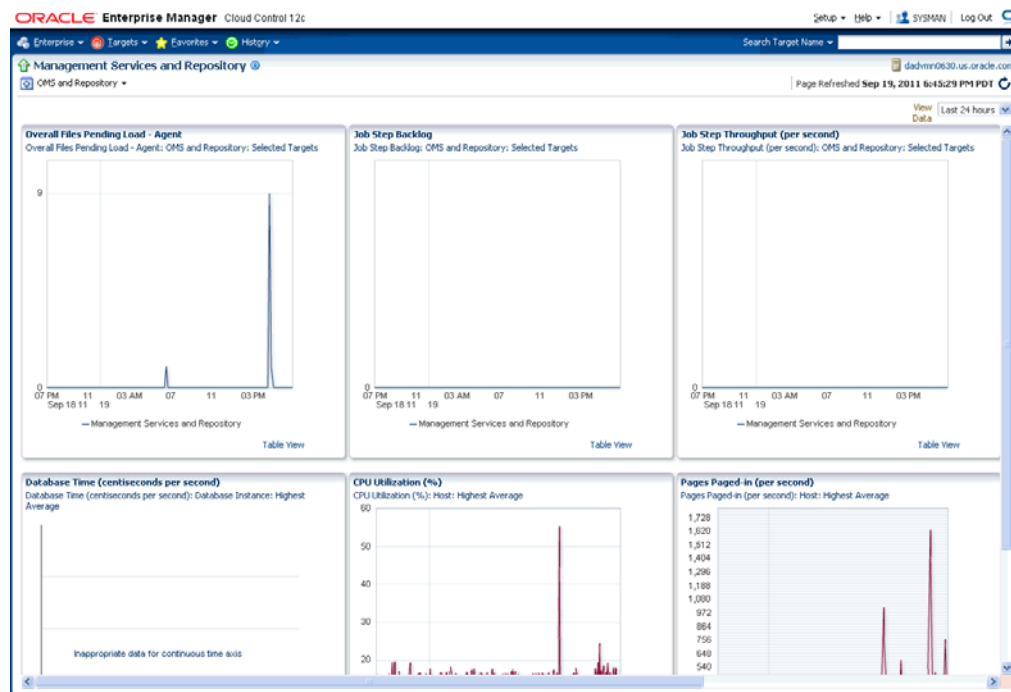

## Enterprise Manager Charts

The Enterprise Manager Charts page displays eight charts representing key areas that together indicate the overall health of Enterprise Manager. These are Overall Files Pending Load -Agent, Job Step Backlog, Job Step Throughput (per second), Request Processing Time (ms), Database Time (centiseconds per second), CPU Utilization (%), Pages Paged-in (per second), Pages Paged-out (per second). Data can be viewed for the Last 24 hours, last 7 days or last 31 days.

## Accessing the Enterprise Manager Charts

1. From the Setup menu, select **Management Services and Repository**.
2. On the Management Services and Repository page, click on the **OMS and Repository** drop-down menu.
3. Select **Monitoring**, then select **Charts**.

**Figure 13–5 Enterprise Manager Charts**

## 13.4 Viewing Enterprise Manager Services

The Enterprise Manager Services dashboard provides details about the two primary services in-context: Enterprise Manager Jobs Service and the Enterprise Manager Console Service. The **Status**, **Performance** (gauged by means of specific metrics), **Usage and Business Indicators** (again through specific metrics), **Component Status** and the **Service Level (%)** for the two primary services for the Last 24 hours, last 7 days and last 31 days are detailed.

### Accessing the Enterprise Manager Topology

1. From the **Setup** menu, choose **Management Services and Repository**.
2. On the Management Services and Repository page, click **Launch EM Services Dashboard** in the Overview region.

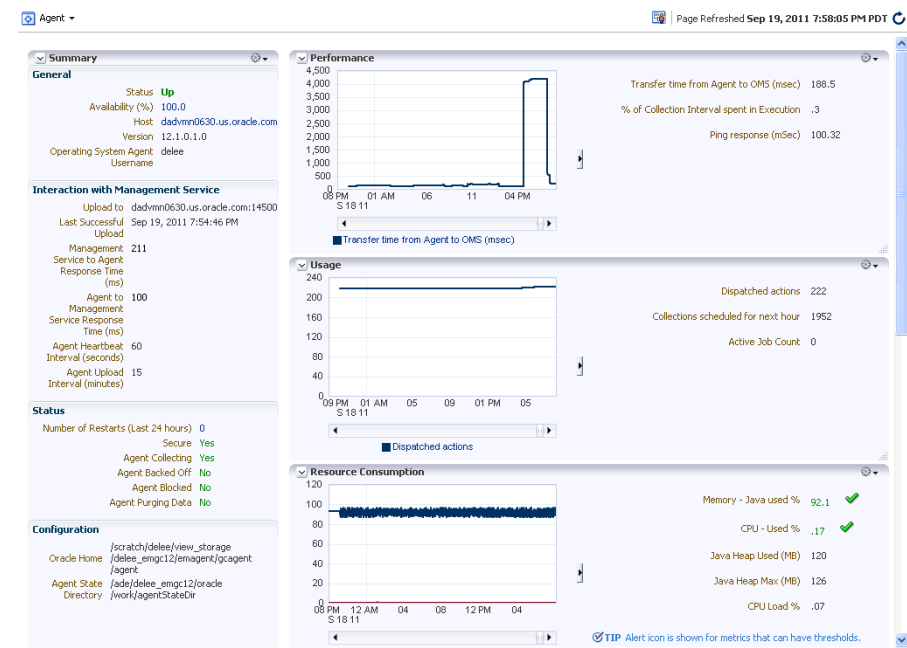

**Figure 13–6 Enterprise Manager Services Dashboard**

## 13.5 Controlling and Configuring Management Agents

Beginning with Enterprise Manager Cloud Control 12c, management of Management Agents can be performed directly from the Enterprise Manager console. This provides a central point where all Management Agents for your managed targets can be compared, configured and controlled.

### 13.5.1 Management Agent Home Page

The Management Agent home page provides details for a single Management Agent. This page also lets you drill down for more detailed information. You can access an Agent home page by selecting it from the All Targets page.

**Figure 13–7 Agent Home Page**

The **Summary** region provides primary details of the Management Agent such as its status and availability. The **Interaction with Management Service** region provides

details on the communication between the OMS and the Management Agent. The **Status** region provides further details on the Management Agent status such as the number of restarts, the action that the Management Agent is performing currently. The **Performance, Usage and Resource Consumption** charts provide further details on the Management Agent in graphical format. The **Incidents** region lists the incidents recorded for the Management Agent. The **Monitoring** section provides details on the targets that are being monitored by the Management Agent, metric extensions and management plug-ins deployed in the Management Agent.

### 13.5.2 Controlling a Single Agent

Control operations for a single Management Agent can be performed on the Agent home page for that Agent.

1. Navigate to the desired Management Agent home page.
2. From the **Agent** drop-down menu, choose **Control** and then one of the control operations (Start Up/Shut Down, or Restart)

---

**Note:** You must have at least operator privileges in order to perform Agent control operations.

---

**Figure 13–8 Control Operations from the Agent Home Page**

Upon choosing any of the above control menu options, a pop-up dialog requesting the credentials of the user displays. These operations require the credentials of the OS user who owns the Management Agent. At this point, you can either choose from a previously stored username/password, preferred or named credential. You also have the option of choosing a new set of credentials which could also be saved as the preferred credential or as a named credential for future use.

When storing a named credential or creating a new set of credentials, a **Test** button is shown, thus allowing you to verify if the credential information you just entered is valid. Once you are authenticated, the chosen control operation begins and continues even if the pop-up dialog is closed. Any message of failure/success of the task is displayed in the pop-up dialog.

When choosing the Secure/Resecure/Unsecure options, you must provide the requisite Registration Password.

### 13.5.3 Configuring Single Management Agents

Configuration operations for a single Management Agent can be performed from the Management Agent home page. To access the Management Agent properties page:

1. Navigate to the desired Management Agent home page.
2. From the **Agent** drop-down menu, select **Properties**.

**Note:** You must have at least Configure privileges in order to perform Agent configuration operations.

**Figure 13–9 Agent Properties Page**

| Name                      | Value  | Description   |
|---------------------------|--|---|
| agentVersion              | 12.1.0.1.0   | Agent Version   |
| agentTZRegion             | PSTPDT   |   |
| emdRoot                   | /scratch/delee/view_storage/delee_emgc12/enaagent/icaagent | EMD Root directory  |
| agentStateDir             | /ade/delee_emgc12/oracle/work/agentStateDir                | Agent Root directory  |
| perlBin                   | /ade/delee_emgc12/oracle/perl/bin                          | Perl home to be used.   |
| scriptsDir                | /scratch/delee/view_storage/delee_emgc12/enaagent/icaagent | Path of scripts directory   |
| EMD_URL                   | https://dadm0630.us.oracle.com:11905/emd/main/             | EMD URL   |
| REPOSITORY_URL            | https://dadm0630.us.oracle.com:14500/embs/upload           | Repository URL  |
| EMDAGENT_PERL_TRACE_LEVEL | DEBUG  | Trace level for the Perl trace file.  |
| UploadInterval            | 15   | Maximum interval at which agent uploads accumulated data files, in minutes. |

The properties on this page can be filtered to show **All Properties**, **Basic Properties**, or **Advanced Properties**. The **Basic Properties** are a simple name, value combination of a property and its value. **Advanced Properties** are also a combination of name and value but can also be grouped into categories. You must have at least *configure* privileges in order to modify the existing properties and set custom properties.

### 13.5.4 Controlling Multiple Management Agents

In order to perform control operations on multiple Management Agents, Enterprise Manager makes use of the Job system to automate repetitive tasks. Therefore, you must have Job privileges for controlling multiple Management Agents through a single action. To access

1. From the **Setup** menu, select **Agents**. The Management Agent setup page displays.
2. Select multiple Management Agents from the list.
3. Click one of the control operation buttons (**Start Up/Shutdown/Restart/Secure/Resecure/Unsecure**).

When you click on any of the control operations, you are taken to the Job creation wizard where you schedule a new job to perform the action on the selected Agents.

**Figure 13–10 Multiple Agent Control Operation: Job Creation**

The screenshot shows the 'Create Agents Control Operation' Job page in the Oracle Enterprise Manager Cloud Control 12c interface. The 'General' tab is selected. The job name is 'Agents\_Secure\_2011\_Sep\_20\_15\_13\_20'. The description is 'This job secures the agents'. The target type is 'Agent'. Below the 'Target' section, there is a table with one entry:

| Select                   | Name                          | Type  | Host                    | Time Zone             |
|--------------------------|-------------------------------|-------|-------------------------|-----------------------|
| <input type="checkbox"/> | dadvm0630.us.oracle.com:11865 | Agent | dadvm0630.us.oracle.com | Pacific Daylight Time |

In the Jobs page, you can view the chosen Management Agents in Target section in the General tab. You can add more Management Agents by clicking the **Add** button. You then provide the parameters for the operation in the **Parameters** tab, if needed. The credentials must be specified in the **Credentials** tab where you can either choose from a previously stored username/password, preferred, or named credential. You also have the option of choosing a new set of credentials which could also be saved as the preferred credential or as a named credential for future use.

You are given the option to start the job immediately or schedule the job for a later time. At this point, you can also create a repeating job by specifying the job start time, the frequency, and the end time.

The Access tab displays the Administrator details and the access levels they have to the job. You can then add a new administrator or modify the access level to **View** or **Full**, if you have the requisite privileges.

**Figure 13–11 Job Creation: Access Tab**

The screenshot shows the 'Create Agents Control Operation' Job page in the Oracle Enterprise Manager Cloud Control 12c interface, with the 'Access' tab selected. The table contains Administrators and Roles that have access to this job. The table has columns: Name, Type, Access Level, and Remove. The data is as follows:

| Name              | Type                | Access Level | Remove |
|-------------------|---------------------|--------------|--------|
| CLOUD_ENGINE_USER | Super Administrator | View         |        |
| SYS               | Super Administrator | View         |        |
| SYSMAN            | Super Administrator | Owner        |        |
| SYSTEM            | Super Administrator | View         |        |
| TESTSUPERADMIN    | Super Administrator | View         |        |

Below the table, there is an 'E-Mail Notification for Owner' section. It states: 'A Notification rule may be used by any Administrator to receive notifications about this job. The owner may choose to receive e-mail notifications based on any of the selected status values below. E-mail will be sent based on the Owner's notification schedule.' There are checkboxes for: Schedule, Running, Suspended, Succeeded, Problem, and Action Required. Below these, it says: 'No E-mail addresses are found. The notification schedule is not defined.'

**Note:** Administrators with insufficient privileges can also schedule jobs for these control operations, but in this situation, the jobs will not complete successfully.

### 13.5.5 Configuring Multiple Agents

As with multi-Agent control operations, you can also perform Agent configuration on multiple Agents in the same way. This greatly simplifies standardizing Agent configurations across your enterprise. To access Agent properties:

1. From the **Setup** menu, select **Agents**. The Management Agent setup page displays.
2. Select multiple Management Agents from the list.
3. Click **Properties**. As with any multi-Agent operation, configuration is implemented using the Job system.

**Figure 13–12 Agent**

The screenshot shows the Oracle Enterprise Manager interface for creating a job. The title is "Create 'Agents Configuration Operation' Job". There are tabs for "General", "Parameters", "Credentials", "Schedule", and "Access". The "Parameters" tab is selected, showing "Agent Configuration Properties".

| Name                 | Value | Description  |
|----------------------|-------|--|
| agentTZRegion        |       |  |
| CLASSPATH            |       | Additional classpath used for launching agent.   |
| agentJavaDefines     |       | Additional java flags used for launching agent.  |
| proxyHost            |       | hostname of HTTP proxy used to connect to targets. Not used for upload to EM repository.   |
| proxyPort            |       | port number of HTTP proxy used to connect to targets. Not used for upload to EM repository.                                      |
| dontProxyFor         |       | comma-separated list of domains that should not use HTTP proxy when connecting to targets. Not used for upload to EM repository. |
| REPOSITORY_PROXYHOST |       | hostname of HTTP proxy used to connect to EM repository.   |
| REPOSITORY_PROXYPORT |       | port number of HTTP proxy used to connect to EM repository.  |
| REPOSITORY_PROXYUSER |       | username for an authenticated HTTP proxy used to connect to EM repository.   |
| REPOSITORY_PROXYPWD  |       | password for an authenticated HTTP proxy used to connect to EM repository.   |

In the Jobs page, you can view the chosen Management Agents in the Target section of the General tab. You can add more Management Agents by clicking the **Add** button if necessary. In the **Parameters** tab, you provide the modified value for a particular set of properties that you want to change. You can also set a custom property for the chosen agents. No credentials are required for modifying Agent properties.

The **Access** tab displays the administrator details and the access levels they have to the job. You can then add a new administrator or modify the access level to View or Full if you have the requisite privileges.

**Figure 13–13 Multi-Agent Configuration: Job Access**

The screenshot shows the 'Create 'Agents Configuration Operation' Job' dialog in Oracle Enterprise Manager. The 'Access' tab is selected, displaying a table of administrators and roles with access to the job. Below the table is an 'E-Mail Notification for Owner' section with checkboxes for various status values.

**Table: Administrators and Roles with Access**

| Name              | Type                | Access Level | Remove |
|-------------------|---------------------|--------------|--------|
| CLOUD_ENGINE_USER | Super Administrator | View         |        |
| SYS               | Super Administrator | View         |        |
| SYSMAN            | Super Administrator | Owner        |        |
| SYSTEM            | Super Administrator | View         |        |
| TESTSUPERADMIN    | Super Administrator | View         |        |

**E-Mail Notification for Owner**  
A Notification rule may be used by any Administrator to receive notifications about this job. The owner may choose to receive e-mail notifications based on any of the selected status values below. E-mail will be sent based on the Owner's notification schedule.

☐ Scheduled ☐ Success ☐ Suspended ☐ Succeeded ☐ Problems ☐ Action Required

No E-mail addresses are found.  
The notification schedule is not defined.

---

## Updating Cloud Control

The Self Update feature allows you to expand Enterprise Manager's capabilities by updating Enterprise Manager components whenever new or updated features become available. Updated plug-ins are made available via the Enterprise Manager Store, an external site that is periodically checked by Enterprise Manager Cloud Control to obtain information about updates ready for download.

This chapter contains the following sections:

- [Using Self Update](#)
- [Setting Up Self Update](#)
- [Applying an Update](#)
- [Accessing Informational Updates](#)
- [Acquiring or Updating Management Agent Software](#)

### 14.1 Using Self Update

The Self Update feature is accessed via the Self Update home page, a common dashboard used to obtain information about new updates and a common workflow to review, download and apply the updates. The Self Update console frees you from having to monitor multiple channels to get informed about new updates that are available from Oracle. The Self Update console automatically informs you whenever new updates are made available by Oracle. Only those updates that are applicable to your site are shown, eliminating the need to wade through unrelated updates.

#### 14.1.1 What Can Be Updated?

Specific updates authored by Oracle that are usually bundled with specific Cloud Control releases can be updated via Self Update. Some examples are Oracle authored Management Plug-ins or Deployment Procedures. In general, Oracle-supplied entities are read-only. You can create a copy and customize the copy as per your needs but you cannot modify the original Oracle-supplied entity.

These entities can also be published on Oracle Web sites such as Oracle Technology Network (OTN) and My Oracle Support (MOS). You can download and import the entity archive into their Cloud Control deployment using specific import features provided by the updatable entity.

##### **Entity Types That Can Be Updated**

Examples of updatable entity types are:

- Management Agents

- Management Plug-ins
- Management Connectors
- Database Profiles and Gold Images
- Application Server Profiles and Gold Images
- Provisioning Bundles
- Enterprise Manager Deployment Prerequisite Checks
- Compliance Content
- Diagnostic Checks

## 14.2 Setting Up Self Update

Before you can use the Self Update feature, you must satisfy these prerequisites:

- My Oracle Support credentials have been set up. This is required to enable entities to be downloaded from the My Oracle Support site.
- The Software Library (also known as the local store) has been configured. Updates are downloaded to this local store before being deployed into Cloud Control.

Review the following sections for instructions on setting up Self Update:

- [Setting Up Enterprise Manager Self Update Mode](#)
- [Assigning Self Update Privileges to Users](#)
- [Setting Up the Software Library](#)
- [Setting Up the EM CLI Utility \(Optional\)](#)

### 14.2.1 Setting Up Enterprise Manager Self Update Mode

In order to set up or modify the Enterprise Manager Self Update feature, you must have Enterprise Manager Super Administrator privileges.

1. Log in to Enterprise Manager as an administrator with Super Administrator privileges.
2. From the **Setup** menu, select **Extensibility**, then select **Self Update**. The Self Update console appears with the default setup displayed.
3. From the **General** status area, click the **Connection Mode** status to set either offline or online mode. Enterprise Manager takes you to the Patching Setup page to specify online and offline settings.
4. Once the desired connection mode has been selected, return to the Self Update console.

From here you can select entity types and schedule updates from the Enterprise Manager Update Store.

### 14.2.2 Assigning Self Update Privileges to Users

Enterprise Manager administrators must have the requisite privileges to use the Self Update feature. The Enterprise Manager Super Administrator must assign the following Self Update roles to these administrators:

- VIEW\_SELF\_UPDATE–User can view the Self Update console and can monitor the status of download and apply jobs.

- **MANAGE\_SELF\_UPDATE**—User can schedule download and apply jobs. User can also suppress/unsuppress updates. This privilege implicitly contains **VIEW\_SELF\_UPDATE**.
- **EM\_INFRASTRUCTURE\_ADMIN**—User can perform all self update operations.

To assign Self Update privileges to regular Enterprise Manager administrators:

1. From the **Setup** menu, select **Security**, then select **Administrators**.
2. Select an administrator and click **Edit**.
3. From the Roles page, assign the appropriate Self Update roles.

### 14.2.3 Setting Up the Software Library

The Software Library is a repository that stores software patches, virtual appliance images, reference gold images, application software and their associated directive scripts. It allows maintaining versions, maturity levels, and states of entities.

In the context of applying updates, it is the "local store" that entities are downloaded to before deployment.

Follow these steps to set up the Software Library:

1. Create a folder in the system where Enterprise Manager is installed. For example, `/net/hostname/sample/swlib1`.
2. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
3. Click **Actions**, then **Administration**.
4. Click **Add**.
5. In the pop-up window, enter a name and location for the folder you want to use as the Software Library. For example, `swlib1` and `/net/hostname/sample/swlib1`. This should be the folder that you created in Step 1.
6. Wait for the processing to complete.

### 14.2.4 Setting Up the EM CLI Utility (Optional)

If you plan to apply software updates in offline mode, you will need to use the Enterprise Manager Command Line Utility, or EM CLI, to import entity archives for deployment to Enterprise Manager.

A page is provided in the Cloud Control console with instructions on setting up EM CLI. Access the page by appending `/console/emcli/download` to the URL used to access the Cloud Control console:

```
https://emcc_host:emcc_port/em
```

For example:

```
https://emcc_host:emcc_port/em/console/emcli/download
```

## 14.3 Applying an Update

The process for applying updates is essentially as follows:

- Check for the latest updates available from Oracle.

- Download the updates you want to apply to the Software Library.
- Apply the update.

Review the following sections to learn how to apply an update:

- [Applying an Update in Online Mode](#)
- [Applying an Update in Offline Mode](#)

### 14.3.1 Applying an Update in Online Mode

Updates must be downloaded to the Software Library (the local store) before they can be applied. You can review the latest available updates from the Self Update console.

Note that Enterprise Manager must have access to the Enterprise Manager Store via the Internet to download available updates. If this access is not possible, you can download entities in offline mode. See [Section 14.3.2, "Applying an Update in Offline Mode"](#) for details.

1. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
2. Click **Check Updates** to submit a job to check for new updates from Oracle. Click **OK** to close the confirmation message.
3. When the job completes, select the desired entity type, then select **Open** from the **Actions** menu. The entity type page appears.
4. Select an update from the list of available updates.
5. Click **Download**. The Schedule Download dialog appears.
6. Select when to download the update. Note that multiple downloads can be scheduled simultaneously.

The following options are available:

- Immediately
  - Later (specified time)
  - Whether or not to send a notification when the download is complete
7. Click **Select**. An Enterprise Manager job is created to download the update to the Software Library.

Enterprise Manager starts downloading the archive from the Oracle Enterprise Manager store. Wait for the download to complete. (When in offline mode the system starts reading from the specified location.)

When the download is complete, Enterprise Manager displays the Confirmation page.

---

**Note:** The page is not refreshed automatically. Click the refresh icon to view the updated download status.

---

8. Once an entity has been downloaded to the Software Library, it is ready to be applied to your installation. Select an update from the list whose status is **Downloaded**, then click **Apply**.

Note that the application process varies according to the entity type:

- For connectors, diagnostic checks, and compliance content, clicking **Apply** will install the update to Enterprise Manager. No further action is required.

- For plug-ins, you will be redirected to the plug-in deployment page.
- For provisioning bundles, you will need to exit the Enterprise Manager console, run Opatch and other commands via a terminal, and then restart the OMS.

### 14.3.2 Applying an Update in Offline Mode

Under certain circumstances, such as in high security environments, an active Internet connection between Enterprise Manager and the Enterprise Manager Update Store may not be available. In such situations, the Self Update feature can be used in offline mode.

The update process still requires that a computer exist at your site that has Internet access, as a connection to the Enterprise Manager Update Store is still required to obtain the updates. Update files from this computer can then be transferred to a computer behind your firewall.

The generic offline mode update procedure is as follows:

1. Ensure that Cloud Control is set to offline mode. From the **Setup** menu, select **Provisioning and Patching**, then select Offline Patching.
2. Change the setting for Connection to **Offline**.
3. Click **Check Updates** on the Self Update home page. A message is displayed that contains the URL to be accessed to download a catalog of all updates.
4. From an Internet-enabled computer, download the catalog file using the aforementioned URL.
5. Copy the downloaded file to the Oracle Management Service host or the Management Agent host you will deploy the update to.
6. Run the `emcli import_update_catalog` command to import the file into the Oracle Management Service instance or the Management Agent you want to update.
7. Review the update from Self Update Home and click **Download** in the **Actions** menu. A message displays with a URL and instructions.
8. Click **Apply** in the **Actions** menu to apply the update.

## 14.4 Accessing Informational Updates

The Self Update feature also serves as a news feed, providing new product announcements, news stories, industry updates, and any number of other items of interest to the Oracle community. These informational updates occur on an ad hoc basis and typically include useful links where you can obtain additional information and download items.

1. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
2. On the Self Update page, click the **Informational Updates** link at the top-right corner, as shown in [Figure 14–1](#). The link includes the number of new updates. A number appears only if there are new (unread) updates.

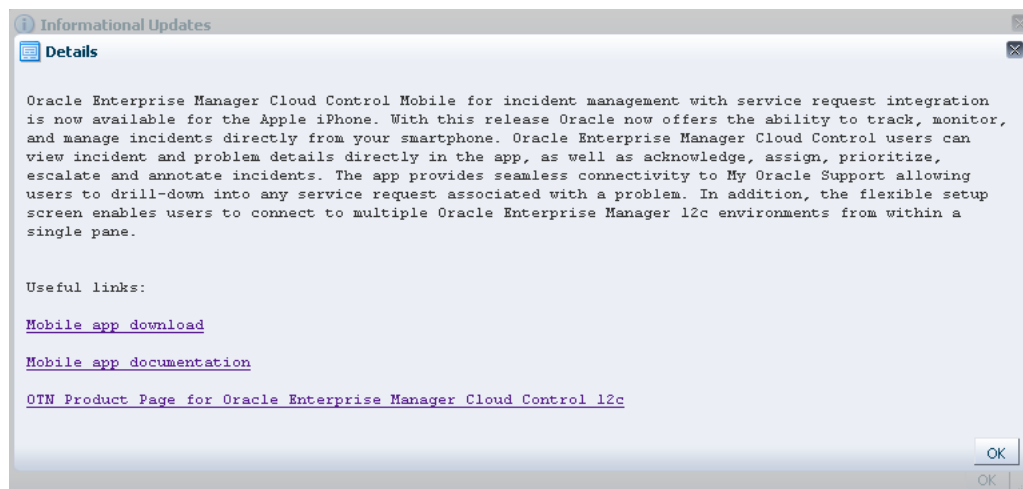

**Figure 14–1 Informational Updates Link on the Self Update Home Page**

The Informational Updates dialog opens.

3. Select an update notification in the table and click **Details**.

A popup appears describing the new product and listing applicable links.

Figure 14–2 shows the informational update announcing availability of Enterprise Manager Cloud Control Mobile, a new iPhone app that enables you to connect to Enterprise Manager remotely. Notice in this case that the announcement includes a link to iTunes where you can go to download the app.

**Figure 14–2 Informational Update for Mobile App**

4. Click **OK** to close the details display and return to the table of announcements.

By default, the table displays only unread announcements. You can choose to display all or only read announcements. You can also toggle selected items between read and unread states. Note that if you mark an item as read, you are doing so for all users. A warning to this effect appears.

## 14.5 Acquiring or Updating Management Agent Software

Management Agent software for the various platforms (operating systems) supported by Enterprise Manager Cloud Control can be downloaded to the Software Library using the Self Update console. Once a Management Agent is persisted to the Software Library, it can be installed on host machines that you want to bring under Cloud Control management using the Add Host Targets wizard.

Steps for obtaining Management Agent software in both online and offline modes are discussed below.

- [Acquiring Management Agent Software in Online Mode](#)
- [Acquiring Management Agent Software in Offline Mode](#)

### 14.5.1 Acquiring Management Agent Software in Online Mode

Using Self Update in online mode requires Enterprise Manager to have access to My Oracle Support via the Internet.

1. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
2. Select the entity type *Agent Software*, then select **Open** from the **Actions** menu. The entity type page appears to show agent software for different platforms.
3. Select an update from the list of available updates. All entries other than the one which matches the platform of the OMS host should show their status as *Available*.
4. Click **Download**. The Schedule Download dialog opens.
5. Select when to download the update. The following options are available:
  - Immediately
  - Later (specified time)
  - Whether or not to send a notification when the download is complete
6. Click **Select**. An Enterprise Manager job is created to download the Agent software to the Software Library.

Enterprise Manager starts downloading the archive from the Oracle Enterprise Manager store. Wait for the download to complete. (When in offline mode the system starts reading from the specified location.)

When the download is complete, Enterprise Manager displays the Confirmation page.

7. Once the download is complete, select the Management Agent, then click **Apply**. This step will stage the Agent software in the Software Library and make it available to the Add Host Targets wizard, which you will use to install the Agent on host machines.
8. Click **Agent Software** to launch the Add Host Targets wizard.

### 14.5.2 Acquiring Management Agent Software in Offline Mode

Follow this Self Update process only when Enterprise Manager is in offline mode.

1. Ensure Cloud Control is set to offline mode. From the **Setup** menu, select **Provisioning and Patching**, then select **Offline Patching**.
2. Change the setting for Connection to **Offline** and click **Apply**.
3. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
4. On the Self Update home page, click **Check Updates**. A message is displayed that contains the URL to be accessed to download a catalog of all updates.

Note that the archive containing the Management Agent software should also be available from the Oracle Technology Network (OTN) site.

5. From an Internet-enabled computer, download the catalog file using the aforementioned URL.

---

**Note:** Do not unzip the file.

---

6. Copy the downloaded file to either of the following:

- To any host that has a Management Agent and EM CLI installed
  - To the Oracle Management Service (OMS) host
7. Navigate to the 12.1 MOS home/bin directory and log in to emcli, running the command as the install user, for example:  

```
./emcli login -username=sysman
```
  8. Perform `emcli synchronize` (mandatory).
  9. Run the `emcli import_update_catalog` command to import the archive into the Oracle Management Service instance or the Management Agent you want to update. For example:  

```
./emcli import_update_catalog -omslocal -file=zip file absolute path
```

**Tip:** For a multi-OMS setup, run `emcli help import_update_catalog` for more options.

10. Return to the Self Update home page and do a refresh to see a count of new updates in the Available Updates column.
11. Select the entity type *Agent Software*, then select **Open** from the **Actions** menu. The entity type page appears displaying agent software for different platforms.
12. Select an update from the list of available updates. All entries other than the one that matches the platform of the Oracle Management Service host will show their status as Available.
13. Click **Download**. A message displays with a URL and instructions.
14. From an Internet-enabled computer, download the file from the URL displayed in Step 13. Do one of the following:
  - Copy the file to a Management Agent host and follow the instructions displayed in Step 13.
  - Copy the file to Oracle Management Service host and follow the instructions displayed in Step 13.

At this stage, the update will show up in a downloaded state in the Self Update home page.

15. Once the download is complete, select the Management Agent, then click **Apply**. This step will stage the Management Agent software in the Software Library and make it available to the Add Host Targets wizard, which you will use to install the Management Agent on host machines.
16. Click **Agent Software** to launch the Add Host Targets wizard.

---

## Using Plug-Ins

Plug-ins are pluggable entities that offer special management and monitoring capabilities customized to suit specific target types. They are an integral part of the architecture of Enterprise Manager Cloud Control, and are required for discovering and monitoring targets in Enterprise Manager Cloud Control.

This chapter contains the following sections:

- [Getting Started](#)
- [Introduction to Plug-Ins](#)
- [Deploying Plug-Ins](#)
- [Discovering Targets After Deploying Plug-Ins](#)
- [Viewing and Administering Installed Plug-Ins](#)
- [Cloning Plug-Ins While Cloning Oracle Management Service](#)
- [Upgrading Plug-Ins](#)
- [Undeploying Plug-Ins](#)
- [Using EM CLI to Deploy, Track, and Undeploy Plug-Ins](#)
- [Troubleshooting Plug-In Deployment Issues](#)

### 15.1 Getting Started

[Table 15–1](#) helps you get started with this chapter. Identify the use case that best matches with the situation you are in, and read the recommended sections to learn and perform various plug-in-related operations.

**Table 15–1** *Getting Started with Plug-Ins*

| Use Case  | Sections You Must Read                                       |
|---|--|
| If you are new to plug-ins  | <a href="#">Introduction to Plug-Ins</a>                     |
| If you understand plug-ins very well, and now want to deploy them and discover targets                | <a href="#">Deploying Plug-Ins</a>                           |
| If you have deployed plug-ins, and want to administer them  | <a href="#">Viewing and Administering Installed Plug-Ins</a> |
| If you know there are some newly released plug-in revisions and versions, and want to upgrade to them | <a href="#">Upgrading Plug-Ins</a>                           |
| If you want to undeploy plug-ins  | <a href="#">Undeploying Plug-Ins</a>                         |

**Table 15–1 (Cont.) Getting Started with Plug-Ins**

| Use Case  | Sections You Must Read   |
|---|--|
| If you want to do all of this in non-interactive mode | <a href="#">Using EM CLI to Deploy, Track, and Undeploy Plug-Ins</a> |
| If you have issues, and you want to resolve them      | <a href="#">Troubleshooting Plug-In Deployment Issues</a>            |

## 15.2 Introduction to Plug-Ins

This section provides an overview of plug-ins and helps you build a foundation on the concepts related plug-ins before you start deploying them in your environment. Oracle strongly recommends you to read this section so that you are familiar with the plug-in lifecycle.

In particular, this section covers the following:

- [Overview of Plug-Ins](#)
- [Understanding How Enterprise Manager Uses Plug-Ins to Discover, Monitor, and Manage Targets](#)
- [Understanding the Different Components of Plug-Ins](#)
- [Differentiating Plug-In Releases from Enterprise Manager Platform Releases](#)
- [Differentiating Plug-In Version from Plug-In Revision](#)
- [Tracking the Plug-Ins Released So Far](#)
- [Understanding Default Plug-Ins Deployed with Enterprise Manager](#)
- [Understanding Plug-In Homes](#)

### 15.2.1 Overview of Plug-Ins

Plug-ins are components that can be plugged into an existing Enterprise Manager Cloud Control installation to extend its management and monitoring capabilities. In the earlier releases of Enterprise Manager, plug-ins enabled you to monitor only third-party targets, but in Enterprise Manager Cloud Control, plug-ins enable you to monitor all types of targets in your environment. And unlike the earlier releases, in Enterprise Manager Cloud Control, the plug-ins work in conjunction with the OMS and the Management Agent to monitor every target in your environment. Therefore, they are deployed to the OMS as well as the Management Agent.

Considering this new framework, Enterprise Manager Cloud Control can be logically divided into two parts:

- Core framework or platform comprising the OMS, the Management Agent, and the Management Repository, which coordinate, orchestrate, and manage the upload and storage of information.
- Plug-ins that actually infuse the capability to start monitoring a particular target on a host.

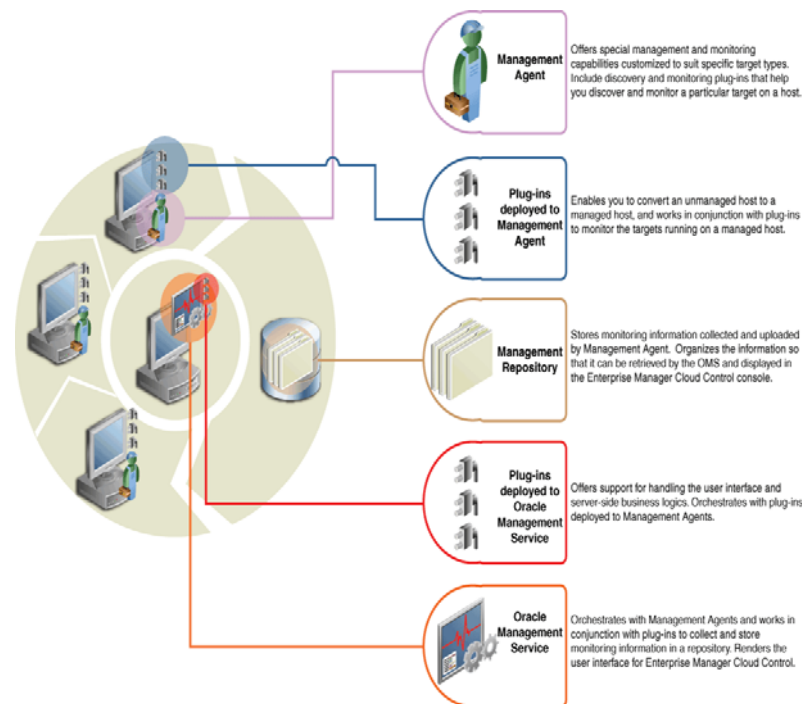

The platform releases happen almost every six months, whereas the plug-in releases happen more frequently, approximately every three to four months. However, the new plug-in management framework simplifies lifecycle management by enabling you to install and deploy plug-ins, as well as upgrade to newer versions and revisions, as and when they become available. This new pluggable framework enables Enterprise Manager Cloud Control to be updated with management support for the latest Oracle

product releases, without having to wait for the next platform release to provide such functionality. For example, when a new version of Oracle Database is released, you can simply download and deploy the latest Oracle Database plug-in, which will include management support for the latest release.

## 15.2.2 Understanding How Enterprise Manager Uses Plug-Ins to Discover, Monitor, and Manage Targets

Figure 15–1 illustrates the architecture of Enterprise Manager Cloud Control, and depicts the different core components, including plug-ins, to show how they are deployed to the OMS and the Management Agent.

**Figure 15–1 Enterprise Manager Cloud Control Architecture**

## 15.2.3 Understanding the Different Components of Plug-Ins

The components of plug-ins are as follows:

- **Oracle Management Service Plug-In Components**

As the name suggests, OMS plug-in components are components that are deployed to the OMS, and are required for handling the user interface and server-side business logics. The OMS plug-in components are found in the OMS plug-in home as described in [Section 15.2.8](#).

- **Oracle Management Agent Plug-In Components**

Management Agent Plug-In components are of two types:

- **Discovery Plug-In Components**

Discovery plug-in components are light-weight plug-in components that enable you to identify targets on a host. They are deployed from the OMS to the Management Agent as and when a new Management Agent is installed or when new targets are discovered using the Cloud Control console. Note that

discovery plug-in components can only discover a target, not monitor them. The Management Agent plug-in binaries are found in the Management Agent plug-in home as described in [Section 15.2.8](#).

- Monitoring Plug-In Components

Monitoring plug-in components are plug-in components that monitor and manage the discovered targets. Monitoring plug-in components are deployed from the OMS to the Management Agent when you *promote* discovered targets to monitor them in Enterprise Manager Cloud Control. *Promotion* is an operation that adds a discovered target to the Enterprise Manager Cloud Control console for monitoring purposes. The Management Agent plug-in binaries are found in the Management Agent plug-in home as described in [Section 15.2.8](#).

---

**Note:** This information provided in this section purely for your reference. You do not have to keep track of which plug-in is an OMS plug-in, discovery plug-in, or monitoring plug-in. Plug-in deployment is automated to the extent possible, although you can manually deploy them from the *Plug-In Lifecycle Application* console as described in [Section 15.5.1](#).

---

## 15.2.4 Differentiating Plug-In Releases from Enterprise Manager Platform Releases

Plug-ins have independent release cycles and may or may not be tied to Enterprise Manager Cloud Control product releases.

While the Enterprise Manager platform releases happen every six months tentatively, the plug-in releases typically happen more often, possibly every three to four months.

[Figure 15–2](#) describes how plug-in releases are numbered.

**Figure 15–2 Plug-In Release Number Format**

[Figure 15–3](#) describes how Enterprise Manager platform releases are numbered.

**Figure 15–3 Enterprise Manager Platform Release Number Format**

## 15.2.5 Differentiating Plug-In Version from Plug-In Revision

Plug-in revision denotes the latest update made to a plug-in version that has already been released. For example, Oracle Fusion Middleware Plug-In (12.1.0.2.0), where 12.1.0.2.0 is the version number that indicates that it is a 12c Release 1 plug-in of version 2.

Plug-in revision refers to the revision made to a plug-in version that has already been released. For example, Oracle Database Plug-In (12.1.0.2.0) [u120427], where 12.1.0.2.0 is the version number that indicates that it is a 12c Release 1 plug-in of version 2, and u120427 is the revision number.

Figure 15–4 describes you can differentiate the plug-in version from the plug-in revision.

**Figure 15–4 Differentiating Plug-In Version from Plug-In Revision**

## 15.2.6 Tracking the Plug-Ins Released So Far

You can track the plug-ins release so far in one of the following ways:

- [Viewing Plug-In Certification Matrix on My Oracle Support](#)
- [Viewing Plug-Ins Available for Download on Oracle Technology Network](#)

### 15.2.6.1 Viewing Plug-In Certification Matrix on My Oracle Support

To view the plug-in certification matrix on My Oracle Support, follow these steps:

1. Log in to My Oracle Support at <http://myoraclesupport.oracle.com/>.
2. Click the **Certifications** tab.
3. In the Certification Search region, in the Search tab, from the **Product** list, select **Enterprise Manager Base Platform - OMS**. From the **Release** list, select **12.1.0.1.0**, and click **Search**.

4. On the Certification Search Results page, expand **Management and Development Tools** to view a list plug-ins with which the 12.1.0.1.0 OMS is certified.

| Certification Search Results   |                                     |
|--|-------------------------------------|
| Edit Search (Enterprise Manager Base Platform - OMS 12.1.0.1.0)                    |                                     |
| Enterprise Manager Base Platform - OMS 12.1.0.1.0 is certified with the following: |                                     |
| Certified with 1   |                                     |
| Agents   |                                     |
| Databases  |                                     |
| Desktop Applications, Browsers and Clients   |                                     |
| Enterprise Applications  |                                     |
| Management and Development Tools   |                                     |
| Apache Tomcat Plug-in  | 1 Release (12.1.0.1.0)              |
| BMC Remedy Change Management Conn...   | 1 Release (12.1.0.1.0)              |
| BMC Remedy Service Desk 7 Connector  | 1 Release (12.1.0.1.0)              |
| CA Service Desk (Managed Target)   | 2 Releases (12, 11)                 |
| CA Service Desk Connector  | 1 Release (12.1.0.2.0)              |
| Enterprise Manager Cloud Control Plug-I...   | 1 Release (12.1.0.1.0)              |
| Enterprise Manager System Monitoring Pl...   | 1 Release (12.1.0.1.0)              |
| Enterprise Manager for Chargeback and ...  | 2 Releases (12.1.0.2.0, 12.1.0.1.0) |

- Click the release number to view more details.

### 15.2.6.2 Viewing Plug-Ins Available for Download on Oracle Technology Network

To view the plug-ins available for download on Oracle Technology Network (OTN), access the following URL:

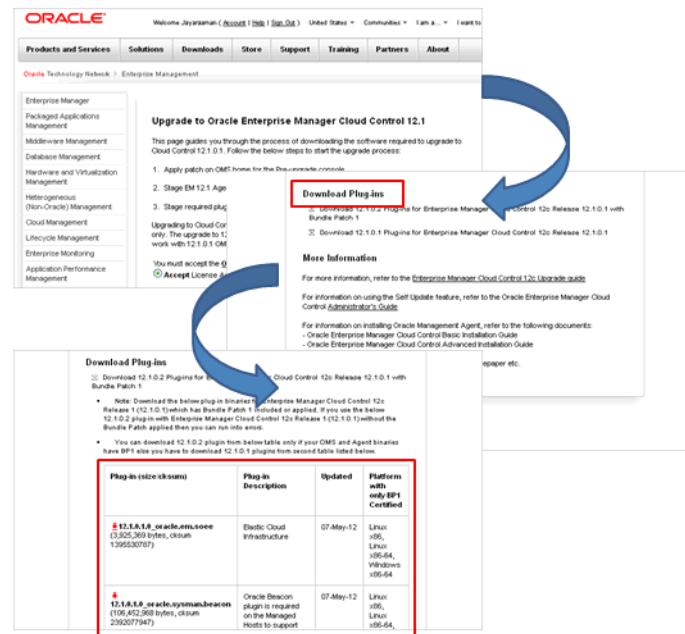

<http://www.oracle.com/technetwork/oem/grid-control/downloads/oem-upgrade-console-502238.html>

Scroll down to the Download Plug-ins section to view a list of plug-ins released, the date when they were released, and the operating system on which they are certified.

To download a plug-in, accept the license agreement, and click the plug-in name, and download the plug-in opar file. For example, for the Elastic Cloud Infrastructure plug-in, you essentially download 12.1.0.1.0\_oracle.em.soe\_2000\_0.opar.

Figure 15–5 illustrates how you can reach the Download Plug-In section.

**Figure 15–5 Tracking the Plug-Ins Released So Far**

## 15.2.7 Understanding Default Plug-Ins Deployed with Enterprise Manager

The following plug-ins are installed by default with Enterprise Manager Cloud Control:

- **Oracle Database**  
Enables you to monitor and manage Oracle Database and related targets such as Oracle Real Application Clusters (Oracle RAC), Oracle Automatic Storage Management (Oracle ASM), and so on.
- **Oracle Fusion Middleware**  
Enables you to monitor and manage Oracle Fusion Middleware products such as Oracle WebLogic Domain, Oracle WebLogic AdminServer, Oracle WebLogic Server, Oracle SOA Suite, Oracle Web Tier, and so on.
- **Oracle My Oracle Support**  
Enables you to log in to My Oracle Support from within the Enterprise Manager Cloud Control console, search the knowledge library for notes and documents, raise service requests, and create patch plans and templates for patching monitored targets.
- **Oracle Exadata**  
Enables you to monitor and manage Oracle Exadata Database Machine targets.

## 15.2.8 Understanding Plug-In Homes

Plug-in homes are essentially Oracle homes that are dedicated for plug-ins. The plug-in home for plug-ins deployed to the OMS is different from the plug-in home for plug-ins deployed to the Management Agent.

Figure 15–6 shows the plug-in homes for plug-ins deployed to the OMS and the Management Agent, which is installed with the OMS, in the middleware home.

**Figure 15–6 Plug-In Homes in Enterprise Manager Installation**

```

<middleware_home>|
  |__wlsserver_10.3|
  |__jdk16|
  |__oms|
  |__plugins|
  |__agent|
    |__plugins|
    |__core|
      |__12.1.0.1.0|
        |__agent_inst|
        |__sbin|
        |__agentimage.properties|
  |__gc_inst|
  |__Oracle_WT|
  |__oracle_common|
  |__utils|
  |__logs|
  |__modules|
  |__user_projects|
  |__ocm.rsp|
  |__registry.dat|
  |__domain-registry.xml|
  |__registry.xml|

```

Figure 15–7 indicates the plug-in home for plug-ins deployed to a standalone Management Agent.

**Figure 15–7 Plug-In Home for Standalone Management Agent**

```

<agent_base_directory>
  |__core
    |__12.1.0.1.0
      |__plugins|
      |__agent_inst
      |__sbin
      |__plugins.txt
      |__plugins.txt.status
      |__agentimage.properties

```

## 15.3 Deploying Plug-Ins

This section describes how you can deploy plug-ins on the OMS, and on the Management Agent. In particular, this section covers the following:

- [Before You Begin](#)
- [Deploying Plug-Ins While Installing Enterprise Manager](#)
- [Deploying Plug-Ins After Installing Enterprise Manager](#)
- [Deploying Plug-Ins While Installing Oracle Management Agent](#)
- [Monitoring the Deployment Status of Plug-Ins](#)

### 15.3.1 Before You Begin

Keep these point in mind before you begin deploying plug-ins:

- You can deploy only one version on the OMS at any given time. If a later version is deployed, it cannot be downgraded to an earlier version.

- You can upgrade the plug-in on the OMS and the plug-in on the Management Agent independently of each other.
- When you upgrade a plug-in to a new version, Enterprise Manager does not remove the content of the earlier version.
- On the Management Agent, you can have the same or earlier version of the plug-in that is deployed to the OMS. However, you cannot have a version later than the version on the OMS.
- If the plug-in version available on the OMS is not certified for the operating system on which the Management Agent is running, then the version of the plug-in that is supported for that operating system is deployed to the Management Agent.
- You can view the available updates on the Plug-ins page. You can download them from the Enterprise Manager store or import them using EM CLI as described in [Importing Plug-In Archives](#).
- You can import multiple versions of the same plug-in, but deploy only one version by selecting it in the Plug-ins page or by specifying in the command line while using EM CLI.

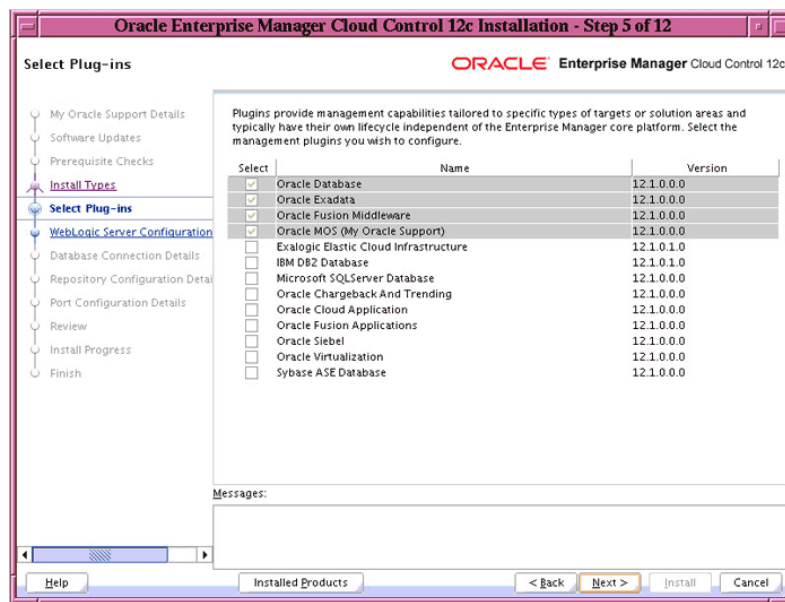

---

**Note:** It is not possible to deploy a plug-in with a newer revision (e.g. 12.1.0.2.0[u120427]) from the OMS to a Management Agent that has the plug-in of the same version (e.g. 12.1.0.2.0) but of an older revision (e.g. no revision number after the version).

---

### 15.3.2 Deploying Plug-Ins While Installing Enterprise Manager

While installing Enterprise Manager Cloud Control, if you want to deploy additional plug-ins, then in the Select Plug-Ins screen ([Figure 15–8](#)) of the Installation Wizard, select the additional plug-ins you want to install. However, by default, this screen lists only those plug-ins that are available in the Enterprise Manager Cloud Control software kit (DVD, downloaded software).

**Figure 15–8 Deploying Plug-Ins While Installing Enterprise Manager**

---

**Note:** The screen depicted in Figure 15–8 is available only on the Advanced installation session and not the Simple installation session.

---

If you want to deploy additional plug-ins that are not part of the Enterprise Manager Cloud Control software kit that is, the DVD or downloaded software, then follow these steps:

1. Manually download the plug-ins from the Enterprise Manager download page on OTN, and store them in an accessible location:

<http://www.oracle.com/technetwork/oem/grid-control/downloads/oem-upgrade-console-502238.html>

2. Invoke the Installation Wizard with the following option, and pass the location where the plug-ins you want to install are available:

```
./runInstaller -pluginLocation <absolute_path_to_plugin_software_location>
```

This displays a list of plug-ins available in the software kit (DVD, downloaded software) as well as the plug-ins available in this custom location. You can choose the ones you want to install.

### 15.3.3 Deploying Plug-Ins After Installing Enterprise Manager

After installing Enterprise Manager, if you want to deploy additional plug-ins to discover and monitor targets, then perform the following tasks:

- [Setting Up Self Update Console](#)
- [Checking the Availability of Plug-Ins](#)
- [Downloading Plug-Ins](#)

## ■ Deploying Plug-Ins to Oracle Management Service

To view a visual demonstration on how you can deploy a plug-in to the OMS and discovery targets using it, access the following URL:

[https://apex.oracle.com/pls/apex/f?p=44785:24:491956260237501::NO::P24\\_CONTENT\\_ID,P24\\_PREV\\_PAGE:6000,1](https://apex.oracle.com/pls/apex/f?p=44785:24:491956260237501::NO::P24_CONTENT_ID,P24_PREV_PAGE:6000,1)

### 15.3.3.1 Setting Up Self Update Console

Self Update console is a common dashboard used for reviewing, downloading, and applying new updates available for Enterprise Manager. The console frees you from having to monitor multiple channels to get informed about new updates that are available from Oracle. Only those updates that are applicable to your site are shown, eliminating the need to wade through unrelated updates. The updates automatically downloaded by Self Update include plug-ins as well.

For instructions on setting up the Self Update console, access the following URL:

[http://docs.oracle.com/cd/E24628\\_01/doc.121/e24473/self\\_update.htm#BEHGDJGE](http://docs.oracle.com/cd/E24628_01/doc.121/e24473/self_update.htm#BEHGDJGE)

### 15.3.3.2 Checking the Availability of Plug-Ins

Before downloading the plug-ins, you must first check whether the plug-ins you want to download are available in the Enterprise Manager Store.

To check the availability of plug-ins, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
2. On the Self Update page, click **Check Updates**.

Enterprise Manager Cloud Control submits a job to connect to the Enterprise Manager Store via the Internet, and check for available plug-ins.

A confirmation dialog appears to confirm that the job has been submitted successfully. In this confirmation dialog, you can click **Job Details** to track the status of the job.

### 15.3.3.3 Downloading Plug-Ins

You can download the plug-ins in online or offline mode. Online refers to an environment where you have Internet connectivity to connect to Enterprise Manager Store. Offline refers to an environment where you do not have Internet connectivity.

#### Downloading Plug-In in Online Mode

To download the plug-ins in online mode, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
2. On the Self Update page, in the table, click on **Plug-in**.
3. On the Plug-in Updates page, select the plug-in available for download, and click **Download**.

Multiple selection of plug-ins is not supported.

4. In the Schedule Download dialog, select an appropriate option to schedule the download. Select **Notify Once downloaded** if you want to be informed once the download is complete.
5. Click **Select**.

Enterprise Manager Cloud Control submits a job to download the selected plug-in from the Enterprise Manager Store to the Software Library.

A confirmation dialog appears to confirm that the job has been submitted successfully. In this confirmation dialog, you can click **Job Details** to track the status of the job.

### Downloading Plug-In in Offline Mode

To download the plug-ins in offline mode, follow these steps:

1. From the **Setup** menu, select **Provisioning and Patching**, then select **Offline Patching**.
2. In the Online and Offline Settings tab, select **Offline**.
3. Click **Apply**.
4. From the **Setup** menu, select **Extensibility**, then select **Self Update**.
5. On the Self Update page, click **Check for Updates**.

A message appears with a URL to an Oracle site from where the updates catalog file can be downloaded.

6. From an Internet-enabled computer, download the catalog file using the aforementioned URL.
7. Copy the downloaded catalog file to the OMS host or the Management Agent host where you plan to deploy the plug-ins.
8. Import the catalog file to Enterprise Manager. For instructions, refer to [Importing Catalog Archives](#).
9. On the Self Update page, in the table, click **Plug-in**.
10. On the Plug-in Updates page, select the imported update that is available for download. Click **Download**.

A message appears with a URL to an Oracle site from where the update can be downloaded.

11. From a computer that is connected to the internet, download the update using the aforementioned URL.
12. Copy the downloaded file to the OMS host or the Management Agent host where you plan to deploy the plug-ins.
13. Import the downloaded plug-in archive to Enterprise Manager. For instructions, refer to [Importing Plug-In Archives](#).

### Importing Plug-In Archives

Import plug-in archives to Oracle Software Library in the following cases:

- When you want to deploy any non-Oracle plug-ins, that is, plug-ins that have been created by a company other than Oracle.
- When you want to import other types of entity archives when Self Update is used in offline mode.

To import a plug-in archive, follow these steps:

1. Download the external archive as described in the previous section.

2. Set up the Enterprise Manager Command Line (EM CLI) utility. To do so, from the **Setup** menu, click **Command Line Interface**. Follow the instructions outlined on the Enterprise Manager Command Line Interface Download page.
3. Import the external archive in one of the following ways, depending on where EM CLI is installed.

- If EM CLI is on the system on which you downloaded the plug-in archive (\*.opar file), run the following command:

```
emcli import_update
-file="<path to *.opar file>"
-omslocal
```

The `-omslocal` flag indicates that the plug-in archive is on the same system where you are running this command and the path exists on this system.

- If EM CLI is on a different system than the plug-in archive, run the following command:

```
emcli import_update
-file="<path to *.opar file you created>"
-host="host1.example.com"
-credential_name="host1_creds"
-credential_owner="admin1"
```

The command syntax is as follows:

`-file`: The absolute path to the \*.opar file on the system where you created the archive.

`-host`: The target name for a host target where the file is available.

`-credential_name`: The name of the credentials on the remote system you are connecting to.

`-credential_owner`: The owner of the credentials on the host system you are connecting to.

---

**Note:** As an alternative to the previous step, you can also run the following command:

```
emcli import_update
-file="<path to *.opar file you created>"
-host="hostname"
-credential_set_name="setname"
```

`-credential_set_name`: The set name of the preferred credential stored in the Management Repository for the host target. It can be one of the following:

HostCredsNormal: The default unprivileged credential set.

HostCredsPriv: The privileged credential set.

---

## Importing Catalog Archives

To import a catalog archive, follow these steps:

1. Download the catalog archive as described in the section [Downloading Plug-In in Offline Mode](#).

2. Execute the following `emcli` command to import the downloaded catalog archive.

```
emcli import_update_catalog
-file="file"
-omslocal

emcli import_update_catalog
-file="file"
-host="hostname"

[-credential_set_name="setname"] | -credential_name="name"
-credential_owner="owner"
```

#### 15.3.3.4 Deploying Plug-Ins to Oracle Management Service

You can deploy plug-ins to an OMS instance in graphical or silent mode. While the graphical mode enables you to deploy one plug-in at a time, the silent mode enables you to deploy multiple plug-ins at a time, thus saving time and requiring the OMS to be restarted only once.

---

**Note:**

- Plug-ins must be deployed on the OMS prior to being deployed on Management Agents.
  - A plug-in deployment failure could put the Management Repository in an inconsistent state. Therefore it is strongly recommended that you back up the Management Repository before deploying the plug-in.
  - The deployment time varies from one plug-in to another, depending on the volume of data populated in the Management Repository. A page is displayed that allows you to monitor the deployment status.
  - The deployment of some plug-ins requires the OMS to be stopped, and then restarted. This process occurs automatically as part of the plug-in deployment process.
- 

To deploy plug-ins to the OMS in graphical mode, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, select the plug-in you want to deploy.
3. From the **Deploy On** menu, select **Management Servers**.
4. In the Deploy Plug-in on Management Servers dialog, enter the Management Repository SYS password, and click **Continue**. Proceed through the steps in the dialog box.
5. Click **Deploy**.

To deploy plug-ins to the OMS in silent mode, follow these steps:

1. Log in to EM CLI as follows:  

```
$ORACLE_HOME/bin/emcli login -username=sysman
```

2. Run the following command:

```
$ORACLE_HOME/bin/emcli sync
```

3. To deploy the plug-ins on the OMS, run the following command:

```
emcli deploy_plugin_on_server
-plugin="plug-in_id[:version]
[-sys_password=sys_password]
[-prereq_check]"
```

---

**Note:** For information on plug-in id, refer to [Section 15.5.2](#).

---

For example,

```
emcli deploy_plugin_on_server
-plugin="oracle.sysman.db:12.1.0.2.0;oracle.sysman.emas:12.1.0.2.0"
```

---

**Note:** The procedure for plug-in deployment remains the same even in a multi-OMS environment. Enterprise Manager automatically detects whether it is a single-OMS or a multi-OMS environment and in case of a multi-OMS environment, Enterprise Manager automatically deploys the selected plug-in on all OMS instances.

If the plug-in deployment fails, perform the same steps again until the deployment succeeds.

---

### 15.3.4 Deploying Plug-Ins While Installing Oracle Management Agent

While installing a Management Agent using the Add Host Targets Wizard, all the discovery plug-ins available on the OMS are automatically deployed to the Management Agent.

For information about discovery plug-ins, refer to [Section 15.2.3](#). For information about installing a Management Agent using the Add Host Targets Wizard, see [Section 15.4.1](#).

If you want to deploy any additional plug-ins after installing the Management Agent, then follow these steps:

1. Set up the Self Update console. For instructions, refer to [Section 15.3.3.1](#).
2. Check whether the plug-ins are available on Enterprise Manager store. For instructions refer to [Section 15.3.3.2](#).
3. Download the available plug-ins. For instructions, refer to [Section 15.3.3.3](#).
4. Deploy the downloaded plug-ins to the Management Agent.
  - a. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
  - b. On the Plug-ins page, select the plug-in you want to deploy.
  - c. From the **Deploy On** menu, select **Management Agent**.
  - d. Follow the steps mentioned in the Deploy Plug-ins on Management Agent dialogue box.
  - e. Click **Deploy**.

---

**Note:** The deployment time varies from one plug-in to another, depending on the volume of data populated in the Management Repository. A page is displayed that allows you to monitor the deployment status.

---

### 15.3.5 Monitoring the Deployment Status of Plug-Ins

To monitor the status of deployment and undeployment operations, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, do one of the following:
  - From the **Actions** menu, select **Deployment Activities**.
  - Select a plug-in, and click the **Recent Deployment Activities** tab at the bottom of the page.

### 15.3.6 Monitoring the Deployment Status of Plug-Ins that Require Down Time

To monitor the status of deployment and undeployment operations of plug-ins that require down time, execute the following command:

```
emctl status oms -details
```

## 15.4 Discovering Targets After Deploying Plug-Ins

After deploying the plug-ins, if you want to discover unmanaged hosts, and monitor targets running on them, you must perform these tasks:

- [Discovering Unmanaged Hosts in Enterprise Manager](#)
- [Configuring Automatic Discovery of Targets on Managed Hosts](#)
- [Checking For and Promoting Discovered Targets](#)

### 15.4.1 Discovering Unmanaged Hosts in Enterprise Manager

If you want to monitor additional targets on the host where you have installed Enterprise Manager Cloud Control, then skip this section. Such a host is already discovered and monitored as a managed host in Enterprise Manager Cloud Control.

However, if you want to add other hosts that are currently not discovered and monitored in Enterprise Manager Cloud Control, follow these methods:

#### **Automatic Discovery of Unmanaged Hosts**

To discover unmanaged hosts automatically, configure the automatic discovery process using the IP scan. For instructions, access the following URL:

[http://docs.oracle.com/cd/E24628\\_01/doc.121/e24473/discovery.htm#CBAEIAFJ](http://docs.oracle.com/cd/E24628_01/doc.121/e24473/discovery.htm#CBAEIAFJ)

---

**Note:** The unmanaged hosts are discovered using an IP address scan. However, to convert the discovered unmanaged host to managed host, you have to promote it. When you click **Promote**, you are taken to the Add Host Wizard where you are required to install a Management Agent on that unmanaged host. For instructions, refer to *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.

If the agent installation fails because the agent image is not available, then download the agent image as described in the following URL:

[http://docs.oracle.com/cd/E24628\\_01/doc.121/e24473/self\\_update.htm#BEHBAGDB](http://docs.oracle.com/cd/E24628_01/doc.121/e24473/self_update.htm#BEHBAGDB)

---

### Installing Management Agent Using Add Host Targets Wizard

The Add Host Targets Wizard is an application that offers GUI-rich, interactive screens. The wizard enables you to do the following on multiple hosts across platforms with options to run preinstall and postinstall scripts:

- Deploy a fresh Management Agent
- Clone an existing well-tested and patched Management Agent
- Install a Management Agent (called *Shared Agent*) using an existing, centrally shared Management Agent (called *Master Agent*)

To install a Management Agent using the Add Host Targets Wizard, refer to the *Oracle Enterprise Manager Cloud Control Basic Install Guide*.

## 15.4.2 Configuring Automatic Discovery of Targets on Managed Hosts

After converting unmanaged hosts to managed hosts in Enterprise Manager Cloud Control, you must configure automatic discovery of targets on those hosts so that the unmanaged targets running on those hosts can be identified.

For instructions to configure automatic discovery of targets on managed hosts, access the following URL:

[http://docs.oracle.com/cd/E24628\\_01/doc.121/e24473/discovery.htm#CBAGJFHC](http://docs.oracle.com/cd/E24628_01/doc.121/e24473/discovery.htm#CBAGJFHC)

## 15.4.3 Checking For and Promoting Discovered Targets

Once you have configured automatic discovery of targets on managed hosts, you must regularly check for discovered targets so that they can be promoted and monitored in Enterprise Manager Cloud Control.

For instructions to check for and promote discovered targets to managed status, access the following URL:

[http://docs.oracle.com/cd/E24628\\_01/doc.121/e24473/discovery.htm#CBAFHEHC](http://docs.oracle.com/cd/E24628_01/doc.121/e24473/discovery.htm#CBAFHEHC)

---

**Note:** The plug-in for a specific target type is automatically deployed to the Management Agent that will monitor targets of that type. For example, if you discover an Oracle Database target, the Oracle Database plug-in will be pushed to the Management Agent installed on the database host machine.

---

## 15.5 Viewing and Administering Installed Plug-Ins

After deploying the plug-ins, you can view and administer them using the *Plug-In Lifecycle Application* console. This section describes how you can navigate to the console, view information about plug-ins, and understand the various operations you can perform on this console. In particular, this section covers the following:

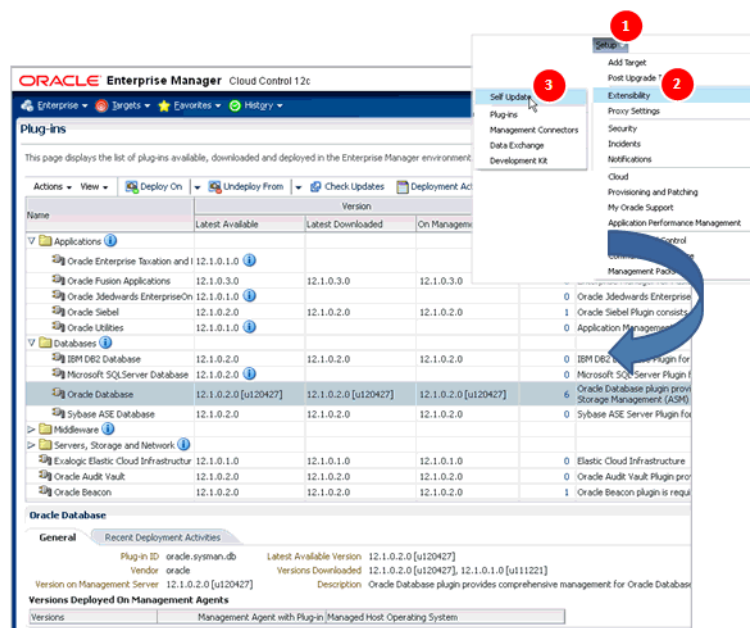

- [Viewing Installed Plug-Ins](#)
- [Identifying Plug-In ID](#)
- [Identifying the Plug-In Version](#)
- [Identifying Plug-In Revision](#)
- [Viewing Targets and Operating Systems Certified for Deployed Plug-Ins](#)
- [Identifying the Oracle Management Service on Which a Plug-In Is Deployed](#)
- [Identifying the Oracle Management Agent on Which a Plug-In Is Deployed](#)

### 15.5.1 Viewing Installed Plug-Ins

To view and administer the installed plug-ins, from the **Setup** menu, select **Extensibility**, then select **Plug-ins**. Enterprise Manager Cloud Control displays the Plug-ins page, which is essentially the *Plug-In Lifecycle Application* console.

Figure 15–9 shows the *Plug-In Lifecycle Application* console.

**Figure 15–9 Plug-In Lifecycle Application Console**

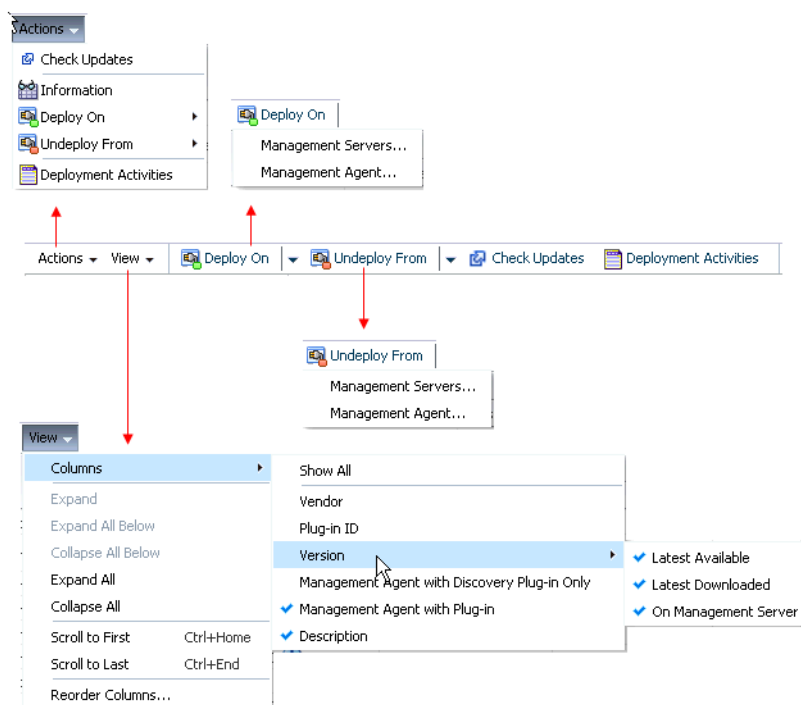

Using the *Plug-In Lifecycle Application* console, you can do the following:

- View plug-ins available for download; plug-ins that have been downloaded; and plug-ins that have been deployed to Cloud Control.
- View critical information about plug-ins such as the name of the plug-in, the vendor who supplied it, the plug-in ID and version, and a short description.

- Check the availability of updated plug-ins in Enterprise Manager Store.
- Deploy plug-ins on OMS and Management Agent.
- Undeploy plug-ins from OMS and Management Agent.
- View the status of a plug-in deployment operation.

Figure 15–10 shows the operations you can perform using the *Plug-In Manager*.

**Figure 15–10 Plug-In Manager Operations**

## 15.5.2 Identifying Plug-In ID

To identify the ID of a plug-in, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, in the Plug-in ID column of the table, note the plug-in ID of the plug-in of your interest.

If you do not see this column, from the **View** menu, select **Columns**, then select **Plug-in ID**.

**Identifying Plug-In ID** Figure 15–11 illustrates how you can identify the plug-in ID of the Oracle Database plug-in.

**Figure 15–11 Identifying Plug-In ID**

| Name                         | Plug-in ID       | Version              |                      |                      |
|------------------------------|------------------|----------------------|----------------------|----------------------|
|                              |                  | Latest Available     | Latest Downloaded    | On Management Server |
| Applications                 |                  |                      |                      |                      |
| Databases                    |                  |                      |                      |                      |
| IBM DB2 Database             | oracle.em.sldb   | 12.1.0.2.0           | 12.1.0.2.0           | 12.1.0.2.0           |
| Microsoft SQLServer Database | oracle.em.smss   | 12.1.0.2.0           |                      |                      |
| Oracle Database              | oracle.sysman.db | 12.1.0.2.0 [u120427] | 12.1.0.2.0 [u120427] | 12.1.0.2.0 [u120427] |
| Sybase ASE Database          | oracle.em.ssad   | 12.1.0.2.0           | 12.1.0.2.0           | 12.1.0.2.0           |

### 15.5.3 Identifying the Plug-In Version

To identify both the latest available plug-in version as well as the plug-in version deployed on the OMS, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, in the Version column of the table, note the latest available version, the latest downloaded version, and the version deployed on the OMS, for the plug-in of your interest.

If you do not see this column, from the **View** menu, select **Columns**, then select **Version**, and then select the type of version you want to see.

Figure 15–12 illustrates how you can identify the plug-in version of the Oracle Exadata plug-in.

**Figure 15–12 Identifying Plug-In Version**

|                                       |                      |            |            |            |
|---------------------------------------|----------------------|------------|------------|------------|
| Servers, Storage and Network          |                      |            |            |            |
| Exalogic Elastic Cloud Infrastructure | oracle.em.soei       | 12.1.0.1.0 | 12.1.0.1.0 | 12.1.0.1.0 |
| Oracle Audit Vault                    | oracle.em.soav       | 12.1.0.2.0 | 12.1.0.2.0 | 12.1.0.2.0 |
| Oracle Beacon                         | oracle.sysman.beacon | 12.1.0.2.0 | 12.1.0.2.0 | 12.1.0.2.0 |
| Oracle Chargeback and Capacity Pl     | oracle.sysman.emct   | 12.1.0.3.0 | 12.1.0.3.0 | 12.1.0.3.0 |
| Oracle Exadata                        | oracle.sysman.xa     | 12.1.0.3.0 | 12.1.0.3.0 | 12.1.0.3.0 |
| Oracle Exadata Healthchecks           | oracle.em.sehc       | 12.1.0.2.0 | 12.1.0.2.0 | 12.1.0.2.0 |
| Oracle MOS (My Oracle Support)        | oracle.sysman.mos    | 12.1.0.2.0 | 12.1.0.2.0 | 12.1.0.2.0 |

### 15.5.4 Identifying Plug-In Revision

To identify the revision of a plug-in version, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, in the Version column of the table, note the version number mentioned for the plug-in of your interest. If the plug-in version has a revision, then the revision number appears in brackets, adjacent to the version number.

For example, Oracle Fusion Middleware Plug-In 12.1.0.2.0 [u120427], where [u120427] is the revision number.

If you do not see this column, from the **View** menu, select **Columns**, then select **Version**, and then select the type of version you want to see.

Figure 15–13 illustrates how you can identify the plug-in revision of the Oracle Database plug-in.

**Figure 15–13 Identifying Plug-In Revision**

| Name                         | Plug-in ID       | Version              |                      |                      |
|------------------------------|------------------|----------------------|----------------------|----------------------|
|                              |                  | Latest Available     | Latest Downloaded    | On Management Server |
| Applications                 |                  |                      |                      |                      |
| Databases                    |                  |                      |                      |                      |
| IBM DB2 Database             | oracle.em.sldb   | 12.1.0.2.0           | 12.1.0.2.0           | 12.1.0.2.0           |
| Microsoft SQLServer Database | oracle.em.ssmss  | 12.1.0.2.0           |                      |                      |
| Oracle Database              | oracle.sysman.db | 12.1.0.2.0 [u120427] | 12.1.0.2.0 [u120427] | 12.1.0.2.0 [u120427] |
| Sybase ASE Database          | oracle.em.ssad   | 12.1.0.2.0           | 12.1.0.2.0           | 12.1.0.2.0           |

### 15.5.5 Viewing Targets and Operating Systems Certified for Deployed Plug-Ins

To view a list of targets and operating systems certified for a deployed plug-in, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, select the plug-in of your interest, and from the **Actions** menu, select **Information**.
3. On the Plug-in Information page, in the **General** tab, review the information provided in the **Certified Targets** and **Certified Operating Systems** tables.

### 15.5.6 Identifying the Oracle Management Service on Which a Plug-In Is Deployed

To identify the OMS instances on which the plug-in of your interest is deployed, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, select the plug-in of your interest, and from the **Actions** menu, select **Information**.
3. On the Plug-in Information page, in the **Management Servers** tab, review the Oracle Management Services on which the plug-in is deployed.

### 15.5.7 Identifying the Oracle Management Agent on Which a Plug-In Is Deployed

To identify the Management Agents on which the plug-in of your interest is deployed, follow these steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, select the plug-in of your interest, and from the **Actions** menu, select **Information**.
3. On the Plug-in Information page, in the **Management Agent** tab, review the Management Agents on which the plug-in is deployed.

## 15.6 Cloning Plug-Ins While Cloning Oracle Management Service

When you install an additional OMS by cloning an existing, running OMS instance, the plug-in deployed to the source OMS are automatically carried over to the cloned OMS as well. Therefore, you do not have to redeploy the plug-ins on the cloned OMS.

For information about installing an additional OMS, refer to the *Oracle Enterprise Manager Basic Install Guide*.

## 15.7 Upgrading Plug-Ins

Oracle releases revisions to existing plug-in versions, and newer versions periodically. Oracle recommends you to upgrade your existing plug-ins to these newer revisions or versions.

This section describes the following:

- [Upgrading Across Plug-In Versions](#)
- [Upgrading Across Plug-In Revisions within a Plug-In Version](#)

---

---

**Note:**

- Always upgrade the plug-in first on the OMS, and then on the Management Agent. If you do not follow this sequence, the plug-in upgrade operation will fail.
  - You need not remove the existing plug-in versions or revisions from the OMS or the Management Agent before upgrading to the latest versions or revisions.
- 
- 

### 15.7.1 Upgrading Across Plug-In Versions

This section describes how you can upgrade across plug-in versions, that is, from one plug-in version to another, higher plug-in version or a revision of another, higher plug-in version. For example, from Oracle Database plug-in version 12.1.0.1.0 to version 12.1.0.2.0, or from Oracle Database plug-in version 12.1.0.1.0 to version 12.1.0.2.0 [u120427].

In particular, this section covers the following:

- [Upgrading Across Plug-In Versions Deployed to Oracle Management Service](#)
- [Upgrading Across Plug-In Versions Deployed to Oracle Management Agent](#)

#### 15.7.1.1 Upgrading Across Plug-In Versions Deployed to Oracle Management Service

To upgrade the plug-in versions deployed to the OMS, follow these steps:

1. Check for the latest available versions and revisions in the Enterprise Manager Store as described in [Section 15.3.3.2](#).
2. Download them as described in [Section 15.3.3.3](#).
3. Deploy them to the OMS as described in [Section 15.3.3.4](#).

#### 15.7.1.2 Upgrading Across Plug-In Versions Deployed to Oracle Management Agent

---

---

**Note:** You will upgrade the plug-in versions and revisions only on Management Agents that are already installed in your environment. All new Management Agent installations will automatically include the latest versions and revisions from the OMS.

---

---

To upgrade the plug-in versions deployed to the Management Agent, follow these steps:

1. Check for the latest available versions and revisions in the Enterprise Manager Store as described in [Section 15.3.3.2](#).
2. Download them as described in [Section 15.3.3.3](#).
3. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
4. On the Plug-ins page, select the plug-in you want to upgrade.
5. From the **Deploy On** menu, select **Management Agent**.
6. In the Deploy Plug-in on Management Agent dialog, select the version or revision of the plug-in you want to upgrade to.
7. Click **Add** and add the Management Agents from which you want to undeploy the plug-in. Click **Continue**. Then click **Next**. And then click **Deploy**.
8. On the Confirmation dialog, click **Close**.

## 15.7.2 Upgrading Across Plug-In Revisions within a Plug-In Version

This section describes how you can upgrade across plug-in revisions within a plug-in version, that is, from one revision of a plug-in version to another revision of the same plug-in version. For example, from Oracle Database plug-in version 12.1.0.2.0 [u120427] to version 12.1.0.2.0 [u120502].

Plug-in revisions of a particular version are usually released only for the OMS, therefore, when you upgrade across plug-in revisions, you essentially upgrade only the plug-in revisions deployed to the OMS.

To upgrade the plug-in revisions deployed to the OMS, follow these steps:

1. Check for the latest available revisions in the Enterprise Manager Store as described in [Section 15.3.3.2](#).
2. Download them as described in [Section 15.3.3.3](#).
3. Apply the patches required for the plug-in revision.
  - a. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
  - b. On the Plug-ins page, select the plug-in revision you downloaded, and from the **Actions** menu, select **Information**.
  - c. On the Plug-in Information page, in the **General** tab, in the **Dependencies** section, in the **Bug Fixes Required** table, click **View Bug Fixes**.
  - d. In the Required Bug Fixes dialog, note the bug numbers listed in the Bug Number column of the Management Server Fixes table.
  - e. Download the patches that contain the fixes for the bugs you noted in the previous step.
  - f. Apply the downloaded patches on the OMS.
4. Deploy the latest available revisions to the OMS as described in [Section 15.3.3.4](#).

## 15.8 Undeploying Plug-Ins

If you want to stop monitoring a target, you can undeploy the plug-in associated with that target from the Management Agent and the OMS.

This section describes the following:

- [Undeploying Plug-Ins from Oracle Management Agent](#)

- [Undeploying Plug-Ins from Oracle Management Service](#)

---

**Notes:**

- Undeploying a plug-in completely removes monitoring of affected targets, and also removes all plug-in metadata from the Management Repository.
  - Always undeploy the plug-in first from the Management Agent, and then from the OMS. If you do not follow this sequence, the undeployment operation will fail.
  - You cannot undeploy default plug-ins offered by Oracle, such as the Oracle Database plug-in.
- 

### 15.8.1 Undeploying Plug-Ins from Oracle Management Agent

To undeploy plug-ins from the Management Agent, follow the steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, select the plug-in you want to undeploy, and from the **Actions** menu, select **Undeploy From**, then select **Management Agent**.
3. In the Undeploy Plug-in From Management Agent dialog, click **Add** and add the Management Agents from which you want to undeploy the plug-in. Click **Continue**. Then click **Undeploy**.
4. On the Confirmation dialog, click **Close**.

To monitor the undeployment operation, click **Show Status**.

---

**Note:** Undeployment of a plug-in from the Management Agent actually restarts the Management Agent. The Management Agent does not monitor any target during downtime.

---

### 15.8.2 Undeploying Plug-Ins from Oracle Management Service

To undeploy plug-ins from the OMS, follow the steps:

1. From the **Setup** menu, select **Extensibility**, then select **Plug-ins**.
2. On the Plug-ins page, select the plug-in you want to undeploy, and from the **Actions** menu, select **Undeploy From**, then select **Management Servers**.
3. In the Undeploy Plug-in From Management Server dialog, enter the Management Repository SYS password, and click **Continue**. Then click **Undeploy**.
4. On the Confirmation dialog, click **Close**.

To monitor the undeployment operation, click **Show Status**.

## 15.9 Using EM CLI to Deploy, Track, and Undeploy Plug-Ins

You can use EM CLI to deploy, track, and undeploy plug-ins. [Table 15–2](#) lists all the plug-in-related EM CLI verbs you can use.

For information on how you can run these EM CLI verbs, refer to *Oracle Enterprise Manager Command Line Interface*.

**Table 15–2 EM CLI Verbs to Deploy, Track, and Undeploy Plug-Ins**

| EM CLI Verb  | Description   |
|--|---|
| deploy_plugin_on_agent                                 | Deploys a plug-in on the Management Agents.   |
| deploy_plugin_on_server                                | Deploys a plug-in on the OMS.   |
| get_plugin_deployment_status<br>-plugin_id="plugin_id" | Displays the status of a specific plug-in deployment or undeployment activity as well as the list of steps.   |
| undeploy_plugin_from_agent                             | Undeploys a plug-in from the Management Agents.   |
| undeploy_plugin_from_server                            | Undeploys a plug-in from the OMS.   |
| get_ext_dev_kit  | Downloads the Extensibility Development Kit to your local system. This verb has no parameters and only downloads a kit called edk.zip to the directory where you run commands. After extracting the contents, you can use this kit to develop plug-ins. |

## 15.10 Troubleshooting Plug-In Deployment Issues

If plug-in deployment to the OMS fails, then review the log file available in the following location. Use them to debug the issue, and if you raise a service request to Oracle Support, then make sure you append these to the service request.

```
$<OMS_HOME>/cfgtoollogs/pluginca/*
```

If plug-in deployment to the Management Agent fails, then review the log file available in the following locations.

```
agent_inst/sysman/log/*
```

```
agent_inst/sysman/registry.xml
```

```
agent_inst/install/logs/*
```

Use the log files found in the aforementioned locations to debug the issue, and if you raise a service request to Oracle Support, then make sure you append these to the service request.

---

## Patching Enterprise Manager

This chapter provides an overview of patching, and describes how you can patch the Enterprise Manager core components, mainly Oracle Management Service (OMS), Oracle Management Agent (Management Agent), and Oracle Management Repository (Management Repository).

- [Overview](#)
- [Patching OMS and Management Repository](#)
- [Patching Enterprise Manager Agents](#)

### 16.1 Overview

A patch is an entity that contains one more bugs fixes. In order to transform a software product with a defect to a software product without a defect, you must apply patches, this process is called Patching. The patching cycle involves downloading patches, applying patches, and verifying the applied patch to ensure that the bug fixes present in the patch reflect appropriately.

Patching involves migrating from one version of the software product to another, within a particular release, unlike upgrading which involves moving from one release of a product to another newer release of the software product.

Oracle periodically releases the following types of patches to fix the bugs encountered in the core Enterprise Manager components:

- **Interim Patches** are released to fix a bug, or a collection of bugs.
- **Interim Patches (for Security bug fixes)** are released to provide customer specific security fixes.
- **Diagnostic Patches** mainly help diagnose and verify a fix, or a collection of bug fixes.
- **Bundle Patch Updates** are cumulative collection of fixes for a specific product or component.
- **Patch Set Updates (PSU)**, are cumulative patch bundles that contain well-tested and proven bug fixes for critical issues. PSUs have limited new content, and do not include any changes that require re-certification.
- **Security Patch Updates** are cumulative collection of security bug fixes.

## 16.2 Patching OMS and Management Repository

Patching OMS and Management Repository follows the Manual patching approach that requires you to follow step-by-step instructions to patch a target. This mechanism of patching expects you to meet certain prerequisites, manually validate the patch for applicability and conflicts, and patch only one target at a time.

This section contains the following topics:

- [OMS Patches](#)
- [Repository Patches](#)
- [Applying OMS and Repository Patches](#)

### 16.2.1 OMS Patches

OMS patches typically fix one or more OMS errors encountered. These patches can be downloaded from *My Oracle Support* portal. For information about the critical OMS patches released by Oracle that apply to your environment, see the Patch Recommendation region available on the **Patches and Updates** tab in *My Oracle Support*. Alternately, if you know the patch number of the OMS patch that you need to apply, go to the Patch Search region available on the **Patches and Updates** tab, enter the patch number, and click **Search**. The OMS patches are applied using the `OPatch` utility, or the `emctl` utility. For information on applying the patch see "[Applying OMS and Repository Patches](#)"

In Enterprise Manager 12c, OMS patches are available as OMS Core Patches and OMS Plugin Patches, required to patch the core component and plugins respectively. Ensure that you navigate to the correct directory location under `<middleware_home>` to patch OMS core or OMS plugin:

```
<middleware_home>
|   ____oms
|   ____plugins
|       ____oracle.sysman.db.oms.plugin_12.1.0.1.0
|       ____oracle.sysman.emas.oms.plugin_12.1.0.1.0
|       ____oracle.sysman.mos.oms.plugin_12.1.0.1.0
```

For example, to patch OMS core, you must navigate to `<middleware_home>/oms` and for plugins, navigate to `<middleware_home>/plugins`.

### 16.2.2 Repository Patches

Enterprise Manager Repository patches typically update PL/SQL procedures, or other SQL content. They are patched using the `emctl` patching tool.

---

**Note:** The Repository Patches are applied on the OMS targets. For location details of a core, and plugin patch, see "[OMS Patches](#)"

---

For information on applying the patch see "[Applying OMS and Repository Patches](#)"

### 16.2.3 Applying OMS and Repository Patches

To apply OMS or repository patches, follow these steps:

1. Log into *My Oracle Support* (<https://support.oracle.com>) console with the necessary credentials.

---

**Note:** Check the Patch Recommendation region to view the patches recommended for your environment. You can also provide the recommended patch number in the patch search region to download the recommended patch.

---

2. On the *My Oracle Support* home page, click **Patches and Updates**.
3. Enter the patch number in the Patch Search region, then click **Search**.
4. Select the patch, and from the context menu, click **Download**.
5. After downloading the zip file, follow the instructions available in the `Readme.html` or `Readme.txt` to patch the target.

---

**Note:** Depending on whether it is a core patch or a plugin patch you must log into the host machine, navigate to the directory location, and unzip the patch file.

---

## 16.3 Patching Enterprise Manager Agents

Oracle offers two approaches to apply the Agent patches: automated approach, and the manual approach. Oracle strongly recommends you to use the automated approach because it not only saves time and effort in mass-deploying patches but also reduces human intervention, thereby minimizing the errors involved while patching.

This section contains the following topics:

- [Management Agent Patches](#)
- [Automated Agent Patching](#)
- [Manual Agent Patching](#)

### 16.3.1 Management Agent Patches

Management Agent Patches are released to fix one or more errors encountered in the agent targets. In addition to the Management Agent running on OMS, you can patch all the agent targets that report to the OMS running on your host machine.

A GUI based utility called Patches and Updates is used to patch the Agent targets. For information about accessing the tool, see "[Accessing Patches and Updates](#)".

In Enterprise Manager 12c, there are separate Agent patches for core components and for plugins. Ensure that you navigate to the correct directory location under `<installation_base_directory>` to patch Agent core or Agent plugin:

```
<installation_base_directory>
|___core
|   |___12.1.0.1.0
|___plugins
|___plugins.txt
|___plugins.txt.status
|___agent_inst
|___sbin
|___agentimage.properties
```

For example, to patch Agent core component, you must navigate to <installation\_base\_directory>/core/ and for plugins, navigate to <installation\_base\_directory>/plugins.

### 16.3.1.1 Patches and Updates Versus My Oracle Support

The [Table 16–1](#) captures the advantages of using Enterprise Manager Cloud Console over *My Oracle Support* for Automated Patching:

**Table 16–1 Advantages of using Enterprise Manager Cloud Console to My Oracle Support**

| Enterprise Manager Cloud Control  | My Oracle Support  |
|---|--|
| Enterprise Manager Cloud Control enables you to leverage existing Cloud Control Agents to perform configuration data collection without having to install individual configuration managers on each managed target.   | You must install Oracle Configuration Manager 10.3.2 (or higher) or Enterprise Manager Cloud Control for My Oracle Support configuration collection (Enterprise Manager harvester) on each of the managed target for the latest patch recommendations. |
| Enterprise Manager Cloud console is inherently built with the intelligence to support the entire lifecycle of patching, it allows you to select the recommended patch for your environment, add to a plan, and deploy the patch on the selected targets after validating the patches for applicability and conflicts in your environment. | MOS only supports adding the recommended patches to a plan, and validating the patch for conflicts. You cannot deploy the patch from MOS.  |
| In Enterprise Manager, once the patches are applied, they will not appear in the recommended patches list for the selected target.  | In MOS this is not an automated process, depending on the data collection by the configuration manager present on the patched targets, the patch recommendation region is automated.   |

## 16.3.2 Automated Agent Patching

Automated Patching is a quick-and-easy, reliable, and a GUI-based patching mechanism that is facilitated using Patch Plans, a new concept introduced through the Patches and Updates functionality within the Enterprise Manager Cloud Control console (Cloud Control console).

Automated patching can be performed in the Online mode, and in the Offline mode. In the Online Mode, you can connect to *My Oracle Support* Web site to download the patches. However, if you are patching in the offline mode, then you must ensure that the patches to be applied are already available on the Software Library.

This section includes the following:

- [Accessing Patches and Updates](#)
- [Viewing Patch Recommendations](#)
- [Searching Patches](#)
- [Applying Management Agent Patches](#)
- [Verifying the Applied Agent Patches](#)
- [Validating Agent Patch Errors](#)
- [Deinstalling the Applied Agent Patches](#)

### 16.3.2.1 Accessing Patches and Updates

To access the Patches and Updates page, in Cloud Control, from the **Enterprise** menu, select **Provisioning and Patching**, then select **Patches and Updates**.

The following page appears:

Some of the advantages of using the Patches and Updates page (Automated Patching approach) are:

- Patching operations are more organized, done through a single window, and is always initiated only from the OMS.
- Allow you to schedule jobs that will run periodically, and connect to *My Oracle Support*, check for the latest patches, and automatically download them. This relieves you of the manual effort involved in searching the latest patches and patch sets, and downloading them whenever they are available.
- One patch plan can be used to add multiple patches to multiple sets of homogeneous targets. For example, both core and plugin agent patches can be added to the same plan.

### 16.3.2.2 Viewing Patch Recommendations

The Patch Recommendation region is one of the regions in the patching domain that proactively communicates all the recommendations that are applicable to your environment. This region minimizes human effort in terms of searching for Oracle recommended patches, which may or may not apply to your environment.

**Note:** Keep the following points in mind:

- Recommendations are not available for custom plugins. Oracle only supports the default plugins that ship with the product, and releases timely updates for them.
- You must use the configuration manager release 10.3.2 or higher for Patch Recommendations to be enabled.

**Figure 16–1** captures the Patch Recommendations region as it appears in the Patches and Updates page.

**Figure 16–1 Patch Recommendations**

Patches are primarily classified as Security patches, and Other Recommended patches. For example, if you select **Security** from the graph, all the security related patches are displayed on the Patch Recommendation page. Alternately, you can also view the patches by their target types. Click the bar graph to drill down to a list of recommended patches, view details about those patches, download the patches, or add them to a patch plan. The bar graph summarizes the number of issues found (for example, if there is one issue, then there is one recommendation for one target).

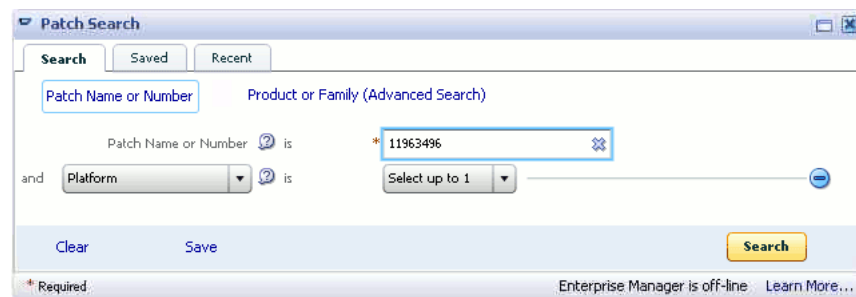

Patch Recommendation region allows you to:

- Compare the patches installed in your configuration with what Oracle recommends, and identifies any missing patches.
- Identify and prioritize targets missing Critical Patch Updates.
- Identify missing recommended patches issued by Oracle.

### 16.3.2.3 Searching Patches

The Patch Search is a region in the patching domain that allows you to search for Oracle, Sun, Siebel, and Hyperion products. The primary purpose of searching a patch is to limit results to the exact patch name or number.

From [Figure 16–2](#) you can see that the Patch Search region contains three tabs: **Search**, **Saved**, and **Recent**. The Search tab lets you apply the desired filters to drill down to the exact results. You can choose to save the search, and view it later. All the saved searches appear in the Saved region. A history of all the searches is registered in the Recent tab, and you can check the logs if you want to access them.

**Figure 16–2 Patch Search**

Use any of the following approaches to search for a patch:

- [Basic Search](#)
- [Advanced Search](#)

#### Basic Search

To perform a **Basic Search**, follow these steps:

1. From the **Enterprise** menu, select **Patching and Provisioning**, then select **Patches and Updates**.
2. On Patches and Updates page, enter the **Patch Name or Number, or Sun CR ID**, if there are multiple values, then they must be separated by commas. You can select the platform name from the list in the Patch Search Region, and then click **Search**.
3. The Patch Search Results page displays the results based on the search criterion provided.

From the Patch Search results page, you can do the following:

- You can highlight one or more patches in the search results and, from the inline tool bar, add the patches to a patch plan (if you use the collector), download the patches, or copy patch details to the system clipboard.
- If a single patch is highlighted, you can view the patch readme.

### Advanced Search

To perform an **Advanced Search**, follow these steps:

1. From the **Enterprise** menu, select **Patching and Provisioning**, then select **Patches and Updates**.
2. On the Patches and Updates page, click **Product or Family (Advanced Search)**.
3. Enter a **Product** name, and set the **Release** number to narrow down your search.

Additionally, if you are accessing Patches and Updates page in the Offline mode, then click **(+)** icon to add more filters like **Type, Platform, or Language**. In the Online mode, in addition to all the filters available in the Offline mode, you can use advanced search categories like: **Classification, Description, Patch Target, or Updated** to drill down to the desired results.

---

**Note:** Advanced Search allows you to search for recommended patches for your environment through the **Classification** search category available when you are accessing Patches and Updates page in the online mode.

---

4. Click **Search**.

After updating the appropriate search filters, you can save the search combination by clicking **Save**.

5. The Patch Search Results page displays the results based on the search criterion provided.

From the Patch Search results page, you can do the following:

- You can highlight one or more patches in the search results and, from the inline tool bar, add the patches to a patch plan (if you use the collector), download the patches, or copy patch details to the system clipboard.
- If a single patch is highlighted, you can view the patch readme.

### 16.3.2.4 Applying Management Agent Patches

To apply a Management Agent patch using patch plans, follow these steps:

---

**Note:** Applying the core agent patch, or the plugin agent patch follows the same patching process (as listed in this section.)

Ensure that the patches selected are applied on homogeneous set of targets, which means that the patches selected should have the same platform and version, as the targets being patched. For example, 12.1.0.1.0 Linux x86 patches can only be applied on 12.1.0.1.0 LinuxX86 targets, any mismatch will result in a patching error.

---

1. In Cloud Control, from the **Enterprise** menu, select **Provisioning and Patching**, then select **Patches and Updates**.
2. On the Patches and Updates page, select Management Agent patches from one of the following regions:
  - In the Patch Recommendation region, click the graph to drill down to the list of recommended patches for your environment.  
For more information on Patch Recommendation, see "[Viewing Patch Recommendations](#)"
  - In the Patch Search region, enter the patch number of the Agent patch or perform an Advanced Search to search, and select the desired patch.  
For more information on Basic and Advanced search, see "[Searching Patches](#)"
3. Select one or more patches, and from the context menu, click **Add to a Plan**.  
Click **Add to New** to create a new plan, if not you can update an existing plan by selecting **Add to Existing** option.
4. If you select **Add to New**, then one of the following dialog box appears:
  - In the Create a New Plan dialog box, enter a unique name for your plan, and click **Create Plan**.

The patch selected along with the associated target gets added to the plan.

- In the Add Patch to Plan dialog box as shown in [Figure 16-3](#), enter a unique name for the plan, and select the targets. To search and select targets, follow one of these approaches:
  - If you know the target name, then enter the name of the target in the search field.
  - Click the search icon to view all the targets reporting to the OMS running on your host machine, group them by type **Agent**, and select the desired Agent targets.
  - Create a group of Agent targets, and provide the group name in the search field to add all the targets in that particular group to the plan. To create a group of targets, from **Setup** menu, select **Add Target**, and then click

**group.** On the Create Group page, add all the Agent targets to the group, and create the group with a unique name.

After selecting the targets, click **Create Plan**. The selected patches and associated targets are added to the plan after validating for conflicts.

**Figure 16–3 Add Patch To Plan**

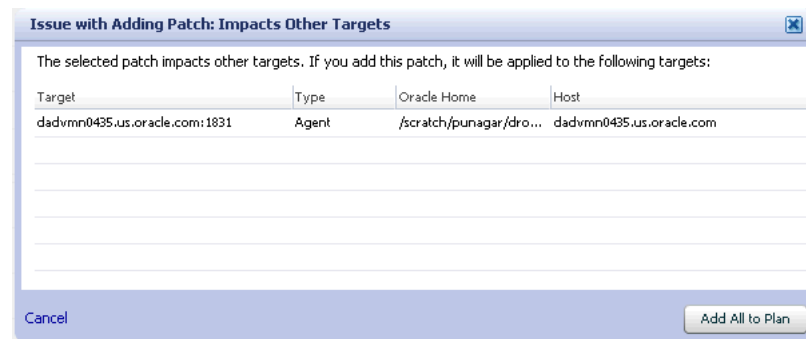

**Note:** If you want to add to an existing plan, click **Add to Existing** and, then click **More**. From the Add Selected Patch to Plan dialog box, select the plan name and click **Select Targets**. From the Add Selected Patch to Plan <plan\_name> dialog box, select the targets and click **Add to Plan**.

- If the selected patches are applied on homogeneous targets, then the plan gets successfully created with a link to **View Plan**. Click the link to view the plan details.

If any of the agent targets added to the patch plan are NFS-Agents, then you may see a warning message **Issues with Adding Patch** as shown in Figure 16–4. As a solution to this problem, a list of all the targets impacted appear, click **Add All To Plan** to add all the affected targets to the patch plan.

**Figure 16–4 Issues with Adding Patch: Impacts Other Targets**

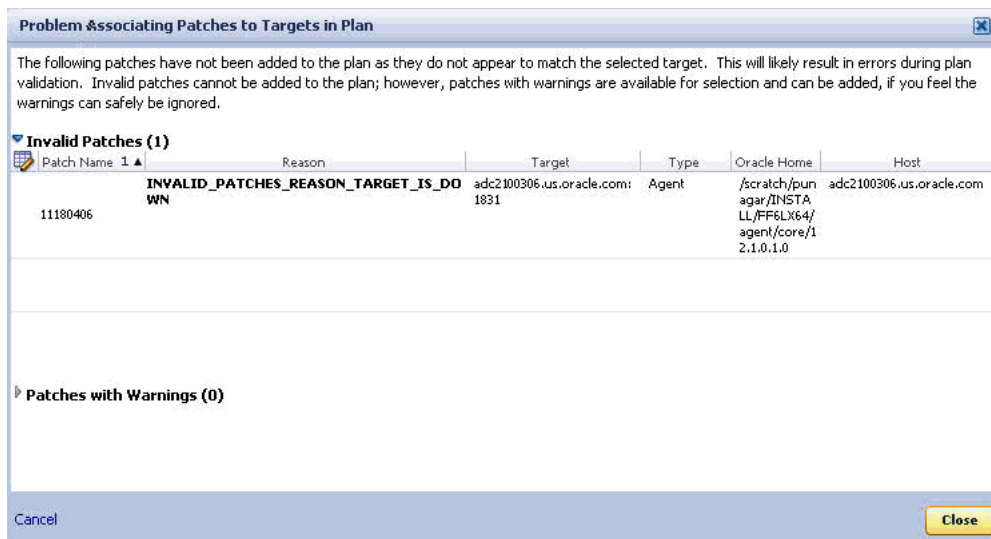

However, if there is a mismatch between the platform and version of the patch selected, and that of the target, you may see one of the following warnings:

---

**Note:** Oracle recommends that you fix the warning before proceeding as it may result in an error during the plan validation. However, if you still want to proceed, you can select the patches, and click **Ignore Warnings and Add** to proceed

---

- a. **Target is Down:** This warning message appears when the target added is not up and running. All the other homogeneous targets get added to the plan, and the plan is created without this target. Click **View Plan** to see the details.

- b. **Null Platform:** This error occurs when the target selected appears with a null platform, the validation fails as there is a mismatch in the platform of the patch and that of the target. This could happen when a target is down, in this case the plan is not created until the error is fixed.

6. On the Patches & Updates page, in the Plans region, click the plan name you want to view, and from the context menu, click **View**.

| Name                     | Status                | Type  | Planned Deployment Date | Created By | Deployable | Plan Privileges |
|--------------------------|-----------------------|-------|-------------------------|------------|------------|-----------------|
| nam                      | New                   | Patch | Not Specified           | SGURUNAG1  | Yes        | Full            |
| New_Testplan             | New                   | Patch | In 2 weeks              | SGURUNAG1  | Yes        | Full            |
| NewTest                  | New                   | Patch | Not Specified           | SGURUNAG1  | Yes        | Full            |
| p1                       | Deployed Successfully | Patch | Not Specified           | SGURUNAG1  | Yes        | Full            |
| p2                       | Deployed Successfully | Patch | Not Specified           | SGURUNAG1  | Yes        | Full            |
| punagar_demo_multitarget | New                   | Patch | Not Specified           | SGURUNAG1  | Yes        | Full            |
| punagar_nfs_group        | Review Analysis       | Patch | Not Specified           | SGURUNAG1  | Yes        | Full            |

To filter the plans table, select **All Plan Types** or **Patch** depending on your preference. To search for a plan, enter a plan name or partial plan name in the search box, then click the search button.

7. In the Create Plan Wizard, on the Plan Information page, in the Overview section, validate the Patch Plan name. You can choose to edit it if you want.

(Optional) Select a date and time when you want to deploy the Patch Plan, and enter a short description to describe the Patch Plan.

8. Click **Next**.

9. On the Patches page, review the patches added to the Patch Plan.

To associate additional targets to a patch that is already in your Patch Plan, click **Add Patch**. In the Edit Search dialog box, enter the patch number and click **Search**. Select the patch, and click **Add to This Plan**. From Add Patch To Plan dialog box, select the targets, and click **Add to This Plan**.

10. Click **Next**.

11. In the Deployment Options page, retain the default location (%emd\_emstagedir%) available on the target machine or edit the **Stage Location** to provide a new location for staging the Agent patches.

In the Credentials section, select Oracle Home Preferred Credentials if you have already set them earlier. You can otherwise click **Override Oracle Home Preferred credentials** and set the Normal Oracle Home Credentials and Privileged Oracle Home Credentials to access the Oracle home of the target.

12. Click **Next**.

13. On the Validation page, click **Analyze** to validate the patch before deploying it. A Validation job is submitted, that performs an exhaustive list of checks like: check for conflicts, check for the latest OPatch version, check if the version and platform of the targets and the patch match (homogeneity rule), and so on in the background.

To track the progress of the job, from **Enterprise** menu, select **Job**, and then click **Activity**. On the Job Activity Page, in the Advanced Search region, enter the name of the job, and then click **Go**. Select the job, and drill down to the steps by click **Expand All**. If the status is **Succeeded**, then the job is valid. If not, then review the issues, and try to resolve it according to the corresponding problem description available on the page. After resolving the issue, click **Re-Analyze**.

Upon validation, if there are conflicts between the two patches, then you might be recommended to request for replacement patches. In this case, click **Request Patch**.

If there is a Merge Patch already available, you can directly opt to replace the conflicting patches with the Merge Patch. In this case, click **Replace Patch**.

**See Also:** For more information about the common errors during the Validation phase, see ["Validating Agent Patch Errors"](#)

**14. Click Next.****15. On the Review & Deploy page, review the details you have provided for the patch plan, then click **Deploy**.**

A job is submitted, to track the progress of the job, from **Enterprise** menu, select **Job**, and then click **Activity**. On the Job Activity Page, in the Advanced Search region, enter the name of the job, and then click **Go**.

---

**Note:** For a demonstration about how to apply patches on Enterprise Manager 12c Agents using Cloud Control Console, see *My Oracle Support* note 1359221.1.

---

**16.3.2.5 Verifying the Applied Agent Patches**

To verify the applied patches using Enterprise Manager, perform the following steps:

1. In Cloud Control, click **Targets**, then select **All Targets**
2. On the All Targets page, enter the **target name** in the Search Target Name field to search for the target you patched.

For example, enter **adc2101818** in the search field, and click the search icon.

3. Click the target name to select Oracle home of the target that was patched.

| View | Search Target Name | Target Name             | Target Type | Target Status | Pending Activation |
|------|--------------------|-------------------------|-------------|---------------|--------------------|
|      | adc2101818         | adc2101818              | Host        | ✓             |                    |
|      |                    | adc2101818:3872         | Agent       | ✓             |                    |
|      |                    | agent12gt1_1_adc2101818 | Oracle Home | n/a           |                    |

A summary page with details about the target is displayed.

4. On the Summary page, in the Patch Advisories region, select **Patches Applied** tab to verify all the patches that have been successfully applied on the target.

**16.3.2.6 Validating Agent Patch Errors**

Here are some of the errors that may appear during the Validation phase of patch plans:

- **Problems Associating the Patches To the Plan**

This error occurs when patches do not match the targets selected.

For example if the patch is released for Linux x86 platform, and you are trying to apply the patch on a Linux x64 target, then the plan fails.

Step 4: Validation

Plan is deployable

**Issues Remain**

Review the issues below to see if any action can be taken to resolve them. Validated and nonvalidated patches are listed on the Review page for download.

Show Detailed Results [here](#)

[Re-Analyze](#)

Back Next Review

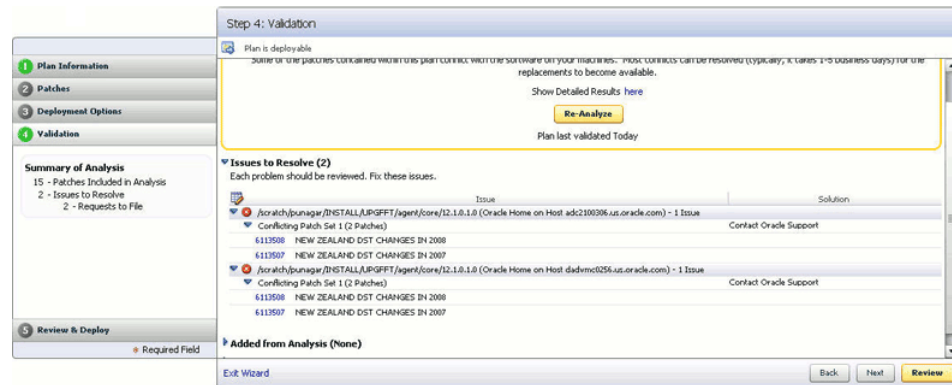

### ■ Oracle Home Credentials Not Set

This error occurs when the Oracle Home credentials like Privileged Oracle Home credentials or the Normal Oracle Home credentials are not set.

### ■ Conflict Check Analysis Failure

This error occurs when there is a conflict in the patches added.

#### 16.3.2.7 Deinstalling the Applied Agent Patches

To roll back applied Agent patches, follow the deinstallation steps available in the `Readme.html` or `Readme.txt` for the patch.

### 16.3.3 Manual Agent Patching

Manual patching is a patching mechanism that requires you to follow step-by-step instructions to patch a Management Agent manually. This mechanism of patching expects you to meet certain prerequisites, manually validate the patch for applicability and conflicts, and patch only one Management Agent at a time.

---

**Note:** Oracle recommends you to use the automated patching mechanism because it not only saves time and effort in mass-deploying patches but also reduces human intervention, thereby minimizing the errors involved while patching.

---

To patch manually, you must perform the following steps:

1. Log into *My Oracle Support* (<https://support.oracle.com>) console with the necessary credentials.

---

---

**Note:** Check the Patch Recommendation region to view the patches recommended for your environment. You can also provide the recommended patch number in the patch search region to download the recommended patch.

---

---

2. On the *My Oracle Support* home page, click **Patches and Updates**.
3. Enter the patch number in the Patch Search region, then click **Search**.
4. Select the patch, and from the context menu, click **Download**.
5. After downloading the zip file, follow the instructions available in the `Readme.html` or `Readme.txt` to install the patch.

---

## Starting and Stopping Enterprise Manager Components

This chapter explains how to use the Enterprise Manager command line utility (emctl) to start and stop the Management Service, the Management Agent, and Cloud Control.

This chapter also explains the various emctl commands for Management Service and Management Agent and how to use log information to troubleshoot emctl.

Following are the sections in this chapter:

- [Controlling the Oracle Management Agent](#)
- [Controlling the Oracle Management Service](#)
- [Guidelines for Starting Multiple Enterprise Manager Components on a Single Host](#)
- [Starting and Stopping Oracle Enterprise Manager 12c Cloud Control](#)
- [Additional Management Agent Commands](#)
- [emctl Commands](#)
- [Using emctl.log File](#)

### 17.1 Controlling the Oracle Management Agent

The following sections describe how to use the Enterprise Manager command line utility (emctl) to control the Oracle Management Agent:

- [Starting, Stopping, and Checking the Status of the Management Agent on UNIX](#)
- [Starting and Stopping the Management Agent on Windows](#)
- [Checking the Status of the Management Agent on Windows](#)
- [Troubleshooting Management Agent Startup Errors](#)

#### 17.1.1 Starting, Stopping, and Checking the Status of the Management Agent on UNIX

When you start the agent on UNIX systems, it starts the parent watchdog process and the child Java process for the agent. The watchdog monitors the agent Java process and attempts to start it if it fails abnormally.

To start, stop, or check the status of the Management Agent on UNIX systems:

1. Change directory to the `AGENT_INSTANCE_HOME/bin` directory.
2. Use the appropriate command described in [Table 17–1](#).

For example, to stop the Management Agent, enter the following commands:

```
$PROMPT> cd AGENT_INSTANCE_HOME/bin
$PROMPT> emctl stop agent
```

**Table 17–1 Starting, Stopping, and Checking the Status of the Management Agent**

| Command            | Purpose   |
|--------------------|---|
| emctl start agent  | Starts the Management Agent   |
| emctl stop agent   | Stops the Management Agent  |
| emctl status agent | If the Management Agent is running, this command displays status information about the Management Agent, including the Agent Home, the process ID, and the time and date of the last successful upload to the Management Repository (Example 17–1). |

**Example 17–1 Checking the Status of the Management Agent**

```
$ emctl status agent

```

On IBM AIX environment with a large memory configuration where the Management Agent is monitoring a large number of targets, the Agent may not start. To prevent this issue, prior to starting the Management Agent, add the following parameters to the common environment file:

```
LDR_CNTRL="MAXDATA=0x80000000"@NOKRTL
AIX_THREADSCOPE=S
```

The LDR\_CNTRL variable sets the data segment size and disables loading of run time libraries in kernel space. The AIX\_THREADSCOPE parameter changes AIX Threadscope context from the default Processwide 'P' to Systemwide 'S'. This causes less mutex contention.

## 17.1.2 Starting and Stopping the Management Agent on Windows

When you install the Oracle Management Agent on a Windows system, the installation procedure creates one new service in the Services control panel.

The procedure for accessing the Services control panel varies, depending upon the version of Microsoft Windows you are using. For example, on Windows 2000, locate the Services Control panel by selecting **Settings** and then **Administrative Tools** from the **Start** menu.

---

**Note:** The `emctl` utility described in [Section 17.2.1](#) is available in the `bin` subdirectory of the Oracle home where you installed the Management Agent; however, Oracle recommends that you use the Services control panel to start and stop the Management Agent on Windows systems.

---

[Table 17–2](#) describes the Windows service that you use to control the Management Agent.

**Table 17–2 Service Installed and Configured When You Install the Management Agent on Windows**

| Component               | Service Name Format  | Description                                      |
|-------------------------|--|--|
| Oracle Management Agent | Oracle<agent_home>Agent<br>For example:<br>OracleOraHome1Agent | Use this to start and stop the Management Agent. |

---

**Note:** If you are having trouble starting or stopping the Management Agent on a Windows NT system, try stopping the Management Agent using the following `emctl` command:

```
$PROMPT> <AGENT_HOME>\bin\emctl istop agent
```

After stopping the Management Agent using the `emctl istop agent` command, start the Management Agent using the Services control panel.

This problem and solution applies only to the Windows NT platform, not to other Windows platforms, such as Windows 2000 or Windows XP systems.

---

## 17.1.3 Checking the Status of the Management Agent on Windows

To check the status of the Management Agent on Windows systems:

1. Change directory to the following location in the `AGENT_INSTANCE_HOME` directory:

```
AGENT_INSTANCE_HOME\bin
```

2. Enter the following `emctl` command to check status of the Management Agent:

```
$PROMPT> emctl status agent
```

If the Management Agent is running, this command displays status information about the Management Agent, including the Agent Home, the process ID, and the

time and date of the last successful upload to the Management Repository ([Example 17-1](#)).

## 17.1.4 Troubleshooting Management Agent Startup Errors

If the agent fails to start, see the `emctl.log` and `emagent.nohup` log files for details. Following are common issues and troubleshooting suggestions:

### 17.1.4.1 Management Agent starts up but is not ready

The Management Agent goes through the following process when it starts up:

1. Starting up (the Management Agent has just received the request to start up and is going to start the initialization sequence)
2. Initializing (the Management Agent is iterating over each of its components and is initializing them)
3. Ready (All components have been initialized and the Management Agent is ready to accept requests)

The command to start the Management Agent (`emctl start agent`) has a default timeout of 120 seconds. At the end of that timeout, it will return control to the caller and will indicate what the last state of the Management Agent was when it returns control. Depending on the number of targets being monitored by the Management Agent, step 2 listed above could take a long time and it is possible that when the command exits, the state of the agent is "Initializing" and the command reports that the "agent is running but is not ready".

You can increase the timeout by setting an environment variable "EMAGENT\_TIME\_FOR\_START\_STOP". The value should indicate the number of seconds to wait before returning control to the caller.

### 17.1.4.2 Management Agent fails to start because of time zone mismatch between agent and OMS

The Management Agent uses the time zone set in `emd.properties` file. During the install process of the Management Agent, the agent and the host target are registered with the OMS along with the time zone. If the Management Agent's time zone is modified at any point after the installation, the OMS will signal the Management Agent to shut down as soon as it detects this mismatch.

To reset the Management Agent's time zone, run the following command:

```
emctl resettz agent
```

For more information about setting the time zone for the agent, see [Section 17.5.5, "Changing the Management Agent Time Zone"](#).

### 17.1.4.3 Agent fails to start due to possible port conflict

If the Management Agent cannot start and `emctl` reports that there is a possible port conflict, check the Management Agent's port (based on `emd.properties:EMD_URL`) and see if there is another application, such as another agent, running on the machine that is already bound to the port.

To resolve this issue, stop the application currently bound to the Management Agent's port.

#### 17.1.4.4 Agent secure/unsecure fails

Securing or unsecuring of the Management Agent can fail if the password to secure the agent against the OMS is incorrect or if the OMS is locked or down. You can find the reason for the failure in the `<agent state directory>/sysman/log/secure.log` file.

## 17.2 Controlling the Oracle Management Service

When you start the Management Service, the following services are started:

1. OPMN process. This is the watchdog for the Apache process. The OPMN process starts the Apache process if it crashes.
2. Apache processes to start the HTTP server
3. Node Manager Java process. This is the watchdog for the Managed Server and Admin Server processes. It restarts the Managed Server and Admin Server processes if they crash.
4. Admin Server Java process (if the command to start OMS is executed on the first OMS machine). This is the WebLogic Server instance that maintains configuration data for configured Enterprise Manager domain.
5. Managed Server Java process. This is the Managed WebLogic Server on which Enterprise Manager application is deployed.
6. (On Windows only) Node Manager service process. This is the Windows service for starting and stopping the Node Manager (equivalent to the Node Manager process on Linux).
7. (On Windows only) OMS service process. This is the Windows service for starting and stopping the OMS.

The following sections describe how to control the Oracle Management Service:

- [Controlling the Management Service on UNIX](#)
- [Controlling the Management Service on Windows](#)

### 17.2.1 Controlling the Management Service on UNIX

To start, stop, or check the status of the Management Service with the Enterprise Manager command-line utility, follow these steps:

1. Change directory to the `ORACLE_HOME/bin` directory in the Management Service home.
2. Use the appropriate command described in [Table 17-3](#).

For example, to stop the Management Service, enter the following commands:

```
$PROMPT> cd bin
$PROMPT> ./emctl stop oms
```

**Table 17-3 Starting, Stopping, and Checking the Status of the Management Service**

| Command                      | Purpose   |
|------------------------------|---|
| <code>emctl start oms</code> | Starts the Fusion Middleware components required to run the Management Service. Specifically, this command starts HTTP Server, the Node Manager, OPMN process, and the managed server on which the Management Service is deployed. In addition if this command is run on the host that has the Administration Server, the Administration Server is started too. |

**Table 17–3 (Cont.) Starting, Stopping, and Checking the Status of the Management**

| Command          | Purpose  |
|------------------|--|
| emctl stop oms   | <p>Stops the OMS managed server and HTTP server but leaves Node Manager and Administration Server running.</p> <p><b>Note:</b> The <code>emctl stop oms</code> command does not stop Fusion Middleware.</p> <p>Use <code>emctl stop oms -all</code> to stop all processes including Administration Server, HTTP Server, Node Manager, and management server.</p> |
| emctl status oms | <p>Displays a message indicating whether or not the Management Service is running.</p> <p>Run <code>emctl status oms -details</code> to view information about the configuration of the management service such as ports being used and the URLs for console and upload.</p>   |

## 17.2.2 Controlling the Management Service on Windows

When you install the Oracle Management Service on a Windows system, the installation procedure creates three new services in the Services control panel.

The procedure for accessing the Services control panel varies, depending upon the version of Microsoft Windows you are using. For example, on Windows 2000, locate the Services control panel by selecting **Settings**, then **Administrative Tools** from the **Start** menu.

---

**Note:** The `emctl` utility described in [Section 17.2.1](#) is available in the `bin` subdirectory of the Oracle home where you installed the Management Service; however, Oracle recommends that you use the Services control panel to start and stop the Management Service on Windows systems.

---

[Table 17–4](#) describes the Windows services that you use to control the Oracle Management Service.

**Table 17–4 Summary of Services Installed and Configured When Installing the Oracle Management Service on Windows**

| Component                | Service Name Format                   | Description   |
|--------------------------|---------------------------------------|---|
| WebLogic Server          | OracleWeblogicNodeManager_EMGC_OMS1_1 | Use this service to start and stop the node manager of the WebLogic Server that was installed and configured to deploy the Management Service J2EE application. |
| Oracle Management Server | OracleManagementServer_EMGC_OMS1_1    | Use this service to start and stop all components that were installed and configured as part of the Management Service J2EE application.                        |

## 17.2.3 Troubleshooting Oracle Management Service Startup Errors

Following are the log files you can check if the OMS fails to start:

### Management Service Fails to Start

Check the logs located as indicated in [Table 17–5](#). The `INSTANCE_HOME` mentioned in the table is the OMS instance home and `n` is the index of the OMS server.

**Table 17–5 OMS Log Files Location**

| OMS Log File             | Log File Location  |
|--------------------------|--|
| emctl log file           | <code>\$INSTANCE_HOME/sysman/log/emctl.log</code> file   |
| Managed Server log files | <code>\$INSTANCE_HOME/user_projects/domains&lt;DOMAIN_NAME&gt;/servers/EMGC_OMS&lt;n&gt;/logs/EMGC_OMS&lt;n&gt;.log</code><br><code>\$INSTANCE_HOME/user_projects/domains&lt;DOMAIN_NAME&gt;/servers/EMGC_OMS&lt;n&gt;/logs/EMGC_OMS&lt;n&gt;.out</code> |
| OMS log files            | <code>\$INSTANCE_HOME/sysman/log/emoms_pbs.log</code><br><code>\$INSTANCE_HOME/sysman/log/emoms_pbs.trc</code><br><code>\$INSTANCE_HOME/sysman/log/emoms.trc</code><br><code>\$INSTANCE_HOME/sysman/log/emoms.log</code>                                 |

### WebTier Service Fails to Start

Check logs under `<WebTier Instance Home>/diagnostics` folder in case WebTier start fails.

## 17.3 Guidelines for Starting Multiple Enterprise Manager Components on a Single Host

Oracle Enterprise Manager components are used to manage a variety of Oracle software products. In most cases, in a production environment, you will want to distribute your database and WebLogic Server instances among multiple hosts to improve performance and availability of your software resources. However, in cases where you must install multiple WebLogic Servers or databases on the same host, consider the following guidelines.

When you start Fusion Middleware Control, the Management Agent, or Database Control, Enterprise Manager immediately begins gathering important monitoring data about the host and its managed targets. Keep this in mind when you develop a process for starting the components on the host.

Specifically, consider staggering the startup process so that each Enterprise Manager process has a chance to start before the next process begins its startup procedure. When you start up all the components (for example, after a restart of the system), use a process such as the following:

1. Use the `emctl start` command to start Oracle Management Service.
2. Wait 15 seconds.
3. Use the `emctl start agent` command to start the Management Agent for the host.

Using a staggered startup procedure such as the preceding example will ensure that the processes are not in contention for resources during the CPU-intensive startup phase for each component.

## 17.4 Starting and Stopping Oracle Enterprise Manager 12c Cloud Control

As described in the previous sections, you use separate commands to control the Oracle Management Service and Management Agents.

The following sections describe how to stop and start all the Cloud Control components that are installed by the Oracle Enterprise Manager 12c Cloud Control Console installation procedure.

You can use this procedure to start all the framework components after a system reboot or to shutdown all the components before bringing the system down for system maintenance.

### 17.4.1 Starting Cloud Control and All Its Components

The following procedure summarizes the steps required to start all the components of the Cloud Control. For example, use this procedure if you have restarted the host computer and all the components of the Cloud Control have been installed on that host.

To start all the Cloud Control components on a host, use the following procedure:

1. If your Oracle Management Repository resides on the host, change directory to the Oracle Home for the database where you installed the Management Repository and start the database and the Net Listener for the database:

- a. Set the ORACLE\_HOME environment variable to the Management Repository database home directory.
- b. Set the ORACLE\_SID environment variable to the Management Repository database SID (default is asdb).
- c. Start the Net Listener:

```
$PROMPT> $ORACLE_HOME/bin/lsnrctl start
```

- d. Start the Management Repository database instance:

```
ORACLE_HOME/bin/sqlplus /nolog
SQL> connect SYS as SYSDBA
SQL> startup
SQL> quit
```

**See Also:** *Oracle Database Administrator's Guide* for information about starting and stopping an Oracle Database.

2. Start the Oracle Management Service:

```
$PROMPT> OMS_HOME/bin/emctl start oms
```

**See Also:** ["Controlling the Oracle Management Service"](#) on page 17-5

3. Change directory to the home directory for the Oracle Management Agent and start the Management Agent:

```
$PROMPT> AGENT_HOME/bin/emctl start agent
```

**See Also:** ["Controlling the Oracle Management Agent"](#) on page 17-1

---

**Note:** Be sure to run the `emctl start agent` command in the Oracle Management Agent home directory and not in the Management Service home directory.

---

## 17.4.2 Stopping Cloud Control and All Its Components

The following procedure summarizes the steps required to stop all the components of the Cloud Control. For example, use this procedure if you have installed all the components of the Cloud Control on the same host you want to shut down or restart the host computer.

To stop all the Cloud Control components on a host, use the following procedure:

1. Stop the Oracle Management Service:

```
$PROMPT> $ORACLE_HOME/bin/emctl stop oms -all
```

**See Also:** ["Controlling the Oracle Management Service"](#) on page 17-5

2. Change directory to the home directory for the Oracle Management Agent and stop the Management Agent:

```
$PROMPT> $AGENT_HOME/bin/emctl stop agent
```

**See Also:** ["Controlling the Oracle Management Agent"](#) on page 17-1

---

**Note:** Be sure to run the `emctl stop agent` command in the Oracle Management Agent home directory and not in the Oracle Management Service home directory.

---

3. If your Oracle Management Repository resides on the same host, change directory to the Oracle Home for the database where you installed the Management Repository and stop the database and the Net Listener for the database:

- a. Set the `ORACLE_HOME` environment variable to the Management Repository database home directory.

- b. Set the `ORACLE_SID` environment variable to the Management Repository database SID (default is `asdb`).

- c. Stop the database instance:

```
$PROMPT> ORACLE_HOME/bin/sqlplus /nolog
SQL> connect SYS as SYSDBA
SQL> shutdown
SQL> quit
```

**See Also:** *Oracle Database Administrator's Guide* for information about starting and stopping an Oracle Database.

- d. Stop the Net Listener:

```
$PROMPT> $ORACLE_HOME/bin/lsnrctl stop
```

## 17.5 Additional Management Agent Commands

The following sections describe additional `emctl` commands you can use to control the Management Agent:

- [Uploading and Reloading Data to the Management Repository](#)
- [Specifying New Target Monitoring Credentials](#)
- [Listing the Targets on a Managed Host](#)
- [Controlling Blackouts](#)

### 17.5.1 Uploading and Reloading Data to the Management Repository

Under normal circumstances, the Management Agent uploads information about your managed targets to the Management Service at regular intervals.

To use these commands, change directory to the `AGENT_HOME/bin` directory (UNIX) or the `AGENT_HOME\bin` directory (Windows) and enter the appropriate command as described in [Table 17–6](#).

**Table 17–6** *Manually Reloading and Uploading Management Data*

| Command                           | Description  |
|-----------------------------------|--|
| <code>emctl upload (agent)</code> | Use this command to force an immediate upload of the current management data from the managed host to the Management Service. Use this command instead of waiting until the next scheduled upload of the data.   |
| <code>emctl reload (agent)</code> | <p>This command can be used to apply the changes after you have manually modified the <code>emd.properties</code> file. For example, to change the upload interval, <code>emd.properties</code> can be modified, and <code>emctl reload</code> can then be run.</p> <p><b>Note:</b> Oracle does not support manual editing of the <code>targets.xml</code> files unless the procedure is explicitly documented or you are instructed to do so by Oracle Support.</p> |

### 17.5.2 Specifying New Target Monitoring Credentials

To monitor the performance of your database targets, Enterprise Manager connects to your database using a database user name and password. This user name and password combination is referred to as the database monitoring credentials.

---

**Note:** The instructions in this section are specific to the monitoring credentials for a database target, but you can use this procedure for any other target type that requires monitoring credentials. For example, you can use this procedure to specify new monitoring credentials for your Oracle Management Service and Management Repository.

---

When you first add an Oracle9i Database target, or when it is added for you during the installation of the Management Agent, Enterprise Manager uses the DBSNMP database user account and the default password for the DBSNMP account as the monitoring credentials.

When you install Oracle Database 11g, you specify the DBSNMP monitoring password during the database installation procedure.

As a result, if the password for the DBSNMP database user account is changed, you must modify the properties of the database target so that Enterprise Manager can continue to connect to the database and gather configuration and performance data.

Similarly, immediately after you add a new Oracle Database 11g target to the Cloud Control, you may need to configure the target so it recognizes the DBSNMP password that you defined during the database installation. Otherwise, the Database Home page may display no monitoring data and the status of the database may indicate that there is a metric collection error.

---

**Note:** You can modify the Enterprise Manager monitoring credentials by using the Oracle Enterprise Manager 12c Cloud Control Console.

---

### 17.5.3 Listing the Targets on a Managed Host

There are times when you need to provide the name and type of a particular target you are managing. For example, you must know the target name and type when you are setting the monitoring credentials for a target.

To list the name and type of each target currently being monitored by a particular Management Agent:

1. Change directory to the AGENT\_HOME/bin directory (UNIX) or the AGENT\_HOME\bin directory (Windows).
2. Enter the following command to specify new monitoring credentials:

```
$PROMPT>./emctl config agent listtargets
```

[Example 17-2](#) shows the typical output of the command.

#### **Example 17-2 Listing the Targets on a Managed Host**

```
ade:[ examplename_1208_qc_ag ] [example_username@example emagent]$ emctl config
agent listtargets

ade:[ example_username_1208_qc_ag ] [example_username@example emagent]$
```

### 17.5.4 Controlling Blackouts

Blackouts allow Enterprise Manager users to suspend management data collection activity on one or more managed targets. For example, administrators use blackouts to prevent data collection during scheduled maintenance or emergency operations.

You can control blackouts from the Oracle Enterprise Manager 12c Cloud Control Console or from the Enterprise Manager command line utility (`emctl`). However, if you are controlling target blackouts from the command line, you should not attempt to control the same blackouts from the Cloud Control Console. Similarly, if you are controlling target blackouts from the Cloud Control Console, do not attempt to control those blackouts from the command line.

**See Also:** "Creating, Editing, and Viewing Blackouts" in the Enterprise Manager online help for information about controlling blackouts from the Cloud Control Console

From the command line, you can perform the following blackout functions:

- Starting Immediate Blackouts
- Stopping Immediate Blackouts
- Checking the Status of Immediate Blackouts

---

**Note:** When you start a blackout from the command line, any Enterprise Manager jobs scheduled to run against the blacked out targets will still run. If you use the Cloud Control Console to control blackouts, you can optionally prevent jobs from running against blacked out targets.

---

To use the Enterprise Manager command-line utility to control blackouts:

1. Change directory to the `AGENT_HOME/bin` directory (UNIX) or the `AGENT_INSTANCE_HOME\bin` directory (Windows).
2. Enter the appropriate command as described in [Table 17-7](#).

---

**Note:** When you start a blackout, you must identify the target or targets affected by the blackout. To obtain the correct target name and target type for a target, see [Section 17.5.3, "Listing the Targets on a Managed Host"](#).

---

**Table 17–7 Summary of Blackout Commands**

| Blackout Action   | Command  |
|---|--|
| Set an immediate blackout on a particular target or list of targets | <pre>emctl start blackout &lt;Blackoutname&gt; [&lt;Target_name&gt;[:&lt;Target_Type&gt;]].... [-d &lt;Duration&gt;]</pre> <p>Be sure to use a unique name for the blackout so you can refer to it later when you want to stop or check the status of the blackout.</p> <p>The <code>-d</code> option is used to specify the duration of the blackout. Duration is specified in [days] hh:mm where:</p> <ul style="list-style-type: none"> <li>■ days indicates number of days, which is optional</li> <li>■ hh indicates number of hours</li> <li>■ mm indicates number of minutes</li> </ul> <p>If you do not specify a target or list of targets, Enterprise Manager will blackout the local host target. All monitored targets on the host are not blacked out unless a list is specified or you use the <code>-nodelevel</code> argument.</p> <p>If two targets of different target types share the same name, you must identify the target with its target type.</p> |
| Stop an immediate blackout  | <pre>emctl stop blackout &lt;Blackoutname&gt;</pre>  |
| Set an immediate blackout for all targets on a host                 | <pre>emctl start blackout &lt;Blackoutname&gt; [-nodeLevel] [-d &lt;Duration&gt;]</pre> <p>The <code>-nodeLevel</code> option is used to specify a blackout for all the targets on the host; in other words, all the targets that the Management Agent is monitoring, including the Management Agent host itself. The <code>-nodeLevel</code> option must follow the blackout name. If you specify any targets after the <code>-nodeLevel</code> option, the list is ignored.</p>  |
| Check the status of a blackout                                      | <pre>emctl status blackout [&lt;Target_name&gt;[:&lt;Target_Type&gt;]]....</pre>   |

Use the following examples to learn more about controlling blackouts from the Enterprise Manager command line:

- To start a blackout called "bk1" for databases "db1" and "db2," and for Oracle Listener "ldb2," enter the following command:

```
$PROMPT> emctl start blackout bk1 db1 db2 ldb2:oracle_listener -d 5 02:30
```

The blackout starts immediately and will last for 5 days 2 hours and 30 minutes.

- To check the status of all the blackouts on a managed host:

```
$PROMPT> emctl status blackout
```

- To stop blackout "bk2" immediately:

```
$PROMPT> emctl stop blackout bk2
```

- To start an immediate blackout called "bk3" for all targets on the host:

```
$PROMPT> emctl start blackout bk3 -nodeLevel
```

- To start an immediate blackout called "bk3" for database "db1" for 30 minutes:

```
$PROMPT> emctl start blackout bk3 db1 -d 30
```

- To start an immediate blackout called "bk3" for database "db2" for five hours:

```
$PROMPT> emctl start blackout bk db2 -d 5:00
```

## 17.5.5 Changing the Management Agent Time Zone

The Management Agent may fail to start after the upgrade if it realizes that it is no longer in the same time zone that it was originally configured with.

You can reset the time zone used by the Management Agent using the following command:

```
emctl resetTZ agent
```

This command will correct the Management Agent side time zone and specify an additional command to be run against the Management Repository to correct the value there.

---

---

**IMPORTANT:** Before you change the Management Agent time zone, first check to see if there are any blackouts that are currently running or scheduled to run on any target managed by that Management Agent.

---

---

To check for blackouts:

1. From the Cloud Control home page, click **Targets** and then **All Targets**. In the All Targets page, locate the Management Agent in the list of targets. Click on the Management Agent's name. This brings you to the Management Agent's home page.
2. The list of targets monitored by the Management Agent are listed in the Monitored Targets section.
3. For each of target in the list:
  - a. Click the target name. This brings you to the target's home page.
  - b. From the <Target> menu, select **Monitoring** and then click **Blackouts**. This allows you to check any currently running blackouts or blackouts that are scheduled in the future for this target.

If such blackouts exist, then:

1. From the Cloud Control Console, stop all currently running blackouts on all targets monitored by that Management Agent.
2. Stop all scheduled blackouts on all targets monitored by that Management Agent.

Once you have stopped all currently running and scheduled blackouts, you can run the `emctl resetTZ agent` command to change the Management Agent's time zone.

Once you have changed the Management Agent's time zone, create new blackouts on the targets as needed.

## 17.5.6 Reevaluating Metric Collections

Use the following command to perform an immediate reevaluation of a metric collection:

```
emctl control agent runCollection <targetName>:<targetType> <collectionItemName>
```

where `<collectionItemName>` is the name of the Collection Item that collects the metric.

Performing this command causes the reevaluated value of the metric to be uploaded into the Management Repository, and possibly trigger alerts if the metric crosses its threshold.

Related metrics are typically collected together; collectively a set of metrics collected together is called a Metric Collection. Each Metric Collection has its own name. If you want to reevaluate a metric, you first need to determine the name of the Metric Collection to which it belongs, then the CollectionItem for that Metric Collection.

When you run the previous command to reevaluate the metric, all other metrics that are part of the same Metric Collection and Collection Item will also be reevaluated.

Perform the following steps to determine the Metric Collection name and Collection Item name for a metric:

1. Go to `$INSTALL_BASE/ngagent/plugins` directory, where `$INSTALL_BASE` is the root of the installation. The Oracle Home of the Management Agent exists in this directory.
2. Locate the XML file for the target type. For example, if you are interested in the host metric 'Filesystem Space Available(%)' metric, look for the `host.xml` file.
3. In the xml file, look for the metric in which you are interested. The metric that you are familiar with is actually the display name of the metric. The metric name would be preceded by a tag that started with:

```
<Label NLSID=
```

For example, in the `host.xml` file, the metric 'Filesystem Space Available(%)' would have an entry that looks like this:

```
<Label NLSID="host_filesys_pctAvailable">Filesystem Space Available (%)
</Label>
```

4. Once you have located the metric in the xml file, you will notice that its entry is part of a bigger entry that starts with:

```
<Metric NAME=
```

Take note of the value defined for "Metric NAME". This is the Metric Collection name. For example, for the 'Filesystem Space Available(%)' metric, the entry would look like this:

```
<Metric NAME="Filesystems"
```

So for the 'Filesystem Space Available(%)' metric, the Metric Collection name is 'Filesystems'.

5. The Collection Item name for this Metric Collection needs to be determined next. Go to the `$INSTALL_BASE/ngagent/plugins/default_collection` directory, where `$INSTALL_BASE` is the Oracle Home of the Management Agent.
6. In this directory, look for the collection file for the target type. In our example, this would be `host.xml`.
7. In cases where a Metric Collection is collected by itself, there would be a single Collection Item of the same name in the collection file. To determine if this is the case for your Metric Collection, look for an entry in the collection file that starts with:

```
<CollectionItem NAME=
```

where the value assigned to the CollectionItem NAME matches the Metric NAME in step (4).

For the 'Filesystem Space Available(%)' metric, the entry in the collection file would look like:

```
<CollectionItem NAME = "Filesystems"
```

8. If you find such an entry, then the value assigned to "CollectionItem NAME" is the collection item name that you can use in the emctl command.
9. Otherwise, this means the Metric Collection is collected with other Metric Collections under a single Collection Item. To find the Collection Item for your Metric Collection, first search for your Metric Collection. It should be preceded by the tag:

```
<MetricColl NAME=
```

Once you have located it, look in the file above it for: <CollectionItem NAME=

The value associated with the CollectionItem NAME is the name of the collection item that you should use in the emctl command.

For example if the you want to reevaluate the host metric "Open Ports", using the previous steps, you would do the following:

- a. Go to the \$INSTALL\_BASE/ngagent/plugins directory where \$INSTALL\_BASE is the Oracle Home of the Management Agent. Look for the host.xml file and in that file locate: <Metric NAME="openPorts".
- b. Then go to the \$INSTALL\_BASE/ngagent/plugins/default\_collection directory. Look for the host.xml file and in that file look for <CollectionItem NAME="openPorts".  
Failing this, look for <MetricColl NAME="openPorts".
- c. Look above this entry in the file to find the <CollectionItem NAME= string and find <CollectionItem NAME="oracle\_security".

The CollectionItem NAME oracle\_security is what you would use in the emctl command to reevaluate the Open Ports metric.

## 17.6 emctl Commands

This section lists the emctl commands for the Enterprise Manager Management Agent and Oracle Management Service.

Table 17–8 explains the emctl commands for OMS.

**Table 17–8 emctl Commands for OMS**

| emctl Command          | Description  |
|------------------------|--|
| emctl [getversion] oms | Gets the version of the Management Service. Sample output is as follows:<br><br>./emctl getversion oms<br>Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0<br>Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved.<br>Enterprise Manager 12c OMS Version 12.1.0.1.0 |
| emctl [start] oms      | Starts the Management Service.   |

**Table 17–8 (Cont.) emctl Commands for OMS**

| <b>emctl Command</b>  | <b>Description</b>  |
|---|---|
| emctl stop oms -all   | Stops the Management Service including Administration Server, HTTP Server, Node Manager, and management server.   |
| emctl stop oms -all -force<br>and emctl stop oms -force   | -force can be used with both emctl stop oms -all and emctl stop oms.<br><br>If the emctl stop oms commands do not shutdown the relevant processes, using -force option will forcefully stop the relevant processes. |
| emctl status oms  | Lists the status of the Management Service  |
| emctl status oms -details   | Lists Management Service details such as port numbers, lock status, domain information, and so on.  |
| emctl config oms -list_<br>repos_details  | Lists the Management Service repository details.  |
| emctl config oms -store_<br>repos_details [-repos_host<br><host> -repos_port <port><br>-repos_sid <sid>   -repos_<br>conndesc <connect<br>descriptor> ] -repos_user<br><username> [-repos_pwd<br><pwd>] | Configures the settings used by Management Service to connect to the Management Repository.   |
| emctl config oms -change_<br>repos_pwd [-old_pwd<br><old_pwd>] [-new_pwd<br><new_pwd>] [-use_sys_<br>pwd [-sys_pwd <sys_<br>pwd>]]  | Configures the password used by Management Service to connect to the Management schema in the Management Repository.  |
| emctl config oms -change_<br>view_user_pwd [-sysman_<br>pwd <sysman_pwd>]<br>[-user_pwd <user_pwd>]<br>[-auto_generate]   | Configures the password used by Management Service for MGMT_VIEW user that is used for report generation.   |
| emctl upload  | Uploads xml files that are pending to upload to the OMS under the upload directory.   |

[Table 17–9](#) explains emctl commands for Management Agents.

**Table 17–9 emctl Commands for Management Agent**

| <b>emctl Command</b>     | <b>Description</b>                    |
|--------------------------|---------------------------------------|
| emctl start   stop agent | Starts or stops Management Agent.     |
| emctl status agent       | Lists the status of Management Agent. |

**Table 17–9 (Cont.) emctl Commands for Management Agent**

| <b>emctl Command</b>         | <b>Description</b>   |
|------------------------------|--|
| emctl status agent -secure   | <p>Lists the secure status of the agent and the port on which the agent is running in secure mode and also the OMS security status of the agent it points to. This command also gives the OMS secure port. Below is an example output:</p> <pre> bash-3.00\$ emctl status agent -secure Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. Checking the security status of the Agent at location set in /ade/example_username_cpap4_ ag/oracle/sysman/config/emd.properties... Done. Agent is secure at HTTPS Port 1838. Checking the security status of the OMS at http://example.us.oracle.com:7654/em/upload/... Done. OMS is secure on HTTPS Port 4473 bash-3.00\$ </pre> |
| emctl status agent scheduler | Lists all Running, Ready, and Scheduled Collection threads.  |
| emctl status agent jobs      | <p>Lists the status of the jobs that are running at present on the agent. The following is an example output:</p> <pre> bash-3.00\$ emctl status agent jobs Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. -----       step id  typ      pid  stat  command line       ----- ----- Agent is Running and Ready </pre>  |

**Table 17–9 (Cont.) emctl Commands for Management Agent**

| emctl Command  | Description   |
|--|---|
| emctl status agent target<br><target name>,<target<br>type>,<metric> | <p>Lists the detailed status of the specified targets in the order of target name, target type. The following is an example of an oracle_database target. You can also provide a particular metric name in the emctl command to get the status of a particular metric of a target.</p> <pre> bash-3.00\$ emctl status agent target database,oracle_ database Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. | emctl reload agent<br>dynamicproperties<br>[<Target_name>:<Target_<br>Type>]... | <p>Recomputes the dynamic properties of a target and generates the dynamic properties for the target.</p> <p>Sample output for oracle_database is as follows:</p> <pre>bash-3.00\$ emctl reload agent dynamicproperties database:oracle_database Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. ----- EMD recompute dynprops completed successfully</pre>  |
| emctl pingOMS [agent]   | Pings the OMS to check if the agent is able to connect to the OMS. Agent will wait for the reverse ping from the OMS so that agent can say the pingOMS is successful.   |
| emctl config agent getTZ  | Gets the current timezone set in the environment.   |
| emctl config agent<br>getSupportedTZ  | Prints the supported timezone based on the setting in the environment.  |
| emctl config console<br><fileloc> [<EM loc>]                                    | <p>Allows you to configure the console based on the configuration entries that you have mentioned in the file &lt;fileloc&gt;.</p> <p>&lt;EM loc&gt; is optional and can be used to operate on a different Oracle Home.</p>   |
| emctl config [agent]<br>listtargets [<EM loc>]                                  | <p>Lists all targets present in targets.xml.</p> <p>&lt;EM loc&gt; is optional and can be used to operate on a different Oracle Home.</p>   |

**Table 17–9 (Cont.) emctl Commands for Management Agent**

| <b>emctl Command</b>   | <b>Description</b>  |
|--|---|
| emctl control agent<br>runCollection <target_<br>name>:<target_type><br><metric_name>                            | Allows to manually run the collections for a particular metric of a target. Sample output is as follows:<br><br><pre>emctl control agent runCollection example.us.oracle.com:host CPUUsage Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. ----- EMD runCollection completed successfully</pre> |
| emctl resetTZ agent  | Resets the timezone of the agent. Stop the agent first and then run this command to change the current timezone to a different timezone. Then start the agent.  |
| emctl getversion agent   | Prints the version of the agent. Sample output is as follows:<br><br><pre>./emctl getversion agent Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. Oracle Enterprise Manager 12c Release 1 Cloud Control Agent 12.1.0.1.0</pre>   |
| emctl dumpstate agent<br><component> ...   | Generates the dumps for the agent. This command allow you to analyze the memory/cpu issues of the agent. Sample output is as follows:<br><br><pre>./emctl dumpstate agent Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. Dumpstate succeeded</pre>   |
| emctl gensudoprops   | Generates the sudo properties of the agent.   |
| emctl clearsudoprops   | Clears the sudo properties.   |
| emctl clearstate   | Clears the state directory contents. The files that are located under \$ORACLE_HOME/sysman/emd/state will be deleted if this command is run. The state files are the files which are ready for the agent to convert them into corresponding xml files.  |
| emctl getemhome  | Prints the agent home directory. The sample output is as follows:<br><br><pre>bash-3.00\$ emctl getemhome Oracle Enterprise Manager 12c Release 1 Cloud Control 12.1.0.1.0. Copyright (c) 1996, 2011 Oracle Corporation. All rights reserved. EMHOME=/scratch/aime/gcagent/ngagent/agent_inst</pre>   |
| emctl start blackout<br><Blackoutname><br>[-nodeLevel] [<Target_<br>name>[:<Target_Type>]]...<br>[-d <Duration>] | Starts blackout on a target.<br><br><Target_name:Target_type> defaults to local node target if not specified.<br><br>If -nodeLevel is specified after <Blackoutname>,the blackout will be applied to all targets and any target list that follows will be ignored.<br><br>Duration is specified in [days] hh:mm   |

**Table 17–9 (Cont.) emctl Commands for Management Agent**

| <b>emctl Command</b>  | <b>Description</b>   |
|---|--|
| emctl stop blackout<br><Blackoutname>   | Stops the blackout that was started on a particular target. Only those blackouts that are started by the emctl tool can be stopped using emctl. This command cannot stop the blackouts that are started using the Console or emcli.  |
| emctl status blackout<br>[<Target_name>[:<Target_Type>]]....  | Provides the status of the blackout of the target. The status includes the type of blackout, whether one time, repeating, or a scheduled blackout. This command also specifies whether the blackout has started or stopped.  |
| emctl secure agent<br>[registration password]   | Secures the agent against an OMS. The registration password must be provided.  |
| emctl unsecure agent  | Unsecures the agent. This will make the agent unsecure and the agent's port will be changed to http port.  |
| emctl verifykey   | Verifies the communication between the OMS and agent by sending pingOMS.   |
| emctl deploy agent [-s<br><install-password>] [-o<br><omshostname:consoleSrvPort>] [-S] <deploy-dir><br><deploy-hostname>:<port><br><source-hostname> | <p>'agent' creates and deploys only the agent.</p> <p>[-s &lt;password&gt;]: Install password for securing agent.</p> <p>[-S]: Password will be provided in STDIN.</p> <p>[-o &lt;omshostname:consoleSrvPort&gt;]: The OMS Hostname and console servlet port. Choose the unsecured port.</p> <p>&lt;deploy-dir&gt; : Directory to create the shared (state-only) installation port.</p> <p>&lt;deploy-hostname:port&gt; : Host name and port of the shared (state-only) installation. Choose unused port.</p> <p>&lt;source-hostname&gt;: The host name of the source install. Typically the machine where EM is installed. This is searched and replaced in targets.xml by the host name provided in argument &lt;deploy-hostname:port&gt;.</p> <p>&lt;sid&gt;: The instance of the remote database. Only specified when deploying "dbconsole".</p> |

## 17.7 Using emctl.log File

The `emctl.log` file is a file that captures the results of all emctl commands you run. For Management Agent, the log file resides in the `$AGENT_INSTANCE_HOME/sysman/log` directory of the Management Agent, and for Management Service, the log file resides in the `$OMS_INSTANCE_HOME/sysman/log` directory. The file is updated every time you run an emctl command. If your emctl command fails for some reason, access this log file to diagnose the issue.

For example, run the following command from the Oracle home directory of the Management Agent to check its status:

```
<agent_home>emctl status agent
```

After running the command, navigate to the log directory to view the following information in the `emctl.log` file:

```
1114306 :: Wed Jun 10 02:29:36 2011::AgentLifeCycle.pm: Processing status agent
1114306 :: Wed Jun 10 02:29:36 2011::AgentStatus.pm:Processing status agent
1114306 :: Wed Jun 10 02:29:37 2011::AgentStatus.pm:emdctl status returned 3
```

Here, the first column, that is, 1114306, is the PID that was used to check the status. The second column shows the date and time when the command was run. The third

column mentions the Perl script that was run for the command. The last column describes the result of the command, where it shows the progress made by the command and the exit code returned for the command. In this case, the exit code is 3, which means that the Management Agent is up and running.

Similarly, for the Management Service, you can run the following command from the Oracle home directory of the Management Service to check its status:

```
<agent_home>emctl status oms
```

In another example, run the following command from the Oracle home directory of the Management Agent to upload data:

```
<agent_home>emctl upload agent
```

After running the command, navigate to the log directory to view the following information in the `emctl.log` file:

```
1286220 :: Tue Jun 9 07:13:09 2011::AgentStatus.pm:Processing upload
1286220 :: Tue Jun 9 07:13:10 2011::AgentStatus.pm:emdctl status agent returned 3
1286220 :: Tue Jun 9 07:13:41 2011::AgentStatus.pm: emdctl upload returned with
exit code 6
```

Here, the entries are similar to the entries in the first example, but the exit code returned is 6, which means the upload operation is failing for some reason.

The exit codes returned depend on the `emctl` command executed. In general, exit code of zero means success and any exit code other than zero means failure. For details about the cause of failure, view the error message.

For more information about Management Agent and Oracle Management Service log files, see [Chapter 18](#).

---

## Locating and Configuring Enterprise Manager Log Files

When you install the Oracle Management Agent (Management Agent) or the Oracle Management Service (OMS), Enterprise Manager automatically configures the system to save certain informational, warning, and error information to a set of log files.

Log files can help you troubleshoot potential problems with an Enterprise Manager installation. They provide detailed information about the actions performed by Enterprise Manager and whether or not any warnings or errors occurred.

This chapter not only helps you locate and review the contents of Enterprise Manager log files, but also includes instructions for configuring the log files to provide more detailed information to help in troubleshooting or to provide less detailed information to save disk space.

This chapter contains the following sections:

- [Managing Log Files](#)
- [Locating Management Agent Log and Trace Files](#)
- [Locating and Configuring Oracle Management Service Log and Trace Files](#)

### 18.1 Managing Log Files

Many Enterprise Manager components generate log files containing messages that record errors, notifications, warnings, and traces.

[Table 18–1](#) describes the columns in the Log Message table. For any given component, the optional column may not be populated in the message.

**Table 18–1** *Message Columns*

| Column Name  | Description   |
|--------------|---|
| Time         | The date and time when the message was generated. This reflects the local time zone.  |
| Message Type | The type of message. Possible values are: Incident Error Warning, Notification, and Trace. In addition, the value Unknown may be used when the type is not known.                                 |
| Message ID   | The ID that uniquely identifies the message within the component. The ID consists of a prefix that represents the component, followed by a dash, then a 5-digit number. For example:<br>OHS-51009 |
| Message      | The text of the error message.  |

**Table 18–1 (Cont.) Message Columns**

| Column Name          | Description   |
|----------------------|---|
| Target (Expanded)    | Expanded target name.   |
| Target               | Target name   |
| Target Type          | Target type   |
| Execution Context    | <p>The Execution Context ID (ECID), which is a global unique identifier of the execution of a particular request in which the originating component participates. You can use the ECID to correlate error messages from different components.</p> <p>The Relationship ID, which distinguishes the work done in one thread on one process, from work done by any other threads on this and other processes, on behalf of the same request.</p> |
| Component            | The component that originated the message.  |
| Module               | The identifier of the module that originated the message.   |
| Incident ID          | The identifier of the incident to which this message corresponds.   |
| Instance             | The name of the Oracle instance to which the component that originated the message belongs.   |
| Message Group        | The name of the group to which this message belongs.  |
| Message Level        | The message level, represented by an integer value that qualifies the message type. Possible values are from 1 (highest severity) through 32 (lowest severity).   |
| Hosting Client       | The identifier for the client or security group to which this message relates.  |
| Organization         | The organization ID for the originating component. The ID is <code>oracle</code> for all Oracle components.   |
| Host                 | The name of the host where the message originated.  |
| Host IP Address      | The network address of the host where the message originated.   |
| User                 | The name of the user whose execution context generated the message.   |
| Process ID           | The ID for the process or execution unit that generated the message.  |
| Thread ID            | The ID of the thread that generated the message.  |
| Upstream Component   | The component that the originating component is working with on the client (upstream) side.   |
| Downstream Component | The component that the originating component is working with on the server (downstream) side.   |
| Detail Location      | A URL linking to additional information regarding the message.  |
| Supplemental Detail  | Supplemental information about the event, including more detailed information than the message text.  |
| Target Log Files     | Link to the log files page for this target.   |
| Log File             | Log file that this message contains.  |

Using Log Viewer, you can do the following:

- [Viewing Log Files and Their Messages](#)
- [Searching Log Files](#)
- [Downloading Log Files](#)

## 18.1.1 Viewing Log Files and Their Messages

You can view Enterprise Manager-related logs in a domain, an Oracle WebLogic Server, or a component.

For example, to view the log files and their messages:

1. From the **Enterprise** menu, select **Monitoring**, then select **Logs**.

or

From the **Targets** menu, select **Middleware**, then select an Enterprise Manager domain. From the **Farm** menu, select **Logs**, then select **View Log Messages**.

The Log Messages page is displayed.

2. If the targets for which you want to view logs are added, expand **Selected Targets** and in the row for a particular component or application, click the **Target Log Files** icon.

The Log Files page is displayed. On this page, you can see a list of log files related to the Managed Server.

3. Select a file and click **View Log File**.

The View Log File page is displayed. On this page, you can view the list of messages.

4. To view the details of a message, select the message.

By default, the messages are sorted by time, in ascending order. You can sort the messages by the any of the columns, such as Message Type, by clicking the column name.

5. To view messages that are related by time or ECID, click **View Related Messages** and select **by Time** or **by ECID (Execution Context ID)**.

The Related Messages page is displayed.

## 18.1.2 Searching Log Files

You can search for diagnostic messages using the Log Messages page. By default, this page shows a summary of the logged issues for the last hour.

You can modify the search criteria to identify messages of relevance. You can view the search results in different modes, allowing ease of navigation through large amounts of data.

The following sections describe how to search log files:

- [Searching Log Files: Basic Searches](#)
- [Searching Log Files: Advanced Searches](#)

### 18.1.2.1 Searching Log Files: Basic Searches

You can search for all of the messages for all of the entities in a domain, an Oracle WebLogic Server, a component, or an application.

For example, to search for messages for a domain:

1. From the **Targets** menu, select **Middleware**, then select a domain. From the **Farm** menu, select **Logs**, then select **View Log Messages**.

or

From the **Enterprise** menu, select **Monitoring**, then select **Logs**.

The Log Messages page displays a Search section and a table that shows a summary of the messages for the last hour.

2. In the Date Range section, you can select either:
  - **Most Recent:** If you select this option, select a time, such as 3 hours. The default is 1 hour.
  - **Time Interval:** If you select this option, select the calendar icon for **Start Date**. Select a date and time. Then, select the calendar icon for **End Date**. Select a date and time.
3. In the Message Types section, select one or more of the message types.
4. You can specify more search criteria, as described in [Searching Log Files: Advanced Searches](#).
5. Click **Search**.
6. To help identify messages of relevance, in the table, for **Show**, select one of the following modes:
  - **Messages:** Shows the matching messages.

To see the details of a particular message, click the message. The details are displayed below the table of messages.

To view related messages, select a message, then click **View Related Messages** and select **by Time** or **by ECID (Execution Context ID)**.
  - **Group by Message Type:** Summarizes the matching messages by grouping them based on message type at the target level.

To see the messages, click the count in one of the message type columns. The Messages by Message Type page is displayed. To see the details of a particular message, click the message. The details are displayed below the table of messages.
  - **Group by Message ID:** Summarizes the matching messages by grouping them based on message ID, message type, and module IDs at the target level.

To see the associated messages, click the count in the **Occurrences** column. The Messages by Message ID page is displayed. To see the details of a particular message, click the message. The details are displayed below the table of messages.

### 18.1.2.2 Searching Log Files: Advanced Searches

You can refine your search criteria using the following controls in the Log Messages page:

- **Message:** You can select an operator, such as **contains** and then enter a value to be matched.
- **Add Fields:** Click this to specify additional criteria, such as Host, which lets you narrow the search to particular hosts. Then click **Add**.

For each field you add, select an operator, such as **contains** and then enter a value to be matched.
- **Selected Targets:** Expand this to see the targets that are participating in the search. To add targets, click **Add** and provide information in the dialog box. To remove targets, select the target and click **Remove**.

### 18.1.3 Downloading Log Files

You can download the log messages to a file. You can download either the matching messages from a search or the messages in a particular log file.

To download the matching messages from a search to a file:

1. From the **Enterprise** menu, select **Monitoring**, then select **Logs**.

or

From the **Targets** menu, select **Middleware**, then select a domain. From the **Farm** menu, select **Logs**, then select **View Log Messages**.

The Log Messages page is displayed.

2. Search for particular types of messages as described in [Searching Log Files: Basic Searches](#).
3. Select a file type by clicking **Export Messages to File** and select one of the following:
  - **As Oracle Diagnostic Log Text (.txt)**
  - **As Oracle Diagnostic Log Text (.xml)**
  - **As Comma-Separated List (.csv)**

An Opening dialog box is displayed.

4. Select either **Open With** or **Save to Disk**. Click **OK**.

To export specific types of messages or messages with a particular Message ID to a file:

1. From the **Enterprise** menu, select **Monitoring**, then select **Logs**.

or

From the **Targets** menu, select **Middleware**, then select a domain. From the **Farm** menu, select **Logs**, then select **View Log Messages**.

The Log Messages page is displayed.

2. Search for particular types of messages as described in [Searching Log Files: Basic Searches](#).
3. For **Show**, select **Group by Message Type** or **Group by Message ID**.
4. To download the messages into a file, if you selected **Group by Message Type**, select the link in one of the columns that lists the number of messages, such as the **Errors** column. If you selected **Group by Message ID**, select one of the links in the **Occurrences** column.

The Messages by Message Type page or Message by Message ID is displayed.

5. Select a file type by clicking the arrow near **Export Messages to File**.

You can select one of the following:

- **As Oracle Diagnostic Log Text (.txt)**
- **As Oracle Diagnostic Log Text (.xml)**
- **As Comma-Separated List (.csv)**

An Opening dialog box is displayed.

6. Select either **Open With** or **Save to Disk**. Click **OK**.

To download the log files for a specific component:

1. From the **Enterprise** menu, select **Monitoring**, then select **Logs**.

or

From the **Targets** menu, select **Middleware**, click a domain. From the **Farm** menu, select **Logs**, then select **View Log Messages**.

The Log Messages page is displayed.

2. Click **Target Log Files**.

The Log Files page is displayed. On this page, you can see a list of log files related to the component or application.

3. Select a log file and click **Download**.
4. An Opening dialog box is displayed.
5. Select either **Open With** or **Save to Disk**. Click **OK**.

## 18.2 Locating Management Agent Log and Trace Files

The following sections provide information on the log and trace files for the Oracle Management Agent:

- [About the Management Agent Log and Trace Files](#)
- [Locating the Management Agent Log and Trace Files](#)

### 18.2.1 About the Management Agent Log and Trace Files

Oracle Management Agent log and trace files store important information that support personnel can later use to troubleshoot problems. The agent main log is located in `$EMSTATE/sysman/log`. The log is segmented by default to 11 segments, 5MB each. The segments are named `gcagent.log` and `gcagent.log.#` where # is a number in the range of 1-10. These settings are controlled by properties in `emd.properties` as explained in the following sections. The latest segment is always `gcagent.log` and the oldest is the `gcagent.log.X` where X is the highest number.

The Management Agent uses the following log files:

- Oracle Management Agent log file (`gcagent.log`)  
This log file contains trace, debug, information, error, or warning messages from the agent.
- Oracle Management Agent trace log file (`gcagent_sdk.trc`)  
This log file contains logging information about fetchlets and receivelets.
- Oracle Management Agent errors log file (`gcagent_errors.log`)  
This error log file contains information about errors. The errors in this file are duplicate of the errors in `gcagent.log`.
- Oracle Management Agent log file (`gcagent_mdu.log`)  
This log tracks the metadata updates to the agent.
- Enterprise Manager Control log file (`emctl.log`)  
The information is saved to `emctl.log` file, when you run the Enterprise Manager Control commands. For more information about `emctl.log` file, see chapter *Starting and Stopping Enterprise Manager Components*.

---

**Note:** All the agent logs mentioned above (existing in `$EMSTATE/sysman/log`) are transient. Agent logs are segmented and have a limited overall size and hence need not be deleted or managed.

---

### 18.2.1.1 Structure of Agent Log Files

The log contain individual log messages with the following format:

```
YYYY-MM-DD HH:MM:SS,### [<tid>:<thread code or code:name>] <level> -<the message>
```

Where:

- YYYY-MM-DD HH:MM:SS,### is a timestamp (in 24 hours format and ### is the fraction in msec).
- <tid> is the thread id (as a decimal number)
- <thread name or code> is the thread full name or an abbreviated hexadecimal code (see the following example).
- <level> is the logging level that can be one of (in ascending order of importance): DEBUG, INFO, WARN, ERROR, FATAL.
- <the message> is the free text message that is being logged. The message can contain new lines and spawn multiple lines.

For example:

```
2011-06-07 15:00:00,016 [1:3305B9:main] DEBUG - ADR_BASE='/ade/example_
user/oracle/example/agentStateDir' 2011-06-07 15:00:01,883 [1:3305B9] INFO - Agent
is starting up
```

## 18.2.2 Locating the Management Agent Log and Trace Files

The log and trace files for the Agent are written in the Agent runtime directory. You can find the runtime directory by using this command:

```
$ emctl getemhome
```

The log and trace files will be located at `<EMHOME>/sysman/log`.

## 18.2.3 Setting Oracle Management Agent Log Levels

Every log message is logged using a specific log level. The log levels are ordered in priority order: DEBUG, INFO, WARN, ERROR, and FATAL. The log setting determines the minimum level that will be included in the log. For example, if the log level is set to INFO (the default), only log messages of level INFO and above (INFO, WARN, ERROR and FATAL) are going to be included in the log.

Agent logging is based on log4j so the logging configuration is also log4j-based. The logging configuration properties are located in `emd.properties` and they all start with the prefix "Logger".

The "rootCategory" property controls the default log level. It is by default set to INFO. For example:

```
Logger.log4j.rootCategory=INFO,Rolling,Errors,Test
```

The agent uses an embedded HTTP server (jetty) to service client requests made on HTTP. There is a dedicated class which enables jetty logging as shown below:

```
Logger.log4j.category.oracle.sysman.gcagent.comm.agent.http.HTTPListener=INFO
```

This can be configured to DEBUG to try to troubleshoot certain communication problems, but the number of entries logged for DEBUG setting cannot be controlled. It is recommended that you configure the DEBUG option only under the direction of Oracle Support as in doing so may cause other valuable logging to be sacrificed.

### 18.2.3.1 Setting gcagent.log

The gcagent.log is configured using properties that starts with "Logger.log4j.appender.Rolling". The following is a sample gcagent.log:

```
Logger.log4j.appender.Rolling=org.apache.log4j.RollingFileAppender
Logger.log4j.appender.Rolling.File=/ade/user_
name/oracle/agentStateDir/sysman/log/gcagent.log
Logger.log4j.appender.Rolling.Append=true
Logger.log4j.appender.Rolling.MaxFileSize=5000000
Logger.log4j.appender.Rolling.MaxBackupIndex=10
Logger.log4j.appender.Rolling.layout=oracle.sysman.gcagent.util.logging.GCPattern
```

Where:

- "File" property controls the location and name of the main log. It is recommended that you do not change the setting for it.
- "Append" determines if the log file should be appended (true) or overwritten (false) on agent startup.
- "MaxFileSize" determines the size of each of the log segments.
- "MaxBackupIndex" determines the number of "backup" segments for the log (the total number of segments are this number plus one).

### 18.2.3.2 Setting gcagent\_error.log

The gcagent\_errors.log is a subset of the gcagent.log. The logging configuration for gcagent\_errors.log is specified in emd.properties. Following are the settings for gcagent\_errors.log:

```
Logger.log4j.appender.Errors=org.apache.log4j.RollingFileAppender
Logger.log4j.appender.Errors.File=/ade/user_
name/oracle/work/agentStateDir/sysman/log/gcagent_errors.log
Logger.log4j.appender.Errors.Append=true
Logger.log4j.appender.Errors.Threshold=ERROR
Logger.log4j.appender.Errors.layout=oracle.sysman.gcagent.util.logging.GCPattern
Logger.log4j.appender.Errors.MaxFileSize=50000000
Logger.log4j.appender.Errors.MaxBackupIndex=3
```

### 18.2.3.3 Setting the Log Level for Individual Classes and Packages

The logging level for individual class and/or packages can also be set. The following are examples that are currently configured by default:

```
# Set the class loaders to level INFO
Logger.log4j.category.oracle.sysman.gcagent.metadata.impl.ChainedClassLoader=INFO

Logger.log4j.category.oracle.sysman.gcagent.metadata.impl.ReverseDelegationClassLo
ader=INFO
Logger.log4j.category.oracle.sysman.gcagent.metadata.impl.PluginLibraryClassLoader
=INFO
Logger.log4j.category.oracle.sysman.gcagent.metadata.impl.PluginClassLoader=INFO
```

The above configuration changed the default level of logging for the four classes to be INFO. When the default level of logging is INFO it does not make any difference but if the default log level is set to DEBUG (when debugging the code) it will prevent those four classes from logging at DEBUG level (as they are normally too verbose).

The reverse is also true, for example if the following configuration is added (not set by default):

```
Logger.log4j.category.oracle.sysman.gcagent.metadata.impl.collection=DEBUG
```

It will cause all classes in the "oracle.sysman.gcagent.metadata.impl.collection" package to log at DEBUG level even if the default log level is INFO.

### 18.2.3.4 Setting gcagent\_mdu.log

A set of entries are created in the gcagent\_mdu.log file for each client command that modifies target instances, target instance collections, or blackouts. Entries are as follows:

```
2011-08-18 22:56:40,467 [HTTP Listener-34 - /emd/main/ (DispatchRequests)] - SAVE
TARGET(S)
<Target IDENTIFIER="TARGET_GUID=6A3A159D0BB320C50B7926E0671A1A98"
STATUS="MONITORED" TIMEZONE_REGION="" ON_HOST="" DISPLAY_NAME="EM Management
Beacon" NAME="EM Management Beacon" TYPE="oracle_beacon"/>
<Target IDENTIFIER="TARGET_GUID=51F9BBC6F5B833058F4278B51E496000"

```

For the batch of saved targets in the above example, the original request came in at 22:56:40 and the list of targets saved are found in the line(s) following the SAVE TARGET(S) message. In this case, there were 8 targets. The result of saving the targets is available in the next 8 lines (for the same thread) and in this case all were saved successfully by 22:57:10.

The pattern is the same for saved collection items (or collections) and blackouts.

The logging configuration for the gcagent\_mdu log is specified in emd.properties but you must not be modify this log. For example, these entries are logged at INFO level, which means that if you decided to save space and change this to WARN only

by editing the mdu log entries in the `emd.properties` file, you will have effectively disabled this log.

Following are the settings for `gcagent_mdu` log:

```
Logger.log4j.appender.Mdu=org.apache.log4j.RollingFileAppender
Logger.log4j.appender.Mdu.File=/ade/user_
name/oracle/work/agentStateDir/sysman/log/gcagent_mdu.log
Logger.log4j.appender.Mdu.Append=true
Logger.log4j.appender.Mdu.Threshold=INFO
Logger.log4j.appender.Mdu.layout=org.apache.log4j.PatternLayout
Logger.log4j.appender.Mdu.layout.ConversionPattern=%d [%t] - %m%n
Logger.log4j.appender.Mdu.MaxFileSize=50000000
Logger.log4j.appender.Mdu.MaxBackupIndex=3
```

### 18.2.3.5 Setting the TRACE Level

The following `_enableTrace` property when set to "true" will enable the TRACE logging level that shows as DEBUG messages.

```
Logger._enableTrace=true
```

The default log level for the agent log must be set to DEBUG for the tracing level to work.

## 18.3 Locating and Configuring Oracle Management Service Log and Trace Files

The following sections describe how to locate and configure the OMS log files:

- [Locating Oracle Management Service Log and Trace Files](#)
- [Controlling the Size and Number of Oracle Management Service Log and Trace Files](#)
- [Controlling the Contents of the Oracle Management Service Trace File](#)
- [Controlling the Oracle WebLogic Server and Oracle HTTP Server Log Files](#)

### 18.3.1 About the Oracle Management Service Log and Trace Files

OMS log and trace files store important information that Oracle Support can later use to troubleshoot problems. OMS uses the following six types of log files:

- Oracle Management Service log file (`emoms.log`)  
The Management Service saves information to the log file when it performs an action (such a starting or stopping) or when it generates an error. This is a log file for console application.
- Oracle Management Service trace file (`emoms.trc`)  
OMS trace file provides an advanced method of troubleshooting that can provide support personnel with even more information about what actions the OMS was performing when a particular problem occurred. This is a trace file for Console application.
- Oracle Management Service log file (`emoms_pbs.log`)  
The Management Service saves information to this log file for background modules such as the loader, job system, event system, notification system, and so on. This file contains messages logged at ERROR or WARN levels.

- Oracle Management Service trace file (`emoms_pbs.trc`)

This trace file provides additional logging for the background modules such as the loader, job system, event system, notification system, and so on when DEBUG or INFO level logging is enabled for these modules. This file can provide Support personnel with even more information about actions these modules were performing when a particular problem occurred.
- Enterprise Manager Control log file (`emctl.log`)

The information is saved to `emctl.log` file, when you run the Enterprise Manager Control commands. For more information about `emctl.log` file, see chapter *Starting and Stopping Enterprise Manager Components*.

### 18.3.2 Locating Oracle Management Service Log and Trace Files

OMS log and trace files are stored in the following location:

```
<EM_INSTANCE_BASE>/em/<OMS_NAME>/sysman/log/
```

Where, `<EM_INSTANCE_BASE>` is the OMS Instance Base directory. By default, the OMS Instance Base directory is `gc_inst`, which is present under the parent directory of the Oracle Middleware Home.

For example, if the Oracle Middleware Home is `/u01/app/Oracle/Middleware`, then the instance base directory is `/u01/app/Oracle/gc_inst`, and the log and trace files are available in `/u01/app/Oracle/gc_inst/em/EMGC_OMS1/sysman/log/` directory path.

### 18.3.3 Controlling the Size and Number of Oracle Management Service Log and Trace Files

OMS log and trace files increases in size over time as information is written to the files. However, the files are designed to reach a maximum size. When the files reach the predefined maximum size, the OMS renames (or rolls) the logging information to a new file name and starts a new log or trace file. This process keeps the log and trace files from growing too large.

As a result, you will often see multiple log and trace files in the OMS log directory. The following example shows one archived log file and the current log file in the `/u01/app/Oracle/gc_inst/em/EMGC_OMS1/sysman/log/` directory:

```
emoms.log  
emoms.log.1
```

To control the maximum size of the OMS log and OMS trace files, as well as the number of rollover files, run the following command, and specify details as described in [Table 18-2](#):

```
emctl set property -name <property> -value <property value> -module logging
```

---

**Note:** In Oracle Enterprise Manager Cloud Control 12c, you do not have to restart OMS for the changes to take effect.

---

**Table 18–2 Oracle Management Service Log File Properties in the *emomslogging.properties* File**

| Property  | Purpose  | Example   |
|---|--|---|
| log4j.appender.emlogAppender.<br>MaxFileSize    | When OMS log file reaches this size, then OMS copies the logging data to a new rollover file and creates a new <i>emoms.log</i> log file. The size of the log is specified in units of bytes. This property is also applicable for <i>emoms_pbs.log</i> .  | log4j.appender.emlogAppender.<br>MaxFileSize=20000000 |
| log4j.appender.emlogAppender.<br>MaxBackupIndex | This optional property indicates how many times OMS will rollover the log file to a new file name before deleting logging data. This property is also applicable for <i>emoms_pbs.log</i> .<br><br><b>Note:</b> Because the log file does not contain as much data as the trace file, it is usually not necessary to create more than one rollover file. | log4j.appender.emlogAppender.<br>MaxBackupIndex=1     |
| log4j.appender.emtrcAppender.<br>MaxFileSize    | When the OMS trace file reaches this size, then OMS copies the logging data to a new rollover file and creates a new <i>emoms.trc</i> log file. This property is also applicable for <i>emoms_pbs.trc</i> .  | log4j.appender.emtrcAppender.<br>MaxFileSize=5000000  |
| log4j.appender.emtrcAppender.<br>MaxBackupIndex | This property indicates how many times the OMS will rollover the trace file to a new file name before deleting tracing data. This property is also applicable for <i>emoms_pbs.trc</i> .   | log4j.appender.emtrcAppender.<br>MaxBackupIndex=10    |

### 18.3.4 Controlling the Contents of the Oracle Management Service Trace File

By default, the OMS will save all critical and warning messages to the *emoms.trc* file. However, you can adjust the amount of logging information that the OMS generates.

To change the amount of logging information generated by the OMS, run the following command:

```
emctl set property -name "log4j.rootCategory" -value "<LEVEL>, emlogAppender,  
emtrcAppender" -module logging
```

---

**Note:** If you change the root logging level for the `emoms.trc` file, then a lot of messages are written to the trace file filling up the space quickly, and potentially slowing down the system. Run the following command to enable debug selectively for specific modules that need to be assessed:

```
emctl set property -name <logging module> -value DEBUG -module
logging
```

Where, `<logging module>` represents the logging module from a specific subsystem.

For example, `oracle.sysman.emdrep.dbjava.loader`.

The logging level can be changed for specific modules by running the following command:

```
emctl set property -name "<CATEGORY>" -value "<LEVEL>" -module
logging
```

where LEVEL can be DEBUG, INFO, WARN, or ERROR, and CATEGORY is specific to the module for which level has to be changed. To change the logging module, contact Oracle Support.

---

---

**Note:** The location of `emoms.trc`, `emoms.log`, `emoms_pbs.trc`, and `emoms_pbs.log` files can be changed to a different location from the default location. However, it is not advisable to do so.

---

### 18.3.5 Controlling the Oracle WebLogic Server and Oracle HTTP Server Log Files

Oracle Management Service is a Java EE application deployed on an Oracle WebLogic Server. Different components of the Oracle WebLogic Server generate their own log files. These files contain important information that can be used later by support personnel to troubleshoot problems.

Table 18–3 lists the location of the log files for some components.

**Table 18–3 Component Log File Location**

| Component                | Location  |
|--------------------------|---|
| Oracle HTTP Server (OHS) | <code>&lt;EM_INSTANCE_BASE&gt;/&lt;webtier_instance_name&gt;/diagnostics/logs/OHS/&lt;ohs_name&gt;</code><br>For example,<br><code>/u01/app/Oracle/gc_inst/WebTierIH1/diagnostics/logs/OHS/ohs1</code>    |
| OPMN                     | <code>&lt;EM_INSTANCE_BASE&gt;/&lt;webtier_instance_name&gt;/diagnostics/logs/OPMN/&lt;opmn_name&gt;</code><br>For example,<br><code>/u01/app/Oracle/gc_inst/WebTierIH1/diagnostics/logs/OPMN/opmn</code> |

**Table 18–3 (Cont.) Component Log File Location**

| Component       | Location   |
|-----------------|--|
| Oracle WebLogic | <p>The log data from WebLogic will be at:</p> <pre>&lt;EM_INSTANCE_BASE&gt;/user_projects/domains/&lt;domain_name&gt;/servers/&lt;SERVER_NAME&gt;/logs/&lt;SERVER_NAME&gt;.log</pre> <p>This log can be restricted, rotated by size, time, and other conditions from the WebLogic Console. The default settings are:</p> <ul style="list-style-type: none"> <li>■ In production mode, they are rotated at a default of 5MB.</li> <li>■ The log level is WARNING.</li> <li>■ The number files are restricted to 10.</li> </ul> <p>For example,</p> <pre>/u01/app/Oracle/gc_inst/user_projects/domains/GCDomain/servers/EMGC_OMS1/logs/EMGC_OMS1.log</pre> <p>The messages written to sysout and syserr will be available in the .out files. They cannot be rotated by size or time. They are rotated only when the server starts. They are located at:</p> <pre>&lt;EM_INSTANCE_BASE&gt;/user_projects/domains/&lt;domain_name&gt;/servers/&lt;SERVER_NAME&gt;/logs/&lt;SERVER_NAME&gt;.out</pre> <p>For example,</p> <pre>/u01/app/Oracle/gc_inst/user_projects/domains/GCDomain/servers/EMGC_OMS1/logs/EMGC_OMS1.out</pre> <p>The node manager logs are at &lt;INST_HOME&gt;/NodeManager/emnodemanager and the admin server logs are at &lt;INST_HOME&gt;/user_projects/domains/GCDomain/servers/EMGC_ADMINSERVER/logs.</p> |

By default, the Enterprise Manager Cloud Control configures Oracle HTTP Server logs to roll over periodically to a new file, so that each file does not grow too large in size. You must also ensure that you delete the old rollover files periodically to free up the disk space. You can use an operating system scheduler, like cron on UNIX, to periodically delete the rollover files.

---

**Note:** Following are log files that you will need to maintain and manually purge:

- `<gc_inst>/user_projects/domains/<domain_name>/servers/EMGC_ADMINSERVER/logs/<domain_name>.log*`
  - All files under `<gc_inst>/WebTierIH1/diagnostics/logs/OHS/ohs1/`. For example:
    - `em_upload_http_access_log.*`
    - `access_log.*`
    - `em_upload_https_access_log.*`
    - `ohs1-*.log`
    - `console~OHS~1.log*`
    - `mod_wl_ohs.log*`
  - Log files under the admin server and emgc\_oms server:
    - `<gc_inst>\users_projects\domains\<domain_name>\servers\EMGC_ADMINSERVER\logs\*.out*`
    - `<gc_inst>\users_projects\domains\<domain_name>\servers\EMGC_OMS?\logs\*.out*`
- 

For instructions on controlling the size and rotation of these log files, refer to chapter "Managing Log Files and Diagnostic Data" in *Oracle Fusion Middleware Administrator's Guide*.

For information about configuring Enterprise Manager to view Fusion Applications PL/SQL and C diagnostic log files, see chapter "Managing Oracle Fusion Applications Log Files and Diagnostic Tests" in *Oracle Fusion Applications Administrator's Guide*.

# Part VI

## Configuring Enterprise Manager for High Availability

This section covers Enterprise Manager high availability best practices and strategies that allow you to safeguard your Oracle Enterprise Manager installation.

- [High Availability Solutions](#)
- [Setting Up High Availability](#)
- [Backing Up Enterprise Manager](#)
- [Enterprise Manager Outages](#)

---

## High Availability Solutions

Highly Available systems are critical to the success of virtually every business today. It is equally important that the management infrastructure monitoring these mission-critical systems are highly available. The Enterprise Manager Cloud Control architecture is engineered to be scalable and available from the ground up. It is designed to ensure that you concentrate on managing the assets that support your business, while it takes care of meeting your business Service Level Agreements.

When you configure Cloud Control for high availability, your aim is to protect each component of the system, as well as the flow of management data in case of performance or availability problems, such as a failure of a host or a Management Service.

Maximum Availability Architecture (MAA) provides a highly available Enterprise Manager implementation by guarding against failure at each component of Enterprise Manager.

The impacts of failure of the different Enterprise Manager components are:

- Management Agent failure or failure in the communication between Management Agents and Management Service

Results in targets no longer monitored by Enterprise Manager, though the Enterprise Manager console is still available and one can view historical data from the Management Repository.

- Management Service failure

Results in the unavailability of Enterprise Manager console, as well as unavailability of almost all Enterprise Manager services.

- Management Repository failure

Results in failure on the part of Enterprise Manager to save the uploaded data by the Management Agents as well as unavailability of almost all Enterprise Manager services.

Overall, failure in any component of Enterprise Manager can result in substantial service disruption. Therefore it is essential that each component be hardened using a highly available architecture.

### 19.1 Latest High Availability Information

Because of rapidly changing technology, and the fact that high availability implementations extend beyond the realm of Oracle Enterprise Manager, the following resources should be checked regularly for the latest information on third-party

integration with Oracle's high availability solutions (F5 or third-party cluster ware, for example).

- Oracle Maximum Availability Architecture Web site  
<http://www.oracle.com/technology/deploy/availability/htdocs/maa.htm>
- Support Note 330072.1: "How To Configure Grid Control Components for High Availability "

## 19.2 Defining High Availability

Oracle Enterprise Manager's flexible, distributed architecture permits a wide range of deployment configurations, allowing it to meet the monitoring and management needs of your business, as well as allowing for expansion as business needs dictate.

For this reason, high availability for Enterprise Manager cannot be narrowly defined as a singular implementation, but rather a range of protection levels based on your available resources, Oracle technology and best practices that safeguard the investment in your IT infrastructure. Depending on your Enterprise Manager deployment and business needs, you can implement the level of high availability necessary to sustain your business. High availability for Enterprise Manager can be categorized into four levels, each level building on the previous and increasing in implementation cost and complexity, but also incrementally increasing the level of availability.

### 19.2.1 Levels of High Availability

Each high availability solution level is driven by your business requirements and available IT resources. However, it is important to note that the levels represent a subset of possible deployments that are useful in presenting the various options available. Your IT organization will likely deploy its own configuration which need not exactly match one of the levels.

The following table summarizes the four example high availability levels for Oracle Enterprise Manager installations as well as general resource requirements.

**Table 19–1 Enterprise Manager High Availability Levels**

| Level   | Description  | Minimum Number of Nodes | Recommended Number of Nodes | Load Balancer Requirements |
|---------|--|-------------------------|-----------------------------|----------------------------|
| Level 1 | OMS and repository database. Each resides on their own host with no failover.                  | 1                       | 2                           | None                       |
| Level 2 | OMS installed on shared storage with a VIP based failover. Database is using Local Data Guard. | 2                       | 4                           | None                       |
| Level 3 | OMS in Active/Active configuration. The database is using RAC + Local Data Guard               | 3                       | 5                           | Local Load Balancer        |

**Table 19–1 (Cont.) Enterprise Manager High Availability Levels**

| Level   | Description  | Minimum Number of Nodes | Recommended Number of Nodes | Load Balancer Requirements  |
|---------|--|-------------------------|-----------------------------|---|
| Level 4 | <p>OMS in Active/Active configuration on the primary site. The standby RAC database (DataGuard) is located at the disaster recovery site.</p> <p>Multiple standby OMS instances at remote site.</p> <p>Data Guard RAC database at the primary site</p> <p><b>Note:</b> Level 4 is a MAA Best Practice, achieving highest availability in the most cost effective, simple architecture.</p> | 4                       | 8                           | <p><b>Required:</b><br/>Local Load Balancer for each site.</p> <p><b>Optional:</b><br/>Global Load Balancer</p> |

## 19.3 Comparing Availability Levels

The following tables compare the protection levels and recovery times for the various high-availability levels.

**Table 19–2 High Availability Levels of Protection**

| Level   | OMS Host Failure | OMS Storage Failure | Database Host Failure | Database Storage Failure | Site Failure/Disaster Recovery |
|---------|------------------|---------------------|-----------------------|--------------------------|--------------------------------|
| Level 1 | No               | No                  | No                    | No                       | No                             |
| Level 2 | Yes              | No                  | Yes                   | Yes                      | No                             |
| Level 3 | Yes              | Yes                 | Yes                   | Yes                      | No                             |
| Level 4 | Yes              | Yes                 | Yes                   | Yes                      | Yes                            |

**Table 19–3 High Availability Level Recovery Times**

| Level   | Node Failure | Local Storage Failure | Site Failure | Cost     |
|---------|--------------|-----------------------|--------------|----------|
| Level 1 | Hours-Days   | Hours-Days            | Hours-Days   | \$       |
| Level 2 | Minutes      | Hours-Days            | Hours-Days   | \$\$     |
| Level 3 | No Outage    | Minutes               | Hours-Days   | \$\$\$   |
| Level 4 | No Outage    | Minutes               | Minutes      | \$\$\$\$ |

One measure that is not represented in the tables is that of scalability. Levels three and four provide the ability to scale the Enterprise Manager installation as business needs grow. The repository, running as a RAC database, can easily be scaled upwards by adding new nodes to the RAC cluster and it is possible to scale the Management Service tier by simply adding more OMS servers.

If you need equalized performance in the event of failover to a standby deployment, whether that is a local standby database or a Level four standby site including a standby RAC database and standby OMS servers, it is essential to ensure that the deployments on both sites are symmetrically scaled. This is particularly true if you

want to run through planned failover routines where you actively run on the primary or secondary site for extended periods of time. For example, some finance institutions mandate this as part of operating procedures.

If you need survivability in the event of a primary site loss you need to go with a Level four architecture.

## 19.4 Implementing High Availability Levels

Once you have determined the high availability requirements for your enterprise, you are ready to begin implementing one of the high availability levels that is suitable for your environment. Use the following information roadmap to find implementation instructions for each level.

| Level   | Where to find information   |
|---------|---|
| Level 1 | <i>Oracle Enterprise Manager Basic Installation Guide</i> and the <i>Oracle Enterprise Manager Advanced Installation and Configuration Guide</i>  |
| Level 2 | <i>Oracle Enterprise Manager Basic Installation Guide</i> and the <i>Oracle Enterprise Manager Advanced Installation and Configuration Guide</i><br>PLUS <ul style="list-style-type: none"><li>■ <a href="#">Configuring the Cloud Control OMS in an Active/Passive Environment for High Availability Failover Using Virtual Host Names</a></li><li>■ <a href="#">Configuring a Standby Database for the Management Repository</a></li></ul>  |
| Level 3 | <i>Oracle Enterprise Manager Basic Installation Guide</i> and the <i>Oracle Enterprise Manager Advanced Installation and Configuration Guide</i><br>PLUS <ul style="list-style-type: none"><li>■ <a href="#">Configuring the First Management Service for High Availability</a></li><li>■ <a href="#">Configuring the Software Library</a></li><li>■ <a href="#">Configuring a Load Balancer</a></li><li>■ Adding Additional Oracle Management Service (Oracle Enterprise Manager Basic Installation Guide, Chapter 7)</li><li>■ <a href="#">Configuring a Standby Database for the Management Repository</a></li></ul> |
| Level 4 | <i>Oracle Enterprise Manager Basic Installation Guide</i> and the <i>Oracle Enterprise Manager Advanced Installation and Configuration Guide</i><br>PLUS <ul style="list-style-type: none"><li>■ <a href="#">Configuring a Standby Database for the Management Repository</a></li><li>■ <a href="#">Configuring Standby Management Services on a Standby Site</a></li></ul>   |

---

## Setting Up High Availability

This chapter discusses best practices for installation and configuration of each Cloud Control component and covers the following topics:

- [Installation Best Practices for Enterprise Manager High Availability](#)
- [Configuring a Standby Database for the Management Repository](#)
- [Configuring Management Service to RAC Management Repository Communication](#)
- [Configuring the First Management Service for High Availability](#)
- [Configuring the Cloud Control OMS in an Active/Passive Environment for High Availability Failover Using Virtual Host Names](#)
- [Configuring the Software Library](#)
- [Configuring a Load Balancer](#)
- [Configuring Standby Management Services on a Standby Site](#)

### 20.1 Installation Best Practices for Enterprise Manager High Availability

The following sections document best practices for installation and configuration of each Cloud Control component.

#### 20.1.1 Configuring the Management Agent to Automatically Start on Boot and Restart on Failure

The Management Agent is started manually. It is important that the Management Agent be automatically started when the host is booted to insure monitoring of critical resources on the administered host. To that end, use any and all operating system mechanisms to automatically start the Management Agent. For example, on UNIX systems this is done by placing an entry in the UNIX `/etc/init.d` that calls the Management Agent on boot or by setting the Windows service to start automatically.

#### 20.1.2 Configuring Restart for the Management Agent

Once the Management Agent is started, the watchdog process monitors the Management Agent and attempts to restart it in the event of a failure. The behavior of the watchdog is controlled by environment variables set before the Management Agent process starts. The environment variables that control this behavior follow. All testing discussed here was done with the default settings.

- **EM\_MAX\_RETRIES** – This is the maximum number of times the watchdog will attempt to restart the Management Agent within the **EM\_RETRY\_WINDOW**. The default is to attempt restart of the Management Agent three times.
- **EM\_RETRY\_WINDOW** - This is the time interval in seconds that is used together with the **EM\_MAX\_RETRIES** environmental variable to determine whether the Management Agent is to be restarted. The default is 600 seconds.

The watchdog will not restart the Management Agent if the watchdog detects that the Management Agent has required restart more than **EM\_MAX\_RETRIES** within the **EM\_RETRY\_WINDOW** time period.

### 20.1.3 Installing the Management Agent Software on Redundant Storage

The Management Agent persists its configuration, intermediate state and collected information using local files in the `agent_inst` directory.

In the event that these files are lost or corrupted before being uploaded to the Management Repository, a loss of monitoring data and any pending alerts not yet uploaded to the Management Repository occurs.

To protect from such losses, configure these sub-directories on striped redundant or mirrored storage. The Management Agent `agent_inst` directory is shown by entering the command 'emctl getemhome' on the command line, or from the Management Services and Repository > Agents tab in the Cloud Control console.

## 20.2 Installation Best Practices for Enterprise Manager Management Repository High Availability

Before installing Enterprise Manager, you should prepare the database, which will be used for setting up Management Repository. Install the database using Database Configuration Assistant (DBCA) to make sure that you inherit all Oracle install best practices.

---

---

**Note:** The Management Repository should be installed as a dedicated database when setting up a highly available Enterprise Manager environment. Deploying the repository as a dedicated database allows repository failover to take place without affecting other applications.

---

---

For both high availability and scalability, you should configure the Management Repository in the latest certified database version, with the RAC option enabled. Check for the latest version of database certified for Enterprise Manager from the Certify tab on the My Oracle Support Web site.

- Choose Automatic Storage Management (ASM) as the underlying storage technology.

When the database installation is complete:

- Go to `$ORACLE_HOME/rdbms/admin` directory of the database home and execute the 'dbmspool.sql'

This installs the **DBMS\_SHARED\_POOL** package, which will help in improving throughput of the Management Repository.

### Management Repository Configuration to perform after installing the Management Service

There are some parameters that should be configured during the Management Repository database install (as previously mentioned) and some parameters that should be set after the Management Service has been installed.

Start by installing Management Agents on each Management Repository node. Once the Management Agents are installed and the Management Repository database is discovered as a target, the Enterprise Manager console can be used to configure these best practices in the Management Repository.

- Enable ARCHIVELOG Mode
- Enable Block Checksums
- Configure the Size of Redo Log Files and Groups Appropriately
- Use a Flash Recovery Area
- Enable Flashback Database
- Use Fast-Start Fault Recovery to Control Instance Recovery Time
- Enable Database Block Checking
- Set DISK\_ASYNCH\_IO

The details of these settings are available in Oracle Database High Availability Best Practices.

Use the MAA Advisor for additional high availability recommendations that should be applied to the Management Repository. To access the MAA Advisor:

1. On the Database Target Home page, locate the High Availability section.
2. Click **Details** next to the Console item.
3. In the Availability Summary section of the High Availability Console page, click **Details** located next to the MAA Advisor item.

## 20.3 Configuring a Standby Database for the Management Repository

### Prerequisites

The standby site must be similar to the primary site in terms of hardware and network resources to ensure there is no loss of performance when failover happens.

There must be sufficient network bandwidth between the primary and standby sites to handle peak redo data generation.

### Configuration Steps

The following steps describe the procedure for setting up a standby Management Repository database.

1. Prepare Standby Management Repository hosts for Data Guard
 

Install a Management Agent on each of the standby Management Repository hosts. Configure the Management Agents to upload by the SLB on the primary site. Install Grid infrastructure and RAC Database software on the standby Management Repository hosts. The version used must be the same as that on the primary site.
2. Prepare the primary Management Repository database for Data Guard

If the primary Management Repository database is not already configured, enable archive log mode, setup flash recovery area and enable flashback database on the primary Management Repository database.

**3. Create the Physical Standby Database**

Use the Enterprise Manager console to set up a physical standby database in the standby environment. The Standby Management Repository database must be a Physical Standby. Logical standby Management Repository databases are not supported.

The Enterprise Manager Console does not support creating a standby RAC database. If the standby database has to be RAC, configure the standby database using a single instance and then use the 'Convert to RAC' option from the Enterprise Manager Console to convert the single instance standby database to RAC. Note that the Convert to RAC option is available for Oracle Database releases 10.2.0.5, 11.1.0.7, and above. Oracle Database release 11.1.0.7 requires patch 8824966 for the Convert to RAC option to work.

During single instance standby creation, best practice is to create the database files on shared storage, ideally ASM, to facilitate conversion to RAC later.

**4. Add Static Service to the Listener.**

To enable Data Guard to restart instances during the course of broker operations, a service with a specific name must be statically registered with the local listener of each instance. The value for the GLOBAL\_DBNAME attribute must be set to a concatenation of <db\_unique\_name>\_DGMGRL.<db\_domain>. For example, in the LISTENER.ORA file:

```
SID_LIST_LISTENER=(SID_LIST=(SID_DESC=(SID_NAME=sid_name)
  (GLOBAL_DBNAME=db_unique_name_DGMGRL.db_domain)
  (ORACLE_HOME=oracle_home)))
```

**5. Enable Flashback Database on the Standby Database.**

To allow re-instate of an old primary database as a standby database after a failover, flashback database must be enabled. Hence do so for both the primary and the standby databases.

**6. To allow Enterprise Manager to monitor a Physical Standby database (which is typically in a mounted state), specify sysdba monitoring privileges. This can be specified either during the Standby creation wizard itself or post creation by modifying the Monitoring Configuration for the standby database target.**

**7. Verify the Physical Standby**

Verify the Physical Standby database through the Enterprise Manager Console. Click the Log Switch button on the Data Guard page to switch log and verify that it is received and applied to the standby database.

## 20.4 Configuring Management Service to RAC Management Repository Communication

If the Management Repository is a Real Application Cluster (RAC) database, the Management Service processes need to be configured to communicate with each node of the RAC database in a redundant fashion.

Note that RAC nodes are referred to by their virtual IP (vip) names. The service\_name parameter is used instead of the system identifier (SID) in connect\_data mode and

failover is turned on. Refer to the *Oracle Database Net Services Administrator's Guide* for details.

Configure the repository connect descriptor by running the emctl command from any Management Service:

```
emctl config oms -store_repos_details -repos_conn_desc '(DESCRIPTION=
(ADDRESS_LIST=(FAILOVER=ON)
(ADDRESS=(PROTOCOL=TCP) (HOST=node1-vip.example.com) (PORT=1521))
(ADDRESS=(PROTOCOL=TCP) (HOST=node2-vip.example.com) (PORT=1521)))
(CONNECT_DATA=(SERVICE_NAME=EMREP)))' -repos_user sysman
```

After making the previous change, run the following command from any one OMS to make the same change to the monitoring configuration used for the Management Services and Repository target:

```
emctl config emrep -conn_desc <repository_connect_descriptor as above>
```

## 20.5 Configuring the First Management Service for High Availability

The Management Service itself has a built-in restart mechanism based on the Oracle Weblogic Node Manager and the Oracle Process Management and Notification Service (OPMN). These services will attempt to restart a Management Service that is down. It is advisable to run OPMN and Node Manager as operating system services, so that they restart automatically if their host machine is restarted.

### 20.5.1 Management Service Install Location

If you are managing a large environment with multiple Management Services and Management Repository nodes, then consider installing the Management Services on hardware nodes that are different from Management Repository nodes ([Figure 20–1](#)). This allows you to scale out the Management Services in the future.

**Figure 20–1 Management Service and Management Repository on Separate Hardware**

Also consider the network latency between the Oracle Management Service and the Management Repository while determining the Management Service install location. The distance between the Management Service and the Management Repository may be one of the factors that affect network latency and hence determine Enterprise Manager performance.

If the network latency between the Oracle Management Service and Management Repository tiers is high or the hardware available for running Enterprise Manager is limited, then the Management Service can be installed on the same hardware as the Management Repository ([Figure 20–2](#)). This allows for Enterprise Manager high availability, as well as keep the costs down.

**Figure 20–2 Management Service and Management Repository on Same Hardware**

If you plan ahead, you can configure your Enterprise Manager deployment for high availability by choosing the correct options during the first Management Service install. You can also retrofit the MAA best practices into an existing Enterprise Manager deployment configured initially using the default install options.

## 20.6 Configuring the Cloud Control OMS in an Active/Passive Environment for High Availability Failover Using Virtual Host Names

This section provides a general reference for Cloud Control administrators who want to configure Enterprise Manager Cloud Control in Cold Failover Cluster (CFC) environments.

### 20.6.1 Overview and Requirements

The following conditions must be met for Cloud Control to fail over to a different host:

- The installation must be done using a Virtual Host Name and an associated unique IP address.
- Install on a shared disk/volume which holds the binaries and the `gc_inst` directory.
- The Inventory location must failover to the surviving node.
- The software owner and time zone parameters must be the same on all cluster member nodes that will host this Oracle Management Service (OMS).

### 20.6.2 Installation and Configuration

To override the physical host name of the cluster member with a virtual host name, software must be installed using the parameter `ORACLE_HOSTNAME`.

The software must be installed using the command line parameter `-invPtrLoc` to point to the shared inventory location file, which includes the path to the shared inventory location.

If you are using an NFS mounted volume for the installation, please ensure that you specify `rsize` and `wsize` in your mount command to prevent running into I/O issues.

For example:

```
oms.example.com:/u01/app/share1 /u01/app/share1 nfs  
rw,bg,rsz=32768,wsz=32768,hard,nointr,tcp,noac,vers=3,timeo=600 0 0
```

---

**Note:** Any reference to shared failover volumes could also be true for non-shared failover volumes which can be mounted on active hosts after failover.

---

### 20.6.3 Setting Up the Virtual Host Name/Virtual IP Address

You can set up the virtual host name and virtual IP address by either allowing the clusterware to set it up, or manually setting it up yourself before installation and startup of Oracle services. The virtual host name must be static and resolvable consistently on the network. All nodes participating in the setup must resolve the virtual IP address to the same host name. Standard TCP tools such as nslookup and traceroute can be used to verify the host name. Validate using the following commands:

```
nslookup <virtual hostname>
```

This command returns the virtual IP address and full qualified host name.

```
nslookup <virtual IP>
```

This command returns the virtual IP address and fully qualified host name.

Be sure to try these commands on every node of the cluster and verify that the correct information is returned.

### 20.6.4 Setting Up Shared Storage

Storage can be managed by the clusterware that is in use or you can use any shared file system (FS) volume, such as NFS, as long as it is not an unsupported type, such as OCFS V1.

---

**Note:** Only OCFS V1 is not supported. **All other versions of OCFS are supported.**

---

If the OHS directory is on a shared storage, the LockFile directive in the httpd.conf file should be modified to point to a local disk, otherwise there is a potential for locking issues.

### 20.6.5 Setting Up the Environment

Some operating system versions require specific operating system patches be applied prior to installing 12c. The user installing and using the 12c software must also have sufficient kernel resources available. Refer to the operating system's installation guide for more details. Before you launch the installer, certain environment variables need to be verified. Each of these variables must be identically set for the account installing the software on ALL machines participating in the cluster:

- **OS variable TZ**

Time zone setting. You should unset this variable prior to installation.

- **PERL variables**

Variables such as PERL5LIB should also be unset to avoid association to the incorrect set of PERL libraries

## 20.6.6 Synchronizing Operating System IDs

The user and group of the software owner should be defined identically on all nodes of the cluster. This can be verified using the 'id' command:

```
$ id -a
uid=550(oracle) gid=50(oinstall) groups=501(dba)
```

## 20.6.7 Setting Up Shared Inventory

Use the following steps to set up shared inventory:

1. Create your new ORACLE\_HOME directory.
2. Create the Oracle Inventory directory under the new ORACLE\_HOME:  

```
$ cd <shared oracle home>
$ mkdir oraInventory
```
3. Create the oraInst.loc file. This file contains the Oracle Inventory directory path information needed by the Universal Installer.

```
vi oraInst.loc
```

Enter the path information to the Oracle Inventory directory and specify the group of the software owner as the oinstall user. For example:

```
inventory_loc=/app/oracle/share1/oraInventory
inst_group=oinstall
```

## 20.6.8 Installing the Software

Refer to the following steps when installing the software:

1. Create the shared disk location on both the nodes for the software binaries.
2. Point to the inventory location file oraInst.loc (under the ORACLE\_BASE in this case), as well as specifying the host name of the virtual group. For example:  

```
$ runInstaller -invPtrloc /app/oracle/share1/oraInst.loc
ORACLE_HOSTNAME=lxdb.example.com -debug
```
3. Install Oracle Management Services on cluster member Host1.
4. Continue the remainder of the installation normally.
5. Once completed, copy the files oraInst.loc and oratab to /etc on all cluster member hosts (Host2, Host3, ...)

### Windows Specific Configuration Steps

On Windows environments, an additional step is required to copy over service and keys required by the Oracle software. Note that these steps are required if your clustering software does not provide a shared windows registry.

1. Using regedit on the first host, export each Oracle service from under HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services.

2. Using regedit on the first host, export HKEY\_LOCAL\_MACHINE\SOFTWARE\ORACLE.
3. Use regedit to import the files created in step 1 and 2 to the failover host.

## 20.6.9 Starting Up Services

Ensure that you start your services in the proper order. Use the order listed below:

1. Establish the IP address on the active node.
2. Start the TNS listener (if it is part of the same failover group).
3. Start the database (if it is part of the same failover group).
4. Start Cloud Control using `emctl start oms`
5. Test functionality.

In case of failover, refer to [Chapter 22, "Enterprise Manager Outages"](#).

## 20.7 Configuring the Software Library

The software library location must be accessed by all Management Services. The configuration of software library is not performed during installation and needs to be configured post-install using the Enterprise Manager Console:

1. On the Enterprise Manager home page, from the **Setup** menu, select **Provisioning and Patching**, and then select **Software Library**.
2. Click the **Provisioning** subtab.
3. On the Provisioning page, click the **Administration** subtab.
4. In the Software Library Configuration section, click **Add** to set the Software Library Directory Location to a shared storage that can be accessed by any host running the Management Service.

## 20.8 Configuring a Load Balancer

This section describes the guidelines for setting up a Server Load Balancer (SLB) to balance the agent and browser traffic to multiple Management Services.

### Server Load Balancer Requirements

In order to configure your OMS's in an active/active configuration behind an SLB, your SLB must meet the following requirements:

- The SLB must provide support for multiple virtual server ports.  
Enterprise Manager typically requires that up to 4 ports are configured on the SLB (Secure Upload, Agent Registration, Secure Console, Unsecure Console)
- Support for persistence.  
HTTP and HTTPS traffic between the browser and the OMS requires persistence.
- Support for application monitoring.  
The SLB must be capable of monitoring the health of the OMSs and detecting failures, so that requests will not be routed to OMSs that are not available.

SLB configuration is a two-step process:

1. Configure the SLB
2. Make requisite changes on the Management Services.

## 20.8.1 SLB Setup

Use the following table as reference for setting up the SLB with Cloud Control Management Services.

**Table 20–1 Management Service Ports**

| Cloud Control Service       | TCP Port | Monitor Name | Persistence          | Pool Name     | Load Balancing | Virtual Server Name | Virtual Server Port |
|-----------------------------|----------|--------------|----------------------|---------------|----------------|---------------------|---------------------|
| Secure Upload               | 4900     | mon_gcsu4900 | None                 | pool_gcsu4900 | Round Robin    | vs_gcsu4900         | 4900                |
| Agent Registration          | 4889     | mon_gcar4889 | Active Cookie Insert | pool_gcar4889 | Round Robin    | vs_gcar4889         | 4889                |
| Secure Console              | 7799     | mon_gcsc7799 | Source IP            | pool_gcsc7799 | Round Robin    | vs_gcsc443          | 443                 |
| Unsecure Console (optional) | 7788     | mon_gcuc7788 | Source IP            | pool_gcuc7788 | Round Robin    | vs_gcuc80           | 80                  |

Use the administration tools that are packaged with your SLB. A sample configuration follows. This example assumes that you have two Management Services running on host A and host B using the default ports as listed in Table 33–1.

### 1. Create Pools

A *pool* is a set of servers grouped together to receive traffic on a specific TCP port using a load balancing method. Each pool can have its own unique characteristic for a persistence definition and the load-balancing algorithm used.

**Table 20–2 Pools**

| Pool Name                | Usage                    | Members                  | Persistence                                    | Load Balancing |
|--------------------------|--------------------------|--------------------------|--|----------------|
| pool_gcsu4900            | Secure upload            | HostA:4900<br>HostB:4900 | None   | Round Robin    |
| pool_gcar4889            | Agent registration       | HostA:4889<br>HostB:4889 | Active cookie insert;<br>expiration 60 minutes | Round Robin    |
| pool_gcsc7799            | Secured console access   | HostA:7799<br>HostB:7799 | Source IP; expiration 60 minutes               | Round Robin    |
| pool_gcuc7788 (optional) | Unsecured console access | HostA:7788<br>HostB:7788 | Source IP; expiration 60 minutes               | Round Robin    |

### 2. Create Virtual Servers

A *virtual server*, with its virtual IP Address and port number, is the client addressable hostname or IP address through which members of a load balancing pool are made available to a client. After a virtual server receives a request, it directs the request to a member of the pool based on a chosen load balancing method.

**Table 20–3 Virtual Servers**

| Virtual Server Name  | Usage                   | Virtual Server Port | Pool          |
|----------------------|-------------------------|---------------------|---------------|
| vs_gcsu4900          | Secure upload           | 4900                | pool_gcsu4900 |
| vs_gcar4889          | Agent registration      | 4889                | pool_gcar4889 |
| vs_gcsc443           | Secure console access   | 443                 | pool_gcsc7799 |
| vs_gcuc80 (optional) | Unsecure console access | 80                  | pool_gcuc7788 |

### 3. Create Monitors

*Monitors* are used to verify the operational state of pool members. Monitors verify connections and services on nodes that are members of load-balancing pools. A monitor is designed to check the status of a service on an ongoing basis, at a set interval. If the service being checked does not respond within a specified timeout period, the load balancer automatically takes it out of the pool and will choose the other members of the pool. When the node or service becomes available again, the monitor detects this and the member is automatically accessible to the pool and able to handle traffic.

**Table 20–4 Monitors**

| Monitor Name            | Configuration  | Associate With           |
|-------------------------|--|--------------------------|
| mon_gcsu4900            | Type: https<br>Interval: 60<br>Timeout: 181<br>Send String: GET /empbs/upload<br>Receive String: Http Receiver Servlet active! | HostA:4900<br>HostB:4900 |
| mon_gcar4889            | Type: http<br>Interval: 60<br>Timeout: 181<br>Send String: GET /empbs/genwallet<br>Receive String: GenWallet Servlet activated | HostA:4889<br>HostB:4889 |
| mon_gcsc7799            | Type: https<br>Interval: 5<br>Timeout: 16<br>Send String: GET /em/console/home HTTP/1.0\n<br>Receive String: /em/login.jsp     | HostA:7799<br>HostB:7788 |
| mon_gcuc7788 (optional) | Type: https<br>Interval: 5<br>Timeout: 16<br>Send String: GET /em/console/home HTTP/1.0\n<br>Receive String: /em/login.jsp     | HostA:7788<br>HostB:7788 |

**Note:** If you have SSO configured, use the following alternate definitions for the mon\_gcsc7799 and mon\_gcuc7788 monitors.

**Table 20–5 Monitors for SSO Configuration**

| Monitor Name               | Configuration   | Associate With           |
|----------------------------|---|--------------------------|
| mon_gcsc7799               | Type: https<br>Interval: 5<br>Timeout: 16<br>Send String: GET /empbs/genwallet<br>Receive String: GenWallet Servlet activated | HostA:7799<br>HostB:7788 |
| mon_gcuc7788<br>(optional) | Type: https<br>Interval: 5<br>Timeout: 16<br>Send String: GET /empbs/genwallet<br>Receive String: GenWallet Servlet activated | HostA:7788<br>HostB:7788 |

---

**Note:** F5 SLB monitors expect the "Receive String" within the first 5120 characters of a response. For SSO environments, the "Receive String" may be returned at some point beyond the 5120 limit. The monitor will not function in this situation.

---

## 20.8.2 Enterprise Manager Side Setup

Perform the following steps:

### 1. Resecure the Oracle Management Service

By default, the service name on the Management Service-side certificate uses the name of the Management Service host. Management Agents do not accept this certificate when they communicate with the Oracle Management Service through a load balancer. You must run the following command to regenerate the certificate on each Management Service:

```
emctl secure oms
  -sysman_pwd <sysman_pwd>
  -reg_pwd <agent_reg_password>
  -host slb.example.com
  -secure_port 4900
  -slb_port 4900
  -slb_console_port 443
  -console
  [-lock] [-lock_console]
```

### 2. Resecure all Management Agents

Management Agents that were installed prior to SLB setup, including the Management Agent that comes with the Management Service install, would be uploading directly to the Management Service. These Management Agents will not be able to upload after SLB is setup. Resecure these Management Agents to upload to the SLB by running the following command on each Management Agent:

```
emctl secure agent -emdWalletSrcUrl https://slb.example.com:<upload port>/em
```

## 20.9 Configuring Standby Management Services on a Standby Site

Consider the following before installing the standby Management Services.

Oracle recommends that this activity be done during a lean period or during a planned maintenance window. When new Oracle Management Service instances are installed on the standby site, they are initially configured to connect to the Management Repository database on the primary site. Some workload will be taken up by the new Management Service. This could result in temporary loss in performance if the standby site Management Services are located far away from the primary site Management Repository database. However there would be no data loss and the performance would recover once the standby Management Services are shutdown post configuration.

### Prerequisites

- The primary site must be configured as per Cloud Control MAA guidelines described in previous sections. This includes Management Services fronted by an SLB and all Management Agents configured to upload to Management Services by the SLB.
- The standby site must be similar to the primary site in terms of hardware and network resources to ensure there is no loss of performance when failover happens.
- Configure storage used by the software library to be replicated at the primary and standby site. In the event of a site outage, the contents of this storage must be made available on the standby site using hardware vendor disk level replication technologies.
- The shared storage used for the software library must be made available on the standby site using the same paths as the primary site.
- For complete redundancy in a disaster recovery environment, a second load balancer must be installed at the standby site. The secondary SLB must be configured in the same fashion as the primary. Some SLB vendors (such as F5 Networks) offer additional services that can be used to pass control of the Virtual IP presented by the SLB on the primary site to the SLB on the standby site in the event of a site outage. This can be used to facilitate automatic switching of Management Agent traffic from the primary site to the standby site.

### 20.9.1 Installing the First Standby Management Service

Install the first standby Management Service using the following steps:

1. Copy the emkey to the Management Repository by running the following command on the first Management Service on the primary site:

```
emctl config emkey -copy_to_repos
```

2. Export the configuration from the first Management Service on the primary site using:

```
emctl exportconfig oms -dir <location for the export file>
```

After the configuration is exported, do not make any configuration changes to the primary site still the standby management service is configured.

3. Install a Management Agent on the standby host if one does not already exist.
4. Perform a software-only install of the Enterprise Manager software using a modified version of the “Add Management Service” Deployment Procedure.

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Procedure Library**.
2. Select **Add Management Service procedure** and click **Create Like**.
3. Go to the **Procedure Steps** tab and select and disable the steps - "Configure Management Service", "Targets Discovery" and "Post Configuration Tasks".
4. Save the modified deployment procedure and use it to install the Enterprise Manager software on the standby OMS host.
5. After the Deployment Procedure completes, delete the file `emInstanceMapping.properties` from `<OMS Oracle Home>/sysman/config` on the standby OMS host.
5. Configure the Management Service by running `omsca` in standby mode. Choose a different domain name for the standby. For example, if the primary WebLogic domain is `GCDomain`, choose `GCDomainStby`.

```
omsca standby -EM_DOMAIN_NAME GCDomainStby -NM_USER
nodemanager -AS_USERNAME weblogic -nostart
```

When prompted for the Administration Server host and EM Instance host, enter the standby OMS hostname (or accept the default).

When prompted for the passwords, provide the same passwords as the primary site.

When prompted for Management Repository details, provide the primary database details.

6. Configure the required plug-ins by running the following command:

```
pluginca -action deploy -isFirstOMS true -plugins
<plugin-list> -oracleHome <oms oracle home> -middlewareHome
<wls middleware home>
```

where `plugin-list` is the list of plug-ins returned by the SQL query

```
SELECT epv.plugin_id, epv.version FROM em_plugin_version epv,
em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN (
'BUILT_IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_
type='2' AND epv.plugin_version_id = ecp.plugin_version_id;
```

and is a comma separate list in the following format:

```
<plugin-id>=<plugin-version>,<plugin-id>=<plugin-version>,...
```

#### Example:

```
"oracle.sysman.empa=12.1.0.1.0,oracle.sysman.mos=12.1.0.1.0,o
racle.sysman.emas=12.1.0.1.0,oracle.sysman.emfa=12.1.0.1.0,or
acle.sysman.db=12.1.0.1.0,oracle.sysman.emct=12.1.0.1.0,orac
le.sysman.vt=12.1.0.1.0,oracle.sysman.ssa=12.1.0.1.0"
```

7. Copy over the configuration exported from the primary Management Service in step 2 above to the standby Management Service host. Import the exported configuration on the standby Management Service using:

```
emctl importconfig oms -file <full path of the export file>
```

Note this command emits a warning about a failed export and prompts for confirmation to proceed. The warning can be ignored by entering "y" to proceed.

Note this command will start the Management Service.

8. Stop the Management Service but leave the Administration Server running using:  

```
emctl stop oms
```
9. Add the standby Weblogic Domain and associated targets:  

The standby Weblogic Domain and associated targets can be added using the Guided Discovery process.

From the **Setup** menu, select **Add Target**, then select **Add Targets Manually**. Select *Oracle Fusion Middleware* from the Target Types menu. Use the secure port (typically 7101) and, under **Advanced**, set the JMX Protocol to **t3s**.

Note that the WebLogic targets, except the Administration Server, will be shown as down as the standby OMS is down at this stage.
10. If you have Single Sign On configured on the primary site, follow the same steps to configure SSO on the standby OMS.
11. If you have Real User Experience Insight, AD4J Manager or BI Publisher configured on the primary site, follow the same steps to configure them on the standby OMS.

## 20.9.2 Installing the First Standby Management Service (Silent Mode)

1. Copy the emkey to the Management Repository by running the following command on the first OMS on the primary site:  

```
emctl config emkey -copy_to_repos
```
2. Export the configuration from the first OMS on the primary site.  

```
emctl exportconfig oms -dir <location for the export file>
```

After the configuration is exported, do not make any configuration changes to the primary site until the standby OMS is configured.
3. On the remote host, perform a software-only installation of the standby OMS as described in the Oracle® Enterprise Manager Cloud Control Advanced Installation and Configuration Guide chapter "Installing Enterprise Manager Software Now and Configuring Later" (Installing in Graphical Mode). Ensure that you install the software binaries in the same middleware location as that of the primary OMS.

---

**Note:** Make sure you select same set of plug-ins as the primary OMS.

---

If you have installed extra plug-ins which are not part of the installation, then complete the following steps.

1. Connect to repository and execute the following query to obtain the list of installed plug-ins:  

```
SELECT epv.plugin_id, epv.version, epv.rev_version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ('BUILT_
IN_TARGET_TYPE', 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id
```

Write down the returned list of plug-ins installed.

2. Download the required plug-in files from the OTN Web site to the directory *<plug-in dir>*.

3. Invoke *runInstaller* with an option specifying the location of downloaded plug-ins.

```
<DVD/Disk1/runInstaller -pluginLocation <plugin dir>
```

4. On the software-only installation, apply all the patches you applied on the primary OMS so that both the primary and standby OMSs are identical and are in sync.
5. Configure the OMS by running *omsca* in standby mode. Choose a different domain name for the standby. For example, if the primary WebLogic domain is GCDomain, choose GCDomainStby.

```
omsca standby -EM_DOMAIN_NAME GCDomainStby -NM_USER nodemanager -AS_USERNAME weblogic -nostart
```

When prompted for the Administration Server host and Enterprise Manager Instance host, enter the standby OMS hostname (or accept the default).

When prompted for the passwords, provide the same passwords as the primary site.

When prompted for Management Repository details, provide the primary database details.

6. Configure the required plug-ins by running the following command:

```
pluginca -action deploy -isFirstOMS true -plugins <plug-in list> -oracleHome <oms oracle home> middlewareHome <wls middleware home>
```

where *plug-in list* is the list of plug-ins returned by the SQL query.

```
SELECT epv.plugin_id, epv.version FROM em_plugin_version epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_version_id = ecp.plugin_version_id;
```

The plug-in list must be a comma separate list in the following format:

```
<plugin-id>=<plugin-version>,<plugin-id>=<plugin-version>,...
```

**Example:**

```
"oracle.sysman.empa=12.1.0.1.0,oracle.sysman.mos=12.1.0.1.0,oracle.sysman.emas=12.1.0.1.0,oracle.sysman.emfa=12.1.0.1.0,oracle.sysman.db=12.1.0.1.0,oracle.sysman.emct=12.1.0.1.0,oracle.sysman.vt=12.1.0.1.0,oracle.sysman.ssa=12.1.0.1.0"
```

7. Copy over the configuration exported from the primary OMS in step 2 above to the standby OMS host. Import the exported configuration on the standby OMS:

```
emctl importconfig oms -file <full path of the export file>
```

Note that this command generates a warning about a failed export and prompts for confirmation in order to proceed. The warning can be ignored by entering "y" to proceed.

This command will automatically start the OMS.

8. Stop the Management Service but leave the Administration Server running using:

```
emctl stop oms
```

9. Configure the Management Agent on the second OMS host by running the following command from the OMS home:

```
$<AGENT_HOME>/sysman/install/agentDeploy.sh AGENT_BASE_DIR=<middleware_
home>/agent OMS_HOST=<oms_host_name> EM_UPLOAD_PORT=<oms_port> AGENT_
REGISTRATION_PASSWORD=<password> -configOnly
```

**Note:** If you have an SLB configured, then directly specify the host and port of the primary load balancer.

If no SLB is configured, then use the secure upload port of primary OMS.

**Example:**

```
./agentDeploy.sh AGENT_BASE_DIR=$MIDDLEWARE_BASE/agent OMS_HOST=prim_oms_
hhost.domain.com EM_UPLOAD_PORT=4900 AGENT_REGISTRATION_PASSWORD=password
-configOnly
```

#### 10. Deploy the required plug-ins on the Management Agent.

For information about deploying plug-ins, refer to the section *Deploying and Updating Plug-ins* in the [Chapter 14, "Updating Cloud Control"](#).

#### 11. Add the standby WebLogic Domain and associated targets:

The standby WebLogic Domain and associated targets can be added using the Guided Discovery process.

From the **Setup** menu, select **Add Target**, then select **Add Targets Manually**. Select **Oracle Fusion Middleware** from the **Target Types** menu. Use the secure port (typically 7101) and, under **Advanced**, set the JMX Protocol to *t3s*.

Note that the WebLogic targets, except the Administration Server, will be shown as "down" since the standby OMS is down at this stage.

#### 12. If you have Single Sign-On configured on the primary site, follow the same steps to configure SSO on the standby OMS.

#### 13. If you have Real User Experience Insight, AD4J Manager or BI Publisher configured on the primary site, follow the same steps to configure them on the standby OMS.

### 20.9.3 Installing Additional Standby Management Services

It is recommended that your standby site be similar in configuration as your primary site. This means configuring multiple OMS on your standby site, similar to your primary site. Install additional standby Management Services as per the procedure listed below under "Additional Standby Management Services".

If, however, you choose to start with a single OMS on the standby site initially, you may skip this step and continue with the next section "Validating your installation and Complete the Setup". If you decide to add an additional standby OMS later after having run the "Validating your installation and Complete the Setup" steps, the steps listed under "Additional Standby Management Services" can be followed after executing the following additional step:

#### 1. Start the standby Administration Server by running the following command on the first standby Management Service:

```
emctl start oms -admin_only
```

#### 2. Export the configuration from the first Management Service on the primary site using:

```
emctl exportconfig oms -dir <location for the export file>
```

After the configuration is exported, do not make any configuration changes to the primary site still the standby management service is configured.

3. Install a Management Agent on the standby host.
4. Perform a software-only install of the Enterprise Manager software using a modified version of "Add Management Service" Deployment Procedure.

From the **Enterprise** menu, select **Provisioning and Patching**, then select **Procedure Library**.

Select **Add Management Service** procedure and then click **Create Like**.

Go to the Procedure Steps tab and select and disable the steps - "Configure Management Service", "Targets Discovery" and "Post Configuration Tasks".

Save the modified deployment procedure and use it to install the Enterprise Manager software on the standby OMS host.

After the Deployment Procedure completes, delete the file `emInstanceMapping.properties` from `<OMS Oracle Home>/sysman/config` on the standby OMS host.

5. Configure the Management Service by running `omsca`.

```
omsca add -nostart
```

When prompted for Management Repository details, provide the primary database details.

When prompted for Administration Server details, provide the standby administration server details.

6. Configure the required plug-ins by running the following command:

```
pluginca -action deploy -isFirstOMS false -plugins  
<plugin-list> -oracleHome <oms oracle home> -middlewareHome  
<wls middleware home>
```

where `plugin-list` is the list of plug-ins returned by the SQL query above and is a comma separate list in the following format:

```
<plugin-id>=<plugin-version>,<plugin-id>=<plugin-version>,...
```

**Example**

```
"oracle.sysman.empa=12.1.0.1.0,oracle.sysman.mos=12.1.0.1.0,o  
racle.sysman.emas=12.1.0.1.0,oracle.sysman.emfa=12.1.0.1.0,o  
racle.sysman.db=12.1.0.1.0,oracle.sysman.emct=12.1.0.1.0,orac  
le.sysman.vt=12.1.0.1.0,oracle.sysman.ssa=12.1.0.1.0"
```

7. Copy over the configuration exported from the primary Management Service in step 1 above to the standby Management Service host. Import the exported configuration on the standby Management Service using:

```
emctl importconfig oms -file <full path of the export file>
```

Note this command emits a warning about a failed export and prompts for confirmation to proceed. The warning can be ignored by entering "y" to proceed.

Note this command will start the Management Service.

8. Stop the Management Service using:

```
emctl stop oms
```

9. Refresh the standby domain target from the console. This will present a guided workflow to discover and add the new managed server and associated targets.

10. If you have Single Sign On configured on the primary site, follow the same steps to configure SSO on the standby OMS.
11. If you have Real User Experience Insight, AD4J Manager or BI Publisher configured on the primary site, follow the same steps to configure them on the standby OMS.

#### 20.9.4 Installing Additional Standby Management Services (Silent Mode)

1. Start the standby Administration Server by running the following command on the first standby Management Service:

```
emctl start oms -admin_only
```

2. Export the configuration from the first Management Service on the primary site using:

```
emctl exportconfig oms -dir <location for the export file>
```

After the configuration is exported, do not make any configuration changes to the primary site still the standby management service is configured.

3. On the remote host, perform a software-only installation of the standby OMS as described in Installing in Graphical Mode. Ensure that you install the software binaries in the same middleware location as that of the primary OMS.

Note: Make sure you select the same set of plugins as primary management service

4. On the remote host, perform a software-only installation of the standby OMS as described in the Oracle® Enterprise Manager Cloud Control Advanced Installation and Configuration Guide chapter "Installing Enterprise Manager Software Now and Configuring Later" (Installing in Graphical Mode). Ensure that you install the software binaries in the same middleware location as that of the primary OMS.

---

**Note:** Make sure you select same set of plug-ins as the primary OMS.

---

If you have installed extra plug-ins which are not part of the installation, then complete the following steps.

1. Connect to repository and execute the following query to obtain the list of installed plug-ins:

```
SELECT epv.plugin_id, epv.version, epv.rev_version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ('BUILT_
IN_TARGET_TYPE', 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id
```

Write down the returned list of plug-ins installed.

2. Download the required plug-in files from the OTN Web site to the directory *<plug-in dir>*.
3. Invoke *runInstaller* with an option specifying the location of downloaded plug-ins.

```
<DVD/Disk1/runInstaller -pluginLocation <plugin dir>
```

5. On the software-only installation, apply all the patches you applied on the primary OMS so that both the primary and standby OMSs are identical and are in sync.

6. Configure the Management Service by running omsca.

```
omsca add -nostart
```

When prompted for Management Repository details, provide the primary database details. When prompted for Administration Server details, provide the standby Administration Server details.

To keep the ports consistent with your primary site, provide all the ports on the command line itself. For example:

```
omsca add -MSPORT 7202 -MS_HTTPS_PORT 7301 -EM_NODEMGR_PORT 7403 -EM_UPLOAD_
PORT 4889 -EM_UPLOAD_HTTPS_PORT 4900 -EM_CONSOLE_PORT 7788 -EM_CONSOLE_HTTPS_
PORT 7799 -nostart
```

7. Configure the required plug-ins by running the following command:

```
pluginca -action deploy -isFirstOMS false -plugins
<plugin-list> -oracleHome <oms oracle home> -middlewareHome
<wls middleware home>
```

where the plugin-list is the list of plug-ins returned by the SQL query above and is a comma separated list in the following format:

```
<plugin-id>=<plugin-version>, <plugin-id>=<plugin-version>, ...
```

**Example**

```
"oracle.sysman.empa=12.1.0.1.0,oracle.sysman.mos=12.1.0.1.0,o
racle.sysman.emas=12.1.0.1.0,oracle.sysman.emfa=12.1.0.1.0,or
acle.sysman.db=12.1.0.1.0,oracle.sysman.emct=12.1.0.1.0,orac
le.sysman.vt=12.1.0.1.0,oracle.sysman.ssa=12.1.0.1.0"
```

8. Copy over the configuration exported from the primary Management Service in step 1 above to the standby Management Service host. Import the exported configuration on the standby Management Service using:

```
emctl importconfig oms -file <full path of the export file>
```

Note this command emits a warning about a failed export and prompts for confirmation to proceed. The warning can be ignored by entering "y" to proceed.

Note this command will automatically start the OMS.

9. Stop the OMS using:

```
emctl stop oms
```

10. Configure the Management Agent on the second OMS host by running the following command from the OMS home:

```
$<AGENT_HOME>/sysman/install/agentDeploy.sh AGENT_BASE_DIR=<middleware_
home>/agent OMS_HOST=<second_oms_host_name>
EM_UPLOAD_PORT=<second_oms_port> AGENT_REGISTRATION_PASSWORD=<password>
-configOnly
```

Note: If you have an SLB configured, then directly specify the host and port of the primary load balancer.

If no SLB is configured, then use secure upload port of primary OMS.

11. Deploy the required plug-ins on the Management Agent.

For information about deploying plug-ins, refer to the section *Deploying and Updating Plug-ins* in the [Chapter 14, "Updating Cloud Control"](#).

12. Refresh the standby domain target from the console. This will present a guided workflow to discover and add the new managed server and associated targets.
13. If you have Single Sign On configured on the primary site, follow the same steps to configure SSO on the standby OMS.
14. If you have Real User Experience Insight, AD4J Manager or BI Publisher configured on the primary site, follow the same steps to configure them on the standby OMS.

## 20.9.5 Validating Your Installation and Complete the Setup

Update the standby SLB configuration by adding the standby Management Service(s) to the different pools on the SLB. Setup monitors for the new Management Service.

### 20.9.5.1 Keeping the Standby Site in Sync

After the initial setup of the standby site, the standby site has to be kept in sync with the changes done on primary site. Transactions on the primary Management Repository get propagated to the Standby Management Repository automatically through Data Guard but the OMS side changes have to be redone manually on the standby site. The following sections describe this procedure for typical activities.

#### Applying patches

When patches are applied on the primary site Management Services, they have to be applied on the standby site Management Services too. Note that patches typically update the Oracle Homes (via the `opatch apply` command) and optionally might require scripts to be run against the Management Repository. On the standby site, it is sufficient to update the Oracle Homes (via the `opatch apply` command) and skip the running of scripts on the Management Repository because database changes are automatically propagated to the standby site using Data Guard.

#### Managing Plug-ins

When new plug-ins are deployed on the primary site or existing plug-ins upgraded or un-deployed on the primary site, the following procedures needs to be run on the standby site too to keep the Standby Management Services in sync. Note if the Standby Management Services are not kept in sync, they would fail to start when a switchover or failover operation is attempted.

The procedure below assumes that the standby site was setup as per the documented process and the standby management services are currently down and point to the primary repository. The plug-in(s) deployment on the primary site has been completed successfully.

#### Deploying a New Plug-in or Upgrading a Plug-in on Standby Site

1. Extract the plug-in archives from the primary site

Go to the Self Update Home, click on Plug-ins, select the required plug-in and select export from the Action table menu. Note the EM CLI command from the popup that gets displayed.

```
emcli export_update -id=<update id> -deep -host=<standby OMS
host> -dir=<directory to export archives> <host credential
options>
```

Note that an additional option “-deep” is required. This command would create 4 files on the destination directory specified. The filename <version>\_OMS\_<platform>\_<revision>.zip is the one to be used in next step.

2. Start the Standby Administration Server, if it is down.

```
emctl start oms -admin_only
```

3. Install the OMS archive to First Standby OMS Oracle Home

```
pluginia -archives <path to plugin archive>
```

4. Configure the Plug-in on First Standby OMS Oracle Home

```
pluginca -action deploy -isFirstOMS true -plugins  
<plugin-list> -oracleHome <oms oracle home> -middlewareHome  
<wls middleware home>
```

where <plugin-list> is the plug-in name in the format  
<plugin-id>=<plugin-version>

5. Repeat steps 3 and 4 for each Standby additional OMS

```
pluginia -archives <path to plugin archive>  
  
pluginca -action deploy -isFirstOMS false -plugins  
<plugin-list> -oracleHome <oms oracle home> -middlewareHome  
<wls middleware home>
```

This completes the plugin deployment on Standby site.

---

## Backing Up Enterprise Manager

As the monitoring and management framework for your ecosystem, an important part of your high availability strategy is to ensure Enterprise Manager is regularly backed up so that it can be restored in the event of failure.

This chapter covers the following topics:

- [Backing Up Your Deployment](#)
- [Management Repository Backup](#)
- [Oracle Management Service Backup](#)
- [Management Agent Backup](#)

### 21.1 Backing Up Your Deployment

Although Enterprise Manager functions as a single entity, technically, it is built on a distributed, multi-tier software architecture composed of the following software components:

- Oracle Management Services (OMS)
- Management Agent
- Management Repository

Each component, being uniquely different in composition and function, requires different approaches to backup and recovery. For this reason, the backup strategies are discussed on a per-tier basis in this chapter. For an overview of Enterprise Manager architecture, refer to the Oracle® Enterprise Manager Cloud Control Basic Installation Guide.

### 21.2 Management Repository Backup

The Management Repository is the storage location where all the information collected by the Management Agent gets stored. It consists of objects such as database jobs, packages, procedures, views, and tablespaces. Because it is configured in an Oracle Database, the backup and recovery strategies for the Management Repository are essentially the same as those for the Oracle Database. Backup procedures for the database are well established standards and can be implemented using the RMAN backup utility, which can be accessed via the Cloud Control console.

### Management Repository Backup

Oracle recommends using High Availability Best Practices for protecting the Management Repository database against unplanned outages. As such, use the following standard database backup strategies.

- Database should be in *archivelog* mode. Not running the repository database in *archivelog* mode leaves the database vulnerable to being in an unrecoverable condition after a media failure.
- Perform regular hot backups with RMAN using the *Recommended Backup Strategy* option via the Cloud Control console. Other utilities such as DataGuard and RAC can also be used as part of a comprehensive strategy to prevent data loss.

Adhering to these strategies will create a full backup and then create incremental backups on each subsequent run. The incremental changes will then be rolled up into the baseline, creating a new full backup baseline.

Using the *Recommended Backup Strategy* also takes advantage of the capabilities of Enterprise Manager to execute the backups: Jobs will be automatically scheduled through the Job sub-system of Enterprise Manager. The history of the backups will then be available for review and the status of the backup will be displayed on the repository database target home page. This backup job along with archiving and flashback technologies will provide a restore point in the event of the loss of any part of the repository. This type of backup, along with archive and online logs, allows the repository to be recovered to the last completed transaction.

You can view when the last repository backup occurred on the Management Services and Repository Overview page under the Repository details section.

A thorough summary of how to configure backups using Enterprise Manager is available in the *Oracle Database 2 Day DBA* guide. For additional information on Database high availability best practices, review the *Oracle Database High Availability Best Practices* documentation.

## 21.3 Oracle Management Service Backup

The Oracle Management Service (OMS) orchestrates with Management Agents to discover targets, monitor and manage them, and store the collected information in a repository for future reference and analysis. The OMS also renders the Web interface for the Enterprise Manager console.

### Backing Up the OMS

The OMS is generally stateless. Some configuration data is stored on the OMS file system.

A snapshot of OMS configuration can be taken using the `emctl exportconfig oms` command.

```
$ <OMS_HOME>/bin/emctl exportconfig oms [-sysman_pwd <sysman password>]
[-dir <backup dir>] Specify directory to store backup file
[-keep_host] Specify this parameter if the OMS was installed using a virtual
hostname (using
ORACLE_HOSTNAME=<virtual_hostname>)
```

Running *exportconfig* captures a snapshot of the OMS at a given point in time, thus allowing you to back up the most recent OMS configuration on a regular basis. *exportconfig* should always be run on the OMS running the WebLogic Admin Server. If required, the most recent snapshot can then be restored on a fresh OMS installation on the same or different host.

Backup strategies for the OMS components are as follows:

- **Software Homes**

Composed of Fusion Middleware Home, the OMS Oracle Home and the WebTier (OHS) Oracle Home and multiple Management Plug-in Oracle Homes.

Software Homes change when patches or patchsets are applied or updates are applied through the new Self Update feature. For this reason, filesystem-level backups should be taken after each patch/patchset application or application of updates through Self Update. You should back up the Oracle inventory files along with the Software Homes and save the output of `opatch lsinventory` –detail to make it easy to determine which patches are applied to the backed up Oracle Homes.

---

**Note:** If you do not have filesystem-level backups, you can also reinstall the software homes using the “Installing Software Only” install method.

**Important:** The location of the OMS Oracle Home must be the same for all OMS instances in your Cloud Control deployment.

---

- **Instance Home**

The `gc_inst` directory, composed of WebLogic Server, OMS and web tier configuration files.

The Instance Home can be backed up using the `emctl exportconfig oms` command.

- **Administration Server**

The Administration Server operates as the central control entity for the configuration of the entire OMS instance domain. The Administration Server is an integral part of the first OMS installed in your Cloud Control deployment and shares the Software Homes and Instance Home.

The Administration Server is backed up at the same time as the Instance Home, the `emctl exportconfig oms` command (only run on the first OMS with the Administration Server).

## 21.4 Management Agent Backup

The Management Agent is an integral software component that is deployed on each monitored host. It is responsible for monitoring all the targets running on those hosts, communicating that information to the middle-tier OMS and managing and maintaining the hosts and its targets.

### Backing Up Management Agents

There are no special considerations for backing up Management Agents. As a best practice, reference Management Agent installs should be maintained for different platforms and kept up-to-date in terms of customizations in the `emd.properties` file and patches applied. Use Deployment options from the Cloud Control console to install and maintain reference Agent installs.

If a Management Agent is lost, it should be reinstalled by cloning from a reference install.

---

## Enterprise Manager Outages

Outages can be planned as might be the case when performing upgrades or periodic maintenance, or unplanned as can happen in the event of hardware/software failure, or perhaps some environmental catastrophe. Regardless of the type of outage, you want to ensure that your IT infrastructure can be restored and running as soon as possible.

This chapter covers the following:

### Recovery of Failed Enterprise Manager Components

- [Repository Recovery](#)
- [Recovering the OMS](#)
- [Recovering Management Agents](#)
- [Recovering from a Simultaneous OMS-Management Repository Failure](#)

### Switching or Failing over to Standby Enterprise Manager Configurations

- [Switchover](#)
- [Failover](#)

## 22.1 Recovery of Failed Enterprise Manager Components

Recovering Enterprise Manager means restoring any of the three fundamental components of the Enterprise Manager architecture.

- Management Repository
- Management Service
- Management Agent

### 22.1.1 Repository Recovery

Recovery of the Repository database must be performed using RMAN since Cloud Control will not be available when the repository database is down. There are two recovery cases to consider:

- **Full Recovery:** No special consideration is required for Enterprise Manager.
- **Point-in-Time/Incomplete Recovery:** Recovered repository may be out of sync with Agents because of lost transactions. In this situation, some metrics may show up incorrectly in the Cloud Control console unless the repository is synchronized with the latest state available on the Agents.

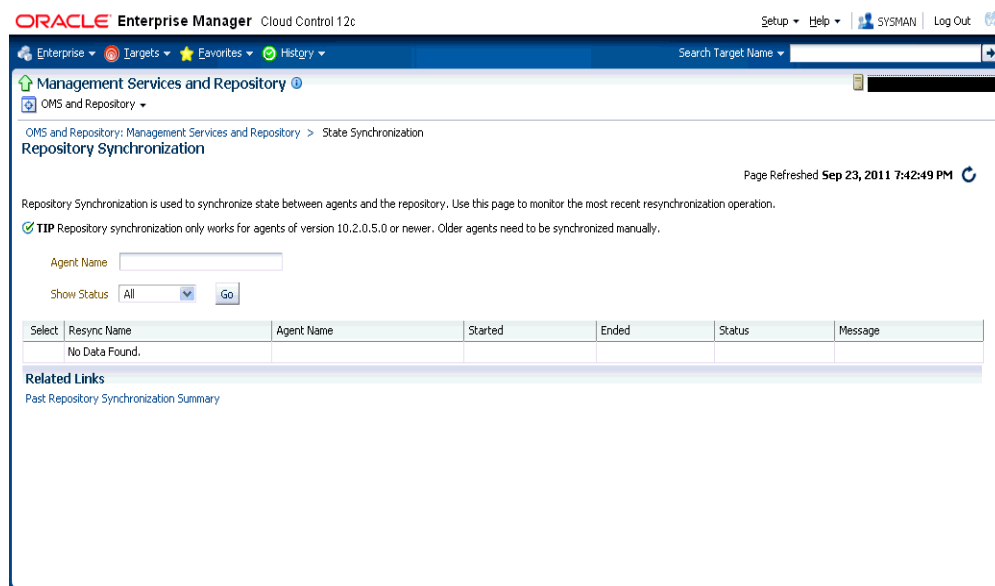

A repository resync feature allows you to automate the process of synchronizing the Enterprise Manager repository with the latest state available on the Management Agents.

To resynchronize the repository with the Management Agents, you use Enterprise Manager command-line utility (emctl) `resync repos` command:

```
emctl resync repos -full -name "<descriptive name for the operation>"
```

You must run this command from the OMS Oracle Home AFTER restoring the Management Repository, but BEFORE starting the OMS. After submitting the command, start up all OMS instances and monitor the progress of repository resynchronization from the Enterprise Manager console's Repository Resynchronization page, as shown in the following figure.

**Figure 22–1 Repository Synchronization Page**

Management Repository recovery is complete when the resynchronization jobs complete on all Management Agents.

Oracle strongly recommends that the Management Repository database be run in *archive* mode so that in case of failure, the database can be recovered to the latest transaction. If the database cannot be recovered to the last transaction, *Repository Synchronization* can be used to restore monitoring capabilities for targets that existed when the last backup was taken. Actions taken after the backup will not be recovered automatically. Some examples of actions that will not be recovered automatically by *Repository Synchronization* are:

- Incident Rules
- Preferred Credentials
- Groups, Services, Systems
- Jobs/Deployment Procedures
- Custom Reports
- New Agents

## 22.1.2 Recovery Scenarios

A prerequisite for repository (or any database) recovery is to have a valid, consistent backup of the repository. Using Enterprise Manager to automate the backup process ensures regular, up-to-date backups are always available if repository recovery is ever required. Recovery Manager (RMAN) is a utility that backs up, restores, and recovers Oracle Databases. The RMAN recovery job syntax should be saved to a safe location. This allows you to perform a complete recovery of the Enterprise Manager repository database. In its simplest form, the syntax appears as follows:

```
run {
  restore database;
  recover database;
}
```

Actual syntax will vary in length and complexity depending on your environment. For more information on extracting syntax from an RMAN backup and recovery job, or using RMAN in general, see the *Oracle Database Backup and Recovery Advanced User's Guide*.

The following scenarios illustrate various repository recovery situations along with the recovery steps.

### 22.1.2.1 Full Recovery on the Same Host

Repository database is running in *archivelog* mode. Recent backup, archive log files and redo logs are available. The repository database disk crashes. All datafiles and control files are lost.

#### Resolution:

1. Stop all OMS instances using `emctl stop oms`.
2. Recover the database using RMAN
3. Bring the site up using the command `emctl start oms` on all OMS instances.
4. Verify that the site is fully operational.

### 22.1.2.2 Incomplete Recovery on the Same Host

Repository database is running in *noarchivelog* mode. Full offline backup is available. The repository database disk crashes. All datafiles and control files are lost.

#### Resolution:

1. Stop the OMS instances using `emctl stop oms`.
2. Recover the database using RMAN.
3. Initiate Repository Resync using `emctl resync repos -full -name "<resync name>"` from one of the OMS Oracle Home.
4. Start the OMS( instances using `emctl start oms`.
5. Log into Cloud Control. Navigate to the Management Services and Repository Overview page. Click **Repository Synchronization** under **Related Links**. Monitor the status of resync jobs. Resubmit failed jobs, if any, after fixing the error.
6. Verify that the site is fully operational.

### 22.1.2.3 Full Recovery on a Different Host

The Management Repository database is running on host "A" in *archivelog* mode. Recent backup, archive log files and redo logs are available. The repository database crashes. All datafiles and control files are lost.

#### Resolution:

1. Stop the OMS instances using the command `emctl stop oms`.
2. Recover the database using RMAN on a different host (host "B").
3. Correct the connect descriptor for the repository by running the following command on each OMS.

```
$emctl config oms -store_repos_details -repos_conn_desc <connect descriptor>
-repos_user sysman
```

4. Start the OMS instances using the command `emctl start oms`.
5. Relocate the Management Repository database target to the Agent running on host "B" by running the following command from the OMS:

```
$emctl config repos -host <hostB> -oh <OH of repository on hostB> -conn_desc
"<TNS connect descriptor>"
```

---

---

**Note:** This command can only be used to relocate the repository database under the following conditions:

- An Agent is already running on this machine.
  - No database on host "B" has been discovered.
- 
- 

6. Change the monitoring configuration for the OMS and Repository target: by running the following command from the OMS:

```
$emctl config emrep -conn_desc "<TNS connect descriptor>"
```

7. Verify that the site is fully operational.

### 22.1.2.4 Incomplete Recovery on a Different Host

The Management Repository database is running on host "A" in *noarchivelog* mode. Full offline backup is available. Host "A" is lost due to hardware failure. All datafiles and control files are lost.

#### Resolution:

1. Stop the OMS instances using `emctl stop oms`.
2. Recover the database using RMAN on a different host (host "B").
3. Correct the connect descriptor for the repository in credential store.

```
$emctl config oms -store_repos_details -repos_conn_desc <connect descriptor>
-repos_user sysman
```

4. Initiate Repository Resync:

```
$emctl resync repos -full -name "<resync name>"
```

from one of the OMS Oracle Homes.

5. Start the OMS using the command `emctl start oms`.

6. Run the command to relocate the repository database target to the Management Agent running on host "B":
 

```
$emctl config repos -agent <agent on host B> -host <hostB>
      -oh <OH of repository on hostB> -conn_desc "<TNS connect
      descriptor>"
```
7. Run the command to change monitoring configuration for the OMS and Repository target:
 

```
emctl config emrep -conn_desc "<TNS connect descriptor>"
```
8. Log in to Cloud Control. Navigate to **Management Services and Repository Overview** page.
9. Choose on **Repository Synchronization** under **Related Links**. Monitor the status of resync jobs. Resubmit failed jobs, if any, after fixing the error mentioned.
10. Verify that the site is fully operational.

### 22.1.3 Recovering the OMS

If an Oracle Management Service instance is lost, recovering it essentially consists of two steps: Recovering the Software Homes, then configuring the Instance Home.

When restoring on the same host, the software homes can be restored from filesystem backup. In case a backup does not exist, or if installing to a different host, the Software Homes can be reconstructed using the "Install Software Only" option from the Cloud Control software distribution. Care should be taken to select and install all Management Plug-ins that existed in your environment prior to crash.

The following SQL command can be run against the repository database as the "sysman" user to obtain the list of plug-ins already deployed:

```
SELECT epv.display_name, epv.plugin_id, epv.version FROM em_plugin_version epv,
em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_IN_TARGET_
TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_version_id =
ecp.plugin_version_id;
```

Note that some plug-ins might have not shipped with Cloud Control and might not be present in the install media. Such plug-ins should be downloaded from OTN and their location passed to the Oracle Installer. Choose all plug-ins returned by the SQL query above in the plug-ins page of the Installer. Recovery will fail if all the required plug-ins are not selected.

After running the installer in software only mode, all patches that were installed prior to the crash must be re-applied. Assuming the Management Repository is intact, the post scripts that run SQLs against the repository can be skipped as the repository already has those patches applied.

As stated earlier, the location of the OMS Oracle Home is fixed and cannot be changed. Hence, ensure that the OMS Oracle Home is restored in the same location that was used previously.

Once the Software Homes are recovered, the instance home can be reconstructed using the omsca command in recovery mode:

```
omsca recover -as -ms -nostart -backup_file <exportconfig file>
```

Use the export file generated by the emctl exportconfig command shown in the previous section.

## 22.1.4 OMS Recovery Scenarios

The following scenarios illustrate various OMS recovery situations along with the recovery steps.

---

**Important:** A prerequisite for OMS recovery is to have recent, valid OMS configuration backups available. Oracle recommends that you back up the OMS using the `emctl exportconfig oms` command whenever an OMS configuration change is made. This command must be run on the primary OMS running the WebLogic AdminServer.

Alternatively, you can run this command on a regular basis using the Enterprise Manager Job system.

Each of the following scenarios cover the recovery of the Software homes using either a filesystem backup (when available and only when recovering to the same host) or using the Software only option from the installer. In either case, the best practice is to recover the instance home (`gc_inst`) using the `omsca recover` command, rather than from a filesystem backup. This guarantees that the instance home is valid and up to date.

---

### 22.1.4.1 Single OMS, No Server Load Balancer (SLB), OMS Restored on the same Host

Site hosts a single OMS. No SLB is present. The OMS configuration was backed up using the `emctl exportconfig oms` command on the primary OMS running the AdminServer. The OMS Oracle Home is lost.

**Resolution:**

1. Perform cleanup on failed OMS host.

Make sure there are no processes still running from the Middleware home using a command similar to the following:

```
ps -ef | grep -i -P "(Middleware|gc_inst)" | grep -v grep | awk '{print $2}' | xargs kill -9
```

---

**Note:** Change `Middleware|gc_inst` to strings that match your own middleware and instance homes.

---

If recovering the software homes using the software only install method, first de-install the existing Oracle Homes using the Cloud Control software distribution installer. This is required even if the software homes are no longer available as it is necessary to remove any record of the lost Oracle Homes from the Oracle inventory.

If they exist, remove the 'Middleware' and 'gc\_inst' directories.

2. Ensure that software library locations are still accessible.
3. Restore the Software Homes.

If restoring from a filesystem backup, delete the file `OMS_HOME/sysman/config/emInstanceMapping.properties` and any `gc_inst` directory that may have been restored, if they exist.

Alternatively, if a backup does not exist, use the software only install method to reconstruct the software homes:

1. Select the 'Install Software Only' option from the 'Install Types' step page within the Cloud Control software installer.
2. Ensure all previously deployed plug-ins are selected on the 'Select Plug-ins' step page.

It is possible to determine which plug-ins were deployed previously by running the following SQL against the repository database:

```
SELECT epv.display_name, epv.plugin_id, epv.version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_
IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id;
```

---

**Note:** At the end of the Software only installation, do NOT run *ConfigureGC.pl* when told to do so by the installer. This step should only be performed as part of a fresh install, not as part of a recovery operation.

---

3. Apply any patches that were previously applied to the OMS software homes.
4. Run omsca in recovery mode specifying the export file taken earlier to configure the OMS:

```
<OMS_HOME>/bin/omsca recover -as -ms -nostart -backup_file <exportconfig file>
```

---

**Note:** The -backup\_file to be passed must be the latest file generated from emctl exportconfig oms command.

---

5. Start the OMS.

```
OMS_HOME/bin/emctl start oms
```

6. Recover the Agent (if necessary).

If the Management Agent Software Home was recovered along with the OMS Software Homes (as is likely in a single OMS install recovery where the Management Agent and agent\_inst directories are commonly under the Middleware home), the Management Agent instance directory should be recreated to ensure consistency between the Management Agent and OMS.

1. Remove the agent\_inst directory if it was restored from backup
2. Use agentDeploy.sh to configure the agent:

```
<AGENT_HOME>/core/12.1.0.0.0/sysman/install/agentDeploy.sh AGENT_BASE_
DIR=<AGENT_BASE_DIR> AGENT_INSTANCE_HOME=<AGENT_INSTANCE_HOME> ORACLE_
HOSTNAME=<AGENT_HOSTNAME> AGENT_PORT=<AGENT_PORT> -configOnly OMS_HOST=<oms
host> EM_UPLOAD_PORT=<OMS_UPLOAD_PORT> AGENT_REGISTRATION_PASSWORD=<REG_
PASSWORD>
```

3. The OMS automatically blocks the Management Agent. Resync the Management Agent from the Management Agent homepage.

If the Management Agent software home was not recovered along with the OMS but the Agent still needs to be recovered, follow the instructions in section *Agent Reinstall Using the Same Port*.

---

**Note:** This is only likely to be needed in the case where a filesystem recovery has been performed that did not include a backup of the Agent software homes. If the OMS software homes were recovered using the Software only install method, this step will not be required because a Software only install installs an Agent software home under the Middleware home.

---

7. Verify that the site is fully operational.

#### 22.1.4.2 Single OMS, No SLB, OMS Restored on a Different Host

Site hosts a single OMS. The OMS is running on host "A." No SLB is present. The OMS configuration was backed up using the `emctl exportconfig oms` command. Host "A" is lost.

**Resolution:**

1. Ensure that software library locations are accessible from "Host B".
2. Restore the software homes on "Host B".

Oracle does not support restoring OMS Oracle Homes from filesystem backup across different hosts. Use the software-only install method to reconstruct the software homes:

1. Select the 'Install Software Only' option from the 'Install Types' step page within the Cloud Control software installer.
2. Ensure all previously deployed plug-ins are selected on the 'Select Plug-ins' step page.

It is possible to determine which plug-ins were deployed previously by running the following SQL against the repository database:

```
SELECT epv.display_name, epv.plugin_id, epv.version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_
IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id;
```

---

**Note:** At the end of the Software only installation, do NOT run `ConfigureGC.pl` when told to do so by the installer. This step should only be performed as part of a fresh install, not as part of a recovery operation.

---

3. Apply any patches that were previously applied to the OMS software homes.
3. Run `omsca` in recovery mode specifying the export file taken earlier to configure the OMS:

```
<OMS_HOME>/bin/omsca recover -as -ms -nostart -backup_file <exportconfig file>
```

---

**Note:** The `-backup_file` to be passed must be the latest file generated from `emctl exportconfig oms` command.

---

#### 4. Start the OMS.

```
<OMS_HOME>/bin/emctl start oms
```

An agent is installed as part of the Software only install and needs to be configured using the agentDeploy.sh command:

#### 5. Configure the Agent.

```
<AGENT_HOME>/core/12.1.0.0/sysman/install/agentDeploy.sh AGENT_BASE_
DIR=<AGENT_BASE_DIR> AGENT_INSTANCE_HOME=<AGENT_INSTANCE_HOME> ORACLE_
HOSTNAME=<AGENT_HOSTNAME> AGENT_PORT=<AGENT_PORT> -configOnly OMS_HOST=<oms
host> EM_UPLOAD_PORT=<OMS_UPLOAD_PORT> AGENT_REGISTRATION_PASSWORD=<REG_
PASSWORD>
```

The OMS automatically blocks the Management Agent. Resync the Management Agent from the Management Agent homepage

#### 6. Relocate the oracle\_emrep target to the Management Agent of the new OMS host using the following commands:

```
<OMS_HOME>/bin/emcli login -username=sysman
<OMS_HOME>/bin/emcli sync
<OMS_HOME>/bin/emctl config emrep -agent <agent on host "B", e.g
myNewOMSHost.example.com:3872>
```

#### 7. In the Cloud Control console, locate the 'WebLogic Domain' target for the Cloud Control Domain. Go to 'Monitoring Credentials' and update the adminserver host to host B. Then do a Refresh Weblogic Domain to reconfigure the domain with new hosts.

#### 8. Locate duplicate targets from the Management Services and Repository Overview page of the Enterprise Manager console. Click the Duplicate Targets link to access the Duplicate Targets page. To resolve duplicate target errors, the duplicate target must be renamed on the conflicting Agent. Relocate duplicate targets from Agent "A" to Agent "B".

#### 9. Change the OMS to which all Management Agents point and then resecure all Agents.

Because the new machine is using a different hostname from the one originally hosting the OMS, all Agents in your monitored environment must be told where to find the new OMS. On each Management Agent, run the following command:

```
<AGENT_INST_DIR>/bin/emctl secure agent -emdWalletSrcUrl "http://hostB:<http_
port>/em"
```

#### 10. Assuming the original OMS host is no longer in use, remove the Host target (including all remaining monitored targets) from Cloud Control by selecting the host on the Targets > Hosts page and clicking 'Remove'. You will be presented with an error that informs you to remove all monitored targets first. Remove those targets then repeat the step to remove the Host target successfully.

#### 11. Verify that the site is fully operational.

### 22.1.4.3 Single OMS, No SLB, OMS Restored on a Different Host using the Original Hostname

Site hosts a single OMS. The OMS is running on host "A." No SLB is present. The OMS configuration was backed up using the `emctl exportconfig oms` command. Host "A" is lost. Recovery is to be performed on "Host B" but retaining the use of "Hostname A".

**Resolution:**

1. Ensure that loader receive directory and software library locations are accessible from Host "B".

Oracle does not support restoring OMS Oracle Homes from filesystem backup across different hosts. Use the software-only install method to reconstruct the software homes:

1. Select the 'Install Software Only' option from the 'Install Types' step page within the Cloud Control software installer.
2. Ensure all previously deployed plug-ins are selected on the 'Select Plug-ins' step page.

It is possible to determine which plug-ins were deployed previously by running the following SQL against the Management Repository database:

```
SELECT epv.display_name, epv.plugin_id, epv.version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_
IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id;
```

---

**Note:** At the end of the Software only installation, do NOT run *ConfigureGC.pl* when told to do so by the installer. This step should only be performed as part of a fresh install, not as part of a recovery operation.

---

3. Apply any patches that were previously applied to the OMS software homes.
2. Modify the network configuration such that "Host B" also responds to hostname of "Host A". Specific instructions on how to configure this are beyond the scope of this document. However, some general configuration suggestions are:

Modify your DNS server such that both "Hostname B" and "Hostname A" network addresses resolve to the physical IP of "Host B".

Multi-home "Host B". Configure an additional IP on "Host B" for the IP address that "Hostname A" resolves to. For example, on "Host B" run the following commands:

```
ifconfig eth0:1 <IP assigned to "Hostname A"> netmask <netmask>
/sbin/arping -q -U -c 3 -I eth0 <IP of HostA>
```

3. Run omsca in recovery mode specifying the export file taken earlier to configure the OMS:

```
<OMS_HOME>/bin/omsca recover -as -ms -nostart -backup_file <exportconfig file>
-AS_HOST <hostA> -EM_INSTANCE_HOST <hostA>
```

---

**Note:** The -backup\_file to be passed must be the latest file generated from emctl exportconfig oms command.

---

4. Start the OMS  

```
<OMS_HOME>/bin/emctl start oms
```
5. Configure the agent.

An agent is installed as part of the Software only install and needs to be configured using the agentDeploy.sh command:

```
<AGENT_HOME>/core/12.1.0.0.0/sysman/install/agentDeploy.sh AGENT_BASE_
DIR=<AGENT_BASE_DIR> AGENT_INSTANCE_HOME=<AGENT_INSTANCE_HOME> ORACLE_
HOSTNAME=<AGENT_HOSTNAME> AGENT_PORT=<AGENT_PORT> -configOnly OMS_HOST=<oms
host> EM_UPLOAD_PORT=<OMS_UPLOAD_PORT> AGENT_REGISTRATION_PASSWORD=<REG_
PASSWORD>
```

6. The OMS automatically blocks the Management Agent. Resync the Management Agent from the Management Agent homepage.

Run the command to relocate Management Services and Management Repository target to Management Agent "B":

```
emctl config emrep -agent <agent on host B>
```

7. In the Cloud Control console, locate the 'WebLogic Domain' target for the Cloud Control Domain. Go to 'Monitoring Credentials' and update the adminserver host to host B. Then do a Refresh Weblogic Domain to reconfigure the domain with new hosts.
8. Locate duplicate targets from the Management Services and Repository Overview page of the Enterprise Manager console. Click the Duplicate Targets link to access the Duplicate Targets page. To resolve duplicate target errors, the duplicate target must be renamed on the conflicting Management Agent. Relocate duplicate targets from Management Agent "A" to Management Agent "B".
9. Verify that the site is fully operational.

#### 22.1.4.4 Multiple OMS, Server Load Balancer, Primary OMS Recovered on the Same Host

Site hosts multiple OMS instances. All OMS instances are fronted by a Server Load Balancer. OMS configuration backed up using the `emctl exportconfig oms` command on the primary OMS running the WebLogic AdminServer. The primary OMS is lost.

##### Resolution:

1. Perform a cleanup on the failed OMS host.

Make sure there are no processes still running from the Middleware home using a command similar to the following:

```
ps -ef | grep -i -P "(Middleware|gc_inst)" | grep -v grep | awk '{print $2}' |
xargs kill -9
```

---

**Note:** Change *Middleware|gc\_inst* to strings that match your own middleware and instance homes.

---

If recovering the software homes using the software only install method, first de-install the existing Oracle Homes using the Cloud Control software distribution installer. This is required even if the software homes are no longer available as it is necessary to remove any record of the lost Oracle Homes from the Oracle inventory.

If they exist, remove the 'Middleware' and 'gc\_inst' directories.

2. Ensure that software library locations are still accessible.

### 3. Restore the software homes.

If restoring from a filesystem backup, delete the file <OMS\_HOME>/sysman/config/emInstanceMapping.properties and any gc\_inst directory that may have been restored, if they exist.

Alternatively, if a backup does not exist, use the software only install method to reconstruct the software homes:

1. Select the 'Install Software Only' option from the 'Install Types' step page within the Cloud Control software installer.
2. Ensure all previously deployed plug-ins are selected on the 'Select Plug-ins' step page.

It is possible to determine which plugins were deployed previously by running the following SQL against the Management Repository database:

```
SELECT epv.display_name, epv.plugin_id, epv.version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_
IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id;
```

---

**Note:** At the end of the Software only installation, do NOT run *ConfigureGC.pl* when told to do so by the installer. This step should only be performed as part of a fresh install, not as part of a recovery operation.

---

3. Apply any patches that were previously applied to the OMS software homes.
4. Run omsca in recovery mode specifying the export file taken earlier to configure the OMS:

```
<OMS_HOME>/bin/omsca recover -as -ms -nostart -backup_file <exportconfig file>
```

---

**Note:** The -backup\_file to be passed must be the latest file generated from emctl exportconfig oms command.

---

### 5. Start the OMS.

```
<OMS_HOME>/bin/emctl start oms
```

### 6. Recover the Management Agent.

If the Management Agent software home was recovered along with the OMS software homes (as is likely in a Primary OMS install recovery where the agent and agent\_inst directories are commonly under the Middleware home), the Management Agent instance directory should be recreated to ensure consistency between the Management Agent and OMS.

1. Remove the agent\_inst directory if it was restored from backup.
2. Use agentDeploy.sh to configure the Management Agent:

```
<AGENT_HOME>/core/12.1.0.0.0/sysman/install/agentDeploy.sh AGENT_BASE_
DIR=<AGENT_BASE_DIR> AGENT_INSTANCE_HOME=<AGENT_INSTANCE_HOME> ORACLE_
HOSTNAME=<AGENT_HOSTNAME> AGENT_PORT=<AGENT_PORT> -configOnly OMS_HOST=<oms
host> EM_UPLOAD_PORT=<OMS_UPLOAD_PORT> AGENT_REGISTRATION_PASSWORD=<REG_
PASSWORD>
```

3. The OMS automatically blocks the Management Agent. Resync the Management Agent from the Management Agent homepage.

If the Management Agent software home was not recovered along with the OMS but the Management Agent still needs to be recovered, follow the instructions in section *Agent Reinstall Using the Same Port*.

---

**Note:** This is only likely to be needed in the case where a filesystem recovery has been performed that did not include a backup of the Management Agent software homes. If the OMS software homes were recovered using the Software only install method, this step will not be required because a Software only install installs an Management Agent software home under the Middleware home.

---

7. Re-enroll the additional OMS, if any, with the recovered Administration Server by running `emctl enroll oms` on each additional OMS.
8. Verify that the site is fully operational.

#### 22.1.4.5 Multiple OMS, Server Load Balancer configured, Primary OMS Recovered on a Different Host

Site hosts multiple OMS instances. OMS instances fronted by a Server Load Balancer. OMS Configuration backed up using `emctl exportconfig oms` command. Primary OMS on host "A" is lost and needs to be recovered on Host "B".

1. If necessary, perform cleanup on failed OMS host.

Make sure there are no processes still running from the Middleware home using a command similar to the following:

```
ps -ef | grep -i -P "(Middleware|gc_inst)" | grep -v grep | awk '{print $2}' | xargs kill -9
```

2. Ensure that software library locations are accessible from "Host B".
3. Restore the software homes on "Host B".

Oracle does not support restoring OMS Oracle Homes from filesystem backup across different hosts. Use the software-only install method to reconstruct the software homes:

1. Select the 'Install Software Only' option from the 'Install Types' step page within the Cloud Control software installer.
2. Ensure all previously deployed plug-ins are selected on the 'Select Plug-ins' step page.

It is possible to determine which plugins were deployed previously by running the following SQL against the Management Repository database:

```
SELECT epv.display_name, epv.plugin_id, epv.version FROM em_plugin_version
epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ( 'BUILT_
IN_TARGET_TYPE' , 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_
version_id = ecp.plugin_version_id;
```

---

**Note:** At the end of the Software only installation, do NOT run *ConfigureGC.pl* when told to do so by the installer. This step should only be performed as part of a fresh install, not as part of a recovery operation.

---

3. Apply any patches that were previously applied to the OMS software homes.
4. Run omsca in recovery mode specifying the export file taken earlier to configure the OMS:

```
<OMS_HOME>/bin/omsca recover -as -ms -nostart -backup_file <exportconfig file>
```

---

**Note:** The -backup\_file to be passed must be the latest file generated from emctl exportconfig oms command.

---

5. Start the OMS.

```
<OMS_HOME>/bin/emctl start oms
```

6. Configure the Management Agent.

An agent is installed as part of the Software only install and needs to be configured using the agentDeploy.sh command:

```
<AGENT_HOME>/core/12.1.0.0/sysman/install/agentDeploy.sh AGENT_BASE_
DIR=<AGENT_BASE_DIR> AGENT_INSTANCE_HOME=<AGENT_INSTANCE_HOME> ORACLE_
HOSTNAME=<AGENT_HOSTNAME> AGENT_PORT=<AGENT_PORT> -configOnly OMS_HOST=<oms
host> EM_UPLOAD_PORT=<OMS_UPLOAD_PORT> AGENT_REGISTRATION_PASSWORD=<REG_
PASSWORD>
```

The OMS automatically blocks the Management Agent. Resync the Management Agent from the Management Agent homepage

7. Add the new OMS to the SLB virtual server pools and remove the old OMS.
8. Relocate the oracle\_emrep target to the Management Agent of the new OMS host using the following commands:

```
<OMS_HOME>/bin/emcli sync
<OMS_HOME>/bin/emctl config emrep -agent <agent on host "B", e.g
myNewOMSHost.example.com:3872>
```

9. In the Cloud Control console, locate the 'WebLogic Domain' target for the Cloud Control Domain. Go to 'Monitoring Credentials' and update the adminserver host to host B. Then do a Refresh Weblogic Domain to reconfigure the domain with new hosts.
10. Locate duplicate targets from the Management Services and Repository Overview page of the Enterprise Manager console. Click the Duplicate Targets link to access the Duplicate Targets page. To resolve duplicate target errors, the duplicate target must be renamed on the conflicting Management Agent. Relocate duplicate targets from Management Agent "A" to Management Agent "B".
11. Assuming the original OMS host is no longer in use, remove the Host target (including all remaining monitored targets) from Cloud Control by selecting the host on the Targets > Hosts page and clicking 'Remove'. You will be presented with an error that informs you to remove all monitored targets first. Remove those targets then repeat the step to remove the Host target successfully.
12. Verify that the site is fully operational.

#### 22.1.4.6 Multiple OMS, SLB configured, additional OMS recovered on same or different host

Multiple OMS site where the OMS instances are fronted by an SLB. OMS configuration backed up using the `emctl exportconfig oms` command on the first OMS. Additional OMS is lost and needs to be recovered on the same or a different host.

1. If recovering to the same host, ensure cleanup of the failed OMS has been performed:

Make sure there are no processes still running from the Middleware home using a command similar to the following:

```
ps -ef | grep -i -P "(Middleware|gc_inst)" | grep -v grep | awk '{print $2}' | xargs kill -9
```

First de-install the existing Oracle Homes using the Cloud Control software distribution installer. This is required even if the software homes are no longer available as it is necessary to remove any record of the lost Oracle Homes from the Oracle inventory.

If they exist, remove the 'Middleware' and 'gc\_inst' directories.

2. Ensure that shared software library locations are accessible.
3. Install an Management Agent on the required host (same or different as the case may be).
4. Use the Additional OMS deployment procedure to configure a new additional OMS.
5. Verify that the site is fully operational.

### 22.1.5 Recovering Management Agents

If an Management Agent is lost, it should be reinstalled by cloning from a reference install. Cloning from a reference install is often the fastest way to recover an Management Agent install as it is not necessary to track and reapply customizations and patches. Care should be taken to reinstall the Management Agent using the same port. Using the Enterprise Manager's Management Agent Resynchronization feature, a reinstalled Management Agent can be reconfigured using target information present in the Management Repository. When the Management Agent is reinstalled using the same port, the OMS detects that it has been re-installed and blocks it temporarily to prevent the auto-discovered targets in the re-installed Management Agent from overwriting previous customizations.

---

**Blocked Management Agents:** A This is a condition in which the OMS rejects all heartbeat or upload requests from the blocked Management Agent. Hence, a blocked Agent will not be able to upload any alerts or metric data to the OMS. However, blocked Management Agents continue to collect monitoring data.

---

The Management Agent can be resynchronized and unblocked from the Management Agent homepage by clicking on the **Resynchronize Agent** button. Resynchronization pushes all targets from the Management Repository to the Management Agent and then unblocks the Agent.

## 22.1.6 Management Agent Recovery Scenarios

The following scenarios illustrate various Management Agent recovery situations along with the recovery steps. The Management Agent resynchronization feature requires that a reinstalled Management Agent use the same port and location as the previous Management Agent that crashed.

### 22.1.6.1 Management Agent Reinstall Using the Same Port

A Management Agent is monitoring multiple targets. The Agent installation is lost.

1. De-install the Agent Oracle Home using the Oracle Universal Installer.

---

**Note:** This step is necessary in order to clean up the inventory.

---

2. Install a new Management Agent or use the Management Agent clone option to reinstall the Management Agent through Enterprise Manager. Specify the same port that was used by the crashed Agent. The location of the install must be same as the previous install.

The OMS detects that the Management Agent has been re-installed and blocks the Management Agent.

3. Initiate Management Agent Resynchronization from the Management Agent homepage.

All targets in the Management Repository are pushed to the new Management Agent. The Agent is instructed to clear backlogged files and then do a clearstate. The Agent is then unblocked.

4. Reconfigure User-defined Metrics if the location of User-defined Metric scripts have changed.
5. Verify that the Management Agent is operational and all target configurations have been restored using the following emctl commands:

```
emctl status agent
emctl upload agent
```

There should be no errors and no XML files in the backlog.

### 22.1.6.2 Management Agent Restore from Filesystem Backup

A single Management Agent is monitoring multiple targets. File system backup for the Agent Oracle Home exists. The Agent install is lost.

1. Restore the Management Agent from the filesystem backup then start the Management Agent.

The OMS detects that the Management Agent has been restored from backup and blocks the Management Agent.

2. Initiate Management Agent Resynchronization from the Management Agent homepage.

All targets in the Management Repository are pushed to the new Management Agent. The Agent is instructed to clear backlogged files and performs a clearstate. The Management Agent is unblocked.

3. Verify that the Management Agent is functional and all target configurations have been restored using the following emctl commands:

```
emctl status agent
emctl upload agent
```

There should be no errors and no XML files in the backlog.

## 22.2 Recovering from a Simultaneous OMS-Management Repository Failure

When both OMS and Management Repository fail simultaneously, the recovery situation becomes more complex depending upon factors such as whether the OMS and Management Repository recovery has to be performed on the same or different host, or whether there are multiple OMS instances fronted by an SLB. In general, the order of recovery for this type of compound failure should be Management Repository first, followed by OMS instances following the steps outlined in the appropriate recovery scenarios discussed earlier. The following scenarios illustrate two OMS-Management Repository failures and the requisite recovery steps.

### 22.2.1 Collapsed Configuration: Incomplete Management Repository Recovery, Primary OMS on the Same Host

Management Repository and the primary OMS are installed on same host (host "A"). The Management Repository database is running in noarchivelog mode. Full cold backup is available. A recent OMS backup file exists ( emctl exportconfig oms). The Management Repository, OMS and the Management Agent crash.

1. Follow the Management Repository recovery procedure shown in Incomplete Recovery on the Same Host with the following exception:

Since the OMS OracleHome is not available and Management Repository resynchronization has to be initiated before starting an OMS against the restored Management Repository, submit "resync" via the following PL/SQL block. Log into the Management Repository as SYSMAN using SQLplus and run:

```
begin emd_maintenance.full_repository_resync('<resync name>'); end;
```

2. Follow the OMS recovery procedure shown in [Section 22.1.4.1, "Single OMS, No Server Load Balancer \(SLB\), OMS Restored on the same Host."](#)
3. Verify that the site is fully operational.

### 22.2.2 Distributed Configuration: Incomplete Management Repository Recovery, Primary OMS and additional OMS on Different Hosts, SLB Configured

The Management Repository, primary OMS, and additional OMS all reside on the different hosts. The Management Repository database was running in noarchivelog mode. OMS backup file from a recent backup exists (emctl exportconfig oms). Full cold backup of the database exists. All three hosts are lost.

1. Follow the Management Repository recovery procedure shown in [Section 22.1.2.2, "Incomplete Recovery on the Same Host."](#) with the following exception:

Since OMS Oracle Home is not yet available and Management Repository resync has to be initiated before starting an OMS against the restored Management Repository, submit resync via the following PL/SQL block. Log into the Management Repository as SYSMAN using SQLplus and run the following:

```
begin emd_maintenance.full_repository_resync('resync name'); end;
```

2. Follow the OMS recovery procedure shown in [Section 22.1.4.5, "Multiple OMS, Server Load Balancer configured, Primary OMS Recovered on a Different Host"](#) with the following exception:

Override the Management Repository connect description present in the backup file by passing the additional omsca parameter:

```
-REPOS_CONN_STR <restored repos descriptor>
```

This needs to be added along with other parameters listed in [Section 22.1.4.5, "Multiple OMS, Server Load Balancer configured, Primary OMS Recovered on a Different Host."](#)

3. Follow the OMS recovery procedure shown in [Section 22.1.4.6, "Multiple OMS, SLB configured, additional OMS recovered on same or different host."](#)
4. Verify that the site is fully operational.

## 22.3 Switching Over or Failing Over to Standby Enterprise Manager Configurations

### 22.3.1 Switchover

Switchover is a planned activity where operations are transferred from the Primary site to a Standby site. This is usually done for testing and validation of Disaster Recovery (DR) scenarios and for planned maintenance activities on the primary infrastructure.

#### **Switchover to the Passive OMS in a Level 2 Active/Passive Configuration**

Switchover follows the same steps as Failover, See Section 'Failover to the Passive OMS in a Level 2 Active/Passive Configuration'

#### **Switchover to the Standby Site in a Level 4 MAA Configuration**

This section describes the steps to switchover to the standby site. The same procedure is applied to switchover in either direction.

Enterprise Manager Console cannot be used to perform switchover of the Management Repository database. Use the Data Guard Broker command line tool DGMGRL instead.

1. Prepare the Standby Database

Verify that recovery is up-to-date. Using the Enterprise Manager Console, you can view the value of the ApplyLag column for the standby database in the Standby Databases section of the Data Guard Overview Page.

2. Shut down the Primary Enterprise Manager Application Tier.

Shutdown all the Management Service instances in the primary site by running the following command on each Management Service:

```
emctl stop oms -all
```

3. Verify Software Library Availability

Ensure all files from the primary site are available on the standby site.

4. Switch over to the Standby Database

Use DGMGRL to perform a switchover to the standby database. The command can be run on the primary site or the standby site. The switchover command verifies the states of the primary database and the standby database, affects switchover of roles, restarts the old primary database, and sets it up as the new standby database.

```
SWITCHOVER TO <standby database name>;
```

Verify the post switchover states. To monitor a standby database completely, the user monitoring the database must have SYSDBA privileges. This privilege is required because the standby database is in a mounted-only state. A best practice is to ensure that the users monitoring the primary and standby databases have SYSDBA privileges for both databases.

```
SHOW CONFIGURATION;
SHOW DATABASE <primary database name>;
SHOW DATABASE <standby database name>;
```

5. Start the Admin Server if it is not already running.

```
emctl start oms -admin_only
```

6. Make the standby Management Services point to the Standby Database which is now the new Primary by running the following on each standby Management Service.

```
emctl config oms -store_repos_details -repos_conndesc
<connect descriptor of new primary database> -repos_user
sysman
```

7. Startup the Enterprise Manager Application Tier

Startup all the Management Services on the standby site:

```
emctl start oms
```

8. Relocate Management Services and Management Repository target

The Management Services and Management Repository target is monitored by a Management Agent on one of the Management Services on the primary site. To ensure that the target is monitored after switchover/failover, relocate the target to a Management Agent on the standby site by running the following command on one of the Management Service standby sites.

```
emctl config emrep -agent <agent name> -conn_desc
```

9. Switchover to Standby SLB.

Make appropriate network changes to failover your primary SLB to standby SLB that is, all requests should now be served by the standby SLB without requiring any changes on the clients (browser and Management Agents).

10. Establish the old primary Management Services as the new standby Management Services to complete the switchover process.

Start the Administration Server on old primary site

```
emctl start oms -admin_only
```

Point the old primary Management Services to the new Primary Repository database by running the following command on each Management Service on the old primary site.

```
emctl config oms -store_repos_details -repos_connDESC  
<connect descriptor of new primary database> -repos_user  
sysman
```

This completes the switchover operation. Access and test the application to ensure that the site is fully operational and functionally equivalent to the primary site. Repeat the same procedure to switchover in the other direction.

## 22.3.2 Failover

### Failover to the Passive OMS in a Level 2 Active/Passive Configuration

1. Establish the IP address on failover host.
2. If the Database and Listener are also part of the same failover group:
  1. Start the TNS listener using the command `lsnrctl start`.
  2. Start the database using the command `dbstart`.
3. Start Cloud Control using the command `emctl start oms`.
4. Test the functionality.

### Failover of the OMS in a Level 3 Active/Active Configuration

OMS failover is handled transparently in a Level 3, Active/Active OMS, configuration. The SLB monitors determine that the failed OMS is no longer available and route traffic to available OMS servers.

### Manual Failover to the Standby Site in a Level 4 MAA Configuration

This section describes the steps to failover to a standby database, recover the Enterprise Manager application state by resynchronization the Management Repository database with all Management Agents, and enabling the original primary database as a standby using flashback database.

The word *manual* is used here to contrast this type of failover with a fast-start failover described later in [Section 22.3.3, "Automatic Failover to the Standby Site in a Level 4 MAA Configuration"](#).

1. Verify Software Library Availability  
Ensure all files from the primary site are available on the standby site.
2. Failover to Standby Database.  
Shutdown the database on the primary site. Use DGMGRL to connect to the standby database and execute the `FAILOVER` command:

```
FAILOVER TO <standby database name>;
```

Verify the post failover states:

```
SHOW CONFIGURATION;  
SHOW DATABASE <primary database name>;  
SHOW DATABASE <standby database name>;
```

Note that after the failover completes, the original primary database cannot be used as a standby database of the new primary database unless it is re-enabled.

3. Start the Admin Server if it is not already running.

```
emctl start oms -admin_only
```

4. Make the standby Management Services point to the Standby Database which is now the new Primary by running the following on each standby Management Service.

```
emctl config oms -store_repos_details -repos_conn_desc <connect descriptor of new primary database> -repos_user sysman
```

5. Resync the New Primary Database with Management Agents.

Skip this step if you are running in Data Guard Maximum Protection or Maximum Availability level as there is no data loss on failover. However, if there is data loss, synchronize the new primary database with all Management Agents.

On any one Management Service on the standby site, run the following command:

```
emctl resync repos -full -name "<name for recovery action>"
```

This command submits a resync job that would be executed on each Management Agent when the Management Services on the standby site are brought up.

Repository resynchronization is a resource intensive operation. A well tuned Management Repository will help significantly to complete the operation as quickly as possible. Specifically if you are not routinely coalescing the IOTs/indexes associated with Advanced Queueing tables as described in My Oracle Support note 271855.1, running the procedure before resync will significantly help the resync operation to complete faster.

6. Start up the Enterprise Manager Application Tier

Start up all the Management Services on the standby site by running the following command on each Management Service.

```
emctl start oms
```

7. Relocate Management Services and Management Repository target.

The Management Services and Management Repository target is monitored by a Management Agent on one of the Management Services on the primary site. To ensure that target is monitored after switchover/failover, relocate the target to a Management Agent on the standby site by running the following command on one of the standby site Management Service.

```
emctl config emrep -agent <agent name> -conn_desc
```

8. Switchover to the Standby SLB.

Make appropriate network changes to failover your primary SLB to the standby SLB, that is, all requests should now be served by the standby SLB without requiring any changes on the clients (browser and Management Agents).

9. Establish Original Primary Database as Standby Database Using Flashback

Once access to the failed site is restored and if you had flashback database enabled, you can reinstate the original primary database as a physical standby of the new primary database.

1. Shut down all the Management Services in the original primary site.

```
emctl stop oms -all
```

2. Restart the original primary database in mount state:

```
shutdown immediate;
```

```
startup mount;
```

**3. Reinstall the Original Primary Database**

Use DGMGRL to connect to the old primary database and execute the REINSTATE command

```
REINSTATE DATABASE <old primary database name>;
```

**4. The newly reinstated standby database will begin serving as standby database to the new primary database.**

**5. Verify the post reinstate states.**

```
SHOW CONFIGURATION;
```

```
SHOW DATABASE <primary database name>;
```

```
SHOW DATABASE <standby database name>;
```

**10. Establish Original Primary Management Service as the standby Management Service.**

Start the Administration Server on old primary site

```
emctl start oms -admin_only
```

Point the old primary Management Service to the new Primary Repository database by running the following command on each Management Service on the old primary site.

```
emctl config oms -store_repos_details -repos_comndesc <connect descriptor of new primary database> -repos_user sysman
```

**11. Monitor and complete Repository Resynchronization**

Navigate to the Management Services and Repository Overview page of Cloud Control Console. Under Related Links, click Repository Synchronization. This page shows the progress of the resynchronization operation on a per Management Agent basis. Monitor the progress.

Operations that fail should be resubmitted manually from this page after fixing the error mentioned. Typically, communication related errors are caused by Management Agents being down and can be fixed by resubmitting the operation from this page after restarting the Management Agent.

For Management Agents that cannot be started due to some reason, for example, old decommissioned Management Agents, the operation should be stopped manually from this page. Resynchronization is deemed complete when all the jobs have a completed or stopped status.

This completes the failover operation. Access and test the application to ensure that the site is fully operational and functionally equivalent to the primary site.

Perform a switchover procedure if the site operations have to be moved back to the original primary site.

### 22.3.3 Automatic Failover to the Standby Site in a Level 4 MAA Configuration

This section details the steps to achieve complete automation of failure detection and failover procedure by utilizing Fast-Start Failover and Observer process. At a high level the process works as follows:

- Fast-Start Failover (FSFO) determines that a failover is necessary and initiates a failover to the standby database automatically

- When the database failover has completed the DB\_ROLE\_CHANGE database event is fired
- The event causes a trigger to be fired which calls a script that configures and starts Enterprise Manager Application Tier

Perform the following steps:

## 1. Develop Enterprise Manager Application Tier Configuration and Startup Script

Develop a script that will automate the Enterprise Manager Application configuration and startup process. See the sample shipped with Cloud Control in the OH/sysman/ha directory. A sample script for the standby site is included here and should be customized as needed. Make sure ssh equivalence is setup so that remote shell scripts can be executed without password prompts. Place the script in a location accessible from the standby database host. Place a similar script on the primary site.

```
#!/bin/sh
# Script: /scratch/EMSBY_start.sh
# Primary Site Hosts
# Repos: earth, OMS: jupiter1, jupiter2
# Standby Site Hosts
# Repos: mars, # OMS: saturn1, saturn2
LOGFILE="/net/mars/em/failover/em_failover.log"
OMS_ORACLE_HOME="/scratch/OracleHomes/em/oms11"
CENTRAL_AGENT="saturn1.example.com:3872"

#log message
echo "#####" >> $LOGFILE
date >> $LOGFILE
echo $OMS_ORACLE_HOME >> $LOGFILE
id >> $LOGFILE 2>&1

#switch all OMS to point to new primary and startup all OMS
ssh orausr@saturn1 "$OMS_ORACLE_HOME/bin/emctl config oms -store_repos_details
-repos_conndesc <connect descriptor of new primary database> -repos_user sysman
-repos_pwd <password>" >> $LOGFILE 2>&1
ssh orausr@saturn1 "$OMS_ORACLE_HOME/bin/emctl start oms" >> $LOGFILE 2>&1

#Repeat the above two lines for each OMS in a multiple OMS setup. E.g.
ssh orausr@saturn2 "$OMS_ORACLE_HOME/bin/emctl config oms -store_repos_details
-repos_conndesc <connect descriptor of new primary database> -repos_user sysman
-repos_pwd <password>" >> $LOGFILE 2>&1
ssh orausr@saturn2 "$OMS_ORACLE_HOME/bin/emctl start oms" >> $LOGFILE 2>&1

#relocate Management Services and Repository target
#to be done only once in a multiple OMS setup
#allow time for OMS to be fully initialized
ssh orausr@saturn1 "$OMS_ORACLE_HOME/bin/emctl config emrep -agent $CENTRAL_
AGENT -conn_desc -sysman_pwd <password>" >> $LOGFILE 2>&1

#always return 0 so that dbms scheduler job completes successfully
exit 0
```

## 2. Automate Execution of Script by Trigger

Create a database event "DB\_ROLE\_CHANGE" trigger, which fires after the database role changes from standby to primary. See the sample shipped with Cloud Control in OH/sysman/ha directory.

--

```
--
-- Sample database role change trigger
--
--
CREATE OR REPLACE TRIGGER FAILOVER_EM
AFTER DB_ROLE_CHANGE ON DATABASE
DECLARE
    v_db_unique_name varchar2(30);
    v_db_role varchar2(30);
BEGIN
    select upper(VALUE) into v_db_unique_name
    from v$parameter where NAME='db_unique_name';
    select database_role into v_db_role
    from v$database;

    if v_db_role = 'PRIMARY' then

        -- Submit job to Resync agents with repository
        -- Needed if running in maximum performance mode
        -- and there are chances of data-loss on failover
        -- Uncomment block below if required
        -- begin
        -- SYSMAN.setemusercontext('SYSMAN', SYSMAN.MGMT_USER.OP_SET_
IDENTIFIER);
        -- SYSMAN.emd_maintenance.full_repository_resync('AUTO-FAILOVER to '||v_
db_unique_name||' - '||systimestamp, true);
        -- SYSMAN.setemusercontext('SYSMAN', SYSMAN.MGMT_USER.OP_CLEAR_
IDENTIFIER);
        -- end;

        -- Start the EM mid-tier
        dbms_scheduler.create_job(
            job_name=>'START_EM',
            job_type=>'executable',
            job_action=>'<location>' || v_db_unique_name || '_start_oms.sh',
            enabled=>TRUE
        );
    end if;
EXCEPTION
WHEN OTHERS
THEN
    SYSMAN.mgmt_log.log_error('LOGGING', SYSMAN.MGMT_GLOBAL.UNEXPECTED_ERR,
SYSMAN.MGMT_GLOBAL.UNEXPECTED_ERR_M || 'EM_FAILOVER: ' || SQLERRM);
END;
/
```

---

**Note:** Based on your deployment, you might require additional steps to synchronize and automate the failover of SLB and shared storage used for software library. These steps are vendor specific and beyond the scope of this document. One possibility is to invoke these steps from the Enterprise Manager Application Tier startup and configuration script.

---

### 3. Configure Fast-Start Failover and Observer.

Use the Fast-Start Failover configuration wizard in Enterprise Manager Console to enable FSFO and configure the Observer.

This completes the setup of automatic failover.

# Part VII

---

## Engineered Systems Management

This section contains the following chapters:

- [Discovering and Managing Exadata Targets and Systems](#)
- [Using Oracle Exalogic Elastic Cloud](#)

---

## Discovering and Managing Exadata Targets and Systems

Oracle Database Machine is an integrated data warehousing solution that eases data warehousing by integrating the whole hardware and software stack into one solution. DB Machine management simplifies monitoring and managing the DB Machine by integrating all hardware and software components into one entity. You do not need to monitor each target individually but instead you can view the whole DB Machine as a single target. You can view all critical issues in the system, monitor performance, and drill down to individual targets from the DB Machine target homepage.

Enterprise Manager automatically or manually discovers the components of the DB Machine and adds these components as managed targets. You can modify the member targets of the DB Machine by adding and removing targets.

The DB Machine homepage includes the following components:

- The hardware schematic allows you to view hardware components of the DB Machine (for example, compute nodes, Exadata cells, and Infiniband switches), monitor critical hardware metrics and view aggregated alerts and faults from all components.
- Alerts sourced from hardware components.
- Easily accessible links and flows to other key feature such as viewing the topology or modifying the schematic

You can also monitor all components of the DB Machine. DB Machine monitors all subcomponent targets, whether hardware or software. This includes the database, ASM, CRS, hosts, Exadata and the Infiniband network. The two targets available to facilitate DB Machine monitoring are:

- Exadata Storage Server
- Infiniband Network Fabric

---

**Note:** The following are the minimum requirements for a DB Machine to be monitored and managed by Enterprise Manager Release 12c:

- Minimum required Exadata Software version 11.2.2.3 and above
  - Supported hardware version
  - Pre-requirement to verify the existence of the Schematic file and the minimum required version. If that does not exist, you must download and run the latest version of Configurator to generate the schematic file.
  - Required Schematic file generated with the DB Machine Configurator of version 120 and above on the compute node where the Enterprise Manager agent is installed.
- 

For more information about discovering and managing Exadata targets, see the following topics:

- [Automatically Discovering an Oracle Database Machine](#)
- [Viewing the Topology of an Existing DB Machine Target](#)
- [Drilling Down to Individual Targets](#)
- [Viewing Critical Hardware Information for the DB Machine](#)
- [Viewing DB Machine Alerts](#)
- [Adding Exadata Components Manually](#)

## 23.1 Automatically Discovering an Oracle Database Machine

To automatically discover a DB Machine target, follow these steps:

1. From the **Setup** menu, select **Add Target**, then select **Add Targets Manually**.  
Enterprise Manager displays the Add Targets Manually page.
2. Choose **Add Non-Host Targets Using Guided Process (Also Adds Related Targets)**.
3. From the Target Types drop-down, choose **Oracle Exadata Database Machine**, then click **Add Using Guided Discovery**.

Enterprise Manager displays the Oracle Database Machine Discovery page. From here you can add the hardware components such as Exadata Storage Servers and Infiniband Switches in the Oracle Database Machine as managed targets. You can choose to discover a new DB Machine and its hardware components as targets or instead discover newly added hardware components in an existing DB Machine as targets.

4. Choose **Discover a new Database Machine and its hardware components as targets**, then click **Discover Targets**.

Enterprise Manager displays the Database Machine Discovery wizard that steps you through the process of discovering the Database Machine. The first page of the wizard, the Discovery Inputs page, appears.

5. In the Discovery Agent section of the Discovery Inputs page, choose or enter the **Agent URL** that exists on one of the compute nodes to perform the discovery and

then enter the **Database Oracle Home** of the database installation (release 11.2 or later) on the agent host. In the Infiniband Discovery section, specify the host name of one of the Infiniband switches in the Database Machine and specify the password of the on the Infiniband switch. Click **Next**.

6. On the Components page, the new components discovered in the Oracle Database Machine display.

In the Compute Node section, select the hosts that are compute nodes in the Oracle Database Machine. The hosts must be added as managed targets before the Oracle Database Machine target promotion can proceed.

In the Infiniband Switch section, select the Infiniband Switches that are part of the Oracle Database Machine. These also will be added as managed targets.

In the Ethernet Switch section, select the Ethernet switches that are part of the Oracle Database Machine. The Ethernet switches will be added as managed targets.

In the Compute Node ILOM section, select the Integrated Lights Out Managers (ILOM) of the compute nodes that are part of this Oracle Database Machine. These Integrated Lights Out Managers will be added as managed targets.

In the KVM section, select the KVM switches that are part of the Oracle Database Machine. The KVM switches will be added as managed targets.

Click **Next** to continue.

Enterprise Manager displays the Monitoring Agents page.

7. On the Monitoring Agents page, choose whether you want the monitoring agents to be selected automatically or manually. If you choose **Manually select the agents**, you must add the **Monitoring Agent** and optionally a **Backup Monitoring Agent** for each of the Exadata Cells and Infiniband Switches.

Click **Next** to continue.

Enterprise Manager displays the Agent Credential page.

8. On the Agent Credential page, specify whether the Management Agent host users and passwords are the same for all agents. The agent users and passwords are required to set up password-less SSH between the agents and the cells monitored by the agents.

If the users and passwords are the same, choose **Same for all agents** and enter the user and password combination. If they are not the same for each agent, choose **Different for all agents** and enter each combination for each agent.

Click **Next**.

9. On the Component Credential page, enter the credentials for the components. In all cases you can choose to enter the same user/password combinations for all components or you can enter the credentials separately for each occurrence.

Click **Next** to continue.

Enterprise Manager displays the Component Properties page.

10. On the Component Properties page, specify the target properties of the different components.

For each component, enter the required information.

Click **Next** to continue.

Enterprise Manager displays the Review page.

11. Use the Review page to view the selections you have made in the previous pages of the wizard. When you have verified your selections, click **Submit**.

Enterprise Manager displays the Target Promotion Summary page that displays the targets that are now managed targets.

## 23.2 Viewing the Topology of an Existing DB Machine Target

You can view the DB Machine topology of the DB Machine target.

DB Machine management simplifies monitoring and managing the DB Machine by integrating all hardware and software components into one entity. You do not need to monitor each target individually but instead you can view the whole DB Machine as a single target. You can view all critical issues in the system, monitor performance, and drill down to individual targets from the DB Machine target homepage.

Use the Topology page of DB Machine to view the topology of the system by Cluster or by Database. Clusters are a complete software system starting with a RAC database, the underlying ASM, and CRS. Clusters define one logical entity that is interconnected. The DB Machine could include several clusters, one cluster, or could just be a number of individual databases. While cabinets define the hardware topology of the DB Machine, clusters define the logical or system topology of the DB Machine.

You can view the Topology by Cluster or Database. Click an element in the Topology and view alert data associated with the element.

You can monitor all components of the DB Machine. DB Machine monitors all subcomponent targets, whether hardware or software. This includes the database, ASM, CRS, hosts, Exadata and the Infiniband network.

To view the topology of an existing DB Machine target, follow these steps:

1. From the **Targets** menu, select **Exadata**.

Enterprise Manager displays the Oracle Exadata Database Machines page showing all the available DB Machine targets. From this page you can add hardware components (such as Oracle Exadata Storage Servers, Infiniband switches, Ethernet Switches, KVM switches, PDU, and compute node ILOM) in the Oracle Database Machine as managed targets.

2. From the Oracle Exadata Database Machines page, select the Oracle Database Machine target whose topology you want to view.
3. From the Oracle Database Machine Home page, click **Target**, then select **Members Topology** from the drop-down menu.

Cloud Control displays the Configuration Topology page.

## 23.3 Drilling Down to Individual Targets

You can drill down immediately to a subcomponent target of the DB Machine (such as RAC, a database instance, or an Exadata cell).

To drill down to individual targets, follow these tasks:

1. From the **Targets** menu, select **Exadata**.

Enterprise Manager displays the Oracle Exadata Database Machines page showing all the available DB Machine targets. From this page you can add hardware components (such as Oracle Exadata Storage Servers, Infiniband switches, Ethernet Switches, KVM switches, PDU, and compute node ILOM) in the Oracle Database Machine as managed targets.

2. From the Oracle Exadata Database Machines page, select the Oracle Database Machine target whose components you want to view.  
Enterprise Manager displays the Oracle Database Machine Home page showing an Overview, Schematic, and Incident section for the selected DB Machine.
3. From the Oracle Database Machine Home page, use the left navigation panel to expand the list of available targets that comprise the Database Machine.
4. Click the target to which you want to drill down.

## 23.4 Viewing Critical Hardware Information for the DB Machine

You can view critical metrics for all the hardware subcomponents of the DB Machine such as DB hosts, Exadata cells, Infiniband switches and so on. These metrics vary for different component targets. For example, database server nodes and Exadata servers include the CPU, I/O, and Storage metrics.

To view critical hardware-centric information for the entire DB machine, follow these steps:

To drill down to individual targets, follow these tasks:

1. From the **Targets** menu, select **Exadata**.  
Enterprise Manager displays the Oracle Exadata Database Machines page showing all the available DB Machine targets. From this page you can add hardware components (such as Oracle Exadata Storage Servers, Infiniband switches, Ethernet Switches, KVM switches, PDU, and compute node ILOM) in the Oracle Database Machine as managed targets.
2. From the Oracle Exadata Database Machines page, select the Oracle Database Machine target whose hardware information you want to view.
3. From the Oracle Database Machine Home page, view the hardware schematic of the Database Machine.

## 23.5 Viewing DB Machine Alerts

You can view alerts on the DB Machine and drill down to details about each alert. These alerts may be performance/configuration metrics or hardware faults.

To view DB Machine alerts, follow these steps:

1. From the **Targets** menu, select **Exadata**.  
Enterprise Manager displays the Oracle Exadata Database Machines page showing all the available DB Machine targets. From this page you can add hardware components (such as Oracle Exadata Storage Servers, Infiniband switches, Ethernet Switches, KVM switches, PDU, and compute node ILOM) in the Oracle Database Machine as managed targets.
2. From the Oracle Exadata Database Machines page, select the Oracle Database Machine target whose machine configuration information you want to view.  
Enterprise Manager displays the Oracle Database Machine home page on which you can see all alerts associated with the current DB Machine.

## 23.6 Adding Exadata Components Manually

You can add Exadata components manually using the following steps:

1. From the **Setup** menu, select **Add Target**, then select **Add Targets Manually**.  
Enterprise Manager displays the Add Targets Manually page where you can choose the type of target you want to add.
2. From the Add Targets Manually section, choose **Add Non-Host Targets by Specifying Target Monitoring Properties**.
3. In the **Target Type** combo box, choose the appropriate target type, for example, KVM for kvm, PDU for pdu, Cisco switch for Cisco, and Oracle ILOM Server for ilom plug-in).
4. Choose the monitoring agent using the search option.
5. Click **Add Manually** and provide the required properties

## 23.7 About Oracle Exadata Storage Server

An Exadata cell is a network-accessible storage array with Exadata software installed on it. Use the Exadata Home page to manage and monitor the HP Oracle Exadata Storage Server (also known as Exadata cell) by managing the Exadata cells as Enterprise Manager Cloud Control targets. You can discover and consolidate management, monitoring and administration of a single or a group of Oracle Exadata Storage Servers in a datacenter using Enterprise Manager.

Exadata cells can be discovered automatically or manually. Once discovered, you can add the Exadata cells as Enterprise Manager targets. The individual Exadata cell is monitored and managed as an Enterprise Manager target and provides the exception, configuration and performance information.

Grouping of Exadata cells is used for easy management and monitoring of the set of Exadata cells. You can group Exadata cells both manually and automatically. The grouping function provides an aggregation of exceptions, configuration and performance information of the group of cells.

You can view performance analysis by linking Exadata performance both at a cell level and group level to ASM and database performance. You can drill down to Exadata configuration and performance issues from both the database and ASM targets.

Storage Grid (for example, multiple database/ASM instances sharing the same Exadata cell) is supported to the same extent as dedicated storage.

For more information about managing Exadata servers, see the following topics:

- [Using Exadata As a Cloud Control Target](#)
- [Performing Administration Tasks on Exadata Cells](#)
- [Performing Administration Tasks on Infiniband Networks](#)
- [Launching the IORM Performance Page](#)
- [Viewing an Exadata Cell Configuration](#)

### 23.7.1 Using Exadata As a Cloud Control Target

Use Oracle Exadata to manage and monitor the HP Oracle Exadata Storage Server (also known as Exadata cell) by managing the Exadata cells as Enterprise Manager

Cloud Control targets. You can discover and consolidate management, monitoring and administration of a single or a group of Oracle Exadata Storage Servers in a datacenter using Enterprise Manager.

Exadata cells can be discovered automatically or manually. Once discovered, you can add the Exadata cells as Enterprise Manager targets.

The individual Exadata cell is monitored and managed as an Enterprise Manager target and provides the exception, configuration and performance information.

Grouping of Exadata cells is used for easy management and monitoring of the set of Exadata cells. You can group Exadata cells both manually and automatically. The grouping function provides an aggregation of exceptions, configuration and performance information of the group of cells.

You can view performance analysis by linking Exadata performance both at a cell level and group level to ASM and database performance. You can drill down to Exadata configuration and performance issues from both the database and ASM targets.

## 23.7.2 Performing Administration Tasks on Exadata Cells

To perform an administration operation on an Exadata cell, such as executing a cell command, follow these steps:

1. Navigate to the Exadata Cell home page by choosing the Exadata target for which you want to perform an administrative task from the All Targets page.

Enterprise Manager displays the Exadata Cell Home page for the target you selected.

2. Click **Target**, then select **Administration**.

From this menu you can choose either **Execute Cell Command**, **Support Workbench**, or **Manage I/O Resources**.

3. Click **Execute Cell Command**.

The Command page of the Exadata Cell Administration wizard appears. Enter a CELLCLI command as the administrative command to be executed on the cell. You must read the Command Instructions before you enter a command. Only a single CELLCLI command is allowed to execute. You must enter the command without the 'cellcli -e' prefix, which is automatically appended when you submit the command. Finally, you cannot use the following characters: ; / ' < > / | .

4. Click **Next** to continue.

Enterprise Manager displays the Admin Credentials page. Select or enter the Administration credentials to execute the command. The credentials you enter are used when submitting the operation. You can choose between Preferred Credentials, Named Credentials, and New Credentials. You can also click **More Details** to view information about Credential Type, Last modified, Credential Name, Credential Owner, Last Modified Date, Last Modified By, and Preferred Credentials Set At.

5. Click **Next**.

Enterprise Manager displays the Schedule page. Use the Schedule page to schedule the administration task. Enter the Job Name and the Job Description, then provide the job information in the Schedule the Administration Job section. You can choose to begin the job immediately or enter the time you want the job to begin.

6. Click **Next** to continue.

The Summary page displays. Use the Summary page to ensure you have entered the correct values and then submit the command. The Summary page lists the Job Name, Description, Command to Execute, when the job is Scheduled, and the Selected Cell.

7. Click **Submit Command** to submit the job.

The Job Status page displays. Use the Job Status page to link to the Job Detail page of the administration task.

### 23.7.3 Performing Administration Tasks on Infiniband Networks

To perform an administration operation on an Infiniband Network, follow these steps:

1. Navigate to the DB Machine home page of the Infiniband Network by choosing the DB Machine for which you want to perform an administrative task from the All Targets page.

Enterprise Manager displays the DB Machine Home page for the target you selected.

2. Select the IB Network for which you want to perform an administrative task.
3. From the Target menu item, choose **Administration**.

The Target & Command page of the Infiniband Network Administration wizard appears.

4. Choose the **Target Type** and then select the target on which you want to perform the administrative task from the Target drop-down list. Enter the administrative command you want to execute. The available operations from which you can select are dependent on the target type and target you selected. Once you choose the operation, you may need to select a value that will appear after choosing the operation.
5. Click **Next** to continue.

Enterprise Manager displays the Credentials & Schedule page. Select or enter the credentials to execute the command. The credentials you enter are used when submitting the operation. You can choose between Preferred Credentials, Named Credentials, and New Credentials. Schedule the administration task. Provide the job information in the **Administration Job Schedule** section. You can choose to begin the job immediately or enter the time you want the job to begin

6. Click **Next** to continue.

The Review page appears. Use the Review page to ensure you have entered the correct values and then submit the command. The Review page lists the Job Name, Description, Command to Execute, when the job is Scheduled, the Target Type, and the Selected Target.

7. Click **Submit Command** to submit the job.

When you click Submit Command, a popup is shown if the job is successful. You can go to the Job Detail Page or back to the page from where this wizard was launched.

### 23.7.4 Launching the IORM Performance Page

To launch the IORM Performance page, follow these steps:

1. Navigate to the Exadata Cell home page by choosing the Exadata target for which you want to view the IORM Performance page from the All Targets page.

Enterprise Manager displays the Exadata Cell Home page for the target you selected.

2. From the Administration menu item, choose **Administration**, and then **Perform IORM Management**.

The IORM Performance page appears where you can view the status of the current IORM configuration.

### 23.7.5 Viewing an Exadata Cell Configuration

You can view the configuration of an Oracle Exadata target by following the steps below:

1. Navigate to the Exadata Cell home page by choosing the Exadata target for which you want to view the IORM Performance page from the All Targets page.

Enterprise Manager displays the Exadata Cell Home page for the target you selected.

2. From the Target menu, choose **Configuration** and then **Topology**.

Enterprise Manager displays the Configuration Topology page for the selected Exadata Cell. The topology page provides a visual layout of a the target's relationships with other targets. From this page you can:

- Do a target search filtered by target status/events/target type)
- Select from a set of relationships to represent in the graph
- Select annotations to display in the graph, such as alerts and link labels
- Select from a set of options: view navigator, expand or collapse all, toggle graph layout, reload topology
- Print
- Zoom via the slide control
- Pan via the navigator control
- Toggle the presentation from graph to table

When you hover over a node or group member, a popup displays detailed information about the entity. A link can appear in the popup to more detailed information such as customer documentation.

### 23.7.6 Managing a Single I/O Resource Management Allocation

You can manage the I/O resource allocation for each cell in your Exadata environment. The Manage I/O Resource page displays the current mode (active or inactive) and allows you to change the mode by using the Update IORM Mode function. You can also change the IORM Objective using the Update IORM Objective function. The page also shows statistics and metrics for the current Exadata cell.

To manage the I/O Resource Management for a single cell, follow these steps:

1. From the **Target** menu of the Exadata cell for which you want to manage I/O resources, choose **Administration**.
2. From the **Administration** menu, select **Manage I/O Resource**.

The I/O Resource Management page displays where you can change the IORM Mode between Active and Inactive or you can change the IORM Objective.

3. Use the IORM Objective chart to display the historical value of objectives.
4. Use the IORM Wait chart to display the IORM Wait times for all databases or a selected database. You can select the database (or all databases) to display in the IORM Wait chart by choosing the database from the **Select Database** drop-down list.

For more information about changing the IORM mode or updating the IORM objective, see *Changing the IORM Mode and Updating the IORM Objective*.

### 23.7.7 Accessing Oracle Support Workbench for Exadata Cell

You can access the Oracle Support Workbench for the current Exadata cell to access diagnostic data for problems and incidents related to the cell.

To access the Support Workbench for a single Exadata cell, follow these steps:

1. From the **Target** menu of the Exadata cell for which you want to access the Oracle Support Workbench, choose **Administration**.
2. From the **Administration** menu, select **Support Workbench**.

The Login to Support Workbench page displays where you can enter the credentials required to access the Workbench.

3. Choose the type of cell administration credential you want to use from the Credential section.

You can choose **Preferred Credential**, **Named Credential**, or **New Credentials**.

4. Depending on what you chose in Step 3, enter the Credential Details (**Username** and **Password**) in the appropriate fields. You can turn on the More Details Option to see more details about the credentials.
5. Click **Continue** to display the Oracle Support Workbench.

### 23.7.8 Changing the IORM Mode and Updating the IORM Objective

Follow these steps to change the IORM Mode or update the IORM Objective.

#### Changing the IORM Mode

To change the IORM mode from the I/O Resource Management page, follow these steps:

1. From the **Target** menu of the Exadata cell for which you want to manage I/O resources, choose **Administration**.
2. From the **Administration** menu, select **Manage I/O Resource**.

The I/O Resource Management page displays where you can change the IORM Mode between Active and Inactive. The current IORM Mode is displayed on the page.

3. In the IORM Mode and Objective section, click the mode (Active or Inactive) to which you want to change and then click the **Change IORM Mode** button.

#### Updating the IORM Objective

To update the IORM Objective from the I/O Resource Management page, follow these steps:

1. From the **Target** menu of the Exadata cell for which you want to manage I/O resources, select **Administration**.

2. From the **Administration** menu, choose **Manage I/O Resource**.

The I/O Resource Management page displays where you can update the IORM Objective. The current IORM Objective is displayed on the page.

3. From the Change IORM Objective box within the IORM Mode and Objective section, use the Select drop-down list to update the IORM Objective and then click **Update IORM Objective**.

You can choose one of the IORM Objectives from the list: Low Latency, Balanced, High Throughput, or Auto.

---

## Using Oracle Exalogic Elastic Cloud

Use Oracle Exalogic Elastic Cloud to discover and monitor instances of Exalogic Elastic Cloud (Middleware Machine). You can then display status information, including alerts and key performance metrics, of the following target types in an Exalogic Elastic Cloud:

- Application Deployments
- WebLogic Domains
- IB Switch - An IB Switch system has IB Switches as members. This is a one to many association. Each IB switch can have many IB Switch Ports as target components.
- Coherence Clusters

Exalogic Elastic Cloud (Middleware Machine) is modeled as a System target rather than a group target.

For more information about using Oracle Exalogic Elastic Cloud, see the following sections:

- [Using the Exalogic Elastic Cloud Discovery Wizard](#)
- [Displaying and Using the Exalogic Elastic Cloud Home Page and Dashboard](#)
- [Viewing Application Deployments in Exalogic Elastic Cloud Targets](#)
- [Viewing WebLogic Domains in Exalogic Elastic Cloud Targets](#)
- [Viewing Coherence Clusters in Exalogic Elastic Cloud Targets](#)
- [Viewing Hosts in Exalogic Elastic Cloud Targets](#)

### 24.1 Using the Exalogic Elastic Cloud Discovery Wizard

You can use the Exalogic Elastic Cloud Discovery wizard to discover and monitor an exalogic target in Enterprise Manager.

One important prerequisite for discovery is that all the components running on the Exalogic Elastic Cloud must already exist in Enterprise Manager as targets. Exalogic Elastic Cloud discovery does not add or discover any of these targets. It simply identifies the targets present in the Exalogic Elastic Cloud and maps them to Enterprise Manager targets and then adds these Enterprise Manager targets as Exalogic Elastic Cloud system members.

To use the Exalogic Elastic Cloud Discover wizard, follow these steps:

1. Navigate to the Systems page.

2. From the Add drop-down menu, select **Exalogic Elastic Cloud**, then click **Go**.  
Enterprise Manager displays the Discover Exalogic Elastic Cloud page which allows you to enter the parameters and values required to discover an Oracle Exalogic target.
3. Specify a unique name for the Oracle Exalogic target you want to monitor in the Name field.
4. Select a Management Agent on one of the hosts in the Exalogic System to perform the discovery.  
  
If you choose a Management Agent that is not part of the Exalogic System, an error message appears stating that no Exalogic Property File can be found and indicating that you must choose a Management Agent which is on a Exalogic System Host.
5. Click **Next**. Enterprise Manager displays the Discover Oracle Exalogic Targets: Discovered Targets page. The page displays the Hosts that are discovered as part of the system.
6. Click **Finish** to complete discovery. You can also choose Back to return to the Discover Exalogic Elastic Cloud page or Cancel to terminate the discovery process.  
  
Enterprise Manager displays a confirmation that the Exalogic Elastic Cloud instance has been added and begins to monitor the Exalogic Elastic Cloud target. The new target is displayed on the Systems page.

## 24.2 Displaying and Using the Exalogic Elastic Cloud Home Page and Dashboard

Use the Exalogic Elastic Cloud Dashboard to display the status information including alerts and key performance metrics of the following targets in the Exalogic Elastic Cloud:

- Application Deployments
- WebLogic Domains
- Coherence Clusters
- Hosts

You can also use the Home page to access the Hardware tab where you can view information about the hardware and infrastructure of the Exalogic Elastic Cloud.

To display and use the Exalogic Elastic Cloud Dashboard, follow these steps:

1. Navigate to the Systems page. Filter the entries in the Search field by choosing **Exalogic Elastic Cloud** from the drop-down list, then click **Go**.  
  
In the Search Results table, choose the Exalogic Elastic Cloud you want to view.  
  
Enterprise Manager displays the Exalogic Elastic Cloud Home page where you can monitor the status of the Exalogic target and its components on the Exalogic Dashboard.
2. You can view detailed information about each component by choosing the component name from the **Exalogic Elastic Cloud** drop-down menu.  
  
Enterprise Manager displays the component page you selected. For example, select the WebLogic Domains Summary page to see the charts showing the status of WebLogic Servers, Request Processing Time metric information, CPU Usage,

Requests per minute, and Heap Usage data. For more information about each of those component pages, see the topics in the Related Topics section below.

3. You can return to this page at any time by choosing by choosing Home from the Exalogic Elastic Cloud drop-down menu.
4. You can display General Information about the Exalogic target by choosing General Information from the Exalogic Elastic Cloud drop-down menu.

## 24.3 Viewing Application Deployments in Exalogic Elastic Cloud Targets

Use the Application Deployments page in the Exalogic Elastic Cloud target area to view details about the applications hosted on the hosts running on the Exalogic Elastic Cloud target.

To display and use the Application Deployments page, follow these steps:

1. Navigate to the Systems page. Filter the entries in the Search field by choosing **Exalogic Elastic Cloud** from the drop-down list, then clicking **Go**.

In the Search Results table, choose the Exalogic Elastic Cloud you want to view.

Enterprise Manager displays the Exalogic Elastic Cloud Home page where you can monitor the status of the Exalogic target and its components.

2. Choose **Application Deployments** from the **Exalogic Elastic Cloud** drop-down menu.

Enterprise Manager displays the Application Deployments page.

3. You can choose to show All Domains or filter by specific domains by choosing the domain from the Show menu.
4. You can drill down to specific applications, targets, domains, or dependencies by clicking its related value in each row.
5. You can filter the list of applications by choosing a value from the Status drop-down. You can select from Up, Down, Unknown, Blackout, and All.
6. You can change the column appearance of the table by clicking **View** and choosing which Columns to display, expanding or collapsing rows, or scrolling to the first or last row. You can also reorder columns.

## 24.4 Viewing WebLogic Domains in Exalogic Elastic Cloud Targets

Use the WebLogic Domains page in the Exalogic Elastic Cloud target area to view details about the domains hosted on the virtual machines running on Exalogic Elastic Cloud target.

To display and use the WebLogic Domain page, follow these steps:

1. Navigate to the Systems page. Filter the entries in the Search field by choosing **Exalogic Elastic Cloud** from the drop-down list, then click **Go**. In the Search Results table, choose the Exalogic Elastic Cloud you want to view.

Enterprise Manager displays the Exalogic Elastic Cloud Home page where you can monitor the status of the Exalogic target and its components.

2. Choose **Weblogic Domain** from the Exalogic Elastic Cloud drop-down menu. You can choose to view either a Summary of the WebLogic Domains or specific information about Members.

Enterprise Manager displays the related WebLogic Domain page.

3. On the Summary page you can view a chart that shows the status of the WebLogic Domains and displays the percentage of domains that are up and down. You can also view server information that shows the Server Status and alert and policy violation information for each. You can monitor charts that display metric information such as Request Processing Time and CPU Usage and you can drill down through these charts for more detailed information. Change the chart view to a table view by clicking **Table View** or **Chart View** beneath each table or chart. The Server table displays information about servers and domains showing host information and related metrics.
4. On the Members page, you can view the Status information along with alerts and policy violation and metric data for each WebLogic Server or Domain. Use the Performance Summary section to view metrics for each, such as Host and Cluster information and metrics such as Heap Usage and Request Processing Time.

## 24.5 Viewing Coherence Clusters in Exalogic Elastic Cloud Targets

Use the Coherence Clusters page in the Exalogic Elastic Cloud target area to view details about the Coherence targets hosted on the virtual machines running on the Exalogic Elastic Cloud target.

To display and use the Coherence Clusters page, follow these steps:

1. Navigate to the Systems page. Filter the entries in the Search field by choosing **Exalogic Elastic Cloud** from the drop-down list, then click **Go**.  
In the Search Results table, choose the Exalogic Elastic Cloud you want to view.  
Enterprise Manager displays the Exalogic Elastic Cloud Home page where you can monitor the status of the Exalogic target and its components.
2. Choose **Coherence Clusters** from the **Exalogic Elastic Cloud** drop-down menu.  
Enterprise Manager displays the Coherence Clusters page.
3. You can view a chart that shows the status of the Coherence Clusters and displays the percentage of clusters that are up and down.
4. You can drill down to specific values for each cluster such as Alerts and Policy Violations along with Node information.
5. You can filter the list of clusters by choosing a value from the Status drop-down. You can select from Up, Down, Unknown, Blackout, and All.
6. You can change the column appearance of the table by clicking **View** and choosing which Columns to display. You can also reorder columns.
7. The Coherence Clusters page displays two charts showing the Top Nodes With Lowest Available Memory and Caches With Lowest Hit To Get Ratio. You can drill down to specific node information by clicking on the Node name below the Top Nodes With Lowest Available Memory chart.
8. The Nodes table displays information about each Node, including Host and several metric values such as Memory Available, Gets, and Puts.
9. The Applications table displays information about applications such as Local Attribute Cache, Clustered Session Cache, and other metrics. You can drill down to specific information about each application by clicking on the Application name.

## 24.6 Viewing Hosts in Exalogic Elastic Cloud Targets

Use the Hosts page in the Exalogic Elastic Cloud target area to view details about the host targets hosted on the virtual machines running on the Exalogic Elastic Cloud target.

To display and use the Hosts page, follow these steps:

1. Navigate to the All Targets page. Filter the entries in the Search field by choosing **Exalogic Elastic Cloud** from the drop-down list, then click **Go**.

In the Search Results table, choose the Exalogic Elastic Cloud you want to view.

Enterprise Manager displays the Exalogic Elastic Cloud Home page where you can monitor the status of the Exalogic target and its components.

2. Choose **Hosts** from the **Exalogic Elastic Cloud** drop-down menu.

Enterprise Manager displays the Hosts page.

3. You can view a chart that shows the status of the hosts and displays the percentage of hosts that are up and down.
4. You can view information about the Middleware Targets that lists the Type, Status, CPU Utilization percentage, Memory Utilization percentage, and Incident statistics along with Configuration Changes.
5. You can view charts showing the CPU Utilization percentage based on time and similarly, Memory Utilization based on time.
