Introduction

This chapter covers the following topics:

[What is Rehosting?](#)

[Rehosting Projects](#)

What is Rehosting?

Rehosting is a way to preserve the expensive investments in business logic and business data trapped in proprietary hardware and software, while opening paths to future modernization by moving to an open and more extensible architecture.

Product Overview

Refine for Z/OS Replatforming package provides automated migration tools to enable customers to replatform COBOL, JCL, DB2, VSAM files and related assets from an IBM DB2 mainframe environment to a UNIX environment with a Tuxedo transaction processor and an Oracle database.

Rehosting Projects

Refine for Z/OS Replatforming and Oracle Tuxedo Application Runtime for CICS and Batch are used within the context of a rehosting project. The process guide gives a global view of rehosting and the use of the conversion and runtime tools in this process. A rehosting project requires the

creation of specific test, integration and production environments. The different functions of a rehosting project are typically:

- Plan the project, setting the general requirements and planning the target architecture options.
- Prepare the assets to be converted and install and configure the target environment.
- Convert the assets.
- Integrate the assets in the target environment.

These functions may be performed iteratively, typically a project consists of the following phases:

- Setting project strategy.
- Assessment study.
- Pilot project.
- Implementation.

Each of these phases is made up of different steps, the results of these steps may be tested and the steps reiterated as necessary.

Projects, Phases and Steps

Rehosting is performed within a project organized into phases and steps. Each step produces one or more deliverables. In parallel to the different steps of the rehosting project are a parallel series of test steps that validate the different phases of the project.

A project concerns different people who have different roles and responsibilities within the project. A project is carried out within an environment and it is impossible to describe the different phases and steps of a project without first describing the environment in which they need to be performed.

Project Environment

There are five clearly distinct environments necessary to carry-out a rehosting project. These include two source (pre-migration) environments and three target (post-migration) environments as described below:

1. A current *production source* environment for the assets to be converted.

2. A *test source* environment for storing and isolating the operations extracted from the production environment and for creating a test database.
3. A *test target* environment for running, tuning and testing the converted assets.
4. An *integration target* environment, which is used to host all activities such as integration, operations migration or pre switch-over processing.
5. A *production target* environment for the converted and tested assets.

Table 1-1 Project Environments

Environments	Production	Integration	Test
Source	Production Source		Test Source
Target	Production Target	Integration target	Test Target

Depending on your needs, there may be several occurrences of the same platform to allow teams to work in parallel within the same project.

Project Phase Overview

A project is divided into different phases of work, producing clear deliverables that are validated before proceeding to the next phase of the project. These phases are as follows

Table 1-2 Project Phases

Phase	Migration Steps	Test Step	Environment	Language/ Data
PROJECT MANAGEMENT	Project Definition			

Table 1-2 Project Phases

Phase	Migration Steps	Test Step	Environment	Language/ Data
PRE-CONVERSION	Asset Generation		Source Production to Source Test	Both
	Asset Cataloging Asset Rationalization (if necessary)		Source Test	Language
	External Specifications Architecture Development		Planning and preparation for Target environments	
	Data Conversion		Source Test to Target test	Data
TEST PREPARATION		Test Engineering Test Preparation Test Tooling	Source Test	Both
PILOT	Pilot Set Conversion	Pilot Set Testing	Target Test	Language
BALANCE	Balance Conversion	Balance Testing	Target Test	Language
INTEGRATION	System Integration Operations Migration	System Testing Operations Testing	Target Test to Target Integration	Both
SWITCH-OVER	Maintenance Conversion Maintenance Conversion Testing	Maintenance Testing Dry Runs	Target Test	Both
	Switch-Over		Target Integration to Target Production	
EDUCATION	Education And Training			

Graphically, the different phases may be grouped as shown below:

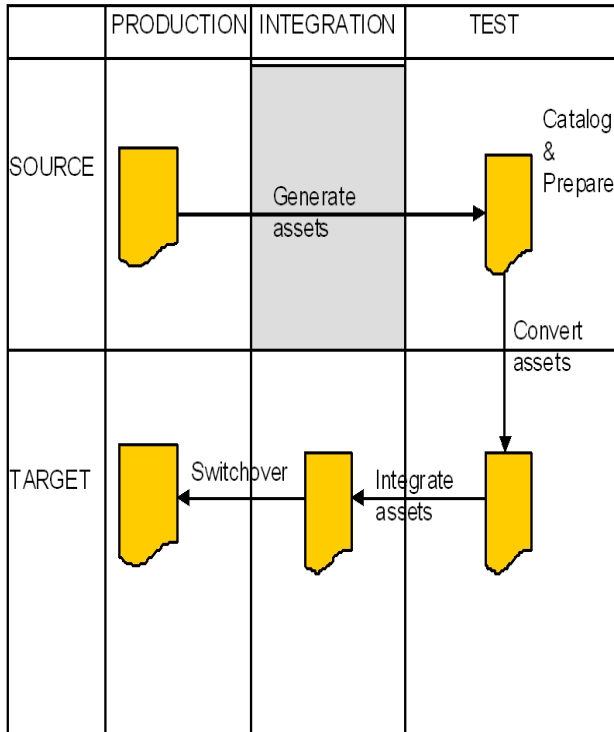

Figure 1-1 Project Phases and Processes

Phase	Process	
Project Management	Project Definition	
Pre-Conversion	External Specifications	
	Architecture Development	
	Data Discovery & Download	Asset Generation
	Data Remodeling & Reload	Asset Cataloging
	Data Validation	Asset Rationalization
	Pilot	Pilot Conversion
Balance	Balance Conversion	
Integration	System Integration	
	Operations Integration	

Overview of Using the Product in a Project

Refine for Z/OS Replatforming is used for converting and integrating program components and data. The following diagram shows the use of the program components, and how they are used to prepare source files for migrating to different environments.

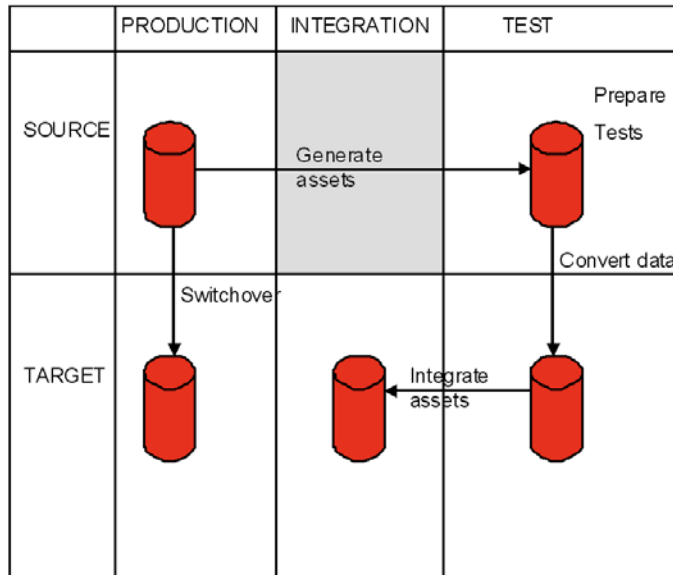

Figure 1-2 Language Migration

Refine for Z/OS Replatforming components are used to convert assets, enabling them after post-conversion adjustments to be moved from the source test environment to the target test environment.

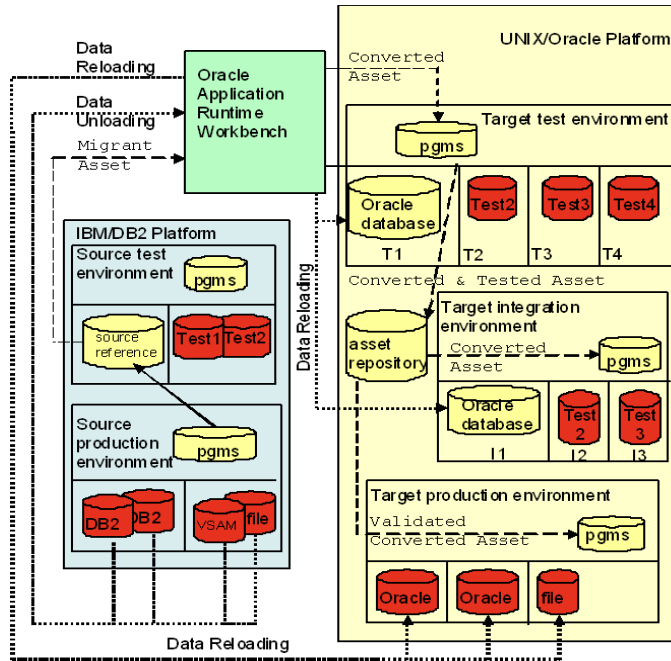

Oracle Tuxedo Application Runtime for CICS and Batch components are used to integrate the converted assets after testing and integration preparation on the target test environment. The COBOL programs, JCL and associated components are integrated with the UNIX, Oracle database and Tuxedo transaction environments. These components are tested to work with the batch and CICS components produced during the conversion process.

Figure 1-3 Data Migration

The assets to be migrated are generated and moved to the source test machine. The migrated assets are then converted and moved to a target test machine containing an Oracle database. After testing, the data is moved to an integration environment where rehosting tools are integrated with the programs to test their quality and performance using the converted data. When switchover occurs the latest data is converted directly from the source production environment to the target production environment.

Figure 1-4 Migration Architecture

Processes

This chapter describes the following processes:

- [Project Definition](#)
- [Asset Generation](#)
- [Asset Cataloging](#)
- [Asset Rationalization \(Conditional Step\)](#)
- [Target External Specifications](#)
- [Architecture Development](#)
- [Data Conversion](#)
- [Balance Conversion](#)
- [Operations Environment Migration](#)
- [System Integration](#)
- [Maintenance Conversion](#)
- [Production Switch-over](#)

Process List

Project Definition

Purpose

Plan and prepare the work to be performed.

Main Tasks

The main tasks are:

- Create the hardware and software environments required and prepare the human resources for the project
- Prepare a workplan including:
 - Detailed planning of the project.
 - Environment and technical requirements.
 - Assignment of resources.
 - Definition of milestones and critical path.
 - Risk mitigation plan.

Asset Generation

This step moves all of the program components, production JCL and the data located in the *source production* environment to the *source test* environment.

Purpose

- Identify and gather the asset information that will be migrated from the *source production* environment.
- Freeze and isolate the asset in a *source test* environment.
- Prepare this asset information for delivery to the production test environment.

Main Tasks

The main tasks to be conducted are as follow:

- Identify the component version levels to be migrated.
- Create and initialize an occurrence of a *source test* environment.
- Copy the data and program components into the *source test* environment.
- Regenerate all asset executables, including compilations and linkage operations.
- Based on the analysis of delivered assets, select pilot assets: programs, copies, includes and tables to be included for compilation and linkage.
- Format the sources onto a suitable media for delivery.
- Execute and validate the source delivery process from the *source test* environment to the target environment.

Asset Cataloging

Purpose

- Define the precise set of components to be converted.
- Verify the completeness and consistency of the assets.

Main Tasks

The main tasks to be conducted are as follow:

- Accept the delivered assets.
- Report on the extracted information.
- Construct an asset inventory including identification of dependencies outside of the asset set.
- Verify the completeness and accuracy of the provided source components.
- Improve the understanding and knowledge of the assets to be migrated, specifically regarding the interdependence between components (transactions, physical files...)
- Correction of the asset set.
- Validation of the cataloging results.
- Choice (or validation of choice) for the *pilot* set.

Asset Rationalization (Conditional Step)

This process is only necessary when the asset cataloging has found too many errors.

Purpose

- Constitute an asset set that meets the three quality measurement levels of: completeness, precision and consistency.

Main Tasks

The main tasks to be conducted are as follow:

- Correction of the asset set (addition, modification, elimination).
- Cataloging of the new asset source.
- Measure and qualification of the three quality measurements criteria.

Target External Specifications

Purpose

Provide the following detailed external specifications:

- The target technical environment.
- The results of the conversion (schema, screens, language).

Main Tasks

The principal external specification tasks are:

- Analyze the asset set and the source environment:
 - Pilot Code walk-through.
 - Source performance review.
- Study the asset set's technical specifications on the *source* and *target* environments.
- Define the external specifications of each *target* technical feature: hardware and software configuration, overall technical architecture and architecture implementation.
- Detailed definition of the asset set's external interfaces.

- Specifications of tools and adaptations to the conversion process
- Definition of the delivery conditions of the converted asset set.

Architecture Development

Purpose

- To set up and validate the *target* technical architecture, Oracle database, UNIX OS, Tuxedo and customer specific features.
- To deliver a prototype configuration that enables to evaluate both a critical batch and transaction process.
- Measure the response time in regard to performance expectations.

Main Tasks

Provide the following detailed external specifications:

- Detail the specifications required for:
 - Developments:
 - Related to the source assets to convert.
 - Site specificities.
 - Adapting pre-existing technical components.
- Define *target* specifications of the technical components of the TP and batch architectures.
- Install the *target* standard architecture.
- Develop site-specific technical components based upon the requirements detailed above.
- Integrate and unit test technical components; batch and TP architecture.
- Integrate and aptitude test asset components.

Data Conversion

Three steps compose the global data conversion process:

- The data discovery and downloading step.

- The data remodeling and reloading step.
- The data static and dynamic validation step.

Purpose

Data Discovery and Downloading

- Produce the source data unloading programs.
- Discover, define, clean and unload the source data.

Data Remodeling and Reloading

- Define, create and validate the Oracle target environments (data base and files).
- Produce the data conversion tools.
- Transfer the *source* data system to the *target* system.

Data Validation

- Validate static data to control the migrated data using process execution.
- Validate dynamic data to control the access control flow to the migrated data using process execution.

Main Tasks

The main tasks include:

Data Discovery and Downloading

- Identify the data environments of the assets to be migrated.
- Deliver COBOL data descriptions.
- Document the data assets.
- Generation of routines to qualify the data assets.
- Generation of routines to download the data assets including data transfer to target system.

Data Remodeling and Reloading

- Study and specify the Oracle *target* data model.

- Use Refine for Z/OS Replatforming to generate reloading tools.
- Use Refine for Z/OS Replatforming to generate *target* data access routines.
- Reload *target* data.

Data Validation

- Test conversion of drivers in the *target* environment.
- Execute programs within both *source* and *target* environment.
- Compare results and identify defects.
- Correct any defects found.

Pilot Conversion

Purpose

- Adapt and establish, with Refine for Z/OS Replatforming, the processes that will achieve during the project:
 - A very high accuracy in conversion.
 - A consistently good result.
- Implement and validate the *target* technical environment
- Produce the first conversion subset (when applicable).
- Validate the performance (load, delivery time and quality) of the implemented process and conversion tools.

Main Tasks

The principal tasks to achieve are:

- Develop and fine tune the conversion rules that will produce the *target* components.
- Setup the *target* architecture software environment including Oracle database.
- Convert the whole asset set according to the industrial process.
- Extract and integrate the pilot onto the *target* environment.

- Perform an initial validation of the conversion rules through aptitude tests.
- Identify possible adjustments regarding project, environment, tools and processes.

Balance Conversion

Purpose

Implement the conversion process for the balance of assets remaining after the pilot conversion using the conversion rules and validated processing used for the pilot set with the same precision and iterative specifications.

Main Tasks

- Conversion of asset balance using the industrial process validated with the pilot set.

Operations Environment Migration

Purpose

To redefine the production means and procedures for the *target* environment from the ones that are available in the *source* environment and in line with the requirements.

Main Tasks

The relevant tasks are divided as follows:

- Analyze existing components: identify and analyze all components implemented to run in the *source* system and analyze relevant documentation.
- Define detailed specifications regarding each *target* operations component and identify constraints.
- Produce a detailed definition of each component of the operations sub-set and the choice of tools to use.
- Set up and configure an approved job scheduler to work with the converted JCL.
- Adapt the converted JCL to work with the approved job scheduler.
- Define a detailed execution schedule.
- Purchase or develop new operations components.

- KSH development, tools installation, ...
- Develop a production procedures guide in the *target* environment.
- Implement and validate each operations component.

System Integration

Purpose

- Define detailed integration specifications for each integration subset.
- Define an integration strategy and plan for each integration subset.
- Define a detailed executions plan.
- Develop integration tests.
- Perform integration tests.

Main Tasks

- Define detailed integration specifications for each integration subset.
- Define integration strategy and plan for each integration subset.
- Define detailed executions plan.
- Test and measure the performance of the migrated applications in the *target* environment – optimize.
- Integrate execution tests.

Maintenance Conversion

Purpose

Convert all changes (addition, modifications, and deletions) which occurred between two images of the same asset (total or subset) with the following constraints:

- Produce a very high quality asset set to minimize the time and workload for validation.
- Minimize the conversion time to shorten the maintenance freeze period.

Main Tasks

- Prepare maintenance conversion:
- Create a Maintenance Guide
- Plan and prepare maintenance changes
- Pre-deliver a maintenance image.
- Catalog.
- Update converted permanent data:
 - Data discovery, unloading and reloading.
- Update converted sources:
 - Source conversion.
- Execute aptitude tests.
- Execution, comparison and diagnosis.

Production Switch-over

Purpose

Uninterrupted switch over from the *source* to the *target* system, complying with the constraints (the size of the switch-over time window specifically).

Main Tasks

The main tasks to achieve are:

- Define a Switch-over plan describing the global switch-over procedures.
- Develop a *source* to *target* data transfer procedure compatible with the delivery time constraints.
- Develop a contingency plan.
- Develop a detailed switch over plan.
- Validate the detailed plan by a switch-over dry run.
- Execute final switch over.

The Simple App Application

Introducing the Simple App Application

Purpose

The Simple App application is intended to be used:

- To validate Refine for Z/OS Replatforming installation.
- To validate the whole migration process – from the source platform to the target platform.

Composition

The simple Sample Application contains batch and online processing coded in the following languages:

- COBOL for batch and online programs.
- CICS for online programs.
- VSAM in batch and online program.
- JCL for jobs (plus the IDCAMS and SORT utilities).

Each program is intended to be as simple as possible, the purpose of this application is not to demonstrate all of the features of Refine for Z/OS Replatforming .

Usage

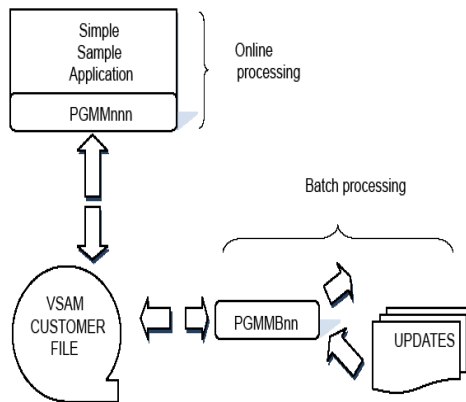

The overall process for using the Simple App application is:

1. Install Refine for Z/OS Replatforming environment.
2. Install the Simple App source platform files.
3. Convert the Simple App components.
4. Install Oracle Tuxedo Application Runtime for CICS and Batch environment.
5. Run the Simple App batch programs.
6. Run the Simple App transactional programs.

Structure

The Simple App has the following structure:

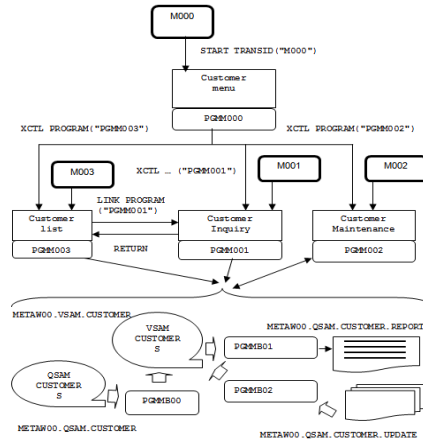

Figure 3-1 Simple App Structure

Description of the Simple App Components

This section describes the Simple App component architecture and the online and batch interactions.

Figure 3-2 Simple App Component Architecture

List of Components by Type

CICS Screens

Name	Description
MAPM000	Customer maintenance entry menu.
MAPM001	Customer data inquiry screen.
MAPM002	Customer data maintenance screen (new customer, update and delete customer).
MAPM003	Customer list screen.

CICS Programs

Name	Description
PGMM000	Customer maintenance entry program.
PGMM001	Customer data inquiry program.

Name	Description
PGMM002	Customer data maintenance program (new customer, update and delete customer).
PGMM003	Customer list program.

Batch Programs

Name	Description
PGMMB00	Initial load of the VSAM file. This file is loaded from a QSAM file.
PGMMB01	This program produces a list of the customers stored in the VSAM customer file.
PGMMB02	This program accesses a QSAM file containing commands and data used to update the main VSAM customers file.

Transaction Codes

Name	Description
M000	Main entry transaction code (program PGMM000).
M001	Customer inquiry (program PGMM001).
M002	Customer maintenance (program PGMM002).
M003	Customer list (program PGMM003).

Jobs

Name	Description
DEFVCUST	This job runs an IDCAMS utility in order to DELETE & DEFINE the VSAM customer file.
CHKVCUST	This job runs an IDCAMS utility and REPRO the VSAM file into a QSAM which can be easily read and checked.

Name	Description
LODVCUST	This job runs the PGMMB00 batch program which reads a sequential file containing data to be stored in the newly defined VSAM customer file.
PRTVCUST	This job runs the PGMMB01 batch program which produces a report of the customers referenced in the VSAM file.
UPDVCUST	This job runs the PGMMB02 batch program which contains data used to update the VSAM customer file.

Program Descriptions

CICS Program Descriptions

PGMM000 (customer maintenance main menu)

PGMM000 is the Simple Sample Application (access) main menu program. From this screen, one may access the following functions:

- Customer list
- Customer detailed information inquiry
- Customer data maintenance:
 - Add a new customer
 - Update customer information
 - Delete an existing customer

Each function can be reached by entering a specific function key. At the end of the called function, a return is performed back to this main menu.

Controls:

This program checks that a valid customer identification number is entered when accessing the inquiry and maintenance functions.

PGMM001 (customer detailed information inquiry)

This program receives – thru the communication area – a customer identification number. The program accesses the `VSAM` customer file in order to display the customer data when known.

Controls:

Assuming that no data can be modified by this program, no control is performed.

PGMM002 (customer data maintenance)

This program enables the maintenance of the `VSAM` customers file:

- Creating a new customer
- Updating an existing customer
- Deleting an existing customer

PGMM002 receives an action code and, when needed, a customer identification number. The action to be performed is displayed on the screen (CREATE, UPDATE or DELETE).

Controls:

The controls carried-out depend on the action to perform.

When creating a new customer, the programs checks that:

- The Customer identification number is not null, is numeric and not already used in the customer VSAM file.
- Last name, first name, address, city, email address and birth date are not equal to spaces.
- Phone number, if not equal to zero, must be numeric.

When updating an existing customer, the controls are the same as the ones used when creating a customer except for the customer identification number, which cannot be modified.

There is no control performed on a customer deletion request.

PGMMM03 (customer list)

This program lists the customers stored in the VSAM file. A limited number of customers are displayed on each screen – the PF7 and PF8 keys give access to the previous and next pages. A non-blank character at the beginning of a customer's line gives access to the detailed customer information screen (see program PGMM001).

Batch Program Descriptions

PGMMB00 (VSAM file initial load)

This batch program reads a sequential file containing data to be stored in the VSAM file. For each record in the entry file, a VSAM record is created. The VSAM file must have been DELETED and DEFINED prior to executing this program. All data from the entry file is supposed to be valid: hence, no control is performed within this program.

PGMMB01 (customer report)

PGMMB01 reads all the customer record from the VSAM file and produces a report. An example of the report produced is included in this document.

PGMMB02 (batch customer maintenance program)

Each input sequential file record contains a three characters action code (ADD, UPD or DEL) and the customer data required when creating a new customer or updating an existing one. Each input line updates the VSAM customer file. Customer data from the sequential file is supposed to be valid so that no control is performed by the PGMMB02 batch program.

Simple App Functionalities

Batch Processing

Batch programs and utilities are used to populate, update and list the *VSAM* customer file that hosts the data managed within the application. Five jobs are delivered with the application. This chapter describes how they are used.

VSAM Customers File Initial Load

1. Step 1: *VSAM* file definition

First, define the *VSAM* customer file thru the IDCAMS utility using DELETE/DEFINE commands.

2. Step 2: *VSAM* file initial load

The batch program PGMMB00 is used to populate the *VSAM* file.

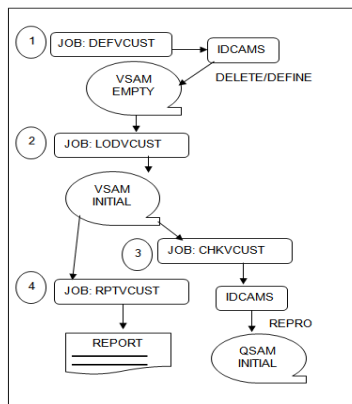

3. Step 3: *VSAM* file check

IDCAMS is used to REPRO the *VSAM* file into a sequential file which can easily be read in the z/OS environment.

4. Step 4: *VSAM* file report

Batch program PGMMB01 produces a list of the customers stored in the *VSAM* customer file.

Figure 3-3 VSAM Customers File Initial Load

VSAM Customer File Update

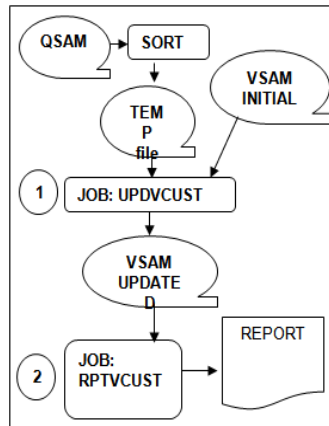

1. Step 1: VSAM file update

Batch program PGMMB02 reads a sequential file containing updates to be performed on VSAM customers file. The input file is sorted by the IBM standard sort utility.

2. Step 2: VSAM file report

Batch program PGMMB02 is used again in order to check that the updates were correctly applied to the VSAM customers file.

Figure 3-4 VSAM File Update

Data Description

Simple Sample Application relies on only one VSAM main customer file. In order to keep the migration process as simple as possible, the data is stored in displayable formats (in COBOL syntax, this means that only "X" and "9" USAGE DISPLAY pictures are used).

The VSAM customer file contains the following information:

Table 3-1 VSAM Customer File Description

Name	Type	Length	Description
CUSTIDENT	Num.	6	Customer identification number
CUSTLNAME	Alpha	30	Customer last name
CUSTFNAME	Alpha	20	Customer first name
CUSTADDRS	Alpha	30	Customer address (street...)
CUSTCITY	Alpha	20	City
CUSTSTATE	Alpha	2	State
CUSTBDATE	Num.	8	Customer birth date

Table 3-1 VSAM Customer File Description

Name	Type	Length	Description
CUSTEMAIL	Alpha	40	Customer email address
CUSTPHONE	Num.	10	Customer phone number

This VSAM file is a Key Sequenced Data Set (KSDS) based on the customer's identification number. Each record contains 266 characters and the key is stored from position 1 to position 6.

VSAM Customer File COBOL Description

Listing 3-5 VSAM Customer File COBOL Description

```

01  ODCSF0-RECORD.
    05  CUSTIDENT      PIC 9(006).
    05  CUSTLNAME     PIC X(030).
    05  CUSTFNAME     PIC X(020).
    05  CUSTADDRS     PIC X(030).
    05  CUSTCITY      PIC X(020).
    05  CUSTSTATE     PIC X(002).

Using the Simple App Application

This section provides an example use of the Simple App Application in order to illustrate how to use the application.

Viewing A Customer Record

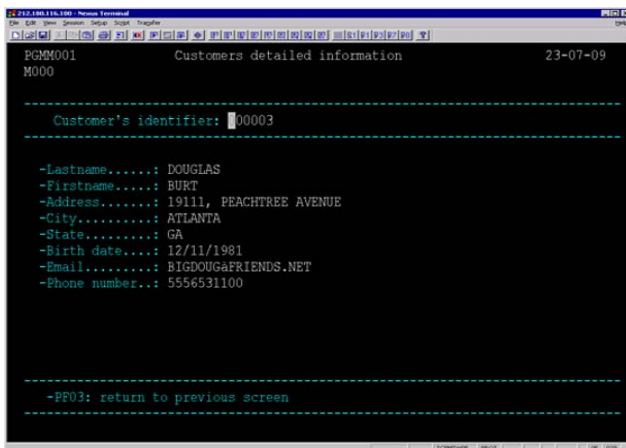

1. Access your CICS environment and enter the Simple App main transaction code M000 to connect to the application.

2. The Main menu is displayed. Enter 000003 in the Customer identifier field and press the PF08 key to inquire on the customer.

3. The customer record of Douglas Burt is displayed. Press PF03 to return to the Main menu.

Updating A Customer Record

1. From the Main menu enter 000003 in the Customer identifier field and press the PF06 key to update customer information.

- In the update screen all data may be modified. The screen header shows the action UPDATE. Change the customer's address and press ENTER.

```

```

Printing Customer Reports

1. From the main menu, press PF04 to access the Customer List first page.

Sel ID	Lastname	Firstname	Birth date
000002	ROBERTS	SAMMY JUNIOR	01/24/1973
000003	DOUGLAS	BURT	12/11/1981
000004	Ewing	Samantha	07/27/1962
000005	PRINCE	ANNE	12/25/1991
000006	Colombus	Christopher	07/27/1950
000007	PRINCE 1	ANNE	12/25/1991
000008	Doors	Bill	01/01/1958
000009	Awing	Charles	06/29/1929
000010	Simms	Arthur	01/17/1969
000011	LaFayette	Eric	02/12/1995

 -PF7: page up -PF8: page down -PF3: return to previous menu
 -Info: Enter a non blank character and press Enter to view customer's data

2. Press PF08 to display the next page in the list. Press PF07 to display a previous page in the list.

Note: You can perform a customer inquiry by entering any non-blank character in the selection (Sel) column to the left of each customer.

Adding New Customers

1. From the main menu press PF05, the following screen is displayed.

Customer's Identifier: 00000 Action: CREATE

 -Lastname.....: |
 -Firstname.....: |
 -Address.....: |
 -City.....: |
 -State.....: |
 -Birth date....: | (mm/dd/yyyy)
 -Email.....: |
-Phone number..:
 -PF03: return to previous screen

Action is set to CREATE in the screen header and fields are unprotected.

2. Enter the new customer data including a valid non-existing identifier, and press ENTER.

The program validates the record; when no errors are found, a confirmation message is displayed.

3. Press PF12 to create a new customer record.

A New customer added message is displayed.

4. Press PF03 to return to the main menu.

Simple App APIs

This section lists the CICS APIs which are used within the Simple App application programs.

MAP APIs

SEND

```
EXEC CICS
```

```
    SEND MAP('MAPM000') MAPSET('MAPM000') ERASE
```

```
END-EXEC.
```

```
EXEC CICS
```

```
    SEND MAP('MAPM000') MAPSET('MAPM000') CURSOR ERASE
```

```
END-EXEC.
```

```
EXEC CICS
```

```
    SEND MAP('MAPM001') MAPSET('MAPM001') FROM(MAPM0010) ERASE
```

```
END-EXEC.
```

RECEIVE

```
EXEC CICS
```

```
    RECEIVE MAP('MAPM000') MAPSET('MAPM000')
```

```
END-EXEC.
```

```
EXEC CICS
```

```
RECEIVE MAP('ORDMAP1') MAPSET('ORDSET1') INTO(ORDMAP1)
END-EXEC.
```

NAVIGATION APIs

RETURN

```
EXEC CICS
    RETURN
END-EXEC.

EXEC CICS
    RETURN TRANSID('M000') COMMAREA(COMM-RECORD)
                                LENGTH(LENGTH OF COMM-RECORD)
END-EXEC.
```

XCTL

```
EXEC CICS
    XCTL PROGRAM(PGM-DEST) COMMAREA(COMM-RECORD)
                                LENGTH(LENGTH OF COMM-RECORD)
END-EXEC.
```

ABEND

```
EXEC CICS
    ABEND ABCODE('META')
END-EXEC.
```

VSAM APIs

STARTBR

```
EXEC CICS STARTBR DATASET ('ODCSF0')
                                RIDFILD (CUST-FILE-KEY)
```

```

                EQUAL
                RESP      (RESPONSE-CODE)
END-EXEC.
EXEC CICS STARTBR DATASET ('ODCSF0')
                RIDFILD (CUST-FILE-KEY)
                GTEQ
                RESP      (RESPONSE-CODE)
END-EXEC.

```

READ

```

EXEC CICS
    READ FILE('ODCSF0')
        INTO(VS-ODCSF0-RECORD)
        RIDFLD(CUST-FILE-KEY)
        LENGTH(LENGTH OF VS-ODCSF0-RECORD)
        EQUAL
        RESP(RESPONSE-CODE)
END-EXEC.
EXEC CICS READ DATASET ('ODCSF0')
        INTO      (READ-ODCSF0-RECORD)
        LENGTH   (LENGTH OF READ-ODCSF0-RECORD)
        RIDFLD   (CUST-FILE-KEY)
        EQUAL
        UPDATE
        RESP     (RESPONSE-CODE)
END-EXEC.

```

WRITE

```
EXEC CICS WRITE DATASET ('ODCSF0')
      FROM      (MAJ-ODCSF0-RECORD)
      LENGTH    (LENGTH OF MAJ-ODCSF0-RECORD)
      RIDFLD    (MAJ-CUSTIDENT)
      KEYLENGTH (6)
      RESP      (RESPONSE-CODE)

END-EXEC.
```

REWRITE

```
EXEC CICS REWRITE DATASET ('ODCSF0')
      FROM      (READ-ODCSF0-RECORD)
      LENGTH    (LENGTH OF READ-ODCSF0-RECORD)
      RESP      (RESPONSE-CODE)

END-EXEC.
```

READNEXT

```
EXEC CICS READNEXT DATASET ('ODCSF0')
      INTO      (CLT-ODCSF0-RECORD)
      LENGTH    (LENGTH OF CLT-ODCSF0-RECORD)
      RIDFLD    (CUST-FILE-KEY)
      RESP      (RESPONSE-CODE)

END-EXEC.
```

READPREV

```
EXEC CICS READPREV DATASET ('ODCSF0')
      INTO      (CLT-ODCSF0-RECORD)
      LENGTH    (LENGTH OF CLT-ODCSF0-RECORD)
      RIDFLD    (CUST-FILE-KEY)
```

```

                                RESP      (RESPONSE-CODE)

END-EXEC.

```

ENDBR

```

EXEC CICS ENDBR DATASET ('ODCSF0')

END-EXEC.

```

DELETE

```

EXEC CICS DELETE FILE      ('ODCSF0')

                                RIDFLD   (CUST-FILE-KEY)

                                RESP      (RESPONSE-CODE)

END-EXEC.

```

MISCELLANEOUS APIs

TIME

```

EXEC CICS

                                ASKTIME  ABSTIME(ABS-TIME)

END-EXEC.

EXEC CICS

                                FORMATTIME ABSTIME(ABS-TIME)

                                DDMMYY(VDATEO) DATESEP(' - ')

END-EXEC.

```

HANDLE CONDITIONS

```

EXEC CICS

                                IGNORE  CONDITION  MAPFAIL

END-EXEC.

EXEC CICS

                                HANDLE  CONDITION  PGMIDERR(PGM-NOTFOUND)

```

END-EXEC.

Simple App Documentation References

You may find a detailed description of the CICS APIs at the following address:

http://publib.boulder.ibm.com/infocenter/cicsts/v3r1/index.jsp?topic=/com.ibm.cics.ts31.doc/dfhp4/topics/dfhp4_commands.htm

Detailed Description of the CICS APIs

The following CICS APIs are used in the Simple App application.

Table 3-2 Simple App CICS APIs

API	Description
ASKTIME	Request current date and time of day.
DELETE	Delete a record from a file - VSAM KSDS, VSAM RRDS, and data tables only.
ENDBR	End browse of a file.
FORMATTIME	Transform absolute date and time into a specified format.
LINK	Link to another program expecting return. The external CICS interface (EXCI) provides a LINK command that performs all six commands of the interface in one invocation. See the CICS External Interfaces Guide for information about the EXCI.
READ	Read a record from a file.
READNEXT	Read next record during a browse of a file.
READPREV	Read previous record during a file browse; VSAM and data tables only.
RECEIVE MAP	Receive screen input into an application data area. For further information about BMS, see the
RETURN	Return program control.
REWRITE	Update a record in a file.
SEND MAP	Send mapped output data to a terminal. The keywords are separated into those supported by minimum, standard, and full BMS. For further information about BMS, see the CICS Application Programming Guide.

Table 3-2 Simple App CICS APIs

API	Description
START	Start task at a specified time.
STARTBR	Start browse of a file.
WRITE	Write a record.
XCTL	Transfer program control.
