About This Document

Scope

The scope of this document includes all the information required to install, configure and administer the ENUM Control Agent application.

Audience

This guide was written primarily for system administrators and persons installing, configuring and administering the ENUM Control Agent application. However, sections of the document may be useful to anyone requiring an introduction to the application.

Prerequisites

A solid understanding of UNIX and a familiarity with IN concepts are an essential prerequisite for safely using the information contained in this technical guide. Attempting to install, remove, configure or otherwise alter the described system without the appropriate background skills, could cause damage to the system; including temporary or permanent incorrect operation, loss of service, and may render your system beyond recovery.

Although it is not a prerequisite to using this guide, familiarity with the target platform would be an advantage.

This manual describes system tasks that should only be carried out by suitably trained operators.

</tr>
<tr>
<td><strong>hypertext link</strong></td>
<td>Used to indicate a hypertext link on an HTML page.</td>
</tr>
</tbody>
</table>

Specialized terms and acronyms are defined in the **Glossary** at the end of this guide.
Overview

Introduction

This chapter provides a high-level overview of the application. It explains the basic functionality of the system and lists the main components.

It is not intended to advise on any specific Oracle Communications Network Charging and Control (NCC) network or service implications of the product.

In this chapter

This chapter contains the following topics.

What is the ENUM Control Agent

Introduction

With the proliferation of IT type systems involved in the call setup path from tier 1 operators to low cost VOIP service providers, a standard low cost method of establishing call routing information was required.

ENUM, which stands for E.164 number mapping, addresses this need by providing a mechanism of establishing routing or/and URI information for a call (or general subscriber query) based on the DNS.

DNS was chosen due to its general availability on IT platforms and its implementation in IP networks.

The ENUM standard also facilitates the mapping of e.164 numbers into general purpose URIs that can be used when establishing a session to a destination.

Diagram

This diagram shows the Oracle Communications Network Charging and Control ENUM interface allowing the SLC to be used as an NP interface for external servers that only have simple DNS query capabilities.
Note: The ENUM interface/components are not limited to solely NP type deployments.

Internal flow

The internal flow scenario is where ENUM is used with the NP service pack to offer an NP service that is hosted on the SLC.

The following table provides comments on the internal flow shown in the overview diagram (green lines).

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>External Gateway launches a DNS request for ENUM resolution.</td>
</tr>
<tr>
<td>2</td>
<td>Request is translated by the ENUM interface, triggering rules activated which results in ACS being triggered.</td>
</tr>
<tr>
<td>3</td>
<td>ACS loads an Internal NP control plan (based on SK).</td>
</tr>
<tr>
<td>4</td>
<td>Control plan is executed, containing an NP DS node which results in a DB lookup on the SLC, using e.164 number in called party field.</td>
</tr>
<tr>
<td>5</td>
<td>Ported information is returned from the local DB to DS node, the looked up subscriber has an URI associated with them in NP DB, DS node copies the URI to the outgoing profile and marks it as URI.</td>
</tr>
</tbody>
</table>
### External flow

The external flow scenario is where ENUM is used in conjunction with DAP components so that an externally hosted NP service can be queried.

The following table provides comments on the external flow shown in the overview diagram (orange lines).

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>External Gateway launches a DNS request for ENUM resolution.</td>
</tr>
<tr>
<td>2</td>
<td>Request is translated by the ENUM interface, triggering rules activated which results in ACS being triggered.</td>
</tr>
<tr>
<td>3</td>
<td>ACS loads an External NP control plan (based on SK).</td>
</tr>
<tr>
<td>4</td>
<td>Control plan is executed, containing a DAP node which uses either e.164 number or FQDN as a substitution parameter in template XML and invokes the DAP action handler.</td>
</tr>
<tr>
<td>5</td>
<td>DAP action handler sends a SLEE message to DAP XML interface containing query parameter(s).</td>
</tr>
<tr>
<td>6</td>
<td>XML interface builds XML message and sends the appropriate query to external ASP.</td>
</tr>
<tr>
<td>7</td>
<td>External ASP processes requests and either sends back one or more URI data blocks or/and one or more NAPT RR data blocks identified within tags.</td>
</tr>
<tr>
<td>8</td>
<td>XML interface extracts return data blocks as configured and returns information in SLEE response message.</td>
</tr>
<tr>
<td>9</td>
<td>Response information returned from DAP action handlers to the DAP feature node which extracts either URI or NAPTR record data item and places in the outgoing profile.</td>
</tr>
<tr>
<td>10</td>
<td>Unconditional Terminate node is used to send a CONNECT, ACS service loader invoked.</td>
</tr>
<tr>
<td>11</td>
<td>ACS sends a CONNECT operation to ENCA containing the outgoing profile (as set by).</td>
</tr>
<tr>
<td>12</td>
<td>ENCA extracts the URI or NAPTR record from outgoing profile, wraps it in the configured NAPTR record field (if URI form) and sends the DNS response to the client.</td>
</tr>
</tbody>
</table>

### ENUM flow

<tr>
<td>3</td>
<td>ACS loads an ENUM NP control plan (based on SK).</td>
</tr>
<tr>
<td>Step</td>
<td>Action</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>4</td>
<td>Control plan is executed, containing ENUM Query node which results in a DB lookup on the SLC, using e.164 number in called party field.</td>
</tr>
<tr>
<td>5</td>
<td>NAPTR information is returned from the local DB to ENUM Query node, looked up subscriber has several NAPTR records associated with them in ENUM DB, ENUM query node concatenates records into one string and copies resultant string to outgoing profile and marks it as NAPTR – OPTIONALLY ENUM response node can be called in order to try and extract an AUS from a NAPTR record that satisfies search criteria.</td>
</tr>
<tr>
<td>6</td>
<td>Unconditional Terminate node used to send a CONNECT, ACS service loader invoked.</td>
</tr>
<tr>
<td>7</td>
<td>ACS sends a CONNECT operation to ENCA containing a DRA (could contain original number OR possibly AUS if ENUM response node invoked) and outgoing profile field (as set by ENUM query node with NAPTR).</td>
</tr>
<tr>
<td>8</td>
<td>ENCA extracts NAPTR information from the outgoing profile, encodes it into the appropriate network representation and sends a DNS response to the client.</td>
</tr>
</tbody>
</table>

## Converting Numbers

### Introduction

When processing a Fully Qualified Domain Name (FQDN) input string, the subscriber number part must be converted to an e.164 number before any subscriber details can be retrieved.

By the same token, when responding to a FQDN the subscriber number needs to be converted from an e.164 number.

### Converting to e.164 number

The numDigitsRem part of the triggerRules is used as part of the conversion rules.

For example, if the input was:

```
0.0.9.9.8.2.3.7.4.1.4.4.e164.arpa
```

and the matching triggerRule was:

```
{ info=".4.4.e164.arpa", numDigsRem=10, trigger=111, noa=4 }
```

The full conversion into an e.164 number is done by:

- The last 10 characters are removed from the string (0.0.9.9.8.2.3.7.4.1.4.4)
- The string is reversed (4.4.1.4.7.3.2.8.9.9.0.0)
- All dots are removed (441473289900)

### Converting to a FQDN

An e.164 Destination Routing Address is converted to FQDN as follows:

- The string of digits (for example. 441473289900) is reversed (009982374144)
- Dots are added after all characters (0.0.9.9.8.2.3.7.4.1.4.4.)
- A configured domain is appended to finish the FQDN.

For example, a default domain is used and configured as:

```javascript
enca = {
    defNoADomain = "e164.arpa"
}
```

This would create the finished FQDN as 0.0.9.9.8.2.3.7.4.1.4.4.e164.arpa.
Typical Installation and Use

Overview

This topic outlines how the Oracle Communications Network Charging and Control ENUM Interface and associated macro nodes are typically deployed when the triggered service on the SLC is configured to use ENUM to retrieve subscriber information (NP) from an external platform.

Diagram

Here is an example installation.

Callout flow

The following table provides comments on the callout flow shown in the diagram.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SSF launches INAP query to resolve a number (for example, number translation service or/and NP or/and number routing).</td>
</tr>
<tr>
<td>2</td>
<td>TCAP i/f sends an IDP to ACS.</td>
</tr>
<tr>
<td>3</td>
<td>ACS triggers the appropriate service loader which loads an appropriate control plan.</td>
</tr>
</tbody>
</table>
**Step** | **Action**
--- | ---
4 | The control plan contains an ENCA Call Out (CO) node, this node allows the number to be specified that the lookup is to be performed on and domain name, this node use action handler to send message.
5 | SLEE message is sent to ENCA containing the number that the query should be performed on.
6 | ENCA builds the FQDN from information received in SLEE message and launches DNS query.
7 | ASP/ENUM server performs lookup and returns one or more NAPTR records back to ENCA in DNS response.
8 | NAPTR record(s) is sent back to the action handler in the SLEE response message.
9 | Action handler builds response and makes it available to ENCA CO node which stores this in temporary profile block. The NAPTR response node is then invoked, this node is capable of extracting information from NAPTR records, performing string manipulation and then copying information to the stated field. The configuration of the NAPTR response node is such that it searches for “E2U+tel” records.
10 | Configuration/operation is performed by NAPTR response node resulting in the DRA being updated with the manipulated result from the ASP. Unconditional Terminate node is invoked resulting in the ACS service loader being invoked.
11 | No need for the service loader extender to be invoked (since URI/NAPT RR not being copied into the CONNECT operation since a network element will not be capable of processing it), so a CONNECT INAP operation is sent back to TCAP i/f with a DRA containing the manipulated result from the ASP.
12 | CONNECT is returned back from SLC to the SSF.

### SIP Based Solution

**Overview**

Previous topics covered the main requirements for the various modules of an NCC solution. The Oracle Communications Network Charging and Control ENUM components can be used in various deployment models to provide end to end solutions.

This topic shows how the ENUM modules can be used in a SIP based charging solution. This topic is primarily concerned with stating requirements for the ENUM and other NCC components (for example, DAP) that will allow the ENUM component to be integrated with other NCC components to provide end to end solutions.
Diagram

Here is an example showing how the ENUM modules can be used in a SIP based charging solution.

**SIP based flow**

The following table provides comments on the SIP based flow shown in the diagram.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Call originated from the network subscriber, Softswitch is triggered through routing which in turn uses the AS (SLC with SCA) for call control. Softswitch sends a SIP INVITE to SCA.</td>
</tr>
<tr>
<td>2</td>
<td>SCA triggers ACS which in turn loads the CCS service loader resulting in details for calling subscriber being loaded.</td>
</tr>
<tr>
<td>3</td>
<td>ACS triggers the appropriate service loader which loads an appropriate control plan.</td>
</tr>
<tr>
<td>4</td>
<td>The control plan contains an ENCA Call Out (CO) node, which allows the number to be specified that the lookup is to be performed (destination number) on and domain (e.164 arpa) name; this node uses the action handler to send the message.</td>
</tr>
<tr>
<td>5</td>
<td>SLEE message is sent to ENCA containing number that the query should be performed on.</td>
</tr>
<tr>
<td>6</td>
<td>ENCA builds FQDN from information received in SLEE message and launches DNS query.</td>
</tr>
<tr>
<td>7</td>
<td>ASP/ENUM server performs lookup and returns one or more NAPTR records back to ENCA in DNS response.</td>
</tr>
<tr>
<td>8</td>
<td>NAPTR record(s) are sent back to the action handler in the SLEE response message.</td>
</tr>
<tr>
<td>Step</td>
<td>Action</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>9</td>
<td>Action handler builds response and makes available to ENCA CO node which stores this in an outgoing profile block. NAPTR response node is then invoked; this node is capable of extracting information from NAPTR records, performing string manipulation then copying information to the stated field. </tbody>
</table>
Overview

Introduction

This chapter explains how to access the Oracle Communications Network Charging and Control ENUM application and describes some of the common functionality of the ENUM screens.

In this chapter

This chapter contains the following topics.

Signing on to ENUM

Signing on to ENUM

SMS Login screen

Here is an example of the SMS Login screen.
Logging into SMS

Follow these steps to log into SMS.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In the <strong>User Name</strong> field, type your username.</td>
</tr>
<tr>
<td>2</td>
<td>In the <strong>Password</strong> field, type your password.</td>
</tr>
</tbody>
</table>

**Notes:**
- Passwords are case sensitive.
- You have three attempts to enter a correct username and password before the User ID is locked. If this happens, you must see your System Administrator to reactivate it.

3  Click **OK**.

**Result:** You see the Service Management System main screen.

**SMS main menu**

Here is an example of the SMS main menu showing the ENUM menu options.
Chapter 3

NAPTR Record Management

Overview

Introduction

This chapter explains how to use the NAPTR screens to manage NAPTR records.

In this chapter

This chapter contains the following topics.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Introduction

Screens overview

The NAPTR record management screens comprise of four tabs within each mode of use.

The tabs are:

- Flags
- Service
- Subscriber/Operator
- NAPTR Records

The modes of use are:

- *Find mode* (on page 13)
- *Find Results mode* (on page 21)
- *New mode* (on page 29)
- *Update mode* (on page 35)
Overview

Introduction

This chapter explains how to find records in the ENUM database for editing.

In this chapter

This chapter contains the following topics.

- Find Flags
  - Finding flag records

Find Flags

Finding flag records

Follow these steps to find flag records in the database.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the Flags tab (See example on page 14).</td>
</tr>
</tbody>
</table>
| 2    | Ensure the current mode shown in the screen title is Find Mode.  
  **Tip:** Click Return until the screen title shows - Find mode. |
| 3    | Enter search criteria in any (or none) of the fields in the tab.  
  **Tip:** Leaving all fields empty will return all flag records in the database. |
| 4    | By entering data in the fields at the bottom of the tab, select the filter and sort criteria. |
| 5    | Click Find.  
  **Result:** The database is searched and all matching records are collated and displayed in Find Results Mode (see "Find Flag Results" on page 22). |
Flags tab

Here is an example Flags tab, for the ENUM/NAPTR Record Management - Find mode screen.

Find Services

How to find flag records

Follow these steps to find service records in the database.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the Service tab (See example on page 15).</td>
</tr>
</tbody>
</table>
| 2    | Ensure the current mode shown in the screen title is Find Mode.  
**Tip:** Click Return until the screen title shows - Find mode. |
| 3    | Enter search criteria in any (or none) of the fields displayed in the tab.  
**Tip:** Leave all fields empty will return all service records in the database. |
| 4    | By entering data in the fields at the bottom of the tab, select the filter and sort criteria. |
## Chapter 4

### Step 5

**Action:** Click **Find**.

**Result:** The database is searched and all matching records are collated and displayed in *Find Results Mode* (see "Find Services Results" on page 23).

### Service tab

Here is an example **Service** tab, for the ENUM/NAPTR Record Management - Find mode screen.

![ENUM/NAPTR Record Management - Find mode](image)

### Find Subscriber or Operator

#### How to find flag records

Follow these steps to find subscriber or operator records in the database.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the <strong>Subscriber/Operator</strong> tab (See example on page 16).</td>
</tr>
<tr>
<td>Step</td>
<td>Action</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
</tbody>
</table>
| 2    | Ensure the current mode shown in the screen title is **Find Mode**.  
**Tip:** Click **Return** until the screen title shows - Find mode. |
| 3    | Enter search criteria in any (or none) of the fields displayed in the tab.  
**Note:** Select the **Entry Type** check box to find operator records, otherwise subscriber records are found.  
**Tip:** Leave all fields empty will return all subscriber or operator records in the database. |
| 4    | By entering data in the fields at the bottom of the tab, select the filter and sort criteria. |
| 5    | Click **Find**.  
**Result:** The database is searched and all matching records are collated and displayed in **Find Results Mode** (see “Find Subscriber or Operator Results” on page 24). |

**Subscriber/Operator tab**

Here is an example **Subscriber/Operator** tab, for the ENUM/NAPTR Record Management - Find mode screen.
# Find NAPTR Records

## How to find flag records

Follow these steps to find NAPTR records in the database.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the NAPTR Records tab (See example on page 18).</td>
</tr>
</tbody>
</table>
| 2    | Ensure the current mode shown in the screen title is Find Mode.  
**Tip:** Click Return until the screen title shows - Find mode. |
| 3    | Enter search criteria in any (or none) of the fields displayed in the tab.  
**Tip:** Leaving all fields empty will return all NAPTR records in the database. |
| 3a   | You can search for the search criteria to include in the following fields:  
- Subscriber/Operator  
- Flag  
- Service  
To search the field, click to the right of the corresponding field.  
**Result:** The Search Dialog (See example on page 19) for that type of record selected displays. |
| 3b   | To reduce the number of database records searched, enter in the fields, as required, for:  
- Subscriber/Operator - a Name or Dialed Number  
- Flag - a Flag or Description  
- Service - a Service or Description  
| 3c   | Click Find.  
**Result:** The results are returned in the grid.  
| 3d   | Click on the required record and click Select.  
**Result:** That service is added to the search fields.  
| 4    | By entering data in the fields at the bottom of the tab, select the filter and sort criteria.  
| 5    | Click Find.  
**Result:** The database is searched and all matching records are collated and displayed in Find Results Mode (see “Find NAPTR Records Results” on page 26). |
NAPTR Records tab

Here is an example NAPTR Records tab, for the ENUM/NAPTR Record Management - Find mode screen.
Search Dialog

Here is an example Search Dialog.
Overview

Introduction

This chapter explains how to use the find results.

In this chapter

This chapter contains the following topics.

Find Flag Results 22
Find Services Results 23
Find Subscriber or Operator Results 24
Find NAPTR Records Results 26
Find Flag Results

Flag results list

Here is an example of find flags results list.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
<th>Last User</th>
<th>Last Date</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Lookup for A, AAAA, or All records</td>
<td>SHF</td>
<td>09/19/2000 15:59:58</td>
<td>2</td>
</tr>
<tr>
<td>P</td>
<td>Protocol specific</td>
<td>SHF</td>
<td>09/19/2000 16:59:58</td>
<td>4</td>
</tr>
<tr>
<td>S</td>
<td>Lookup for SKY records</td>
<td>SHF</td>
<td>09/19/2000 16:59:58</td>
<td>1</td>
</tr>
<tr>
<td>U</td>
<td>Output of DNS resolution is a URL</td>
<td>SHF</td>
<td>09/19/2000 16:59:58</td>
<td>0</td>
</tr>
</tbody>
</table>

Selecting flag for update

To amend any of the records in the results list, click on the row to change, then click **Select**.

**Result:** The record detail is displayed in *Update Mode* (on page 35).

Exporting results list

The export function downloads all the information displayed in the results list.
To export, click **Export**, then follow the prompts for what to name the file and where to save it to.

You can view the saved file using a text processor.

**Printing flag results list**

Click **Print** to print the results list.

Page setup and printer selection panels prompt for what and where to print.

**Find Services Results**

**Service results list**

Here is an example of service find results list.

<table>
<thead>
<tr>
<th>Service</th>
<th>Description</th>
<th>Last User</th>
<th>Last Date</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2U11x1033</td>
<td>Maps E164 numbers to URLS starting 1033</td>
<td>SNF</td>
<td>01/04/2000 10:59:50</td>
<td>7</td>
</tr>
<tr>
<td>E2U11x10fag</td>
<td>Maps E164 numbers to URLS starting 10fag</td>
<td>SNF</td>
<td>01/04/2000 10:59:50</td>
<td>6</td>
</tr>
<tr>
<td>E2U11x11map</td>
<td>Maps E164 numbers to URLS starting 11map</td>
<td>SNF</td>
<td>01/04/2000 10:59:50</td>
<td>5</td>
</tr>
</tbody>
</table>

**Service results columns**

This table describes the content of each column.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service</td>
<td>The unique name of the service.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the service.</td>
</tr>
<tr>
<td>Last User</td>
<td>Name of last user to amend (or add) this record</td>
</tr>
<tr>
<td>Last Date</td>
<td>Date when this record was added or amended</td>
</tr>
<tr>
<td>ID</td>
<td>Record number within the database table</td>
</tr>
</tbody>
</table>
Selecting service for update

To amend any of the records in the results list, click on the row to change, then click **Select**.

**Result:** The record detail is displayed in *Update Mode* (on page 36).

Exporting service results list

The export function downloads all the information displayed in the results list.

To export, click **Export**, then follow the prompts for what to name the file and where to save it to.

You can view the saved file using a text processor.

Printing flag results list

Click **Print** to print the results list.

Page setup and printer selection panels prompt for what and where to print.

Find Subscriber or Operator Results

Subscriber or operator results list

Here is an example of subscriber or operator find results list.
Subscriber or operator results columns

This table describes the content of each column.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The operator or subscriber name, depending on the option selected.</td>
</tr>
<tr>
<td>Number Start</td>
<td>The start of number in a range for this operator or subscriber.</td>
</tr>
<tr>
<td>Number End</td>
<td>The last number in a range for this operator or subscriber.</td>
</tr>
<tr>
<td>Entry Type</td>
<td>Indicator of type of list, either O(perator), or S(ubscriber).</td>
</tr>
<tr>
<td>Last User</td>
<td>Name of last user to amend (or add) this record</td>
</tr>
<tr>
<td>Last Date</td>
<td>Date when this record was added or amended</td>
</tr>
<tr>
<td>ID</td>
<td>Record number within the database table</td>
</tr>
</tbody>
</table>

Selecting flag for update

To amend any of the records in the results list, click on the row to change, then click Select.

Result: The record detail is displayed in Update Mode (on page 36).

Exporting subscriber or operator results list

The export function downloads all the information displayed in the results list.

To export, click Export, then follow the prompts for what to name the file and where to save it to.

You can view the saved file using a text processor.

Printing flag results list

Click Print to print the results list.

Page setup and printer selection panels prompt for what and where to print.
Find NAPTR Records Results

NAPTR records results list

Here is an example of NAPTR records find results list.

![NAPTR Record Management - Find result mode](image)

### NAPTR record results columns

This table describes the content of each column.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscriber/Operator</td>
<td>The subscriber or operator name</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Order</td>
<td>A 16-bit unsigned integer that specifies the processing order of the NAPTR records, with lower-numbered records processed before higher-numbered records.</td>
</tr>
<tr>
<td>Preference</td>
<td>A 16-bit unsigned integer that specifies a processing preference within NAPTR records that have equal order values.</td>
</tr>
<tr>
<td></td>
<td>The distinction between the order and preference values is that a client can process records having the same order number but different preference numbers, but cannot process records with a different order number after a match is found.</td>
</tr>
</tbody>
</table>
### Column

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flag</td>
<td>A character that governs the interpretation and rewriting of the record's</td>
</tr>
<tr>
<td></td>
<td>fields. Letters can be either uppercase or lowercase. Only values S, A,</td>
</tr>
<tr>
<td></td>
<td>U, and P are defined. The S, A and U flags indicate that the current</td>
</tr>
<tr>
<td></td>
<td>NAPTR record is the last one and they determine what the next action will</td>
</tr>
<tr>
<td></td>
<td>be.</td>
</tr>
<tr>
<td></td>
<td>- The letter S specifies that the next lookup is for SRV records.</td>
</tr>
<tr>
<td></td>
<td>- The letter A specifies that the next lookup is for an A, AAAA, or A6</td>
</tr>
<tr>
<td></td>
<td>record.</td>
</tr>
<tr>
<td></td>
<td>- The letter U specifies that the output of the Regexp field is a URI.</td>
</tr>
<tr>
<td></td>
<td>Because some applications also lookup aspects of URIs, developers should</td>
</tr>
<tr>
<td></td>
<td>understand that this can create loop conditions and take appropriate</td>
</tr>
<tr>
<td></td>
<td>measures. It is highly recommended that developers use the U flag to</td>
</tr>
<tr>
<td></td>
<td>control which areas of the application algorithm are executed.</td>
</tr>
<tr>
<td></td>
<td>- The letter P specifies that the remainder of the application algorithm</td>
</tr>
<tr>
<td></td>
<td>is executed in a manner that is consistent with the Services field. The</td>
</tr>
<tr>
<td></td>
<td>rules are identified by the protocol specified in the Services field.</td>
</tr>
<tr>
<td></td>
<td>See the standards documentation for the naming authority pointing dns</td>
</tr>
<tr>
<td></td>
<td>resource record for more information on these values.</td>
</tr>
<tr>
<td>Service</td>
<td>The service name.</td>
</tr>
<tr>
<td>Regular Expression</td>
<td>A string that holds a regular expression to apply to the client's original</td>
</tr>
<tr>
<td></td>
<td>string to create the next domain name to look up. See the standards</td>
</tr>
<tr>
<td>Replacement</td>
<td>The next name to query for NAPTR, SRV, or address records depending on the</td>
</tr>
<tr>
<td>Last User</td>
<td>Name of last user to amend (or add) this record</td>
</tr>
<tr>
<td>Last Date</td>
<td>Date when this record was added or amended</td>
</tr>
<tr>
<td>ID</td>
<td>Record number within the database table</td>
</tr>
</tbody>
</table>

### Selecting NAPTR record for update

To amend any of the records in the results list, click on the row to change, then click **Select**.

**Result:** The record detail is displayed in *Update Mode* (on page 37).

### Exporting NAPTR records results list

The export function downloads all the information displayed in the results list.

To export, click **Export**, then follow the prompts for what to name the file and where to save it to.

You can view the saved file using a text processor.

### Printing flag results list

Click **Print** to print the results list.

Page setup and printer selection panels prompt for what and where to print.
Overview

Introduction
This chapter explains how to add new records to the ENUM database.

In this chapter

This chapter contains the following topics.

New Flags 29
New Services 30
New Subscriber or Operator 30
New NAPTR Records 31

New Flags

How to add a new flag
Follow these steps to add a new flag record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Ensure the current mode shown in the screen title is Find Mode. Result: The New button becomes available. Tip: Click Return until the screen title shows - Find mode.</td>
</tr>
<tr>
<td>2</td>
<td>Select the Flags tab.</td>
</tr>
</tbody>
</table>
| 3    | Click New. Results:  
  ● The screen title changes to New mode.  
  ● The allowed new mode buttons are active and disallowed buttons grayed out.  
  ● The last Used Data section is grayed out. |
| 4    | Enter the flag name in the Flag field. |
| 5    | Enter the flag description in the Description field. |
| 6    | Click Save. Result: A saved confirmation message appears at the bottom of the screen. |
| 7    | Click one of the following:  
  ● Return - to return to the Find Mode  
  ● Clear - to add another record |
New Services

How to add a new service

Follow these steps to add a new service record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Ensure the current mode shown in the screen title is **Find Mode**.  
*Result:* The **New** button becomes available.  
*Tip:* Click **Return** until the screen title shows **Find Mode**. |
| 2    | Select the **Service** tab. |
| 3    | Click **New**.  
*Results:*  
  * The screen title changes to New Mode.  
  * The allowed new mode buttons are active and disallowed buttons grayed out.  
  * The last Used Data section is grayed out. |
| 4    | Enter the service name in the **Service** field. |
| 5    | Enter the service description in the **Description** field. |
| 6    | Click **Save**.  
*Result:* A saved confirmation message appears at the bottom of the screen. |
| 7    | Click one of the following:  
  * **Return** - to return to the Find Mode  
  * **Clear** - to add another record |

New Subscriber or Operator

How to add a new subscriber or operator

Follow these steps to add a new subscriber/operator record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Ensure the current mode shown in the screen title is **Find Mode**.  
*Result:* The **New** button becomes available.  
*Tip:* Click **Return** until the screen title shows - Find mode. |
| 2    | Select **Subscriber/Operator** tab. |
| 3    | Click **New**.  
*Results:*  
  * The screen title changes to New mode.  
  * The allowed new mode buttons are active and disallowed buttons grayed out.  
  * The last Used Data section is grayed out. |
| 4    | To add:  
  * **operator** record, tick the **Entry Type** check box.  
  * **subscriber** record, clear the **Entry Type** check box |
| 5    | Type the subscriber/operator name in the **Name** field. |
| 6    | Type the start of range number in the **Number Start** field. |
New NAPTR Records

How to add a new NAPTR record

Follow these steps to add a new NAPTR record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>Type the End of range number in the Number End field.</td>
</tr>
<tr>
<td>8</td>
<td>Click Save.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> A saved confirmation message appears at the bottom of the screen.</td>
</tr>
<tr>
<td>9</td>
<td>Click one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Return - to return to the Find Mode</td>
</tr>
<tr>
<td></td>
<td>• Clear - to add another record</td>
</tr>
</tbody>
</table>

Step 1:
Ensure the current mode shown in the screen title is **Find Mode**.

**Result:** The **New** button becomes available.

**Tip:** Click **Return** until the screen title shows - Find mode.

Step 2:
Select the **NAPTR** tab.

Step 3:
Click **New**.

**Results:**
• The screen title changes to New mode.
• The allowed new mode buttons are active and disallowed buttons grayed out.
• The last Used Data section is grayed out.

Step 4:
Select a Subscriber/Operator, by clicking next to the **Subscriber/Operator** field.

**Result:** The Subscriber/Operator Search Dialog displays.
5. Enter a Name or Dialed Number as required to reduce the number of database hits. Click Find.

6. Click on required record and click Select. **Result:** That subscriber/operator is added to the NAPTR record.

7. Enter a brief description of the record in the Description field.

8. Enter the NAPTR order in the Order field. This is the order in which records must be processed to ensure the correct ordering of rules. Low numbers are processed before high numbers.

9. Enter the NAPTR preference in the Preference field. This is the order in which NAPTR records with equal "order" values should be processed, low numbers being processed before high numbers.

10. Select a flag by clicking on next to the Flag field. **Result:** The Flags Search Dialog displays.
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>Enter a <strong>Flag</strong> or <strong>Description</strong> as required to reduce the number of database hits. Click <strong>Find</strong>.</td>
</tr>
<tr>
<td>12</td>
<td>Click on required record and click <strong>Select</strong>. <strong>Result:</strong> That flag is added to the NAPTR record.</td>
</tr>
<tr>
<td>13</td>
<td>Select a service by clicking next to the <strong>Service</strong> field. <strong>Result:</strong> The Service Search Dialog displays.</td>
</tr>
</tbody>
</table>
Enter a **Service** or **Description** as required to reduce the number of database hits.

Click **Find**.

Click on required record and click **Select**.

**Result:** That service is added to the NAPTR record.

Enter one of the following:

- The NAPTR regular expression in the Regular Expression field. This is a string containing a substitution expression that is applied to the original string held by the client in order to construct the next domain name to lookup.
- The NAPTR replacement in the Replacement field. This is the next NAME to query for NAPTR, SRV, or address records depending on the value of the flags field.

Click **Save**.

**Result:** A saved confirmation message appears at the bottom of the screen.

Click one of the following:

- **Return** - to return to the Find Mode
- **Clear** - to add another record
Overview

Introduction

This chapter explains how to update ENUM records.

In this chapter

This chapter contains the following topics.

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Flags</td>
<td>35</td>
</tr>
<tr>
<td>Update Services</td>
<td>36</td>
</tr>
<tr>
<td>Update Subscriber or Operator</td>
<td>36</td>
</tr>
<tr>
<td>Update NAPTR Records</td>
<td>37</td>
</tr>
</tbody>
</table>

Update Flags

How to change or delete a flag

Follow these steps to amend or delete a flag record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>List the flag records. See <em>Find Flags</em> (on page 13).</td>
</tr>
<tr>
<td>2</td>
<td>Click on the record to amend.</td>
</tr>
</tbody>
</table>
| 3    | Click **Select**.  
**Result:** The record detail is displayed in Update mode. |
| 4    | To delete the record, click **Delete**.  
**Result:** The Confirm Delete Record appears.  
Click one of the following:  
- **Yes** to delete the record  
- **No** to keep the record. |
| 5    | Change fields as required. |
| 6    | Click **Save**.  
**Result:** A saved confirmation message appears at the bottom of the screen. |
| 7    | If required, click **Check Consistency** to check that the currently selected record matches those held upon any replication targets. |
Update Services

How to change or delete a service

Follow these steps to amend or delete a Service record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>List the service records. See <em>Find Services</em> (on page 14).</td>
</tr>
<tr>
<td>2</td>
<td>Click on the record to amend.</td>
</tr>
</tbody>
</table>
| 3    | Click *Select*.  
*Result:* The record detail is displayed in Update mode.  
To delete the record, click *Delete*.  
*Result:* The Confirm Delete Record appears.  
Click one of the following:  
- *Yes* to delete the record  
- *No* to keep the record |
| 4    | Change fields as required. |
| 5    | Click *Save*.  
*Result:* A saved confirmation message appears at the bottom of the screen. |
| 6    | If required, click *Check Consistency* to check that the currently selected record matches those held upon any replication targets. |

Update Subscriber or Operator

How to change or delete a subscriber or operator

Follow these steps to amend or delete a Subscriber or Operator record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>List the Subscriber or Operator records. See <em>Find Subscriber or Operator</em> (on page 15).</td>
</tr>
<tr>
<td>2</td>
<td>Click on the record to amend.</td>
</tr>
</tbody>
</table>
| 3    | Click *Select*.  
*Result:* The record detail is displayed in Update mode.  
To delete the record, click *Delete*.  
*Result:* The Confirm Delete Record appears.  
Click one of the following:  
- *Yes* to delete the record  
- *No* to keep the record |
| 4    | Change fields as required. |
| 5    | Click *Save*.  
*Result:* A saved confirmation message appears at the bottom of the screen. |
| 6    | If required, click *Check Consistency* to check that the currently selected record matches those held upon any replication targets. |
Update NAPTR Records

How to change or delete NAPTR records

Follow these steps to amend or delete a NAPTR record.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>List the NAPTR records. See <em>Find NAPTR Records</em> (on page 17).</td>
</tr>
<tr>
<td>2</td>
<td>Click on the record to amend.</td>
</tr>
</tbody>
</table>
| 3    | Click *Select*.  
**Result:** The record detail is displayed in Update mode. |
| 4    | To delete the record, click *Delete*.  
**Result:** The Confirm Delete Record appears.  
Click one of the following:  
• *Yes* to delete the record  
• *No* to keep the record. |
| 5    | Change fields as required. |
| 6    | Click *Save*.  
**Result:** A saved confirmation message appears at the bottom of the screen. |
| 7    | If required, click *Check Consistency* to check that the currently selected record matches those held upon any replication targets. |
Overview

Introduction

This chapter explains how to configure the Oracle Communications Network Charging and Control (NCC) application.

In this chapter

This chapter contains the following topics.

Configuration Overview 39
eserv.config Configuration 39
ENUM.conf Configuration 41

Configuration Overview

Introduction

The Oracle Communications Network Charging and Control ENUM Control Agent is configured in both the eserv.config and ENUM.conf files.

eserv.config Configuration

Introduction

The eserv.config file is a shared configuration file, from which many NCC applications read their configuration. Each NCC machine (SMS, SLC, and VWS) has its own version of this configuration file, containing configuration relevant to that machine. The eserv.config file contains different sections; each application reads the sections of the file that contains data relevant to it.

The eserv.config file is located in the /IN/service_packages/ directory.

The eserv.config file format uses hierarchical groupings, and most applications make use of this to divide up the options into logical groupings.

Example eserv.config detail

This configuration is used by the ENUM macro nodes.

The code shows an example of a part of an eserv.config file ENUM section structure:

```json
ENUM = {
    interfaceHandles = [ "enumIF" ]
    maxQueueLength = 500
}
```
Parameters

Listed below are the parameters in the ENUM section of eserv.config file:

interfaceHandles
Syntax:    interfaceHandles = ["handles"]
Description:    A list of the interface handle names that can be used by the ENUMCallOut feature node.
Type:    Array of strings
Optionality:    Mandatory
Allowed:    Any valid handler name
Default:    None
Notes:    Multiple instances are comma separated
Example:    interfaceHandles = [ "enca" ]

maxQueueLength
Syntax:    maxQueueLength = value
Description:    The maximum number of queued ENUM requests allowed
Type:    Integer
Optionality:    Optional (default used if not set)
Allowed:
Default:    0 (no maximum queue length)
Notes:    Used to load-balance between ENCA instances
Example:    maxQueueLength = 500

Configuration file format

To organize the configuration data within the eserv.config file, some sections are nested within other sections. Configuration details are opened and closed using either {} or [ ].

- Groups of parameters are enclosed with curly brackets - {}
- An array of parameters is enclosed in square brackets - []
- Comments are prefaced with a # at the beginning of the line

To list things within a group or an array, elements must be separated by at least one comma or at least one line break. Any of the following formats may be used, as in this example:

```
{ name="route6", id = 3, prefixes = [ "00000148", "0000473" ] }
{ name="route7", id = 4, prefixes = [ "000001049" ] }
```

or

```
{ name="route6"
  id = 3
  prefixes = [
    "00000148"
    "0000473"
  ]
}
{ name="route7"
  id = 4
  prefixes = [
    "000001049"
  ]
}
```
eserv.config files delivered

Most applications come with an example eserv.config configuration in a file called eserv.config.example in the root of the application directory, for example, /IN/service_packages/eserv.config.example.

Editing the file

Open the configuration file on your system using a standard text editor. Do not use text editors, such as Microsoft Word, that attach control characters. These can be, for example, Microsoft DOS or Windows line termination characters (for example: ^M), which are not visible to the user, at the end of each row. This will cause file errors when the application tries to read the configuration file.

Always keep a backup of your file before making any changes to it. This will ensure you have a working copy to which you can return.

Loading eserv.config changes

If you change the configuration file, then you must restart the appropriate parts of the service to enable the new options to take effect.

ENUM.conf Configuration

Introduction

The following configuration ENUM.conf parameters are used by the ENUM Control Agent.

Example ENUM.conf detail

The code shows an example of the ENUM.conf file.

```python
enca = {
    enumDns = {
        listeningSockets = [
            {
                address = "IP ADDRESS"
                port = PORTNUM
                protocol = "udp"/"tcp"/"tcp+udp"
            },
            {...}
        ]
        allowedClients = [
            "IP ADDRESS 1",
            "IP ADDRESS N"
        ]
        maxTotalQueries = 0
        triggerRules = [
            info = "el64.arpa"
            numDigitsRem = 9
        ]
    }
}
```
The code shows an example of how the triggerRules parameter array may be configured.

Example triggerRules

triggerRules = [
  
  info="e164.arpa"
  numDigsRem=9
]
Example numDigitsRem

The numDigitsRem part of the triggerRules allows an input string to be converted into a valid e.164 number.

For example, the input was:
0.0.9.9.8.2.3.7.4.1.4.4.e164.arpa

The matching triggerRule was:
{ info="4.4.e164.arpa", numDigsRem=10, trigger= ... }

This parameter would indicate 10 trailing characters removed, leaving:
0.0.9.9.8.2.3.7.4.1.4.4

enumDns parameters

Listed below are the Domain Name System (DNS) parameters in the ENUM.conf file, enumDns sub-section:
listeningSockets

Syntax:      \[\text{listeningSockets} = [{\text{socket1}},\ldots]\]
Description: A list of socket descriptors
Type:        Array
Optionality:  Optional (default used if not set)
Allowed:     
Default:     Empty (no sockets)
Notes:       
Example:     \[
\begin{array}{l}
\text{listeningSockets} = [\\
\quad \{\\n\quad \quad \text{address} = \quad \\
\quad \quad \quad \text{port} = \\
\quad \quad \quad \text{protocol} = \\
\quad \}, \\
\quad \{\ldots\}\n\end{array}
\]

address

Syntax:      \text{address} = <"\text{IP_Address}"">
Description: Interface IP address for this socket
Type:        String
Optionality:  Mandatory
Allowed:     
Default:     None
Notes:       
Example:     

port

Syntax:      \text{port} = \text{Port_Number}
Description: Interface port number for this socket
Type:        Integer
Optionality:  Optional (default used if not set)
Allowed:     
Default:     53
Notes:       
Example:     \text{port} = 99

protocol

Syntax:      \text{protocol} = "\text{protocol}"
Description: Interface protocol for this socket
Type:        String
Optionality:  Optional (default used if not set)
Allowed:     
\quad \bullet \text{udp} \\
\quad \bullet \text{tcp}
Default:     tcp+udp
Notes:       To include both protocols, separate each with a plus (+) sign
Example:     \text{protocol} = "\text{tcp+udp}"
allowedClients
Syntax: allowedClients = ["IP_Address1","..."]
Description: A comma separated list of acceptable client IP addresses
Type: Array of string
Optionality: Optional (default used if not set)
Allowed:
Default: Empty (no clients allowed)
Notes: When present, must be a fully qualified IP address
Example:

maxTotalQueries
Syntax: maxTotalQueries = value
Description: The overall maximum number of concurrent DNS queries
Type: Integer
Optionality: Optional (default used if not set)
Allowed:
Default: 0 (no limit)
Notes:
Example: maxTotalQueries = 600

triggerRules
Syntax: triggerRules = [{rule1},{...}]
Description: An unlimited list of trigger rules
Type: Array
Optionality: Optional (default used if not set)
Allowed:
Default: Empty (no services configured)
Notes:
Example: See Example triggerRules (on page 42)

info
Syntax: info = "value"
Description: Comparison string, to be matched to the end of the input FQDN.
Type: String
Optionality: Mandatory
Allowed:
Default: None
Notes: May be blank
Example: info = "e164.arpa"

numDigitsRem
Syntax: numDigitsRem = value
Description: Number of digits to remove from end of the input FQDN when this rule matches
Type: Integer
Optionality: Mandatory
Allowed:
Default: None
Notes: This parameter is necessary to distinguish between what is and what is not part of the e.164 number, as the trailing domain can contain any valid domain-name characters, including numbers (for example ".9.nonsense.11.net")
Example: numDigitsRem = 9

source
Syntax: source = "IP_Address"
Description: An IP address to be matched against the client IP address in the allowedClients list.
Type: String
Optionality: Optional (default used if not set)
Allowed:
Default: Blank (any client)
Notes:
Example: source = "1.2.3.4"

trigger
Syntax: trigger = value
Description: Servicekey to be triggered on a successful match
Type: Integer
Optionality: Mandatory
Allowed:
Default: None
Notes:
Example: trigger = 0

noa
Syntax: noa = value
Description: The NoA (Nature of Address) value to be placed in the IDP on a successful match
Type: Integer
Optionality: Mandatory
Allowed:
  • 1 - Subscriber
  • 2 - UNKNOWN
  • 3 - National
  • 4 - International
Default: None
Notes:
Example: noa = 4

dataType
Syntax: dataType = "type"
Description: Type of data this service will return
Type: String
Chapter 8

Optionality: Mandatory
Allowed: • URI  
• NAPTR  
• DYNAMIC
Default: None
Notes: When type is DYNAMIC, the type of data (URI/NAPTR) is expected to be part of the response
Example: dataType = "URI"

dataProfileTag
Syntax: dataProfileTag = value
Description: Profile tag where the data will be returned. This is a Profile Tag’s ID value, and is expected to be found in the Outgoing Extensions profile block.
Type: Integer
Optionality: Optional (default used if not set)
Allowed: 
Default: 210001 (Enum NAPTR Temporary Store)
Notes:
Example: dataProfileTag = 0

idpFQDNProfileTag
Syntax: idpFQDNProfileTag = value
Description: Location where the DNS query FQDN will be placed
Type: Integer
Optionality: Optional (default used if not set)
Allowed: 
Default: 210002
Notes: FQDN is from input query
Example: idpFQDNProfileTag = 5000

idpAUSProfileTag
Syntax: idpAUSProfileTag = value
Description: Location where the AUS will be placed
Type: Integer
Optionality: Optional (default used if not set)
Allowed: 
Default: 210003
Notes: AUS is derived from FQDN
Example: idpAUSProfileTag = 50000

serviceTimeout
Syntax: serviceTimeout = value
Description: The maximum number of seconds to wait for a triggered service to respond
Type: Integer
Optionality: Optional (default used if not set)
Allowed: 2
Default: 2
Notes:
Example: serviceTimeout = 4

uriNaptrRules
Syntax: uriNaptrRules = [{rule1},{...}]
Description: A list of URI to NAPTR record templates.
Type: Array
Optionality: Optional (default used if not set)
Allowed:
Default: Empty (always use defUriNaptrRule values)
Notes: Rules must be listed in descending order of preference
Example: Example rule, for "mailto:" URIs using default replaceTag value
uriNaptrRules = [
    {
        searchURI = "mailto:"
        replaceNAPTR = "NAPTR 10 100 \"u\" \"E2U+msg\"
        "!.*(!$!<INPUT>!\" ."
    },
    {...}
]

searchURI
Syntax: searchURI = "value"
Description: String to search for in the URI
Type: String
Optionality: Mandatory
Allowed:
Default: None
Notes:
Example: searchURI = "SEARCH STR"

replaceNAPTR
Syntax: replaceNAPTR = "value"
Description: The Output template
Type: String
Optionality: Mandatory
Allowed:
Default: None
Notes:
Example: replaceNAPTR = "NAPTR STR"

replaceTag
Syntax: replaceTag = "value"
Description: The tag in replaceNAPTR to be replaced by the input URI
Type: String
Optionality: Optional (default used if not set)
Allowed:
Default:  
Notes:
Example:  replaceTag = "<INPUT>"

defUriNaptrRule
Syntax:  defUriNaptrRule = {default_rule}
Description:  The default URI to NAPTR rule template
Type:  Parameter group
Optionality:  Mandatory
Allowed:  See example
Default:  None
Notes:  This is a standard uriNaptrRule, less its searchURI string because it is inapplicable
Example:
   defUriNaptrRule = {
       replaceNAPTR = "NAPTR 10 100 \"u\" \"E2U+example\" \\
       \"!^.*$<INPUT>!\" .",
       replaceTag = "<INPUT>"
   }

noaDomainNameRules
Syntax:  noaDomainNameRules = (rule1),{...}
Description:  A list of NoA to Domain Name rules
Type:  Array
Optionality:  Optional (default used if not set)
Allowed:
Default:  Empty (always use defNoADomain rule)
Notes:  Used for manual DRA to FQDN conversion
Example:
   noaDomainNameRules = [
   
   ]

noa
Syntax:  noa = value
Description:  The NoA value.
Type:  Integer
Optionality:  Mandatory
Allowed:
Default:  None
Notes:
Example:  noa = 0
domain

Syntax:  \( \text{domain} = "\text{name}" \)
Description:  The output domain
Type:  String
Optionality:  Mandatory
Allowed:  
Default:  None
Notes:  
Example:  \( \text{domain} = "\text{example.arpa}" \)

defNoADomain

Syntax:  \( \text{defNoADomain} = "\text{domain}" \)
Description:  The default NoA to Domain value where the NoA is unknown
Type:  String
Optionality:  Mandatory
Allowed:  See example
Default:  None
Notes:  Used for manual DRA to FQDN conversion
Example:  \( \text{defNoADomain} = "\text{e164.arpa}" \)

dnsTTL

Syntax:  \( \text{dnsTTL} = \text{value} \)
Description:  The Time To Live (TTL) value, in seconds, to be used in all outgoing DNS responses
Type:  Integer
Optionality:  Optional (default used if not set)
Allowed:  
Default:  0 (use result once)
Notes:  
Example:  \( \text{dnsTTL} = 2 \)

\text{enumCallOut parameters}

Listed below are the CallOut parameters in the \text{ENUM.conf} file, \text{enumCallOut} sub-section:

\text{maxTotalQueries}

Syntax:  \( \text{maxTotalQueries} = \text{value} \)
Description:  The maximum number of concurrent call-out requests
Type:  Integer
Optionality:  Optional (default used if not set)
Allowed:  
Default:  0 (no limit)
Notes:  
Example:  \( \text{maxTotalQueries} = 30 \)
timeout
Syntax: 
timeout = value
Description: The maximum time for a DNS server to respond, in seconds
Type: Integer
Optionality: Optional (default used if not set)
Allowed:
Default: 2
Notes: This and the maxRetries parameter are used to determine when an alarm is raised, causing the CallOut macro node to branch on the DNS Timeout exit
Example: timeout = 4

maxRetries
Syntax: 
maxRetries = value
Description: The maximum number of DNS retries
Type: Integer
Optionality: Optional (default used if not set)
Allowed:
Default: 2
Notes: This and the timeout parameter are used to determine when an alarm is raised, causing the CallOut macro node to branch on the DNS Timeout exit
Example: maxRetries = 4

servers
Syntax: 
servers = [{server1},{...}]
Description: A list of external DNS servers
Type: Array
Optionality: Optional (default used if not set)
Allowed:
Default: blank (no servers)
Notes:
Example: servers = [
{
    address = "IP ADDRESS"
    port = PORTNUM
    protocol = "udp"/"tcp"/"tcp+udp"
},
{...
}
]

address
Syntax: 
address = "address"
Description: IP address or host name for this server
Type: String
Optionality: Mandatory
Allowed: 
  • IP_Address
  • Host
Default: None
Notes:

Example:

port

Syntax: \textit{port = Port\_Number}
Description: Port number for this server
Type: Integer
Optionality: Optional (default used if not set)
Allowed: 
Default: 53
Notes:
Example: \textit{port = 99}

protocol

Syntax: \textit{protocol = \textchar{protocol}}
Description: Protocol for this server
Type: String
Optionality: Optional (default used if not set)
Allowed: 
\begin{itemize}
  \item udp
  \item tcp
\end{itemize}
Default: \textit{tcp+udp}
Notes: To include both protocols, separate each with a plus (+) sign
Example: \textit{protocol = \textchar{tcp+udp}}
Chapter 9

Feature Nodes

Overview

Introduction

This chapter lists all the available Oracle Communications Network Charging and Control ENUM Control Agent feature nodes.

In this chapter

This chapter contains the following topics.

Available Feature Nodes

Introduction

This topic lists all the Feature Nodes that may be available for ENUM control plan category. The actual nodes available are dependent on the application in which the Control Plan Editor is operating. In some cases, additional nodes may have been created and installed to fit a specific customer need. These custom nodes do not appear in this list.

ENUM nodes

Here is an example feature palette for the ENUM nodes.

ENUM Node descriptions

Here are the nodes in this category.

<table>
<thead>
<tr>
<th>Node name</th>
<th>Node icon</th>
<th>Node description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENUM Call Out (on page 54)</td>
<td>ENUM Call Out</td>
<td>The ENUM Call Out node performs an ENUM lookup using the ENCA interface.</td>
</tr>
<tr>
<td>ENUM Naptr response (on page 56)</td>
<td>ENUMNResp</td>
<td>The ENUM NAPTR Response node processes a previously retrieved NAPTR response to extract specific records.</td>
</tr>
<tr>
<td>ENUM Query (on page 58)</td>
<td>ENUMQuery</td>
<td>The ENUM Query node is used to query the ENUM database.</td>
</tr>
</tbody>
</table>
ENUM Call Out

Node description

The ENUM Call Out node performs an ENUM lookup using the ENCA interface.

Node icon

Restrictions

A control plan may contain as many ENUM Call Out nodes as required.

Node exits

This node has one entry and ten exits. The number of exits cannot be changed.

<table>
<thead>
<tr>
<th>Exit</th>
<th>Cause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Success</td>
<td>ENCA return code = 0</td>
</tr>
<tr>
<td>2</td>
<td>Too Few Parameters</td>
<td>No number was given in the call-out ENCA request (number is blank).</td>
</tr>
<tr>
<td>3</td>
<td>Failed Translation</td>
<td>ENCA DNS response translation failed.</td>
</tr>
<tr>
<td>4</td>
<td>DNS Timeout</td>
<td>DNS server(s) failed to respond within the configured time-limit.</td>
</tr>
<tr>
<td>5</td>
<td>DNS Format Error</td>
<td>DNS served responded with message: &quot;Format Error&quot;.</td>
</tr>
<tr>
<td>6</td>
<td>DNS Server Failure</td>
<td>DNS served responded with message: &quot;Server Failure&quot;.</td>
</tr>
<tr>
<td>7</td>
<td>DNS Name Error</td>
<td>DNS served responded with message: &quot;Name Error&quot;.</td>
</tr>
<tr>
<td>8</td>
<td>DNS Not Implemented</td>
<td>DNS served responded with message: &quot;Not Implemented&quot;.</td>
</tr>
<tr>
<td>9</td>
<td>DNS Refused</td>
<td>DNS served responded with message: &quot;Refused&quot;.</td>
</tr>
<tr>
<td>10</td>
<td>ENCA Fail</td>
<td>ENCA failure (out of resources / bad domain name / any other error).</td>
</tr>
</tbody>
</table>
Configuration screen

Here is an example Configure ENUM Call Out screen.

Configuring the node

Follow these steps to configure the node.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select where the number to convert will be sourced from, one of:  
  - **Profile** (from a profile block and tag)  
  - **Freeform** (from this configuration screen)  
  **Result:** The relevant Number Location fields are made available.  
| 2    | Depending on what was selected at step 1, one of:  
  - Select the Number Location from the **Number Location** and **Number Field** drop down lists  
  - Enter the number in the **Number** field |
Step | Action
--- | ---
3 | If the number is to be converted to FQDN format, select the Convert to FQDN check box.
4 | Select where the domain name will be sourced from, one of:
   - Profile (from a profile block and tag)
   - Freeform (from this configuration screen)
   Result: The relevant Domain Name fields are made available.
5 | Depending on what was selected at step 4, one of:
   - Select the Domain Name from the Domain Name Location and Domain Name Field drop down lists, or
   - Enter the domain name in the Domain Name field.
6 | Click Save.

**ENUM Naptr Response**

**Node description**

The ENUM NAPTR Response node processes a previously retrieved NAPTR response to extract specific records.

When extracting AUS (Application Unique String) type, the presence of the AUS is detected by a ‘+’ character found, followed by one or more numerical characters terminated with ‘@’ (for example "!^."$!+441473289900@oracle.com!")

**Node icon**

![ENUMNResp NAPTR](image)

**Restrictions**

A control plan may contain as many ENUM NAPTR Response nodes as required.

**Node exits**

This node has one entry and four exits. The number of exits cannot be changed.

<table>
<thead>
<tr>
<th>Exit</th>
<th>Cause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Success</td>
<td>The record was extracted and saved.</td>
</tr>
<tr>
<td>2</td>
<td>No Match NAPTR</td>
<td>The required record could not be found.</td>
</tr>
<tr>
<td>3</td>
<td>No Match AUS</td>
<td>An AUS format number could not be found.</td>
</tr>
<tr>
<td>4</td>
<td>Error</td>
<td>Any other error situation.</td>
</tr>
</tbody>
</table>
Configuration screen

Here is an example Configure ENUM NAPTR Response screen.

Configuring the node

Follow these steps to configure the node.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | In the **Search String** section, set the search criteria to match records against.  
* Enter the record type to extract in the **Search String** field  
* Enter the record number to extract in the **Index** field |
| 2    | In the **Active Record Save Location**, identify where the found record is to be saved, one of:  
* A new location, select from the **Profile Location** and **Profile Field** drop down lists |
Step | Action
--- | ---
3 | In the **Regular Expression Substitution** section, to invoke the regular expression substitution, check the **Perform Substitution** check box, then:
   - Identify incoming profile location, one of:
     - Select an incoming AUS value from the **Incoming Profile Location** and **Incoming Profile Field** drop down lists
     - Select the **Use Default Profile** check box
   - Select a save location from the **Outgoing Profile Location** and **Outgoing Profile Field** drop down lists
4 | In the **AUS Processing** section, for AUS format numbers extracted:
   - Select the **Extract AUS** check box
   - If required, select the **Remove +** check box to remove the preceding +
   - If required, select the **Remove -** check box to remove the preceding -
5 | In the **AUS Save Location** section, for AUS format numbers, select the save location from the **Profile Location** and **Profile Field** drop down lists.
6 | Click **Save**.

**ENUM Query**

**Node description**

The ENUM Query node is used to query the ENUM database.

**Node icon**

![ENUM Query Icon](image)

**Restrictions**

A control plan may contain as many ENUM Query nodes as required.

**Node exits**

This node has one entry and five exits. The number of exits cannot be changed.

<table>
<thead>
<tr>
<th>Exit</th>
<th>Cause</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | Subscriber records | Search key found subscriber records that matched the search key (dialed number within a record number range) and may have matched the optional **Service** criteria.  
**Note:** The search key is used to find subscribers/operators. This is a dialed number (for example, 1234567) that is searched for between a range of numbers. |
<table>
<thead>
<tr>
<th>Exit</th>
<th>Cause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Operator records</td>
<td>Search key did not find any subscriber records, but did find operator records that matched the search key (dialed number within a record number range) and may have matched the optional Service criteria.</td>
</tr>
<tr>
<td>3</td>
<td>No NAPTR Records</td>
<td>Search key did find subscriber or operator records that matched the search key but did not find any NAPTR records.</td>
</tr>
<tr>
<td>4</td>
<td>No SUB/OP info</td>
<td>Search key did not find any subscriber or operator records that matched the search key.</td>
</tr>
<tr>
<td>5</td>
<td>Error</td>
<td>Database or I/O error.</td>
</tr>
</tbody>
</table>

**Note:** The Service criteria is an optional delimiter for the NAPTR record returned. By specifying the service you can delimit on the service of a NATPR records (that is, only return records of E2U+sip type). The search key is still the primary search criteria.

**Configuration screen**

Here is an example Configure ENUM Query screen.

![Configure ENUM Query](image)
## Configuring the node

Follow these steps to configure the node.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select the **Search Key Location**, one of:  
  - Select from the **drop down lists**  
  - Select the **Use Default Profile** check box |
| 2    | To optionally specify a **Service Type**:  
  - Select the **Specify Type** check box  
  - Select the **Service Type** from the drop down list  
  **Note:** The Service Type list is configured in **SMS > Services > ENUM service > NAPTR Record Management > Service** tab/screens. |
| 3    | Select the **Outgoing Destination** location using the drop down lists. |
| 4    | Click **Save**. |
Chapter 10

About Installation and Removal

Overview

Introduction

This chapter provides details of the installation and removal process for the application.

In this chapter

This chapter contains the following topics.

Installation and Removal Overview
Post-installation Configuration

Installation and Removal Overview

Introduction

For information about the following requirements and tasks, see NCC Installation Guide:

- NCC system requirements
- Pre-installation tasks
- Installing and removing NCC packages

DCA packages

An installation of Oracle Communications Network Charging and Control ENUM Control Agent includes the following packages, on the:

- SMS:
  - enumSms
- SLC:
  - enumScp

Post-installation Configuration

Overview

Before Oracle Communications Network Charging and Control ENUM Control Agent can be started, several configuration tasks are required.

Default and eserv.config configuration

After installing the packages, both the default configuration file for the ENCA component and the main eserv.config will need to be edited after installation.
Multiple interfaces

The ENCA can be configured as multiple interfaces in the SLEE.cfg.

Configuration file location

The ENCA on startup will, by default, attempt to read a configuration file at:

/IN/service_packages/ENUM/etc/enum.conf

This can be overridden by setting the environment variable ENUM_CONFIG_FILE to refer to another filename. Where multiple concurrent ENCA interfaces are needed, setting this variable for each instance is essential, and should preferably be done in enca startup shell scripts.
NCC Glossary of Terms

ACS
Advanced Control Services configuration platform.

AS
Application Server. The logical entity serving a SUA routing key. An AS is equivalent to an SS7 end point (for example, HLR, MSC,…). An AS contains, at least, one ASP.

ASP
- Application Service Provider, or

AUS
Application Unique String.

CC
Country Code. Prefix identifying the country for a numeric international address.

CCS
1) Charging Control Services (or Prepaid Charging) component.
2) Common Channel Signalling. A signalling system used in telephone networks that separates signalling information from user data.

Connection
Transport level link between two peers, providing for multiple sessions.

DAP
Data Access Pack. An extension module for ACS which allows control plans to make asynchronous requests to external systems over various protocols including XML and LDAP.

DB
Database

Diameter
A feature rich AAA protocol. Utilises SCTP and TCP transports.

DP
Detection Point
DRA
Destination Routing Address. The parameter in the INAP Connect operation, sent from ACS to the SSP. This is the number the SSP is instructed to connect to.

DTMF
Dual Tone Multi-Frequency - system used by touch tone telephones where one high and one low frequency, or tone, is assigned to each touch tone button on the phone.

ENUM
E.164 Number Mapping.

GPRS
General Packet Radio Service - employed to connect mobile cellular users to PDN (Public Data Network- for example the Internet).

HLR
The Home Location Register is a database within the HPLMN (Home Public Land Mobile Network). It provides routing information for MT calls and SMS. It is also responsible for the maintenance of user subscription information. This is distributed to the relevant VLR, or SGSN (Serving GPRS Support Node) through the attach process and mobility management procedures such as Location Area and Routing Area updates.

HPLMN
Home PLMN

HTML
HyperText Markup Language, a small application of SGML used on the World Wide Web.
It defines a very simple class of report-style documents, with section headings, paragraphs, lists, tables, and illustrations, with a few informational and presentational items, and some hypertext and multimedia.

IDP
INAP message: Initial DP (Initial Detection Point)

IN
Intelligent Network

INAP
Intelligent Network Application Part - a protocol offering real time communication between IN elements.

Initial DP
Initial Detection Point - INAP Operation. This is the operation that is sent when the switch reaches a trigger detection point.

IP
1) Internet Protocol
2) Intelligent Peripheral - This is a node in an Intelligent Network containing a Specialized Resource Function (SRF).

**IP address**

Internet Protocol Address - network address of a card on a computer

**ISUP**

ISDN User Part - part of the SS7 protocol layer and used in the setting up, management, and release of trunks that carry voice and data between calling and called parties.

**MS**

Mobile Station

**MSC**

Mobile Switching Centre. Also known as a switch.

**MT**

Mobile Terminated

**MTP**

Message Transfer Part (part of the SS7 protocol stack).

**NP**

Number Portability

**Oracle**

Oracle Corporation

**PLMN**

Public Land Mobile Network

**SCA**

1) Service Centre Address
2) Session Control Agent for Session Initiation Protocol (SIP)

**SCCP**

Signalling Connection Control Part (part of the SS7 protocol stack).

**Session**

Diameter exchange relating to a particular user or subscriber access to a provided service (for example, a telephone call).
SGML

SGSN
Serving GPRS Support Node

SIP
Session Initiation Protocol - a signaling protocol for Internet conferencing, telephony, event notification and instant messaging. (IETF)

SK
Service Key

SLC
Service Logic Controller (formerly UAS).

SLEE
Service Logic Execution Environment

SMS
Depending on context, can be:
- Short Message Service
- Service Management System platform
- NCC Service Management System application

SN
Service Number

SRF
Specialized Resource Function - This is a node on an IN which can connect to both the SSP and the SLC and delivers additional special resources into the call, mostly related to voice data, for example play voice announcements or collect DTMF tones from the user. Can be present on an SSP or an Intelligent Peripheral (IP).

SS7
A Common Channel Signalling system used in many modern telecoms networks that provides a suite of protocols which enables circuit and non circuit related information to be routed about and between networks. The main protocols include MTP, SCCP and ISUP.

SSF
Sub Service Field.
**SSP**
Service Switching Point

**SUA**
Signalling Connection Control Part User Adaptation Layer

**System Administrator**
The person(s) responsible for the overall set-up and maintenance of the IN.

**TCAP**
Transaction Capabilities Application Part – layer in protocol stack, message protocol.

**URI**
Uniform Resource Identifier.

**VLR**
Visitor Location Register - contains all subscriber data required for call handling and mobility management for mobile subscribers currently located in the area controlled by the VLR.

**VWS**
Oracle Voucher and Wallet Server (formerly UBE).

**XML**
eXtensible Markup Language. It is designed to improve the functionality of the Web by providing more flexible and adaptable information identification.

It is called extensible because it is not a fixed format like HTML. XML is a `metalanguage` — a language for describing other languages—which lets you design your own customized markup languages for limitless different types of documents. XML can do this because it's written in SGML.
