3.4 Backing up a RUEI Deployment.....	3-2
3.4.1 Backing up RUEI Configuration Data	3-2
3.4.2 Backing up Session Diagnostic Data	3-3
3.4.3 Restoring a RUEI Deployment Backup	3-3
3.5 Moving RUEI Datafiles to a New Location.....	3-3
4 Managing the Database	
4.1 Viewing the Status of RUEI Database Tables	4-1
4.2 Suspending Processing When Performing Database Maintenance.....	4-2
4.3 Enabling Online Tablespace Backups	4-2
4.4 Using Redo Logging	4-3
4.5 Improving Database Performance.....	4-3
4.6 Configuring Statistics and Facts Tables.....	4-3

5 Troubleshooting

5.1	Enabling Core Dumps for Collector Processes.....	5-1
5.2	Manually Creating Helpdesk Reports	5-1

Index

Preface

Oracle Real User Experience Insight (RUEI) provides you with powerful analysis of your network and business application infrastructure. You can monitor the real-user experience, set Key Performance Indicators (KPIs) and Service Level Agreements (SLAs), and trigger alert notifications for incidents that violate them.

Audience

This guide describes the Oracle Real User Experience Insight (RUEI) command-line interface tools and commands available for performing advanced system administration. It is intended for Administrators responsible for maintaining your RUEI deployment(s).

Using This Guide

This guide is organized as follows:

- [Chapter 1, "Controlling Reporting"](#) describes settings to optimize the reporting of monitored traffic. These include increasing the amount of information available within the Failed Data Browser groups, increasing the default user flow limits, and obtaining user event information.
- [Chapter 2, "Configuring Collector Systems"](#) describes settings to configure your Collector systems to perform domain-based segmentation, and increase the memory available to Collector processes.
- [Chapter 3, "Maintaining the System"](#) describes settings to perform various maintenance tasks, such as backing up a RUEI deployment, and improving Reporter GUI performance.
- [Chapter 4, "Managing the Database"](#) describes a number of steps necessary to perform database maintenance and facilitate backups.
- [Chapter 5, "Troubleshooting"](#) describes settings for helping Customer Support to resolve problems encountered when using RUEI.

More information

- Information on Oracle Enterprise Manager is available at the following location:
<http://www.oracle.com/us/products/enterprise-manager/index.html>
- Detailed technical information is available from My Oracle Support:
<https://support.oracle.com>

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

For more information, see the following documents in the Oracle Real User Experience Insight (RUEI) documentation set:

- *Oracle Real User Experience Insight User's Guide.*
- *Oracle Real User Experience Insight Installation Guide.*
- *Oracle Real User Experience Insight Release Notes.*

The latest version of this and other RUEI books can be found at the following location:

<http://www.oracle.com/technetwork/documentation/realuserei-091455.html>

RUEI also provides extensive online help. Select the option **Help** option from the **System** menu, or click the **Help** icon within a dialog to display the online help system.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Controlling Reporting

This chapter describes settings to optimize the reporting of monitored traffic. These include increasing the amount of information available within the Failed Data Browser groups, increasing the default user flow limits, and obtaining user event information.

1.1 Obtaining User Event Information

The RUEI database contains information about user events (such as when a user opens a report, consults a KPI alert log, or logs on and off). This information can be used for a wide variety of purposes, such as determining how often a particular report is opened or downloaded by users, or which is the most frequently accessed Data Browser group. In this way, you can optimize your RUEI installation to best meet the needs of your users.

The recording of user events is controlled by the `user_events_enabled` setting within the `uxs_config` table. When set to 1 (the default), user events are recorded; when set to 0, user events are not recorded.

By default, information about user events is held in the database for a maximum of 31 days. This is controlled by the `db_max_user_events` entry within the `uxs_config` table. To modify either of these settings, do the following:

Become the `RUEI_USER` user, and issue the following command to modify the user event retention setting:

```
execsql config_set_value processor db_max_user_events days
```

where `days` specifies the maximum number of days for which user event information should be stored. Note that this setting has an impact on database usage.

User Event Table Structure

The `UXS_USER_EVENTS` table, shown in [Table 1-1](#), contains user event information.

Table 1-1 *UXS_EVENTS Table*

Column	Type	Description
ID	NUMBER	Unique ID used to identify the user event.
STAMP	TIMESTAMP	Time (in UTC format) when event was performed by user.
USERNAME	VARCHAR2 (255 BYTE)	Logon name of user.
CODE	NUMBER	This is an event code.
EVENT	VARCHAR2 (4000 BYTE)	Brief description of the event.

Event Codes and Descriptions

The possible CODE events and their associated descriptions are shown in [Table 1–2](#).

Table 1–2 UXS_LANG_CATALOG_DATA Table

Code	Description
0	User logon.
1	User logout.
2	Load/reload Dashboard tab.
3	Added new dashboard (%1\$s).
4	Updated dashboard (%1\$s).
5	Removed dashboard (%1\$s).
6	Load/reload Report tab.
7	View report (%1\$s).
8	Load/reload preview report (%1\$s).
9	Save report (%1\$s).
10	Save report as new (%1\$s).
11	Download report as PDF (%1\$s).
12	Download report as CSV (%1\$s).
13	Download report as TSV (%1\$s).
14	Download report as XLS (%1\$s).
15	Download report as XML (%1\$s).
16	Add report to Favorites (%1\$s).
17	Remove report from Favorites (%1\$s).
18	Toggle report %1\$s mailing (%2\$s).
19	Remove report from %1\$s mailing (%2\$s).
20	Send %1\$s mailing now.
21	Load/reload Browse tab.
22	Select graph (%1\$s).
23	Select graph category (%1\$s).
24	Select group (%1\$s).
25	Load/reload diagnostics.
26	Browse report (%1\$s).
27	Load/reload KPI overview tab (%1\$s).
28	Load/reload KPI overall alert log.
29	Show KPI specific alert log (%1\$s).
30	Load/reload KPI correlation (%1\$s).
31	User %1\$s has been added.
32	User %1\$s has been removed.
33	Application %1\$s has been added.

Table 1–2 (Cont.) UXS_LANG_CATALOG_DATA Table

Code	Description
34	Application %1\$s has been removed.
35	Service %1\$s has been added.
36	Service %1\$s has been removed.
37	Suite %1\$s has been added.
38	Suite %1\$s has been removed.
39	Collector profile %1\$s has been added.
40	Collector profile %1\$s has been removed.
41	Collector %1\$s has been registered in profile %2\$s.
42	Collector %1\$s from profile %2\$s has been unregistered.
43	Collector %1\$s in profile %2\$s has been restarted.
44	Collector %1\$s in profile %2\$s has been disabled.
45	Collector %1\$s has been moved to profile %2\$s.
46	Traffic filter in profile %1\$s has been changed to %2\$s.
47	VLAN filter in profile %1\$s has been changed to %2\$s.
48	Port numbers (%1\$s) in profile %2\$s has been added.
49	Port numbers (%1\$s) in profile %2\$s has been removed.
50	The IP filter (%1\$s) has been added in profile %2\$s.
51	The IP filter (%1\$s) has been removed from profile %2\$s.
52	User account %1\$s has been enabled.
53	User account %1\$s has been disabled.
54	User account %1\$s has been locked.
55	User account %1\$s has been unlocked.
56	Maximum login attempt reached for user account %1\$s.
57	The password for user %1\$s has been expired.
58	The initial password for user %1\$s has expired.
59	The minimum password length has been changed to %1\$s.
60	The maximum password duration has been changed to %1\$s.
61	Remove report (%1\$s).
62	URL prefix %1\$s with action: %2\$s has been added.
63	URL prefix %1\$s with action: %2\$s has been removed.
64	URL prefix %1\$s with action: %2\$s has been updated.
65	Default replay action has been changed to %1\$s.
66	Replay IP range action has been changed to %1\$s.
67	Replay IP range %1\$s has been added.
68	Replay IP range %1\$s has been removed.
69	Replay all IP ranges have been removed.
70	Replay IP range %1\$s has been changed.

Table 1–2 (Cont.) UXS_LANG_CATALOG_DATA Table

Code	Description
71	Replay IP ranges uploaded.
72	%1\$s action with source value: %2\$s and action: %3\$s has been added.
73	%1\$s action with source value: %2\$s and action: %3\$s has been removed.
74	%1\$s action source value: %2\$s and action: %3\$s has been updated.
75	Default action for %1\$s has changed to %2\$s.

1.2 Increasing the Size of the Failed Groups

As explained in section 12.10 of the *Oracle Real User Experience Insight User's Guide*, the Failed URLs, Failed services, and Failed pages groups do not use the maximum group size setting. Instead, their size is controlled through the `event_max_fail` setting. This specifies the maximum number of rows that can be added to the group's main database table during a 1-minute period. By default, this is 1000 rows. For the Slow URLs group, the `event_max_slow` setting is used, and specifies the number of the slowest URLs that are recorded within each 1-minute period. By default, this is 1000 rows.

Note that if you change the `event_max_fail` or the `event_max_slow` setting, you should also review the `daily_max_fail` setting. This specifies the maximum number of rows that the groups' tables can contain. This is derived from the formula $1440 * \text{event_max_fail}$. The default is 1.4 million rows.

To modify the above settings, issue the following commands:

```
execsql config_set_value processor event_max_fail 10000
execsql config_set_value processor daily_max_fail 4320000
```

Note that the `event_max_fail` setting is limited to a maximum of 10,000 rows.

Before starting the procedure described below, you should do the following:

- Confirm that more than 1000 error pages are *actually* reported for a 1-minute period within the All sessions group.
- Ensure that replay viewer functionality is enabled. To check this, select **Configuration**, then **Security**, and then **Replay logging policy**, and then click the **Default replay action** setting. Select the "Complete logging" option.

Important

Before changing the default of 1000 error pages, you should consider the following:

- Carefully consider whether you actually need to increase this limit. Typically, if a high number of error pages are reported within a 1-minute period, it is unlikely that they refer to different problems. Hence, having a large number of recordings for the same page errors will probably not help with root-cause analysis.
- Increasing the limit imposes a considerable I/O overhead on both the Reporter and Collector systems. Therefore, you should carefully consider the limits of these systems before modifying the default limit.
- Each group within the Data Browser has a maximum size. This is 1.5 times its "condense limit" (as specified by the `cube_max_size` option in the `UXS_CONFIG` table). The effect of trying to merge more than 5000 error pages within a 5-minute period can be that the system stops merging data at some point during the day. Obviously, the more error pages that are encountered, the sooner the Data Browser

group will become full. Note you can diagnose this in the error log file (*RUEI_DATA/processor/log/error.log*) by searching for errors containing the string "wg_failpg_dy_*" starting with the string "no merge:".

- The `event_max_fail` settings is used not only by the Failed pages group, but also by the Failed URLs and Failed services groups.

1.3 Increasing the Default Limits for User Flows

The default maximum number of steps that can be defined within a user flow is 15. This can be modified via the `txn_max_steps` setting. The default maximum number of user flows that can be defined is 200. This can be modified via the `txn_max_trans` setting. To change either setting, do the following:

1. Logon to the Reporter system as the *RUEI_USER* user.
2. Issue the following commands:

```
execsql config_set_value processor txn_max_steps steps
execsql config_set_value processor txn_max_trans flows
```

where:

- *steps* specifies the new maximum number of steps allowed with user flows.
- *flows* specifies the new maximum number of user flows that can be defined.

Important

Be aware that increasing either default maximum carries a performance overhead. In addition, if the maximum number of steps within user flows is significantly increased, the graphical reporting of user flows (such as the Flow status and Flow transitions) may become difficult to read.

1.4 Obtaining Client IP Addresses within Desktop Virtualization Environments

By default, the client IP address is obtained from the IP header packet sent from the client. The IP packet contains, among other things, the numerical source and destination address of the packet. If RUEI has been placed after a NAT device (such as a load balancer), you can configure RUEI to look in a specified header (set by the NAT device) rather than the IP packet. The procedure to do this is described in section P.2 of the *Oracle Real User Experience Insight User's Guide*. However, if monitored clients are using a desktop virtualization environment (such as a Citrix server), the IP address of the server is returned as the client IP address.

Important: The following procedure requires you to have a correct user-client IP address mapping.

In order to configure RUEI to report a preferred client IP address, do the following:

1. Create a file containing a list of the IP address range(s) that you want to be remapped. Each range must be specified using the format 10.1.1.0/24. It is recommended that you call the file `ip-map-ranges-file.tsv`. For example:

```
RANGE
169.254.0.0/16
172.16.0.0/12
```

2. Create a tab-separated file containing a list of the required user IDs and client IP addresses. It is recommended that you call the file `ip-map-users-file.tsv`. For example:

```
USER_ID\tCLIENT_IP
JohnSmith\t10.10.10.50
FredWhite\t10.10.10.51
SteveBrown\t10.10.10.52
```

Note that in the above example `\t` indicates a tab character. Ensure that both files do not contain any leading or trailing characters, and no lines containing only whitespace or special characters (such as `/n` or `/r`).

3. Logon to the RUEI Reporter system as the `RUEI_USER` user.
4. Import the two created files onto a suitable location on the RUEI Reporter system.
5. Execute the `import-ip-map` script (located in the `RUEI_DATA/processor/bin` directory) using the following command:

```
import-ip-map -r ip-map-ranges-file -u ip-map-users-file
```

where `ip-map-ranges-file` and `ip-map-users-file` are the two files created and imported above.

Any reporting changes made by this facility take effect within appropriately 5 minutes.

Restoring Default functionality

To restore default client IP address reporting, create two files containing only column headers and repeat the above procedure.

1.5 Controlling the Maximum Session Duration and Idle Time

By default, a visitor session is regarded as terminated if the visitor has been inactive for longer than 60 minutes. This is controlled through the `session_idle_time` setting. In addition, the default number of hours that user IDs and custom dimensions are remembered for a session is 12 hours. This is controlled through the `max_age_session` setting.

Lowering the `session_idle_time` setting will increase Reporter system performance in terms of CPU utilization. It has no impact on memory usage. However, be aware that a drawback of lowering this setting is that identified visitors returning within the specified session idle time will be reported as anonymous.

You should consider lowering the `max_age_session` setting when the Reporter system does not have enough memory and starts to swap. Be aware that when this setting is lowered, and the monitored traffic contains mostly long sessions, user IDs can be lost. This setting should not be set lower than the `session_idle_time` setting.

Use the following commands to obtain a setting's current value:

```
execsql config_get_value processor session_idle_time
execsql config_get_value processor max_age_session
```

Use the following commands to modify a setting's value:

```
execsql config_set_value processor session_idle_time idle_time
execsql config_set_value processor max_age_session max_age
```

where

- *idle_time* specifies the number of seconds of visitor inactivity after which the session is considered terminated.
- *max_age* specifies the maximum number of hours after which session information is cleared from memory.

1.6 Improving Processing Concurrency

By default, 3 threads are used on the Reporter system for traffic processing. It is controlled by the `lookup_threads` setting. Performance improvement can be obtained (through additional concurrency in processing) by increasing this setting. An indication that this setting is too low is the following internal error appearing in the Event log:

```
Processing backlog larger than %d minutes, restarting loggr (the backlog will be
skipped).
```

It means that the Reporter system cannot keep up with the processing of the arriving data.

Use the following command to obtain the setting's current value:

```
execsql config_get_value processor lookup_threads
```

Use the following command to modify the setting's value:

```
execsql config_set_value processor lookup_threads threads
```

where *threads* specifies the number of threads available for use by the Reporter system. This setting should not be higher than the number of cores available on the Reporter system.

Configuring Collector Systems

This chapter describes settings to configure your Collector systems to perform domain-based segmentation, and increase the memory available to Collector processes.

2.1 Increasing Memory Availability to Collectors

By default, the Collector process (`panther`) is assigned 30% of available system memory within a single-server installation. Within a remote Collector installation, the Collector process is assigned 70% of available memory. To set the memory available to the Collector process, use the following command:

```
execsql config_set_profile_value wg profile config MaxMemoryUsage replace setting
```

where:

- *profile* specifies the name of the Collector profile that needs to be updated.
- *setting* is the percentage of system memory available to the Collector process. Note that percentage sign must *not* be specified with the setting. It is recommended that you specify a percentage not higher than 90%. If the Collector process has to share resources with other software running on the system, a maximum setting of 80% is more appropriate.

Collector Profile Name

Note that the required Collector profile name can either be obtained via the Reporter GUI (select **Configuration**, then **Security**, and then **Collector profiles**), or by executing the following command:

```
execsql config_get_profiles wg
```

2.2 Configuring Domain-Based Segmentation

To configure RUEI to filter (segment) monitored traffic based on domain names, do the following:

1. Select **Configuration**, then **Security**, then **Network filters**, and select the required Collector profile. Ensure that the **Packet capture** menu specifies the "Specified domains" option for each required Collector profile.
2. Create, modify, or delete the required rows in the `wg__domain_segments` database table. The table has the following format:

ID	Priority	Domain	Profile_ID	Traffic_segment
1000	10	*.nl	2	1 1
1100	8	*.be	2	1 2

1150	3	*.oracle.*	2	1 1
1200	1	*.com	2	3 4

where:

- The `ID` column represents a unique identifier for each row in the table.
 - The `Priority` column represents the order in which the filters are applied. The filters with the highest priority numbers are applied first, and those with the lowest are resolved last. Hence, in the above example, monitored traffic relating to the domain `myshop.oracle.com` would be filtered as `*.oracle.* 1|1`, and not the `*.com 3|4` filters. Also, all domain traffic with the country code `nl` is monitored, while only the first half of the data stream should be monitored for domains with the country code `be`.
 - The `Domain` column contains the actual filter value where `*` can be used as a wildcard.
 - The `Profile_ID` column relates to the ID of the Collector profile for which the filters should apply. This ID can be found in `wg__cprofiles`.
 - The `Traffic_segment` column contains the segment which should be used for the specified filter. You can specify up to 128 parts. For example, `34|128` will take the 34th segment out of 128.
3. To view the currently defined network filters, logon to the Reporter system as the `RUEI_USER` user, and issue the following command:

```
sqlplus /@RUEI_DB_TNSNAME
select id, prio, domain, profile_id, traffic_segment from wg__domain_segments
order by prio;
```

4. To insert a row into the table, issue the following command:

```
insert into wg__domain_segments (id, prio, domain, profile_id, traffic_segment)
values (wg__domain_segments_seq.nextval, 1, '*.nl', 2, '1|2');
```

5. To delete a row from the table, issue the following command:

```
delete from wg__domain_segments where id=1;
```

6. To alter a filter's priority, issue the following command:

```
update wg__domain_segments set prio=100 where id=2;
```

2.3 Configuring the Number of NPA Threads

By default, a Collector system use three threads for Network Protocol Analysis (NPA). This is controlled by the `NumNPAThreads` setting. Collector performance can be improved by increasing this setting.

If not currently defined, this number can be increased by using the following command:

```
execsql config_set_profile_value wg profile config NumNPAThreads add 4
```

If previously defined, it can be modified by using the following command:

```
execsql config_set_profile_value wg profile config NumNPAThreads replace 5
```

where `profile` specifies the name of the Collector profile that needs to be updated.

Maintaining the System

This chapter describes settings to perform various maintenance tasks, such as backing up a RUEI deployment, and improving Reporter GUI performance.

3.1 Disabling Modification to Administrators' Properties

By default, users with Administrator permissions can change the properties of other Administrators, as well as create and delete Administrator user accounts. If this is not consistent with your security requirements, you can disable this functionality by issuing the following commands:

```
execsql config_set_value wi_core user_mgmt_admin_edit_admins 0
```

3.2 Increasing the Linux Socket Memory Allocation Limit

The underlying Linux socket interface used by the Collector for monitoring traffic has a memory allocation limit of 20KB. This limit can be exceeded when a large number of network filters (or VLAN definitions) are configured. If so, the following error is reported in the Event log:

```
linux.c, 326, cap_dev_set_filter(): setsockopt(): Cannot allocate memory
```

In order to increase this limit, do the following:

1. Logon to the required Collector system as the `root` user.
2. Issue the following command to increase the underlying limit:

```
/sbin/sysctl -w net.core.optmem_max=65535
```

3. To make this setting persistent across reboots, add the following line to the `/etc/sysctl.conf` file:

```
net.core.optmem_max=65535
```

3.3 Improving GUI Performance

Within the Reporter user interface, the performance of queries (such as refreshing a dashboard or retrieving data within the Data Browser) is heavily influenced by the specified Degree of Parallelism (DOP) setting. This regulates the maximum number of parallel queries that may be made to the database. By default, this is two. In the case of deployments where the Reporter system has substantially more cores than this default, or where a dedicated database server is being used, a considerable user interface performance improvement can be realized by increasing the DOP setting.

The DOP is controlled by the `db_gui_dop` entry within the `uxs_config` table. Upon installation, this entry does not exist in the database. Do the following:

1. Logon to the Reporter system, become the `RUEI_USER` user, and issue the following command:

```
# sqlplus /@uxinsight
```

2. Issue the following command to obtain the setting's current value:

```
execsql config_get_value wi_core db_gui_dop
```

Use the following command to change the setting's value:

```
execsql config_set_value wi_core db_gui_dop dop
```

where `dop` specifies the degree of parallelism used for queries within the Reporter interface. Note that this should be less than the number of cores within the database system.

3.4 Backing up a RUEI Deployment

RUEI does not provide dedicated database backup and recovery functionality. Instead, it relies on standard Oracle database functionality. This is described in the *Oracle Database Backup and Recovery User's Guide*, available at the following location:

http://docs.oracle.com/cd/B28359_01/backup.111/b28270/toc.htm

Important

Regardless of the backup method you use, it is *strongly* recommended that you first stop RUEI data processing. Unless you do so, the integrity of the backed up data cannot be guaranteed. To do so, issue the following command as the `RUEI_USER` user:

```
project -stop wg
```

Be advised that this procedure may take several minutes, and any data being processed at the time of the stop command will be lost. However, traffic monitoring continues, and is written to log files that will be committed to the database once processing is resumed.

After backup creation, processing can be restarted with the following command:

```
project -start wg
```

3.4.1 Backing up RUEI Configuration Data

In addition to the database, RUEI configuration data should also be backed up. The procedure described below extracts configuration data from both the database as well as the file system, and writes it to the file system where it can be picked up for further backup to a suitable storage device.

1. Logon to the Reporter system as the `RUEI_USER` user, and issue the following command:

```
project -save --all
```

By default, this stores backup data to the `RUEI_DATA/processor/backup`. An alternate location can be specified using the `-file` directive. For example, to store to the location `/tmp/backup`, use the following command:

```
project -save --file /tmp/backup --all
```

2. To restore an earlier backup, issue the following command:

```
project -restore --file /tmp/backup --all
```

3.4.2 Backing up Session Diagnostic Data

One of the major strengths of RUEI is its ability to diagnose individual user sessions for slow performance or problem pages. This functionality relies on log files that are stored outside of the RUEI database. In order to allow access to Session Diagnostics functionality, this data also needs to be available during a restore. Backup the contents of the `RUEI_DATA/processor/data` directory.

Replay content is the data required to replay error pages or the full content of a session. Backup of this data depends on your requirements. That is, if there is a need to replay session content on a regular basis. Replay content can be easily backed up from the file system. The relevant directories are `$APPSSENSOR_HOME/*/REPLAY`. The default location is `RUEI_DATA/collector/wg/REPLAY`. Note that the entire directory (and all sub-directories) should be backed up.

Note that the directories indicated above must be backed for *each* required Collector system. In a distributed environment, that means that the backup may have to be performed on multiple systems.

3.4.3 Restoring a RUEI Deployment Backup

To restore a RUEI deployment from scratch, do the following:

1. Install the RUEI software. The procedure do this is fully described in the *Oracle Real User Experience Insight Installation Guide*.
2. Restore the database content following the instructions in *Oracle Database Backup and Recovery User's Guide* for the selected backup approach.
3. Restore the RUEI configuration information using the following command:

```
project -restore --all backup-file-location
```

where `backup-file-location` specifies the location of the backed-up data.

4. Restore the RUEI Session Diagnostics information by restoring the contents of the `RUEI_DATA/processor/data` directory.
5. For each required Collector system, restore the replay content to the location `$APPSSENSOR_HOME/*/REPLAY`. Note that the Collector must be stopped before performing a restore. To stop the Collector, issue the following command as the `RUEI_DATA` user:

```
appsensor stop wg
```

To restart the Collector, issue the following command as the `RUEI_USER` user:

```
appsensor start wg
```

3.5 Moving RUEI Datafiles to a New Location

You may need to move the database datafiles to a new location. For example, because the current mount point or directory is running out of space. Note that the following procedure assumes that the database is running on the Reporter system, and the default installation paths are being used. This is fully described in the *Oracle Real User Experience Insight Installation Guide*.

Do the following:

1. Logon to the Reporter system as the *RUEI_USER* user.
2. Stop the database and processing by issuing the following commands:

```
project -stop wg
exit
/etc/init.d/oracledb stop
```

3. Prepare the new mount using the following commands:

```
mkdir -p /oradata/ux/
chown oracle:oinstall -R /oradata
```

4. Copy the datafiles as the *oracle* user by issuing the following commands:

```
cd /u01/app/oracle/oradata
mv ux/* /oradata/ux
rm -f ux
ln -s /oradata/ux ux
```

5. Restart the database and processing by issuing the following commands:

```
# /etc/init.d/oracledb start
# su - RUEI_USER$
project -start wg
```

Managing the Database

This chapter describes a number of settings necessary to perform database maintenance and facilitate backups.

4.1 Viewing the Status of RUEI Database Tables

In the event of a database crash, objects may become corrupted. Typically, this reveals itself with ORA-00376 and similar errors reported in the Event Log. It is recommended that you carefully review the information in the Knowledge Base article at the following location:

<https://support.us.oracle.com/oip/faces/secure/km/DocumentDisplay.jspx?id=1303180.1>

In particular, ensure that the indicated tablespaces are set to force logging. You can use the following command to view the status of the database tables:

```
cop stats %period
```

where *period* indicates the required year (2012), month (201203), or day (20120326). The command output appears as follows:

hash	STRUCTURE			PRESENTATION		DATA ROWS		DATA SIZE		cube name
	data	dims	lvls	pres	view	data	desc	data	desc	
ftTq7vQ	19	11	22	133	156	0	2	0.1 MB	0.1 MB	wg_keypage_mo_201203
u7q+3g	9	4	8	13	7	-	470	0.6 MB	0.1 MB	wg_kpi_mo_201203
PMocAw	22	9	17	159	174	-	16960	19.0 MB	4.0 MB	wg_page_mo_201203
K/p4ww	12	12	29	123	104	0	0	0.1 MB	0.1 MB	wg_service_mo_201203
1S2Ggg	10	19	29	79	90	-	247	2.0 MB	0.1 MB	wg_slowurl_mo_201203
lZRuxg	29	5	10	279	61	0	0	0.1 MB	0.1 MB	wg_trasta_mo_201203
yuY0aQ	29	11	20	153	204	-	343	2.0 MB	0.1 MB	wg_visit_mo_201203

Note that if the Data column contains a zero value, or there a large number of zeros or dashes, this would indicate corrupted database tables. In this case, you should use the script described in the following Knowledge Base article to restore the database:

<https://support.us.oracle.com/oip/faces/secure/km/DocumentDisplay.jspx?id=556733.1>

In addition, it is recommended that you issue the following commands to force an update of the RUEI configuration and template tables:

```
makedatabase @
modr -fn all
```

4.2 Suspending Processing When Performing Database Maintenance

When performing maintenance on the database, it is recommended that you manually stop RUEI processing for the time that the database is down to prevent the reporting of error messages to show. Do the following:

1. Use SSH to logon to the Reporter system as the `RUEI_USER` user.
2. Issue the following command to stop processing:

```
project -stop wg
```

3. Ensure that the following processes are no longer running before bringing down the database: `qjob`, `logr`, and `rsynclogdird`. If necessary, use the `kill` command to stop them.
4. After completion of database maintenance, restart processing by issuing the following command:

```
project -start wg
```

4.3 Enabling Online Tablespace Backups

As of version 12.1.0.3, the `USERS` and `UXCONF` tablespaces within new installations are set to `force logging` mode. Previously, the default mode was `nologging`. The upgrade procedure does not change your database's current setting. However, be aware that changing the tablespace mode to `force logging` can considerably increase disk I/O.

By default, the database does not support online backups. In order to do so, the database's `noarchivelog` mode needs to be changed, and a number of operations changed from `nologging` mode to `force logging` mode. Do the following:

1. Logon to the database system as the `oracle` user:
2. Stop all processing by issuing the following commands:

```
source /etc/ruei.conf
su - $RUEI_USER
project -stop wg
killall logmsgd
killall qjobd
killall rsynclogdird
```

3. Ensure that the `$RUEI_DB_INST` setting specifies the RUEI database.
4. Change the database to `archivelog` mode by issuing the following commands:

```
. oraenv
sqlplus / as sysdba
shutdown immediate
startup mount
alter database archivelog;
alter database open;
```

5. Issue the following commands to set the required operations to `force logging` mode:

```
alter tablespace USERS force logging;
alter tablespace UXCONF force logging;
```

6. Configure and schedule the online backup.

See the *Oracle Backup and Recovery User's Guide* for further information. It is available at the following location:

http://www.oracle.com/pls/db112/portal.portal_db?selected=14

4.4 Using Redo Logging

By default, redo logging of the RUEI database is disabled. If this is enabled for the complete database, very large redo log archives can be created. Therefore, if you want to use redo logging as part of your backup strategy, you need to make a number of configuration changes. Do the following:

1. Logon to the database system as the `oracle` user.
2. Issue the following commands to set the required logging options in the RUEI database table spaces:

```
sqlplus / as sysdba
SQL> alter tablespace USERS force logging;
SQL> alter tablespace UXCONF force logging;
SQL> alter tablespace UXSTAT no force logging;
SQL> alter tablespace UXTEMP no force logging;
```

Note that the `UXSTAT` and `UXTEMP` tablespaces are not set to force logging because they are not relevant to the backup and restore process because they only contain intermediate data.

4.5 Improving Database Performance

By default, the degree of parallelism used for core-related queries in the database is 1. This is controlled by the `db_core_dop` setting. Increasing the number available can improve database performance. However, this setting should never be set to a number higher than the amount of cores available from the database server. This setting utilizes the DOP features of the Oracle database. It has no functional impact other than potentially making data processing run faster.

Use the following command to obtain the setting's current value:

```
execsql config_get_value processor db_core_dop
```

Use the following command to modify the setting's value:

```
execsql config_set_value processor db_core_dop dop
```

where `dop` specifies the degree of parallelism used for queries in processing.

4.6 Configuring Statistics and Facts Tables

Additional statistics and facts database tables are automatically created to facilitate RUEI integration with Oracle Enterprise Manager. These tables can significantly increase the level of database I/O activity and storage requirements. The creation of these tables is controlled by the `appliance_fact_enabled` and `appliance_statistics_enabled` setting:

Use the following commands to obtain the settings' current values:

```
execsql config_get_value appliance fact_enabled
execsql config_get_value appliance_statistics_enabled
```

Use the following commands to modify the settings' value:

```
execsql config_set_value appliance fact_enabled value  
execsql config_set_value appliance statistics_enabled value
```

where *value* specifies whether the setting should be enabled (1) or disabled (0).

Important

Be aware that disabling either of the above settings will prevent the correct operation of an Oracle Enterprise Manager deployment with a RUEI integration.

Troubleshooting

This chapter describes settings for helping Customer Support to resolve problems encountered when using RUEI.

5.1 Enabling Core Dumps for Collector Processes

By default, in the event of a Collector instance crashing, no core dump is generated. This is for security reasons because the Collector may be monitoring encrypted (SSL) traffic. However, some customer issues can only be resolved by Customer Support if a core dump is made available. In order to ensure the creation of core dumps, do the following:

1. Issue the following command as the `RUEI_DATA` user on the system on which the Collector instance is running:

```
ulimit -c unlimited
```

2. Edit the `APPSENSOR_HOME/wg/config/config.cfg` file, and modify the value of `CoreSize` setting to `-1`.
3. Restart the Collector by issuing the following command as the `RUEI_DATA` user:

```
appsensor restart wg
```

When core dumps are enabled, stack trace extracts are stored in the `APPSENSOR_HOME/core_dir` directory. Note that RUEI automatically cleans up any core dumps in the `APPSENSOR_HOME` directory every night at 2:30 AM. In addition, be aware that if core dumps are regularly generated, the file system may start filling up. Therefore, it is recommended that the default configuration is restored as soon as the required core dumps have been harvested.

5.2 Manually Creating Helpdesk Reports

When contacting Customer Support, it is *strongly* recommended that a Helpdesk report file is created and uploaded to the Service Request (SR). This file contains extended system information that is extremely useful to Customer Support when handling any issues that are reported. This file can be created by selecting **System**, then **Maintenance**, and then **Helpdesk report**.

If the Reporter user interface, the Helpdesk report can be created manually by doing the following:

1. Logon to the Reporter system as the `RUEI_USER` user.
2. Issue the following commands:

```
source /etc/ruei.conf  
project -save --all
```

3. Fetch the generated .tgz file from the location as indicated by the command output.
4. Upload the file to the appropriate SR.

Third-Party Licenses

This appendix contains licensing information about certain third-party products included with this version of RUEI. Unless otherwise specifically noted, all licenses herein are provided for notice purposes only.

The sections in this appendix describe the following third-party licenses:

- [Apache Software License, Version 2.0](#)
- [OpenSSL](#)
- [PHP](#)
- [Java Runtime Environment](#)
- [The MIT License \(MIT\)](#)

Apache Software License, Version 2.0

Apache License

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. **Definitions.** "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

- You must give any other recipients of the Work or Derivative Works a copy of this License; and
- You must cause any modified files to carry prominent notices stating that You changed the files; and
- You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

-
- If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License. You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Java Runtime Environment

Oracle is required to provide the following notice as part of the license terms for the Sun JRE that the field of use for the JRE is: (i) general purpose desktop computers, laptops and servers, and (ii) embedded systems (by way of example: embedded applications, cell phones, PDAs, TV devices, digital set top boxes, telematics devices and home gateway devices), provided that the Java Runtime Environment (JRE) is licensed only to run Licensee applications, middleware and database products and the JRE is not licensed to directly run any third party applications. This shall not be understood to prevent third party applications from indirectly and incidentally utilizing the JRE, but only as such is required to enable other Licensee Product functionality.

After installing the JRE, the complete terms of the Sun Microsystems license agreement are available in the file `/usr/java/jre1.5.0_18/THIRDPARTYLICENSEREADME.txt`.
